You urge not only co-operation between Western European countries and Governments but some pooling of sovereignty. You say that "Western Union, if it is to mean anything at all, must mean some pooling of authority, some willingness to submit, on some defined questions, to the decision of a central authority." You admit that the decision is a grave one. "It is no small thing for a Government to hand over any of its responsibilities to a foreign body." You ask Mr Bevin to "face it now." But to whom are the British Government and the other Governments and their Parliaments to hand over authority? Clearly not to Mr Bevin and his colleagues individually. Is it to the Permanent Consultative Council collectively? But the subjects to be discussed by this Council are foreign affairs, defence, matters involving peace or war, and incidentally involving huge expenditure. You cannot mean that these Foreign Ministers themselves are to have collective authority to determine the fate of Europe and its constituent states. If this is admitted, are they then to be responsible, say, to a Bundesrat or Council of Western European nations? If so, what sort of Council and by whom selected? Is such a Council to be supplemented by a European Parliament, as the German Bundesrat was supplemented by the Reichstag? You cannot divest yourself of sovereignty without transferring that sovereignty to some other sovereign authority. What your proposal really involves is a Western European Constitution and it seems unfair on Mr Bevin to blame him for his backwardness in not creating one.

You say it would be foolish to underrate the gravity of the decisions involved. Indeed it would, in my opinion, be impossible to overrate it. In no existing Federation has such a step been taken except after years, rather than months, of discussion and consideration. And in all such cases—except Switzerland which represents a growth of centuries—the populations of the Federated States have spoken the same language and had the same laws and history. Nothing approaching a democratic union of such deep-rooted and exceedingly different nations as those of Europe has ever before even been thought practicable.

The fact that we ourselves have no written constitution seems to blind even the most intelligent and experienced people to what must happen when you set out to create a new Government *ab ovo*. Moreover, the British people have not even begun to think of what is involved for themselves, for the Commonwealth and for their whole future, if all the most important of the sovereign powers of the British Parliament and Government are to be handed over to some other sovereign Parliament and Government.

My own opinion is that the urgent problem of the defence of Western Europe must be based on the solid foundation of existing Governments and co-operation between them, rather than on the uniquely hazardous experiment of attempting now to create a new European Government. Who knows to what strains it would be subject and what stability in existing circumstances it would show. A good many countries co-operated with very good

success to fight the last war. Is there any reason to suppose the countries represented in the Permanent Consultative Council cannot devise the methods by which they can successfully co-operate in their own defence?—Yours faithfully,

11 Old Broad Street, London, E.C.2

BRAND

[We did not suggest that powers of sovereignty should be handed over without there being a body to receive them. Nowhere did we suggest that "all the most important of the sovereign powers of the British Parliament and Government" should be handed over "to some other sovereign Parliament and Government." Our carefully chosen phrase was the one quoted by Lord Brand—"some willingness to submit, on some defined questions to the decision of a central authority." We are unshaken in our belief that without this (which, with all respect to Lord Brand, was done during the war) Western Union will not amount to much. But this does not mean that all subjects must be decided centrally; nor does it necessarily imply, at this stage, a central Government; nor, finally, were we criticising Mr Bevin for not having a Constitution all ready. What we did say was that a great many people were being led to believe that when the British Government talked about a Western Union, it meant a Western Union, not a new form of alliance between sovereign states; and that if this is not what it had in mind, not necessarily for the immediate present, but for a not too remote future, it ought to say so now, before misunderstanding has gone so far that the removal of it will be dangerous. This was the question that we asked Mr Bevin to face.—EDITOR.]

Consumption Up or Down?

SIR,—Mr Harrod argues that personal consumption in 1947 was 12 per cent lower than in 1938 and not, as the White Paper states, with important and well-emphasised reservations, slightly higher. The argument is not easy to follow.

1. Mr. Harrod calculates "from information provided in the White Paper that costs of production, including profit, were up on the average by some 80 per cent." There is no readily available information about costs in my copy of the White Paper (except for consumer's goods and services). To get from the National Income statistics to changes in costs presumably requires some rather intricate calculations. As it stands, however, it is not clear exactly what this 80 per cent signifies.

2. The next stage of the argument appears to assume that price index numbers, however different their weights and construction, and whatever the range of goods covered and the stage of production concerned, may not differ from one another by more than a certain amount. Mr Harrod's justification for this assumption is a reference to some very elaborate calculations he has made, but he does not tell us what sort of calculations they were.

3. Prices are measured *per unit of output*. If, as Mr Harrod does in his second paragraph, we include profits in cost, then—apart from subsidies and indirect taxes, which do not seem to be in point here—changes in money cost per unit of output are by definition the same as changes in price. What then does Mr Harrod mean when he talks of prices rising more than wage rates and other costs? If he is referring to costs *per unit of factor*, e.g., time rates of wages, how does he treat profits?

Mr Harrod cannot expect us to accept his final conclusion without showing us more precisely his method. Meanwhile he runs the danger of spoiling a valid criticism of the authors of the White Paper. Each year important estimates are changed, sometimes by considerable amounts, and it is only rarely that we are given an explanation. May we ask that in the complete study

ANNUITIES

(Single lives : Last survivor : "Capital-protected" : "Capital-redemption" : Reversionary : Certain : Deferred, etc.)

Circumstances have made annuities an attractive proposition to an increasingly large number of people, particularly now that the capital invested in them can be safeguarded against loss due to premature death. Very considerable loss (up to £1,000 and over in individual cases) has been and is being sustained by the public due to their entrusting the purchase of their annuities to inexperienced and unrepresentative part-time agents. The undersigned has specialised for many years in every kind of annuity issued by the various Life Offices (for all of which he acts impartially and in the sole interests of his clients), and is therefore in a position to advise on those giving the highest NET yield with complete safety.

The Experimental Period

SIR,—A death is by murder when so proved, not otherwise. In certain countries—in one of which at least the knife is readily drawn—it was found after the death penalty had been abolished that the number of deaths proved to be by murder did not increase. Accordingly Britain is to try if this phenomenon is repeated here over an experimental period of five years. The

argument is that if less murders are disclosed the experiment will be deemed successful and as a conclusion it will be continued permanently. The conclusion may be good, since a bad argument may lead to a good conclusion, but the logic is a complete *non sequitur*. We might as well try reducing the police till no murders are detected and rejoice at a clear statistical record. Is there any reason why we should not be told today whether we are to abolish the death penalty because more murders a year are detected in the experimental period or because *less* are brought to justice in that period?

In my view, what the experiment has to prove is whether more criminals are armed and whether more poisoners "try it on." We should forthwith take steps to establish comparative records on these criminal habits—as for the total of murders discovered, this has no known relation to the number committed, and proves nothing.—Yours faithfully,

Documentary History

"Documents on British Foreign Policy, 1919-39." E. L. Woodward and Rohan Butler, Editors. HMSO. First Series, Vol. I, 1919. 30s. Second Series, Vol. II, 1931. 21s.

It has been the fashion among some reviewers and historians to give a poor, and sometimes ungracious, reception to those volumes of these documents which have so far appeared; and it may be of interest to consider the reasons advanced to justify this attitude.

In the first place, the good faith of the editors has been questioned. It has been suggested that they are subordinating their independence in the choice of documents to the Foreign Office. Needless to say, this suggestion has been made without any evidence to support it, and, apart from the fact that the editors have publicly denied it, there is no need to take it seriously. It has even been implied that the decision to follow the method of arrangement by subject, instead of in strict chronological order, was due to this subordination, on the grounds that it is easier to hide deliberate omissions if arrangement by subject is the method used. This deduction is unreasonable. Given that some selection must take place, it would be just as easy to conceal deliberate omissions—if that were the intention—under the chronological method as under the other. The truth must surely be that there was just as much to be said for either method, and the choice was a matter of preference.

A more reasonable complaint has been against the editors' decision to exclude Foreign Office minutes from the collection. This is a serious matter, and the explanation of this decision, in the general preface to the collection, is not entirely satisfactory. It is true that the number of such minutes must be very great. Selection may make them unintelligible, and the editors assure us that to include them all would more than double the size of the collection. Among other reasons for their exclusion they remark that "as a rule it is unnecessary to print minutes, since the executive decisions taken on incoming material are given in the outgoing dispatches and telegrams." This suggests that they are overlooking the point that the minutes are important, not so

From The Economist of 1848

April 29, 1848.

THANK God! we are Saxons! Such is our daily thanksgiving; and at every fresh escapade of our two inscrutable neighbours, we reiterate in a fresh access of the sincerest gratitude, thank God, we are Saxons! Flanked by the savage Celt on one side, and the flighty Gaul on the other—the one a slave to the passions, the other a victim to the theories of the hour—we feel deeply grateful from our inmost hearts that we belong to a race, which, if it cannot boast the glowing fancy of one of its neighbours, nor the brilliant esprit of the other, has an ample compensation in the solid, slow, reflective, phlegmatic temperament, which has saved us from so many errors, spared us so many experiments, and purchased for us so many real, though incomplete and unsystematic, blessings.

While there is observable a marked similarity, there is, also traceable, a definable distinction in the general character and the present proceedings of the Irishman and the Frenchman. . . . The Frenchman is a civilised Celt. The Irishman is a barbaric Gaul. Both are deplorably excitable, and, when aroused, furiously wild. Both are slaves to the ear—both are to be swayed almost with equal ease by a clever jest, or an eloquent declamation—both are set on fire by watchwords. But the Frenchman requires ideas, pungency, and nerve, in the eloquence to which he succumbs: the Irishman is satisfied by mere violence and rant. . . . Both the Frenchman and the Irishman, too, are prone to worship idols of their own construction; but the Irishman makes his idols out of coarser clay, and he clings to them "through glory and shame" in spite of all exposures of their low humanity. . . . The Frenchman often bows down to an ignoble shrine; but, let his idol be once convicted of some monstrous folly, or some mean and shameless iniquity, and he is sensible of the degradation, and the altar and the idol sink together in the dust. . . . Lastly (and this, perhaps, lies at the root of nearly all their differences), the Frenchman is carried away by *wrong ideas*; the Irishman, by *bad passions*. What is Communism in France, becomes highway robbery and burglary in Ireland.

editors. It has been suggested that the formal record of the proceedings of the Supreme Council (a part only of which takes up the whole of Volume I of the First Series, which runs to nearly 1,000 pages) need not have been included in the collection. It is true that the entire record has already been published by the United States Government; but that is surely no argument against its inclusion in the British collection of published sources.

A more sensible argument for its exclusion has been that it is unrelievedly detailed and dull. The peace treaty with Germany had already been signed when the record begins. The great topic had been settled; the principal figures had departed. The Council had been entirely occupied with the detailed wreckage which resulted from the outstanding fact that, besides the German and Austro-Hungarian Empires, the Ottoman and Russian Empires had also foundered during the First World War. All this is true, and the 1919 Volume will, accordingly, be of no value or interest for the general reader. But to resent its publication on these grounds is to overlook the fact that the conduct, and so the history, of international relations is unbelievably detailed and dull at many periods. It need not be concluded, as has been done, that at such periods vital and exciting developments were taking place outside the Foreign Office, which only the records of the Cabinet, the papers of the Prime Minister and the proceedings of the Committee of Imperial Defence would reveal. It goes without saying that it would be valuable to have these additional records published, and it is legitimate to regret that many valid considerations stand in the way of this. But it is by no means the case that dissatisfaction with the dullness of what is being published would thereby be relieved.

Another deduction, highly ingenious but fundamentally unsound, has been reared on this misconception. That this collection is to be confined to Foreign Office documents, whereas all the interesting developments would be revealed only if the records of the Cabinet and of other departments were released, this—so goes the argument—is an attempt to reassert the independence of the Foreign Office which has been lost since 1919. It need hardly be said that this is a fantastic suggestion. It may be true that between the wars, as this argument continues, British foreign policy has largely been made elsewhere. But has this been more true since 1919 than it was before? The making of British foreign

policy has never been solely, or even largely, the work of the Foreign Office. It has always been the collective responsibility of the Cabinet. The influence of the Foreign Office within the Cabinet will be smaller or greater according to the calibre of the Foreign Secretary, both absolutely and relatively to that of his colleagues. It is arguable that since 1919 the Foreign Office has been held by a series of comparatively weak Secretaries and that its importance has accordingly been smaller than at other periods. But it is ridiculous to suggest that the aim of the Foreign Office under a strong Secretary would be to assert its independence of the Cabinet or that the collection of Foreign Office documents now being published is an attempt to reassert an independence which the Foreign Office has previously known.

The further implication is that the records of the Foreign Office alone, especially in a weak period like that since 1919, cannot be expected to reveal the foreign policy which the Cabinet made. This, in its turn, would probably not bear serious investigation. It would, of course, be ideal if all the other records could also be made available. But it is futile, because they cannot be, to ignore the fact that this comprehensive collection of Foreign Office documents, when complete, will provide a sure insight into British foreign policy between the two wars. It is misleading, as well as malicious, to suggest that its editors are engaged on a useless task.

Shorter Notice

"Baltic Background." By Bernard Newman. Illustrated and with Maps. 280 pages, Robert Hale. 16s.

MR NEWMAN is not to be congratulated on this latest addition to his already copious works. In this book he discusses the history, geography, politics and prospects of the countries of the Baltic region. When the author sticks to facts and figures available in other published books the summary has some value, but when he indulges in a more philosophical or prophetic view some remarkable irrelevancies and errors of judgment appear: he thinks, for example, that Sweden will be the architect of a Scandinavian Federation. Such blemishes show up the egotistical and superficial character of the book and reinforce the reader's feeling that, in spite of the many personal anecdotes, its air of authority is spurious.

THE WORLD OVERSEAS

Report from Germany—II

Bizonia in the Marshall Plan

(From Our Special Correspondent)

FROM the inception of the Marshall Plan, the principle was laid down by Mr Marshall himself and his chief advisers, that the recovery of the German economy was an essential condition of European recovery. In fact, Western Germany will probably be allocated the largest share in American aid after Britain. The German total consists not only of the \$437.4 million proposed for Bizonia under ERP proper, but also of about \$800 million which Congress may vote as appropriated funds for the War Department's use in occupied territories, together with whatever funds or services Britain may supply. Further, the Administrator has proposed that the French Zone shall receive \$96.4 million under ERP, and the Saar Basin another \$15.6 million.

Nevertheless, if it had not been for the urgent demand of the Dutch, Germany would have been left out of the report of the Committee for European Co-operation in Paris last year. As it was, a section was included by the British and French Military Governors. The report for Bizonia was not a German product, though in the vital part dealing with food it was the result of close co-operation and agreement between Herr Schlange-Schoeninger's department and the Anglo-Americans.

It was not until the talks held in London last February between America, Britain, France and Benelux that a concrete decision was taken to include Western Germany in ERP and eventually—when a German Government exists—to allow it to take part in the Continuing Organisation. In the meantime, it was conceded that Germans might take part in the technical committees. However, at the foundation of the Organisation for European Economic Co-operation in Paris on April 16th, owing to French opposition, no representative of the German States Councils signed with General Robertson and General Koenig the pledge of mutual aid on behalf of Germany.

Dollar-Happy Planners

In Frankfurt, the start has been equally inauspicious. At the end of last month, the heads of the bizonal administration handed over their first estimate of Bizonia's balance of payments for the first Marshall Plan year, and were ceremonially given the drafts of the Continuing Organisation, with the announcement that Germany would take its place in it. The Germans showed their complete misconception of the Marshall Plan, which they both over- and underestimate. Dr Koehler, president of the Economic Council, went too far, and prepared the ground for future disappointment, by declaring that Germany was now "a partner with equal rights" in the Western organisation. Their first estimate was a shopping list drawn up by dollar-happy planners with even less idea than their counterparts in Paris last July that the Marshall Plan requires them in increasing measure to give as well as take. Their ignorance is not entirely the fault of the Germans, cut off as they are from the world, with no means of buying publications abroad (except, as a very recent concession, trade journals). Even the editor of one of the leading economic newspapers has never seen, and would be unable to secure, such basic data as the CEEC report, or the Harriman report. German news agencies and press are too unskilled and parochial as well as too restricted to fill the gap.

The news that Germany was in the Marshall Plan hardly sugared the pill represented by General Robertson's warning that unity is a dream to be forgotten for an indefinite time to come. The average German is too taken up with the problem of existence, and has had too many broken promises of increased rations, for him to respond to any more official forecasts of better times to come.

To the German businessman, the Marshall Plan seems a poor substitute for economic unity. If the German East, including the Polish territories, had not been cut off, the economy of the

country—he argues—would be more or less all right; though it would need annual credits of about three billion marks to set it firmly on its feet. If it were not forced into the dollar area, it could restore its prewar trade, particularly its food imports from the South-East of Europe. As it is, the Marshall Plan will merely load future generations with debt, and will not in any case solve Germany's balance of payments problem. The Marshall countries and America, to which trade must be diverted, will never accept the \$2 to \$3 billion worth of German exports a year, which will be necessary eventually if Western Germany is to be viable. They fear German competition and will impose restrictive tariffs. So the arguments run, and they are not easy to refute.

Economists stress that the investment needs of Western German industries amount to many hundreds of millions of dollars. At the same time, it is pointed out that if American capital is extensively invested in German firms, the workers will be roused by Communist propaganda on "capitalist imperialism." Clearly, the Marshall Plan has not made an encouraging psychological start in Germany.

Trimming the Estimates

The first German estimate of requirements was a shock to the British and Americans. Its worst features were that the import list was headed by 5,000,000 tons of coal, at a cost of \$106 million, and imports of 750,000 tons of semi-finished steel; while exports included only 150,000 tons of scrap, or little more than the present contract for Britain, and only 75,000 tons of steel.

This estimate was revised on request. The second version, which the *Frankfurter Rundschau* secured for publication, showed a deficit of \$1.6 billion for the year 1948-49. Total imports were placed at \$2½ billion, still including the coal, and exports at \$660 million, including this time 600,000 tons of scrap. This version was again returned for revision by the Anglo-American economic authorities. The total deficit was larger than the sum which is likely to be available to the bizonal area.

A third version was therefore produced under protest just before the Paris meeting on April 16th. This has now been approved by both the German Chambers with a reservation that it must be slightly amended in Paris. The compilers of the estimate, however, privately maintain that it is already so distorted that Germany's commitments under it are not likely to be fulfilled.

This third version showed a total deficit reduced to the required figure of \$1.2 billion. The reduction had been achieved by cutting imports to just under \$2 billion and increasing exports to \$730 million, chiefly by doubling the exports of scrap, to 1,200,000 tons. Imports of food and seeds remained at the figure of \$900 million, as everyone agrees that this sum, large though it is, is essential if a ration of 1,800 calories a day for the normal consumer is to be provided.

Imports for industry have now been placed at \$1 billion. How vast the increased flow into Germany will be can be judged when it is recalled that imports for industry, excluding oil, amounted last year to only about \$50 million. The proposed 5,000,000 tons of coal have been removed and coal imports to the value of only \$6,000,000 remain. Small amounts of American coal are already being imported, as part of an arrangement by which Germany in return exports more coke, which will lead to the production of over one million tons more steel in the recipient countries. Some small amounts of coal are also being imported for special purposes from Czechoslovakia.

Only small cuts were made in imports of ores (\$42 million for iron ore and \$4,500,000 for other ores), or for semi-finished steel and iron (\$75 million in the second version). Textile raw materials have remained almost the same as the original figure of \$180

million; chemicals now stand at \$110 million, cellulose and paper at \$56 million. The very large figure of capital equipment required for the railways, mines and power plants was cut to \$128 million.

After cuts, the Germans put their minimum import needs for consumer goods, tobacco and coffee at nearly \$98 million for the year. If currency reform is to be a success, and nobody likes to think what will be done if it is not, consumer goods will have to be imported. The figure estimated is apart from \$45 million worth of goods, including foodstuffs, which will be imported as part of the incentive scheme for miners and the bonus scheme under which export firms can buy abroad with 10 per cent of their foreign exchange proceeds.

Twentyfold Export Increase

In return for the twentyfold increase in imports for industry, the Germans undertake to export a total of \$730 million for the first Marshall Plan year. The total for 1947 was only \$222 million. Raw materials—coal, timber and scrap—will still account for half the total (\$363 million). (In 1947 the proportion was as high as 72 per cent, to the extreme resentment of the Germans.) Export of manufactures will realise, it is estimated, about \$300 million, or approximately eight times the 1947 figure. The balance is made up of exported gas and services.

The second version of exports, which was little changed in the third version, with the exception of scrap, gave the following main exports of manufactures: machinery, \$32 million; chemicals, \$10.2 million; pharmaceuticals, \$2.8 million; rolling-mill products, \$10 million; vehicles, \$29 million; electrical goods, \$9 million; photographic goods, \$13 million; clocks and fine mechanical goods, \$11 million; ceramics, \$10 million; rayon and staple fibre textiles, \$16 million; cotton textiles, \$30.8 million; wool textiles, \$21 million.

Coal is the main hinge on which the whole plan turns. The scene of decisions on this vital point has now changed from Frankfurt to Paris, where politics will play their part.

The German planners maintain that they can only reach their production targets, and thus export targets, if the Moscow sliding scale of coal exports is reduced, or coal—presumably British coal—is imported. If five million tons of British coal were imported, it could be used for general consumption, while the present scale of coking coal exports could be maintained.

At present total bizonal production is still only about 48 per cent of the 1936 figure—or less in the German estimate, which presupposes that a rise of 10 per cent at least will be achieved. Industry operates on 50 million tons of coal a year, compared with about 200 million tons in Britain and 75 million tons in France. The minimum which the German planners say they require is 64 million tons. They have been made to cut this figure to 59 million tons. Though the German estimates of needs are certainly inflated, there can be no doubt that they cannot be ignored. To retain 64 million tons for German industry with the present sliding scale of exports in operation, it would be necessary for daily output to reach 370,000 tons—a figure which no one thinks possible. The figure of 59 million tons itself is based on an output of 310,000 tons of coal a day, rising to 330,000 tons a year hence. At present the daily output is only about 270,000 tons, though it spurts occasionally over the 300,000-ton mark (at which point it is 75 per cent of the prewar output), in order to earn a bonus food parcel. Many believe that the incentive scheme has lost its power; but hopes are placed on better output as the numerous recruits become trained. The increase achieved over the last year has been mainly due to more than 100,000 new men having been taken on. It is hardly denied in Frankfurt that only a series of miracles can prevent German industry from being short of about two million tons of coal in the last quarter of the Marshall year, unless the sliding scale of exports is altered, or British coal sails to Hamburg.

Pressure from Americans

It is probable that American support will be forthcoming in Paris for the German case. Apart from the influence which Mr Harriman will exert as ERP ambassador, America, represented by General Clay's economic adviser in Paris, is to a certain extent one of the Marshall Plan nations itself, owing to its responsibility, shared with Britain, for Bizonia. It may also be recalled that the export of British coal, with increased production of French wheat, has from the outset been pressed by the American advisers behind the Marshall Plan.

At present, an extraordinary situation exists with regard to Ruhr coal. Owing to lack of dollars, Norway did not take up its allocation this quarter, and several countries are in arrears with payments. Denmark, which owes \$10 million, has just

been cut off from further supplies. This situation calls for immediate attention in Paris.

In the German view, their commitment to export 1.2 million tons of scrap is a grave weakness in the plan. Scrap is a well-known subject of conflict between the Germans and the British. German industrialists declare that they need 1.8 million tons themselves if they are to produce the 6,000,000 tons of steel in the year beginning July 1, 1948, which is demanded of them. At present, the steel industry, they maintain, is only getting 70,000 tons of scrap a month, whereas it needs 150,000 tons.

Search for Scrap

The American view is realistic. They know that there must be 8,000,000 to 10,000,000 tons of scrap lying round, but that nothing to speak of will be secured from the German scrap-owners until incentives are provided. The Germans will admit unofficially that large quantities are being hoarded for Bizonia's D-day—currency reform—though probably not in immediately usable form, since to keep ready material would be inviting trouble from inspectors. But any hope of securing any hoarded scrap for export before currency reform may be buried.

The most important fact for the future is that the German Marshall planners propose to solve the problem. They will suggest—after currency reform—the establishment of a collecting organisation, which would be provided, by the Americans and British, with equipment and incentive goods for the workers. This organisation would have to be allowed to allocate a percentage of its haul to German industry, which would otherwise find itself short of scrap, as all available workers would be attracted to the firm that gave them food and clothing. With this scheme working, the Germans believe they could provide the 1.2 million tons which have been entered in their Marshall Plan. One may ask why their first estimate started with a figure of only 150,000 tons.

To conclude, one may truly say that a new period has begun for the two-thirds of Germany west of the iron curtain. So vast is the increase in supplies of raw materials and goods that will now flow into Germany that the crazy German economic structure, its labour reserves and its creaking administrative apparatus, may not be able to cope with it. One set of problems is giving way to another.

(To be continued)

Who Will Lead Italy's Workers?

[FROM OUR ROME CORRESPONDENT]

THE biggest problem now facing Italy is whether a Premier with so much political power and responsibility can co-exist with a Communist leadership of the Trade Unions. The Italian General Confederation of Labour, created in 1944 by agreement between the Communist, Socialist and Christian Democratic parties, enjoys in practice a monopoly of the representation of labour and is in theory above party politics. Office holders at each level are chosen by indirect election from below. In practice candidates are presented and supported by the political parties. The Communist and "Nennian" Socialist parties are reckoned to control fully 80 per cent of the voting power and constitute the majority of the executive, while the Christian Democrats have one of the three secretaryships. There are also vice-secretaries representing the independent Socialists and the Republicans. The minority parties have been able to exert some influence by publicly dissenting from strike orders and other measures ordered by the majority.

Following the general elections, there has been a demand for the overhaul of the whole organisation, which under the new constitution of the Republic enjoys its status on condition that its internal arrangements are "democratic." The Communists passionately desired that the Confederation should remain a single and united body, for the existence of a powerful separate Catholic Confederation in 1920 is looked back upon as one of the conditions which facilitated the rise of Fascism. Yet the first act of the General Secretariat since the general elections has been to issue a manifesto calling for mass demonstrations on May 1st to demand the realisation of the slogans of the Popular Front—distribution of the land, control of industry by factory councils, and no entanglement of Italy in any "war bloc."

At the same time the Confederation's Manifesto warns the workers that employers are now preparing a big drive to discharge redundant labour and to revise the sliding scale which is now in

force for adjustment of wages to rising (but not to falling) prices. It cannot in fact be doubted that the Government, with the high prestige which the elections have conferred upon it, will now try more vigorously to carry through Professor Einaudi's campaign for the stabilisation of the lira. The deflation policy was intensely unpopular not only among business circles and traders, but also among Christian Democratic political circles which diagnosed a grave danger of a drift of small business voters to the ranks of the Popular Front. Although the economic signals were already more favourable a month or more before election day, it has been noticed that the economic policy of Professor Einaudi was passed over in silence by the Premier and his lieutenants in their election. A dropping of the economic pilot was expected and desired by many. Now, however, the decisive election results and the resulting sense of liberation from an incubus, have restored commercial confidence in a way which may allow of the prosecution of the currency defence campaign in a shorter, sharper and altogether more promising manner. It is generally expected that Professor Einaudi will remain in charge as Vice Premier, Minister of the Budget and chief economic counsellor of the Premier.

Next Attack on Inflation

There is a current Budget deficit of some 600 milliard lire, leaving 40 per cent of current expenditure uncovered, and the Government now proposes to eliminate or reduce this source of inflation. Subsidies on food prices, and the maintenance of a gigantic surplus bureaucracy, are two main drags upon financial recovery which cannot be eliminated painlessly. The Marshall Plan, according to the Minister of Industry, Dr Tremelloni, will look after Italy's balance of payments for the next five years. But the problem of readjusting Italian industry to a world in which its chief customers and providers, Germany and Eastern Europe, have provisionally gone out of existence, cannot be solved if the Government's deflationary drive is met by a four-square resistance to change—except of a sort that adds to production costs—by the embattled revolutionary trade unions. It has, for example, been hitherto impossible to liberate industry from the burden of carrying some 150,000 redundant workers on account of the Trade Unions' attitude, although the emergency statute which required their retention has long since been nominally repealed. A massive inflow of foreign capital is considered by Dr Tremelloni to be the only cure for unemployment in industrial Northern Italy, which is fed by an annual net addition of over 400,000 souls to the population. Foreign (namely American) investment once again raises questions upon which it seems to be fundamentally necessary that the Trade Unions should not be in official and diametrical opposition to the policy of the Government. Will the Communist leaders seek to save the unity of the organisation and their place in it by meeting the Government (and its friends inside the Unions) half way? Or will the lost electoral battle be fought out afresh on the syndical field? This is perhaps the most serious question thrown up by the memorable elections of April, 1948.

Two Native Policies in South Africa

[FROM OUR JOHANNESBURG CORRESPONDENT]

SOUTH AFRICA's first postwar general election on May 26th will be primarily a battle between two native policies—the 76,000-word document prepared by the Government-appointed commission under Mr Justice Fagan and the rival report of the Nationalist Party.

General Smuts's United Party says the Nationalists propose to set up a slave state for all non-Europeans. The Nationalists accuse the Government of cutting the throat of "white South Africa" by proposing the gradual extension of democratic rights to educated non-Europeans. Of these criticisms, the United Party's seems nearer the mark.

In 1936, native policy achieved an uneasy compromise between the Cape liberal theory of ultimate "equal rights for all civilised men," and the theory of dividing the country into native Reserves and white areas, and somehow having parallel development of the different communities. The Cape natives were no longer allowed to vote on the common roll, but at the same time were allowed three European representatives in Parliament, while a Natives' Representative Council was set up to advise the Government on native aspirations. Thus the natives were no longer

encouraged to believe that in time they might become full citizens of a common state; but they were not entirely excluded from common citizenship either.

Of the Union's 8,000,000 natives, one-quarter are now living in urban areas, and their numbers continue to grow. The eroded Reserves are grossly over-populated. The towns welcome labour for the new factories, but continue to frown on natives in their other capacity as urban immigrants who have to live somewhere as well as work. In consequence, "shanty towns" have sprung up illegally, and crime has increased.

Back to the Reserves

The Nationalists' solution is to demand a return to the pre-industrial system of migrant labour. No natives are to live permanently in urban areas. Those now there, apparently the whole 2,000,000, are to be sent back to the Reserves, "the natives' true fatherland." But from the Reserves the State will recruit labour and allocate it to mines, factories and white farms. The migrant labourers will not be allowed to organise trade unions and will have no political rights. Propaganda, by churches and other bodies which criticise this native policy, will be "checked" as "foreign to the nation."

The Fagan Report dismisses this theory of *apartheid* (separation) as hopelessly impracticable. The Reserves are already over-populated without adding to the numbers living there, and industries could not exist on a basis of migrant casual labour. The Fagan solution is to accept the urban native population as permanent, and to give native townships in urban areas a small degree of self-government—though they will still be under white municipal or State control. Present restrictions, whereby, for instance, a native's wife and family may not join him in an urban area, are dismissed as an out-of-date legacy of the days when natives in towns really were migrant labourers with homes in the Reserves. Migrant labour is also accused of breaking up native family life on an enormous scale and producing an incidence of venereal disease and tuberculosis which is the highest in the world.

Another legacy of the former system is the pass laws—natives in towns have to carry one or more passes, permission by their employer to move about, tax receipts, etc.—and produce them on demand or go to gaol. Educated natives are exempted, but as they must show their certificate of exemption on demand, this too becomes a pass. The Fagan Report does not recommend the abolition of the pass system, but suggests a voluntary system of identity cards which if accepted by natives might in time supersede the various passes. The identity card would have the native's finger prints or photograph.

Prospects for the Elections

Thus the Fagan Report accepts the accomplished fact of a permanent urban native population. But the native policy it proposes is still a compromise. Natives would still have only limited political rights, would have no representation on town councils, would at best have to carry one pass instead of several, and would still be restrained by law or more powerful custom from doing any but unskilled jobs. Unkind critics who do not understand the complexities of the Union's racial problems might be tempted to say that the only important difference between the Fagan Report and the Nationalist proposals is that the former proposes, on the grounds of practicability and convenience, to replace the worn-out Reserves with urban native townships under white control as handy reservoirs of underprivileged labour.

Both Government and Opposition are basing most of their election propaganda on the rival reports. But it is doubtful if the election will really be decided by either. No doubt the half-caste coloured people in the Cape, who are still on the common roll, will vote against the Nationalists, who propose to remove them from it and segregate them as well as the natives and Indians. But on the other hand the Government's more enlightened non-European policy may conceivably lose it some white votes. The United Party confidently expects to win, and a Government victory is indeed a virtual certainty. But this will probably not be because the majority of white voters are either highly shocked by the Nationalists' native policy, or especially enamoured of the Government's more liberal one. It will be because the Nationalists continue to be rent by divisions, while the United Party, though a far from homogeneous political unit, continues to hold together round the dominating personality of General Smuts. "When Smuts goes," there may very well be a realignment of political forces—but that will not be in time for this election.

The Capital Budget

A YEAR ago, an attempt was made in *The Economist* to give the outline of a capital budget. It was a mixture, as all such attempts must be, of hazy arithmetic and hopeful guess-work, but if its sums were in some respects wrong, its broad conclusions have stood the test. It was suggested that if the capital investment programme last year proved to be non-inflationary, it would be so only because of greater borrowing from abroad, because of close restriction on new capital investment in the non-Government sector of the economy, and because of failure to rebuild the stocks of industrial raw materials, which a year ago had been run down to the limit. During the summer, it became obvious that the conjectural figures of capital formation on which this judgment was originally based would in fact be far exceeded; the aggregate demand upon the nation's resources was too big; external loans and reserves were being exhausted at a fantastic rate; and the Government, seized with alarm, decided to reduce the investment programme for 1948 from a gross figure of £1,600 million (which it would "probably have reached") to £1,420 million.

The cuts in capital investment which were proposed in the White Paper issued last December were severely criticised from the first on the ground that they fell with particular force on new industrial capital; there has been plenty of evidence during the last four months to show that in certain cases they are having a dire effect. Any discussion of the capital budget this year must rest on the foundation that industrial capital investment has already been severely cut; and if, later in the year, it begins to look as if Sir Stafford Cripps has gone too far in the direction of disinflation, that would be an argument for restoring the damaging cuts already inflicted upon industry before any other relaxations are permitted. There is no doubt about industry's claim, and it must not be jumped.

A capital budget for 1948 can draw usefully on the Economic Survey and on the national income statistics. The Economic Survey made a brave attempt, four weeks in advance of the Budget and the National Income White Paper, to give a *pro forma* capital budget, on what was then known about the projected volume of investment work this year and of the public and private savings that would be required to finance it. The Budget has since given greater precision to the estimates of savings which were tentatively put forward in the Economic Survey. In particular, it has accepted the view that the volume of personal saving for which the Economic Survey called, in order to finance the investment programme without resort to further inflation, was far more than is likely to be forthcoming. The Chancellor has decided that since individuals will not save enough voluntarily, they must save involuntarily by producing a large budget surplus from the taxes they pay. So far as the current year is concerned, that is the big change in principle between the Survey, issued on March 9th, and the Budget on April 6th. But there were other changes in the Economic Survey figures during the same four weeks which were disconcertingly large. Reference was made to some of these perplexing changes in an article on the National Income which appeared on April 10th. The task now is to see whether this tentative and vulnerable series of estimates about the volume of capital investment and the savings which are expected to finance it points towards inflation or deflation this year.

The first step is to explain the connection between capital formation and the other claims on the national resources for personal consumption and the needs of the Government. There is no better guide to this relation than the first table in the national income estimates; it is indeed fundamental to a proper understanding of the process of inflation:—

TABLE I—GROSS NATIONAL PRODUCT AND BORROWING FROM ABROAD (£ Mn)

	1938	1946	1947		1938	1946	1947
National income of the United Kingdom....	4,707	8,100	8,770	National cost of:—			
Provision for depreciation and maintenance	450	725	775	Personal consumption	3,713	5,573	6,161
Gross national product	5,157	8,825	9,545	Government	767	2,411	2,115
Borrowing from abroad and sale of assets to foreigners	70	380	675	Gross capital formation at home	747	1,221	1,944
Total resources available for use at home	5,227	9,205	10,220	Total resources used at home	5,227	9,205	10,220

The table shows the impact of three sets of demands upon the nation's resources. If these three—personal consumption, the Government's needs, and capital formation—exceed the total national output (at a given level of prices) then inflation at home can be avoided or mitigated only by borrowing from abroad. This is a much simplified way of putting the problem for there was inflation in plenty last year, despite heavy borrowing from abroad. But it illustrates the truism that what is used from the national resources for capital investment cannot also be used for personal consumption or for the Government's current needs. If the public or the Government are demanding too much (in other words, if they are not saving enough) prices will rise and inflation will be let loose.

Thus the problem is whether the projected capital investment programme in 1948 can be financed without inflation—whether the incomes which this volume of capital formation will create during the year will be offset by an equal amount of saving from this year's national income. That would be the perfect solution, neither inflationary nor deflationary; an excess of capital investment over savings would mean further inflation while an excess of savings over capital investment would produce a tendency towards deflation. But while these theoretical principles have an attractive neatness, it is a hazardous business to translate them into figures. The White Paper on the national income admits that no direct estimate of all the constituents of capital formation has been made for any years since 1938, and declares that the figures for investment are "undoubtedly the most vulnerable estimates in the whole Paper." So rudimentary is the state of knowledge about capital investment that it is given in the White Paper merely as a balancing item between the estimates of total resources and of personal and government expenditure. Statistically, as in fact, capital investment is a residuary legatee.

The same conjecture and groping after the truth is illustrated by the marked differences between the estimates given in the Economic Survey for total capital formation in 1946 and 1947, and of the means by which it was financed. The Survey suggested that gross capital formation at home in 1946 amounted to £1,350 million, and in 1947 to £1,900 million; the White Paper puts these figures at £1,255 million and

£2,020 million respectively. (There is an unexplained difference between this last figure and the estimate given in Table I.) If the White Paper is right, the Survey underestimates the depreciation allowances by £125 million in each year, and private saving by £100 million in 1947, while the dis-saving of public authorities was underestimated by £200 million for 1946 and by £100 million for last year. The reason for setting out these wide changes in detail is not to convict any one of error (for no one knows what the truth is) but to emphasise once more the tentative nature of all arithmetic about savings and capital investment. These changes in official figures over a period of a few weeks are disturbingly large, simply because the national income approach to the problem of inflation has now been adopted by the Chancellor. The new approach is most welcome; but until it is served by better statistics it will not produce the best results.

In many respects, the estimates about capital formation in the Economic Survey have been much changed by the White Paper and again by the Budget. In the second table, the estimates which were given in the Survey for 1945 and 1947 have been re-worked from the National Income figures, and the Survey's estimate for the current year has been revised, mainly in the light of the Budget:—

TABLE II—COMBINED PUBLIC AND PRIVATE CAPITAL ACCOUNT (£ Mn)

	1938	1946	1947	1948	
				Econ. Survey Estimate	Revised Estimate
Depreciation allowances	450	725	775	700	800
Saving of public authorities	—89	—617	—135	+275	+400
Private saving	339	767	705	575	350
Total sums set aside	700	875	1,345	1,550	1,550
Gross capital formation at home	770	1,255	2,020	1,800	1,800
Net borrowing abroad	70	350	675	250	250
Total capital formation	700	875	1,345	1,550	1,550

According to the national income estimates, gross capital formation at home last year amounted to £2,020 million—though this figure may, in fact, have been overstated by some £100 million, because it includes exports already shipped for which cash had not been paid and shipments of capital equipment for British oil companies. On a strict calculation, therefore, gross capital formation at home might be £1,920 million, and overseas disinvestment would be reduced to £575 million. Total capital formation was, therefore, £1,345 million, of which £775 million was financed by depreciation provisions by industry, and £705 million from private saving, less £135 million represented by the deficits (dis-saving) of public authorities. The two sides of the account balance, but that is not to say that last year's capital programme was financed without inflation. Quite

obviously, the high volume of private saving was fed in part by the wage and cost inflation which took place last year, and was further assisted by the Government's deficit financing.

What of the prospects for the current year? When the capital cuts were decided on last Autumn, it was thought that the highest volume of capital investment that could be carried out in 1948 would be £1,600 million, reckoned in terms of 1947 prices. It was decided to reduce that rate to £1,420 million for the current year. But these estimates refer only to fixed capital, and some allowance had to be made for additions to stocks and to work in progress. So the original estimate of £1,600 million was raised to £2,000 million (to include additions to stocks and to allow for increased prices), and the revised programme of investment in fixed capital and stocks was put at £1,800 million. That figure, first put forward in the Economic Survey, has remained unchanged in the Budget discussions, though it may in fact proved to be too low—perhaps by £100 million. So has the assumption that borrowing abroad and overseas disinvestment will not exceed £250 million, compared with £675 million (or was it £575 million?) last year. The problem, therefore, can be simply put: will depreciation allowances, the savings of public authorities, and private savings, together suffice to finance £1,550 million of total capital investment? It will be noted that the problem in this form makes two assumptions: first, that the external deficit will be kept as low as £250 million, which is by no means certain; and secondly, that the Government's policy of stabilising personal incomes is successful.

The answer to the problem is suggested in the last two columns of Table II. First, it is evident that depreciation allowances will exceed the £700 million allowed in the Economic Survey; the Chancellor has himself put the figure "somewhere between £700 and £800 million" and, perhaps, £800 million is not likely to be far out. He has also disclosed that the savings of public authorities (from the Budget surplus, so far as it relates to the calendar year, from the savings of local authorities and the accumulation of the insurance funds) will amount all told to "about £400 million." The residue required from private saving, therefore, has been reduced from the impossibly high figure of £575 million which was mentioned in the Economic Survey to £350 million largely because public saving, in the form of a large genuine Budget surplus, has replaced the need for such a big volume of private saving. On these assumptions, the financing of £1,550 million of investment work this year will present no difficulties.

Of the three constituents of saving, depreciation allowances and the surpluses of public authorities are known within tolerable limits of accuracy. If, therefore, private saving can be reduced with safety to £350 million, granted the intended

volume of capital investment, how will it be made up? The third table provides an analysis of private saving, taken from the White Paper for the past years, and with a revision of the Economic Survey estimates for 1948:—

TABLE III—ANALYSIS OF PRIVATE SAVING
(£ Ml)

	1938	1946	1947	1948 From Survey Estimate	1948 Revised Estimate
Total private saving	339	767	705	975	350
Of which:—					
Personal savings	154	711	445	450	100?
Undistributed profits	170	269	320	225	325
Depletion of tax reserves ..	+15	-210	-60	-100	-75?

The task is to provide £350 million. Towards this, the undistributed profits of companies will contribute possibly £325 million this year, and certainly much more than the £225 million expected in the Survey. There may be some further depletion of their tax reserves, and an allowance of £75 million should cover it generously. That would mean that personal savings need not contribute more than £100 million towards the capital programme.

This is an astonishingly small figure. Despite the blow which has been dealt to saving by the Special Contribution, it is

The Builders' Merchant

WHEN Mr Harold Wilson moved the second reading of the Monopoly Bill last week, he quoted in support of the Bill evidence not at that time published—the Report of the Committee, under the chairmanship of Lord Simon of Wythenshawe, which has been inquiring into the trade in building materials and components and the part played by the builders' merchants. The report*, now published, reaches conclusions which handsomely support the case for the Monopoly Bill. Many of the factors which contribute to the inflated cost of building in this country are outside the Simon Committee's inquiry, but one of them at least is analysed, expounded, and established in full detail. The report declares that

our examination of the field has revealed no industry producing building materials or components in which we can state with confidence that there is free competition in prices.

It shows in detail how prices are maintained and competition circumvented in certain branches of the trade. For others it leaves the point still to be proved, and the method open to conjecture or to later inquiry; when the Monopoly Bill is passed, there will still be questions in the building trade for the new Monopoly Commission to investigate.

The bulk of building materials and components are distributed through builders' merchants. The builders' merchant does not necessarily handle the goods; about 19 per cent of his trade, according to an estimate quoted in the report, passes through his books, earning a substantial margin for him, though it does not enter his stores. In some of this business he still performs, no doubt, a true trader's function; for he knows the trade and finds what the builder wants. Most of the goods he handles, whether they enter his stores or not, are resold in bulk; only about 7 per cent are disposed of by what are called "over the counter" sales. The strictures which the report makes on the high margins charged by the builders' merchant are clearly influenced by this fact.

Since the argument of the report rests to a large extent on its examination of the trade practices of the builders' merchant, it is important to know how much trade he handles. Bricks

*The Distribution of Building Materials and Components. 2s. 6d.

surely to be expected that personal savings will comfortably exceed £100 million. To the extent that they do, there would be a clear argument for restoring the capital cuts as soon as physical supplies permit. For the implication of this year's Budget is not an impetus towards further inflation, but the development of conditions in which appreciably more capital investment could be done, without any risk of inflation, than has in fact, been planned. It would be wrong to start any scare about a threatened "deflation." That cry will be taken up quickly enough by the ex-Chancellor and his supporters long before the proper time. Indeed, the danger is that the consequences of disinflation—the occasional pockets of unemployment in the less essential industries—will be misinterpreted as the beginning of a slump. Nothing could be further from the truth; these symptoms will be the first stage in a more rational distribution of labour and resources than has been possible during a period of rampant inflation. But it begins to look as if the capital cuts which were inflicted on industry early in the winter could be safely restored before the year is out. It will be a test of economic statesmanship that this decision is taken in good time, and that industry's prior claim is protected against the competition of other claimants for capital, such as housing, which, however desirable they may be on social or political grounds, make no direct, and little indirect, contribution to national productivity.

are largely a separate story; the curious price structure of the brick industry appears to be maintained less by trade practices than by Government intervention, and the Committee, though it took evidence from brickmakers, has not gone into their affairs in detail in the report. In the brick trade the merchant plays only a minor part. Fifty per cent of bricks are supplied direct to builders, only 25 per cent to the builders' merchant, and the remainder to other merchants. Of concrete products for the building trade the merchant deals in less than 5 per cent, and less than one per cent enters his yard. But as the value of materials or components rises in relation to their bulk, the proportion handled by the merchant rises too. Between 60 and 75 per cent of cement used in building is sold through the builders' merchant; 53 per cent of lead sheet and pipe; 47½ per cent of glazed tiles, and 68 per cent of tiled fireplaces; 60 per cent of brass and copper tubes; 70 per cent of range boilers, and 79 per cent of cookers; 79 per cent of baths; 95 per cent of brassfoundry products; 95 per cent of sanitary earthenware; 100 per cent of plastic fittings and of locks and latches; and 100 per cent of cisterns.

The report is clear that the builders' merchants play a useful part in the trade. Its criticisms are directed mainly to the way the merchants are organised, to the agreements with manufacturers' associations which give them advantages so long as they keep to the terms which the manufacturers lay down, and to the fact that prices are higher than they need be because of these arrangements and give the merchants excessive margins of profit. There is competition between merchants, but not in prices; it takes the form of showrooms, sales facilities, and transport services which the Committee regards as lavish and wasteful. The merchant is under penalty not to perform the one service which, above all others, should justify his existence—to help the builder to buy where goods are cheapest and thus help the public to get cheaper houses.

Builders' merchants (who must, by their own definition, have no part or share in any building concern) are organised into associations which negotiate price-fixing agreements with the various associations of manufacturers. The actual agreements

are made between the individual merchant and the manufacturers' association, which maintains a list of approved merchants. Twelve associations of manufacturers which maintain agreements of this sort are listed in the report, but there are analogous arrangements in many other branches. In general, the merchant undertakes to buy only from members of the manufacturers' association at its list prices; to sell at the list prices less only the authorised discounts for the different classes of buyers; and to produce his books for inspection when required. A standing joint committee of merchants and manufacturers with formidable powers of enforcement administers the agreements; it can withhold rebates, impose fines, withhold supplies, or even strike a recalcitrant merchant off the list. No merchant can afford to break the agreements openly. Furtive undercutting of the list prices is not unknown, but in general the manufacturers' aim of keeping prices up is secured.

The practices of the trade provide every encouragement to keep to the agreements. The latter offer financial inducements for everybody, by a system of discounts and rebates. In addition to the standard trade discount and cash discount, the merchant gets an "association discount" (usually 5 per cent) which buyers who have not signed price-fixing agreements do not get, and a "deferred rebate," similarly exclusive, which varies between 1 and 5 per cent but is sometimes even higher. All this assures to the well-disciplined merchant a substantial margin, the working of which is shown by the following specimen figures referring to an order for galvanised tanks valued—at list price—at £500:

MANUFACTURER TO MERCHANT					
	£	s.	d.	£	s.
List Price	500	0	0	305	7
Trade Discount 32½ per cent	162	10	0	11	0
Cash Discount 5 per cent	337	10	0	16	17
Association Discount 5 per cent	16	17	6	0	8
Less Association Expenses	320	12	6	15	4
Deferred Rebate 5 per cent (or £320 12s. 6d.)	16	0	8	7	11
(a) NET COST TO MERCHANT	289	7	3	16	0
MERCHANT TO BUILDER					
List Price	500	0	0	81	2
Trade Discount 20 per cent	100	0	0	9	10
Quantity Discount 5 per cent*	400	0	0	370	10
Cash Discount 2½ per cent	20	0	0	9	10
(b) NET COST TO BUILDER	380	0	0	21	9
Gross Margin (b) minus (a)	28	per cent.			
Percentage on Cost Price (a)	28	per cent.			
Percentage on Sales Price (b)	21.9	per cent.			

* This may vary from nil to 15 per cent.

The report comments pointedly on this system:

The less enterprising and efficient a merchant is the more these benefits are likely to appeal to him. They prevent or make it more difficult for new and improved products to reach the public, except those made by manufacturers within the associations which can be sold at or above the minimum price. Where there are fixed margins, merchants are prevented from passing on to the public improvements in efficiency in the form of lower prices. There is an induced search for substitutes which would not arise if a competitive price were charged for the original article.

The Committee's examination of the costs and profit margins of builders' merchants confirms the inference that these arrangements inflate the profits of merchants beyond a reasonable level. The value (though not the volume) of their sales has risen substantially in recent years; expenses have not risen in proportion; and no benefit from the lower margin of expenses has been passed on to the consumer. At the same time gross margins earned by the merchants have risen, and net margins (which were already on the high side, in the Committee's opinion, before the war) have risen even more sharply. The effect is shown in the tables in the next column.

The expenses in these tables include interest on working capital. For the trade as a whole, they show a gross margin in 1946 of 20.97 per cent, expenses of 14.27 per cent, and a net

margin of 6.70 per cent of sales value. Already in 1946 the merchants were doing much better than before the war. In the Committee's opinion they are by now doing better still, for prices have risen still farther:

We are informed by the Ministry of Works that the average annual turnover may fairly be taken to be four times the capital employed. If we regard a net annual profit of 10 per cent on the capital employed as reasonable, this would involve a net profit on turnover of 2½ per cent. In fact, the actual net profit on turnover in 1946 of 6.7 per cent would on this basis represent a return of 26.8 per cent on capital employed.

This being so, what is to be done? The Committee has described a state of things not peculiar to the trade in building materials. Excessive margins; once useful trading functions which have become blurred, embedded in comfortable habit, and lost to view; the state of mind in which accommodation has

more attraction than initiative—these are symptoms of a sickness which spreads widely outside the Committee's field of inquiry. Its members, no doubt, were aware of this. They have not accepted it as inevitable. Two members visited Canada and the United States, and found that the anti-trust laws have a real effect and provide evidence that the removal of restrictive practices would create keener competition and cheaper and more efficient service. This is achieved partly by publicity; the mere publication of the facts in authoritative and well-documented Government reports brings an informed public opinion to bear upon the problems, and the Committee believes that "this atmosphere of broad daylight is a good safeguard." Restrictive practices in England, it adds, are not in fact all furtive or secret, but too little is known about them.

As an immediate measure the Committee urges that the Government should control distributors' margins on building materials and components. The proposal, it is clear, is made with reluctance and with no faith in the long-term value of price control. But the existing price controls, based so far as the merchandising processes are concerned merely on the Prices of Goods Act, are ineffective; so long as manufacturers' prices are fixed, distributors' prices should (the Committee holds) be effectively controlled too by Government action.

For the permanent cure the Committee relies (in addition to the virtues of "broad daylight") on the Monopoly Bill. Its members wrote without knowing what the Bill would contain. They suggested that it should give power "after specific inquiry by the appropriate body" to require the registration of agreements on trade practices; to declare agreements illegal; to prohibit price discrimination; and to control profits and margins. Their inquiries in North America convinced them that anti-trust laws can do much to freshen the commercial atmosphere. But the first task is to establish the facts. For that reason alone, the Simon Committee's Report is invaluable.

Business Notes

The Special Contribution

A first impression of the clauses in the Finance Bill which deal with the Special Contribution suggests that the draftsmen have made a good attempt to cover an immensely complicated issue. But despite their labours abundant doubts will still remain to be settled in debate and by later interpretation by the Courts. The method of assessment, as was to be expected, is founded on the surtax returns of individuals. Investment income, on which the levy is calculated, includes all income apart from earned income. It includes, for example, the Schedule A value of a house, though not the value of property used for business purposes. But it does not include terminable annuities or pensions from a business in the hands of the receiver on death or retirement. On the other hand, payments made for pensions may not be deducted by the payer in calculating his investment income; nor is he entitled, for the purpose of the Special Contribution, to deduct payments under covenants "not made for full consideration," although they are allowed, under certain conditions, as deductions for surtax purposes.

Trusts, as the Chancellor recognised in his Budget speech, present special difficulties. The Finance Bill makes no attempt to cover the case of foreign trusts, with which, indeed, the authorities are quite impotent to deal. Detailed consideration is needed of the position of trusts and their beneficiaries. If investment income arises wholly or partly from a trust, the beneficiary can transfer the whole or the proportionate liability for the Contribution to the trust. Trustees are empowered to apply capital or to raise money to pay the contribution. But these are the obvious arrangements which had to be made. Their application in practice will involve a multiplicity of parties and great complication.

For this reason, if for no other, strong objection must be taken to the provision that the contribution will be surcharged with interest at 2 per cent if it is not paid by January 1st next year, whether it is assessed or not. It is good law that liability to tax does not depend on assessment, but arises as soon as the statute is passed. To the three stages laid down by Lord Dunedin—declaration of liability, assessment, and measures for recovery—the Government proposes to add a fourth, between the first and the second. This is a financial penalty for failure to pay what may well be an unknown sum at a fixed date. Whatever its legal foundations may be, this administrative provision is repugnant to ordinary sense and justice.

Reform of Expense Allowances

Part IV of the Finance Bill, which deals with expense allowances and benefits in kind, will be generally approved, except perhaps by those who have enjoyed the benefit of tax free emoluments on an unjustifiably generous scale in the past. It applies to directors and employees—the latter only if their total income including expenses (whether allowable or not under Rule 9 relating to Schedule E assessments) amounts to £2,000 a year or more, and the former irrespective of any income limit. All sums paid in expenses or benefits in kind received by such individuals will in future rank as emoluments and will be subject to tax, save to the extent that they can be shown by the receiver to be expended "wholly exclusively and necessarily" for his office or employment. Benefits of a long-standing kind—like the bank manager's flat over the bank premises, or the headmaster's house—are allowable. The general rule is that the practice must have prevailed for twenty years, and that residence in such premises is "necessary." There is no extension of the number of items which can be brought under tax. The effect of the clauses is to require the receiver of such payments to prove that they reimburse him for expenses wholly exclusively and necessarily incurred in his profession or business.

Meals taken on business premises are not to be counted as benefits in kind, provided that they are available "for the staff generally." The directors' dining-room, in other words, must also be accompanied by a works' canteen. The clauses also give a wide definition of the word "director," and controlling partners of a business are equally covered by their provisions. It is evident, too, that members of public boards will be affected, though not members of that informal body of persons known as the Cabinet—though perhaps the senior ministers would in any case be protected by the twenty-year rule.

Fortunately, room has been left for a fair degree of administrative discretion in deciding what expenses are legitimate, and companies can obtain, at the discretion of the surveyor, a clearance on payments in cash or kind which they submit for his consideration. This kind of arrangement has worked fairly satisfactorily in connection with contracts for directors' service, but the surveyor's decision is not open to appeal, and if he rejects a statement submitted to him, the company has no recourse but to appeal within the meaning of the precise words of the Act.

No Increase In Coal Prices ?

Lord Hyndley's letter to the Minister of Fuel and Power was doubtless intended to clarify the outlook for coal prices, but it seems, on examination, to have confused it instead. The purpose of the letter was to assure the Minister that the revision of the price structure of the coal industry, on which the National Coal Board is engaged, will not in itself lead to a general increase in coal prices.

The purpose of this revision (wrote Lord Hyndley) is, of course, to bring qualities and prices into a more rational relationship, and we can assure you that we do not think there will be any need for a general increase in inland coal prices except in so far as such increases are necessary to cover increases in costs beyond our control or increases in wages within the limitations of the White Paper on Personal Incomes, Costs and Prices.

In other words, the National Coal Board will not put up the price of coal unless it has to. But what the average person wants to know is whether the price is going to rise, from whatever cause; and on this question Lord Hyndley's letter sheds no light at all. It is necessary to wait for the Board's financial statement on its first year's operations, expected in May, to see whether the Board is making ends meet on the present price of coal. If it is not, and if productivity cannot be improved or some other economy achieved, then prices will no doubt have to go up.

The increase in supplies of domestic coke for the coming year, announced this week, has led to questions about the general coke position. The steel industry, it is known, is not getting enough coke; nor are the steel industries of the Continent. Could not the coke be better used for steelmaking? Technologists answer that domestic coke is of two kinds: coke from the gas-works, which is too soft for steelmaking, and that part of the output from coke ovens which is too small for the blast furnaces. It is true that the blast furnaces can, when necessity presses, use smaller coke than the ironmakers consider ideal. Lately because of the shortage, they have been taking a good deal of small coke, although this makes it difficult to get a strong enough blast in the furnace. Supplies have now improved enough for them to return to something nearer their normal practice, and the domestic user benefits. Whether the position is really so satisfactory as to justify the relaxation still seems doubtful.

Marshall Supplies

No further news has been received from Washington about the first annual appropriation requested by the Economic Co-operation Administration. It is apparently taken for granted that the total sum of money requested—£1,325 million, of which Britain was to receive £331 million—will be cut by the Appropriation Committee. Moreover, it is doubtful whether the allocation of funds to specific commodities is at all hard and fast. Must Britain spend £41½ million on cotton supplies in the first year, or could £20 million of this first allocation be used to pay for wheat purchases? Again, no price limits for the various commodities have been fixed; hence to assess the physical supplies which will be provided by Marshall aid must be largely a matter of conjecture.

The attempt to estimate physical supplies which has been made in the accompanying table therefore represents a hopeful statistical exercise to discover something about their order of magnitude. The allocations for specific commodities have been taken as first announced, and converted into physical quantities by using average current prices or British contract prices. The table also gives a rough comparison between Marshall aid (on these necessarily rough assumptions) and British food import requirements as submitted to the Paris Conference last summer and the

requirements of certain raw materials based on consumption last year.

Of the staple foods, cheese alone looks like being fully provided by Marshall supplies. Less than half of Britain's supplies of grain from dollar countries last year will be paid for by ECA, and only 30 per cent of the sugar. According to the table, British meat requirements should be fairly adequately covered. But if the allocation of £15½ million for meat should also include bacon, the actual quantity of meat available will be well under 500,000 tons, and in that event less than two-thirds of Britain's

BRITISH IMPORT REQUIREMENTS AND MARSHALL SUPPLIES
(000 Tons)

	Total Import Requirements	Actual Imports, 1947					Possible Supplies under E.R.P.
		Total	U.S.A.	Canada	Argentina	Other "Dollar" Sources

* Based on data supplied to Conference for European Economic Co-operation.

† Based on U.K. consumption of virgin metal in 1947.

‡ Based on U.K. consumption in 1947 of which American type cotton amounted to 185,000 tons.

hard currency meat supplies would be met by Marshall aid. It must also be remembered that 400,000 tons of Argentine meat and 1,250,000 tons of Argentine maize (which might strictly be regarded as hard currency supplies) have already been purchased this year from the proceeds of the sale of the British-owned rail-ways. Will Marshall aid be available for the purchase of more Argentine meat? Or can dollars earmarked for meat be used to pay for other more urgently needed commodities?

The prospects for raw materials look more satisfactory. All hard currency lead supplies, one half of the copper supplies and more than one half Britain's dollar zinc purchases could be paid for by ECA, while cotton supplies should be more than adequate. Is Britain to substitute American cotton for Brazilian and West African? For some cotton supplies from soft currency or sterling countries, Britain has long-term commitments. Are these to be interrupted or is Britain to build up a large stockpile for future use? This discussion about the quantities of goods under use? Marshall aid must for the time being remain largely hypothetical. In any case, the commodities listed in the table account for less than half of Britain's proposed first year appropriation—£150 million out of £331 million.

"Abstention from Spending"

The salutary realism which Sir Stafford Cripps has brought to bear upon budgetary policy is already having its effect upon the National Savings Movement. The theme for this year's savings campaign, the launching of which was announced by Lord Mackintosh this week, is to be "Abstention from Spending." An appeal on this basis is in welcome contrast to the publicity technique of the movement during the war, when noisy "War Weapons" drives put all the emphasis upon mere subscriptions to savings securities, regardless of whether they were financed simply from accumulated cash resources without any new act of saving at all. It is in even greater contrast to the notorious "last-tricks of inflating monetary subscriptions by the notorious 'last-chance' devices or by raising the limits upon individual holdings. Now the emphasis is put squarely where it always ought to have been, revealing that subscriptions to "savings" securities are not saving at all unless the money has been found by genuine abstention from spending out of current income. As the Chancellor himself said, in his Budget speech, "the amount saved is more important than the particular security or institution in which the savings may be held, but money saved should be invested safely and kept unspent until it is wise to use it." If in the past the whole efforts of the Savings Movement had been exerted in this direction, instead of in a pursuit of meaningless "targets," the pressure of inflation in the past two years might have been significantly lessened.

A refreshing consequence of the change in attitude is that no national financial target is to be fixed for this year's campaign. Instead, local savings committees are being asked to focus their

attention upon increasing the membership of savings groups, and, if they wish, to fix their own targets in these terms. It is to be hoped that every effort will be made by the central authorities to bring home to local organisers the significance of these changes. In the year 1947/48, for which the financial target was £366 million, net savings, as officially defined, amounted to only £203 million, of which £106 million may be regarded as merely the counterpart of the 3 per cent Defence Bonds repaid at maturity. After this depressing performance, there is clearly a danger that rank-and-file workers in the Movement may jump to the conclusion that the real object of the omission to fix a target this year is to ensure that any comparable failure would be less apparent. The policy-makers in the movement have learned the lesson at last; but the habits bred by the methods of the past decade will not be easy to eradicate among the publicity experts and workers at the perimeter. After all these years, the process of educating the public in the true nature of savings has only just begun. As an object lesson in the new process, it might be useful if the Committee now explained to its members why the "savings" figures of recent weeks are not quite so depressing as they look, by contrast with the figures shown at this time last year. Then subscriptions were still being inflated by the last minute rush to secure savings certificates before the rate of interest was reduced.

European Clearing

The Finance Ministers of the five Western European signatories of the Treaty of Brussels have been meeting this week in Brussels to discuss financial problems of mutual interest and, more particularly, the difficulties arising out of the distorted balances of payments between the five countries. It is known that the Ministers have before them the latest version of the Belgian proposal for a multilateral compensation of clearing balances arising from intra-European trade. The fact that Belgium should have taken the initiative in framing such proposals is not surprising, in view of the creditor position of that country in its trade with other European nations. The first result of this initiative was the Basle compensation operated through the Bank of International Settlements. That scheme has quickly shown its limitations owing to the persistent creditor status of one or two of the members and the equal persistence of the debtor status of others. It had been hoped that with the infusion of a dollar reserve the scheme might be made to work. Such hopes have had to be abandoned at least so far as they envisage the allocation of Marshall dollars for this purpose. The United States have shown themselves adamant in their refusal of this proposal, and this attitude is now confirmed by the manner in which the first 12 months' allocation for ERP has been passed. This leaves no room for assistance to the Basle compensation scheme.

The ingenuity of the European countries concerned has since then been applied to devising some other scheme which would help to get trade inside Western Europe moving again and to tide over the difficult period that must elapse before European production and exports have revived with the help of ERP assistance. The latest version of the Belgian plan appears to envisage the use of local currencies deposited as a counterpart to Marshall assistance to finance intra-European trade. Under this scheme creditor countries such as Belgium would lend their own local currency to others such as France. This would have to be done with the approval of the Economic Co-operation Administrator in Washington. In itself it would achieve little more than the raising of the present overdraft limits under which European trade is being largely financed.

There is no question of introducing a common currency for all five countries, though it is possible that accounts might be kept in a new unit of account that would protect creditors from exchange risks. Until such time as the clearing can be underpinned by a dollar reserve, whether contributed by the United States or by the participating countries out of their current hard currency income or accumulated resources, it is difficult to see that much more can be achieved by refining the clearing technique. The creditors need dollars and nothing but dollars. The best solution, therefore, would be to find some source other than ERP from which dollars could be injected into the European compensation scheme which is now being worked by the BIS at Basle.

Shipbuilding at the Peak ?

A slight decline in the tonnage of ships under construction is recorded by Lloyd's Register of Shipping for the first quarter of 1948. The world total (excluding Russia, Germany and Japan)

has declined from 3,971,978 tons gross at the end of 1947 to 3,919,374 tons at the end of March. Great Britain's proportion of the total has decreased slightly to 54.6 per cent, its total of 2,138,035 tons gross being 24,947 tons lower than in December, 1947. The decline in the volume of work in hand in the shipyards is too small to be taken as indicating a downward trend in activity; probably it means that the arrears of work in the fitting-out stages, which were the result of shortages of components and also of a large reconversion programme, are gradually being worked off. Ships completed during the quarter, for example, totalled 233,639 tons, a figure higher than for any quarter of the previous year except the last. Launchings totalled only 181,168 tons, compared with the exceptional figure of 390,626 tons for the previous quarter and 270,000 tons for the corresponding quarter of 1947. It will be recalled that last year launchings exceeded completions by some 250,000 tons; in consequence, more ships are likely to be completed in 1948, while launchings and hulls newly begun may decline owing to the uncertainties about steel supplies and the reduction in working hours. A much smaller volume of new shipbuilding work (213,451 tons) was begun during the quarter than in any quarter last year.

The proportion of export work in British shipyards continues to increase. More than half of the tonnage begun during the quarter was for Dominion or foreign account, bringing the total to 696,416 tons gross (32.6 per cent). This includes 207,443 tons for Norway, 104,317 tons for Portugal, 97,369 tons for the British Commonwealth, 68,852 tons for France, 63,945 tons for Argentina, 35,500 tons for Panama and 33,143 tons for Sweden. The flow of new orders has not diminished, for the *Shipping World* lists ships under construction and on order totalling 3,687,235 tons gross at the end of March, compared with 3,462,185 tons at the end of December. Of these, 1,297,120 tons were for registration overseas in March, compared with 1,142,722 tons in December. Tankers account for as much as one-half of these figures. *Lloyd's Register* records that work is in progress on 54 ocean-going tankers of 439,155 tons gross in British yards, out of world totals of 89 tankers of 812,227 tons gross. As the work on this large tanker fleet progresses the demand for steel will increase, but it is too early to say with any certainty whether lack of steel will in fact restrict shipbuilding output for 1948. For the time being the shortage of electrical equipment appears to be a cause of delay in fitting out.

* * *

The Engineers' Claim

The engineers' claim for higher wages has now been published as a pamphlet. Mr Jack Tanner, who presented the claim on behalf of the Confederation of Shipbuilding and Engineering Trade Unions, based his arguments on four main grounds: first, that the cost of living had increased by 74 per cent over 1938 while engineers' wages had risen only by 54½ per cent; secondly, that skilled engineers were underpaid in relation to other skilled workers; thirdly, that the increased wages could well be met out of the engineering industry's current profits; and finally that the claim was justified by increased production. To support this argument, Mr Tanner put in evidence a "productivity index" purporting to show a 22 per cent increase in productivity in the metal, engineering and shipbuilding industry between January, 1946, and December, 1947. On all these counts, he argued, the claim did not infringe the principles laid down in the Government's White Paper on Personal Incomes.

It may well be that engineering workers who are on minimum rates regard themselves as underpaid, although in practice average earnings are well above average rates. The unions also feel aggrieved because negotiations for a complete revision of the wages structure, to bring different grades of skill into more sensible relationship are still hanging fire. But the value to be attached to comparisons of present "productivity" with the early period of 1946 is more doubtful. At that time many men were not fully productive owing to the reconversion of industry. The rise of output in the latter part of the two years may be largely a reflection of the industrial rearrangements which were being made early in 1946 and resulted in unduly low output at that time.

On the face of it, the engineers' claim for a national rate of 115s. for skilled men and 100s. for unskilled men may seem reasonable. But any claim, judged in isolation, might be reasonable; the task is to put it in its national context. There is, at least, no labour shortage in engineering, and the dependence of the export drive on the output of the industry is a strong argument against any increase in its costs. It now rests with the

employers to consider the claim; should they reject it, the unions would then have recourse to arbitration.

* * *

South Africa's Reserve Problem

It is not often, in these days, that the legal rules which govern the operations of central banks are seen to have an impact upon policy. The world-wide expansion of credit which resulted from the war and its aftermath created such a need for flexibility in banking systems that many people have come to take it almost for granted that, wherever necessary, the rules will be adapted to fit the circumstances. In many countries, bankers have long forgotten the constrictions which formerly played so important a part in determining the scale and nature of their operations. But perhaps, after all, it is time to revive the habit of scrutinising central bank returns for indications of official policy. A study of the recent returns of the South African Reserve Bank strongly suggests—surprising though it may seem—that legal considerations may have played an important part in South Africa's recent decision to try to restrain the influx of funds from Britain.

South Africa waited for fourteen years before revaluing its gold holding to give effect to the depreciation of the South African pound in terms of gold. When it did so, in mid-1946, the official reserve ratio—the proportion of the Bank's gold holding to its liabilities on notes and deposits—was raised by the stroke of a pen from 46 to 87 per cent compared with the statutory minimum of 30 per cent. At that level, it might have been thought, legal constrictions were so remote as not to deserve a moment's consideration. But, owing partly to the pressures on the Union's balance of payments on current account and partly to the gold sales agreement with Britain, the Reserve Bank's gold holding dropped from £257 million in mid-1946 to £191 million early in 1948, reducing the reserve ratio to 74 per cent. During the second half of 1947, when the gold holding was slowly rising, the declining trend of the ratio was wholly due to a steady growth in the Bank's deposits, for which the influx of sterling funds was mainly responsible. The Bank's sterling balances, which had been around £20 million last summer, stood at £52 million by end-January last, despite the demands which had been made during 1947 on the sterling area dollar pool and despite the large payments that had to be made for purchases from the sterling area and from other countries then committed to accept sterling.

That was the position when, in the second half of February, South Africa delivered the £80 million of gold due to Britain under the three-year loan agreement—an operation which reduced the Bank's gold holding to only £111 million and the reserve ratio to about 42 per cent. When the South African authorities launched their restrictions upon the inflow of capital, the spectre of the legal minimum of 30 per cent could already be discerned, for under the new agreement the gold sent to London has ceased to be—what, in effect, it formerly was—an overseas reserve that could be tapped at will. South Africa is now committed not to draw upon the central dollar pool, and, moreover, must offer gold in settlement of deficits for current trade with the sterling area. That perhaps explains why the gold holding dropped further, by nearly £4,000,000, in the first half of March (the latest return for which full figures are available is dated March 19th). At the same time, the rise in deposits continued, reducing the ratio to only 39½ per cent. The attempt to restrain the inflow of hot money seems to have given only momentary relief. The latest cabled figures, for mid-April, show sterling balances at no less than £76 million—some £23 million more than at end-January. Necessarily, there has been an almost corresponding rise in bankers' deposits at the Reserve Bank—from £166 million to £185 million.

The failure of the recent measures to stem the inflow was to be expected, for they excluded (among other things) transfers for the purpose of buying quoted South African securities. Is it possible that the South African authorities were so obsessed by the forms and formalities of their problem that they supposed a mere ban upon acquisition of *deposits* would suffice? If so, they were doubly mistaken: even from the technical point of view the effects are the same whether British residents acquire securities or deposits. If the legal ratio is to be regarded as sacrosanct it seems that, for that reason alone, a tightening of the regulations may shortly be needed. Unless the pressure is relieved at its sources, the South African authorities have the room for manoeuvre within their legal framework. Even if they wanted to neutralise the growth of sterling balances by open-market operations in domestic securities, it would be hard to exert any large effect. At mid-March they held less than £3,000,000 of Govern-

THE THREE BANKS GROUP

Total resources over £300,000,000

A complete, modern banking group with connections all over the world and with a specialised knowledge of conditions affecting trade and finance both at home and abroad from an experience gained during two centuries of banking. It is a banking group, moreover, giving individual attention to the particular requirements of its customers.

ROYAL BANK OF SCOTLAND
Founded 1727 Edinburgh, London & Branches
GLYN, MILLS & CO.
Founded 1753 London
WILLIAMS DEACON'S BANK LTD.
Founded 1771 Manchester, London & Branches

Yes, exports destined for Australia and New Zealand can 'boomerang' if their price or quality is unsuited to the market. For although these Dominions are still eager for British goods and services, their buyers are becoming increasingly selective. Exporters planning to sell to Australia and New Zealand are invited to consult the Overseas Department of The Bank of Australasia—where they will find up-to-date information from the Bank's branches 'down under' on local markets and conditions.

THE BANK OF AUSTRALASIA
(Incorporated by Royal Charter 1835)

HEAD OFFICE: 4 Threadneedle Street, London E.C.2. (Manager: G. C. Cowan)

Eastern Enterprise

For over three hundred years men of enterprise and initiative have engaged in trade with the East. For nearly a century The Chartered Bank of India, Australia and China has supplied them with the specialised banking services that this trade demands. Today, in addition to these services, the Bank's wide network of branches ensures that a wealth of information on local needs for products and services is readily available to customers. Those planning to enter the markets of the East are cordially invited to discuss their problems with the Managers of the Bank in London or Manchester.

Vickers Group Reserves

Following the acquisition in December, 1946, by Vickers Limited of the share interests of Vickers-Armstrongs in English Steel Corporation (amounting to 64.6 per cent of the equity), the process of consolidating the reserves of the Vickers group has been carried an important stage farther in 1947. That was clear from the recent preliminary profits statement of the group; the full report and accounts disclose details of the changes. The most important transaction in 1947 was the further transfer from English Steel Corporation, Vickers-Armstrongs, Cooke Troughton and Simms, and The Isle of Walney Estates to Vickers Limited of reserves and provisions no longer required totalling £4,513,767. Cammell Laird, which holds the remaining 35.4 per cent of the equity of English Steel Corporation, also shared in the distribution of the reserves and provisions of that company. In addition Vickers Limited has taken over from Vickers-Armstrongs advances of some £1,055,000 made to George Mann and Co. (1932), Palmers Hebburn Co., and G. J. Worssam and Son, as well as the investments represented by these and three other subsidiaries valued at a total of £1,320,421. The consequent increase in the reserves of the parent amounts to nearly £5,000,000 net, bringing the total to £14,365,511, while some of the transfer of indebtedness is obviously reflected in the increase from £10,225 to £12,140,043 in amounts owed by subsidiaries shown in the balance sheet.

The motives behind these internal rearrangements of Vickers are probably only partly dictated by the desire to put the resources of the group as far as possible out of reach of steel nationalisation. Whereas the reserves of operating companies could hardly escape the net, their possession by the parent which is now mainly a holding company might be construed differently. But there will be other more direct advantages. For instance, in view of the coming into force of the full provisions of the Companies Act on July 1st there is obviously much to gain from the centralisation of the finances and a simplification of the structure of the group.

After its great activity during the war years, the Vickers group inevitably experienced a sharp fall in profit in 1946, but the figures for last year show that the concern has projected itself with vigour into the peace-time tasks of reconstruction. Consolidated earnings have recovered sharply and on the most favourable analysis, earnings which fell to 26.6 per cent in 1946 increased to 69.3 per cent last year, which is only slightly below the 1945 level. And apart from the internal adjustments of reserves already referred to, group reserves last year were raised from £18,145,487 to £22,587,764, of which £1,643,087 was appropriated out of the profits for the year.

Lancashire's Export Task

The size of the task which faces the Lancashire textile industry is emphasised by an analysis of exports of cotton and rayon textiles to world markets in 1947, which appears in the *Bulletin* of the Cotton and Rayon Merchants' Association. The following table shows British exports of cotton and rayon piece goods to hard currency markets in 1938 and 1947:

PIECE GOODS EXPORTS FROM UK (Mn. Sq. Yards)				
	1938		1947	
	Cotton	Rayon & Mixture	Cotton	Rayon & Mixture
United States	8.7	...	7.6	...
Canada	64.5	4.2	8.1	6.9
Argentina	97.6	0.9	6.2	...
Other Latin America	22.0	0.1	1.8	0.5
Belgium	4.7	...	1.9	...
Belgian Congo	1.9	...	5.0	...
Portuguese East Africa	6.5	...	0.5	...
Sweden	20.2	...	6.2	...
Switzerland	13.9	...	4.6	...
Iran	1.7	...	3.3	...
Total to hard currency areas	241.7	5.2	45.2	7.4
Total exports	1,386.2	60.7	531.2	109.6
Hard currency exports as percentage of total exports	17.0	8.0	8.0	6.0

The Board of Trade intends that 35 per cent of all British cotton and rayon exports shall be shipped to these markets in 1948 and the export target has been fixed at 800 million square yards. This means that some 280 million square yards of cotton and rayon piece goods must find purchasers in the markets listed above. Evidence suggests that 100 million square yards will not be sold to Canada without difficulty. From Toronto it is reported that the British Textile Agents' Association in Canada has repeatedly warned Lancashire that no further price advances will be tolerated above the present level (which is 260 per cent of prewar), and that Canadian buyers are growing impatient for the medium and staple types of fabrics which formed the bulk of British exports to that market before the war.

At the same time, Japanese textiles are reappearing in Canada. The Primary Textiles Institute of Toronto describes the process by which these are reaching the Canadian market as "something history never before encountered." American dollars for the purchase of American textiles are rationed under the quota restriction, but the Institute claims that they are available in unlimited quantities from the Canadian Foreign Exchange Control Board to importers who wish to purchase textiles from Japan. Presumably the Lancashire representatives were aware of this situation when they gave their assent to the report and proposals of the recent Anglo-American Cotton Conference. Having agreed to facilitate the marketing of Japanese textiles in the sterling area, the British industry must still expect competition from them in dollar markets.

*

But even if Canada can be counted upon to take the expected 100 million square yards, what are the prospects of raising exports to other hard areas to 180 million square yards? Unless openings in Argentina and the other Latin American republics develop on a scale at present entirely unforeseen, they are not bright. There is no reason to expect any spectacular rise in imports into the USA, whose own exports fell by 10 per cent in volume between January, 1947, and January, 1948. The reviving Belgian industry may be expected to provide strong competition in the Congo, and in Portuguese Africa priority is given to cottons from Portugal. Imports of piece goods by Sweden and Switzerland are not likely to return to the prewar level; their main demand on Lancashire in the future will be for more yarn.

* * *

Contraction of World Cotton Trade

It is now clear that the contraction of world foreign trade in cotton and rayon textiles which was evident before the war is likely to continue. One of the most significant contributions to the recent talks between leaders of the British and American cotton industries was the following table, drawn up by the Cotton Board, to show the changes which have taken place in the pattern of production and foreign trade in cotton textiles since before the war:

COTTON TEXTILES: PRODUCTION AND EXPORTS (Mn. Sq. Yards)				
	Production		Exports	
	1936-38 Average	1947	1936-38 Average	1947
United Kingdom	3,500	1,800	1,741	531
United States	8,530	10,800	252	1,500
Japan	4,230	660	2,512	400
Mexico	370	450	...	10
Brazil	900	1,200	7	160
Indian Union	...	5,600	200	250
Pakistan	3,920	70	...	...
France	1,400	1,300	374	320
Italy	850	1,000	364	110
Belgium	500	550	142	120
Netherlands	500	400	186	70
W. Germany	2,000	700	190	100
Spain, Portugal, Switzerland	700	1,400	60	...
U.S.S.R.	3,600	2,500	200	15
Czechoslovakia	550	300	60	80
Poland	500	450	10	...
Totals	32,050	27,310	6,298	3,686

This table shows that foreign trade in textiles is not recovering at the same rate as production in the leading countries. In 1947, production had recovered to about 85 per cent of the prewar volume; but foreign trade was no higher than 57 per cent. Moreover, in 1936-38 about 20 per cent of total production was exported; in 1947 the figure was only 11 per cent. Nor, in the view of the Cotton Board, is it likely to rise any higher. In a

"tentative estimate of the position in 1950" it is argued that by that year world consumption of cotton and rayon textiles will be at the level of some 44 billion square yards (of which cotton piece goods will represent 35-36 billion square yards), and that no more than 10 per cent of this will be provided by imports. This leads to the sobering conclusion that "the volume of international trade in cotton goods is unlikely to be much above its present level."

Blocked Balances in Germany

The restrictions in the use by foreign-owned undertakings of their blocked balances in Germany were discussed in *The Economist* on February 21st. A statement by the Foreign Office in the *Board of Trade Journal* announces that they are to be relaxed to "allow United Nations and neutral enterprises to play their part in the reconstruction of the German economy." But it is a severely limited relaxation. Foreign firms in the British and American zones will be able to use their accumulated Reichsmark funds for investment—but only on specific conditions. In particular, it is stipulated that the proposed investment must be devoted "either to the reconstruction of existing property or to the replacement of essential property, lost to the owner for any reason since 1939, by property similar in character."

This is no mere formality. A foreign-owned enterprise wishing to enter into any capital transaction—say, to extend its buildings or to buy additional plant—will still have to apply to Property Control for a licence. This licence (which an ordinary German firm wishing to do the same thing would not need) is in addition to all the other licences needed in Bizonia to carry out any industrial operation. To obtain it the owners must do more than show that the extension would be useful or would assist reconstruction in the western zones. They must show what property they have lost, or what damage needs to be repaired, and state what property they wish to acquire or what rebuilding they wish to undertake to replace it. They must even be prepared to show that the proposed investment "could not have the effect of putting the applicant in a superior position in the particular industry concerned to that which he occupied in 1939."

Reichsmark balances in the hands of foreign-owned undertakings in Germany are large. The German undertakings belonging to members of the Committee of British Industrial Interests in Germany hold about 165 million marks in German banks, the accumulated earnings of many years during which money could not be sent out of Germany. They would have liked to use these funds—as German firms have been able to use them where the state of trade allowed—for expansion or improvement, and even to enter fresh fields of enterprise. But expansion and new enterprise will clearly be out of the question within the framework of the agreed Anglo-American statement. And since the German business world knows that an attempt at currency reform cannot be delayed much longer, they will hardly find it easy even to rebuild and renew in the next few months.

A Free Metal Market?

This is the high season for study groups. Last week the Tin Study Group finished its second session in Washington, and on Monday the Rubber Study Group opened its fifth. These conferences of producers and consumers are useful, but they also involve Government officials—to the embarrassment, it would

seem this week, of the Minister of Supply, who has postponed a statement about the possible reopening of the London Metal Exchange until his adviser has returned from Washington. A new scheme for the resumption of private trading in metals (which, it is understood, overcomes the difficulty of foreign exchange shortage) has recently been submitted to the Government. The problem ranges beyond mere provision of dollars. The maintenance of a high level of industrial activity in the United States will increase its demand for base metals far beyond its domestic sources of supply, and this demand may be further increased by the new American defence programme and by larger stockpiling purchases. If the London metal market were open it might do a good business and for dollars; but its sales to America might also have the effect of seriously depleting the already restricted supplies of base metals which British industry now receives.

The reopening of the London Metal Exchange would involve the question of the continued international allocation of tin, about which, apparently, no decision was taken in Washington. The Study Group estimated tin production this year at 150,000 tons, increasing to 170,000 tons in 1949 and to 200,000 tons in 1950. These estimates are smaller than those made a year ago owing to the difficulties of Far Eastern rehabilitation, although current tin production in the Netherlands East Indies was stated to be 60 per cent of prewar capacity and may reach 100 per cent by the end of the year. This recovery will be of particular importance to the United States and will no doubt help to maintain the Texas smelter in operation. Potential industrial consumption—that is, if tin were freely available with no restrictions on its use—was estimated at 190,000 tons annually for the next three years. In view of this statistical position, the delegates agreed to recommend to their Governments that a "working party" should examine the possibility of framing an inter-governmental tin agreement to conform to the general spirit and principles of the Charter of the International Trade Organisation. Such an agreement would presumably have to forgo the restrictionist elements of the prewar days. But it seems a little early to be worried about the emergent "surplus" in tin. And does the recommendation presuppose that £500 tin is here to stay?

* * *

Malayan War Damage Payments

The non-payment of war damage has long been a matter of grievance to tin and rubber producers in Malaya. In October, 1942, the British Government declared its general aim to restore productive activity, property and goods in the Colonial Empire. This week a joint plan has at last been published by the British and Malayan Governments, which deals with war damage claims on an austerity basis and restricting the total cost to £55 million. This sum is made up of a free grant of £10 million from the United Kingdom, of £10 million from the proceeds of Japanese reparations and a maximum of £35 million from Malayan sources. Both these last two amounts virtually have the backing of the British Government, although its assistance is limited to £6,000,000 a year for the first three years. The Malayan Government has in return agreed to maintain its sterling balances in this country if necessary by continuing or extending import restrictions.

This news will cause little rejoicing by rubber and tin producers. War damage claims total some £129 million, and a

The Bank undertakes general banking business and with its numerous branches offers special facilities in Canada, Newfoundland and the United States.

further £22 million is due, as a legal liability, under the War Risks Insurance scheme. The insurance fund, however, has only £12 million, so that £10 million from the £55 million must be used for this purpose. Moreover, the management of the insurance fund is reported to be contesting many claims on legal technicalities such as seizure, frustration and abrogation which may increase the compensation for war damage by a further £5,000,000. Hence a maximum of only £45 million is available to meet war damage claims of £134 million: on an average, therefore, only one-third of the claims can be met, and the period of repayment has not been laid down.

The total allotment of £55 million has evidently been assessed on the basis of the British and Malayan Governments' ability to pay rather than on the legitimacy of the claims—rather like a composition offered to creditors. Much of the physical rehabilitation of the tin and rubber properties has been carried out, new plant and machinery has been installed. Last year's rubber output in Malaya was an all-time record. Industry found the money by drawing on its reserves and by borrowing, and now desires reimbursement. Physical rehabilitation has been achieved to the limit of British productive capacity and dollar resources. Thus cheques on war damage payments would not reduce Malaya's dollar earnings, and therefore the present Government may be unwilling to impose a further burden on the British taxpayer in order fully to reimburse the expenditure of rubber producers and tin miners, despite the earlier undertaking of 1942. This will be small consolation to those who will suffer by this "austerity plan."

Exchange for Foreign Travel

With the lifting, this week-end, of the ban on tourist traffic to countries outside the sterling area, the Bank of England has issued new instructions to the banks about the allocation of currency for tourism, as well as an explanatory leaflet for the guidance of travellers themselves. The new regulations do not differ substantially from those in operation before the ban was imposed, but the basic allowance, now restored, is necessarily at the level to which it was reduced by the emergency cut made last summer. Until end-August last the allowance for an adult was £75 for the twelve months beginning on November 1, 1946. It is now £35 for the twelve months beginning today. The allowance for children will be £25, which is an improvement of £5 upon the limit fixed last summer. As in the past, special allocations of exchange will be made against applications by travellers for "genuine business purposes," and will be related to the duration of the trip. A bank authorising such applications must be satisfied that:

the applicant is a business executive and/or properly accredited representative of a business house in the United Kingdom who is travelling genuinely and solely on business directly connected with the export of goods from, or the import of goods into, the United Kingdom and that imports into or exports from (as the case may be) the countries to be visited are part of the normal

22, RYDER STREET, ST. JAMES'S, LONDON, S.W.1.

business of the firm or company on whose behalf the journey is undertaken.

In certain circumstances, special allocations of exchange may also be made for travel for purposes of health or education or on compassionate grounds.

The regulations emphasise that in every case the exchange is solely for the personal use of the individual to whom it is allotted, and may not be used even on behalf of his wife or family. Travellers are advised to finance their main expenses during their stay abroad by travellers' cheques or letters of credit; the maximum they may take with them in foreign currency in the form of notes is the equivalent of £10. Any notes so taken will, of course, rank as part of the exchange allowance. In addition, however, up to £5 may be taken in sterling notes for use on British ships and aircraft and to cover the landing expenses on return to Britain. As in the past, these sterling notes will not rank against the exchange allowance. Where the traveller is proceeding by a "normal direct" route, and is able to purchase travel tickets in the United Kingdom for payment in sterling, these payments will not rank against the allotment of exchange, even though the transport companies concerned are resident outside the sterling area. But where the journey is not by the normal direct route, the amount of the payment may be deducted from the exchange allowed. Payments to booking agents in the United Kingdom for other purposes, such as hotel accommodation, guides or entertainment, will definitely be treated as part of the allotment if the services are to be provided outside the sterling area. Travellers are warned that it is illegal to cash cheques outside the sterling area, or to borrow currency or enter into any arrangement to obtain foreign currency, unless permission to do so has been granted.

* * *

Can the Dockers do More?

This week's meeting of the National Dock Labour Corporation to wind up its affairs provided an occasion for some plain speaking on the need for speeding the turn-round of ships. Mr Bevin, a former dockers' leader and the author of the wartime scheme for decasualisation, appealed to men and managements to co-operate in an effort to clear ships as fast as in 1938, so that the maximum value could be got from Marshall Aid. Before the war employment in the docks was notoriously casual. Now that the dockers have gained their lifelong dream of decasualisation, they might be expected to do at least as well as they did before the war. Neither dockers nor dock managements are entirely to blame for delays to shipping, for much of the equipment in ports is run-down and obsolete, and there has been no opportunity for nearly a decade to improve and mechanise the docks. But even in existing conditions there is room for an increase in efficiency and greater co-operation from dock labour.

The report of the Ministry of Transport's "working party" on dock organisation in the major ports will soon be available, and many of its recommendations about the Port of London are already known. They include schemes for nationalisation and re-deployment which may be resisted by the men, improved lighterage facilities, elimination of unnecessary time taken at the Customs, and, in general, a radical reorganisation of methods in this essentially conservative industry. The difficulty will arise in putting the recommendations into practice.

One important policy of the Corporation, which it hopes the new National Dock Labour Board will continue, has been to raise the standards of welfare. In many ports these are still more appropriate to casual than to regular employment. Although there are exceptions, the dock industry as a whole has lagged behind factories and mines in providing reasonable amenities. Since the Board is now responsible for labour conditions in every port in the country, it has a twofold task—to reduce the delay to ships in port and to complete the process of raising the status of the dockworker.

Light on the Lamp "Ring"

The second reading of the Monopoly Bill produced a debate about the influence for better or worse of the Electrical Lamp Manufacturers' Association. This body comprises 10 firms who together supply 60 per cent of all lamps, though in some lines presumably the proportion may be higher. The ten firms, whose manufacturing interests in most cases extend well beyond the manufacture of lamps, are General Electric (Osram), British Thomson-Houston (Mazda), Ediswan (Royal Ediswan), Metropolitan Vickers (Cosmos), British Electrical Lamps (Bell), Philips Electrical, Siemens, Cryselco, Aurora Lamps and Crompton.

SECOND NASSAU INVESTMENT CORPORATION, LIMITED

FINANCIAL POSITION STRENGTHENED

WELL SPREAD HOLDINGS

MR R. K. FRAAY ON GOLD PRICES AND INFLATION

The third ordinary general meeting of shareholders of Second Nassau Investment Corporation Limited was held, on the 15th ultimo, in Johannesburg.

Mr R. K. Fraay, the chairman, presided, and in moving the adoption of the report and accounts said:—

The total revenue amounted to £706,710, as compared with £318,244 in the previous year.

In comparing these results one must, of course, take into account the fact that the capital of your corporation was substantially increased during the year under review.

You will note that the revenue was obtained from the following sources:—

Dividends Received and Accrued	£271,153
Profits less Losses on Investments realised	432,412
Underwriting Commission and Sundry Revenue	3,145
	£706,710

The total expenditure increased from £43,247 in the year ended December 31, 1946, to £59,179 during the year under review, sub-divided as follows:—

Administration Expenses	£33,610
Expenses re New Issue of Shares	4,202
Interest	15,989
Directors' Fees and Bonuses	5,378
	£59,179

After deducting the expenditure from the revenue there was a balance of £647,531 (last year £274,997) to be carried forward to Appropriation Account. To the net profit of £647,531 must be added £38,023, being the balance unappropriated at the beginning of the year, making a total of £685,554.

The following allocations have been made:—

Dividends on Ordinary Shares	£354,375
Dividends on Preference Shares	20,000
Provision for Taxation	90,000
General Reserve	125,000
	£589,375

Leaving a balance to be carried forward of 96,179

£685,554

I am pleased to be able to add that the results for the first three months of the current year have been very gratifying, and that in consequence the unappropriated profits have been substantially increased since the beginning of the current year.

An interim dividend of 7½ per cent. was declared payable to shareholders registered on June 30, 1947, and a final dividend of 7½ per cent. to shareholders registered on December 31, 1947, making a total of 15 per cent. on the ordinary shares for the year. This compares with 12½ per cent. for the previous financial year.

A total dividend of 4 per cent. was declared payable to the holders of the convertible cumulative preference shares. The holders of these convertible cumulative preference shares have the right to convert their shares into ordinary shares during the six months ending June 30, 1950, on payment of a premium of 5s. per share.

Your directors have continued to follow the sound policy of increasing dividends gradually, without losing sight of the necessity for strengthening the general reserve account and increasing the balance on appropriation account. I feel sure that you will agree with this cautious policy.

OPTION TERMS

At the extraordinary general meeting of ordinary shareholders, held on March 27, 1947, it was decided to increase the authorised capital of your corporation to £3,650,000 by the creation of a further 1,050,000 ordinary shares of £1 each. Your directors were then authorised to offer 525,000 new ordinary shares of £1 each to ordinary shareholders registered in the books of the corporation at the close of business on June 30, 1947, at 40s. per share, being at a premium of £1 per share, in the proportion of one new share for each four shares held at that date. These shares were all taken up by shareholders. Your directors were also authorised to grant to the persons to whom the 525,000 new ordinary shares would be allotted options to take up at 40s. per share the balance of 525,000 ordinary shares in the capital of the corporation, in the proportion of one option for each share so allotted, provided that such options were to be exercised between July 1, 1948, and July 31, 1948, only. Your directors were also given the necessary power to allot any shares not so taken up to other persons, whether shareholders of the corporation or not, at prices not below 40s. per share.

This means, therefore, that option certificates are at present in circulation in respect of the balance of the unissued capital of 525,000 ordinary shares, entitling the holders of such option certificates to take up these shares at 40s. per share between July 1 and July 31, 1948. I consider that holders of these option certificates will be well advised to exercise their options, because it would be against their interests to allow them to lapse. I also take this opportunity of reminding the holders of these options that any shares which are not taken up under these options on or before July 31, 1948, will, in accordance with the powers given to them by shareholders, be allotted by the directors to other persons, whether shareholders of the corporation or not, at a price not below 40s. per share.

In consequence of the issue of new shares made in 1947 the total issued capital of your corporation was £3,125,000 at the end of the year under review, divided into 2,625,000 ordinary shares of £1 each and 500,000 4 per cent. convertible cumulative preference shares of £1 each, all fully paid.

General Reserve.—This account showed a balance of £650,000 at the beginning of 1947. A premium of £525,000 was received on the new issue of 525,000 ordinary shares, and this amount was transferred to general reserve, and, in addition, £125,000 was appropriated from the profits made during 1947, thereby increasing the general reserve to £1,300,000 at the end of the year under review. A further £525,000 will be received by your corporation as premium on the 525,000 ordinary shares to be taken up during July, 1948, when the options are ex-

ercised. This will naturally strengthen the position of your corporation still further.

VALUATION OF INVESTMENTS

The investments of your corporation at December 31, 1947, appear in the balance sheet at £5,027,722, representing their cost, which includes brokerage. The market value of these securities based on the ex dividend quotations on January 5, 1948 (the first business day in 1948 on the Johannesburg Stock Exchange), was £5,193,259.

There has been an even greater appreciation in the market value of the holdings of your corporation as compared with cost since the beginning of this year. On April 7, 1948, your corporation held shares in 145 companies, with a market value of £5,649,117 and a book value of £5,188,167. This shows convincingly that the position of your corporation has improved considerably during the last three months.

The investment portfolio is under daily and close supervision, and changes are effected whenever it is thought desirable in the interests of shareholders and with a view to strengthening the position of your corporation. I need not add that, in these uncertain times, it is even more necessary to effect changes in the portfolio from time to time than it would be in more normal times.

I have always maintained that devaluation of various currencies is inevitable; in other words, that the gold price must eventually rise. Such a rise in the gold price will be followed by an increase in the price of gold-mining securities, and this will naturally benefit investment companies such as yours on account of the large holding of gold-mining shares.

LIST OF SECURITIES

In my statement to the Company Law Amendment Enquiry Commission, I strongly advocated that an amendment to the company law should make it compulsory for all companies holding shares in other companies, including subsidiary companies, to state once annually on a date common to all companies, in the Union of South Africa, the number of shares held in each company. The publication of such holdings would enable shareholders in companies to have, at least once annually, a clear picture of the investment portfolio held by their company.

Such a provision would prevent a great deal of undesirable speculation, and such speculation should be prevented in the interest of the general investing public. I am of opinion that many debacles in the past could have been prevented if such information had been available. I hope that the Commission will strongly advocate that the publication of such information should be made compulsory.

It has been decided, however, by the directors of your corporation that, pending the passing of such legislation, a detailed list of the holdings of your corporation will be given by the chairman in his address at the annual general meeting.

ANALYSIS OF INVESTMENTS

Having read the list of the company's holdings, he continued: This holding comprised shares in 149 companies, and I will, as usual, give you a closer analysis. Only 0.37 per cent. of the total holding was in shares not quoted on the Stock Exchange, and 4.98 per cent. in quoted securities which had not yet reached the dividend-paying stage, leaving 94.65 per cent. in quoted dividend-paying shares; 31.29 per cent. was invested in shares of land and financial companies (including 18.65 per cent. in our associated companies); 27.18 per cent. in industrial and commercial companies; 37.09 per cent. in gold-mining companies; and 4.44 per cent. in collieries, diamond and base metal companies.

The information I have given you is very detailed, but I wish to make it clear that I prefer the compulsory publication of holdings by all companies on a common date. This

procedure can be followed only if the necessary legislation is passed.

You will agree with me that the holding of your corporation is well spread over a large number of companies. It will be the constant endeavour of your directors to increase the dividend income of your corporation and thereby to reduce the difference between dividends paid by the corporation and its dividend income. On the other hand, it is reasonable that shareholders of the moment have the right to receive, in the form of dividends, part of the profits derived from the realisation of investments.

It will be seen from the accounts that, although a portion of the profits realised on investments has been paid to shareholders by way of dividend, the major portion of revenue of this nature has been utilised to cover expenses and to increase the general reserve account and the balance on appropriation account.

It is sometimes said that the profits of your corporation derived from the realisation of investments will be subject to heavy fluctuations, but I feel little apprehension on this score, due to the nature of our business. Your corporation has become one of the most important investment companies in this country and exercises a steadying influence on the Stock Exchange because it is a constant buyer and seller of investment securities.

ALTERATIONS TO ARTICLES OF ASSOCIATION

This meeting will be followed by an extraordinary general meeting of ordinary shareholders for the purpose of considering, and if deemed fit passing with or without modification or addition, a special resolution to effect various alterations to the Articles of Association.

Proposals in this connection were submitted to you by your directors simultaneously with the notice of this meeting, and I take it that these proposals are quite clear to you.

It is proposed that various clauses of the articles be amended in order to conform with the requirements of the Stock Exchange, London, because it is the intention of your directors to apply in the near future to the Council of the Stock Exchange, London, for permission to deal in the shares of your corporation. A number of shares in your corporation are held by overseas shareholders, and it will be to the advantage of those shareholders and the shareholders resident in South Africa to have the shares of your corporation quoted in London. This will, no doubt, tend to a broadening of the market in the shares of your corporation.

COMPANY LAW AMENDMENT ENQUIRY COMMISSION

I have already made reference to the memorandum submitted by me to this commission, in which I recommended, in the interests of the general body of shareholders, various amendments to the Companies Act.

I cannot at this meeting repeat all the recommendations I made to the commission, but there are a few special points to which I should like to make reference.

I felt justified in stating that my experience has proved that the large majority of companies in the Union are managed as efficiently as possible in the interests of their shareholders, taking South African conditions and the South African outlook on life into account. It must be realised, of course, that the development of a new country and its enterprises is bound to be more rapid than that of older countries, and that the outlook of the population in new countries is usually more speculative than in older countries.

There is, admittedly, a greater tendency here than overseas for some directors to look upon the companies of which they are directors as their own private property, and it is therefore essential to impress upon such directors that they are in a position of trust towards their shareholders, and that they are, in fact, only

the representatives of the whole body of shareholders.

This attitude amongst directors is accentuated by the fact that most shareholders in public companies display very little interest in the affairs of the companies in which they are shareholders, unless difficulties are encountered.

It is my contention that control over companies in South Africa should be stricter than elsewhere, because, as already stated, this country suffers from certain disadvantages which cannot very well be prevented in a new country.

DEVELOPMENT OF SOUTH AFRICA

An American visitor remarked some time ago—in my opinion quite rightly—that conditions here could best be compared with the conditions which existed in the United States of America 80 years ago. The United States of America had then, just as South Africa has today, to contend with the problems which can be looked upon as the birth pangs of a new nation.

South Africa is, for its development, just as America did 80 years ago, drawing for the strengthening of its population on the emigrants from various countries. It is inevitable, therefore, that the outlook and attitude towards different problems must differ amongst those emigrants. It may take generations before such differences disappear.

Another opinion I expressed was that the Press in South Africa should play a bigger part than it does at present in shaping public opinion on financial matters. I explained that this was only possible if some protection were provided against unwarranted libel actions, and suggested that it was necessary to investigate how this could best be achieved.

It has been said that the Press need not fear libel actions if comments are in the public interest. It might, therefore, be interesting for you to know that the frank comments which I have made from time to time on certain financial matters have been strongly resented by certain interested parties, who obtained legal advice to find out whether a libel action could be instituted against me. I would naturally have welcomed such action, because I feel strongly that what I have said from time to time was not only in the interests of the shareholders of the different companies forming our group but of the general investing public as a whole.

I have dealt with this matter fully, because I am firmly convinced that legislation, however strict, will never be able to stop undesirable financial practices unless ways and means can be found to induce investors and the general public to display a greater interest in business matters. Investors and the general public can only be guided in this connection by a well informed Press. After all, public opinion is a stronger deterrent against malpractice than even the strictest legislation.

INCREASED GOLD PRICE AND INFLATION

In my remarks to shareholders of Unit Securities and Trust Company of South Africa, Limited, on March 12, 1948, I touched upon two matters of great importance to this country, namely, the influx of capital from Europe and its dangers, and the inevitable devaluation of various currencies. I said then that it might be advisable for this country to devalue independently even before other countries are forced to do so. Such an independent devaluation would mark the beginning of an independent South African financial policy.

My remarks in connection with devaluation have—as I fully expected—been severely criticised in some quarters, mainly on the assumption that devaluation would create further inflation. One critic went so far as to write that currency devaluation is nothing but a snare and a delusion.

I cannot agree that general devaluation means the beginning of greater inflation. Devaluation is, in my opinion, nothing but the acceptance of inflation as an accomplished

fact. Inflation, or rather a reduction in the purchasing value of money, has been a continuous process, but has been accentuated by the two world wars during this century. It is just as necessary to increase the price of gold—in other words to devalue currency—after a major inflation has taken place, as it was to increase wages to meet the reduced purchasing value of money due to this inflation.

I have always felt that much suffering during the depression between 1920 and 1931 could have been prevented if we had been realistic enough in 1919 to admit that the inflation caused by the 1914-18 war was a natural consequence of that war, and that that inflation had come to stay. Instead of this, everything possible was done to try and put the clock back, thereby creating unnecessary economic upheavals, followed by the political repercussions which had much to do with the outbreak of the 1939-45 war. Are we going to repeat the same mistakes? We all agree that the purchasing value of money has decreased substantially since 1939, but many of us are not prepared to face the position realistically by agreeing to devaluation.

As far as the influx of overseas capital to this country is concerned, it is well known that this has gone on uninterruptedly since my remarks to the shareholders of Unit Securities and Trust Company of South Africa, Limited, were made. Certain measures are now being taken to control this movement of capital, but I am doubtful whether such control will be successful, because experience has shown that it is very difficult to make such control effective. Total prohibition of the export of capital from England to other parts of the British Commonwealth might be successful, but would severely strain the relations between the different Commonwealth nations.

THE ECONOMIC POSITION

I have lately discussed the present economic position of South Africa with various prominent overseas financial experts. Some of these experts were unimpressed in their praise of what has already been accomplished in this country. Others criticised certain aspects of our economic set-up, including housing accommodation for the lower income groups and our native population, our agricultural productions, etc.

I felt justified in telling these critics bluntly that they should not overlook the following facts:—

(1) That practically no Europeans were living in the three provinces, Orange Free State, Natal, and Transvaal, 125 years ago, and that consequently practically all our development has taken place in that short period;

(2) That most of the European immigrants who arrived in this country up to as recently as 30 years ago came with the main object of trying to make sufficient money to return to their homeland to retire. This attitude stemmed practically all undertakings started by these immigrants before the 1914-18 war. In other words, there was no desire or intention to build lastingly;

(3) That the attitude towards life of our native population has changed tremendously during the last few decades. This population has become largely detribalised, and has moved from its native reserves to the towns, thereby creating the ordinary problems which follow in the wake of a movement whereby a large part of the population of the country turns from agricultural and pastoral pursuits to unskilled labour in industry, mining, and other occupations.

TOWN PLANNING

I would like to address you today about a matter which has exercised my mind during the last 12 years—namely, whether the time has not arrived to change drastically our ideas about town-planning in this country. It cannot be denied that the cost of living in South Africa has always been greatly affected, and to a much greater extent than in other countries, by the high prices ruling for land

and houses. This will seriously retard progress, and everything should be done to reduce this burden resting upon our wage-earning population.

Most of the European population in our towns are today living under similar conditions to those of 50 years ago—that is to say, in houses surrounded by gardens measuring from one-quarter of an acre to many acres, even when these houses are near to the centre of the town. This was a luxury falling within the means of the man with even a moderate income 50 years ago but we want more out of life now than we did then in the form of essential services such as good roads, water, light, transport and sanitary arrangements, and the cost of upkeep of these requirements becomes too heavy a burden if the acreage covered by a town is too large in comparison with its population.

I feel that we will have to get used to the idea of concentrating our towns on a much smaller acreage than at present in order to reduce the cost of living and to bring down land values outside the flat area.

The present position has also created other problems such as the provision of sufficient transport and parking accommodation for the many motor-cars required by our town population to cover the enormous distances in the towns, etc. It has also aggravated the economic difficulties of that part of our native population which finds employment in the towns. These natives have to live outside the European areas, and therefore so far away from their places of employment that a very considerable part of their income is swallowed up by the cost of transport.

The high cost of land and building makes an investment in houses for letting purposes in this country unprofitable. This has, in its turn, made it necessary for an unduly large part of our population to own their own houses, which are often very heavily mortgaged. The Rent Act which is supposed to be successful has—as is often the case with Government measures—actually made the position more difficult. It has unintentionally forced many people who would have preferred to rent houses or flats to buy houses, simply because houses to rent are practically unobtainable.

Many people have, therefore, been forced to accept a liability in the form of a mortgage on their house, which is really far beyond their carrying capacity. They have, in fact, taken a heavy mortgage on their future earning capacity, and they may find themselves in great difficulties if this country should encounter even a small set-back.

I contend that it would have been far better for these people to pay a somewhat higher rental while this scarcity lasts, than to accept this heavy liability in the form of a mortgage on their houses. They are now, in addition, facing the possibility of a heavy loss on their investments if property prices should recede.

INFLUX OF IMMIGRANTS

The position has lately become aggravated due to the influx of immigrants. Many of these immigrants also are forced to buy houses to get a roof over their heads. It is admittedly true that scarcity of houses is a world-wide problem, but the conditions existing here are peculiar to this country, as only a small proportion of houses are owned for letting purposes. Most houses are owned by the occupants.

I submit that the danger point in the economic structure of a country has been reached when people with an income of between £800 and £1,200 per annum have to pay between £4,500 and £6,000 for a property with a five-roomed house in a decent locality. These people are endangering their savings by the purchase of houses and land at such high prices and—as already stated—accepting a heavy mortgage on their future due to the money which they have to borrow on these houses.

We are at present trying to attract a great number of immigrants to South Africa. Many of these will be wage-earners who cannot buy their own homes, and have therefore to hire their living accommodation. The only

manner in which our present and future problems in this connection can be overcome is by zoning a much greater part of the acreage of each town for flat buildings. At least one-third to one-half of the European population of our towns should be able to hire their living accommodation and be able to live within a reasonable distance of their place of employment. This will, incidentally, also overcome some of our difficulties in connection with transport and reduce the cost of maintenance of roads and other essential services.

This policy might necessitate giving greater powers to the municipalities to fix reasonable prices on land required near the centre of the towns for erecting flat buildings, etc. It is unfair that certain holders of land near the centre of towns should make exorbitant profits at the expense of the community as a whole.

I feel convinced that a city such as Johannesburg could, in this manner, provide accommodation for practically five times its present population, without having to extend still further. It will also force down land prices in suburbs too far away from the centre of the city.

I have gone into this matter fully because we are all greatly concerned about the increase in the cost of living during the last few years and are trying to take steps to remedy the position.

INCOME-TAX—1948

It is greatly to be regretted that Parliament in this country decided to leave the passing of the income tax proposals for the income tax year ending June 30, 1948, until after the general elections, because this creates an element of uncertainty which should have been prevented.

It is well known that the financial year of many companies and partnerships ends on June 30 of each year, and it will now be impossible to finalise the accounts of such companies and partnerships until Parliament has passed proposals in connection with this income tax year. It is rumoured that many changes in income tax are contemplated, and this naturally adds to the general confusion.

I sincerely hope that the Government to be elected will not follow the example set by the British Government by proposing a levy on income derived from investments. Such a levy can only have one effect—namely, to stifle private initiative and the urge to save—and, as I have said so often, such initiative is imperative in a new country. Everything possible should be done in South Africa to encourage private enterprise and initiative in order to take full advantage of the great possibilities which exist in this country at the moment. It is necessary in a new country for the level of attainment to be fixed at the level of the greatest producer and not at the level of the medium or low producer. This is the only manner in which great progress can be achieved.

THE DIRECTORATE

Your corporation suffered a great loss during the year under review by the death of Mr G. W. Campbell and by the death of Mr John Hungerford at the beginning of the current year. Both these gentlemen had been connected with your corporation as directors since its inception, and were well known throughout South Africa as men of high integrity and great business experience.

Their advice and guidance will be greatly missed by the remaining members of your board of directors, and I can only say that it will be extremely difficult to fill their vacant seats by men of the same calibre. I, as your chairman, feel their absence deeply, not only as colleagues who looked upon the interests of your corporation as of paramount importance, but as loyal and firm friends.

I now propose: "That the directors' report and accounts be adopted, and that all acts and undertakings done for and on behalf of the corporation by the directors be and are hereby confirmed."

MR S. T. RICHARDS'S REMARKS

Mr S. T. Richards: Mr Chairman, ladies and gentlemen, it is with much pleasure that I rise to second the motion for the adoption of the directors' report and accounts which has been moved by the chairman, and I think you will all agree that, once, again, he has given us a most constructive and inspiring address covering a wide review of present day conditions.

I also feel certain that the very detailed and exhaustive information given by our chairman of the holdings of your corporation will be greatly appreciated and reassuring to shareholders. Actually, it sets a new standard in the history of investment companies and it is to be hoped that the practice now inaugurated by this corporation will become general. Not less than 94.65 per cent. of the corporation's holdings are quoted dividend-paying shares, and the investments of the corporation are spread over 149 companies—surely a very comprehensive cover.

The question of devaluation has been mentioned by our chairman; this is a very contentious matter and one on which I am not prepared, at the moment, to express an opinion, but the suggestions put forward are very worthy of close attention.

The present housing position is another subject on which our chairman has put forward some excellent suggestions; there is no question that the position as it exists at the present moment needs serious consideration.

Although the capital of the corporation has been increased, the dividend for the past year was increased from 12½ per cent. to 15 per cent., which we must all consider most satisfactory. The general reserve now stands at £1,300,000, a figure which will be further increased by an amount of £525,000 when options are exercised in July placing the corporation in a remarkably sound position.

In due course it is anticipated that a quotation for this corporation's shares will be obtained on the Stock Exchange, London—there is no doubt that this will broaden the market for your corporation's shares.

I think we all realise the enormous developments which are steadily taking place in this country and, provided there are no serious disturbances in Europe, the prospects of expansion are likely to be very considerable.

In conclusion, on your behalf, I wish to express our sincere appreciation of the untiring efforts of your chairman, Mr Fraay, in the interests of the corporation, the success of which is due almost entirely to his personal keen foresight and initiative.

The report and accounts were unanimously adopted.

The retiring directors, Mr C. H. Leon, Mr F. W. Patten and Mr H. J. Sanderson, were reappointed and the remuneration of the corporation's auditors for the past year was fixed.

ALTERATION OF ARTICLES

The ordinary meeting then terminated and was immediately followed by an extraordinary general meeting of shareholders convened for the purpose of effecting alterations to the articles of association of the corporation.

Professor C. S. Richards suggested that, if alterations were made to the articles of association at any future date, a brief explanation of the effect of the proposed alterations should be given to shareholders. An explanation of the effect of certain of the alterations proposed was given in reply to questions asked by Professor Richards.

The resolution was thereupon passed as a special resolution and the meeting then terminated.

A copy of the full speech, which contains a complete list of holdings at January 1, 1948, may be obtained from the company's office, Unit Security House, cor. Fox and Sauer Streets, Johannesburg, or Dorland (City), Limited, 1 Royal Exchange Avenue, London, E.C.3.

ROYAL EXCHANGE ASSURANCE

228TH ANNUAL REPORT

INCREASED VOLUME OF BUSINESS

LORD BICESTER'S SPEECH

The following is a summary of the address given by the Right Honourable Lord Bicester, Governor of the Royal Exchange Assurance, at the Annual General Court held at the office of the Corporation, Royal Exchange, London, E.C.3, on the 28th ultimo:—

Our Life Department issued 5,588 policies for sums assured amounting to £4,381,735, an increase over the previous year in both figures. The total premium income at £1,643,330 also showed a substantial advance. The gross rate of interest earned on the Life Fund is £4 1s. 8d. per cent.—an appreciable fall compared with 1946 and 1945 when the rates earned were £4 6s. 2d. per cent. and £4 5s. 3d. per cent. respectively. Recently there has been a change in long and medium term money rates and consequently the yield on Government securities has lately increased considerably. It is possible that our available cash resources may now be invested to give a somewhat higher return than has been practicable in recent years.

It must nevertheless be realised that the investment field open to us has undergone a very severe contraction since the war ended and in future it is probable that industrial securities will have to form a larger percentage of our life fund investments. Meanwhile I am happy to say that our life fund is extremely strong.

FIRE AND MARINE FIGURES

In our fire department the premium income has increased to £2,755,680, which is nearly £400,000 higher than in 1946. Much of this increase is accounted for by the rise in values that has taken place both in property and in commodities, and is no doubt a reflection of the wise precautions now being taken by many policyholders in increasing the amount of their cover to correspond fully with such enhanced values. There are still, however, a large number of insurances which have not been sufficiently increased. The fire wastage in this country in 1947 was the highest ever reached. Heavy losses were also experienced in several overseas territories, and the fire wastage in the United States was again particularly severe. The final result after providing increased premium reserve at the rate of 50 per cent. on the greatly increased income is a small loss of £12,582. This is the first time since the San Francisco disaster of 1906 that the department has shown an actual loss.

The marine account shows a satisfactory result. The premium income amounts to nearly £200,000 more than the previous year. Our fund stood at £1,245,093 at the end of the year, and we are transferring £100,000 to the profit and loss account.

ACCIDENT DEPARTMENT

In our accident department the nett premium income has increased by almost £350,000 to a total figure of £1,898,393 which constitutes a new record. While the

motor vehicle insurance income again shows a substantial increase, the unfavourable experience has continued. Owing to the high cost of labour and materials, accidental damage claims now cost more than double the 1939 figure and the cost of personal injury claims has also greatly increased.

Our accident business will naturally be affected by the National Insurance (Industrial Injuries) Act of 1946, which will come into operation in July next. Notwithstanding the provisions of the state schemes, an employer will still be responsible for considerable liabilities to his employees, and we are taking the necessary steps to advise our policyholders of the facilities which we offer for their protection. We are able to transfer from the accident department the sum of £91,029 to the profit and loss account.

RESULT OF YEAR'S WORKING

The balance of our year's working, namely, £206,654, has been carried to the profit and loss appropriation account and with the balance from the previous year gives a total of £720,713. The year 1947 has been a very difficult one owing to the dislocation of peacetime economies. In such circumstances the overall results of the corporation may be counted as not unsatisfactory.

The results of our associated companies have naturally also been affected by similar difficulties. The "Car and General" and the "Motor Union" have both transacted very substantially increased business and their combined premium income was over £5,400,000, an increase of £1,038,000. While the underwriting results of the "Car and General" produced a profit, those of the "Motor Union" showed a loss on the year's working. Owing largely to bad experience in the fire department, the State Assurance Company has had a disappointing year.

DIVIDEND 30 PER CENT.

In the consolidated profit and loss account you will see that the combined interest earned by the group amounts, less tax, to £317,359. The total transfers from the group departmental underwriting accounts are £331,912. On the other side there appears the figure of £205,445, being the loss sustained by the group fire business and taxation at £251,500. The transfer to the consolidated profit and loss appropriation account amounts to £129,231 and the final figure carried to the balance sheet shows a decrease of some £50,000 at £1,051,624.

Your court of directors are recommending the payment of a final dividend of 20 per cent., making 35 per cent. for the year, which is the same as for 1946.

TRIBUTE TO EXECUTIVE AND STAFF

I am sure you will wish me on your behalf to extend our appreciation and thanks to our general manager, the executive, branch and district managers and staff and

to our local directors and agents both at home and overseas for the contribution they have again made to the well-being of our affairs. I know you would wish me to convey these sentiments also to the directors, executives and staffs of our associated companies.

As governor of the corporation for many years it has been my good fortune to place before you statements which in general have been consistently satisfactory. For reasons which I have explained, the picture this year is less attractive but that is nothing more than the ebb and flow of business, and setbacks must necessarily be encountered from time to time. Much care has gone to the building up of the position we are in today when the total consolidated assets of the group exceed £48,000,000, and I feel our organisation is such that we can face the future with every confidence.

The report and accounts were unanimously adopted.

THE ROYAL LONDON MUTUAL INSURANCE SOCIETY, LIMITED

INCOME, £13,400,000

TOTAL ASSETS, £77,400,000

The eighty-seventh annual general meeting of this Society, was held, on the 27th ultimo, in London.

Mr J. K. Wiseman, F.C.I.I., chairman and joint managing director, who presided, said:—

I have much pleasure in informing you that in 1947 the new business transacted by the society surpassed all previous records in both the Ordinary and Industrial branches.

NATIONAL INSURANCE ACT, 1946

The appointed day for the coming into force of the remaining provisions of the National Insurance Act, 1946, has been fixed as July 5, 1948. Therefore, July 5, 1948, will see the transfer of the operation of National Health Insurance from the Approved Societies, which will cease to exist.

One of the benefits under the National Insurance Act, 1946, is a death grant, the amount of which is £20, with certain exceptions. I want to make it quite plain that the introduction of a death grant in association with the National Insurance Scheme does not affect or prejudice in any way any policy already in existence.

INCREASED TOTAL INCOME

Turning now to our accounts, the total income for the year amounted to £13,418,000, an increase of £988,000 over the previous year. The Combined Premium Income amounted to £10,619,000, an increase of £849,000 over the previous year. The total Claims and Surrenders paid during the year amounted to £5,132,000.

The premium income in the Ordinary branch (including consideration for annuities granted) amounted to £3,021,000, an increase of £362,000 over the previous year.

During 1947 new policies for a sum assured of £9,014,000 were issued. This figure has never been surpassed in the history of the society and the results not from an increase in the number of policies issued but from an increase in the average sum assured by each policy, which in 1947 was in excess of £360.

In the Industrial Branch the premium income for the year amounted to £7,597,000, an increase of £487,000 over the previous year. Claims and Surrenders amounted to £3,385,000.

The amount added to the fund during the year was £3,362,000, which includes £1,918,000 interest on investments. This addition to the fund is money put aside as a provision for future payments to policyholders. Adding this item to the actual disbursements to policyholders during the year the total is £6,747,000.

The report was adopted

RICHARD COSTAIN, LIMITED

PROFITS WELL MAINTAINED

FACTORY SITE GROWING

MR R. R. COSTAIN ON THE OUTLOOK

The fifteenth ordinary general meeting of Richard Costain, Limited, was held at Rodney House, Chichester Street, Dolphin Square, London, S.W., on the 27th ultimo, Mr R. R. Costain, C.B.E. (chairman and managing director), presiding.

The secretary (Mr L. Richards, A.S.A.A.) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman, which had been circulated with the report and accounts for the year to December 31, 1947:—

You will observe from the profit and loss account that, in spite of the difficult trading conditions which prevailed during 1947, and to which I will return later, the profits of the Costain group of companies were well maintained. The increased profits for the year arose in the subsidiary companies and you will observe that a substantial amount of such profits is being retained in those companies for the development of their businesses. The net profit of the parent company, after providing for all expenses, depreciation and taxation, and including dividends receivable from subsidiary companies, amounted to £90,790, as compared with £86,183 for the previous year.

PENSION FUND

The board has transferred back to profit and loss account the sum of £20,000, which was appropriated in the accounts for 1943 and 1945 as a provision for staff pensions. The company has a staff pension scheme in operation and this provision has not been utilised. It has, therefore, been decided to appropriate this sum, together with £30,000 from the profits for 1947, to a fund to provide for an educational, training and benevolent scheme for the benefit of the company's employees. It is proposed that this fund should be administered by trustees, including representatives of the employees, and I am confident that the scheme will be of great value both to the company and to its employees. Shareholders will realise that a well-trained, efficient and loyal staff is the cornerstone of any business.

The board recommend the payment of an ordinary dividend of 10 per cent., less tax, as in the previous year and, after these appropriations, there will remain a sum of £17,756 to be added to the amount carried forward by the parent company.

BALANCE-SHEET ITEMS

The balance-sheet at December 31, 1947, reflects the large volume of work-in-progress which has necessitated considerable bank borrowings, amounting to £462,268 at the year end. In this connection shareholders have been asked to approve an increase in the company's borrowing powers which have remained unaltered since 1936.

The increase in the item freehold and leasehold properties consists mainly of a transfer from work-in-progress of certain house property which is let to tenants and may, therefore, be regarded as a fixed asset. Shareholders may be interested to know that virtually the whole of the company's house property, including that of its sub-subsidiary

company, Rylands Estates, Ltd., is valued at prewar cost.

You will observe that it has not been necessary to draw on the special provision account of £50,000 which was provided last year against contingent losses at home, due to the exceptional weather conditions, and abroad. This provision will, however, be retained, since the risks always inherent in contracting and civil engineering work are magnified under current conditions.

PAST YEAR'S ACTIVITIES

In the year under review, the construction of the hydro-electric scheme in Scotland and the erection of factories and houses of many different types continued satisfactorily. We were also successful in securing two further large open-cast coal contracts in the North of England, and work on a new atomic power station. Our branches in the Near East and Southern Rhodesia are still expanding and the reputation already acquired by your company is being enhanced. Your directors also have under consideration further expansion in other parts of the world.

The factory side of our business is growing and the factory in Wales has practically completed a contract for the manufacture of Airey house components and is already engaged in other types of manufacture which will, we believe, prove successful. The factory in Essex is still producing Airey house components. We have also entered into a contract with the Ministry of Works for the manufacture and supply of prestressed concrete sleepers. We are at present converting a factory in Scotland for this purpose and production will commence towards the end of the current year.

THE FUTURE

Before considering the future prospects of the company, I would like to remind you of my remarks of last year with regard to the properties owned by your company, and I have regretfully to inform you that the profit and loss position, in so far as this aspect of our business is concerned, continues to deteriorate, as the Government has not yet taken any steps to mitigate the legislation that imposes such severe restrictions on property owners.

With regard to the future prospects of your company, it is impossible to make any predictions as to developments in this country in either the building or civil engineering spheres of work. It is hoped, however, that the rigorous policy laid down in the Government White Paper will be modified during the ensuing year and, if this is so, it is felt that your company is in an excellent position to play a considerable part in the essential work of rebuilding in this country. Already your company has been successful in securing a contract for the erection of a large block of Government offices in Whitehall. This, it will be appreciated, is a contract of considerable importance and will assist materially in maintaining the high grade of staff that will be required for the future rebuilding of our cities.

THE DIRECTORATE

During the year under review, Mr J. K. Costain, who has been a member of the board since the inception of the company, has resigned and his resignation was accepted with considerable regret. In view of this, and in order to strengthen the board, it will be pro-

posed during the meeting that Mr R. B. Minto and Mr H. M. Stewart should join the board of directors, and I hope that these appointments will meet with your approval. Mr Minto has been with the company more than 11 years and was appointed personnel manager some four years ago. I am sure you will appreciate the necessity for having this increasingly important side of the organisation represented on the board. Mr Stewart joined the company in 1934 and was made chief civil engineer in 1941. Each of these gentlemen will prove a valuable acquisition to the board of directors.

In conclusion, may I take this opportunity of paying a tribute to the directors and staff for their enthusiastic and loyal support during the past year. I am sure the shareholders will wish to join me in expressing our appreciation and thanks.

The report and accounts were adopted; the proposed dividends were approved; Mr R. B. Minto and Mr H. M. Stewart were appointed directors; the retiring directors, the Right Hon. Lord Clwyd and Mr J. W. Whiter, were re-elected, and the auditors, Messrs James Worley and Sons and Messrs Peat, Marwick, Mitchell and Co., were re-appointed.

At separate meetings of the preference and "A" preference shareholders, and an extraordinary general meeting of the company, resolutions were unanimously passed approving an alteration in the directors' qualification and increasing the borrowing powers of the company to £1,500,000.

NORTH BRITISH AND MERCANTILE INSURANCE COMPANY, LIMITED

LORD BRAND'S STATEMENT

The annual general meeting of the North British and Mercantile Insurance Company, Limited will be held, on the 6th instant, in Edinburgh.

The following is an extract from the statement by the Rt. Hon. Lord Brand, C.M.G., D.C.L., chairman of the General Court of Directors, in connection with the accounts for the year ended December 31, 1947:—

Life department:—The new business results are again satisfactory, the amount completed during 1947 being £7,556,370 net compared with the 1946 total of £5,921,105, which itself was a record.

The premium income has again expanded. Business written during 1947 under the "Two Generations" policy—£250,000—indicates that it is proving popular. We again record an expansion of the annuity fund.

In the fire account the increase in premiums is more than £1,300,000. Unfortunately the loss experience has been adverse both at home and abroad. The outcome of the year's trading is a profit of £29,783.

Casualty department:—The premiums of the Railway Passengers Assurance Company, which transacts our casualty business, at £2,542,108 show a substantial increase of 22 per cent. over the previous year's record figure. The underwriting profit of £150,204 compares favourably.

Marine department:—Although our marine business, transacted by the Ocean Marine Insurance Company, Limited, has had to meet increasing problems, it can be regarded as very satisfactory. Premiums were £1,017,390 against £765,232 in 1946. An amount of £150,000 has been transferred to profit and loss account from the profits of past years now closed.

The Fine Art and General Insurance Company, Limited:—Premiums for 1947 were £638,472 compared with £533,604. The underwriting profit was £28,298 against £50,190.

Consolidation of profit and loss accounts:—The combined underwriting profit is £358,285. Net interest on investments amounts to £500,840 against £448,260. The aggregate balance is £7,651,164 compared with £7,686,254. The ordinary dividend recommended is 7s. per share.

CLERICAL, MEDICAL AND GENERAL LIFE ASSURANCE SOCIETY

RECORD NEW BUSINESS

At the annual general meeting of the Clerical, Medical and General Life Assurance Society, held recently at the Society's chief office, 15, St. James's Square, London, S.W.1, the deputy chairman, Lt.-Col. Sir Francis H. Humphrys, G.C.M.G., G.C.V.O., presided, in the absence, owing to illness, of the chairman, Sir Francis E. J. Smith. In the course of his address, the chairman reported the transaction of a record amount of new business, large increases in premium income, interest receipts and funds, as well as progress in, and additions to, subsidiary companies.

GROWTH OF BUSINESS

The new life assurance business amounted, after deduction of re-assurances, to £4,341,723, an increase of 23 per cent. over the corresponding figure of the previous year. This new business consisted mainly of Whole Life and Endowment Assurances, of which the greater part was effected under With Profit tables, implying a continued confidence in the Society's ability to maintain its high reputation as a bonus-paying office.

As the result of the year's transactions, the Life Assurance Fund rose by £537,881 to £16,947,837; the Capital Redemption Fund by £699,524 to £1,222,065; and the combined Assurance Funds by £1,237,405 to £18,196,902.

INTEREST YIELDS

The interest receipts of the year showed a material increase, the gross yield earned on the Life Assurance Fund rising by 7s. 2d. per cent. to £4 17s. 1d. per cent., and the net yield, after deduction of income tax, by 4s. 4d. per cent. to £3 12s. 8d. per cent.

In part, these unusually large increases in yield reflected a genuine improvement in the income produced by the Society's investments, but in part they rose from the receipt, during the year, of non-recurrent arrears of interest from mortgages and other investments. To this latter extent, therefore, the high yields of 1947 may not prove capable of complete maintenance. At anything like the present levels, however, they imply an ample margin over the rate of interest assumed in the valuation of the Society's liabilities, which margin provides an important contribution to the surplus available for bonus distribution.

EXPENSES

The rapid growth in the volume of new business, and the rise in costs generally, have produced an increase in expenses. The expansion of staff required to handle the increase in new business and to restore an adequate standard of service, after the break of the war years, to our policyholders, has caused an immediate rise in expenses, whilst the premium income can respond only more gradually to the influx of new contracts. Constant efforts are made to secure the maximum degree of economy of management consistent with the efficient conduct of the business.

ASSETS OF THE SOCIETY

The total of the assets of the balance-sheet amounted to £19,187,429 and showed an increase of £1,579,528.

Among the investment changes of the year have been an increase in ordinary shares, and

an increase in investments in subsidiary companies, which are four in number. Of these, the General Reversionary and Investment Company has experienced a prosperous year of record expansion, and the Lands Improvement Company continues to transact an active loan business with landowners. The remaining two subsidiaries are property companies, in which the Society has acquired a controlling interest during the year; both show every sign of proving to be remunerative investments.

The favourable margin between market values and book values of Stock Exchange securities has decreased during the year, but remains substantial and the further hidden reserves which exist on the Society's holdings of freehold and leasehold properties and of shares of subsidiary and associated companies, create an aggregate position of impressive financial strength.

VALUE OF LIFE ASSURANCE

The attractions of a life policy to the family man are already well realised. Moreover, under present conditions, the element of voluntary saving renders life assurance a matter not only of wise personal choice, but also of urgent national necessity. Proof that these facts are becoming increasingly recognised exists, in the case of the Society, in the new business results of 1947, and in the even more encouraging start made, to date, in 1948.

Two forms of policy to which especial attention is invited are "Supplementary Units" and the recently introduced "Improved Deferred Assurance for Children." Both are designed to offer a wide choice of options at low rates of premium, which have the added attraction of ranking for income-tax allowance, and both are achieving increasing popularity.

The report was adopted.

RUBBER PLANTATIONS INVESTMENT TRUST, LIMITED

INCREASED REVENUE

The annual general meeting of the Rubber Plantations Investment Trust, Limited, was held, on the 28th ultimo, in London.

Mr H. J. Welch, the chairman, said that the revenue account showed an increase as compared with 1946 of £36,861 in gross income and £16,799 in taxation. At the end of last year quoted investments had a market value of £2,111,203; unquoted securities were valued at £56,519 and, together with the Sumatra Tea Estates Limited holding brought in at cost, aggregated £2,881,091, compared with a total net cost of £3,146,030. Last year they recommended dividends with a distribution of 3½ per cent. for 1946. It was proposed to pay a similar dividend for 1947.

The Ministry of Food continued to be the sole importers of tea from India, Ceylon and British East Africa for consumption in the United Kingdom. The prices paid to producers continued to be based on 1936-8 prices adjusted in respect of the considerable increases in cost of production since those years. Producers could look forward to remunerative prices this year; beyond that the trend of prices appeared less certain.

During 1947 the rubber producing industry, particularly in Malaya, had made steady and substantial progress. On the consumption side the influence of the United States had continued to be the dominating factor. But for the obligatory use of synthetic material in the U.S.A., the replacement of synthetic by natural rubber would progress still further than it had. Remarkable progress in the rehabilitation of Malayan estates had been achieved in 1947, and it was to be hoped that the expense would in due course be reimbursed by the Malayan Government.

The report was adopted.

INTERNATIONAL NICKEL COMPANY OF CANADA, LIMITED

ANOTHER ENCOURAGING YEAR

The annual meeting of this company was held at Toronto on the 28th ultimo.

Mr Robert C. Stanley, chairman and president, said: Your organisation is a Canadian international mining company, which has branches in Great Britain and in the United States; 19,750 employees and \$136,000,000 were required in 1947 to run the entire company.

We refine in our plants nickel, copper, cobalt, selenium, tellurium, gold, silver and the platinum metals. The company's rolling mills and foundries process part of these metals into rolled nickel, monel, inconel, nimonic and other alloys. Sheets, rods, tubes, wire, forgings and castings are made. These commodities are produced in our rolling mill at Huntington, West Virginia, in our Wiggins rolling mills at Birmingham, England, and Glasgow, Scotland, and in our foundry at Bayonne, New Jersey.

Sales of nickel in all forms in 1947 were 205,278,868 lb. comparable with 201,103,234 lb. in 1946. Our mill products have had a steadily expanding growth for many years. Among current demands for monel that of the petroleum industry is important. Monel and "K" monel are being employed in the corrosive oil wells of West Texas in pumps, sucker rods, gas lifts, balls and seats of valves and for other pieces of equipment. The consumption of Ni-Rod for welding cast irons has expanded appreciably and provides a production item of importance for the Bayonne Works.

UNITED KINGDOM PLANTS

Improvements have been made in the nickel carbonyl process at the refinery in Clydach, Wales. A new copper sulphate plant has been built and the headquarters of the chemicals division has been expanded. Costs have been lowered. Our Wiggins rolling mill in Birmingham, England, is operating at record peace-time capacity and is doing a large business in blanks for nickel coinage. Its plant in Glasgow, Scotland, is also busy. Wiggins continues to be the largest producer of wrought nickel products in Europe.

The precious metals refinery at Acton, England, is running satisfactorily and great attention is being spent on establishing low costs for refining our platinum metals. Birlec, Limited, our electric furnace manufacturing company, a subsidiary of the Mond Nickel Company, Limited, is located in Birmingham, England. At this plant, orders are being received which assure another profitable year.

International Nickel does its business in three principal countries all having different currencies. The company's accounts are stated in United States dollars and its dividends are declared in that currency. In keeping with our original charter, issued in 1902, the letters patent of the present company require that preferred dividends be paid in United States dollars. This has been done since payments started in 1906. Dividends on the common stock were started in 1909 and since that time dividend declarations have been in United States dollars.

Our mining, smelting and the bulk of our refining is done in Canada, in Canadian dollars, whereas 67½ per cent. of our nickel output is sold for United States dollars. Of the balance, 27 per cent. is sold in England and elsewhere for sterling and the remaining 5½ per cent. is sold in Canada and elsewhere for Canadian dollars.

Total income for 1947 was \$167,483,797 and for 1946 was \$134,429,340. The difference between total income and total costs shows \$33,503,466 of net profits as compared with \$29,681,352. Quarterly dividends of 40 cents per share were paid on the common stock and an extra dividend of 40 cents was declared.

The report was adopted.

HADFIELDS LIMITED

CONTINUED EXPANSION

BIGGER OUTPUT PER MAN-HOUR

The sixtieth ordinary general meeting of Hadfields Limited was held at the Royal Victoria Hotel, Sheffield, on the 27th ultimo.

Lord Dudley G. Gordon, D.S.O., the chairman, presided.

After referring to the award to Mr W. J. Dawson of the C.B.E. and also of the Bessemer Medal of the Iron and Steel Institute, the chairman said: Plans for the re-arrangement and, where necessary, reconstruction of the works, have been actively pursued throughout the year. A decision has now been reached about the productive capacity to be retained for armour plating. As a result of this decision our commitments can be clearly defined.

The scheme for the development of the foundry, which includes completely new melting plant and rearrangement of the flow of the work, has progressed. Plant for the new forge is also in hand.

In addition we have to deal with the ordinary repairs and replacements which were necessarily deferred during the war; thus we have to contemplate an expenditure during the next five years of some considerable magnitude.

Included in the general scheme of works replanning is the concentration into a single building of the metallurgical, scientific and research work.

EXPANSION OF COMMERCIAL WORK

The expansion in the value of our commercial work, which was so necessary to take the place of ordnance work, has continued during the past year. Indeed the orders received were more than £1,000,000 in excess of the value for the previous year. Vital supplies to the Mining Industry include wheels and axles for colliery tubs and cars at the rate of more than double last year's supplies. Manganese steel is steadily replacing carbon steel as the material used for these colliery wheels.

For open cast coal mining, we are supplying increasing numbers of drag line buckets of the Esco type, besides alloy and other quality steel castings for excavators. Supplies for the railways, which also have a high priority, include wheel centres and track work. One of our most important supplies is that of dredger buckets for which it can be claimed that we have secured by far the greatest proportion of total orders placed in this country.

We have continued to expand our business for the highly finished fully hardened forged steel rolls and we are steadily improving methods by which they are manufactured as the result of constant research and development. We do indeed make the confident claim that our fully hardened rolls will compare favourably with the best rolls from the other side of the Atlantic.

The activities of our subsidiary, Millspaugh Limited, continue to expand.

TRADING PROFIT MORE THAN DOUBLED

The accounts are presented in a somewhat altered form, complying for the most part with the requirements of the new Companies Act, which will come into force later in the present year. The most important feature of this new arrangement is that we now publish a consolidated balance sheet which shows all the companies included in what is termed the "Hadfields Group of Companies."

The profit and loss account of the parent company, Hadfields Limited, shows a trading profit of £381,000, compared with £149,000

for 1946. This is not the result of any startling increase in the volume of trade or the rate of gross profit (though there has, in fact, been an increase as indicated in the directors' report), but is due in part to a different method of application of overhead charges. In its year of adoption, this method shows an apparent increase in profit. Later years will be comparable with each other.

The other notable change in the profit and loss account is that we have drawn from the Iron and Steel Prices Fund Agreement, £50,000 only in respect of the year 1946, as against a claim of £224,000 for the previous year.

In the balance sheet, "amounts due by subsidiary companies" now stands at £13,000 as against £140,000 for last year. This considerable decrease is accounted for by the liquidation of the amount advanced to Millspaugh, whose share capital is now in line with the real amount of capital employed in the business.

DIVIDEND DECISION

In common with other companies, we thought it right, in response to a letter from the President of the Federation of British Industries to agree that the board will not recommend to the stockholders any increase in the rate of dividend on the ordinary stock during the next twelve months.

It is only by increased output per £ of gross earnings by each individual that it will be possible to pay the cost of the new measure which will come into force during this year. The aid which is expected from American sources is temporary only, and we can only reach permanent success by means of our own efforts.

So far as our own works are concerned, the latest results show that there is a definite increase in output per man hour, though still below the prewar figures; this compares very satisfactorily with industry in general and our own people are to be congratulated on the progress which is being made towards that level of production which must be the ultimate aim.

The credit of the profit and loss account has been steadily mounting in previous years, and has now reached such a large figure that we think it right to recommend the transfer of a considerable proportion of it to specific reserves. That is to say, £250,000 for the equalisation of dividends, £250,000 for deferred repairs and, thirdly, £100,000 to inaugurate a reserve to provide pensions for retired workpeople after thirty years' service.

DEPUTY CHAIRMAN'S REMARKS

Mr J. B. Thomas, F.C.A., deputy chairman and managing director, said:—The reduction of the weekly standard hours from 47 to 44 has resulted in an increase in production costs. The statement that the same amount of work that was done in 47 hours would be done in 44 has not proved to be true in practice. Production has increased, but this can only be attributed to overtime and incentive bonus schemes which, whilst giving extra production, add considerably to the costs.

No one begrudges workers better conditions and more leisure, but surely, considering the serious position of the nation, the change was ill-timed. We are all today living in a fool's paradise, merely because of shortages, and the sooner everyone realises that the time is fast approaching when we shall have to fight very strenuously for our very existence, the better we shall be enabled to meet future conditions.

The revenue collected by way of taxation

for 1938-39, when the re-armament programme was well under way, was 931 million pounds. The war has been over nearly three years, and yet the country has to find no less than four times that amount in 1948-49, the highest rate in the history of the country.

If it had not been for the exceeding generosity of the United States, this country would at present be suffering privations very difficult to imagine. How long are we to wait for the Government and the nation to realise our extreme peril, and to take effective steps to remedy the position? What we urgently require is an up-to-date edition of "Wake Up, England."

NATIONALISATION

We are repeatedly told that the Government intend to nationalise the steel industry. What justification has it for proceeding with such a scheme? Have the lessons of "Coal" and the "Air Services" taught them nothing at all? The steel industry has proved itself an outstanding example to the country for its efficiency and freedom from labour troubles, and will continue to do so if it remains free from Government interference.

If steel is nationalised, then it is good-bye to prosperity in this country, if the results of those industries already nationalised are a guide as to efficiency and management, for which the Government must be held responsible. If, as appears probable, losses are sustained in those industries, these losses can only mean that they must be borne by way of extra taxation by labour and industry not nationalised. Have the large industries lost the will to fight for their rights, and must they accept the extinction of private enterprise, by which this country became the greatest power in the world? If something is not done soon, the cry will be again "Too late."

The report and accounts were adopted.

B. MORRIS AND SONS, LIMITED

INCREASING SALES

The annual general meeting of B. Morris and Sons, Limited, was held, on the 28th ultimo, in London.

Mr A. J. May (chairman and managing director) said that at their last meeting he had expressed the hope that they would produce a good result on the year's trading for 1947. He trusted that most of the shareholders would agree that that remark had been justified. The period covered the fuel shortage crisis and the disorganisation caused by the alteration in tobacco duties.

The sales of the company's various products were increasing and the first three months' trade of the current year had been very satisfactory. They were in a much better position regarding raw material compared with previous years. In connection with supplies of raw material for tobacco and cigarettes, they had always been large users of Empire-grown tobacco and were not very much affected by the shortage of American tobacco. They were still experiencing difficulty as regarded labour.

The profit for the year was £27,481. The increase was due to exceptional circumstances. They were proposing to maintain the dividend on the ordinary shares as last year at 10 per cent. and increase the carry-forward by £2,840 to £4,249.

With regard to the future, their allocations of materials under the various controls were very fair, but it was not possible to plan far ahead owing to those controls. The high cost of raw material and labour also tended to reduce profits, but they had fortunately overcome many difficulties in the past and hoped to do so in the future. He had great hopes that 1948 would show further progress.

The report was adopted.

THE ECONOMIST, May 1, 1948

MANGANESE BRONZE AND BRASS COMPANY, LIMITED

A MOST SUCCESSFUL YEAR

MR J. C. COLQUHOUN'S STATEMENT

The forty-ninth ordinary annual general meeting of The Manganese Bronze and Brass Company, Limited, was held on the 23rd ultimo, at 63, Grosvenor Street, London, W., Mr J. C. Colquhoun, M.B.E. (chairman and managing director), presiding.

The secretary (Mr W. K. Gibb) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended December 31, 1947, and was taken as read:—

I am again circulating my review of the year's working on the assumption that this practice meets with your approval.

PROFIT AND DIVIDEND

The profit for the year before providing for taxation and dividends is £173,277, compared with £127,977 for the previous year. The directors recommend that a final dividend of 20 per cent. be paid on the Ordinary shares, making a total of 30 per cent. for the year, the same as for the previous year.

The dividend recommendation naturally follows a decision made by your Board on March 3rd to refrain from increasing the rate of gross dividend declared during the next 12 months. This decision, which was immediately communicated to the Stock Exchange, was taken in response to a letter received from Sir Frederick Bain, President of the Federation of British Industries.

After providing for taxation and for Preference and Ordinary dividends there remains a surplus for the year of £45,407, bringing the total of profits retained in the business to £255,820. In this amount I have included £33,000 excess profits tax refund. This has now been spent on re-equipment and development and can therefore be regarded as part of surplus though we may still be required for a time to show it as a separate item.

We continue to show dividends at their gross amount, for the only reason that the Budget date intervenes between the publication of our accounts and the payment of dividends. To show dividends at their net amount would be to show them incorrectly every time the rate of tax is changed. I mention this partly because of criticism of this procedure and also to point out that provision for taxation as shown in the accounts at £78,659 is not the full provision. The full provision for the year, regardless of what dividends are paid, is £100,803 or 58 per cent. of the net profit.

The depreciation charge for the year amounts to £48,835. This includes normal depreciation on recent plant additions, but we have substantially increased depreciation rates on plant acquired at prewar prices. The necessity for this arises from the fact that depreciation at prewar levels completely fails to make adequate provision for replacement of plant and machinery at current prices.

You will see also in the accounts that stocks and debtors together amount to £586,158 against £418,391 a year ago. Net current assets now amount to £254,531, an increase of £51,288 on the year. Fixed assets at their net value, after the increased depreciation to which I have referred, amount to

£203,295 against £197,015. As I informed you last year we have disposed of the trade investments and this item now disappears from the balance sheet. You will observe that virtually all the capital including retained profits is employed in the business.

TRIBUTE TO MANAGEMENT

The past year has been the most successful in the history of the company. For this great credit is due to the local management at your works—Mr E. Robson at Ipswich and Mr R. N. Richardson and Mr F. J. Tector at Birkenhead. I mention these names in particular, but the great achievement in production, the results of which are now before you, could not have been obtained without the goodwill, co-operation and teamwork of all the staff and workpeople. I am sure you will join me in sending them all our congratulations and thanks.

We have heard much of late about "the two sides of industry." There are no two sides in a good team and given fair play all round I believe that our employees naturally prefer and take a pride in loyalty and teamwork.

The company is now in its fiftieth year and although it is impossible for me to forecast with any degree of accuracy what the results will be, I would say that we have an excellent chance of being able to celebrate our jubilee with a new production record. The demand for the company's products is sufficient to make this possible.

In regard to profits and prices, I have already referred to the profits retained in the business amounting to £255,820. These profits have been ploughed back into the business and have made possible the high rate of production and employment which we have now reached. Improvements in efficiency, working conditions, quality of production, facilities for research and so on have also been made possible. These industrial needs are never fully met. In slump years they are badly neglected and even today we are behindhand with much that ought to be done on account of restrictions on capital expenditure. Such needs must be kept in mind but none-the-less price cuts have been made and the position is being kept continually under review.

EXPORTS AND HOME REQUIREMENTS

Finally in regard to exports, we are maintaining our foreign connections to the best of our ability, but home requirements now have first call on the products of your business. These requirements are all for essential home needs or export and call for our products as component parts in the more valuable end products. Your marine propeller business on Merseyside is making a splendid contribution in this respect, as is also the wrought side at Ipswich with extruded, rolled and forged brass and bronze products and the manufacture of "Oilite" self-lubricating bearings. Direct exports have been satisfactory under the circumstances.

The report and accounts were unanimously adopted, and the dividends as recommended were approved.

The retiring directors, Lt.-Col. S. J. M. Auld, O.B.E., M.C., and Mr J. C. Budd, were re-elected and the auditors, Messrs. Lever Honeyman and Co., having been re-appointed, the proceedings terminated with a vote of thanks to the chairman, directors and staff.

SOFINA

INTERNATIONAL PROBLEMS

The annual shareholders' meeting of the Société Financière de Transports et d'Entreprises Industrielles (SOFINA) was held in Brussels on the 22nd ultimo, Vicomte Van de Vyvere, chairman of the board, presiding. The following statements are extracted from the directors' report:

"Ideological differences continue to bring conflict between groups of nations, and at the same time to foster within individual nations suspicion and hatred, cupidity and fear. The essay which, as has been our wont for many years, is appended to this report, and of which the subject on this occasion is 'Envy and distrust, obstacles to economic progress,' analyses the nature and causes of these conflicts. It also indicates how they could be allayed by a better understanding of the background motives.

"Recently our company has suffered from arbitrary action in Spain in two of the undertakings in which it has interests. The hostile attitude taken towards us, or tolerated, by certain authorities is particularly unjustifiable considering the conspicuous services we have rendered their country for many years.

"Elsewhere, public utilities fail to obtain permission to effect tariff adjustments called for by increased operating charges. As a result, their sound operation is jeopardised, and so long as new investments would prove unremunerative they are unable to proceed with extensions which the public interest demands.

"Instead of giving full attention to creative endeavours, our company is at present compelled to devote an excessive part of its activities to negotiations purporting merely to obtain redress from wrongs which its subsidiaries or itself have suffered, or equitable treatment which they are denied and at best will be tardily granted. In this its situation is typical of present-day world economy, prevented by futile disputes from utilising the resources with which it is endowed."

Besides giving the usual particulars concerning the principal undertakings in which SOFINA has interests, the report comments on the progress of electricity production in various countries and technical developments in this field.

THE DIVIDEND

The balance sheet at December 31, 1947, shows an increase of 460 million francs in "Holdings," resulting partly from a re-integration of reserved profits. "Cash in hand and on deposit" was about 104 million francs higher than at the end of 1946, and net profits amounted to 153 million francs as against 109 million francs for the preceding year. Some of the income was of an exceptional nature, and 63 million francs are therefore allocated to "Reserve fund and tax provision."

A dividend of 135 francs net per ordinary share is payable on the 630,000 shares old and new, whereas the dividend of 400 francs for the preceding year went only to the 210,000 old shares.

New ordinary shares have been at the disposal, in Belgium, of holders of old shares—or of groups of 25 one-fiftieth shares—since February 12, 1948. In Great Britain such new shares will be obtainable (after complying with certain regulations) through the Midland Bank (Overseas Branch), who can supply full particulars. It has not yet been possible to deliver new one-fiftieth shares, but arrangements are made for the payment of the appropriate dividends to holders of old one-fiftieth shares.

Translations of the report and essay, and of an address by Mr D. N. Heineman on "The Shortage of Hard Currencies," are obtainable on application to Electric and Railway Finance Corporation, Limited, Claridge House, 32, Davies Street, London, W.1.

MIDLAND EMPLOYERS' MUTUAL ASSURANCE, LIMITED

RECORD PREMIUM INCOME

ASSETS NOW EXCEED £8,415,000

1898 - GOLDEN JUBILEE YEAR - 1948

The forty-ninth annual general meeting of this company was held, on the 29th ultimo, at 16 Waterloo Street, Birmingham, 2.

Lieut.-Colonel J. Beaumont Neilson, C.M.G., D.S.O., C.A., presided.

The following are extracts from his speech:—

LIFE DEPARTMENT

In the first year of operations 693 policies were issued for sums assured totalling £531,347, of which amount £213,824 was reassured and considerations for annuities granted amounted to £7,709. At the close of the year the life and annuity fund, together with £52,373, Excess Profits Tax post-war refund transferred thereto in accordance with the undertaking given, amounted to £70,013. These results can be regarded as highly satisfactory.

FIRE DEPARTMENT

There was another satisfactory increase in the fire department, the net premiums amounting to £30,728, being £14,154 more than the figure for 1946.

PERSONAL ACCIDENT DEPARTMENT

The premium income in the personal accident department amounts to £25,941, an increase of £15,759. Claims paid and outstanding amounted to £12,389, being 47.8 per cent., and after making full provision for the consequent increase in reserve for unexpired risk the account shows a profit of £113.

EMPLOYERS' LIABILITY DEPARTMENT

In this, the original and principal department of the company, the premium income amounted to £3,509,926, an increase of £625,176. Claims paid and outstanding amounted to £2,470,577, being 70.4 per cent. It is satisfactory to report, in this the golden jubilee year of the company, that the premium income for 1947, the forty-ninth year of the company's operations, is a record in its annals. The National Insurance (Industrial Injuries) Act, 1946, comes into operation with effect from July 5, 1948, and will repeal the Workmen's Compensation Acts. From that date employees injured at work will draw compensation from State funds subscribed by the employer, the employee and the taxpayer. This will mean a temporary loss of premium income, but it does not mean that our work for the community will end. On the contrary, the injured employee will, in addition to his State benefit, retain his right to claim damages from his employer where injuries are caused by the negligence of the employer or some other person for whom the employer is responsible. Common law claims have increased, and are still increasing, both in number and cost, and, with the advent of the new legislation referred to, the obligations of an employer will be an incalculable but increasingly grave risk for some time to come.

GENERAL INSURANCE DEPARTMENT

The premium income in this department amounts to £264,170, an increase of £28,871. Claims paid and outstanding amount to £133,083, being 50.4 per cent. All sections of this department, including motor, have contributed a profit, although the utmost care in the selection and underwriting of risks is still required.

EXPENSES OF MANAGEMENT

The expenses of management amount to £375,260, being 9.8 per cent. of the total premium income compared with 10 per cent. for the year 1946. Notwithstanding the continued increase in salaries and the cost of all forms of office equipment, supplies and services, it is satisfactory to record that this large organisation can be administered on such an economical basis.

PROFIT AND LOSS ACCOUNT AND BALANCE-SHEET

I now turn to the profit and loss account. The balance brought forward from last year, after payment of the dividend for 1946, was £30,880, which, together with net interest not credited to other accounts makes a total of £402,057. As already mentioned, the surplus on the fire account, £2,751, has been transferred as additional reserve on that account, and, after providing for bad debts and directors' fees and provision for taxation £155,000 on the profits of the year, a sum of £50,000 has been transferred to reserve fund, making this fund £500,000. Your directors have considered it prudent to create an investment reserve, and have set aside £100,000 for this purpose.

It is proposed to pay the usual maximum dividend of 10 per cent. free of Income-tax, which will take £858 net, and after providing for this there remains a balance on the profit and loss account of £85,500, to be carried forward to the next account.

The assets of the company continue to grow, and an increase during the year of £1,073,823 brings the total assets up to £8,415,435.

In this the company's golden jubilee year I am sure the shareholders will wish to join with me in conveying to Mr Barnfield, our general manager, our sincere appreciation of his able management of the business of the company during the past ten years.

The report was adopted.

CAMP BIRD, LIMITED

EARNINGS AGAIN HIGH

The forty-sixth annual general meeting of Camp Bird, Limited, was held, on the 27th ultimo, in London, Mr F. C. Heley presiding.

The following is an extract from the circulated review of the chairman, Mr F. W. Baker:—

The company's earnings during 1947 were again high, amounting to £188,511, being £2,083 in excess of the profits for the previous year. The individual items making up the gross earnings of the company are profits on realisation of investments, £141,708, which is some £10,000 less than in the previous year; dividends and interest, amounting to £50,884, as against £33,327 in 1946; Camp Bird Mine profit, £4,952, as against £11,020 in the previous year; and sundry receipts amounting to £5,554, as against £2,800 under this heading in the year 1946. Your directors recommend a dividend of 10 per cent., less income tax. The break-up value of the company's shares at December 31, 1947, was 20s. 4d. per share before making provision for the dividend recommended, and this compares with 19s. twelve months ago.

The company's results for the year 1947 may be considered as satisfactory. We have increased our investment portfolio partly by depleting our cash, but to a greater extent by ploughing back current earnings; we have again increased our general reserve and our dividend of 10 per cent. is maintained; also, the balance of profit and loss account carried forward is greater this year than last. I must point out, however, that income tax and profits tax will become payable in respect of the current year's profits, and because of this it should not be expected that the company's net results for 1948 will equal those for the two previous years.

The report was adopted.

MONSANTO CHEMICALS, LIMITED

RECORD SALES

The annual general meeting of this company was held, on the 28th ultimo, in London, Dr L. F. Nickell, the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts:—

The year just closed has been a mixed and busy one. The fuel crisis early in the year adversely affected our operations at the time, and later on had the effect of limiting the availability of some raw materials and some construction materials for a considerable period. This after-effect was the more serious. Whilst our volume of sales exceeded that for the previous year, and was, in fact, an all-time record for the company, it nevertheless fell considerably short of the budget for which we planned, because these shortages curtailed production. During the year, eight plant construction projects, started earlier, were completed, and helped out on the sales volume. Other factors, besides volume of sales, important as that is, were not so favourable. Restriction of raw materials interfered most with wider margin products, and a shift in sales toward lower margin products was noticeable. Costs of fuel, raw materials and labour all increased, so that production costs were appreciably higher.

In spite of the numerous delays encountered under present conditions, other new plant projects are being completed from time to time, and in consequence the volume of production is gradually increasing. We have therefore felt justified in materially increasing the sales budget for 1948, and the results for the first quarter indicate the increase is justified and reasonable. There still remain difficulties in the supply of a few important raw materials.

Throughout the year the company has continued to extend and reconstruct its entire organisation to meet the needs of current and future enlarged activities. The sales office in Manchester was re-established, and markets, both domestic and foreign, are being more thoroughly canvassed than ever before. Not only are our own sales personnel calling regularly on domestic customers, but during the year agencies and customers in some twenty foreign countries have been visited. We have active agencies in practically every trading country of the world.

The year has seen the development of a heavy construction programme. With it there has come the need for additional research, project-analysis, chemical engineering studies, and other work of a preliminary nature. In addition, such a programme requires much increased staff for engineering, purchasing, supervision for necessary liaison with Government departments and for training for new operations. This accounts for a large proportion of our increased staff, and represents an increase in overhead that by its very nature cannot be offset by increased production for a time.

During the reorganisation of Monsanto (Australia) Pty., Limited, last summer, this company had the opportunity to acquire 70 per cent. of the equity of that company.

The income for the year is £710,215 compared with £880,280 in 1946. The directors recommend a final dividend of 30 per cent. (making 45 per cent. for the year). This distribution to all classes of stockholders represents 71.2 per cent. of the profit and loss account balance for the year, and the distribution to Ordinary stockholders is 68.6 per cent. of the net of £270,295 for the equity. The equity in the company comprises not only the ordinary share capital of £750,000 but also the share premium account of £1,042,361 and reserves and surplus of £727,656, a total of £2,520,017, and on this equity the dividend recommended represents 13.4 per cent. before tax.

The report was adopted.

GOVERNMENT RETURNS

For the week ended April 24, 1948, total ordinary revenue was £67,411,000 against ordinary expenditure of £32,348,000 and issues to sinking funds £110,000. Thus, including sinking fund allocations of £344,000 the surplus accrued since April 1st is £41,186,000 against a deficit of £2,856,000 for the corresponding period a year ago.

 For the purpose of preparing Interest Warrants due July 1, 1948, the BALANCES will be STRUCK on the evening of June 1, 1948, after which date the Stock will be transferred ex-dividend. For BANK OF MONTREAL, A. D. HARPER, Manager, 47 Threadneedle Street, E.C.2. May 1, 1948.

SUEZ CANAL COMPANY
 Notice is hereby given that the Annual General Meeting of Shareholders will be held at the "Salle d'Iéna," 10, Avenue d'Iéna, Paris, on Tuesday, 8th June, 1948, at 2.30 p.m.
 Holders of not less than twenty-five shares who are desirous of being present or represented at the meeting must prove at the Head Office of the Company, 1, rue d'Assolvi, Paris, before 2.30 p.m. on Thursday, 3rd June, 1948, that they have deposited their shares with the Company or with any of the Company's appointed agents.
 Shares may be deposited in London with Messrs. N. M. Rothschild and Sons, who will in due course deliver a card of admission for the meeting.
 Le Directeur Général, MICHEL HOMOLLE.

THE ALEXANDRIA WATER COMPANY, LIMITED

PAYMENT OF DIVIDEND
 NOTICE IS HEREBY GIVEN that a Dividend of Nine Shillings and Three Pence per £5 Share on Coupon No. 119 will be paid without deduction of British Income Tax but less Egyptian Government and Alexandria Municipal Taxes amounting to 1s. 1-653d. making 8s. 1-347d. net on and after April 15, 1948, at the National Bank of Egypt in Alexandria at Rue Toussoun, or in London at 6, King William Street, E.C.4.
 Net profits for the year ended December 31, 1947, £138,600 (last year £161,200).
 DATED, Alexandria, Egypt, April 8, 1948.
 By Order of the Board,
 ROBERT WALTON, Manager

CANADIAN PACIFIC RAILWAY COMPANY—(Incorporated in Canada with Limited Liability).—CANADIAN PACIFIC RAILWAY FOUR PER CENT CONSOLIDATED DEBENTURE STOCK.—NEW BRUNSWICK RAILWAY FOUR PER CENT DEBENTURE STOCK.—CALGARY AND EDMONTON RAILWAY FOUR PER CENT DEBENTURE STOCK.—ATLANTIC AND NORTH-WEST RAILWAY FOUR PER CENT FIRST MORTGAGE REDEMPTIBLE DEBENTURE STOCK.—In preparation for the payment of the half-yearly interest payable on the 1st July next on the above Stocks, the Transfer Books will be closed on 24th May and will be reopened on 2nd July.—R. F. TREMAYNE, Deputy Secretary, 8 Waterloo Place, Pall Mall, London, S.W.1. 23rd April, 1948.

THE CROOKES LABORATORIES, LIMITED, Park Royal, N.W.10, invite applications for the position of General Manager. Applicants should state fully their experience and achievements and address their communications (which will be treated in the strictest personal confidence) to The Chairman, 3b Denis Yard, S.W.1.

THE British Institute of Management invites applications for a senior position on its Information and Research Staff, to specialise in mining and Production Management (including Factory Layout, Planning and Production Control, Time and Motion Study, Inspection and Quality Control, Purchasing, Works Transport, and Maintenance Organisation). Applicants must hold a University Degree or equivalent qualifications, and be competent to compile information and advise, assist in the direction of research and education, deal with industrial and professional organisations, and edit text-books and other material for publication. Salary £1,250 per annum or over, according to experience.—Apply in writing to the Director, British Institute of Management, 17 Hill Street, London, W.1.

MAN (49), with long managerial experience in national sales, sales promotion and advertising, seeks suitable post. Analytical and planning aspects of marketing a speciality. Straightforward and loyal service of full competence is offered.—Box 708.

IMPORTANT PROGRESSIVE CHEMICAL CONCERN invites applications for post of General Manager. Salary £3,000 per annum upwards. Applicants must be fully conversant with modern processes in the field of synthetic organic chemical industry.—Box 709.

COMPANIES whose annual appropriations for publicity are in the £500 to £5,000 range, who believe that wisely used publicity can produce substantial benefits despite the natural limitations of a small appropriation, are served by an organisation which, for a small annual fee, provides the services of an experienced publicity executive to take full responsibility for the administration of the expenditure and the preparation of all publicity matter.—BCM/SYK, London, W.C.1.

FOR SALE—Complete set *The Economist*, 1947. £4.—Box. 710.

NORANDA MINES LIMITED

DIVIDEND NOTICE.

Notice is hereby given that an interim dividend of Seventy-five Cents (\$75) per share, payable in Canadian funds, has been declared by the Directors of Noranda Mines Limited, payable June 15, 1948, to shareholders of record at the close of business May 14, 1948.
 Toronto,
 April 23, 1948.

Ebb Tide?

ONE or two signs have been appearing in recent weeks that the inflationary tide in British internal affairs may at last be turning. It might be a mistake to put too much confidence in them: the Stock Exchange, which is often an accurate bell-wether of general economic changes, has been surprisingly strong of late and many of those more luxurious markets which were depressed nearly a year ago by the sharp fall of security prices have made some recovery. But this time it is in the markets that respond to the ordinary man's spending that one or two strangely unfamiliar phenomena are appearing, such as spontaneous price reductions and stocks piling up on the shelves of the shops. This should not, after all, be very surprising. The Budget is really balanced for the first time for many years, and though there are many complex cross-currents in the money market (as an article on a later page explains), there is very little doubt that there will be a net reduction in the National Debt in the course of the year. This is a novelty, and its effect should not be underrated. The inflationary pressure is still very heavy—there can be no mistake about that—but it begins to look as if a year's campaigning for disinflation is beginning to bear fruit and as if the tide of demand, though still very high, is turning to the ebb.

This is probably the underlying explanation of the position that has arisen in the textile trade. The matter has been so irresponsibly exaggerated in those sections of the press that are anxious to beat the Government with any stick that presents itself that it is difficult to form a clear view of what has happened. Stocks of certain forms of clothes and household textile goods have unquestionably piled up on the shelves of the wholesale trade. But it is equally clear that there is not—that there cannot be—any general excess of the supply of textiles over the rationed quantities. Textile production in general is still cruelly low and the export targets are high. What has happened, it would appear, is not that the planning of demand and supply in the domestic market has gone wrong in the quantitative aspect, but simply that the demand for particular lines has been wrongly estimated, particularly for some of those where changes in fashion can be important or where the prevailing prices strike the public as unduly high. In normal times, this is a familiar and natural hazard of trade, and the usual way of dealing with it is by clearance sales. But it is interesting to find it reappearing after so long a period of indiscriminate public buying of everything that industry could produce. The stage has apparently been reached when the public even within its exiguous rations, would rather wait to buy what it wants than rush to buy all it is offered.

There is, of course, no reason why goods should be left on the shelves—those of them that cannot be sold abroad—so long as there is somebody to buy them, and the President of the Board of Trade on Thursday announced the ration equivalent of a clearance sale. But there is an essential point of policy hidden here, which should not be overlooked. It may be right to increase, for a time, the quantities of textiles that the individual citizen can buy, if there really

are stocks that cannot otherwise be disposed of. But it would be wholly wrong to do this in such a way as would lead to any more textiles being made for the domestic market than are at present envisaged. It may be right to move sheets off the shelves; it would certainly be wrong to take a single textile worker off export work. There is no case at all for doubling the clothing ration, as is being suggested in some not wholly disinterested circles.

These technical problems of the manipulation of coupons have their interest. But what is of far wider concern is the consequences that will follow for economic policy if the present signals are confirmed and it becomes clear that general demand really is on the ebb. There will, for one thing, have to be a great deal more elasticity in the rationing schemes, to meet a much greater discrimination in public demand. The country may be moving into a period when, though there will still be a general shortage of goods to meet the general demand of consumers, there may be an increasing number of particular surfeits. It is in coping with a situation of this kind that the price system is at its best. It will be a long time before rationing can be generally abandoned; but henceforward, within the framework of rationing, there must be some effective means of responding to the shifts in demand and communicating them promptly to the producers. Otherwise, stocks of things the public does not want will pile up—which can only mean that the things it does want are even scarcer than they need be. Clearly, there will have to be much less rigidity, and much quicker thinking, within the rationing schemes.

But there will also be a growing number of exceptional cases in which it will be possible to dismantle the rationing scheme. It is as well to be clear in what circumstances it will be right to do this. It will not be right for a long time to come to divert any resources into increasing the supply of any rationed article. Nor will there be many instances, like that of

potatoes, where the bounty of nature will provide an increased supply without additional human resources. It follows that the only clear cases for abolishing rations will be those where rationing is now necessary more because of excessive demand than because of short supplies, and where the ebb tide of demand can consequently be expected to remove the pressure from supply. This may seem an unduly academic way of setting out the matter; but it enshrines a most important principle. If, through Marshall aid or any other means, any more resources become available to the British community than there are now, they must not be diverted into additional consumption so long as they can possibly be used for export or for productive capital investment. The British people would be most improvident if they were to eat, or otherwise consume, any greater quantities than they can reasonably be expected to be able to pay for in 1952, when ERP ends. This is a hard rule. But it is a necessary one if Britain is not to become a permanent dependant on other people's charity.

Nevertheless, even within this ascetic rule, there will be some instances where rationing can be abandoned as the tide goes out. Lord Woolton, speaking to the Primrose League last Friday, produced a list of seven—bread rationing, sweet rationing, leather controls, rationing of footwear, the direction of labour, and "all controls hampering house building by private enterprise" (by which he presumably did not mean what the reported words say, but all those controls which put the private house builder at a disadvantage relative to the local authority). It is not an unreasonable list. Perhaps none but the first and the last could be effected at once—bread rationing being mainly a precaution and the ban on private enterprise building mainly a prejudice—but the others may not be far from the border line of possibility and may cross it as the year goes on—that is, if the Government can bear to prove Lord Woolton right.

Unizonia in Japan

TROUBLES of the kind that arise from the quadrisection of Germany do not afflict Japan. All Japan is one zone subject to the supreme authority of the person known as SCAP, which cabalistic lettering signifies the Supreme Commander of the Allied Powers. The Allied Powers are indeed mentioned in this magnificent proconsular title, but that is as far as they have ever got in controlling Japan. At the time of the surrender, the United States insisted, overriding Russian objections, on holding an undivided command in the occupation of Japan.

The American insistence was not at that time due to conflict with Russia, but simply to the preponderant part played by American forces in the final victory over Japan, the relative shares of the principal allies in the decisive war effort having been altogether different in the Pacific from what they had been in Europe. Later on, however, as Russo-American relations deteriorated, the American supremacy in the control of Japan came to be valued in Washington more and more as a means of excluding Russian interference from Japanese affairs. Formal concessions were made to the principle of joint allied responsibility by instituting the Far Eastern Commission in Washington and the Allied Council in Tokyo (which is advisory only), but neither of these bodies has succeeded in being more than a mere critical spectator of the activities of SCAP, which have been controlled, when at all, by the State Department and the War Department in Washington.

The benefit to Japan has undoubtedly been very great, for Japan has retained national unity and uniformity of administrative policies and has escaped the divisions which have split Germany, Austria and Korea. From the American point of view the policy of exclusive control has worked well, in spite of the burden of unshared relief on the American budget, for

Japan has been kept intact on the right side of the Iron Curtain. For the same reason it has given substantial satisfaction to other Western Powers and to China. Nevertheless, it has been in many ways irksome, even to those nations which share Washington's desire to ensure that Japan does not catch the Communist infection. The argument that Britain, Australia and China must be kept outside the door, because their admission would enable Mr Molotov to slip in as well, often seems to be used to the detriment of the real interest which nations other than the United States have in regulating the reconstruction of postwar Japan.

Mr Bevin, when opening the foreign affairs debate on Tuesday, alluded with his customary brevity to the Far East, prefacing his remarks with the odd statement that he had been "asked to say a few words" about it—as if a British Foreign Secretary could not be expected to see as far as the Pacific Ocean unless somebody made a personal appeal to him to take a look. Mr Bevin said that he was keeping in close touch with other Commonwealth Governments and had lost no opportunity of making his views known "to the other Powers concerned," but there was not much to be done without agreement on the "composition and procedure" of a peace conference. Mr Butler for the Opposition, however, in a speech which gave expression to the anxious thoughts of Lancashire, emphasised the importance of arriving at agreed decisions on the future level of Japanese industry, estimating that by 1953 Japan would need to increase its exports by some \$415 million a year in order to support its population.

The fact is that there is no prospect of a peace treaty with Japan in the near future. Russian insistence on the framing of the treaty by the Council of Foreign Ministers is quite unac-

ceptable to the United States, for it would enable Russia by obstructive use of the veto to impose terms which could not be obtained under present conditions. In the negotiations for the peace treaties with the European satellites the Western Powers held a good bargaining hand, for Western consent to Russian demands over Rumania, Bulgaria and Hungary could be traded against Russian concessions over Italy; even so, the question of disposal of the Italian colonies could not be settled. For a treaty with Japan, on the other hand, Russia would have all the advantage in the veto game, for Russia's territorial gains—Karafuto, the Kuriles, Port Arthur and the Manchurian trunk railways—were secured by Russia at Yalta without any corresponding promises to the United States; and by the looting of the industrial plant of Manchuria as "war booty" Russia has long ago skimmed the cream of Japan's possible reparations assets. In the American view, which has been hardening in recent months, Russia has already been handsomely overpaid for its one-week campaign at the end of the Pacific war, and to submit American proposals to Russian veto blackmailing would merely mean, either bribing Russia to sign the treaty or having to break up the conference after a prolonged wrangle.

The attitude of China is a further complication, for though the Chinese Government is very far from being aligned with Moscow, it favours Four-Power decision with veto right as the best way of safeguarding its own interests. Britain, on the other hand, agrees with the United States in wanting a conference of all nations engaged in the Pacific war, with majority voting and no veto, particularly in order to allow Australia and New Zealand the fair share in the making of the treaty which they earned by their great contribution to the common victory.

But, if there is not going to be a peace treaty, the present legally indeterminate state of affairs must continue, only with more and more irrevocable decisions being taken *de facto* by American policy. The Americans have the real power and the equally real liability in Japan, and the indications are that they are not going to wait for the ever-receding peace conference before decisively arranging matters which will shape Japan's future. It is for the Americans to decide whether they will keep their troops in Japan or withdraw them, whether they will save the Japanese from starvation or leave them to their fate, whether they will hand over to other nations as reparations any more of the industrial plant on which depends Japan's ultimate solvency, and whether they will help Japan to re-enter the markets of the world as a major exporting country. The United States may be influenced in its decisions by representations from friendly Governments with interests at stake, but there should be no doubt that the real decisions of policy will be taken in Washington—and not by the Far Eastern Commission that meets in that city.

As regards the occupation itself, there has been much talk in America of bringing it to an end and substituting a purely

civilian control, with forces held in reserve somewhere in the Pacific to re-enter Japan in case of need. But it is very unlikely that such a withdrawal will be carried out for a long time to come, unless America suddenly relapses into a crazy isolationism. The problem is not merely that of the good behaviour of a disarmed Japan in relation to its conquerors. The very disarmament and demilitarization of Japan is a source of danger. Having created a vacuum of military power in Japan, the Americans in withdrawing would take the risk that someone else might step in by a process of armed infiltration and transform Japan overnight into a Platts-Mills democracy.

It is significant that in the last fortnight the American army has had to proclaim locally a state of emergency for the first time since Japan's surrender. The occasion was the rioting of Korean mobs in Kobe and Osaka, with support from the Japanese Communists; the Japanese police were quite unable to keep order. Italy has been left with an army, but Japan has none. To cope with the problem of internal order the Americans have been expanding the Japanese police force, and have recently authorised an armed coastguard service in defiance of Russian protests. But, in spite of alarmist reports of Japanese military revival, there is so far nothing Japanese which could conceivably take the place of American combat troops. A continuation of the American occupation seems inevitable, and also desirable, both as a barrier against violent subversion of the new regime in Japan and as a guarantee for Australia and other nations formerly victims of Japanese aggression that the samurai sword will not re-emerge from the scrap-heap, no matter in what ideological cause.

Given the stability which can be ensured by continued American occupation, the problems involved in Japan's economic rehabilitation should be discussed with the United States by Britain, Australia and other interested countries within the framework of an extended Marshall plan for world trade recovery. If western Germany is to be included in the scheme of Marshall aid and contribute to international trade, Japan cannot indefinitely be treated otherwise, especially as the burdens of relief on the American taxpayer and the political dangers of permanent impoverishment and despair are the same in both countries. Japan's business efficiency, technology and productiveness can be immensely helpful in world economic revival, and agreement with the United States can ensure that they are directed in such a way as to cause the minimum of damage to other trading interests which the logic of the Marshall Plan requires America also to promote.

Mr Bevin cannot continue indefinitely the policy of letting sleeping dogs lie; if he attempts to do so, he will merely exasperate the Labour Government in Australia, which, with the best will in the world, cannot effectively protect British interests without a more active policy from London.

Back Bench Drivers

(By a Parliamentary Correspondent)

ANY Parliamentary Party with a large majority has always to face the restiveness of its back benchers. The Nenni telegram affair, with which the Labour Party has been grappling, is only the latest, though perhaps the culminating, incident in a series which stretches back to the early dispute about Old Age Pensions in the autumn of 1945. Something akin to guerrilla warfare, particularly on the issues of foreign affairs and Palestine, has been waged against Ministers throughout this Parliament by first one section and then another of their own back benchers.

Some of these troubles are the outcome of the normal process of digestion by the Party of the new and varied elements which were thrust into its midst by the unexpected victory of 1945. Of the 393 Labour MPs who assembled at Westminster that year, more than half were new to Parliament and many were relatively new to the Labour Party. They could not all be kept busy with Departmental work—there were already too many Members chasing too few Ministries—and they were too full of spirit and ability and ambition to be left to doze in their places. Moreover a handful of them, between six and a dozen, soon showed suspicious evidence of being, if not Communists who had got by when Transport House's guard was down, then at least very busy fellow-travellers. These men complicated greatly the task of leadership. Could the Party allow freedom to the vast majority of loyal, even if troublesome Party members, without at the same time opening the gates to undisguised Communist activities? This is the nettle which, by its Nenni telegram purge, the Party leadership has tried to grasp.

But back in those flushed days of 1945 the diplomatic conflict with the Soviet was not yet under way, and the front bench could afford, for the time being at least, to ride with an easy rein. Accordingly Ministers withdrew from office in the Parliamentary Labour Party, whose chairman and vice-chairman have been, from 1945 onwards, elected from the rank and file. A Liaison Committee was established to keep contact with the front bench. Early in 1946 the Party's Standing Orders on discipline were suspended. And to utilise some of the spare energies of the back benchers, seventeen groups, such as an External Affairs Group and a Services Group, were set up to specialise in different aspects of policy.

This system has, with one important change, endured, and it has certainly provided the buffers and springs to ease the worst jolting of the Party disputes. The change came in the specialised Group system. Instead of serving a purpose as study and research groups, and so fulfilling the role of a lightning conductor, one or two of these were rapidly transformed into pressure groups and utilised with some skill against Ministers. The External Affairs Group was soon sending delegations to Mr Bevin or letters to Mr Attlee demanding changes in the Government's policy towards Indonesia, Greece and Spain. After the Services and Manpower Groups had taken a leading part in organising the conscription revolt in the spring of 1947 the system was swept away and a series of Regional Groups put in its place. In theory, each major issue was to be argued out by groups of Members from different parts of the country and then brought to the Party meeting. By these means the supporters of the front bench—who are less active than the critics but more numerous—would, it was thought, be able to curb the passions of the dissidents. But the system has proved too cumbersome, and has been virtually abandoned. In effect the chief machinery of the Party has

remained the fortnightly meetings of the full Parliamentary Party, meetings which Ministers have attended to explain policy and hear criticisms.

Considerable publicity has attended the arguments at these Party meetings, and Labour "revolt" and Labour "rebels" have become stock newspaper headlines. What was often no more than vociferous, if irritating, back-seat driving has been frequently interpreted as attempts by the "rebels" to seize control of the wheel. But even when all wishful sensationalism has been discounted, there has undoubtedly been a steady and exceptionally large volume of speeches, motions, protests and agitation against Government policy. This has followed three main lines which have sometimes overlapped, sometimes diverged. In home affairs there has been pressure from the radicals of the Party for swifter or more extensive social change. The agitation for immediate increases in the Old Age Pensions, for reducing or abolishing conscription and for dropping the death penalty all come within this category. Such pressure is a sign of health in the Party, and was on the whole accepted, albeit grudgingly, by the front bench.

*

But in foreign affairs, where the other two main groups of critics have been active, the Government has refused to budge. As might be expected, in this field the pro-Communists have been most active, and they have been at the heart of a long list of incidents—votes against Mr Bevin's policy in Party meetings, messages to the German Unity Party, praise for the new regimes of Eastern Europe, and finally the Nenni telegram. For a time they marched in step with a larger, left-centre group which sought, but hardly found, a leader in Mr Crossman. It was the combination of the left-centre and the fellow-travellers which produced the mass abstentions during the debate on the Address at the end of 1946, when Mr Bevin claimed that he had been "stabbed in the back." And it was the combination of the left-centre and the pacifists which forced the reduction in the period of conscription.

The left-centre was, however, checked in time by something more formidable even than Mr Bevin's anger. Their enthusiasm for the middle way shrank in the face of Soviet intransigence in Europe, and after the cannibalisation of the Czech Socialists they were prepared to give support, however reluctant, to the main lines of the Government's policy. Moreover the realisation that an election lay none too far ahead was tending to close the gaps in the Party ranks.

It was at this point that Mr Platts-Mills organised his telegram to Signor Nenni. It was an act of such foolishness, or of such defiance, as to invite immediate retaliation from the Party's leaders. Moreover, for the first time on a major issue, the main group of fellow-travellers was isolated. True, not all of the 22 signatories who remained after the withdrawals and disavowals were close to the Communists. Some refused to withdraw merely out of stubbornness or a mistaken group loyalty. But enough were there to offer the Executive a sitting target. They took it, and on the principal of *pour encourager les autres* struck hard and decisively at Mr Platts-Mills.

The others appear to have been duly encouraged, and future critics from the left are likely to tread carefully as they near the bounds of party loyalty. But at the same time there is an equal obligation on the Executive not to demand uniformity as well as loyalty. One of the strengths of British politics has been the capacity of the major parties to absorb and contain men of

varied views who abroad have frequently found a footing only in splinter parties. In the breadth and looseness of its dogma the Labour Party has been at times compared to the Church of England. It behoves Mr Morrison and Mr Phillips, now that excommunication has been duly proclaimed, to exercise a broad episcopal tolerance.

One final factor of more enduring importance is emphasised by these disputes in the Parliamentary Labour Party. They underline the importance which attaches at the present time to the party machine in politics. It is significant and somewhat disturbing that it was the full Party Executive and not the Parliamentary Whips who excluded Mr Platts-Mills from the Labour ranks in the Commons. This comes dangerously near that external interference with Parliamentary matters which caused so much contention at the General Election when it was associated with the name of Professor Laski. Fifty years ago a man who disagreed with his leaders as fundamentally as Mr Platts-Mills has done would have walked, if not across the House, at least across the aisle to another party. If his public statements mean anything, he is a Communist. But the vehemence of the attacks of these left-deviationist critics on their

Malthus Regained?

THE public reaction to the prophecies of the Rev. Mr Malthus has undergone many changes since they were first published just 150 years ago. In the early years, the doctrine that the growth of population would inexorably chain the great mass of mankind to the lowest tolerable level of bare subsistence seemed to correspond so exactly with the facts that every observer could see around him that it cast a pessimistic gloom over the whole of early nineteenth-century economic thinking. Gradually, however, the great triumphs of the Victorian age cleared the mists. Manifestly it was possible for the standard of living to rise in spite of an enormous birthrate. And when, later in the century, the birthrate began to fall, the optimism became more confident. But after the first Great War, there was a change. Keynes declared that the Malthusian devil, so securely chained up by the Victorians, had broken loose again, and twenty years ago the teaching of the universities was again, if not Malthusian, at least neo-Malthusian. It was no longer taught that fecund human nature would drive the standard of living down to a mere subsistence level—at least not in an advanced industrial country. But it was believed that there was much more risk, even in Britain, of over-population than of under-population.

Then in the thirties, there was another turn-round in the accepted opinion. The optimism of the Victorians was not, indeed, restored. On the contrary, public opinion was instructed to view the trend of the national population with renewed alarm. But this time it was the prospects and the perils of a declining population that were found to be frightening. Quite a considerable momentum of opinion was built up, which culminated in 1944 in the appointment of a Royal Commission to investigate the whole subject.

But now, before the Royal Commission has reported, there are signs of still another reversal of opinion. The last few years have had a definitely Malthusian tinge. The birth rate rose steadily in the war years, after the first. It passed the minimum necessary for the replacement of the parental generation. Shortage of food and shortage of houses gave a colourful imitation of excessive population pressing upon inadequate resources. The perils of atomic warfare reinforced the trend of thought. A public opinion poll taken today would probably reveal a general belief that the British population is too large and should be reduced. And there is a school of thought which

Party's policy has been matched by their desperate anxiety to remain within its fold. They want to rebel—but from inside. They want not only the protective cloak of the Labour banner, but also the backing of its massive electoral equipment—its pamphlets and posters, its funds, and above all the services of its tens of thousands of voluntary workers who, in any party, provide the real force and strength. They exemplify excellently the attitude noted by their own theorist, H. B. Lees-Smith, in his book on "Second Chambers." He wrote that

the Party machine is the result of such prolonged labour and persistence that it cannot be created under normal political conditions in less than a generation. . . . The importance which working politicians attach to the Party machine is revealed by the ferocious though mainly silent conflict that takes place before its capture, when the Party is on the verge of a schism. The Labour Party was, it is true, very far from any real schism over the Nenni telegram affair, but the ferocity has been there. It has flashed out, if only for a moment, both on the part of those who seek to swing party politics more to one side, and on the part of those who, with their hands firmly on the wheel, have no intention of changing their course or even of permitting too much turbulence among the passengers behind.

advocates the deliberate dispersal of a large number of people—10 millions is a figure often mentioned—from the United Kingdom to the emptier lands of the British Commonwealth.

Possibly the anti-Malthusian reaction of the thirties went too far. But the current swing back to Malthus is certainly being overdone. Far too much is being read into the high birth rates of the war years. Superficially encouraging as they are, the vital statistics of the last eight years by no means rule out, or even mark as improbable, a steep decline in the future. The average age at marriage has dropped, probably as the result of full employment, and so has the average age of mothers bearing their first child. Children have thus been born in these years who otherwise would not have been born until later. But nobody can yet tell whether these earlier births are also additional births. If they are merely an anticipation of what would have happened later—if it is simply that some of the babies of 1949 and 1950 got born in 1946 and 1947—then the upward bulge of the birthrate curve will be followed by an equal and opposite downward bulge in the years to come. The apparent gain will be proved illusory, a mere borrowing of babies from the future. The essential fact is whether or not the average family is not merely coming earlier but is also going to be larger. If today's young marriages go on to produce more children than these "borrowed" first and second babies, the prospective decline of the population will be mitigated and perhaps even averted; but of the probability of that if there is no statistical evidence at all. The essential figures, showing how many of the total births were the first, second, third, fourth or later in their families, appear only in the latest annual reports of the Registrar General, and no earlier figures are available for comparison. An impression exists, indeed, that the middle classes are tending to discard the two-child ideal in favour of a three-or-four child family, and this fashion may spread to other classes as did the pigeon-pair fashion before it; but it can hardly in the near future catch up with the decline in the numbers of enormous and unwanted families which contraceptive knowledge is mercifully making possible. In the absence of statistical evidence to the contrary, decline looks as likely as ever.

The most that can be said about the war and postwar increases in the birthrate is that they have ruled out the most pessimistic estimates of the prewar forecasters. The possibilities as they now appear are summed up in the new report by PEP on

"Population Policy in Great Britain" in a chart which is reproduced below. This chart illustrates the consequences on future population of five possible hypotheses regarding fertility and mortality. The line labelled 1 projects unchanged the mortality and fertility rates current in 1938-39—that is to say in ordinary language, it assumes that the average size of family and the average expectation of life remain what they were in 1938-39. No. 2 combines with the 1938-39 fertility rate a fall in mortality rates, over the next 25 years, to those ruling in New Zealand, the country where they are now lowest. No. 3 assumes that, when the temporary disturbance of the war has been removed, both fertility and mortality will go on declining about as fast as they were doing in the prewar years. No. 4 assumes a continuation of the 1945-46 fertility rate, a rate adequate for replacement, and combines this with falling mortality. No. 5 assumes that fertility will fall until 1959 and thereafter recover (as under the impact of a successful, but belated, population policy) to replacement level in 1974; many people will think this last possibility the most likely.

This chart makes no projections based upon the high birth-rate of 1947. But that this was, in fact, as exceptional as *a priori* it appeared to be is certainly hinted by the Registrar-General's latest quarterly return, which shows for the March

quarter of 1948 a total of births lower than that for any March quarter since the end of the war, down by nearly 20 per cent since last year, and just halfway back to the 1938 figures, well below replacement level. A single quarter's return may be inadequate evidence, but it certainly looks suspiciously like the steep downturn which ended the postwar baby boom in 1921. Public opinion, always a day behind the fair, may be still discussing the problems of the high birthrate while the glissade back to the demographic conditions of the 1930s is gathering impetus.

★

But even if the next few quarters make it clear that a decline in population is, after all, still in prospect, there yet remains the other half of the argument. Is it a good thing? After all, the public is inclined to ask, why should not the population decline? Britain is horribly overcrowded, as witness the housing shortage, traffic and transport congestion, and a dozen other only too tangible indices. The British people are having the utmost difficulty in feeding themselves, and their densely concentrated industrial towns offer a disastrously vulnerable target for atomic warfare. So far from trying to arrest any decline in population, policy should encourage it; if not by actually discouraging births, at all events by large-scale measures of assisted emigration aimed at dispersing both people and industrial potential into the sparsely populated Commonwealth.

The argument is attractive; but its attraction is very super-

ficial. From the purely social point of view, it is indeed possible that Britain would be a better place with 35 millions than with 48; but it is not certain. Overcrowding is as likely to result from maldistribution as from a high density—within reason—over the country as a whole. From the economic point of view, there is no evidence that a decline in population would be a panacea. Even if it be assumed that the adverse turn in the terms of trade, which is making it such a difficult proposition at the moment to pay for the necessary imports of food, is permanent—and that, on the long view, is already a fairly large assumption—there would be something to be said for a smaller population only on another important condition: that British production could be carried on as efficiently as ever by a smaller labour force and for a smaller market. Under modern conditions Britain is probably, if anything, rather a small technical unit, and could only lose by becoming smaller. A similar argument applies to the strategic argument for dispersal. Dispersal sounds good; it might reduce the temptation to an aggressor and give a better immediate chance of survival to the Commonwealth should aggression actually happen. But the power of immediate survival is one thing; the power to hit back and to keep up resistance is quite another. There is a certain size below which an economy cannot hope to have a balance of all the multifarious things that are necessary for strength in war. The United Kingdom barely achieves this minimum size as it is, and to disperse it would weaken the centre far more than it strengthened the extremities. If this island is tenable, it will be stronger with its present population—in both the wars the great limiting factor was neither food nor materials but manpower. If it is not tenable, the argument should be for dispersing not 10 millions but 48. It is also worth noticing that a strategic dispersal of population, concentrating on the shifting of skilled men, would be the precise opposite of a migration policy designed to meet the social and economic arguments, for it is an essential part of these that a complete cross-section of the population should be moved, including a fair proportion of the old and unproductive.

If the benefit of every doubt be given to the advocates of decline and dispersal, if it be conceded, against the bulk of the evidence, that a smaller population would be a good thing, the fact still remains that a declining population would be—will be—extremely uncomfortable. It will be an ageing population, carrying a growing load of pensioners on its increasingly middle-aged and stiff-jointed shoulders, lacking new blood, fresh outlooks, the venturesome attitude. It will have to bear the cost of maintaining capital equipment designed for larger numbers. It will offer a fickle and a shrinking market to business men and to planners; it is likely to suffer more, not less, from unemployment. Altogether shrinking pains are worse than growing pains; and even if a population of 35 or 25 millions represented Paradise, the way to it lies through Purgatory.

The Report of the Royal Commission—when, at length, it appears—may produce fresh evidence and new arguments. It may call for a revision of views. But at least until this authoritative contribution has been made, the wisest course is unquestionably to stand by the views that were formed before the war. It is probable that the high birth rates of the war years were an interruption, not a reversal, of the previous downward trend. Some of the exaggerated estimates of future population that were made before the war were excessively alarmist; but it still seems overwhelmingly likely that under-population is a far greater risk than over-population. It is highly unlikely that any decline at all in the British population is desirable; and even if it is, it is only by making it gradual that distressing consequences can be averted. In either case, there is need for a positive and intelligent population policy. There are plenty of unchained devils abroad in the land of Britain—but not the particular devil invented by the Rev. Mr Malthus.

The Sterling Area—II

SOME profound changes had taken place in the sterling area during the war, and at the end of hostilities it held within itself the seeds of difficulties that were not fully appreciated at the time. Subject to certain reservations about the position of colonial currencies, the sterling area remained the voluntary association of nations described in the first of these articles. This association was, and is, in essence held together by a set of gentlemen's agreements. Its smooth and effective functioning depended on the restraint shown by members in their use of the central reserve of gold and dollars. During the war this gentlemanly behaviour came easily. In the first place there was a cohesion and unity of interests created by the common cause for which most members of the area were fighting. Even more important was the fact that import policies were formulated, not by the member countries themselves, but by decisions of combined boards in Washington which allocated scarce materials and even scarcer shipping space in accordance with a rigorous order of essential priorities. This compulsory restraint on imports created its parallel restraint on the use which members of the sterling area could make of the central gold and dollar reserve.

It also protected the reserve from the new threat of encroachment created by the vast accumulation of sterling balances held by most members of the area. The growth of these balances represented a major revolution in the make-up of the sterling area. Before the outbreak of the war the sterling assets of the sterling area countries, other than the United Kingdom itself, amounted to slightly over £200 million. By the middle of 1945 the total had grown to nearly £2,700 million. The owners of these funds could not be expected to take kindly to their complete sterilisation. But any attempt to use them would inevitably mean one of two things: either "unrequited" exports from the United Kingdom or else a heavy drain on the central reserve of dollars. Britain was wide open to the first because export licensing did not operate over more than a small fraction of British exports; moreover, the countries which held the largest accumulations of sterling were for the most part those which had undergone the largest measure of inflation and which, therefore, could offer the highest prices for British goods. The threat to the central reserve of gold and dollars was increased by the fact that the inter-Allied control over materials and shipping and, therefore, over the import policy of member countries ceased soon after the end of hostilities.

These dangers were perhaps not adequately realised at the time. But, even with all the advantages of hindsight, it can hardly be argued that the right course would have been to impose a rigid blocking of the sterling balances and to allow the sterling area countries only the most restricted access to the central reserves. The sterling area is, as has been pointed out, a voluntary arrangement and the consent of the participating governments could not be strained too far. Moreover, they had all—or nearly all—contributed during the war to the central reserves, leaving at London's disposal the substantial net earnings of dollars that some of them had. By what reasoning was it right to use the central reserves to buy essential capital equipment for the United Kingdom and refuse to use them to buy no less essential equipment for the Dominions?

It was therefore inevitable that, in a period of world-wide dollar shortage, some part of the reserves of gold and dollars held by the United Kingdom should be made available to the other members of the sterling area. What can be said, in retrospect, is that too much was made available. Agreements were, it is true, negotiated with some members limiting their allocations of hard currencies to fixed quotas. But some of

these agreements were very generous. And for the most part it was left to members of the area to deal wisely and discreetly both with their accumulated sterling assets and with their use of gold and dollars. And to judge by the available evidence, not all the sterling countries adopted anything like the same standards of austerity as the United Kingdom. Moreover, there remains the suspicion that some of the controlling authorities permitted far too much capital to leak out of the sterling area. Looking back, one can certainly say that the £201 million released from the accumulated sterling balances in 1946 and 1947, of which £148 million took the form of gold and dollars provided for sterling area countries other than the United Kingdom is a very large figure—almost certainly larger than was reasonable in relation to the total resources of the United Kingdom.

★

The whole subject was naturally brought to a head by the convertibility crisis of last August which, in this respect as in many others, swept away the last excuses for complacency about the balance of payments between the pound sterling and the dollar. It became clear that much tighter controls would be needed all round the sterling area. The principal members of the area had sent representatives to London in September, 1947 to attend the meetings of the International Bank and Fund, and advantage was taken of their presence to hold a family council at which they concerted general lines of policy with the immediate objective of achieving the greatest possible economy of dollars. They undertook to tighten up their licensing of imports from dollar countries, to make themselves as far as possible self-supporting in their hard currency income and expenditure, and to stop the leaks through which capital had been escaping at the periphery of the area. It had become obvious that the freedom of movement of funds within the area would only be maintained if the standards of import control and exchange control were made uniform; where this could not, or would not, be done, the boundary of the area had to be drawn tighter. Thus though Egypt's withdrawal was on Egypt's own initiative, it was not unwelcome in London, and Palestine had to be extruded when it became apparent that strict control was no longer possible. There have also had to be some special arrangements with South Africa, which has always occupied a rather special place in the sterling area. South Africa has not made the whole of its gold production available for the sterling area and to that extent has not participated in the pool. But South Africa's deficit of payments with the sterling area—which until recently was large—has been settled in gold; indeed, the South African Government was willing to make an advance against it. But when, in the last nine months, the flow of capital from the United Kingdom to South Africa became large, this source of gold for the central pool showed signs of drying up. In the interest of both countries, it has been agreed to bring these under control.

These are the signs of pressure within the sterling area. But it would be a great exaggeration to regard them as signs of disintegration. Nevertheless, the relations between the sterling area and the dollar area are becoming so difficult that the question of dismantling it is being openly discussed—at least in Washington. It may therefore be appropriate to conclude this brief review by asking whether the continued existence of the sterling area still carries a balance of advantage. Is it worth while to the sterling area countries, other than the United Kingdom itself? Are the Americans right to regard it with hostility? And is it to the advantage of the United Kingdom?

The fact that none of the sterling area countries, with the exceptions mentioned above, has withdrawn from it is in itself a sign that they still find it of advantage to belong. It may be said that their hands are tied by the fact that the bulk, if not the whole, of their external reserves are invested in London, that, for better or for worse, they must continue to adhere or endanger their currency backing and overseas working balances. But there are far more compelling arguments than this for their continued membership. Their trade is still in large part transacted with sterling countries, and therefore they need the exchange stability which the sterling area mechanism gives them. The banking facilities which they find in London and on which they largely rely are still the most efficient of their kind.

Moreover, these countries would only put themselves in a worse position by withdrawing. They would then have to balance their own payments without any help from a central pool. They would certainly find it no easier, and possibly harder, to pay for dollar goods. And trade with the United Kingdom itself, which is now subject to no exchange difficulties, would immediately suffer from all the restrictive conditions that afflict countries that are competitively trying to sell in hard currency areas and to buy in soft currency areas. It may be galling to these countries to receive a steady flow of admonitions from London of the need for painful economy, and it may be tempting to some of their politicians to put the stringency down to the existence of the sterling area. But their authorities know that hitherto the existence of the sterling area has provided them with more hard currency than they could otherwise have been able to secure—that is, indeed, the burden of the criticism that was outlined above. It would be rash, however, to be too confident that the sterling area will not break up from within. As the resources of the central pool get smaller and smaller, it becomes harder to allocate them in a way that satisfies everyone of its fairness—and, by the same token, the penalty for being omitted from the allocation becomes smaller. Moreover, if a steady tightening up of the exchange control regulations becomes necessary, a point may be reached where some members either cannot or will not keep up with the rest. If the position does not become worse, the sterling area will hold together. But if the flux in the central reserves cannot be stopped, the position may well become dangerous.

The American desire to be reassured that ERP dollars specifically appropriated for the United Kingdom are not diverted, through the mechanism of the sterling area, to other countries is a wholly reasonable one, especially in view of what happened to the dollars provided under the loan of 1946. It is obviously impossible wholly to segregate dollars that accrue in different ways, but it should not be very difficult to devise means whereby the American apprehensions can be allayed. The British "concession" that has been reported from Washington this week probably amounts to no more than this. It is certainly not true, as newspaper headlines of egregious irresponsibility have proclaimed, that "control" of the sterling area has been "surrendered" to Washington.

Unfortunately, American hostility to the sterling area goes deeper than the reasonable desire to see that Marshall dollars are used only for approved purposes. In part, the hostility is a reflection of that almost instinctive aversion that most Americans feel—and that so few British observers can fathom—for all of the symbols that unite the British Commonwealth of Nations. In part, it springs from a belief that the sterling area must necessarily be discriminatory—which is at least partly true—and that it must thereby harm American interests—which is not true. It is true that the existence of the sterling area makes it easier for Great Britain and Australia to buy each other's goods than for either of them to buy American goods. But in what way would the dissolution of the sterling area lead to a single dollar more being spent on American exports? Britain might buy

more and Australia less, but the combined total could not be larger and might well be smaller. Moreover, the end of the sterling area, by making it harder for Britain to buy Australian food and for Australia to buy necessary manufactures from Britain, might make each of them more clamant for American aid. The British Government might well offer a prize, payable in sterling, to any American who could show—in practical terms, not in theory—that the existence of the sterling area damages American interests.

Indeed, it can be claimed that its existence is really in line with American policy. The object of that policy is to restore the freedom of the exchanges throughout the world. The exchanges are still free within the sterling area, and to destroy it would greatly extend the scope of exchange controls and exchange prohibitions. Many thoughtful Americans are already willing to admit that their insistence on the universal convertibility of sterling last year in fact destroyed a system of convertibility that was not universal but was gradually spreading. This was an almost classical example of destroying the good in the vain search for the perfect. The convertible payments agreements having gone, the freedom of movement within the sterling area is now the only example left in the world—other than the dollar itself and the Swiss franc—of financial freedom. It would be more truly in the interest of American objectives to support the sterling area than to destroy it.

★

Finally, is the continuance of the sterling area worth while for the United Kingdom itself? Most Englishmen will answer affirmatively for exactly the same instinctive reasons that lead so many Americans to regard it with suspicion. The analogies between politics and finance are not too close; Canada has never been in the sterling area, but it is none the less a valued member of the Commonwealth. Nevertheless, if the fostering and expansion of trade and economic development between the United Kingdom and the Dominions and Colonies plays any part at all in long-range policy, then the sterling area must be regarded as an essential factor in it. In the short run, it is perhaps enough merely to ask what would happen to the existing volume of trade within the Commonwealth if it all suddenly became subject to exchange control.

But if the maintenance of the sterling area is an essential British interest, it cannot be achieved without cost. One aspect of the cost appears in the dollars that will have to be found out of the central reserve for the sterling area countries. Furthermore, if the sterling area countries are to cut down their purchases of dollar goods, they can reasonably require some assurance of essential deliveries from the United Kingdom. A certain volume of "unrequited exports" is an essential condition of the continuance of the sterling area, and those who inveigh against unrequited exports might be invited to bear this in mind. But beyond this, the supreme price that Britain must pay if it wishes to keep the sterling area in working order is to solve its own balance-of-payments problem as soon as may be. The sterling area is built on confidence and if it is to endure it can only be on the basis of a solvent Britain. In some ways sterling is now living on a goodwill and tradition built up in the past. The monetary system represented by the sterling area grew to its stature and eminence because sterling possessed qualities of universal acceptability and free convertibility. These in turn depended on the fact that Britain was paying its way. If there are deep-seated and long-term threats to the sterling area today they derive not in the main from abuses of its facilities on the part of its members, or from objections to it on the part of outsiders, but from the possibility of continued weakness at the centre. Its future, in other words, is in Britain's own hands.

NOTES OF THE WEEK

Progress Report by Mr Bevin

Mr Bevin now personifies common-sense and imperturbability—both invaluable qualities in his difficult post. He chides idealists and enthusiasts as lustily as did Colonel Blimp in the thirties. His advocacy of patience and piecemeal experiment in the task of knitting together Western Europe is as weighty as a quotation from Burke. And his self-confidence has reached the point where he can open an eagerly awaited foreign affairs debate with a speech lasting less than an hour, and containing nothing for the headlines save the blunt statement "We are in Berlin as of right. It is our intention to stay there."

The House seemed disappointed on Tuesday with his sober and restricted report of progress, partly because it wanted someone in authority to analyse its fears of war, partly because so much faith is now pinned to Western Union that believers want to hear of miracles and cures performed on the tortured body of Western Europe. Mr Bevin was wise not to offer such signs. They would only obscure the fact that the structure of committees and agreements which now represents Western "consolidation" was built up with so much hard negotiation that what has been done for economic co-operation in ten months, and for political and military in three is really quite impressive. To have run parallel to this work any crusade for a European parliament or for regional security might have frightened the timid and cautious Foreign Ministers who have yet to gather round the "hard core" of the Brussels Powers.

But Mr Bevin must know, from those trade union days to which he so often refers, that no one has ever captured imaginations with committee work. There is no sign yet in Western Europe that ordinary men and women are distracted from their daily cares and fears by the vision of a united, prosperous and strong West. And there will be none until there is some pledge from statesmen like Mr Bevin that, when it comes to the pinch, the right to make certain important decisions will lie not with individual governments but with governments in council.

★ ★ ★

Sacrificing Sovereignty

It is true that in the debate Mr Bevin spoke of "sacrificing narrow and national interests—and in some cases very substantial interests—in favour of the common European good." And Mr Attlee said "we are prepared with other Powers to pool some degree of authority." This is encouraging—but what interests, and at what stage? This is the kind of sentence that foreign correspondents in London include in their messages knowing that it will be cut if space is tight.

Mr Bevin seems to think that all his critics want him to indulge in "academic discussions of sovereignty." On the contrary some of them want to know—for example—whether the Foreign Secretary can persuade Mr Bevan to accept a cut in his housing programme if a West European plan demands that France should have timber at the expense of Britain. And it is not only idealists in this country who are asking what he means by "a wholly new conception of sovereignty throughout the world." The question is being asked by Germans who have no sovereignty—and by Congressmen who will vote for or against the next instalments of European aid in 1949. It is also being asked in a more aggressive and worried way by the most ardent defenders of national sovereignty in Europe today—the Communists.

★ ★ ★

Nine Months or Twelve?

As has been rumoured, the party conference on the reform of the House of Lords has broken down. But at first sight the White Paper (Cmd. 7380), giving a summary of what was achieved by the discussions of the last three months, shows that far more agreement was reached than could have been hoped for when the Parliament Bill of 1947 was in the Commons. For on the composition of the House of Lords the representatives of all three parties agreed to place before their parties far-reaching proposals. These would secure as far as possible that a permanent majority in the Lords would not be granted to any party; they would abolish hereditary membership and substitute appointment of members, from hereditary peers and life peers, on grounds of personal distinction or public service; they would allow women members, and provide for the inclusion of certain descendants of

the Sovereign, certain lords spiritual and the law lords; they would provide for payment of members, and would enable members who neglected their duties or became unfitted to perform them to be disqualified. Peers who were not appointed to be the rechristened "Lords of Parliament" would be entitled to stand for election to the Commons and to vote like other citizens.

Final agreement to these proposals, however, was dependent on general agreement over the powers of the House of Lords as well as its composition, and it was here that the conference broke down. The Parliament Bill proposes that to override the Lords' veto a Bill must pass the Commons in only two successive sessions, instead of three as at present, and after only one year, instead of two, has elapsed between its second reading in the Commons in the first session and its third reading in the second session. Where the conference broke down was not on the question of whether there should be a period of delay or not, but on how long that period should be. The representatives of both the main parties put forward a compromise. The Labour representatives agreed to change the period from one year after second reading to nine months after third reading. This, they argued, would give the Lords plenty of time to consider a disputed Bill if it had taken a long time to pass through the Commons. The compromise proposed by the Conservatives was that the minimum period of delay should be twelve months from the third reading in the Commons.

★

On the face of it the difference looks trivial. But, according to the Government and Opposition representatives, it masks a fundamental difference of opinion on the functions of the House of Lords. The Government maintains that its delaying powers exist to give the Commons a chance to change their minds, having regard to the state of public opinion on the disputed measure. The Conservatives want the people to speak their minds more directly, through a general election. A period of twelve months would allow this verdict to be obtained for disputed measures introduced in the fourth session of a quinquennial Parliament, whereas the Government's representatives declared that the effectiveness of the fourth session for legislation should be ensured.

It is not, however, likely that the mass of the electorate will appreciate the point of this difference of opinion. For most people it will be seen as a dispute over twelve months or nine. And if the Lords throw out the Parliament Bill as a result of the conference's failure to agree, the odds are that on this issue the people will not support them.

★ ★ ★

The Party Dotted Line

However ungrudging may be one's agreement with official Labour that Mr Platts-Mills and other recalcitrants of the same kidney should have no place in a party adhering to the principles of Western democracy, and however outrageous the offence for which they were arraigned, the subsequent flourishing of Transport House's big stick to left, right and centre is a deplorable spectacle; particularly when internal disciplinary action is accompanied by a campaign against co-operation, for even the most urgently desirable common ends, between Governments of different political shades. Before Dr Dalton's egregious sabotage of Western Union, the threat of party displeasure held over the heads of those MPs proposing to attend the Hague conference might have been dismissed as a politically necessary *pro forma* gesture, designed to balance the party's attitude to the actually very different, but superficially similar, Left deviation of the Nenni-goats. This is no longer possible. The screws are visibly tightening; henceforward members are to subscribe to the Party line, the whole Party line and nothing but the Party line—in the case of the Nenni sinners a dotted line to be signed on by first post Thursday, or else—

The limits of party discipline are hard, if not impossible, to determine *a priori*. The tie of common interest in which the party system originated has evolved, in theory at least, into a unity of principle; the interpretation of that principle in terms of the casting of Aye and No votes in the House of Commons on particular issues has long been a prerogative of the party leadership, with abstention from voting as a possible but only sparingly-to-be-used loophole for individual conscience and judgment. More than the other major parties, Labour has always shown an anxiety to extend this homogenising process to activities outside the

House; an attitude understandable enough given the vulnerability of any Socialist body to Communist permeation, but too easily translated by illiberal minds into outright regimentation. No doubt (as a leading article this week argues) many of Labour's present troubles result not merely from the internal stresses which must face any party enjoying its first term of genuine power after a lifetime of almost unbroken opposition, but also from the very completeness of electoral victory—which showed up any carelessness in the selection of candidates not seriously expected to win. Such errors can be remedied with comparatively little scandal in 1950; but that does not make matters easier now. The present rain of ultimata, excommunications and interdicts, however, is inexcusable; they only show that spiritually Labour is drawing dangerously near to that which it condemns.

* * *

Wise Counsel from the BMA

At last there seems to be some hope that the dispute between Mr Bevan and the medical profession will come to an end. The latest—and, one hopes, the last—plebiscite taken by the British Medical Association shows, it is true, another majority against the national health service, even after the amendments promised by Mr Bevan. But the majority has fallen considerably. To the question put to the whole profession, including its retired members—do you approve or disapprove of the National Health Service Act in view of the modifications now proposed?—25,842 answer that they disapprove and 14,620 that they approve. In the February plebiscite, before Mr Bevan made his gesture, the comparable figures were 40,814 and 4,735. It is, however, interesting to note that doctors already working full-time in the public service, including Government service and local authority service, are still on balance against the Act, although the majority this time is very small.

The more crucial question, however, was whether doctors not already in the public service intend to join the national health service. Altogether 13,891 doctors are not in favour of joining, against 12,799 in favour. In February, the comparable figures were 25,340 and 4,084. The BMA had again declared that it would not advise the profession to stand out unless at least 13,000 general practitioners declared that they would not join. Actually, only 9,588 said that they would not join, compared with 8,639 who intend to join; there were also some 2,000 abstentions. In February, 17,000 general practitioners declared that they would stand out.

Faced with a change of mind on the part of general practitioners, consultants and specialists, and doctors working whole-time in voluntary hospitals, the Council of the BMA has taken the only sensible course in recommending doctors to co-operate in the new service. The recommendation still has to be approved by a representatives' meeting, to be held at the end of this month, but although there may be some hard words, the Council's recommendation is not likely to be refused.

The dispute, therefore, is probably over. But the success of the health service is not thereby assured. One of the Council's recommendations suggests that people should be informed that for reasons outside the control of the profession the improvements promised by the Government will not be available for some time because of the shortages of doctors, nurses, equipment and premises. A public warning of this sort is certainly badly needed.

* * *

Canada's Future Role

It has been apparent for some time that Canadian foreign policy might be moving in new directions—which does not mean towards new formulae. The remarkable speech made last week by Mr St. Laurent, Secretary of State for External Affairs, gave some broad hints of what these directions are likely to be, without any of the precise definitions which might have divided instead of uniting Canadian opinion. He repudiated the idea that Canada could isolate itself from the measures being taken in other countries against Communism; he subscribed to the Marshall-Bevin doctrine that only a great political and productive effort can weaken the "accumulated forces of social discontent"; and he recognised the strategic interdependence with the United States imposed by geography and expressed through their joint defence arrangements.

But there stood out sharply from the rest of his speech two suggestions: that defence and economic co-operation might be developed most effectively through regional arrangements, and that

the free states, or some of them, will soon find it necessary to consult together on how best to establish "a collective security

league." It might grow out of the plans for Western Union now maturing in Europe.

It is possible that Mr St. Laurent sees in such suggestions a way out of the present British difficulty—often hinted at by Mr Bevin and his colleagues and even more often openly discussed in Western capitals—of finding ways to develop with the Continental political and economic links which will not disturb or break the more indefinable ties of the Commonwealth. It will not have escaped the notice of Dominion governments that the Brussels Treaty is open to them, or that talks on a possible western customs union have several times brought up the idea of creating a system of preferences over the area covered by the Western countries and their dependencies.

Unfortunately, in spite of the British Government's professed willingness to call a Commonwealth conference to discuss these questions, the difficulties in the way of an early meeting are very great. The solution might be for London to conduct bilateral talks with each Dominion and to take the responsibility for sorting out and grouping together the various views about future political and economic policy developments in the Commonwealth. Certainly these hints from Canada by the favoured candidate for the Premiership should not pass unnoticed.

* * *

India and Commonwealth

The appointment of Mr Rajagopalachari as Governor-General of India in succession to Lord Mountbatten has given as much pleasure in London as it seems to have given in Delhi. He is a man who has won universal respect for his austerity of life, steadfastness of conviction and unflinching will to reconciliation in political conflicts. As former Prime Minister of Madras and recently Governor of West Bengal, he has shown his qualities as a statesman, and his elevation to the position of Governor-General gives assurance of constructive effort in Delhi both for the improvement of relations with Pakistan—for Mr Rajagopalachari was the first Congress leader to recognise the Moslems' right to a state of their own and incurred much unpopularity in his own party for doing so—and for working out the political adjustments required in order that both India and Pakistan may decide to remain in the association of nations for which the formula of "Dominion status" provides.

Now that Mr Noel Baker is home again from Lake Success, it is to be hoped that he will apply himself with energy to preparing proposals to deal with the problems which would arise as soon as the three younger and four older Dominions met in council for the first time to discuss common military and economic interests. It is a critical moment for the Commonwealth and, if the tide is not taken at the turn, no such opportunity may ever occur again. The United Kingdom and seven Dominions may have to find a new concept of association, perhaps even a new title, to perpetuate their historic community in a changing world. Now that the India Office is a thing of the past, the field lies open to Mr Noel Baker and his departmental junior Mr Gordon Walker whose Commonwealth Relations Office has possibilities and responsibilities not yet fully understood by Cabinet Ministers. Execution of the Brussels Pact alone will need more thorough consultation with the Dominions than has so far been customary.

* * *

Policies in Palestine

In his review of foreign policy in the Commons, Mr Bevin made a reference to Palestine which gave rise to speculation about a change in British policy. He said:

We have always made it clear that if there was agreement between Jews and Arabs for a cease fire order or a temporary truce or some other kind of interim Government working towards a final settlement, and if we were approached by all concerned to render assistance in conjunction with others—I repeat, in conjunction with others—this would create a new situation and we should have to consider it most carefully.

Mr Bevin did indeed reiterate that there was no question of Britain going back on its decision to surrender the Mandate next Saturday, but his words seemed to gain extra point from the sudden reinforcement of British troops in Palestine a few days previously and from the vigorous lead which Mr Creech Jones was giving the Special Assembly after so many months of British passiveness at Lake Success.

In London it is insisted that there has been, in fact, no change of British policy. This may be accepted. It is circumstances that have altered, enabling Britain to play a more active part. It has naturally also been asked whether America has not taken some new initiative behind the scenes which would justify a

British response. But this again would read too much into the situation. America is already committed to some kind of enforcement action, "in conjunction with others," of its various truce and Trusteeship plans, and Mr Bevin's words were at most an encouraging gesture. Mr Creech Jones, for his part, has been pressing in Lake Success for a strictly practical plan—first a truce, and secondly the creation of a neutral authority to hold Palestine assets after the Mandate, to further mediation between Arabs and Jews, and to act as a unifying central authority on behalf of the United Nations.

In Palestine, the Arabs are for the moment beaten and leaderless, but the cease-fire which was brought about in Jaffa and Jerusalem this week was only secured by the vigorous intervention of the strengthened British forces. It is precarious, and it would be a great temptation to the Jews if, on May 15th, British forces were withdrawn without being replaced, to exploit their temporary advantage. And events in Jaffa have shown that the Irgun-Hagana merger does not mean the Irgun is under control. If a truce fails in the rest of Palestine, it is not conceivable that Jerusalem could be isolated from the conflict without complete neutralisation and demilitarisation under an international authority with adequate force.

Outside Palestine, Mr Bevin confirmed that Britain had been using its influence in the Arab states to prevent further intervention and secure a truce. So far as most of the Arab governments were concerned, these moves were certainly welcome. They are most reluctant to venture their armies in Palestine, but they have their own public opinion to think of, and are in the uncomfortable position of risking their own future stability as much if they do intervene as if they do not. A probable exception is King Abdullah, whose own ambitions include an outlet to the sea and who may yet emerge as a saviour of the Arabs. On the whole the short-term outlook for Palestine has slightly improved in the past week, but that is all that can be said.

* * *

"Third Force" Prospects in France

M. Schuman's coalition Government, having tripped up immediately the Assembly met after its Easter recess, will have to jump many higher hurdles as more controversial issues on the parliamentary agenda are reached. Last week's debate, which ended with the Government being defeated by a small majority (composed of Gaullists, Communists and Radicals) concerned technical clauses of the proposed statute of the nationalised civil aviation company, Air France. The Government chose not to make a political issue of the vote, and the amended Bill has now gone through.

Nevertheless, the incident demonstrated again the precarious parliamentary backing of the present "Third Force" Cabinet, which depends for its survival on the approval of centre parties outside the "Third Force," many of whom are now openly advocating an enlarged anti-Communist front, stretching from the Socialists to the Gaullists. Hitherto these people have been too frightened to provoke a political interregnum: each time the Government's majority dwindled (seven times between Christmas and Easter) M. Schuman tabled a vote of confidence and, with the fear of disorder still vivid after last November, his appeal always succeeded.

The force which kept the Government from falling apart was unquestionably fear of Communism, at its most defensive and negative. This fear is much less intense since the defeat of the Popular Front in the Italian elections, and timid right-wing souls may now risk provoking a crisis, rather than endure the continued displeasure of their shop-keeping clientèle with M. Mayer's fiscal policy. Similarly, timid left-wingers may risk a crisis rather than the displeasure of their proletarian clientèle over the wage-freezing policy to which the Government is firmly pledged. Other issues too have threatened to tear the Third Force apart: for example the lengthening of the conscription term from one year to eighteen months, denounced by the National Council of the Socialists (SFIO) last week, but supported by the Progressive Catholic Minister of War, M. Tietgen; and now reduced by a Cabinet compromise to fifteen.

The Gaullists, impatient for office, are waiting for just this kind of crisis to stake their claim to establish order and authority—personified by the General—against anarchy and the impotence of the derided political parties. If the "Third Force" feel confident of their own ability to handle difficulties as they arise, there is no reason, economic or political, why they should not even now, salvage their majority. Outside parliament they are unlikely to be overthrown by extra-legal action, since recent

demonstrations have shown how firmly they control the police and the prefectural authorities.

The outlook for the "Third Force" therefore remains unsettled. Much will depend on the support the present Government gets from the Western Allies, and on whether the Americans will indicate a preference for a French regime further to the right. Even more will depend on Kremlin strategy and on whether the French Communists are instructed to organise strikes, sabotage and disorder, which would certainly provoke reaction in favour of de Gaulle among the deputies.

* * *

Church versus State in Belgium

It is unfortunate that M. Spaak should have had to face a political crisis at home within a month of being elected chairman of the Organisation for European Economic Co-operation. The crisis developed out of the century-old issue of State versus Church control of the schools. The Belgian Government had proposed to pay a subsidy to Catholic technical colleges in order to help recruiting for industry. The proposal was presented to the Chamber of Deputies by the Socialist Minister of Education, M. Huysman, on April 13th and aroused immediate opposition from certain groups in the Socialist party. The opposition increased until at the beginning of this week the group of Socialists in the Government Coalition was defeated at a party meeting, and on Wednesday M. Spaak and his Cabinet resigned.

The quarrel between Church and State over education is one of the fundamental issues that still divides parties on the Continent. Although, for the most part, it is concealed from British observers by more modern disputes such as those over wages and working hours, when it does come to the surface it arouses deep and bitter feelings. M. Spaak seems to have decided to try to bring the Socialists round to a more tolerant attitude towards the controversy, but for the moment he has succeeded only in splitting the Socialist party. His reputation in Belgium is so high, however, that he should be able to survive this latest outburst of old recriminations, but the episode is a reminder that there are questions still alive across the Channel which federalists—especially British ones—tend to forget.

* * *

Mr Shinwell Does it Again

Mr Shinwell has a genius for dropping bricks. And as usual, if they are dropped often enough, a few are bound to crack to good purpose. It was thus refreshing to hear at least one Minister admit that the Government had been carried away by its enthusiasm for nationalisation and that

there was far too little detailed preparation in the formulation of schemes of nationalisation, and that in consequence we found ourselves with legislation that had to be applied without the necessary blueprints. . . .

It has been said that there are three kinds of intelligence:

INTELLIGENCE, HUMAN
INTELLIGENCE, ANIMAL
INTELLIGENCE, MILITARY

The Economist Intelligence Unit, however, is concerned with a fourth category: INTELLIGENCE, ECONOMIC. Our specialist staff of research workers and statisticians can provide information on industries, agriculture, commodities, banking, finance and commerce, at home and abroad. If you will send us details of your needs, we shall be glad to put our services at your disposal.

The Economist Intelligence Unit

22, RYDER STREET. ST. JAMES'S.
LONDON, S.W.1.

Telephone: WHIttehall 1511, Ext. 13.

Even if naïve, this is honest, and Mr Shinwell cannot be a popular person among Ministers at present for being so forthright.

The rest of his speech was not, however, so satisfactory. It appears that nationalisation is "only a means to an end," but that end is not the efficiency of the industry nationalised or the good of the workers and consumers. Apparently industries are not nationalised to make them serve the community more usefully, but to prove that nationalisation as a principle is right. Therefore the Coal Board must be successful to prove that the Labour Party's principles are right, not to provide the nation with better and cheaper coal. Such views are nonsense, but they explain the pressure behind the Government to move still further along the road of nationalisation; indeed on this theory the more efficient an industry before nationalisation, the more tempting for the Government to prove that nationalisation works by taking it over. The enthusiasm for nationalisation appears to work in inverse ratio to the degree of personal responsibility. While experience of difficulties has taught the Cabinet discretion, less responsible Ministers and still more the rank and file clamour for more nationalised industries. In a subsequent speech, Mr Shinwell went on to say that the Socialists would never be satisfied until they had nationalised all the major industries of the country and "have introduced the right democratic content into the nationalised industries."

* * *

The Coal Board Tussle

Mr Shinwell's emphasis on changing the spirit within the nationalised industries appeared to be directed as much against the management of the Coal Board as against irresponsibility among the men. His criticism of those who were "castigating and criticising the men in the mines" was presumably a rap over the knuckles for Sir Charles Reid. Mr Shinwell was speaking to the miners in Edinburgh, and it was only three weeks ago that Sir Charles made a forthright speech to Scottish miners (referred to in *The Economist* of April 24th) reproaching them for preventing the fruits of mechanisation from appearing in greater output.

Divergencies in point of view between Ministers and members of nationalised Boards are not unhealthy, if kept within reasonable limits. But remarks such as those made by Mr Shinwell at the same meeting about the "silly fatuous nonsense" being talked about a deficit in the nationalised mining industry go far beyond what any responsible Minister can say. It is outrageous to suggest that those who are concerned at the rise in coal costs are only interested in reducing wages and lengthening hours. The price of coal is fundamental to the wellbeing or otherwise of the country's economy, and it is the craziest frivolity to suggest that the miners have not a personal share in those costs and responsibility for them.

This is the sort of attitude which makes the issues now being fought out at Waleswood Colliery, near Sheffield, much harder to solve. Waleswood is a test case, for the same decisions must be settled in dozens of other pits all over the country, and unless the Board's decision to close the pit is upheld there is no hope of increasing the efficiency of the industry and reducing costs. In this case it would require the investment of about £250,000 to keep Waleswood going for another seven years. Most of the coal in this pit can be obtained through neighbouring pits, which could be developed more economically, and with the prospect of 60 to 100 years of life before them. From a financial and technical point of view the case against pouring more money into Waleswood is very strong. The human issues are more difficult since the men strongly dislike moving elsewhere. But provided that reasonable efforts are made to smooth the transfer, there can be no justification for weakness. In the long run the men stand to lose far more from inefficiency. The National Union of Mine-workers have recognised this in principle. They must now persuade their members to carry it out in practice.

* * *

Wages Policy

The latest pamphlet of the Design for Freedom Committee, Mr Peter Thorneycroft's "Design for Wages," is a sort of pom-pom gun, peppering a wide area of public opinion. It is an essay in public education, a reasoned account of the evils of inflation; it is a party squib, an attack on the Labour Government's sins in this field; it is also, indeed predominantly, a special appeal to trade unionists to consider the fatal incompatibility between trade union freedom (and indeed effective survival) and central planning of prices; to recognise that in spite of all appearances free-

enterprise Codlin's the friend, not Socialist Short. The first two targets have been hit before, many times, and Mr Thorneycroft, even while dismissing Sir Stafford Cripps's £330 million surplus as inadequate and illegitimately achieved, lays himself open to the charge of flogging dead horses and battering open doors. It is the third aim, the framing of a convincing argument for trade union opinion, which is the most interesting and the most difficult. Trade unions, he opines, *ought* to press for higher wages; that is their job, while the Government's job is not to arbitrate between admissible and inadmissible claims, or vaguely to preach restraint, but to create those conditions in which, automatically, the inadmissible will in fact be rejected. He describes very pertinently the function of wage movements in a free economy, the link between the demand for a product and the demand for labour, and the manner in which that function is inhibited and that link broken by the imposition of a national wages policy.

This is all very well, and very well done. But like so many accounts of the superiority of the well-tryed and smoothly-working price system over the improvised and creaking pseudo-plan, it does some telescoping of long and short term processes and problems. Let it be granted that inflation has distorted the economy, maldistributing workers, capital, incomes and bargaining power; that this inflation can be laid to the Government's charge; and that its speedy and effective reversal, while highly uncomfortable, is perfectly possible. It still remains true that the redistribution of workers, capital, incomes and bargaining power cannot be instantaneous; and that until it is achieved, and in order to speed it up, a "wages policy" is essential. Recovery is hardly furthered by telling the unions that any appeal for the consideration of their claims in a national contest is a step in a process towards their abolition or enslavement. Much, however, must be forgiven to a man who can write that

Dr Dalton's resignation from his office was welcomed by a circle far wider even than his colleagues in the Cabinet.

* * *

Forward from Bogotá

The Bogotá Conference ended quietly last week with the signing of the charter of the Organisation of American States. By it a new regional organisation within the framework of Uno is established and a new and stronger version of the Pan-American Union. Its most important provisions deal with the peaceful settlement of disputes between members, and lay down the procedure for mediation, arbitration and the reference of legal questions to the International Court. The recognition of *de facto* governments and of territories acquired by force—knotty problems in Latin America—the propagation of doctrines leading to aggression and the political and civil rights of women are also covered.

The resolutions on European colonies in the Western Hemisphere and on combating anti-democratic infiltration will attract wider attention. The resolution on Europe's retention of colonies, on which the United States and Brazil abstained from voting, contented itself with a grandiloquent declaration of their undesirability, and a decision to set up a central commission in Havana to study the whole problem. Even so, the British Government was prompt to protest in defence of its rights.

The agreement on economic co-operation, signed the day after the official end of the Conference, is of particular importance. It deals with financial and technical co-operation and the principles for handling scarce commodities. It also relaxes the conditions on which foreign capital may operate in Latin America and assures prompt and adequate payments for expropriation. The need for American investments is thus accepted. Whether private American capital will consider Latin America even now a better risk than Europe remains to be seen—but Europe has nothing to offer as tempting as the prospect of rich new oilfields.

* * *

Homes and Funds for DPs

The International Refugee Organisation, with one more ratification still required to bring it into proper existence, met again on Tuesday as a Preparatory Commission. During the first eight months of its existence, which began in July, 1947, it has repatriated or resettled over 192,000 displaced persons and refugees. It is reckoned that between 800,000 and 900,000 have still to be resettled, of whom over 630,000 are under the direct care of the IRO. If it is to complete its task in three years, as it is supposed to do, resettlement will have to be speeded up, especially as little more can be done by way of repatriation. Most of

those still enduring boredom of life in a refugee camp are much too afraid of political persecution ever to think of returning to their homelands.

That more spectacular inroads have not yet been made into this problem is partly the fault of the interested Governments, which have not realised that to dole out inadequate funds is false economy. If the IRO is not to continue indefinitely it must be provided with a budget sufficient not only to cover the cost of maintaining the DPs in camps for the time being, but also to pay the cost of their resettlement when new homes have been found for them. Instead of the \$150 million it had hoped for, the IRO has had to make do with \$119 million during the present fiscal year, and at the moment over 70 per cent of its resources are being used up in maintaining the camps. As a result, in March nearly 20,000 DPs were provided with everything except the money to pay their passages to their new homes. At present the IRO is limiting new admissions to its camps to special hardship cases, and it has approved a British proposal that Governments should be asked to form, by advance contributions to next year's budget, a special fund of \$10 million for the charter of ships. Thus, money which might be used next year to maintain DPs in their present unsatisfactory existence will be used this year to get them to new homes.

Increased financial contributions will not provide a permanent solution to the problem of the DPs, so long as there is not more readiness on the part of member countries to take them in. That is the root of the matter. And of the countries which do most in this way it is the United States which shows the greatest reluctance. At the moment both Houses of Congress are considering Bills to admit, in one case case 100,000 DPs, and in the other 200,000, over a period of two years. If either gets through it will only be after a hard struggle. Americans who oppose them, largely on the score of housing and other shortages, should remember that exactly the same and greater obstacles exist in this country; yet of the 192,000 repatriated or resettled by IRO during the first eight months of its existence Britain took in over 40,000 and the United States only just over 12,000.

* * *

Price Reduction and the Subsidies

Following the example of the co-operative societies, most of the multiple retail stores have reduced their prices for certain

rationed foodstuffs. Butter and bacon are each 2d. a lb. cheaper, cheese and margarine 1d. a lb., and sugar ½d. a lb. This is in answer to Sir Stafford Cripps's call for lower prices to stem the tide of inflation. Yet it is surely not a coincidence that the foodstuffs which are reduced in price are precisely those which are heavily subsidised. The actual weekly reduction to the housewife is under 2d. per person or about 7d. for a family with four ration books. Is this a sufficient incentive to prevent demands from her husband for a further increase in his wages? From the housewife's point of view, these price changes are obviously in the right direction, and they emphasise once again that retail margins are ample for the large retailers.

Reduced prices may reflect a counter-inflationary tendency in the economy, and perhaps the fact that these reductions have been agreed to is a sign that something of the sort is happening. But to put prices down as a means of *starting* a counter-inflation is false reasoning. Price reductions are anti-inflationary only if the public's savings are increased by an amount equivalent to the reductions. A sounder policy would have been to maintain the retail prices and reduce the subsidies. If these retail prices had in fact been kept at their maximum levels—nobody would suggest that they are out of reach of any income group, especially since the ration allowed for each of the foodstuffs concerned is so small—and the subsidies reduced by an amount equivalent to the recent price reductions, the Government would have saved over £25 million a year. This is undoubtedly a more effective way of combating inflation than retail price reductions whose immediate result is to place more purchasing power in the pockets of the people.

More Newsprint?

It appears that no battering on the door nor whistling beneath the windows of the room in the Board of Trade, where newsprint policy is decided, have caused its inmates to make any clarification of their policy. Two statements this week have, indeed, been made, one in the House of Commons and one by Mr Hoffman, administrator for Marshall aid in Washington, but neither so far answers the vital question about whether larger newspapers will in the future be possible.

KODAK LIMITED • DEPT. E555 • KINGSWAY • LONDON • W.C.2

In a brief debate in the Commons on Monday, Mr York painted a gloomy picture of the newsprint position. As things now stand imports of newsprint and pulp for the home mills might just suffice to maintain four-page papers of this year if no accidents at all occurred. Stocks are, however, now so low that the smallest failure to achieve the import programme would have disastrous results. Last year, when stocks were much higher, restrictions in imports and the drought in Scandinavia brought crisis very near: this year there is no margin for any errors in estimates and the position is dangerously unstable. For the year 1949 nothing definite is known, but the Government's warning that it might cut imports from Canada and Newfoundland still further next year—to save dollars—would mean either lower circulations or smaller papers.

Fortunately Mr Hoffman's statement appears to mean that this really desperate situation will not arise. The figures so far given by him are incomprehensible to the experts over here, but they appear to mean one of two things. Either the four-page papers will continue and Marshall dollars will be used to fill the gap between the Government's previous offer and the amount sufficient for a reasonable continuance of four-page papers. Or—more desirable but less probable—the new supply of dollars will be used to fulfil the earlier Canadian contracts on a six-page basis. The question must be decided urgently before the Canadians are forced to make long-term contracts with the Americans.

* * *

Poll on Class Consciousness

The middle class is, in most people's minds and certainly in those of the Government, a minority class; even a very small minority class, to be contrasted with the working masses who comprise a majority so huge as to be, according to some notorious pronouncements, the only group worth considering. The latest Gallup Poll suggests that, whatever the statistics of income may say, this view does not correspond to the social consciousness of individual citizens. Asked "If you had to say what social class you belonged to, which would it be?" 2 per cent of the sample questioned said "Upper class," 6 per cent "Upper middle," 28 per cent "Middle," 13 per cent "Lower middle," and 46 per cent "Working"—thus giving the three middle class groups taken together an actual numerical superiority over the masses. This distribution does not coincide, of course, with that of property or incomes; as Mr Nigel Balchin once wrote, "the middle class income is about as near to the middle of the real scatter of incomes as the thirty-third inch is to the middle of a yard. The replies to the question obviously did not use any economic criterion as a guide. What they did use remains obscure. The table also lacks symmetry in that the working class remains unanalysed. It is, perhaps, unlikely that anyone would deliberately classify himself, if given the opportunity, as a down-and-out, a hobo or a member of the Submerged Tenth, but the class difference between the tramp and the skilled artisan is at least as wide as that between upper and lower middle class—or, one may hesitantly suggest, between the Upper Class, the Best People and the rest of the bourgeoisie.

Certainly anyone looking for a dividing line in the class struggle, or for the centres of gravity of class solidarity, would find the Gallup results extraordinarily baffling. Even the expected predominance of support for Labour in the working class and for Conservatism in the middle-to-upper classes (revealed by the answers to a subsequent question) is less well marked than one might expect; possibly there is significance in that the swing of the pendulum towards Conservatism is much more marked in the latter, though it is puzzling to find Liberal opinions gaining ground, apparently, only in the lower groups. Altogether, while the poll may remove some preconceptions, it puts less that is definite in their place, and is probably more valuable as a minor sidelight on social psychology than as a contribution to the understanding of the British class structure. But it remains a fact of great political significance that a clear majority of the British people at least *think* they are in the middle class.

* * *

Planning the Briar Patch

It is often in small matters that the clash of opposing philosophies is most strikingly shown up. There could hardly be a vivid example than the collision of Mr Leslie Kirby, master carpenter, family man, pioneer and village Hampden, with the majesty of the state in the shape of the Rural District Council of Easthamstead, Berkshire. Mr Kirby, with his own hands, on his

own land, and with salvaged materials, built a cottage in which to house his bombed-out family, and moved in. He did not fill up the right forms; he did not comply with the local by-laws; and he contravened, blest word, the Town and Country Planning Act. When warned to move and pull down the offending structure, he "misaid," or at all events did not appropriately use, the papers necessary for a possible appeal. His six months' grace having expired, the Council sent a squad of demolition workers to pull his home down, plank by plank, around his ears and those of his wife, children and invalid mother-in-law; and Mr Kirby became news—so much so that the Minister of Town and Country Planning has been compelled to take notice and has stopped the demolition pending "an impartial examination" of the case.

The immediate normal reaction to this story of a decent non-official person bred in a free country is one of sheer rage. (One can imagine, longingly, what G. K. Chesterton would have said about it.) The tree is known by its fruits, and if this is the fruit of planning, then planning is damnable; no abstract argument for its utility can stand up against the simple, child's-pioneer story of Mr Kirby. Of course second thoughts are more rational; the arguments do stand up; the greatest good of the greatest number demands a curb on the propensity of ingenious home-seekers to create shanty-towns and rural slums. The Town and Country Planning Act is not discredited by Mr Kirby's hard case. But other things are discredited: the hypocrisy which, with half the beauty spots of England defaced and defiled with barbed wire and rubbish, with Service departments riding roughshod at their pleasure over the Act, lifts its hands in righteous wrath over a few cubic feet of misplaced bungalow; and the hidebound rigidity which could find no alternative penalty than outright destruction. That will perhaps be a suitable enough penalty—though it will still be a harsh one—ten years hence, when the housing problem may be solved, when the incentive to get even an illicit roof over one's head will be less overwhelming, and the consequences of eviction will be less desperate. But it is about as appropriate now as the drowning of a stowaway because he ought not to have come on board without a ticket. If anything can bring about a blind reaction against the whole painfully learned idea of communal control of the common environment, it is a succession of Briar Patch cases.

* * *

Minding the Milkman's Business

Milk may be innocent-look stuff, and full of vitamins. But the nation should beware; a serpent lurks in the bottle, and it bears the odious name of consumer's choice. This is a creature abhorrent to all high thinkers who know what is best for the other fellow, and anathema to the custodians of the true economic doctrine that the customer is always wrong. The Government has usually been sound on the need to exterminate this eighth deadly sin, and it must have been in a rare mood of reckless heterodoxy that it decided at the end of March that between May 3rd and May 15th the drinker of milk should be free to change his milkman, just as he has been free—more or less—to change his supplier of other foodstuffs.

But bonds are not so easily broken. The glorious freedom of writing a new name on page RG13D/1 of the ration book seems likely to be reserved for a fortunate few. In many parts of the country the hideous spectre of more than one delivery van in the same road is evidently proving too much for the trade, which apparently fears that the next stage of economic heresy would be to let loose the forces of competition. It is facing this danger to its comfortable legal monopolies of the war and postwar years, however, with steady calm—fortified by the assurance of Dr Summer-skill that milk distributors are free to refuse new customers if they so desire. Its answer to the cry "sack the milkman" is to refuse to be sacked. A customer who is tired of inferior milk, or incivility, or having to tip the milkman is entitled to find a new one, but often he will find that he cannot.

Arguments against increasing the amount of manpower in the distributive trades are as valid now as they have ever been, and freedom for the consumer to choose any milkman as he did before the war would involve quite unjustifiable cost. That is the only valid case for the system of recent years—one supplier to one street, with the occasional intrusion of the Co-operative van to add variety to the dull suburban scene. But that system had Government sanction behind it. The new system removes the control from the arena of public responsibility and hands it over, without any safeguards, to the milk distributors. If there were an ample supply of milk for house delivery, competition and efficient service might have a chance, and the consumer might get some benefit. But there is not. And because of this, the trade

THE NAME SPENCE IS A household word in the world of heavy chemicals. SPENCE dates back to 1846 and its chemicals have always been respected for their high and consistent quality. Recently some interesting new products have been introduced, including materials for pharmaceutical specialities. An abridged booklet will gladly be sent to you giving a brief survey of SPENCE products, including:

Alum, Aluminium Sulphate, Aluminium Chloride, Aluminium Nitrate, Alumina White, Activated Alumina, Calcium Carbonate, Detergents, Pharmaceutical Alumina, Sodium Aluminate, Sulphuric Acid, Titanium salts, Silica, etc.

Beetle Cement, a product of B.I.P. research, binds together the laminated sections of this strong, light ladder.

A better ladder for the fireman

Firemen's ladders have always been made of ash, but ash is now difficult to obtain, and working from solid lengths is a wasteful business. Better ladders can be more economically produced by bonding together strips of ash with Beetle cement. The new ladders are made this way and they're stronger for it.

We're right at the top of the ladder in amino-plastics and we have helped to overcome many shortages of material, invariably improving the finished product in the process. So whether or not you yourself work in wood, you may find that a talk with our research and development workers means new, cheaper and better ways for you—

BRITISH INDUSTRIAL PLASTICS LTD.

THE BRIDGE BETWEEN

Every type of textile merchandise crosses this bridge more economically than by any other route. It brings the retailer the quantities he needs at the times he needs them, and thus bridges the seasons. For the wholesaler's buying transactions are often six to nine months ahead of market demand. It is a great tribute to the efficiency of the wholesaler that the toll of this bridge is so small.

Issued in the Interests of Economic Textile Distribution
The Wholesale Textile Association, 75 Cannon Street, London, E.C.4

has been left free, if it so wishes, to carve up each district into tied roads of its own choosing in which there will be the minimum of competition—and of service. Legally enforced monopolies are bad enough. But is not this the perfect case of the Government offering a freedom and the trade association ensuring that it remains, as far as they can contrive, a purely token freedom?

* * *

Executions in Greece

The execution of 152 Communists in Greece last Tuesday and the threat to shoot a further 800 of the prisoners, who have been in gaol for the past three years, has done much harm to the Greek Government. Such an action was not only an offence against the moral standards of their allies in the west, but also politically unwise if any peaceful settlement of the civil war is ever to be attempted. The British Government have expressed the dismay and disgust which this kind of reprisal always arouses.

Internally the executions, like similar executions during the war, can only serve to stiffen the antagonism of the Communists, enabling them to rally wavering fellow-travellers to their banner. Even in Britain it has brought about the extraordinary spectacle of the editor of the *Daily Worker* offering to lead fellow London editors in moral indignation against deeds more usually associated

with the type of totalitarian regimes which the *Daily Worker* upholds.

Shorter Notes

The month of March showed the highest number of houses completed in any month since the war. Twenty thousand permanent houses were completed compared with 16,000 in February and nearly 18,000 in December. At the present rate it should be possible easily to reach a target of 200,000 for the year. The labour force has remained almost exactly stationary, which is surprising in view of the widespread years of unemployment.

*

Too much should not be read into Sir Stafford Cripps' statement in the House of Commons on Monday that action concerning the activities of civil servants suspected of Communist leanings has been temporarily suspended. The Staff Side have been pressing for additional safeguards and talks have been taking place concerning this. There are probably far greater difficulties in resolving the divergent views of the staff associations, the Civil Service Clerical Association having a strong Communist streak among its leaders than for the other staff associations to agree with the Treasury. There appears to be no weakening in the Government's attitude.

Letters to the Editor

D-Day for Western Union

SIR,—I note your comments on my letter in your last week's issue. But when, during the war, was there "some pooling of sovereignty," some willingness to submit, in some defined questions, to the decision of a central authority," without which, to use your words, "Western Union is merely a phrase of deception?" What "central authority" was there in the case of the United States, the United Kingdom, and the rest of the British Commonwealth, save President Roosevelt and Congress on the one hand, and Mr Churchill and the Prime Ministers of the British Commonwealth and their Cabinets and Parliaments on the other? These authorities agreed to the creation of the Combined Chiefs of Staff and other combined bodies, which were under their direct control. And Commanders-in-Chief over all the combined forces

(such as General Eisenhower and General Alexander) were appointed, subject of course to the Governments and the Combined Chiefs of Staff, but with the very wide and immensely important powers Commanders-in-Chief must have.

If you mean that Western Europe must co-operate now, as we did in war-time, in unifying defence plans, in standardising arms, in preparing plans on the assumption of a unified command if war were to come, I am all with you, as I indicated in the last two sentences of my letter.

But that is a totally different thing from "some pooling of sovereignty." Congress and Parliament cannot transfer some defined part of their sovereignty to another "central authority" without the latter becoming in its sphere sovereign. If it were to be concerned with defence—which is hardly separable from foreign affairs and finance for defence—you would have created a sovereign body with authority over Western European defence, foreign affairs and finance. What sort of a body would it be, and to whom responsible?

If you mean that existing Parliaments and Governments should remain sovereign, but go as far as they can in creating, subject to them, Councils and/or Combined Chiefs of Staff and so on to co-operate, then that is what they are now doing. But in this case there is no pooling of sovereignty. In view of the amount of woolly thinking on this matter, it is highly important that we should be clear what we mean.—Yours faithfully, BRAND

[It is indeed important to be clear; that is what we have been urging. Lord Brand still seems to want it left unclear. He wants to pretend that there can be something deserving to be called "Western Union" without surrendering any sovereignty. We still insist that he cannot have it both ways. If he holds—as, behind his array of questions, he appears to—that it is foolish to talk of any surrender of sovereignty, then that is a perfectly tenable position (although we do not agree with it). But if so, he goes on talking about "Western Union" only at the risk of building up an enormous and dangerous misconception in Europe and in America. If, on the other hand, he is merely saying that the surrender of sovereignty—though desirable and possible in the end—is a very tricky business which cannot be rushed, then we agree with him subject only to the two reservations: (a) that everybody ought to be put clearly on notice that some eventual surrender of sovereignty is contemplated and will be accepted, and (b) that time is very short. What happened during the war is not strictly relevant; but we should have said that some of the Allies most certainly surrendered some of their sovereignty to the Combined Boards.—EDITOR.]

Consumption Up or Down?

SIR,—Detailed calculations must be reserved for another place. But, in view of Mr Worswick's difficulties, I should be grateful for space to recapitulate the logic of the steps in my argument.

1. We know the percentage increase in total wage payments and therefore the percentage increase per man employed outside the forces; we also know the percentage increase of salaries, interest, profit and rent per man so employed; we know the per-

centage rise in the price of imports. Therefore we can compute the average rise of overall cost per article of standard quality, assuming efficiency or output per head to be unchanged. I put this at 80 per cent.

2. We know from the reliable Board of Trade figure that the average rise of export prices was 130 per cent; the authors of the National Income White Paper give the rise of prices contained in home consumption as 61 per cent, ex subsidies and indirect taxes. This is a tremendous discrepancy.

3. We know that exports contain a high proportion of cost components that have risen more than the average (imports) and that home consumption contains a high proportion of those which have risen less (salaries). However generous an allowance one makes for this, and taking into account the production of capital goods, one cannot get as big a spread as that shown in the preceding paragraph. Mr Worswick, or anyone, may make the calculation for himself.

4. If, as we must believe, export prices were 130 per cent up, efficiency or output per man in production for export must have gone down considerably. This accords with the testimony of producers.

5. We are driven to one of two conclusions. Either (i) the figure of 61 per cent does not accurately represent the rise on the home front for goods of prewar quality, or (ii), despite the considerable fall of output per man of those working for export, the output per man of those working for the home market has risen very considerably.

6. The second alternative is not acceptable. Output per man may not have fallen so much on the home front as in exports, and I have allowed for that. It is not permissible to assume a big change in opposite directions in output per man in these two comprehensive averages, which contain many common items.

7. We are driven back upon the first alternative. The White Paper gives a lead in that direction by admitting that it has not allowed for changes in quality; and quality is notoriously down. Furthermore it is probable that in many cases prices actually paid are higher than reported prices. To accept the first alternative rather than the second is to embrace a probability rather than a gross improbability.

8. I conclude that, unless evidence is produced to the contrary, we may assume that home consumption is considerably down. I put the fall at 15 per cent per head, but subject to a margin of error.—Yours faithfully, R. F. HARROD

Christ Church, Oxford

Frontiers of Planning

SIR,—In your review article entitled the "Frontiers of Planning," you say, "... would even Professor Jewkes suggest that competitive buses be allowed to cream off the rush-hour traffic by cutting fares?" Thereby you imply that, at any rate, in the important public service of road passenger transport, the results of competition are manifestly unacceptable. But why this horror at "competitive buses" coming in just at the time when they are most urgently needed, i.e. at the rush-hour? I take it that in fact you would not object to more and better buses coming on to the roads in the rush-hour *per se*, but that you take exception to the general relationship that is likely to arise under competitive conditions between peak and off-peak hours as regards fares and services. May I try to describe what that relationship is likely to be, and persuade you that it has something to be said for it

after all, particularly from the point of view of providing for the rush-hour?

The operator, working for profit, will continue to work into the valley hours just so long as the extra costs, which he must incur to provide that service, are covered by revenues earned. (Once in service those costs may be quite small, but will include petrol and oil, some wear and tear, and wages in certain, though not in all, circumstances.) But when effective demand falls off to such an extent that revenue no longer covers such relatively small costs, he will cease operation. If any operator goes substantially beyond that point he will be incurring losses. Similarly, if he ceases to operate substantially beforehand, he will be missing opportunities. So that the keener the competition, the nearer to that point will all operators have to keep.

Question, do we really want operators to work into the off-peak to a greater extent than they would in competition, i.e. to incur expenses, uncovered by revenue? Alternatively, do we want them to work to a lesser extent? I would point out that, unless an outside subsidy is obtained, in either case a burden is necessarily put on the peak-hour traveller in the form of higher fares or less adequate services—to make up for the losses incurred or opportunities missed in the valley hours. Again, short of a subsidy, I see no position more favourable to meeting the peak demand than what may well be described as the competitive position. And if there are times when revenues are so meagre as not even to cover the extra (or marginal) costs of keeping the service going, are there not better ways of providing for the few travellers concerned than by adding to the difficulties of providing for the great majority of travellers who travel in the peak? One solution may well be price differentials as between peak and off-peak periods. This may sometimes require a relatively high level of fare at the off-peak periods, though not always.

There may be many other good reasons for deliberately establishing monopolies in the case of road passenger services. But the "cream of the traffic" argument does not seem to me to be one of them.—Yours faithfully, G. J. PONSONBY,

London School of Economics

Houghton Street, W.C.2.

Bottleneck in Bearings?

SIR,—In your issue of April 17th under the above heading you refer to a suggestion made by me that the bearing manufacturing plant still remaining at Schweinfurt should be removed to and operated in England and the bearing industry in Germany ended. You consider that it would be unfair to attribute this suggestion to anything other than the "exuberance of success."

The proposal that Germany should not be permitted to have an anti-friction bearing industry was made, I understand, by the Allied Military Authorities as a simple way of controlling the production of war material.

My suggestion was made with a view to helping Great Britain, if this policy regarding Germany is still to be followed, to take the leading place in this industry in Europe (described by your correspondent as "rudely efficient"), which has so long been held by Sweden.—Yours faithfully,

MICHAEL DEWAR,
Chairman of British Timken, Ltd

22, Bruton Street, W.1

From The Economist of 1848

May 6, 1848

We deeply regret to observe that the advisers of the Queen have committed her to the exploded fallacy of "giving encouragement to the trade and industry of the United Kingdom," by recommending the exclusive use of British manufactures. A few days since the *Court Circular* contained the following notice:—

St. James's Palace, April 29.

The Lord Chamberlain has been commanded to announce to the ladies who shall attend the drawing-rooms, and shall be honoured with invitations to Buckingham Palace, that her Majesty the Queen, ever desirous of giving encouragement to the trade and industry of the United Kingdom, and particularly so at this time of commercial depression, would wish to see them in dress of British manufacture.

Even were no violation of a great and now almost universally acknowledged principle contained in the above notice, common prudence and policy should have prevented the appearance of such an announcement in a British journal, and especially as coming from the British Court. No doctrine more dangerous or suicidal for British interests could be promulgated to other countries. We, more than any other people on earth, depend for the employment of our population upon the consumption of British manufactures in other countries.

Such a notice, moreover, at the present moment, is on other grounds unfortunately little called for. Lyons, as well as all the other manufacturing towns of France, which usually contribute so much grace and good taste to the toilette of English ladies, and offer so much that is worthy of imitation by the British manufacturer, are no longer either makers or sellers of goods. The arts of peaceful industry have succumbed to the anarchy and confusion of revolutions. But whatever the practical effects of such a notice at this moment, the great objection to it is that so false a doctrine should receive so high a sanction.

THE FEW ...

... And they were surprisingly few, who came to stay with us over Easter, enjoyed themselves immensely.

We say "surprisingly" because even without a car this lovely Island is very easy to get to. There are plenty of fast, comfortable trains to Plymouth, whence an Hotel car can meet you. Once you have arrived, the charm of your surroundings, the excellent service and sheer comfort of its modern Hotel make Burgh Island unrivalled as a resort at which to relax and enjoy yourself, if only for a few days.

So don't miss the chance of a glorious Whitsun down here. The climate is so mild, and the Spring flowers are adding much to the natural beauty of South Devon.

AMERICAN SURVEY

Priorities for Economic Aid

(From Our US Editorial Staff)

IT was apparent at the Bogotá Conference that the interest of the Latin American nations in the Pan-American regional organisation was less than enthusiastic. The comment by one South American delegate, that the conference was made up of two blocs, one asking and one denying, the first including all the nations except the United States, and the second the United States only, underlined the general feeling that the issues before the Conference were highly artificial.

For the United States, Mr Marshall made it clear that there will be no direct advances of US funds to Latin American countries, and his suggestion of American private investments brought only the politest of applause. The emphasis of the US delegation on the advantages that will accrue to Latin America through off-shore purchases under the Marshall Plan and the revival of traditional triangular trade between the United States, Western Europe, and Latin America was likewise coldly received. The reaction was that European deliveries, in Europe's present condition, are hypothetical, and that rather than chase around two legs of a triangle, it would be preferable to reach the world's only area of surplus by the shortest distance between two points.

It is possible that this is the first appearance of a negotiating pattern that will become increasingly familiar. Today the upper part of the North American continent has a rate of production from which something can be set aside and still leave the standard of consumption high, fantastically high compared to that of most other areas. Europe, and particularly Britain, whose savings in the past have financed the development of more backward areas, are today deficit areas, where standards of consumption are on the decline. Under such circumstances, the number of claims on the American economic surplus are so great that the establishment of a set of priorities—harsh priorities—is the only alternative to a planless dissipation of assets.

★

The European recovery plan is the first expression of that system of priorities. Its basis is readily defensible. Spectacular war damage, and the less spectacular depreciation and lack of development during the war, have sharply reduced productivity in an area where production per man hour has been great enough to provide a surplus in the past. Revived activity in this area consequently promises the greatest yield on the American investment. Europe also enjoys a political priority. The loss to Communist domination of the economic capacity that exists in Western Europe would be a greater blow to the United States than any that might be sustained elsewhere. The restoration of that capacity has corresponding advantages. But the Latin American reaction at Bogotá showed that this theory of priorities, however sound, provides a very negative answer as to what is to be done elsewhere.

Beyond its belief in political civil rights, and in the dignity of the individual which is their foundation, the major tenet of

the American system is mass production and broad distribution of goods and services. At three successive press conferences Mr Hoffman has emphasised that the test of ERP is the extent to which the participating countries can increase production and distribution, partly by treating the resources of Western Europe as a whole and making the most of them through mutual aid, partly through the best use of American help. This policy and the conditions which make it effective have not been clearly extended to countries outside the scope of the Marshall Plan.

Yet it is unlikely that the decision to give priority to Europe can suffice without a similar policy for other areas. Before the war Europe was great both because of its own productivity and because Europe, and particularly Britain, was the hub of world trade and the recipient of returns on major investments made by European capital elsewhere. The success of ERP will be limited to what can be accomplished locally in Europe unless increased world trade can follow the restoration of Europe's capacity to produce. As time goes on the labour of the men who struggled over the International Trade Organisation at Geneva and Havana, and the Reciprocal Trade Pacts in Washington, may seem to have been less an excursion into the hypothetical than it did while "realistic" ERP negotiations were going on.

Latin America, as the Argentine report quietly released during the conference joins the US delegation in forecasting, will probably secure considerable benefits from ERP, at least over the short term. But when world shortages become less severe, problems of high-cost production loom in a good many of the Latin American countries: in Chile for nitrates; in Bolivia for tin; in Venezuela for oil; in Brazil for cocoa and coffee. To the extent that Latin American trade with Europe prospers, direct economic intervention on the part of the United States may be avoidable for the time being. During that interval, machinery can, perhaps, be found for activity under United Nations auspices which will make less acute the political polarity noticeable at Bogotá. The current interest of the Latin American countries in the United Nations as contrasted with their disinterest in regional organisation is an indication that they hope to find safety in numbers. On the other hand, the Latin American nations may use their votes in Uno to bring political pressure on the United States to diversify the current system of its economic priorities.

★

The events in Colombia at the time of the conference flamboyantly illustrate the political problems raised in many countries by US economic aid. Latin American delegates to the conference pointed out that the caloric intake of Latin Americans is lower, and has been lower longer, than that of Europeans. They argued that this was a good reason why priority should not be given to Europe. But such consideration for the underdog has not been a feature of the Colombian government's domestic policies, although the cost of living has been shooting upwards. The Conservative President holds office by a plurality won in a three-cornered contest against two divided wings of the Liberal party but, since the beginning of the year, the Conservative-Rightwing Liberal coalition has been disintegrating. It was against this background that the riots took place. Help from the United States for countries in any part of the world means help to the governments in power there. Once economic installations are made, such as the transportation equipment, hydroelectric generators and steel mills that the in-

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

dustrialisation of a country requires, the dilemma arises of a need for order, lest these facilities be wrecked by revolutionaries, and the progress towards higher living standards be sabotaged. But the existence in the world of a source of wealth as disproportionately great as that of the United States means the existence of political power. It may be exercised unconsciously, or, as is more likely in these days, it may have conscious policy behind it. That policy may be adroitly exercised, or it may not. How good that policy is, and how adroitly exercised, is likely to be subject to periodic check in terms of Communist tactics.

Electoral Geography—II: The South

[FROM A CORRESPONDENT IN VIRGINIA]

A CARTOON recently published in the *Washington Post* showed Mr Truman viewing the dismembered pieces of the Democratic Party donkey; the caption was: He has partitioned here, all right! At a recent two-day session at Atlanta, Georgia, Democratic leaders from Florida, South Carolina, Georgia and Mississippi explored possible ways of making Mr Truman feel their displeasure with his civil rights programme for the Negro. This programme was necessary to counteract the promises Mr Wallace was making to minorities in key States like New York and Illinois and the known Republican intention of bringing a series of civil rights Bills into Congress just before the end of the session, leaving the onus of their rejection on the Democrats.

But its necessity does not make it any less infuriating to the Southerners. They have several alternatives. They can walk out of the Democratic convention and nominate a candidate of their own—who would probably be Senator Byrd of Virginia—as the South did in the election of 1860. They can stay in the convention and use their votes to bring pressure on Mr Truman and the party platform. At a later stage, if they are still unplaced, they might withhold their votes in the electoral college from Mr Truman in the hope of throwing the election into the House of Representatives.

None of these ideas is really very promising. A Fourth Party would be a lost cause and an expensive one. Since the abolition of the rule that a two thirds majority be required for any decisions taken at the Democratic convention, the South has not been strong enough to dominate the party. The possibility of forcing the election into the House of Representatives in order to chastise Mr Truman is even more remote. Such a strategy would require, in the first place, Democratic victory at the polls, and then the willingness, on the part of all the thirteen Southern States, to throw away the victory. Actually only seven State Governors participated in the "semi-secession" move which followed Mr Truman's civil rights message. It is not surprising that the leaders of the Southern rebels confined their threat to the menacing, but empty statement: "Our strategy will be revealed as the battle rages." This week the course of the battle favoured them. The Alabama Democratic primary has, apparently, been won by candidates pledged to oppose Mr Truman or anyone who supports his civil rights programme.

Hence the yearning for General Eisenhower's candidature expressed by Democrats of varying backgrounds. He could put the donkey together again. And not only that—he could quite likely ride him to a win. The wistfulness of most Southerners is expressed in the statement:—

While he stands upon the previous renunciation, many of us believe that under certain conditions he would yield to a draft. If the Republicans should submit to the reactionaries now eagerly reaching for power, the General might regard it as a patriotic duty to become a candidate.

As to the General's attitude on civil rights legislation, Senator Eastland of Mississippi, addressing the American Society of Newspaper Editors on April 15th, made a point of a sentence in General Eisenhower's recent testimony before Congress:

"You can never make people love each other by passing a law."

But if Senator Vandenberg or Mr Stassen is the Republican nominee, Southern and Northern Democrats alike have little prospect of anyone but Mr Truman being their candidate. In such a situation will the South, or some Southern States, vote Republican? Mr Virginius Dabney, of the *Richmond Times Dispatch*, also addressing the Newspaper Editors, forecast support of the Republican candidate by an unprecedented number of Southern papers, especially if he be Senator Vandenberg or Mr Stassen. After all, Mr Hoover carried seven of the thirteen Southern States in 1928: Florida, Kentucky, Maryland, North Carolina, Tennessee, Texas and Virginia. Such a result might come about in either of two ways: the Democratic organisations might release party members from the party pledge. (A formal release would be necessary because party membership, and with it the right to vote in the party primary where, in the one-party States, most matters are decided, can be challenged on the ground that a voter did not vote the party ticket in the previous election.) Then everyone could vote Republican this fall and Democratic next time. Or the Republicans might win because two lists of Democrats were on the ballot. In Virginia, if Mr Truman is the candidate, this seems likely to happen. The efforts of the Democratic organisation to find its way out of the Democratic Party have produced some curious constitutional results.

★

Normally, the ballots in the various States carry the names of the presidential candidates and with them the electors nominated by the parties to cast the State's votes in the electoral college for those candidates if their side wins. By a long tradition, dating from the time that parties became a recognised factor in national political life, members of the electoral college have been bound to support the candidate of the party under whose auspices they appear on the ballot. But at the recent meeting of the Virginia legislature, representatives of the Byrd organisation introduced a Bill which, as initially drafted, would have kept the names of all candidates off the ballot and left the citizen to vote blindly for a list of electors whom the state executive of the party would subsequently instruct how to vote. Their objective was colourfully summarised at the public hearing in the state capital when an elderly Negro testified: "I remember readin' a story once about William Tell. Now Mr Truman is the apple on the head of the Democratic party. But gemmun, I tell you you is goin' to kill that party if you keep on tryin' to shoot off that apple."

The move was advertised as a return to the electoral practice of the Founding Fathers, who, after perhaps more discussion than was devoted to any other clause in the constitution, decided that if the voters in each State picked the best men of their State to represent them in the deliberations of the electoral college, the choice of the executive would be a wise one. But the device has become meaningless because of the subsequent development of political parties, through which candidates offer themselves to the voters and are supported on a national basis. The Tuck Bill proposed that electors should serve not as uninstructed representatives—which was what the Founding Fathers wished—but as delegates who would receive and be bound by instructions from the party executive after the popular voting was over.

U.S. Business Bulletin

THE first issue of this bulletin was posted to subscribers on May 5th, 1948. Full details of this new fortnightly review of U.S. economic affairs, and a specimen copy of the first issue, can be obtained from:

The Economist Intelligence Unit,
22, Ryder Street, St. James's London, S.W.1.
TELEPHONE: WHITEHALL 1511

Many Virginia citizens did not take kindly to this request for proxies. The bland paternalism of the Byrd organisation, one of whose most successful techniques, over the years, has been to minimise discussion of public issues, found itself unable to control the outburst. Mr Douglas Freeman, editor of the *Richmond News Leader* and author of monumental volumes on Lee and his lieutenants, is normally able to view contemporary issues with historical perspective and corresponding calm. But Mr Freeman demanded that his fellow citizens "Rise Up and Take a Vow"—the vow that no one associated with the iniquitous measure should ever hold public office again. The *Richmond Times Dispatch* inquired: "Vote Ja, for Whom?"

The machine promptly moved to revise the Bill, so that the names of candidates will now appear on the ballot, but at the same time the legislature voted that the State Corporation Commission should investigate the Richmond papers to see if they were a monopoly. (They have been under the same ownership for the last ten years.) When the papers replied that this coupled the attack on the freedom of election with an attack on freedom of the press, an effort was made to rescind the resolution—but failed for lack of a quorum.

So two Democratic lists, one offered in the name of the Democratic Party by the Virginia State organisation, and one offered by non-bolting Virginians in the name of the National Democratic Party, will be on the November ballot if Mr Truman runs. Perhaps the most interesting effect is the opportunity this will offer for a test of the strength of the Byrd organisation in the State. But it will provide only a detail in the vast electoral picture in November.

American Notes

Stalemate in Ohio

Mr Stassen had much to gain but less to lose in the Ohio Republican primary; the reverse was true of Senator Taft. In the event each has suffered a definite, but not irretrievable, setback. When Mr Stassen first announced his intention of fighting Senator Taft in the State which is the heritage as well as the home of the Taft family, the Senator was not prepared to concede the intruder even one of Ohio's 53 convention delegates. By the beginning of May, Mr Stassen was riding the wave not only of his Wisconsin and Nebraska victories, but of his unexpected success in Pennsylvania, and the Taft supporters were reminding the public that it was not unusual for a challenger in Ohio to win between four and nine delegates. Mr Stassen himself was hoping for twelve; he was only opposing 23 of the Taft candidates, so that complete victory was out of the question. The final figure of nine delegates for Mr Stassen was probably about what both sides had expected, but neither will feel enthusiastic about it.

Mr Stassen organised his Ohio campaign with care, and challenged Senator Taft only in the 11 districts where the Senator had shown weakness in 1944 and where a strong labour vote would make his clearly labelled responsibility for the Taft-Hartley Act a liability. Senator Taft took his stand on his own record in Congress, and defied Mr Stassen to prove that he was a better liberal or internationalist. But in primaries, policies count for less than personalities and local ties: the choice of Ohioans is evidence not so much of their approval of the Senator's political theories as of their refusal to desert their traditional, even if uninspired, leader, and possibly also of their resentment at the invasion of the glamorous newcomer.

Nevertheless, Senator Taft now goes to the Republican convention without the solid support of his own State, a serious handicap, especially when his vote-getting ability elsewhere is so demonstrably weak. The effect of the Ohio result on Mr Stassen's chances will be largely psychological; it will certainly slow the pace of his bandwagon, but it has been gathering speed at an almost dangerous rate, and a check at this point may not be altogether unwelcome. Success attracts opposition, and this, too, may be checked. Victory in Ohio, which would have proved Mr Stassen's ability to defeat a well-organised machine and to gather votes in industrial as well as agricultural areas, may have seemed less important after the demonstration in his favour in the industrial areas of Pennsylvania, where the Republican machine is also strong. He did not win convention delegates in Pennsylvania, but with little effort on his part about 75,000 voters took the trouble to write in his name on their ballot papers as their choice for Republican candidate, a significant sign of his popularity in

the East. Only 70,000 wrote in Mr Dewey's name, compared with 146,000 in 1944. In two weeks' time in Oregon Mr Stassen will be matched against Mr Dewey and the result may give some clearer indication than exists at present of who is likely to win the final game at Philadelphia in June.

Defence for the West

The consequences of the Czechoslovak coup, like the ripples produced when a large stone is thrown into a pond, continue to widen. They have reached the United Nations; the pressure to revise its structure to minimise the influence of Russia and her vetoes has become so strong that committee inquests on the United Nations are being held in both the House and Senate. Some of the boldest and most persistent demands for revision come from men who were among the earliest advocates of a strong international organisation. Mr Marshall, in his testimony to the House Foreign Affairs Committee, made a vigorous attempt to stem this tide. He made clear his view that no changes in machinery could get to the root of the trouble, while to abandon the United Nations and seek to establish a new world organisation without the Russians would destroy what slender possibility remained of preserving the world community. He went on to contend that even if the Russians acquiesced in the elimination of the veto power, it must be maintained to protect American interests. Thrusting aside hopes of any quick mechanical remedy for the deficiencies of the United Nations, Mr Marshall insisted that the ability of democratic peoples to preserve their independence rested upon their economic and political health. These could best be restored through economic aid and the extension of American support, under the Charter, to the arrangements some of the democracies have concluded to provide military bulwarks for peace and security.

Apparently authoritative rumours also forecast an early request to Congress by the President for authority to lend-lease military supplies to non-Communist countries, or to approve a joint resolution recognising the American intention of coming to the aid of the Brussels Powers if they are attacked. On this issue the President's political weakness is almost an advantage; Republican co-operation is not being withheld in the fear that the President will be able to make political capital of the revolution in foreign policy.

But it is nip and tuck whether such a last great achievement of the bipartisan foreign policy can be ratified before all American eyes turn inward to the Presidential race. The result of the Italian election has eased Congressional tension. The Republican convention, the great drama of this year's election, is only six weeks off. Congress hopes to adjourn on June 15th. Mr Eaton, head of the House Foreign Affairs Committee, which asked the Administration to submit a Bill for military lend-lease, fears it is already too late for action this session. The Administration has run into difficulties in devising a military fence which would encircle, not only the Brussels Powers, but the whole non-Communist world; it is reluctant to act without prior assurances of Congressional support; and it hopes that evidence to convince Congress that western Europe is not neglecting its own defences will be forthcoming from London.

American Defence

If devices for marshalling the American military potential behind the defence of Europe are still in the formative stage, the outlines of the new American defence programme are becoming clearer. The commentators, at least, have finally ferreted out the source of confusion. It is whether America is to be prepared for a challenge in 1948 or 1952; whether America must mobilise all her resources this summer, or may hope for time to develop overwhelming strength. The signs are that Congress is determined to be prepared for all eventualities. Mr Forrestal's attempt to appease the advocates of air supremacy by stepping up the Administration's programme for aircraft from 55 to 66 combat groups has fallen flat. Congress has not been slow to see that the chief new ingredient in the Administration's prescription consists of taking 300 B-29s out of storage; and Congressmen demanding modernisation cuttingly compare the Administration's "mothball" air fleet to the jet-propelled vision they cherish. This is highly prejudiced. The B-29s at least exist; the jets are on paper. But Mr Forrestal virtually gave the game away when he admitted that the Joint Chiefs of Staff felt the Administration's programme was inadequate from a military point of view, and supported it only because it would not strain supplies of

UNDERWOOD ELLIOTT FISHER SUNDSTRAND *Speed the World's Business*

In thousands of offices
throughout the world...

Underwood Elliott Fisher and Sundstrand Office machines are giving wings to writing and figuring... speeding routine, lightening demands on labour, and effecting valuable economies by their incomparable flexibility, efficiency and reliability. Whatever the volume and nature of the business, however simple or complex the problem, a complete range of equipment covers every

writing and figuring need—Typewriters, Adding Machines, Accounting Machines. Our Technical Advisory Service, with the experience of thousands of successful installations, is specially qualified to survey your accounting problem and suggest machines that will handle the work more effectively and at less cost.

IF YOU PLAN TO ATTEND THE

Canadian International Trade Fair

TORONTO, MAY 31 TO JUNE 12

Please let us know at once so that we may arrange the accommodation you require. Thousands of businessmen are coming, and your early advice will help us to serve you better.

For this purpose, write directly by Air Mail to the Canadian International Trade Fair, Exhibition Grounds, Toronto, Canada.

Applications for dollars by firms through their own banks, for their accredited representatives, will receive every consideration by the Bank of England.

For full information concerning the Fair, or if you have any difficulty in obtaining your passage either by sea or air consult your nearest Canadian Trade Representative.

LONDON: R. P. Bower, Commercial Secretary, Office of the High Commissioner for Canada, Canada House, Trafalgar Square, S.W.1.

LIVERPOOL: M. J. Vechter, Canadian Government Trade Commissioner, Martins Bank Building, Water Street.

GLASGOW: G. F. G. Hughes, Acting Canadian Government Trade Commissioner, 200 St. Vincent St.

BELFAST: H. L. E. Priestman, Canadian Government Trade Commissioner, 36 Victoria Square.

materials and manpower. The Senate Appropriations Committee, by a vote of 16 to 1, has now placed itself squarely behind the vote of the House for a modern 70-group Air Force.

There are likely to be greater divergences between the Senate and House on the calling up of manpower than over what General Bradley has stigmatised as "cheque-book warfare." The Senate Armed Services Committee has "married" conscription and universal military training by providing in a single measure for the call-up of about 190,000 19 to 25-year-olds for the Armed Forces in the first year, and the training each year of about 161,000 18 to 19-year-olds. The scope of both draft and training is to be selective and strictly limited; even military training, instead of being universal, would apply to only about 25 per cent of the country's youths. Except for the fact that trainees could not be sent overseas in time of peace, there would seem to be few differences between the conscripts and trainees. President Truman has termed this compromise an acceptable, though not ideal, substitute for two separate schemes for conscription and universal military training independent of each other. The House Committee has also produced a conscription Bill, but stubbornly refuses to couple it with UMT, even though the joint system would be cheaper. If each House follows its committee, there will be a hard knot for the conference committee to unravel.

* * *

Interim Government

When the Republican certainty of victory in November leads the Senate Appropriations Committee to vote \$50,000 to "get the White House in good shape for next year," it is merely amusing. But when it leads to delays in the reappointment of the Atomic Energy Commissioners and in the renewal of the Trade Agreements Act, the security of the nation and the continuity of its economic foreign policy are threatened by political expediency.

The original appointments of the five Atomic Energy Commissioners expire on August 1st and President Truman has sent to Congress their renominations for staggered terms of from one to five years, in accordance with the Atomic Energy Act. Mr David Lilienthal has been renominated for a five-year term, and Senator Taft's opposition to this "New Dealer" is as unyielding as it was during the bitter struggle over his confirmation last year, although some of his colleagues now seem ready to judge Mr Lilienthal on his demonstrated ability. Others, however, maintain that a new President must not be bound throughout the whole of his term by the choice of a defeated predecessor, and propose to extend the present appointments for one or possibly two years in order to avoid a repetition of last year's unsavoury controversy. The President insists unyieldingly that the long-term continuity which the Act was designed to establish is essential to the development of atomic energy, in which there is no place for politics.

The President has given notice to Congress that failure to renew his authority to negotiate reciprocal trade agreements, which expires on June 12th, would undermine the country's foreign policy and make it impossible for Europe to make payments for aid received under the Economic Co-operation Act. It would also undermine the agreements negotiated at Geneva and the proposed International Trade Organisation. The President was reacting to Congressional attacks upon the trade agreements policy, which this year, as in the past, take the form of amendments renewing the Act for one year only and giving Congress a veto power over individual agreements. The President's supporters argue that this would constitute a notification to the world that the Republicans intend to abandon the trade agreement policy, but this should not be taken for granted. The more responsible Republicans share the President's realisation that it is inextricably bound up with the European Recovery Programme, and it is noteworthy that few of the opponents of the Act are prepared to face the charge of economic isolation that would be heard if they allowed it to expire.

* * *

The Courts and Civil Rights

In Congress the civil rights programme for minorities is not much more than a party pawn. The Republicans are pressing forward anti-lynching and anti-poll tax legislation which they hope will widen the chasm between the Southern Democrats and Mr Truman, and exhibit Southern Senators in the unsympathetic role of filibustering for the right of mobs to take the law into their own hands. The great advances in civil rights are being written by the Courts. In January the Supreme Court

ordered Oklahoma either to admit a Negress to the Law School of the State University or to provide truly equal educational facilities elsewhere. Last month it upheld a lower court which had declared illegal the South Carolina "white primary." (This State, in order to evade an earlier ruling that Negroes may not be prevented from voting, invented the fiction that the primary, which in a one-party area like the South is the important election, was a private function of a private club, the Democratic party.) This week the Supreme Court has ruled that the Fourteenth Amendment prevents the States and their courts from enforcing residential agreements which bar Negroes from living in certain areas.

Men of yellow skins as well as black have sought, and found, relief. Not long ago the Supreme Court ruled that California was wrong in seizing land belonging to a minor of Japanese ancestry but American by birth. The majority decision merely overruled the application of the California Land Law in this particular case, but five justices wrote separate opinions criticising, as unconstitutional, the law which California passed in 1913 to prevent Japanese residents from owning agricultural land. In California itself, a Federal judge has restored American citizenship to 2,700 people of Japanese descent who signed statements of renunciation at Tule Lake, the notorious segregation centre established for Japanese hastily moved away from the Pacific Coast during the war. The Judge, commenting on the "unfortunate saga of Tule Lake," remarked that even expediency could not remove the "taint of unfairness" with which the renunciations were marked.

As Andrew Jackson once said of a decision of Chief Justice Marshall, "Mr Marshall has made his decision. Now let him enforce it." In the South many alternatives to the white primary exist and others are being explored. Of nearly 5,000,000 Negroes of voting age in the South, only about 600,000 are able to meet the character, poll tax and literacy requirements which bar the way to the polls. On residential covenants, which are a more explosive issue in the North than in the South—where no Negro would dare move into a white district—the Court agreed that the covenants themselves were perfectly legal, even though it would be illegal for the States to enforce them. Pushing back the frontiers of civil rights is slow work.

Channels for Exports

The Administration is having some difficulty in explaining why it is not employing more vigorously the export controls Congress extended so reluctantly last year. The change springs, of course, from suspicion of Russian intentions. How far the United States will go in banning exports to Russia is of importance to western Europe because of the clauses in the Economic Co-operation Act which urge the Administrator to keep the Russian trade policies of the Marshall countries in line with American export policy.

The longshoremen who recently refused to load a Soviet ship summed up American views concisely when they said they did not want any of the cargo shot back at them later. The Administration has attempted both to appease and to reason away this agitation, which is led by Mr Harold Stassen, now a formidable contender for the Republican nomination. Russian trade is important to the United States for two reasons. It brings in scarce metals and minerals, such as manganese and chrome, without which the United States "would be very much embarrassed," in Mr Harriman's phrase. It also helps to keep open a door through which goods will flow to western Europe. The Administration has conceded, however, that the export of surplus American war materials is perhaps unwise, and the State Department is empowered now to veto the sale to Russia of aircraft, aircraft engines and spare parts. The advice of the Services is being sought on whether the export of machine tools, agricultural machinery, automobiles and lorries should continue freely. Mr Harriman has also suggested that import controls might be employed against Russia if she endeavoured to pay for her American purchases by furs and other luxury articles, rather than the chrome and manganese the United States needs.

Russia represents the extreme case for export controls. But the majority of exports to Europe worth over \$100 are also under licence, in an effort to see that Europe does not spend its own and its Marshall dollars unwisely or drain goods in short supply. This week's relaxation of the requirement for a list of relatively abundant commodities was drafted by a committee representing the Atomic Energy Commission, the Armed Forces and the Departments of State, Agriculture, Interior and Commerce—an indication of the wide importance now given export policy.

THE WORLD OVERSEAS

Report from Germany—III

Changes in Bizonia's Foreign Trade

(From Our Special Correspondent)

IMPORTANT reforms are in progress in the foreign trade of Bizonia. They began in January, when the controlling body, the Joint Export-Import Agency (JEIA) was reconstituted. It became a virtually autonomous organisation, operating under a charter, and responsible only to its board of directors, on which the Americans have the post of chairman and a majority vote.

JEIA was reshaped with the idea that it would henceforth be a streamlined, businesslike organisation which would cut away from itself the mass of restrictions which made traders inside Germany and out feel that life was too short for dealing with it; and then, to hand over their trade to Germans, keeping only overall supervision and control of foreign exchange.

The Agency has had to deal with two basic faults, firstly that Bizonia is externally a dollar area, and secondly that the internal price structure is completely senseless. JEIA has attempted the impossible. It has tried to please everybody, and has succeeded in pleasing nobody. Subjected to constant complaints about German competition, it has tried to sell at a price which would not undercut the British or American market; and at the same time, it has tried to secure the maximum proceeds for German exports in the interests of the British and American taxpayers. The Agency has hitherto had to ignore the German internal price, since the Allied Control Council in its quadripartite wisdom had decreed that the price stop should be maintained which Hitler's economists imposed in 1936 as an offset to the inflation caused by the Nazi rearmament programme. At that time the prices of related groups of commodities were in line with each other, as well as with world prices. Even under the regime of Dr Funk, however, they became distorted and unreal, and subsidies were resorted to in order to patch up the façade. After the collapse, the whole price structure became a crazy fiction. Prices no longer bore any relation to each other, and still less to those on world markets.

In the beginning of April, however, the first step towards a reform of the financial structure was taken. It was decreed by Military Government that the isolation of German internal prices from the world market must be ended, and internal prices brought into relation to the real cost of imported materials and the cost of production. The price stop has officially gone.

For imports and exports, a single conversion rate of 30 marks to the dollar (13.45 to the £) has now been fixed, instead of varying rates chosen in order to arrive at the "world market price." In future the German exporter will receive the full value of his goods, paid to him in marks at the 30-cent rate, instead of, as hitherto, the 1936 price. And the importer will pay for his raw materials at the same rate, and pass on the cost, which will be fully reckoned in the cost of production. Hitherto, it has been completely immaterial to the German what price was paid or received by JEIA for imported or exported materials. The 30-cent rate, contrary to some interpretations, is not a rate of exchange but a temporary conversion factor adopted as a preliminary to the fixing of a rate of exchange after currency reform.

Will German Goods Compete?

A great incentive has now been given to the Germans to export. It will become really effective if currency reform gives real value to the marks in which he is paid. Exporters retain only 10 per cent of their proceeds in foreign exchange, for use in purchase of materials and incentive goods for workers.

On the other hand, Hamburg business circles have already complained that the 30-cent rate greatly overvalues the mark, and will make it impossible for Germany to compete in world markets. It must be borne in mind that even now the exporter will not be able to take his internal price and reckon it into foreign currency at the 30-cent rate in order to arrive at his export offer. That would be contrary to the object of the measure, which is to raise German prices to some approximation of the world

level. JEIA will still intervene, and try to see that the Germans do not undercut or overcharge. It is hard to see how this clog in the mechanism can be avoided until German internal prices are adjusted.

The adjustment of internal prices will be an extraordinarily difficult and slow process. How, the Germans are asking, can they estimate the cost of production, and the part played by imported raw materials, when the greater proportion of business is carried out by barter? How can the cost of labour be estimated, and how can wages be adjusted to meet the present decreed rise in prices, when the food or the goods which the workman receives are virtually the only wages that count? It is intended that the first rise shall be made before currency reform, and that prices shall then be adjusted further, until a level is found at which new government controls can be imposed. The Germans speak of a probable rise of 50 per cent in prices and 40 per cent in wages; but it is clear that many such theories will go by the board. Everything hangs on the success of currency reform proper.

Owing to the abnormal conditions in the German economy, some exports will probably have to be sold at a loss in order to keep to the world price level. Details are not fixed, but it is proposed that, in cases where the selling price works out at less than the internal German price, the exporter will receive some form of subsidy out of an equalisation fund.

Textiles may be one of the commodities which will be hard to sell at the 30 cent rate; Japanese competition is being felt. In order to get rid of quantities of low quality goods manufactured from American cotton under a mixed US Government and private credit, JEIA is inducing the Dutch to buy for Indonesia with the promise to take some of Holland's surplus vegetables for Germany. If they do not agree, it appears that the Dutch may as well put weed-killer on their lettuce, since the normal market in Germany is unlikely to be restored. On the other hand, it has hitherto been found possible to sell German pharmaceuticals at approximately world prices, taking as high a value to the mark as 80 cents.

Coal is excepted from the new conversion rate for exports. The internal price has, however, been raised, though a subsidy will still have to be paid to the mines. The price of steel has also been separately raised, to cover cost of production. (Only a nominal quantity of semi-finished steel will be exported, in the first Marshall year, if the Germans have their way. As was pointed out here last week, steel is to be imported. Opinions differ on the question whether some German steel might be spared. If various provisos are met, the industry may be producing at the rate of over 7,000,000 tons a year by the second quarter of 1949; and it could probably compete with other exporters in price.)

Staple foodstuffs have also been exempted from the new conversion rate, in order to prevent a steep rise in the cost of living, which would be felt after the currency reform.

New Freedom for Traders

The new conversion rate is the most important, but not the only change in Germany's foreign trade. JEIA has been relaxing its grip to a large extent since the beginning of the year. German export-import firms are gradually taking up their prewar role in handling business. The bulk of German trade before the war was in small contracts; hence the importance of the decision made last February to allow "open-end" licences for the conclusion of contracts up to \$10,000 without prior approval of each transaction by either JEIA or the State Economics Ministry.

Many other relaxations have followed, each revealing the basic difficulty of how to give Germans freedom while they are still financially dependent. As a small instance of the problem it may be mentioned that, as soon as sample post was re-introduced, almost the entire available export supplies of cutlery vanished abroad, presumably to return in the form of food parcels. And

when JEIA allowed Germans to go buying for themselves, it was found that they did not care what they paid with their dollars. Complaints were at once heard that they were forcing up the market for scarce goods.

It appears as if Germany's entry into ERP (details of which were given last week) will solve its import problems. General Clay has stated that imports totalling \$1.7 billion will flow into Bizonia in the first year; and this is as much as, or even more than, the economy can digest.

So far, however, it is not clear how far ERP will solve the problem of how to buy from Germany. Hopes are placed in Marshall dollars; it seems certain, indeed, that the 16 nations will be provided with "off-shore" dollars for buying from Germany. The ERP Administrator announced on May 1st that \$6,455,000 had been given to Italy, Holland and France for buying Ruhr coal.

Even if the Marshall nations receive "offshore" dollars, it is unlikely that the countries of eastern Europe will be so favoured. At present, Germany's prewar pattern of trade is distorted, both as regards its direction and the type of commodities exported. Instead of manufactures predominating, over half the 1947 exports consisted of raw materials—coal and timber. And instead of 15 per cent of total trade being with the eastern European countries, as in 1937, only 4 per cent was reached in 1947.

On the other hand, Germans who complain about this distortion of trade fail to grasp the realities. The fault does not only lie in JEIA's insistence on trading by offset agreements, with balances settled in dollars, but also to the fact that the eastern countries have as yet no food for export to Germany. And it is only against food that Germany's still scarce engineering products would be sold to them. The days of aspirins in exchange for wheat are gone. It is doubtful if they will return. Western Germany is more likely to remain dependent upon the Western Hemisphere for its food.

A well-founded grievance of Germans and their would-be customers is that coal and food (with some exceptions) are kept outside the bilateral trade pacts. Germany's neighbours have to pay for their Ruhr coal in dollars and cannot sell butter in exchange. With a few increasing exceptions, food is not imported under JEIA offset agreements. The distinction between Category A imports (food, fertilisers, seeds and oil products, paid for out of appropriated funds) and Category B products (imports for industry financed by exports—or by ERP funds in future) has been maintained, to the confusion and irritation of all. Some change will have to be made. The Americans show that, when it is a question of helping another country which they have to finance, they can compromise; significantly, JEIA has recently placed a large order for vegetables with Italy.

One fact, however, remains paramount—even the present reforms, and the provision of ERP dollars to Germany's western and southern customers, will not provide more than a palliative. The fundamental problem remains—how to remove the country from the dollar area altogether. No solutions for this dilemma are to be found in Frankfurt today.

(Concluded)

Future of Newfoundland

[BY A SPECIAL CORRESPONDENT]

WHEN the spring comes to Newfoundland, at the end of May, there is usually a week or so between the time the ice breaks up and the time the fishing fleets leave. On June 3rd, during that week, Newfoundlanders will vote for some new form of government or for continuing the present semi-colonial "Commission of Government" which began in 1933 when the island ran into economic and financial difficulties. The choices on the ballot will be:

- (1) "Commission of Government" for a further period of five years;
- (2) Responsible Government as it existed in 1933 prior to the establishment of Commission of Government; and
- (3) Confederation with Canada.

If none of the three choices gets a clear majority a second ballot will be taken to decide between the two that get the most in the first.

On March 11th the Secretary of State for Commonwealth Relations announced these choices and this form of voting. Previously he had received the recommendations of a Newfoundland National Convention elected for the purpose nearly two years earlier. The Convention sent one delegation to London a year ago to ask what help would be forthcoming if Responsible Government was restored, and another delegation to Ottawa to ask on what terms Newfoundland could enter into a confederation.

All that the London delegation got was an indication that Britain would be willing to carry on the Commission of Government for the time being, coupled with a warning that there was a strict limit to the deficits that could be financed from London. The delegation had hoped that Britain would show some enthusiasm for a return to Responsible Government in the tangible form of special tariff arrangements, cancellation of outstanding debts, and some "compensation" for the territory which had been turned over to the Americans during the war on 99-year leases for military bases. But they got no encouragement, tangible or intangible; indeed, the mission was dogged by ill-fortune. One of their leaders missed the plane; they arrived too early for their hotel accommodation in London; and they did not see nearly as much of Cabinet Ministers and senior officials as they had hoped.

Nevertheless, despite the apparent lack of encouragement from Britain, out of the 45 members of the National Convention, 28 favoured a return to Responsible Government. This choice has always been favoured by leading citizens of St. John's. These leading citizens, most of them merchants providing supplies on credit to the fishermen scattered around the shore in tiny, isolated "outposts," and marketing the catch when it comes in, have traditionally run the affairs of the island, and feel, not without some justification, that they know how to do it better than anyone else.

However, the feelings in favour of a return to Responsible Government—that is, of a return to Dominion status—spreads far beyond St. John's. And it is further argued that any completely new form of government, such as Confederation with Canada, should be brought in by negotiations between responsible governments on both sides and not simply as a result of a plebiscite on an offer put forward by the Canadian Government.

Confederation with Canada

Only a minority of the National Convention, 12 out of the 45, favoured Confederation with Canada. Since this possibility had been the subject of three months' discussions in Ottawa, however, and since a formal offer had been requested and made from Canada, it obviously deserved a place on the ballot. The issue was beclouded by a special vote that opponents of Confederation forced on the Convention: by a vote of 29 to 16 the Convention actually recommended *against* putting Confederation before the people. This manœuvre was so barefaced that it brought sharp and surprisingly widespread protests. These, it is claimed, were received from something like 50,000 people—there are only some 170,000 voters in the country.

In St. John's it is being said that the Canadian offer does not go as far as it might, that better terms might be obtained by representatives of a responsible Newfoundland government fully staffed and briefed by Newfoundland civil servants and fully empowered to negotiate. There is not the slightest support for this point of view to be found in Ottawa. There it is emphasised that the terms are exceedingly generous—well beyond the financial arrangements that the Dominion has made with any of the present nine provinces—and that if Newfoundland became a tenth it would be in a specially favoured position. Finally, it is pointed out that time is playing doubly against better terms; first, Newfoundland is already eating into an accumulated surplus that bulked quite large in the offer made last autumn; second, it is scarcely conceivable that the island will continue to be as prosperous as it has been in the past few years. The recent terms were thus based on more favourable estimates of the future than could possibly be made when the island's exports of fish and forest products were less in demand and when revenues, foreign and domestic, were less buoyant. When transmitting the Canadian offer Mr Mackenzie King said, in his letter of October 29, 1947, "I must emphasise that as far as the financial aspects of the proposed arrangements for union are concerned, the Government of Canada believes that the arrangements go as far as the Government can go under the circumstances."

The Canadian offer provides for a permanent subsidy to the new province on as generous a basis as is possible in comparison with subsidies paid to existing provinces. Further, it provides for a transitional subsidy to be paid at a decreasing rate over twelve years and for a review within eight years which may lead to an increase (but not decrease) in assistance if it is found that the other Maritime Provinces are better able to maintain public services than Newfoundland. In addition, Ottawa would have to go in for heavy capital expenditures on the island to bring various federal services up to the Canadian level; a national park would no doubt have to be established and other capital outlays would be needed in connection with mining, forestry and agriculture. The railway service would have to be raised into line

with that given by the Canadian National Railways elsewhere. To the average family in Newfoundland the greatest attraction in joining Canada is without doubt the Canadian family allowance. The transitional subsidy is also designed to allow Newfoundland to raise its social and educational services to a Canadian level.

Reasons for the Canadian Offer

Why is the Canadian offer so generous? In part, of course, it is a reflection of Canada's present prosperity which makes it possible to envisage increased financial burdens with equanimity. In part it comes from the realisation, during and since the war, that from the point of view of sea and air power Newfoundland and its vast territory in Labrador are vital to Canadian defence. In part it comes from a vague hope, fostered by the discovery of huge iron ore deposits on the Quebec-Labrador border, that the new province might turn out to be a source of wealth. And, for the man in the street, it may come from a glance at the map which suggests that Newfoundland somehow "belongs" to Canada.

But behind and beyond all these reasons is another—the possibility that Newfoundland and Labrador might become part of the United States, for a campaign for economic union with the United States is now being conducted in the island. It is bad enough to have Alaska on the north-west, with its long "pan-handle" cutting off much Canadian territory from the coast; it would be infinitely worse to have the island dominating the mouth of the St. Lawrence and a huge area on the mainland to the north absorbed as well. Already there are three great American bases on Newfoundland where the Americans have almost complete "extra-territorial rights." Opponents to Confederation in Newfoundland are saying that the financial estimates underlying Canada's offer are unsound, and that in fact Newfoundland would probably be an economic asset rather than an economic liability. This is obviously impossible—unless mineral wealth happens to be discovered that is far richer than anything dreamed of at present.

The simple fact of the matter is that well over half the people depend directly or indirectly on the fisheries. The basic question is whether the Newfoundland fishing industry will fare better inside or outside Confederation. Put in this way, the issue may seem in doubt; the island, which sells most of its fishery products in soft currency countries, would be tied permanently into the hard currency area covered by the Canadian dollar, and would have to depend on Canadian negotiators in future commercial arrangements. On the other hand, while Canadian negotiators would have to look after existing Canadian fisheries as well, there is no reason to believe that the Newfoundland fisheries would be neglected. Moreover, the Canadian offer of Confederation specifically provides for Newfoundland to continue selling its own fishery products through its own central agency—a privilege not enjoyed by the other provinces. Further, there is the simple fact that, with the abolition of the Canada-Newfoundland tariff, the cost of living would fall. Finally, the wealth and diversity of Canada offer at least some buffer against the misery and starvation that, in bad times, have afflicted the fisheries of Newfoundland in the past.

Europe's Manpower

[BY A CORRESPONDENT]

THE surplus manpower of western Europe has now reached the alarming total of about 1,600,000. This figure is given in the report* of the manpower conference held in Rome during January and February this year by a special committee of the ERP countries. Statistics provided by the various countries showed that although slightly more than 2,000,000 surplus workers were available, the total number required by countries with a

Subscriptions for the above should be sent to:

The Publisher,

The Economist, 22 Ryder Street, St. James's, London, S.W.1

shortage of manpower amounted to only 380,000. By far the biggest part of the surplus is found in Italy (1,700,000), the remainder consisting almost entirely of displaced persons. The report points out that the potential surplus from Italy is greater still, since an additional 2,200,000 workers are employed on an average for only 110 days per year.

The present demand for workers from countries with a shortage is set out in the following table:—

Countries	Skilled	Requirements Unskilled	Total (thousands)
Austria	18.0	10.0	28.0
Belgium	21.0	...	21.0

More than two-thirds of the demand is for skilled workers, although the resources consist almost entirely of unskilled or very slightly skilled labour. Moreover, it will be difficult to use more than half the available manpower in those essential branches of industry and trade where they are needed most. There are no miners at all, for instance, among the large Italian surplus of workers.

Apart from the impossibility of using in democratic countries totalitarian methods to enforce mass migration, the principal obstacles to solving the problem of surplus manpower are the lack of technical training facilities, the shortage of houses and the present restrictions on sending savings or salaries to foreign countries. The conference recommended that international organisations should help to finance technical training, that countries requiring labour should not discriminate between immigrant and native workers in their housing policies, and that the transfer of wages and savings of immigrant workers to their home countries should be freed from restrictions. Such proposals offer a quite severe test of the kind of good-will without which Western Union cannot thrive.

As a first step towards overcoming these and other difficulties, the conference agreed to set up a special committee in Rome to co-ordinate the movements of European manpower. The Committee was charged with the tasks of simplifying emigration procedure, preparing and training migrants according to the needs of the receiving countries, and studying the transport problems involved.

Of the many aspects of the manpower problem which were discussed in Rome the increase in Europe's population was only touched on lightly. It has been estimated that, in spite of the war, Europe's population, excluding Russia, has increased by ten per cent. Whether this increase was abnormal or whether it will continue at the same rate is still uncertain; but if, as in Italy, the rate of increase continues, then the problem of surplus manpower will grow to serious proportions. It can be met by increased industrial production and by emigration to areas such as the colonies where new development schemes require large numbers of workers. Although this particular aspect of the problem would seem to be of national rather than international concern, much could be done by bilateral arrangements between countries proposing to increase their industrial output or with colonial dependencies and countries where there is a large surplus of manpower. For such arrangements the committee at Rome will serve as a useful clearing house. Provided it is given sufficient authority, it will also be able to act as an international watchdog over the treatment of emigrants.

THE BUSINESS WORLD

Money and Gilt-edged

THE recovery in the gilt-edged market from the shock administered by the news of the special levy bore, at the outset, all the marks of a merely technical rally. Recently, however, another and perhaps more important influence has been at work. Investors and their advisers have been pondering the wider implications of the Budget. In particular, they have been noting the analyses, in these columns and elsewhere, showing that the Chancellor's proposals may have a stronger counter-inflationary effect than was at first supposed. Majority opinion in the City has by no means reversed its bearish view of gilt-edged, but many people are already becoming aware that important changes may be taking place in the underlying monetary background against which the trends of the gilt-edged market need to be viewed. This tentative conclusion results rather from an instinctive reflex action than from any reasoned analysis. Bankers, in particular, feel in their bones that a Budget which decisively ends the long phase of Government borrowing must be good for gilt-edged. But most of them would be unable to explain how the assumed beneficial effect may be asserted.

Indeed, the confusion of thought on this matter in the City is exceeded only by the muddled thinking about the effects of Marshall aid. A favourite argument among the sceptics is that, since Mr Dalton had to create more money to push up gilt-edged prices, how is it that Sir Stafford Cripps's policy—which, it is widely assumed, will reduce the volume of money—may work in the same direction? There is, of course, no assurance that it will, in fact, do so. The volume of money, as the ex-Chancellor found to his cost, does not determine the level of gilt-edged prices; it determines the size of the framework within which a complex of other influences exert themselves. An understanding of the way in which the framework may be altered does not, therefore, afford any ready-made or infallible guide to the trend of the market. It is, however, an indispensable foundation for all sound analysis of investment trends—especially at a time, such as the present, when important changes can be discerned in embryo.

In this article, an attempt will be made to explain the mechanical process by which Sir Stafford's Budget may alter the shape of the framework. For this purpose, it is necessary to isolate what may be called the "monetary" influence on gilt-edged from all other influences. The underlying assumption has to be that purely "investment" influences are neutral—that is to say, it is assumed that investors' preferences for cash as against securities, for gilt-edged securities as against equities, and for short term gilt-edged securities as against long term, remain unchanged. The assumption of such an equilibrium is, of course, purely theoretical; these preferences are always in a state of flux. But the distinction between what have been called the "monetary" and "investment" factors can best be appreciated if it is realised that, given an "investment" equilibrium, the trend of gilt-edged prices would be determined directly or indirectly by the monetary influences alone.

An article in these columns last week examined the nation's capital budget for the calendar year 1948, on the basis of the Chancellor's tax proposals and the official estimates of capital outlay at home and the deficit on the external balance of payments. To examine the monetary factor in the gilt-edged equation, it is necessary to translate this capital budget into the broad financial and banking operations by which the nation's

programme of capital formation may be expected to be financed—assuming that the central banking authorities follow a "neutral" monetary policy, conforming more or less closely to the pattern set by the capital budget.

Most people seem to have assumed that, because there will be a large and genuine surplus on the Budget, the Chancellor will repay floating indebtedness to the banking system and the volume of bank deposits will tend to fall correspondingly. In fact, that is too facile a conclusion. It is, indeed, true that the operations of the central Government should involve some reduction in the level of deposits, but demands for finance from the private sector of the economy are likely to involve a roughly corresponding increase—at least, they would do so if the nation's capital budget as a whole is balanced. Moreover, the amount by which deposits may be reduced by Treasury repayments will not be the amount of the Budget surplus as set out in last week's article. Part of the surplus will be employed in meeting that portion of the nation's capital outlay which is centrally financed. On the other hand, the Government will have available for employment, not only the surplus, but also an amount approximately equivalent to the nation's net borrowings from overseas (including Marshall aid) as well as any net receipts from National Savings after providing for redemption of tax reserve certificates.

The surplus of central and local Government authorities, including the social insurance funds, has been put at £400 million for the calendar year, after taking only "revenue" items into account. If the net deficit on the overseas balance of payments conforms to the estimate of £250 million upon which Sir Stafford's Budget was based, the Government will receive in sterling a rather larger sum than that from its resales of imports secured under Marshall aid or paid for by gold drawn from the central reserve, but it will expend part of this sterling to redeem past borrowings, in the form of sterling balances, from the countries with which Britain continues to run a surplus. Unless these redeemed balances were already held in the form of cash on commercial banking accounts, the central Government's net sterling receipts from external sources will be equal to the net external deficit. On the basis of the official estimates, the gross sum available for employment by the central and local Government authorities would, therefore, be £650 million. But it is estimated that £160 million of this will be expended in meeting War Damage claims and EPT refunds and a further £300 million will be required to finance new capital outlays in the form of loans to local authorities and the nationalised industries and for colonial development. On the assumption, therefore, that net receipts from National Savings just suffice to cover any net redemption of tax reserve certificates, the residual sum available for debt redemption by the Government would, on the official estimates, be about £200 million. On the further assumption that the Government, avoiding all Daltonian techniques, aims at pursuing a passive monetary policy, this residual sum would be employed in repaying indebtedness to the banking system, thereby cancelling a corresponding volume of bank deposits.

The resultant cancellation of bank credit would never be visible, however, in the published bank statements. The hypothetical balance sheet outlined above for the Government sector of the economy takes credit for the whole of the proceeds of

external dis-investment but provides directly for only £300 million of the nation's programme for investment outlay at home. Hence, if this investment outlay is taken at the £1,800 million at which it is officially estimated, £1,500 million would remain to be financed through the private sector of the economy. As last week's article showed, at least £800 million of this may be expected to be financed by specific depreciation provisions by companies and others out of their gross current incomes. A further £160 million would be provided by reinvestment of War Damage payments and EPT refunds and, say, £350 million might be furnished by undistributed profits of businesses and personal savings other than "National" savings.

This £1,300 million odd—the sum of the three figures last mentioned—would not, of course, be wholly employed in direct financing of private capital outlays. A portion of each category would be so employed, but under each head there would remain unexpended sums which (on the assumptions about "investment" equilibrium indicated earlier in this article), the savers themselves would seek to employ in financing, directly or indirectly, others whose capital outlays exceeded their current savings or provisions. Such financing would take the form of purchases of gilt-edged securities sold by industry or of new issues of industrial securities, or direct private loans. But, even assuming full employment of unexpended savings in such ways as these, the total available would still not suffice to meet the £1,500 million of assumed private capital outlay. The residual demand for finance would have to be met by the banks by purchases of gilt-edged securities or new loans and advances—operations which would create a volume of bank deposits corresponding to the amount of deposits cancelled through Governmental repayment of debt.

If, therefore, the nation's capital budget were indeed to be in equilibrium at the levels indicated by the official estimates set forth last week, it might be expected that the banks would lend £200 million less to the Government but would provide £200 million of additional finance for the private sector of the economy, so that the level of bank deposits would be unchanged. In that event, the influence of the monetary factor upon the investment markets would be neutral. Such an equilibrium would, of course, rest upon the assumption that the monetary

authorities followed a policy of stabilising the volume of bank cash, so as to enable the banks to maintain the level of their deposits despite the repayment of Governmental indebtedness. In that event, on the same assumptions about the stability of "investment" influences, there would be neither pressure nor slack in the demand for savings in the financial markets. Given the fact that the banks would be meeting the residual £200 million of industry's needs for finance, the unexpended portions of the £1,300 million of private savings and depreciation provisions would just suffice to absorb the securities which industry will have to sell. If, however, the volume of undistributed profits and personal savings (other than National Savings) were larger than the £350 million assumed above, the surplus resources would press upon the investment markets and tend to raise prices. On the other hand, if these savings fell short of the £350 million, industrial borrowers would be pressing upon the market, and prices would tend to fall. Of course, if in fact the gross capital outlays at home proved, as is probable, to be larger than the £1,800 million which the Government assumes, the additional demand for finance would press upon the market. But, if it is likely that the official estimate of investment will turn out to be wrong, it is at least equally probable that there will be a large error in the official estimate of the deficit on the external balance of payments. If the Government secures from external sources a larger volume of finance than the £250 million assumed above, the redemption of its indebtedness to the banks would, of course, be larger too, and this would leave room for a bigger volume of industrial financing through the banks while still maintaining monetary policy on an even keel.

It is too soon, as last week's article showed, to make firm guesses about the level at which equilibrium is likely to be reached; but the direction in which the monetary factor is changing is already clear. In recent years, and especially in the past two, the investment markets have had to contend with an excess of demand for finance. Henceforth—so far as the monetary factor alone is concerned—this excess will disappear. For the first time for some years, there is now a possibility that, if monetary disequilibrium arises, it will be a disequilibrium of the opposite kind. That is an important conclusion, and its implications will require detailed discussion in a later article.

Business Notes

Steel Politics and Production

The condemned man is presumably entitled to criticise the quality of the prison cooking without being told that he is politically undesirable. The analogy may not be quite perfect, but it is close enough to the comments which the Minister of Supply, Mr George Strauss, made to the conference of the Confederation of Shipbuilding and Engineering Unions on Wednesday. Some discount has, perhaps, to be applied to his remarks on account of the occasion—a meeting of unions which had earlier in the week listened to some frank speaking on wage claims from the Chancellor of the Exchequer and was doubtless ready for a little politics. But Mr Strauss was quite unreasonable in the attack which he made on the Iron and Steel Federation. He alleged that in its latest monthly bulletin the Federation had gone out of its way to attack the Government, and he warned it against acting as "a wing of the Conservative Party."

The April bulletin includes an article on the record output of the steel industry during the first quarter of the year. It examines the reasons for this record production—the seven-day week, the first fruits of the post-war development programme, the benefits of oil-firing of steel furnaces—and comments informatively on the flow of scrap supplies which is necessary to sustain the expansion of steel output. It points out that improved supplies of home scrap are primarily responsible for the high level of steel production, and that the reduction in stocks of scrap and pig-iron, to which the Chancellor publicly referred last month, must be attributed to the Government's failure to implement the programme for imported scrap and coke supplies. The article proceeds:

Notwithstanding the shortfall in these two items, production has been carried forward to record levels on the assumption that the plans under these heads will eventually be carried out; and the deficiency for the time being has been made good out of stock.

Surely this is perfectly fair technical comment on matters for which the Government is ultimately responsible. At least, most people would not regard a factual demonstration of the principle that steel cannot be manufactured without raw materials as a piece of Tory mischief-making.

If the Minister seeks evidence of co-operation for the highest possible production of steel, a second reading of the article ought to convince him. Report suggests that a further draft of the Steel Nationalisation Bill is now under consideration by Ministers. This is thought to provide for the acquisition by the Government of the share capitals of the separate firms in the industry, so that their separate identity can be preserved, on paper at least, for the purpose of export business. This is not a formula which will satisfy those who, to transcribe Mr Shinwell's words, have not done enough thinking about nationalisation. And even Mr Strauss would not expect the present firms to welcome it with delight. It is much to the credit of the industry that it is keeping its production well apart from its politics. It is an example that might be followed by Government spokesmen.

* * *

Financial Talks at Brussels

The veil remains discreetly drawn over the outcome of the Brussels discussions between the Finance Ministers of the five

Western Union Powers. The European clearing scheme which was discussed at these talks must be referred to the Economic Co-operation Administrator in Washington, since it involves the use of local currencies deposited as a counterpart of Marshall aid. It has also had to be referred to the continuing organisation in Paris, since the clearing envisaged in Brussels was conceived not in terms of the five Western Union Powers, but of the sixteen Marshall countries. No official details of what was decided at Brussels need, therefore, be expected until after the next meeting of the Organisation for European Economic Co-operation in Paris next week.

Unofficial reports of what is involved by this new scheme continue to circulate and are beginning to give some hint of its outline. It can hardly differ in essentials from the Belgium "Ansiaux" scheme which provided the basis of the intra-European compensation that has been operated through the Bank for International Settlements at Basle since the beginning of this year. In the course of the Brussels discussions, however, it was tacitly recognised that there might be psychological and other advantages in re-christening the scheme, which has now become "Le plan Cripps." It will, however, take a very keen eye to differentiate it from its predecessors. Under the BIS scheme two types of compensation were envisaged. The first was a clearing of mutual debts which would achieve a general reduction of the debts arising from trade inside Europe. The scope for these "first category compensations" was found to be extremely limited. The second category compensations were those which could be achieved only if one or more countries were prepared to increase the amount of their credits extended to others. For example, a second category compensation would be involved if a debt from the Netherlands to Belgium could be cleared by Belgium agreeing to increase its holding of sterling, and Britain, for its part, agreeing to a transfer of sterling from Dutch to Belgian account. For obvious reasons, British consent to such operations has not been given in the past. What is now proposed is that these second category compensations should be eased by increasing the overdraft facilities to the extent, it is reported, of one-third of the local currencies which are to be put up as counterpart of grants under ERP.

* * *

ERP and European Clearing

The introduction of ERP local currency in the European clearing scheme is, however, meaningless juggling. If France is to continue to run a deficit with the sterling area, it makes no real difference whether that deficit is financed by putting at France's disposal some of the sterling accumulated against ERP shipments to Britain or whether it is financed by overdraft facilities granted by Britain to France. To introduce the European Recovery Programme into this is merely to pull wool over the eyes of all concerned. The Marshall Plan may be brought more effectively into the scheme by making European countries eligible for off-shore purchases, i.e., by enabling France to pay for British coal or Belgian steel with Marshall dollars. It is probable that this feature will appear in the new plan, but only to a very small extent. The first year's ERP allocations are inadequate to meet Europe's deficit with the Western Hemisphere, and must, therefore, leave very small scope for any off-shore purchases in Europe.

It is probable that all the British influence at Brussels—and it must have been considerable in view of the re-christening of the plan—was exerted to keeping the introduction of dollars into the new compensation plan down to the smallest possible figure. The British have long contended that to inject gold or its equivalent, US dollars, into such a compensation must tend to contract and not to expand trade, since each participating country will, in prevailing circumstances, strive by all means to cut its imports from the others in order to create the credit balances that will become claims to the gold or dollars in the clearing. It is likely, therefore, that the new scheme will be little more than a slight re-dressing of the BIS compensation plan, reinforced by greater willingness on the part of the creditor countries to engage in "second category compensations," i.e., to extend more credit to their European debtors.

* * *

How the Treasury Bought Its Stock

A corner has been lifted this week of the thick curtain which has shrouded last year's official activities in the gilt-edged market. In the past, the technique of Governmental accounting has generally sufficed—thanks, partly, to the systematic omission to publish any details of the investment holdings of the Bank of England—to hide most departmental activities from the public gaze. But operations so large as Dr Dalton's were bound to peep

through the screen sooner or later. The portion now disclosed is not a pleasant sight. The investment account of the Unemployment Fund as at March 31st last reveals that no less than £79,973,046, or over 15 per cent of the resources employed on behalf of the Fund by the National Debt Commissioners, was in 2½ per cent "Daltons." Was Daltonian faith in cheap money matched by a conviction that full employment will last for ever? "Daltons," it may be recalled, are redeemable only at the Treasury's option, in or after 1975. Yet they are flanked in the Fund by large slices of other long and medium-long securities. Altogether nearly half the investments are in issues with final or optional dates of 1967 or later. The cynic might well ask whether the Commissioners of the National Debt had ever heard of a document known as the Economic Survey, with its warning of wholesale unemployment this year if Marshall aid had not materialised.

On the immediate issue of market-rigging this latest statement of the Unemployment Fund provides a test case. The invested resources of the Fund expanded in twelve months by some £80 million. No less than £55 million of this new money went into "Daltons"; £13 million went into 3 per cent Savings Bonds, 1965-75; and almost the whole of the remainder went into Transport Stock. The £24½ million of "Daltons" held at end-March last year was perhaps acquired by original conversion of Local Loans or through the tap; but the additional £55 million was presumably bought on the market. It is equivalent to fully one-ninth of the total issue of £482 million and to a much larger proportion of the amount originally held outside official quarters. Is it possible that these large purchases were part of the abortive attempt, launched in Dr Dalton's speech at last October's Bankers' Dinner, to bring the market back to a 2½ per cent basis for the Transport issue? In the pre-Budget phase last autumn, "Daltons" rose by some 10 points, only to collapse after their sponsor disappeared from the scene. Is it possible, too, that the £13 million addition to the portfolio of 3 per cent Savings Bonds, 1965-75, is the measure of the subsequent grooming of the market for the 3 per cent basis eventually adopted? After the controversies of the past two years, Parliament is entitled to know more about these matters. It should press for precise information about the circumstances, prices and dates at which these critical purchases were made.

There is, moreover, a wider aspect of this matter than that of Daltonian market-rigging. One reason for the establishment of such autonomous funds as the Unemployment Fund was to ensure that their investment policy was suited to their particular objectives, on the analogy with private pensions funds. This was always a rather questionable principle for Governmental funds; but in the past the Government has at least been able to sustain the fiction that the rule was being observed. Now that its flagrant infringement is apparent, it is time to review the whole foundations of this policy. There is, in fact, much to be said for placing upon the Treasury full and unquestioned responsibility for managing all centrally administered funds, on the ground that such management ought to be integrated with central monetary policy, the proper conduct of which is much more important than the due observance of the actuarial principles which underlie the fiction of autonomy. As it is, the Treasury has access to the funds but is not bound by any clear definition of its duties and responsibilities. It would be folly, however, to abandon the actuarial principle—incongruous though it may be—without a thorough factual inquiry into Government technique in the gilt-edged market as it has evolved in the period since cheap money began in 1932. Within this period, indeed, there has been so revolutionary a change in the whole approach to monetary policy that a strong case could be made for a much wider investigation.

* * *

Sabotaging Savings

After the departure of Dr Dalton, it might have been hoped that nothing more would be heard from the Treasury bench of the stupid charges that anyone who disagreed with its policy was guilty of sabotage. But this week Mr Glenvil Hall has taken a leaf from his ex-chief's book. Asked to explain the reason for the continual fall in National Savings, he thought that "some of the falling-off is due to sabotage on the part of the Opposition." The occasion for this childishness was a question in Parliament about Lord Mackintosh's statement at the weekend upon the effects of the new investment levy upon savings. At the National Savings Assembly at Hastings last week, Lord Mackintosh announced that, anticipating discussions of this problem, the National Savings Committee had resolved

That the National Savings Committee, while expressing no opinion concerning the merits or demerits of the capital levy, has been made

aware of the discouraging effect it is having on the members of the movement and feel it is their duty to bring this to the attention of the Chancellor of the Exchequer.

It is easy to understand why the Treasury should be touchy about this development. But the trouble is of its own making. Sir Stafford himself has had the grace to admit that the special levy is a purely political device. In a part of the Budget debate which seems to have escaped public attention, he said:—"I have been accused [by Sir John Anderson and others] of partisanship in applying this. . . . Of course, they never do anything from a political point of view. . . . I am, quite frankly, not as perfect as that. . . . I have held certain theories for a long time. . . . I feel it is my duty to do the things which I think, according to those political theories, are right." This admission, coupled with the recognition that the levy will be largely paid out of capital, makes it impossible for the Government to argue that there was any economic or financial case for it at all.

But they would have been wise to count the economic cost. The wider effects of this levy, even though it be a non-recurring device, cannot be considered in isolation. The drive against capital has taken diverse forms, and each successive move tends to have cumulative repercussions upon savings. The Financial Secretary to the Treasury should guard his tongue, and ponder well the Treasury's own record in this matter before he again makes these irresponsible accusations. Beyond doubt, the boot is on the other foot. If there has been any sabotage of savings in the past two years, it has been sabotage by the Treasury itself. Those who followed Dr Dalton's foolish boastings and promises about the level to which he would raise gilt-edged values have lost between one-fifth and one-quarter of their capital—even if the loss is measured only in monetary terms. But the policies by which these rash ambitions were pursued have involved other, and more far-reaching, losses. The small savers who followed the ex-Chancellor in his "last-chance" drives have escaped the loss of financial capital which hit those who did his bidding in the investment markets, but the value of their savings has none the less been dissipated by the inflationary rise in prices which his antics produced. And almost everyone has suffered from the wider repercussions of that inflation.

Sir Stafford's courageous budgeting has put an end to these reckless policies, and, if it succeeds in stopping inflation, will prevent any further fall in the real value of savings. But, in this particular context, the political policy of the levy threatens to throw away most of the advantage which the anti-inflationary policy offers. If the Government still believes that there is any economic worth in voluntary personal savings, as distinct from forced saving achieved by high taxation and a Budget surplus, it will have to find a way of removing the malaise it has created. There is no escape by the Daltonian technique of decrying the critics and of pretending that criticism itself is an act of sabotage. It is time the Government dropped its moral lectures on economics for patriots.

* * *

Lancashire's "No" to Overtime

After an unprecedented concentration on Lancashire of eloquence by members of the Government the attempt to get the workers in the cotton trade to work overtime through the summer has largely failed. It is true that about half the spinning industry responded, in the recent ballot, to the appeal for overtime work, and preparations are being made to put their

decision into effect. Those districts which are already working overtime will go on, and a few more will start. But half the spinning industry and two-thirds of the weaving industry have refused; the unfavourable vote in weaving was 41,545, the favourable vote only 20,572. On balance the Government's campaign to get more production in the cotton industry has suffered a serious setback.

It is clear that the export drive cannot afford this setback, and ways will have to be found of getting more production without overtime. The Government committee dealing with textile output will have to concentrate on the other ways, which are in any event more promising; the overtime proposals were only for an extra five per cent, and experience has shown that some of the extra effort would probably have been offset by absenteeism and slackening at other points. Since overtime plainly cannot succeed, a redoubled effort will be needed to recruit labour for the industry; and it should be an effort on imaginative and comprehensive lines, taking real account of the difficulties which deter women from going back to work, and ensuring that those who do are not drawn off into inessential small trades.

One lesson must be drawn from the ballots. The publicity which has been done did not succeed in convincing the cotton workers of the urgent need for their maximum effort. Why is this? The most probable reason, which is supported by a number of comments from the spinning and weaving areas in the last few days, is that the workers know that the best use is not even now being made of their normal working time. The case for redeployment, already strong, is made stronger. What can be done by redeployment has been shown in a number of mills, and was demonstrated lately by the Cotton Board's experiment described in the Musgrave Mill report. The increase in output per man-hour achieved there (39 per cent) is worth many hours of extra work in the bad old way. It is true that substantial increases in earnings have to be conceded to make redeployment palatable, and the danger that increased earnings per hour will swallow up its fruits has to be faced and overcome. Yet one of the necessities is to make the cotton industry more attractive to workpeople; another is to create the sense of urgency without which production will not rise as quickly as it must. Reorganisation of effort in the mills seems to be the only answer.

* * *

Uruguay Rail Schemes

Full particulars have been issued this week by the British owned railway companies in Uruguay for the distribution among the various classes of stockholders of the £7,150,000 which the Government of Uruguay has agreed to pay for the railways. Since the global sum and its allocation between the six companies concerned was announced early in March, the companies have submitted their proposals for its final distribution. These proposals have been adjusted by an independent panel consisting of Sir David Maxwell-Fyfe and Mr Gilbert D. Shepherd, and are now submitted for the approval of the shareholders. As in the Argentine rail purchase, the directors declare that the scheme must be agreed by all companies, and that the stockholders in each company must approve the subdivision of the payment moneys between the various stocks. Otherwise the dissention of any one class of stockholders will involve the rejection of the whole arrangement.

This, the most unpalatable aspect of the scheme, can hardly be avoided, however strongly the owners of prior charge capital may feel inclined to protest at the departure from their strict dues

(Incorporated in Victoria)

to full repayment of capital and arrears of interest for the purpose of appeasing holders of the junior stocks to accept the plan. Agreement by the stockholders is thus the next step; in view of the special circumstances of the purchase—the railways which had long since ceased to pay their way—perhaps the reduction in the allocations to debenture and preference shareholders is not an excessive price for them to pay for its smooth passage.

The sums allocated fall short of the agreed sale price by some £66,675; presumably this margin will be required to meet winding-up expenses, though it is possible that the directors of the companies have the question of compensation for loss of office in view

as well. Any surplus from these residual amounts will go to the most junior stocks, and any expenses incurred above these amounts will be deducted from their allocations. In any case, the allocations given to the prior charges, except possibly in the case of the debenture stock of Midland Uruguay Extension, will not be altered.

If the Argentine railways scheme can be taken as a guide, the actual cash distribution may not take place for many months after the ratification of the scheme by the stockholders. Apart from the necessary formalities to be observed by the companies themselves, the scheme has to be submitted for the sanction of the High Court and it still has to be finally ratified by the Legislative Authority of Uruguay.

Concessions on Clothing Coupons

As this issue of *The Economist* goes to press the President of the Board of Trade has announced the reduction in the number of clothing coupons required for utility wool cloths and clothes made from them, for waterproof garments, seamless stockings, and adults' footwear. Children's shoes are taken off the clothing ration. Discussions are also being held with the trade on the prices at which surplus stocks of clothing can be sold in the summer sales at half their normal coupon rates. So the wholesale textile trade has won its point—or rather, part of it, for at the height of the argument suggestions were heard that with a few exceptions all garments could be made coupon free. If the clothing trade's contribution to the export drive is no more impressive than this line of argument, it will deserve censure as downright as that which it has directed at the Board of Trade this week. Of course, stocks of clothing have increased out of all proportion during recent months. The Attorney-General, who invited his week-end audience not to believe all that they read in the newspapers about stocks of clothing, is

doubtless familiar with the figures compiled by the Wholesale Textile Association in collaboration with the Bank of England, which show an increase in stocks at the end of March, compared with a year ago, of 75 per cent, while stocks of household textiles increased by 99 per cent, piece goods by 115 per cent, knitted underwear by 124 per cent and ladies' hose by 175 per cent. Such increases cannot be explained by abnormally low stocks at the end of the fuel crisis. They have accumulated steadily on wholesalers' shelves and are doubtless matched by the increased stocks of manufacturers and retailers.

What is the explanation for these accumulations? Partly they are the result of resistance to high—and still rising—prices. In women's wear there are changes of fashion—and some doubts about their permanence. The smaller ration of coupons, coupled with threats of a further cut, may have caused some hoarding of coupons and postponement of purchases. Some of the stocks of clothing are of poor quality and poor coupon value. There is still insufficient children's clothing, because the trade has preferred to make more profitable lines of women's wear. If the trade has misjudged the market it deserves to suffer the inevitable financial loss. It is not, after all, the first occasion when it has been wrong, for the same thing happened on a smaller scale a year ago. Nor has it any automatic right to a replacement of the coupons represented by the stocks which it now holds, for despite the trade's misjudgment, these stocks represent the textiles and leather to which the British consumer is entitled—and perhaps even more, having regard to the need for exports.

The Board of Trade has thus had a twofold problem. The first is to safeguard the export drive; this is of prime importance, and no complaints about the growth of stocks and no lighthearted assumptions that clothes rationing is no longer necessary must be allowed to obscure it. The second need is to make full use of textile capacity which cannot satisfy established markets overseas. Insufficient attention has been given to the part which woollens, as distinct from worsteds, might play. And what is to prevent greater sales of clothing to Germany? British exports to Bizonia are equivalent to dollars, and last February the Board of Trade announced that certain exports of women's clothing to Germany would be permitted. Representatives of German miners have already purchased such goods, and doubtless there are other German industries which would be prepared to spend their export bonuses on further supplies. Moreover, Bizonia will obviously require substantial quantities of clothing for the shops if currency reform is to be given a fair chance of success. Greater exports of clothing to Germany would not only help to clear accumulated stocks from British warehouses; they would also give an impetus to economic recovery in western Germany.

Rise in Bank Deposits

Hopes that the big rise produced in bank deposits by the Argentine pay-out in March would be only a temporary interruption of a declining trend have been disappointed by the April figures. The clearing banks' return for the "make-up" of April 21st reveals an expansion of £64.6 million in net deposits, which are thus raised to £5,674.2 million, only a little below the end-1947 peak. In banking circles it has been too readily assumed that this increase reflects the ostensibly very heavy "supply" expenditure of the Government during the closing days of the financial year. It is true that the additional credit has been created mainly on Government account, but the operative factor was not the abnormality of year-end demands. During the four weeks most nearly coinciding with the period covered by the banks' statement, the Government's above-line deficit was nominally a little under £150 million, but in fact no less than £170 million of the apparent expenditure at the end of March comprised mere internal debits for the purpose of repaying advances made by the Civil Contingencies Fund. In the four weeks, therefore, the above-line position disclosed a "real" surplus of about £20 million. Below-the-line, however, there were large outgoings—£32 million for housing, £13 million for war damage, £17 million for net repayment of tax certificates and £10 million for overseas food, to mention only the principal items. Taking the "above" and "below" line accounts together, the Treasury's visible requirements for finance in this period were about £80 million, before allowing for the sterling received from sales of gold and dollars drawn from the central reserve. If the sterling income from this source were put at £45 million, the Government's net demands from the banking system would have been no more than about £35 million. But in fact the banks' holdings of Treasury deposit receipts rose by £86½ million, and only £31 million of this was offset by a decline in their money market assets.

Meanwhile, non-Governmental demands upon the banks were abnormally small. During the preceding three months, bank advances had expanded by no less than £94 million, a rate of growth which presumably reflected borrowings to finance the exceptional flow of tax monies to the Exchequer. Now that the main tax-gathering season is over, the pressure upon bank advances has relaxed; in the five weeks from mid-March they rose by only £7,300,000—but reached a new high level at £1,306 million. Investment portfolios declined slightly, by £4,300,000. The presumption is, therefore, that some £60 million of the new credit created during the month was absorbed by the Government. The difference between this figure and the £35 million indicated above points to additional Governmental demand for purposes undisclosed. To some extent the discrepancy may arise from the customary gap between the banks' make-up days and the dates of the Exchequer returns, but the difference is sufficiently large to suggest that some other factor has been at work. A possible explanation is that continuing unrequited exports financed by the drawing-down of overseas sterling balances are necessitating repayment of floating debt held by overseas monetary authorities.

The Builders' Merchant Replies

Neither the builders' merchants nor the manufacturers who supply them are satisfied with the findings of the Committee on the Distribution of Building Materials and Components, discussed in *The Economist* last week. There should be room for an informative discussion which would swell the already substantial body of facts which the Committee amassed and arranged in its report. But the first reactions from the trade associations concerned have been of too general a kind to take things much farther. The Distributors of Builders' Supplies Joint Council remarks that "greater knowledge of the trade will correct many of the erroneous and unwarranted conclusions of the Committee." It observes in particular that

the quaint proposal of the Committee that prices should be identical for all classes of buyers will be regarded with mixed feelings by hundreds of other industries. How distributors could function under such conditions and whether the proposed "uniform price" is to apply to like quantities and conditions of trading is not made clear.

Two tractors put 6000 people into essential industry!

150 acres of this rough ground had to be graded absolutely flat before a single brick could be laid for the Dundee Industrial development scheme.

Every hour two men shifted 250 tons of earth using two "Caterpillar" Bulldozers with Scrapers which scoop up 12 cu. yds. at a single bite!

With 250,000 tons of earth moved ten times quicker by "Caterpillar", the first factory is already completed and in full production.

The Dundee Industrial Scheme, sponsored by the B.O.T. and built almost entirely by Sir Robert McAlpine and Sons Ltd., puts 6,000 people to work in new and essential industries. In this project "Caterpillar" Earth-moving equipment—supplied and serviced by the Olding organization—has made immense savings in cost, time and manpower. Onemorecaseof "Caterpillar" making a powerful contribution to Britain's recovery.

"Caterpillar" moves the Earth—to help rebuild Britain

Jack Olding World's Biggest "Caterpillar" Distributor
JACK OLDING & CO. LTD., HATFIELD, HERTS. 'PHONE: HATFIELD 2333

This is not exactly what the Committee proposed: but it did criticise the system of special discounts to approved merchants who accept the association disciplines, and it did recommend that power be taken to declare individual agreements under this system illegal. And it is legitimate for the builders' merchants to point out that their practices are common to many other distributive trades. So they are. They have been fostered (as the Distributors of Builders' Supplies Joint Council points out) by the Government's "consistent refusal to deal with industry except through the medium of appropriate trade associations." Observations of this sort do not dispose of the issue; they merely put it on the general level on which the Committee, with its terms of reference to consider, could not handle it.

Such generalities may serve a useful purpose, but particular cases are at least as important. To take one, the Distributors of Builders' Supplies contend that the years (1938 and 1946) chosen by the Committee for its inquiry into their costs and margins were unrepresentative—a "slump year" and a "boom year." It is perhaps worth while to recapitulate the Committee's point about the margins earned by the builders' merchants. It is said that margins were "on the high side" in 1938, were substantially higher in 1946, and are probably still higher today. The argument does not seem to depend on a particular year being representative or not. But it would be useful to know at what point the Distributors of Builders' Supplies Joint Council decided that 1938 and 1946 were bad years to study. The Simon Committee appears to have consulted the chairman of the Joint Council before sending out its questionnaires, and indeed pays a graceful tribute to his helpfulness. Again, the Ministry of Works informed the Simon Committee that "the average annual turnover may be fairly taken to be four times the capital employed"—a mere assumption, retort the Distributors of Builders' Supplies, "unsupported by any evidence." Ministries can err. But if this is an error, could the Joint Council say what ratio would be correct?

The producers of building materials, through their National Council, declared last week that details in the report were "in many instances inaccurate and incomplete," and that

of the 91 Producers' Associations stated in Paragraph 40 to have been examined, less than half gave any oral or written evidence.

A casual observer of the architecture of the Union of South Africa would probably place more emphasis on the sky-scrapers of the Rand than on the spacious old Early Dutch houses which form such a pleasant decoration to the countryside of Cape Province.

There are, however, numerous examples of this attractive form of architecture still remaining. Many of them, as in the case of Groot Constantia near Cape Town, were designed as chateaux for the vineyards which still surround them and have served as centres for the wine industry ever since the seventeenth century. The wine industry in turn has done much to contribute to the prosperity of the Union in general and of the port of Cape Town in particular, and continues to hold its own to-day in the busy and expanding commercial life of the Union.

Full and up-to-date information from our branches in South Africa on the state and trends of local markets is readily obtainable on request.

BARCLAYS BANK
(DOMINION, COLONIAL AND OVERSEAS)
HEAD OFFICE: 54 LOMBARD STREET, LONDON, E.C.3

This should not be difficult to prove or disprove; an appendix to the report lists nearly 70 associations as having given written evidence, in addition to a fair number of individual firms which gave evidence or were visited. The National Council of Building Material Producers denies that the trade associations or their practices are against the public interest. It points out that the price index for primary building materials—as distinct from components—rose only 7.9 per cent between August, 1945, and the first quarter of 1948, and adds: "It is precisely in those industries that are well organised that prices have risen least."

The Small Man in the Motor Industry

As recently as February the Minister of Supply was insisting that the smaller manufacturers of cars must each fulfil the export quota of 75 per cent, in spite of their special difficulties about sales and service in foreign markets. Since then the motor industry as a whole has reached and, for the moment, exceeded its export target. No doubt this is mainly due to the sales efforts of a few big firms, but it has made possible a rather more flexible policy towards the smaller specialist manufacturers; their export targets have been reduced and they are no longer threatened with the curtailment of their supplies of steel.

An achievement by one of the smallest of the small manufacturers last week-end served as a pleasant reminder of the service that these firms can render to the motor industry on occasion. The Healey sports car had become known in the trade—though hardly at all outside the trade—as a promising junior. By winning the Mille Miglia it has made good its claim to public notice. An individual effort, largely hand-made and costing (with purchase tax) more than £2,000, it has no place in the bulk export picture. But its innovations in design, which proved their success last week-end, might not have been produced without individual initiative on this small scale.

This is an exceptional case, for the motor industry has always presented immense difficulties to the small-scale innovator, and it is doubtful whether these will grow less. It is difficult, to take one point that has been raised, for the small firm to obtain membership of the Society of Motor Manufacturers and Traders. Without it the firm cannot show its product at the annual exhibition, which is one of the industry's most effective means of publicity and attracts all the home and foreign buyers. Membership is open only to firms with a paid-up capital of £50,000; Mr Healey's firm, for one, has not this qualification. It is true that the society can allot space at Earls Court to non-members, should it so desire, and it probably will desire now to allot space to the Healey car. There are other exhibitions from time to time at which non-members may show, but these lose much of their business attraction because members of the Society have delivered a substantial bond which they may forfeit should they take part.

In fact, the big firms who control the Society of Motor Manufacturers and Traders have little competition to face from the small man, and realise in general that he is a useful stimulant and a useful source of ideas. Often they are helpful to the small man; indeed, were they not, it would probably be impossible for him to make a car at all. The Healey car has a Riley engine, made by the biggest of the big manufacturers; the Allard is powered by a Ford V8 engine; and all makers have to rely for electrical and other accessories on suppliers who are equally members of the society. This dependence was the basis of complaints made by the management of Grantham Productions in 1946 and 1947, but it is a matter of opinion how far those complaints were justified. But the Society's strong position makes it important that the handling of newcomers should be liberal and that care should be taken to avoid any suspicion of exclusiveness.

Unit Trust Dealings in the "House"

For many months the Stock Exchange Council has been considering the possibility of allowing dealings in Unit Trusts on the floor of the Stock Exchange. The Council has now issued amendments to the rules, which are due for confirmation on May 18th, authorising jobbers to deal in units and laying down requirements which must be satisfied before a quotation would be granted. The Stock Exchange was the first authority to take critical notice of the Unit Trust movement in its exuberant period of expansion and it is not surprising, therefore, that the requirements it has laid down are strict. Provision is to be made for the exercise of disciplinary powers over the Trust which seek a quotation; these will reside in an "approved independent authority" of which, perhaps, the Unit Trust Control Council might be regarded as a prototype. The Stock Exchange authorities also requires to be satisfied about management charges, the pricing of units and the contents of Trust deeds. The Council too has come down in favour of the method of operation known as the "cash fund" (of which the Municipal and General Group are the leading exponents) as distinct from the "appropriation" method of operation (which is used by the Trust of Insurance group). In the case of new trusts (though not existing ones) only cash trusts will be recognised.

It remains to be seen whether there will be any widespread movement on the part of unit trust managements to seek a quotation. The Municipal & General Group will presumably seek recognition, while the Trust of Insurance Shares Group assert that they will not. Obviously there may be some prestige value for a trust which has an official quotation; on the other hand the advantage to the investing public (apart from the safeguards on which the Council will properly insist) will depend on the ability of jobbers to make better prices in the sub-units than the managers themselves. Ultimately, unit prices must be determined

within the close limits of the buying or liquidation value of the underlying securities with the addition or deduction of management expenses. Under present conditions, dealing profits represent an important part of the managers' incomes, and some trusts will be disinclined to let the jobbers take such profits for themselves, leaving the managers to carry the expense of running the trust and also obliged to feed the market or take units from it as the jobbers trim their own position. The experiment will be worth making, but its extension throughout the Unit Trust movement is likely to be slow.

Miles Aircraft Investigation

The Chancery Division has this week granted an application by the Board of Trade for the appointment of an inspector to investigate the affairs of Miles Aircraft Limited. This action invokes for the first time the new powers provided in Section 43 of the Companies Act, 1947, by which the Board of Trade can appoint "one or more competent inspectors to investigate the affairs of a company and to report thereon in such a manner as the Board direct, if the company by special resolution, or the court by order, declares that its affairs ought to be investigated by an inspector appointed by the Board." In making his decision Mr Justice Roxburgh considered that a *prima facie* case had been made out for such an appointment by the submission of the Board of Trade that when in August, 1947, the directors of the company recommended a dividend of 7½ per cent and a bonus of 2½ per cent on the ordinary capital they ought to have been aware that a big loss was being suffered by the company—in fact a loss of £967,700 was disclosed for the 10 months' period which ended only two months later.

The background of the Miles Aircraft is familiar and comment on it, in view of this week's developments, would be undesirable. The interest in the case lies for the moment in the establishment of a precedent in the interpretation of the new Act. The Board of Trade has been able to take a step which under the old Act would have been possible only on the application of a representative body of shareholders. The shareholders, however, have shown less interest in probing the mystery of the sudden change in the company's fortunes than in salvaging something from the wreck. In this, they have been rather forcefully led by a body of smaller creditors who in November last sought the approval of the Court for liquidation, but failed on the ground that a scheme of arrangement was in course of preparation to obtain an equitable solution for both large and small creditors and to reorganise the capital structure. This scheme of arrangement when published in March, itself produced a distinct shock owing to the drastic proposals for writing down all classes of capital. It has yet to be confirmed by the Court and in their representations this week the directors expressed the hope that the Board of Trade investigation would not prejudice the confirmation of the scheme.

The Future of Rubber

The official communique issued at the end of the fifth meeting of the Rubber Study Group gives the barest details of what transpired at Washington. Estimates of natural rubber production in this year and next were compared with estimated world consumption of both natural and synthetic rubber. These

figures are given in the accompanying table, with particulars for the main countries. A surplus output of some 80,000 tons of natural rubber is expected in 1948 and there is a possibility of an even larger surplus in 1949. The Study Group, however, stressed the need to treat these estimates with the "greatest caution." Yet after looking at the figures, the Group felt that the time had not arrived "for any consideration or examination of a commodity agreement." Barely a week previously the Tin Study Group, which also met in Washington, decided to examine the possibility of an inter-governmental tin agreement, although according to the statistics accepted by the Study Group, no surplus production of tin would be apparent until 1950.

The discussions on the two commodities have not been published. They would make an interesting comparative study. Evidently, the United States had no desire to maintain an artificially high price for natural rubber. American policy on

WORLD RUBBER PRODUCTION AND CONSUMPTION
('000 Tons)

Natural Rubber Production			Natural and Synthetic Rubber Consumption			
	1948	1949		1948		1949
				Natural	Synthetic	Total
Malaya	675	700	U.S.A.	576	392	917
Indonesia	370	460	U.K.	205	5	225
Ceylon	90	90	France	93	9	117
Indo-China	45	80	Canada	33	20	49
British Borneo	62	65	Netherlands	12	..	14
Others	149	152	Others	393	7	425
Total	1,391	1,547	Total	1,312	433	1,747

synthetic rubber production is now more or less settled and recent experience suggests that natural rubber can only offer effective competition on the basis of price—which would mean quite a sharp reduction from its present level of 1s. 0½d. a lb. Nevertheless, the US Government's strategic stockpile of rubber is known to be small; hence increased American purchases of natural rubber are likely in the coming months. Moreover, the American defence programme should also lead to increased American consumption of natural rubber, although its effect may not be noticeable for some time. These two factors alone were probably considered sufficient to stabilise a market which sooner or later may be faced with surplus production.

Rubber production in both Indonesia and Indo-China is expected to increase significantly in 1949. If political stability can be achieved in these two countries, rehabilitation of the rubber plantations is likely to follow Malaya's experience, and a sharp increase in supplies may result. The imposed rest on the trees may give a large initial yield, particularly as much of the stock in Sumatra and Java was replanted with high yielding trees just before the war. But factories and plantations in Indonesia have suffered more damage than those in Malaya and re-equipment may take more time. If output from these two areas greatly exceeds the Study Group's estimates, the balance between supply and demand will be adversely affected unless large quantities of natural rubber are absorbed in Government stocks.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports appear in the *Supplement*: *Stewarts and Lloyds*; *W. T. Henley's Telegraph*; *Ever Ready*; *British South Africa Company*.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'e'), and those paying 3 per cent or less will be repaid at the latest date (these are marked 'l'). Net yields are calculated after allowing for tax at ½% in the £. (f) Flat yield. * Assumed average life 15 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2½ per cent free of income tax. Yield, cent. (g) To latest redemption date. (h) Fifteen months to March 31, 1947 (yield basis 7.6 per cent). (i) Free of tax.

ANGLO-PALESTINE BANK, LIMITED

SATISFACTORY PROGRESS

MR. S. HOOFIEN'S STATEMENT

The forty-sixth ordinary general meeting of the Anglo-Palestine Bank, Limited, was held recently at the registered offices of the company, 6, Gracechurch Street, London, E.C.

The following is the statement by Mr. S. Hoofien, the chairman, circulated with the report and accounts for the year ended December 31, 1947:—

I have first of all to refer to the resignation in July last of Mr. L. Braudo from the office of chairman. Mr. Braudo joined the board in 1934 and was elected chairman in 1937. For some years past Mr. Braudo has on more than one occasion requested his colleagues to relieve him from the burden of office. They have now reluctantly agreed to do so, and they wish to record their great appreciation of his devoted service during the ten years in which he held office. I must add my own personal thanks to Mr. Braudo, in whom I have always found a wise counsellor and a staunch friend. I am happy to be able to announce that Mr. Braudo continues to serve on the board.

As to myself, I have retired from the office of general manager, and the directors have honoured me by electing me as their chairman, and by expressing the desire that in this new office I continue to give my full time to the Bank.

I am succeeded as general manager by Mr. A. Barth, who has resigned from the vice-chairmanship, but retains his seat on the board.

I must also mention the promotion of Messrs. D. Israeli, H. Margulies and S. Saalheimer all of them executive officials of long standing and proved ability, to the rank of assistant general managers.

CONDITIONS IN PALESTINE

The bank's business is to so large an extent interwoven with the entire economy of Palestine that, in reporting its progress, it is only natural that I should start by saying some words on the general conditions prevailing at present in that country. Events move so quickly that it seems necessary for me to point out that the present statement has been written in the third week of April, some days after the Special General Assembly of the United Nations started on its thankless labours.

His Majesty's Government, having decided to give up the mandate, placed the whole issue in the hands of the United Nations. That body decided in November last that sovereign Jewish and Arab States should be set up in Palestine, that the City of Jerusalem should be placed under international trusteeship and that the three territories should form an economic union. His Majesty's Government announced that it accepted the decision, but that it would be no party to its implementation. In pursuance of this policy the administration began to wind up its services, and this process of liquidation of the civil administration of a highly developed modern community is now in a far advanced stage. I do not believe that there exists a precedent for such a procedure.

The United Nations' Palestine Commission has in its report to the General Assembly stated that the attitude of His Majesty's Government has made it impossible for the Commission to take the necessary preparatory measures to assure continuity in administration after the date of termination of the mandate and it has made a definite complaint of lack of co-operation from the mandatory Power. It is difficult, looking at the facts, to quarrel with the Commission's conclusions.

I need say nothing about the lack of security, mainly brought about by the incursion of armed bands from neighbouring territories. It cannot be denied that the administration has been unsuccessful in whatever effort it may have made to maintain security, law and order. Such lack of success, when neither the duty nor the power to attain it were in dispute, is a painful thing to note.

A crucial step, taken by the Government, was the exclusion of Palestine from the sterling area on February 22, 1948. In modifying unilaterally, acting in virtue of their powers as Palestine's trustee, the conditions of their debt to Palestine, His Majesty's Government find themselves placed in a position of no little delicacy. The way in which the measure was announced caused some amount of avoidable dislocation, but it may be expected that the country will be able to adapt itself to the new conditions.

POLITICAL SITUATION

The political position is highly confused at the time the present statement is written, and there is no hope that it will have reached complete clarification at the time it will be read. No doubt there is still considerable trouble ahead, and a final and satisfactory solution is not yet in sight. There is, however, no reason to give up the hope that the two peoples of Palestine will ultimately attain their ideal of independence and statehood, each in its own territory, and that they will discover the road towards peaceful and fruitful co-operation. When that time comes it may well be expected that the present feelings of bitterness towards the Mandatory Power which the events of the last decade have caused to grow up within the two peoples in Palestine (and which, one must fear, are to some extent reciprocated) will gradually abate.

ECONOMIC PROGRESS

It is a comfort to note that, in spite of the political difficulties which the country experienced during the whole of the year under review, considerable economic progress has been made.

Statistics again show a considerable increase in imports, partly due to increased imports of machinery, building materials and transportation equipment, partly to the continued replenishment of stocks and partly, of course, to higher prices. The export figure, too, has grown. Citrus exports for the 1947-48 season are estimated at 10,000,000 cases as against 7,900,000 in the previous season.

Sales of electric current went up to 303,000,000 kw. hours from 252,000,000 kw.h., the increase for industrial purposes being from 74,500,000 to 86,100,000 kw.h., and for irrigation from 64,200,000 to 73,100,000 kw.h.

Housing, too, progressed considerably. The figures available for Jewish districts show that about 18,000 rooms were con-

pleted in 1947 and a similar number of new ones begun; this in addition to extensive commercial and industrial building. There was also considerable building activity by other sections of the population for which adequate figures are not yet available. Local cement production rose from 259,000 tons to 328,000 tons.

Total deposits in the country decreased from £97.4 millions to £94 millions. Total advances increased from £37.7 millions to £48 millions.

Currency in circulation on December 31st stood at £42.1 millions as against £43.4 millions a year ago.

All this shows a picture of very satisfactory progress in a year of continued and accentuated political insecurity.

SUBSIDIARIES

Our main subsidiary, the General Mortgage Bank of Palestine, Ltd., continues to show progress. The amount of outstanding debentures has risen from £2,154,000 to £2,706,000, and the item building loans has gone up from £2,909,000 to £3,517,000. The dividend on both the preference shares and the ordinary shares has been maintained at 6 per cent., subject to Palestine income tax (5s.).

The Orsar La-Taassiya, Ltd., which grants medium and long-term loans to industry, has increased its paid-up capital from £200,000 to £320,000, and its loans from £186,000 to £424,000.

The Orsar La-Haqlauth, Ltd., which grants similar credits to agriculture, has increased its paid-up capital from £100,000 to £160,000 and its loans from £116,000 to £188,000.

The A.P.B. Investment Co., Ltd., which was established mainly with a view to providing a convenient medium of investment in Palestine for foreign investors, has increased its ordinary capital from £100,000 to £135,000, its preference capital from £150,000 to £175,000, and its debenture issue from £253,000 to £471,000. In this way close on £300,000 was made available for new investment.

Progress was, therefore, satisfactory in all the three companies. We are still continuing our policy of allowing these companies to retain their profits in the business.

Towards the end of the year we opened two new branches, in Nathanya on the seashore, thirty miles north of Tel-Aviv, and in Ramath-Gan, three miles north-east of Tel-Aviv. Both branches have made good initial progress.

PROFIT AND LOSS ACCOUNT

The profit and loss account again shows an increase at £198,387 after an allocation to contingencies. The increase in income resulting from the expansion in advances has been set off to a large extent by an increase in expenditure.

Your directors have appropriated £75,000 to the contingencies reserve and £75,000 to the reserve fund, bringing the latter up to £500,000. They recommend a final dividend of 4 per cent. (free of income tax) on the ordinary and "A" ordinary shares, which, together with the interim dividend of 3 per cent. paid in October, makes the total dividend for the year 7 per cent., tax free.

I cannot close my remarks without paying high tribute to the management and staff for their devotion and energy in coping efficiently with considerably increased work during a rather trying year.

The report and accounts were unanimously adopted and the dividends as recommended were approved.

The retiring directors, Mr. A. Barth and Mr. A. Brudny, were re-elected; and the auditors, Messrs Jackson Pixley and Co., having been reappointed, the proceedings terminated.

CALEDONIAN INSURANCE COMPANY

TRIENNIAL VALUATION RESULTS

The one hundred and forty-third annual general meeting of this company was held, on the 6th instant, in Edinburgh.

The chairman, Mr W. H. Fraser, W.S., in moving the adoption of the report, said:—

Life Department.—The net life assurances issued during 1947 amounted to £2,550,342, a record for the company, the premiums thereon being £115,685, of which £21,215 were single premiums. The new annual premium income shows an increase of £18,596 over the corresponding figure for 1946.

Death claims for the year at £221,616, though greater by £24,526 than the amount last year, compare very favourably with those of recent years, and the mortality experience of the company has been satisfactory.

The life assurance and annuity fund has increased by £213,709 to £9,375,277.

The results of the triennial valuation are embodied in the report. The net rate of interest earned during the year increased to £3 4s. 8d., and for the triennium the average net rate of interest earned was £3 3s. 3d. Acting upon the advice of the actuary, and in view of the uncertain conditions, the basis of valuation was again strengthened and a sum of approximately £110,000 has been applied to this end. "With profits" policies have been valued assuming interest of 2½ per cent. per annum and "without profits" policies and annuities have been valued assuming interest of 2½ per cent. per annum. The surplus disclosed is very satisfactory and, after providing for the reversionary bonuses declared and referred to in the report, the amount carried forward is £71,121.

It has also been decided to pay as interim bonus for 1948 the same rates of bonus as have been declared for the past three years.

Fire Department.—The premium income for 1947 was £1,507,190. This figure exceeds the figure for the previous year, which was the highest in the history of the company.

The income could have been much higher, but on account of continued adverse experience in America we restricted our income there. It is our immediate intention to continue this course.

The experience of fire insurance throughout the world for 1947 was less favourable than for the preceding year, and the company's operations resulted in a substantial loss, to provide for which a sum of £121,826 has been transferred from the profit and loss account to the fire account.

Accident Department.—The premium income for 1947 was £1,437,483, which is a figure 35 per cent. higher than the figure for the previous year. The underwriting results for the year were unsatisfactory, and we have transferred a sum of £53,755 from the profit and loss account to the accident account.

The premium reserve for unexpired risk required a sum of £149,250. This is no less than 10.4 per cent. of the whole income of the department, and arises as the result of the large increase in income.

Marine Department.—The account continues satisfactory, and a sum of £70,000 has been transferred to the profit and loss account. The fund is £645,965, which is 171 per cent. of the premium income, compared with 254 per cent. for the previous year. The reduction is largely due to the increased premium income for 1947, which at £377,824 is £143,591 higher than for the previous year.

Total Premium Income.—The premium income for all the above-mentioned departments for 1947 was £4,062,762, compared with £3,411,968 for the previous year, an increase of 19 per cent.

The report was adopted; the allocation of £20,000 to the staff pension fund was approved, and a dividend of 3s. a share, subject to deduction of income tax, was declared for the year 1947, payable in equal half-yearly instalments on May 15 and November 11, 1948.

THE LONDON ASSURANCE COMPANY

ALL-ROUND INCREASES

The annual general court of the London Assurance will be held in London on the 20th instant.

The following is an extract from the circulated statement by the governor, Mr R. Olaf Hambro:—

In the life department we have to report a record year, both in the total of sums assured, which exceeded £4,500,000, and in the annual premium income at £1,148,021, which is in excess of £113,000 over the previous year. Our net interest rate has also very gratifyingly moved upwards from £3 2s. 4d. per cent. in 1946 to £3 4s. 2d. per cent. in 1947. Our mortality experience was a little higher than in the previous year, but was well within our expectations. Surrenders, including surrenders of bonus, are at a slightly lower figure. Expenses of management, including commission, show in combination a slight decline on a percentage basis. The resultant position, after allowing for all outgoings, is that the life fund increased during the year by £563,618, closing at £13,830,496.

FIRE AND ACCIDENT

In the fire department the volume of income now stands at £3,845,770 in respect of 1947. The increase over the previous year is £36,307. Our loss experience during 1947 has been heavier than for many years. The ratio for 1947 stands at 51.2 per cent. against 43.1 per cent. in the previous year. Within living memory there has never been a higher fire loss wastage in this country or in the United States of America. Our experience has been one common to all offices.

The accident insurance account shows a very substantial increase in premium income, the increase being £384,140, which has involved the financing of the 40 per cent. reserve by an additional £163,031. The reserve now stands at £885,426. Claims paid and outstanding show an increase from 49.1 per cent. to 52.6 per cent. Commission is virtually stationary at 16.1 per cent., and expenses of management show a slight decline at 16.5 per cent. compared with 17.1 per cent. Overseas taxation calls for a debit less than 1 per cent.

MARINE ACCOUNT

The marine insurance account, with an income of £2,276,748, shows an increase over the previous year of £521,233. Losses paid, after deduction of reinsurance and salvages on account of 1947 and previous years, are 61.7 per cent., which is 7.6 per cent. in excess of the same item in the 1946 account. As in previous years, we are making a transfer from the marine account under two headings, namely, £250,000 in respect of reserve for taxation and £200,000 as a transfer to profit and loss account. The resultant balance shows an increase in the fund of £211,352, which is 120 per cent. of the annual premium income compared with 143.6 per cent. in the previous year. The fund at this figure is exceptionally strong, and it is my view, looking to possible future developments, that it is necessary to keep it at the highest possible level.

The capital leasehold and redemption account opens with a fund of £311,359 and closes with an increase of £40,472 at £351,831.

In the profit and loss account there is provision for taxation of £250,000. We are recommending an appropriation to the staff pension scheme of £100,000. After dealing with all debits there emerges a balance of £1,075,033, which is in excess of the figure brought into the year of account by £88,494.

The total premium income for all departments for the year 1947 was £9,499,916, which shows an increase over the previous year of £1,048,121.

ALLIANCE ASSURANCE COMPANY, LIMITED

YEAR OF EXPANSION

The annual general court of the Alliance Assurance Company, Limited, will be held, on the 19th instant, in London.

The following is an extract from the statement of the chairman, Mr Richard Durant Trotter, circulated with the report and accounts for the year 1947.

In the life department the net new business completed during the year reached a record total of £4,956,771, compared with £3,965,000 in 1946 and £4,205,415 (the previous record total) in 1938. The total "Alliance" life and annuity funds at the close of the year amounted to £24,705,074, an increase of £522,244 over the 1946 figure of £24,182,830.

In the fire department the net premiums amounted to £3,506,172, being £710,528 more than those for 1946. The claims for the year, including contributions to fire brigades, amounted to £1,495,377, an increase of £533,632 over those for the preceding year. The result, after providing an increase of £284,212 in the reserve for unexpired risks, is a surplus of £190,465, which has been carried to profit and loss account.

ACCIDENT DEPARTMENT

In the accident department the net premiums, including the revenue of the "National Boiler," amounted to £2,976,571, which compares with £2,433,004 for the previous year. The result, after providing an increase of £210,184 in the reserves for unexpired risks, is a surplus of £96,884, which has been transferred to profit and loss account.

The expansion in the business applies to all sections of the department. I am sorry to say, however, that the motor account, in spite of an increase in income both at home and abroad, resulted in a loss, which was largely due to the fact that the revised rates proved to be insufficient.

In the marine department the net premiums at £1,484,746 show an increase of £464,173 over the premiums for 1946. The underwriting account for 1945 has now been closed, with a balance of £336,288, which compares with £359,160, which was the balance on the 1944 account. After setting aside £105,222 to meet further claims, which maintains the reserve for previous years at £425,000, a surplus of £231,066 is transferred to profit and loss.

In the trustee department the fees received for 1947 amounted to £11,089, compared with £9,974 in the previous year, and the department continues to make good progress.

DIVIDEND MAINTAINED

In the investment department the year was one of exceptional difficulty. The abandonment of the Government's ultra cheap money policy caused a substantial decline in the market prices of the majority of fixed interest securities. Nevertheless, there remained at the end of the year a substantial margin between the book values and the market values of our Stock Exchange securities.

The following appropriations have been made from the consolidated profit and loss account: £96,800 to staff pension funds; £20,876 to writing down of premises; £30,000 to reserve, and £45,247 to the widows' and orphans' funds. In addition, provision has been made for the dividend payable in 1948, which the directors feel should on this occasion be maintained at the same rate as that declared for last year, in spite of the increased burden imposed on the company by the present penal rate of profits tax.

ARMY AND NAVY STORES LIMITED

TRADING PROBLEMS

The seventy-sixth annual general meeting of Army & Navy Stores, Limited, was held, on the 5th instant, in London.

Major-General Guy Dawnay, C.B., C.M.G., D.S.O., M.V.O., the chairman, presided and, in the course of his speech, said: The figure of £1,033,793 shows the actual gross profit made by trading. The gross profit from trading and all other sources amounted to £1,150,591, and the expenses to £692,393, which leaves a balance of net profit of £458,198, or £29,107 less than the previous year. If you will now turn to the profit and loss appropriation account you will see that the total credits are £573,442, and out of this sum we are providing £290,000 for income-tax, profits tax, etc., leaving for disposal £283,442.

APPROPRIATION OF PROFITS

We recommend the appropriation of this balance as follows: Payment of a 10 per cent. dividend, plus a bonus of 10 per cent. which is the same as last year; this will absorb £90,200 after deduction of income-tax; the allocation of £2,000 to the Indian good service fund; of £21,979 to the staff pension fund, and £55,000 to reserves, leaving £114,263 to be carried forward, or £2,705 more than last year.

I propose to say a few words about our net profit. Out of each £1 of net profit that we make, the Government takes in taxes 12s. 0½d.; debenture and other interest, 11d.; necessary reserves, 2s. 3½d.; staff benefit funds, 1s.; and dividends to stockholders, 3s. 9d. That is where the money goes. You will notice that the Government is out and away the largest shareholder in your business. For every £1 you get out of it this year, the Government gets £3 4s.

To conduct a retail business like ours is no mere child's play in these times. The prices of what we buy and at which we sell are constantly more and more minutely controlled and our operations more and more closely regulated. In a number of directions, our functions become those of retail agents, rather than of traders; and this does not apply only to such things as branded goods sold on a pre-determined margin, but also to large lines such as the Government concession wines, where moreover our capacity for judgment and selection is largely restricted.

PURCHASE TAXES AND PRICE CONTROLS

The operation of the purchase taxes and of price controls admit of little or no "cushioning" of the effect of constantly rising costs of what we have to buy and in respect of labour, material, transport, and handling generally. And it is obvious that all these factors restrict the exercise of experience in trading. Many of the controls, and restrictions, regulations and statistical inquiries under which we labour may be necessary in the present plight in which our country finds itself. But—and here I speak quite generally—I cannot refrain from the comment that in many cases they are mere pills prescribed to alleviate the symptoms of a disease that may be mortal. As I see it, the root cause of that disease is monstrously extravagant Government expenditure, much of it undertaken, as we gather from the pathetic speech of Mr Shinwell last Sunday, without the necessary knowledge, foresight or detailed preparation. Until the disease itself is attacked, and the Government ceases to spend "like a drunken sailor," the palliatives for the symptoms will inevitably continue to be needed, and will also inevitably, I think, fail to effect a cure.

The report was adopted.

ASSOCIATED ELECTRICAL INDUSTRIES, LIMITED

A SUCCESSFUL YEAR

The forty-eighth annual general meeting of Associated Electrical Industries, Limited, was held, in London, on the 5th instant.

The Right Hon. Oliver Lyttelton, D.S.O., M.C., M.P., the chairman, in the course of his speech, said: The year 1947 has been particularly difficult. We were able, however, through arrangements which had previously been made, to keep a good proportion of our workpeople in employment. We were also glad to be able to pay the guaranteed week through the whole period of the stoppage, whereas a strict adherence to our legal obligations would have confined the payment to one week after notice had been given.

Interruptions in the smooth flow of raw materials through the shops, and the shortages of certain vital supplies for our industry, have also added to the difficulties of both management and workpeople. Lastly, several new factories were or had been acquired, and the management has had to deal with the baffling problems which present themselves when new factories have to be laid out, the flow of production planned, the machine tools deployed and labour trained.

It is, therefore, with a sense of satisfaction that I am able to record that during the year the invoicing of finished products from our factories, which are now situated all over the country, rose by no less than 18 per cent. Part of this is due to the rise in prices of our products, which in its turn is chiefly due to the rise in price of raw materials which we use. Part, however, is due to increased volume made possible by our additional manufacturing capacity.

EXPANSION OF EXPORTS

We have made great efforts to expand the volume of our exports, and in this we can claim to have been successful. The total value of exports made by this Group to all parts of the world in 1947, amounted to little short of £14 million. This figure should give some heart to those who are inclined to think that the industries of this country are incapable of competing in the markets of the world. Since the close of the year, we have been able to make still further increases in our export business to all parts of the world.

At the end of 1947 the firm orders on the books were the highest ever recorded in the history of the Group, and in 1948 the rate at which orders are being received is still increasing. Besides increased sales abroad, we have also increased our interests in the Empire by making a further considerable investment in South Africa. We have been engaged in expanding the manufacturing capacity of our Indian factory. The Australian General Electric Proprietary, Limited, in which we have approximately a 50 per cent. holding, continues to develop satisfactorily.

We have continued to take further orders for generating plant at home and are fully maintaining our position as the leading suppliers of heavy plant in this country. We continue to receive important orders for rolling mill motors and other electrical equipment. We regard the development of gas turbines as being of great importance in this century, and we expect that gas turbines will be used on an increasing scale as prime movers.

Striking advances have been made by the Group in the field of electronics. Great progress has been made in fluorescent lamps and lighting. The products of your company cover a wide range from the largest turbo generators to the smallest radio valve.

The report was adopted.

THE BRITISH SOUTH AFRICA COMPANY

PROFIT DOUBLED

The annual meeting of The British South Africa Company was held, on the 6th instant, in London.

Sir Dougal O. Malcolm, K.C.M.G., the president, said that the net receipts from mining royalties, rents and fees were multiplied more than threefold. These had risen from £410,000 odd to over £1,250,000. Those remarkable figures, of course, resulted in the main from the prosperity of the great Northern Rhodesian copper mining industry. The total production of copper from Northern Rhodesia during the year under review of 194,746 long tons exceeded the previous year's production only by about 23,000 tons, but the value of that production had increased by nearly £6,700,000, owing to the rising price of copper. Of that total production, Rhokana Corporation had produced 67,632 long tons of copper, and in respect of its financial year ended June 30, 1947, had paid dividends on its share capital of 85 per cent., which figure, however, bore very little relation to the much more modest return received by the stockholders in that undertaking on the money actually found and expended by them.

Nchanga Consolidated Copper Mines had produced 23,036 long tons of copper during the year under review. It was still in the process of expansion, and had not yet reached the dividend-paying stage. The production of copper by Roan Antelope Copper Mines and Mufulira Copper Mines was respectively 52,865 long tons and 51,213 long tons. Those companies had paid dividends of 15 per cent. and 25 per cent. respectively.

Their interest direct and indirect as shareholders in those Northern Rhodesia mining companies was very large, but their main receipts from Northern Rhodesia mining rights came to them in the form of royalties on their production.

MODEST INCREASE IN DIVIDEND

The profit from the estates at £25,600 was about £25,000 less than the corresponding figure last year. The overall result was that the profit for the year under review was £951,564—more than double the previous year's profit at £453,164. In the circumstances of the present time they had thought it right to confine themselves to proposing the modest increase of 9d. from 1s. 9d. to 2s. 6d. per share or unit of stock in the dividend, which would call for £602,285, less than two-thirds of the profit for the year, and to increase the carry-forward by the large sum of nearly £350,000 to £1,155,823. The dividend represented a return of 16½ per cent., less tax, on the nominal issued capital of the company, but of only 10 per cent. on the capital actually invested in the business.

That they felt was the least that they could do in fairness to shareholders, who were now at last approaching the fruition of the hopes which, in the commercial sphere, had inspired the long patience of the whole body of shareholders, who by their faith and with their resources had backed the great imperial project of Cecil Rhodes, and had made its realisation possible.

The company had a long history behind it, for nearly 59 years was a long time, and they were looking forward to celebrating their Diamond Jubilee on October 29, 1949. For more than a third of a century from the beginning, while they were carrying the burdens of the administration of Southern and Northern Rhodesia, they had never paid any dividend at all. Since then they had paid dividends, steady but not large, for about a quarter of a century.

The report was adopted.

Kite from the Kremlin

ONE would like to know whether the Politburo is now reproving its Foreign Affairs Commissar for a diplomatic blunder or congratulating him on a brilliant stroke of political warfare. By rudely broadcasting to the world on Monday night a statement of Russian policy which had been handed to the American Ambassador in Moscow only on Sunday, Mr Molotov has provoked a depressing series of diplomatic "no bids." Mr Truman says there is "no new departure in American policy," Mr Marshall denies that he has any wish to discuss alone with Mr Molotov matters affecting other nations, and Mr Bevin insists that the ground should be cleared before new talks are attempted. To achieve this much in 48 hours is indeed a feat—whether of clumsiness or skill.

It may have been calculated in Moscow that a diplomatic sensation would help Mr Wallace in the presidential elections, or that the sails of Western Union might begin to flap if the wind blew less steadily from the east. Or Mr Stalin's advisers may have seen in the full and frank reminder of American policy presented on May 4th an attempt to score a point in the cold war. Or, indeed, it is just possible that Mr Molotov mistook General Bedell-Smith's *aide-memoire* for a *billet-doux*.

Whichever may be the correct explanation, the hopes that were aroused have been quickly dashed. Having explained to Moscow that the shape of a bipartisan American foreign policy is set, and that it will be modified only in response to a change of tone in Russian policy, Mr Marshall has now to persuade a disappointed Europe that a desire for general conversations is no new feature of the policy of the Russians, and that they could better express their goodwill, in more than one capital or committee, by action instead of words. But Mr Marshall is entitled to expect that there should be no suspicion or resentment in London or Paris or Brussels about his single-handed and secret approach to Mr Molotov. A joint approach would have been regarded in Moscow as tantamount to a threat ; a public gesture would have been treated as a challenge or ignored. General Bedell-Smith's memorandum was well-timed, carefully drafted and free from any taint of appeasement.

It is not easy to do justice to the spirit of the argumentative Russian reply, because its version of postwar international history is the usual Marxist fantasy. It is friendly—by the standards of 1948—in so far as it speaks of the “positive attitude” with which the Soviet Government receives the American assurance that “the door always remains open for discussion and settlement of our differences.” But the Russians at once aroused suspicion of their good faith by interpreting it as “the proposal to *begin* . . . a discussion and settlement of the differences between us,” and by then broadcasting the distortion to the world in the midnight hours.

As for the American statement, there is a significant sentence which has escaped notice. Referring to attempts by Communist minorities to seize power and establish "regimes subordinated to foreign interests," it declares that, if these attempts ceased,

then the necessity for certain manifestations in the foreign policy of the United States which evidently cause dissatisfaction in Moscow will be eliminated.

That is a broad and promising hint of possible concessions. There is no counterpart to it in the Russian reply, save the general suggestion—by no means a concession—that Russia would be interested in a programme of European economic recovery outside the limits of the Marshall Plan. This is hardly the way to appeal to Mr Marshall.

The public airing of the two government's statements will have done a little good to the American and Russian publics. But in Europe it will have done great harm, by encouraging the appeasers. If any progress towards negotiation and settlement is now to be made this dangerous public diplomacy should cease. It is no good Mr Marshall's pointing to the Uno council

Long-Term Economic Problems—I.

The Importance of Capital

BEYOND very much question the most fundamental problem of the long run that faces the British economy is the rate at which it will create capital. It is less urgent than the problem of the balance of payments, which must be solved in a very few years. But if Britain contrives to bring its international accounts into balance by the early 1950s, it will only be by a great effort and by much privation. The only possibility of combining a balanced international account with ease and prosperity at home is by a great and sustained increase in real productivity—and that rests on the rate of capital creation more than on anything else.

The process by which capital is formed is familiar to anyone who has read even the simplest textbook of economics. Not only Robinson Crusoe on his island but also the most complex industrial community must set aside out of its annual production enough resources to keep its existing capital equipment in repair, to replace it when it wears out or becomes obsolete, and to increase its total amount. The essential characteristic of capital creation is that though it competes with consumption (and with the activities of the Government) for the limited resources of the community in the present, it is the means of increasing the whole level of production and consumption in the future. A high rate of capital creation lowers the standard of living now, but (if the capital is properly applied) raises it later on. It reduces the size of the slice that is available to be eaten now, but it increases the size of the cake later on.

The New Economics of the 1930s, under Keynes's leadership, turned a very bright spotlight on the relationship between the amount of capital creation that was undertaken and the amount of monetary saving that the community spontaneously performed out of its income. If capital creation exceeded saving, there would be a boom; if capital creation fell short of saving, there would be a slump. This doctrine, in its broad outline at least, is now all but universally accepted. But being worked out in a period of massive unemployment, it had the natural but unfortunate result of concentrating attention on the apparent phenomenon of over-saving. It is true that, throughout the 1930s, the British community (and still more the American) had a tendency to save more than it invested in the creation of capital. It is true that if the community had then saved less, it would have suffered less from unemployment.

But the crucial fact that was hidden by this concentration on the causes of unemployment was that even if Savings and Investment (to use the Keynesian terminology) had been equal to each other before the war, they would still have been far too small. By any test, the British economy of the inter-war years was creating far too little capital. It did not maintain its machinery; it was woefully inadequate in scrapping old plant and replacing it by new; much of its transport equipment (both

table. That method has been tried with the Russians and has failed too often. There should be negotiations through diplomatic channels, with the most careful preparation and without popular expectation of quick results. For the general agreement which is—and always has been—the objective of British and American policy may take years to achieve. Meanwhile, the measures taken to strengthen the West—political and military as well as economic—must go on swiftly and steadily, just as the consolidation of the east European bloc will go on. The condition of reaching, let alone maintaining, a general settlement between Russia and America is to achieve a new balance of power in Europe.

track and rolling stock) was allowed to become very antiquated. Almost the only forms of capital in which there was a rapid rate of replacement and expansion were dwelling houses and electric power equipment. With all the advantages of hindsight, it is very easy to see today that there should have been a much greater creation of capital of all kinds in the inter-war decades.

Certainly the boot is on the other foot now. The economy is now embarrassed by the enormity of its demands for capital. There are the arrears—the recognised arrears, so to speak—of the war years to be overtaken and the actual damage to be put right. There is also a growing recognition of the hidden arrears that existed in 1939 and of the need to overtake the effects, not merely of six years' preoccupation but of twenty years' indifference. And finally there is an enormous demand for social capital of all kinds—houses, hospitals, schools, new towns, parks, public buildings and the like—which is not directly productive but neither can be nor should be denied. In 1938 some 14 per cent of the gross national product was devoted to gross capital formation, and of this fully three-quarters must have been absorbed either in the mere maintenance and replacement (slow though it was) of the existing capital or else in the relatively unproductive form of dwelling houses. Broadly speaking, only sixpence out of every pound of gross income was invested in the means of increasing the nation's capacity to create wealth for itself.

★

It is not intended in this article to suggest any precise target for a long-range programme of capital formation. That, presumably, will be contained in the Government's promised long-term plan. But it is quite obvious that the proportion of gross capital formation must in future be considerably larger than the 14 per cent of 1938. There is, indeed, no more important decision that a community has to make—whether it makes it consciously through some mechanism of planning or unconsciously through the unplanned decisions of its citizens—than how much of its resources it will put into new capital. It would be going too far to say that the standard of living of a nation depends solely on the productive capital it possesses; but it certainly depends on that much more than on any other single thing, or even than on all other things put together. Why is the standard of living in America or in Britain higher than it is in Russia or in China? Basically it is because, through the accidents of economic history, every pair of American or British hands has many more mechanical slaves to supplement it than the Russian or the Chinese pair of hands. But why is Russia's wealth-creating power increasing so much more rapidly than Britain's? Because the Russian people are, year by year, putting into new productive capital equipment

a much larger proportion of their annual income (and starving themselves in the process) than the British. This is not a matter of free enterprise or socialism. The vital distinction is between "high-capital" and "high-consumption" economies and there are examples of each to be found under private and public ownership. Mr Stalin is certainly a far better capitalist (in any literal sense of the term) than the Tory businessmen of inter-war Britain.

The mark of a progressive economy is thus to have a high rate of capital formation. There is certainly no country in the world that has a more imperative need to be economically progressive than Britain, which needs to be very progressive for several decades simply to keep its present, or its prewar, place in the world, to become independent without suffering the pains of a permanent siege economy, to build up an income sufficient to afford the social promises it has made to its own people. But unfortunately a nation cannot achieve a high rate of capital formation simply by desiring it, or by approving of the general proposition, or by planning it in a White Paper. Even if it be fully accepted as a national objective, there are still two separate orders of difficulty in the way. The first is to create the supply of savings to finance the capital formation, or—to put the same point in non-monetary language—to see, by one means or another, that the community consumes, or uses up in Government activities, a smaller proportion of its annual resources. But the second, when the supply of savings has been assured, is to see that it is in fact invested in capital formation of a productive and profitable kind. To save gigantic amounts and then not to invest them would be to court unemployment on an unprecedented scale. There is nothing automatic about the investment

Lessons of The Hague

FOR Mr Churchill's speech alone it was worth holding the Congress of Europe. Whatever the proceedings at The Hague last weekend may have lacked in preparation and procedure, they were given an impressive send-off by Europe's only great orator. Mr Churchill was able to invoke his wartime authority, as well as the warnings of his Zurich speech two years ago, to present the workings of the Marshall Plan and the committees of the Brussels Treaty as great steps forward in a direction which he was one of the first to point out. He was able, too, to dramatise the simple motives and fears which had brought so many leaders of European life to the Ridderzaal; and he reminded the federalists, customs unionists, multi-lateralists and other expert pleaders that their real task was to interpret and harness the heart's desire of millions of families in Europe—the longing to be free of fear:

Why should they now be regimented and hurled against each other by variously labelled forms of totalitarian tyranny, all fomented by wicked men, building their own predominance on the misery and subjugation of their fellow human beings? Shall so many millions of humble homes in Europe, aye, and much of its enlightenment and culture, sit quaking in dread of the policeman's knock?

That, said Mr Churchill, was the question the Congress had to answer. And by this formulation, so unlike the cold economic propositions of Mr Marshall and the cautious political generalities of Mr Bevin, the purpose of union in Europe is put in a way that the ordinary man can remember as well as understand. Thereby Mr Churchill set the Congress working on what seems likely to be its main task; to act as the voice of Europe, formulating principles, reminding statesmen of their promises and voters of their aspirations, planning unofficial ways of co-operation, and debating differences between national groups.

of savings, as the experience of the inter-war years showed; it must be made to seem worth while to those who are in charge of industry.

Both of these problems—that of the supply of savings and of the demand for them—will be taken up in subsequent articles. It is not intended by that to suggest that any adequate solutions will be offered to either of them. On the contrary, in the particular circumstances in which Britain will find itself in the second half of the twentieth century, both of these two problems are likely to prove intractable. It is all too easy for a democratic, universal-suffrage community to allow capital formation to be pushed to the wall. Long-range intentions may be excellent, but at any one moment it may be politically impossible to cut down consumption or prune Government activities enough to create a sufficient margin in the national income. Capital creation may be necessary; but there are very few votes in it. Yet the penalties for neglecting it, though they may take some time to mature, will in the end be inexorable. An instalment is being experienced now. But if under-investment continues much longer, then it may be wholly impossible to rescue the British economy. Nor—to re-emphasise another essential point—is this an issue that can be advanced an inch by any comparative arguments of free enterprise against socialism. The Britain of the future may be fully dedicated to complete *laissez faire* or it may be completely socialised and planned; in either case it will be progressive or stagnant according as it succeeds or fails in securing a high rate of capital formation. This is not an issue on which the choice for Britain is between America and Russia; it is a choice between being as buoyant as either of these or as moribund as Ottoman Turkey or Bourbon Spain.

But not all Mr Churchill's good advice was taken last weekend. There was a strong party of those who want "sharply cut formulas or detailed arrangements." On several occasions distinguished men lost their tempers over niceties of drafting. French and Belgian trade unionists kept the economy committee up all night with an argument which, on the face of it, seemed to insist on a foolishly narrow interpretation of the word "workers." Above all there were federalists who wanted a European assembly at once, and who proposed quite recklessly to give equal status in it to self-appointed exiles from eastern Europe and Spain. In short, the congress drew to The Hague not only a distinguished company of statesmen out of office and leaders of public life, but also more than a sprinkling of Europe's cranks. And the result of their meeting was what the veterans had foreseen: a succession of sharp duels between those who make haste slowly and prefer birds in the hand to birds in the bush, and those who believe in blue-prints, planning, vision and hustle.

It cannot be said that either side won a clear victory. The political resolution voted by the Congress declares that

the time has come when the European nations must transfer and merge some portion of their sovereign rights, so as to secure common political and economic action for the integration and proper development of their common resources.

The economic resolution asks governments to abolish obstacles to trade, to reduce and remove customs duties, to restore the equilibrium of their budgets, to raise standards of living in Europe and to co-ordinate economic policies so as to achieve full employment. These economic proposals are now common coin in all countries working on the European Recovery Plan; all that the Congress has done is to say the coin is good. What it did not do—and what no discussion among statesmen and politicians has yet done—is to show the practical effect of such

It will be seen that the contributions are fairly heavy. They will seem particularly so to those who are now entering insurance for the first time. Many people, too, will have to pay employers' contributions for their employees, for instance, domestic servants, as well as their own contributions as employed persons. A small shopkeeper will have to pay 5s. 9d. a week as a self-employed person and if he employs, say, two assistants at a wage of over 30s. a week, 4s. 2d. in respect of each of them. In the circumstances, it is perhaps not surprising that the self-employed and the non-employed are being slow to apply for contribution cards under the scheme. There are approximately one and a half million persons in each class, but only 354,000 odd applications had been received from the two classes together by May 1st. Yet it was the alleged hardships of the self-employed class that made Members of Parliament persuade the Government, against its judgment, to allow it sickness benefit on the same conditions as employed persons. If the self-employed were as eager to obtain the full benefits of the insurance scheme as MPs said they were, a little more enthusiasm to be enrolled under it might have been expected.

The trouble, as always, is that people want the benefits of the scheme without having to pay for them—or work for them. They refuse to relate the size of their contributions to the size of the benefits they will receive. When the new contributions are levied from July 5th, it is quite probable that they will be the signal for further demands for increases in wages. Yet any rise in the price level will decrease the value of the benefits under the scheme. When the basic rate for old age pension, unemployment and sickness benefit was fixed at 26s. a week early in 1946, it was above the subsistence level as fixed by the Assistance Board. But the Board will shortly introduce new rates for national assistance, which will narrow the gap between assistance grants, paid after a test of need, and insurance benefits paid as of right. If the Board's rent allowances are taken into consideration, the 26s. a week benefit will be lower than the assistance payments. Is there going to be an outcry that 26s. is not enough, that it is wrong that old age pensioners and the unemployed are having to have recourse to the Assistance

Board to supplement their benefits? And, in the administration of national assistance itself, will the Minister of National Insurance be able to withstand political pressure that the Board should be ever more generous in its determination of need? During the passage of the National Assistance Bill through Parliament this pressure was very obvious. The disregard of an applicant's resources before his needs are determined has gone very far. No doubt from the standpoint of encouraging savings it is right that the thrifty should have some advantage over the spendthrift in the determination of need. But the essence of national assistance, as of the poor law which it is superseding, is that it is available for the completely destitute. What, after all, are savings for if not to prevent a person from seeking financial help from the state?

When that help in time of need had to come from the rates, many people were too proud to ask for it, and there was much suffering in consequence. But the more it has become centralised, the more willing people are to avail themselves of it—indeed, they fail to see that it has to be paid for by their neighbours as taxpayers, and regard it as something which that mythical "They" should provide, as a duty, for "Us." Now that a costly health service is to be paid for almost entirely by the state through taxes, there is a similar danger that people will overuse it and will quite fail to see that the country cannot afford to go on adding indefinitely to the number of nurses, doctors and other medical technicians it will be asked to provide.

The purpose of the social security scheme was to abolish the anomalies in the existing provision, to prevent overlapping between one social security agency and another, between voluntary effort and state provision, and to establish a comprehensive scheme to cover everyone against the normal hazards of life. It is a pity that, in all the publicity at present being devoted to the introduction of the scheme, no Minister has emphasised that it is certainly not its purpose to undermine the will to work and that it will only be a success if it is worked for. It is right that the harshness of the old system should have been abandoned. But the country could do with more of the individual pride which that harshness engendered.

too must also send in armies, but their small forces are so badly organised and lacking in transport, and their internal situation such, that they dare not risk more than a small part of them. Moreover, Hagana units in eastern and western Galilee bar the way and any clash would be likely to result in a Syrian defeat.

It is not only the Palestine Arabs who melted and fled before the Jews; the Liberation Army often led the way. The men wanted to get back home to help with the harvest, and quickly realised that they were no match for the Jews, for their equipment lacked heavy arms, transport, and petrol. It is impossible to estimate the number of Arabs who have fled from Palestine, or from towns and villages in the Jewish area into the Arab triangle and towns such as Acre and Gaza, but it must be something like 200,000. This does not suit the Jews, who are trying to persuade the Arabs to return to Haifa, where they count on using cheap Arab labour. Meanwhile Jewish industry and commerce are still at a standstill everywhere, except possibly in the Tel Aviv area, and the Jewish Agency is heavily in debt.

Arab League's Dilemma

The Arab States in the League now face this dilemma: either they can try by intervention to fulfil a part of their pledges to the Palestine Arabs, or they must abandon virtually all pretence of wielding effective power in the modern world. Egypt's declaration of martial law may be as much a preparation for non-intervention as for intervention. And unless King Farouk is goaded by public opinion into risking Egypt's armoured division and air force across the Sinai desert, the Hashimi axis of Trans-

Jordan and Iraq emerges as the only Arab combination capable of intervention. King Abdullah's intervention may, it is true, be covered by some face-saving pan-Arab formula, but this will not change the actual state of affairs. And the King is never the man to forgo any credit that may be due to him. If his intervention achieves a measure of success—and even the occupation and defence of the Arab rump of Palestine would be a success under present conditions—an important shift of power in the Arab world would result, and Hashimi pressure on Syria would be inevitably increased. If there is complete failure the political consequences inside the Arab countries will be far-reaching.

The real military point of the Arab collapse in Palestine is that guerilla warfare, combined with economic attrition, was considered the most effective as well as the most convenient strategy against the Jews. The failure of guerilla warfare leaves them with what may prove a still weaker weapon, their official armed forces. As was always foreseen, the real test for the Jewish state will be in the long run the economic one. The second post-Mandatory phase, of economic warfare, may now be beginning. But without guerilla resistance, the Jews may be able now, with United Nations help, to force a measure of Arab compliance in making the economy of Palestine work again. The Arabs, too, are suffering tragically from the economic breakdown, and this may help the Jews. None the less, they cannot run Palestine indefinitely on a siege basis.

Duel Over Germany

The London talks on Germany, which are intended to submit agreed recommendations to the Foreign Ministers of Britain, France, the United States and the Benelux group, ran into grave difficulties as soon as the experts left generalities and got down to details in the technical committees. The fundamental difference of views between the French and the Americans has been starkly revealed. In some ways, the British are equally far from the French, without being close to the Americans.

Though more has emerged about differences over the Ruhr, which is the focus of attention for the French man-in-the-street, it is in fact the political future of Germany which forms the basic issue. Broadly speaking, the question is whether the establishment of a German government in Frankfurt will ensure or endanger the attachment of Germany to the West. The French are quite certain (and they have a body of German Christian-Democrat opinion behind them) that a centralised German Government might start in Frankfurt, but would end in Berlin under Russian and Communist patronage. The French would prefer not to have a German Government in Frankfurt at all, but to build up the existing states. And if a constituent assembly is to be formed by September 1st, as proposed, it should—in the French and German Christian-Democrat view—be nominated by the states, and not elected.

The Americans, and to a lesser extent the British, are anxious to establish a government directly responsible to the electorate, and which would be granted far wider powers than the present ineffective bizonal economic administration in Frankfurt. In insisting on elections they are under Anglo-Saxon illusions about the way in which Germans now regard democracy, and there is much to be said for the view that it would be best to relieve the Germans of the responsibility for setting up the first separate government, especially in the present international situation. If the government has adequate powers it will function and be obeyed just as well or badly as if it were elected by an apathetic populace.

Though the French are in many ways more realistic than the Americans and British, their policy is fatally negative. The present stage in the administration of Western Germany cannot be allowed to continue without disaster to ERP, and to the whole concept of combined Western European strength which lies behind it. The Germans will continue to obstruct until they have more control over their own affairs. Their present reluctance to co-operate is due, not by any means only to their fear of being regarded as quislings, but simply to the fact that they are being prevented by military government from establishing an economic system in which business men could make money. Given a reasonably powerful government of their own, established by decree of the Occupying Powers, freedom from military government except in a very few essentials, currency reform, and the vast flow of imports which is coming under ERP, self-interest would keep Frankfurt from looking towards Berlin. The interest of Western Europe demands that this new German state shall be, from its inception, included in all the forms of Western integration which are now being tentatively established.

Equality of Misery

It was perhaps inevitable that last week's second reading debate on the Finance Bill should concentrate mainly on what were really committee points, especially where, as in the matter of the special contribution, principles and technicalities are inextricably intermingled or where, as in the purchase tax changes, the parts are obviously more controversial than the whole. There was no major attack to call forth a major defence—a deficiency which the Chancellor evidently found disappointing. Nevertheless, there did emerge from the background of special pleading and technical argument some points of principle. The question of the investment of Unemployment Insurance funds in "Daltons," and the losses thereby incurred, for example, is hardly a technicality; and when one remembers the electioneering play made in 1931 with the Government's comparatively unexceptionable use of Post Office savings, one wonders what has happened to the Tory propaganda machine.

But on a broad view the most striking feature of the debate was the clash between the two fundamentally opposing views on real income and its distribution.

We have proceeded, quite definitely [said the Chancellor in winding up], upon the basis that as long as there is a shortage provision must be made for giving everybody equal shares of what is short.

This is mercifully an exaggeration. There is no equal distribution per head of cigarettes, books, taxi rides, seaside holiday accommodation, or many other things of which the shortage is undeniable; but Sir Stafford evidently wishes that there were. Things should be controlled, he added,

to see that they are used for the general benefit of the community, and not for some particular small class of the community to enjoy when other people cannot enjoy them.

It is not, evidently, an absolute diminution in the enjoyments of the less fortunate which is to be guarded against; it is the shocking and immoral spectacle of a minority enjoying relatively more. The old yearning for equal misery still governs the Chancellor and marks what he calls "the profound difference between the two sides of the House"—a difference earlier underlined when, in a passage between Mr Warbey and Mr Casson, the latter explained that

we do not consider that some people have too large incomes, but that others have too small incomes.

Conservatism may have richly earned the reproach of complacency in the face of social injustice, but this Conservative statement embodies—as its maker claimed—a more positive and constructive attitude than does Labour's reiteration of the ingrained negativism of the underdog-in-the-manger.

Ban on Processions

The three months' ban on political processions in certain London boroughs has now been extended to the whole of the Metropolitan police district. This is the Home Office's answer to the Mosley demonstrations and Communist counter-demonstrations of recent weeks. Under the Public Order Act of 1936, the Commissioner of Police has power to impose conditions on those taking part in processions if he fears that serious public disorder may result, or he may ban a procession altogether. The ban does not apply to meetings, which are not covered by the Act. Nevertheless, the ban on all processions in the Metropolitan police district for three months is not a thing to be lightly accepted. Why has it to be imposed now, three years after the end of the war? The answer is, of course, that the police have too much on their hands, in their present depleted strength, to keep public order during political processions. Therefore, the only solution is to ban the processions. If one could be sure that the ban was recognised as only a short-term solution and that in the meantime the Government would do all in its power to strengthen the police, there might be less disquiet about this surrender of a liberty. But instead all the Government does is to pile new duties on the police by the creation of new offences—as witness the Motor Spirit Bill—which only weakens it further. Of all Departments, the Home Office must be by prewar standards one of the least overworked. Why does it not devote more energy to bolstering up the police instead of relying on more restrictions and suppressions?

Motor Spirit Bill in Committee

The Bill which attempts to put down the black market in petrol passed through its remaining stages in the House of Commons this week. It is a loathsome Bill and its loathsome-

NOTES OF THE WEEK

Debacle in Palestine

Before the end of the British Mandate last night, the Jews in Palestine had secured a territorial basis for their State. They have thus completed the predicted first phase of their post-Mandatory task, and done it in such a way as to expose Arab weakness to Arabs themselves and to all the world. The extent of the debacle is described in a despatch from our correspondent in Jerusalem who telegraphs: "Hagana's capture of Safad, with its 8,000 Arabs and 4,000 Jews, and the Arab town of Beisan, and the surrender of Jaffa, leave only five or six sizeable towns and the triangle of Samaria and Judaea still held by the Arabs. And if the Jews succeed in reopening the Jerusalem-Tel Aviv road, the battle of Palestine will be ended until and unless the Arab armies invade it from Transjordan. Even those who appreciate the Arabs' lack of preparedness, organisation, equipment, and knowledge of modern warfare are astonished at their complete and abject collapse and panic flight. There is hardly a responsible Arab left in Palestine."

Significantly a number of Palestine Arab officials and minor leaders who have not fled are now hurrying to Amman to transfer their allegiance from the Mufti to King Abdullah. Reports place the guerilla commander Fawzi Qawuqji in this category, though he would be abandoning not the Mufti but his Syrian sponsors. King Abdullah's reiterated threats of a march against the Jews must be judged in the light of these events, but it is thought that he certainly intends a march into Arab Palestine. The Jewish Agency declare that they will oppose even this, but this may be no more than a threat.

The Syrians are in a most difficult position. To forestall an attempt by King Abdullah to take over all Arab Palestine, they

ness is not diminished by the fact that the need to end the black market is essential if the basic petrol ration is to be restored. Opposition Members were, therefore, quite right in attempting, not to whittle away the object of the Bill, but to make it less repugnant. Thus they proposed an amendment which would shift some of the onus of proof of innocence away from a defendant who is being prosecuted for having the wrong coloured petrol in his tank. They tried also to allow some discretion to the court in the imposition of penalties; severity in black cases is one thing, automatic severity in all cases, grey and black—and possibly white if an innocent person cannot establish his innocence—is quite another.

The Government, however, refused to make these concessions, though it promised that in the House of Lords a clause may be inserted which will allow a motorist, disqualified from having a licence, to ask the court for a review of the penalty after six months. What, however, was disquieting was not so much the Government's refusal to make concessions as its general attitude to the Bill. If the responsible Ministers had said: "We dislike the Bill as much as you do, but it is a necessary price to pay for the restoration of pleasure motoring," the public might have been made more anxious to co-operate. Instead, the Attorney-General in particular gave the impression that he positively delighted in the severity of the Bill and that a lot of fuss was being created about nothing. This sort of attitude is not likely to encourage people to keep the law.

Cost of Western Defence

There has lately been no dearth of advice on the strategy that should be worked out by Britain and its western allies. Those who offer it disagree on many points, but not on the conclusion that adequate defensive preparations by the Brussels Powers—whatever assumptions are made about the American contribution—will cost a shockingly large proportion of national budgets. Exactly how large will depend on the decisions of the defence ministers, who have now begun their consultations; and it will obviously be a long time before the co-ordination of national plans leads to any noticeable economies.

It is useful at this stage to set out the defence expenditure of the Brussels Powers in two years of alarm and high spending—1938 and 1948.

DEFENCE EXPENDITURE OF BRUSSELS PACT COUNTRIES

	1938		1948	
	Total	% of Budget	Total	% of Budget
United Kingdom	£234,150,000	24.8	£692,632,000	23.3
France*	23,479,000,000 francs	42.9	352,000,000,000 francs	38.6
Holland	110,359,238 guilders	17.9	400,817,600	10.3
Belgium	1,278,000,000 francs	10.4	4,078,385,720 francs	5.6

* French defence expenditure has been appropriated only for the first three months of 1948. The figure given is based on the appropriation of 88 billion francs for that period.

In the flourishing United States the proportions are also impressive. In 1947-48 \$10.7 billion, or 29 per cent of the budget, was allotted to defence expenditure. For 1948-49 the figure is likely to be \$14 billion or 35 per cent of the budget.

The implications of these figures should not be ignored by the representatives of the Sixteen now working in Paris on the revision of ERP estimates and programmes. For Marshall aid was—and still is—intended for economic reconstruction. But, if too great a share of the burden of western defence is thrust on the shoulders of the Brussels governments, the ERP estimates will be quickly made out of date.

Italian Parliament Meets

Over election slogans still painted on the streets of Rome, the deputies to the new Italian Parliament have now travelled to Montecitorio. Their first task on May 8th was to elect a Speaker for the Chamber of Deputies and a President for the Senate. The new Speaker is Signor Gronchi, who received 314 votes against 164 for a Communist candidate. Signor Gronchi is generally regarded as the leader of the progressive wing of the Christian Democrat Party. In the Senate the vote went to the elderly but vigorous and distinguished Signor Bonomi, an Independent who has also been a candidate for the Presidency of the Republic. He

was preferred to Signor Terracini, the Communist who so ably presided over the former Constituent Assembly.

On Monday the two Houses assembled in joint session to elect Signor Einaudi the first President of Italy's newly-constituted Republic. Signor Einaudi is thus relieved of the duties of Minister of the Budget which he performed with courage and distinction. During his period of office he carried out in practice principles in the expounding of which he had gained an international reputation. *The Economist* takes particular pride in saluting the elevation of one who was for very many years its correspondent in Italy.

Meanwhile the deputies had had time to look round the new Parliament in being. More than one in every two persons they saw in the Chamber was a Christian Democrat. The party holds 307 seats, which gives it a bare but absolute majority of just over 51 per cent. Of the remaining seats, 182 go to the Popular Democratic Front of Communists and Left-wing Socialists under Signor Nenni, 33 to the Saragat-Lombardo Right-wing Socialists, 18 to the conservative National Block of Liberals and the Common Man Party, 14 to the Republicans, 9 to the Monarchists, 6 to the neo-fascist Social Movement, and 5 to miscellaneous others.

The balance of the parties in the Senate brings home the fact that, for all their great victory, the Christian Democrats are not the undisputed rulers of Italy. Owing to the constitutional procedure by which a large number of seats are allotted to men with notably anti-Fascist records, and on other grounds, the Christian Democrats, holding 150 seats, are in a minority of just under 46 per cent. The ultimate relationship between the two Houses is left a little vague in the Constitution. But if they are to give the country the strong lead which it now awaits, the Christian Democrats will need to allow themselves room for manoeuvre in both Houses. This means that Signor De Gasperi must take other parties into coalition with his own, and has now to decide to what extent they shall share such specially difficult tasks as the management of Italy's foreign and financial policies.

Trade Unions in Rome

The World Federation of Trade Unions has been given a new lease of life, though no one can yet tell how healthy or how effective the body snatched from death can be. The meetings that have just ended in Rome, were marked by continuous clashes between the democratic and the Communist-dominated groups—the latter having a clear numerical majority on both bodies. They ended in a series of verbal compromises and agreements to differ on the most controversial issues.

Thus, the application of *Force Ouvrière*, the anti-Communist French breakaway movement, for affiliation was postponed until a later meeting of the bureau. It might well have caused a crisis, since it was supported by the Americans and British, and bitterly opposed by the French *Confédération Générale* and the pro-Russian elements. The Marshall Plan, as such, was not directly discussed, although its shadow darkened most of the debates. The committee skated round the difficult question of unifying the German trade unions by agreeing that the initiative for such a move must come from the Germans themselves, and that there was little which the WFTU could do at this stage to promote it.

From a practical point of view, it was most important that delegates agreed to reform the federation's administration and secretariat, which were criticised by the British and Americans as inefficient, inept and politically partisan. Mr Carey, of the American Congress of Industrial Organisations, at one stage threatened to leave if M. Louis Saillant remained the secretary. But he did not press his threat and agreed with the formula which leaves the ubiquitous M. Saillant where he is, but in effect clips his wings. Thus, he has to resign from his secretaryship of the French CGT, and the authority of the assistant secretaries has been increased.

The truth of the matter is that the western trade union leaders, particularly the Americans, would probably have been not greatly perturbed if the federation had collapsed; but none of them wanted to have a break in trade union unity laid at his door. The Russians were in a conciliatory mood, although in the debates they took every opportunity to attack Britain and America. Signor Di Vittorio, the Italian Communist trade union secretary, worked hardest for conciliation, fearing no doubt that a breakdown would cause a split in his own Confederation, and encourage Signor Pastore, the Christian Democrat leader, to form an Italian break-away *Force Ouvrière*.

Mr Arthur Deakin, the president, remarked after the final session of the conference, that there would need to be a great deal of good will all round if the federation is to continue. There

will need to be more than this. The Communists within the WFTU will do well to recall Mr Citrine's advice, given in 1945, to concentrate on trade union activities and keep politics out. If they do not, the Rome meeting will have been a complete waste of time.

A Lesson to the Miners

Sir Charles Reid's resignation from the National Coal Board will bring out completely in the open what has long been almost public property—that the high hopes of nationalisation have been disappointed and that the Coal Board is divided on fundamental issues of policy. The "stay down" strike at Waleswood in Yorkshire may not have been the cause, or even the occasion of the final breach, but it is certainly the symbol of the difficulty. The Waleswood miners are protesting against a decision to close their inefficient pit—although they are promised work elsewhere. But if nationalisation does not mean a concentration on the low-cost mines it means nothing—at least nothing that bodes any good for the national economy. The latest instalment of evidence for this is contained in a report issued on Wednesday by the Coal Board, of a visit to the United States by Mr T. E. B. Young, a mining engineer and a member of the Board. In spite of a number of technical recommendations of some interest and importance, the sting of the report lies in its tail: Mr Young believes that the only one quick solution to the country's coal problem and its one immediate answer is—more work. Without more work mechanisation and reorganisation cannot succeed.

The report is not a very original document, but it gives a fair picture of the problems before the industry. On the technical side, Mr Young has gone into great detail into American methods and their applicability to this country, and on the whole his conclusions are that there is at present little more new to be learned: it is now a question of pushing ahead with methods which are known, but have yet to be applied in the exceptionally difficult conditions of British mines. The key objective in this respect is to reduce the crippling proportion of unproductive work in the mines, which takes place between the hewer at the face and the final worker on the surface. The following figures are given for comparison:—

	America	Great Britain
	%	%
Actual productive labour ...	72	26
Ancillary work at face	—	15
Underground haulage	8	15.9
Others underground	10	19.6
Surface	10	23.5

To the ordinary reader Mr Young's general reflections will be more interesting. Since his first objective is more work from the miners, he is greatly concerned with increasing incentives. He is convinced that higher wages are not the answer, since the industry cannot afford them, but that the requirement is more goods for the miner to spend his earnings on. To this end he suggests "commodity dockets" for additional rations based on attendance, a suggestion which is not likely to be well received by other workers and has indeed been thoroughly explored, and rejected. At the second stage he is concerned to recruit more and better mining engineers and to give them more authority and responsibility. And as his final recommendation he stresses the necessity for closing uneconomic pits more rapidly, because he believes this policy "can make a greater immediate contribution towards both reducing costs and increasing output than any other means."

Dr Dalton Asks for Orders

The fraternal greetings brought by Dr Dalton from the National Executive of the Labour Party to the annual conference of the United Textile Factory Workers' Association were calculated—if calculated is the word—to add fresh impetus to the questions now being asked about the party's special brand of collectivism. Labour is, of course, officially wedded to Socialism and the national plan; but is there a morganatic marriage to syndicalism to be taken into account? When the party sends an emissary to ask an industry's trade union what, if anything, they would like to see done about that industry in the next instalment of the party programme, the merits or demerits of the answer he may get are of only secondary importance; what really matters is the impression created (to put it at its lowest) that that answer has some binding force, that a pledge is implied and that the

preferences of the workers in any particular trade, rather than the needs of the consumers of its products or the national interest, constitute the real criterion according to which policy should be shaped.

Dr Dalton is not, so far as any of his more measured utterances would lead one to believe, a syndicalist, nor are his ex-colleagues of the Cabinet; nor has any Labour spokesman seriously attempted, on a national plane, to make syndicalism respectable. Its practical incompatibility with the idea of national planning, to say nothing of national welfare, has been shown clearly enough by its unofficial manifestations in the coal industry—the last industry, incidentally, to whose unions Dr Dalton carried fraternal greetings. Syndicalist feelings, if not open syndicalist convictions and claims, are natural to the trade unions; and a party built up on trade union money and trade union efforts would be superhuman if it were able entirely to eradicate syndicalism from its own ways of thought. But there have at all events been signs that Labour, however thoroughly tied to the trade union interest, was aware of the dangers presented by syndicalism both to the national interest and to its own unity and power of effective action. Dr Dalton's expansive nature doubtless enjoyed a warm sense of good fellowship as he declared the party's willingness—in effect, as he hopes, the next Government's willingness—to reshape the cotton industry just as the textile unions may order. It probably never occurred to him that he was strengthening a disruptive force and, in the eyes of the non-trade union majority, discrediting both himself and the party whose fraternal greetings he bore; but it should, by now, have occurred to the National Executive.

British Nationality

The British Nationality Bill, which was given its second reading in the House of Lords this week, is excellent in its intentions, but it may bring some awkward and quite unintended problems in its train. Any discussion of British nationality is prickly with those unobserved thorns to which the skins of Englishmen and Scotsmen are insensitive, but which find the most unexpected tender spots among the inhabitants of the Dominions and Colonies. The issue turns on how far the word "British" is specific to people born in or descended from these islands, and how far it is generic to all the inhabitants of lands which are a part of the Commonwealth. No one has yet found a word more suitable than British, however "un-British" a Dutch South African or a Singalese may feel.

The Bill attempts to clarify the position concerning British nationality, and to give a common status throughout the Commonwealth. It was originally intended, by the Nationality Act of 1914, that all the members of the Commonwealth should adopt a common test of nationality. This was not done: several members preferred to enact separate legislation making their own terms. Those terms were very limited, but certain anomalies appeared and have since increased. The crowning complication to the existing system was an Act passed by the Canadians in 1946, which, by admitting a person to citizenship of Canada, automatically entitled him also to British nationality. The new Bill now lays down the rules by which citizens of the United Kingdom and Colonies or of the Dominions may also claim to be British subjects.

It is thus in essence a clarifying rather than a creative Bill. It does, however, carry out one useful and long overdue measure concerning the nationality of married women. British women marrying foreigners will no longer lose their nationality, and foreign women marrying British subjects will have to apply for British nationality. The loss of British nationality has for long been a grievance, and this reform will be welcomed.

The naturalisation procedure has been improving over the last year. During 1947 17,739 certificates of naturalisation were granted, of which 6,800 were to Germans, 3,200 to Austrians, 1,700 to Czechs and 1,300 to Poles. Fortunately, one no longer hears stories like that of the alien whose anxiety for naturalisation caused him to write and remind the Home Office every fortnight. Wondering at the lack of progress, he called in person, only to be informed that his action made postponement indefinite since his file, which slowly made its way up the pile for 13 days, was extracted and put at the bottom every time his fortnightly reminder arrived.

A Constitution for Cyprus

Do the Cypriots really want responsible government? If so, they should find the project now put to them by the British

Colonial Secretary an immense advance upon any form of government they have hitherto known. For the first time, it offers them the running of their affairs through an elected majority. Hitherto, on such legislative bodies as they have experienced, the votes of the Greek members were never more than equal to the sum of the votes of the Turkish members plus the British official representatives. The island's population is 80 per cent Greek by sentiment, church and language, yet a Greek view could in the past always be quashed by the non-Greeks, owing to the Governor's casting vote. Now, the legislature that is proposed will consist of 22 elected members, four seats being reserved to Turks, and of only four Government nominees.

Cyprus is sharply divided, politically, not only as between Greek and Turk, but as between left and right. The right, led by the Greek Orthodox Church, champions *enosis*, or union with Greece, but, if it cannot have this, prefers British rule to rule by the left. On the left is a small but ably led communist party which, in conjunction with some fellow-travellers, demands full self-government.

Neither left nor right will be pleased with the document now offered. It would be humanly impossible to produce a text satisfactory to both. The document is far from complete and can, within certain limits be moulded to suit their wishes. A refusal to try and hammer it into usable shape would evoke the suspicion that each side is rejecting the advance through fear of rule by its opponents—in a word, that Cyprus is frightened of democracy.

For it is democratic government that is now on offer. It will not, at this first essay, spring into being as fully fledged self-government. In the interests of defence, foreign relations and other imperial commitments, the British Governor will retain the last word on a limited number of subjects. The first messages from Nicosia suggest that local misgivings on this score may be paraded in order to shuffle off responsibility for considering and completing the plan. Both parties will reveal a weakness if they refuse to cross the starting line. Why not both do so, like the two yachts in a once-famous ocean race, each flying protest flags?

Medical Research 1939-45

Perhaps the most striking fact revealed by the report of the Medical Research Council during the six years of war (Cmd 7335 7s. 6d.) is that its work can be carried out on such a small budget. The grants-in-aid provided by Parliament amounted to only £195,000 in 1940-41 and £295,000 in 1945-46. Even when allowance is made for the fact that to a large extent the Council uses for its work the equipment and staff already provided and maintained by hospitals, universities and other institutions, it is amazing that so much good can be achieved at such small cost. One's imagination boggles at the prospects that might be open to mankind if medical research were financed on the same scale as military research, which was voted £60 million in 1947-48. The development of penicillin alone must be worth to mankind many hundreds of times £295,000.

It is indeed the chapter on penicillin that the layman may find the most interesting of the report. Also the chapter on nutrition and in particular the section on the work of the Food Rationing (Special Diets) Advisory Committee, for the priority rations allowed on the advice of this committee to invalids and others in need of special diets affected, and still affect, many people very nearly. These two chapters also reveal an important matter of principle. In the early days of penicillin, it was so scarce that priorities had to be laid down on what persons could be treated with it. Should the saving of life of an ordinary civilian dying from septicaemia have priority over the treatment of a soldier or war worker who had a less serious infection but whose period of incapacity would be shortened by penicillin? Similarly, in the question of special diets, the extreme shortage of food compelled the advisory committee to restrict extra rations to cases where the rations were of proved therapeutic necessity and, in deciding between competing claims, to give preference to those who could be restored to working capacity over mental and physical defectives and hopeless invalids. Decisions like these were "grim and distasteful." How will priorities be determined under the national health service in the period before its benefits are adequate for everyone?

* * *

Fewer Restrictions on Building?

The cuts in the housing programme are now bringing in their train unemployment of men, materials and capital equipment. As a result there is beginning to be pressure on the

authorities to raise the limit, above which a licence must be obtained for private building work, from £10 to the previous level of £100. There are many persuasive arguments in favour of this course. The regulations are evaded already on a wide scale, so why not bring the law into line with practice. Buildings are seriously deteriorating for lack of attention, and may even pass beyond redemption; why not repair them in time and so save them? Men are idle; why not employ those who cannot be moved to more essential industries on minor building and repair work? Materials—with the exception of timber and cement—are mostly in plentiful supply; why let them pile up in the stock-yards?

These are the arguments for a relaxation of the building regulations, and everyone can quote individual instances which deserve more lenient treatment than they now get. But these special instances do not add up to a general case. The building programme was cut because, in its present economic situation, the country cannot afford to devote so large a proportion of its current resources to non-productive capital equipment. If the Government was right in cutting the building programme—and it obviously was—then the consequences must be faced, even if they are unpleasant. The economic situation itself is unpleasant, and it would be absurd for the Government to yield at the first breath of North wind.

The Government has only itself to blame for the public's failure to appreciate the consequences of the cuts in housing. The whole onus has been put on the shortage of timber, not on the need to divert building resources elsewhere. Hence the outcry when the old pressures of unemployment and losses begin their unpleasant squeeze. If the Government succumbs it runs the danger of losing control over the building labour force and therefore over its own policy. A hundred pounds of building work may seem a little thing, but to allow it opens a small hole in the dyke through which quantities of men and building resources will fight to make their way. The only breach which might possibly be made without danger would be to permit more

D-Day for Western Union

SIR,—Since your note completely misinterprets my letter, perhaps you will allow me to try in a few words to make my meaning clear.

I do not want to "leave it unclear" or to "pretend" anything or "have it both ways" or "go on talking about Western Union."

Still less am I "merely saying" that the surrender of sovereignty is a "very tricky business." On the contrary, far from merely recording a truism, I regard the surrender as involving the British people in the most fateful decision in their history. Do they remain the centre of an Oceanic Commonwealth and yet co-operate closely with Western Europe or do they join as a state or province in a European Union and abandon the Commonwealth, or at least any association with the Dominions?

Sovereignty in Europe can be exercised in one of two ways. Either it can be exercised by the co-operation and agreement of existing sovereign Governments through Councils, Combined Boards or whatever other means may be thought effective for the joint exercise of their sovereign powers. That means no surrender of sovereignty and that is the course now being pursued by the Governments concerned.

Or if existing Governments definitely surrender—as in other Federations—some of their sovereign powers, they can only be surrendered to a new Government which in exercising the surrendered powers must itself be sovereign. And since the Western European Powers are democratic Powers, the new Government must consist both of a Parliament responsible to the Western European peoples and an Executive responsible to that Parliament.

Since the main object would be to develop the greatest defensive power possible, it would be worse than useless not to clothe the new Government with full powers over defence, over the finance needed for defence, and over the foreign policy of the new state as well.

This would mean a true Federation, in which the United Kingdom, if we joined, would be a province or state in the United States of Europe, just as Virginia is in the United States of

licences in areas where there were no alternative essential industries and labour was genuinely immobile.

Shorter Notes

During the first months of peace there were constant complaints about the dilatory machinery for naturalising aliens, many of whom had fought side by side with British troops and had been promised British nationality. The machinery now appears to have been greatly accelerated. During 1947, 17,700 aliens received their certificates of naturalisation, of which 6,800 were Germans, 3,200 Austrians, 1,700 Czechs, and 1,300 Poles.

*

In the article on "Changes in Bizonia's Foreign Trade" in last week's issue (p. 767), an error occurred in the passage dealing with the new conversion factor of one mark equals 30 cents. It was stated that the conversion rate is "30 marks to the dollar." This should be "3.333 marks to the dollar." German business circles refer for convenience to the rate as 3.30 marks to the dollar, but in practice the conversion has to be made accurately to three places of decimals. It should be repeated that what has been established is not a rate of exchange for the mark, but only a temporary conversion factor, pending the fixing of a rate of exchange after currency reform.

*

Although the statement in last week's article on "Malthus Regained?" that the total of births in the March quarter of 1948 was "down by nearly 20 per cent since last year" was correct, the accompanying statement that it was also "lower than that for any March quarter since the end of the war" was wrong. March quarter births were 181,220 in 1946, 241,421 in 1947, and 202,184 in 1948.

Letters to the Editor

America. We should no more have a foreign policy of our own, or our own Army, Navy and Air Force than has Virginia. Being merged in another Union, we should and could no longer form part of the British Commonwealth, or (except through the new European Government) have any relations with the United States. It is not, in my opinion, reasonable to assume that Canada or the other Dominions would or could become states in a European Federation.

This is the dilemma with which the British people may be faced, and this in my opinion is what you are talking about when you speak of surrendering sovereignty.—Yours faithfully,

11 Old Broad Street, London, E.C. 2

BRAND

[We are sorry if we have misrepresented Lord Brand. Unfortunately, it is clear that he himself still completely misunderstands the argument of our article of April 24th which started this controversy. Let us therefore make one more attempt to set out the difference between us—which we conceive to be small—and perhaps the argument might then terminate.

Lord Brand and *The Economist* are agreed that there are two possible courses that a closer association of the Western European nations might take. Course A is co-operation, going as far as "the joint exercise of sovereign powers." Course B involves the surrender of sovereignty over some defined subjects to a new Western European organ of government, which would itself be sovereign in those subjects. The present controversy is not about whether Course A is preferable to Course B. Although Lord Brand's three letters have permitted a progressively clearer inference that he does, in fact, prefer Course A, he has nowhere said so. Similarly, in our article of April 24th we carefully refrained from arguing for the one course or the other, although on other occasions we have made it clear that our ultimate aim is Course B—if only because we see no other prospect of solving the German problem. (Incidentally, we do not anticipate any such disastrous results for the Commonwealth from it as Lord Brand suggests.)

The argument, as we understand it, is not about what should be done now or in the next few years (on which we imagine there would be little difference between us), but on what should be said. Lord Brand, we take it, is arguing that sufficient could be done, within the limits of Course A, without any surrender of sovereignty, to justify the description of "Western Union." We still hold, for reasons

that are argued at somewhat greater length in a leading article this week, that co-operation will not get very far if it is left to depend, not merely in general but in every detailed proposal, on the positive assent of sovereign governments. We are alarmed by the fact that British Ministers are using words and phrases, such as "Western Union," which suggest to American and European minds that they are contemplating Course B, whereas we suspect that in fact they would agree with Lord Brand that Course A is all, or more than all, that is possible. We are not suggesting that in so doing they are misrepresenting the British public. As this week's article points out, it would be very difficult to persuade the British (or any other) public to agree to Course B, though for ourselves we would make the attempt. We have certainly no desire to be dogmatic about the choice that should be made. But we are willing to be very dogmatic about the dangers of a situation in which the British Government talks one way and acts another. That was why we urged Mr Bevin to make it clear "what Western Union is to be and when it can be expected to arrive."—EDITOR.]

Consumption Up or Down?

SIR,—Were it not for the last paragraph of Mr Harrod's letter of May 8th I should be content to await the publication of his calculations in full in some other place. The validity of his conclusions depends both on the method and upon the specific figures put in at each stage. With regard to the former a number of obvious difficulties spring to mind which have received no mention in either of Mr Harrod's letters, no doubt because of lack of space. As for the latter, the claim which emerges from his calculations that output per man in manufacturing industry in 1947 was well below 1938 is not easy to reconcile with the index of UK industrial production prepared by the Economic Commission for Europe.

The only evidence about total consumption based upon direct estimate is that contained in the White Paper. The onus is upon Mr Harrod to prove not only that these figures do not square with other published data, but that it is these particular figures which are at fault.—Yours faithfully,
G. D. N. WORSWICK
Magdalen College, Oxford

From *The Economist* of 1848

May 13, 1848

WE were a little startled at reading on Wednesday, in *The Times*, that "a great town is a great evil," which seems the revival of the protectionist saying, that it would be well for England if half her great towns were destroyed. *The Times*, however, in the excess of its benevolence carries its destructive furor further than the *Standard*; for evil is that which every man tries to extirpate, and *The Times*, to be consistent, would destroy all our great towns—being great evils.

There is a bill before parliament, entitled A Bill for Promoting the Public Health, and it has got as far as a committee without meeting with that opposition it deserves. It is an immense mass of minute legislation, occupying 71 pages, and consisting of 152 clauses, besides schedules. It refers to a great variety of matters which we cannot even enumerate, without crowding our space with a catalogue of somewhat offensive words. . . . That well lighted, well ventilated, well built towns, with comfortable abodes for all the people, are necessities of modern life cannot be doubted; but the taking away from those who inhabit them the discretion of acting for themselves, the making them dependent for all improvement on a few gentlemen in the metropolis, the subversion of the order of nature, by which not those who suffer from an act, but some official persons who know nothing of it, undertake to correct it; the mental imbecility which is everywhere produced in the masses by such subversion, one or a few, instead of the millions, being made responsible for the public welfare; one or a few clever men, assuming by their regulations to be wiser than all the clever men of the world, seem to us far greater evils than the perpetuation of bad smells, and generation of partial disease, suppose they were the inevitable consequence of non-interference by authorities with the dwellings of the multitude. In our condition suffering and evil are nature's admonitions; they cannot be got rid of; and the impatient attempts of benevolence to banish them from the world by legislation, before benevolence has learned their object and their end, have always been productive of more evil than good. We have been admonished by the mental imbecility in the masses, caused by such interference, in every country where it has been tried, to refrain from it more urgently than we have been admonished not to contaminate the sweet air by our impurities.

Local Government Reform

SIR,—I observe that in the article in your issue of April 17th on the report of the Local Government Boundary Commission, you accept, apparently without question, the dictum that, for efficient administration, all counties, whatever their views or characteristics, should comprise at least 200,000 inhabitants; and that you consequently regard as axiomatic the suggested fusion of Rutland with Leicestershire.

Even if, in regard to many counties (e.g. those comprising considerable urban and industrial areas) the "experts" are right in postulating a minimum of 200,000 inhabitants, this specification need not necessarily hold good in the case of Rutland, which possesses no large towns or industries, and whose economy is almost entirely based on agriculture carried on from small villages.

In spite of its small size there is no social service enjoyed by the larger areas which is not available to us in Rutland. Our County Council, very wisely, does not always seek to provide these itself, but contracts for some of them with whichever of its neighbours can best meet our requirements. For instance, our small police force—one of the first, incidentally, in the country to provide itself with wireless cars—makes use of the excellent forensic laboratory at Nottingham; we send our lunatics to Leicester; we obtain certain medical services from the Soke of Peterborough; we were the first county in England to start central schools, but we share our agricultural college with Leicestershire.

The fact that our own county headquarters can be reached by any villager in about half an hour keeps our officials in close touch with the ratepayers, and enables working farmers and tradesmen to run our local government. Each councillor represents only two or three villages. He knows his neighbours and their needs; and they watch him closely. Few of our councillors could afford to give up a whole day in order to go and sit at Leicester, where much of the business could be of no interest to them or their constituents. We should, therefore, become at the mercy, more and more, of the semi-professional element in local government, and the purity and efficiency of our administration might well fall to the unedifying level all too common in "large" units.

Moreover, if we are amalgamated with Leicestershire our rates will immediately go up by several shillings though we shall, so far as we can see, obtain absolutely no benefits or services which we do not already enjoy. Further increases would certainly be inflicted on us later, as services—necessary perhaps in semi-industrialised Leicestershire—were added or elaborated, however little value might accrue from them to our purely rural area.

You stress the importance of maintaining "the vital democratic principle of local self-government," and the Commission were instructed to have regard, *inter alia*, to "the wishes of the people." But in Rutland over 75 per cent of the estimated adult population have signed a petition *against* any form of amalgamation. Local government in Rutland shows no lack of the "life and vigour" which you so rightly hope may be restored to other larger and perhaps more heterogeneous areas. So why abolish it?—Yours faithfully,
WILLIAM CODRINGTON

Preston, Uppingham, Rutland

SIR,—Reference is made in *The Economist* of May 1st to the depopulation of rural areas in central Wales.

Surely the obvious solution which reason would suggest is to incorporate Herefordshire and Shropshire into Wales. These counties, and especially the former, have much in common with their western neighbours agriculturally and little in common with the east.—Yours faithfully,
C. F. MATTHEWS
Falkland Drive, Newbury

The Capital Budget

SIR,—In the article in your issue of May 1st, reference is made to the difference between the estimates of gross domestic capital formation in Table I and Table 13 of the White Paper on National Income and expenditure. This difference is, as you say, unexplained, but it is not inexplicable. The figures in Table I are at "national" or factor cost and are derived from the market value estimates of Table 13 by subtracting indirect taxes and adding subsidies in accordance with Table 23 on page 47.

The only inexplicable discrepancy I have discovered in the White Paper is that between the personal savings estimates for 1944 given in Table 8 and in Table 11, and this involves "only" £2,000,000.—Yours faithfully,
1 Stanley Gardens, W.11
P. WYKEMAN

Europe's Manpower

SIR,—In *The Economist* of May 1st your correspondent has extracted figures from the report of the Rome Conference, ERP special manpower committee, which give Britain's labour requirements as 100,000 skilled workers and no unskilled.

This seems contrary to the requirements of the Minister of Labour, who, in his present recruiting drive for foreign workers, is emphasising the training schemes available for unskilled labour in the undermanned industries of coal, textiles, etc. Admittedly his efforts are at present concentrated on European volunteers from the displaced persons' camps in Germany and Austria. But this source is reported to be drying up, and the need for unskilled labour, both male and female, in essential industries is unsatisfied by tens of thousands. In these circumstances there seems no reason why Britain's representatives on the ERP manpower committee should demand skilled workers exclusively.

It may further be argued that skilled labour is exactly what is not required, except in relatively small numbers, and then only in the teeth of determined trade union opposition. This was made plain in the case of the recruitment of skilled Italian foundry hands in 1946-47, when the refusal of individual lodges to work with them resulted in the collapse of the scheme.

On the other hand, the trade unions have agreed to the recruitment of unskilled foreign workers with relatively little opposition. The European Volunteer Workers' scheme has been generally well received by both management and labour, and is working smoothly.

On the face of it, the Rome report appears to contain another instance of lack of liaison between government departments in this country, and lack of co-ordinated policy on a vitally important question.—Yours faithfully,
JOAN DICKINSON
Barnett House, Oxford

Books and Publications

Germany's Generals

"The Other Side of the Hill." *Germany's Generals, Their Rise and Fall, with their own account of Military Events 1939-45.* By B. H. Liddell Hart. Cassell. 320 pages. 10s. 6d.

In his preface the author refers to this book as a "piece of historical research." In one respect it is, for he has reduced to a clear and fascinating narrative a great deal of information from first-hand sources, obtained in conversation with leading German generals in British hands. But in another respect it is not: for there is little effort either to assess the reliability of the sources or to check them with other evidence available. Many readers will derive—for example, from the statements of Rundstedt and Manteuffel—misleading impressions of the strength and skill of the German forces that the British and Americans had to overcome when they reached the Continent in 1944. Rundstedt says, "The Atlantic Wall was an illusion, conjured up by propaganda"; yet in the places where it mattered it certainly was not. If Allied air reconnaissance had permitted such a judgment, the Mulberry harbours would have been superfluous. Again, referring to the 3,000 miles of Western coastline which he had to cover with 60 divisions, Rundstedt says, "Most of them were low-grade

Examination for Schools

SIR,—Whilst I would welcome any discussion or criticism of the policy of the National Union of Teachers, I strongly object to the unfair and even prejudiced misrepresentations of our motives in your article of May 1st. Without the slightest supporting evidence, the NUT is accused of putting the trade union interests of teachers before the educational interests of the pupils. The facts on the point at issue, and the whole history of the NUT, warrant no such conclusion.

The purpose of the External Examination, as we conceive it, is to measure fitness for the next stage of education. It therefore follows that the examination should be taken as late as possible in the school life. Such a policy has other educational advantages, reducing the risk of cramming and enabling the school course to be planned as a whole, instead of in two parts, as at present—the first up to School Certificate and the second up to Higher School Certificate.

Such were the reasons for our policy. They were wholly related to the needs of children. "The trade union interests of teachers" were never considered, and the suggestion that they were is unworthy of the columns of *The Economist*.

It can fairly be claimed that the NUT has invariably placed the interests of children first. Hadow Reorganisation, for example, meant unwelcome transfers and decreasing opportunities of promotion for the teaching profession, but the policy was supported for the sake of the children.

That a case can be made against our examinations policy I readily concede. That our motives were as base as you suggest, or related to anything other than educational considerations, I deny utterly.—Yours faithfully,
RONALD GOULD,
General Secretary, National Union of Teachers

London, W.C. 1

divisions, and some of them were skeletons." There should be sufficient material now available to show just how accurate such a statement is. It was certainly not the impression of the British troops fighting around Caen.

Other readers will be surprised—or indeed shocked—that Captain Liddell Hart abstains from all moral judgments on the men he interrogated. Yet it is hard to see how such judgments could have found a place in a scheme which contains only a one-sided commentary on campaigns and only brief prolegomena to a study of Hitler's grand strategy. The author makes the intellectual limitations and political cowardice of the generals quite clear, and this much judgment is sufficient for his purposes. But one result of such a limited approach is the strongly professional and between-gentlemen air which pervades the narrative.

The first third of the book has an interesting, if sketchy, account of the events which moulded the ideas of the German generals before 1939. The next two-thirds of the book deal with campaigns, the best chapters being on the Western breakthrough in 1940, the battle of Normandy and the Ardennes offensive. On each of these the author was able to interrogate the leading German commanders—Rundstedt, Manteuffel, Student, Heinrici and, above all, Blumentritt. (On the Russian front the treatment is not so good, as such leading figures as Bock and

FROM THE LEAGUE TO U.N.

By GILBERT MURRAY

15s. net

Professor Gilbert Murray has here brought together a number of lectures and articles written during the past fourteen years and therefore covering the period between the weakening in the first great experiment in world management by international conference and the setting up of the second. In view of the part played by the author in commending the idea and endeavouring to further the practice of international unity, his new book has a marked historical interest.

OXFORD UNIVERSITY PRESS

Kleist were not available.) Is one unduly suspicious in seeing in these chapters the seeds of two dangerous German military legends? One that the British were deliberately allowed to escape through Dunkirk, the other that the major failures in Russia and in the West were due to Hitler's interventions from the headquarters where command was concentrated?

Captain Liddell Hart's conclusions about Hitler as a supreme commander are worth quoting: "Hitler had a natural flair for strategy and tactics of an original kind, while the German General Staff . . . were very competent without much originality. I felt that, from the way many of the generals talked, Hitler's misunderstanding of technical factors so jarred them that they tended to discount the possible value of his ideas, while he was angered by their orthodoxy and lack of receptivity. In this way it seemed to me that a tug-of-war had developed instead of a good working combination."

Altogether this is an unsatisfactory book because the general reader may not understand its limitations. But as a summary account of some of the things that happened "on the other side of the hill" it is useful and uncommonly readable.

Reward of Single-mindedness

"Our Partnership." By Beatrice Webb. Longmans. 545 pages. 25s.

To read this book is like watching a piece of tapestry in the making: the movements are so deft, the pattern so complicated, the efforts so concentrated and absorbing, and the final results so satisfying. By her narrative, and even more by the voluminous quotations from her diaries, Beatrice Webb has brought to life again the stage on which the Webbs' life was set, the immense labour and pertinacity which lay behind such books as "The History of Trade Unionism," the skilful pamphleteering and manoeuvring which produced the new Technical Education Board of the London County Council, the courage and adventurousness which created the London School of Economics from a bequest of £10,000, the almost impish diplomacy which caught the Local Government Board unaware and finally ended in the famous minority report on the Poor Law. Throughout the names of famous men appear as the friends or antagonists of the Webbs' schemes—Shaw, Haldane, John Burns, Graham Wallas, Churchill, H. G. Wells and dozens more.

To his opponents Sidney Webb often appeared as a dangerous intriguer. Yet in spite of a disarmingly frank assessment of his faults and his lack of personal magnetism, this book brings out the extraordinary benevolence of both partners, their unalloyed sincerity and their lack of personal ambition. Everything was for the cause of human progress, and to that end their efforts were single-minded and quite extraordinarily persistent. They succeeded brilliantly, partly because they lived in an age of reform, but just as much because they were prepared to back their ideals by more solid knowledge than their opponents, and a singleness of purpose which was irresistible. As an account of the political and social currents of the years between 1892-1912 this book would be hard to beat.

Their industry is breathtaking. How much the reader sympathises with Beatrice when she says:

New and again, I long to rest and have time to look round and enjoy beauty or to dissipate in purposeless thought, yet I doubt whether with my ingrained habits of methodic work I could be long out of the tracks without dissatisfaction and displeasure.

At times this concentration seems almost inhuman, yet its points, both direct and indirect, have been astonishingly great. The book is not light reading, but the comments are so frank that for all the Webbs' single-mindedness they remain very human.

Shops of Britain

"The Shops of Britain." A Study of Retail Distribution. Hermann Levy. Kegan Paul. 242 pages. 21s.

PROFESSOR LEVY, author of "Retail Trade Associations," was the obvious man to write this long overdue study. In the absence of a Census of Distribution he had an unenviably difficult job, and the evidence assembled is in many ways thinner than he would have wished. But his nose for facts has served him well, and "The Shops of Britain" is an impressive example of what can be achieved by extreme pertinacity in research coupled with an unflinching sense of perspective. He begins with an analysis of the retailer's function as part of the distributive process, and offers a reasoned classification of shops according to whether they follow a single trade, combine this more or less preponderantly with sidelines, or add to retailing proper some associated work such as repairing, servicing or actual manufacture; goes on to consider the chief types of retail outlet trade by trade, from baker or greengrocer to car retailer or bookseller, isolating their particular problems and indicating the fields in which their functions overlap; and rounds off this factual survey with one shrewdly argued chapter on prices and margins and another, particularly stimulating and valuable, on competition and labour. Thence he goes on to consider the question probably uppermost in the minds of most of his readers: how can distribution costs be reduced? In particular, can they be reduced by a concentration of retail outlets? And is the small shopkeeper, in any such scheme of rationalisation, due to be swept away?

To this last question the answer is an emphatic No. Some of the small man's functions, in some trades, could be better carried out by larger-scale specialised bodies; and coal distribution, and very likely milk, might be most economically managed as a co-operative or public service. But the mass of evidence goes to show that the small shop's low labour costs and absence of expensive frills easily outweigh, except over a fairly narrowly defined range of mass-produced and mass-demanded goods, the quicker turnover of the big establishment. Professor Levy is sceptical, indeed, about any plan for reducing "redundancy." No fair criterion exists either for redundancy or, given the complex social factors involved, "efficiency" itself. Any necessary reduction would be far more effectively carried out by the restoring of price competition, now almost wholly replaced by an expensive competition in amenities and general frills which, in his view, is far less in the customers' interest. "The first general conclusion," he says at the beginning of his final section, "is that there cannot be a general conclusion"—but his penultimate page carries, after a plea for a Royal Commission on Distribution, a sentence calculated to appeal to any reviewer for *The Economist*: "We reject restriction and we recommend reform."

Federalist For Today

"The Federalist." By Alexander Hamilton, James Madison and John Jay. Edited with an Introduction and Notes by Max Beloff. Basil Blackwell. Oxford, 1948. 8s. 6d. net.

MR BELOFF'S edition of this classic of American political writing is published at a most appropriate moment. For the clear-headed and hard-hearted arguments used 160 years ago to win votes for the new United States constitution, which had emerged from the Philadelphia Federal Convention, have as much general application now as ever, even though Hamilton and his friends were writing in a pre-industrial society. They will certainly surprise—if they read them—the impatient advocates of European federation in our time, for the men who had rebelled against British rule had some very conservative ideas about society and politics.

Mr Beloff's editing follows the form previously adopted in this excellent—and remarkably cheap—series of political texts, in which *The Federalist* has been preceded by Mill, Locke and Hobbes, and will be followed by Bentham and Aquinas. Not only does he set out clearly the purpose and course of argument in the letters; he also brings out the economic factors which influenced their writers and the political background against which they worked. This book of nearly 500 pages should attract attention on the Continent to the quality of American political thought and experience, to which Tocqueville paid memorable tribute 100 years ago. It will also do a great service if it stimulates publicists and business men in western Europe to set out their ideas on federalism with similar force and clarity. Hamilton and Madison and Jay wrote to influence less than 200,000 voters; someone has to write now to influence at least 100 million voters in western Europe. Mr Beloff has helped to make it easier.

Imperial Preference

"Britain's Colonies in World Trade." By F. V. Meyer. Issued under the auspices of the Royal Institute of International Affairs. Oxford University Press. 273 pages. 18s.

DR MEYER'S book covers the wide field of the history and economic effects of Imperial preference and other forms of protection on the trade of the British Colonies. It sets out in detail the origins and applications of preferences, quotas and discriminatory duties of each of the principal colonial areas, together with an interesting section on the foreign and regional trade of the British Colonial Empire. The only fault in this otherwise excellent survey is the absence of up-to-date figures. None of the tables are dated later than 1938, and Dr Meyer would have done even better had he included at least some figures to show the radical change in the terms of trade during the post-war years.

But the chief interest of this book lies in two analytical chapters—one on the benefits of Imperial Preference, the other on the question of which trade policy best suits the colonies. Dr. Meyer points out that preferences are not always beneficial and that to impose uniformity must be unfair to some Colonies. On the basis of the figures and analyses which form the body of the book, Dr. Meyer concludes by suggesting that, for economic reasons if not political, Imperial Preference should be abandoned in all colonies except the West Indies, Cyprus, Nyasaland, Mauritius and Fiji. His opinion is backed by arguments which are convincing on the assumption that world trade assumes again the pattern of 1938.

Baltic Eclipse

"Baltic Eclipse." By Ants Oras. Gollancz. 307 pages. 15s.

THE silence in which the Baltic States suffer under an alien and ruthless tyranny is seldom broken. The State Department recently issued a sharp reminder that it did not recognise the

THE WORLD OVERSEAS

Oil Prospects in Latin America

(From Our Correspondent in Latin America)

THE Western Hemisphere is in search of oil. So far as certain Latin American countries are concerned, the success of its quest depends at least as much on politics as on geology. The terms on which foreign enterprise might co-operate in developing Latin America's resources have long been a thorny issue between the United States and its "good neighbours." The agreement on economic collaboration which was recently signed at Bogotá may help to resolve it. But the underlying conflict must be borne in mind in any attempt to weigh up the prospects of an expanded petroleum industry in Latin America. The industry's history there is a tangled one, and its prospects are no less complicated.

The Western Hemisphere provides about 80 per cent of world output of crude oil. The United States, however, which produces about 61 per cent of the world's oil and consumes about 66 per cent, is a net importer of petroleum products. Mexican production does little more than meet domestic demand and next year may not even meet this. Venezuela is the hemisphere's only substantial exporter. It consumes a negligible fraction of its own output, in contrast to other Latin American countries, where the general rise in postwar demand has only been partially checked by dollar shortages. Colombia consumes a quarter of its output, Peru almost two-thirds, and in both countries consumption is rising steadily. Argentina, whose outlook is, geologically considered, unpromising, now imports half of the oil it consumes. Other importers are Brazil and Chile. Thus many Latin American consumers are affected by the world shortage. And it is to an improvement of the tanker situation rather than to further drilling that consumers who can afford dollars must

look for fuller satisfaction of their present wants. For experts doubt whether any appreciable increase in Latin American production would be possible before larger supplies are obtained from the Middle East.

Immediate commercial shortages make the United States anxious to see the hemisphere's reserves increase. But the State Department's interest, which began to emerge about three months ago, is primarily strategic. Two reasons were officially given for this policy. First, there was an unprecedented rise in consumption in the United States. Secondly, the State Department was anxious to avoid dependence on the Middle East in the event of war, although under normal working conditions Middle Eastern oil is cheaper than Caribbean, even to Latin American importers. Though he did not specify petroleum, Mr Marshall no doubt had the State Department's policy well in mind when he told the Latin American delegates at Bogotá that his Government would help them as much as its heavy commitments elsewhere allowed, but that they must look to private capital which, he significantly added, would gravitate to countries giving it equitable treatment. So far as petroleum is concerned, there seems to be no alternative to the open door for private capital if Latin American potentialities are to be exploited. It may reasonably be argued that the international oil industry is, as it has proved to be in the past, the only instrument adequate to the task, because of its command of both capital and technique. This view is borne out by conditions in Mexico, where, although the foreign companies have left, it is thanks to their equipment that the Govern-

Norway the trade unions of the heavy industries provide a similar problem. The Norwegian steel industry is politically important in another respect. At Paris Mr Molotov pointed to it as a specific instance of a development desired by a small Power which would be vetoed by the great imperialists.

The variety of opinions that are entertained indicates the instability and confusions of Scandinavian policy towards the problems raised by the prospect that neutrality will be untenable in any future war. The wartime realisation of their country's strategic importance renders Norwegians particularly sensitive to the possibility of foreign plans to control it. Yet of the three countries Norway is most likely to enter an effective and timely alliance with the West, if events should demand this. Denmark hardly expects its vulnerable position to be buttressed by an alliance. Yet both countries differ radically from Sweden in that their experience in the war made them capable of an objective consideration of the prospects and implications of an alliance.

No official mention of any alliances is made in Sweden. Yet it is difficult to avoid the conclusion that Sweden in fact counts on Western help. But it is certain that nothing will be done to prepare the way for its effective use. Swedish policy will remain ambiguous, inconsistent and, above all, opportunist, a policy of armed neutrality, of economic and cultural collaboration, of limited obligations, of membership of Uno—and insurance against its failure. Thus the strongest state in Scandinavia is the weakest. By this fact, it imposes a permanent weakness on the structure of Scandinavian defence and a permanent strain on Scandinavian relations.

Poland Looks at Europe

[FROM A CORRESPONDENT IN WARSAW]

ALTHOUGH political prospects for internationally minded East European Communists are nowhere near so bright and shining as the May weather, they are not felt to be dimly gloomy. From Warsaw it appears that the Italian elections and the beginning of Marshall aid—which means the end of Marshall Plan debates—have had the same relaxing effect on this side of Europe as in the West. While the sigh of relief has come mainly from the politically ineffective masses, the Communist leadership has also felt the easing of tension. All had feared that a close race in Italy, or a Popular Front victory, would have meant direct or indirect armed intervention from the West, which the Communist world would have had to fight—and nobody here is ready for a real fracas.

The popular reaction has been one of plain pleasure that nothing grave has happened, and a slight renewal of hope that maybe nothing will. It must be said, though, that in Poland ordinary people were not surprised at the Italian election results. They have, from long experience, developed a deep cynicism towards elections, reflected in the comment of a Warsaw workman who said, "I'm glad the Reds were beaten. But, after all, the Americans and British were there. You don't suppose they'd have let the Communists win." It is not local propaganda but local practices that have nursed this attitude, so in Eastern Europe the defeat in Italy did not mean nearly such a loss of prestige for the Communists as might be expected by citizens of countries accustomed to accepting, not dictating, the decision of the polls.

The leadership does not regard Italy as lost. Communists here are already talking hopefully about municipal elections there next year. But what is more important, they are making use of the present to consolidate their holdings. For there was considerable concern below the surface that, if the elections should force a fight in Italy, risings and discontent might spread into Yugoslavia and all through the Communist empire. To an outsider it is hard to see how this would be possible, but there are indications that the Communists had not completely disregarded the possibility. Certainly the purge of Socialists with the smallest taint of right-wing leanings or Western sympathies is being carried out more thoroughly than was foreseen. Disconcerting as the setback in Italy was to the Communists, who thought their organisation there superb and unshakable, they seem just as glad to have discovered that the time is not ripe for a head-on struggle and that, instead of manning the barricades, their job is still consolidation and spade-work.

With the possible exception of the Russians, the Eastern European leaders have an equally paradoxical reaction to the beginning of the Marshall Plan. There is little they can do directly to contribute to attempts at wrecking it. Naturally, they must hope for the sake of the "war against imperialism," that the plan will fail to make of Western Europe a robust, healthy damsel, who has wed the Washington witch-doctor in return for her

recovery. A bedraggled waif would be more responsive to poorer suitors. Yet there is also the wish that the West shall continue without interruption to sell machinery, steel, iron and industrial raw materials to the East. This is only possible if Western production is maintained. There is even an undercurrent of belief that, if the plan succeeds in putting Western Europe on its feet, then Britain, France, Italy and the others will be better able to assert independence from the United States and plunge more wholeheartedly into natural trading with the East.

Two Minds About Marshall Aid

No Communist openly admits this half hope that the Marshall programme of "fraud and slavery" (it's not called ERP here) may not collapse completely. Yet Communism's most able economist outside Russia, the Polish Minister of Industry Hilary Minc, never loses a chance to state how anxious he is to maintain trade with the mechanised West. He has proved it by his successful efforts to increase the turnover of trade with Britain, France, Sweden and Italy.

The greatest fear about ERP in Poland is that somehow the Americans will force its recipients to adopt restrictions on trade with Eastern Europe similar to their own tight licensing system, thus trapping the Poles, who are exporting products now in return for industrial goods to be delivered within the next few years. However much the Communist in Mr Minc would like to see the party triumph which would result from continental bankruptcy, the economic planner in Mr Minc is sufficiently anxious for markets and supplies in Western Europe not to waste too much energy in denouncing the way they are provided.

The sort of stabilisation which has resulted from this breathing spell is not, of course, reflected in public speeches nor will it mean less strident propaganda on this side of Europe. May Day, particularly, was the occasion for endless jibes and attacks on the imperialist war-mongers. But the horrid descriptions of the Western monster have been repeated so often that they now seem quite a commonplace and no longer attract much attention nor arouse much reaction. In Warsaw, at least, it would be an overstatement to say that one out of twenty or perhaps even one out of fifty, of the 40,000 people gathered for the May Day demonstration listened to a word of the outpourings. Poles are not so disciplined as Russians. They attend, if they must; but once they have contributed their presence to the celebration they feel free to gossip, munch sandwiches, and make it as much of a picnic as possible.

Lessons of Defeat in Italy

No one expects the breathing spell, which mainly affects the satellites, to be unspoiled by distracting squabbles, like the recent political sorties in Berlin and Vienna. But these encounters do not drain Eastern strength, nor divert attention from the task of cleaning out remaining dissidents where the party has achieved power. This is regarded as a time to learn the lessons of the Italian defeat and, where possible, make use of them. The most striking—to the Communists—was the power displayed by the Church. So far as Poland is concerned, the election apparently put an end to the two-year wrangling with the Vatican for a concordat, and instead convinced the Polish Government that it should try to force the Polish Church away from Rome's political influence. The Pope's recent friendly overtures to Germany have put a handy tool into the government's hands.

Another lesson of Italy is the effect of outside support for nationalist aspirations (Trieste, a seat in Uno). This is not so easy to apply to Polish circumstances. But Eastern Europe can take such a stand, without too many complications over Palestine. It is clear from the propaganda line on this matter ("the Anglo-Americans have started an aggressive war in Palestine") that the Communists have hope of gaining some support from disillusioned Jews in every nation.

A third deduction to be drawn from the Italian campaign is that, in the West at least, people do not turn to bite the hand that feeds them so easily as some Communists seemed to suppose. While Russia is in no position to compete with the USA in the distribution of largesse, those of its satellites who have received benefits are being reminded of the fact through the local governments. What plan of action is to be based on these experiences has not yet become apparent, if indeed it has been worked out. The shouting has not died down, but the impression here is that a temporary calm is spreading beneath the agitated surface. Contrary to the prognostications of some commentators writing from the West, it looks from Warsaw as if this year's major crisis in the East-West battle has been safely passed.

AMERICAN SURVEY

ECA Gets Under Way

(From Our US Editorial Staff)

THE Economic Co-operation Administration, after being slowly nuzzled from the dock like a giant liner, is now in midstream, with its bows pointing in the right direction and ready to start its journey under its own power. Just as a liner is dependent for its early movement on tugs, the European Recovery Programme was pushed and pulled for the first few weeks by a mixed team of those who had been responsible for the planning during the last nine months, special assistants who volunteered from all over the country and men borrowed by Mr Hoffman from his companies and committees.

From across the Atlantic the rescue ship must seem to have taken a long time to get moving. But during the first month it has faced two serious problems which would not have afflicted a similar undertaking in England, two problems which have taken up most of Mr Hoffman's time, to the exclusion of any but emergency operations. The first, which is by no means finished, was to steer the programme through the Appropriations Committees of both the House of Representatives and the Senate. The second was to choose a staff which would be equally acceptable to the Democratic Administration now in power and the Republican one expected at the beginning of next year.

The Senate is constitutionally the more important body when foreign affairs are considered, but it is the House which is paramount in money matters. While the Foreign Assistance Act began in the Senate, with hearings before the Foreign Relations Committee, its Appropriations Bill, without which ECA cannot spend more than \$1 billion, comes up first in the House of Representatives. Within a few days of being appointed Mr Hoffman had to argue his case before the House Appropriations Committee, headed by the redoubtable Representative John Taber, who has a reputation for examining both sides of every penny equal to that of Mr Harry Lauder.

As the proceedings of the Committee have been closed to the public, nothing is known for certain of what has been going on. Plenty of stories have been spread—many of them, no doubt, by Mr. Taber himself, who delights in his reputation as an ogre with the habit of eating alive executive agencies who try to get more money than he thinks they need. Members of Mr Hoffman's staff, however, seem to be pleasantly surprised with their reception at his hands. But they have still had to spend a great deal of time with his Committee, with no decision yet, and they must then repeat their performance before the Senate Committee.

*

The task of picking a staff has been no less laborious, beginning with the choice of Mr Hoffman himself. The President had to pick an Administrator, from the very short list of men whom he and his advisers thought of sufficient ability for the post, who would have the enthusiastic support of Senator Vandenberg and the approval of the Joint Congressional Watch-dog Committee. Mr Paul Hoffman, who had been a member of the Harriman Committee, knew the problems of ERP in detail, in testimony before the Senate Foreign Relations Committee, had shown that his ideas for carrying out the programme fitted in with those of the Administration.

Mr Hoffman is in the accepted tradition of American business, having risen from small beginnings to be president of a large corporation. But he is also one of the leaders of the new type of business men, developed since the slump, who believe they have a responsibility to their country as well as to their shareholders. Before 1929 salesmanship seemed to be the chief quality needed for success in business. Economics was a

subject for professors who, since they had never, in the phrase still in use in antiquarian business (and Congressional) circles, "sweated out a pay-roll," were considered only dangerous theorists. But during the war Mr Hoffman, through the Committee for Economic Development, of which he was chairman, persuaded other business men to take an interest in future planning and to use economists to help them. Mr Hoffman made his reputation by bringing the Studebaker Corporation out of the slump and a receivership, but he began as a salesman in Los Angeles. The smile which sold motor cars so successfully twenty years ago will be needed many times in the next four years. It is not the eager, superficial grin which usually goes with salesmanship, but a worldly-wise smile forced to the surface by some interior spring of sympathy.

Another kind of self-made man has been appointed Deputy Administrator. Mr Howard Bruce comes from one of the first families of Virginia and Maryland—beside which the Cabots and the Lodges of Massachusetts are parvenus—but, as son of a comparatively penniless member of the clan, had to make his own fortune. He did it early in life and with great success. He was the owner of Billy Barton, which ran second in the Grand National of 1926. He is one of only four civilians awarded the Distinguished Service Medal; this was for his work on procurement in the War Department. General Somervell called him "one of the great architects of the war machine." Senator Vandenberg said in the Senate that the country was fortunate to get him to accept the post of deputy as he was seriously considered for the Administrator's post. He is old for such a taxing job—he will be 69 this year—but it would be hard to find another man with such proved ability to keep the organisation running while Mr Hoffman keeps ECA's policy abreast of the changing European situation and ECA's reputation clean in the eyes of Congress and the nation. Mr Bruce was for fourteen years a member of the Democratic National Committee, which makes him an attractive choice for Mr Truman.

The third man on the Washington team is Mr Richard Bissell, a young Professor of Economics from the Massachusetts Institute of Technology with an insatiable appetite for overwork. As Secretary of the Harriman Committee he was responsible for much of the Committee's Report. He returned to Washington as soon as ECA was set up and for the last month has been carrying out all its operations almost single-handed. Most of the other posts are still filled only on an acting basis and the organisation is not yet settled. It is certain that there will be a separate Food Section—under Mr D. A. Fitzgerald, until recently Secretary-General of the International Emergency Food Committee—but all other commodities will be grouped in one section.

For Europe, the most important appointment is that of Mr Averell Harriman as Roving Ambassador. Like Mr Hoffman and Mr Bissell, he has been involved in ERP from the beginning and has a fervent belief in its aims which has led him to leave the Cabinet to take what is technically a post of

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

lesser rank. He knows more than anyone else what can and cannot be done in Europe. "Our greatest potential allies in Europe," he said the other day, "are the Social Democrats. We must make them understand that we have a common cause." (This statement should be compared with Mr Stassen's first reaction that Socialism and Communism are "two peas from the same confining pod.") Mr Harriman is rapidly becoming, for this generation, what Mr Stimson was for his. Both are great public servants whose sense of duty takes them above party, a quality which is recognised by Congress, which has never failed to confirm any appointment of either with enthusiasm, regardless of the party in power.

Mr Harriman has also the quality of giving devotion to, and getting devotion from, those who serve under him. Leaving the Department of Commerce, he has taken its top men with him. His Under Secretary, Mr William Foster, a Republican, will be his Deputy in Paris and his Assistant Secretary, Mr David Bruce, will be the ECA Administrator in France. This Mr Bruce, whose brother is Ambassador to Argentina, is a cousin of Mr Howard Bruce, the Deputy Administrator, sharing his ancestry, but coming from a branch which had no need to make a new fortune. He has spent his whole career in the Maryland or Virginia legislatures, Government service and—during 1940 and 1941—as representative of the American Red Cross in England.

The plethora of Bruces caused certain confusion in the Senate and held up confirmation of the Deputy's appointment for twenty-four hours. Senator Wherry paid a stirring tribute to Mr David Bruce's qualities in the belief that he was talking about Mr Howard Bruce, and Senator Langer objected to the appointment, mistaking the latter for still another member of the family. The *Washington Post* came to the rescue with an account of the careers of all three, adding "There was also Robert Bruce, from whom all other Bruces claim to be descended. Robert Bruce was a supporter of William Wallace, who may have been an ancestor of Henry A. Wallace. Henry A. Wallace has almost nothing to do with American foreign policy and the ERP. That makes everything clear."

American Notes

Open Door for Russia

In spite of the State Department's insistence that Mr Molotov has presumed an invitation to a meeting where none was intended, there can be little doubt that, if Mr Molotov had chosen to steer a normal diplomatic course through the door that "always remains open for the discussion and settlement of our differences," Mr Truman would have gained a definite advantage in his election battle. The immediate reaction to the Russian offer to begin conversations bore out the evidence of recent public opinion polls that a very substantial proportion of American voters are deeply concerned about the present international deadlock and desire some new attempt to build peace through international co-operation. They can have little sympathy for the complacency about the inevitability of war which has been growing in Washington and elsewhere, the belief that, since war is bound to come, it had better come soon, while the United States still has a probable monopoly of the atom bomb and before the nation's economy has been exhausted by the strain of continued preparedness. The Senate demonstrated this reliance on military power last week by its almost unanimous vote in favour of the 70-group Air Force already approved by the House.

Such fatalism has been strongly condemned by the Federal Council of Churches of Christ, of which Mr John Foster Dulles, Mr Dewey's adviser on foreign affairs, is a leading member. But so far in the political field only Mr Wallace has offered any striking proposals to arrest the drift towards war and the President may well have felt the need to provide some counter-attraction. However, the broad interpretation put by Moscow upon what was intended to be at the most only an exploratory and private approach took the wind from Mr Truman's sails before they were hoisted. Mr Truman now appears to have abandoned this particular voyage and there are many in the United States who will be disappointed at what may seem a lack of courage. Mr Wallace is, of course, making good use of his opportunity to advertise the rival cruise which he is running.

Nor will the reputation of the Administration be enhanced by the ineptness which the State Department is considered to have

shown in its handling of the situation, although the Russian disregard of the confidential nature of the American Note provides some excuse. It also provides further evidence of the impossibility of doing business with Russia. Exasperation with Russia is in large part responsible for the demand in Congress for revision of the United Nations Charter. This demand is still strong, although it was checked by the forceful arguments against it put forward by both Mr Marshall and Mr Austin, who are convinced that any attempt at such revision would be fatal to the United Nations. They maintained that the United Nations could not be expected to function satisfactorily until the peace which it was designed to preserve had been made, and that in the meantime much useful, although little publicised, work was being done and a forum was provided "for explaining our policies to other states and peoples and for mobilising their support." Mr Marshall insisted that "a fundamental task of the United Nations and of our foreign policy is to dispel the misconceptions of the Soviet leaders and to bring about a more realistic view of what is possible and what is impossible in the relationship between the Soviet Union and the world at large." It is on that task that he has been working this week.

Seizing the Railways

Mr Truman is once more running the railways through the Army. The railway strike scheduled for May 11th could not be allowed to take place, both because of the domestic chaos and privation it would cause, and because of the injury it would inflict upon the European Recovery Plan. But the railroads, because they are covered by the Railway Labour Act of 1926, an ancestor both of the Wagner Act and the Taft-Hartley Act, were exempted from the provisions of the latter. Mr Truman therefore had to act under a law passed in 1916 and never repealed, which authorises the seizure of the railroads in time of war. Fortunately for this twilight zone of executive authority, a technical state of war still exists. It is upon precarious subterfuges of this kind that the constitutional limitations upon the authority of the Government have been expanded to meet twentieth-century emergencies. In 1946 the railwaymen struck despite Government seizure; this year they show no signs of such intransigence, because the Government has been able to secure a judicial restraining order, following an earlier ruling by the Supreme Court that, when the Government seizes private property, injunctions may be obtained to prohibit a walk-out.

The non-operating unions and two of the operating Brotherhoods accepted a settlement of their claims last autumn; it is the remaining three of the five operating unions which have precipitated the present crisis by refusing to accept the recommendations of the President's fact-finding board for a 15½ cent an hour increase in wages and limited changes in working rules. No doubt these unions were emboldened by Mr Lewis's success in securing Republican support, in an election year, for his demands. But it is also true that the "model" provisions of the Railway Labour Act for peaceful settlement of disputes have been overridden time and again, as the war and the postwar crisis made an American railroad strike not only a national, but an international, disaster. In years of rising prices, full employment and national necessity, the record inevitably has been one of appeasement.

Seizure is no solution; it merely holds the issues in an uneasy suspension. From union statements that the 15½ cent award will be recommended to the members and that negotiations are proceeding on working rules (which usually boil down to questions of money) it does not appear that a solution of the present dispute will be hard to reach. Every consideration of the inflationary consequences of further wage increases must encourage Mr Truman to stand firm. He is being fortified by public opinion, which has been outraged by the possibility that the chaotic experiences of the 1946 strike might be repeated.

In Congress there is a disposition to feel that the cure may be to bring the railways under the jurisdiction of the Taft-Hartley Act. This would mean that an 80-day injunction against a strike could be procured without the ponderous fiction of government seizure. But too much faith should not be put in this mechanical remedy. The provisions of the Taft-Hartley Act designed to deal with strikes affecting the public interest have never been thoroughly tested on a national scale. No one knows what would happen if, after an 80-day injunction had expired, a union in an essential industry were still determined to strike. Mr Lewis, still enjoined from pursuing the miners' recent walk-out, is

already plotting another on June 30th if his new demands are not met. (The emergency provisions of the Act have not been invoked in the meat-packing strike, now two months old, and could not be applied to this week's strike at the Chrysler plants, or to the projected strike of electrical workers. How to preserve the right to strike, while ensuring that it is not used in industries essential to the national welfare, is a problem of education rather than legislation.

Death Sentence for Basing-Points

In one of the most important monopoly decisions for many years, the Supreme Court has upheld the contention of the Federal Trade Commission that the basing-point system of identical delivered prices is in illegal restraint of trade. The decision was taken on the FTC's eleven-year-old campaign against the cement industry, but the basing-point system is common to many others and reaches its finest flower in the steel industry. Originally the basing-point system was identical with "Pittsburgh plus" for steel. No matter where a steel mill or its customers were located, it sold its products at the Pittsburgh price plus rail freight from Pittsburgh. That is, the Chicago customer of a steel mill in Chicago paid "phantom freight" charges from Pittsburgh although his steel actually moved only a few miles. Under other circumstances the process was reversed; the company absorbed freight charges. The effect was to rule out price competition, and divide up markets.

In 1924 the FTC issued an order against "Pittsburgh plus." The industry, acting on the assumption that what was at fault was the number of basing-points rather than their effect on competition, then produced the multiple basing-point system which is now employed in the cement, lead, brick, window glass, salt, sugar, and other industries. The FTC insists that most of the evils persist; cross-hauls are exaggerated, inefficient location of industry and excess capacity are encouraged, and prices are kept higher than necessary. Business, on the other hand, insists that the basing-point system prevents wasteful cut-throat competition in industries with heavy fixed charges.

Industry has been stunned to find that the Supreme Court has caught up at last with a monopolistic device used since the turn of the century. The steel industry forecasts "widespread dislocation of the economy" if it is deprived of what one expert has called "far and away the most successful single device that American big business has hit on in 75 years." But the extent of the dislocation will provide a measure of the extent to which the system has distorted the development of industry. And if dislocation there must be, the anguish surely can be borne more easily at a time of insatiable demand for steel and cement than at some future period when industrial activity may be much lower. The experience of the past suggests, however, that the victory may be more academic than real. Outright mergers may well increase, and the steel and cement firms may insist on going to Congress for the same kind of exemption granted to the insurance companies and proposed for the railroads under the Reed-Bulwinkle bill. The cold war, they will no doubt argue, provides grounds similar to those which persuaded the Administration during the recent fighting war to overlook monopoly if only it produced the goods.

The Power Shortage

In 1947 electricity plants in the United States generated 255 billion kilowatt hours of electric power, double their output in 1939 and substantially more than in 1944, the peak year of the war. Supplies of power are already insufficient to meet all demands, and it is not therefore surprising that a shortage of electricity is likely to be one of the first scarcities arising out of the new defence programme and one which may mean that there will not be enough aluminium to make the aircraft authorised by Congress.

Shortly after his message to Congress on March 17th President Truman directed the chairman of the Tennessee Valley Authority to prepare plans for the expansion of electric capacity. This move made it seem probable that Congress would hesitate to refuse the TVA's request for \$4,000,000 to construct a 120,000-kilowatt steam plant for generating electricity, but the House Appropriations Committee nevertheless rejected it last week. The matter has still to be considered by the House itself. The Committee took its stand on the constitutional issue, which gave the power lobby a stronger base than usual from which to attack

the TVA. The official purpose of the TVA is to develop the Tennessee Valley in the interests of navigation, flood control and national defence, and it is only entitled to generate and sell electricity in order to avoid the waste of water power. This is the first time that the TVA has asked Congress for permission to construct a steam plant which has no connection with its statutory purpose. TVA representatives contend that the new plant is necessary to meet the normal growth in demand in the area and to provide an insurance against drought. The power lobby's attack is probably inspired not so much by respect for the constitution as by the hope that if the TVA is unable to meet the demands of its industrial consumers, private companies may be able to regain a foothold in the area.

The power lobby will look more favourably on Governor Dewey's plan for the New York State Power Authority, in co-operation with the Province of Ontario, to develop the power resources of the St. Lawrence, since it is intended that this electricity shall be distributed by private facilities. The Governor's proposal is, in fact, the scheme for power development contained in the St. Lawrence Waterway project, which was once more rejected by the Senate at the end of February and is now regarded as a dead issue. Congressional approval for Mr Dewey's plan is not required; only that of the US-Canadian International Joint Commission is needed and is expected. In New York State itself opinion is sharply divided on the waterway question, but all are agreed on the desirability of the power development by itself. The Province of Ontario welcomes the suggestion and the Canadian Government is unlikely to object.

Dewey and Stassen

In the 1944 campaign, President Roosevelt succeeded, by a few skilful taunts, in disrupting Mr Dewey's well-laid plans and forced the Republican contender to meet the President on his own ground. This year no Democrat exercises even remote control over the Republican campaign. It is the pressure of events, and Mr Stassen, which make foreign issues the heart of the Republican campaign even in the Middle West, and have forced Mr Dewey out of his corner to fight for his political ambitions.

Campaign speeches are no sure index to what a politician will do in office. Mr Roosevelt's platform in 1932 gave no hint of the New Deal of 1933. But it is significant that under the persistent pressure of public opinion Mr Dewey has come to advocate military training, the Marshall Plan, the Truman Doctrine, the union of Western Europe, help for China, and greatly strengthened national defence. In a recent major address on foreign policy at the University of Oregon, he offered an eight-point programme for peace which ranged from the atom bomb on the one hand, to a great moral offensive which would tell the "thrilling story" of American enterprise and rally, peoples everywhere to the standard of liberty.

Mr Stassen is more forthright and more adventurous. He has made himself the political leader of anti-Russian sentiment. He would outlaw Communists in all democracies; he would ban American exports to Russia; he advocates revision of the United Nations Charter; he wants as much money to be allocated to Marshall aid next year as this. Even Mr Stassen balks at committing himself as yet to a military guarantee to Western Europe, but he favours the use of Article 51 of the Charter to facilitate advance consultations against aggression. But it is impossible not to recognise that Mr. Stassen possesses in a high degree the politician's traditional skill of being able to work both sides of the street at once. Although he would outlaw the Communist party, regard for the labour vote leads him to denounce the requirement that union leaders must file anti-Communist affidavits. Last year he said that no aid should go to "socialist" Britain if the government persisted in nationalising the steel industry. Now he declares that Britain is not socialist; only Russia and Yugoslavia qualify for that odious adjective. He urges controls, but at the same time demands a housing programme which would aggravate inflation. Despite his anxiety to label himself a liberal, labour is unconvinced, and there are rumours that some sections of business feel he is a liberal who can be reasoned with.

Mr Dewey and Mr Stassen are keeping the issues of foreign affairs before Oregon and the West. But the chief beneficiary of this contest may yet prove to be Senator Vandenberg, who is remaining in Washington, fighting no campaign and making no enemies, but devoting himself solidly to the nation's interests and reinforcing his claim to be the Republican party's most distinguished authority on foreign policy.

THE BUSINESS WORLD

Still a Bear Market?

FEW periods in Stock Exchange history have been more confused than the past seven months. The market has been trying to resolve the main issue whether the fall in ordinary share prices, which began with the fuel crisis and was carried last summer to the lowest point since April, 1944 by the rapid exhaustion of the American loan, marks a decisive change in the investment cycle. In October last year, there were scarcely two opinions about the future trend of ordinary shares. The possibility of severe economic difficulty during the winter and the spectacle of Britain down to its last dollar reserves (with no assurance, at that time, of Marshall Aid) was too much for the nerves of Stock Exchange dealers. They lightened their books—and they have been paying for their foresight ever since. They were, so to say, right; but prices have mischievously proved them wrong.

Between the middle of October and the end of the year, ordinary shares belied expectations, and rose on the average by 17 per cent. The "Hatch" school re-entered the market; and some of the chart-readers who had been so confident during the summer that a bear market of classic proportions was in train, began to show deviationist tendencies about a secondary interruption to a long-term bull market. Ordinary shares as a whole took the doubling of the Profits Tax last November—and the change of Chancellors—in their stride; yet their advance was not due to any recalculation of British economic prospects, but rather to the re-investment in equities of steady sales of railway stocks. Indeed, at the very moment of the take-over of railway stocks on January 1st the equity market turned; preoccupations about British economic prospects in the absence of Marshall Aid increased, particularly in February, when the frank forecasts of the Economic Survey came as a shock. In the last two months, the assurance of American aid, coupled with reinvestment from sales of electricity stocks, has brought further support. In sum, the *Financial Times* index of ordinary shares is now fluctuating about 120, some 9 points lower than at the end of 1947, but 16 points higher than the lowest point touched at the beginning of September.

To be sure, this is slender evidence for the view, which is now gaining support among the perennial Stock Exchange optimists, that the fall of ordinary shares last year was merely an interruption to a bull trend. Indeed, that view is tenable only on the assumption that the Chancellor's financial policy—to back his earlier deflation by exhortation—makes no difference to the investment scene. Recent articles in *The Economist* have argued the importance of the budget surplus for the gilt-edged market. The exponents of the theory that the rate of interest on undated stocks was bound for 3½ per cent or higher have modified their opinion during the past month. In the seven weeks between the middle of February and Budget Day, the return on 2½ per cent Consols rose from £3 2s. 6d. per cent to £3 6s. per cent; but in the last month the yield has steadied to exactly £3 5s. per cent. Here, at least, is some sign of the new monetary factor at work.

A market forecast for the summer months, therefore, starts from the premise that gilt-edged securities should now have an anchor which they lacked as soon as confidence in the ex-Chancellor's cheap money drive lapsed. The shorter the date,

no doubt, the firmer will be the anchor; but the prospects of an unspectacular recovery, extending perhaps to the twenty-year stocks, are not to be disregarded. On that assumption, the investor can base his immediate policy on a yield structure ranging from just under 3 per cent for twenty-year stocks, about 3.1 per cent for thirty-year stocks, 3.2 per cent for the

(a) Fifteen months yield at 7.6 per cent. * Ex. dividend.

forty-year Transport Stock, and 3½ per cent for the irredeemables. But although this may be a fairly firm basis on which institutional investors can frame their operations, private investors will need rather more convincing assurance than a mere change in monetary policy, important though that is. The lesson of the Special Contribution has not been lost on private investors; many of them will want a more tangible incentive to enter the market again than a fair prospect of greater stability in gilt-edged prices. The levy will tend to increase their preference for holding cash rather than investments, and it has yet to be seen whether this will be a permanent consequence of the "once-for-all" levy.

Yet this provisional conclusion offers some datum line for comparative yields of equities and Government securities. The differential between ordinary share yields and the return on Old Consols (illustrated in the accompanying chart) has narrowed to little more than one per cent, compared with

1½ per cent in February and as much as 2 per cent last September. An ordinary share yield is an exercise in two dimensions—a dividend relating to the past, and a present price which attempts to measure the prospect of dividends in the future. The Chancellor has removed this latter element from the calculation by voluntary dividend limitation—again, ostensibly for one year only. There is no statistical evidence, as yet, that industrial profits are falling. Indeed, the sample of 505 companies whose reports were analysed in the *Records and Statistics Supplement* a fortnight ago revealed a rise in profits before tax of over 20 per cent, from £105,991,000 to £127,786,000. But the total ordinary dividends of these 505 companies showed a quite modest increase, from £58,952,000 before tax to £60,788,000; and their average ordinary dividend represented 15½ per cent on the issued capital, compared with the (possibly exceptional) rate of 22.9 per cent paid by a similar but not identical sample of companies a year earlier.

But other evidence points to a material slowing down in the rise in industrial earnings of recent years. In some industries—radio is one example—it will not be voluntary dividend limitation which determines the level of dividends during the coming year, but a reduced total of distributable profits. The comfortable profit margins of the war and post-war period are under pressure. Industry as a whole is still congested by work "in progress," at the very moment when stocks are accumulating on the warehouse shelves. In the capital goods industries, there is no immediate sign of a return to buyers' markets, but even here order books are not so bulging, and delivery dates are not so far distant as they were. In many consumers' goods the sellers' market is waning fast. The conclusion that some fall in industrial profits is more likely than a further rise during the next twelve months seems justified by this evidence, for while prices may be under pressure, industry will not easily be able to cut its costs either for wages or most raw materials.

Some of these factors are reflected in present yields obtainable in the industrial share market. The table which accompanies this article gives some typical examples in the various yield groups. Low yield shares like Bleachers, Electric and Musical Industries, Distillers, British Celanese, and Boots Pure Drug are often those in which some increase in dividend had been reasonably anticipated before voluntary dividend limita-

tion had been thought of. Their strength, in present circumstances, suggests that investors are prepared to take a longer view than a mere twelve months about their prospects. Such optimism indeed may be justified in certain cases; but if the trend of profits is now in process of change, some low yield shares would hardly escape the consequences. A yield below the "blue chip" level of 4 per cent does, indeed, require a special justification today. There may well be doubt whether that return itself is high enough, for it leaves a bare 1 per cent difference, compared with the return on gilt-edged securities, to take care of industrial risks. The higher yield groups are composed of shares on which dividends may be maintained, with good luck, or reduced with bad. They include shipbuilding, tobacco, aircraft and some textile shares—with steel shares as a special class in view of the threat of nationalisation. The varying yields of these shares at the decisive dates of market change given in the table show that the market has gone a long way since June, 1946, in recasting its expectations about future profits in particular industries. But it seems, so far, to have been rather insensitive to the prospects for earnings and dividends for industry as a whole, and especially so in the low-yield and "blue chip" groups. It may be that the reinvestment of £150 million of Argentine railway money is now a sustaining factor for equity shares, as British railway money was before Christmas. It may be that a generous margin of earnings over dividends is worth paying for, in the hope of higher dividends at some future time. But Stock Exchange values cannot for ever be determined by adventitious reinvestment, and markets nowadays are narrow and sensitive. Even with Marshall Aid, a large sector of industry is about to run into problems of which it has seen little since the late 'thirties: problems of markets; of meeting changing demand; of reduced profits, and in some cases perhaps even losses; of changes in labour supply and perhaps increased unemployment. For many concerns, this will be a thoroughly uncomfortable process, and the shareholder will come out worst of all. For others, it will check the anticipated growth of profits on which current share values are still based. The answer to the question posed in this article must be a sober "Yes" in the case of ordinary shares. And for gilt-edged stocks, the trend of recovery is likely to be so gentle that it could hardly be characterised as a bull market. Boanerges, after all, has gone.

Wages and Hours

SIR STAFFORD CRIPPS'S recent warning to the engineers against general wage increases, and the utterances of the engineers' leaders themselves, show that the conflict between trade union demands and the policy expressed in the White Paper on Personal Incomes will not be easy to resolve. The May issue of the Monthly Journal of the Amalgamated Engineering Union states:

Our Union, in association with others in the engineering and allied trades, is proceeding with its claim for wage increases. It is charged against our group of unions that we are acting in defiance of the recommendations accepted by the special conference of Executives, but this is not true. Apart from the fact that our own Union voted in the minority against acceptance, there is the fact that the wage claim was formulated under instructions from the membership through their elected delegates before the White Paper was published, and there is the further fact that the wages of the engineering workers have not been increased for more than two years, although the cost of living has risen considerably during that period.

Sir Stafford Cripps, when he addressed the annual conference of the Confederation of Engineering and Shipbuilding Trade Unions at Weston-super-Mare, did his best to drive home the case for keeping the level of earnings down. "This country is sunk," he said, "if at this moment we indulge in a general rise of wages. . . . Our object is to try to preserve the present wage levels undiminished and gradually get improvements in the standard of living by lowered costs and so lower prices. . . . And we can't succeed on the basis that each section of industry can have its own way but the others must be stopped having theirs."

So far as the engineers are concerned (and they are responsible for the largest wage-claim at present under negotiation) the Government's case comes up against more than the general desire for more money: the engineers feel that in the general reshuffling and inflating of wages during the last ten years they have not had their fair share. The last war (like the war of 1914-1919) narrowed the gap between skilled and unskilled earnings in industry. The engineers believe themselves to be entitled, on the ground of their skill and labour, to improve their position in relation to other industrial groups. But this—a recasting of the wages structure—is precisely the hardest thing to achieve without a general raising of earnings: no other method of doing it has yet been found in this or any other country.

*

Social habit, the custom of the trade, and the formidable mesh of trade union agreements are together strong enough to keep the rates of pay of industrial workers in different industries in fairly constant relation to one another over a period of years. Wars and economic crises may render these relationships fluid for a time. One such period of fluidity has occurred during the past eight years. There is a possibility now that the relative wage structure of British industry may be about to set in something like its present pattern. This is by no means certain. But it is the probable effect of the policy embraced in the White Paper, if that policy is not destroyed by the provision for exceptional cases which the White Paper itself admits.

The half-yearly inquiry into earnings and hours of work conducted by the Ministry of Labour is a valuable guide to the wage structure over the greater part of industry—or rather, to what it was last October—and to the changes which have occurred during the war and postwar periods of fluidity. The inquiry covered some 52,000 establishments with about 6,000,000 workpeople; its results have been recalculated by the

Ministry of Labour on the basis of the numbers estimated to be employed in each group of industries, in order to give a fair general picture, though certain industries (coal-mining, agriculture, and others) are left out. The first general feature is the rise in weekly earnings in every industry between April, 1947 (the date of the previous survey), and October, 1947, when average earnings of all industrial workers were higher than they had ever been before. Since October, they have risen still further. The average increase throughout industry between April and October last year was 4s. 8d. a week. It ranged from 1s. 8d. a week in transport (excluding railways but including road haulage and dock workers) to 7s. 7d. in mining and quarrying and 8s. 3d. in the treatment of non-metalliferous mine and quarry products. This increase was more than could be explained by the increase of 12 minutes in the average length of the working week, from 45 to 45.2 hours, for hourly earnings were about 1d. higher in October than in April, 1947, for men, boys and girls, and about ½d. higher for women.

Wages, which in 1936 formed 36 per cent of the total of civilian income from work and property before taxation, accounted for 40 per cent in 1947. The White Paper on National Income

TABLE I
AVERAGE EARNINGS AND HOURS IN INDUSTRY, 1938-1947

	Earnings			Hours		
	Weekly Average	Percentage Increase Since Oct., 1938		Hours Worked Weekly Average	Hourly Average	Percentage Increase Since Oct., 1938
	s. d.	per cent		s. d.	per cent	
October, 1938	53 3	Nil		46.5	1 1.7	Nil
July, 1940	69 2	30		...	...	...
July, 1941	75 10	42		...	...	...
January, 1942	77 9	46		...	...	...
July, 1942	85 2	60		...	...	...
January, 1943	87 11	65		...	...	...
July, 1943	93 7	76		50.0	1 10.5	63
January, 1944	95 7	79		49.2	1 11.3	70
July, 1944	96 8	82		48.6	1 11.9	74
January, 1945	93 9	76		47.0	1 11.9	74
July, 1945	96 1	80		47.4	2 0.3	77
January, 1946	92 7	74		45.8	2 0.3	77
October, 1946	101 0	90		46.2	2 2.4	101
April, 1947	103 6	94		45.0	2 3.6	101
October, 1947	108 2	103		45.2	2 4.7	109

and Expenditure last month showed how the share taken by wages had increased. The Ministry of Labour's figures express the same point in terms of average weekly earnings and relate it to the hours of work in industry. In the last week of October the average industrial worker in the industries covered by this inquiry earned 108s. 2d., an increase of 103 per cent over October, 1938, when earnings averaged 53s. 3d. A girl earned 43s. 9d., or 136 per cent more than in 1938; a woman 69s. 7d., or 114 per cent more; a boy or youth 51s. 10d., or 99 per cent more. (Youths, in the Ministry of Labour's vocabulary, become men at 21, though girls turn into women at eighteen.) The average man earned 128s. 1d. in October, 1947, but the rise in his earnings of 86 per cent over 1938 has been relatively the smallest of all the groups. Thus the second feature of the Ministry's analysis is that the disparity between men's and women's earnings in industry, though still great, has narrowed during and since the war. It began to widen again at the end of the war, when women were leaving industry and men were returning to it, but this tendency was soon reversed; no doubt the efforts being made to get women into the textile and other industries will further reduce the gap, particularly since female labour will become scarcer in the next few years.

Since the Ministry's survey takes into account bonuses and overtime pay, the figures in the accompanying tables represent not basic wages, but actual earnings before deduction of insurance and tax. Earnings have outstripped wage rates, mainly because industry is more fully occupied than before the war, but also because reductions in the basic working week have caused more work to be paid at overtime rates. The Ministry estimates that in the industries covered by the inquiry the average level of rates of wages for a full ordinary week's work was only 61 or 62 per cent higher in October, 1947, than in October, 1938. The difference between increased wage rates and increased earnings is considerable. And the number of hours actually worked in industry has fallen, not risen.

The second table shows that comparative wages in the groups of industries investigated have greatly changed in the past nine years. Such changes are inevitably blurred by the craft structure of a large part of the trade union movement; many workers receive not the rates of the industry but the rates of their craft. But the consequences of a long period of labour shortage are easily discernible. There is a tendency towards a levelling-up of wage rates as between the more skilled and the less skilled trades; and (another expression, perhaps, of the same fact) trades with lower standards of pay have given larger increases in pay than those with higher standards—no doubt in an effort to hold their employees when work is plentiful elsewhere. Text-

TABLE II
EARNINGS AND HOURS BY INDUSTRIAL GROUPS
(October 1938 and October 1947)

Industry Groups	Average Weekly Earnings			Average Hours Worked		Average Hourly Earnings		
	Oct., 1947	Increase since Oct., 1938		Oct., 1938	Oct., 1947	Oct., 1947	Increase since Oct., 1938	
	s. d.	%				s. d.	%	
Iron, stone, etc., mining and quarrying	118 0	108		45.8	46.6	2 6.4	105	
Treatment of non-metalliferous mine and quarry products	125 11	106		49.3	49.1	2 6.8	107	
Brick, pottery and glass	108 1	127		46.8	46.3	2 4.0	129	
Chemical, paint, oil, etc.	108 5	97		47.2	45.2	2 4.8	106	
Metal, engineering and shipbuilding	122 2	105		47.1	45.0	2 8.6	114	
Textiles	85 5	126		45.8	44.5	1 11.0	132	
Leather, fur, etc.	102 8	120		46.8	44.2	2 3.9	132	
Clothing	76 0	117		42.4	41.7	1 9.9	121	
Food, drink and tobacco	95 11	104		47.8	46.0	2 1.0	112	
Woodworking	108 7	109		46.4	44.4	2 5.3	119	
Paper, printing, stationery, etc.	105 2	83		45.4	43.9	2 4.7	89	
Building, contracting, etc.	109 7	79		46.3	46.9	2 4.0	77	
Miscellaneous manufacturing industries	106 10	130		46.8	44.6	2 4.7	141	
Transport, storage, etc. (excl. railways)	118 11	82		48.8	48.2	2 5.6	84	
Public utility services	102 1	71		48.0	45.6	2 2.9	80	
Govt. industrial establishments	114 9	63		49.1	45.6	2 6.2	75	
All the above	108 2	103		46.5	45.2	2 4.7	109	

tiles, still among the lowest-paid trades, show one of the largest percentage increases in earnings over 1938; and there have been further increases in textile earnings since those recorded in the Ministry's survey. Building, transport, paper and printing, and the public utilities—all fairly well-paid trades—record low percentage increases. Clothing, even worse paid than textiles, shows an average increase of 117 per cent since 1938, well above the average rate of increase and, indeed, well above the increase of 105 per cent in the metal, engineering, and shipbuilding group. Thus, war and postwar conditions, by threatening to draw workers from trades such as clothing into trades such as engineering, have resulted in the greatest percentage increases in earnings going to the former. But that result has not succeeded in moving such low-paid workers to a much more favourable level. It means merely that their datum level in 1938 was very low indeed. The miscellaneous manufacturing group, which includes a variety of essential and non-essential things from scientific instruments to sports requisites, shows the most handsome increase of 130 per cent.

For a significant contrast it is necessary to turn to the railway

service, an industry not covered by the Ministry's survey. Here the Ministry of Transport's own returns show that average earnings of railway workers in March, 1947, were 123s. 6d. for men, 46s. 2d. for youths and boys, 87s. 4d. for women, and 43s. 6d. for girls. These earnings represent increases since March, 1939, of 80 per cent for men and 60 per cent for youths and boys. They do not include the increase in the standard rates for railway workers (7s. 6d. for men and women and 3s. 9d. for youths and girls) which took effect at the end of June. But they show that the railway worker is in a less favourable position than he was nine or ten years ago, compared with that of workers in a number of not so obviously necessary trades.

*

Coal mining also was not covered by the survey, but here again the Ministry of Labour Gazette has procured some comparable figures from the Coal Board. Miners' earnings have risen far more rapidly than those of any group in the survey. For all classes of mineworkers, including juveniles, average earnings per man-shift were 28s. 10d. in October, 1947, as compared with 11s. 2d. in 1938, an increase of 158 per cent. Average weekly cash earnings for all mineworkers were 145s. 4d. compared with 55s. 5d. in October, 1938—an increase of 162 per cent. For men they were 152s. 10d., compared with 60s. 4d. nine years earlier.

The earnings of different trades shown in the survey contain enough eccentricities to make it doubtful whether the structure can be maintained unaltered for long without friction. One change, however, is at work in some industries and may provide a safety-valve. The Ministry inquired into the proportion of workers paid on piece rates or by other systems of payment by results, including output bonus systems and other methods by which workers are paid partly on time and partly on output: altogether, 28 per cent of workers were paid by systems of this kind last October, compared with 26 per cent in the previous April and 25 per cent in 1938. This inquiry does not distinguish between one system of payment-by-results and another (there are good systems and bad) nor does it record the attempts which employers in some trades are making to improve their existing incentive systems. If the wage structure is to be kept broadly stable for a time without becoming intolerably rigid, or imposing intolerable strains, such attempts may take on a new importance.

COMMODITIES COAL AND OIL

ERP allocations to W. Europe for fifteen months from April 1, 1948. US quotas, showing grade and destination, for May-July, 1948.

Business Notes

Another Australian Conversion

Underwriting was being arranged in the City last week for a new £10 million Australian conversion loan, the cash lists for which will be open only on Tuesday, for the purpose of re-financing four 4 per cent State issues, totalling just over £14½ million, which are being called for redemption this year. Sterling for repayment of the portion which is not being replaced will be provided by drafts on Australia's accumulated London funds. The new issue takes the form of 3 per cent Commonwealth stock, 1964-66, offered at par. The last Australian conversion, the long-postponed £13 million operation eventually launched in January, also comprised a 3 per cent stock, but this was offered at 1½ points below par with a life (1963-65) one year shorter than the loan now announced. At first glance, this notable stiffening of the terms may seem a little surprising, for British Government securities, despite their recent strong recovery, still stand rather below their levels of three months ago. It was apparently this consideration which led some quarters to suggest at first that the authorities seemed determined to squeeze the last ounce out of the market.

This view does less than justice to the new issue, and certainly fails to give due weight to the market circumstances which surrounded the previous issue. Australia had been waiting for many months for a chance to make a further assault upon its callable 4 per cent loans, but had been held back, first by the priorities given to Mr Dalton's own programme, and later by the unpropitious conditions of the market after the first violent break of last summer. But when, eventually, the all-clear was given, the market was still in no condition to withstand forcing tactics. On the contrary, after the relatively unhappy experience with the launching of Australia's earlier 2½ per cent issue, it was imperative to make the new issue attractive. The nearest comparable British Government security both to the January issue and next week's is 2½ per cent Savings Bonds, 1964-67. The measure of the attempt to ensure success for the January flotation was that the final redemption yield at the issue price—£3 2s. 3d. per cent—offered 5s. 2d. more than was then obtainable from the slightly longer-dated British Savings Bonds. On the eve of the latest Australian announcement, the yield on Savings Bonds was £2 17s. 7d. per cent, so that the yield differential offered by the new loan was rather less than half that offered in January. There is still, however, a margin of nearly ½ per cent.

But this is not the only, or perhaps the best, test by which the issue should be judged. It is clear that British Government credit and Australia's have, for the present, ceased to march precisely in step. Between the dates of the announcement of these two Australian loans, the net price of 2½ per cent Savings Bonds excluding interest, showed little or no change, but that of 2½ per cent Consols dropped from 80½ to 76½. Over the same period the 3 per cent Commonwealth stock (1963-65) moved up from its issue price of 98½ to 101¼—the closing price last Monday. In short, if indications of the policy of the British authorities are to be sought in this operation, the conclusion must be, not that there has been any attempt at forcing tactics, but simply that the authorities are satisfied that no such tenderness is necessary in handling the market as was evidently needed three months ago. Most market observers, indeed, would have reached that conclusion without the aid of an official pointer. Australia plainly has the advantage of riding on the crest of the wave—but that, in itself, does not indicate the state of the tide.

IMF and Devaluation

Summaries cabled from Washington a fortnight ago of the views of the International Monetary Fund upon exchange rates—as set forth in a statement prepared by the Fund for the Economic and Employment Commission of the United Nations—played a part in reviving rumours about imminent devaluation of the pound and other European currencies. Since then the recurrent bogey of sterling devaluation has receded, and its departure has been speeded by a particularly forthright declaration of faith by the Chancellor of the Exchequer. Speaking in the debate on the Finance Bill last week, Sir Stafford affirmed that “nothing more fallacious could possibly be put forward” than the argument that sterling devaluation is necessary. “To embark upon such a programme would be the extreme of folly. This Government certainly have no intention whatever” of doing so. Now that the full version of the IMF statement is available, it is apparent

that the brief extracts gave a false impression, but it is easy to see, too, how the confusion arose. The document is a rambling dissertation upon the problem of exchange rates in general, with many veerings and tackings; careful reading is needed to confirm that it is not in fact constantly contradicting itself.

A large part seems to be intended as an apologia for the Fund's attitude to European exchange rates in the past—especially for its approval of the arbitrary initial parities and its condonation of certain multiple currency practices. But this process of self-justification serves some useful purpose. It demonstrates more completely than any previous exposition the Fund's freedom from that excessive orthodoxy by which it was originally expected to be ridden. It defends the Italian free rate system on the ground that the free market is not really free but requires astute management. It excuses—or appears to excuse—the multiple rate practices of Latin America on the ground that, except to the extent that “penalty” rates for imports are designed as a conveniently disguised method of taxing consumers of non-essentials, the system will tend to disappear as inflationary pressure diminishes (“when the establishment of a new parity at the penalty import rate will be helpful”). It deplores the “disorderly” cross-rates which arise for inconvertible currencies—yet actually advocates, as a remedy, concerted import and export policies to achieve bilateral equilibrium between each pair of countries whose currencies are in question. It insists upon orderly cross-rates based upon the agreed parities because these “are among the essential conditions for restoring currency convertibility and multilateral trade”; but it “will not insist upon the empty shell of exchange stability if this would have the effect of hurting a country's economy and the expansion of world trade.”

* * *

Would Depreciation Help Exports?

Thus, on the crucial issue whether any particular currency ought to be devalued, the Fund's test is strictly practical: would devaluation assist the country to export? The basic functions of an exchange rate, it says, are to enable a country's exports to flow in a volume appropriate to its needs, and to keep its imports within its capacity to pay. But, endorsing in effect Sir Stafford's reiterated thesis, the Fund points out that in present conditions of shortage an exchange rate cannot generally perform this second function. Hence its concentration upon the export criterion, by which, it contends, its own action in approving arbitrary parities initially has been vindicated—because, until last autumn, exports of nearly every country of Western Europe expanded faster than production. But in recent months the position has been changing:

It has become clear that in some countries the initial parity has begun to burden export trade, more particularly exports to the dollar area. Whether these developing difficulties are proof that an error in judgment was made in accepting the initial parities is a matter of opinion. There is, however, strong evidence for the belief that if the necessary changes are made promptly the record will support the wisdom of the Fund's original action. If, however, changes are unnecessarily delayed, the course of events is likely to show that the members of the Fund are making a serious mistake in continuing the over-valuation of their currencies. Under such conditions the Fund will not hesitate to urge on a member consideration of the desirability of a revision of the parity of its currency.

This looks forthright enough—even though, in this context, the Fund names no names.

But then the veering begins afresh. Is prompt adjustment desirable, it is asked, during a continuing inflation, when devaluation might “restore” exports for merely three or six months? Again, in this matter of exchange rates, the problem of inflation is stated to be subordinate in many countries “to the real deterioration in their international economic position.” And, finally, though European prices are too high to attract US buyers, there is “no basis” for the view that “if European exchange rates and prices were properly adjusted the dollar shortage which these countries are experiencing would be corrected. . . . There is no reason why the Fund should embark on a general adjustment of parities, either now or later.” All of which suggests that the IMF, though leaning increasingly towards specific devaluations, is most anxious not to commit itself.

Oil Supplies to Industry

It was Mr Hugh Fraser, the member for Stone, who in the Commons debate on oil supplies on Tuesday drew a comparison

between Marie Antoinette and the Ministry of Fuel and Power. The Ministry, as he put it, said to the industrialists in 1946: “You have no coal? Burn oil.” Mr R. S. Hudson, who opened the debate for the Opposition, described the resulting situation:

Some firms have installed conversion machinery and have no fuel, others have installed machinery and can get fuel, some are still going ahead with conversions, and others are now reconverting back.

Mr Robens, the Parliamentary Secretary to the Ministry of Fuel and Power, gave figures of what had been done under the Government's scheme for encouraging conversion to oil firing in industry. Inland consumption of fuel oil before the campaign started amounted to about 860,000 tons a year. The 1,548 plants which had converted and were now using oil required 2.54 million tons a year. A further 291 conversions had been authorised, and would require 250,000 tons; and the further 120 which the Ministry proposed to authorise soon would require 340,000 tons a year. This would mean a consumption of 4,000,000 tons of oil in a full year. But there remained about 435 schemes initiated with Government approval which could not be put into effect now or in the near future, representing an oil consumption of .94 million tons a year. In this class are to be found the industrialists who are now receiving the oil plant they ordered last year and are wondering whether to sell it cheaply or keep it for another turn of the tide.

Mr Gaitskell, who wound up the debate, did not offer much comfort to industrialists in that predicament. He had been repeatedly pressed to state whether the oil companies were getting the steel for the big new refinery projects on which the future level of oil supplies will largely depend. His answer adhered obstinately to the secrecy with which members of the Government find it necessary to surround all questions relating to the allocation of steel:

It would be wrong for the Government to publish the steel allocations to different industries. There are all sorts of reasons, one of which is security. There is bound to be a great deal of misunderstanding about such figures.

He confined himself, therefore, to affirming that the immense importance of the refinery programme is appreciated: “We are anxious, within the limits set by the inevitable high demands for steel for other purposes, to give them as much as we possibly can.”

It is hard to see any good reason for this reticence. The oil companies have, after a long wait which they have used to complete their plans and prepare their contracts, been authorised to start work on the main refinery projects, and one of them at least has started preparing sites. The companies expect to get enough steel to start building, but the rate at which they get the steel to complete the work is uncertain; it will depend on the state of steel supplies. This is not an entirely happy position, but it is intelligible; Mr Gaitskell would have given more reassurance if he had stated it with as much, instead of as little, factual detail as he could supply.

Inquiry into Building

The Minister of Works announced in the Commons on Monday his intention of setting up a working party to inquire into “the organisation and efficiency of building operations in this country,” but he did not state what its terms of reference would be. The inference that the working party will extend to the building trade the type of inquiry which the Simon Committee applied to the trade in building materials is to be drawn from Mr Cherwynd's question rather than from Mr Key's answer. But the general intention has been quite enough to draw a hostile reaction from the Federation of Building Trades Employers, which observed on the same day that the time was “highly inopportune” for such an inquiry:

The Government's decision will create uncertainty and destroy confidence and the necessary team spirit. Production generally will be adversely affected by the dissipation of energies which should be used in getting on with the actual job of building, and conditions are still so unsettled that the Working Party will find it difficult to make recommendations which will be of any real value in less abnormal times.

These are strong words—for the purpose of the inquiry has yet to be stated. What are the questions into which the working party may be thought likely to inquire?

The term “organisation” suggests that it may be required to interest itself in the size and number of building firms. On this the Simon Report, from which the accompanying table is extracted, has already thrown a certain light: the number of

building firms in existence increased from about 80,000 before the war to about 140,000 last year. Most of the increase was in extremely small firms, many of them one-man firms—a consequence, indeed, of the Ministry of Works' own liberality in granting licences to ex-Service men previously connected with building to start business on their own. Here is one matter for inquiry.

NUMBER AND SIZE OF BUILDING AND CIVIL ENGINEERING FIRMS

Size of Firms	May, 1945		May, 1946		May, 1947	
	Firms	Employees	Firms	Employees	Firms	Employees
One-man firms	30,752	0	48,150	0	68,832	0
1-5 employees	26,441	60,861	34,688	84,524	43,302	104,028
6-15 employees	9,862	102,110	15,713	153,720	18,169	185,551
20-99 “	4,314	169,760	7,009	274,233	7,788	302,666
100-499 “	608	111,746	1,059	196,597	1,114	211,223
500 and over	55	60,343	98	111,285	107	137,016
TOTAL	72,032	504,820	106,777	826,759	139,312	938,490

Organisation may well be considered in relation to equipment, and there is work to be done on the remarkably disparate standards of efficiency between building firms. The difficulty here is to find an acceptable norm of efficiency by which the performance of builders can be measured. The costs of house building have been investigated during the past year by a Ministry of Health Committee, which is expected to report soon; the new working party might extend that inquiry to the costs of other kinds of building. In considering productivity it will no doubt take an interest in the working of payment by results in the building industry. The Building Trades Employers concluded an agreement with the trade unions towards the end of 1947 for the application of incentive systems of payment. Such systems have not yet been at all widely applied in building, but the employers' federation has begun an inquiry of its own into their working, and may have some provisional conclusions to put before the working party.

Silence on Films

When the film industry was discussed in the Adjournment Debate a fortnight ago the President of the Board of Trade spoke of publishing the full text of the American film agreement “right away,” and announcing his arrangements for financing independent film production “in a few days.” Neither of these announcements (which are awaited by the trade with some anxiety) has yet been made. In the American agreement too much appears to have been taken for granted. It became clear after the agreement was signed that the American producers had much bigger ideas of the extent to which they could enter film production in this country than Mr Harold Wilson had, and that the two sides interpreted in quite different ways the provision that the American expenditure on film activities in this country “shall not be such as to go beyond the limits of fair competition or be otherwise harmful to the legitimate interests of the British film industry.”

Indeed, a formula lending itself more easily to various interpretations would be hard to conceive, and it would be surprising if in these days American and British ideas of “fair competition” or of “the legitimate interests of the British film industry” were to coincide. These and other differences were enough to require a visit by Mr Fay Allport (the representative in London of the American film producers' organisation) to his chief, Mr Eric Johnston, in the United States. Mr Allport arrived back in England on Thursday; it is to be hoped that he brought terms that will end a delay that has been embarrassing to the Board and disturbing for the film trade.

The import duty on foreign films was taken off on May 3rd, and renters have been able to get the release of films from the Customs on producing an import licence. The procedure for obtaining an import licence threatened for a time to hold up the trade shows which had been arranged this week for fifteen or more American films; one trade show at least had to be cancelled. But the majority took place without hitch. It is still a little absurd that renters seeking an import licence should have to sign an undertaking that they will observe the principles of the agreement, the text of which they have still not seen.

If one can speak of unsettling the British film industry, this situation is bound to have an unsettling effect. Finance can hardly be expected to start flowing in any adequate volume into the film industry until it is cleared up: that is, until it is known not merely how the agreement reads in its final form, but how it is to be interpreted in practice. This will not become clear at once, and the independent British film producers will need what help they can get to finance production in the meantime. Here Mr Wilson's plan for finance to assist independent film produc-

Canada's Dollars

The report of the Canadian Foreign Exchange Control Board for 1947 repeats the familiar story of Canada's utter dependence upon triangular trade for an effective balancing of its international credits and, therefore, upon the convertibility which allows that triangular trade to be cleared. In 1947 the triangle was larger than ever. On current account there was a deficit of \$1,138 million with the United States, a surplus of \$872 million with the sterling area, and a surplus of \$313 million with other overseas countries, leaving a net surplus of \$47 million. Last year, however, rather more than half the surplus with countries other than the United States was paid for in convertible exchange. The net deficiency on Canada's current and capital account amounted to \$743 million, this being the figure by which the holding of gold and US dollars had to be reduced during the year. This reserve, which had stood as high as \$1,508 million at the end of 1945, and had come down to \$1,245 million by the end of 1946, was thus reduced to about \$502 million by the end of 1947. The report of the Control Board cannot be accused of exaggeration when it points out that "these reserves are unsatisfactorily low, given the importance of Canada's international transactions and disturbing uncertainties of international affairs."

The report refers hopefully to the European Recovery Programme and, more particularly, to the possibility of "off-shore purchases," which would provide an opportunity for Canada to earn more convertible exchange from shipments to Europe than would otherwise be the case, thus enabling Canada, while supplying to Europe the goods which Europe needs, to continue the flow of essential imports from the United States. The report, however, adds that off-shore purchases would not by themselves solve the immediate foreign exchange problem, which is to restore Canada's surplus in its current operations with the rest of the world. In 1947 the current account surplus was small and it would have disappeared altogether in 1948 had not special remedial action been taken. If, therefore, Canada's inadequate reserves are to be fortified, more will have to be achieved than to get convertible exchange for the whole of the Dominion's exports at their current rate.

Finally, the Control Board's report points out that there are very definite limitations to Canada's ability to extend credit to other countries. It emphasises that if Canadian lending is not to involve further drafts on the gold and US dollar reserves it must be covered by a current account surplus of equal size. The report, which is signed by Mr Graham Towers, governor of the Bank of Canada, will undoubtedly further the general understanding of Canada's peculiar and difficult exchange problem; but it leaves some questions unanswered—in particular, why effective remedial measures were delayed until the reserves had fallen to so low a level as to leave little or no room for manoeuvre.

ICI's New Capital Requirements

Among a number of leading companies, Imperial Chemical Industries is apparently approaching the point where it will no longer be able to cover the entire cost of new capital development from internal resources. Despite the considerable "ploughing back" of profits and EPT refunds in the past two years this is not surprising; ways and means of raising additional finance are under consideration by the board. In 1947 the group made gross additions of £13½ million to its fixed assets compared with a little over £4,000,000 a year earlier, and at the end of last year had outstanding capital commitments of some £16½ million, a figure which is a good deal below the total planned outlay. In addition to these fixed capital projects, working capital represents an equally urgent and complementary claim for finance. The extent to which rising prices and increasing turnover have absorbed working capital is reflected in the expansion—by nearly £11 million to £42,878,706—of stocks of raw materials, stores and finished goods. The total absorption of cash in 1947 for additions to fixed and working capital was over £20 million and although cash and near cash items for the group at December 31st last still exceeded £10 million, the total was over £12 million lower than a year earlier. Meanwhile, the group's turnover has risen from £118 million to £137 million.

The inevitable question of the effect of the Government's policy of capital cuts on ICI's expansion programme is effectively answered by Lord McGowan in his statement which accompanies the accounts. While Lord McGowan admits the need for this policy "under present conditions," he rightly sees a danger in delaying the translation on a full industrial scale of the technical discoveries and fruits of research of the group. Lord McGowan cites several examples from the group's achievements in 1947 as well as projects mooted for the future. For instance, a cheapen-

ing of standardised sizes of industrial explosives is expected to result from the modernisation of the plant at Ardcer; production of the new insecticide "Gammexane" which is in keen export demand was started in February, 1947, and good progress is reported in the construction of the Wilton plants. And among the group's discoveries for which development plans are laid is the wool-like fibre "Ardil," although so far the erection of full-scale plant to manufacture it has been held up. A new dye stuff "Alician Blue" has been produced and much is expected from it in the textile printing industry, while in the field of new synthetic fibres the early promise of the polyester "Terylene" has been confirmed. The exploitation of these and other products will be pressed forward as circumstances permit; but the delay occasioned by current restrictions has impeded the group to shift the emphasis of its research in directions which will involve the erection of plant only after a number of years.

"Marshall" Deficits, 1948-49

If the breadth of the statistical basis of the Marshall Plan were the measure of its chances of ample fulfilment, success would already be assured. That, at least, is the impression left by the latest evidence of the comprehensiveness and minuteness with which the Washington authorities, with the aid of the sixteen-nation organisations on this side of the Atlantic, are busily preparing the blueprints of statistics and forecasts. It is, perhaps, too cynical a response—but a little cynicism about governmental estimates, especially when presented in extreme detail, is surely excusable among those in Britain who have lately been setting the Economic Survey beside the National Income White Paper, issued only a few weeks later. Be that as it may, this latest Washington document is a testimony of great effort. In 150 pages of tables it sets forth and analyses estimates of the balances of payments of each of the Marshall countries and their dependencies for the first fifteen months of the Plan—the three months to end-June next and the ensuing twelve months, the US fiscal year 1948-49. Exports and imports under almost fifty commodity groups and debit and credit invisibles under some ten heads are set out separately for each country for each of the two periods, and are sub-classified throughout so as to show in each instance the division of trade between Marshall and non-Marshall trade areas, and, within the latter category, between the United States, other Western Hemisphere countries and countries outside that hemisphere.

The assumptions which underlie these estimates are not disclosed, but the fairly close alignment of the figures for the United Kingdom with the deficit assumed for the calendar year 1948 in the Economic Survey may afford a clue. The Survey figure of £250 million did not "include" Marshall aid, but was derived from a projection, for the full year, of the rate of importation planned for the first half on the assumption that such aid would be available eventually. According to these new ERP estimates, Britain's total deficit on current account is expected to be at an annual rate of £685 million in the current quarter and £267 million in the twelve months thereafter. As the accompanying table shows, the deficit for the twelve-month period is put at \$1,617 million with the Western Hemisphere (of which \$825 million with the United States) and \$67 million with the Marshall group of countries; with other countries there is expected to be a surplus of \$615 million. These estimates, which are dated March, 1948, show a reduction of \$333 million from the estimates made three months earlier of Britain's Western Hemisphere deficit for the same fifteen-month period. On the other hand, the estimate of the fifteen-month period surplus with the Western Hemisphere of the group described as "United Kingdom Dependencies" has been revised from \$310 million to \$99 million.

U.K. BALANCE OF PAYMENTS, 1948-49—E.R.P. ESTIMATES (\$ mn.)

	3	12	15
	Mths. to end-June 1948	Mths. to end-June 1949	Mths. to end-June 1949
Western Hemisphere	540	1617	2157
United States	196	825	1021
Other Countries	343	792	1135
Marshall Recipients	61	67	128
Rest of World	85	615	530
TOTAL	686	1069	1755

For the Marshall countries as a group, the deficit for the fifteen months is now put at \$9,166 million, of which \$8,308 million is with the Western Hemisphere (\$5,332 with the United States) and \$858 million with other non-Marshall countries. The previous estimate of the Western Hemisphere deficit (for the

same period) was \$246 million smaller; most of this deterioration is due to the large revision (by \$194 million) of the needs of the German bizon, now put at \$1,109 million. The estimate for France has been reduced from \$1,460 million to \$1,285 million, but that for the French dependencies, formerly \$163 million, is raised to \$248 million.

Of the Marshall countries, the only ones to show perceptible prospective surpluses with their co-participants considered as a group are Italy (\$222 million), the Netherlands (a surplus of \$183 million for the Dependencies comfortably covers the \$119 million deficit for Metropolitan Holland), the Saar (\$176 million), Sweden (\$165 million) and Norway (\$129 million). The largest deficit is the French, at \$271 million, reduced to \$203 million by the surplus for the French dependencies.

Bricks After Price Control

As the Minister of Works announced on Monday, the control of brick prices is to be removed on May 17th. The brick industry has had a special system of price control: maximum prices, minimum prices, and a schedule of haulage charges. All these are now to go. The system was devised during the war, when it seemed important to preserve for the postwar housing drive firms which might otherwise have been unable to survive. Prices were therefore fixed at different levels for each district, and were based largely on the costs of production of the existing works—costs which show extremely wide variations. The great majority of the 1,350 brickworks in the country are small. Seventy per cent of the firms, responsible for 35 per cent of the output, still dig their clay by hand and foot and operate only in the summer months. At the other end of the scale are the five firms which make Fletton bricks and produce one-third of the total national output of all bricks. These firms, using mechanised digging and continuous kilns, operate on the East Midland clay belt; their raw material is "Oxford" clay, which contains carbon, helps to burn itself, and thus saves fuel. With their vast output and low costs of production they already dominate the brick trade in southern and eastern England and the Midlands. A new brickfield on the clay belt in Wiltshire threatens existing firms in the West Country as well. For some years Government price control has been holding the ring. Now that it is to go, the smaller brickworks will be driven back on their two advantages: the quality and variety of their output, and proximity to their markets. To carry a brick a hundred miles doubles its cost.

What will happen to brick prices now? Firms which do not make Flettons intend to raise prices by four or five shillings a thousand. This is not strictly a consequence of the removal of control—which, indeed, has been put forward to enable the industry to sell at lower prices. In negotiations with the Ministry of Works early this year the trade gained the Ministry's agreement to an increase in prices to cover increased coal and labour costs. Then the White Paper on Incomes and Prices appeared,

and the increase was not put into effect; the Government has decided on the removal of price control instead.

Evidently, this decision has taken the brick trade by surprise. A year ago, with the building programme in full swing, free prices might have been more welcome. Today, many brick makers are uncomfortably disturbed by fears of competition and accumulating stocks. Production, which was 650 million bricks a month in 1938, was only 119 million in October, 1945; by October, 1947, spurred by encouragement from the Ministry of Works, output rose to 467 million. Since then the housing programme has been cut, production of bricks has been reduced, and many brickworks have had to turn away men; production in March was 397 million, and stocks had risen from 260 million in October, 1947, to 538 million. If the smaller producers raise their prices, as they now intend, it will be a demonstration of team spirit within the trade rather than of anything else. And it will leave the smaller brickmakers at a distinct disadvantage against competition from the mass producers, whose prices are as likely to fall as to rise.

Raw Materials from the Commonwealth

The importance to the United Kingdom of raw material supplies from the Commonwealth needs no emphasis. But in recent years it has been impossible to illustrate this dependence in statistical form. For that reason alone, the resumption by the Commonwealth Economic Committee—formerly the Imperial Economic Committee—of its informative commodity surveys is to be welcomed. The first two annual summaries published this week are *Industrial Fibres** covering cotton, wool, silk, flax, jute, hemp, mohair, coir and rayon, and *Plantation Crops** covering sugar, tea, coffee, cocoa, spices, tobacco and rubber. In each case statistics referring to production, trade and consumption are given for the years 1938 to 1946. Summarised extracts are published in this week's *Records and Statistics Supplement*.

For each commodity, the Committee has calculated the net Commonwealth import or export balance, which represents the surplus of imports into all Empire countries over exports from all Empire sources or the converse. In 1946, the Commonwealth had a net export balance of 205,000 tons of rubber, 178,000 tons of cocoa and 129 million lb. of tea. With sugar, coffee and tobacco, the Commonwealth—and particularly the United Kingdom—has to depend on foreign supplies to meet its requirements. Throughout the war years, the Commonwealth remained a large net importer of cotton, but in 1946 the import balances for rayon yarn, silk and flax were considerably smaller than in 1938. The Empire, however, continues to provide a net export surplus of wool, jute and hemp. Britain's requirements of wool, jute, hemp, rubber, spices, cocoa and tea were met almost entirely from Commonwealth sources in 1946, but large quantities of cotton, flax, tobacco and coffee still had to be purchased from foreign countries, most of them hard-currency countries.

* HMSO, 5s. each.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports appear in the Supplement: Imperial Chemical Industries; J. and P. Coats; Home and Colonial Stores; Whitbread & Co.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'r'), and those paying 3 per cent or less will be repaid at the latest date (marked 'l'). (n) Net yields are calculated after allowing for tax at 30% in the U.K. (ff) Net yield. * Assumed average life 15 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2 1/2 per cent free of income tax. Yield worked on 15 per cent basis. (h) Fifteen months to March 31, 1947 (yield basis 7-6 per cent). (i) To latest redemption date. † Free of tax.

Consent of His Majesty's Treasury has been obtained to this issue in compliance with the Order made under Section 1 of the Borrowing (Control and Guarantees) Act, 1949

Issue of £10,000,000 Government of the Commonwealth of Australia

3 per cent. Registered Stock, 1964-1966

at the rate of £100 per cent.

Interest payable 15th February and 15th August.
Six months' interest will be paid on 15th February, 1949.

The Government of the Commonwealth of Australia will comply with the requirements of the Colonial Stock Act, 1900, in order that Trustees may invest in the Stock subject to the provisions set forth in the Trustee Act, 1925.

OFFER OF CONVERSION TO HOLDERS OF

£2,902,116 VICTORIA 4% CONSOLIDATED INSCRIBED STOCK, 1940-1960.
£5,948,000 QUEENSLAND 4% INSCRIBED STOCK, 1940-1950.
£2,939,035 SOUTH AUSTRALIA 4% INSCRIBED STOCK, 1940-1960.
£2,798,000 TASMANIA 4% INSCRIBED STOCK, 1940-1950
£14,587,951

for which Stocks notice of repayment on 16th August, 1948 (15th August, 1948, falling on a Sunday), has been given.

COMMONWEALTH BANK OF AUSTRALIA is authorised by the Government of the Commonwealth of Australia to offer to holders of the above-mentioned Stocks, conversion of their holdings, in whole or in part, into an equal amount of Government of the Commonwealth of Australia 3 per cent. Registered Stock, 1964-1966, on the terms set forth in this Prospectus.

The aggregate amount of the above-mentioned Stocks outstanding is £14,587,951. This offer of conversion is limited to a total amount of £10,000,000 and the List will be closed when applications totalling that amount of Stock have been accepted. In any case the List will be closed not later than 28th May, 1948.

Principal of the new Loan will be repaid in London at par on the 15th February, 1966, the Government of the Commonwealth of Australia having the option to redeem the Stock at par, in whole or in part, on or after 15th February, 1964, on giving three months' notice by public advertisement.

The Loan, which has been approved by the Australian Loan Council, is authorised by Acts No. 25 of 1919, No. 5 of 1928, No. 4 of 1929 and No. 46 of 1944, of the Parliament of the Commonwealth of Australia, and is issued in accordance with a law passed by that Parliament by which the Commonwealth of Australia, as from 1st July, 1929, took over the debts of the various States. The direct liability of the Commonwealth to Stockholders and Bondholders in respect of the Loans so taken over was confirmed in the Financial Agreements (Commonwealth Liability) Act, which became law in March, 1932.

Holders of Victoria 4 per cent. Consolidated Inscrubed Stock, 1940-1960, and Queensland 4 per cent. Inscrubed Stock, 1940-1950, whose applications for conversion are received on or before 16th August, 1948, on interest payment of £1 10s. 0d. per cent. (less tax) representing four and a half months' interest at the rate of 4 per cent. per annum from 1st April, 1948.

Holders of South Australia 4 per cent. Inscrubed Stock, 1940-1960, and Tasmania 4 per cent. Inscrubed Stock, 1940-1950, whose applications for conversion are accepted, will receive interest payments as follows:—

(a) On 1st July, 1948, the usual six months' interest then due.
(b) On 16th August, 1948, 10s. per cent. (less tax), representing one and a half months' interest at the rate of 4 per cent. per annum from 1st July, 1948.

Six months' interest on the new Stock will be paid on 15th February, 1949. Applications for conversion must be lodged on the appropriate forms: in the case of Victoria 4 per cent. Consolidated Inscrubed Stock, 1940-1960, at WESTMINSTER BANK LIMITED, Stock Transfer Office, 41, Lothbury, London, E.C.2.; in the case of Queensland 4 per cent. Inscrubed Stock, 1940-1950, by post, at BANK OF ENGLAND, 18, Finsbury Circus, London, E.C.2.; and in the case of South Australia 4 per cent. Inscrubed Stock, 1940-1960, and Tasmania 4 per cent. Inscrubed Stock, 1940-1950, at COMMONWEALTH BANK OF AUSTRALIA, 8, Old Jewry, London, E.C.2. Forms for conversion have been posted to the Stockholders, or, in respect of joint accounts, to the Stockholder first named in such accounts.

Applications for conversion of Stock Certificates to Bearer must be accompanied by the relative Stock Certificates, and all unexpired Coupons, and must be lodged at the appropriate Banks named above; in the case of the BANK OF ENGLAND, at the Chief Accountant's Office, Threadneedle Street, London, E.C.2. Interest payable in respect of the period to the redemption date will be paid by warrant.

Any Victoria 4 per cent. Consolidated Inscrubed Stock, 1940-1960, and Queensland 4 per cent. Inscrubed Stock, 1940-1950, not converted, will be paid off at par on 16th August, 1948 (15th August, 1948, falling on a Sunday), together with an interest payment of £1 10s. 0d. per cent. (less tax), representing four and a half months' interest from 1st April, 1948.

Any South Australia 4 per cent. Inscrubed Stock, 1940-1960, and Tasmania 4 per cent. Inscrubed Stock, 1940-1950, not converted, will be paid off at par on 16th August, 1948 (15th August, 1948, falling on a Sunday), together with an interest payment of 10s. per cent. (less tax), representing one and a half months' interest from 1st July, 1948.

The books of all the above Stocks will be finally closed for transfers on the evening of 15th July, 1948. Instructions as to the disposal of redemption moneys must be lodged at the appropriate Banks on the prescribed forms, which will be forwarded in due course.

The Stock now offered will be registered and transferable in any amount by deed, at COMMONWEALTH BANK OF AUSTRALIA, 8, Old Jewry, London, E.C.2. Stamp duty on all transfers will be paid by the Government of the Commonwealth of Australia. Interest Warrants will be transmitted by post at the Stockholder's risk, and in the case of joint accounts, the warrants will be forwarded to the person first named in the account, unless instructions to the contrary be given.

Commonwealth of Australia Stocks issued and payable in London and the interest thereon, the property of persons not domiciled in Australia, are not, and will not be, subject to any taxes, duties or levies in Australia.

All Commonwealth Loans, all Loans issued by the several States and now taken over by the Commonwealth, and all Loans guaranteed by the Commonwealth, carry a Sinking Fund in accordance with the provisions of the National Debt Sinking Fund Act, 1923-1934, and the Financial Agreement Act.

In the case of all such Loans, the following contributions to the Sinking Fund must be made out of Commonwealth and State Revenues:—

(a) On the present Conversion Loan and all Loans existing on 30th June, 1927, including such Loans when converted into other Loans a minimum of 7s. 6d. Australian currency per £100 per annum;
(b) On any new Loan, 10s. Australian currency per £100 per annum.

In the case of Loans raised in the United Kingdom the contributions stated above are in respect of each £100 sterling.

The Sinking Fund moneys allocated by the National Debt Commission for use in London during the year ending 30th June, 1948, amount to £3,195,000 sterling.

COMMONWEALTH BANK OF AUSTRALIA is further authorised to offer for subscription in cash Government of the Commonwealth of Australia 3 per cent. Registered Stock, 1964-1966, to such amount as may be required to make up the above total of £10,000,000 in the event of conversion acceptances not reaching that total.

PRICE OF ISSUE £100 per cent.
Payable £10 0 0 per cent. on Application.
£20 0 0 " " " 15th June, 1948.
£70 0 0 " " " 15th August, 1948.
£100 0 0 per cent.

An interest payment of 3s. 4d. per £100 Stock will be made on 16th August, 1948.

Cash applications on the prescribed forms will be received at COMMONWEALTH BANK OF AUSTRALIA, 8, Old Jewry, London, E.C.2, and must be for even amounts of £100 of Stock and be accompanied by a deposit of £10 per cent. on the amount applied for.

In the event of partial allotment, the surplus from the amount paid as deposit will be returned to the applicant. In the case of default in the payment of any instalment at its due date the amount previously paid will be liable to forfeiture, and the relative allotment to cancellation.

Payment in full may be made on or after allotment, but no discount will be allowed.

Script Certificates to Bearer in respect of Cash Allotments will be issued in denominations of £1,000, £500 and £100, in exchange for Allotment Letters. These Certificates must be surrendered at the time the final instalment is paid, for exchange into Registered Stock Certificates, at COMMONWEALTH BANK OF AUSTRALIA, 8, Old Jewry, London, E.C.2. Interest Coupons for 3s. 4d. per £100 Stock, payable 16th August, 1948, will be attached to the Script Certificates.

The revenues of the Commonwealth of Australia alone are liable in respect of this Stock and the interest thereon, and the Consolidated Fund of the United Kingdom and the Commissioners of His Majesty's Treasury are not directly or indirectly liable or responsible for the payment of the Stock or of the interest thereon, or for any matter relating thereto.—40 and 41 Vict. cap. 59, sec. 19.

A commission of 5s. per £100 Stock will be paid to Bankers and Stock-brokers on allotments made in respect of conversion acceptances and cash applications bearing their stamp.

Prospectuses, with Statistical Statement relating to the Commonwealth of Australia, may be obtained from Commonwealth Bank of Australia, 8, Old Jewry, London, E.C.2.; Bank of England, Chief Accountant's Office, Threadneedle Street, London, E.C.2.; Westminster Bank Limited, Stock Transfer Office, 41, Lothbury, London, E.C.2.; from Messrs. R. Nisbitt & Co., 6, Threadneedle Street, London, E.C.2.; at the Offices of the Government of the Commonwealth of Australia, Australia House, Strand, London, W.C.2.; from the Agent-General for Victoria, Victoria House, Melbourne Place, Strand, London, W.C.2.; the Agent-General for Queensland, 409 and 410, Strand, London, W.C.2.; the Agent-General for South Australia, South Australia House, Oxford Street, London, W.1.; and the Agent-General for Tasmania, Golden Cross House, Charing Cross, London, W.C.2.

COMMONWEALTH BANK OF AUSTRALIA,
8, OLD JEWRY, LONDON, E.C.2.
The List for Cash Applications will open on Tuesday, 14th May, 1948, and will be closed at 3 p.m. on that date.
The List for Conversion Applications will be closed not later than 3 p.m. on Friday, 28th May, 1948.

THIS FORM MAY BE USED.
Application Sheet No. Allotment No.

APPLICATION FOR

Government of the Commonwealth of Australia

3 per cent. Registered Stock 1964-66

To: COMMONWEALTH BANK OF AUSTRALIA,
8, OLD JEWRY, LONDON, E.C.2.

I/We hereby apply for £..... (pounds)

(say.....) of Government of the Commonwealth of Australia 3 per cent. Registered Stock, 1964-1966, according to the Prospectus of 14th May, 1948, and undertake to pay £100 for every £100 of Stock, and to accept the same or any less amount that may be allotted to me/us, and to pay for the same in conformity with the terms of the said Prospectus.

I/We enclose the required deposit of £..... being £10 per cent. on the amount applied for.

I/We declare that I am not/none one of us is resident outside the Scheduled Territories within the meaning of the Exchange Control Act, 1947, and that I/we shall not be acquiring the Stock on behalf of or as the nominee(s) of any person(s) resident outside those Territories.

If this declaration cannot be made it should be deleted and a Form D (obtainable from a Banker or Stockbroker) completed as to Declaration 2A and the appended Certificate, should accompany this application.

Ordinary Signature.....
Full Name.....
(IN BLOCK LETTERS.) (State if Mr., Mrs., Miss or Title.)
Address.....

† The Scheduled Territories: The British Empire (except Canada and Newfoundland), British Mandated Territories of Cameroons, Nauru, New Guinea, South West Africa, Tanganyika, Togoland and Western Samoa, British Protectorates and Protected States, Burma, Iraq, Iceland and the Faroe Islands.

The definition of "nominee" is given in the Bank of England's Notice E.C. (Securities) 1.

N.B.—Applications must be for amounts of not less than £100 and in multiples of £100.

Cheques should be made payable to BEARER and should be crossed thus:

COMMONWEALTH BANK OF AUSTRALIA,
a/o Australian Loan (22).

SPILLERS LIMITED

INCREASE IN TRADING SUPPLIES

DIVIDEND MAINTAINED

FLOUR PRODUCTION AT HIGH LEVEL

PROFIT MARGIN FROZEN

MR ARTHUR WHITTAKER'S STATEMENT

The sixty-first annual ordinary general meeting of Spillers Limited will be held at the Abercorn Rooms, Great Eastern Hotel, London, E.C., on the 21st instant, and will be followed by the adjourned 60th annual ordinary general meeting.

The following is the statement of the chairman, Mr Arthur Whittaker, which has been circulated with the report and accounts as at January 31, 1947:—

This being the first annual general meeting of the company since I assumed the chairmanship, I should like to express to the stockholders my high appreciation of the importance of the office and the honour done me by my colleagues in electing me to it. You may be assured that I shall continue to use my best endeavours to further the interests of the company.

TRIBUTE TO SIR MALCOLM ROBERTSON

The occasion also enables me to pay tribute to the great services rendered to the company by my predecessor, Sir Malcolm Robertson. During his period of office the business of the company was consolidated and expanded in a manner which I think must have commended itself to the stockholders. Sir Malcolm carries with him our deep gratitude for his outstanding contribution to the success of the company and our best wishes for many happy years to come.

We welcome Mr H. B. Vernon, M.C., who was co-opted to the board during the year and a resolution asking you to confirm his appointment will be submitted at the meeting. Mr Wilfred Vernon became President of the National Association of British and Irish Millers in June, 1947, and thus received the highest honour which the industry can confer on any member. It was most gratifying to his colleagues, and I am sure equally so to the stockholders, that he should have been chosen to lead the industry in these critical times. Sir Norman Vernon is on the point of completing his second term as chairman of the Baltic Mercantile & Shipping Exchange, and we congratulate him upon the distinction of presiding over one of the great market organisations of this country.

The following are the salient features of the accounts now presented to you for the year ended January 31, 1947:—

The approximate nature of the figures and the reason thereof has been indicated in the directors' report. I am able to say, however, that provisional agreement has now been reached with the Ministry of Food in respect of the results of the controlled side of the undertaking up to August 31, 1946.

VALUE OF FIXED ASSETS

The reduction in the book value of the fixed assets is almost entirely attributable to

the provision for depreciation and obsolescence less such limited capital expenditure on essential replacements as it has been possible to carry out during the year. I must emphasise that the real value of the fixed operating assets is very substantially in excess of replacement and their effective life. Capital costs continue to rise, and the directors have maintained the provision for depreciation and obsolescence at the increased level referred to last year, and which they consider to be the minimum necessary under current conditions.

Stocks at January 31, 1947, showed a substantial reduction as against the previous year, which was accounted for by the carrying of smaller wheat stocks. The increase in debtors is mainly attributable to amounts owing by the Ministry of Food under the control arrangements. The net surplus of current assets over current liabilities and provisions amounted to £4,223,000 in the case of the parent company (an increase of £260,000, as compared with the previous year) and £5,814,000 for the group (an increase of £464,000 as compared with last year).

On the basis of book values (which reflect the conservative policy of writing down in the past), the total capital employed in the group is over £10,000,000. If account is taken of the real value of the fixed assets the capital employed is very much greater.

RESULT OF YEAR'S OPERATIONS

The trading surplus of the parent company shows a small reduction as compared with the previous year, which arises from a falling off in the profit of the animal foods section. The net available balance for the year of the parent company, including dividends from subsidiary companies and income from investments and after providing for depreciation, obsolescence and income tax, is £385,000. After providing for the dividends for the year as approved by the stockholders, it is proposed that £50,000 shall be appropriated to general reserve, leaving the amount to be carried forward at £277,000, as compared with the amount brought in of £267,000.

The trading surplus of the group after providing for depreciation and obsolescence is £996,000, as compared with £913,000 for the previous year. The increase is in part due to the inclusion of the results of a new subsidiary company for a portion of the period. After providing for income tax, the available balance is £493,000. Dividends and transfer to reserve absorb £391,000, and the consolidated balance carried forward is increased from £389,000 to £491,000.

Production of flour during the year ended January 31, 1948, has been maintained at a high level. Output of other commodities while maintained at about the same volume as in the previous year is still seriously hampered by shortage of raw materials and but for this could be considerably expanded.

The directors, although unable to estimate with any precision the results for the year ended January 31, 1948, feel justified, having regard to the general position of the company, in recommending to the stockholders a distribution at the same rate as for the previous year.

I think it important to state that under the control arrangements applying to the Milling Industry the profit margin on flour is frozen at the same average rate per unit of output as operated over a number of years before the war and furthermore that this applies only to output up to the prewar level, any output in excess thereof earning a much lower margin of profit. This is a matter of grave concern to us as it makes no allowance for the considerable fall in value of money which has occurred since 1939 and the necessity to make substantially greater provision for the increased cost of replacement of fixed assets. This apart, and while recognising that conditions may still necessitate control by Government of supplies of imported raw materials and prices of finished products, your directors would welcome some modification of the present basis of the financial arrangements designed to afford the maximum incentive to initiative and efficiency.

The Government's decision that capital investment should be further restricted has set back even more the date when we can make any substantial progress with the replacement of capacity destroyed during the war. While appreciating the general economic difficulties giving rise to this situation I cannot refrain from issuing an emphatic warning of the dangers of further delay in restoring adequate and efficient milling capacity in this country.

It is with great pleasure that I record the excellent services given by the management, staff and workpeople throughout the group and express our gratitude to them all.

LACRINOID PRODUCTS, LIMITED

IMPROVED TURNOVER

The eleventh annual general meeting of Lacinoid Products, Limited, was held, on the tenth instant, at 82, King William Street, London, E.C., Mr T. L. Horabin, M.P. (chairman of the company), presiding.

The following is an extract from the chairman's statement:—

The trading profit for the year amounted to £41,973, as compared with £45,613 for 1946. The turnover for the year 1947 was an improvement on that of the previous year, but the expenses showed an unavoidable increase, partly due to payment in full to our employees during the industrial shut-down at the beginning of the year. Provision for taxation has required £24,500, against £27,500 for 1946 and the amount of £9,300, against nil, has been written off the investment in the Canadian subsidiary company.

We have made considerable progress in extending our own mould and tool department; this work was substantially completed at the end of 1947 and the benefit of the increased facilities is already being felt.

EXPORT DEVELOPMENT

Reference was made last year to the difficulties in developing the export business, which we hoped to overcome through the medium of our Canadian subsidiary company. In the circular to shareholders of October 3, 1947, mention was made that it was inevitable that the subsidiary would suffer a loss in its first year because of the world shortage of dollars, whereby our overseas customers were unable to place orders in Canada. The directors are giving their constant attention to the steps to be taken to deal with the present conditions.

The purchase of Insulation Equipments, Limited, gives your company entry into a new market in the plastics industry, as that company is mainly engaged in the production of technical components for all types of industries and decorative products for the furnishing and building trades.

Your board look forward with confidence to the progress of your company and to the maintenance of its profits.

The report was adopted.

HAMBROS BANK LIMITED

DEMAND FOR STERLING CREDITS.

The thirty-sixth annual ordinary general meeting of Hambros Bank Limited will be held in London on the 27th instant.

The following is an extract from the statement by the chairman, Mr R. Olaf Hambro, circulated with the report and accounts for the year to March 31, 1948:

The year under review has been a difficult one from many aspects which concern our bank. The increasing difficulties of the exchange position as a result of shortages of both dollars and sterling in many countries, especially in the case of the Scandinavian countries with which we are so closely associated, has had some adverse effect on the deposits of the bank. On the other hand, the demand for sterling credits has shown a gratifying increase and despite the initial difficulty in securing in certain cases the necessary currency guarantees, we have been able to provide to an increasing extent the credit demands of our friends abroad, as evidenced by the addition of £4,000,000 to the amount of bills under acceptance which are steadily approaching the pre-war average figure for this important branch of our activities.

Turning to the home market, the fluctuations in the gilt edged market, which we have experienced during the past year as a result of the apparent disagreement of policy between the two Chancellors of the Exchequer, have contributed in no small measure to the general uneasiness of the present situation and has increased the difficulties of those whose business is inevitably affected by any severe fluctuations in the market for gilt edged securities.

ATTEMPT AT BUDGETARY EQUILIBRIUM

As a counter to this, however, there has been a definite improvement in many branches of industry during the year, and even though there is justifiable criticism of certain of the provisions the present Chancellor has seen fit to introduce into his programme for the current year, the fact remains that a serious attempt has been made to achieve budgetary equilibrium. Given a steady and increasing effort on the part of all members of the working population, there is no doubt that this country will meet and overcome its difficulties in achieving balance of payments, especially in view of the breathing space provided by our great and generous friends across the Atlantic.

With regard to the future, the E.R.P. encourages the belief that Europe, or at any rate that part covered by E.R.P., will now turn the corner and will be strengthened in their efforts to establish economic peace and well-being, which is the only sure guarantee against future wars. We particularly welcome the signs of returning prosperity in Italy, a country with which this bank has had old and pleasant financial relations, which we hope will be renewed in the future.

Turning more particularly to the balance sheet, the situation I have already referred to is the main reason for the reduction in our deposits and the increase in acceptances. It will be noted also by reference to our holdings of cash and bills that the bank continues to maintain a very liquid position and the investment in subsidiary companies remains the same. These companies have continued to achieve satisfactory results. The gross earnings of the bank have been in excess of the previous year, but the increase in the running expenses, a contribution to the staff pension fund, which was inaugurated this year, and the transfer to the contingency fund for reserve against gilt edged holdings have slightly decreased the net figures, which, however, amply cover the same rate of dividend on the increased capital and permit a further substantial transfer to the contingency fund.

THE UNION BANK OF SCOTLAND, LIMITED

POSITION OF GREAT LIQUIDITY

SIR A. STEVEN BILSLAND'S REVIEW

The annual meeting of shareholders of this Bank was held, on the 12th instant, Sir A. Steven Bilsland, Bt., M.C., D.L., Chairman of the Bank, in the chair.

The Chairman, in the course of his speech, said:—

The balance sheet presented showed a total of £81,582,000, which compared with £78,598,000 last year, an increase of £2,984,000. Deposits at £69,269,000 showed an increase of £2,769,000, but for a large part of the year under review their deposits had attained substantially higher figures than were shown at the date of the balance sheet. Notes in circulation at £6,456,000 were £220,000 lower.

On the assets side, cash, money at call and short notice, Treasury bills and Treasury deposit receipts amounted in all to £24,154,000, and this figure represented 32 per cent. of the Bank's liability in respect of deposits and notes in circulation. Their holding of Treasury bills had been increased by £445,000, but Treasury deposit receipts had been reduced by £1,500,000 to £5,000,000, the amount at which they stood two years ago. From these figures it would be appreciated that the Bank's position was one of great liquidity.

British Government securities at £38,242,000 were £869,000 higher than last year. These securities had well-spread maturity dates and a considerable proportion was of a short-dated nature. They were glad to report that the market values of the investments were, in the aggregate, substantially in excess of the amounts at which they appeared in the balance sheet.

Loans and advances at £13,512,000 showed a welcome increase of £2,833,000, and they were glad to have had further opportunities of financing trade and industry by granting facilities for business development.

Costs generally, but particularly in respect of administration, continued to rise, and a further burden had been laid upon them by the substantial increase in profits tax. These charges had been nearly offset by the revenue which accrued from the increased funds they had been in a position to employ, and in the result the profit for the year of £336,800, which was arrived at after providing for every known liability or contingency, was only £2,500 lower than that earned in the previous year.

SERIOUSNESS OF NATION'S POSITION

A fundamental fact in our national economy today was that we are far from paying our way in the world. Unfortunately, the simple but serious facts of the situation were not generally understood.

The end of the war had found us an impoverished nation, and without outside aid we would have been reduced to a starvation standard. We had negotiated the American Loan and, thanks to the generosity of the Government of Canada, we had obtained much needed help by way of financial credits to be drawn upon over a period with the object of assisting us to maintain our standard of living and full employment. At that time it was hoped that we should have sufficiently expanded our export trade to cover the costs of what we must import before the loans and credits were exhausted.

Unhappily, our hopes had been far from being realised. Partly on account of the steep rise in the prices of imported goods, partly as the result of our failure, for various causes, to reach our export targets, and partly by reason of the terms of the Convertibility Agreement, the loans had been largely consumed when we were still far from the path towards recovery. As a result, we had been thrown back on our rapidly dwindling reserves. The rate at which these resources had been drawn upon in recent months, representing a rate of not much short of £600,000,000 a year, gave cause for serious anxiety. Without further aid our position would soon be precarious.

The effect of Marshall Aid on the economy of European countries (which were formerly important British markets) would, it was hoped, stimulate international trade, although the unfortunate division of Europe—a large part of which was now enclosed behind the iron curtain—would hamper and reduce our trading activities in these areas.

CRITICISMS OF THE BUDGET

In opening the Budget on April 6th, Sir Stafford Cripps had set a precedent which should be followed in relating the financial returns and proposals of the Budget to the framework of economic policy. In providing for a large surplus this year and in some other respects the Chancellor had shown wisdom and courage. But three features of the Budget deserved the strongest criticism—the maintenance of a rate of expenditure far beyond what the country could afford, the failure to begin the reduction of food subsidies, and the imposition of the special contribution on investment incomes.

The attitude of those who condemned or criticised the making of profits was inimical to the interests of this country. Our progress depended on men of enterprise and ability being willing to take risks. When they succeeded their reward in profits was a measure of their service to the community.

The report was unanimously adopted and a dividend at the rate of 18 per cent. per annum declared.

THE LIVERPOOL AND LONDON AND GLOBE INSURANCE COMPANY, LIMITED

112TH ANNUAL REPORT

In a statement circulated with the 112th annual report of The Liverpool and London and Globe Insurance Company, Limited, the chairman, Mr P. R. England, underlined the valuable contribution British Insurance makes to Britain's economy through the earnings of its worldwide business. It was one of the country's most precious invisible exports today, making no demands on raw materials or shipping space.

Fire, Accident and Marine premiums in 1947, at £16,967,808, constituted a record for the company, and were £2,464,020 higher than in 1946.

Underwriting profit was £580,571.

General expenses represented 16.80 per cent. of premiums.

Life new business at £4,777,000 was over £700,000 higher, and provided a new record.

Fire premiums advanced to the company's highest yet—£6,728,026 (against £5,912,757).

Accident premiums at £8,927,558—another record—compared with £7,660,017 in 1946.

Marine premiums were higher at £1,312,224.

The directors recommend a final dividend of 13s. 6d., making 27s. per share, less tax, for 1947.

SCOTTISH UNION AND NATIONAL INSURANCE COMPANY

A YEAR OF CONTINUED EXPANSION

MR GEORGE F. HENDERSON'S SPEECH

Mr George F. Henderson, M.C., W.S., chairman, presiding at the 123rd annual general meeting of the shareholders of the Scottish Union and National Insurance Company, held at Edinburgh, on the 12th instant, said:—My Lords and Gentlemen, The annual accounts for the past year have been in your possession for some days and with your permission I will take them as read.

The year has been one of continued expansion. All departments have contributed to the general increase in premium income as have our branches and agencies throughout the world. Our total premium income for 1947 was nearly £5,500,000, an increase of 25.47 per cent. over the previous year.

LIFE DEPARTMENT

In 1947 we issued 2,751 policies assuring just over £2,250,000 and 746 immediate or deferred annuities securing £72,816 per annum. The new sums assured showed an increase of over 25 per cent. over 1946 whilst the figure for annuities granted was 100 per cent. greater than in the preceding year. Both the new annual premiums secured and the total premium income constitute record figures for the company.

The considerable increase in our new business is in accordance with the general experience of insurance offices and reflects the inflationary conditions existing today. During the first three months of this year there was every indication that the rate of saving through life insurance would be more than maintained as compared with last year, but caution must be exercised in forecasting a continuance of this trend. It remains to be seen how far the urge to save is affected by the Chancellor's proposition of a special contribution from capital. Although comparatively few people are directly concerned in the payment of the special levy its imposition has an effect on a very wide circle. There is a fear in the minds of some people that the contributions may be repeated—possibly in a different guise—and its scope increased. Unless apprehension on this score can be relieved considerable harm may be caused by discouraging life insurance and other methods of saving.

EXTENSION OF ACTIVITIES

Towards the close of last year the directors decided to extend the company's activities by establishing a special department to undertake staff life assurance and pension schemes on a group basis. The results to date are most encouraging and we shall await the developments of this offshoot of our life organisation with confidence. There is a wide awareness today not only of the moral obligation to grant adequate pensions at retirement but of the practical needs for this course owing to competition for labour. Once the needs for pensions are acknowledged it is obviously desirable to establish a proper scheme under which pensions and life assurance are provided out of funds accumulated during the time of active employment of the employees to be provided for. We are building the new department on lines which I am sure will enable us to give to employers and employees alike an efficient service.

On the expenditure side of the revenue account there is an unavoidable increase in the figures for commission and expenses. The former is due to the increase in business written and the latter is also due in part to this cause. Principally, however, the expenses of management have increased owing to the advance in the cost of goods and services, including staff salaries. The need to restrict our expenses to the lowest figure commensurate with the efficient conduct of our business is kept constantly in mind.

FIRE DEPARTMENT

I am pleased to report that another new record has been achieved by this department. For the first time in the company's history, the annual fire premium income has exceeded £2,000,000. The increase in premiums last year even surpassed the very substantial improvement reported in 1946 and brought the total premium income for the year up to £2,295,937.

The claims experience has, however, been heavier than in the previous year. In the British Isles a large number of claims had to be met for damage caused through storm and burst pipes during the unusually severe weather at the beginning of the year. In addition, there was unfortunately a very marked increase in the total fire wastage in this country, and we have shared the general experience of all companies in the home field in meeting the heavy additional cost of these claims.

The general level of claims in North America still continues to run high. 1947 was a year of many catastrophes in the USA, the most outstanding being the Texas City disaster. It is, however, gratifying to report that, notwithstanding an increase in the volume of losses, our North American results show some improvement over those of the previous year, and compare favourably with other companies operating in that continent.

In the general overseas field the premium income showed an increase in almost every country where we do business and although the results were not as favourable as in 1946 the experience indicates that the selection of business and underwriting have been sound.

The year's trading surplus of this department was £203,399, but the substantial increase in premiums has necessitated the large additional provision of £190,163 being made to the unexpired risk reserve, which as you know is on a 50 per cent. basis, leaving a sum of £13,236 to be transferred to profit and loss account.

ACCIDENT DEPARTMENT

Premium income increased during the year to £707,563, an advance of £154,874 over 1946 and with the outstanding exception of motor business each section of this department produced a profit. Very much has been said and written upon the unprofitable experience of all companies in the motor department due mainly to the greatly increased cost of repairs and the heavy awards for personal injuries. Whilst steps have been taken to revise premium rates to conform with current conditions it is doubtful whether the proposed increases will be adequate to place the business upon a satisfactory footing from an underwriting point of view. As in the fire department we provide 50 per cent. of premiums for unexpired risk reserve and although there was a trad-

ing surplus for the year of over £68,000 the increase in the premium reserve combined with the adverse experience in the motor section necessitated a transfer of £7,101 from the profit and loss account

MARINE DEPARTMENT

Premiums in this department increased by some £276,000 compared with the previous year and indicate continued progress. This increase is due to a variety of causes, chief of which are high values of ships and cargoes, expansion of our export trade, release of tonnage from requisition and a steady flow of ships from the shipyards. Claims and expenses were heavier, the increase in the latter being mainly due to salary increases. The fund at the end of the year was £1,269,926 equivalent to approximately 120 per cent. of the premium income for the year.

INVESTMENTS

In 1947 a general upward movement in interest rates occurred throughout the world. Although less marked elsewhere than in Britain, where the most artificial position had been created, the change is welcome and healthy in conditions when every incentive to save and add to productive capacity is necessary. Market values of our investments have therefore declined, but there is still a large appreciation over book values.

It has been a difficult year for investing. The dangerous position to which Britain's international trade had come gave cause for greater alarm than was apparent amongst the general public. Had it not been for the generous aid from the United States our people would now be facing a painful and protracted reduction in the standard of living. Even with the "Marshall Aid" we have little prospect of keeping the present standard unless we do more to help ourselves.

Whilst the turn in interest rates will ultimately produce better earnings, the restraint now imposed in Britain on distribution of ordinary dividends and the heavy Profits Tax weight the scales against the general investor and are bound to discourage enterprise and the acceptance of normal trading risks.

OVERSEAS VISITS

During the past year a visit was made to the headquarters of our business at Hartford in the United States of America by Mr. Mounsey and Mr. Blair, two members of our board, along with the general manager. Mr. Mounsey afterwards proceeded to San Francisco where a re-organisation of our business on the Pacific Coast has recently been carried out and is already producing good results. Before returning home, Mr. Mounsey also visited our branches and representatives in Canada and brought back much useful information. After leaving Hartford, Mr. Blair, in company with Mr. Cotton representing our associated company, the Maritime Insurance Co., visited South America, visiting our agents and representatives in that continent and making many useful contacts. Later in the year our general manager, Mr. Stevens, accompanied by our London manager, Mr. Johnson, visited our branches and agents in South Africa and Australia. They also looked in on our branch in Bombay and saw our agents in Colombo. From all these visits very useful and interesting reports by Mr. Stevens have been received.

I regard these meetings with our overseas representatives as most important. They enable us at headquarters to understand and appreciate better the many problems which have to be solved in the ordinary course of business and the general development and extension of our business overseas.

TRIBUTE TO EXECUTIVE AND STAFF

The year has been a difficult and trying one in many respects and we owe a great

deal to the loyal and devoted services rendered by our executive and staff both at home and abroad. I wish to take this opportunity of thanking them for their good work and to assure them of our appreciation of their loyal and devoted service. In this connection I wish specially to mention the services of our assistant general manager, Mr James Henderson, during the necessarily prolonged absence of Mr Stevens when in the United States, South Africa and Australia. Mr Henderson never spared himself and carried his additional burden with unflinching courtesy and good humour.

Finally I wish to express our very sincere thanks to all our local directors both at home and abroad and last, but not least, to the directors, officers and staff of the Maritime Insurance Company for their successful work during the past year.

The report and accounts were approved.

ROYAL INSURANCE COMPANY, LIMITED

102ND ANNUAL REPORT

INSURANCE AS "INVISIBLE EXPORT"

In a statement circulated with the 102nd annual report of the Royal Insurance Company, Limited, the chairman, Mr P. R. England, said he was encouraged by the thought that the problems of this country and the world were much more in the open, and peoples knew what they had to face. At home, the domestic situation admitted no misunderstanding: the need, insistent and unrelenting, was for ever-increasing exports. He emphasised the tremendous value to the country of the invisible export represented by the company's overseas operations.

INSURANCE DOLLAR EARNINGS

The vital emphasis was on hard currency earnings, particularly dollars. Since 1940 the "Royal" and its associated companies had contributed remittances of no less than forty million dollars to Great Britain's economy.

In 1947, despite the difficult phase through which underwriting had been passing in the United States, a profit was shown there in all departments—fire, casualty and marine.

In the general foreign field, there were immense difficulties but the company had spared no effort to rebuild and develop its business in territories overseas, and in dollars, kroner, pesos, liras and other currencies, the fruits had been gathered in from all quarters of the earth.

Insurance profits overseas were net profits; no raw materials were required, no shipping space was absorbed.

CONFIDENCE

The company's vast overseas business reflected an act of faith on the part of tens of thousands of policyholders; faith in the foundations on which the business was built at home. It was impossible to exaggerate the importance of maintaining that confidence. Anything said or done to damage the credit or strength of British insurance at home was a blow against a vitally important invisible export. No greater disservice could be done to the British economy at this time. The Government had realistically left with the British market the insurances of food and commodities coming under their control, and the nationalised industries were equally understanding.

INFLATION

The 1947 accounts demonstrated not only the strength of the company but progress in all departments, with combined fire, accident

and marine premiums reaching a record high level. In normal times this would be welcomed as a reflection of economic progress. Insofar as it was still based on real development it was to be welcomed, but the substantial increase in premiums reflected also a world-wide inflationary pressure on money values. Inasmuch as this was symptomatic of deep-seated maladjustments in the world's economy, it was to be viewed with some concern as a sign of economic instability.

1947 RESULTS

The 1947 accounts of the "Royal" showed combined fire, accident and marine premiums at the record high level of £27,082,800, an increase of £5,242,000 over 1946.

Underwriting profits in 1947 amounted to £1,340,592, or 4.95 per cent., a modest ratio of profit but a satisfactory sum.

Expenses, apart from agency commission and overseas taxation, were 15.6 per cent. of the premiums.

Record new life sums assured, at £7,971,000, represented an advance of over £373,000.

In this country, the total annual amount saved through life assurance premiums was estimated to be over £120 million. There could be no more striking evidence of the outstanding value of life assurance to the country's economy at this time as an effective means of absorbing excess spending power.

Net interest in the profit and loss account amounted to £1,150,300—an increase of £93,800; profit on foreign exchange £115,450; profit on realisation of investments £137,590. After providing for the final dividend and other specified outgoings, a balance of £2,534,350 was carried forward, an increase of £762,500.

The directors recommend a final dividend of 3s. 9d. (less tax), making 7s. 6d. per £1 stock for the year, the same as for 1946.

AGRICULTURAL MORTGAGE CORPORATION, LIMITED

FURTHER EXPANSION OF BUSINESS

Speaking at the 19th annual general meeting in London, Mr. E. J. Bunbury, M.C., chairman, said: During the past financial year our business has continued to expand, and a further £2,115,162 of new loans have been completed, representing an increase of £369,138 or 21 per cent. over the aggregate of loans granted in the preceding year. In addition, loans totalling £712,390 approved by the directors are in course of completion, an increase of 38 per cent. over last year. Thus, loans completed and in course of completion show substantial increase in current demand for the corporation's credit. The average amount of loan granted this year is £3,948, more than double the average in 1939.

A large proportion of advances made this year has been utilised to repay existing mortgages at rates of interest higher than the 3½ per cent. charged by the corporation, and to pay for improvements to agricultural land. We have also been able to assist a considerable number of purchasers, many of whom were sitting tenants, to acquire their holdings.

In a year of uncertainty and crisis, agricultural holdings continued in great demand. Properties with vacant possession changed hands at high prices. This inflationary aspect requires careful watching to ensure that the proper agricultural basis of our credit is not affected by the "on-value" paid for vacant possession or residential amenities.

1947 will be remembered for the trials and difficulties which beset our farmers. It is a great tribute to the efficiency and ingenuity of our dairy farmers that notwithstanding those difficulties they are today producing some 200 million gallons more milk per year than prewar, though our total of dairy cows has increased by only 150,000.

NORWICH UNION INSURANCE SOCIETIES

RECORD NEW LIFE BUSINESS

The annual meetings of the Norwich Union Insurance Societies were held at Norwich on May 10th and 11th.

Speaking at the Life Society's meeting, the President, Sir Robert Bignold, said that directors and head office officials had paid visits during 1947 to overseas branches and agencies in New Zealand, India and South Africa, whilst the Society had commenced the transaction of Life business in Canada and Kenya.

With new business of more than £32,250,000, the Society had exceeded all past records; 96 per cent. of this total came from Britain and the Empire. The net rate of interest was £3 14s. 10d. per cent., an increase of 2s. 5d. per cent.

The total funds amounted to £67,548,633, including nearly £19,000,000 of mortgages, which had increased by £5,300,000, due mainly to house purchase loans. The Society had also continued its policy of buying first-class properties in this country, and our investments under this heading show a very satisfactory return.

The year 1947 has been very difficult for all who have to deal with the investment of funds. There has been a serious fall in the value of Stock Exchange securities, which was not unexpected by us, as we felt the keeping down of interest rates by artificial means could not last indefinitely. While the depreciation has been considerable, I am able to tell you that the margin between the market value and balance-sheet value of Stock Exchange investments is still very large.

FIRE AND MARINE

Sir Robert Bignold also presided at the Fire Society's annual meeting, and, commenting on the disappointing fire and accident accounts, said that they had been called upon to settle claims on the much enhanced present-day replacement costs without a corresponding increase in premiums, an experience unfortunately common in the business of insurance at the present time. An underwriting loss of £53,913 in the fire account was due to unfavourable loss experience in Britain, Canada and the USA, whilst the loss of £12,107 in the accident account was almost entirely accounted for by adverse results from motor business. The Marine account showed good results and had contributed £150,000 to the credit of profit and loss. The fund at the end of the year represented 170 per cent. of the premium income.

Total premium income at £7,097,946 showed an increase of £992,632, whilst the total assets had increased by £625,745 to £10,184,422.

Our USA affairs, as you will have judged from my previous reference to the general experience in that country, are still causing us anxiety. We are not alone. I would like to assure you, however, that there is the closest contact and keenest possible interest displayed in our affairs in that country.

Canada shows an improvement over 1946. Loss ratios there continue on the high side, but we are reasonably confident that this improvement will continue. Last autumn, South Africa, where our interests are steadily developing, was visited by two of your directors. I am confident that these visits and the interchanges to which I have referred are of inestimable value to the Society in promoting welfare and good will.

South America is also included in our programme of inspections. We have increasingly important commitments in that vast continent and one of our head office officials is proceeding there shortly.

The reports were adopted.

JOHN SUMMERS AND SONS, LIMITED

PROFIT UP BY HALF-A-MILLION

MR RICHARD F. SUMMERS ON STEEL PRODUCTION

The annual general meeting of John Summers and Sons, Limited, will be held, on the 26th instant, at the Iron and Steel Institute, 4, Grosvenor Gardens, London, S.W.

The following is an extract from the statement by the chairman, Mr Richard F. Summers, which has been circulated with the report and accounts for the year ended December 31, 1947:—

Whilst the profit figure of £2,675,000 shows an increase over last year of approximately half-a-million pounds, the amount available for appropriation is only up by some £75,000, a striking example of the enormous burden that taxation now places upon industry. There can be no doubt that the very high rates of taxation to which both companies and individuals are today subjected are, in themselves, a major contributory factor to high prices; if this heavy drain could be substantially reduced a great step forward towards lower prices would be achieved, and it would act as a check to inflation.

From the directors' report you will see that the final dividend proposed on the ordinary stock, together with the interim dividend paid on December 1, 1947, gives a total dividend for the year of 8½ per cent.—the same as last year.

After giving the matter very careful consideration your directors decided to agree not to propose an increased dividend this year, as it was felt that any steps that could be taken to prevent inflation must in the long run be for the benefit of all concerned.

RESERVES AND DEPRECIATION

Reverting for a moment to the accounts, I would say that pursuing our usual practice in regard to reserves we have placed £205,000 to general reserve and £50,000 to contingencies reserve, and the balance at credit of the profit and loss account has been increased from £178,000 to £193,000. These figures taken together are some £2,000 greater than was actually ploughed back in 1946. The provision for depreciation has been increased from £240,000 to £270,000 to cover the additions to the strip mill plant during the year. In addition to this figure savings in taxation granted by initial allowances under the 1945 Finance Act have been charged as depreciation, making the total figure charged in the accounts £328,017.

Following the practice introduced last year, I am again giving figures showing the distribution of the group's income as follows:—

	£	%
Gross proceeds of sales and income from investments, etc.	15,839,643	100.0
Raw materials	4,162,103	26.3
Wages, salaries, fees, pensions, State and Workmen's Compensation Insurance	4,428,449	27.9
Maintenance materials, spares, miscellaneous supplies and expenses	2,011,085	12.7
Coal, fuel oil and electricity	2,361,677	14.9
Carriage	543,682	3.4
Taxation	1,236,175	7.8
Provision for depreciation	444,433	2.8
Transfers to reserve ..	277,906	1.8
Dividends—net	374,133	2.4
	15,839,643	100.0

Where these figures and percentages show substantial variations from the previous year it is in great measure due to the fact that our collieries passed to the National Coal Board on January 1, 1947. In passing, I should mention that while negotiations for the transfer price for the collieries is continuing, I am afraid that the final settlement is still some way off.

PRODUCTION

Many references have been appearing during the last few months to the high level of production which has been achieved by the steel trade. I wonder whether it is really sufficiently appreciated what a magnificent effort this represents. You will remember that the Government set a target for the trade for 1948 of 14,000,000 ingot tons, which at the time looked like being a formidable task, but so far this rate has been substantially exceeded, and we are hopeful that we shall be able to maintain production at a level which will achieve this target figure and finish the year with something in hand, even allowing for the usual holiday shut down in August.

In spite of this achievement, however, there is still a shortage of steel, and in some cases one has seen the suggestion that this is in some degree the fault of the steel industry. This, I think, is unjust, for there are shortages of everything today, and there are not many industries which in spite of innumerable difficulties and uncertainties have stepped up production so materially, and in such a short time after the cessation of hostilities.

RECORDS BROKEN

So far as this company is concerned, last year I was able to announce increased production and delivery figures. This year I am again in a position to tell you that all our previous records have been broken, and this in spite of the fuel crisis and the abnormal weather in the early part of the year. These difficulties cost us 25,000 tons of steel ingots, but owing to the improvements which we were able to make during the year in our steel melting practice, our total output of ingots was in fact far greater than in 1946. This fine achievement, coupled with the fact that we were fortunate in having very large stocks of semi-finished steel at the beginning of the year, enabled our rolling mills to break all their records, and the deliveries from our finishing departments to exceed those of the previous year's record figures by no less than 64,000 tons.

The new wide cold reversing mill, which I told you last year had just commenced production, made a valuable contribution to these highly satisfactory results, and it is gratifying to be able to tell you now that its performance has exceeded all our expectations. Further, during the year we were able to bring into operation various parts of the new annealing and finishing plant which have been in the course of installation, and which in their turn have produced benefits both in efficiency and production costs.

I am glad to say that the improvement which I have mentioned in our steel making practice continues, and we are hopeful that our make of ingots this year will be substantially in excess of last year, and that we shall exceed our share of the 14,000,000 ingot ton target. Whether or not we shall be able to exceed—or even equal—our record delivery figures, must depend to some extent on whether we receive any semi-finished steel from outside sources.

E. POLLARD AND COMPANY, LIMITED

DEMAND EXCEEDS MATERIALS AVAILABLE

The thirty-sixth annual general meeting of E. Pollard and Company, Limited, was held, on the 11th instant, in London.

Mr H. Edward Pollard, the chairman, in the course of his speech, said:—

The net profit for the year is £124,129, and after providing for redemption of debentures and for the estimated liability for taxation on the whole of the profits earned to date, there remains £63,440. Out of this an amount of £34,000 has been transferred to general reserve account, and after providing for the dividend paid on the preference shares and the proposed dividend of 7½ per cent. on the ordinary shares, there remains £6,453 which, with the balance brought forward from the previous year, gives an amount to be carried forward of £55,129.

BALANCE SHEET

The total assets amount to £1,262,366, and these are mainly represented by fixed assets £309,756 and current assets and shares in and debts due from subsidiary companies £913,713. The current liabilities and debenture stock total £385,287, leaving a surplus of assets over liabilities of £877,079. This is an excess, over the issued share capital, of £301,904.

The balance sheet shows, I think you will agree, a strong position. The year 1947 was another one of licences and permits and shortages of materials were persistent with the exception of plate glass, which became more easily obtainable towards the end of the year. This is a most important commodity for our shopfitting business and its supply allowed us to increase our output.

SHOP DISPLAY

In the shop factory we were very busy all the year on export trade, and I hope this will continue as it formed the major portion of our turnover in this section. Home trade was weak because of the difficulty of supplies of raw materials, but we were able to develop with the help of the manufacturers, a good substitute for velvet, which has been and still is almost unobtainable.

On the engineering side of our business we also had a good export turnover. Haskins' steel shutters were sent to all parts of the world and more than compensated for the small home trade. Until commercial building starts in real earnest we cannot expect much improvement in our shutter section, apart from export.

Hammmond and Champness lifts, on the other hand, had a very good year. Many large contracts were received for lifts for blocks of flats which included one notable installation of gearless lifts for a building in Piccadilly. This is probably the most modern fully automatic set of lifts in the country, and marks the successful end of a long period of experimental and designing work started in 1938.

The Morris Singer Company, our other subsidiary, was busy on several important contracts. The casting of the Roosevelt memorial by Sir William Reid Dick, K.C.V.O., R.A., and the castings of the three memorials in the Abbey cloisters to the Submarine, Commandos, and Airborne troops by Gilbert Ledward, R.A., were done at our Clapham foundry. This company also completed and fixed the large memorial window in Vienna for the 8th Army.

Generally, the demand for all our products was in excess of the raw materials available for their manufacture. We are told that building work may increase in 1948, and this should be a great help, but we are so dependent on licences and permits that it is almost impossible to forecast the future, except to say that it appears that we may look forward to some improvement.

The report was adopted.

COMMERCIAL UNION ASSURANCE COMPANY, LIMITED

FURTHER EXPANSION

The annual general meeting of the Commercial Union Assurance Company, Limited, will be held, on the 31st instant, in London.

The following is an extract from the statement by the chairman, Mr John F. G. Gilliat, on the accounts for 1947:—

Fire Department.—The premium income at £13,170,669 showed an increase of £3,704,645 over that of 1946. The ratio of claims paid and outstanding was 48.25 per cent., commission absorbed 19.71 per cent. and expenses 20.10 per cent. After adjustment of the reserve for unexpired risks, £450,000 has been transferred to profit and loss account and the fire fund now amounts to £11,039,974 or 83.82 per cent. of the premium income.

At home the premium income has shown further expansion, but it has been accompanied by a sharp rise in the ratio of claim payments. Fire wastage in this country reached a new high level during 1947, and the severe weather experienced in the early part of the year accounted for many thousands of additional claims for damage to property.

The restoration and replacement of buildings and machinery after damage by fire are greatly handicapped by the shortage of labour and materials, with the result that the period of interruption of business is prolonged and the financial burden correspondingly increased. Appreciation of this situation has brought about a marked improvement in the demand for insurance against consequential loss following fire, and the importance of the protection afforded by policies of this kind cannot be over-stressed. We continue to draw the attention of policyholders to this form of cover.

In the United States our premium income was substantially increased, but losses from fire, explosion and tempest were extremely heavy and there was only a small margin of profit. In part the increase in these figures is due to the conversion this year of American currency into sterling at the new par rate of exchange.

In the Dominions, the Colonies and elsewhere overseas the results of our operations have been satisfactory. The expansion of our business in many areas has been particularly encouraging and due in no small measure to the activities and devotion to our interests of our representatives and local officials.

LIFE DEPARTMENT

During 1947, 11,973 new life assurance policies for sums assured of £12,306,990 set up a new high record in the company's history for the second year in succession. The life fund increased by £1,652,100 to £36,258,563, and at £2,824,391 the life assurance premium income was £279,178 in excess of the 1946 figure. 1947 being the last year of the quinquennium, a valuation of the assets and liabilities was undertaken. Assets exceeded liabilities by £2,434,031.

The directors have decided to distribute £2,041,581 of the surplus, of which £1,837,423 is the share of the policyholders.

This will provide a compound reversionary bonus of 32s. 6d. per cent. per annum for new series participating policies, and, in respect of policies under the old series (which was closed to new entrants on December 31st, 1939), a reversionary bonus corresponding to a minimum cash bonus of 26 per cent. of the premiums, all bonuses being calculated in respect of years' or part-time premiums due and paid during the five years ending December 31, 1947. Interim bonuses will continue to be paid in respect of death or maturity claims which occur before the next quinquennial valuation, but in view of the uncertain outlook the directors consider it prudent to pay such interim bonuses, until further notice, at a rate slightly lower than that of the bonus now allotted, viz., 30s. per cent. compound reversionary bonus for the new series and a minimum 24 per cent. cash bonus for the old series.

Marine Department.—Net premiums amounted to £1,855,614, an increase of £694,290. Claims paid and outstanding amounted to £918,447 and £450,000 has been transferred to profit and loss account. The marine fund now stands at £2,347,773 or 126.52 per cent. of the premium income. The expansion in premium income is due to the increased activity of our world-wide organisation, coupled with the delivery of new vessels and the substantial rise in shipping values. It has been a year in which underwriters have had to meet an increasing number of total losses, including one for £1,865,800 caused through the destruction by fire of the *Monarch of Bermuda* whilst at a shipbuilders' yard for reconversion—the largest single hull loss since that of the French liner *L'Atlantique*, also by fire, in 1933. This loss emphasises the importance of adequate fire patrols and fire-fighting equipment on this type of risk; and it is to be hoped that complete precautionary measures may be the means of preventing such serious losses in the future. The services of the Institute of London Underwriters in keeping under constant review the many problems that arise, as well as the co-operation of Company and Lloyd's Underwriters on many committees, give us cause for satisfaction.

ACCIDENT DEPARTMENT

Premium income amounted to £14,545,200, an increase of £3,411,438. The ratio of claims paid and outstanding was 58.25 per cent.; commission accounted for 16.47 per cent. and expenses 18 per cent. The revenue surplus was £1,106,769. The large increase in income necessitated additional provision for unexpired risks amounting to £1,036,659 and with this adjustment there remained an underwriting profit of £70,110 or 0.48 per cent. of the premium income. The accident fund now amounts to £9,405,947, which is

54.67 per cent. of the premium income. This department is passing through very difficult times by reason of abnormal conditions and increased costs. The crime wave has not abated and losses by burglary and shop-breaking have again been heavy. Third party claims for compensation for personal injury and damage to property are still higher as is the cost of repairing damage to insured motor vehicles. The effect of these conditions and the hazards of travel has been to increase the demand for insurance, but it takes time to adjust premium rates to the higher claims cost, consequently our accident account for 1947 shows only a slight improvement on that for 1946, in which we had to report an underwriting loss.

In the United States results were not profitable, due to much the same conditions as those facing us in this country. Over the years our Casualty business in America has been successful and we are taking all possible steps to improve upon last year's results.

The transfer to the appropriation account is £780,638, which, after writing £25,000 off freehold premises, leaves sufficient to provide the interim dividend of 3s. per £1 stock paid in November last and the final dividend of 4s. 6d. per £1 stock recommended by the directors and an increase of £25,513 in the amount carried forward at £603,317.

THE LICENSES AND GENERAL INSURANCE COMPANY, LIMITED

YEAR OF EXPANSION

The fifty-eighth ordinary general meeting of the Licenses and General Insurance Co., Limited, was held in London on the 12th instant.

Mr Ronald Gilbey (the vice-chairman), who presided in the absence of the chairman, Mr Stanley Christopherson, through illness, made the following points:—

My first mention would be to point out the growth of the funds in a further increase this year of £363,049 to a total of £2,686,224. Likewise an upward movement of some importance is to be seen in the total premium income which has risen from £1,053,816 to £1,378,162 during the year under review.

Progress is also the keynote of the Life department, where the total funds come within measurable distance of the half million mark. A small profit emerges from the Personal Accident account.

The operation of "Social Insurance" will affect the future of our Employers' Liability business and bring about changes. 1947 figures are perfectly satisfactory. There is an increase of income, and this factor together with adjustment of the reserve for outstanding claims, requires the sum of £14,294 to be added to the fund, which will then amount to 143 per cent. of the written premiums. Thereafter the sum of £4,450 is transferred as a profit.

1947 has been a year of expansion, and the growth and general wellbeing of your company is a matter of real satisfaction. We see no reason to face the future with any other thought than the utmost confidence.

The report was adopted, and a final dividend of 22½ per cent., making 32½ per cent. for the year, was approved.

YOUNG qualified Secretary/Accountant required by Transatlantic Pictures Corporation, Ltd., for progressive position. Experience of film production industry desirable, but not essential. Applicants should apply in writing, giving particulars in the following order: age, education, married or single, qualification, experience and salary required, to Personnel Manager, c/o Granada Theatres, Ltd., 36, Golden Square, London, W.1.

PUBLICITY Manager required for important group of paint manufacturers. Administrative ability and experience, initiative and capacity to absorb and reflect in his work the policy and ambition of the company rather than technical advertising knowledge is required, although a publicity background is desirable. Details of education and experience to—Box 719.

INSURANCE ENGINEERS, LIMITED.—Mr. J. A. Miller, D.S.O., has been appointed Chairman and Mr. E. B. Ferguson, F.C.I., Deputy Chairman.

GOVERNMENT RETURNS

For the week ended May 8, 1948, total ordinary revenue was £89,178,000 against ordinary expenditure of £32,764,000 and issues to sinking funds £320,000. Thus, including sinking fund allocations of £774,000 the surplus accrued since April 1st is £120,787,729 against £160,836,049 for the corresponding period a year ago.

Every description of Banking Service undertaken.

UNIVERSITY OF OXFORD

LECTURER IN COLONIAL ECONOMICS

Applications are invited for the post of Lecturer in Colonial Economics in the University of Oxford. The appointment will begin on 1st October, 1948, and be tenable for three years in the first instance. Salary £540 to £900, according to age and experience, plus children's allowances and membership of the F.S.S.U.

Duties will be to lecture, to give instruction, and to undertake research in the University in Colonial Economics, and especially to assist in the training of Probationers for the Colonial Civil Service.

Applications, giving the names of three referees, must be submitted in quadruplicate before 30th June, 1948, to the Registrar, University Registry. Further particulars can be obtained from Professor S. H. Frankel, 91, Banbury Road, Oxford.

THE UNIVERSITY OF LIVERPOOL

Applications are invited for the post of Lecturer (Ungraded) in the Department of Civic Design, at a salary within the range £850-£1,050 per annum.

Applications, stating age, academic qualifications and experience, together with the names of three referees, should be received not later than 12th June, 1948, by the undersigned, from whom further particulars of the conditions of appointment may be obtained.

STANLEY DUMBELL, Registrar.

UNIVERSITY OF MELBOURNE

SENIOR LECTURER IN POLITICAL SCIENCE

Applications are invited for the position of SENIOR LECTURER IN POLITICAL SCIENCE.

Salary £650-£850 (Australian) per annum, plus £78 (Australian) per annum cost of living allowance, subject to superannuation contributions. Further particulars which give method of application may be obtained from the Secretary, Universities Bureau of the British Empire, 8 Park Street, London, W.1.

The closing date for the receipt of applications is 30th June, 1948.

DELIGHTFUL Country Holidays at BRYANSTON MUSIC SUMMER SCHOOL.—A Summer School for Music will be held at Bryanston, Blandford, Dorset, from 31st July-28th August this year. There will be lectures each morning and concerts every evening. Two general studies run through all four weeks—a survey of contemporary music (Stravinsky, Schonberg and School, Hindemith, Bartok) and another of English music from the sixteenth century to the present day. Morning full-time music students. Lecturers include Nadia Boulanger, Arthur Schnabel, Alan Bush, J. A. Westrup, Dyneley Hussey, Imogen Holst, and, it is hoped, either Paul Hindemith or Virgil Thomson. Choir under Orchestra under Edric Cundell and Walter Goehr for last two. Performances of COSI FAN TUTTE in Week 3. Programmes also include (Week 2), Purcell (Week 1). Artists include Myra Hess, Paul Baumgartner, Denis Matthews, Wyndham Lewis, E. Canetti, V. S. Pritchett. E. M. Forster will talk—one each week on literature and art. Prospectus from the Secretary, 17, Cavendish Square, London, W.1.

CAMBRIDGE Graduate, ex-officer, Economics degree, wishes visit U.S./Canada June-September. Invites assignments.—Box 726.

OXFORD Undergraduate, 25, ex-Staff Captain, requires interesting work during summer vacation.—Box 717.

BUSINESS man (36) of proved ability to organise and promote Export seeks appointment.—Box 713.

FOR sale, highest offer, unbound complete set of *The Economist*, July, 1932, to December, 1939, inclusive. Wanted, copies of *The Economist* dated 8/6/40, 20/6/43, 2/10/46.—Box 715.

WANTED.—Back numbers *Economist* "Records and Statistics" Supplement, 3rd January/10th April, 1948, inclusive.—Box 714.

OPPORTUNITY for swift promotion to higher executive status for men aged 20-30, holding University degree in Arts or Science. Industrial firm Manchester area. Give full particulars, academic record, subsequent experience, present salary and occupation.—Box 724.

Labour's Choice

MR HERBERT MORRISON has always been the longest-sighted of the leaders of the Labour Party. This week he has been striving at Scarborough to bring the Party Conference to a sense of realities. He has told the Party such hard truths as that their margin of votes is slender, that they will have the fight of their lives to win the General Election, that they must draw up their programme to please public opinion rather than to satisfy their own desires and that there is more need to make the existing schemes of nationalisation work well than to initiate new ones. To judge by reports from Scarborough, the Lord President had only moderate success with this line of argument. He was not booed, but the cheers were respectful rather than enthusiastic. Perhaps nothing else could be expected. Party conferences are peculiar occasions. The passport to membership is to be a loyal party worker. In such an atmosphere complacency is almost compulsory and any moderation of attachment to the sacred principles of the party is almost equivalent to treason. The delegates are very conscious that they are the party, and from this it is only a step to believing that they are the people who put it into power. It is difficult in such an atmosphere to remember that elections, like values, are determined at the margin and that an unbroken record of party loyalty, though it may make a man important at Scarborough, makes him utterly unimportant at the polls. It is the non-member, the disloyalist, the wavering sceptic, who puts parties into power or removes them from office. The people who really matter to the Labour Party were not represented at Scarborough—except perhaps by Mr Morrison.

Observers report that this is a dull conference. The first exhilaration of power has passed and the excitements of the election are still too far off. The truth is that the Labour Government, in an electoral sense, is not doing too badly and not doing too well either. It has lost no by-elections—but the figures of votes cast, as well as the public opinion polls, suggest that it has lost the essential margin. The Opposition is incoherent; but the Right has often won elections on incoherence. If there were an election this month, it would be touch and go which side would win. Everything therefore depends on which way the trend goes in the two years that probably lie ahead before the election. It is Mr Morrison's instinct to do as little as possible that is new or startling in those two years because he believes that the Labour Government has already done too much, rather than too little, for the taste of the crucial, marginal voter. And there can be little doubt that Mr Morrison's instinct is correct.

There have been some notable converts within the Labour Party of recent months to this view that an effort must be made to please, or at least not to frighten, the unattached middle-class voter who put Labour in in 1945. The country has even been treated to the strange spectacle of the organ of the Socialist intellectuals advocating such things as the restoration of incentives in industry, the removal of controls and the restoration to "the secondary industries" of "the greatest possible freedom"—all this in order to "regain the support of some at least of

the professional and technical classes which have been alienated since 1945." This is refreshing (if also, from its source, more than a little amusing). But it is not yet by any means the view of the Party. That this is so is shown most clearly by the elections to the Party Executive at Scarborough. Of the candidates elected (other than the trade union nominees), the first three in order of votes received were Mr Aneurin Bevan, Mr Dalton and Mr Shinwell. Mr Morrison fell from third place to fourth, and the moderate Mr Noel Baker lost his place to Mr Michael Foot, the Junius of the revolutionaries. These results do not give the impression that the Party is slowing from the gallop of its first three years to a sedate walk. They rather suggest that it has the bit between the teeth.

The crux of these differences of view lies in the blessed word nationalisation. It is not merely the simple issue of whether there shall be more or less of it—though that is indeed a matter for dispute, with Mr Morrison at the one extreme trying to limit the programme to steel, and wishing he could avoid even that, to Mr Mikardo at the other extreme, who recently told a second batch of industries that he'd got them on his list, or to Mr Dalton who characteristically suggested this week that nationalisation should be the fate of any industry that did not behave itself in the matter of dividend limitation. These are more or less mechanical issues. What is of much greater importance is the fact, which has now become painfully clear, that the Labour Party is very far from being of one mind about what the purpose of its nationalisation schemes should be.

The orthodox view of nationalisation—what can, in terms of present personalities, be called the Morrison-Cripps view—is that it is a means of securing a much more efficient, scientifically planned, productive organisation of industry. The justification for schemes of nationalisation, says the latest statement of this view, "is that they are essential for a planned and expanding economy which stimulates true initiative and enterprise." Socialist planning should give "an assurance that, while serving the needs of society, it gives a chance for initiative, scientific research and modern management techniques." These and similar arguments have been deployed for years on thousands of platforms and in thousands of books and pamphlets. They were the arguments with which the nationalisation Bills were commended to Parliament. They were quite certainly the arguments that secured for the Labour Party and its programme enough of the floating vote to put it into office.

In no case was this more true than of coal. A clear majority of the public was convinced, first, that there was an urgent need for a drastic reorganisation of the coal mines, secondly, that this would not happen under private ownership, and thirdly, that nationalisation opened up the way to greater efficiency. If the Coal Act had been submitted to a plebiscite, it would have been given a large majority, and for these reasons. And this is why the resignation of Sir Charles Reid from the National Coal Board is a political event of the first importance. As always when a long series of disagreements between a man and his colleagues finally reaches breaking point, the particular causes of the rupture are obscure and the outsider should hesitate to pronounce judgment upon them. But Sir Charles Reid has for three years been of great symbolic importance. The Reid Report, with its emphasis on the need for, and the possibility of, radical technical reorganisation, was a beacon of hope when it was published three years ago. "At last there is a real report on coal" were the opening words of *The Economist's* leader, and it is safe to say that the decisive element in the public support for the nationalisation of the mines rested on the belief that it was designed to implement the Reid Report. For coal, there existed (as there never has existed for the other nationalisation schemes) an authoritative programme which could be carried out with public ownership and could not be done without it.

Now Sir Charles Reid has resigned and once again the event

has a symbolism that is greater than its actual content warrants. The occasion of the break appears to have been matters of the Board's organisation. But it looks as if the real cause was the resistance of the union to the necessary measures of technical reorganisation—which everybody knew would be unpleasant—and the unwillingness of the Board to stick to its principles. This interpretation is certainly supported by the recent crop of clear indications that a very large and influential section of the Labour Party never accepted the "efficiency" view of the purposes of nationalisation. When Mr Shinwell, in his much-misunderstood speech of a fortnight ago, expressed dissatisfaction with the working of coal nationalisation, he did not mean that the campaign for greater efficiency had been too slow in getting off the mark; he meant almost the exact contrary, that the Board, in the pursuit of technical efficiency, had paid too little attention to the wishes of the miners. Since then, other voices have joined in. Mr Dalton has invited the cotton operatives to write their own ticket. Mr Horner has made it clear that the miners expect to get for themselves the greater part of any benefit that may accrue from the mechanisation of the mines. And on Wednesday Mr Will Lawther, the President of the Mineworkers Union, summed the whole matter up with admirable clarity.

We have a very sincere objection to people who are as far away from the pits as possible . . . telling us how they should be run. We tell you, not you tell us.

It would be difficult to exaggerate the importance of this issue. There are clearly two wholly different conceptions of the purpose for which industries are brought under public ownership, and both conceptions can be found within the Labour Party itself. The one conception of the purpose is that the nationalised industry shall better serve the interests of the nation—that is, that it shall produce more, at lower real cost. The other is that it shall better serve the interests of the men and women who work in it—which does not, in so many words, exclude higher production, but certainly involves more leisure and higher costs. In theory, the two conceptions are perhaps reconcilable, on the lines that it is only when the workers are content that real efficiency can be secured. But in practice they lead in opposite directions. The one school of thought would always give the unions everything they want, in the hope that social loyalty will make them do their duty. Nobody can say that, in the mines, this policy might not work in the end; but enough evidence has accumulated to show that the costs of mining coal by these methods would be—have already been—stupendous. The other school of Socialist thought would restore the proper connection between efforts and rewards, which, when all is said and done, is a simple matter of sequence in time—efforts first and rewards afterwards, as in Russia.

This confusion of purpose is not confined to the Labour Party. On the contrary, it runs all through contemporary British thought, and exactly the same conflict reproduces itself among the capitalists. On the one side there are those whose economic objective is a comfortable featherbed for all, whose only idea of economic policy is to concede to particular interests the right to protect themselves at the community's expense. On the other side there is the belief, which can be seen just as clearly in Socialist doctrine as in the theory of *laissez faire* liberalism, that the interests of the community transcend those of any of its parts.

The Labour Party will have to make its choice between these two doctrines. It can hardly, for much longer, ride both horses at once. Being a free agent, it can make its own choice. To judge by the voices at Scarborough, it will side with Mr Lawther rather than with Sir Charles Reid. That is its own affair. But it ought to be put upon notice that the two million crucial votes that placed it in office will certainly take the other side.

Whose War in Palestine?

THE guns are going in Palestine. Armies under at least six different flags are engaged there. Shells are falling in Jerusalem, where all efforts to preserve a truce or to set up a trusteeship have failed. The State of Israel, which was declared some hours before the British mandate finished, has been attacked and is attacking back. The news is reported to have thrown delegates at Lake Success into consternation. Their surprise is unfounded. All had had plenty of warning that there would be fighting. Their minutes over the last two months have been peppered with warnings that this was "inescapable" from the five Palestine Commissioners, from Mr Creech Jones, from Rabbi Silver, from Jamal Hussein and, most lately, from their own neutral Truce Commission on the spot. Surprise is legitimate only in regard to the one unknown factor, which is the intensity and quality of the campaign.

This is still a matter of conjecture. So far, the Arab States have moved in unexpected synchronisation. But the volume of their effort is hard to gauge. Outsiders have little more than their word for what they are doing, since communications with abroad have become scanty, and foreign correspondents on the spot are ill-placed for checking stories and little able to vouch for anything they do not actually see. But it is plain that the main incoming armies have so far used routes on which there is unlikely to be much opposition. All military critics will be confounded if the Arab Governments turn out to be ready to commit their small forces to large-scale operations.

If one communiqué or broadcast is checked off against another, the military position at the time of writing seems to be somewhat as shown on the map on this page. From it three conclusions can be drawn. The first is that the

only acknowledged Arab penetrations in depth are advances into what is, by partition standards, Arab territory. The second is that for a certainty the Syrian and Iraqi armies, and probably also the Egyptian army on the "fairly broad front" that it claims in one of its communiqués, have violated what is by partition standards Jewish territory, whereas the Transjordan and Lebanese forces do not seem to have done so. The Egyptians and Iraqis have also bombed Tel Aviv. The third is that, if partition standards apply, the Jews too are guilty of violating foreign territory. They have done so at Jaffa, at Acre (which has surrendered to them) and northward from there to the Lebanese border. They have in any case violated it by a commando raid on a strategic bridge in the Lebanon.

Outside Palestine the most striking event of the week is, without doubt, the inconsistency once again displayed by President Truman. When, within twenty minutes of the end of the mandate, he recognised the Jewish provisional government as the *de facto* authority of the new state, he added that this act in no way lessened his desire to obtain a truce. Can he not grasp the simple truth that the act negates the wish, since it proves to the Arabs that if they were to cease fighting against partition, they would find partition

foisted upon them by the back door? His act is likely to produce some major results. First, it makes war inevitable. Secondly, announced as it was without a word as to frontiers, it is likely to increase the land hunger of the Jews. Thirdly, following as it did upon his government's "withdrawal of support" for the partition plan and sponsorship of a month's discussion of its proposal for a "temporary trusteeship," it induces a world-wide belief in American opportunism and sharp practice. The only thing to be said for it is that, by getting

in before the Kremlin, Mr Truman may be able to pose as a better friend of the Jews than Mr Stalin or Mr Wallace, and even so, the experience of the Bronx election suggests that it will lose him as many votes as it wins him. Clumsy is the mildest adjective appropriate to Mr Truman's personal interventions in his government's Palestine policy.

The American recognition of Israel has thrown out of joint several of the events of the week at Lake Success. It fell like a bombshell among Assembly delegates who were, at the moment of impact, engaged on voting for a proposal, made jointly by the US and French Governments, to establish a special temporary trusteeship for Jerusalem. This project, which had been initiated by 46 votes to none, thereupon failed to secure acceptance by 15 votes to 20, with 19 abstentions. The Assembly therefore rises with but one futile act to its credit—the decision, again taken on the proposal of the United States, to send a powerless mediator to the scene of battle. What can he do that has not already been tried by the Security Council's Truce Commission? What can either do now that the Jews have proof, straight from the White House, that they have nothing to gain by showing a spirit of compromise?

*

The Security Council, upon which sole charge of the Palestine matter now devolves, is therefore left to face a series of charges and proposals. It is confronted with a Jewish demand to stop Egypt's "open aggression." The Egyptians have informed it that they have entered Palestine "in order to preserve security and order pending a just political settlement." If Arab troops commit aggression by crossing the line (which they have never accepted) into Jewish areas, do not Jewish troops equally commit aggression by crossing the line (which they *did* accept) into Arab territory? If the Egyptians have aggressed by crossing an international frontier, is not the Jewish commando raid upon the Lebanon also aggression? The American Government has proposed that the Council shall act under Article 39 of the Charter, declaring that a breach of the peace exists and calling upon the warring parties to cease fire within thirty-six hours. The appeal would, of course, be futile: even if the Jews were to comply with it, in the hopes of securing a raising of the American arms embargo as their reward, what have the Arabs to gain by doing so? What would the Americans propose to do then? In the Charter, Article 39 leads straight to Article 41, which is the article covering economic sanctions, and Article 42, covering the taking by the United Nations of "such action by air, sea or land as may be necessary." But the Council seems doomed to a fresh display of impotence before it reaches either of these further stages. For no action can be taken until facts are established, and the chances of establishing facts that would be interpreted alike by all delegations seem somewhat slender. The Americans have proposed that any future action be based on the answers to three questions: one, addressed to the Arab States, asking what they are doing in Palestine; another, addressed to the Palestinian Arabs, asking whether they have solicited help; a third, addressed to the Jewish authorities, asking whether their forces are operating outside the area proposed for the Jewish state. But these questions, which seem suitable enough to Americans and Russians who recognise the partition line, seem unsuitably phrased to Britons and Chinese, who have never yet done so, and who still say they regard "Arab areas" and "Jewish areas" simply as areas chiefly inhabited by one and the other community. If the meaning of the questions is open to doubt, how much more so will be the meaning of the answers?

Given this peculiar and uninviting set of circumstances, what ought British policy to be? The Government is confronted with two issues upon which decisions are called for. One is

whether it shall recognise the Jewish State or not; the other is whether it shall save its conscience by casting a vote in favour of a concerted effort to stop the fighting, even though nobody has yet offered to do anything, beyond casting votes, to bring about that result. On the first of these issues, that of recognition, the British Government's mind seems to be made up, and rightly so. It holds that a new state cannot be recognised unless it fulfils certain conditions. These are, at the minimum, that it shall have established frontiers, that it shall exert administrative control within those frontiers, and that it shall be able to undertake international obligations covering the area. The whole question of frontiers and sovereignty within Palestine today is in a state of flux. No legality flows from the Assembly's original partition resolution; this was conditional upon the acceptance by both parties of certain undertakings that are not being fulfilled. Further, the case against recognition has more to it than a purely legal basis. It has a foundation in equity. For what is the major issue that is at stake in Palestine? It is not whether Mr Ben Gurion's government is or is not the right one for Israel. It is not whether Israel should have this or that frontier. The major issue is whether or not Israel—that is, a sovereign Jewish state—should exist at all. To confer recognition now would be to decide that issue in favour of the Zionists and against the Arabs—in fact, to do what the British Government has, for a generation, consistently refused to do. If the British attitude has been right hitherto, there can be no recognition; if there is recognition, it is a stultification of everything that the Government has stuck to all through these weary months.

To the second question—whether Britain should support the American proposal to call on both sides to stop fighting—there is no such obvious answer. But it should surely be clear that an affirmative answer can only be given if two prior conditions are met: first, if it can be shown that the proposal is just; and secondly, if it appears to have a chance of working. As for the justice of the matter, a mere standstill could be just only by accident, and to agree to it on the basis of each side keeping whatever it happens to hold at the moment would be, once again, to settle the major issue in favour of the Zionists and against the Arabs. If the British Government is willing to do this, it could have said so many months ago and saved many British lives. And as for the effectiveness of a summons to cease fire, it obviously has none at all so long as it is backed by nothing more than the despatch of a mediator. There ought to be no voting for futile proposals of this type. On the other hand, it is impossible to vote against anything so virtuous as a proposal that killing should stop. Abstention is the only course remaining, but to abstain in silence is not enough. Such is the rueful lesson of last autumn's Assembly when the British Government, seemingly out of fear of Zionist allegations that it was "sabotaging partition," let too many impracticable plans roll by uncriticised. For the time being every British abstention should be accompanied by the comment that an affirmative vote can only be given to propositions which specify the terms upon which the fighting is to stop, and the means by which those terms will be enforced.

*

These conclusions are wholly negative. It would be useless to try to blink that fact. But what other course makes sense? The situation that has arisen in Palestine has long been foreseen. The British attitude has been very clearly stated many times: it is that this country is not prepared to enforce a solution on either party. It is always a mistake to modify, under the pressure of sudden emotion, a policy that has been coolly adopted beforehand. And why should there even be any sudden emotion in this country, since the only new fact is that it is now somebody other than the British Army that is being fired

upon? The Palestine problem remains exactly what it has been for at least a year. No agreed solution is possible. Mistakes in British policy have doubtless contributed to producing this *impasse*. But other villains are, first, Hitler for creating such a pressure of Jewish immigration as to add new ground for old Arab fears of being outnumbered; and secondly, the policy of the United States, for so encouraging the wilder ambitions of the Zionists that the least they will accept is immensely more than the most the Arabs will concede. There

Long-Term Economic Problems—II

The Supply of Savings

THE preceding article stated the thesis that a high rate of capital creation is the essential attribute of a progressive economy. Whether it be wholly given over to free private enterprise or wholly planned at the centre, an economy that wishes to increase its total production decade by decade at a more-than-average rate must so arrange matters that a more-than-average proportion of its present output takes the form of productive capital. In the past, there have been countries that have trod the capital way to higher production by borrowing from others richer than themselves. This was the way in which the United States, the British Dominions and several South American countries got their start; it may still be a method that is appropriate to, and possible for, other undeveloped countries; but it can hardly be held out as a hope for Britain. If borrowing is not possible, the only other source of capital creation is from the community's own savings.

It is now painfully obvious that the rate of saving, and of capital creation, in Great Britain in the inter-war decades was inadequate. Yet there cannot be any question that the lasting effect of public policy in the past ten years will prove to have been strongly to the disadvantage of saving. The immediate effect, it is true, has been more favourable. Private saving rose from 6.3 per cent of total private incomes (before tax) in 1938 to 7.7 per cent in 1947. But this is partly the effect of over-full employment and partly the effect of continued shortages of the things on which private persons, and particularly business firms, spend their incomes. When times become more normal, it is hardly possible to believe that either persons or companies will save as much of their incomes after paying the present crushing load of taxation as they did before the war. Moreover, so far as personal savings are concerned, there has been in the second war, to an even greater extent than in the first, a massive redistribution of income from the rich to the poor. In 1938 the average surtax payer had £3,120 left after paying tax, in 1946 only £1,980. Opinions will differ on the social justice of the changes that wartime taxation has wrought. But there cannot be two opinions about the effect that they have had on private savings, and the weekly figures of the National Savings Movement make it quite clear that the savings of the rich that have been lost have not been made good, on any permanent basis, by increased savings by the less well to do. It would, indeed, be ridiculous to expect anything of the sort. Moreover, on top of the actual effect of high taxation on the margin of income available for savings, an atmosphere progressively less favourable to thrift is being built up among the middle and upper classes, the effects of which are likely to be much greater than any produced lower down the income scale by the propaganda of the Savings Movement. The old Victorian belief that to draw on capital for current expenses was a shocking, a shameful, thing to do has largely vanished. It is common observation that many of the professional and other "prosperous" classes are drawing on their savings in order to continue such deeply rooted social habits as the education of their children in expensive boarding schools

being no present possibility of an agreed settlement, there are only two remaining courses that can be followed. The first is for some outside body—whether it be the United Nations, the Arab League, the United States or Soviet Russia—to occupy Palestine in considerable force for a long time. The other is to let the Jews and the Arabs fight it out. To say this is cold-blooded. But for those who will not face the first alternative to hold up their hands in horror at the second is merely pious hypocrisy.

and the maintenance of houses that cannot be staffed out of income. This new attitude of mind towards the virtues of thrift and the disgrace of improvidence is partly a natural reaction to the very drastic and sudden pruning of real net income that has occurred in the last ten years. Whether or not adjustments would be made in time, they cannot be made so quickly. But since the war ended, there can be no question that thrift has been put at an even lower discount by the Labour Government's fiscal measures, culminating in the Special Contribution of this year's Budget. Even if this particular impost is "once for all" (and few people believe that), leaders of the Labour Party have made it clear that they reserve their right to impose another sort of capital levy in due course. In these circumstances, there is very little inducement to anybody whose income or capital is above the exemption limit to perform any more saving than is strictly necessary for personal security.

It would be unrealistic to expect any very significant reversal of policy on these matters. The drastic taxation which virtually abolishes the large income was imposed by Conservative Chancellors of the Exchequer because of the fiscal needs of the State, and it cannot in any event be removed until those needs have abated. It will certainly not be possible to retrace more than one or two of the steps that were taken during the war, and if Labour remains in power, even those few steps will not be taken. The large net income has gone for good. If the nation needs to do more saving than it did in the inter-war years, it cannot expect to do it through the medium of personal incomes.

The second big channel of saving is through the undistributed profits of business. This flow of savings is a large one, and if it is taken in conjunction with the funds set aside by business for the depreciation of existing capital it is still larger. The gross savings of the community in 1938 (including depreciation) were £774 million, and of this total £620 million was under the control of business firms. Clearly, if these two flows—of depreciation funds and of undistributed profits—could be expanded, they might help to offset the decline in personal savings.

So far as depreciation is concerned, considerable improvements were made by the Income Tax Act of 1945. Generally speaking, the businessman who scraps his plant and replaces it is much more generously treated now than he used to be. What has not been made very much easier, on balance, is the accumulation of depreciation funds in advance of the physical act of replacement. What this means—or, more accurately, what it will mean when replacement once again becomes possible—is that the fiscal obstacles to a more rapid rate of replacement will have been reduced—which will be a considerable gain—but that there is not likely to be a larger flow of depreciation moneys available to finance capital creation outside the businesses that give rise to them.

The "ploughing back" of profits, on the other hand, has

been made more difficult. Not only have profits had to bear the full weight of the increase in the standard rate of income tax, but they have also suffered the imposition of the Profits Tax. Any profits that are put to reserve now pay taxation at the rate of 50½ per cent. It is true that business men are discouraged by the still heavier tax on dividends from distributing their profits. But even so, the real value of the profits that are now available for "ploughing back" is undoubtedly lower than it was before the war.

Even if the general level of taxation cannot be reduced, there is a strong case for reducing the rate of taxation on "ploughing back." The argument does not rest entirely on the merits of this particular form of saving—though those merits are considerable, since company reserves are, on balance, invested far more skilfully and productively than individual savings. The case rests on the fact that, of the various channels through which savings pass into capital creation, the "ploughing back" channel now bears much heavier taxation than any other. There is a general belief that because undistributed profits pay income tax at the "standard rate," they are paying only what all other forms of saving have to pay. But this is not so. The "standard rate" is a mere arithmetical convenience; no individual pays tax on his income at the standard rate save by the coincidence that his surtax liability exactly equals the effect of his personal and other allowances; and he has to have quite a large gross income for this coincidence to occur. The saving that is done *via* undistributed profits bears taxation at a rate that may be as much as two shillings in the pound heavier than the average saving that is done *via* individual incomes or life assurance companies. The case for removing this discrepancy is overwhelming. Indeed, a community that recognised a crying need for a higher rate of productive capital creation might well decide that the merits of "ploughing back" were great enough to justify a burden of taxation actually smaller than that borne by other forms of saving.

There is, of course, little hope of persuading the Labour Party to this way of thinking. But a Conservative Government might possibly be induced to move in this direction. But even so, it would be very optimistic to hope that the real value of the saving that is done by this route can be raised to much more than it was before the war, in the spacious days of four-and-sixpenny income tax. The utmost limits of permissible optimism would seem to be that, by sound policy, company savings could be increased so as just to offset the inevitable decline in personal savings, so that the total of non-governmental savings would be left unchanged.

If, then, the total of the community's savings is to be larger, in proportion to the national income, than it was before the war, the whole of the increase will have to be found from the only remaining source—that is, out of savings imposed by the Government through the medium of a budget surplus. This would not necessarily be undemocratic; but it would certainly be very distasteful and difficult. It is as well to bear the dimensions of the problem in mind. In 1938, gross capital creation, all of it financed by private saving, amounted to

14 per cent of gross national product. A possible target for the 1950s would be 20 per cent—which might indeed be considered to be moderate in view of the volume of arrears to be overtaken. If private savings can only with some optimism be put at the prewar figure, it follows that, to attain the moderate rate of 20 per cent, the State would have to impose forced savings amounting to 6 per cent of the gross national income. In 1947, 6 per cent of the national income would have amounted to £575 million. It does not follow that there would have to be a budget surplus of this amount, since this sum would presumably be spent on capital projects, either directly or by being lent to the Boards of nationalised industries. But it does mean that £575 million would have to be raised by taxation, over and above whatever has to be raised to pay for the current activities of the Government. The budgetary problem will have to be examined in a later article of this series. But it is clearly not making any very hazardous anticipation to say that the superimposition of any such burden upon a tax system that is already groaning is well nigh impossible.

*

At what point, then, does the argument arrive? On the one hand there is the manifest urgency of action to increase the rate of capital formation. The Left have been foremost in asserting this necessity, both in their attacks upon the unprogressive character of the British economy in the inter-war years and in the gigantic capital programmes that they have attached to their nationalisation projects. But it is very difficult indeed to see where the necessary savings to finance an enhanced rate of capital creation are to come from. Either horn of the dilemma is equally painful. For example, let us suppose that there is no increase in savings—indeed, that the decline which is the natural result of taxation aimed at profits and at large incomes is allowed to occur without any offset in budget surpluses. The result can only be that the fine dreams of catching up in the race for technological progress must be abandoned, that the housing programme will always compete with industrial development, that hope will have to be abandoned of getting British costs of production down to a competitive level without attacking the workers' standard of living, that the structure of the social services will break down and that Britain will never escape from the grim choice between siege conditions and dependence on other nations' charity.

Those are the consequences of starving capital. But suppose that we shrink from them in horror, what do we find on the other horn of the dilemma? We find an imperative need to increase the rate of saving and, as means of doing so, to face such unpleasant measures as the deliberate re-creation of the rich man, the sharp reduction of taxation on company profits or the imposition of taxes (which, since they could not fall on rich men or on profits, would have to fall on the ordinary man) on a scale even heavier than will in any case be necessary to meet the current expenditure of the Government. Never was there a clearer case for planning, in the sense of a deliberate decision of policy. And never was there a problem that the planners will find it harder to solve. Yet solved it must be if the days of ease and prosperity are ever to return.

NOTES OF THE WEEK

Diplomacy from the Housetops

It has escaped notice that Mr Stalin and Mr Wallace have not been talking about precisely the same things in their recent exchange of messages. From the long programme for Soviet-American negotiation, submitted by Mr Wallace on May 11th, the reply broadcast by Moscow Radio on Monday night omits a number of points, some of major and some of minor importance. Among the former is Mr Wallace's reference to "excessive use of the veto" in Uno and his suggestion that "each nation should state definitively and categorically that it has no design on the territorial integrity of any other nation." Among the latter is the proposal that "citizens, students and newspaper men" should move freely between and within the two countries. Obviously Mr Wallace is not yet the perfect partner and is still liable to lead into the weaker parts of Mr Stalin's hand.

The effect of his initiative on international relations has been negligible. The proposals he put forward did not form "a concrete programme for a peaceful settlement"—although the phrase is Mr Stalin's. It was a statement of objectives on which there has been general agreement for three years. It is, of course, useful to have new assurances that Mr Stalin wants a settlement, but it is difficult to decide whether they are more important than similar statements made to a news agency eighteen months ago.

Without for a moment casting doubt on the Russians' genuine desire for talks with the Americans, it is impossible to treat the Molotov and Stalin broadcasts as anything but political warfare in which Mr Wallace played a deliberate part. By this technique the way to "a century of peace" is made to seem easy for the millions of listeners and readers who are addressed over the heads of their statesmen. In using it the Russians have the advantage of addressing an audience which is free to hear and discuss everything they care to say. Mr Marshall and Mr Bevin enjoy no comparable advantage beyond the iron curtain. But it should be understood in Moscow that these demagogic methods are the negation of diplomacy, the object of which is to establish confidence and exchanges of view between Governments—which means in the first instance between the men representing them.

What confidence can Mr Marshall and Mr Bevin feel when, at any moment, their most carefully phrased hints and reminders may be shouted from the housetops with whatever interpretation it suits Mr Molotov to put on them? They have a right to expect that the Soviet Commissar for Foreign Affairs should show in his exchanges with them the same discretion that he shows in his dealings with Prague, Warsaw and Belgrade.

* * *

Mr Marshall on the Right Tack

Now that Mr Marshall is playing from strength—his predecessor never had comparable cards—he can afford to resume the initiative in relations with the Soviet Union along the two lines he has indicated. He can ask Mr Molotov to show his desire for conciliation by actions at the numerous council tables where representatives of East and West are still arguing about a dozen or more important issues. He can also clear the ground for strictly bilateral talks about such particular matters as the course of Soviet-American trade or about such general matters as the need for an up-to-date general definition of the purposes of Soviet policy. It would be a pity if he were deterred from such talks by taking seriously the peevishness of Mr Bevin and M. Bidault about the Bedell Smith exchanges with Mr Molotov. Indeed, he had reason to believe that Mr Bevin would approve the blend of firmness and good temper which was the American contribution to those exchanges.

Probably for the first time since the war Mr Molotov may feel the need for a little assistance of this kind. Things have been done in the West which he cannot undo without using force—the European Recovery Programme, the Brussels Pact, the decision to revive western Germany and the victory of the Right and Centre in Italy. The strategy of the Cominform, intended to wreck the Marshall Plan and to kill Socialism in Europe has failed. The men in the Kremlin—whether nervous or not—must be taking stock of the new situation in Europe, and considering whether the time has not come for a gradual change of tactics—if not of policy. Already Mr Stalin's assurance to Mr Wallace that the co-existence of different "economic systems and ideologies" is "not only possible but also doubtless necessary" is the exact

opposite of the policy laid down to the Cominform nine months ago by his younger colleague, Mr Zhdanov.

The questions and recriminations of the last ten days are now dying down. Before continental Europe falls back into the nervous and faint-hearted mood on which Communist propaganda played so skilfully, it is important to recall that American policy has recently been restated by Mr Marshall in masterly fashion. Addressing a rather impatient Foreign Affairs Committee of the House on May 5th, he said:

A fundamental task of the United Nations and of our foreign policy is to dispel the misconceptions of the Soviet leaders and to bring about a more realistic view of what is possible and what is impossible in the relationship of the Soviet Union and the world at large. In this way there can be restored to international society the equilibrium necessary to permit the United Nations to function as contemplated.

It may be that misconceptions are beginning to melt; certainly equilibrium is less remote than it was. It cannot be argued for a moment that there would have been any progress in either direction if Mr Marshall had not followed the policy he has since March, 1947. The risks he ran and the tension that resulted have been enormously exaggerated. He is now just beginning to get results, and there is no reason why that policy—as defined in the speech of May 5th—should not be vigorously continued, with full British support, without prejudice to any conversations and gestures which Mr Molotov may feel inclined to offer.

* * *

Progress of ERP

Mr Harriman's statement last Tuesday that the ERP countries are expected to submit to the Economic Co-operation Administration within a fortnight a specific recovery programme for the period ending on October 1st is an encouraging reminder of the steady progress made since the Organisation for European Economic Co-operation first met on April 23rd. Mr Harriman did not attempt to forecast the general nature of this programme, which can be guessed from previous discussions. Nor, when praising the enthusiasm with which the European nations are attacking their problems, did he draw attention to the excellent start the ECA had made in its task of helping them. The simple list of its activities to date is impressive. Its main members were swiftly appointed: it was announced this week that Mr Thomas Finletter, formerly chairman of the Air Policy Board, is to be its liaison officer in London. The advance guard lost little time in arriving in Paris; and Mr Harriman soon followed. A week ago Mr Hoffman announced the tentative allocation of \$1,186 million for the first three months of the Recovery Programme. Of this sum \$278 million is in the form of loans at a rate of interest not yet determined; and Britain gets \$400 million, of which \$100 million is as a loan.

The prospect is thus becoming clearer—a process aided by Sir Stafford Cripps's statement of May 6th on precisely what commitments Britain had undertaken by participating in ERP. Similarly the role of the International Monetary Fund as described by the Economic Secretary to the Treasury added a few more clarifying strokes—dollars are to be bought from the Fund only in exceptional circumstances for at least the first year that ERP is in operation. From the American side further important details have been added more recently. The attempt to uphold one of the Paris Report's original assumptions—that there would be an increase in trade between western and eastern Europe—is being maintained. Polish coal is being bought for Austria with ERP funds. And the purchase in eastern Europe of other goods which are scarce in the United States is foreshadowed. But these matters are not the immediate concern of the OEEC, which is adding the finishing touches to its programmes. When June 5th comes—the anniversary of the Harvard speech in which he made his offer of aid to Europe—Mr Marshall and his American colleagues will be able to celebrate a year of solid and remarkably swift achievement.

The Labour Expulsions

The Labour Party executive's decision to expel from the party Mr Alfred Edwards, MP for Middlesbrough, on the eve of the Party's annual conference will not strengthen its reputation in the

The Economist by Air

The Economist can now be sent by air to countries in the Western Hemisphere at the following annual rates of subscription:

United States and Canada
By Air Express to New York and thence by surface mail - \$24
By Air Express to New York and thence by Air Mail (not recommended for points east of Kansas City or Winnipeg) - \$27

Subscriptions for the above should be sent to:

R. S. Farley, 111 Broadway, New York 6

or to

British Publications Inc., 150 East 35th Street, New York 16

South America, West Indies, etc.

Azores - £6
Argentina, Bahamas, Bermuda, Bolivia, Brazil, Cayman Is., Chile, Colombia, Cuba, Falkland Is., Jamaica, Paraguay, Peru, Trinidad & Tobago, Turks & Caicos Is., Uruguay, Venezuela - £7

Subscriptions for the above should be sent to:

The Publisher,

The Economist, 22 Ryder Street, St. James's, London, S.W.1

eyes of the public. Mr Edwards had made himself a nuisance, in the official view, in recent weeks for criticising the proposed nationalisation of iron and steel. He has certainly not minced his words, which have described the Government's policy as "suicide" and "sheer madness." But, when due allowance has been made for the intemperance of a political individualist who enjoys making himself heard, what is the difference between Mr Edwards's public views on iron and steel nationalisation and the private views of a large section of the Cabinet? Mr Edwards approves of nationalisation if it means purchase by the Government of the shares of iron and steel companies. But he thoroughly denounces the suggestion that the industry should be run by the methods adopted for coal and other nationalised industries. As this week's leading article points out, the hierarchy of the Labour Party is divided along these lines—between those who want to go forward with nationalisation and those who want to hold back. How, then, can the Labour executive have been so hypocritical as to expel Mr Edwards for views which some of its own members are known to hold?

The probability is that Mr Edwards was expelled, not so much because of his views on iron and steel as because a head was wanted to placate the Party's left-wing supporters, who were disturbed by the expulsion of Mr Platts-Mills. It would never do, it appears, for the Labour Party to tolerate a right-wing critic and expel one from the left. If Mr Zilliacus has to follow Mr Platts-Mills into the wilderness, who will be the next victim from the right?

It is all rather ridiculous. And perhaps the sorriest part of the whole business is the quiet acceptance of the expulsions by the Labour Party Conference. A motion which would have enabled Mr Platts-Mills to address the conference was defeated. Mr Edwards's case was not even discussed. Labour rank and file, it appears, can suffer its critics no more gladly than can its leaders.

Sterling Devaluation

A report by the National Advisory Council—the organ of the United States Government in supreme charge of American international economic policy—citing the adjustment of currencies as one of the conditions that might be exacted by the United States for Marshall aid, appears to have created a belief, in London and elsewhere, that there is pressure from Washington for an early devaluation of the pound sterling. This appears to be far from the truth. The report did not name the currencies its authors had in mind and its actual effect is to remit the question to the International Monetary Fund. There is reason to believe that the Fund has examined the question of a devaluation of sterling and decided against it.

The belief that a fall in the exchange value of sterling would be helpful, and in any case is inevitable, is nevertheless widespread, particularly in America. It is fed very largely by the very low rates at which pound notes can be bought in New York. This wholly artificial rate, which is created solely by the prohibition on importing pound notes into Great Britain, is frequently—one might almost say usually—misconstrued as a measure of the value that would attach to sterling in a free market.

The real test of whether a devaluation would help matters is severely practical. Britain's overwhelming economic problem is to earn as many dollars as it needs to spend. Devaluation of sterling, in the present conditions of a seller's market, would not alter by a single cent the dollars that have to be spent to purchase food and raw materials on the world market. As for British exports, it does not yet seem to be the case that sales are restricted—save perhaps in one or two lines—by high prices. Generally speaking, the limit on exports is still set by the availability of the goods. It is certainly true that a devaluation by, say, 20 per cent could not be followed by an increase of 20 per cent in the volume of British exports. If this is so, a reduction in the dollar prices of British goods would merely result in a smaller earning of dollars. Since the adverse terms of trade are one of the most serious handicaps from which the country is suffering, it would obviously be foolish to make them still more adverse. Devaluation would thus in no way reduce the need for dollars and might reduce the number of dollars earned. Moreover, by putting up the sterling prices of imported foods and raw materials, devaluation would make it necessary either to raise wages or to increase the subsidies. In short, there is nothing to be said in its favour.

Some day, of course, the seller's market will give way to a buyer's market, and many of these arguments will be reversed. If, at that time, the world's biggest buyer lowers its bid, it may be able to affect the world market (i.e. dollar) price for the things it buys. And a reduction in the dollar prices of British exports might then be the means of selling more of them. When that

time comes, devaluation may be a means, as it would not be today, of reducing Britain's dollar requirements and increasing its dollar earnings. But this is speculation. For the present, two things are clear. The first is that the world is still very much more of a seller's than of a buyer's market and that nobody can tell when the change will come. The second is that nobody now can possibly know whether, when it does come, the pound sterling will prove to be overvalued or not.

Russian Grain and British Coal

Mr Bevin is now beginning to get a little of the coal for export with which he said last year he could wield such power in Europe. Only luck and American aid have averted another case of "too little and too late." During the first three months of this year—when Britain produced over 49 million tons—the two countries most politically vulnerable, Italy and Finland, have received 12,737 and 208 tons of coal respectively, although they are to receive under the latest trade agreements 400,000 and 500,000 tons respectively. France, another important victim of European coal shortage and consequent dollar difficulties, has imported in the same period only 69,890 tons, against over one million tons delivered in a similar period of 1938. Spain, on the other hand, is to receive 750,000 tons over the next 12 months.

Progress towards this year's target of eight million tons for export, promised by Mr Gaitskell, seems curiously slow and to receive none of the priority which is given by the Russians to their no less potent grain exports. A comparison in this respect is illuminating. The series of trade agreements concluded recently by the Russians seems now complete for the season 1947-48. They have promised grain supplies for delivery during the current season as follows:

	(In 1,000 Metric Tons)		
	Wheat and Rye	Coarse Grain Barley, Oats, Maize	Total Grain
<i>Western Europe:—</i>			
United Kingdom.....	...	750	750
Belgium.....	...	400	400
Sweden.....	65	...	65
Norway.....	170	20	190
Denmark.....	60	40	100
Total Western Europe..	295	1,210	1,505
<i>Eastern Europe:—</i>			
Czechoslovakia.....	400	200	600
Finland.....	170	85	255
Poland.....	260	40	300
Rumania.....	60	20	80
Bulgaria.....	5	20	25
Total Eastern Europe..	895	365	1,260
GRAND TOTAL.....	1,190	1,575	2,765

During the five pre-war years average Russian total grain exports were as follows:—Wheat and rye, 748,000 tons; coarse grain, etc., 407,000 tons; total, 1,155,000 tons.

Exports for Barter

Compared with these prewar figures, the commitments for 1947-48 are impressive, although the Soviet Union's territory and grain-growing area has been enlarged by the Baltic States, large parts of Eastern Poland, Bessarabia and Bukovina, and two-thirds of German East Prussia. It is generally agreed that Russia's cereal harvest from this area for 1947 amounted to at least three-quarters of the 1934-38 annual average, or from 65 to 73 million tons. Whereas the average annual export during 1934-38 amounted to about 1.2 per cent of total production, exports are now intended to take between 3.7 per cent and 4.2 per cent of the estimated harvest for 1947.

It is reasonable to suppose that this emphasis on exports has a political as well as a commercial reason behind it. It is therefore interesting to note that, in the East, Czechoslovakia will receive the largest share and in the West the lion's share goes to Britain. Poland, Rumania and Bulgaria have been hitherto partly dependent on Russian grain, although in the years before the war they, with Hungary and Yugoslavia, exported each year an average of two million tons of bread grain and 3.7 million tons of coarse grain to Western Europe. In short, to assist its *bloc* of neighbours, Russia is exporting more grain in spite of reduced production, whereas Britain appears to be making no comparable effort with its coal exports.

Franco's Poor Cards

Nothing has occurred during the last few months to invalidate the moral arguments for treating General Franco's regime as it is being treated by the British Government. Even in the recent lengthy correspondence in *The Times* few new points have emerged. What has in fact happened lately is that the strategic importance of Spain has become more sharply defined. In the struggle for power between East and West, Spain has seemed to assume a new military and economic importance. Expediency is putting pressure on men of principle. But would they be right to yield to it?

Seen from Spain, many recent events do not make sense. To take the latest, the new Anglo-Spanish Trade Agreement (discussed on p. 856) looks like one more proof of the perfidy of Albion. Why, say the Spaniards, should the British help us with fertilisers and coal through the tradesmen's entrance, when they will hardly speak to us at the front door? Again, why do the reputedly more logical French open their garden gate and come to market with us, when they will not have us to any parties, either at Lake Success, or the Royal Monceau Hotel in Paris, or round the Five-Power table at Brussels?

The result of the Italian elections has been both an inspiration and a disappointment to General Franco; an inspiration because it is reported to have given him the idea of staging elections in Spain, and a disappointment because he had hoped that, if Italy went Communist, Spain might take its place in ERP and in American strategy. The cynicism of this reasoning is quite enough to show why Spain is excluded from the international circle. Democracy is not just a matter of staging elections—no one believes that they could be free or secret in the Spain of today. And ERP, that "most unsordid act," springs from an essentially democratic ideal.

There remains the point of view of anti-Communist strategy, much exaggerated by the Spanish press. Geographically, of course, the Iberian peninsula has a certain significance, but in the realm of ideas it has none at all. However friendly the feelings of the West for the Spanish people, to include Franco Spain in its present state in either the Marshall Plan or the Brussels Pact would be to compromise them both seriously. This reasoning may disappoint those who think they prefer Falangists to Communists, but it has so far ruled in the councils of the Western governments. If these should be tempted to falter in their attitude, let them consider what would be Spain's position in an open East-West conflict. Franco is more firmly in power than at any time since his anti-Communist civil war; what chance, then, would there be of finding him in the Russian camp and against the West? The truth is that Franco's cards are still poor, and this is no time for the West to deal him a stronger hand.

The growing tendency to compromise the principles of Western Europe by purely strategic arguments is dangerous, and it is most marked in British and American discussion about Spain. As Mr Marshall said in his remarkable speech to the House Foreign Affairs Committee on May 5th:

The emphasis often placed solely on the military aspects of world affairs does a disservice to the cause of peace. The more that present differences are talked about and treated exclusively as a military problem, the more they become so.

A Matter of Facts

That there is no clear dividing line between facts and propaganda, or between truth and party politics, was clearly demonstrated in the Parliamentary debate on the Central Office of Information last week. While Ministers declare, for example, that "Something Done"—a handsome illustrated brochure issued by the Stationery Office—is a straightforward story of the work and achievements of the British people between 1945 and 1947, the Opposition consider it an unwarranted piece of party propaganda carried out at the taxpayer's expense. This cleavage of opinion was apparent right through the debate, although both sides subscribed to the necessity for having information services of some sort to help the ordinary citizen to disentangle himself from the web of orders and controls in which he is enmeshed.

Opposition speakers were pressing in the direction of the abolition of the COI. Some Labour speakers at the other extreme longed for the old Ministry of Information to return. It is clear that there can never be agreement on this subject, since whatever party is in opposition will always feel that the Government in power has too strong a propaganda instrument in its hand. On the whole, however, that instrument has been used with reasonable fairness. Self-criticism of the Government for its own failures one

could hardly expect to see: that would be straining the duty of self-immolation too far.

At present the Central Office of Information is spending at the rate of £4,134,000 a year (including £586,000 as appropriations in aid), of which about £2,400,000 is for publicity work at home. Its staff consists of 2,000 persons, of which some 400 are receiving over £700 a year. In addition there are in departments outside the COI about 330 press and public relations officers, whose salaries and activities aggregate about £2,200,000 a year. Home publicity is, therefore, now costing about £4,600,000 a year. This is a large sum, of which the best possible use may not yet have been made. At the end of the war there was a general exodus of able men to better-paid and more attractive jobs elsewhere, and many of these are today wanted back. But far more important than personnel or a tidy organisation at the centre is a clearly seen and clearly expressed objective on the part of the Government. The "Work Not Want Not" slogan is fortunately dead. "Who Killed the Inflation?" is much better. But something even better is still wanted.

General Election in South Africa

The first postwar general election in South Africa is to be held on Wednesday. Apart from the small Labour and Dominion parties and a few independents, the main struggle will be between General Smuts's United Party and Dr Malan's Nationalist Party. The present position in the House of Assembly of 153 members (three of whom are European representatives of the natives) is that the United Party holds 90 seats; the Nationalists, 48; Labour, 8; the Dominion Party, 3; and there is one independent.

Election propaganda on both sides has been poor. It reveals in both cases hesitation and confusion about South Africa's chief problem—what to do about the African, Indian and "coloured" (half-caste) peoples. The Nationalists' policy is *apartheid*, which means "separation," but is defined by them as the exclusion of natives from all political rights, the return of as many natives as possible to the Reserves, and the use of the Reserves thereafter as reservoirs of labour for mines, factories and farms.

The Government's policy rejects economic but not residential segregation. It proposes the creation of native townships for the 2,000,000 or so natives now permanently resident in urban areas, and the demolition of the existing "shanty towns." On the other hand, the Government seem to have no effective answer to the growing native demand for a greater share in local government, for the abolition of the pass laws, and for permission to own land. To refute Nationalist charges that their policy leads to equal rights for the natives, some United Party candidates have become faint-hearted even about the moderate proposals in their party's platform. Mr Hofmeyr himself, who is Deputy Prime Minister and the most active South African reformer on the natives' behalf, has for the period of the election disclaimed all intentions to give the natives fuller social, economic or political rights; he merely reiterates his faith in "Christian trusteeship," which is hard to define.

The exceptional feature about the pre-election campaigns is the lack of interest in Commonwealth or international issues. The Nationalists have barely mentioned their traditional demand for a republic outside the British Empire; and though both sides are strongly anti-Communist, neither has drawn any practical conclusions for policy from this emotion. Foreign policy is for the moment largely bi-partisan.

Any estimate of results must be provisional, but it seems probable that, while the Nationalists will gain seats, they will not come anywhere near a majority. The United Party will probably have a working majority on most important issues, and enable General Smuts to continue his wise rule over what is potentially one of the most unsettled Dominions in the Commonwealth.

Target-Work in Steel

It will obviously take more than the best efforts of Sir Ernest Gowers to expunge the word "target" from the official and political vocabulary; or even to define its meaning or relate it to that of such near-alternatives as "objective," "minimum," or "standard." At present the meaning can only be deduced, roughly and on more or less psychological grounds, from the context. A "target" of so many million tons of X may mean the amount which, on present form, one might get with luck; or

the amount which it is pleasant to dream about getting; or the amount which had better be got, or else—the amount which has been selected more or less at random because otherwise there would be a blank space in the plan—which, of course, would be intolerable. The most common meaning, perhaps, is “ten per cent more than is likely.” And it is this meaning which makes most sense when one considers last week’s decision to “raise the target” of steel production for the current year from the once impossible-seeming but now visibly attainable 14½ million tons to a round 15 million. (The proceeding seems more appropriate to the bar of a high-jump competition, but consistency in metaphor is no more reasonably to be expected in official language than diplomatic good manners in the Kremlin.)

This kind of target-work demonstrates, if demonstration were necessary, just how flimsy a paper structure is the national plan. Either the rest of that plan depended on an output of 14½ million tons of steel—in which case the “raising of the target” for steel should be the signal for a corresponding “raising of the target” for the steel-using industries—or it depended on the 15 million now called for, in which case the whole plan was obviously unsound and due for a new series of amputations. There is, of course (with apologies to the language purists) a third alternative; that there is so much play or looseness in the articulations of the plan that an extra half million tons of steel is neither here nor there—it can be absorbed in stocks or used to implement marginal schemes, thankfully but without calling for any proportionate readjustment. This is the most probable interpretation of the facts. But, in that case, why pretend that any particular significance attaches to the target figure? Perhaps the whole interrelated complex of targets, advancing, retreating, raised, lowered, enlarged, diminished, gyrating in a stately economic ballet, should most charitably be regarded not as a would-be rational device. It should rather be regarded as a form of sympathetic magic akin to the invocations of crap-shooters, or to the curious bodily contortions with which bowls addicts pursue, and attempt to influence, their woods on the way to the jack.

Pay at the Chairside

The report of the Spens Committee—the late departmental Committee on the Remuneration of General Dental Practitioners (Cmd. 7402)—follows a line roughly parallel to that of the corresponding Committee on the remuneration of general medical practitioners. It analyses the pre-war spread of net incomes at different ages, shelves the question of adjustment for ensuing increases in the cost of living, considers the prospects necessary in order to attract an adequate new entry to the profession, concludes that those now offered are not nearly enough, and recommends that “arrangements should be made to ensure that between 35 and 54 years of age 75 per cent of those practitioners should receive net annual incomes of over £850, 50 per cent of them should receive incomes of over £1,100, and 25 per cent incomes of over £1,400”—all, as it were, in pre-1939 pounds; with special provision for extra earnings by experienced senior partners, by part-time consultants, and by those supermen who can without detriment to their health or the quality of their work put in more than the 33 hours a week “at the chairside” regarded by the Committee as “full but not excessive employment.”

Such recommendations are, of course, only a first step towards the determination of actual scales of pay and of the earnings of individual members of the profession. They are, however, of considerable interest. They bear out further the widespread opinion that the current remuneration of the professional classes is far below that required in the long run to sustain the necessary flow of professional services. Secondly, they attempt to assess the comparative attractiveness of different professions—in this case the medical and dental—at least to the extent necessary to give a rough first approximation to the proper relation of their earnings; the greater arduousness and concentration, for instance, of the dentist’s work being balanced against his better prospects of genuine free time. In a more abstract sense they are interesting as an example of an attempt to short-circuit, not by the brutal methods of physical control and direction but by intelligent anticipation, the workings of supply and demand in the new circumstances brought about by the National Health Act. A decision based on the best evidence available now can start the whole system off on the right foot, just as a right decision, in the field of foreign currencies, on the official par of exchange, can reduce subsequent pressures and readjustments to a minimum. Trade union susceptibilities prevent the development of a national wage policy, but a national salary policy is visibly, if partially, in the making. This is really sensible planning.

The Colonial Service

Last week’s debate in the House of Lords on the Colonial Service provoked one of those expert discussions which are a chief justification of the upper House, however it be constituted. At the same time, like so many Lords debates it elicited no clear formulation of Government policy, not even any apparent line of cleavage between Government and Opposition. The purpose of Lord Tweedsmuir’s motion was to discover, first, whether in view of the enhanced importance of the colonies in world affairs, the colonial servant was being trained, in the middle as well as at the beginning of his service, to play his part; and, secondly, whether, in view of the inevitable shrinkage of the service as territories continue to pass from the colonial to the self-governing stage, adequate material inducements exist to attract the right men. The Government’s answer was that training was magnificent, the material inducements were constantly under review, and that all was for the best.

A more fruitful line of discussion was followed by Lord Harlech and Lord Rennell, who emphasised a problem that may well prove more urgent than the actual conditions within the service. The District Officer, and the administrative side of the Service as a whole, stand in real danger of losing authority to various high pressure representatives of special interests, governmental and private—for instance to the authorities of the East African ground nuts scheme. There is a possibility of endless friction unless a clear division of authority is established. At the same time, since all administration is everywhere becoming more bureaucratic, the District Officer is more and more tightly chained to his desk; and men of the type whom the Colonial Office needs for native administration do not take kindly to that kind of work, and will not remain in a service which lets it get the upper hand.

The problems of selection for entry and promotion in the Colonial Service are not easy. As Lord Listowel pointed out, it is only a generic name for the staffs of thirty-four separate governments, many of whose problems—for example in Bermuda, Aden and St. Helena—are not comparable. It will be greatly simplified by the disappearance of Palestine, and it is probable that, as the other fields of endeavour in India, Burma, Ceylon and so on close up, the quality of entrants for the Colonial Service will rise rather than fall. But it will do so on no mathematical computation, and only if the Colonial Service offers three things: first, a genuine decentralisation whereby the good man can leave his mark upon the territory which he administers; secondly, a scale of pay, pensions and family allowances which reflects the confidence which the Government is supposed to have in its Colonial Servants; and thirdly, a genuine *carrière ouverte aux talents* whereby the intelligent Colonial Servant is given a chance to train himself for the highest positions without being left in an up-country district for twenty years, and then being told that he lacks the necessary breadth and experience to be given a governorship.

South Korean Elections

The long-awaited general election in the American zone of Korea has now been held, and a high percentage of the registered voters went to the polls in spite of the efforts of the Communists to prevent the election being held. Conditions during the few days before the polling were quieter than might have been expected; the roll of recorded deaths did not exceed 93. American troops were held in readiness to reinforce the police in the event of open insurrection.

The Korean Communists’ objection to the elections was because they were being held before the withdrawal of foreign troops. Their demand, supported by Russia, was that both American and Russian troops should be first withdrawn from their respective zones. This, it is generally considered by those acquainted with the Korean situation, would enable the Communists, with the powerful army which has been trained and equipped in the Russian zone, to seize power in the south as well as in the north—where they already have it—and then rig nation-wide elections in the standard Communist manner. The Russians and the Korean Communists, therefore, refused to admit to the Russian zone the Uno Commission, sent out on a vote of the “Little Assembly” to arrange for free elections, as a preliminary to setting up in Korea a representative national government to which the occupying armies could hand over authority on their departure.

The Russian refusal to co-operate did not, however, deter the Americans from going ahead with preparations to hold elections in their zone and thus provide a basis for a government there. Recently a conference was held in the Russian zone, attended by Communist and pro-Communist delegates from the American

Why millions more
face starvation

In his 1947 FAO report to the United Nations, Sir John Boyd Orr warned the world that “during the coming year, many in Europe and Asia will die from the direct or indirect effects of food shortage.” Despite the fact that two-thirds of the people of the world are engaged in producing food, production methods of the majority of the world’s farmers today are substantially as they were hundreds of years ago. They have not kept pace with the mechanisation of industry. Trying to cultivate the land to maximum productivity with implements that trail behind animals or vehicles is like sending a boy to do a man’s work.

THE SOLUTION

With the Ferguson System of complete farm mechanisation, the world’s food balance can add up to plenty for all. By producing more food from every available acre at less cost, the otherwise inevitable starvation of millions can be prevented. Actually the Ferguson System can produce as much as ten times more food from some areas of land. By producing more food at less cost, the Ferguson System can also help to reduce the cost of living while raising the standard of living. It can help to cut the vicious circle of ever increasing prices and wages.

* Every week more than 1,000 Ferguson Tractors are produced by the Standard Motor Co. Ltd. Every week more than 5,000 Ferguson Implements are produced by the foremost British manufacturers. Every week more than 100,000 acres somewhere in the world are beginning to produce more food at less cost.

Inserted in the public interest by
Harry Ferguson Ltd., Coventry

amounts of money. Under these conditions, future traffic losses will tend to produce a vicious circle because, as a result of a relatively high proportion of fixed costs, which cannot be reduced in step with a reduction in traffic, their unit costs of rendering service will rise. This, in turn, may well result in a demand for still further rate increases—and these will divert still more traffic to the railroads' competitors. The ability to make capital improvements would be further curtailed. The rules changes demanded by the unions, many of a "make-work" or "make-pay" variety, would introduce additional elements of inflexibility at a time when the emphasis should be upon increasing flexibility and improving operating efficiency.

But even if every possible means of securing greater efficiency was adopted, many believe that the railroads of the country cannot be placed permanently on a paying basis. Government seizure has been freely used to solve their labour problems. At one time, government ownership was advocated to break the alleged transportation monopoly of the railroads. Now, it may be argued that government ownership is the only way to secure the efficient operation of the country's basic transportation system, which is essential to the transportation of its basic commodities and particularly important in time of war.

Housing Under Full Employment

[FROM OUR US EDITORIAL STAFF]

ON April 2nd the Taft-Ellender-Wagner Housing Bill was approved by the Senate, but the odds are that the Bill will founder in the House and thus conclude another skirmish in the battle of the housing Bills which began over three years ago. Since it was introduced in August, 1945, this particular bill has undergone changes both in content and title. It started as the Wagner-Ellender-Taft Bill, but today the name of its Republican, rather than its Democratic, sponsors takes precedence.

The TEW Bill was originally designed as a comprehensive approach to long-range housing problems. This approach has, however, been overshadowed by the general hysteria over the more immediate housing shortage, an hysteria which has been sustained at ever mounting fever pitch for an unusually long period of time. The Bill has, therefore, been espoused by many groups as a cure for present evils. But far from being the answer sought, many believe its provisions would be so ill-timed as to increase present difficulties. Even viewed in long-term perspective some critics question whether it reaches the real heart of the housing problem.

The long-run housing problem in the United States has many facets. Perhaps the most vital is the need to reduce the cost of housing to provide decent shelter for the lower middle income and lower income groups; another is the question of who will do the job—government or private enterprise. Successive studies by private agencies and those of the government in the last ten years have reached fair unanimity on the proposition that high costs are due chiefly to inefficient small-scale units in the building industry, to antiquated methods, obsolete local building codes, restrictionist practices by industry and labour, and poor utilisation of land. Financing charges, now far lower than they were 20 years ago, have been shown to play a less important part. And yet, with the exception of some relatively weak provisions to encourage technical research, the TEW Bill, like its predecessors, generally stresses the "insurance" (i.e., government contingent guarantee) of mortgages with increas-

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

ingly liberal financing terms such as smaller down payments, and longer periods of amortization.

Not only does this emphasis neglect the areas of real significance, it is argued, but such provisions tend to rob federal housing agencies of the one effective club they possess to persuade local authorities, builders, and trade unions to mend their ways. The high standards of valuation and eligibility imposed by the Federal Housing Administration for insurance between 1934 and the outbreak of war brought revolutionary improvements in home design and land utilisation. Now such gains threaten to be washed away in a permanent flood of easy credit, in continuation of trends clearly evident in the last several years. The attempts to strengthen appraisal standards in the present Bill pay only lip service to the ideal from this point of view.

Nor is the real problem going to be solved by the hotly contested provisions for further assistance to families in the lowest income groups through enlarged loans and grants for public housing. The basic cost of housing will not, thereby, be reduced one iota; it will only be redistributed so that more will be borne by the general taxpayer. The Bill's provisions for similar grants to enable cities to acquire land in blighted areas, and write it down to current use value, are good in themselves. But again, they obscure the basic issue, the more so since urban redevelopment is not solely a housing problem but one of re-creating jobs and economic opportunities in the high-cost central areas of cities.

★

These objections are accentuated when the critic considers the short-run problem of finding houses at reasonable prices for the extraordinarily large number of new families formed in the past three years. This demand has been greatly enhanced by relatively high incomes which have enabled people in all walks of life to demand more and better housing. On the supply side, the limiting factor on the total volume of new homes constructed has been the restricted supply of labour and materials for which all contenders in this inflation-swollen economy are bidding. Under full employment housing measures emphasising liberal credit cannot increase the current rate of housing investment except at the expense of other lines of consumption and investment. At their worst, they will add liberal fuel to the inflationary fires; at their best they will divert some of the supply to groups needing it most. The measures of the last several years have accomplished a little of both, although the inflationary effects have tended to defeat the desired routing of supply. The costs of construction have risen so drastically that they have outstripped the purse of the average veteran, even though his purchasing power is supplemented by the cornucopia of veterans' guaranteed loans.

The problem thus tends to be self-generating and self-amplifying. Paradoxically, Americans, on the average, have more and better housing than they had before the war, yet the "doubling up" of families is more pronounced. The explanation lies in high incomes and relatively low controlled rents, which have encouraged tenants in particular to spread out and to maintain their favoured position. The young veterans, as late comers to the fray, have been squeezed in a kind of puss-in-the-corner game, with their demands focused largely on the supply of new, high-cost housing coming on the market. There is some reason to believe that the high construction rate of 1947 made a sizeable dent in the backlog of their unsatisfied demands. The net increase in families in 1947 probably did not exceed 600,000—700,000, as against a probable 920,000 in 1946. Against this net increase in demand, 835,000 new dwelling units were completed. In addition, 150,000 temporary family units were made available through authorisations for the relocation and use of war housing, dormitories, and barracks. Over and above these known additions to the housing supply, an unknown number of dwellings have been converted into multiple units.

The plain truth of the matter is, however, that any measures designed to increase the supply of materials and manpower going into housing are unwise at this juncture. But only Mr Eccles of the Federal Reserve Board has had the political courage to grasp this nettle in an election year, although Senator Taft has fumbled tentatively in its direction. Mr Eccles has highlighted the obvious inconsistency of deliberately taking measures

leading to the restriction of private credit, and then breaching the dike with public credit. But the defeat of the Housing Bill alone would not plug up the hole in the dike. Title VI of the emergency housing Act is the present fountain head of mortgage credit. Congress may extend these insurance powers even if the House turns down the Taft Bill. The American people have the opportunity to make a decision, unless they want ever higher prices to make it for them. The housing problem may well put the question: Which shall it be—more goods and services, more housing—or the European recovery plan and more adequate defence?

American Notes

Firmness without Frenzy

The Kremlin's dove of peace homed into Mr Wallace's arms this week after an inhospitable reception in Washington. Mr Wallace, who has always advocated a deal with the Russians to carve up the world into two great spheres of influence, will make some electoral capital out of Mr Stalin's response, as final proof that his Third Party has a monopoly of peaceful intentions in the United States. How much this talking-point will be offset by the further proof provided that a vote for Wallace is a vote for Stalin is uncertain; in the case both of Mr Wallace's supporters and his critics it may be largely a question of preaching to the converted.

The State Department has been severely criticised for having been caught unprepared by the whole episode. But at least Mr Marshall has made it quite clear that he is not prepared to buy peace with Russia on the black market and at the expense of other countries. American policy still follows the outline Mr Marshall presented to the House a fortnight ago when he was defending the United Nations: firmness to Russia without frenzy at home, and the rebuilding of the economic and military resources of Western Europe.

The important resolution put before the Senate by Mr Vandenberg is a practical expression of both these aspects of official policy. It has the approval of the State Department and has been passed,

by 13 votes to nil, by the Senate Foreign Relations Committee. In part, it seeks to stem the tide running strongly in the House toward revision of the United Nations Charter "with Russia if possible, without Russia if necessary." The revisionists are an ill-assorted, but not therefore negligible, alliance of the idealists who yearn for an instalment of world government and of the disillusioned who are resigned to a showdown with Russia. Their programme includes the elimination of the veto on matters of enforcement; giving teeth to the United Nations through troops drawn from the smaller nations; and a determination to secure international control of arms, particularly the atomic bomb. Indeed, it appears to have been the final breakdown of the talks on control of atomic energy which precipitated the hearings in the House. By urging the President to continue to seek, within the framework of the United Nations, a voluntary agreement eliminating the veto, except in matters of enforcement, and an agreement on a police force for Uno and on the reduction of armaments, the Vandenberg resolution attempts to preserve the shell of the United Nations until the time when the revival of Western Europe induces the Russians to abandon their intransigence.

★ ★ ★

Formula for Military Aid

The more striking and constructive passages of the resolution advise the President to explore the possibilities afforded by the Charter for buttressing economic recovery by American participation in the regional defence arrangements permitted under Article 51 of the Charter. It was Senator Vandenberg, one of the authors of the United Nations, who insisted over a year ago that the Truman Doctrine must pay at least lip service to the United Nations and he is convinced that, if properly exploited, the Charter can be made to serve the need of the democracies for common defence as well as to provide a sounding-board for Soviet polemics.

The critical passages in the Senator's "working paper" advise the President to seek the "progressive development of regional arrangements for self-defence in accordance with the Charter" and recommend the "association of the United States," under constitutional processes, with such regional arrangements as are

based on self-help and mutual aid and "affect American national security." The pattern is consciously that of the European Recovery plan; the United States may, if it feels its own security is endangered, fill any gap which remains after the countries of Western Europe have pooled their resources for defence.

This is much less than a military guarantee, but it may be more than the Senate will approve without modification. Already some members of the Foreign Relations Committee have sought assurances that the resolution involves no military commitments and will not pledge the United States to large expenditures for foreign military assistance. Even in its preliminary form, the resolution is no more than a formula through which aid may be channelled in the event of another crisis, a green light for future action. But it puts the Truman Doctrine upon a firmer footing, and opens the door, shut for so many generations, to an American partnership, in times of peace, with like-minded countries outside the Western Hemisphere.

* * *

Spring Strikes

It is becoming a tradition that the pattern for wage negotiations is set by the steel industry, and at first it looked as if this year would be no exception. The meat packers, the automobile manufacturers and the telephone companies all followed the example of the steel producers in refusing to offer any increase (or only a very modest one) to their workers. But the steel workers were bound by contract not to strike, while those in the other industries suffered under no such prohibition. As a result, the demand for a third round of wage increases has led to a number of work stoppages, which it had been hoped to avoid this year. Some 225,000 workers are already out, including the meat packing employees, who struck two months ago. A strike of shipping workers is possible in June and so is another coal stoppage at the end of that month. The procedure of the Taft-Hartley Act has been used to postpone the strike of long-distance telephone operators.

More important is the action of the United Automobile Workers against the Chrysler Corporation, where the strike is now over a week old, against the General Motors Corporation, where the strike is due to begin on May 28th, and against the Ford Company, where wage negotiations can be reopened on July 15th. There has been no major strike in the automobile industry for over two years, and it will probably be here that this year's pattern for wage increases is established. In this industry, as in many of the others where strikes are in existence or threatening, the demand is for an increase of 25 or 30 cents an hour, based on the rise in the cost of living. All three companies have rejected the union's demands. The Chrysler workers, in a last-minute effort to avoid the strike, offered to accept 17 cents, but the company's best offer was 6 cents. The Ford Company has gone so far as to suggest that the union should accept an actual reduction, since its average wage of \$1.46 an hour is higher than the average of the other automobile companies. The union naturally finds this ridiculous, but is prepared to withdraw its demands if the Ford Company can exert its influence successfully to roll back the cost of living and can prove that wage increases would force it to raise its prices.

In most of these cases the question of pension and welfare funds, first brought into the limelight by Mr Lewis, is also in-

involved, and future negotiations are likely to concentrate on these issues if employers maintain their new and unyielding attitude towards straight wage increases. The steel workers have given their usual lead in this matter. They propose in the future to ask for \$150 a month for retired employees; health and welfare funds, which would cost about 9½ cents an hour per worker, are already under discussion with the employers. United States Steel has replied with a much less liberal plan, under which the costs would be shared between industry and labour.

* * *

First Line of Defence

Congress, by approving the 70-group Air Force with only five dissentients, has in effect decided that the Air Force will be the first line of defence of the United States in the next war. This defeat of the traditional Services by the force which has had an independent existence for only ten months is largely due to the conviction that Russia is the "only possible foe" and that a war with Russia will inevitably begin, even if it does not end, in the air. The full amount authorised by Congress for aircraft and guided missiles in the fiscal year 1949, beginning in July next, is \$3,198,100,000, of which nearly \$100,000,000 is for naval aviation. Some of the money has already been made available, so that procurement of aircraft can start at once. Deliveries are expected to begin next January and the full programme will take at least three years to complete.

The 1949 appropriation for the 70-group Air Force is only the first instalment of what will eventually become an annual expenditure of \$7½ billion and perhaps more, since the composition of an air force group is constantly changing, and Congress is determined that its new favourite shall be up to date at all times. The 70-group Air Force was actually recommended to both Houses not by their Armed Services Committees, but by their Appropriations Committees, which are less well qualified to appreciate the implications of the programme. Nor did Congress get much guidance from the conflicting and indecisive advice it received from Government spokesmen. Many Congressmen are fully aware, and much concerned, that the voyage upon which they have embarked so enthusiastically has not been fully charted, although only Senator Cain showed his disquiet at this lack by voting against it (the other four dissentients were all supporters of Mr Wallace and opposed the appropriation on principle). Senator Lodge pointed out that "if we increase our appropriations every time we get angry, we can bleed ourselves to death," and called for a full investigation of the point at which the national economy will be threatened by military expenditures.

The Administration has insisted that the 70-group Air Force itself is such a threat under present conditions, unless it is accompanied by inflation controls which Congress is no more ready to impose now than it has been in the past. These are the grounds on which the Administration opposes the larger Air Force, adding that it will involve substantial additions to the other Services, for defending and supplying bases and so on, if the defence programme of the country is to remain in balance. Congress has still to consider the remaining appropriations for the original 1949 defence programme, amounting to some \$11 billion, and it may hope to find there some means of compensating for its extravagance in the air.

THE WORLD OVERSEAS

Pakistan's Prospects

(By a Correspondent)

EIGHT months is a short time in the life of a nation, but it is long enough to show that Pakistan has come to stay. In little more than a decade the idea of separate statehood for the predominantly Muslim portions of India (old-style) grew from an almost casual suggestion to be the passionately held ideal of the vast majority of Muslims in the country; and led irresistibly to the partition of the country last August. The realisation of this ideal needed energies and talents other than those required to play the game of Indian power politics. The surprising thing to most observers is that these were available.

It would have been task enough for Pakistan to have organised itself with every other factor favourable. But it had to cope straightway with a succession of appalling problems—mass migrations, the complete dislocation of economic life over large areas of north-western Pakistan, a serious dispute with India over Kashmir. Yet Pakistan survived, and is today firmly established.

The first reason for this is the Governor-General. Mr Jinnah does not pretend to be a constitutional Governor-General in the sense understood in the older Dominions. He plays an important part in the formation of policy and sometimes in the minutiae of administration. His tours to the provinces, in particular his recent visit to the North-West Frontier Province, have been outstandingly successful in assisting the cohesion of the various parts of the state. Few would have believed it possible that such practical statesmanship would have been shown by this elderly, ascetic and aloof politician, who now finds himself in power for the first time in his life.

Next in importance in keeping Pakistan united, and making its leaders determined to succeed, has been the attitude of India, as seen from Karachi. From that angle there has been a series of acts—the massacre of Muslims in Delhi in early September, the sufferings of Muslims in the East Punjab, the aggression against Junagadh, followed at once for contrary reasons by the occupation of Kashmir, an unofficial trade embargo on exports from Bombay to Karachi, and so on. No doubt Delhi had good reasons for doing all this and could produce a lengthy charge-sheet against Pakistan. But the important point is that Pakistan did not think so; and this proof of what a Hindu-dominated government meant in practice in its relations with the new Muslim state, as well as India's treatment of Muslims left in India, had a marked effect in maintaining the authority of the Pakistan Government.

Growing Self-Confidence

This was most evident in the Kashmir issue. It was obvious that once the principle of partition had been accepted as the solution of the Indian problem, and had been rightly applied to provinces like Bengal and the Punjab, it should also be applied to a large state like Kashmir, where there is an even more clearly defined line of demarcation between majority and minority community. The lamentably prolonged deliberations of Uno over this issue gave Pakistan its first chance to appear on the world's stage. Its debut was reassuringly successful; and the realisation of its international position was fostered by the steady expansion of the *corps diplomatique* at Karachi.

Pakistan's appreciation of its own strength grew visibly and was soon made evident to its northern neighbour. Afghanistan had for months been playing up the "Pathanistan" idea, with thinly concealed ambitions of dominating the tribal areas of the north-west frontier, and possibly some of the Indus valley as well. With the New Year, however, and Pakistan's growing self-confidence, a rougher note became evident in its dealings with Afghanistan; and it is safe to say that the "Pathanistan" issue is now dead, and that Afghanistan will have to adopt, in its future

dealings with Pakistan, a policy which recognises clearly the relative strength and stability of the two states.

The final and probably conclusive reason why Pakistan has come to stay is the fact that it now consists, in the north-west, entirely of Muslims. Where formerly there were millions of Hindus, there are now only a few thousand. Eastern Bengal, though over twice as populous, has never been associated with the creation of Pakistan in the same way as the north-west, nor have any real links yet been forged between these two widely separated halves of Pakistan. But the will to do so is abundant, and the leaders of the state have fertile brains. In any case, Pakistan is essentially a Muslim state, and reunion with India is out of the question. Yet Pakistan's greatest interest in the field of foreign affairs is that it should be on good terms with India. There is, however, no apparent willingness in the capital of either dominion to act on the principle that its good relations with the other are indeed the most important part of its foreign policy. The mistrust and ill-feeling born of recent events and the personal rivalries of the leaders of both dominions are too great.

A New Type of Dominion?

What of Pakistan's relations with the Commonwealth? Is it likely to stay inside? The answer again is Yes, but with the important proviso that Great Britain and the other members of the Commonwealth must show themselves understanding and helpful. It will be no good treating Pakistan as a daughter nation, or expecting the same automatic responses to matters concerning Great Britain's welfare, or the position of the Crown, and so on, as we have come to rely on from the older Dominions. Pakistan is at present called a Dominion, but the name obscures what is in fact a new and different relation. Precedents applicable to the older Dominions should never be automatically applied to Pakistan. We should not repeat our performance of last autumn, when Pakistan appealed to us in its hour of desperate need, and we did not even send anyone to speak words of comfort, let alone assist in solving its grievous disputes with India—except by distant words of advice. That was not the way to recommend membership of the Commonwealth; and it caused bitter comment in Karachi. There is in Pakistan a great fund of goodwill towards Great Britain and the British. The two countries have a variety of interests in common and a background of the same political ideas. Here then is a great opportunity for the Commonwealth to evolve a new type of relation so that, even if Pakistan should choose to stop calling itself a Dominion, the links which can be developed from common interests would still enable us to go forward together. That might mean a change in the nature of the Commonwealth; but the ability to change our political institutions has always been our strength.

Beyond its immediate neighbours and the Commonwealth, Pakistan has not had time to consider its foreign policy. It might seem fitted for the rôle of leader of a Middle East bloc of Muslim states; as the fifth most populous state in the world it is far bigger and more powerful than any of the others. But it has so far shown no disposition to think along these lines. Indeed, after an early abortive effort at making contact with certain of these states, it is being most circumspect in its further approaches; and there is no indication as yet how the intrusion of this new power into their affairs would be welcomed by the Middle East countries. Pakistan has joined with them, it is true, in opposing partition in Palestine, but is unlikely to do anything very active about it.

Field for British Business

And, finally, what of Pakistan's economic prospects? Much was made, in the conclusions reached by the Cabinet Mission to

India in 1946, of the non-viability of Pakistan, and this was the general view up to the time of partition. It is true that Pakistan has no big industries comparable with India's iron and steel, coal or sugar. But Pakistan has a surplus of valuable raw materials, in particular jute, cotton and certain grains. So long as world raw material prices remain anywhere near their present levels that spells prosperity, on one condition: that condition is that it should be possible to move the crops. But lack of transport facilities is at present Pakistan's main economic problem. Until coal for the railways, vehicles and petrol for the roads, and improved port facilities in East Bengal are all available to an extent not yet in sight, Pakistan will be unable to derive full advantage from its resources. Their development offers a fruitful field for the co-operation of British business. The Pakistan Government has already laid down the conditions on which the investment of foreign capital will be welcomed. As in the political sphere so in the economic, there is an enormous field for the development of friendly and mutually profitable co-operation between Britain and Pakistan. Pakistan has no intention of remaining entirely a primary producer and it is to Great Britain that it first looks for help in its development towards a more balanced economy.

Church and State in France

[FROM OUR PARIS CORRESPONDENT]

"Celui qui croyait au ciel, celui qui n'y croyait pas. . . ." This rhythmic refrain is repeated at the end of each verse of one of the best known resistance poems, written during the occupation by the Communist, Louis Aragon. The poem was first printed by the underground press, and has been made into the text of a brief, but very moving film which is now being shown as a "short" before a sentimental melodrama at a cinema on the Champs Elysées. The theme is simple: the Catholic and free thinker sink their differences, fight side by side, and die together for the same cause of human dignity and freedom.

The delay in producing the film, which was planned in the halcyon days after the liberation, was the result of material difficulties, but its appearance today has given it a curious twist of dramatic irony. It has, in fact, coincided with the revival of the old feud between Catholic and anti-clerical all over western Europe which was dormant during the war years—the very feud over which M. Aragon pronounced a premature obituary. Its vigour has recently been shown in the crisis which left Belgium for many days without a government, and last week it almost brought the precarious French coalition to an ignominious tumble.

The incident which precipitated the crisis in France was of quite Lilliputian proportions: the practical issue was the direction of exactly 28 elementary schools in the Catholic province of Lorraine. The sequence of events was as follows. Before the debate the Prime Minister, M. Robert Schuman (of the Catholic MRP) had prevailed upon his anti-clerical colleagues to accept a compromise between claims of Church and state.

In this project the 28 schools, which had belonged to the collieries of Lorraine before these were nationalised, were to be taken over by the state, but leased out to Catholic institutions wherever the parents preferred to have their children educated by priests and by nuns rather than by lay school-teachers: in Lorraine this preference is, in fact, very marked. The Assembly in its preliminary resolution (*motion préalable*) seemed favourable to this compromise, but trouble began when it was rejected by the anti-clerical majority in the parliamentary commission on education. The acute feelings and strong language exchanged in the commission induced the Socialist ministers to withdraw their approval from the Schuman project. So when it was put to the House, the Cabinet publicly split and the Prime Minister was defeated.

Crisis in the Cabinet

The crisis lasted all through Friday night, and two feverish Cabinet meetings were held between midnight and four a.m. The Prime Minister, who is cautious, conciliatory and anti-doctrinaire by nature, gave up his project and obtained from his party colleagues in the Cabinet the sacrifice of the 28 elementary schools—which will now be turned over to lay school-masters. Though there was intense excitement in the lobbies of the Chamber and quite serious doubts about the Government's survival, the fact that the trouble was settled before most Parisians

awoke (the Assembly voted the anti-clerical motion at 6.46 a.m.) and that the attention of the press was almost entirely monopolised that day by the future Queen of England, enabled the unedifying incident to escape the usual and undesirable publicity.

The relative insignificance of the particular issue on which the simmering French political pot all but boiled over, provides two important clues to the present situation. Firstly it shows the intensity of feeling aroused on the Catholic issue and its immense political importance (overshadowed but by no means eliminated by the war). Secondly it shows the fragile and precarious nature of the coalition now governing France.

The Catholic revival, measured in church attendance, was marked during the war. The revulsion against Communism in western Europe, caused by recent manifestations of its aggressiveness, has confirmed that revival. In France the church has been particularly well placed to strengthen its hold on the younger generation through the deplorable decline in the standard of public education. This decline is the result of crippling economies which have made the proportions of the national budget spent on education smaller in France than in almost any other European country. French experts agree that the standard of teaching and the proportion of teachers to pupils is falling and ambitious parents have therefore every motive to set aside the money necessary to obtain private-school (which in France almost always means Catholic) education for their children.

Catholics and de Gaulle

While the Church has been consolidating its hold over French minds, its direct intervention in politics since the liberation has been discreet. During the occupation most of the higher clergy were heavily compromised with Vichy, and indirectly with the Nazis, although many village *curés* formed rallying points for resistance. Since then the Vatican has played its hand cautiously, obstructing the purge of collaborationists, but otherwise largely abstaining from participating in the current political fights. At last October's municipal elections the faithful in different parishes received varying advice from their spiritual guides when called upon to make their choice between independent, conservative, Gaullist and MRP lists. Potentially, however, the Church can, at its present strength, play a decisive part in turning the balance among the anti-Communist forces battling with each other for power. As that potential force becomes increasingly apparent its counterpart—anti-clericalism—inevitably revives as a fighting force on the other side.

The revival of the old feud is nothing less than a disaster for the present Coalition Government and for the "Third Force," already so deeply divided on economic, financial and social policy. The Church-versus-state quarrel, which was patched up last week, can break out again at any moment. There has still been nothing more than a provisional solution for the general problem of financing church schools, and this issue is rich with possibilities of friction and discord. Both Communists and Gaullists stand to gain obvious and immediate advantages, in exploiting these possibilities; and the two middle parties principally concerned (the progressive Catholics and the Socialists—MRP and SFIO) will require wisdom and long sight if they are to avoid collision. The MRP will be unwilling to make further concessions for fear of throwing the Vatican decisively on the Gaullist side, the Socialists will be encouraged to stand firm for fear of losing anti-clerical voters to the Communists.

M. Schuman as Prime Minister has set a good example of forbearance and restraint, but his team will have to prove itself capable of following it, if the Government is to realise its declared object: political and economic stabilisation, so ridiculously incompatible with these recurrent crises.

Holland's Dollars

[FROM OUR CORRESPONDENT AT THE HAGUE]

THE annual report of the Netherlands Bank, combined with a new memorandum from the Minister of Finance to Parliament on the foreign exchange situation, gives more favourable figures than previous estimates, and shifts the emphasis from pious exhortations to clear and hard thinking.

Dutch production now appears to be making excellent progress. In 1947 it was 26 per cent higher than in 1946, and in the first three months of this year it was even 5 per cent higher than the average for 1938. Only coal lags far behind.

Accordingly, in 1947 exports increased from 23 per cent in 1946

to 49 per cent of the prewar volume. They amounted to Fl. 1,752 million,* but the cost of imports had in the meantime been raised to Fl. 4,066 million. As a result, total exports covered 46 per cent of imports against 35 per cent in 1946.

Although exports increased considerably, trade relations with several countries remained unsatisfactory. Like nearly all European countries, Holland was unable to export as many goods to hard currency countries as it would have liked. The dollar shortage is quite as urgent as anywhere else. But, apart from that, exports to Great Britain and Germany, too, were bad. The balance of payments with Britain was largely made up by British payments of about Fl. 100 million for Dutch ships used during and after the war and Fl. 50 million in gold transferred to Holland. Real exports remained very low, however, and the situation with Bizonia was quite as bad. Complaints about the indifference of the British and American authorities about Benelux and French participation in German trade are persistent—Western Union may improve this commerce.

The great internal disillusion about Benelux is the unsatisfactory development of Dutch-Belgian trade: exports from Holland to Belgium are much less than imports from Belgium, and only the extension of larger credit facilities by the Belgian authorities may save the balance of payments of the Dutch with their Belgian Benelux partners.

Foreign Exchange Plans

The main problem is, of course, dollars. In order to stimulate exports to dollar countries, the Dutch Government has "under consideration" (two years after the proposal was made), allowing exporters some 10 or 15 per cent of their earned dollars. But all the same the outlook, even with ERP, is sombre.

The Finance Minister's memorandum speaks about three "plans" for the use of foreign exchange: plan A, plan B and plan C. Plan A—which is impossible—is the continuation of Dutch imports at the 1947 level. The dollar shortage, and particularly the slower flow of American credits, make it imperative to restrict imports. Until April 1st nobody knew for certain how much Marshall Aid—if any—would be received, and so a plan C was drawn up just in case Holland would have to continue during 1948 without any further American facilities. It is fairly clear that plan C did not exist in concrete, elaborated form; it was clearly impossible for Holland, as it was for nearly all European nations, to forego further American help without (a) first cutting imports to a level gravely prejudicial to health and productivity, and (b) crippling industry by reducing the import of machinery and raw materials. Even in the first quarter of 1948, whilst waiting for the Marshall Plan, the Dutch Government licensed more imports than were compatible with a "Plan C" scheme, in order not to cause irreparable damage later. A bad harvest, the end of sterling convertibility, insufficient exports to Belgium, and technical difficulties with World Bank loans together created a most unpleasant situation.

Even with Marshall Aid, a return to plan A, the former level, is quite unwarranted. An intermediate plan B has, therefore, been worked out, and the Minister of Finance emphasised once more that, although ERP aims at making Europe viable by 1951, an immediate increase in the standard of living was improbable.

The first estimate for 1948 reckons with an export of Fl. 2,150 million (Fl. 300 million more than in 1947); imports will remain at Fl. 3,930 million, however, only Fl. 100 million less than last year. Gold transfers (Fl. 100 million), further use of foreign balances (Fl. 60 million), and the free sale of foreign securities (Fl. 135 million)—no figure is quoted for the forced sale that has now begun—make up part of the balance; but if the very restricted plan C had had to be executed, and if no Marshall Aid had been available, an adverse balance of Fl. 911 million would have had to be met.

Economic Recovery in Eastern Indonesia

[BY A CORRESPONDENT]

BEFORE the war, in 1938, Indonesia as a whole contributed 80 per cent of the world's supply of copra, 90 per cent of the cinchona bark (for quinine), 38 per cent of the rubber, and 22 per cent of

* Fl. 10 = £1.

the world's supply of palm oil products. Since the war, reconstruction has been hampered by the unsettled political situation. The lack of goods from Indonesia, particularly raw materials, has aggravated the general delay of world recovery. But, as a result of the settlement which was reached at the beginning of this year, there has been a marked improvement throughout the islands. As the fear of political unrest decreased, so has production increased, and Indonesia is once more beginning to take up its proper place as one of the world's largest primary producers.

The recovery of Indonesia as a whole owes much of its success to the example set by the eastern group of islands. The state of East Indonesia—comprising all the islands to the east of Java from Bali to the Moluccas, but excluding New Guinea—was created on December 24, 1946, at the conference held at Denpasar in Bali, with Mr Soekawati as its first President.

Since its inception the keynote in the management of affairs in this new autonomous state—which will eventually be one of the equal partners in the proposed United States of Indonesia—has been development and progress under a Government plan drawn up on the spot and approved by its own Parliament. In accordance with the terms on which the state was set up, civil administration, the police, justice, public health, lower and secondary education, etc., are now all carried out by the Government of East Indonesia, whereas they had previously been under the control of the Central (Dutch) Government in Batavia.

Co-operation with the Dutch

Although the running of these affairs is now entirely in the hands of the East Indonesian Government, these officials decided that they could not as yet run such a vast enterprise without certain outside assistance. They have therefore requested the Dutch—with their 350 years' administrative experience in the

Indies—to give them such aid as they may require. They preferred to co-operate with the Dutch rather than to follow the hostile policy adopted by their neighbours in the republic. The natural result was that East Indonesia forged ahead in both the political and economic fields.

The Indonesian Premier offered the post of Finance Minister in the first Cabinet to a Dutchman. This offer was accepted, and though there have since been three Cabinet reshuffles, no change has ever been made in this particular office—the only one to be held by a European. Furthermore, the Dutch members of the former civil service in East Indonesia have been placed at the disposal of the state by the Central (Dutch) Government, and they are rendering invaluable service to the new administration.

The 1948 Budget at some 205 million guilders, can still be only a provisional one. However, the various Ministries have drawn up provisional estimates for their own requirements, arriving at a total of 176 million guilders (£17.6 million). The main items of expenditure are Home Affairs and Police (36 million guilders), Education (27 million), Public Works (37 million), Economic Affairs (18 million) and Health (18 million).

This figure of 176 million guilders is about eight times as large as the prewar expenditure, partly because of such matters as enhanced prices, general rehabilitation and increased wages and partly because of the costs of setting up the new Home Government.

Economically, the State of East Indonesia is mainly dependent on agricultural produce, and it is estimated that some 74 per cent of the inhabitants are engaged in farming.

This part of the archipelago was fortunately spared most of the postwar upheavals and terrorist activities that so badly re-

tarded progress in Java and Sumatra, with the result that rehabilitation could be taken in hand immediately after the capitulation of the Japanese. Although rice is the staple food of the Indonesian—he consumes about 225 lb. per head per year in this area—between 20 and 25 per cent of the rice fields had been left unplanted during the Japanese occupation. Now, however, the farmers were able to work in their fields again without being terrorised. They knew that they would be allowed to retain their crops for themselves, and not have to hand them over without payment either to the Japanese invader or to bands of roving gangsters who claimed to be “liberating” them from the Dutch. As a result, production capacity is practically back to the prewar level, though adverse weather conditions in 1946 caused a considerable loss of rice and maize. Nevertheless, the estimated rice-surplus in South Celebes for 1947 was 20,000 tons, and a maize surplus of 50,000 tons was also expected. The island of Lombok (lying to the East of Bali) was expected to produce a rice surplus of 10,000 tons in 1947, though part of these surplus tonnages will be required for other districts in East Indonesia where there is insufficient rice or maize available. There is also considerable work being projected on irrigation schemes in the state, and it is estimated that, with these coming into operation, East Indonesia will be able to produce within ten years a rice surplus of 100,000 tons annually.

By far the most important prewar export from East Indonesia was that of copra, which in 1939 accounted for 80 per cent of the volume and 60 per cent of the value of all exports from Macassar. East Indonesia exported three-fifths of all the copra shipped from the Netherlands Indies, the bulk being produced by the Indonesians themselves and not on large European-controlled estates.

Dependence on Copra

Being so largely dependent on copra exports, the economic position of East Indonesia, as it stands at present, is somewhat vulnerable. Copra prices are subject to violent fluctuations; for instance in 1923 copra fetched 30 guilders per picul (136 lb.) but in 1930-31 the price had dropped to fl.1.50/fl.2 per picul. After the Japanese capitulation a top-price of fl.68 per picul was recorded, but by the beginning of 1947 this figure had been

halved, and in the second half of that year another drop of about 50 per cent was recorded. Before the war, the bulk of the Netherlands Indies copra had been shipped to Europe, but when this market ceased to exist in 1940 the NEI Government erected a body known as the Copra Fund, whose task it was to find other markets for the home-grown copra and to take such measures as were necessary to assist the producers.

After the Japanese capitulation it became apparent that the only way to bring improvement into chaos was by Government intervention, which meant the resumption of activities by the Copra Fund, and the assistance of the Government Import and Export Organisation. The Copra Fund immediately started to encourage production, and to this end issued—in collaboration with the Import and Export Organisation—such essential articles as textiles, tobacco, bags, dried fish, etc. It also aimed to protect the producer from the worst effects of world market fluctuations by a regulated purchase policy and the issue of cash advances where necessary. As a result of these activities, the sharp drop in price in April, 1946, was originally absorbed by the Copra Fund, and it was not until half-way through May that it became necessary to lower the price it was paying for copra. Even after a further drop in June, 1946, the Copra Fund was still able to pay a higher price to the producer than world markets would normally have warranted.

The Copra Fund operates as little as possible in the field of trade, so as not to cut out the dealers and remove their livelihood. It does, however, exercise sufficient control to prevent the small producer from being paid too little for his copra. As the Fund now buys minimum lots of 5 tons, the middle-man acts as collector from the small producers, and it is estimated that 80 to 90 per cent of the copra bought by the Copra Fund comes from Chinese dealers.

Although economically East Indonesia is at the moment too largely dependent on copra, plans to improve the economic outlook of the state as a whole are being worked on vigorously. In this respect fisheries, industries and cattle-raising are all being given careful attention, so that it is not too much to expect a great improvement in the position as time goes on; and this all the more so as the state has elected to work together with the Dutch and will greatly benefit from this collaboration.

THE BUSINESS WORLD

The Coal Board's Quandary

LIKE Sir Charles Reid, *The Economist* was among those who believed that public ownership of coal mining was wise and right. It had several reasons for this belief, but the chief one was that nationalisation alone held out any hope of providing the capital and the technical opportunity for the improvement in mining methods for which Sir Charles argued so convincingly in the Reid Report. There was no assurance that, even with nationalisation, technical reforms in the industry would in fact be accomplished. But so long as Sir Charles remained a member of the National Coal Board, their eventual accomplishment at least formed a tenable article of faith. His resignation from the Board, after months of internal differences, is much more than the loss of a skilled mining engineer; it is a direct threat to the hope that cheap and plentiful coal, though not forthcoming today, might eventually result from greater efficiency in the pits.

Many complex issues have been brought into the open by Sir Charles Reid's resignation. There is the struggle for mastery between organised labour and technical management, to which reference is made in an earlier article. There is the controversy about the Coal Board's organisation. There is the disappointing lack of progress towards reorganisation in the pits. To decide exactly what is wrong and how to correct mistakes of the past is a task which will certainly tax the powers of the committee which the National Coal Board has set up “to take stock of the position reached in the development of the Board's organisation and advise the Board whether any improvements can be made.” Sir Charles Reid had demanded a “full impartial investigation by competent, independent persons into the entire organisation” as a condition of continuing to serve on the Coal Board. Perhaps a grand inquest would have added to the present confusion, without providing any immediate remedies. But it implies no disrespect to the committee which the Board has set up (of which the chairman, Sir Robert Burrows, became a part-time member of the Board at the beginning of this month, having ceased to be chairman of the LMS Railway on December 31st) to suggest that it is unlikely to find solutions for difficulties which the Board itself has so far failed to solve.

The Board is commonly criticised for excessive “functionalism.” There is, indeed, good ground for the criticism, though it is a reflection not so much on the Board itself as upon the Minister who appointed it. Certain attempts have recently been made to meet the criticism. On the Coal Board itself, a policy-making section has been created, free of functional duties; this consists of the chairman, the deputy chairman, Sir Charles Reid (until his resignation), and Sir Robert Burrows. But the other members of the Board are still functional specialists in charge of labour and welfare, finance and production. At the area level also, a significant change has been made. The area general manager, who is in each case a mining engineer, was previously only *primus inter pares* among the specialist officers of the area in charge of labour, production, sales, etc. Since the beginning of the year, these specialists have been put under the control of the general manager, who is thus clearly responsible for all that happens in his area. But on the divisional boards, which stand between the National Board and the areas, functional and non-functional members, production men and labour men, are still on an equal footing.

These arrangements are not perfect; nor are they necessarily final. But experience during the last sixteen months suggests that too much has been attempted in too short a time. The coal industry—unlike, say, the railways—had no regional structure on vesting day. The divisions and their subordinate areas are all new; at the best, they can only slowly build up a corporate sense. A limited parochial outlook is common in coal mining because miners (much more than factory workers) see only a small part of the problem of production. That is a fact which no amount of reorganisation can change very quickly. It may be that the Coal Board and the divisional boards have largely failed even to begin to inspire a corporate sense of responsibility in the industry. It is unfortunately true that indiscipline is far too common; that the most self-evident schemes for technical reorganisation (as at Waleswood) meet with unthinking resistance; that absenteeism, though lower than it was, is still far too high. But what, in present circumstances, is the substitute for discipline? Sir Charles Reid has asked for “sound business principles” and “the fullest possible personal responsibility for management at every level and the authority which this demands.” Those are the views of a technical expert, and they are entitled to respect. Whatever their merit may be, however, they stood no chance of being accepted, either by the Coal Board or by the men. For at this moment they would involve a head-on collision and strikes. The views may be right, but the cost of enforcing them under present circumstances would certainly be too great. But because they have been turned down, the consumers' doubts about getting good and cheaper coal some day have undoubtedly increased.

Yet the fact remains that this problem of technical reorganisation in the pits cannot be solved without a sound organisation. It might have seemed more sensible to build the industry into divisions, and then to integrate the divisions at a later stage. But fully independent divisions would not have worked, for one prime reason—they could not have been given independent access to the capital which the State is providing for the industry. The greater, then, is the responsibility of the Coal Board for giving more urgent consideration to development schemes which the divisions are preparing. The Act only provides for £150 million of new money, of which part is for working capital. Choices have to be made between developing one pit instead of its neighbour, or favouring one division more than another. This work has not really begun. It was only recently that the Board appointed an additional chief mining engineer at headquarters, to take charge of reconstruction and planning. The scale of the work is immense. It is not, as some commentators often suppose, a mere matter of installing a coal cutter here and a new conveyor there. It is a more fundamental and more costly problem of opening new haulage roads and improving underground transport in order to take full advantage of mechanisation at the coal face.

An example may make this point clearer. In the Northern Division of the Coal Board, a large amount of machinery has been installed at the coalfaces since the beginning of the war; last year, £1,564,000 was so spent, and the results have been negligible compared with the capital outlay. Thus experience in this division confirms Sir Charles Reid's recent criticisms

“I think I'd like
a White Horse
better than anything”

BALKAN SOBRANIE CIGARETTES & TOBACCO

THIS ENGLAND . . . No. Fourteen

THERE is no excuse for keeping pets in hard times — and we need no excuse. They are a part of our English life. They take us out or they keep us in. They demand a new rug or require a new chair by a roaring fire. They guide our lives and enable us to enjoy life when all other things are conspiring to thwart our enjoyment. They go with that *Balkan Sobranie* which we might deny ourselves save that we remember it takes less from our purse because we need it more rarely—so satisfying is its long cool smoking. So, let sleeping dogs lie; and fill up with *Balkan Sobranie*.

SOBRANIE LTD. LONDON, E.C.1.

of the inadequate return for "great masses of machinery" put into the pits. But as collieries grow older and workings are pushed further away from the shafts, the effects of inadequate haulage on working costs become considerable. Maintenance of long mileages of arterial roads, the limited capacity of rope haulages, lack of underground riding facilities for men and the increasing problem of ventilation—all these factors reduce the amount of coal that can be taken through any underground haulage. Delays occur, loading has to be suspended during the working shift, and compensation has to be paid to piece workers. Gradually, the standard of output per shift at the face falls. Even with the most modern arrangements at the face, no improvement in average output per manshift is possible if underground haulage is inefficient.

One pit in the Northern division, where the underground transport system is described as "relatively good," employs nearly 25 per cent of its total labour force on underground transport; this costs 6s. 7d. per ton of saleable coal. New roads, driven more or less level through unproductive strata, would enable locomotive haulage to be used, with a far greater capacity than the rope haulage; ventilation would be improved; the number of underground transport workers could be reduced from 1,576 to 571, and the cost of underground haulage per ton of saleable coal from 6s. 7d. to 1s. 11d. By working this pit and its neighbour as one undertaking, surface workers could be reduced from 1,237 to 660, and output per manshift for all workers could be raised from 20 cwt. to 40 cwt. The estimated cost of this scheme, and its ancillary items, like a new coal preparation plant, is put at £2,582,000, of which £1,300,000 would be spent underground. The full task would take at least six years, and perhaps as long as nine years, but an appreciable improvement in output per manshift would be noticeable within two years.

There is nothing exceptional in this scheme. It could undoubtedly be matched by many others which are being drafted by other divisions. But someone, somewhere, has to make up his mind about them all, choosing some and rejecting others; and undoubtedly mining engineers responsible for production in the divisions feel that decisions on new development schemes are being too long delayed. Certainly, the Coal Board has nothing in the shape of a master development plan by reference to which each separate scheme might be judged. It ought to allocate its capital—which is small enough for the job—by a strict test of improvement in output per manshift, so that the

greatest expansion of output can be obtained for the total expenditure. But it is doubtful if the Coal Board has even dimly formulated the criteria on which long-term development is to be planned. It has to make guesses about future markets for particular coals, and future costs of wages and materials; and given the Government's views about the Development Areas, it may not feel wholly free to apportion new capital among the divisions to the best economic advantage. The consequences of these delays are already appearing—in frustration among mining engineers in the divisions, and the resignation of good technicians who can hold their patience no longer.

The focus of the problem is the taking of decisions, and the exercise of personal responsibility for which Sir Charles has argued. The Coal Board must try, at any rate, to keep control of the purse, to hold some balance between the worker and the consumer, and between one division and another. It is now tackling the immense task of rationalising the present artificial structure of coal prices, within the limiting proviso—or hope—that on the average they will not be increased. To suppose that this most gigantic of monopolies will stumble by the light of nature on the "right" prices for different grades of coal may indeed be optimistic. But the attempt has to be made, and it is bound to cause more heartburning in the divisions.

Thus Sir Charles Reid's resignation has come at a critical stage in the early history of the Coal Board. It is a source of disappointment to those who have believed that good technique, given time, might solve the worst of Britain's coal problems. And evidently it is a source of satisfaction to those union leaders who believe that they should wield more, and not less, power than the technicians. The struggle for supremacy between the two sides is now open, and it has to be confessed that mining engineers, at the moment, are not in a position to make their fullest contribution to the rehabilitation of British coal mining. Great changes are required; little is being done towards making those changes; and the power of persuasion, much less of enforcement, over the miners is not strong. The Coal Board is in a quandary. It may allow itself to be forced into a supine acceptance of the doctrine that the miners are the final arbiters of how much they will produce and of technical reorganisation of the pits. Or it may somehow contrive to learn to exert not indeed ruthless authority, but certainly effective leadership. The Coal Board cannot escape choosing between the two alternatives.

Timber for Houses

THE cuts in the capital programme which the Government made last autumn are beginning to have their effect on the building trade. Unemployment is increasing in certain localities, though most of it is in industrial building; employment in housing has been less affected, particularly in the finishing trades. Last year the housing programme aimed at the provision of 240,000 permanent and 60,000 temporary houses. In fact only 127,100 permanent and 45,400 temporary houses were completed and 12,650 war-damaged houses rebuilt. Immediate housing projects were not curtailed by the capital cuts. Those schemes which had begun or were approved were allowed to continue but new plans were only to be passed as the supply of raw materials warranted them. A full review of the housing position has been promised for July. Mr Bevan said recently that he hoped 180,000 permanent houses would be completed this year, and he has since put his estimate up to 200,000; the Economic Survey has set a target of 140,000 houses to be started in 1949, and Mr Bevan has lately put in an advance claim that this figure should be raised on the ground that labour and materials will be available.

The critical material for housing is softwood. Production of other building materials has expanded strikingly during the past year, although for most of them, including bricks, cement and slates, it has not yet reached prewar level. Under current specifications, not more than 1.6 standards* of softwood may be used in any one house. Thus to produce 180,000 permanent houses, about 290,000 standards of timber are needed. Total imports in 1948 are put at 900,000 standards, of which housing might absorb as much as one-third. Before the war, when Britain's annual import of softwood averaged over 2,000,000 standards, it is estimated that between 20 and 25 per cent was used by the building trade. As in the case of steel, the Government refuses to disclose the allocations of timber to various uses, but a large amount of softwood must still be used for packing cases, despite the increased use of fibreboard and other materials. And consumption of timber by the packing industry is expected to increase as the volume of exports increases this year.

* A standard equals 165 cubic feet.

Britain's softwood imports last year totalled 1,550,000 standards—a great improvement over the 1946 figure of 870,000 standards, but nevertheless still considerably below the 1938 level. Canada, Sweden, and the United States alone supplied over 900,000 standards in 1947—60 per cent of the total—and each of them required payment in hard currencies. The other main suppliers were Germany and Finland. But Germany is now for practical purposes a dollar source, and Finnish timber can only be bought by exporting steel and coal. Consumption of softwood in Britain last year amounted to 980,000 standards, and the relatively large imports enabled stocks to be built up from the dangerously low level of 215,000 standards at the beginning of 1947 to 615,000 standards at the end of December. Britain's prewar supplies came mainly (as Table I shows) from Canada, Finland, Sweden, Russia and Poland. But then there was no dollar shortage to contend with. Much

of Finland's forest area has been handed to Russia, and no exports from Poland are yet forthcoming. Canada, Germany and the United States are the only three sources which can now ship more than they shipped before the war.

Imports of 900,000 standards this year will not allow any material increase in British consumption compared with last year—unless another gamble in reduced stocks is risked. Supplies are tight, and for some time to come they are likely to remain tight. For Britain's timber problem is merely a reflection of Europe's problem. The war has brought in its train a striking change in the pattern of the world's timber trade. Canada's share in world timber exports rose from 15 per cent before the war to 35 per cent in 1947; Europe's share fell over the same period from 75 per cent to 45 per cent of a much smaller total trade. Demand, in the same interval, was transformed by the interruption of building and by the devastation of war. Europe's needs are the greatest, but a pent-up demand for housing exists in all countries, even in the United States. Moreover, Russia (including the incorporated Baltic States), which before the war supplied 40 per cent of Europe's timber exports, became a net importer for the first time in 1947, although it has acquired well-forested territories from its neighbours.

The European timber position is indeed serious, but it is further aggravated by foreign exchange difficulties. Europe's needs in 1948 have been estimated by the Timber Subcommittee of the Economic Commission for Europe at 4,275,000 standards, compared with maximum supplies available to Europe (including timber from the Western Hemisphere) of 2,911,000 standards. In 1947, world supplies amounted to 2,362,000 standards, compared with 4,542,000 standards in 1937. These figures reveal the drop in output caused by the war and the extent of the recovery which is needed. Yet shortage of foreign exchange is likely to reduce Europe's effective demand to only 2,593,000 standards—with the odd result of a prospective "surplus" of over 300,000 standards at a time of acute shortage.

Less than twelve months ago a European timber conference obtained agreement from the timber exporting countries to increase their output by 10 per cent during the 1947-48 felling season, despite the shortage of labour, logging and cutting equipment. Importing countries were requested to economise in timber. But within six months effective demand was greatly reduced through the general shortage of foreign exchange by the demand for payment in hard currencies by certain timber exporters, and by rising timber prices.

If foreign exchange is made available either from Marshall Aid or some other source, demand could easily outstrip available supplies and cause a sharper rise in timber prices than occurred last year. As a safeguard against this possibility, importing countries have agreed to limit their purchases up to July 1, 1948 to a total of 2,700,000 standards of sawn softwood, including boxboards and sleepers. Under this agreement, Britain will not buy more than one million standards. The prospective import of 900,000 standards is within this agreed limit.

Freer supplies of foreign exchange—particularly of hard currencies—would give immediate relief to the timber trade; but the basic problem remains, to increase supplies so that the reduction in exports from Scandinavia, Eastern Europe and

opened. The Council has appointed a special sub-committee to deal with the Simon Report, and this week it has devoted some time to contesting the findings of the Report in detail. Sir Dudley Pryke, the chairman of the Council, complained that the trade had not been made aware that restrictive practices were under investigation by the Simon Committee, and that the Committee, though it took advice of the Council, did not act on the Council's suggestions as to the firms it should visit. He asked that there should be a further inquiry in which the investigators should take the trade's advice as to where they should look, and, having collected their evidence, should even get the trade's interpretation of it before arriving at their conclusions.

The ratio between the capital and turnover of builders' merchants, which is crucial to the question of whether their profits are unreasonably high, continues to be a point of contention. The Simon Committee stated:—

No figures of capital are available from our last inquiry, but we are informed by the Ministry of Works that the average annual turnover may be fairly taken to be four times the capital employed.

The Council claims that if the Committee had asked for evidence, "it would have been shown that the average turnover is less than 2½ times the capital employed." Mr G. M. A. Miller, of Eastwoods, Limited, who went into the question more closely, stressed the difficulty of giving a firm answer about average turnover. He pointed out that a table appended to the Simon Report (Appendix III) gave the value of stocks carried by 2,000 builders' merchants as £27 million and their aggregate annual sales as £81,000,000—a ratio of 1 to 3. If allowance were made for the surprisingly large proportion of the builders' merchants' capital which is tied up at any one time in credit to builders, the ratio would become 2 to 1. The further capital tied up in installations and vehicles would bring the two figures still closer together.

In its more general aspects the controversy tends to broaden into a discussion either of the nature of trade or of the purpose of committees of inquiry. Price maintenance agreements, states the Council, are fair, logical and a necessary corollary to national wage agreements. They exist in most trades. How are the distributor's services to be paid for unless he is assured of a margin? If Government action fixes the price of one material at a level which the trade considers too low, then the sales of other goods have to pay for the loss. Credit is generous and bad debts are common in the building trade; this burden has to be included in the margins agreed within the trade. Trade associations and the trade control of prices have been fostered in recent years by the Government habit of refusal to deal with industry except through trade associations. They have thus become general. Is it fair, asks the Distributors of Builders' Supplies Joint Council, to use the builders' merchant as a chopping block? Such questions should be dealt with, it feels, generally or not at all. Clearly the Simon Committee could only stick to its subject. If committees point out the facts as they arise in particular instances, it is for the community to draw the general inferences. The builders' merchants and producers of building materials need not fear that they are thought to be sole practitioners of price-fixing. They are not. But they provide an instructive example of some present-day interpretations of private enterprise. And it cannot be said that their reply to the Simon Report is wholly convincing.

* * *

Anglo-American Films

While the probable impact of the American film agreement on the British film industry is still a matter for speculation, an instructive pointer may be seen in the agreement announced this week between London Film Productions (Sir Alexander Korda) and Mr David Selznick. The President of the Board of Trade remarked three weeks ago that American producers had been trying to get British studio space ("trying" was perhaps an understatement):

I have, therefore, informed Mr Johnston that we cannot agree to the alienation of studio space until the Agreement is published, the control committee set up and we can see the American production programme as a whole.

It does not appear that the arrangement now made with Mr Selznick could be fairly described as the "alienation" of studio space. It does, however, present Mr Selznick with what appear to be ample opportunities for investing his non-transmittable sterling in film production in this country, and for earning dollars with the product. Four films are to be made in a year, financed by London Films and Mr Selznick jointly, using Shepperton and Isleworth studios, British producers and predominantly (no doubt)

British technicians. American stars under contract to Mr Selznick will be lent to give the universal box-office appeal which is so highly prized. Most of the remaining actors, it is supposed, will be British. The world market for the finished film will be divided, London Films taking the rights for Great Britain, the sterling area and certain other countries, the Selznick organisation taking the rights for the United States and the dollar area. The two sides will agree on a price for these two groups of rights.

The scheme has advantages for each side. For the American partner there is a good prospect of converting pounds into dollars, of keeping highly paid stars employed, and of avoiding obstacles which might confront American companies entering production in this country on their own account—the expense of taking technicians on tour, the difficulty of getting space and equipment, and, of course, the possible displeasure of the President of the Board of Trade. For the British partner the scheme may solve both the problem of finance and the problem of finding overseas markets. It will employ British producers, technicians, actors, studios, and equipment which might otherwise go short of work. There are drawbacks—inherent, perhaps, in the situation which causes an agreement of this sort to be made. Will the product be British in character, or American, or hybrid? Is the day advanced or retarded when British films can enter the dollar markets under a British trademark? The producers who are to be employed are among those "independent" producers about whose lack of opportunities for production there has been so much discussion. Independence in film production has never been easy to maintain; this arrangement suggests that it will not become much easier.

* * *

Mr Wilson's "Warning"

The President of the Board of Trade may well be annoyed by the rise in raw cotton prices, particularly since he has been hoping for several months that the terms of trade would begin to move in Britain's favour. The export plans have been based on this premise but apart from the temporary break in American prices last February, the hope has been disappointed. But that is no excuse for Mr Wilson's hectoring and naive statement in the House last week:

We must give a quite clear warning to Egypt and other countries which, not to put too fine a point on it, are exploiting the world shortage with the prices charged at present. There will be a day of reckoning; there is bound to be, and I think the sooner it is realised in one or two of these countries in which the price policy has gone on these lines, the better it will be.

It is true that some day raw cotton prices will fall and if that is the "day of reckoning" presumably Britain will exploit the world surplus. Cotton is not the only scarce commodity. Has Mr Wilson heard of British coal for which, in foreign eyes, high prices are being asked?

If the price mechanism is not used as a method of distributing supplies when they are short, a complicated allocation scheme would have to be introduced. And what responsible body would operate such a scheme? Would Britain be satisfied if it were allotted smaller supplies than Lancashire could use? There is, indeed, a world shortage of raw cotton and the demand for Egyptian growths in particular has increased since the end of the war because countries want to manufacture high quality goods for export, because Egypt does not require dollar payment, whereas the United States does and because the use of high quality fibre increases output and helps to reduce labour costs. In Egypt, as in other cotton producing areas, cotton acreage was reduced during the war years in order to grow more food. Even now, if the Egyptian Government were guaranteed an annual import of grain, the cotton acreage could be considerably expanded. Mr Wilson referred in his speech to the fact that Egypt had concentrated during the war on the shorter stapled cottons, but that was a direct consequence of the fixing of prices by the British buying commission in 1940. Even so, by 1946 the surplus of these shorter staple cottons had been transformed into an even greater surplus of long staple.

Nor has Mr Wilson any legitimate complaint about the Egyptian Government feeding its supplies of Karnak into the market "in extremely small quantities." Britain is acting in a similar manner in the disposal of its surplus wool stocks. Is it not also exploiting a world shortage? Again, if all other countries have to pay the same high prices for their Egyptian cotton, how can British exporters be at a competitive disadvantage—unless it is because their manufacturing costs are so high? The Egyptian cotton market is conscious of the shortage of cotton and the demand of buyers, and it is not to be blamed for acting according to its self-interest. Whether that is enlightened or not, time eventually will show—not Mr Wilson's "quite clear warning."

Private Trading in Metals?

Rumour persists that the London Metal Exchange will shortly reopen, despite official pronouncements that no decision has yet been taken. In present circumstances it is unlikely that private trading in metals will be resumed except on a restricted scale, and it might be better for the Metal Exchange not to reopen until it could function efficiently—as it did before the war. This is not to suggest that Government trading should be maintained longer than necessary; but there is a world shortage of non-ferrous metals and the United States is fast becoming a large importer. In these conditions, private trading might have a difficult task to provide adequate supplies to British industry without distorting the price of the same metal in different markets. Such a task is the more difficult for a country bound by foreign exchange restrictions.

Present rumours about the metal exchange appear to originate from American discussion on the European Recovery Programme. It is an open secret that the US Government would welcome a

wider scope for private trading in Marshall supplies. It is suggested that countries will purchase goods in the American market through their agents or merchants under a system of export licences—except for commodities held by the Commodity Credit Corporation. But details of the exact working of ERP have yet to be determined. On this point, however, the American Government is unlikely to be too rigid, otherwise the whole basis of

A French Market.

LIKE THEIR ENGLISH counterparts, the markets of France have their own individuality and reflect the needs and habits of those who use them. The Frenchman is a careful buyer and those who would sell to him need first hand information on the state of the French market. Barclays Bank are particularly well placed to help exporters to France and to Europe generally, through their Associated Companies in France and Italy and their close links with the leading banking houses on the Continent. Details of the foreign banking services provided by the Bank may be obtained through any local branch. Alternatively, please write direct to the address given below.

BARCLAYS BANK LIMITED

British food purchases through bulk contracts would have to be altered. Nevertheless, within the limits of the Marshall Plan there is at least scope for some private trading in metals as far as Britain is concerned, although the traders would be more or less acting as the Government's agents.

The plan of British imports of non-ferrous metal under ERP is given in the accompanying table. These figures are by no means firm; they are merely part of the statistical scheme drawn up by the American Government. Except for lead, they allow for little more than last year's consumption, and even the sources of supply show no drastic change in pattern except for the substitution of Chilean for American copper. These figures have no bearing on the argument about the reopening of the London Metal Exchange, but at least they conform to the Ministry of Supply's present buying arrangements. If it is decided to reopen the market, some time would have to elapse between the decision and the actual resumption of trading, particularly since many of the Government purchases are made on the basis of six months' forward contracts.

Transport Facts and Figures

The British Transport Commission has issued the first of a regular four-weekly series of statistical returns, covering the period to January 25th. The scope of the returns is broadly similar to the monthly statistics issued by the Ministry of Transport before the war, which gave information about traffic and operating results. The Commission intends to include information about other forms of transport as it becomes available, and to issue the returns within the month following the period to which they refer. No estimates of financial results will be included; this is a matter for regret, for the lack of any estimates of net revenue was a serious gap in the prewar figures of the main line companies, and the Commission might have been expected, in due course at least, to fill it.

With that main reservation, the new returns seem adequate and well arranged. They give tangible proof of the intention of the Commission—to quote the chairman's words—"to maintain as fully as possible the apparatus for enabling judgments to be formed of the progress and efficiency of their activities." The

tables are likely to be expanded by much new information relating to road transport, which will fill an important gap in transport statistics. The new returns when they are brought more up to date will replace the incomplete—and occasionally misleading—statistics about transport which have hitherto appeared in the monthly Statistical Digest.

The appearance of these new figures coincides with the final estimates for the pool accounts of the railways and London Transport for 1947. It was known that last year's net revenue of the pool would wholly fail to cover the rental of £43½ million hitherto paid to the controlled undertakings by the Government. But in fact the White Paper shows a deficit on net revenue account of no less than £16,239,000, despite increases in London Transport fares in February last year and in main line railway charges last October, which together were estimated to yield £21 million in 1947, apart from possible loss of traffic. These higher charges are being currently reflected in the gross traffic receipts of the Commission, which for the first sixteen weeks of this year total £17,222,000 compared with £14,754,000 for the corresponding period of 1947. But it is doubtful, to say the least, whether an increase on this scale comes near to covering the Commission's rising costs.

* * *

Agreement with Ceylon

Financial negotiations with Ceylon have led to a comprehensive agreement concerning Ceylon's sterling assets and monetary co-operation between the two Governments. The agreement involves the immobilisation of the bulk of Ceylon's accumulated sterling balances which amount to approximately £51 million. The machinery through which this immobilisation is being effected is the now familiar device of No. 1 and No. 2 accounts, the latter holding the blocked resources and the former being credited with Ceylon's current sterling earnings, with any funds that may be released from No. 2 accounts and with the earnings on the investments or balances held in No. 2 accounts. The new agreement covers the period to the end of this year. It provides in the first place for an immediate release of £3,500,000. This should be sufficient to cover any foreseeable deficit in Ceylon's balance of payments up to the end of the year. In addition, £4,000,000 will be released from No. 2 to No. 1 accounts to provide a working balance. This may be increased by a further £1,000,000 if prices of essential foodstuffs which must be imported by Ceylon undergo an unforeseen rise. The agreement does not have to provide a specific release of hard currency for Ceylon's needs. Since 1939 Ceylon has been a net earner of dollars and continues to play that enviable and welcome role. In 1948 Ceylon's earnings of US and Canadian dollars are expected to be of the order of Rs 180 million, or slightly over \$50 million, while its gross dollar expenditure will not exceed Rs 100 million, or about \$30 million. The net surplus will, as hitherto, be banked with the sterling area dollar pool, while the sterling counterpart representing current loans will be freely available to Ceylon in its No. 1 accounts.

The agreement provides that the British Government will do what is possible to help Ceylon to develop its natural resources. In order to facilitate the attainment of this general objective the British Government will sponsor Ceylon's application for membership of the International Monetary Fund and Bank for Reconstruction and Development. An interesting clause in the agreement refers to the exchange of information between the two governments regarding movements of capital between Ceylon and the rest of the sterling area. Provision is made to compensate these movements of capital, in so far as they can be estab-

lished, by the appropriate transfers between No. 1 and No. 2 accounts. This means that if, on balance, capital is flowing from other parts of the sterling area to Ceylon the Ceylon Government will be prepared to immobilise its funds by transferring them from No. 1 to No. 2 accounts. Conversely, any net movements of capital from Ceylon to the rest of the sterling area will be offset by the transfers from No. 2 to No. 1 accounts. The agreement foreshadows the establishment of a reserve bank by the Government of Ceylon. Pending this development, the currency affairs of the country will continue to be handled by the Board of Commissioners of Currency. The interest received by the Board on their sterling assets is to be credited to a No. 1 account. This particular arrangement is to operate until October 31 next, after which the interest received by the Board on their sterling assets is to be credited in the first instance to their No. 2 account.

* * *

News on the Gold Drain

The drain on the gold reserves was one of the many subjects raised during the House of Commons debate on the Whitsuntide adjournment. The Economic Secretary to the Treasury, in answering accusations that capital transactions had involved excessive losses of gold, gave some interesting information about the policy which is being followed to curtail drawings on the common gold and dollar reserve and to limit the running down of accumulated sterling balances. The Government has been striving for several months to achieve a co-operative effort among all members of the sterling area to limit their purchases from dollar and other hard currency countries, and they have met with some success. Mr Jay was able to announce that "the outflow of gold and dollars on account of other parts of the sterling area has been very much lower in the last two months than previously."

The results which the Government had hoped to see in January and February have, in fact, appeared in April. Agreements have now been made with practically all sterling area countries limiting their drawings on their accumulated sterling balances. Attempts are also being made to exercise the strictest possible exchange control round the sterling area—but without any attempt to apply compulsory methods "which would threaten to break up the sterling area and, perhaps, the Commonwealth." Mr Jay admitted that the loss of over £1,000 million of gold and dollars last year was excessive, but deprecated undue emphasis on that part of the drain to other members of the sterling area. Out of that £1,000 million, more than £675 million, he said, was spent on account of one member, namely, the United Kingdom, and it behaved critics not to use exaggerated language about the gold and dollars that had been "lost" in supplying other members of the area from the common pool to which they had equal rights with the banker himself.

* * *

Israel's Sterling

The termination of the British mandate in Palestine has been followed by a further tightening up of the payments arrangements with that country. Last February Palestine's sterling balances, amounting to some £100 million, were blocked, but arrangements were made for £7,000,000 to be released to supplement current accruals of sterling and to enable Palestine's sterling needs to be met during the period up to May 15th. Further releases were also agreed upon to finance private imports of food for consumption during the few weeks after the termination of the mandate. No further general releases from accumulated

balances can be allowed since no effective central exchange control authority now exists in Palestine. In order to meet urgent and essential needs the British Government have decided to consider applications for releases from individual banks, submitted through their correspondents in the United Kingdom to the Bank of England. Before approving such applications the authorities in London will have to be satisfied that the funds are required for a proper purpose and that the payment cannot be met out of current sterling earnings. The Bank of England has already agreed to the release of sterling in order to meet commitments under confirmed credits opened before May 15th. The Government will discuss more permanent arrangements with Palestine as soon as circumstances render this practicable.

Monetary arrangements with Palestine remain unchanged for the time being. The Currency Board in London is still prepared to provide currency against payments in sterling from No. 1 accounts. The Currency officers in Palestine are operating under some difficulty, but Palestine banks are taking over all the necessary arrangements and are even prepared to take delivery of currency in London and arrange for its transport to Palestine. The present troubles were clearly anticipated by the local banks, which supplied themselves with ample cash resources.

* * *

Electricity Charges

In the last fortnight the Electricity Boards in the North-West, South-West, London, Eastern, Southern, Yorkshire and East Midland areas have announced higher electricity charges in some districts. In the South-East and North-East areas no general increases are expected, and in South Wales no immediate increase. Under the terms of the Act the areas are not financially autonomous, and their statements of policy merely reflect that made by Lord Citrine on May 6th. Briefly, domestic and non-industrial tariffs are being adjusted upwards in districts where trading losses have been or would be made at the existing charges. In many such districts losses have been going on for some time and have eaten into reserves. Industrial and bulk supply tariffs usually include a "coal clause," under which charges increase when the cost of coal increases; domestic charges were frozen by the Electricity Commission during the war, though some increases have since been made.

So far there has been no general policy of equalising electricity charges between districts, though some of the anomalies are being tidied. Where the flat rate has exceeded 6d. a unit it has been brought down to that figure, and where the unit charge under a two-part tariff was less than 4d. it has been increased.

Lord Citrine has forecast a further revision of tariff policy for the country as a whole. Area boards have been asked to report on their finances, the consideration of which may take some months. Some of the problems which the British Electricity Authority will have to solve are already clear. Is the domestic price of electricity reasonably related to the industrial price? Electricity suppliers should consider not their average but their marginal costs, in particular the cost of installing and operating sufficient capacity to meet the peak load—in which domestic consumption represents a disproportionate share. Should the Authority equalise charges between districts? How will it apportion its capital costs between the different areas? Will it pursue rural electrification in defiance of the economic justification for differences in price between town and country? These are some of the problems. That Lord Citrine envisages an aggregate deficit for 1948-49 is not a reassuring sign that they will all be solved.

* * *

Endurance Test on the Gas Bill

The Gas Bill, which was regarded when it first appeared as among the less controversial of the Government's measures for nationalising industry, has proved a dark horse. It has given the Government a remarkable amount of Parliamentary trouble, and caused Mr Herbert Morrison, at the Labour party conference, to speak of "foolish, old-fashioned, nineteenth-century obstruction." In short, Mr Morrison thought the Tories were filibustering. He went on to utter the threat that if the Tory obstructionists wanted to go on with this kind of "foolery," which was contrary to the working of Parliamentary institutions, they were asking for more reforms of Parliamentary procedure.

The Standing Committee on the Gas Bill concluded its proceedings at the end of last week after thirty-six sittings and, in the closing stages, it sat almost continuously for fifty hours. Clearly the Opposition was being difficult. But if this was "foolery," it was foolery with a purpose; the Opposition wanted modifications in the Bill, and sometimes concessions which cannot

be obtained by persuasive reasoning can be obtained by threatening the Parliamentary timetable. Many of its amendments were accepted, and it claims that the future control of the gas industry will, as a consequence, be more efficient and less political than it promised to be.

In the most controversial aspect of all, however—the compensation clauses—the Bill has not been substantially changed. So far as the gas companies are concerned, the difficulty of getting a fair basis of valuation of their stocks has not been overcome. For stocks which are rarely dealt in, market quotations are very little guide to their true value. Many stocks without a quotation will have to go to arbitration. Local authorities will fare worse than the gas companies; in general, they will merely be relieved of any indebtedness which they may still be carrying in respect of their gas undertakings. A municipality which has been thrifty will, therefore, lose any money which it has devoted to paying off its debt. A city which refused an offer of a million pounds for its gas undertaking before the war may not be very pleased to get £200,000 for it today. The Bill provides for £2,000,000 to be distributed among local authorities as "further compensation in respect of severance," but this will not go very far. What happens if another deserving case comes to light after the £2,000,000 has been apportioned? The clause seems unreasonably rigid.

* * *

Rhodesia's Gold Subsidy

The Southern Rhodesian budget for 1948 includes one highly debatable feature: the payment of a subsidy of £1 7s. 6d. per ounce on all gold produced in the territory. Under the Gold Mining Subsidy Act certain mines are already receiving a subsidy of £2 per ounce. These subsidies will be retained; but in addition, the price paid to the mines will be raised from the official price of £8 12s. 6d. to £10 per ounce. The subsidy will cost £695,000 and will be met by a special 10 per cent surcharge on income tax to be known as the Gold Industry Contribution. The subsidy was justified in the budget speech as necessary "to save the gold industry from disaster" and as the most direct and easiest way of increasing Rhodesia's much needed hard currency earnings. The budget speech explained that the Government had reached the conclusion that the only possible means of stimulating the gold mining industry lay in an increased price of gold, but that this could not be done directly "since our currency is linked with sterling." But, added the Finance Minister with some naivety "the same result can be achieved at the present time by a subsidy on all gold produced."

This is another case for the attention of the International Monetary Fund, whose edicts on the subject of gold subsidies can surely not have escaped the notice of the Southern Rhodesian authorities. The proposed subsidy would be in direct conflict with the ruling of the IMF on the subject, though it would be possible for Southern Rhodesia to conform with orthodoxy, as Canada did last year, by making the subsidy indirect and variable by granting it through a subsidisation of costs. Southern Rhodesia is not a member of the IMF but has a common quota with the United Kingdom. It will, therefore, be on British backs that the notes of protest from Washington will fall. Meanwhile, capital gains are raining on fortunate owners of Rhodesian gold mining shares which this week have provided one of the features on the Stock Exchange.

Free Sterling in Europe

Although the bulk of business between the United Kingdom and countries outside the "scheduled territories" is financed at the official rate of exchange, a growing volume of trade and financial transactions is taking place at rates below \$4.03 to the £. What is the business and what are the rates?

There are, broadly, four distinct rates for this unofficial business: notes, T.T., inland payments and security sterling. To take the quotation of a pound note in terms of Swiss francs or dollars as a fair measure of the value of sterling is nonsensical. The discount is determined by the degree of illegality attached to exporting and importing notes, and the valuation placed upon the notes in comparison with the local currency. No note can stand at par when, like the pound note, it takes two smuggling operations—apart from any others en route—to complete the circuit. Moreover, as a means of settling trade transactions a note has severely limited usefulness. Sterling notes in Switzerland are quoted at Sw. fcs. 10.55 to the £ against the official rate of Sw. fcs. 17.34. Since the Italian elections, they have risen in value by nearly 10 per cent, but they are still at a heavy discount of 38½ per cent. On the other hand, dollar or escudo notes can be quoted at T.T. rates because

"As every schoolboy knows...."

In Macaulay's time, perhaps, every schoolboy did not know that intelligence seldom comes in of its own volition; stories of the last war, however, have made us all familiar with the fact that a flow of information must be organised. THE ECONOMIST has devoted much care to the organisation of its information service, which now covers the chief countries of the world and the principal fields of economic activity. This information and our research facilities can be made available to firms and other organisations through:

The Economist Intelligence Unit

22, Ryder Street, St. James's, London, S.W.1.

TELEPHONE: WHITEHALL 1511, EXT. 13

Switzerland, Portugal and the United States place no restrictions on note movements.

The inland payment rate is not countenanced by the big Swiss banks in any way. Business is transacted on the basis of "If you pay X in London, I will pay Y in Zurich." The rate is about 11 francs to the £—a little higher than the note rate because the smuggling risk is eliminated. Business done with Britain is very small, but with many other countries its volume is believed to be considerable. Fourthly, British Government bearer bonds may be purchased legitimately in Switzerland and New York at a rate of \$1.80 to the pound, against \$2.50 a few months ago. To import securities a Bank of England licence is required—but the uses to which such sterling may be put in this country are restricted in most cases to switching operations, from which South African securities were recently excluded. This rate also reflects a growing disinclination in the United States to invest in British securities. Gilt-edged can be purchased on a 7 per cent yield basis despite the fact that interest and dividends—being currently earned sterling—are convertible at \$4.03 to the £.

Sterling for Exports

The discount on sterling held by foreigners in London in terms of dollars is more significant. This is reflected in T.T. rates for foreign account sterling. The main "market" for such sterling is in Switzerland, unencumbered by exchange control, and well equipped with an excellent banking system, and arbitrageurs whose skill has not become rusty by years of enforced idleness. Sterling held in London on Italian, French, Dutch or Belgian account may be purchased at a cross rate of \$3.35 and sold for \$3.25. The Bank of England will not sanction transfers of such sterling from one foreign account to another foreign account. Nor may the foreign banks hold sterling in their own names. Thus, in order to deal, they have to match buyers and sellers, but the seller of such sterling does not draw directly on his balance to pay for, say, the dollars he is buying. Instead, he merely hands over a sterling cheque to the seller of dollars who can use the proceeds to pay for goods bought in Britain. As far as the Bank of England is concerned, there is no possible means of checking any change in the beneficial ownership of such sterling, and it does not change its nominal owner until it is paid to a British exporter. Sterling thus acquired in sufficient volume could undermine the official rate of \$4.03 to the £ simply because it can be used to purchase exports in Britain. For example, a Dutch or Italian trader may use his American or Swiss connections to obtain sterling cheaply against dollars; he then purchases goods in Britain, ships them to his own country, re-exports the goods to the U.S.A. and thus liquidates his dollar loan. Actually, it is difficult to see how the foreigner operates without contravening his foreign exchange control. But the net

effect is that the Bank of England might have earned these dollars; instead it must be content with the cold comfort that French, Belgian, Dutch or Italian sterling claims have been reduced. It is even conceivable that enterprising British exporters may find dollar guarantors, who have access to foreign account sterling, to sell their wares for them in the American market and thus obtain a higher sterling price for themselves or obtain an entry into the American market, by this devious route, at a competitive dollar price.

Another source of free sterling is the so-called Swiss controlled pound. This is sterling obtained from dividends and interest on British securities payable to Swiss residents. Since it is currently earned sterling, it is available either for purchases of goods in Britain, or is payable in Swiss francs at the official rate. However, for various reasons, transfers of such sterling have quadrupled since the war, and are now running at over Sw. fcs. 175 million. As a result, the Swiss National Bank is now prepared to accept only a limited amount of such sterling in each quarterly period. Accordingly, investors in Switzerland who cannot or do not want to wait can sell their sterling in the free market at a cross rate of \$3.52-3.60.

There is hope—and a lesson—in all these commercial transactions. Free as opposed to black market sterling is acquitting itself well. The discount is 70 cents or 17½ per cent—not an excessive margin in relation to the higher cost of shipping goods to the United States by roundabout routes. If it requires a reduction of only 17½ per cent to enable certain British goods competing in the American market, it should not prove impossible to effect this reduction by means other than devaluation of the pound. It would also indicate that merchants and industrialists are still not making sufficient effort to sell in the American market, perhaps because their sterling earnings are higher and obtained with less effort by selling in "softer" markets.

Shorter Note

Trade negotiations have been concluded with Spain and the proposals submitted to both Governments for approval. The agreement was expected to be signed this week, and it governs the course of trade and payments between the Sterling Area and Spain over the next 12 months. Total trade between the two countries is expected to expand from £25 million in 1947 to £80 million. Spain will provide Britain with potash, pyrites, iron ore, olive oil, fruit and other foodstuffs. Britain will send in return 750,000 tons of coal, machinery, chemicals and electrical goods. Spain has also agreed to grant import licences on "non-essential" British exports to a much wider extent than before. Payments up to March 31, 1949, will be governed by the Monetary Agreement signed in March, 1947. The Supplementary Monetary Agreement of June, 1947, will be abrogated, but Spain will remain inside the transferable account area.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports appear in the Supplement: John Summers and Sons; Associated Portland Cement; Morris Motors.

Redemption yields on stocks optionally or finally redeemable within the next five year														

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 5 per cent will be redeemed at the earliest date (these are marked *), and those paying 5 per cent or less will be repaid at the latest date (marked †). (a) Net yields are calculated after allowing for tax at 9% in the £. (f) Flat yield. * Assumed average life 15 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2½ per cent free of income tax. Yield worked on 15 per cent basis. (g) Fifteen months to March 31, 1947 (yield basis 7.6 per cent.). (h) To latest redemption date. † Free of tax.

Insurance = valuable net "Invisible Export"

Extract from Statement issued by Mr. P. R. England
Chairman of the Royal Insurance Company Ltd.
in connection with the Company's 102nd Annual Report.

The cry, insistent and unrelenting, is for ever increasing exports. I emphasise once again the tremendous value to this Country of the invisible export represented by our overseas operations. The vital emphasis is, of course, on hard currency earnings, particularly dollars, and I record with pride that, since 1940, the "Royal" and its Associated Companies have contributed remittances of no less than forty million dollars to this Country's economy...

The Royal Insurance Company has spared no effort to rebuild and develop its business in territories overseas, and in dollars, kroner, pesos, lire and many other currencies, the fruits are gathered in from all quarters of the earth.

RAND MINES, LIMITED

(Incorporated in the Union of South Africa)

GOLD MINING INDUSTRY'S PROBLEMS

INCREASING COSTS; LABOUR AND MATERIAL SHORTAGES

SERIOUS EFFECT OF STRIKES

MR W. H. A. LAWRENCE'S SURVEY

The annual meeting of Rand Mines, Limited, was held on the 7th instant at Johannesburg.

Mr W. H. A. Lawrence, the chairman, who presided, said that before commenting on operations of the company during the past year he would like to draw the attention of shareholders to certain alterations which had been made in the method of presenting the annual accounts. Reserve accounts were now shown individually, and those accounts formerly grouped under the heading of creditors accrued liabilities and contingency reserves were consequently segregated into the shareholders' contingency reserve, trustees of the Corner House pension fund, creditors and provisions, and contingency reserve. The amount standing to the credit of the latter account at the beginning of the year had now been transferred to the new provision exploration reserve account. To facilitate reference, comparative figures for the previous year were shown in the margins of the accounts.

PROFIT AND DIVIDENDS

The profit earned during 1947 and transferred to the appropriation account had amounted to £573,369, which was £9,798 less than that for the previous year. Two dividends of 35 per cent. and 45 per cent. respectively declared during the year had absorbed £430,199, which together with other appropriations shown in the accounts left £105,079 to be added to the unappropriated balance of £1,011,900 brought forward from the previous year. The amount realised by the sale of investments and freehold property had exceeded their book value, and amounts written off as depreciation by £25,290 and following the usual practice that sum had been added to the investment reserve account. At December 31, 1947, that account had stood at £3,962,124.

Investments in shares and debentures had been brought into the account at a total book value of £4,930,506, being an increase of £216,003 over the figure for the previous year. Investments for which share market quotations were available appeared in the books at or under cost, but in no case above the relative market price at December 31, 1947. Unquoted securities had been entered in accordance with a conservative valuation placed upon them by the board and in no instance at valuation exceeding cost. Where it appeared prudent to do so, the book value of holdings had been written down below cost and below market value. It was evident from the schedule of investments published in the annual accounts that the market value of quoted securities largely exceeded the total book value of all securities mentioned in the balance sheet.

ADVERSE FACTORS

Throughout the year under review the Witwatersrand gold mining industry had continued to be faced by problems arising from the high and increasing costs of production, shortages of labour and materials and the necessity for rectifying the generally depleted ore reserve positions of various mines. In addition, operations had been seriously affected by another strike of European miners which had lasted for a period of about seven weeks from January 27, 1947.

As in the case of the strike which had taken place a year previously, that strike had arisen through internal dissension within the ranks of the Mineworkers' Union and had been in no way directed against mine managements. The effect on profits, which had already been diminished by rising costs, had been none the less grave, and several of the mines had suffered working losses during February and March.

EFFECT ON OPERATIONS

The results of operations of producing companies of the Witwatersrand gold mining industry reflected the adverse effects of those various factors. Tonnage milled had decreased by over three million tons to 53,712,300 tons.

Working revenue had decreased by £6,500,000, but owing to a contraction in the scale of operations, total working costs had been lower by £1,600,000, although the cost per ton milled had increased by a further one shilling to 26s. 7d. per ton. There had consequently been a decrease of £4,900,000 in the total working profit. Those results, however, reflected only a portion of the retrogression which had been taking place over the last five or six years. At the recent annual meeting of the Chamber of Mines, the president had given certain figures showing how severe that retrogression had been since the peak period of 1941-42.

COMPARISON WITH PREWAR POSITION

It was also of interest to examine the postwar position of the industry in 1947 as compared with the prewar position in 1938. There had been little difference between the tonnages milled in each of these two years, and it was therefore possible to compare production figures per ton milled. Working revenue, in spite of an increase of 21 per cent. in the price of gold, had increased by only 11 per cent. from 31s. 1d. per ton to 34s. 7d. per ton, due to the lower grade of ore milled.

Working costs had increased by 38 per cent. from 19s. 3d. to 26s. 7d. per ton. Segregation of costs into customary categories showed that white wages, including cost-of-living allowances, had risen by 66 per cent. (from 5s. to 8s. 4d. per ton); coloured wages, excluding costs of housing and feeding, by 25 per cent. (from 3s. 8d. to 4s. 6d. per ton); cost of stores by 35 per cent. (from 8s. 4d. to 11s. 4d. per ton) and "other costs" had risen by 7 per cent. (from 2s. 3d. to 2s. 5d. per ton). As had been said so often, such increases in costs of production were particularly serious in the case of the gold mining industry, because, unlike other industries, the producer could not compensate for them by raising the price of his product. In most industries the price of the product fluctuated, but was more or less equivalent to the cost of production plus a fixed percentage representing profit.

In other words, a more or less fixed percentage of the selling price of an article was absorbed in costs of production. That was not the case with the gold mines, and the position was that working costs per ounce of gold produced, which excluded such charges as capital expenditure, silicosis, outstanding liabilities and taxation, had risen from 62 per cent. of the price of gold in 1938 to 77 per cent. of the price of gold in 1947.

LABOUR SHORTAGE

The shortage of labour on the mines might be gauged from the fact that the native labour force was now 100,000 less than the peak of 380,000 early in 1942. The European labour force in December, 1947, had been 38,776 compared with 46,243 in December, 1941. The ever-increasing demand for labour by secondary industry and by non-producing mines of the Witwatersrand and Orange Free State was having a very serious effect on the labour force of the producing mines. This was particularly severe in the case of the deep mines of the Central Rand, where mining conditions were least attractive and which were situated in an area where demand for labour by other industries was greatest.

Discussions were at present taking place between the Government, industry and employees regarding the demands of the mining unions' joint committee for increased wages, shorter hours and other benefits. The meeting of those demands might have some favourable effect on the European labour supply but the gold mining industry was unfortunately in the anomalous situation of having to meet a large proportion of the increased wages of secondary industry by paying higher prices for the equipment, stores and materials which it purchased, when it was in no position to increase earnings of its own employees. Mining operations continued to be restricted by shortages of materials, particularly of such basic requirements as steel and cement, and by the slow delivery of plant and equipment on order from overseas.

RESTRICTIONS AND SHORTAGES

As far as the gold-mining industry was concerned, steel was now in shorter supply than at any time during the war, and it would seem that there could be no permanent solution to the problem until the expansion programme of I.S.C.O.R. was completed. The cement position would probably be eased in due course when the various cement companies were able to increase their output, but that would also take time. Meanwhile, those restrictions, coupled with the European and native labour shortages, made it impossible for the gold-mining industry to push ahead at adequate speed with its long overdue development requirements. Although development work had been increased considerably since the war, the total footage accomplished by producing mines during 1947 had still been 13 per cent. less than that driven during 1938. That was not a very encouraging position in view of the urgent necessity to rectify the generally depleted ore reserves of the mines.

Ore milled by the twelve Witwatersrand mines of the group during 1947 had totalled 16,546,690 tons, which was 552,410 tons less than during the previous year. The average yield of gold per ton milled had increased by 0.148 dwt. to 3.902 dwt. Working revenue, including special declarations, had increased by £127,162 to £27,981,968, while working costs had decreased by £326,726 to £21,890,547. Consequently, there had been an increase of £453,888 in the working profit, which had amounted to £6,091,421. The amount distributed in dividends had been £3,595,837, an increase of £377,278 over that for 1946. Taxation had decreased by £448,074 to £1,377,259. Lease consideration had increased by £82,021 to £153,888. Development accomplished had totalled 464,909 feet, a decrease of 4,194 feet.

ORE RESERVES

The available ore reserves of those mines at the close of their respective financial years had amounted to 49,478,500 tons, which was a decrease of 1,196,600 tons compared with the estimates made the year previously. It should be noted, however, that those group figures had been materially affected by the improved results obtained during 1947 at Blyvooruitzicht and East Rand Proprietary Mines, where working

profits had increased by £1,084,121 and £513,394 respectively. The serious effects of the shortages of labour and materials and disruption of operations caused by the strike of European miners were therefore not so apparent as they might have been.

The average number of Europeans employed by Witwatersrand Mines of the group had decreased during the year by 502 to 12,435, while the average number of non-European employees had decreased by 3,460 to 93,077. The health record of native employees had shown that there had been a small increase in the morbidity rate from disease and accident. What was of more importance, however, was that the mortality rate from disease had decreased from 3.15 per thousand in 1946 to 2.99 in 1947, and deaths from mining accidents had fallen to 1.29 per thousand. Shifts lost per native per annum due to disease and accidents had shown a further decrease from 5.73 to 5.57.

SILICOSIS LIABILITIES

The present value of silicosis outstanding liabilities of mines of the group was £5,663,523, a decrease of £116,581 compared with 1946. The eleven mines affected had provided, with accrued interest up to the end of 1947, a total of £4,664,445 towards meeting that liability. Geldenhuis Deep, Limited, had ceased normal mining operations during the year and had met its final assessment of £341,986 in respect of silicosis outstanding liabilities from funds already provided for the purpose. Over and above the amounts provided to meet outstanding liabilities, mines of the group had paid out during 1947 a sum of £104,602 in respect of additional outstanding liabilities and £713,071 in respect of current silicosis costs.

Particulars of interests the company held in a number of Witwatersrand gold mining companies outside the Central Mining-Rand Mines group were contained in the schedule of investments attached to the directors' report.

Results of operations at producing mines of the group in the Pilgrims Rest district of the Transvaal did not call for any lengthy comment. Glynn's Lydenburg, Limited, had declared dividends amounting to £26,250, which was £8,750 less than the previous year's figures. At Transvaal Gold Mining Estates, Limited, profits from mining had increased by £12,359 to £19,493 and from plantations by £4,106 to £113,565. Dividends declared by that company at £76,500 had again shown an increase over the amount distributed during the previous year.

INDUSTRIAL INTERESTS

The various South African industrial concerns in which the company was interested, such as coalmining, lime, pipe and cement manufacturing companies, had all been maintained in a sound position and had distributed satisfactory dividends. The Transvaal Consolidated Land and Exploration Company, Limited, had made good progress under difficult conditions with the opening up of Van Dyk's Drift Colliery. An incline shaft had been completed and equipped to its final depth of 1,513 feet on incline. The station layout was being installed. The station layout was being installed. The main east and west haulages were being advanced in coal of high calorific value and coal derived from that source had been sold during the year.

The erection of the Pretoria Portland Cement Company's new factory at Orkney was well advanced; extensions and improvements were being made at the Slurry factory and plans for expansion of the Pretoria and Johannesburg factories were being pushed ahead. Subsidiary and associated companies with factories at Cape Town, Port Elizabeth and in Rhodesia were also actively pursuing their expansion programmes.

The Hume Pipe Company (South Africa), Limited, and its subsidiary Hume Steel of South Africa (Proprietary), Limited, had also had successful years. The Hume Steel Company's new factory at Wadeville, near

Germiston, was now in production and should be completed shortly.

NEW O.F.S. GOLDFIELD

The task of opening up the new goldfield in the Orange Free State was being resolutely pursued, but the difficulties inevitably associated with an enterprise of such magnitude were being enhanced by lengthy delays in delivery of essential plant and equipment from overseas. Eight mining leases had been applied for and sinking was in progress at nine shafts. The railway line from Whites to Odendaalsrust had been opened to limited traffic. Electricity supply mains were connected to some of the mines, and a pipeline was being constructed by the irrigation department to convey water from the Vaal River.

The principal gold-bearing reefs had not yet been penetrated by any of the shafts and the potential value of the Free State mines remained to be established by reef development. Borehole values had been good in the proved area but problems associated with depth, heat and faulting have yet to be elucidated. The company's holdings in various Free State companies were shown in the balance-sheet. Exploratory work by means of borehole drilling outside the proved area had continued during the year, and the two main centres of interest were now in the Ventersburg area and in the area to the south of the Vaal River, near Klerksdorp. The company had interests in numerous Free State options held by the Central Mining and Investment Corporation, Limited.

Recently some of those options had been abandoned over farms in extent of 26,350 morgen, principally in Brandfort and the Parys-Vredefort area, as preliminary drilling and prospecting had shown that those areas held little or no promise. On the other hand, the Central Mining and Investment Corporation, Limited, had taken up new options over 51,519 morgen, principally in the Winburg and Ventersburg districts. The company had been offered and had accepted interests in those options.

RESIGNATION OF MR J. MARTIN

It was with profound regret that he referred to the resignation at the end of last year of Mr John Martin from the Board of Directors, after being associated with the company since 1926 and having been its chairman since 1930. His retirement from the gold mining industry after such a long and intimate association with the direction of its affairs had been a severe loss, not only to the company and to other companies of the Corner House group, but also to the mining industry as a whole.

His sound judgment and wise counsel would be greatly missed, and the directors wished to record their very high appreciation, endorsed, he knew, by the general body of shareholders, of Mr Martin's outstanding services to the company throughout the many years he had taken a leading part in administering its affairs.

TRIBUTE TO MANAGEMENT AND STAFFS

In conclusion, the chairman said he would like to pay tribute to the valuable and loyal work done by the head office staff of the company and by the managers and staffs of the mining and other companies of the group. He would also like to express appreciation of the services rendered during the past year by their London Secretaries, Messrs. A. Moir and Co.

A report of the proceedings at the meeting would appear in the Press, and copies could be obtained on application to the head office in Johannesburg or to the London Secretaries.

The report and accounts were adopted.

ROYAL EXCHANGE ASSURANCE.—We regret that in a heading in the report of the Chairman's speech, in our issue of May 1st, the dividend was stated to be 30 per cent. This should have read 35 per cent.

CITY DEEP, LIMITED

(Incorporated in the Union of South Africa)

EFFECT OF MINERS' STRIKE

MR G. V. R. RICHDAL'S SPEECH

Mr G. V. R. Richdale, chairman, presided at the annual meeting of City Deep, Limited, in Johannesburg, on the 5th instant.

The chairman said shareholders would have noticed that with the object of giving them a more easily comprehensible picture of the company's financial position some alterations had been made in the method of presenting the accounts. The shareholders' contingency reserve and abnormal costs reserve (previously called renewals and replacements reserve) were now shown separately in the balance sheet while, to facilitate comparison, figures relating to the previous year had been included in the accounts.

LOSS OF TONNAGE AND REVENUE

The strike of European miners which had taken place during the first quarter of the year and the shortage of European and native labour which had continued throughout the period under review, had affected operations at the mine very adversely and had caused a serious loss of tonnage and revenue. The net profit had been £283,840. Dividends had absorbed £224,812, provision for taxation had amounted to £1,517, net expenditure on capital account had been £8,648, provision made in respect of silicosis outstanding liabilities had totalled £9,240 and there had been a transfer to the shareholders' contingency reserve of £900.

Capital expenditure incurred during the year had amounted to £39,438 and had been mainly in connection with winding equipment for No. 5 shaft, where a permanent hoist was now erected and functioning satisfactorily. Against that amount there had been offset sales of property and plant which had realised £30,790.

FOOTAGE DEVELOPED

Footage developed during the year at 33,632 feet had been 2,015 feet more than in the previous year. Work carried out had been mostly on the Main Reef Leader horizon, satisfactory values being disclosed in the western and central areas of the mine. As areas available for development in the western section were becoming limited, increased work had been done to the east between Nos. 1.F. and 1.D. incline shafts but values here had been again disappointing. No payable values had been disclosed in the Main Reef but increased south reef development, mainly in upper levels of the No. 1 shaft area, had opened up a small tonnage of payable ore. Exploratory borehole drilling and development on Pyritic Quartzites east of No. 1 incline shaft had exposed some encouraging values but no payable blocks had yet been proved. Total payable ore developed during the year had amounted to 488,000 tons, valued at 7.1 dwts. per ton. That represented a decrease of 221,900 tons compared with the tonnage developed during 1946, the value being 0.6 dwt. higher.

The available ore reserve had been re-estimated at December 31, 1947, to be 3,125,000 tons of an average value of 6.4 dwts. over a stopping width of 40.3 inches. Available reserve showed a decrease of 193,000 tons compared with the previous year's figure, the value being 0.4 dwt. higher and the stopping width 0.8 inch less.

He had informed shareholders at last year's meeting that the board had applied for undermining rights of an additional area, equal to about 472 mining claims, adjacent to the southern boundary of the present

mining area. That application was still under consideration by the Mining Leases Board who were fully aware of the need for urgency in that matter. It was expected that they would reach a decision in the near future.

PRICE OF GOLD

The price of gold had remained unchanged throughout the year at 172s. 6d. an ounce fine. There had been no alteration in the taxation position in so far as profits earned during the first six months of 1947 were concerned, but with regard to the latter half of the year the Government had not yet disclosed its taxation proposals.

A report of the proceedings at the meeting would be published in the Press and copies could be obtained on application to the head office in Johannesburg or to the London Secretaries.

The report and accounts were adopted.

CROWN MINES, LIMITED

(Incorporated in the Union of South Africa)

IMPROVED DEVELOPMENT FOOTAGE

MR A. J. WALTON'S SPEECH

Mr A. J. Walton, chairman, presided at the annual meeting of Crown Mines, Limited, in Johannesburg, on the 5th instant.

After reviewing operations, the chairman said that total profit for the year had been £627,053. Provisions in respect of silicosis outstanding liabilities had totalled £65,072, provision for taxation had accounted for £12,446, forfeited dividends refunded had amounted to £77,532 and dividends declared during the year had absorbed £518,684.

CHANGED FORM OF BALANCE SHEET

Shareholders would notice that the form of the company's balance sheet had been altered slightly to show as separate amounts certain items which in previous balance sheets had been grouped under one heading. Those items were: Shareholders' contingency reserve pending claims for dividends forfeited since 1939 as a result of conditions brought about by the war, creditors and provisions, and abnormal costs reserve (formerly reserve for renewals and replacements). In addition, comparative figures for the previous year were shown in the margins of the accounts.

Net capital expenditure on equipment during the year had amounted to £135,443. There had been, however, a credit of £301,760 in respect of sales of property, thus leaving a net credit of £166,317 on account of capital expenditure for the year.

At the last annual meeting reference had been made to the strike of European miners which had occurred during the early months of the year. That strike had extended from the end of January until the middle of March and had so affected operations at the mine that for the months of February, March and April the total working profit had amounted to only £299.

SHORTAGE OF LABOUR

The average numbers of European and native employees at work had shown a slight improvement over the period, but had been far below the requirements of the mine. That shortage of labour, which was common to most mines on the Witwatersrand, was responsible in a large measure for the curtailment

of operations at the mine and the consequent reduction in profits.

Development accomplished during the year had totalled 88,074 feet, which was an improvement of 1,398 feet compared with the figure for 1946. On the other hand, at 49,315 feet the footage sampled on the reef had been lower by 855 feet while the payable footage showed a reduction of 9,960 feet, with a slight improvement in the average inch-dwt value. Payable ore developed had amounted to 1,783,000 tons with an average value of 5.9 dwt per ton, which represented a decrease of 334,000 in tonnage and an increase of 0.6 dwt in value in comparison with relative figures for the previous year.

The available ore reserve as re-estimated at December 31, 1947, had been 10,146,000 tons, with an average value of 5.0 dwts over a stopping width of 47.5 inches. That was a decrease of 746,000 tons on the previous year's figure; the average value was greater by 0.1 dwt and the stopping width was 0.3 inch less. The continued decrease in ore reserve might be attributed to several causes, chief of which were the shortage of labour, lack of sufficient development ends and the decrease in payable development footage. The available ore reserve had decreased, by 11,194,000 tons since the end of 1939, and the number of stope faces available for production continued to be inadequate for the most economical working of the mine.

APPLICATION FOR FURTHER RIGHTS

As reported at the last annual meeting, an application had been submitted to the Mining Leases Board for undermining rights of an additional 992 claims, which would extend the southern boundary of the property to a point where it was estimated the vertical depth of the Main Reef Leader was approximately 10,000 feet below the surface. If that additional area was obtained it would enable development footage to be increased, provided there was sufficient improvement in the labour position.

Taxation for the year had amounted to £12,446, being a reduction of £458,767 on the figure for the previous year. That improvement was due to the decrease in profits and increase in the amortisation allowance to 22½ per cent. of the balance of unredeemed capital expenditure at the end of each year. That relief had been most welcome, and in existing circumstances with heavy capital expenditure still required to open up the reef at great depth, it appeared to be unlikely that the company would be subject to high taxation for some time.

Capital expenditure for the current year had been estimated at £360,000 and would be chiefly on account of the air-cooling plant at No. 16 shaft, winding equipment for underground incline shafts, and additional pumping equipment.

RESIGNATION OF MR JOHN MARTIN

At the close of the financial year under review, Mr John Martin, who had been a director of the company since July, 1926, and chairman since November, 1935, had tendered his resignation from the board and that had been accepted with great regret. Mr Martin's services to South Africa and the mining industry were well known and had been outstanding during the difficult times through which the company had passed. His sound judgment had been invaluable in the conduct of the company's business and his advice and guidance would be greatly missed by his colleagues on the board who wished to record their very high appreciation of Mr Martin's services throughout his long association with the company.

A report of the proceedings at the meeting would appear in the press and copies could be obtained by shareholders on application to the head office of the company in Johannesburg or to the London secretaries.

The report and accounts were adopted.

THE EMPLOYERS' ASSURANCE CORPORATION, LIMITED

RECORD FIGURES

The sixty-seventh ordinary general meeting of The Employers' Liability Assurance Corporation, Limited, was held in London, on the 19th instant, The Right Hon. Lord Courtauld-Thomson, K.B.E., C.B., the chairman, presiding.

The following is an extract from his statement circulated with the report for 1947:—

The greater part of the enhanced figures arises from the natural growth of our business, but the balance is the consequence of the establishment of the new par of exchange for United States and Canadian dollars of \$4.03 to the £ in place of \$4.86. Our total premiums, at £12,727,990, showed an increase of £3,890,116 on the figures for 1946 and were the largest we have ever reported, even excluding the adventitious increase of £1,758,096 resulting from the revision in the rate of exchange. The increase comes to us from all parts of the world and from all our principal classes of business and represents to a considerable extent, particularly in the United States, the effect of increased rates on lines whose past results more than justified higher premiums.

The fire account continues to show considerable growth in volume, and the premiums of £863,795 were £194,869 in advance of those for 1946, but the profit of £37,642 did not at 4.4 per cent. reach the standard to which we have become accustomed. Greatly increased damage by fire has been the subject of much concern in many parts of the world.

The bulk of our business is, as usual, in the accident and general account, in which we had for 1947 a premium income of £11,864,195. There has been a distinct improvement in the experience of our casualty business in the United States, with the result that we are once again able to report a profit on the transactions included in this account, although it is a very modest one at £104,608.

THE PIONEERING SPIRIT

In the United Kingdom workmen's compensation assurance in its existing form will under present arrangements cease in July next, and I cannot let this occasion go without a word of regret at its passing. The Employers' Liability Act became law in 1880 and it was to provide an insurance service for the benefit of employers, who were thus faced with new liabilities, that the Corporation was then formed. As other countries in their turn passed similar legislation, so did the Corporation extend its activities and become the pioneer of employers' liability assurance in the United States and other places abroad, as it had been in the United Kingdom.

It is from this modest start, in one particular class of insurance and in an entirely new field, that the Corporation has grown to its present position in the insurance world, transacting, either directly or through its associated companies, every main class of insurance—fire, accident, life, marine and aviation. The pioneering spirit originally shown by our founders is still, we feel, part of our tradition, and we shall, I hope, ever be ready and willing to undertake fresh commitments or to break new ground.

Our associated company, The Clerical, Medical and General Life Assurance Society, has once more produced record results, with total new business of £4,456,923, an advance of £748,954 on the figures for 1946. The operations of The Merchants' Marine Insurance Company, Limited, continued on the more favourable lines evident in recent years, and The Aviation and General Insurance Company, Limited, is showing a similar development and operating on a profitable basis.

The report was adopted.

IMPERIAL CHEMICAL INDUSTRIES, LIMITED

DEMAND STILL EXCEEDS SUPPLY

PROFIT AND DIVIDEND

The twenty-first ordinary general meeting of Imperial Chemical Industries, Limited, was held in London on the 20th instant, the Right Hon. Lord McGowan, K.B.E., D.C.L., L.D., the chairman, presiding.

The following is an extract from his circulated statement:—

The year 1947 was a difficult one for production, and it was a tribute to the effective work of your company's employees that we were able, to a considerable extent, to meet the pressing demand for our products in spite of the difficulties of maintaining production at the highest level. The demand for many of our products has exceeded our ability to supply. In a number of cases we have been forced to introduce rationing schemes for the home trade. With the important exception of alkali, production of the company's major products was higher than in the previous year.

We are doing our utmost to maintain the company's direct exports at the maximum level, both for the sake of the balance of payments, and in order to keep in operation the extensive and valuable selling organisations which the company has built up in so many parts of the world. We estimate that, by volume, our direct exports in 1947 showed an increase of 26 per cent. over those for 1938. In spite of shortage of supplies, currency difficulties and related import restrictions, our overseas companies were, in general, able to maintain their trading activities at a satisfactory level, even in such countries as China, India and Palestine.

The construction of new plants proceeded as fast as the difficulties of the economic situation and the shortage of manpower and materials would allow. By prewar standards, however, the rate of progress has been painfully slow. In view of the importance of our products as basic raw materials for home industries, and also as direct exports, it is hoped that our rate of expenditure on new construction and equipment in 1948 will be somewhat higher than in 1947.

RESEARCH AND DEVELOPMENT

Research continued on about the same scale as last year, but the difficulties associated with the erection of new manufacturing units is leading to a change of emphasis. Rather more attention is now being paid to long-term projects, which are unlikely to lead to the construction of new plant for a number of years.

More time, too, is being devoted to the study of fundamental scientific problems, the solution of which can be applied to our chemical and metallurgical manufacturing processes at a later stage. The search for new therapeutic substances for the control of diseases, such as malaria and sleeping sickness, is being actively pursued. Our discovery of the anti-malarial drug "Paludrine" has received very welcome recognition. In the plastics field we are pursuing our development work on plastic optical components. We have increased our facilities for the experimental production and evaluation of new synthetic fibres, and our latest work on the polyester "Terylene," in which world-wide interest has been expressed, confirms its early promise. In the field of dyestuffs, we have made another important discovery in "Alcian" Blue.

During the year the company further developed its schemes for the education and training of all categories of employees. Relations with the trade unions have been maintained on the basis of a frank understanding of our respective problems.

Once again, we have every reason to be proud of the loyalty and zeal of our employees both at home and overseas and on your behalf, I should like to thank them all for their co-operation during the past year.

Total gross income for 1947 is £25,207,846 compared with £22,490,032 for 1946, an increase of £2,717,814, but if the amounts included in the respective year's income which belonged to previous years are adjusted the increase in gross income is nearly £4,000,000. The total consolidated sales turnover has risen from £118,000,000 in 1946 to £137,000,000 in 1947.

Net consolidated income is £8,290,859 for 1947 compared with £7,552,606 for 1946, an increase of £738,253, after providing in full for taxation to be borne by the companies concerned. Net income carried to the company profit and loss account is £7,646,933 for 1947 against £7,171,109 for the previous year.

The final dividend recommended on the ordinary stock of the company is 7 per cent., making with the interim dividend of 3 per cent., a total of 10 per cent. for the year. This is the same total distribution as for 1946 though for that year it was split as between a dividend of 8 per cent. and a bonus of 2 per cent. The board see no need to continue to declare part of the total dividend as bonus. The amount of £1,000,000 is appropriated to revenue reserve (general).

THE OUTLOOK

While I remain an optimist about this country's future I must emphasise the importance of facing squarely the grave difficulties which now confront us. Our Government has shed the easy optimism of its early days. Now I am thankful to say that greater emphasis is being placed upon hard facts, with much wider publicity. In the Economic Survey for 1948 the Government recognise that Britain—and the same is true of Western Europe—cannot by herself alone recover the prosperity of prewar days. Further substantial external aid was essential if we were to maintain our industries and no more than our present austere way of living. That aid has now come, in the enactment by the United States Congress of the European Recovery Programme.

The struggle to sell our goods overseas will become more and not less intense. The paradox of our position is that while our task abroad will be more arduous, at home we have a continuous pressure for higher incomes, more leisure, more amenities and better conditions. Our land and our manpower are limited. Unless we reason from the facts and mend our ways, we shall learn through bitter experience. This is the battle of output—quality output, competitive output. We can only cancel the losses we sustained by war by more and more productive power per man/year.

PRICE REDUCTIONS

It has been our policy throughout the war and since to keep our prices as low as possible. To comply with the wishes of the Chancellor of the Exchequer for a reduction in prices, we are in process of reducing our home prices for selected products with a view to achieving reductions which should amount to more than £1,000,000 over the next twelve months. On the other hand there will be increases in the prices of some of our export products. Despite all the uncertainties, I believe that so far as your company is concerned the coming year will find its productive resources fully occupied. I believe that we shall maintain and in some directions sharpen our competitive powers. There will be no slackening in our efforts to meet the demands that are made upon us.

The report was adopted.

BRITISH ENKA

RECORD PRODUCTION

The twenty-third ordinary general meeting of British Enka, Limited, was held in London on the 13th instant, Mr A. D. Carmichael presiding.

The following are extracts from the chairman's statement circulated with the report and accounts:—

The working profit for the year 1947 amounted to £348,361, and the net profit is £104,986. The board recommends a dividend on the stock of 7½ per cent., less income tax.

In February, 1947, we suffered a severe setback, caused through the fuel crisis. Despite this, we succeeded during the year in producing more yarn than ever before, and the directors consider the results very satisfactory.

EXPORTS

Nearly 40 per cent. of our product is exported either directly as yarn, or in fabric form. The rayon industry has been set one of the highest percentage export targets in the country for 1948, and I believe it will be achieved. It is important to recognise that the amount of imported raw material used in producing rayon yarn is very small, and that therefore exports of rayon goods are of the greatest value in providing foreign exchange. The excise duty was repealed in May, 1947, and the reduction in price was immediately passed on to our clients.

It has been a matter of concern that for a considerable time costs of labour and raw materials—pulp, chemicals, fuel, etc.—have been rising steadily.

If all goes well, the production from the new machinery should commence in the second half of this year. We can only, however, expect to feel the benefit in a limited way during 1948. The directors' proposals for completing the financing of this expansion will be put forward in due course. Demand continues good, both at home and abroad, and our expansion scheme should help us effectively to meet the competition which certainly will face us in the coming years.

INTIMATION FROM A.K.U.

Addressing the meeting, the chairman said: I have only one observation to add to my statement, which was circulated with the annual report. The item in the balance sheet as at December 31, 1946, of £146,445 for patents, secret processes and other rights at cost includes the consideration paid for certain long-term agreements with the Dutch company (A.K.U.) dealing with technical advice and the mutual disclosure of secret processes. Your directors have been advised that, as a result of the occupation of the Netherlands by the German Forces, some of these agreements may have been abrogated by operation of law on the ground that A.K.U. became a "statutory enemy." Pending clarification of this situation, which may involve the negotiation of new agreements, your directors have deemed it prudent to write down the value of these assets to £1, by the transfer of £49,651 from the special capital reserve which was created on the recent reduction of your company's capital, £51,399 from the share premium account and £45,394 from profits.

I have to report that early this week I received from the Dutch company (A.K.U.) an intimation that they had decided to discontinue rendering technical services to your company. My colleagues and I are giving careful consideration to the situation which arises as a result of this intimation and are discussing the matter with the Custodian of Enemy Property. I am sure that shareholders would not wish me to say more on this subject at today's meeting.

The report was adopted.

WILLIAM BEARDMORE AND COMPANY, LIMITED

AMPLE LIQUID RESERVES

Sir James Lithgow, Bt., the chairman of William Beardmore and Company, Limited, presiding at the company's annual meeting in Glasgow, on the 19th instant, stated that during the year under review the demand for all the company's commercial products remained strong. Conditions of uncertainty and frustration still obtain. It may well be that 1948 will be a year of disillusionment. Until the illusion of industrial prosperity by legislative action is dissipated it will be difficult for boards of companies to see clearly how best to conduct their affairs.

The recent Budget shows little signs of financial disillusionment. The transfer of the burden of taxation from the shoulders of those who have been accustomed to spend all they earn, or to earn only what they can spend, to the shoulders of those who by habit and instinct have been accustomed to save is not likely to check inflation. Capital punishment is no substitute for production encouragement.

A company which does its profit and loss account by drafts from reserves of the past and loans from competitors of the future cannot be in a position to maintain much less increase its dividends. That is what capital levy plus Marshall aid add up to.

An increase in our national production in the widest sense is our urgent need. Restrictions on output are an immediate obstacle. He hoped he saw signs of the exposure of a dangerous illusion. The public have been

led to believe that restrictions have been placed upon production as a matter of policy by organised industry. We are now being advised that trade unions are guilty of this practice.

CAUSES OF RESTRICTIONS

The restrictions from which we are suffering today arise from two main causes. In the first place, there is the natural instinct of the human being only to work his hardest when he feels the need to do so. In the second place, there is the organised restriction of output by associations of people who object to the more energetic being allowed to do more than their more easy going fellows, resulting in a dull mediocrity. Restrictions are defended by such people on the false grounds of spreading employment to avoid unemployment and of guarding against exploitation. Fear of unemployment is more likely to stimulate the individual to greater efforts to retain his job than to slacken to spin it out.

It can only be hoped that we do not require to wait until the miserable process of supply exceeding demand exerts the economic pressure associated with the old system which we all felt was capable of improvement in an enlightened and prosperous community.

After commenting upon the figures shown in the accounts and indicating the difficulty of making firm forecasts in regard to the future, the chairman concluded by stating: "Your company is in good shape and with its ample liquid resources is well able to maintain its outstanding position in its own particular trade, in addition to being well placed to take advantage of any opportunities that may arise for further expansion and development."

The report and accounts were adopted.

THE MERCHANTS' MARINE INSURANCE COMPANY, LIMITED

GROWTH OF PREMIUMS

The seventy-seventh ordinary general meeting of The Merchants' Marine Insurance Company Limited, was held on the 19th instant in London, the Rt. Hon. Lord Courtauld-Thomson, K.B.E., C.B., the chairman, presiding.

The following is an extract from his circulated statement:—

In reviewing our operations during 1947, it will be observed that the premiums shown in the Marine account amount to £460,470, an increase of £82,736 over 1946. The claims paid in respect of 1947 and previous years amount to £332,340 and, after transferring £10,000 to profit and loss, the Marine Fund is increased to £686,985, which represents 149.2 per cent. of the premium income. The premiums in the Fire and General account amount to £85,768, an increase of £25,288, and the profit of £5,997 has been transferred to profit and loss account. The balance at the credit of the latter amounts to £30,512 and, after making provision for taxation, there is a balance of £25,512, which we carry forward.

The growth of our Marine premiums is not due to any increase in the rates of premium for the risks underwritten but mainly to greater volume of business transacted due to the derequisitioning by the Ministry of Transport of vessels previously uninsured, the general recovery in world trade and the greatly increased income from our agents abroad.

During the past year the Marine insurance market has shared with the rest of industry the difficulties of the world situation but, whatever the problems of the future may be, I am confident that the initiative of the British insurance market will, as it always has done, prove equal to the tasks it is set.

The report was adopted.

GOVERNMENT RETURNS

For the week ended May 15, 1948, total ordinary revenue was £55,705,000 against ordinary expenditure of £29,649,000 and issues to sinking funds £230,000. Thus, including sinking fund allocations of £1,004,000 the surplus accrued since April 1st is £146,613,971 against £167,602,655 for the corresponding period a year ago.

Applications to be made not later than the 30th May, 1948, to The Professor of Agricultural Economics, University of Reading, 7 Redlands Road, Reading, from whom further particulars may be obtained.

UNIVERSITY COLLEGE OF SOUTH WALES AND MONMOUTHSHIRE

COLEG PRIFATHROFAOL DEHEUDIR CYMRU A MYNWY.

Applications are invited for a Research Fellowship in Industrial Relations. The holder of the Fellowship will be expected to undertake study and research in Industrial Relations, Organisation, and Administration, and will also be required to undertake limited teaching duties in the Department of Industrial Relations. The Fellowship will be tenable from October 1st, 1948, for one year, but may be renewed for a further two years. The value of the Fellowship will be £400 p.a. Applications should be addressed to the undersigned not later than June 21, 1948.

(Signed) LOUIS S. THOMAS,
 Registrar.

Cathays Park, Cardiff.

UNIVERSITY COLLEGE OF WALES, ABERYSTWYTH

Applications are invited for the post of Assistant Lecturer in Economics (initial salary £450), or Lecturer in Economics, salary on the scale £500-£750 according to qualifications and experience. Applications should be sent to the Registrar, from whom further particulars may be obtained, not later than the 31st May, 1948.

RESEARCH OFFICERS IN SOCIAL AND ECONOMIC PROBLEMS

The Crawley Development Corporation invite applications from persons with suitable practical experience and academic qualifications, which should include a knowledge of statistics, for two posts, one senior and one assistant, which are in the first instance expected to continue for two years. Applications, giving full particulars and salary required, should be addressed to the Chief Executive, Crawley Development Corporation, 13, Grosvenor Square, London, W.1, so as to be received by first post on Monday, May 31st.

New Business Contacts

With its wide network of Branches, The Union Bank of Australia is able to give the fullest assistance to those seeking to establish new business relationships in Australasia. If desired, visitors so interested will be put in touch with importers and exporters of standing.

Full information is available on all aspects of industrial, commercial and social conditions throughout Australia and New Zealand.

Head Office:
 71, CORNHILL,
 LONDON, E.C.3.

Branches throughout
 Australia
 and New Zealand.

The UNION BANK OF AUSTRALIA LIMITED

Established 1837

THE VICTORIA FALLS AND TRANSVAAL POWER COMPANY, LIMITED

The Directors of the above Company make the following announcement. The negotiations which were mentioned by the Chairman at the last Annual General Meeting for the transfer of the ownership of the Company's undertaking in the Union of South Africa to the Electricity Supply Commission there have progressed to the point at which the terms of transfer may soon be embodied in a formal contract. This is now being drafted and will, when approved by the Electricity Control Board, be executed, provide for the final transfer being effected on June 30, 1948. The Directors anticipate with the information now available that in the winding up which will follow the transfer the Ordinary Stockholders should receive not materially less than the present market price of their holdings.

At the earliest date the Board will forward a communication to all Stockholders.

HEMEL HEMPSTEAD DEVELOPMENT CORPORATION

Applications are invited for the appointment of Senior Assistant (Research) in the Public Relations Department. Applicants should have had practical experience of social and statistical research into problems related to town planning and town development. B.Sc. desirable but not essential. The post will be under the supervision of the Public Relations Officer with considerable freedom of initiative. Commencing salary according to qualifications and experience within the range £550-£750 per annum. Some form of contributory superannuation will be provided. The person appointed will be required to work at the Development Corporation's office at Hemel Hempstead, and to reside in the locality. Applications giving particulars of age, qualifications and experience, together with the names of three persons to whom reference can be made, should be made in writing to the undersigned and endorsed "Research Assistant," to arrive not later than 7th June, 1948.

Westbrook Hay,
 Hemel Hempstead, Herts.

W. O. HART, General Manager.

LANCASHIRE COUNTY COUNCIL

COUNTY PLANNING DEPARTMENT

Applications are invited for the post of Assistant Planning Officer (Research) in the County Planning Department, at a salary of £1,060 rising by annual increments of £50 to £1,310 a year.

Candidates should possess a University Degree to the standard of first-class honours preferably in geography or economics, and should be fully versed in the problems arising from town and country planning. Experience in connection with the preparation of planning schemes or with a Government Department or planning authority will be an advantage.

The officer appointed will be on the headquarters staff at Preston. The appointment will be subject to the terms and conditions of the National Joint Council and to the Local Government Superannuation Act, 1937.

Testimonials are not required, but applicants should give the names of two persons who can testify to their character and ability.

Applications stating age, qualifications and experience should be received by the undersigned not later than Saturday the 29th May, 1948.

R. H. ADCOCK,
 Clerk of the County Council.
 County Offices, Preston.
 May 6, 1948.

War by Proxy?

SUDDENLY, in the last ten days, the coherence and good sense of Western diplomacy, which had increased steadily in the last year, have been shattered. Since Mr Marshall's Harvard speech in June, 1947, a pattern of policy has been emerging in the Western world which carries with it the hope of stability and peace. It has aimed at the close collaboration of the United States with the sixteen nations of Western Europe in European reconstruction. It has aimed at a concerted attitude towards Russia compounded of strength and reasonableness. It has within it the germ of a wider collaboration, the collaboration of the whole non-Communist world, first to achieve balance and equilibrium with the Soviet Union and later, on the basis of the new equilibrium, to seek possibilities of contact and collaboration.

In all this, the fact has emerged more and more clearly that a close Anglo-American partnership is the condition of all the rest. Without it, there could be no genuine co-operation in Western Europe, no hope of a world-wide consolidation of the forces of free men; and it is precisely at this central pillar of stable and successful Western diplomacy that the events of the last two weeks have dealt so violent a blow. Since the outbreak of war in Palestine, a tornado of unreason has unleashed itself on the relations between Britain and the United States. In New York and in Congress strident voices accuse the British of every kind of perfidy for their—supposed—determination to back Arab against Jew. In Britain, the inevitable reaction of anger and obstinacy has set in and, as tempers rise and irrevocable things are threatened, the main purposes of both American and British foreign policy are lost to sight.

For let there be no doubt about the consequences of the present crisis. If it is allowed to develop unchecked, the Americans will raise their arms embargo in order to supply the Jews with weapons; and if Britain continues to fulfil its contracts to the Arabs and to maintain its special relationship with the military forces of King Abdullah, Britain and America will, in effect, be fighting each other by proxy in the Middle East. Such a situation will instantly affect the wider field of foreign policy. If the British and the Americans fight each other in Palestine, they will not collaborate anywhere else. It may be that Zionist opposition can hardly prevent the passage of appropriations under the European Recovery Programme this year. But there are three or four more appropriations to come before the full four years of the Plan are accomplished. Their chances would be slender indeed if last week's anti-British bitterness in New York and Washington were to be fanned month after month by a continuing "Anglo-American" war in Palestine. Under these conditions, the policy of rebuilding Western Europe would, of necessity, peter out. With equal necessity, a failure in Western Europe would end all hopes of collaboration in other continents. The Soviet Union, as *tertius gaudens*, would once again face a Western world impoverished, disorganised and, above all, bitterly and hopelessly divided against itself.

Such an outcome to the present trend of events is at once so possible and so sinister that there can be only one aim in Anglo-American diplomacy—to stop the drift at all costs. This is no time for polemics.

It is obvious that President Truman is irresponsibly playing domestic politics. It is notorious that sections of the Foreign Office are strongly pro-Arab. But it is no use concentrating on these irrational factors if a crisis is to be checked which emotion and unreason have already carried almost beyond cure. The question now is not to decide who is right but how to avoid irreparable damage to Anglo-American relations.

*

The first problem is to enter into the closest and most direct consultation that can be achieved with the United States Government. To those who protest that nothing can be achieved with a vacillating White House, the answer must be that there are other elements in the making of American policy, notably the State Department, and that the accident that during this crucial fortnight Britain has been without an Ambassador in the United States has undoubtedly helped to widen the breach between London and Washington. This is the more unfortunate in that many American officials inside and outside the State Department are aware of the dangers of the President's partisan politics. The national interest of the United States demands that the Arab lands, in which lie the world's oil reserves, strategic positions of vital importance, and landing rights of the great airways, should not be driven into implacable hostility. American officials are aware of the fact that, in proposing action under Article 39 of the Charter of the United Nations, their Government has gone much too far and may, if a method of retreat is not worked out, find itself obliged to propose economic sanctions against the Arab States—thus jeopardising Western Europe's oil supplies under ERP—and even to propose military action against the Arabs. There can be no doubt that a section at least of the American Government is seeking to withdraw from its present exposed position. It is with this group that the British Government can make its first efforts to retrieve the Palestine situation.

A second possible point of contact is at Lake Success. Opinion in this country underestimates the hold of the United Nations on the imagination of the American people, and probably the only way in which the volatile President could be constrained to pursue a consistent line would be if that policy had been worked out and agreed within the Security Council, and had on it the official stamp of the United Nations.

But even if there are points at which close consultation between Britain and America can be initiated, the question remains whether there is a single policy upon which both sides can agree. There appear to be only four possible outcomes in

Palestine. The first is that Arab and Jew should negotiate and agree without outside intervention—which is ruled out. The second is that the Great Powers should intervene to impose a settlement—but none of them, with the possible exception of Russia, is prepared for such a direct intervention and there is no agreement on the settlement that should be imposed. The third—the infinitely dangerous situation which exists today—is that the fighting will continue, different Great Powers supporting different sides as they did in Spain. The fourth is an agreed and vigorous attempt to localise the fighting, to prevent all outside intervention in the hope that, in the shortest space of time, a balance of forces will emerge in Palestine itself. Clearly it is only in this fourth alternative that any hope of an agreed Anglo-American policy can be sought.

In this search to localise the struggle by achieving Great Power neutrality, the British might well take the first step. Nominally, the United States is neutral so long as it continues to maintain its arms embargo. Britain is the Power which today, through its Arab contracts and subsidies and its officers and military missions involved in the Arab war effort, at least appears to break the strict letter of neutrality. The only hope of securing a continuance of American neutrality lies in a decision by Britain to suspend its military commitments to the Arab States that are involved in the fighting in Palestine, and thus to make its own total withdrawal from the Palestine conflict clear beyond doubt. If Britain took the initiative in proposing a general arms embargo, a general agreement on non-intervention and a general convention on the status of volunteers serving on either the Jewish or the Arab side in Palestine, it is likely that the Americans would agree to negotiate, and it is possible that the Security Council would snatch at the chance of agreement after the futilities of the last weeks.

It is not easy for the British to take the first step. Their friendship and their treaties with the Arabs are of long standing. The blame for developments in Palestine can legitimately be laid in large part at the Zionist door, and it is the Zionists that are now using every device of insult and vilification to shift the responsibility solely on to Britain. In these circumstances, patience and reason tend to be at a discount. But the first aim of all diplomacy must surely be to see that the lesser interest does not dwarf the greater. To propose general neutrality in the present conflict may involve Britain—and America—in some sacrifice of past relationships and future hopes of oil and bases. Yet can this on balance be set against the supreme objective of maintaining Western solidarity and securing its base in close Anglo-American relations?

Commonwealth and Western Union

EVEN before General Smuts gave his broadcast last Sunday, there were big ideas in the air about the role that the nations of the British Commonwealth and of Western Europe might play if they organised themselves as a third world power. Americans had discussed with Canadians and Belgians the idea of an Atlantic union or community, stretching from the North Cape to the Cape of Good Hope. Mr Bevin had told the Labour Party conference that his policy was to "harness the Commonwealth and those overseas territories for which we are responsible to the skill, ability and productive capacity of the West." Mr St. Laurent had expressed the Canadian hope that a "collective security league of free states might grow out of the plans for Western Union" now maturing. And General Smuts himself had already sketched out his vision of a "super-group" of nations which might hold the balance of power in the global rivalries of the Soviet Union and the United States. There would thus seem to be a powerful reaction away from the hesitations that the proposals for Western Union had earlier

awakened, from the timid idea that the Commonwealth tie might be a leash around Britain's neck in its leadership of Western Europe and from its equally timid counterpart, the fear that British commitments to Western Europe might loosen the bonds of the Commonwealth. To these ideas there is succeeding the bolder and more fruitful conception that an association between the United States, Britain, the Commonwealth and Western Europe can be achieved through new and existing regional arrangements for security, trade and political collaboration.

This horizon-scanning by Commonwealth statesmen can of course be harmful as well as useful. It is good that people in Britain and the Dominions should be made to think—if only for a moment—about the new power relationships of the post-war world, and about the effort that must be made by the British and their allies if America and Russia are not indefinitely to stand face to face in a broken Europe. On the other hand, it is bad that every fresh sweep of the horizon, every speech

on bold and imaginative lines should be allowed to distract officials and ministers from the need to make the practical decisions and plans of which policies are formed. To expatiate on ways of organising power is no substitute for its exercise. It will be bad too if statesmen in Europe and the Commonwealth should think that it is the main purpose of such declarations to *épater les Communistes*, and that it is not necessary for fine phrases to have any practical meaning. Yet on balance it is a good thing that, within the space of six months, Mr Bevin and five Dominion statesmen have either approved, or developed, or analysed, the basic idea of present British foreign policy: that there must be built up between America and Russia—and against neither—a new world power built around Britain's position within Western Europe and within the Commonwealth.

*

It would be a mistake, nevertheless, to imagine that all is now plain sailing for the United Kingdom as between the two concepts of Commonwealth and of Western Union. An atmosphere of good will has been created, but the practical problems remain. Those problems are of two kinds, corresponding to the two purposes that Western Union is intended to achieve. In its political and strategic aspects, Western Union involves wider and more explicit commitments by the United Kingdom than have ever been given before, and the Dominions wonder how far they too will be morally and contingently committed, and whether Britain is going further than they would wish to follow. And on the economic side, they ask whether the "integration" of Western Europe is going to cost them the favoured position they have hitherto enjoyed in the British market.

The strategic argument should not be too difficult to resolve. The Dominions' hesitation is natural. Though they would always accept the logic of the argument that Great Britain cannot dissociate itself from what happens in Western Europe, and though they were willing, twice in a generation, to spill their blood in a quarrel that started in Europe, nevertheless, distance alone is sufficient explanation for their tendency, at any one moment, to wish to stand aloof from the problems of Europe. There were no more enthusiastic supporters of the prewar British policy of refusing commitments and appeasing the dictators than the Dominion Governments. It is an attitude which has flourished for centuries in Great Britain itself and is not yet dead—"we know we cannot keep out in the end, but we will make up our minds about it when the time comes." In Australia, this general instinctive feeling is reinforced by another no less natural tendency to require that the Pacific should receive some of the thought and of the resources that are devoted to Europe.

But, though these feelings are natural, they will all give way to the manifest fact that the greatest dangers to the world's

peace, and to the security of the Commonwealth, are in Europe. Nobody can really argue that the Brussels Pact creates a commitment that did not exist before. It formalises the oldest and most permanent commitment in British foreign policy. It does not create new tasks for Britain so much as create means whereby an existing task can be more efficiently discharged. Moreover, if some closer defence association in Western Europe is—as it appears likely to be—a stepping stone to an American underwriting of the commitment, the last hesitations ought to disappear.

There is, in fact, no reason to suppose that the Dominions do not heartily approve of the Brussels Pact. This is not to say for a moment that they would join the Pact, open though it is to them. Written commitments in Europe are as far from their thoughts as ever they were. The development and interweaving of regional security schemes which might involve them in such commitments still lie beyond the range of present debate. Canada has military obligations to the United States under the North American Defence Pact of 1940. Australia and New Zealand are bound together by their Pacific defence agreement of 1944. Otherwise the British Dominions have no military commitments beyond their own immediate spheres of interest. Their defence policies still rest on the tacit assumption that a united Commonwealth would resist aggression against any member of it. The form that assumption takes has somehow to be understood and accepted by those continental peoples with which Western Union is to be achieved, and they should note that it was defended again recently by the Canadian Minister of External Affairs, Mr. St. Laurent, who said:

We should continue to resist, as in the past, efforts to reduce to formal terms or specific commitments this association, which has demonstrated its vitality through the common understanding on which it is based.

*

The economic argument is more difficult. The Dominions now enjoy a preferential status in the British market which has been of great value to them in the past and will be so again when markets, rather than sources of supply, once more become a matter of major concern. (It should not be forgotten that the United Kingdom also enjoys preferences in the Dominions and would not like to have to forgo them.) Clearly, the value of any preference is lessened if it is diluted; more than this, in some instances it is precisely against the products of the countries of Western Europe that the imperial preference has hitherto been of greatest value. Nevertheless, it should not be by any means impossible to devise means whereby Great Britain can play a real part in the closer economic association of Western Europe, without doing harm to any of the important economic links of the Commonwealth. There are a number of commodities that no Commonwealth country produces, or would export to Great Britain, where a preference could be given to Europe. A preference on steel, for example, in some

or all stages of manufacture, might play an important part in European integration, and would injure no Commonwealth interest. Even where there is a direct clash of interests—as in bacon and butter, for example—there may be ways and means of adjustment through the device of bulk purchasing. The Dominions might be content to share their preferential status in the British market if they were promised an assured market either for stated quantities or for stated proportions of total British imports. Observers from the Dominions have been present at the discussions of the customs union study group set up as part of the OEEC organisation and once they have convincingly reported to their governments that there is no thought in London of abandoning the Dominions for new loves across the Channel, these practical measures can be worked out. It may not in every respect be easy for Great Britain to be a member of both clubs without disloyalty to either. But there is no reason why it should be regarded as impossible.

★

There is no doubt that misunderstandings and suspicions of this kind can only be cleared up in direct conversations between British and Dominion Ministers. Present methods of consultation in London are no substitute for the kind of personal exchanges which, say, Mr Chifley would wish to have with Sir Stafford Cripps. But the most urgent reason for beginning such direct conversations is that ideas in Whitehall about Western Union—even about the implementation of the Brussels Pact—are far less clear and advanced than Dominion cabinets imagine. And a major reason for this state of affairs is the opinion, so often heard in London, that progress must only be made at the pace of the slowest Dominion.

Mr Attlee has recognised the need of direct consultation, and efforts are now being made to assemble a Commonwealth conference before the year is out. Presumably it will be preceded by bilateral talks and by the most careful preparation: if not, it will raise more difficulties than it will settle. For 1948 is no

ordinary year in Commonwealth history. Ceylon has become and will remain a Dominion. India and Pakistan will decide this year whether they will retain the Dominion status they have enjoyed for ten months. Whatever their decision, the new situation in the Indian Ocean—the last preserve of the *pax Britannica*—would call for a conference of Commonwealth ministers on diplomatic relations, on security, on defence, and on communications. And if India and Pakistan did decide to remain Dominions, their policies and problems alone would test fully the good temper and flexibility of the present Commonwealth relationship. It would seem inadvisable therefore that this particular set of problems and that which concerns Britain's new policy in Europe should be tackled simultaneously in a full Commonwealth meeting. Whereas a start can be made now with the problems of Western Union, nothing can be done about the others until India and Pakistan have made and executed their decisions for the future.

It seems probable that these two tests of Commonwealth statesmanship will in fact be kept separate, and there is no doubt which should have priority. A decision on the Commonwealth attitude and contribution to Western Union and a clarification of Britain's interpretation of these words are both most urgently needed. Critical months lie ahead. It is possible—indeed probable—that Russian policy will cease for a time to provide that impetus of fear which has driven Western governments so hard in the past winter. It is of the utmost importance that British and Commonwealth policy for western Europe should become single-minded, explicit and determined. For there are doubts on the Continent and in the United States about Britain's capacity to play convincingly the dual role which events are thrusting on it. A clear vote of confidence in Western Union from the Ministers of the British Commonwealth would enormously strengthen Mr Bevin's position, remove the main grounds for the diffidence of his advisers, and—most important of all—convince the United States that its money is on a winner.

Long-Term Economic Problems—III

Capital Shyness

THE first article in this series argued the thesis that the British economy, if it is to be solvent and progressive, needs to secure a considerable increase in its rate of capital creation. But the second article pointed to the major difficulty in the way of such an increase—the fact that the rate of savings, already lower before the war than would be necessary to sustain an adequate rate of capital creation, will almost certainly be discovered, when the transition from war to peace is completed, to have been still further reduced.

In this third article, another order of difficulties will have to be examined. Even if the savings were forthcoming, it cannot by any means be taken for granted that they would actually be used to finance the creation of productive capital equipment. Low as the prewar rate of savings was, it still tended to be more than adequate to cover the volume of capital creation that was actually undertaken. Moreover, of the capital investment that was undertaken, an impartial observer from outside would almost certainly say that too high a proportion consisted of forms of capital that are not directly productive. Houses and public buildings, though desirable things to have, contribute very little, or only indirectly, to increasing the material output of the nation. Highways are a little better in this respect; but the really productive investments are those in industrial plant and equipment, and of this kind of capital creation there was lamentably little before the war. Clearly, there would be no point, and much positive harm, in trying to in-

crease the rate of saving unless the willingness to invest the national savings in productive capital increased with it. No amount of demonstration on paper that the national interest requires more capital will achieve anything until there is some change in the circumstances, whatever they were, that kept the willingness to use capital in productive investment down to such low levels in the inter-war years.

Why was there so little productive capital investment before the war? Why were the managers of industry so reluctant to use even the inadequate flow of savings available to them, whether from the thrift of the general public or from their own undistributed profits and depreciation funds? The proximate answer is that they did not find it worth while, and since British industry before the war was almost entirely in private hands, this can only mean that the profits to be derived from capital creation did not sufficiently outweigh the risks. But this does not really make any progress in answering the question; it merely repeats it in another form. Why was British industry so capital-shy? Why was it content to allow its technical standards to decline so badly, as it is now recognised that they did?

In some part, the answer must be found in the attitudes and aptitudes of the managers themselves. Undoubtedly, between the wars, depression and slump-mindedness fed upon each other. The typical British industrialist came to believe that there was no expansibility in his market, that he was living in a static economy. The factor that the academic economists

call the elasticity of demand was almost banished from the calculations of business men. Yet it is the great dynamic factor of any economy and most of the great forward bounds of industrial productivity have been taken when some pioneer was willing to explore the response that the market would make to better products offered more cheaply. Clearly any economic system that is settling down to a static fatalism has very little occasion to discover better ways of making things and very little use for new equipment so long as the old equipment will hang together. Moreover, the progressive banishment of competition from British industry, the gradual spread of cartel-mindedness, powerfully reinforced the same tendency. In a competitive industry, any pioneer who re-equips his plant and explores the expansibility of the market can make all his competitors follow suit—or go out of business. In a cartelised economy, he can be brought to book and compelled to toe the line. Any competent accountant will always be prepared to demonstrate that it cannot possibly pay to instal a new machine, since it would have to bear not only its own capital charges but also the unamortised cost of the machine it replaces. The doctrine that progress does not pay attained an astonishing dominance in the inter-war years; Lord Stamp was particularly fond of expounding it. And where he led, who can blame the ordinary industrialist for following suit? He would read his accountant's memorandum, turn the machinery salesman away without an order, and insist on his trade association fixing prices that would cover the costs of continuing to produce on old machines. There is perhaps an element of caricature in this picture; but not a large one. It is certainly true that if the British economy between the wars had been a competitive one, it could not possibly have afforded to neglect its equipment as it did. Nor perhaps could it have neglected as badly as it did the methods of recruiting and training its industrial managers. Quite a large part of the backwardness of British industry is due to the fact that large sections of it do not know what good management is or what a good manager looks like. How can a firm keep up to date when none of its directors understands its own technology?

The managers of industry carry the major responsibility and it is therefore right that their own defects should be put at the head of the list. But they could very justly retort that, even when a good manager appears in British industry, he is not given a fair chance either by the state or by the trade unions. The tax collector was never willing, throughout the inter-war years, to permit the depreciation of plant at anything like the speed that is technically desirable. And the trade unions have consistently used their power to slow down the rate of technical progress. This they have done in two ways. The first is either to put an absolute veto on labour-saving machinery (and what new processes are not labour-saving in their first impact?) or else to deprive it of all purpose by insisting that just as many men shall be employed with the new machine, even if they have to idle all day long, as were needed with the old. The second is by refusing to allow expensive machinery, new or old, to earn its keep by being worked more than one shift a day. The intensity of these prejudices has varied from industry to industry and from time to time. Patient negotiation can usually soften them; but the process is very slow and difficult, and it imposes a very severe brake on technical progress and productive capital creation.

★

Most of the reasons for capital shyness sketched above arise from the mental attitudes of different sets of people. They are a reflection of the general atmosphere of genial indifference to efficiency that pervades British industry; the roots of them are psychological and imponderable. This makes it very difficult to find any purchase for specific acts of public policy designed to correct the situation. Where the difficulty lies in public psychology and industrial atmosphere, there is little that

can be done by Acts of Parliament or administrative orders. This does not mean that nothing can be done. The Income Tax Act of 1945 was only a beginning of the necessary reform of the tax structure, and the next instalment is badly overdue. This year's Monopoly Bill may provide some raw material for the re-education of industry and the public.

But these and other such contributions, though hardly small, will be slow in their action. Can the state do anything else to increase the demand for savings—always supposing an adequate supply to be available? It can, of course, always initiate "public works," and this is likely to be very useful in smoothing out the flow of capital creation from year to year. But "public works" as usually conceived are not the sort of directly productive capital that is most needed and they cannot form more than a small part of a programme of expanded capital creation.

Will the spread of public ownership in industry lead to a greater rate of capital creation? Here again, the state's influence can usefully be exerted in favour of a steadier flow of capital expenditure. But each of the nationalised Boards has been instructed to balance its accounts, "taking one year with another," and they cannot be expected to undertake more capital investment than they think will pay. But the difficulty before the war was precisely that not enough investment offered a promise of paying. Can it be expected to pay a nationalised Board although it did not pay private owners? There are some reasons for thinking so. The Boards will be able to obtain their finance at lower rates of interest, and their monopoly pricing powers can be used to take some of the risk out of capital expenditure. But there are arguments on the other side too. If lack of competition was one of the chief reasons for lack of willingness to venture before the war, nationalisation is clearly more likely to make the position worse than better. And a politically appointed Board will be much more sensitive to the social obstacles to rapid technological progress than private boards of directors. It seems likely, on balance, that the Boards will reflect the prevailing philosophy of industry just about as faithfully as private managers—in fact, they will probably be even more orthodox.

There is thus very little escape from the awkward conclusion that what is needed is no less than a revolution in popular thought. Not much can be accomplished by the more mechanical acts of public policy until the psychological tide can be turned. When the other great issues of economic policy are taken up later in this series of articles, the same conclusion, in greater or less degree, will be found to emerge from each of them. The economic problems of Britain are, in the last analysis, one single moral problem, and it is intended, before the series is concluded, to set down some reflections that arise from this fact.

Meanwhile, it may be as well to insist once again that, however difficult it may be, the subject of capital creation is one that the British community will neglect at its peril. The easiest course, without doubt, would be to jog along with a high-consumption economy, saving very little and creating very little new capital. If Britain were a wholly closed economy, the results of so doing might not be very spectacular. Britain would simply become imperceptibly more and more backward in comparison with other countries and the increase in the standard of living of its people would gradually slow down. But Britain is not a closed economy; there is hardly another that is as open to the winds that blow in the world market. If Britain is not able to make the effort to increase its productive efficiency and its competitive strength, it will never be able to escape from its present dependence on the charity of others and the British standard of living will continue to turn, as it does now, on votes in Congress.

(This is the last of the group of articles dealing with the subject of capital creation. The series of articles on "Long-Term Economic Problems" will be resumed shortly.)

Coupons for Sale

(By a Correspondent)

IT is quite legal and quite simple. Nothing is needed but strength of mind and an empty garage—or a garage occupied by a saleable and dispensable automobile. The car, whether acquired *ad hoc* or already owned, sits in its garage from June 1st until, say, September. It is then licensed, receives its six months' allocation of petrol coupons, and is offered for sale; no mere car, but a car plus the appropriate gallonage of petrol, stored mobility, liquid independence, at a time when most second-hand vehicles will be, after the summer rush, legally dry or semi-dry. A car cum-petrol is obviously worth more than a car ex-petrol; the coming summer will show by how much. The proceeding being perfectly legal, there should emerge a genuine market price—a little difficult to calculate, it is true—per standard gallon; or rather, a market price for the right to buy a standard gallon, which at a guess will prove to be considerably higher than the black market rate (before the Motor Spirit Bill) of two bob a coupon. A little rough consumer research suggests a price of between 10s. and £1 a gallon.

The economics of the Right to Buy are fascinating, but difficult to reduce to rules. The original warranty of a Right to Buy used, of course, to be money, distributed between individuals in proportion to their skill in choosing the right parents, their qualifications and opportunities for rendering valuable services, their judgment in estimating public needs and technical possibilities and impossibilities, their propensity to work hard, their thrift, their charm, their venturesomeness, their reliability, their predaciousness, their ability to play poker, and their sheer blind unqualified luck. This distribution, in short, had certain irrational and ethically unsatisfactory elements, and still has; so that the distribution of real wealth following the exercise of this generalised Right to Buy has always presented a good many obvious discrepancies when compared with that corresponding to physical needs, moral merits, or the ideal assessment of the value of economic conduct. Hence progressive taxation, redistributory social services, death duties, and legislation to protect the consumer and supplement the inadequate conscience of the producer; all of which measures, however, left money unchallenged as the embodiment of the Right to Buy.

Nous avons changé tout cela. Money is still useful stuff; but over a vast field it is only one ingredient in the Right to Buy. This right is now splintered up into separate rights—rights to buy food of various kinds, to buy clothes, to buy chicken-food or steel or coal or new houseroom or petrol or the services of a foreign maid or orange juice or miscellaneous imports; and these rights are distributed, not on the general principles, whether more or less satisfactory, which govern the distribution of money, but on special principles appropriate to each particular right. The Right to Buy ordinary rationed food-stuffs is distributed universally; the Right to Buy orange juice and cheap milk is distributed according to age; the Right to Buy petrol or the services of a DP according to the size of one's car or family and to one's pertinacity, persuasive powers, and knack of wirepulling. The Right to Buy chicken-food depends on the possession of a piece of land on which, before the Flood, someone had elected to raise chickens, and the Right to Buy imported raw materials on the equally antediluvian history of one's previous importing activities. And so on.

The common feature of all these Rights is that they cannot be obtained, as money can be obtained, by the provision of money's worth. They are as essential as money, as desirable as money, but only exceptionally—as when land is bought for the sake of its chicken-food quota, or a derelict tailoring business for its coupon float—are they even indirectly marketable. One

can get a high place on the local council's housing list, and so approach the covered Right to Buy houseroom, by presenting a colourable picture of overcrowded squalor in one's present quarters; one cannot earn it by any amount of useful overtime. One can obtain the right to handle imported dried fruit by presenting proof that one imported dried fruit in 1939; one cannot obtain it by so reducing one's costs, or so improving one's final product, as to be able to outbid other would-be importers.

Occasionally a faint parallel can be discerned between the distribution resulting from control and that which would in the old days have resulted from market forces now rendered ineffective. The Right to Buy steel can be obtained on evidence of the dollar-earning properties of the product for which the steel is to be used; in the days of free trade, free prices, and free exchanges, the superior sucking power of the expanded dollar market and the decline of a deflated home market would probably have produced a not dissimilar effect. But the more general rule is that whatever the standards of distribution may be, they shall have nothing to do with the ability of the recipient to provide, in exchange for his Right to Buy, something freely demanded by the rest of the public. The wheels of history have been reversed; and Status has replaced Contract.

*

The result has been the creation of a mass of desirable assets, deriving from status, on which a money value can be more or less accurately set, but for which money cannot legally, or except by a fiction, be offered. Clothing coupons are worth roughly half-a-crown; strictly illegal. Petrol coupons, with car attached, are worth a sum which experience will determine; quite legal. In the first case, the black marketers' risk insurance, the existence of forgeries, and the variations of scrupulousness among consumers make the price an unreliable guide; but in the second, one may conclude that the controlled price of petrol plus the price of the Right to Buy represents a genuine market price, an equilibrium price—in so far as any equilibrium can exist in markets so imperfect.

The point is not merely academic. For the legal marketability of specific Rights to Buy could, in certain cases, be a handy halfway house between the strictly controlled personal allocation of those rights and the complete freedom of the money economy, and so a step on the way to dismantling controls. It allows a general control by the planning authority; conceding that free imports of petrol are impossible in the present state of the balance of payments, the total amount of specific Rights to Buy petrol can be kept down to the necessary limit, as they certainly could not be if they were merged in the general money demand. But it does allow the individual holder of a Right to Buy to set a value on it or dispose of it (at present through the clumsy method of buying or selling the car to which the specific right is attached) with certain limits, in accordance with his own tastes and needs. And simultaneously it sets working again, however jerkily and confusedly, the old and invaluable price indicator; the difference between the controlled price and the total price (including that of the specific Right to Buy) measures, as the controlled price alone has hopelessly ceased to do, the pressure of demand. Thus it indicates the direction in which (on the democratic assumption that the planners' business is to satisfy the consumers) the plan should, so far as possible, be modified in the future.

Obviously there would be administrative difficulties in making

specific Rights to Buy directly marketable. The black market is hard enough to control even when they are not; and the firm attachment of the Right to Buy petrol to a particular car is a precaution essential, in the absence of yet further administrative ingenuity, to prevent a kind of specific inflation (*via* the allocation to essential users) which would upset the whole precariously founded scheme for the restoration of the basic ration. Obviously, too, there are specific Rights to Buy which ought not to be made marketable in any way, direct or indirect. No one acceding to the idea of a national nutrition policy could favour the marketability of the Right to Buy cheap milk for under-fives. But leaving these aside, there remain a mass of Rights to Buy whose present distribution has nothing to do with a collective conviction that certain specific goods should be consumed by certain specific persons, nor yet with enforcement difficulties. The maintenance of Rights to Buy imports, either directly or from the official bulk purchaser, on the basis of a prewar quota which grows year by year more completely unrelated to any real, competitively established ability to serve the public, is a case in point. To make these rights marketable, either by the importers themselves or, through the technique of auction, by the import-licensing authority, would revive the competitive stimulus and do away at a stroke with a mass of feather-bedding; nor has any convincing reason ever been given for the official refusal to entertain such an idea.

Analysed, the official predilection for rigidly personal, rigidly specific, legally unmarketable Rights to Buy arises partly from the preference of badgered and overworked authority for the *status quo*, partly from a psychological phenomenon akin to that which makes a poor rider yank incessantly at the reins and a poor driver grip the steering wheel—an intense conviction that the darn thing will run away if given an inch of play—and partly from the profound and profoundly undemocratic aversion of Labour to “rationing by the purse.” With wearisome reiteration, with a never-failing triumphant air of having produced

an unanswerable argument, spokesmen counter any criticism of the rationing system by announcing that rationing is nothing new; that the system rationed the poor but did not ration the rich.

Of course rationing, in this sense, is nothing new; of course there never was a time of universal plenty; capitalist Britain was not the land of Cockaigne, where little pigs run around ready roasted. And equally, of course, the particular outcome of rationing according to the prewar distribution of incomes produced injustice and anomaly.

But apart from the siege-economy emergencies of warfare, apart from such generally agreed priorities as cheap milk for babies, the way to deal with these injustices and anomalies is by way of the redistribution of the general Right to Buy, that is, of money incomes; partly by direct State action, partly and more fruitfully by the opening up of opportunity and the breaking down of monopoly. The common-form obloquy heaped on “rationing by the purse” (that is, the free budgeting of individual incomes) the exquisite moral superiority attributed to rationing by authority (that is, the assignment of specific Rights to Buy) rest less on any logical foundation than on the deep distrust that official Labour seems to have for its fellow-citizens' judgment; an instinctive paternalism which, at its highest point of development, throws a sinister bridge between the Socialist and Fascist creeds. One can go so far as to say that the distrust of price is a hallmark of dictatorship. There must be no tampering with official allocations. Father knows best. The Duce is always right.

The dismantling of controls must, with the best will in the world, be a long and tricky business. But that process can be made both swifter and safer by a willingness to use price as a guide and to allow the pricing process out from under the counter into the light—a light if possible less imperfect than that which will be afforded in the coming months by the indirect marketability of petrol coupons.

NOTES OF THE WEEK

Squalls in the West

Relations in the West at the moment do not make a pretty picture. The French and Americans have wrestled one another almost to a standstill in the London conversations on Germany. French, Belgians and British are involved in complicated, technical but none the less damaging wrangles about their sterling position, on which French press comment is at the same time petulant and ill-informed. Mr Dalton, with his insistence that Socialism is the only hope for Western Europe, is trampling down the young grass of Western Union like a hiker in a hayfield. And there seems to be a general tendency to bicker and dally which may be not unconnected with the recent peace offensive from Moscow.

It is too early to say how the Marshall Plan's execution is affecting Europe, except that in France the Communists have been visibly embarrassed by an increase in the bread ration which 250 grammes and by the assurance that the yellow bread which gripped Paris this time last year will not reappear. American wheat may yet keep M. Schuman in power. The OEEC of the sixteen western governments is plodding on with its work in Paris, and the dollar import estimates are now being examined and adapted to American specifications for presentation on June 5th. Of the Brussels Pact little has been heard, as was to be expected in a period devoted to discussion of procedure and agenda.

But enough has been heard of happenings in the permanent military committee in London to cause provisional disappointment. It seems to be entering on to one of those vicious circles of discussion which result when Anglo-Saxons are confronted with French logic. How, the French appear to be asking, can we co-ordinate resources and defensive plans, commands and weapons, unless we have a strategy? And how can we have a strategy until we know what the American contribution to the defence of western Europe is likely to be? The argument is

elegant, but it is no answer to the American point of view, which is quite simply this: that the American contribution cannot and will not be proposed until the Brussels Pact governments have demonstrated their ability to make the best possible use of their resources by pooling them. The American argument is also excellent—in fact, it is precisely the argument used by Mr Marshall a year ago when he offered economic aid. It should not be difficult for the British to find, with American assistance, a way out of this kind of talk; provided that the French can show themselves a little less rebarbative in military matters.

* * *

Arabs and the Security Council

The Arab states have rejected the cease-fire resolution and the Security Council is now considering their alternative offer. This was first, that truce discussions be resumed in Jerusalem and, secondly, that the Arab League will study any suggestions the Council may make within 48 hours along the lines of a solution to the Palestine problem. What will the Council do? Leading up to its discussions is a chain of happenings which throw doubt on its competence to do anything at all. Since the partition resolution of November 29th, not a single important development in the Palestine question has been determined by the United Nations. It has been defied by the Arabs, used with cold opportunism by the Jews, and ten days ago it was informed by Mr Warren Austin that, so far as America was concerned, the recognition or otherwise of the disputed Jewish state was a question outside its competence. The weak and backward peoples of the world have received notice that armed force and the accomplished fact are still what count with the Powers.

The question whether or not America is to raise its Middle East arms embargo and lend \$100 million to Israel to buy arms in the United States has not yet been taken out of the

Security Council's competence. But the manner in which these threats were made known did much, in London's view, to stiffen the Arabs in refusing to cease fire. Both America and Britain have now indicated that they will await and abide by the Security Council's decision.

The signs are that the Council will not immediately be pressed by America to proceed to sanctions against the rebellious Arabs, who have not disguised their own wish for peace if it can be got with honour. This can hardly now be. The Arabs face humiliation in any case. The achievement of their armies in Palestine is inconsiderable. Even without an official American loan, arms are pouring in to the Jews, and what the Arabs are unable to do in these few days they will have small hope of achieving in any near future. But at least there is more prospect for negotiation than there was.

* * *

Britain's Future Role

The Arabs are not entirely friendless, and one longer term effect of President Truman's handling of this problem may be to line up Asia and Islam in a community of fear and hatred of the West. But their friends are almost as weak as themselves. On the Security Council, China is even less likely than Britain to use its veto. Russia and America are hostile, while France, the other permanent member, though allied with Britain in the Brussels Treaty, is traditionally anti-Arab in the Middle East. Thus the question is not whether the Arabs will be brought to heel but how. And this will depend on negotiations between Britain and America, rather than between the United Nations and the Arabs.

It is satisfactory to learn from Mr Bevin that only two British officers have been actually engaged in the fighting in Jerusalem and that these have now been sent back from the front. Of the 37 British officers in the Arab Legion, 16, including Glubb Pasha, are free agents, not under the orders of the British Government except so far as their duties as British subjects are concerned. The remainder are on secondment from the British forces. If the fighting continues in Palestine, it is certain that these at least should be withdrawn.

The consequences of present events in all the Arab countries are unforeseeable. At a moment of weakness in most of them, and near anarchy in many, they are being thrown back on themselves in a dangerous way. They face a continued deterioration of civil government until some leader emerges capable of carrying through the social reforms that are needed, or until they are taken in hand by some great Power. Britain has to decide whether to be that great Power, or, if its balance of payments does not permit, how far to cut its strategic losses, to give up its bases, and try to fall back on a purely commercial relationship with the Arab countries. This is not a decision which can be taken in one night or clearly executed, but in the long run it cannot be avoided.

* * *

Communist Failure in Finland

If the Finnish Communists thought that recent events gave them the opportunity of seizing control of their country, as their Czechoslovak colleagues did three months ago, they have now been disillusioned. They have failed to keep a communist in the Ministry of the Interior. How little intrinsic strength they have has been shown by the failure of their strikes and demonstrations in the last few days. Their leader, Mr Leino, was last week dismissed from his post as Minister of the Interior for illegally extraditing Finnish and foreign citizens to Russia in 1945. In true Communist fashion, he had refused to resign after giving his word to do so. When he sought to back his attitude by strong-arm methods, he found his arm too weak.

The failure of the general strike called this week by the Communists was quite remarkable. On their own reckoning, less than 7 per cent of Finland's 1,500,000 workers responded. Their "Action Committee" fell far short of the standards of Prague: few of the police and none of the Army showed any inclination to support the Communists. The crisis has now been solved by appointing Mr Kilpi, who only recently joined the Communist-led Democratic League, to be the new Minister of the Interior. Mr Leino's wife, Mrs Hertta Kuusinen, a more able leader and resolute Communist than her husband, becomes Minister without Portfolio. The Social Democrat leader, Mr Peltonen, has also joined the Cabinet, which is thus made more representative.

Communist control of the dockers' union has been the most serious factor in the present situation. For it is in the dockers' power to hold up reparations deliveries to Russia. Finland,

already hard pressed, is liable to the heavy penalty of a 5 per cent monthly fine at compound interest on the value of each category of goods delayed. Russia's terms for waiving any penalties incurred as a result of political disturbances could be no less damaging to Finnish independence than the increased economic servitude, which the imposition of fines would bring.

Everything, in fact, depends on Russian intentions. In spite of the revolutionary ardour of the rank-and-file, the Finnish Communists have no hope of seizing power by force unless they are openly supported by Russia—and their leaders know it. Hopes of getting this support were not encouraged by the relatively mild terms of the recent Soviet-Finnish pact of mutual assistance, which may well have been the first move in the Kremlin's present peace offensive. If that offensive is to be maintained on a scale likely to impress the West, it is hardly conceivable that the Finnish Communists will be given from Moscow the help they need. The test is, anyhow, likely to come later, at the elections on July 1st. If these are free the Communists will suffer a heavy defeat—but Moscow could afford it.

* * *

More Changes in the Clothing Ration

The first impression produced by Mr Harold Wilson's statement this week on changes in the clothing ration is one of wonder that decisions of this sort always seem to be made in various stages. There is first of all public agitation, followed by a Government announcement that no change in policy is contemplated. Then comes more agitation, followed by a minor Government concession. Finally, there is downright indignation, followed by the Government's conceding a large part, if not the whole, of the particular demand.

The result in this case is that the bonus of twelve clothing coupons to be used between now and September 30th, the un-rationing of a few articles, such as ties and gloves and some stockings, and the downpointing of others, and the bargain sales at half-coupon rates look at first sight as though Mr Wilson had yielded to pressure from the clothing trade. In fact, he has done nothing of the sort. There is no question of an end to clothes rationing or of a general release of more of the most wanted articles for the home market. A temporary relief has been granted to deal with a temporary situation—the need to clear the "hump" of stocks caused by the improvement in output before the diversion from home to export manufacture became fully effective. But Mr Wilson very rightly emphasised that it is only a temporary situation and that supplies of cloth for the home trade are already falling. The export trade must have priority, and rationing is necessary to ensure that it gets it. The stress laid by Mr Wilson on this function of the rationing system, which the public tends to overlook, is very welcome. The only doubt is whether the up-pointing of articles for which there is a good demand in export markets has gone far enough.

But, granted the need for rationing to enforce the export drive, it still raises problems in the home market. There is hardly any doubt now that the public is becoming much more discriminating in its purchases, and if the piling up of stocks of particular goods is to be avoided, there will have to be more flexibility in the rationing system. Mr Wilson, however, deprecated changes in pointings. The new points values he announced this week and earlier this month are "permanent," in order to remove uncertainty from the minds of the public. The total number of clothing coupons available may indeed be increased or decreased—a decrease in the next rationing period has indeed been threatened—but changes of this sort will only reflect the general clothing position, not the surfeit or shortage of particular goods. Mr Wilson and his new advisory committees, to be drawn from the trade, will have some difficult obstacles to get over if the rationing machine, so necessary for the export trade, is to run smoothly and without irritating the public.

* * *

Mr Morrison and the Lords

Mr Morrison's defence of the Second Chamber principle, prompted by a resurgence at Scarborough of traditional Labour antagonism, can hardly be said to have actually reopened the door so disappointingly shut by the breakdown of the inter-party negotiations on the reform of the House of Lords; but it demonstrated that the Government is still anxious to stabilise the relationship of the two Houses. If the House of Lords did not exist, Mr Morrison virtually asserted, it would be necessary to invent it; one can read between the lines of his argument the expression of a wish for agreed reform. The Parliament Bill could in certain circumstances be modified. The effectiveness of the fourth session

is to be sacrosanct—on that issue, the issue on which the inter-party talks broke down, the Government remains firm; but there is no recriminatory note of "You had your chance and you lost it" in their spokesman's words. If the door has not been opened, at all events Mr Morrison has refused to take Mr Lawson's advice and bolt it; he has practically invited the other side to give it a good push and see what happens.

The invitation should be accepted. The next move must clearly come from the Opposition; a recently suggested compromise (a twelve-month delay in the first three sessions, a nine-month delay in the fourth) might serve as occasion. The apparently negligible difference between the parties' respective last words hitherto does, of course, mark a more fundamental division; the division between those who regard the delaying powers of the Lords as providing merely an opportunity for second thoughts inside Parliament itself, and those who insist that it is the country at large, not Parliament, to which appeal must be made when the Houses clash. But even this difference is, in the last analysis, one of degree. Agreed—say the Government—that the public must have time to make up its mind; it can do so during the Parliamentary debates. It cannot do so properly until the debates are over, say the Opposition. Evidently there are times when debate rather unsettles public opinion than otherwise—the abolition of the death penalty is a case in point; evidently, too, there are matters on which the crystallisation of public "second thoughts" might take not months but years. Is it reasonable to insist on sterilising the fourth session of any Parliament wherein Lords and Commons disagree for the sake of three months' extra maturing of public opinion?

* * *

Debate on the House Party

A sword of Damocles has swung perilously over the heads of the Civil Service Selection Board (CISSB—or Sisby to its friends) this week. Fortunately it has escaped without serious damage, although it has been an anxious time for all concerned. First that terrifying animal the Press—albeit only in its more respectable manifestations—was allowed the run of the country house-party last week-end while actual tests were proceeding. Secondly, a debate in the House of Lords on Wednesday probed into CISSB's procedure from a more exalted height. On both occasions it was abundantly clear that the advantages of publicity and openness easily outweigh those of secrecy. In every case the Press easily outwitted those of secrecy, which must have done much to dispel the rumours and misunderstandings which have been widely current. During the Lords' debate it was obvious that the three peers, Lord Simon, Lord Piercy and Lord Pakenham, who had themselves visited the Selection Board, were able to give a convincing first-hand impression of the proceedings and their value; whereas the others for the most part merely gave a wider currency to prejudices and false impressions. It is really astonishing how many eminent peers were prepared to lend their name to views founded on the experience of a few disappointed candidates, or on a vague and hopelessly inaccurate picture of the work being done at Stoke d'Abernon.

*

The verdict of the 100 or so visitors who have observed the operation of the Civil Service Selection Board, and of the candidates themselves, is that the two-day series of tests and interviews is an enormous improvement on anything that went before. Eighty-nine per cent of the candidates questioned and ninety-one per cent of the visitors voted in favour of the retention of the "house-party" procedure. Such personal testimony is a convincing refutation of all the rumours about excessive strain, the probings of psychologists and the withering censure of the new school tie.

It is, indeed, quite obvious that after 48 hours of close personal contact the selectors are in a far better position to judge their human material than the ordinary interviewing board which lasts an hour. This is not, however, to suggest that the methods are perfect, as the selectors would themselves be the first to admit. Experiments are made constantly: but there still appears a certain uniformity and over-refinement in the tests imposed, and too little emphasis on discovering those streaks of toughness, vigour and enterprise which the Civil Service needs in its departments which face the outside world. There still seems to be too high a premium on pure intellect, so that the Board appears to be using its new methods to get civil servants of the old type, instead of looking for at least a proportion of a different type. This criticism has been endorsed by teams of industrialists who have visited the

Board, several of whom are using similar methods of selection themselves.

It is not certain what permanent role the method of Selection Boards will play in entry to the public service. The Foreign Office intends to take all of its candidates in future by this means, by-passing altogether the type of very stiff written examination which was required before the war. The Home Civil Service is more lukewarm. In future, when the reconstruction period is over, 75 per cent of candidates will be selected by the prewar method of examination and single interview, and 25 per cent by CISSB. It is very difficult to see the justification for this. A good case can be made for returning to the prewar written examination, but why should it not be coupled with the 48 hour interview, since it is recognised that this is so much better than the single board? The cost is not prohibitive. At present it costs £18 to put a candidate right through the selection course, £14 of which is spent at the house-party. As about one candidate in five is accepted for the Home Civil Service and one in seven for the Foreign Service, the cost averages about £120 per successful candidate. This is a small price to pay for getting the right men to control millions of pounds thereafter.

* * *

New Start in Italy

Signor De Gasperi has been generous to his allies. Considering the number of Christian Democrat seats in parliament, it is surprising that 9 out of 20 Cabinet appointments have been given to men of other parties. Three of these go to the Right-wing Socialists, two to the Republicans, two to the Liberals, and two to independents. This only leaves a small Christian Democrat majority in the Cabinet itself. Such generosity, however, is wise. It will take some of the sting out of the comment, frequently heard in Italy just after the elections, that the Christian Democrats had won by too big a margin, and that consequently the Right would be too strong. It also means that the Ministry has been strengthened with some useful new blood. The Christian Democrats themselves have been criticised for the lack of really able men among them.

In completing his Cabinet—his sixth since he first took office over two years ago—Signor De Gasperi has been delayed by long negotiations with the Liberals and Right-wing Socialists, and by "the worry of finding a replacement for Einaudi," as he himself put it. His own party deliberately gave him a free hand. The outcome is that there are two special features among the new appointments. First, the important Ministry of Industry and Commerce has been given to the new secretary of the Socialist Union group, Signor Lombardo. A business man by profession and inclination, he made his political name on the Italian financial mission to Washington last year. He is now the driving force of his party. Secondly, the number of Ministers responsible for finance has been reduced from three to two. This represents a return to Mussolini's arrangements, but is regarded as practical. It means that Signor Pella (Christian Democrat), who now becomes Minister of the Treasury, combines with his post Signor Einaudi's former Ministry of the Budget. He has already done good work as Minister of Finance, a post now given to a newcomer, Signor Vanoni. But with financial policy entirely in Christian Democrat hands, it remains to be seen whether Elijah's mantle will really fit Signor Pella.

The Christian Democrats have the advantage of not having fought the elections on a definite programme. They are not, therefore, committed to embarrassing promises, although people expect them to give a strong lead. It is a dramatic moment. For the first time since the war Italy has a constitutional government ready to attack long-term problems. Signor De Gasperi has hinted that agrarian reform in the South is high on the list. Primarily, this means capital investment in water projects and in roads; the report just completed by American technical experts is likely to be used as a guide. Other urgent tasks are a new policy to absorb surplus labour, an increase in the flow of emigration, and the re-equipping of industry.

* * *

Moves Around Tito

The execution of several members of the Yugoslav Communist Party in Slovenia for espionage in the interests of a foreign Power has been followed by a series of changes among highly placed political personalities. There is no reason to assume any direct connection between them, but the changes are worth mentioning and may indicate that something is going on inside the party. The Minister of Finance, Zujovic, and the Minister of Light Industry,

Hebrang, both of whom are generally considered to be at least among the first ten in the hierarchy of the Communist Party, have been relieved of their posts, with no reason stated. Neither has been given a new official post. It is not announced whether Zujovic keeps his post as General Secretary of the People's Front (Yugoslavia's Communist-controlled monopoly party). It may be that both men will now devote themselves to important tasks within the party: it may be that one or both of them are in disgrace. At the same time reshuffles have taken place in the governments of the constituent republics of Macedonia and Serbia.

The Communist Party of Yugoslavia differs from those of all neighbouring states in its love of secrecy, maintained even after its crushing victories. The composition of its Central Committee and Politbureau has never been announced, and it has held no congress since the war. In the other "popular democracies" (with the exception of Albania, which in all things follows the Yugoslav model) the party, whether under the old name of Communist or the new title of Socialist Unity, exists openly side by side with the "front" or "block" of "democratic parties": in Yugoslavia the party hides behind the front. This makes it difficult to judge the significance of the removals.

Lately there have been reports in the American Press of growing disorder in Yugoslavia. That country, with its impenetrable mountains and its bewildering variety of nationalities and religions, has always been difficult to govern. But the Tito Government has gone further in sovietisation than any other east European country. This has certainly aroused plenty of hostility, but lack of organisation or force has doomed the opposition to helplessness. If misgivings have spread to the ranks of the Communist Party itself more important results might be produced. Of course, as long as the European balance of military power remains as it is, there can be no change of régime, but changes of policy are another matter. The situation needs watching.

* * *

Catholics and "Popular Democracies"

Since the elimination in Eastern Europe of all independent political parties, completed with the *Gleichschaltung* of Czechoslovakia in February, the Catholic Church remains the only

organised force opposed to Communism. It is therefore not surprising that signs are multiplying of a serious open conflict between the Church and the Popular Democratic régimes.

Hitherto the only government which could be said really to have persecuted the Church is the Yugoslav. In its defence must be admitted that several bishops (notably Rozman of Slovenia and Saric of Sarajevo) "collaborated" with the Nazis and the Croatian Fascists during the occupation, and that individual priests even took part in the infamous persecution of the Serb populations of Bosnia and Dalmatia. But the case of Archbishop Stepinac of Zagreb, whom Tito's courts sentenced to 16 years of prison, is much less simple, and many other sentences passed on priests suggest a twisting of evidence for political reasons. The Catholic Church in Yugoslavia has by now been deprived of a very large part of its priests, obstacles are put in the way of Catholic teaching, and anti-Catholic propaganda on a mass scale receives state backing.

In Hungary, where the Communist-Catholic struggle has recently come into the news, about half the schools were controlled by the Catholic Church under the old régime, and were largely supported from the revenue from Church lands. The 1945 land reform confiscated the lands, but the Government has hitherto subsidised the schools without interfering in their administration. Now Education Minister Ortutay has announced that the Church schools are to be nationalised. Their existing personnel will be maintained, and compulsory religious teaching will continue, but the State will be responsible for administration and Government-approved text-books will be brought into use.

The project is not in itself unreasonable. Neither party, however, trusts the other; Hungarian Catholics, remembering the development of the Soviet Union, and watching the process by which the East European States have since 1945 moved through successive stages of Sovietisation, do not believe that the present law is final. Cardinal Mindszenty, who has already more than once polemicised with the present régime, has denounced the law, and appears (from the Hungarian official account) to have threatened with excommunication all teachers who remain in their jobs under it. Hungary is therefore plunging into a first-class *Kulturkampf*.

LORD WOOLTON writes:

"Cancer is the disease most universally dreaded today. For years able and devoted men and women have sought by Research to find its cause and its cure. Constantly success in this noble endeavour seems to be just round the corner. The Royal Cancer Hospital needs the money to maintain this fight and, meanwhile, it seeks to bring relief to the suffering.

British people, ever kindly in their sentiments, will not withhold their help to this great hospital—which never fails to help those who appeal to it."

Although the State will become responsible for hospital maintenance after July 5th, it will still be necessary to seek voluntary support for research on the scale required. Please mark your gift "Research Fund" and send addressed to the Secretary.

The Royal Cancer Hospital

FULHAM ROAD - - - LONDON, S.W.3

The fable of the lion who blinked

There was once a Lion who opened his eyes to find himself in a world where nobody professed to believe in British Lions any more. 'You're a fabulous monster,' they told him. At that the Lion lifted his head . . . and everybody stepped back. 'I notice,' he said, 'that initiative is still respected among you. I think I can undertake to remind you of my existence.'

Rejecting the defeatists and tellers of woe, TI are planning, reorganising, training and working with one object in view: to see that their kind of British engineering keeps ahead of its reputation. TI are a team of engineering industries who specialise in such various fields as precision tubes, bicycles, electrical equipment, wrought light-alloys, pressure vessels and paints.

TUBE INVESTMENTS LTD. THE ADELPHI, LONDON, W.C.2

The Vatican in the Field

In Poland a similar crisis seems imminent, as a result of a pastoral letter, signed by the heads of the country's Catholic hierarchy, warning Polish youth against the dangers of "materialism." It is clearly directed against the Marxist parties, and its challenge is not likely to be left unanswered. Hitherto the Polish Government has not directly attacked the Church, but has preferred to incite Catholic bodies to disapproval of Vatican policy. An example is the recent statement of the Labour Party (a fellow-travelling rump of the former party of the Silesian Catholics) denouncing a recent Papal letter to German bishops, in which it suggests that German national claims against Poland received the sympathy of the Vatican.

In Czechoslovakia, too, where the Communist-controlled government includes a priest as Minister of Health, the issue has boiled up in time to affect to-morrow's elections. Archbishop Beran has ordered the clergy to choose between politics and their religious calling. His letter, published this week by the Vatican, is practically an order to refuse co-operation with the Gottwald régime. It is unlikely seriously to affect the voting of Catholics, who are well aware of two things: that the blank ballot papers, with which alone a vote against the Communists can be given, are easily identifiable by the official who takes the voter's name and address—and that Mr Gottwald is determined to have a majority of 90 per cent or more.

* * *

Larger or Smaller Newspapers?

If Mr Harold Wilson really has the Government behind him in aiming at five-page newspapers (that is, an average size of five pages, secured by alternating between four and six pages) "as early as possible, and certainly in 1949," his statement provides some comfort among all the other conflicting statements about supplies of newsprint. But it is difficult to feel confidence in this reassurance; all the other indications go the other way. It has been said that the Canadian contracts, under which 100,000 tons of newsprint are being supplied this year, may be cut to 30,000 to 50,000 next year, and Mr Wilson appears to pin his hopes on making good the deficit from Scandinavian sources at a sterling cost 50 per cent higher than the cost of importing newsprint from Canada. Drought affected the supplies from Scandinavia last year, and it is conceivable that future supplies from Finland may be affected by its relations with Russia.

All this uncertainty is caused by the sum of about £1,000,000 worth of dollars. For that £1,000,000 this country could cease playing ducks and drakes with the Canadian contracts for newsprint, and secure a firm long-term source of supply which could gradually be increased to provide papers of a size more suited to the responsibilities of a country like Great Britain. All the newspapers are now asking for is that the contract for 1949 should be continued at 100,000 tons, at a cost of £2,500,000.

If Mr Wilson's optimism is justified, there will be widespread relief. It is unfortunately only too easy to fear that his intentions will not be supported. Too many members of the Cabinet and Labour members of Parliament clearly resent press criticism to a degree inconsistent with the principles of free speech or with the Government's own recent protestations at Geneva. It is, of course, no use pretending that the press would use all of any extra space for matters of political importance or educational value. Nevertheless, there is no other more effective means by which grievances can be aired, public opinion aroused, and the people made to understand the issues at stake. When the next General Election comes, does this Government hope to get by on the strength of ignorance and the kind of distortion which is almost unavoidable with the present restrictions on space?

• *The Economist*, it may be pointed out, and the other periodicals, are not affected by this dispute about newsprint. The small cut made in their paper supplies last year has now been restored.

* * *

Another Electric Shock

It would, of course, be grossly unfair to write down the electricity *débâcle* of last Sunday to the debit of nationalisation; unless, of course, one were to join oneself to that peculiar body of opinion which, in February, 1947, attributed the cold weather to divine displeasure with the Government. It was a nasty chilly day following on a succession of nice warm ones; on went the heaters, up went the load, and the skeleton of the grid, denuded by an unusually large week-end repair-and-maintenance programme, broke down with a crash. The same thing would no doubt have happened had electricity nationalisation still been in

process of debate on the floor of the House; in which case any bad marks, merited or unmerited, would have gone to private enterprise.

Nevertheless there is a lesson to be learned from this annoying but fortunately minor mishap. The grid embodies, and embodies on the whole very successfully, the principle of strength through unity—of mutual aid between areas, of broad strategic planning, of shared reserves. With the grid, the generation and transmission of electricity can, as a whole, work with far less of a safety margin than would be necessary were its constituent units forced to rely on their own resources. So far, so good. But there is also such a thing as strength through dispersion, the localising of trouble, the averaging out of errors of judgment; and though the sacrifice of this advantage is, where electricity is concerned, universally judged to be well worth while, it is none the less a genuine sacrifice. Someone, last weekend, took a chance on the weather and was wrong; and the results of that error spread all over Southern England. In a less integrated system, spoiled dinners and blacked-out streets might have been confined to a single town or county. Integration, in fact, while it admirably narrows the permissible safety margin, increases the penalties for transgressing it; and this is not an argument which applies to electricity alone.

The more obvious fact illustrated, not for the first time, by Sunday's breakdown is the unbalance still existing between the supply of current and that of the electrical apparatus whose use constitutes the demand for current. The country has not yet finished paying, in inconvenience and recurrent dislocation, for the aberration in planning which so freely multiplied electrical outlets while failing to provide either adequate power to serve them or a price tariff which would limit their use to existing power capacities. It is this earlier major error which continues to call for the exercise of superhuman judgment and foresight—too often in vain—on the part of electricity authorities, whenever rough winds do shake the dashing buds of May or, *a fortiori*, the less affectionately regarded icicles of February.

Commonwealth Citizens

A Government amendment to the British Nationality Bill now before Parliament has proposed that the expressions "British subject" and "Commonwealth citizen" shall be legally equivalent and that any person who is a citizen of the United Kingdom, a Dominion or a Colony may therefore choose for himself which description he prefers. This proposal is indeed a straw that shows which way the wind is blowing; evidently nobody thought of it when the Bill was being drafted, but the government was quick to take up the point—when it was made in a House of Lords debate—that not all present and future inhabitants of the Commonwealth wish to be called British subjects.

The new legal formula seems to solve the difficulty successfully. It is of great importance at a time when all human rights are so dependent on nationally determined status, and when the possession of a valid passport may even mean the difference between life and death. But the conception of "Commonwealth citizen," once it has received official endorsement, can hardly remain confined to the legal regulations of nationality; it must surely spread into the usage of political ideas, as a term expressing the new sense of community growing out of the old imperial ties. It may even be that it will have an attraction for countries now outside the Commonwealth, for there is no need to regard the membership list of this free association as finally closed.

As General Smuts said in his "explosive" speech of November, 1943:

Other neighbouring nations, living the same way of life and with the same outlook, can with perfect safety say: This is our group; why are we not there? With full retention and maintenance of our sovereign status, we choose that grand company for our future in this dangerous world.

British Coal to Germany

The news that Britain may shortly begin exporting coal to North-West Germany has appeared at the same time as figures of Ruhr coal production for April, showing a decline of 6.8 per cent in daily output compared with the previous month. In resuming this prewar practice, the Coal Board is giving an admirable example of the Marshall Plan spirit.

According to a plan worked out by the coal committee of the Economic Commission for Europe, which allocates European coal exports, 140,000 tons of gas coal and industrial fuel will be delivered to the region round Hamburg during the current quarter. The plan has been approved in principle in London, but no con-

tracts have yet been placed. None will be, unless the firms to be supplied undertake to increase their exports to the dollar area.

From the Ruhr there will be no *quid pro quo* in the way of additional exports of coal or coke. On the contrary, even if Britain supplies coal to the extent of some 600,000 tons a year, it will still only fill a fraction of Germany's deficit. The German estimate of ERP requirements and exports laid down that a minimum of 64 million tons a year was necessary for home consumption if production is to be raised by ten per cent. This amount would only be made available by three means: if 5,000,000 tons were imported, if the present sliding-scale of exports were reduced, or if Ruhr output were increased. Production would have to rise to 370,000 tons a day. But the output in March was less than 270,000 tons a day, and there are not the slightest prospects of its increasing to the necessary extent; it was, in fact, 20,000 tons a day lower in April than in March.

British imports will, therefore, not be enough to save the sliding scale of exports; but any suggestion to reduce Ruhr exports will meet with the worst possible reception in France. The present London talks have revealed the deep distrust with which the French regard American policy for Germany. It is precisely because M. Bidault is sure that General Clay would insist on the Ruhr retaining its coal that he is objecting to the proposal for an International Authority which would give the deciding voice to the Americans.

* * *

Ruhr Failure and Dollar Drain

How to raise Bizonia's output remains, therefore, the crucial problem. The incentive scheme which was introduced last August seems to have exhausted its effect. Various reasons have been put forward, and the British and Americans are trying to work out an improved scheme. The German argument is that it is useless to expect that incentives of the present kind will alone raise production to 300,000 tons, still less to the 370,000 tons which are required by the ERP estimates. They maintain, and there is a measure of agreement on the part of the British and Americans, that new equipment is also essential. Dis-mantlement of plant producing mining material must be banned before any new scheme is begun. In addition, equipment will have to be imported if quick results are to be secured. It is a great pity that ERP has made a bad start at its vital centre.

The suggestion has been made that Britain would indirectly earn dollars by selling coal to Bizonia, even though the direct payment would be made in sterling. This is not quite correct. The advantage would be only temporary. Owing to the provisions of the Anglo-American financial agreement on Bizonia, any gain in dollars which this country makes in its trade with Bizonia is offset by the fact that Britain is committed to convert sterling whenever the dollar funds held by the Joint Export-Import Agency fall below a certain point. At this moment, JEIA dollar funds are running out, owing to heavy purchases in advance of fixed arrangements for ERP financing. In fact, the peculiar situation may arise that Britain will have to provide Germany with dollars for ERP. It is to be hoped that this absurdity will prove the final spur which will induce the American authorities to change the basis of bizonal trading with Britain, and, perhaps, other Western European countries, from dollars to sterling.

Franco's Friend in Need

Whatever changes the future may bring, the first few weeks of the European Recovery Programme have already passed without either of the two largest Spanish-speaking peoples securing a share. The Spaniards have missed the initial allocations and there is no sign of their chances improving; Argentina, to its own surprise, has so far failed to obtain any "off-shore" dollar purchases. In Madrid and Buenos Aires these facts inevitably lend increased significance to the Franco-Perón Protocol, which was added on April 9th to the Spanish-Argentine Treaty of 1946.

Under this Protocol, Argentina has extended the former credit of 350 million pesos, granted in 1946, to a total of 1,750 million pesos, available to Spain up till the end of 1951—500 million pesos will be credited this year, 350 million next year and also the year after, and 200 million in 1951. The Spanish side of the bargain is remarkable. Not being able to repay such a large sum by any normal means, General Franco has contracted, first, to build ships, railway engines and other capital equipment for Argentina with materials bought with Argentine pesos on world markets. Secondly, he will accelerate work on the free port at Cadiz already granted to Argentina in 1946, and grant in addition any other free ports on Spanish territory that Argentina may require. Thirdly, he will establish a peseta fund, equivalent to

the difference between Spanish imports from Argentina and exports to that country, for financing harbour installations, grain elevators and meat freezing plant in the Cadiz free zone. This zone covers about 235 acres and work there will cost 600 million pesetas during the next five years. Lastly, Spanish-Argentine companies will be formed in Spain to develop mines and industries which will "stimulate Spanish economy in co-ordination with the needs of Argentina."

Negotiations for this Franco-Perón Protocol began last December on General Franco's initiative. Señora Perón played an important part in persuading her husband to like the idea, but once he had taken it up he drove a hard bargain. The view in Madrid is that Franco threw in his hand at the last moment, when he found he had been left out of ERP. It is notable that he signed the Protocol within a week of President Truman's signing the Foreign Assistance Act.

This huge new external credit is likely to add to Argentina's inflationary difficulties. But President Perón is satisfied to run financial risks in order to stop being so dependent on British and American industrial supplies, and to assert his own leadership in the Spanish world. Franco's answer to his critics is that he has ensured his country's food for three years and obtained extra raw materials for Spanish industry. But some Spanish economists fear that Argentina may now secure an embarrassing grip on their country's economy, and they regard this as a high price for an *ersatz* version of ERP. Both Franco and Perón themselves continue to hope also for some dollar crumbs from the American table.

* * *

Poll on Spilt Milk

Railway enthusiasts—those amiable and perennial schoolboys—still recall past splendours on British railways (with a small "r"). How bright, in nostalgic retrospect, were the liveries of engines and coaches in those remote days before 1923 when the four groups were formed—the Caledonian blue, the Midland lake, and the green of the North Eastern. Perhaps the railways were never quite as gay as reminiscence suggests. But the grouping was a blow to the railway "fan" from which he has never recovered. And the creation of British Railways (this time with a capital) has roused fiercer mutterings against dull uniformity.

But British Railways seems determined to give the public what it wants—at least in the matter of paintwork. Fourteen services will be running this summer, bedecked in experimental colours. To step into the Cornish Riviera express is always a pleasurable experience; to be drawn by an engine painted "blue, with lining of red, cream and grey" and sit in a coach "chocolate and cream lined with black and yellow" will be a new delight. Yet there seems something familiar about the formula for the coach. Has this never been seen at Paddington before? And what of the other design for main line corridor trains: "Plum and spilt milk, lined with bands of yellow-maroon-yellow separated by lines of spilt milk"? Doubtless the subtle difference between milk and spilt milk has been the subject of tense—though happily successful—discussions between British Railways and the British Colour Council; "cream" is not the word for these austerity days, and "ivory" at once suggests hard-currency imports beyond our means. But closer examination of the colour scheme stirs the memory of the old days of the London and North Western Railway, on which, too, a certain amount of milk was spilt.

But it would have been gauche to refer to old railways by name. For multiple-unit electric coaches, green is the selected experimental colour. This will hardly come as a shock to the suburban traveller south of the Thames (what *was* the name of that railway?) though he might prefer the word "pre-selected." But he, too, can express his opinion—in writing—to British Railways, and ask for sky blue, or perhaps green rather than greens. Yet there are dangers in all polls; the doctrine of the mandate and the popular will has its limitations, particularly on questions of taste. If colours are open to the vote, the public will taste blood—separated perhaps by lines of spilt milk. They will demand the vote for lower fares, and first-class travel for everybody at third-class prices. And when that happens, faces on the Railway Executive will certainly be maroon, lined with golden yellow-black-golden yellow.

Greek Executions—Correction

The Information Department of the Greek Government in London has pointed out that the correct figure of executions carried out since the assassination of the Greek Minister of Justice was 60 and not 152 as reported in *The Economist* of May 8th. This is still an exceptionally large number of executions to be carried out in only four days.

Letters to the Editor

The Military Legend

SIR,—May I be allowed to comment on one aspect of your critic's approach to Captain Liddell Hart's book "The Other Side of the Hill"?

In his assessment of the attention paid by Captain Liddell Hart to the tendency of the German generals to attribute Germany's major failures in Russia and the West to Hitler's personal interventions, the reviewer asks us if one is unduly suspicious in seeing in these chapters "the seeds of a dangerous military legend." (I refrain from raising the Dunkirk question, since it is, for me at least, too problematic on the military side.) I cannot help feeling that, since the occupation of Germany, English theorists have devoted an excessive amount of time to the retrospective theme of the "military legend."

The problem has only two relevant factors. The first is that a defeated country inevitably produces its various apologists who feel compelled to search for their various scapegoats. In the case of the German General Staff this scapegoat must obviously be Adolf Hitler. (All of us must remember how we, under the threat of defeat in Britain's dark days, were already finding our individual explanations for the series of military catastrophes which had befallen us.) Let us, therefore, accept the inevitability of the "legend" in a country which did meet defeat and which is now suffering from a violent postwar neurosis. The second factor is far more vital. A military legend only becomes a positive danger when it is exploited (and perhaps embellished) by political elements which are seeking to justify a warlike policy to the nation they dominate or hope to dominate. (Although Russia belongs to the victors of the last war, the Soviet Government is today finding it necessary to propagate its own form of military legend.)

The answer to this problem is surely not to spend our time on a negative endeavour to demonstrate to a now sceptical German people that the German military leadership failed for this or that reason (indeed, experts such as Trevor-Roper, Schulman and Dulles have already given ample support to the arguments of the German generals), but to obviate by all means in our power the creation of conditions under which the Germans feel the need of a "legend" and whereby apologist theories can be exploited by any future exponents of German aggression. If we can give the German nation positive proof of its indispensability in a confederation of western democracies, the "legend" can never become more than the hobby-horse of a handful of militarist dilettantes.—Yours faithfully,
Malvern, Worcestershire

A. G. POWELL

Coal Output

SIR,—To Mr R. A. C. Radcliffe "it seems more than probable that many (miners) . . . will never become skilled mechanics (to handle the new mining machinery) and that it will be necessary to change the type of labour before the increased output . . . will be obtained."

This proposition is hardly a sound one, and the "parallel" of the coachmen is far from apposite. With all the complications of modern machine design the operator is becoming progressively less skilled, and skilled mechanics as such form a decreasing proportion of the total labour force. This applies no less to mining

than to other mechanised industries. The physical and mental efforts demanded of the miner to operate the new machinery being installed will be less than those demanded of him by existing manual methods. In the main it can be said that, apart from maintenance and repair work, no special skill, other than that already shown, will be required—so why should it be necessary to change the type of labour?

What does need changing is the approach—not only of the miner but of us all—to our work and things in general. The unfortunately popular phrase "I couldn't care less" epitomises our attitude, and when Sir Charles Reid in his Edinburgh speech said "there is something wrong somewhere," it is not unlikely that he had this in mind. Whatever may be the technical reasons for low productivity, no real improvement can be looked for until a more positive approach to our collective problems is made by us individually.—Yours faithfully,
The University, Birmingham, 15

JOHN C. CLEWS

Europe's Manpower

SIR,—In *The Economist* of May 15th you gave a letter commenting on figures extracted from the Report of the Manpower Conference held in Rome in January and February of this year and reproduced in an article published in your issue of May 8th. It is true that the immigration requirements of the United Kingdom for 1948 were shown in a table in the Report as 100,000 skilled workers and none unskilled. But immediately opposite this table, in the body of the Report, was the following statement:

It may be noted that the United Kingdom is seeking, as far as possible, skilled workers. It is, however, willing to accept unskilled workers for all requirements and give the necessary training.

For reasons of space, no doubt, this qualification was not mentioned in the article of May 8th, and as a result the letter of May 15th is based on incomplete information. There are various advantages in the United Kingdom recruiting as many experienced workers as possible for the industries requiring foreign labour. In so far as experienced workers are not available, inexperienced workers are being recruited and given the necessary training in this country.—Yours faithfully,

L. H. HORNSBY,

Director of Public Relations

Ministry of Labour and National Service

The Appointed Day

SIR,—One conclusion to be drawn from your article is the need for a radical overhaul of the whole structure of National Insurance. Under the present "tripartite" plan the contributions of employees and employer are pooled in the Unemployment Fund. It is suggested that the contributions of employed persons and the self-employed should be credited in individual ledger accounts on which the contributors would draw for periods of unemployment or sickness subject to a weekly maximum, the state adding a bonus of, say, five shillings a week for each week of regular employment. Employers' contributions would continue to be pooled to provide for industrial injuries and as a reserve for "national assistance" payments to those who had exhausted their credits. At the time of retirement the balance to the credit of

ANNUITIES

(Single lives : Last survivor : "Capital-protected" : "Capital-redemption" : Reversionary : Certain : Deferred, etc.)

Circumstances have made annuities an attractive proposition to an increasingly large number of people, particularly now that the capital invested in them can be safeguarded against loss due to premature death. Very considerable loss (up to £1,000 and over in individual cases) has been and is being sustained by the public due to their entrusting the purchase of their annuities to inexperienced and unrepresentative part-time agents. The undersigned has specialised for many years in every kind of annuity issued by the various Life Offices (for all of which he acts impartially and in the sole interests of his clients), and is therefore in a position to advise on those giving the highest NET yield with complete safety.

THE FEW MORE...

A few more visitors were with us for Whitsun than came for Easter, and a very good time was enjoyed by all.

As we've said before, even without a car this lovely island is very easy to get to. There are plenty of fast, comfortable trains to Plymouth, whence an Hotel car can meet you. Once you have arrived, the charm of your surroundings, the excellent service and sheer comfort of its modern Hotel make Burgh Island unrivalled as a resort at which to relax and enjoy yourself, if only for a few days.

So why don't you come for a week-end, a week or a month? Come now, when the climate is so mild, and enjoy the beauties of early summer in South Devon.

BURGH ISLAND HOTEL

Terms from £2 per day inclusive

The Manager, Burgh Island, Bighury Bay, South Devon

Telegrams or Telephone: Bighury-on-Sea 272

the contributor would be converted into an annuity in supplementation of a basic old age pension.

It is claimed for a scheme on these lines, first, that it would bring home to the individual a sense of personal responsibility and a realisation that social benefits have to be earned and paid for and do not drop like manna from heaven; secondly, that it would encourage thriftiness in the use of social benefits or at least discourage their abuse; and, thirdly, that the proposed weekly bonus will act as a definite incentive to regularity of work.

The additional expenditure to be met from general taxation need not amount to any large figure and would be offset to some extent by savings in unemployment and sickness benefits. Nor would the scheme involve much extra accounting work, since under the existing system a record of each individual's contributions has to be kept. It might even turn out that when the scheme had been run in, there would be a saving in both money and clerical labour. In any case, if the scheme proved effective in promoting regularity of work and discouraging the disposition to expect something for nothing, it would in the end pay for itself, if not in cash at least by a change for the better in the morale of the working population.—Yours faithfully,

Larchfield, Churt, Surrey

GEOFFREY BRACKEN

Malthus Regained?

SIR,—Has not your article confused "the future population of Britain" with "the future population of Britons"? These are surely separate and independent concepts; we can (if we want to) reduce the population of Britain without suffering the discomfort which a declining population of Britons would impose.

Your article optimistically suggests that Britain is "rather a small" technical unit for peace or war production; this is a good reason (among others) for making Britain part of a greater unit,

whether that unit is the Commonwealth, or Western Europe, or both combined; we might call it "X + GB." If this is achieved Britain's population can be adjusted in relation to needs other than that of self-sufficiency.

It is true of Britain that "overcrowding is as likely to result from maldistribution as from a high density—within reason—over the country as a whole"; but does it follow that overcrowding in London can only be mitigated by allowing or encouraging the birthrate in London to fall? Or is it better to maintain the London birthrate at a level high enough to prevent deterioration, while transferring excessive population to emptier areas?

The same argument applies to "X + GB"; the birthrate in Britain need not affect or be affected by the distribution of Britons in "X + GB" as a whole, as long as the emigration rate is controlled in relation to the birthrate.

It seems clear that a declining population of Britons would be uncomfortable; that the population of "X + GB" as a whole is not large enough to incur the wrath of the Rev. Mr Malthus and his devil; and that, within "X + GB" the best population of Britain could be estimated on the basis of strategic, economic, social and spiritual considerations (for Britain might serve better as the social and cultural centre of "X + GB" than as its vulnerable strategic and economic heart).

A solution, therefore, is that a high British birthrate should be encouraged—at least sufficient to maintain the present population of Britons in numbers and vigour. Also, however, such a rate of emigration should be encouraged as will adjust the population of Britain to, or keep it at, the level decided.

Probably most people would agree that Britons have done a lot for the world, and can do a lot more; we need as many new Britons as we can get—but not necessarily in Britain.—Yours faithfully,

Farnborough Grange Hostel,
Hawley Lane, Farnborough, Hants

FRANCIS HEAD

Books and Publications

Skeleton in the Cupboard

"Defeat in Victory." By Jan Ciechanowski. Victor Gollancz, 18s.

UNFORTUNATELY this book is, in its main outlines at any rate, a true narrative. Mr Ciechanowski was Polish Ambassador to the United States from March, 1941, to the de-recognition of the Polish Government in London in July, 1945, and the story he tells is that of the gradual abandonment of the cause of Polish independence by Britain and the United States under the relentless pressure of Russian threats and *faits accomplis*. The sequel to his story has already been told by Mr. Arthur B. Lane, the first American Ambassador to the so-called Polish Provisional Government of National Unity, in his book *I Saw Poland Betrayed*. Mr Lane was a witness of the shameless rigging of the "free and unfettered" elections which the Polish Communists promised in return for Anglo-American recognition of their regime and which Mr Ciechanowski was told the Western Allies would insist on supervising.

The tale of the acts of British and American policy towards Poland in the later years of the war adds up to a record of gross treachery. Yet it was not, as the policy of the Kremlin clearly

was, a process premeditated and calculated from the beginning. First Mr Churchill, and later President Roosevelt also, slid gradually down the slippery slope of dishonour like the embezzler who starts by really intending to pay back the money he takes. It was argued—top secretly, of course—that Stalin must be placated (at Poland's expense) or he might make a separate peace with Hitler. In time the idea of Big Three Unity, both for the war and postwar periods, became a fetish to which it was thought right to sacrifice every legal and moral obligation. The final betrayal was the decision to recognise the Morawski Government in spite of the kidnapping of the Polish Underground leaders, who had revealed themselves at British request and had received a safe conduct from the Russian military authorities. By this time Hitler was already finished and the over-riding necessity of winning the war could no longer be pleaded as an excuse for British complicity in a gangster act. But a general election was impending in Britain and the Conservative Party wished to demonstrate to the electorate that it was not anti-Soviet and that it had "solved" the Polish problem. The recognition of the bogus "Government of National Unity" was announced on the very day of the election, though, as it turned out, it did not help Mr Churchill very much.

The turning point in this history was really the Soviet rupture of diplomatic relations with the Polish Government in April, 1943. For the occasion the Russians turned to their advantage an event which in other circumstances would have been embarrassing for them—the finding of the corpses in Katyn Forest. The Polish Government had asked for an investigation by the International Red Cross. The British and American Governments fully relied on the independence and impartiality of the International Red Cross for enquiries in connection with their own prisoners of war, but from what they knew of the efforts to trace the missing Polish officers during the previous eighteen months they saw at once that, for the sake of Allied wartime publicity, such an investigation in this case must at all costs be prevented. There was no knowing what it might reveal. The Poles were imperatively urged to let the matter drop, which they did. Thus Russia, in breaking off relations, was able to kill several birds with one stone: to clear the way for the puppet Polish Communist regime which was already being prepared, to avoid having to answer unanswerable questions about Katyn Forest, and to damn the Polish Government in the eyes of Western public opinion for having failed to repudiate a Nazi propaganda lie.

Russian Economics

"Soviet Economic Development Since 1917." By Maurice Dobb. Routledge and Kegan Paul. 474 pages. 18s.

THIS massive and well-produced book is both interesting and important. Mr Dobb is direct, lucid, and learned in a subject essentially difficult, confused and dubious. His theme is of great significance in any study of the social, political and economic realities of the modern world, and at the same time is rich in matter for both the theoretical and practical economist. What is more, this study completes an unexampled trilogy in modern economic thought. Mr Dobb occupies a lonely eminence as the one academic Marxist economist of distinction in this country, and his acute, erudite and uneven justification of faith is set forth on the theoretical side in "Political Economy and Capitalism," historically in "Studies in the Development of Capitalism," and now by contemporary example in this latest work in a field he has already so often tilled. It is unfortunate then, that for all its real virtues, this book should be in so many ways unsatisfying.

The book is in three sections. The first provides an introduction and a factual background to the economy before 1917. This is well done and unsatisfactory only in its analysis of the conditions and organisation of the town workers—a fault which persists oddly throughout the book. The second section gives a general economic history of the USSR to the present day. The work concludes with a study of planning, finance, industrial location and the organisation and conditions of the workers. In all this a certain incoherence rules. Each topic is dealt with clearly enough in itself but sequence is largely lacking and it is difficult to obtain any valid picture of the whole and almost impossible to follow the growth of a particular industry or even of agriculture itself. Furthermore, the statistical material is sparse and unhelpful—as are, indeed, the official sources and statistics themselves. The account of the planning methods at the centre is inevitably inconclusive—though Mr Dobb has valuable suggestions to make. But Mr Dobb fails most frequently through his Marxist orthodoxy: he feels he is saying something significant when the manner of saying it corresponds with the slogans of Moscow; he maintains the feud with Trotsky and all the dead in the 1936-38 purges; he treats Stalin's statements of economic policy with a respect that never recognises that their wisdom is nearly always after the event; he ignores the Allied contribution to Russian war resources—in line with nearly all recent Soviet accounts of the war—and he believes with Marx that "justice can never rise superior to the economic conditions of the time." The role of forced labour in the Russian economy is not even considered.

On most topics this would be enough to damn a book. But fortunately the bias is obvious and easy to discount, and where our ignorance is so great, Mr Dobb's learning, diligence, and candour combine to produce what is, with all its faults, by far the most valuable single volume on its subject.

Organised Common Sense

"Applied Economics." By A. J. Brown. Allen and Unwin. 295 pages. 15s.

THIS collection of essays may be taken as a sort of sample display, for the benefit of the intelligent lay public, illustrating the work in progress in the back rooms of economic research—its interest, its methods, and its possible future results. Research, as in its context, is research into recent or current events and statistical data and their interrelations; it is inductive, not deductive; it harks back to the old ideals of "political arithmetic" in a way which would delight Dr Lancelot Hogben. The economics which Professor Brown applies is, in fact, organised commonsense, not pure theory and the refinements of reason.

The essays comprised in his first two sections provide between them a clear outline picture, in quantitative terms, of the war economy—taking the phrase "war economy" to cover, as in realism it should, the period of rearmament as well as that of actual fighting—of the belligerent powers, comparing the magnitude and the resources of their respective war efforts and estimating the proportion that war expenditure, in real terms, bore to world output as a whole.

"The world as a whole at the height of the war," says Professor Brown, "was probably depleting its capital resources to the extent of well over 2 per cent annually, quite apart from what had been deliberately destroyed; but the bulk of the war resources was drawn neither from this process nor from the concomitant reduction in civilian standards, but from a very large increase in gross national income."

The next two essays deal with wartime inflation, in general and with particular instances, and yield the conclusion that monetary virtue is no substitute for an adequate system of price control and rationing—a view on which, however inescapable the inference from wartime experience, one would like to have a postwar gloss. Two chapters on World Population, while sound enough, lack novelty; then follow two groups of essays, dealing respectively with the criteria and causes of industrial efficiency, and with the "pattern" of world trade, which represent organised commonsense at its best; stimulating and realistic in themselves, they also indicate where closer scrutiny and more refined analysis are likeliest to yield results. The final essay is a sober and indeed rather deflating estimate of the economic potentialities, given various technical assumptions, of atomic energy.

To apply any general criticism to a work at once so diverse and so competently businesslike is not easy. One can, however, wish that Professor Brown had had enough methodological self-consciousness to induce him to expand his prefatory remarks into a full-length essay; for one thing, whatever he had to say on method would have been intrinsically interesting, and for another it would have imposed a certain unity on the otherwise inevitable scrappiness of his book.

Shorter Notice

"Money." By D. H. Robertson. Nisbet and Cambridge University Press. 223 pages. 6s.

IT is twenty years since Professor Robertson's "Money" first demonstrated to a delighted audience how very undismal the Dismal Science could be. It has worn extraordinarily well. In this reissue the main bulk of the text has been revised only on minor points; but two new chapters have been added, covering briefly the monetary events of two catastrophic decades and keying-in, as builders say, the structure of post-Keynesian theory to the original edifice. ("It's really dreadful," she muttered to herself, "the way all the creatures argue. It's enough to drive one crazy.") So runs the quotation from "Alice in Wonderland" with which, in accordance with his admirable habit, Professor Robertson heads this last chapter. The new matter is very well up to standard—can one say more?—and anyone who feels disconsolately that he used to know some economics, but that "the creatures" have hopelessly outstripped him, is urgently advised to procure the new edition of "Money" forthwith.

From The Economist of 1848

May 27, 1848.

PRINCIPLES OF POLITICAL ECONOMY, with some of their Applications to Social Philosophy. By JOHN STUART MILL. J. W. Parker, West Strand.

MR MILL's two thick volumes of 1,142 pages contain about twice as much matter as the *Wealth of Nations*. They treat of a great variety of subjects classified in five distinct books, on Production, Distribution, Exchange, Influence of the Progress of Society on Production and Distribution, the Influence of Government, etc. Under one or other of these heads, there are extensive dissertations on large and small farms, peasant proprietors, the Metayer system, which Mr Mill defends; on property, on Communism, on Colonisation, on *laissez faire*, on national debt, besides all the ordinary topics usually embraced in such systematic works. Every topic touched on is minutely, carefully and elaborately treated. The latest information is brought to bear on it; writers of various countries are quoted; different opinions are referred to and noticed; and not only does the work embrace many more topics than other similar works, but they are all examined as if each one were a favourite with the author. Throughout, the style is clear and pleasant, sometimes eloquent and impressive; on the whole, it is a remarkable book, which will add to the great reputation of the author, and become a standard work.

We might, perhaps, somewhat object to Mr Mill's sentimentality, caught, apparently, from Sismondi, which makes him talk about a person with the capacities of reason not concerning himself about the destinies of the human race because the world is not constituted exactly according to his ideal; we might say that there is throughout the book the want of a guiding principle, which renders it difficult or impossible for Mr Mill to explain many of the phenomena of society, of which those can supply a solution who find in the laws of population a clue to the whole; but we are not disposed to carp or cavil at a work which is undoubtedly the most complete exposition of the whole subject which has yet issued from the press.

AMERICAN SURVEY

On with the Boom

(From Our US Editorial Staff)

SENTIMENT about the future of business, which drooped during the winter, has changed in this late spring to something like ebullience. A few months ago, a significant fraction of the population expected a recession; now, a sizable majority anticipates that production and incomes will be maintained, or even increased. The reasons for this change in springtime fancy are numerous. Probably the most prominent is the swing toward enlarged armament expenditures, which now are expected to offset any weaknesses which might have developed this year, and to continue that function for an indefinite time ahead. A close second is the European Recovery Programme, which in 1948 and for some years to come is expected to prevent any major decline in exports even if shipments are not maintained at the high rate of 1947.

These two considerations are only the beginning of the current list of favourable expectations. The reduction of taxes will provide funds to sustain both consumption and investment expenditures, and it is now calculated that industry's capital outlays this year will exceed those of 1947. Interest rates are to stay low: Mr Snyder, the Secretary of the Treasury, surprised almost everyone by retaining the rate of $1\frac{1}{4}$ per cent on Certificates of Indebtedness for his summer refunding instead of moving to $1\frac{1}{2}$ per cent, and gilt edged issues rose sharply. The third round of wage increases will be much more limited than its predecessors; numerous large corporations have recently said "No!" to labour proposals so ringingly as to carry conviction and labour extremists are being curbed in the Courts. The threats of the re-imposition of controls, proposed by President Truman last fall, and of the enactment of a much feared excess profits tax, have vanished as Congress moves toward adjournment for the nominating conventions without taking any action. Russia looks far less menacing than she did just after the Czechoslovak coup and before the Italian elections—and her peace talk may not be wholly meaningless. The business and upper income groups, who are preponderantly Republican, are confident a Republican will enter the White House next January and provide a sounder government. The historians reveal that business activity improved in 13 of the 20 Presidential election years prior to World War II. And hopes, are mounting that the inflationary rise of prices may really have ended with the February decline in commodities; something like stability has prevailed for more than three months.

These improved expectations are not only discernible; they can be measured. Since the middle of March the stock market has moved almost steadily upward and on May 14th, to the accompaniment of greatly enlarged trading, moved out of the very narrow range in which it had fluctuated since September 1946. Bullishness is now running high in New York, even though London is adjudged to be still in a bear market. First quarter corporate earnings are about 25 per cent higher than they were a year ago and apparently are being maintained in the second quarter. The cheapness of stocks in terms of earnings, dividends and interest rates, which was discussed in a leader in *The Economist* of November 1, 1947, has been maintained. The slight increase in prices since then has been offset by rising earnings and prospects, and by a slight decline in money rates. The shortage of equity capital, then postulated as a chief explanation, has been remedied in part by the reduction of taxes. The amount of relief in the income brackets where equities are purchased (above \$10,000 a year) exceeds stock flotations for new money in 1947. In 14 out of

the last 22 presidential election years furthermore, the stock market has closed the year higher than it opened. And finally, the "breakout" of May 14th provided a strong bull market signal to followers of the Dow theory which has been officially established as constituting a major force in the stock market.

This theory, which was worked out by the first editor of the *Wall Street Journal* several decades ago, closely resembles a technique which might be used to determine the state of the tide. If the latest incoming wave stops short of its predecessor, the tide may be presumed to be going out; if it overruns the furthestmost point of its predecessor, the tide is coming in. So with stock prices, with the theory offering the additional test of comparing the action of the rail issues with that of the industrials. What happened on May 14th was that the industrials rose above the best price they had previously attained in the recovery from the 1946 break, thereby "confirming" the suggestion of a rising tide previously given by the rails. History provides a number of cases where such "confirmation" has been followed by a prolonged market rise. The influence of this theory on investors was officially demonstrated by the Securities and Exchange Commission in connection with the last major decline in the market. The severe break of September 3rd, 1946, was exhaustively analysed by that agency for almost a year. All transactions were studied on a minute-by-minute basis for the entire trading day, and this information was supplemented by interviews with sellers. The investigators concluded that "confirmation" of a bear market at 11:16 a.m., announced at 12:12 p.m., provoked at least 20 per cent of the sales directly and probably somewhat more indirectly. This official demonstration of the influence of the theory has, of course, increased its authority.

The cynic may contend that there is something of the dog chasing its tail in all this. He may, indeed, go a great deal further. The Dow theory, like all other market techniques, has sometimes given false signals. And in the new confidence of business there is something of eating one's cake and having it too. In the long run business cannot have both a peaceful USSR and a permanent armament boom; or tax cuts and an expanding budget for defence; or rising profits and stable wages; or price stability and heavy rearmament. More basically, the country still remains unprecedentedly prosperous after an unprecedentedly long boom, though with some not insignificant disequilibria. The cynic who explores history may also discover that in the majority of the last 22 post-election years the stock market has closed the year lower than it has opened.

But for the present many people are having the happy experience of making a lot of money. They have heard the false cry of "wolf" almost continually since 1944, they remember the 1920's as a period of long prosperity after the postwar setback, and they feel that this time such a setback may have been avoided. And even the most erudite economists give great weight to the state of expectations.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

American Notes

The Oregon Trail

Oregon's twelve delegates to the Republican National Convention were carried off last week by Governor Dewey after the closest fight of this year's primary elections. The popular vote was 111,230 for Governor Dewey to 101,911 for Mr Stassen. The contest in Oregon was the last important appeal to public opinion before the conventions, and both candidates badly needed a victory. This explains why the puzzled voters of Oregon, who control only six votes in the electoral college, have been courted with a thoroughness and ardour new to the North-West.

Mr Dewey has demonstrated, in the nick of time, that he has not lost that capacity for getting votes which made him Mr Roosevelt's most formidable opponent. But Oregon's influence in the party's councils is slight, and victory there cannot wipe out entirely the memory of earlier defeats. For Mr Stassen the result is likely to be more decisive. His only chance of forcing himself upon the convention was by producing evidence of a popular demand which could not be resisted. Oregon has shown that he is no Eisenhower. The party bosses will now tend to write off Mr Stassen as a Willkie who failed to make the grade.

But it would be a mistake to underrate Mr Stassen. His challenge was formidable enough to force Mr Dewey to throw overboard the Olympian detachment he has affected, replace the blue serge suit with political work-a-day clothes, and accept his share of the grime, tedium, and what one commentator has called the "grim intimacies" of going to the voter. Mr Dewey has had to fight hard for his political life. He is, observers report, a "new Dewey," hard-hitting, unpretentious, even folksy. This "new look" which Mr Stassen has popularised is in the oldest tradition of American politics. In June Mr Truman will also be making a homely, informal, impromptu tour in the West, carefully designed by the Democratic strategists to reveal a "human Truman."

Mr Truman's advisers are thinking of the election, rather than the convention. Although the Southern bloc of anti-Trumaners has rallied 55 convention votes, out of a total of 1,234, the President has, it is thought, enough votes to be nominated on the first ballot despite Alabama's avowed intention of starting an Eisenhower hare. In the Republican convention, Mr Dewey's managers claim that he has 300 firmly pledged delegates, and it seems certain that he will enter the convention as the strongest individual contender. But 548 votes are necessary to win; and this year there is an unusually large crop of favourite sons waiting hopefully for the lightning to strike. If a deal must be arranged among a number of strong candidates, it is significant that Senator Vandenberg is the second choice of many state delegations.

Priorities for Congress

Republican members of Congress will arrive in Philadelphia for their convention on June 21st hoarse and exhausted by the seven or more hours a day they have been labouring, six days a week, in order to complete their year's work six weeks earlier than usual. Even so, they are threatened with a return to Washington, either between the two conventions or after the Democratic meeting which begins on July 12th. The heat of Washington will be even less bearable than usual this year when contrasted with the irresistible attractions of home—the babies to be kissed, the fences to be mended and the political bargains to be struck, all in sufficient quantity to keep most members of Congress fully occupied until the final show-down in November.

The Republican leaders have spent much time trying to decide which are the most important logs to extract from the jam in the Congressional river during the next three weeks, if Senators and Representatives are to face their constituents with the confidence born of a job well, or even adequately, done. Many bills on which important work has been accomplished are certain to be lost, including probably the Senate's plans for housing and Federal aid to education, both very dear to Senator Taft, and the House's anti-Communist Bill; there is more hope for the admission of displaced persons. The only measures which are sure to get through the legislative mill are the Appropriations Bills and those continuing essential legislation which is due to expire before the end of the year. The former cover amounts equal to about half the total Budget, including funds for European recovery and for the defence programme: amongst the latter are supports for farm prices and the Trade Agreements Act. In the case of these two programmes, lack of time provides an excuse, which many Republicans welcome, for a temporary extension which will

permit detailed reconsideration when the new Administration takes office.

A Selective Service Bill is still regarded as almost a certainty, and its progress may determine whether or not Congress has to resume its sittings after the conventions. Reluctance to do so arises not only from home sickness, but from the realisation that a post-convention session gives each party a chance to force the other to demonstrate the solidity of platform planks, distinguished more for the ingenuity with which they conceal the gaps in the party ranks than for their weight-bearing ability. The weakest plank in any platform will almost undoubtedly be the Democratic civil rights compromise, if indeed it is possible to construct one at all, and the Republicans will do their best to splinter it. They still give a high priority to some civil rights measure, either an anti-lynching or an anti-poll-tax Bill, during the present session of Congress, but it now seems probable that shortage of time may deliver the Democrats from this addition to their already serious embarrassment.

Wage Formulas at General Motors

Court hearings on the temporary injunction against the railroad strike were postponed until May 28th, to allow more time for negotiations between the employers and the unions. If the temporary injunction is made permanent, the Army can continue to operate the railroads indefinitely: it looks as if it may have to do so, since the striking unions have once more refused to agree to the recommendations of the President's fact-finding board. Mr John Lewis has, as usual, found occasion to break off negotiations with the coalowners for a new contract, but there are still five weeks before the old one expires. The meat packing strike has finally collapsed, and the union has had to accept the increase of 9 cents originally offered by the companies.

This defeat may have made the United Automobile Workers less militant in their attitude to the General Motors Corporation, but their reluctance to strike probably arose chiefly from fear of overstraining their treasury by adding strike pay for the 225,000 members of the union who are employed by General Motors to that already being paid to the 75,000 striking employees of the Chrysler Corporation. The General Motors Corporation, on the other hand, was probably equally reluctant to interrupt the maximum output of which, according to its chairman, it is assured for the next two years. In any case it has deserted the firm front which industry has been presenting to the demand for a third round of wage rises, and labour hopes that the front will now collapse. The increase of 11 cents an hour under the General Motors agreement, although far below the 25 cents for which the union was asking, falls within the 10-15 cent limit which has always been regarded as the probable amount of the third round increase, and halfway between the 6 cents offered by the Chrysler Corporation and the 17 cents which its employees were prepared to accept. It is hoped that a Chrysler settlement will be reached on the same terms, and it appears possible that this year's wage pattern is now set.

If so, it is an interesting pattern and one which is likely to fulfil the hope, expressed in the preamble to the settlement, that it will be an important step forward in relations between labour and industry. Labour's claims for wage increases have been based on the rise in the cost of living, and the General Motors contract recognises this claim by providing for adjustments in accordance with changes in that cost. This new approach is made even more unusual by its provision for adjustments downwards as well as upwards. Wages will rise or fall by one cent an hour with each rise or fall of 1.14 points in the cost of living index of the Bureau of Labour Statistics, provided that the total drop in wages does not exceed five cents an hour. The contract also provides for an automatic increase of three cents an hour in a year's time and runs until May, 1950.

Controlling the Communists

The tiny American Communist Party, while flattered by the immense amount of free publicity it is receiving at the hands of Congress and Presidential candidates, may also reflect, more soberly, that Communists now occupy the place filled, in happier times, by the man-eating shark. It is admirable and perfectly safe and even mandatory for politicians to oppose them. In Oregon Mr Stassen forced Mr Dewey into a full-dress debate on the question whether the party should be outlawed. Mr Stassen accused the Governor of New York of "coddling" the Reds in his State; Mr Dewey insisted that the Courts could be relied upon to punish illegal acts without endangering civil liberties by making Communism illegal.

Much of the debate turned on whether the Mundt Bill, passed this week by a vote of 319-58 in the House, outlaws, or merely exposes, the Communist Party. The Bill makes it a crime to attempt to establish in America a totalitarian dictatorship under Russian control; and it requires Communist and Communist-front organisations to register, and declare their memberships and sources of funds. The criminal law, that is, is to be invoked to cut the links between Russia and the American Communists, but painful publicity will be relied on to show the true path to members and fellow-travellers who are misguided, but not treasonable. Members of Communist organisations would also be refused Federal employment and passports.

The Bill's sponsors assert that they have carefully avoided the illiberal and probably unconstitutional step of outlawing the party. Mr Truman, without committing himself to a judgment on the Mundt Bill, recently declared it contrary to American tradition to outlaw a political party, and said small splinter parties did no harm. No one yet seems to have raised the interesting question of whether Mr Wallace's Third Party might be classified as a Communist-front organisation. Definitions of this kind will provide many headaches for the courts, while the Communist Party itself makes no secret that it will go underground.

Heavy pressure is also being put on the unions to make their officers sign the anti-Communist affidavits required before a union may enjoy the protection of the Labour Board. As a routine matter, the House now adds a rider to appropriation Bills forbidding payment to Government employees who are members of a non-complying union. (This device back-fired recently when it was found that several Congressmen with union cards would forfeit their salaries.) The United States Steel Company has also informed Mr Murray, the president of the steelworkers, that it will refuse to sign contracts with the union next year unless its officers have complied. Although the union's hierarchy is thought to be free of Communists, it has found non-compliance costly in certain disputes. Nevertheless, after taking a strong anti-Communist line, the union convention last week authorised the executive to fight the affidavit requirements in the courts and to refrain from taking the oath as long as the officers could prudently do so.

Delays in the Draft

Now that the Air Force question has been decided, Congress will find it hard to delay much longer on the question of manpower for the Services; the Air Force will probably have little difficulty in securing the necessary recruits, but the forces as a whole need about 700,000 men. Both Houses, after several postponements, are expected to debate the recommendations of their Armed Services Committees shortly; these recommendations are very similar as regards selective service. Both provide for the drafting, that is, conscription, of men between 19 and 26 years of age for two years of active service, followed by some form of service in the reserve; veterans of World War II are exempt if they served for more than twelve months or were wounded, and students, essential workers and men with dependants are eligible for deferment. These Bills are regarded as a satisfactory way of meeting the immediate requirements of the Service Departments, but universal military training for all young men is still considered the only means by which an efficient long-term reserve can be built up.

The Senate Armed Services Committee has included in its selective service Bill a provision by which 161,000 18-year-olds would be called up each year for one year only, followed by four years in the reserves. This attempt to get started on UMT is acceptable to Mr Truman. The trainees would serve with the ordinary selective service men, but would not be liable for overseas duty. Not only would this mean administrative difficulties, but it is a departure from the basic idea of UMT, in which the trainees are supposed to be under civilian control. Further, the compromise would lead to charges of unfairness, since under it only about one in four boys would be called up at the age of 18 and the rest would have to wait for a year and then do two years' service. There is a definite danger that, if the Senate passes this compromise Bill, both selective service and UMT may be lost in the bitter fight which seems sure to develop, since the Republican leaders in the House apparently are determined to resist any linking of the two measures or even any consideration by the House as a whole of the UMT Bill which was passed by its Armed Services Committee last year.

Complications have also arisen in connection with the simple selective service measure. It has been held up in the House by the Rules Committee, whose chairman, Representative Allen, has proposed an alternative bonus plan to encourage voluntary

enlistments; the attractions of this scheme for some of his colleagues will not be lessened by the fact that Mr Truman has called it "asinine." In the Senate the Southern Democrats are threatening to use delaying tactics, even going to the extent of a filibuster, unless the question of race segregation in the Armed Forces is settled in a manner satisfactory to them. They are sponsoring an amendment allowing enlisted men to demand that they be assigned to units composed entirely of their own race, which would be directly contrary to the President's recent directive that discrimination in the Services be eliminated as quickly as possible.

Congress and the President

Under Mr Roosevelt, Congress was resentfully conscious of being treated as a mere "rubber-stamp." Mr Roosevelt was freely accused of dictatorial designs, and of usurping the authority of the Legislature. Today the shoe is on the other foot. Mr Truman is fighting off Congressional invasion of the President's prerogatives. The frontiers between President and Congress have always been somewhat fluid, and today the tide of executive authority is receding from the high water-mark reached during the war. The emergency war powers granted the President have expired. The President's elbow-room in manipulating appropriations is being reduced. Congress is reasserting itself and carving out new responsibilities, particularly in foreign affairs.

In many instances, such as the Marshall plan, Congressional initiative is welcome and essential. But the immediate challenge to the President concerns the loyalty and fitness of Government employees, a field in which Congressional interest has too often confined itself to hounding out of Government service men it feared or disliked. Mr Truman has just vetoed a Bill which would have authorised the Senate members of the Atomic Energy Committee to require the Federal Bureau of Investigation to submit, to the Committee, reports on candidates for the Atomic Energy Commission. The veto was upheld by the narrow margin of four votes. Mr Truman based his veto in part upon the necessarily confidential nature of loyalty investigations and partly on the fact that the FBI, an executive agency, should be kept responsible only to the President. Any attempt to make it serve the Senate would, in his view, threaten that separation of powers which is the theoretical basis of American government.

Mr Truman's determination to be master in his own house may have sprung to some extent from the suspicion that the Bill was part of the general attack upon Mr Lilienthal, the head of the Atomic Energy Commission. Mr Truman recently requested that the Senate confirm Mr Lilienthal for a new five-year term. But Mr Lilienthal is so unpopular with certain Senators that the most the Committee can be induced to offer is a two-year extension of his term, and that only because it recognises the danger of appearing to play party politics with the atom. Even this concession may fail to be approved by the Senate.

In the Condon case (discussed in *The Economist* of March 20, 1948) the House has offered an even sharper challenge to the President's control over his official family. After threats of impeachment and refusal of funds had failed to persuade Mr Harriman to give the Committee on Un-American Activities a copy of the FBI report on Dr Condon, the House passed a Bill ordering Cabinet officers (though not the President for whom they act) to supply Congress with any information requested, on pain of fine and imprisonment. Such a Bill would almost certainly be judged unconstitutional by the courts, even were it to pass the Senate and sufficient support be mustered to override a veto. But, for safety's sake, Mr Truman himself has taken charge of the Condon report.

Shorter Notes

Congress has extended the lending powers of the Reconstruction Finance Corporation, due to expire on June 30th, for six years, but it has cut its total lending power from \$2 billion to \$1.5 billion. The RFC's authority to make deferred participation loans is also restricted to guaranteeing 70 per cent of loans under \$100,000 and 60 per cent of loans over that amount.

The Department of Agriculture forecasts, from conditions on May 1st, that this year's winter wheat crop will be 845 million bushels. This is a little less than the previous month's forecast and 21 per cent less than last year's record crop, but it is 23 per cent above the 1937-46 average. Winter wheat makes up about three-quarters of the nation's total wheat supply.

THE WORLD OVERSEAS

Russian Gold

(By a Correspondent)

AMONG the most important assets of Russian economy and power at the present time are very large holdings of gold. No exact figures of holding or production are available, for the industry is one of Russia's state secrets and is concealed by a curtain of more than ferrous texture. Enough information, however, has reached the West to leave no doubt that the Russian production of gold has increased enormously during the last eighteen years. On the basis of the evidence which exists it has been estimated that the Russian output has been multiplied between four and six times since 1930 and is now nearly half of the total gold production of the world. Reports and comments on the size of Russia's holdings of gold have been frequent in the American press, though the subject seems to have attracted little notice in this country.

The increase in Russian gold production has been due almost entirely to the exploitation of very rich goldfields in the basin of the Kolyma river above or close to the Arctic Circle in north-eastern Siberia. It so happens that great resources of the metal which the convention of mankind has decreed to be "precious" are located in what is perhaps the most inhospitable area of the earth's surface. The region of the Kolyma and the neighbouring river Yana holds the distinction of the world's record for winter cold; temperatures as low as 94 degrees below zero Fahrenheit have been recorded there. The subsoil of the whole region is "permafrost" or "geological ice"; only a thin upper crust is thawed out during the brief summer. The rivers are ice-bound for eight to nine months of the year. The country is broken up by mountain ranges; elsewhere the landscape consists of vast expanses of swamp, dwarf forest—large trees cannot grow because of the subsoil ice—and moss "tundra."

The native inhabitants of this bleak land consist of a few thousand members of primitive tribes who traditionally subsist by hunting, fishing and reindeer-keeping. Up to a little over 20 years ago there were no Russians there except a handful of traders and officials; according to the Soviet census of 1926-27 the population of the whole Kolyma region was only 7,580. No official figures have been published since, but from what is known of the number and scale of the goldfields and ancillary enterprises it can be estimated that the population is now somewhere round the half million mark. In 1940 there were 66 goldfields grouped under seven administrative agencies, each field employing some thousands of workers; the number of fields is believed now to have been increased by the working of newly discovered deposits east of the Kolyma along the coast of the Arctic Ocean.

End of the Private Prospectors

This rapid development of the Kolyma region has been one of the most remarkable processes of internal colonisation in the Soviet Union during recent years. It is worthy of study as an economic phenomenon in comparison with other historic regional developments consequent on the discovery of gold, as in the Transvaal, California and Alaska. Normally such a development has gone through two stages: the first—the "gold rush" period—of extraction of alluvial and surface gold by numerous prospectors with little or no capital, and the second, of regular mining operations by companies with large capital. Curiously enough, Kolyma, in the early days, even under the Soviet regime, followed the individualistic gold rush precedents. Commercial extraction of gold in Kolyma began in 1927, when the "New Economic Policy" was still in force, and private prospectors were encouraged to go and make what they could, provided they sold their gold at a fixed price to a state trust, the Soyuz-Zoloto. This private prospecting was allowed to go on until 1932, but was then brought to an end by the Soviet Government for three main reasons. In the first place, after the inception of the first Five-Year Plan it was contrary to public policy to leave any important industry in private hands. Secondly, much of the gold found had gone abroad, for the prospectors, instead of delivering it to

the Soyuz-Zoloto, had found it more profitable to sell it in exchange for consumer's goods to Japanese fishing boats calling on uninhabited stretches of the Okhotsk Sea coast. Thirdly, the Government wanted to have more gold and to have it quickly, but as long as the country remained a roadless and almost uninhabited wilderness, no rapid expansion of the industry was possible.

Kolyma gold, however, was only one of many planned projects which, in the absence of foreign loans, had to be financed out of capital accumulation from the current national income. Very little capital could be spared for this development. Nor indeed was the labour available anywhere in the vicinity of Kolyma and in order to attract free labour from a distance to what was notoriously one of the worst "badlands" in Siberia it was necessary to offer attractions of high wages and good living conditions. Even so, it would have been virtually impossible to get free labour owing to the great demand for it in more favoured areas of the Union. In any case the Government was not prepared

to pay for the cost of free labour in Kolyma. But happily it was not dependent on free labour at all.

The task was entrusted to the police organisation of the GPU (subsequently transformed into the NKVD and now the MVD), to be carried out, among many other enterprises, by means of "corrective labour camps." A special department was set up within the GPU under the name of Dalstroy and was given supreme authority—superseding all local branches of the civil administration—over most of north-eastern Siberia. The administrative boundaries of Dalstroy appear to have varied at different times; its present area is rather more than ten times that of Great Britain. The Kolyma basin is only one part of its territory, but the Kolyma gold mining is its most important economic enterprise. The head of Dalstroy enjoys viceregal powers and is responsible only to the MVD; he is in control of some tens of thousands of free men—free, that is, by Soviet standards—and of some hundreds of thousands of convict prisoners who provide the labour force of the colony. The economic organisation is directed by the department of the MVD known as GULAG ("Chief Administration of Corrective Labour Camps, Prisons and Special Settlements").

As there was no overland communication with Kolyma by road or rail, convict labour was transported by rail to Vladivostok and shipped thence to a bay on the northern coast of the Okhotsk Sea, where they were to build a port—now the town of Magadan, the "capital" of Dalstroy—and construct motor roads

to the goldfields. The "middle passage" was well organised; in the holds of the ships set aside for the service cages were constructed in which prisoners were packed in tiers to the number of 6,000 to 9,000. The voyage from Vladivostok to Magadan took eight or nine days, and each of several ships could make more than a dozen voyages during the summer months when the sea was free from ice floes. This has gone on every year except during the war, and the population of Kolyma has thus been rapidly built up. Attempts have also been made to convey labour to Kolyma by a roundabout sea route through the Bering Strait to the port of Ambarchik on the Arctic Ocean coast, but this route has disadvantages; in 1933 the ship *Dzhuma*, sailing from Vladivostok with a full cargo of several thousand prisoners, was caught in the Arctic ice and finally reached Ambarchik in the summer of the next year without a single convict; as there was barely enough food to keep the crew alive, the human freight had had to be disposed of.

Once landed, the convict slaves were put to work on construction projects; they slept in the open on the bare ground until they had made huts for themselves in their spare time. The road from Magadan to Seimchan, the centre of the goldfields, was a major undertaking; it had to be carried for 400 miles across mountains and through swamps, and it took five years to complete. With the opening of this and other lines of communication it became possible to employ many more workers on the goldfields; at the same time fisheries, lumbering and even coal-mining were developed in order to give the region maximum self-sufficiency for food supplies and materials. Agriculture is generally impossible because of the subsoil ice, but by a special technique crops are now raised in one or two localities. Some of the development which has been going on in Dalstroy may have a strategic as well as an economic motive, for north-eastern Siberia is the part of the Soviet Union which approaches nearest to territory of the United States, and since the construction of the Alaska Highway during the war American power has existed, not only in name, but in reality to the east of the Bering Sea.

Ingenious Differential Rations

The convict slaves, who form well over 90 per cent of the population of Dalstroy, work under the control of armed guards and specially trained dogs and under the pressure of an ingeniously devised system of economic incentives. Norms of work are fixed and the prisoner's rations are proportionate to the percentage of the norm he achieves each day. Refusal to work is punished by death; work less than 30 per cent of the norm is counted as refusal and earns the same penalty. Above the 30 per cent mark there are four grades of rations for ordinary workers and a special ration for "shirkers"; the shirkers' ration and the lowest of the regular rations are quite insufficient to maintain life if continued for any length of time, and only the best and hardest work earns anything like adequate nourishment. All those who wish to remain alive, therefore, struggle to reach the higher ration grades; those who fail over a period of days or weeks rapidly weaken and die or are finished off by the guards. At the upper end of the scale a few prisoners attain posts on the supervisory staffs and live comparatively well, owing their elevation either to special technical qualifications or to services in the system of espionage which the MVD maintains in its own prisons and camps.

Escape from the slave camps is virtually impossible, not so much because of the guards as because of the dogs. Apart from attempts to escape, discipline is very harsh, as it has to be when the conditions of life are in any case so highly punitive; insubordination is requited with death or with cruel punishments often fatal to the victim. But there is no merely wanton killing, for the slaves have been brought to Kolyma to produce gold, and the Dalstroy officials have to calculate the point at which the cutting of labour cost begins to yield diminishing returns through too high a mortality of convicts. During the war the flow of compulsory immigrants to Dalstroy ceased and was even reversed, for numbers of able-bodied Soviet citizens were shipped back to Vladivostok to be enlisted in the Red Army, and survivors from the captures and deportations in Poland were released to join the new Polish army formed under the short-lived Polish-Soviet treaty of 1941. Production was kept up, however, with mining machinery imported from the United States, and since the war slave labour has again been abundant, with the result that new fields have been opened up and output increased. It is reported to have risen from about 11 million ounces in 1940 to 16 or 18 million last year. The Dalstroy system has undoubtedly been successful in furnishing Russia with an enormous hoard of gold, second in quantity only to that held by the United States—for whatever gold may be worth in the world of today.

Perplexities of Cyprus

[FROM OUR SPECIAL CORRESPONDENT]

POLITICALLY-MINDED Cypriots fall into four classes. On the Left is a vociferous all-or-nothing group which wants unfettered self-government. On the Right, a corresponding all-or-nothing school, led by bishops and priests who would greatly like political power, wants a different all—*enosis* or union with Greece. Centred somewhere between the two are some unvoiced, unemphatic but reflective Greeks who, while true Hellenes by church and sentiment, feel that Greece and Britain are allies, that now is not the moment to raise issues confusing to either, and that as they have not piloted themselves for centuries they had best try dual control before embarking on solo flight. The fourth group, numbering 20 per cent of the islanders, is Turkish and Moslem. It prefers British rule to rule by the Greek majority because it fears that the latter would accord it little more than religious and educational liberty. Are a band of the moderates going to take a hand in shaping the new constitution?

In theory, the answer to this question should be an unqualified yes. The British draft proposal described in *The Economist* of May 15th was last week accepted by the island's Consultative Assembly by 11 votes to 7. But the composition of the majority is such that the future course for the constitution's backers is by no means plain sailing.

The story behind their problem is as follows. When the Assembly was charged with recommending how the people should "participate in their internal affairs," it was intended to be 40 strong. It was to be nominated from all creeds and classes. In fact, it never numbered more than 18 members. The Church led the whole of the Right (which was in the doldrums because it had lost the municipal elections) into opposition to any body that was to discuss measures short of *enosis*. The eighteen members consisted, therefore, of eight Left-wing Greeks, of six Turks and of 4 government nominees—these last being one Turk, one Maronite and two non-party Greeks. A nineteenth member was appointed—an independent British chairman. He is Sir Edward Jackson, a man of experience in framing the constitutions both of Malta and Ceylon—experience the value of which is recognised by all his shrewder colleagues. The Left-wing Greek members, who want full self-government at once, forwarded to London a memorial which said so. Their document, needless to say, met with the disapproval of the Turks. The absent Ryat also disapproved of it. "Better the rule of Storrs and Palmer," wrote the Church newspaper *Ephemeris* in April, "than self-government conducted by Servas and Clerides." The names of Storrs and Palmer locally connote high-handed British ways. Mr Servas, Mayor of Limassol, is the able leader of the island's small Communist party, and was trained in Russia. Mr Clerides, Mayor of Nicosia, is a fellow traveller.

Criticism of Governor's Powers

Plainly, no conceivable draft could please all these people. The British authorities' problem was to produce a document acceptable as a basis for discussion to the widest possible swathe of reasoning opinion. Its proposal suggests a legislature of 22 elected members, of whom four are to be Turks elected by communal representation, and only four official members. Its intention is that these last shall serve as a sounding board from people to Governor as well as from Governor to people. Executive power is to lie with a Council consisting of approximately four officials and four Councillors drawn from the majority in the legislature. The introduction of questions of defence, external affairs and the special interests of minorities are reserved to the Governor; to this even the Left wing nationalists are ready to agree. But they are opposed to a clause which gives the Governor reserve legislative powers to push bills through. The absent Right similarly opposes a clause that excludes "the status of Cyprus within the British Commonwealth"—alias *enosis*—from discussion by the legislature. The reservation of such powers to the Governor is common in colonial constitutions. Naturally it is repellent to him to use them. In practice the clause serves its purpose as a brake on impetuosity simply by being there. But these fruits of experience are difficult to put across to Greek minds full of native aptitude for carping at government.

At the Assembly's session of May 21st the seven voters against accepting the British draft even as a basis for discussion were the five Left wing Greek mayors and the two Greek Trade Union representatives. The representative of the Greek Co-operatives

Valenta
the luxury cigar from Jamaica

Good news for smokers of fine cigars is the introduction of Valenta Imported Jamaican cigars in new 'Handy Fives' pocket cartons. The experts' first choice of all Jamaican cigars, Valenta can now be obtained from your usual cigar merchant in any of three popular sizes and in two attractive packings—the handy "Fives" pocket cartons as well as the popular cedar boxes of 25. Be sure to ask for Valenta by name—it's the luxury cigar from Jamaica.

Guaranteed by the Government of Jamaica

(who had signed the memorial to London) surprisingly and courageously voted with the Turks, the Maronite and the moderate Greeks to form the majority. It would be difficult to proceed to fill in the many blanks that have been left to local choice and judgment without the cooperation of either of the wings of political thought. Yet to abandon the considerable body of middle opinion that would genuinely like to give constitution-making a try is, after the vote, unthinkable. Some of the Left wing leaders seem to have burnt their boats. There are chances that some of those on the Right (who have, in Cyprus as elsewhere, gained ground at the expense of the Communists in recent months) will not follow their aged Archbishop down the blind alley of intransigence.

Adverse Balance of Payments

Some hesitations about taking over the reins of government are comprehensible. Assumption of responsibilities in the summer of 1948 is no light matter. The Eastern Mediterranean is suffering disturbances that are likely to handicap trade and tourist traffic. The island has just come through a boom period based on war profits and there are signs that it must pull in its belt. Visible trade figures for the last three full years are as follows:—

	£,000,000		
	Imports	Exports	Balance
1945	4.8	2.9	-1.8
1946	7.5	3.8	-3.7
1947	12.3	4.6	-7.6

In the first two of the years the unbalance was wholly offset by invisible exports. In 1946, these brought in £4,396,000, of which, perhaps, one-sixth was contributed by some 13,000 bona fide tourists and the rest by military expenditure and sums spent in connection with the camps of Jewish illegal immigrants to Palestine. In 1947, the unbalance was not nearly met from these sources. Bank returns and other indications suggest that the general position is still sound thanks to the accumulation of war savings and to the investment at home by Cypriots abroad of wartime profits made in Alexandria, West Africa and elsewhere. But it is now clear that British military expenditure is not going to continue on any large scale and that imports must drop in 1948. Prices and particularly labour costs are high. (The 44-hour week does not cure the one-time all day worker of his habit of pausing for thought and chat, and a system of payment by results has become imperative.) The value of the £10 million originally allocated under the British 10 year Development and Welfare plan has, as a result, fallen by at least one-third. Nevertheless, long term prospects are not unpromising. The colony's economy is very broadly based; the development moneys now being spent upon small-scale but ubiquitous irrigation schemes are starting to show results; health is good; D.D.T. has finished malaria; the four years of the war have wiped out peasant indebtedness; and small holders now find it worth while to improve their land. Young trees, therefore, now dot the once barren central plain and terraced vineyards are making inroads into the hills. But unless oil is discovered (prospecting is in progress) no spectacular advance in wealth can be expected. All that can be said is that, measuring the island by Aegean standards, which are low, it is prosperous and comfortable.

It will be a grave disappointment to all devotees of political development in the colonies if both Cypriot Left and Cypriot Right shelter behind extremist slogans in order to conceal their fear of encountering the downs as well as the ups of democracy. Yet that is, in the light of their past protestations and the island's present problems, the impression that they will create if they refuse to give the new system a try. "What we want," proclaimed Mr Servas in January, "is a constitution similar to that in Malta." Is it because his political opponents are temporarily in the ascendant that he now seems anxious to take no more risk?

Surer Shield in Malaya

[FROM A CORRESPONDENT IN SINGAPORE]

ON May 2nd Mr Malcolm MacDonald returned from leave to take up a post of supreme importance. He lost no time in holding a press conference and in explaining his new duties. Visual acuity is an occupational disease of Governors, but even when due discount is made for professional optimism public opinion will endorse his attitude. The ordinary citizen, seeing his neighbours in the once fertile and richly productive countries of South East Asia harassed by private stress and political storm, cherishes the idea of stability and security. A price will have to be paid, but he is prepared to meet Mr MacDonald's bill if Singapore is safely buttressed.

On his appropriately timed arrival, the eve of Whitsuntide, Mr MacDonald has shouldered the responsibility of a trinity. He is Governor-General of Malaya, and hence responsible to Mr Creech Jones for the general supervision and co-ordination of policies in the Federation of Malaya, Singapore, Sarawak, Brunei and North Borneo. As Special Commissioner for South East Asia he has to do everything possible to further and co-ordinate the economic development of neighbouring countries. For this he is responsible to Mr Bevin. Also, as Special Commissioner, he is chairman of the Defence Co-ordination Committee in the Far East, and is thus responsible to Mr A. V. Alexander. Mr MacDonald's local reputation is that of a sincere, sensible and likeable man who combines knowledge and experience with a flexibility of methods and a readiness to adapt himself to a changing situation. His prestige is great, and his courage in undertaking this triple post is even greater.

Improved Defence Organisation

The duties previously performed by Mr MacDonald as Governor-General are comparatively simple, but even so his great abilities will be taxed in driving a team in which the ultra-modern Singapore is required to pull with the backward states of North Borneo and Sarawak. His responsibilities for Defence are the outcome of the fall of Singapore. The Percival Report on that ill-arranged and ill-starred campaign from December, 1941, till February, 1942, revealed many weaknesses—lack of organic union among the civil, military, naval, and air services; absence of a responsible authority; dependence on a too distant War Office for many decisions which should have been taken immediately on the spot. The focal point of Singapore makes it a convenient centre round which to group the armed services headquarters, which can now jointly and severally plan in detail against any future aggression. Local airports are being enlarged; and the Imperial Government will contribute to the cost. A Malayan navy is being recreated. Volunteer regiments will be restarted when it is more clear how part-time soldiers can play a useful part in mechanised warfare.

In his capacity as Foreign Office representative, Mr MacDonald has inherited the large organisation built up by Lord Killearn, who has just retired from the position of Special Commissioner for South East Asia. Lord Killearn had various diplomatic tasks: he was adviser to the British Government on general international questions touching foreign affairs in South East Asia; he made useful contributions in the Netherlands East Indies negotiations; and he had in addition economic responsibilities in connection with food, particularly in the production, import, and distribution of rice. Inducing Malayan, Colonial and Foreign Governments to run in gear will demand the fullest exercise of the great administrative abilities which Mr MacDonald has shown he possesses. The fusion of duties must be attended by some temporary snarls; but Malaya is quite prepared to exercise patience, because it sees in the new arrangement a business-like recognition of its importance as a factor for stability and security, while the rest of South East Asia is adjusting and adapting itself to the atomic age.

Signs of Economic Recovery

The signs which Mr MacDonald found hopeful are quite numerous. Rubber has been produced in record abundance; soap manufacture is attaining a useful output; the pineapple industry is off to a good start; on May 10th the Singapore Harbour Board accomplished its highest discharge per day, 11,000 tons, and three saw-mills have reopened. But handling charges are still high, and in competitive international trade services must be cheapened. For a long time the labour exchange was almost empty of labourers. It has now 3,000 artisans and 2,500 unskilled men on its books. Many employers have stated that they can now replace dissatisfied exponents of the go-slow type of labour by men who are willing to give a decent day's work for a day's pay. Politically there is also an improvement. The police are winning the battle in the fight against extortion and crime because they can now obtain co-operation rather than the scared abstinence of the public.

In addition to his threefold duties Mr MacDonald has many commitments on the domestic side and a very limited income. There are imperative needs. More houses, more schools, more hospitals, more machines must not be removed from the top of the priority list however strongly challenged. The Universities Commission's report has been published. Its recommendations are excellent, but giving them effect will make Malaya's University the most expensive in the world. Whether the much over-strained income of Malaya can be further stretched to establish it without serious detriment to other services is another unsolved problem. Mr MacDonald must realise that it is necessary to keep whole and undefiled the faith that ends must be related to means.

THE SPIRIT OF ENQUIRY

A half-empty bottle in 1836 . . .

In the 1830's Charles Askin, formerly a young Birmingham veterinary surgeon, devoted himself to finding a method of extracting pure nickel from the nickel-cobalt ores then available.

His final experiment depended on the addition of a quantity of bleaching powder which it was expected would precipitate the cobalt hydroxide and leave only a nickel compound from which nickel could then be relatively easily obtained.

Askin found he possessed only half the powder he calculated he would require, but he continued with his experiment, and succeeded by chance where an associate, using ample powder, failed. Thus was a lucky stride made towards the Nickel Age.

The spirit of enquiry and research typical of this pioneer still characterizes the Nickel Industry.

Born 1820—still going strong

or where residence is necessary. The director will not have to account to the tax authorities for his meals, provided that meals are provided generally for the staff and are taken in part of the business premises. But he will be accountable for any assets which may be transferred to him by his employer, or for the Schedule A assessment of a house provided for him by the company—the latter is almost a concession, for Schedule A values are usually well below economic rents. These various provisions would involve much detailed accounting by a company, which in future will formally be required to make returns for the smallest items of expenses paid to senior employees and directors—and, it would seem, to deduct PAYE from them. Much of this work, however, should be avoided by the operation of Clause 41, which provides that if a company satisfies the Revenue that no additional tax would be payable on payments or services provided to employees or directors, then they may be excluded from the operation of Part IV of the Act. This administrative discretion, sensibly administered, should avoid much investigation of petty expenses, without reopening the door to evasion.

If the clauses relating to expense allowances are relatively straightforward, the same claim can hardly be made for Part V which deals with the special contribution. This will long provide a happy hunting ground for the lawyers. The levy purports to be a levy on capital, measured by reference to "investment income," as defined in Clause 48. But examination of the first Clause shows that the levy, in certain not unusual circumstances, can in effect be a tax on earned income. A man who had £2,000 of investment income in 1947-48 and earned nothing pays no levy and no surtax. If he worked and earned £800 (or less) he will pay in taxes on that £800 all that he earned. Income tax will absorb £288; surtax £87 10s.; and the levy will amount to £425. Thus the total taxation attracted by an earned income of £800 would amount to £800 10s. A similar penalty would apply to a man with an investment income of £2,000 and a modest pension, for while pensions are not "investment income" for the purpose of the levy, they are included in total income, by which the levy is in part determined. Unless some change is made in the marginal reliefs to such persons, they will be unfairly prejudiced, and naturally inclined not to supplement their investment income by working in future.

One of the most severely criticised points in this part of the Bill relates to private companies, whose members happen to have taken their income from the business in the form of dividends rather than as salaries. Assume that five men are in partnership, and made £100,000 profit in 1947-48. No levy will be payable on this sum. But if they had formed themselves into a company and took the whole of the profit as dividends on their shares, they would, as Clause 48 now stands, be liable together for a total levy of £45,625. Such a

business might have quite modest assets, and its profits might depend very largely on the skill and energy of its members. Such, for example, is the position of corporate members of the Stock Exchange. Evidently, some amendment is required to deal fairly with the incidence of the levy on income received by way of dividends on shares of director-controlled companies.

Clauses 48 to 51 define the meaning of "investment income." Annuities and annual payments come within the definition, but Government annuities and annuities payable by insurance companies are not to be treated as investment income. The point of this differentiation between such annuities and other forms is not quite clear. An annuity purchased for proper consideration is surely entitled to rank equally with another of the same class. Clause 51 deals with periodical payments, like payments of alimony or payments under covenants. It cannot be said that this clause is clear beyond doubt, but it appears to imply that such payments may not be deducted in computing the investment income of the payer, and that the corresponding receipts of the person to whom they are paid are not to be treated as investment income of the payee. But there is room for doubt on this point, and the clause should be made clear, beyond question.

As the Chancellor recognised in his budget speech, trusts present a number of problems in assessing and collecting the levy. The burden of Clause 55 is to make arrangements, under certain conditions, for payment of the contribution from the capital fund of the trust. If the life tenant works and enjoys an earned income, it may raise his total income and set up a liability for the special contribution. In that case, the levy will be payable out of the trust funds, and the prospects of the remainder-men will thereby be worsened. For example, a man receives £2,000 from a trust; if he has no other income, no levy is payable. But if he earns £1,000 in addition, the trust will be liable to find £425 in respect of his amount of levy. Similar anomalies may arise where the trustees have discretion to distribute the income from the trust. These are only a few of the simpler anomalies which arise, as the Bill stands, in the case of trusts. Since trusts rank as "indirect contributors," they have a plain interest in ensuring that the assessment of the levy is correct; yet their rights of appeal are materially limited. They may not learn their liability until the assessment is final, and it is not clear whether they would then have any right of appeal. The penal provisions of this clause require careful scrutiny in Committee; if trusts are to be called on to meet a levy which is assessed by reference to the total income of life tenants, they should not be liable until they have had notice of assessment and the opportunity of entering an appeal. Clearly, so many special cases are likely to arise under the particular provisions of individual trusts that this amendment should be accepted as a matter of plain equity.

Business Notes

The Yawning Gap

The trade figures for April have come as a rude shock to those who had hoped, from experience of the early months of the year, that solid progress was at last being made towards closing the menacing gap in Britain's balance of payments. Imports in April, valued on the usual cif basis, rose by £8,000,000 to £186 million, surpassing by several millions the highest total ever previously recorded (in January, 1920). Despite the moderate further expansion of exports, the visible deficit rose by £3,400,000 to £54.4 million, the worst figure since last September. Imports for the first four months of this year, at £186 million, have surpassed by fully £39 million, or 27 per cent, the figure for the similar period of 1947, and the visible deficit has widened from £154 million to £174 million, despite an expansion of total exports by £143 million, or 40 per cent.

These figures show plainly enough that the programme set forth in the "Economic Survey" for reduction of the total deficit in 1948 will not be achieved, as the press last week was not slow to point out. In trying to compare the programme with the trend shown by these figures, some commentators forgot, however, that the "Economic Survey" valued imports fob, whereas the Trade Returns show them cif; they thus made a poor performance look even worse. This was too much for the Treasury, which is plainly becoming increasingly sensitive to criticism. The Economic Information Unit promptly issued a list of explanations and excuses. It pointed out, among other things, that at least 10 per cent ought to be deducted from cif imports to adjust them to the basis assumed in the "Economic Survey." But, even on this basis, the record of the past four months is depressing. With imports valued fob, the visible deficit in April was £36 million, compared with £33 million in March and £16 million in February. Even if the deficit in the next two months were to fall to the average monthly rate assumed in the "Economic Survey"—which is inconceivable—the half-year's

deficit would be £136 million, or £50 million worse than the official forecast. The Treasury's apologia says that imports were below expectations in January and February and abnormally high in the following two months. Yet the adverse balance in the first two months was much above the average rate assumed in the estimates, and it is already clear that imports for the first

BRITAIN'S VISIBLE BALANCE OF TRADE
Monthly Averages £ million

Area	Monthly Average				
	1st Qtr., 1947	2nd Qtr., 1947	3rd Qtr., 1947	4th Qtr., 1947	1st Qtr., 1948
United States of America	-17.9	-21.0	-21.6	-17.3	-12.2
Canada and Newfoundland	-11.9	-17.8	-18.9	-14.8	-13.8
Argentina Republic	-7.4	-6.7	-10.2	-7.7	-7.6
Rest of Western Hemisphere (other than Sterling Area countries, but including Japan and Philippines)	-4.7	-9.2	-12.1	-7.8	-3.7
Union of South Africa	+5.5	+5.9	+5.3	+5.6	+6.2
Rest of Sterling Area	-4.3	-8.8	-6.4	-0.8	-5.8
European Countries (including their overseas possessions other than those in the Western Hemisphere)	+6.5	+1.3	-6.0	+1.7	-1.2
Other Countries	+2.1	-1.3	+2.0	+1.5	-1.5
TOTAL	-32.1	-57.6	-67.9	-39.6	-39.6

half-year will exceed the target by some £100 million fob. If net payments on invisible account are no larger than the official forecast, Britain's total deficit on current account for the six months is unlikely to be less than, and will probably exceed, £200 million—in contrast with an official forecast of £136 million.

The trend in dollar trade has been somewhat less disquieting. As the accompanying table shows, in the first quarter of this year the monthly rate of visible deficit (taking imports cif) with the Western Hemisphere declined to £37.3 million, compared with £47.6 million in the fourth quarter of 1947, and with a peak

rate of £62.8 million in the third quarter. If imports are abated by 10 per cent, to allow for freight, the total visible deficit with the Western Hemisphere in the first quarter of the year becomes £94 million. This figure, likewise, compares adversely with the official target (a visible deficit of £162 million with the Western Hemisphere for the half-year), but the contrast between hope and performance is less marked here than in the figures of the external deficit as a whole. It is impossible, however, to dismiss this deterioration, as the Treasury tries to do, by the facile argument that most of it is due to increased imports from the non-dollar world. The Treasury seems to think that increases in expenditure outside the dollar area are quite inconsequential unless they result from rising prices. In the circumstances, it is hard to understand how the authorities can say in the same breath, "that the achievement of an overall balance . . . is of course one of the main objectives of our policy."

Chancellor on Sterling

Hardly a week passes nowadays in which Sir Stafford Cripps does not find an opportunity to underline the merits of sterling and the reasonableness of its existing parity. These statements serve the useful purpose—which doubtless is their objective—of neutralising the effects on public opinion of the continual indications that Washington is concerning itself increasingly with the problem of devaluation of European currencies. The Chancellor should beware, however, of defeating his purpose by protesting too loudly and too often. In the circumstances, it is a pity that his latest denial of any need to devalue sterling should have been founded, in effect, upon so questionable a footing as a purchasing power parity calculated on official cost of living indices. It was unfortunate, too, as an earlier article points out, that his description of sterling as "the only large scale convertible currency that still exists" for the Commonwealth and Western Europe should have coincided with the news that two more countries are to leave the shrinking system of transferable sterling accounts. Yet both contentions are reasonable. The case against any early devaluation of sterling can be substantiated by better arguments than Sir Stafford chose this time; and it is beyond doubt that sterling, even though its automatic convertibility shrinks further, is the only non-dollar currency which can be a common medium in the non-dollar world.

The crucial question, however, whether sterling's acceptability can be sustained, or any multilateral system of payments be established in Western Europe, does not turn upon mere currency matters. On this aspect, Sir Stafford's latest speech supplied a touch of realism which has been woefully lacking in most of the recent discussions of this problem. Marshall aid, he emphasised, will not alone restore the foundations of sterling. If it supplies £400 million of dollar relief in a year, Britain will still be receiving in external dollar aid £600 million less than the dollars expended last year for all purposes. Marshall aid merely provides time in which to restore the position by the only means in which it can be restored without a disastrous fall in the standard of living—by increased production. But as exports and production climb higher, the steeper and more difficult the path becomes: "sales resistance is building up, we have almost reached the limit of raw material supplies . . . and there is no more labour to come back." In other words, increased efficiency is the cardinal need: the main objective now must be more production from existing resources.

Basis of Convertibility

The fundamentals of Europe's exchange problem are similar. On the basis of figures compiled by the Economic Co-operation Commission for Europe, Sir Stafford Cripps showed that the balance of payments for Europe as a whole (excluding the USSR) deteriorated between 1938 and 1947 by \$7,500 million—of which, \$2,700 million reflected the fall in invisible income, \$1,200 million resulted from the decline in the physical volume of trade and \$3,600 million from increased prices. To redress its vast deficit, Europe would need either to increase its exports by 125 per cent of the 1947 level or to reduce its imports by 55 per cent. To satisfy such a programme (by any combination of the two processes of adjustment) production of capital goods and chemicals would have to rise to between 40 and 50 per cent above its prewar level. It is on hard facts such as these that every discussion of Europe's collective currency problems should be based. In principle, every Marshall country agrees that a production deficit of this magnitude cannot conceivably be bridged except by a co-

operative effort involving many painful mutual sacrifices to ensure not only increased production but production of the specific goods which are indispensable. Schemes to extend the convertibility of currencies and to widen the area of multilateral payments within Europe may supply a lubricant for such a concerted drive as this. But it is folly to suppose that such schemes can work by themselves. Their chances of success depend absolutely upon the willingness of the participants to face squarely and quickly the difficult adjustments and painful sacrifices which are inherent in the ideal of an integrated production plan. In the currency sphere, mutual extension of overdraft limits (or their equivalent) are the technical means by which the lubricant must be injected; but they will not be conceded unless the creditors are confident that the claims will be discharged in necessary goods in the reasonably near future.

Imperial Chemical Issue

At the annual meeting of Imperial Chemical Industries a week ago, Lord McGowan disclosed that application had been made by the company to the Capital Issues Committee for permission to make a new issue of ordinary shares to the existing stockholders. The board intends, if permission is given, to make the issue as of right (giving preference stockholders the opportunity to subscribe for any shares which are not taken up) and the date and terms of the issue have yet to be decided. On this news, the shares reacted somewhat to 48s. 9d. but they have remained steady at this price during the past week.

The need for new capital—the first that the company has publicly raised since 1929—was clearly explained in the ICI report. The group as a whole has present commitments for capital expenditure amounting to £16½ million; but the full programme of extension stretching into the future will involve finance much beyond present commitments. Last year, no less than £20 million was absorbed for new plant and increased working capital and stores. The group is, of course, strongly equipped with current assets; they exceeded £76½ million at end of last year, but net current assets showed a fall—despite the customary caution of the directors' reserve policy—from £37.3 million to £33.4 million. This is not a material change, but it is a portent of some significance for the future.

There has naturally been much speculation about the terms of the new issue. Will the directors decide to offer all the £20½ million of unissued capital in one operation? If they did, a two for five offer would be a simple conclusion in proportion, for there is £50,465,116 of ordinary stock in issue. And what price are the directors likely to fix? There will be two practical limits: not to fix the price so high that shareholders have nothing "to go for," but not to fix it so low that the company is unnecessarily burdened by the bonus issues tax. The group's future commitments are such that the directors will be anxious to obtain the greatest volume of new resources from the issue. The market's guess is that 45s. would be a fair price, in all the circumstances, for the new shares; and since the dividend yield at that price would be 4½ per cent it would enjoy good support. But it is for the directors to decide.

Industry Seeks New Capital

An active season of new industrial share issues is indeed in full swing. At the end of last week the terms of the offer to shareholders of Cunard Steam Ship were announced. As the chairman showed a month earlier, the main purpose of the issue is to repay short-term indebtedness incurred by last year's purchase from outside interest of the 3,800,000 shares of Cunard White Star at 40s. The company hopes to raise some £3,805,000 net by the offer to ordinary shareholders of 2,228,105 new £1 ordinary shares at 35s., in the proportion of two new shares for every £5 of stock held. The stock stood at 44s. 9d. at the date of the offer, so that the rights were worth about 2s. 9d. per share; the stock has fallen this week to 40s. 6d. ex rights. It has been suggested that the Cunard group might have in mind some further expansion, since an increase in the authorised ordinary capital from £5,600,000 to £12 million has recently been approved by the shareholders. But the Cunard accounts showed that some £4,881,300 was still outstanding for unsecured loans, and although it is known that substantial reductions had been made in the balance between December 31, 1947, and April, the new issue will be no more than sufficient, presumably, to repay the balance. It is estimated that Cunard Steam Ship will be liable to bonus issues tax amounting to some £80,000 on the issue.

Under Charles II

The Great Fire of London, following on the Great Plague, changed the face of the capital. In recent years another Great Fire has changed the face of London once again. In both these catastrophes the watchword in Lombard Street was "business as usual."

Martins Bank, through the old private bank which operated at the sign of the Grasshopper, a business which was absorbed in 1918, has a link with the famous men of the reign of King Charles II, for the King himself, Prince Rupert, the Duke of Monmouth, the Prince of Orange, and Samuel Pepys, the famous diarist, all had accounts at the old bank.

The business of Martins Bank is now countrywide and branches number nearly 600, but the personal touch has not been lost and is still one of the outstanding features of the service provided for customers.

MARTINS BANK

LIMITED

LIVERPOOL, LONDON & 600 BRANCHES.

Two tractors put 6000 people into essential industry!

150 acres of this rough ground had to be graded absolutely flat before a single brick could be laid for the Dundee Industrial development scheme.

Every hour two men shifted 250 tons of earth using two "Caterpillar" Bulldozers with Scrapers which scoop up 12 cu. yds. at a single bite!

With 250,000 tons of earth moved ten times quicker by "Caterpillar", the first factory is already completed and in full production.

The Dundee Industrial Scheme, sponsored by the B.O.T. and built almost entirely by Sir Robert McAlpine and Sons Ltd., puts 6,000 people to work in new and essential industries. In this project "Caterpillar" Earth-moving equipment—supplied and serviced by the Olding organization—has made immense savings in cost, time and manpower. Onemorecaseof "Caterpillar" making a powerful contribution to Britain's recovery.

Manchester Branch: 52, Mosley Street, Manchester, 2.

New York Agency: 65, Broadway, New York City.

Associated Institution in India and Pakistan:
The Allahabad Bank Ltd.

THE CONDITIONS which interest the modern exporter are those prevailing in his market, the 'commercial weather' in which he must trade. British products will always sell in Australia and New Zealand provided they are adapted in both quality and price to the Dominion markets. The Overseas Department of The Bank of Australasia can put at the disposal of the British exporter accurate up-to-date information from the Bank's Branches 'down under' giving him a picture of prevailing conditions upon which he can base his export programme.

THE BANK OF AUSTRALASIA

(Incorporated by Royal Charter 1835)

HEAD OFFICE: 4, Threadneedle Street, London, E.C.2. (Manager: G. C. Cowan)

May

The British Industries Fair opened in London and Birmingham early in May. This great display reflected the skill and resourcefulness of the people of this country in providing the exports so essential to our national well-being. Many exhibitors enjoying an international reputation can recall their first steps and not a few the aid and support received from the Midland Bank. Over a century ago this Bank began as a local undertaking in Birmingham, side by side with other examples of early enterprise. To-day the Bank is as ready to meet the needs of those whose requirements are modest as it is of those of the great industrialists, and offers its services to all having need of them.

MIDLAND BANK LIMITED

John Mayow *Air is necessary both to keep a fire alight and to maintain life.*

Though this important fact has been known for thousands of years, it was an English chemist and physician, John Mayow, who first proved by practical experiments that only a part of air supports life and that there is a great similarity between breathing and burning. This part of the air, which we now know to be oxygen, Mayow called the "nitro-aerial spirit". He kept a mouse in a jar of air closed by a bladder and observed that the bladder bulged inwards probably with the contraction of the air inside as the mouse used up the oxygen. He also observed that a mouse alone in a closed jar lived twice as long as a mouse kept in a jar together with a burning lamp, showing that both mouse and lamp were using up the same part of the air.

Though Mayow produced some remarkably shrewd theories on chemical affinity and was one of the first chemists to explain how nitric acid is produced by the action of sulphuric acid on nitre, his reputation rests on his work as a practical experimenter. He was born in London in 1643 and entered Wadham College, Oxford, in 1658. He died at Bath at the early age of thirty-five, a few months after his election to the Fellowship of the Royal Society. John Mayow, English physician, was one of several chemists who helped to solve the riddle of combustion—one of the most fundamental reactions in chemistry.

The reasons for the increased capital requirements of Crompton Parkinson, London Brick, British Oxygen and Colvilles—among other companies—are akin to those of Imperial Chemical Industries. Their need is for additional capital to finance expanding stock values and to meet the ever-rising cost of new plant and buildings. Only Crompton Parkinson have, as yet, come forward with definite new issue proposals, although British Oxygen and London Brick are both increasing their authorised capital in anticipation of a new issue. Colvilles are still contemplating alternative means of raising fresh money.

Crompton Parkinson intend to raise over £1,000,000 by an issue to ordinary and "A" ordinary shareholders of 1,025,932 5s. "A" ordinary shares at 20s. in the proportion of one new share for every five shares held. This issue, like that of Cunard, is not apparently being underwritten. The directors point out that the departure from the usual practice of the company of financing normal expansion out of the resources of the company has been necessitated by the continued rise in costs. Additional capital requirements of the company up to the end of 1949 are put at between £1,000,000 and £1,500,000. Another company seeking extra finance is Petrochemicals (a member of the Manchester Oil Refinery group) for which arrangements are in hand to raise £2,450,000. No public issue is contemplated, since £1,450,000 will be subscribed by the Finance Corporation for Industry and the remainder will be privately subscribed.

The Haifa Refinery

Although the war in Palestine has not cut the pipeline from Iraq, it has (by forcing the Haifa refinery to close) stopped the refining of Iraq petroleum. More will be heard of the position at Haifa. The refinery there was completed before the war up to the point at which it could handle 2,000,000 tons of petroleum a year; during the war its capacity was doubled. It became the main supplier to the Eastern Mediterranean and a useful supplier to the United Kingdom. Last month, when relations between the Arab and Jewish workers there became impossible, it closed; the Arab workers, exasperated by being shot at on their way to work, departed to their villages. The European technicians left a fortnight ago, just before the State of Israel was proclaimed, leaving a few behind to handle the crude oil terminal.

Crude oil can still be loaded at Haifa port; at present it is pumped through the pipeline from Iraq only when a ship is ready to load. By these means perhaps 1,000,000 tons of crude a year can be sent out of Haifa by tankers making the short run to Tripoli; another 2,000,000 tons of Iraq oil can be pumped out by the Tripoli branch of the pipeline. But where can this 3,000,000 tons be refined? Not at Tripoli, which has only a small refinery supplying local needs; in recent years the bulk of the oil arriving at Tripoli has been shipped south to Haifa for refining. Most of the world's refineries (including those of the United Kingdom, already quite insufficient for United Kingdom needs) are working to capacity, and additional stocks of unrefined oil are of no help. The loss of the output of Haifa means, in terms of refined products, the loss of 700,000 tons of motor spirit, 2,000,000 tons of fuel oil, and nearly 1,000,000 tons of gas oil and kerosene a year.

The Haifa refinery was operated by Consolidated Refineries Limited, a company owned half by Shell and half by Anglo-Iranian. Its supplier, the Iraq Petroleum Company, is 47.5 per cent British-owned (Anglo-Iranian and Shell), with the remainder divided mainly between French and American oil interests. Both companies are now faced with difficult problems. To be so essential can be embarrassing, and pressure for the reopening of the Haifa refinery seems inevitable. In Palestine the generating stations, the bulk of industry, and some of the railway rolling-stock run on oil; whether in peace or war, neither Israel nor the neighbouring Arab countries will find it easy to manage without Haifa petroleum.

Belgian Francs as Scarce Currency

One of the inevitable results of stifling the demand for the best is to increase that for the second best. The International Monetary Fund might have borne this in mind when it recently barred the sale of US dollars to ERP recipients. The immediate result of this ban appears to have been to unloose a widespread demand for the second hardest currency, namely Belgian francs. Unconfirmed rumours suggest that during May, France, Holland, Denmark and even Great Britain have made application to the IMF for Belgian francs. The scale of these demands has been sufficient to cause serious concern in Belgium. That country has

for some time past complained of the inordinate lengths to which it has gone in making "unrequited" exports to its European partners.

Having called a halt to this lending, which has reached a total of 13,000 million Belgian francs (about £75 million, Belgium suddenly saw itself confronted with the prospect of a further but involuntary extension of credit through sales of Belgian francs by the IMF. It therefore asked the IMF to suspend sales of its currency. That request has been refused but, in mitigation, the IMF has informed Belgium that the ban on dollar sales to ERP recipients will not apply to it and that it may purchase dollars from the Fund up to the amount of the Fund's sales of Belgian francs. This prospect of acting as a funnel for the injection of US dollars into the European economy can hardly appeal to Belgium. It is decidedly costly, the service charge alone making it an expensive operation, while if the movement proceeds for any length of time, the grim prospect will arise of the Belgian franc becoming and being formally declared a "scarce currency." No holds would then be barred to the rest of the IMF membership in discriminating against Belgian trade—which is hardly the reward that Belgium had hoped to receive for its toleration of unrequited exports.

French Sterling Credits

The negotiations between Britain, Belgium and France, designed to place additional sterling credits at the disposal of France, have struck some difficulties. When the general principles of the arrangement to make Belgian sterling to the amount of £5,000,000 available to France were agreed in Brussels at the meeting of the five Western Union Finance Ministers, the details of the operation were not discussed. The difficulty that has since arisen concerns the source from which this Belgian sterling is to be provided. The British view is that it should come from the Belgian current account, now very near to its upper gold point limit of £27 million. London's attitude on this issue is governed by the fact that there is still a tendency for the balance on this current account to push beyond the ceiling and, therefore, for gold to be lost to Belgium. The removal of £5,000,000 from the account would be more than welcome.

Belgium, however, has other sterling resources temporarily immobilised under the usual pattern of number one and two accounts, and would prefer that sterling placed at French disposal should be drawn from the latter and not from the former. Pending agreement on this subsidiary but by no means unimportant point, no further progress can be made. The arrangements for a direct British credit to France have, however, given no difficulty. The amount is for £10 million, so that with the Belgian credit France will have £15 million of additional credit at its disposal. This should help to tide over the gap until such time as ERP can assist France to restore some semblance of equilibrium in its current payments with the sterling area.

World Bank Issue in Switzerland

The International Bank for Reconstruction and Development announced this week that it had issued bonds maturing in 1953-54 to the value of 17 million Swiss francs to the Bank for International Settlements. The operation is of considerable interest on several counts. It is the second bond issue to be made by the Bank, the first being the \$250 million flotation in the New York market last July. The Swiss francs in question are required in order to satisfy Holland, which last August was granted a loan equivalent to \$195 million by the Bank. The greater part of this loan was taken in dollars for expenditure in the United States. Some of it, however, was needed in Belgian francs. These are being provided out of the International Bank's holding of that currency provided by Belgian contribution of its quota. No similar source of Swiss francs was, however, available to meet Dutch requirements for Swiss currency, since Switzerland is not a member of the Bank. It was, therefore, decided to raise the Swiss currency by an issue of Swiss franc bonds. It is interesting to note that the bonds should have been issued direct to the Bank for International Settlements, which is thus entering into direct business relationship with the Bretton Woods Institutions. This latest operation should certainly help to widen the activities of the World Bank, though it need hardly be stressed that its ability to operate on an appreciable scale must, for the time being, continue to depend on its ability to make additional issues of bonds on the United States market. The fate of the issues of dollar bonds made last July does not carry promise of a successful repeat performance in the early future.

Record Imports—Fair Exports

Imports into the United Kingdom in April, valued at £186 million, were the highest on record. They surpassed the previous postwar peak of £179 million of last July, and were nearly £3,000,000 higher than the record figure of January, 1920. The month's largest increase was in raw material imports, which totalled nearly £65 million compared with £53 million in March. The recent rise in world cotton prices is clearly reflected in the import figures; the quantity of cotton received in April was 50 per cent greater than the average for the first quarter, but its value was more than double. Larger quantities of wool also arrived during the month, and the import of oils and oilseeds and paper and paper-making materials were the highest on record, though in each case the increase was partly seasonal.

Food imports showed a reduction of £5,000,000 on the month, but were over £6,000,000 higher than the average for the first quarter. Supplies of grain and dairy produce were heavier, but the value of meat imports fell to the lowest figure for two years. An interesting item in the food category is the receipt of 1,220,000 cwts of potatoes during April at the cost of nearly £1,000,000. The trade returns refrain from revealing the sources of supply, but a large part is believed to have come from Poland, and the price appears to have been high. Evidently last month's imports have a direct connection with the end of potato rationing.

Exports continued to expand in April, and amounted to over £126 million. The daily average was a little higher than in March, reckoned by value, but 1 per cent less, reckoned by volume. The volume of exports for the month has been provisionally estimated at 132 per cent of 1938 compared with 129 per cent in March and 126 per cent for the first quarter. This is moderately encouraging progress. The export target aims at a 30 per cent increase on the 1938 volume during the whole year—a 25 per cent increase in the first six months (which up to April has been more than achieved) and a stiffer increase of 36 per cent in the second six months.

Textiles exports showed the largest expansion in April. Wool yarn and manufactures and rayon manufactures were mainly responsible, although cotton yarn and manufactures rose by £500,000 to over £9,000,000—the highest since the war. Nevertheless, there was still no marked increase in shipments of textiles to Canada or the United States. Exports of cars reached another

record at 18,366 units, an increase of 2,023 on the month; sales to America exceeded those to any other foreign market. Machinery exports totalled £21 million and regained their lead. Coal exports expanded further; last month 734,000 tons were shipped abroad, mainly to European countries, though large quantities were also sent to Egypt and Argentina. The provisional conclusion is that the export drive is producing results. The problem is to quicken the expansion and, as an earlier note shows, to rectify the disparities between hard and soft currency trade.

British Cottons for Canada

Cotton weavers have been not a little sceptical about achieving their target to ship 100 million yards of piece-goods to Canada, as the Board of Trade exhorts them to do. Sales to the Canadian market were already difficult owing to the relatively high price of British cottons. These difficulties were increased when preferential duties of 15 to 22½ per cent were reimposed on a range of British cotton and rayon goods at the beginning of this year. Moreover, British cotton manufacturers were unable to sell their goods in Canada at smaller profit margins than in the United Kingdom or elsewhere owing to the incidence of "anti-dumping" duties designed to make up the difference. Last week's announcement by the Canadian Minister of Finance of the abolition of both the preferential and the anti-dumping duties on cotton and rayon goods is therefore greatly to be welcomed. British cotton goods will, as a result, be able to enter Canada duty-free until June 30, 1949.

Now that these obstacles have been removed, it is up to Lancashire to sell its wares at competitive prices. According to Mr Abbott, the British Government has assured Canada that "it will take all possible steps to see that the target of 80 million yards of cotton piece goods shipped to Canada in 1948 will be met." But other difficulties still have to be faced. Canadian consumers have been nursed with subsidies on textiles, and although these were withdrawn last Autumn, buyers are evidently not yet accustomed to paying current high prices. Moreover if British goods are to sell readily in Canada, British traders must be content with smaller profit margins. Canadian buyers have repeatedly expressed their desire for British goods, and particularly for utility cloth. Under the open-export scheme, merchants must export a proportion of their goods to hard currency markets, which include Canada; the proportion is fixed for the current quarter at 20 per cent.

Actual exports during the past four months do not reveal a very encouraging picture. Total exports of all woven cotton piece-goods in this period were 216 million yards, of which rather less than 6,000,000 yards went to Canada. This is admittedly a distinct improvement on the year's figures for 1947 when Canada took 8,000,000 yards out of total exports of 539 million yards. If the gap of 74 million yards is to be filled this year, average monthly exports to Canada for the next eight months must exceed 9,000,000 yards, compared with average exports of 1,500,000 yards for each of the first four months. Thus a heavy burden will have to be shouldered by producers and salesmen in the latter half of the year if British cotton exports to Canada are to approach the required volume.

* * *

Is Japan a Threat?

Figures for Japanese textile yarn production in 1947 may alleviate the immediate fear of Japanese competition in world markets. Output of cotton yarn was only 17 per cent of the 1938 level, wool yarn 22 per cent, rayon filament 8 per cent and staple fibre 4 per cent. Total production was small, and in each case it also showed a decline in the later months of the year. But a true assessment of Japanese competitive power in world markets turns on the causes of the present small output. If it is due to a lack of productive capacity, it is likely to be long lasting. If, on the other hand, it is caused by shortage of raw materials, then Japan's export potential in textiles would depend very largely on the amount of dollars which the United States is prepared to supply to pay for them.

In February, 1948, Japan's wool textile industry had 450,000 worsted spindles available compared with 1,633,000 in 1939. Capacity is thus only 28 per cent of the prewar level. The number of woollen cards, however, totalled 491,000 compared with 765,000 in 1939. Under the rehabilitation plan it is expected that 733,000 worsted spindles will be available next year and 815,000 woollen cards. The emphasis is obviously on the pro-

Fothergill & Harvey introduce

Tygan

A NEW WOVEN FABRIC

TOUGH · WASHABLE · WEATHERPROOF · ROTPROOF
MOTHPROOF · FAST TO LIGHT

Tygan, a new synthetic fabric woven from Bexan, is introduced by Fothergill & Harvey Ltd., the old established Lancashire textile manufacturers, in association with B.X. Plastics Ltd., who have devoted years of intensive research to the development of synthetic yarns.

Tygan, which is immensely tough, has excellent wearing qualities. It has a negligible water absorption, is equally strong wet or dry, and can easily be cleaned by sponging. Tygan resists corrosion (even sea water) and in general possesses outstanding weathering properties. It is also exceptionally resistant to acids, alkalis, alcohol and many other organic solvents.

TYGAN UPHOLSTERY FABRIC

**“Glad you like this sherry
—it's South African**

It's extremely good. I got some South African wine the other day . . .

I know. A good wine, but not of this quality.

Precisely, but why the difference?

Well, this is a truly representative South African wine. You see, though the Cape has been for centuries one of the world's finest wine countries, it couldn't compete in Britain with European countries until Empire wines got a duty preference twenty years ago. That bucked up the South African industry.

But why haven't we tasted such wines before?

Because really fine wines are achieved by selectivity, experiment and slow maturing. South Africa has done as much in twenty years with some wines as the Continent has in generations.

Only certain wines, then?

So far. All are good, but not all are fine. The improvement is naturally progressive.

Were South African wines well-known here before the preference twenty years ago?

Now you're delving into history. They used to be very popular. But in 1860 Mr. Gladstone removed the Colonial Preference and sent the South African wine industry into the wilderness.

Is that likely to happen again?

I hope not. Imperial Preference has encouraged the South African wine growers to tremendous efforts. The British Government is not likely to lead such an important Empire industry up the garden again. It wouldn't make sense.

So we can look forward to several kinds of really fine wines from South Africa?

You certainly can, and very soon, too.”

Shorts *It's fun to fly by flying boat!*
THE FIRST MANUFACTURERS OF AIRCRAFT IN THE WORLD

lators, toys, suitings, linen and household textiles, men's shoes, china, pottery, glass, silverware, cutlery, leather, fancy goods, wheel and sports goods. The survey was conducted by a series of personal interviews with the executives of 63 department stores in 48 cities, chosen to give a representative selection of geographical locations, and of different grades and size of stores.

In the main, the reports add little to what the British manufacturer ought to know already. But each detailed report contains some interesting suggestions and critical comments. Many of their points about design and quality are painfully true. Other criticisms are offered on high British prices and uncertain deliveries. Even before the war, it was said, many British exporters did not realise the importance of dependable delivery dates to meet seasonal buying. The lack of sales promotion is also shown to be a handicap. There were few complaints about the quality and design of British china, pottery and glassware or suitings, and it is at least consoling that British toys seem to be outstanding. The United States is a vast potential market if the right goods can be sold at the right price over the American tariff. But the main lesson of this survey is that British exporters will have to change their traditional methods of selling goods overseas.

* * *

Gas Compensation Prices

The Share and Loan Department of the Stock Exchange has recently pointed out to members dealing in gas stocks on the basis of compensation prices issued by the Ministry of Fuel and Power in April that compensation prices under the Gas Bill may vary if after October 25, 1947 (or in some cases after December 31, 1945), new issues of capital or further issues of existing stocks have been made. Members have been enjoined to make every endeavour to ascertain the exact status of the stocks in which they are dealing since purchasers will have no claim to the "best."

This complication arises from Section 24(5) of the Gas Bill. But the matter admits of no easy solution for both the market and the companies themselves have shown that it is virtually impossible in most cases to distinguish those stocks to which a price other than the published compensation price will apply. In Section 24(5) it is laid down that the value of the excepted securities shall be deemed to be the price at which they were issued. But this is qualified in the succeeding sub-section which limits the rule to securities still held by the person who originally acquired them; in all other cases the price will be the average obtained by the undertaker for securities of that class. Even in cases where the issues were "further issues" after the dates given above there appears to be some confusion. Before the Gas Bill was published some companies gave an undertaking at the time of making "further issues" that they were identical with existing stocks. Now under the Gas Bill they are deemed not to be identical.

MATTERS OF FACT

Ever since its earliest days, over a century ago, THE ECONOMIST has taken as its task, not merely to comment on the passing scene of events, but also to provide a permanent record of facts, both statistical and documentary.

In these days of paper shortage, this task cannot be adequately performed within THE ECONOMIST itself. Accordingly the RECORDS AND STATISTICS Supplement to THE ECONOMIST was started early last year to take over this function and perform it in a fully adequate, specialist form.

Each issue of RECORDS AND STATISTICS is the equivalent of 20 to 24 pages (and sometimes more) of THE ECONOMIST, entirely devoted to the recording of factual information. Nowhere else in the world are so many facts put so promptly on record.

RECORDS AND STATISTICS is available on postal subscription only. The present subscription rates are 30s. a year for RECORDS AND STATISTICS alone or £4 together with THE ECONOMIST. On and after July 1st, these rates will be raised to £2 10s. and £5 respectively.

The Economist

22, RYDER STREET, ST. JAMES'S, LONDON, S.W.1.

Open-Exports Targetry

The authors of the open-export scheme for cotton piecegoods have given the word "target" a meaning all its own. The target for exports to hard-currency areas has been reduced from 35 per cent to 20 per cent this quarter—a reduction which is perhaps not so disappointing as it sounds. Each quarter the Board of Trade negotiates with the Cotton Board to decide how much raw cotton can be devoted to making up cloth for export. The Government's aim is to reach by the end of the year 79 per cent of the 1938 export rate, which for cotton piecegoods was 1,386 million square yards. At present piecegoods exports are less than half of the volume of 1938. Out of the export quota a gradually diminishing proportion is allocated to island colonies which depend on British supplies; the remainder is for disposal under the "open-export" scheme.

Each merchant is given an allocation, based on his prewar exports, and he has till June 4th to book orders with manufacturers for his share of the output. But he must undertake that a fixed percentage of these export goods will go to "group A," or hard-currency, markets. It is this percentage which the Cotton Board calls a target and which has been reduced. There are two reasons why the reduction does not necessarily imply that exports to "group A" countries will be reduced. The first is that the percentage is a minimum. The second is that the total amount of piecegoods for export can be altered after applications from the merchants have come in.

A high and rigid percentage might hinder the development of trade with countries outside "group A." Because of the high "target" achieved last quarter, a considerable quantity of cloth is now under production to fill orders from "group A" buyers. The normal time between the placing of orders and delivery is nine months, and merchants could easily find that they had over-ordered for countries like, say, Argentina where licensing policy might suddenly put a limit on imports. Thus the merchant has to take a risk on the economics and politics of 1949. In the American and Canadian markets, where prices matter most, he is inclined to limit such risks at present, on the ground that the rise in the price of raw cotton is big enough to throw these markets into confusion. The results of this quarter's open-export programme will be a good pointer to the importance of raw cotton prices in determining demand.

Obviously this system is too cumbersome for an emergency and the reduction in the "target" to 20 per cent may be regarded as a concession to flexibility rather than a confession of defeat. Flexibility is also the aim of the abolition of price-control on cloth produced under the scheme. Price-control took the form of fixing manufacturers' margins for various types of specified cloth, and the Cotton and Rayon Manufacturers' Federation in their annual report last week had plenty of complaints to make about it—

trade interferes with the smooth progress of production generally and the production of the required export cloths in particular. In "A" markets the provision of the right cloth is considered to be fundamental to a successful export drive.

The merchants won another point when Mr Wilson promised last Monday that requests for exporting utility type cloth and yarn would be met with greater readiness than in the past. Post-war records in yarn output were made in the weeks ending May 1st and May 8th, and there are signs of a new spirit in the cotton trade. It is not too soon, and it will need to be long sustained.

* * *

Development Council for Hosiery?

The Board of Trade is making rather slow work in setting up development councils. Only one has been created under the Industrial Organisation and Development Act—the Cotton Board (1948)—but this replaced the Cotton Board, which had been in existence for some time, and retained the chairman and many of the original members. The effect was, therefore, largely to give statutory recognition to the Cotton Board, which had already to its credit considerable achievements in improving Lancashire technique.

A development council for hosiery is next on the list. It is already evident that the Hosiery Manufacturers' Federation does not regard the proposal with any enthusiasm. Representatives of the industry on the working-party in 1946 wanted a council which should be advisory in character and which would give 50 per cent of the votes to the employers, and the other 50 per cent to workers' representatives and independent members. But such proposals have not found favour with the Board of Trade, which insists on a tripartite development council, representing employers, employees and independent members and equipped with the considerable powers provided under the Act.

**for the 'feel'
of fabrics**

Today, even the most modest fabrics have a lovely soft feel and texture due in part to the new detergents used in their processing. Shell chemicals are playing a vital part in many industrial processes and helping to swell British exports.

The last few years have shown us all the importance of coal. The English Electric Company helps to solve the coal problem in two vital ways—first, by the manufacture of more electrical equipment for the mines, to speed production and improve conditions for the miners; second, by ensuring the efficient utilisation of the coal by designing and manufacturing the best possible generating plant so that Britain's factories can have more electricity to make more goods.

Their goodwill sells YOUR goods—the under

35's

Never before has a younger generation assumed such great responsibilities as the under-35's of today—yet, owing to war shortages, only now are they reaching maturity as consumers—only now are they comparing, deciding, forming buying habits that can make them your customers for life

Over a third of the adult population of Great Britain comes into this under-35 age group. Here is a vast market of potential consumers with long buying lives ahead, and the *Daily Mirror* is read by nearly half a million more of them than is any other national daily paper

A business whose success depends on the goodwill of the under-35's will wisely advertise in the *Daily Mirror*

Daily Mirror

THE NATIONAL DAILY
WITH THE SECOND LARGEST SALE

470,000 more adult readers under 35 than any other national daily paper (vide independent Hulton Survey)

Cost of advertisement space (per column inch per thousand readers) lower than any other national daily

The Board of Trade's proposals have not been published. They followed considerable pressure by the trade unions, which are actively enjoining the Government to use its compulsory powers to set up development councils. The powers conferred by the Industrial Organisation Act cover such matters as registration of firms, collection of statistics, and the imposition of a levy to cover the cost of these services. Other functions are likely to be added only at the request of the industry. The main concern of the employers is about the composition of the councils. The Act stipulates that it should be tripartite but does not say how many members should be representative of each part. Equal representation of the two sides of industry under a single voteless chairman, who purported to represent an independent viewpoint, would be likely to produce a useless stalemate. This first experiment in development councils will be watched with interest—and with some concern.

What the Chairman Said

The statements of company chairmen provide one of the most fruitful sources of industrial intelligence at this time of the year, when many big concerns are publishing their accounts. This year has been no exception. Indeed, they have been rather more prolific of information than usual. For instance Sir F. M. Killberg, the chairman of United Molasses (whose statement is more fully analysed in this week's issue of the *Records and Statistics Supplement*) after finally exploding the fallacy that the compensation paid for vessels lost during the war is sufficient to finance the cost of replacement at present building costs, goes on to show how official restrictions on British shipping companies tend to prejudice their relative position in the world tanker trade. As evidence of this, the chairman cites statistics of vessels now under construction and on order in the world's shipyards which indicate that, excluding the United Molasses group, British independent owners have only 200,000 dead weight tons building on their account compared with 2,142,000 dead weight tons building on behalf of Scandinavian owners.

The remarks of Sir P. Malcolm Stewart of Associated Portland Cement on the subject of the correct level of depreciation allowances are of particular importance, for they relate to a problem which confronts practically the whole of British industry. Associated Portland Cement, along with many other concerns, finds that the cost of replacement of fixed assets is more than twice the prewar level and that normal depreciation allowances are insufficient to meet it. The company has taken the one course open to it of making a special provision for depreciation out of taxed profits. This is a costly solution to the problem which can only be alleviated by a reduction of taxation as the chairman had suggested—or by a revision of the Inland Revenue formulae for depreciation allowances.

At the recent annual meeting of Vicker's the chairman, Sir Archibald A. Jamieson, referred to the absurdity of the "fine" of some £600,000 which the company would have to pay for capi-

talising £6,157,742 of its reserves in order to restore the nominal value of the 10s. stock units to the original value of £1. These constant reminders of the unwisdom of the tax on bonus issues have so far elicited no sympathetic response from Sir Stafford Cripps.

East African Sisal

The Board of Trade last week agreed to extend the long-term contract for East African sisal for another six months up to the end of 1948. But no decision on the new price has yet been announced. Output in East Africa has recently shown an improvement and for the first quarter of the year was 20 per cent above the first three months of 1947. Production in 1948 is expected to reach between 140,000 and 150,000 tons. Last year's output, according to Messrs Wigglesworth and Co., amounted to 134,000 tons compared with a peak figure of 155,000 tons in 1942 and 144,000 tons in 1938. The main obstacle to any large-scale expansion of sisal in East Africa is shortage of labour, and this will no doubt be aggravated by the groundnuts scheme. Machinery and spare parts are more plentiful, but towards the end of 1947 hemp began to accumulate on the estates because equipment for the groundnuts scheme was given priority on rail. Then lack of shipping space in March and April at Dar-es-Salaam caused stocks to pile up in the port and railway wagons were used for storage. Shipments, however, are now proceeding, but unless the transport can be radically improved before the large scale production of groundnuts begins congestion is likely to increase.

Britain is particularly dependent on East African sisal to replace manila, which has to be purchased from the Philippines with dollars, and as an inferior substitute for jute in sacking. British imports from East Africa in 1947 totalled 61,000 tons compared with 25,000 tons in 1938, while manila imports declined from 37,000 tons before the war to 5,500 tons last year. Moreover the continued shortage of jute and manila has opened a useful dollar trade in sisal. But it is useless to expand production if output cannot be shipped.

Shorter Note

Traffic receipts of the British Transport Commission for the twenty weeks to May 16th totalled £146,240,000, compared with £120,026,000 for the corresponding period of 1947. Railway receipts have increased by £23,304,000 and London Transport receipts by £2,780,000. Gross receipts thus reflect the benefit of increased charges and the normal working of transport during the first months of this year, compared with 1947. There is some ground for the belief that the volume of traffic is by no means so reassuring as these figures at first sight suggest. But the outlook is not so black as might have been inferred from the wrong traffic figures which were included in a note on transport facts and figures last week.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports appear in the Supplement: Colvilles; Dunlop Rubber; United Molasses.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'a'), and those paying 3 per cent or less will be repaid at the latest date (marked 'b'). Net yields are calculated after allowing for tax at 10% in the U.K. (i) Flat yield. (ii) Assumed average life 15 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2 1/2 per cent of income tax. Yield worked on 15 per cent basis. (g) Fifteen months to March 31 1947 (yield basis 7.6 per cent). (h) To latest redemption date. (i) Price of 100.

COMPANY MEETINGS

BIBIANI (1927), LIMITED

MAJOR-GENERAL SIR EDWARD L. SPEARS' ADDRESS

The twenty-first ordinary general meeting of Bibiani (1927), Limited, was held in London on the 20th instant.

Major-General Sir Edward L. Spears, the chairman, explained that there was no change in the issued capital or share premium account. A reserve for taxation 1948/49 of £30,000 was included. The provision for deferred maintenance was down by £12,171. Trade creditors were higher by £35,587.

The value of stores at the mine and in transit had risen by £59,933. British Government securities were included at a written-down value. They stood in the balance sheet at their realised value.

Turning to the profit and loss account, expenditure in West Africa showed another increase. In the appropriation account provision had had to be made for £15,500 in respect of profits tax.

INCOME TAX

£69,433 had been charged to income tax 1947/48, this being the tax due to the Gold Coast government and the Imperial government based on the profits for 1946. This year the company benefited considerably from the initial allowances and amortisation allowances given to the mines by the income tax Act of 1945.

They had a credit this year of £50,798, covering the fifteen months to December 31, 1946, in respect of the final amount of E.P.T. recoverable. Of this, £30,000 had been allocated to reserve for the estimated liability on the profits in these accounts in addition to the legal liability.

DIVIDEND

An interim dividend of 10 per cent. had been paid on September 24, 1947. They had had to reduce the recommendation for a final dividend to 5 per cent., making 15 per cent. for the year, against 25 per cent. for 1946. The strike of African workmen at all the mines on the Gold Coast which began on September 29, 1947, and lasted till November 3, 1947 had forced this cut on them. The strike had cost over a month's production, whilst expenses necessarily incurred had cost £15,013. Though work re-started on November 3rd, production had been retarded, with a resulting loss of £6,796 for that month. It had taken three months' working after that to recover the position.

The profit of £144,399 less charges for profits tax and income tax £84,933, depreciation of securities £5,913, and staff assurance fund £9,350, left a balance available of £44,203. The proposed final dividend with the interim already paid would take (less tax) £41,250.

OUTPUT AND DEVELOPMENT

With the spread of the organised trade union movement throughout the country their operations had received a serious setback on account of labour troubles. Output for the year was less, by some 4,700 tons and 2,100 ounces, than the previous year. After the difficult months of October and Novem-

ber output had been more stable and had reached the total of 24,000 tons in March.

Their reserves had been depleted by 176,000 tons with a value slightly lower than the previous year. With the reappearance of values to the extent already proved on No. 15 Level although of low grade, the prospects of additional tonnage being made available were encouraging. Plant and machinery had been maintained in good order and some additions made.

TAXATION

Shareholders should be made aware of the crushing burden of taxation under which they laboured. Export duty on gold amounted to 17s. 5½d. per ounce, or about 10 per cent. of the gold produced. Income tax was severe and the rate of profits tax had been increased with the result that they now paid 25 per cent. on practically their entire profit. By the present year the mines on the Gold Coast should have been producing 1 million ounces, instead of which the figure of 640,000 only had been attained, a result as unfortunate for their country so badly in need of dollars as for their industry.

Meanwhile costs of mining and management had increased to £403,728. Depreciation took £51,695, and taxation £150,502, leaving a balance of only £50,116 or 7.6 per cent. on gross earnings for the shareholders.

LABOUR AND WELFARE

They had an unusually happy and contented labour force at Bibiani which had been intimidated into striking very reluctantly. There were many signs that their workers deeply regretted the strike. They were now studying and trying out different systems of incentive payment.

The report was adopted and a final dividend of 5 per cent. making 15 per cent. (less tax for the year, was approved.

ASHANTI GOLDFIELDS CORPORATION, LIMITED

DEVELOPMENT UNDER DIFFICULTIES

The fifty-first ordinary general meeting of the Ashanti Goldfields Corporation Limited was held in London on the 20th instant. Major-General Sir Edward L. Spears, K.B.E., C.B., M.C., the chairman, in an address previously circulated with the reports and accounts, said that the year had been more difficult than anticipated.

THE ACCOUNTS

Total reserves stood at £587,314 and sundry creditors at £205,503. On the assets side, expenditure on plant, machinery, works and buildings and main shafts was higher. The re-opening of Ayeinm and Sansu Mine had cost £15,550. Cash on deposit and at bankers on current account with bullion in transit totalled £260,852. The payment of government royalty and export duty had left them with a balance of profit of £711,240, out of which profits tax and income taxes had taken £392,529. The interim and proposed final dividend required £291,851. Interim dividend had been reduced to 25 per cent. The doubling of the rates of profits tax and the losses due to the October strike meant that 17½ per cent was the maximum final dividend they could recommend, making 42½ per cent. for the year.

OUTPUT AND DEVELOPMENT

A fall in output per man had been their greatest problem. Ore reserves totalled 1,636,244 tons of average value 20.1 dwt. The Pompora Treatment Plant had been practically completed during the year, and operations to date had proved it to be a very wise investment. From the re-opened Ayeinm

Mine they had so far hoisted 7,230 tons. Steps to re-open Sansu Mine had also been taken.

TAXATION

The tax which affected the industry most adversely was the export duty on gold. In the year under review this had cost them £168,121. Since the increase in rate of profits tax they paid 25 per cent. on practically their entire income. Out of their earnings of £893,009 the government had taken £611,000, or more than two-thirds. That burden of taxation tended to limit their production at a time when they were the only considerable source of gold directly available to Great Britain and therefore the best dollar producers the country controlled.

LABOUR AND WELFARE

Output per man had been affected by inflation and lack of consumer goods. The African did not see why he should work if there was nothing to buy for his money. He hoped that the Board of Trade would take steps to improve the situation. Measures taken by the mines had included the institution of canteens where a 9d. meal was served for 4d. Interested parties had objected, and owing to a boycott the canteens had had to be closed. They were constantly endeavouring to bring up the African to more responsible positions, and they had provided, in the new fitting shop at Obuasi, opportunities that were available nowhere else in the Colony.

THE STRIKE

The chairman said that those who thought fit to impose the British trade union system upon the native mining community bore a heavy responsibility. During the war the mines had increased wages to meet the rising cost of living. Since then the mines union had made demands which would have amounted to an annual increase in the wage bill of £600,000. The industry had been unable to meet the new demands and had willingly submitted the issue to arbitration. They had been represented in those proceedings by Mr. Duncan Sandys, who had since joined the board of the corporation. In addition to the award of wage increase and back pay, hours of work had been reduced from 48 to 45 per week, increased rates for overtime and public holidays had been granted, sick pay, as distinct from workmen's compensation, had become the liability of the employers, and gratuities with travelling expenses for men with five years service had been enforced. He hoped that the severe losses sustained by the government as well as by the mines would be a warning that ideologies were dangerous in lands like the Gold Coast.

He concluded by expressing his appreciation of the excellent work done by the staff in such a difficult year.

A RECENT DEVELOPMENT

At the meeting the chairman said that members would no doubt have seen the report of the recent development on No. 29 Level. The lateral extent of the pay shoot on the lower levels of the mine had been known for some time, and the location of further payable reef so close to the assumed boundaries had not been expected.

In crosscuts Nos. 19, 20 and 21 South, a strong body of quartz had reappeared after values had apparently run out. Over a length of 100 ft. represented by those crosscuts values averaging 35 dwt. over a width of 27 feet of reef had been proved. The latest information on a further crosscut—No. 22—was that values averaging 35.9 dwt. over a width of reef of 41 feet had been proved. Results on No. 30 Level, too, suggested that the new shoot was of considerable importance. Work was being accelerated to prove the upward and downward extension of the new ore body. Until then its size and value could not be assessed. He was indeed gratified to give them the good news—in fact, the very good news—of this development.

MANAGED INVESTMENTS (UNIT SECURITIES), LIMITED

POSITION STRENGTHENED AND DIVIDENDS INCREASED

MR R. K. FRAAY ON THE OUTLOOK

The third annual general meeting of Managed Investments (Unit Securities), Limited, was held, on the 21st instant, in Johannesburg.

Mr R. K. Fraay, the chairman, in the course of his speech, said:

The year under review has been a very satisfactory one for your company because its position was strengthened during the year, and for the shareholders who received increased dividends.

APPROPRIATION ACCOUNT

To the net profit of £289,290 must be added £70,868, being the balance unappropriated at the beginning of the year, making a total of £360,158. The following allocations have been made:—

Dividends to shareholders (9 per cent.)	£225,000
Provision for taxation	35,000
General reserve	25,000
	£285,000
Leaving a balance to be carried forward of	75,158
	£360,158

DIVIDENDS TO SHAREHOLDERS

During the financial period ended December 31, 1945, a total dividend of 6 per cent. was declared. In 1946 the dividend was increased to 7½ per cent., and in 1947 was further increased to 9 per cent. I expect that it will be possible to maintain this dividend of 9 per cent. during the current year.

BALANCE SHEET

The authorised and issued capital of your company remained unchanged at £2,500,000 divided into 5,000,000 shares of 10s. each, all fully paid. £25,000 was appropriated from the profits during the year to strengthen general reserve thereby increasing this reserve to £50,000. It is the intention, whenever possible, to continue to strengthen the general reserve by appropriating part of the profits in the ensuing years.

INVESTMENTS

The other items on the balance-sheet do not call for any special comment, with the exception of investments. The investments of your company at December 31, 1947, consisting of fully paid-up stocks and shares in 107 companies, appear in the balance-sheet at £2,957,146, representing their cost including brokerage. The market value of these securities, based on the ex dividend quotations on January 5, 1948 (the first business day in 1948 on the Johannesburg Stock Exchange), was £2,969,960.

You will recall that there was a slight depreciation in the market value of your holding as compared with cost at the end of 1946, and, from the information now before you, you will note that this has been converted into an appreciation over cost at the end of the year under review.

Although this is very gratifying, I wish to emphasise once more that I do not attach undue importance to the fluctuations in the market value of the holdings of an investment company. An investment company acquires its holdings mainly for investment purposes and to obtain a regular dividend income. A temporary setback in the market value of the holdings need not cause anxiety to the shareholders of such companies, pro-

vided the portfolio is well spread over a number of sound securities. The directors of such companies must be mainly guided by the intrinsic value of the investments when investing the funds of the company. Market fluctuations are only of secondary importance.

MARKET FLUCTUATIONS

Without wishing to forecast events, I feel that I must state as my personal opinion that there is a distinct possibility that market fluctuations in South African securities may be even greater during the next few years than they have been during the last two years, for reasons which I will touch upon later. Such fluctuations will, however, clearly show the advantages of an active joint investment policy as followed by the investment companies forming our group.

Market fluctuations are occasioned by various factors, many of which are beyond the control of anybody, but it goes without saying that an investment company is in a better position to take advantage of and to guard against temporary fluctuations than an individual investor.

ANALYSIS OF HOLDINGS

In my last address I submitted full information in connection with the holding of your company, and also a detailed analysis of this holding. I feel that you should be given similar information at least once annually. An analysis of the holding of your company at December 31, 1947, gives the following results:—

Type of Company	No. of Cos.	Amount Invested £	Per Cent. of Total Hldg.
Gold-mining companies..	31	1,269,337	42.92
Land and financial companies (excluding our associated companies) ..	14	264,483	8.94
Holding in associated companies	7	665,288	22.50
Industrial and commercial companies	50	698,233	23.62
Coal, diamond and base-metal companies	5	59,805	2.02
	107	2,957,146	100.00

96.36 per cent. of the holding was invested in quoted dividend-paying securities; 2.06 per cent. in quoted securities which had not yet reached the dividend-paying stage, and only 1.58 per cent. in shares not quoted on the Stock Exchange.

The chairman then gave shareholders a complete list of the holdings of the company on May 14, 1948.

Continuing he said: the total book value of the holding of shares in 12 land and financial companies at May 14, 1948, was £264,901, being 8.66 per cent. of the total holding. The investments of your company at May 14, 1948, consisted of shares in 102 companies, with a total book value of £3,060,663, inclusive of brokerage, and a market value of £3,143,323.

BOARD'S ACTIVE POLICY

I can add further that it has been possible to increase the unappropriated balance of profits from £75,158 at January 1, 1948 to £191,924 at April 30, 1948. In arriving at this balance, no provision has been made for taxation for the first four months of the current year. From the detailed information which I have given to you to-day, it will be clear that your directors have followed, and are following a very active investment

policy, and that everything is done to protect your interests as shareholders.

The world is passing through very critical times, politically and financially, and in such times it is essential to watch events very carefully and to make rapid changes in one's investment portfolio whenever necessary and possible. This—as I have already stated—is almost impossible for individual investors, but is one of the functions of an investment company.

THE FINANCIAL OUTLOOK

I mentioned that I expect severe market fluctuations during the next few years. These fluctuations will, in my opinion, take place not only in South African shares, but also in overseas securities. I base my convictions in this connection on the fact that the general financial position of the world is becoming more complicated, and that something will have to be done to cope with the difficulties which are being encountered by various countries, including our own.

It is well known that very rigid control is being exercised by governments in various continental countries, and that this has given rise to certain anomalies which could hardly be avoided and has tended to localise markets in securities. For example, shares in companies carrying on business in these continental countries are being dealt in on various international stock exchanges at prices far below those ruling on the stock exchanges in such countries themselves. The same position has already arisen with South African securities held in countries outside the United Kingdom.

It seems to me, however, that the time has arrived to face the position squarely, more especially as far as this country is concerned. We cannot continue to import commodities from the United States of America at the same rate as during 1947, for the simple reason that we cannot afford to do so. Our present diminishing gold production and gold reserves make strict control of these imports imperative in order to prevent serious financial difficulties in South Africa.

RELATIONS WITH U.K.

Our financial relations with the United Kingdom seem to be more rosy—but only apparently so. A great influx of capital from the United Kingdom has taken place during the last eighteen months, but practically the only consequence has been to increase our sterling balances in London to a somewhat alarming extent. I say "alarming extent" because these balances are practically useless to this country unless the United Kingdom can supply sufficient capital goods to meet our requirements and thus keep these balances within reasonable limits, which is not the position at the moment. We have to import many of our requirements from the United States simply because the United Kingdom cannot supply the goods at competitive prices, thereby creating difficulties for both the United Kingdom and South Africa. We have to use gold to buy dollars to pay for our imports, while the United Kingdom does not obtain this gold to buy the dollars she requires so badly.

In view of all these difficulties, I would not be surprised to see more countries following the continental example of rigidly controlling imports and exports, exchange and movements of capital. Such control might have serious repercussions here, but it will, incidentally, be a good thing for those of our citizens who have been living in a fool's paradise, and who have not realised that South Africa is only a very small part of the economic structure of the whole world. It might also end the inflationary pressure here which has been caused partly by the influx of overseas flight capital.

The report was adopted. A copy of the full speech, which contains a complete list of holdings at May 14, 1948, may be obtained from the company's office, Unit Security House, corner of Fox and Sauer Streets, Johannesburg, or Dorland (City), Limited, 1, Royal Exchange Avenue, London, E.C.3.

COLVILLES, LIMITED

DEMAND EXCEEDS SUPPLY

EVERY DEPARTMENT FULLY OCCUPIED

INCREASED STEEL OUTPUT

SIR JOHN CRAIG'S STATEMENT

The seventeenth ordinary general meeting of Colvilles, Limited, was held, on the 26th instant, in the registered office of the company, 195 West George Street, Glasgow, Sir John Craig, C.B.E., D.L., chairman and joint managing director, presiding.

The following is his statement, circulated with the report and accounts for the year to December 31, 1947:—

ADMINISTRATION

My first duty today is a pleasant one. It is to intimate that the Rt. Hon. Lord Clydesmuir, P.C., G.C.I.E., D.L., who recently retired from the position of Governor of Bombay, accepted an invitation to join the board. Lord Clydesmuir in this way renews a connection with the company which he relinquished in 1931 when, as Mr John Colville, he became Secretary to the Department of Overseas Trade. His acceptance has been welcomed by the directors and the staff of the company. We are confident that his wide experience in national affairs, as well as his knowledge of the industry, will be of the greatest value to the company, and I am sure you will have pleasure in confirming his re-election today.

The knighthood conferred by His Majesty the King upon Sir Andrew McCance has given great pleasure not only to the directors but to the staff at all the works, and I feel sure this pleasure will be shared by the members of the company. It is an additional pleasure that the University of Glasgow propose to confer on him the degree of LL.D. During the past year Sir Andrew visited a number of the large steel works in America and renewed his acquaintance with many of the leading steel makers. The visit was of real value to the company, as it enabled him to see and discuss the latest developments of the industry in America, which will be most useful to our plans for the extensions now under active consideration.

It is with pleasure that I refer also to the honour conferred by the University on another colleague, Sir Steven Bilsland. He is to receive the degree of LL.D., and we are gratified that his great public services to the city and the country are thus being recognised.

I am pleased to be able to state that the formation of our executive board has been fully justified by experience. The executive board meets regularly and is responsible for all problems affecting works' operation, improvements in plant, maintenance of quality and the general technical and commercial development of the works of the company.

ACCOUNTS

The balance-sheet sets forth clearly the financial position of the company. As you will have noticed, the profits do not show any great variation from those of 1946. Progress has been made in adjusting the tax position and the directors were assured that the provision for taxation was in excess of requirements. This surplus had arisen through the uncertainties of the war years—1939-45—and the directors felt that the stock-

holders were entitled to benefit from the over-provision disclosed. They therefore transferred part of the surplus to the profit and loss account and used it for the payment of an additional interim dividend of 5 per cent., which, with the interim of 3 per cent. and the final of 5 per cent. if approved, makes a total of 13 per cent. paid for the year. Your directors have indicated that they will not recommend this year any increase on these payments.

No settlement has yet been reached regarding our coal properties although a comparatively small sum, arising from allowances made by the Coal Board in accordance with the Coal Nationalisation Scheme, is included in the subsidiary companies' profits.

SALES

I am sure you will be interested in the analysis of each £ of sales.	
Sales	20s.
Purchased materials and services	10s. 5d.
Wages, salaries and superannuation	5s. 0d.
Rents, rates, insurance, etc.	2s. 2d.
Taxation	1s. 5d.
Depreciation	6d.
Transfers to reserve	3d.
Dividends	2d.
Carry-forward	1d.
	20s.

From the above, you will see that dividends, about which we hear so much unfair criticism these days, represent only a very small proportion of our gross income. It is to be remembered that this small return is all that goes to the stockholders who supplied the money to buy the ground, buildings and plant of the company which provide employment for 17,000 people.

OUTPUT

The demands for the company's products throughout the whole year exceeded the supply. Every department was fully occupied as the supply of raw materials would permit. At the beginning of the year, outputs dropped considerably because of the compulsory reduction in our fuel supplies. Towards summer, conditions improved and, with the improvement, outputs steadily increased. Unfortunately, the higher output was maintained only by the steady consumption of stocks of pig-iron and of scrap. Notwithstanding these difficulties in the early part of the year, I am glad to say our steel output for the whole year exceeded that of 1946 by 5.57 per cent.

It should be noted that this increased output was only achieved through the adoption by the industry of an extended working week. It is to the credit of the workmen and their unions in the steel industry that they agreed to this enlightened policy. The benefits to British steel production in consequence and to the country generally were clearly shown by the very excellent outputs during the last quarter of 1947. Unfortunately, in many other industries throughout the country, the application of the policy of a shorter working week is having a damaging effect on the national economy.

FUEL—CONVERSION TO OIL

When the coal shortage was acute, the Government urged steel makers to convert as much of their plant as possible to the use of oil. We responded immediately to this appeal and altered a melting shop at Motherwell from the use of coal to oil fuel. This has involved an expenditure of about £500,000 in rebuilding the furnaces for oil burning and in the re-equipment of the ancillary plant to take advantage of the increased output anticipated from the use of oil. This large alteration was carried through without interrupting production. We completed a similar conversion at Clydebridge. Unfortunately, and quite unexpectedly, the price of oil was increased in September, 1947, by £1 15s. per ton and again by £1 per ton in February of this year. These increases not only eliminated any benefit from the use of oil but added substantially to the fuel cost of steel melting as compared with the use of coal. We had commenced to convert the furnaces at Hall-side works in the same way when, after a considerable amount of money had been spent and the plant installed, we were informed that the amount of fuel oil available was insufficient for our needs there and this scheme had to be abandoned. This experience illustrates the difficulties arising from State intervention in industrial matters.

FUEL—COAL

Coal is an important item in the cost of producing steel, and in recent years the price has risen steeply. For example, at one of our works the price of fuel delivered during 1947 increased by 195 per cent. over that of 1938—the last full year before the war—whereas the advance in the selling price of steel for the same period was 52 per cent.

The company, however, are reaping the benefit now of their policy of adopting every practicable method for the utilisation of waste heat. The total quantity of coal saved in this way is now approaching 100,000 tons per annum. If it had not been so, the results shown in the balance-sheet could not have been achieved. We have had to contend, however, not only with a greatly increased price of fuel but with a marked deterioration in its quality. In some of our works we are actually using 20 per cent. more fuel per ton of ingot output than we would have used if the sources of supply and the quality had been the same as in 1938.

NEW PLANT

The position regarding pig-iron supplies became so acute throughout the country that our third blast furnace, to which I referred in last year's statement, was brought into operation early in 1948 with supplies of coke from outside sources. This furnace, which has a capacity of 5,000 tons per week, has proved successful in every way and has substantially augmented our supplies of pig-iron.

As I explained on a previous occasion, our own coke production is not sufficient to keep the third furnace in operation, but we have now received authority to build additional coke ovens for this purpose and these will be constructed as soon as possible. We have been assured by the National Coal Board that supplies of coking coal will be made available as required.

Land—The company acquired during the year, about 294 acres of land adjoining their properties at Motherwell and thus are assured that there will be ample land available for the development of our Motherwell and Lanarkshire works.

RESEARCH

Our research department continues to be actively engaged, not only with problems arising from current production but in looking ahead. It is also endeavouring to anticipate the future requirements of users

for example in the engineering and chemical industries. One interesting development during the year has been the production of stainless-clad steel by a new process. Patents have been applied for in all countries. This provides a steel with a stainless surface at much less cost than if the steel were stainless throughout. We have already received good orders for this class of material, which should prove a valuable addition to the company's products in the future.

I would like to mention the excellent and friendly feeling that exists throughout the steel industry in this country between all the concerns engaged in steel manufacture. Not only is technical information freely exchanged but visits by staff members to the works of other makers are of frequent occurrence for the purpose of exchanging views and of studying improvements and developments at first hand. I believe that this is a most encouraging and healthy state of affairs and that by widening the experience of all, there results a general increase in the national productive efficiency.

SOCIAL SERVICES

I think it is desirable to refer once again to the social services that exist at our works. In their own way, they make a real contribution to the benefit of the employees and consequently to the company. I should like to mention specially the work of the social committee, which is drawn from all the works and has organised schemes for the benefit of employees and retired employees financed by contributions from the employees and the company. Under their control, there is a mansion house with golf course, bowling greens, tennis courts, gardens and playing fields. They also manage a home at the seaside, where men, recommended by the doctor for a change of scene after illness or fatigue, can spend some weeks under congenial conditions.

It may surprise you to know that this committee, during the past year, have disbursed some £50,000 on work such as the foregoing and in contributing to institutions of various kinds. One of the funds at Dalzell Works that is greatly appreciated is the old men's fund, from which several hundred are now drawing an allowance. Although this may not be strictly a business item, I think it will enable you to appreciate the relationship which has existed, and still exists, between the company and its employees generally. I am assured that it is greatly appreciated by our men and contributes in its own way to harmonious relations and to our ultimate success.

THE OUTLOOK

As to the future, we have submitted plans to the authorities for large extensions to several of our works. I have already mentioned the new coke ovens, which are to be built at Clyde Iron Works and there is planned additional melting plant at Clydebridge, and we have also proposed extensive additions to the plant at Dalzell and Lanarkshire works. If these plans develop along the lines which we have proposed, it will involve large capital expenditure, and the directors are now giving careful consideration to the financial aspect of this matter. You can be assured that they are determined that the steel production in Scotland will be efficiently and adequately developed to meet all the varied demands of our many customers.

One of our regrets at the present time is that we are still in the unhappy position of not being able to respond to the many appeals from our old customers abroad. We recognise the difficulty of the situation, however, but are anxious whenever it is permitted to resume our export trade.

Subsidiaries.—As revealed in the directors' report, the subsidiaries as a whole have shown improved results of a substantial nature. The demand for the special steels produced by

the Clyde Alloy Steel Company has greatly increased and important foreign connections have been developed. Smith and McLean had a most successful year, and the Lanarkshire Steel Company have had a record year so far as total deliveries were concerned.

SERVICES OF THE STAFF

The year was one of great difficulty because the uncertain supplies of raw materials were a source of constant anxiety to the management at the various works. On many occasions, they actually waited for daily deliveries

to keep the furnaces in operation. I am, therefore, all the more desirous of expressing to them and to all our staff and employees our appreciation of their able and loyal service.

The report and accounts were adopted; the proposed dividend was approved; the retiring directors, the Rt. Hon. Lord Clydesmuir, P.C., G.C.I.E., D.L., Sir Frederick E. Rebbeck, D.L., D.Sc., and Mr Harry Yates, were re-elected, and the auditors, Messrs Moores Carson and Watson, C.A., were re-appointed.

RIO TINTO COMPANY, LIMITED

HIGHER TURNOVER

LORD BESSBOROUGH ON THE OUTLOOK

The seventy-fifth ordinary general meeting of the Rio Tinto Company, Limited, was held, on the 11th instant, at Winchester House, Old Broad Street, London, E.C., The Rt. Hon. The Earl of Bessborough, G.C.M.G. (chairman of the company), presiding.

The secretary (Mr H. A. Mellor), having read the notice convening the meeting and the report of the auditors,

The chairman said: Gentlemen,—This year I have the honour of addressing you directly for the first time as chairman of the company—last year, owing to indisposition, I was obliged to do so by proxy.

THE DIRECTORATE

First, I will refer to the reorganisation of the board which has taken place since our last meeting. On December 31st last Mr J. N. Buchanan and Mr T. Robbins resigned.

Of the new directors appointed by the board, Mr Gerald Coke brings much business experience in various fields to our deliberations.

Sir Mark Turner, in addition to experience in business, has been employed by Departments of Government both during and since the war on important work.

Sir Eric Gore Browne will be known to you all as the former chairman of the Southern Railway. The nationalisation of the railways has made his valuable services available to us. We welcome these gentlemen to the board and look forward to their helpful co-operation. You will be invited to confirm their election.

REPORT AND STATEMENT OF ACCOUNTS

Passing now to the accounts, you will have noticed that the higher turnover is reflected in the considerably higher figure shown as net return on sales of produce. On the other hand, expenses have also risen considerably, so that the balance carried to appropriation account does not differ very much from that of 1946. The considerable increase in administration expenses is in part due to the incidence of United Kingdom taxation and in part to a provision for certain social charges in Spain, the imposition of which has been back-dated into a previous year.

The amount of £270,706 net dividends and interest represents in the opinion of the board, a very satisfactory return on the company's investments. The companies operating in Rhodesia in which we are interested continue to prosper and there is no reason to believe that their development has reached anything like its peak. Dividends received have been shown net, in order to afford a better view of the relative portions of the balance carried to appropriation account due respectively to trading and to income from investments.

You will have noticed in the appropriation account we have added £1,000,000 to general reserve, made up as to £902,760 from the debenture redemption reserve which had accumulated and as to £97,240 from the appropriation account.

BALANCE SHEET ITEMS

The increases in the items "Stocks and stores" and "Sundry trade debtors" are a reflection of the greater turnover.

The increase in the item "Subsidiary companies" is chiefly due to the participation we have taken in Brandeis Goldschmidt and Company.

The book value of investments has fallen, mainly because we have made a favourable sale of our interest in Minerals Separation, Limited, but lest any misapprehension should arise we have shown as an inset the market value of quoted investments.

POSITION IN SPAIN

The problems connected with the company's operations in Spain remain most complicated and difficult.

Coal—As indicated to you in my speech last year, for the first half of the year 1947 our metallurgical operations were practically at a standstill owing to lack of coal. I am glad to be able to report that the position has since improved both as to the quantity and quality of the coal we have been able to purchase. Nevertheless, I am far from being able to state that our fuel situation is comfortable, and only by continuous and unremitting efforts both here and in Spain is the supply maintained.

Supplies—The board, fully realising the need for rehabilitation of much of the plant and equipment at the mines after so many years of warfare and of economic difficulties that follow war, has made strenuous efforts to carry it out, but has met with much disappointment through delays in securing import permits and currency allocations, and especially through sadly deferred delivery dates. Nevertheless, every possible step is being taken to surmount the obstacles as they arise. There was a time when I should have dilated upon the high price of replacements, but price, most important though it is, has to become a secondary consideration compared with the primary necessity of "keeping the wheels turning."

Labour—The cost of labour, particularly of the social services element in wages, continues to increase. In fact social services now cost well over one-half of basic wage rates. But that is not all. The calculations of the net pay of each man and of the company's contributions to the various services have become so complex and lengthy that they constitute a serious administrative problem and expense. As a result, figures of importance in the management of the business tend to fall considerably behind.

The company's production of copper and sulphur continues to be sold entirely inside Spain. The demand for pyrites is good—in fact, were it not for the difficulties previously recited, we could take much greater advantage of the business available to us; in other words, the demand is there but the maintenance, not to mention the increase, of the supply depends upon many factors which the board cannot in present circumstances control.

Necessarily, in the circumstances I have just outlined, prophecies are out of the question, and your board faces the future with hope rather than with assurance.

We have endeavoured as a board during the past year to maintain close contact with your company's properties and organisations in Spain.

Last autumn, with the managing director, I paid a second visit to the mines. Two of our new directors, Mr Coke and Sir Mark Turner, have recently returned from Spain.

After the long inevitable separation due to war conditions the directors attach great importance to keeping close personal touch between the board in London and the staff in Spain, and to regular visits by directors.

At the same time we feel it is wise to supplement this contact by periodic visits to London by the general manager in Spain.

THE DIVIDEND

In connection with the redemption of the outstanding debentures which took place in October last year, I said at our last annual meeting: "Once the company is freed from the gross annual charge of £160,000 for the service of the debentures the date for the resumption of a dividend on the ordinary shares is appreciably nearer." That position has now arisen.

We must keep well in mind, however, as is stated in our directors' report: "The cost of labour and social services continues to rise out of all proportion to the increase in prices obtained."

None the less, as the charge for the service of the debentures is no longer required, and as the company's income from investments justifies it, the directors have decided to resume the payment of a dividend on the ordinary shares and recommend a payment in respect of the year 1947 at the rate of 8 per cent. free of tax.

Let me emphasise, in order to remove any possibility of misunderstanding, that this dividend in no way follows from the result of our mining and trading operations or anticipates satisfactory results in the future, but is solely related to our investments position.

THANKS TO STAFF

In conclusion, I desire on behalf of the board and I am sure also in your name, to express our very warm thanks to the whole of our staff both at home and abroad for their loyalty and devotion to the interests of the company, under circumstances of continuing difficulty.

We feel that the company is very well served indeed by its staff and it is a privilege and a pleasure to pay this tribute.

I now have to propose that the directors' report and the accounts for the year ended December 31, 1947, which have been submitted, be and they are hereby received and adopted.

Mr G. E. Coke seconded the resolution and it was carried unanimously.

The dividend as recommended was approved; Mr G. E. Coke, Sir Mark Turner and Sir Eric Gore Browne, D.S.O., were elected directors; the retiring directors, Sir Francis L. Joseph, Bt., K.B.E., D.L., and the Rt. Hon. R. Anthony Eden, M.C., M.P., were re-elected; and the auditors, Messrs Turquand Youngs McAuliffe and Company, having been reappointed, the proceedings terminated with a vote of thanks to the chairman, directors and staff.

W. J. BUSH AND COMPANY, LIMITED

SATISFACTORY TRADING RESULTS

DR. P. C. C. ISHERWOOD'S STATEMENT

The fifty-first annual general meeting of W. J. Bush and Company, Limited, was held on 21st instant at Winchester House, Old Broad Street, London, E.C. Dr P. C. C. Isherwood, O.B.E., Ph.D., F.R.I.C. (chairman and managing director), presiding.

The secretary (Mr D. E. Arnold, F.C.I.S.) read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement which had been circulated with the report and accounts for the year ended December 31, 1947, and was taken as read:—

In my report last year I referred to the delays and restrictions in our operations arising from shortages of capital equipment and raw materials.

SHORTAGE OF ESSENTIAL EQUIPMENT

During the year under review the position in regard to the former has remained much the same, and we have experienced great difficulty in obtaining essential equipment for the maintenance of existing operations. In addition, the restrictions applying to building and the purchase of new plant have and still are making implementation of forward plans very difficult of achievement. In the case of raw materials, we are still handicapped by the shortages which generally prevail.

The trading results for the year under review taken as a whole were satisfactory and I am particularly pleased to report that the volume of our exports exceeded that of the previous year, which year itself constituted a record in the company's history. Our exports would have been still greater had it not been for the restriction of imports by many countries overseas. The growing tendency to develop secondary industries in countries abroad is one which may in the future make the granting of import licences by them still more difficult for British manufacturers, and this aspect of the situation has been greatly to the fore in discussions by the many trade associations and export groups to which we belong.

The building restrictions, particularly in the London district, have resulted in the company making somewhat extensive developments outside the Metropolitan area. We have, for example, built a new factory at Witham in Essex on which site there is still ample room for future extensions as opportunities arise. We have also made considerable extensions to our factory at Widnes, Lancashire, which work is still actively proceeding. We have also found it desirable to acquire substantial accommodation within existing premises at Tottenham.

RESTRICTION OF SUPPLIES

It is devoutly to be hoped that British industry will, before long, be permitted a reasonable opportunity of extension by the releasing to a much greater extent of supplies of steel and other materials together with a freer granting of building licences. It is only when this takes place that the large amount of work successfully undertaken by our chemical and engineering research staffs can be translated into large scale production. Too much stress cannot be laid on the importance of increasing technical efficiency in order to meet the growing competition of countries better placed to obtain up-to-date plant, which competition will, I fear, be increasingly experienced by British exporters.

In regard to the accounts, we have been informed by our income tax advisers that during the war years, excess provisions were made for taxation, which are no longer required. The accumulation of these, estimated at £150,000, has been placed to "Contingencies Reserve." This reserve, standing at £238,355, which has been built up largely as a result of taxation adjustments, is now shown as a separate item in the balance sheet.

In view of the heavy strain which has been placed on our plant during the war years and since, your directors have deemed it prudent to increase the reserve against this item in the balance sheet by £60,000. Similarly, a sum of £30,000 has been allocated to the reserve against buildings.

CONTRIBUTORY PENSION SCHEME

At our meeting last year I expressed the hope that the Contributory Pension Scheme which we have been preparing for some time would be in operation before our next annual general meeting. Although this has not been possible, I am pleased to report that the scheme will, I understand, shortly be approved by the Department of Inland Revenue, and will be presented to our staff within the next two or three months. Your directors have allocated a further sum of £25,000 to pension account, making, with the previous provisions, £125,000.

Our branches and subsidiaries throughout the world have maintained a satisfactory position and I would again like to express the board's appreciation of the loyal support it has received from the staff, both at home and overseas.

The report and accounts were unanimously adopted and a final dividend of 8 per cent. on the ordinary shares, making 12 per cent. for the year, was approved.

The retiring directors, Mr E. L. Bush and Mr A. J. McIntyre, were re-elected; and the auditors, Messrs Turquand, Youngs, McAuliffe and Company, having been re-appointed, the proceedings terminated with a hearty vote of thanks to the chairman, directors and staff.

THE UNITED MOLASSES COMPANY, LIMITED

REBUILDING PROGRAMME

The twenty-second annual general meeting of The United Molasses Company, Limited, will be held, in London, on the 16th proximo.

The following is an extract from the statement by the chairman, Sir F. Michael K. Kielberg, K.B.E., circulated with the report for the year 1947:—

Present indications are that we may expect delivery of eleven tankers by late spring 1951. As none of the tankers now on order could be placed at a firm price, the total liability in connection with the building programme upon which we have embarked can only be estimated, but the amount will probably be in the region of £6,500,000. The completion of even this ambitious programme only tells part of the task ahead of us. Although the eleven tankers on order will by 1951 restore our Molasses Fleet to its prewar carrying capacity, we shall probably in the early 'fifties find it necessary to order additional tonnage to replace old reconditioned tankers.

Based on present costs this further building programme will involve additional capital outlay of anything from £3,500,000 to £4,000,000. It is our intention, if at all possible, to finance any such new building programme out of future earnings. If it were not for the fact that an efficient and economical fleet of specially constructed tankers forms the very basis for the successful conduct of our Molasses business, I very much doubt if your directors would have had the courage to embark upon the present building programme at today's costs.

Trading for the first four months of the current year has been satisfactory and the prospects are not unpromising.

INCORPORATED ACCOUNTANTS

SIR FREDERICK ALBAN'S ADDRESS

The sixty-third annual general meeting of this Society was held on the 26th instant in London.

Sir Frederick Alban, C.B.E., J.P. (the president), in the course of his address, said that the membership of the society ranged from Abadan (Iran) to Zurich (Switzerland), with hardly an important place at home or abroad where an incorporated accountant could not be found.

ECONOMIC SURVEY

The White Paper published early in 1948 presented stark facts worthy of the closest study by every member of their profession. The Economic Survey suggested a target of only 13 million tons for coal bunkers and exports in 1948. Yet, from Bristol Channel ports alone, the exports of coal in 1923 were 34 million tons. Surely there was a wide scope for vast development in coal production and export. The other day Sir Charles Reid stated that with the manpower and machinery now in the industry, at least 30 million extra tons of coal per annum could be produced, provided that absenteeism was reduced to prewar level; manpower put where it could be most effectively used and men and managers alike were inspired to give their best services. Could not the National Coal Board become the National Saviour?

As the Economic Survey repeatedly emphasised, our survival depended on our ability to sell our goods in the markets of the world, which could be accomplished only by keeping in check inflationary tendencies and producing at a cost which was competitive. The question of cost was paramount. Accountants in general, and industrial accountants in particular, by reason of their general experience and their costing technique, had an intimate and specialised knowledge of the inner working of industries and a deep insight into the make-up of "cost." In the past there had been a tendency to regard accountancy as a form of overhead expense, but if accountancy played its unquestioned part in the service of industry, accountancy became productive in the widest sense.

PRICES AND CONTROLS

Incorporated accountants were intimately concerned with the working of controls, particularly price controls. With reference to price controls for the purpose of controlling profits, it should be appreciated that there were two kinds of profits—that which came from an excess of demand over supply and that which came from such factors as efficiency and an ability to anticipate the consumer needs. It was important that attacks on profits should be confined to the first type of surplus. Surely there was no merit in making a loss. On the other hand, a firm which showed a high profit might be rendering public service, if it achieved that result by improved production, by improved conditions of work and by meeting consumer demand adequately and at reasonable prices. Unless that truth was realised, British industry would lose its flexibility—flexibility which it must have if it was to meet foreign competition. Profits were the life blood of an industry. Unless profits could be made and retained in industry, equipment could not be kept up-to-date and new developments could not be financed.

From the accounting point of view they warmly welcomed the important variation in the form of "Statement of Revenue and Expenditure" which was laid before the House of Commons by the Chancellor of the Exchequer when opening the recent Budget. He assured the Chancellor that the accountancy profession would readily place its specialised experience at his disposal to assist him in his laudable endeavours.

The report was adopted.

LEGAL AND GENERAL ASSURANCE SOCIETY

VALUE OF LIFE ASSURANCE

The annual general meeting was held, on the 26th instant, in London.

The Hon. W. B. L. Barrington, the chairman, who presided, said:

Life Assurance and Annuity Fund.—The new life assurance business transacted during the year was a record in the history of the society. The ordinary business amounted to £13,317,606. The decreasing term and group assurance section was also well maintained.

Mortality Experience.—The death claims during the year amounted to £1,254,384, and the mortality experience was again favourable.

Rate of Interest.—The net rate of interest earned by the life assurance fund was £3 12s. 1d. per cent. as compared with £3 10s. 8d. per cent. for 1946.

Expenses of Management.—You will have noticed an increase in commission and expenses of management. These increases reflect the largely increased new business. Our expense ratio is 9.98 per cent., compared with 8.53 per cent. for 1946. I think you will agree that this ratio is exceedingly moderate, bearing in mind that we charge against the life premium income the cost of administering the large amount of immediate annuity business which we transact.

Fire Insurance Account.—We received a substantial increase in our premium income last year of £303,828, or 28 per cent. The net profit in the account was £6,635, which was added to the additional reserve, which now stands at £208,538.

Accident Insurance Account.—The premium income also shows a marked increase, amounting to £111,722, or nearly 20 per cent. Claims paid and outstanding absorbed 45.94 per cent. of the premium income, an increase of 6.69 per cent. Our experience in the motor vehicle section was unfavourable—a loss of £17,000. This result, in view of the high cost of repairs, was only to be expected. Premium rates are being increased, but it remains to be seen whether the adjustment of rates is adequate.

The net profit on the account, after adding interest and providing for tax and staff pensions, was £7,144. This has been added to the additional reserve, which is now £74,354.

The total funds of the society and its subsidiaries, excluding the Gresham Life, increased by £10,004,422 to £98,573,062. The total premiums received during the year were £13,878,861.

To comply with the New Companies Act, you will observe that debited to this account there is the interim dividend paid in January and also the proposed final dividend for 1947, in addition to the dividend paid in respect of 1946. The balance carried forward into 1948 amounts to £452,301.

Assets.—The assets now total over £100,000,000. The care of these assets is a responsibility which the directors take very seriously. The investments are under constant review, and we consider that they are fully of the value at which they stand in our books. Our Stock Exchange securities stand at £68,483,642.

The British Government securities included in our portfolio amount to £42,033,418, or 41 per cent. of the total assets, compared with 44.8 per cent. last year. These may increase this year by the inclusion under this heading of the society's holdings of Home Railway and Electricity stocks.

During the year we have increased our investments in freehold and leasehold properties by approximately £5,100,000, and these now amount to a total of £14,472,992.

I think we can claim a very satisfactory year, and the directors are satisfied that the society is in a strong financial position.

The report and accounts were unanimously adopted.

ASSOCIATED GAS AND WATER UNDERTAKINGS, LIMITED

IMPENDING NATIONALISATION

The fifteenth ordinary general meeting of Associated Gas and Water Undertakings, Limited, was held, on the 26th instant, in London, Mr W. H. Bennett, M.Inst.Gas.E. (chairman and managing director), presiding.

The following is an extract from his circulated statement:—

The uppermost thought in the minds of all holders of gas stocks today is, necessarily, the threatened nationalisation of the industry. Together with the owners of gas undertakings throughout the country, your directors have consistently done all that lay in their power to obviate a change which they believe will be to the detriment of both the gas consumer and stockholder. Nevertheless, the Bill to nationalise all gas undertakings—whether company or municipally owned—and holding companies such as ours, was introduced in Parliament last January. Compensation for holders of gas stocks is based upon Stock Exchange transactions on certain dates in 1945, or, if no transactions took place on those dates, then by agreement or arbitration.

BASIS OF COMPENSATION

If a last appeal for justice is rejected by the Government, it is certain that upon the proposed basis of compensation a very serious loss of income will result to stockholders. While it is at present impossible to say what this loss will be, based upon the assumption that Government stock bearing interest at the rate of 3 per cent. per annum will replace existing stocks in this company, the loss of income for ordinary stockholders will be 29 per cent., for deferred stockholders 40 per cent., for 4½ per cent. redeemable preference stockholders 29 per cent., for 4 per cent. redeemable preference stockholders 23 per cent. and for 4 per cent. irredeemable preference stockholders, 27 per cent.

In agreement with the policy of the British Gas Council, your directors have continued and developed their plans for the integration of the undertakings under their control despite the threat of nationalisation. Schemes which had been prepared during the war for the shutting down of smaller works and the interconnection of distribution systems have been put in hand, but the delay in obtaining plant and materials will prevent some of these being completed before the change in ownership takes place. We shall, however, have the satisfaction of knowing that we have done everything in our power to maintain and improve a service of which we may justly be proud.

INCREASED REVENUE

Revenue from all sources in comparison with the previous year is up by £8,622, principally accounted for by enhanced returns from investments and loans. A further £2,000 has been set aside as reserve for taxation. The total amount now provided under this heading is more than sufficient to cover the estimated liability for income tax for the year ending March 31st next. The net profit amounting to £77,991 is a record one and exceeds that of last year by £5,214.

Reference has been made in the report to the fact that the financial position of the company warranted the distribution of dividends at the increased rates of 5½ per cent. per annum on the ordinary stock and 7 per cent. on the deferred capital. Unfortunately, however, the company is precluded by the terms of the Gas Bill from declaring dividends in excess of those for the previous accounting period. The final dividends must, therefore, be limited to the rates of 2½ per cent. on the ordinary stock and 2½ per cent. on the deferred stock, making the totals for the year 5 per cent. and 6 per cent. respectively.

The report was adopted.

ARGUS PRESS HOLDINGS, LIMITED

FURTHER PROPERTIES ACQUIRED

The nineteenth ordinary general meeting of the Argus Press Holdings, Limited, was held, on the 26th instant, in London.

Mr. J. C. Akerman presided in the absence of the chairman, Sir H. Brent Grotrian, Bt., K.C.

The following is his speech which was circulated with the accounts for the year ended December 31, 1947:—

I will deal first with the accounts of the Argus Press, Limited. The gross profit, including interest and dividends, after charging working expenses, amounts to £142,493. Contrary to recent practice, this year the earnings of some subsidiary companies have not been brought into the profit and loss account. To this extent, and further in respect of profits tax chargeable for the first time on the earnings of subsidiary companies, the amount of gross profit shown is not comparable with the corresponding figure last year of £161,876. The real comparison of earnings is to be seen in the consolidated profits statement, where the figures of aggregate profit, together with sundry revenue, amount to £186,734, as against £185,556.

The net consolidated profits of the group, after charging depreciation and all taxation, amount this year to £65,233, as against £84,333 last year, the decrease being mainly due to the heavy charge of profits tax.

The net profit of the company for the 12 months ended December 31, 1947, after providing for directors' fees, depreciation, and taxation, amounted to £58,657. It is proposed to pay a final dividend of 21 per cent., less tax, amounting to £28,875 net, making a total of 31 per cent., less tax, for the year.

The book value at which the shares in subsidiary companies stand in the balance sheet of the Argus Press, Limited, has increased from £219,467 to £380,872 during the year under review. The increase represents the cost to that company of further properties acquired during 1947.

RESTRICTED SUPPLY OF NEWSPRINT

Paper restrictions are even more stringent to-day than they were when I addressed you last year, and no alteration has been granted to enable printers or publishers to counter-balance increasing costs, both of wages and materials, by increasing the size of newspapers or periodicals. The freedom of the Press has been widely debated in this country and abroad, but the effective control which lies in the rationing of paper in this country remains. It has been stated that, even were paper supplies freed from control, the launching of a new national daily newspaper would be impossible on account of the heavy capital cost involved and the impossibility of obtaining printing plant for years to come. I welcome this opportunity of correcting that statement. The Argus Press is well equipped with modern plant and is able to undertake the production of a national daily newspaper without disturbing its present output.

Turning to the accounts of the Argus Press Holdings, Limited, as you know, the whole of the ordinary shares of the Argus Press, Limited, are held by the Holdings Company. The receipt from the Argus Press, Limited, of the interim dividend amounting to £13,750 net, and the final dividend amounting to £28,875 net which has already been declared, together with sundry revenue and tax recoverable, produce with the balance brought in of £16,594 a total sum of £60,000. There is available for distribution £47,028. An interim dividend on the ordinary shares of 12½ per cent., less tax, amounting to £13,750 net, was paid on October 31, 1947, and it is proposed to pay a final dividend of 15 per cent., less tax, amounting to £16,500 net, when the final dividend from the Argus Press, Limited, has been received, leaving a balance of £16,778.

The report and accounts were adopted.

THE BRISTOL AEROPLANE COMPANY, LIMITED

SOLID PROGRESS

The 38th ordinary general meeting of the Bristol Aeroplane Company, Limited, was held at Bristol on the 27th instant.

Sir William G. Verdon Smith, C.B.E., the chairman, in the course of his speech, said: Despite the anxieties of the time, the year was one of solid progress for the company, and output for the first few months of 1948 has been encouraging.

Aircraft Division.—Our Aircraft Division had a year in which much progress was made. The Brigand aircraft was being built throughout the year for the Royal Air Force, and deliveries of the Bristol Freighter were made to a variety of countries. Outstanding among other civil projects is the Brabazon prototype now nearing completion. Another important civil aircraft project was launched during 1947; a medium range Empire aircraft known as Bristol Type 175. Our Aircraft Division also made good progress with its Helicopter research programme, and, apart from civil projects, the Division is also engaged on further military projects.

Engine Division.—Our Engine Division had another successful year. Bristol Hercules are the most widely used high-powered British civil engines in service today. The Bristol Centaurus is in regular use in "Sea Fury" and "Brigand" aircraft, and will be used in the Airspeed "Ambassador" and the Bristol Type 175. The Engine Division looks forward confidently to a continuing demand for Hercules and Centaurus engines. Further good progress has been made in the development of Bristol Theseus and Proteus gas turbines. The Proteus will equip the Bristol Brabazon Mark II and the Saunders-Roe SR45 flying boat.

Car and Light Engineering Division.—In the Car and Light Engineering Division, production is going ahead, and a modest but expanding volume of export business is being done.

THE ACCOUNTS

Net profit for the year was £855,512. Owing to the incidence of E.P.T. payable on profits arising from previous years, the net amount brought in from previous years is only a trifling proportion of the total net profit. Provision for developing and putting into production certain of our post-war products has again been made. In addition to the trading profit, interest of £20,018 has been received during the year. Charges against net profit are Profits Tax (£146,000) and Income Tax (£320,000). The balance carried to the Appropriation Account, together with the balance from the previous year, leaves available £492,793. Out of this the dividend on the Preference Stock and a 4 per cent. interim dividend on the Ordinary Stock have absorbed £89,100, and your board has decided to add £150,000 (compared with £100,000 last year) to general reserve. Out of the remaining balance of £253,693 your board now recommends payment of a final dividend of 6 per cent., making 10 per cent. for the year, the same percentage as previously, leaving an increased carry forward of £144,793.

Stocks and work in progress less cash received on account have increased since 1946 by £415,213. Tax Reserve Certificates have been reduced by £446,675, but bank balances and cash in hand show an increase of £863,754. Current liabilities and provisions show an increase of £415,316, partly due to increased E.P.T. liability arising on pre-1947 sales brought to credit in these accounts. Comparison of net current assets for 1946 and 1947 show an increase of £121,682. "Capital and Surplus," at £6,412,062, shows an increase of £209,868 on the corresponding amount at the end of 1946. The general reserve (£1,550,000) and the carry forward (£144,793) together exceed half the Ordinary Stock Capital.

The report was adopted.

EQUITABLE LIFE ASSURANCE SOCIETY

RECORD FIGURES

Sir William Palin Elderton, the president, was in the chair at the 186th annual general meeting of the Equitable Life Assurance Society held in London on the 26th instant. The following are extracts from his speech:—

I would like to refer to my predecessor in the chair, Mr. Desmond Abel Smith. He became president in 1940 and held that office with great distinction through the difficult years of the war.

The new sums assured written in 1947 exceeded £4,000,000—the largest total ever secured by the society. This reflects credit on all concerned. As a result of the alteration in values since the war, our existing policy-holders should ask themselves whether the amount of life assurance they have effected is sufficient. We hope that they will continue to bring the society to the notice of their friends.

Now that it is known that the British Transport Stock is at 3 per cent. the society faces a loss of investment income of £15,000 p.a. gross. There will be further losses in respect of other industries to be nationalised. For assurances effected after October 1, 1947, the rates of premium were increased for most classes of business, but the premiums for whole life assurances remain the same as before the war.

The net rate of interest earned on the funds is well over 3½ per cent. The expense ratio of a little under 5½ per cent. is still at a low level. Claims by death are at about the same level as in 1946 and each £1,000 of original assurance under whole-life major profits policies which became payable in 1947 had on the average been increased to £2,225. We now look forward to the valuation to be made at the end of 1948.

The report was adopted.

JOHNSON AND PHILLIPS, LIMITED

EXCELLENT FIGURES

The 43rd annual general meeting of Johnson and Phillips, Limited, was held in London on the 20th instant.

Mr. G. Leslie Wates, J.P. (chairman and joint managing director), said that they lived in times of anxiety, strain and stress. Crisis followed crisis, and it all seemed so uncontrollable that the individual was dwarfed by the magnitude of the forces against him. Whatever satisfaction or pleasure they would in ordinary times have had in presenting such excellent figures of profits and assets was largely qualified by wondering what problems would have to be faced.

The dividend distributed only represented a return to the shareholders of approximately 3.3 per cent. net on such capital figure, not, he submitted, an extravagant return having regard to the uncertainties and the present difficulties of trading.

Of the sale price of their products and other income the larger proportion was spent in providing raw materials and supply services. That accounted for 38.4 per cent. of the total. Salaries and wages and other payments for the benefit of their employees represented 27.3 per cent. The amount provided for taxation represented 6.8 per cent. They retained in the business by way of profits ploughed back and reserves for future contingencies 4.5 per cent., and only the modest sum of 3 per cent. net was divided among the shareholders. That represented approximately 7d. in every £1 of sales. They had joined with other manufacturing companies in supporting the report of the Federation of British Industries on prices and profits which was forwarded to the Chancellor of the Exchequer in March in response to his invitation for co-operation.

The report was adopted.

GOVERNMENT RETURNS

For the week ended May 22, 1948, total ordinary revenue was £40,670,000 against ordinary expenditure of £39,443,000 and issues to sinking funds £370,000. Thus, including sinking fund allocations of £1,374,000 the surplus accrued since April 1st is £147,471,205 against £208,672,666 for the corresponding period a year ago.

The list is so impressive that there may be some temptation to complacency. But it is entirely out of place. One year after Mr Marshall's initiative is a fitting occasion to measure not only the ground that has been covered but the immense tasks that lie ahead. In almost every field the Western Powers have committed themselves to policies revolutionary in implication, which involve quite new relationships between each other and which must of necessity take years to carry out. The fact that the Powers have taken the first step is little or no guarantee that they will as certainly finish their course. The new Western strategy demands that the Sixteen Nations pledge themselves to associate in a new type of co-operative community, that the Americans persist in their present willingness to enter into long-term relations with that community, and that the problem of integrating the recalcitrant Germans into it will be satisfactorily solved. It is difficult to imagine a more ambitious programme, and it is inconceivable that solid and lasting success will be achieved unless the Powers concerned remain completely unwavering in their determination to work together. And this in turn demands a high measure of confidence and mutual trust which has not been evident in recent weeks.

*

Two issues have thrown a shadow of uncertainty across Western relations—the Russian “peace offensive” and the Palestine crisis. One may speculate for ever on the real inner meaning of the Russian initiative, but one or two points are clear. The Marshall Plan put a stop to the spread of Communist influence and restored a measure of confidence to the non-Russian world. The Russians declared war on the Plan and spent nine months using every device to destroy it. During that time each new act of violence, each new savage attack of propaganda, stiffened the determination of the West in general and of Congress in particular to make the Plan the basis of their policy. The culmination of this “dialogue” between East and West was the Communist *coup* in Prague, which had the effect of sending the Economic Co-operation Act through Congress with unlikely speed and equally unlikely majorities.

It must be assumed that the Kremlin is no more friendly than a year ago either to the Plan or to the consolidation of Western Europe. But violent attacks and opposition have had the effect of hastening both. Like the wind in Æsop's fable, Russia has huffed and puffed to remove the cloak of Western solidarity, and each blast has led the Western Powers to gather the cloak more and more closely around them. But what might not a little Russian sunshine do? It seems that the sun may now have been switched on, and the Russians need not be altogether dissatisfied with the effects of the first four weeks of diplomatic ultra-violet rays. The urgency which drove the Economic Co-operation Act through both Houses is noticeably absent in the leisurely discussion of the actual allocation of the money in the Appropriations Committee, which is even considering a cut in the total for the first year. No one should underestimate the deep underlying desire of the American people to reach an understanding with Russia, which would then leave them in peace. Only a relatively small and sophisticated minority realise that Russia's apparent willingness to talk is conditional upon the new firmness shown by the United States in the field of Western relations and defence and that the maintenance of the Western Powers' “grand strategy,” far from being an obstacle to a settlement with Russia, is a condition of it.

In Europe, it is France, now the most uncertain and internally divided of the Western States, that appears to be most unsettled by the Russian peace offensive. The press—and not simply the left wing press—has in recent weeks made uncomfortable reading. M. Bidault has come in for heavy criticism on the charge that he is conniving at the “American determination” to divide Germany and that if Russia reacts violently, it is France that will bear the brunt. The crazy rumour is allowed to circulate that American defence plans aim at using

Britain and Spain as advance bases while leaving France to be the battlefield.

These extravagances reveal the extent of the strong strand of neutrality in French thinking. Russia and America are dismissed as “rival titans” and commentators talk of France's mission to mediate between them while keeping clear of both. The more the Russians press their offer of a settlement, the more French criticism may batten on the United States for refusing to come to terms. America may wake up one day to find a chorus from France denouncing it as a “warmonger.” It is hardly necessary to point out that these criticisms undermine the whole strategy of Western consolidation. How can Western policy survive successfully the full five years of the Plan, and the longer years necessary to achieve Western Union, if one of the key member states is for ever wavering on the brink of a decision to abandon association and go off to the old fruitless pursuit of “building bridges between East and West”?

It is precisely because sustained decision to work together is the condition of a successful Western strategy that the Palestine issue has such disturbing implications. In the United States, the revulsion against Britain was fanned by every conceivable accusation of hypocrisy and double dealing, and newspapers which for months had given every support to the idea of Western association switched in a day to denouncing America's principal partner in the enterprise as utterly untrustworthy and irresponsible. In Britain, the anti-American reaction, though less vocal and less visible in print, was instant and angry. In France, the Right's bitter memories of France's exclusion from the Levant, coupled with the Socialists' traditional Zionism and the Communists' support for the Russian line at Lake Success, produced that unique phenomenon—complete unity in the French press. Unhappily, the theme was a bitter attack upon Great Britain.

*

The lesson of the last three weeks for the West is that there are moral and psychological pre-conditions of success. It is therefore entirely appropriate that Mr Marshall, whose initiative launched the West on its new strategy, should have brought the first year of his Plan to a close with a speech in which he underlined the intangible elements of will and dedication without which no strategy can be sustained. His speech in Oregon reminded a worldwide audience that Europe was plagued

by constant fear that we cannot be depended upon, that we will change our minds, that we will turn from a formally adopted policy like the European Recovery Programme without notice and without regard for the devastating effect of such vacillation.

But vacillation in any of the key nations of the plan will have an equally deplorable effect, and again Mr Marshall spoke for all of them when he added that

it is essential that we debate the pros and cons of each proposed line of action; but once we have decided upon it, it is even more important that we do not quickly weaken . . . in our support of that policy.

Mr Marshall's Harvard speech brought the strategy of the West into being. His Oregon speech lays down the conditions—constancy, single-mindedness and confidence—which alone can give that strategy a chance of success. Admittedly, these are the intangibles. They may seem less important than the billions that Congress is appropriating and the concrete plans which are being laid down in Brussels and Paris and Frankfurt. But in reality they determine all the rest. No group of separate nations has ever in peacetime, embarked on such a prolonged experiment in co-operation. No comparable test has therefore ever been set for their staying power. Behind all problems of supply and availability, of finance and indebtedness lies the much more simple and fundamental question: have the Western powers the will and the courage to finish the job?

Too Much Equality?

IT is all to the good that the efficiency of the newly nationalised industries is being kept under a fierce scrutiny of public opinion. Sometimes the Boards are criticised for what is their fault—such as the shocking blunder of the Coal Board in spending \$8 million in importing from America belting that turned out to be unneeded, a mistake that it is difficult to imagine private enterprise making. Sometimes they are criticised for what is not their fault—such as the recent breakdown of the electricity grid or the increases in charges for electricity. But in either case it is a good thing that they are kept under constant pressure for maximum efficiency. It is good news too—if it is confirmed—that the Government are contemplating a full-dress inquiry into the methods of organisation of the Boards.

It should not, of course, be imagined that any such inquiry will prove anything, one way or the other, about the virtues or defects of public ownership. It has always been clear, ever since nationalisation was first talked about, that nationalised industries would suffer from the defects that afflict all large-scale organisations. That has always been one of the entries on the debit side of the Socialist account, and nobody should be at all surprised that it is now being presented for payment. To condemn public ownership as such because the Coal Board is unwieldy is no more justifiable than to condemn joint-stock enterprise as such because the South Sea Bubble burst. Private joint-stock enterprise had faults in its irresponsible youth that experience has largely cured, and national enterprise has not been proved incapable of outgrowing its awkward age. But willingness to learn is essential; and success in learning is less easy to estimate for public than for private enterprise. The private entrepreneur who refuses to learn goes broke; the similarly recalcitrant office-holder in public enterprise merely inflicts the results of his incapacity on consumers, workers and taxpayers.

It would therefore be foolish to expect that the argument for and against public ownership will ever be conclusively settled by “efficiency auditing.” But it is essential none the less that the efficiency auditing should be undertaken and that its principles should be worked out. For otherwise there is a risk that the Boards will forget that they have any responsibility at all for efficiency. The other pressures upon them are insistent and often wholly hostile to efficiency. It was pointed out in an article in *The Economist* two weeks ago that the trade union wing of the Labour Party does not support nationalisation as a means to greater industrial efficiency but as a device for securing to themselves greater control over the conditions of work of their members—which is almost, if not quite, the opposite. Moreover, in the other wing of the party, the specifically Socialist wing, it was not for efficiency that nationalisation was invented. Its purpose, when it was first thought of, was to secure greater equality of income and welfare among the citizens of the state, even at the cost of some reduction in the total income available to be divided among them. To the extent that fair compensation is paid for the property taken over, of course, nationalisation does not in fact succeed in reducing the inequality of wealth. But that was its original purpose and the doctrine that it could also serve the objects of economic productivity is a latter-day gloss upon the doctrine.

Socialism was born of the desire for economic equality, and there cannot be any doubt that the passion for equality is still by far the dominant psychological force that holds the Labour Party together and drives it along. People can come by the passion for equality in different ways, and there are many different sorts of Socialists. In the Labour Party of today, for

example, at least four main types can be distinguished. There is Type A (the Attlee type), which graduated to Socialism from humanitarian work in the slums and from a hatred of other people's poverty. There is Type B (the Bevan type), the poor boy of commanding ability, who has had to fight all the way up and is determined to come out on top. There is Type C (the Cripps type), which is impelled into Socialism by a philosophical, almost a religious, conviction that a good society can not be founded on selfish motives of gain. And there is Type D (the Dalton type), which appears to be mainly concerned to revenge itself on the society into which it was born. No doubt there are many other types of Socialist, leading eventually to type Z (the Zilliacus type), whose psychological mainsprings would be difficult to identify. But the one thing that holds them all together is the common desire to reduce the inequalities of a non-Socialist society.

Nor is the passion for equality peculiar to the Labour Party. It spreads over wide sections of the British public and is shared even by many whose own standard of welfare would suffer if the ideal of equality were ever achieved. It is, inevitably, reinforced by the bureaucratic organisation of so much of the nation's affairs, since any problem of administration is immensely simplified if the objects of it can all be treated exactly alike. What is perhaps not so widely recognised is that this passion for equality is felt far more strongly—or at least is practised far more assiduously—in Great Britain than anywhere else in the world. There may be countries where there is less inequality of money incomes—even after tax—than there is in Great Britain. But it is safe to say that there is none where there is less in equality in the real conditions of life. There is probably no country in the world today—certainly not Russia—where the food or the clothes that the rich can buy differ so little from the food or the clothes that the poor can buy as they do in Great Britain. There is no country where all the restrictions of a wartime economy have been administered with such fairness between income groups as here.

*

There is much in all this that is very good—or at least that seems very good to the great majority of people. The equalisation of food habits that has occurred in the past eight years, for example, has shown a great balance of advantage. The poor eat more and the rich eat less; and it is difficult to say which of the changes has been the more beneficial. It may be, as the critics allege, that the total food supply of the community is not fully adequate; but no one (except, sometimes, the Mineworkers' Union) argues that it would be an advantage to distribute it less equally. Most people in present-day Britain would be disposed to agree that the grosser degrees of inequality—or at least of undeserved inequality—that have existed in the past were in themselves an evil. Nor can it really be argued that in prewar Britain, where so many of the inequalities of wealth and status depended simply on the accidents of birth and inheritance, inequalities of welfare corresponded to inequalities of merit. That it has been possible for the British people, without very much open class conflict, to make such large strides towards greater equality is undoubtedly, from the moral and social point of view, a good thing.

Nevertheless, when all this has been said, it is still necessary to ask whether the community can afford the economic cost of all the admirable progress towards equality that was made in wartime—and even more whether it can afford the very much less admirable steps towards equality that have been made in the three years since the war ended. That there is a large

economic cost it is becoming daily more difficult to deny. It can be seen in the sluggishness with which the economy responds to any stimulus, because the doctrine of "fair shares for all" makes it worth nobody's while to try to enlarge the cake in order to get a larger slice for himself. It can be seen in the cost of that large part of the apparatus of control that would be unnecessary, or could be greatly simplified, if the Government would permit a restoration of the price mechanism, which may be unfair but is certainly effective. It is impossible for an Englishman to visit a country like Belgium or Switzerland without reaching the conclusion that a willingness to tolerate inequality, however much it may offend the moralist, certainly pays large economic dividends.

Moreover, there is not much room for doubt that the moral justification of the strivings after equality in Britain has seriously deteriorated in the last three years. This is partly due to the different circumstances of peace and war. For example, the "percentage of prewar," by which so many industries are still rigidly governed, had some justification during the war. To continue it into the postwar period and to keep it in force year after year is gradually becoming more and more indefensible; the economic harm it does by stifling all initiative progressively mounts as the moral justification for petrifying the *status quo* dwindles. But the pollution of the spring of equality is also very largely due to the deliberate injection into it of party poison. Far too many of the Labour Party's actions seem to be inspired, consciously or sub-consciously, by mere envy and malice. The pursuit of equality ceases to be good when it becomes merely destructive, when it levels down without levelling up, when it pays more attention to pulling down the mighty from their seats than to exalting the humble and the meek. This trait of envy can be seen in the Labour Government's fiscal measures, which have "soaked the rich" without regard to the economic consequences or to the elementary justice of so doing. It can be seen in their administration of the national educational system, which has to date destroyed more values than it has created. It could be seen in its fullest flower in

some of the incredible follies that were perpetrated during the fuel crisis fifteen months ago, when it was apparently the official belief that it was better for all to starve and freeze in perfect equality than that anybody should enjoy the unfair advantage of surviving. And it is only necessary to read the back-bench speeches in favour of any nationalisation Bill to realise how large is the part played by the nasty desire to punish the successful and the fortunate.

The present Parliament has passed its watershed and the tendency is apparent on all hands to begin to think about the next election. In all probability the country has two full years in which to make up its mind what verdict it shall pronounce on the present trends of policy. And the Labour Party has two years to decide what defence it shall make before that assize. The verdict will be the fairer, and the more helpful to the country, if in the meantime there can be some clearing of minds on this question of equality. A greater equality of economic welfare is certainly one of the three great aims of any economic policy; the other two are productive efficiency—which means maximum production at minimum real cost, not simply output at all costs—and stability, or freedom from the damaging ups and downs of boom and slump. The difficulty is that these aims are often contradictory; equality and efficiency often pull in opposite directions, as they are doing now. The task of sound policy is to keep a judicious balance between them. On which side should the balance be cast in the next few years? Which policy would better serve the interests of the community, one that concentrated on the maximum production of wealth at the cost of allowing individuals to enrich themselves, or one that concentrated on re-distributing wealth at the risk of limiting the national output and lowering its power to compete in the world? There are times, and places, when either answer is the sounder. But in this time and place, can there be any doubt? It is proclaimed on every hoarding and in every newspaper that the British economy is in mortal peril. From what? From too much inequality? Or from too little economic efficiency? The answer is obvious, and the inference should be clear.

Danger Signals in South Africa?

THE shock of General Smuts's defeat has been softened with suspicious speed. Plausible apologists have been busy giving an air of verisimilitude to their otherwise bald and unconvincing arguments that nothing very much has gone wrong in South Africa. Are the arguments justified? Or is there indeed reason to believe that the personal defeat of General Smuts and the general defeat of his United Party at this time are major tragedies for South Africa and for the Commonwealth?

There appear to have been three reasons for the defeat. First and foremost it was due to the defection of the Afrikaans voters, who distrusted the Hofmeyr policy of more liberal treatment for the natives. Secondly, it was due to the greatly increased immigration from Great Britain and Europe which was supported by the Government, and which gave rise to the old Boer fears of foreign intervention. Thirdly, but to a much lesser degree, it was due to General Smuts's sudden recognition of Israel which, though it gave pleasure to the large Jewish community, offended the anti-Semitic feelings which are latent in many parts of South Africa, particularly on the Rand. If the popular votes are totalled, General Smuts's United Party received the support of a clear majority of the electorate. But in South Africa, as in many other countries, the rural constituencies are smaller than the urban, and General Smuts had evidently not taken sufficient care to court the farmers. He lost his own seat at Standerton, and the United Party and their electoral

allies, the Labour Party, won only 65 and 6 seats respectively against the 70 and 9 seats of the Nationalist and Afrikaner parties. The Speaker is usually chosen from the winning party, while the three European representatives of the natives usually vote for General Smuts. No independents were successful. This leaves Dr Malan, the leader of the Nationalists, with a probable working majority of four.

Of the reasons for General Smuts's defeat, the first two reveal what has always been, the greatest danger in South Africa—the possibility of a final split between the rural Afrikaners and the anglicised urban communities. The founders of the Union, Louis Botha, General Smuts himself, and Lord Milner, were well aware of the racial hatreds which could be aroused, and they tried to provide against the danger. But, in spite of surface harmony, the fundamental discord between the two white races has remained. It is based on memories of the Boer War, which are resurrected with Irish persistency, and on intense jealousies between town and country. The chief harm done at the elections last week was to reveal how powerful these emotions still are when they are brought out into the open, and how easily they could still divide South Africa against itself.

In recent years, under the Hertzog-Smuts coalition, and under General Smuts alone, South Africans had moved a long way from the partisan feelings of the Boer War. South Africans of British descent had come to regard South Africa and not England as their home. They shared with the Afrikaners

a feeling of contempt for the *rooinek*, the immigrant from Europe, and a strong spirit of nationality based on geographical location rather than on race had sprung up. The consequences of undoing such healthy progress can bring nothing but evil to South Africa. It is the one great danger, far more real than a Bantu rising, which South African statesmen have hitherto sought to avoid. Few elections have laid bare so clearly and so rudely the deeper emotions of the electorate. Moderate South Africans of all parties must hope that they will be decently covered up again as soon as possible. That is why the apologists have been cabling such comforting messages.

Still, the case for the apologists is based on something more than wishful thinking. Dr Malan's majority is far too small to enable him to do anything drastic. The Senate, even if re-elected as it may be within four months, will probably still be against him. Although its powers are limited, it can prevent any of the big changes which Dr. Malan may be contemplating, for such changes would mean altering the South Africa Act, and that requires a two-thirds majority of both Houses. Moreover, if Dr Malan follows the guide of reason, he will refrain, as his former leader, General Hertzog, did, from antagonising the goose which literally lays the golden eggs.

The farmers in South Africa are utterly dependent on the gold-mining industry for the subsidies which keep them going. Even if the market for gold should fade away, they will still be dependent upon the new industries which are now being developed with British and American capital. The Afrikaans farmers are indeed capable of disregarding such hard economic arguments, accepting instead the emotional inspiration of republicanism but, to judge from the experience of government under General Hertzog, their leaders are not likely to fan emotions which would lead to their own destruction.

But it is more difficult to calm emotions than to arouse them. For the past ten years Dr Malan's party has been preaching the gospel of a Republic, with a State President answerable only to God and his conscience and not to parliament. They have promised to reduce English to a secondary language, to be accorded equal status only when such a move is deemed to be "in the national interest." They have committed themselves to a native policy which will reduce Bantu, Indians and Coloureds (half-castes) to a helot status inferior even to their present one. And, though it should not be taken too seriously, the students at Pretoria University, mostly Nationalists, ended the election campaign by cheering the memory of Hitler.

It is important to understand that these extravagant policies are still only emotional. Few practical schemes have been evolved. During the election campaigns Dr Malan himself kept the Republican ideas of his followers well in the background, and the fate of small, independent countries during the past ten years has probably contributed much to the slackening of Republican fervour by other Nationalist leaders.

There is, therefore, still time to stop the split between the rural Afrikaners and the rest of South Africa. Dr Malan has shown himself to be a believer in constitutional rather than fascist methods. If, as well, he is genuinely concerned for the future of South Africa as a whole and not merely for a section of the population, he can redeem an ugly situation with comparative ease by forming a coalition government. Not only is a coalition government the only practical method of ruling a country with such a tiny majority, it is also the most effective means of stopping the reciprocal hatred which will be aroused in the other half of the European population if the fanatics in his party continue their emotional campaign. So far the followers of General Smuts—and they outnumber the Nationalists—have kept admirably calm. It would be disastrous if they, too, were carried away by the emotions of racial hatred. It is to be hoped that Dr Malan and his electoral ally, Mr Havenga, will see the grave dangers of a too-partisan government for South Africa and that they will adopt the safer, saner solution of co-operation with their fellow South Africans.

South Africa has, during the past three years, moved into a peculiar relationship with the rest of the Commonwealth. Like Canada, it is now virtually a hard currency area, and, although Britain is still its biggest market, British restrictions on hard currency imports must sooner or later take effect. From the political point of view, British moves in the African colonies—particularly the development of the Africans—is not too well received in the Union. There has been no clash with Britain yet, but many responsible and liberal-minded South Africans think that the political development of the native races has been too fast and may lead to dangerous repercussions. South Africans also resent their partial exclusion from the big colonial schemes for industrial and agricultural development in Africa.

These factors have caused South Africa to be less intimately connected with Commonwealth affairs than, say, Australia. Under the guidance of General Smuts the drift away from Britain would and could have been stopped: under Dr Malan it might become the easy way out of his dilemma of reconciling opposing policies. The effect on the Empire might not be great, but it would weaken the economic strength of the central Power which Mr Bevin is trying to build up between Russia and America. The acid test will be not so much whether Dr Malan accepts the invitation to the Commonwealth conference this year—he can hardly refuse—but rather whether he shows himself at that conference willing to combine actively with the other partners of the Commonwealth.

There is thus ground for the hope that Dr Malan will keep in check the fanatical members of his party. But it is stupid to try to conceal the real dangers which exist. All is not well in South Africa, but the disease is not yet so far advanced as to be beyond cure. Moderates of all parties must combine to restore the unity upon which South Africa's life depends.

It costs less

to effect a With-Profit Endowment Assurance as you may now take advantage of the reduced rates of premium recently announced. The Society's With-Profit Policies provide OUTSTANDING VALUE IN LIFE ASSURANCE.

NOTES OF THE WEEK

Uncertainties Over Defence

One consequence of the Six Power talks on Germany is to leave the world in no doubt about France's concern for security. The search for it which dominated French policy in the twenties and thirties is as urgent today, and public opinion in France is reacting unfavourably to the news that, at the London talks, M. Bidault failed to secure definite guarantees of America's readiness to deal with the possibility of Russian aggression.

The curious point is that, on the face of it, the outlook for an American guarantee of the integrity of Western Europe has never looked so good. The Americans have reminded the French that the presence of thousands of Americans in occupied Germany would automatically involve the United States in a war if the Russians were foolish enough to start one. On May 19th, the Senate Foreign Relations Committee took a step which, in its unprecedented historical importance, has received strangely little publicity in Europe. The Committee agreed unanimously to a resolution proposing in principle the association of the United States with regional and collective security arrangements within the framework of the United Nations. This step is likely to lead to Congressional approval of American participation, in peace time, in such arrangements as the Brussels Pact.

It is true that no formal guarantees have yet been given by the United States to Europe, but the Western Powers might well ask themselves whether they are not in some measure to blame. The Americans have moved so far in their defence policy since 1946 that they greet with surprise and some chagrin the complaint that they are not prepared to underwrite Western Europe. And they in turn are inclined to turn the tables and reply "What assurance have you given us yet that you are seriously engaged in building a watertight regional defence scheme? What are your plans? What are your arrangements for collective defence? You ask us to join, but what should we be joining?"

This American reaction may be quite unjustified. Observers report that the military agreements reached under the Brussels Pact are concrete and far reaching. But if they are, the Americans have not yet been made aware of the fact, and they are not likely to be reassured by the omission from recent statements, both by Field Marshal Montgomery and the French Minister of War, M. Teitgen, of all mention of collective arrangements under a working western defence pact.

France's Continuing Crisis

The Schuman Government is tacking unsteadily between the Scylla of the civil servants' dismissals and the Charybdis of the church schools. Both issues throw light on the fundamental weakness of political life in France today. The Centre parties, which make up the government, and which offer France the only real hope of continuing republican and parliamentary rule, are threatened with disintegration, and have to judge every issue in the light of the effect it may have on their chances in the local elections in October.

The Socialists derive much of their waning support from the civil servants, and the fear that mass dismissals would destroy their loyalty has led the Socialists to resist M. René Mayer's demand that, in the interests of economy and stability, 150,000 redundant officials should be dismissed. It now seems that M. Mayer has had very largely to give way, which in turn weakens the other wing of the Coalition—the MRP, who will lose more of the middle-class vote to General de Gaulle if economic conditions go off into another landslide.

The issue of the church schools (which was discussed in an article in *The Economist* of May 22nd) has a similar effect. If the MRP cannot secure some subsidies for the church schools, more of their Catholic vote will go to the General. But if subsidies are given, traditional anti-clerical feeling among the workers will still further weaken the Socialists.

This weakness and instability in the Centre parties are making France today the most divided and ineffective parliamentary system in Western Europe. The Italians, even after twenty years of Fascism, are managing their affairs with infinitely more skill. If one reason more than any other explains this peculiar contrast, it is that the Italians are mercifully free of any "Saviours," generals or otherwise. The Right vote solidly for Signor de Gasperi and thus reinforce the Centre. In France, General de Gaulle's authoritarian, anti-Communist *mystique* has undermined

all hope of MRP fulfilling the rôle of the Christian Democrats in Italy. When, last week-end, President Vincent Auriol indirectly criticised General de Gaulle for talking so much of the State's authority and doing so much to undermine it, he laid his finger on one of the main causes of political confusion and weakness in France.

Truce in Palestine

The agreement on a four-week truce for Palestine has rightly been claimed as an achievement, but it has still to be implemented. And if it is not to be wasted, it must be followed up. Even if a truce is obtained, the shooting may be touched off again at any minute. An accident might do it; further United Nations evasion certainly will. By their actions since May 15th the Arabs have improved their bargaining position, but that is all. The fact of partition has to be faced. They are too weak and the forces against them too strong.

But if the United Nations—and that means America—want peace in Palestine, and not merely a Jewish victory, they too have a fact to face. It is that their original partition scheme must be formally torn up. With its absurd patchwork it was never anything but a plan for the eventual conquest of the whole of Palestine by the Jews. Even though they accept partition, the Arabs cannot be expected to accept this form of it without a further struggle. The only kind of partition which has a chance of averting further hostilities is one with a continuous frontier separating the Jewish from the Arab zone. A line, however irregular, drawn from, say, Samakh, south of Lake Tiberias, to Majdal, on the coast south of Tel Aviv, would now be a possible basis of argument.

It would raise a host of problems. The chief of these would be Jerusalem, Jaffa and Haifa. The only acceptable regime for Jerusalem is still an international one. The city must be completely demilitarised together with the surrounding area; the Irgun and Haganah boys who have been terrorising their fellow Jews and looting the Arab houses must be sent back into the Jewish zone; the religious Jews of the Old City and the Arab refugees from Zatonon (now housed in the Government Arab college) should be allowed, if they wish, to return to their homes, and the Arab Legion must be withdrawn. None of these things can be done until the United Nations provide an international force, and this fact too must be faced. Indeed, King Abdullah would do well to propose some such solution himself and to offer to hand over to the force when it arrives. The problem of provisioning Jerusalem may not prove so difficult to solve as it now seems. The problem of the free access to the city now claimed by the Jews can be solved in only one way: to make militarisation possible requires that the international authority should impose restrictions on access for Jews as well as Arabs.

All this will need time and patience, but the first steps must be taken quickly. The questions of Haifa and Jaffa, as of the other towns from which the original Arab inhabitants have been expelled, will have to be bargained about. The Jews, wanting Arab labour, may try to be conciliatory. The Arabs, wanting jobs and houses, may some of them put their pride in their pockets. Arab Palestine needs port facilities, Haifa needs Arab labour in the refineries.

One cannot tell how much these points will weigh, but they will not weigh at all unless the United States and Britain come together in a genuine attempt to reach an acceptable compromise. The gap between their policies has been temporarily bridged by the truce. Only a real agreement can turn the truce into a settlement.

Israel and Russia

"The foundation of the State of Israel, amid the struggle against Arab feudalism and American oil men, added to the fact that the Jewish State can count on international support only from the USSR and the truly democratic countries, is a matter of great significance. There is no doubt that an independent Palestine can exist only if it orientates itself towards the progressive forces of the world." Here, quoted from a Polish newspaper, is the theme song of Russian propaganda about Israel. How much of it is wishful thinking? How great is the response to it in Tel Aviv and the rural settlements? Any man who can

answer these two questions possesses the key to the unknown quantity in the new equation now developing in the Middle East. On the surface the response looks good enough. Gratitude for help given is inevitable. After all, the Russians, unlike other Great Powers, decided without flinching that of the two contestants in Palestine one was worth backing and the other was not. Contacts with Warsaw have been developing apace. Warsaw is the spearhead of the Kremlin's Zionist policy. Over 40 per cent of the Jews now in Palestine are of Polish origin, and it is therefore a centre in which ties of language and culture function without effort. An active Jewish Agency representative is stationed there. Not only the avowed Communist and workers' leaders, but the left wing opportunist Dr Moshe Sneh have visited it in the last two weeks.

But when the link is examined more closely, flaws are detectable at the Russian as well as the Jewish end. In Palestine itself, the Stern gang is showing many people too strong a red light. It has attacked the election of Dr Weizmann as president because "to repeat such mistakes may lose us Soviet support." It has nothing but praise for the USSR, "friendship with whom will bring us victory." But to countless factions inside Israel, what the Stern gang advocates is, axiomatically, neither prudent nor right. In Russia, too, there are well founded misgivings about the complexion of some of the Jewish socialist leaders. "The situation in Palestine must not be allowed to cloak the fact" the quotation is again from a Polish newspaper, and was written the only two days after the Russo-Polish recognition of Israel—"that the Jewish government is far from being a workers' movement, and ideologically has nothing in common with such a movement."

The Cabinet Changes

The return of Dr Dalton to the Cabinet as Chancellor of the Duchy of Lancaster, after only six months as a back-bencher, is an eloquent tribute to his adroitness as a politician and to the success of his policy of catching the public eye. He succeeds Lord Pakenham in an office shorn of its administrative duties, elevated to Cabinet rank, and considerably increased in emolument. Just what his duties are to be will presumably be determined after severe internal jockeying within the Cabinet. It is hard to believe that his advice will be welcomed in the Foreign Office or in the Treasury, or that he and Mr Morrison will make a happy team in planning the political strategy of the Labour Party. Though he may be welcome as a visitor to the Ministry of Health, it is ironic that the financial and economic measures which he initiated should be largely responsible for retarding the improvements in social conditions and amenities which he has so much at heart. The conditions and amenities which he has so much at heart. The real point, however, is not that Dr Dalton is a valuable addition to the Cabinet, but that the Cabinet must take account of his enhanced prestige within the Labour Party if they are to maintain the appearance of unity which is so essential as the elections loom nearer. No one, on the other hand, can be more relied upon to alienate the middle-class voter. Labour's dilemma remains unresolved.

With Lord Pakenham's succession to Lord Nathan at the Ministry of Civil Aviation, the Foreign Office campaign to swallow the administration of the British zones of Austria and Germany is completed; there is now no Minister specifically charged with their problems. Lord Pakenham has not perhaps achieved a great deal in his year of office, but he has done his level best, and his enthusiasm, energy and understanding have given the Germans much-needed proofs of the honesty of British intentions as well as easing some of the rigidity of the administration. Without a specifically responsible Minister, German and Austrian questions will cease to get the attention they deserve. Unless Lord Pakenham is replaced by a junior Minister, or at least by a first-class representative to a future government of Western Germany, the change in Government organisation can only be regarded as a retrograde step in the development of this country's relations with Europe.

The Lords and the Death Penalty

As was expected, the House of Lords has thrown out, by 181 to 28, the clause in the Criminal Justice Bill abolishing the death penalty for murder for an experimental period of five years. Since the second reading of the Bill in the Lords had been largely devoted to the subject, this week's debate added little to the arguments on either side. The opponents of the death penalty were able to find some reinforcement in the statistics contained in a White Paper [Cmd. 7419] on capital punishment; but the statistics, so far as this country is concerned, are not worth very much, for they refer only to convicted murderers who

were subsequently reprieved and not to the total number of murders.

The main interest now lies in what will happen when the Bill returns to the House of Commons. All the indications are that the Government will insist on the clause being retained, thus making the abolition of the death penalty into a Lords v. Commons issue. This would in the circumstances be quite unjustifiable. Not only was the clause put into the Bill against the Government's own wishes, but, in the recent White Paper on the reform of the House of Lords, the Government declared that the function of the House was to give the Commons a chance to change their mind, in the light of the expression of public opinion in the meantime. In so far as public opinion has revealed itself by polls, it has shown itself quite definitely against abolition.

The state of public opinion does not, of course, mean that the Government has to abide by it. If government were always carried on after deference to public opinion polls, it would get nowhere—there would certainly be no penal reform. But it does mean that the Commons should have a real chance to change their mind, in other words, that the question should be settled by a second free vote on its own merits and not as something secondary to the need to uphold the supremacy of the lower House. It also means that, in view of its own original convictions, the Government should see if some compromise could not be achieved. What, after all, the public opinion polls really reveal is not so much a popular feeling in favour of the death penalty as popular disquiet at the number of crimes of violence at the present time. The best course for the Government would therefore be for it to propose an amendment to the clause enabling the Home Secretary to bring it into force by Order in Council when he thinks fit. In the meantime he could continue to exercise the prerogative of mercy in the same sort of cases as he has in the past, keeping the death penalty for the murders that are at present causing public alarm.

Grants or Loans?

Washington reports of the discussions on the detailed allocation of the first quarter's Marshall assistance emphasise how severe a test of good relations between the United States and the recipient countries the European Recovery Programme is likely to prove. The Economic Recovery Administration, in publishing the tentative allocations for the first quarter, has divided the totals for each country into grants and loans. This division is largely arbitrary. It cannot have been based on a detailed study of the goods covered under each of these two categories. Some countries, such as Greece, are deemed so poor as to deserve the whole of their allocation in grants. Others, like Eire, are expected to take the whole of theirs in loans. Britain is offered \$300 million in grants and \$100 million in loans of which the terms have not yet been specified. Already these appropriations are being questioned. Eire has said that it would remain outside ERP rather than accept loans which it did not feel able to repay. British officials in Washington have been pointing out to the ECA that Britain can accept no dollars in the form of loans unless they are intended for self-repaying projects.

The issue calls for honest thinking and reasonableness on both sides. Britain and the other recipients must beware of slipping into the all too easy attitude of expecting as of right and on their own terms the assistance provided by the United States. The United States, for their part, must realise that in the long run it will do the cause of European reconstruction much more harm than good to create a mass of new dollar indebtedness which the debtors will have very little chance of repaying. The British objection to using loans for consumer goods can meet with no serious objection on the American side. Nor should it be difficult in the very near future to allocate to loan account an adequate volume of capital goods required from the United States and thus ensure the full use of any likely allocation of ERP loans to Britain. Congress has required that \$1 billion of the \$5.3 billion authorised for the first year's ERP expenditure should take the form of loans. Some arbitrary juggling with estimates may be required to fit requirements of consumer and capital goods respectively into this framework. But the ratio is not unreasonable. It is to be hoped that ultimately the proportion of consumer to capital goods imported under the ERP will prove much smaller than the figures of 4½ to 1 envisaged for the current year.

Markos in Trouble

There is no end to the innovations introduced by Communists into diplomatic procedure. General Markos has now made peace

overtures to the Greek Government in a morse broadcast from his radio station, which his own supporters were not intended to hear. Neither the overtures nor the accretion are surprising in view of the turn in rebel fortunes which has occurred in the last three months and of the Greek's Army's readiness to launch its heaviest attack of the spring offensive. It is unlikely that General Markos is just playing his part in the general Russian peace offensive, for there is reason to believe that his affairs were in bad shape as long ago as last February. In fact, it now seems that stern British and American warnings to Belgrade and Sofia of the consequences of their recognising Markos's "Government of the mountains" had their effect. And it was doubtless noticed in Moscow how Mr Bevin, in his speech of January 22nd to the House of Commons, addressed to Greece's neighbours this sentence: "In all solemnity I would advise great care."

There have, of course, been other factors in the situation. Greek Government forces have been decisively stiffened in morale and equipment by American aid and the tough exhortations of General Van Fleet, head of the American military mission. The force of 132,000 men began their offensive on April 15th, and have cleared much of central Greece. Lately they have had notable minor successes in western Thrace and eastern Macedonia. Public feeling in Greece against the Communists generally has stiffened, and there is a general wish to get quickly down to the task of working a new economic policy. From the Greek share of Marshall aid \$50 million have been authorised for the quarter ending July 1st. Prices have been for some time turning downward, road construction is going ahead, and Mr Griswold, head of the American Aid Mission, has said that inflation was checked and held about the beginning of the year.

There is nothing at all conciliatory in the tone of the Markos peace overtures; they may well be intended as much to alarm Moscow as to relieve Athens. Their generalities, reduced to concrete terms, seem to demand withdrawal of British troops and American advisers and a Communist share in the Government. If the General's backers in Belgrade and Sofia have recommended these terms they are doing him a grave disservice. Having pushed him into military action just short of world war, they are now pushing him into diplomatic action just short of defiance. Thereby they are reducing the chances of his rescuing anything from the ruins of Greek Communist policy.

* * *

Vote to Order in Czechoslovakia

The Czechoslovak elections have brought the expected overwhelming majority for the Government—90 per cent in the Czech lands and 86 per cent in Slovakia. This familiar type of result is of very little interest, and provides no evidence of the state of opinion. The absence of opposition candidates; the official propaganda campaign denouncing the use of blank papers as treason; the house-to-house canvassing by Communist or fellow-travelling agitators; the encouragement to voters to vote openly on the grounds that the screen provided in the booth was "not required by true patriots"—all show how bogus the election was. Whether votes were falsified, whether Communist "mobile voting squads" voted many times over (as last autumn in Hungary), whether some special device or trick enabled the authorities to discover and record those voting "no," is uncertain and unimportant. It was enough that the electors should believe that these methods would be used, for them to decide that they had better vote for the regime. No doubt Mr Gottwald can count on enthusiasm from the Communist cadres, passive support from the majority of industrial workers, and apathetic acquiescence from a large part of the nation. In any case, the familiar road of Sovietisation through "Popular Democracy" lies ahead, and no obstacles will be provided from inside Czechoslovakia.

The only question to which it would be interesting (though impossible) to have an answer, is this:—Has Communist propaganda persuaded most Czechs that the Western Powers are set on reviving an aggressive Germany, against which only Russia can protect Czechoslovakia? Or has it occurred to Czechs, firstly that the German Communists under Soviet patronage are agitating for a powerful united Reich; and secondly that the Soviet-sponsored Communist regime in their own country may be quite as oppressive, and quite as alien to the Czech tradition, as was the Nazi yoke?

* * *

At Loggerheads in Belgrade

After three years of "liberation," the Yugoslav Communist Party has announced that it will hold its congress in July—the first since the war and the fifth in the party's history. The six

names announced as principal spokesmen at the congress do not include Zujovic or Hebrang—the two prominent Communists whose dismissal from their ministerial posts was discussed last week—but did include the Slovene leader Kidric and the comparatively obscure Serb, Neskovic. This makes it quite certain that the dismissals were a mark of disgrace, and that there is serious dissension within the party. No doubt it has been, or will be, overcome by Mr Rankovic's secret police, and will be hushed up. But Communist Party congresses are curiously outspoken affairs, and it will be surprising if the debates in July do not provide a clue to the nature of the disagreements.

Meanwhile Sovietisation goes ahead. Nationalisation has recently been intensified, and further measures have been taken against private shops. In principle, private enterprise in trade is still allowed, but in practice any shopkeeper who does well, risks an accusation of "speculation" or "profiteering." Discussions in the Communist press on agricultural organisation emphasise that, though membership of existing collective farms must remain voluntary, and there must at present be no pressure on peasants, yet the aim of State policy is in fact collectivisation. Officials who underestimate the value of the "labour co-operative," and show undue deference to private property, are guilty of a "right-wing deviation" quite as culpable as those who show "left-wing sectarianism" in pushing too rapidly forward. All this suggests that Jugoslavia, the most "advanced" (i.e., nearest to the pure Soviet model) of the new popular democracies, is approaching the end of the NEP period.

* * *

Commonwealth Conference

The Nationalist victory in South Africa in no way lessens the arguments in favour of an early meeting of Commonwealth Prime Ministers in London, and the British Government has rightly proceeded with its soundings in the Dominion capitals on the matter. Though there is no reason to believe that Dr Malan would oppose the Conference on grounds of principle—he was a Minister in the Nationalist Government of 1926 which sent General Hertzog to London—there may be difficulties in the way of his leaving the Union for any length of time so early in his period of office. This, however, strengthens the argument, put forward in these columns last week, for the holding of two Commonwealth Conferences, or at least for holding one which could do its work in two distinct sessions. There is a powerful case for an early if brief discussion by all the Prime Ministers of the Commonwealth on the immediate issue of Western Union, followed by another and more elaborately prepared meeting on what is wanted is primarily an exchange or clarification of views, particularly on the issues of trade and defence—issues which face all the countries concerned, whether they intend to remain within the Commonwealth or not.

More elaborate preparation would, however, be needed for a later Conference to face the constitutional problems which have been raised by the postwar developments in the Commonwealth, and particularly in India and Pakistan. There might even be a case for re-examination, if not of the wording, at least of the interpretation, of the Balfour declaration of 1926, which later became the foundation of the Statute of Westminster. A step in this direction has already been taken by the Government's proposed amendment to the British Nationality Bill, now before the Lords; this makes the terms "Commonwealth citizen" and "British subject" interchangeable. The discussion of the Bill, which was to begin in the Lords early this week, has been delayed pending, it appears, the provision of information called for by Lord Altrincham about the attitude of the different parts of the Commonwealth towards the proposed change.

* * *

Protocol in the Car Parks

Ambassadors today are no longer quite the exalted beings they were in the days of Metetrnich and Talleyrand, but they still enjoy privileges denied to ordinary mortals. Among these is access to car parks specially reserved for them on important occasions, when the common man has to struggle for survival in a noisy turmoil of clashing mudguards, angry drivers and baffled policemen. The sleek cars of the *corps diplomatique* can glide in and out through the confusion like denizens of another world, with other laws of motion than our own.

But what about the cars of High Commissioners of the

Commonwealth? Are they to be numbered in the ethereal company? Problems of protocol as severe as any which ever arose over the precedence of an Archduke's morganatic wife now trouble the authorities responsible for looking after the vehicles of the very important. How to relate the status of High Commissioners to that of Ambassadors is a question which has long been ignored, shelved or resolved by elusive ambiguities; but in the battle of the car parks, now rising to its height at Epsom, Wimbledon and Ascot, the issue is squarely put in a manner which admits of no evasion. The public has little idea of the strains on the unity of the Commonwealth which can occur when the representatives of the Dominions must envy the facilities of movement accorded to San Domingo or Siam. But the Foreign Office insist that diplomatic privileges only belong by right to the representatives of sovereign states and that, if a High Commissioner were to be classified as an Ambassador, it would mean that the King had a representative accredited to himself. This argument, however, seems to show a lack of legal resourcefulness. Why should it not be in order for the King of Canada to be represented at the court of the King of Great Britain and Northern Ireland? If it is not yet in order, it ought quickly to be made so.

* * *

Australia's Warning to Labour

Mr Chifley's government has been sharply rebuked by the Australian people. Their decision by referendum against permanent control of prices and rents has revealed the internal political tension in yet another Dominion. The transitional stages through which the domestic politics of Canada, South Africa and through which the domestic politics of Canada, South Africa and now Australia are seen to be passing may make the Commonwealth conference planned for this year less effective than might be hoped. If the Dominion leaders who come to London enjoy only uncertain support in their own countries, they will be all the more loth to make far-reaching decisions.

The referendum last week was on the question whether the Australian Constitution should be amended to allow the Federal Government to exercise a permanent control over prices and rents. Its result was awaited with particular interest, not only as an indication of the popularity of the Labour Government, but also as a measure of the extent to which Australians in the states would concede further powers to the administration in Canberra. Since federation in 1901, only four proposals to change the Constitution have been accepted by electors in the 25 referenda put to them. This last proposal was rejected by 58 per cent of the total adult population of Australia.

The result shows first that Mr Chifley will have to work hard if he is to retrieve the position of his party in time for the general election next year. Since their defeat in a number of state elections last year the popularity of the Australian Labour Party has been steadily waning. Discontent reached a climax over the Act to nationalise the banks, and many voters used this referendum to express their feelings. Second, the result shows how firmly Australians cling to their written Constitution. The Federal Government's powers are defined within fairly narrow limits, and there is clearly no intention of letting the men at Canberra get out of hand.

* * *

Development Charges

On July 1st, when most parts of the Town and Country Planning Act come into operation, all development values in land will be transferred to the State and partial compensation for their loss will eventually be paid to private landowners out of the £300 million fund set aside for this purpose. This means, or is intended to mean, that the free market value of any piece of land will then become equal to its value for its existing use, whatever that may happen to be. Any private developer, who in future wishes to build on land or otherwise to change its use, must first obtain planning permission from his local authority, and must also pay the "development charge" specified by the Central Land Board, which has been appointed by Mr Silkin under the Act.

The general principles according to which this development charge will be assessed by the Board were presented last week for Parliamentary approval. They represent a complete change of mind on the part of the Minister since the debates on the Act. Then he envisaged that the Board would act largely as an ordinary commercial vendor, albeit a monopoly one, with something to sell—namely, the right to develop, except that in many cases it

would vary the charge according to public considerations of what development should be encouraged and where. This plan would have caused frequent and obscure haggling between the Board and would-be developers, and it is as well that it has been abandoned. The new policy now proposed is as rigid as the old one was flexible. It stipulates with one minor exception that the Board must always charge a private developer the full 100 per cent of the difference between the "existing use" value of the land and its enhanced value under the proposed development.

* * *

A Brake on Enterprise?

The acceptance of a uniform principle for the buying of development charges is to be welcomed. It enables private enterprise to know where it stands, and it steps up the more obvious dangers of individual favouritism and inequity. The 100 per cent rule contradicts, however, the recommendations of both the Uthwatt Report and the Coalition White Paper that some margin of profit should be allowed so as to stimulate desirable development. This concession has been refused not simply on ethical grounds, but because of technical considerations advanced by the Central Land Board, and apparently accepted by other expert bodies, to the effect that any other course would upset the Act's workability.

This fact does not alter the possibility that the proposed system of development charges may act as a serious deterrent to private enterprise. Mr Silkin argued with some plausibility that a developer will have to pay no more for his land under the new system than under the old one—since "existing use" value *plus* development charge should be the same as the old market price. But the case is rather different with those owners who do not themselves carry out development. A farmer, for instance, may very well be extremely reluctant to sell his fields for factory building at their agricultural value. The Labour benches countered this argument by saying that the land could always be compulsorily acquired. But such a threat is hardly the way to get the effective co-operation of private enterprise in working the Act.

* * *

The Doctors Join Up

Last week's representative meeting of the British Medical Association showed that there is still considerable opposition to the National Health Service among the medical profession, and the council received some hard knocks for having, so it was alleged, given way to Mr Bevan. But Dr Dain, chairman of the council, in a forthright and statesmanlike speech, urged the meeting to face the facts of a public opinion won over to Mr Bevan by his concessions and of a change of mind on the part of a large section of the profession. Thereafter the council had its main recommendation—that doctors should co-operate in the new service—carried by a large majority.

The decision to co-operate is conditional upon Mr Bevan's agreeing to continue negotiations with the profession on matters still undecided. That he will be willing to negotiate is not in doubt, but it is worth pointing out that although the service is due to start in a month's time, the promised amending Bill has still to be introduced, the Central Health Services Council and the Medical Practices Committee have still to be appointed. Areas considered over-doctored have still to be defined, and—most extraordinary gap—the pay and conditions of service of specialists and consultants have still to be made known—indeed, the Spens Committee's report on specialists' salaries has still to be published. It seems reasonably certain, in fact, that the regional boards will not be able to offer contracts to the medical staff of the new hospital service by July 5.

Since the BMA's meeting, however, general practitioners have been signing on in increasing numbers. Dr Dain reported that up to last week 26 per cent of panel doctors in England, 37 per cent in Wales and 36 per cent in Scotland had placed their names on their executive councils' lists. Later figures for various areas are as follows:—in central London by Tuesday of this week 935 doctors had signed on (this is about 50 per cent of the total of panel doctors, but it may, of course, include doctors who at present only do private practice); in Middlesex county on the same day the percentage was well over 50 per cent; in Surrey it was 40 per cent; and in Essex it was well over 50 per cent. Middlesex and Surrey can be considered rich areas, where the

opportunity for private practice is good. The proportion of doctors who have already signed on in provincial areas is likely to be larger. It may well be that, in spite of the diehards' protests at last week's meeting, by July 5th the numbers joining in the country as a whole will have reached the 17,900 total on which the estimate of compensation for the loss of goodwill in doctors' practices has been based.

Exercise Britannia

Lord Montgomery deserves congratulations for having chosen civil defence as the subject of next year's exercise for senior officers at the Staff College. The prospect of having to contribute papers to "Exercise Britannia" should have a tonic effect on the numerous Whitehall departments now interested in the subject. For there argument is still painfully worming its way through files whose contents and titles recall the controversies of 1938-39.

It was decided some time ago that the Army should provide the main force and mobile reserves for the work of rescue and restoration after air raids, and it was therefore logical that Camberley should start studying as quickly as possible the new tasks falling to the War Office. It remains for logic to lead to further important results: to convince the Cabinet that the Civil Defence Joint Planning Staff should be responsible to the Ministry of Defence and not to the Home Office, whose Minister has no seat on the defence committee of the Cabinet; and to convince individual ministers that it is their duty to attend in person meetings of the Civil Defence Committee of all departments which are at present left to the permanent civil servant.

The Services have been little quicker than civilian departments to understand that civil defence is fundamental to the national strategy, and that it needs its *cadres* and regular forces just as urgently as do the three fighting branches. Between 1938 and 1944 these were largely furnished by the local government authorities and police. It is doubtful whether they can shoulder the whole of this burden again. In any case, it is intended that new civil defence areas should be created to correspond to the military command areas, and the sooner these are given their full-time heads the better. Ultimately, of course, military and civilian control will have to be centralised in something like the GHQ Home Forces of wartime.

On all these matters the lessons of the last war are clear and have been under study for three years. It is unnecessary to assume—as Lord Montgomery last Saturday seemed to assume—that a "civil defence doctrine" cannot be worked out until next year. A good tactical doctrine already exists and could be examined by the Services experts now. What does not exist is a strategical doctrine adapted to and helping to shape the general framework of Commonwealth defence. Also to be borne in mind is the fact that London is for Paris, Brussels and The Hague the centre and model for civil defence planning.

Tidying up the Black Country

Two million people live in the 269 square miles which comprise Birmingham and the Black Country. They inhabit what is really a single urban concentration, whose industrial life is varied and thriving but whose amenities are surprisingly poor and whose living and housing conditions are far from satisfactory. The area is a complete example of how to misuse limited land resources. Over half the land is undeveloped, but so considerable is the dereliction and waste that most of it is of little value for the purposes of either agriculture or recreation. It is not surprising that the West Midland Group, in their handsomely illustrated and documented field study of this "Conurbation" (Architectural Press, 30s.), conclude that radical physical replanning of the whole area and of the surrounding countryside, into which it threatens to sprawl, is urgently required.

The plan put forward is not, for once, one of green belts and satellite towns. Instead it is proposed that the conurbation should keep strictly within its present borders, and cleanse itself from within. To do this will be practicable only if the net immigration of population into the area is stopped, which in turn means turning away factories which have no valid economic reason for entering the conurbation or remaining within it. Granted this condition it will be possible in time to house the existing population at high standards and give them an ample sufficiency of open space and other facilities within the area of the conurbation.

But it will be a long, slogging process of piecemeal tidying up and cleaning up, of rehabilitating waste and derelict land, of clearing slums and putting a limit on ribbon development, before the Group's vision of an archipelago of individual towns of various sizes framed against a continuous green setting approaches anything like reality. The mess which has taken over a century to accumulate cannot be cleared up in less than a generation; and long before then, impatience for pleasanter living conditions may disperse citizens all over the surrounding countryside, while sheer lack of economic resources may keep the redevelopment plan from getting off the mark. Physical planning of this sort, which must start by putting right the sins and omissions of the past, involves a very real and considerable cost. The gains to posterity would be enormous. But is this generation prepared to shoulder the work? Theoretically, its answer is always yes—and the rash of blueprints such as this for a better Britain have aroused real enthusiasm. But in practice? To keep the wheels turning at all seems the limit of present exertion. There is little energy yet available outside the planning room for reshaping the nation's social heritage.

Poor Persons Procedure

The Law Society has now published its annual report for 1947 on the work of the Poor Persons Committees for which it is responsible. It is the 22nd yearly report, and it shows that the bulk of the work falling on these committees still concerns matrimonial disputes of one kind or another. Not all; for example, the West Surrey Committee reports the recovery of £1,800 damages for a poor person whose husband was killed by an Army lorry.

The Law Society has two responsibilities. First, it supervises the work of some 76 local Poor Persons Committees, whose function it is to provide legal advice and assistance to those whose means do not enable them to pay for it. That work is done on a part-time and charitable basis by practising solicitors and barristers up and down the country. Its second responsibility is more direct. During the war it set up, at the request of the Services, its own department to supplement the voluntary work of solicitors, and was authorised to maintain a salaried staff for that purpose. This department, as the Services Divorce Department, handled in 1947 12,247 Service cases (below its 1946 peak of 13,879) at a total cost of £15,097, which cannot be considered as excessive. As the pressure of Service work diminished, this Department was authorised to assist in civilian cases as well, and over the year 2,585 cases of this kind were assigned to it. But in all civilian cases the old means test remains. Its effect is summarised in the Report thus: "The income limits prescribed by the Rules are such as now to render nearly all persons in employment ineligible for assistance." In short, there is no financial obstacle to divorce if you are out of work or underpaid, nor again if you have a substantial income. But if you are merely a wage-earner the normal costs are probably beyond your means, and the present system can give you no assistance.

It is precisely this problem that the plan outlined in the Rushcliffe Report was designed to meet, but the Rushcliffe Report is still safely in its pigeon-hole. In the eyes of the Cabinet, apparently, there is no parliamentary time available for this kind of legislation, yet the need for such a plan is only too clear. The Law Society and the legal profession generally are prepared to play their part—quite substantially a charitable part—in carrying the plan into action. All that is lacking is a Government Bill and the necessary Government finance. The Government remains inert and uninterested, although this is exactly the kind of maladjustment of civil equality in which they profess to be so keenly interested.

The National Minimum

The financial part of the social security scheme, which starts in exactly a month's time, has been completed with the publication this week of the National Assistance Board's draft regulations on the scale of assistance payments—though the regulations still have to be approved by Parliament. These regulations are of great importance to the social security scheme for they lay down what the Board—and Parliament—consider to be the minimum sum of money necessary for a person to maintain a certain standard of living. The scale laid down is quite unconnected with the contributions and benefits paid under the national insurance scheme,

but it means that if a person's benefit under that scheme fails to reach the minimum laid down by the Assistance Board, he can apply to the Board for supplementary assistance to bring his income up to that level. Similarly, if a person does not qualify for insurance benefits, he can apply for national assistance payments instead.

The main scale rates proposed by the new regulations are shown in the following table and compared with the existing rates and the benefits paid under the national insurance scheme:—

	Scale Rates for Requirements other than Rent			National Insurance Benefits
	Current Rates		Proposed Rates	
	Unemployment Assistance	Supplementary Pensions	National Assistance	
	Per Week s. d.	Per Week s. d.	Per Week s. d.	Per Week s. d.
Husband and wife	31 0	35 0	40 0	42 0
Single householder	18 0	20 0	24 0	26 0
Dependent children:				
Under 5	7 6	7 6	7 6	7s. 6d. for first child;
5-11	9 0	9 0	9 0	5s. paid for subsequent
11-16	10 6	10 6	10 6	children under the
				Family Allowances Act.

In addition to the scale rates, the Board pays a rent allowance which for a householder is usually the net rent actually paid.

When the national insurance benefits were fixed, in 1946, they were, for a single person or married couple without children, just about on the level of subsistence laid down by the Board after an addition has been made for its rent allowances. That is, most people were to be assured of an income sufficient to meet their minimum needs during unemployment, sickness or old age without having to undergo the very modified means test, rechristened needs test, applied by the Assistance Board. The proposed increases in the scale rates, however, which are the result partly of the higher cost of living and partly of a feeling that the minimum standard of life should be conceived more generously, mean that the insurance benefits fall below the minimum. For

instance, a couple with three children aged 11, 7 and 4 will be given £3 7s. plus their rent under national assistance; but if they are on sickness or unemployment benefit, they will only receive £2 19s. 6d.

Provided that people are willing to undergo the Board's needs test to have their insurance income supplemented, the fact that it has fallen below the minimum is immaterial. The danger, however, as the history of old age pensions has shown, is that a cry will go up for higher benefits—in particular, for higher pensions—to be paid as of right without a test. This cannot be allowed. If there is any case for increasing benefits, it is in respect of children. But old people in need must be willing to have their needs tested. The state cannot afford to subsidise without limit its unproductive members merely because they are old and not because they are in want.

Awards to Inventors

The award of £100,000, free of tax, to Air Commodore Whittle for his work in the development of jet propulsion, besides being an example of unusual imaginativeness and generosity on the part of the State, represents an interesting development of public and official thought. In the first place, it shows how very important the jet-propelled engine must be to the future of the RAF. The award is obviously made in recognition of the future of jet-propulsion to national defence, for its contribution to the late war was slight, and the amount of the award exceeds by more than eight times the sum given to the inventor of that handmaiden of victory—the Bailey Bridge.

In the second place, it is a recognition of the enhanced importance in modern war of the machine over the man. Marlborough was given Blenheim, Wellington Strathfieldsaye, the Nelson family the Trafalgar Estate, and Haig £100,000. But in this war the cash prize goes to Whittle, the inventor, and not to Montgomery, Cunningham or Alexander, the commanders. This perhaps is in accordance with the realities of modern war, and the thanks of the nation would be due to Air Commodore Whittle were it not for the fact that, thus amply endowed, he now becomes, if Mr Bevan and others are to be believed, an enemy of the social democratic order.

THE BRIDGE BETWEEN

Every type of textile merchandise crosses this bridge more economically than by any other route. It brings the retailer the quantities he needs at the times he needs them, and thus bridges the seasons. For the wholesaler's buying transactions are often six to nine months ahead of market demand. It is a great tribute to the efficiency of the wholesaler that the toll of this bridge is so small.

THE NAME SPENCE IS A household word in the world of heavy chemicals. SPENCE dates back to 1846 and its chemicals have always been respected for their high and consistent quality. Recently some interesting new products have been introduced, including materials for pharmaceutical specialities. An abridged booklet will gladly be sent to you giving a brief survey of SPENCE products, including:

Alum, Aluminium Sulphate, Aluminium Chloride, Aluminium Nitrate, Alumina White, Activated Alumina, Calcium Carbonate, Detergents, Pharmaceutical Alumina, Sodium Aluminate, Sulphuric Acid, Titanium salts, Silica, etc.

British Castings now better than ever

Shortage of natural oils for bonding the sand cores from which castings are made, resulted in B.I.P. research workers being called in. The outcome is that sand cores now bonded with "Beetle" Resins possess good green and dry strength, are highly permeable by gases, and resistant to damage by damp. Sand cores may be outside your province, but our research and development men are expert at ironing out any problems concerning the use of amino-plastics. Call them in to co-operate with your research workers whenever you strike a sticky problem.

AMERICAN SURVEY

The Definition of Treason

(From Our US Editorial Staff)

BEHIND the clamour that surrounds the Mundt-Nixon Bill, passed last week by the House and now under debate in the Senate Judiciary Committee, lies a dilemma that has plagued the American people at intervals ever since, in the eighteenth century, they discarded the definition of treason as an attack on the person of the king. How can a free people be secured against the dangers of disloyalty without imperilling the right of loyal opposition? The dilemma is not so phrased, but the more thoughtful recognise that as its substance, and it is more than coincidence that Miss Rebecca West's "Meaning of Treason" has recently won high praise from press and public.

The Bill's proponents believe that the nation's present course should be to make any attempt to set up a Communist dictatorship in the United States a punishable crime, to require public registration of Communist organisations, and to deprive Communists of the possibility of government employment or of passport. Those who oppose the Bill argue that the cure is worse than the disease, that it endangers the very existence of the liberties it professes to protect, and that, in any case, its procedures would not work.

In the House of Representatives the debate was distinguished more for heat than for light, and the majority by which the Bill was passed—319 to 58—testified at best to the political awareness of the debaters. The Senate discussion cuts deeper, but neither Senators nor Presidential candidates are averse to making capital out of an issue which, because it involves the fundamentals of the political system under which Americans live, touches new fears as well as old faiths. Mr Clark, the Attorney General, has recently come forward with a second little list of organisations he believes to be suspect, and these new thirty-two should be a help in time of need to politicians who find the muddy waters supplied for so long by the lists of the House Committee on Un-American Activities to be running dry. The defeat of Mr Stassen in Oregon and his subsequent shift of position on this issue, like Mr Dewey's discovery that "you can't shoot an idea with a law," suggest that Communist-baiting may not be as easy to exploit as it appeared to be at first, but there are few demagogues who will refrain from trying.

The Communists, in the person of their chairman, Mr William Z. Foster, say that they will not obey this Bill or any other requiring registration. Their desire for martyrdom is hardly a help to non-Communists who oppose the Bill on grounds they think more commendable. Mr Wallace denounces it as "a declaration of war on American rights," claims that it "reeks of hypocrisy" in that, while pretending to guard the United States against dictatorship, it gives the Attorney General the right to dictate to every organisation in the land. "For every Communist who might be registered there would be a thousand liberals silenced whose voices are vital to the preservation of democracy," he thunders, and many a silent liberal agrees. Senator Taft, who seldom turns his head to see eye to eye with Mr Wallace, is seriously concerned over the Bill's threat to fundamental American rights, and a quiet Quaker voiced before the Senate Committee the traditional belief that "Any citizen who wants to change our form of Government should be allowed to say so, and Congress ought to act only if he wants to do it by violent means."

The attempt, in an age when disloyalty is a cultivated tactic of a foreign power, to square the right of loyal opposition with the need for loyal support, has so far taken the form of imposing tests of loyalty on Government employees and "loyalty screening" of those who seek to enter Government service. These

have been worked out and applied, and sensitive areas—the State Department, the Defence Departments, the Atomic Energy Commission—have been delineated. Applicants for employment must now declare whether they are or have been members of Communist or Fascist organisations or groups advocating overthrow of the government by force; the pertinent data and finger prints are subject to check by the Federal Bureau of Investigation. To safeguard those who may be charged with disloyalty after entering government service, a twenty-member Loyalty Review Board to hear appeals has been established within the Civil Service Commission.

It is the affiliations of the general public which the Mundt-Nixon Bill is now intended to check. Beginning with a series of definitions which set forth the existence of a world-wide Communist movement—interrelated, directed from abroad, committed to the establishment of totalitarian dictatorship—the Bill provides fines, imprisonment and loss of American citizenship for any attempt to establish such a dictatorship in the United States. Members of Communist organisations must not be employed by the Government nor be granted passports. Communist organisations, political or "front," must register with the Attorney General, naming their officers, the sources and disposition of their funds. Material mailed from a Communist organisation must be so marked on its face. Tax deductions and exemptions are denied.

How effective such legislation may be is one question—the evidence that Communist activity shows above the surface in the same proportion as icebergs is considerable, and there are many who think that such restrictions would merely force more of its bulk below water. The effect of such legislation on the active danger with which it tries to cope is equally debatable. Treason is defined in the Constitution as consisting "only in levying war" against the United States "or in adhering to their enemies, giving them aid and comfort. No person shall be convicted of treason unless on the testimony of two witnesses to the same overt act, or on confession in open court."

In the whole history of the United States there have been hardly more than two-score treason trials. After 1799 no convictions were returned by Federal Courts on this charge until World War II, when two naturalised citizens of German birth were proved to have aided an escaped Nazi prisoner and a Nazi saboteur. Where death sentences were imposed by the Federal Courts they were afterwards commuted. This minimal record is due to a deep concern lest the innocent be convicted through perjury, inadequate evidence, or the passions of critical times, and lest established authority pervert itself to repress peaceful political opposition. This concern was voiced early by Chief Justice Marshall in the trial of Aaron Burr, and later in writings of Mr Justice Holmes. If it seems to languish in the present Congress, there is still a reasonable certainty that it will find fresh vigour in the courts.

On the other hand, few Americans would find Supreme Court sanction of Communist nibblings desirable. The postwar attempt to control activities which appear to be preludes to treason is based on the conviction that Communist tactics of infiltration and disintegration do in fact represent the "clear and present danger" which Mr Justice Holmes warned must be proved. Admiration for Coke's dictum that "words may make an Heretick, but not a Traitor" has been tempered by experience with the power of the Hitler lie and the flexible virulence of the Communist line. It remains to be seen how much of the ground won for free men by Anglo-Saxon law can stand against such German-Slavic attack.

be raised by at least 50 per cent from the present level of \$25 a month will be received gratefully by the more than 2,000,000 people who find that their benefits buy less than half what they bought in 1940. The crisis in education is attested both by teachers and parents. The attack on the TVA in Congress has so aroused the South that Senator McKellar, its almost hereditary enemy, has buried his hatchet and is leading a non-partisan defence movement.

If Mr Truman still hopes the Roosevelt magic will work, the Republicans are willing to fight him on this chosen ground. In the first report of the Joint Economic Committee the majority takes its stand on lower taxes and spending, no revival of controls, and an end to the centralisation of authority in Washington which grew up during the New Deal and the war. If Mr Truman's opponents were not so confident that this is a Republican year they could hardly afford so negative a programme, or allow the President to make social welfare his undisputed monopoly.

* * *

Civil Rights for Margarine

Some weeks ago the Republican leaders chose the anti-lynching Bill as the ground on which they would force a decision in the Senate on the question of civil rights. But the Bill has been held up in the Judiciary Committee by doubts on the constitutionality of certain points; almost the only hope of embarrassing the Democrats by this means before the election now lies in the possibility of attaching some civil rights clauses as a rider to a measure on which action is essential. The Bill for the repeal of the Federal taxes on margarine, which favour butter at the expense of its competitor, hardly falls into this category: if Senator Ferguson succeeds in his declared strategy of linking the anti-lynching Bill to the margarine Bill, he is more likely to secure the defeat of the latter than the passage of the former, a consideration which may have entered into his plans.

Tactically his move is a good one, since it would force the Southern Democrats to choose between their economic interests

and their political principles. Peanut and cottonseed oils are leading cash crops in the South and their importance has been increased by the war and postwar demands for fats and oils, just as has that of soyabean oil in the North: these three oils are the chief ingredients of American margarine. The margarine manufacturers are therefore receiving greater support than in the past from farmers and pressure for repeal of the margarine tax has been reinforced by the desire of many Congressmen to prove to their urban constituents that they have done something to reduce the cost of living. As a result the margarine Bill has been passed by a big majority in the House and has a good chance of success in the Senate, in spite of the present congested state of business. But this progress, after sixty years of frustration, has been achieved at the cost of an unprecedented split in the Congressional farm bloc, where the representatives of the dairy states are now threatening reprisals against the tobacco, cotton and peanut interests of their Southern colleagues.

The bitterness of the dairy farmers is explained in part by the steady decline in annual production of butter, in spite of a growing population and the equally steady increase in that of margarine. Butter now sells at nearly \$1 a pound, compared with about 43 cents for uncoloured margarine, and this, coupled with the wartime shortage of butter, presumably explains the preference of consumers. The Bill before Congress repeals the Federal taxes of 10 cents a pound on coloured and ½ cent a pound on uncoloured margarine and also the licence fees which discouraged most margarine distributors from selling the coloured product.

If the Bill passes, housewives in about half the states may be relieved from the labour of mixing the white margarine with the yellow dye provided by the manufacturers, but the fight has only just begun in the states where the sale of coloured margarine is prohibited by state law. The "butter bloc's" defence of this discrimination has always been that the consumer must be protected against the deceptions of unscrupulous distributors, and this point has been recognised by the Senate Finance Committee, which has unanimously passed the Bill removing the colour bar from margarine, but has stipulated that public eating houses must publish the fact that they serve it.

Letters to the Editor

Sterling Devaluation

The Struggle for Germany

SIR,—It seems to me that, in your note on sterling devaluation, you overlook one point of the first importance, namely, the effect of devaluation on the allocation of productive resources within Britain.

Devaluation, by raising the sterling price of British imports, would increase the attractiveness of the import-competing industries to producers besides, of course, reducing the pressure of demand for imports. On the import side, that is, there would be a direct beneficial reaction on the balance of payments.

As to exports, it is by no means certain that Britain is exporting to the fullest extent of her power. Exporters at present sell abroad under compulsion. If their most profitable markets were, in fact, situated abroad, they would have an incentive to sell all they could there and not merely the percentage of output laid down by the Government.

Devaluation could raise the profitability of foreign markets over that of the home market. For the prices of British goods abroad would not simply fall in proportion to the depreciation of sterling. If Britain were overwhelmingly the greatest producer in the world market this might be so, but as it is she can do no more than influence world prices. After she had reached the limit of her power to supply world demand at a given price, that price would have to move upward to a point at which other producers were willing or able to sell. The result would be that the (say) dollar prices of British exports would fall, but less than in proportion to the depreciation of sterling.

Exporters, that is, would obtain larger sterling receipts and would be able to bid higher for productive resources at home. Exporting would become attractive and the energy and expense at present necessary to prod producers into the export market could be diverted to other purposes.

The spontaneous increase in the volume of exports might well atone for the drop in prices as expressed in foreign currencies and the home economy would certainly be in a much less artificial condition than at present.—Yours faithfully,

J. KENNY
The Graduate College, Princeton University,
Princeton, N.J., U.S.A.

SIR,—I wish to congratulate you on your leading article on Germany of April 17, 1948. So far I have searched in vain for an impartial statement, on the Anglo-American part, on the sources of the much commented on German-French "Erbfeindschaft," the adjustment of which is of basic and vital importance for European peace. The realisation of a peaceful Europe requires a frank—though perhaps a tacit—self-confession on the part of all nations, including Germany, of their own wrongs committed in the past. Only this can be the basis for a constant and durable peace in Europe and a true understanding among the European peoples, for the want of which all present endeavours to revive European economy and to stimulate European co-operation will be fruitless. The dangerous spark of national and personal ambition is glimmering under the ashes and might be fanned into a flame. There is easy work for anyone who wants to revive this spark, based on qualities which are no more deeply rooted in the German nation than in other more fortunate nations and which are being deliberately humiliated. Your article clearly points out what chaos this could result in not only for Europe, but possibly for the whole continent.

Therefore, everyone should find the mote in his own eye and hold out his hand to his neighbour. And if it cannot be a friend's hand right now, let it be the hand of an honest and truthful partner. Make an appeal to Germany by admitting us as equal partners to co-operate for European recovery without a long testing period. This would mean the only effective remedy against the so-called "threat" of a new German aggression. A "threat" which virtually—though it is always emphasised—does not exist, and the constant mention of which can only be designed to aggravate the aforementioned humiliation. If you cannot bring yourselves to give us full confidence in all spheres immediately, we might find it possible to appreciate this hesitation; but limitations and controls should not be extended over too long a period, and should be subject to fair considerations based on Germany's part in European industrial recovery and not be liable to be suspected as aimed at economic oppression.

Be honest and frank with us, and never make promises you

don't intend or are not in a position to keep. Here we are—perhaps—super-sensitive, and hence all this present talk of the "perfidie Albion." In general, we can more easily forget a big blow than continuous pin-pricks. Germany is eager and has all goodwill to co-operate. Don't make it more difficult to us than the great cause of Europe would justify.—Yours faithfully,
Hanover, Fritz-Beindorff-Allee 3 HEINRICH C. SUIRE

The Supply of Savings

SIR,—It is not quite correct to assert that out of the gross savings of the community in 1938 (including depreciation) of £774 million, £620 million was under the control of business firms. The allowance for depreciation included in the latter figure (£450 million to be exact) covers not only wear and tear allowances and obsolescence claims under Schedule D and repairs allowances under Schedule A, but the amount received by business insurers in respect of claims for damage to fixed capital goods and the increase in assurance reserves to meet business claims of all kinds. In addition, sums repaid to lenders and transferred to sinking funds by local authorities are treated as the equivalent of depreciation allowances and expenditure by public authorities on maintaining highways and bridges is also classified as depreciation. The 1946 White Paper on National Income and Expenditure [Cmd. 7099] analyses total depreciation as follows:—

	£ million
Business enterprises	340
Local authorities	100
Central government	10
	—
	450

As regards the Income Tax Act, 1945, the only real improvement provided is in relation to depreciation allowances for industrial buildings. So far as plant and machinery are concerned, businesses receive in the long run exactly the same allowances as they did under preceding legislation. The only change is in the timing of the allowances. Now a large proportion of the original cost is written off in the earlier years of operational life, leaving less to be written off later on. Many firms are just beginning to realise this, and to discover that the charge for taxation can be distorted in any one year by excessive allowances for depreciation. In many instances this has led to the transfer to a depreciation suspense account of an amount equivalent to the tax saving caused by the operation of initial allowances for depreciation on new plant and equipment so as to spread the tax saving over the life of the plant.—Yours faithfully,

R. W. MOON
Littlecroft, Pullens Lane, Headington, Oxford

Quantity or Quality in Coal

SIR,—The March 27th issue of *The Economist* calls attention to a phase in the British coal supply situation which has puzzled me for a long time and which discussions with both my American and British friends, who are familiar with the coal situation, have failed to clear up. It is the passivity with which the British coal user has acquiesced in a gradual deterioration and possibly adulteration in quality of British coal while the price of coal has increased. In your comments in the issue of March 27th you point out the disheartening condition of the industrial consumer when told that the exigencies of the coal export programme require him to put up with inferior coal since a fall in quality is the

NOT AGAIN UNTIL 1951

will you have the chance of starting your subscription to KEESING'S so much from scratch as on 1st July 1948 when KEESING'S will commence an entirely new, its seventh volume—a particularly good opportunity for you to begin compiling your own weekly diary of the time in which you live.

Whether Italy should have Trieste, the West Indies a New Deal and British Doctors a fixed part-salary; whether Chiang Kai-shek is right, or Sophocles is wrong—to form your own opinion of national and international affairs, you must turn away from hackneyed clichés and get to the bottom of things.

Your foremost pre-requisite obviously is a record of the Facts, compiled unemotionally and without prejudice, always up-to-date and sensibly indexed for easy reference. In other words: KEESING'S.

same as an increase in price. As a matter of fact the increase in price is more than is represented by the loss in the British Thermal Unit value of the coal as a result of deterioration in its quality since inferior coal is more difficult to burn, reduces the capacity of mills and furnaces, and creates additional costs in erosion of boiler surfaces and in ash handling.

On the other hand, just as long as a ton of coal is treated as a ton of coal, regardless of quality, and there is a direct economic incentive to deteriorate its quality and its thermal value, just so long will you find quality of coal deteriorating. The remedy for it is so simple that it is surprising that all British coal users haven't insisted on it and, as a matter of fact, that the Coal Board hasn't proposed it as an example of fair dealing by a newly nationalised industry. Obviously all you need to do is to place the price of coal on a BTU basis with suitable further adjustments for quantity of ash and moisture above normal values and the situation will remedy itself in a reasonable time.—Yours faithfully,

PHILIP SPORN, President
American Gas and Electric Service Corporation
30 Church Street, New York 8

Ebb Tide

SIR,—Your article of May 8th states "there cannot be any general excess of the supply of Textiles over the rationed quantity."

I believe you may be wrong. There are at least two factors which may have caused such an excess.

(1) Garment-makers receive, for certain types of garments, coupons slightly in excess of the coupon value of the material used in the garment. These small coupon profits have been immediately re-invested in the purchase of more cloth to make more garments. This process has been going on since clothes' rationing was introduced and may by now have led to the accumulation of stocks in excess of the coupon holdings of the general public.

(2) There is considerable doubt in the trade as to whether allowance has been made for the very large yardages of textiles imported from France, Belgium, Italy and Switzerland in coupons issued to the public. In fact, it is difficult to see how such an allowance can have been made. Coupons are valid in terms of yards but import quotas are arranged in terms of value or weight and the yardage involved cannot be accurately assessed by taking an "average" price.

I believe at present, there are stocks in excess of the coupon-spending capacity of the public and your leading articles are so often taken as being authoritative that I feel it may be useful to draw your attention to a statement which seems to me to be open to question.—Yours faithfully,

W. E. VENN
157-161 Regent Street, London, W.1

Europe's Manpower

SIR,—In view of the Ministry of Labour's explanation of the ERP Manpower Conference Report, I am glad to withdraw the last paragraph of my letter dated May 15th.

May I, at the same time, inquire if there is not a considerable difference between the terms "skilled worker" and "experienced worker"? A woman experienced in the burling and mending of woollen cloth works faster than the inexperienced, but she remains an "unskilled" worker. It is this type of worker who is required in British industry in considerable numbers, with or without experience. The wording of the ERP Manpower Report gives the opposite impression.—Yours faithfully,

JOAN DICKINSON
Barnett House, Oxford

THE FEW MORE...

A few more visitors were with us for Whitsun than came for Easter, and a very good time was enjoyed by all.

As we've said before, even without a car this lovely island is very easy to get to. There are plenty of fast, comfortable trains to Plymouth, whence an Hotel car can meet you. Once you have arrived, the charm of your surroundings, the excellent service and sheer comfort of its modern Hotel make Burgh Island unrivalled as a resort at which to relax and enjoy yourself, if only for a few days.

So why don't you come for a week-end, a week or a month? Come now, when the climate is so mild, and enjoy the beauties of early summer in South Devon.

BURGH ISLAND HOTEL

Terms from £2 per day inclusive

Commonwealth Prospects

"Twentieth Century Empire" By H. V. Hodson. Faber and Faber. 186 pages. 15s.

It is always easy to underrate the rôle that ideas have played in the development of the British Commonwealth, especially in the last 50 years. Many of those ideas have been worked out in that circle of imperial debaters and thinkers of which Mr Hodson is a distinguished younger member—the group associated with *The Round Table* and *All Souls*. In this highly stimulating, and in places cryptic, book one finds ample evidence of their influence. In the sense that he wants to see the power of the Commonwealth efficiently organised and effectively exercised, Mr Hodson is an imperialist of a kind little trusted in the Dominions and little understood in the Mother Country. For, in spite of his wide administrative experience, he is in this book a little given to pattern-weaving and to building up structures of ideas which outranges slow, empirical English way of thinking.

This tendency leads the author to produce sentences which are teasing and rather Teutonic. Speaking of the internal weakness that threatens the Commonwealth wherever there are nations within nations—for example, in Malaya and Burma—he says:

If the problem of political independence in plural societies can be solved internally by some constitutional device for sharing power, this will automatically modify and mitigate their external nationalism. They can bridge the antithesis of their own racial or communal structure only by appealing to a higher synthesis, some wider community to which their constituent communities both severally and jointly belong.

This criticism of style apart, there can be nothing but praise for the range and wisdom of much of this book, covering past and future policies in India, the problem of defence, the forms of Commonwealth association in the future, the pros and cons of large-scale emigration, and the lack of vision and determination in the policies framed by London in the past.

There are curious gaps: there is no satisfactory discussion of the Commonwealth's relationship to the United States (for example, in the case of South Africa), and strikingly little is said on economic matters—certainly not enough to explain to the average reader what is gained economically by Commonwealth membership. Likewise a number of important arguments are not properly documented. Criticisms of the Dominions' contributions to defence, for example, need some statistical illustration. None the less, coming at this moment, Mr Hodson will give home and Dominion readers at the higher level plenty to think about. He should next address his message to the non-experts in the simple, factual language through which British political ideas have always gained currency.

The Structure of Industry

"Investment, Location and Size of Plant." By P. Sargant Florence. Cambridge University Press. 200 pages. 18s.

"The Location of Industry." By Walter Scott Elliott, M.P. National News Letter, 162 Buckingham Palace Road, S.W.1. 46 pages. 1s. 6d.

THE notions of internal and external economies, of the relation of scale to technique, of the forces making for localisation, are familiar to anyone who has read the most elementary of economic textbooks. But the empirical verifying of these notions, the clothing of them in statistical and descriptive flesh and blood, is another matter altogether. In these matters—as indeed over too much of the field of economic theory—it is a good deal easier to be elegant than to be realistic. Professor Sargant Florence's study of the structure of industry and the inter-play of the forces shaping it is as solidly realistic as anyone could wish, but it differs from the general run of similar works in displaying a certain willingness, once the evidence has been duly assembled, to speculate, to raise theoretical questions, to look for implications even outside the purely economic field. *Apropos* of the large firm's problems of management he says, for example.

"Political Science has hitherto been used to denote the philosophical theory of the State. With the trend towards large-scale plants and larger-scale staff it should take its place beside economics in the service of consumer and worker as well as citizen."

The narrower and more directly pursued task of his book is, in the publisher's well-chosen words, to "develop and test the hypothesis that there is an important relationship between the

size of an industry's plant and its location pattern." From a close study of Census industries from this point of view there emerge a number of conclusions having an important bearing not only on the problems of general industrial efficiency but on those of strategic dispersal, town and country planning, the survival of the small man, and the policy of "bringing the work to the workers." All of these, it is discouraging to report, appear considerably more complicated and difficult when Professor Sargant Florence has finished with them. The interconnections of size, locality and intensity of capital investment appear, under his microscope, both more definite and more complex than they do to the naked eye. This is a valuable book for all students of economic affairs; to any who fancy themselves as planners, officially or unofficially, it is indispensable.

Mr Walter Scott Elliott, it is reasonable to assume, has not read "Investment, Location and Size of Plant." His brief report, sketching the process of localisation in the past and discussing in a little more detail the schemes, actual and projected, for the development of the Development Areas, is well written and factually useful, but in the light of Professor Sargant Florence's conclusions it shows a pathetic innocence of the forces involved.

Shorter Notices

"A Bank in Battledress." Printed for Private Circulation by Barclays Bank (Dominion, Colonial and Overseas.)

THE great commercial and industrial corporations of the country are, one by one, producing the records of their war service. Inevitably there is about most of them a certain sameness in the telling, heroic though the details often are. But this is not true of Barclays Bank (Dominion, Colonial and Overseas), which is no ordinary bank and had no ordinary war. The reader of this very handsome volume will gain an insight into a number of banking curiosities, such as the encashment of a traveller's cheque of which the "less essential" portions had been eaten by a shipwrecked sailor on a raft, or the problems of acting as banker in Cairo to twelve different armies simultaneously, or the hazards of banking in Addis Ababa, where a normal day's deposits might weigh five tons.

"Register of Research in the Social Sciences." Published by the Cambridge University Press for the National Institute of Economic and Social Research. 104 pages. 12s. 6d.

THIS most useful compilation, which is produced by the National Institute with the assistance of a representative committee, has hitherto been available only for private circulation. With the present edition, which is the fifth, it is placed on public sale and will be of great value not merely as a guide to the research work that is being done in the social sciences, but also as a directory of the institutions engaged in it.

From The Economist of 1848

June 3, 1848

OUR readers need scarcely be reminded of the disastrous consequences which attended the attempt, which was made in Ireland, last year, by the Government, to find work and wages, for a vast number of men, whose ordinary resources were destroyed by the potato failure.

The experiment was the greatest of the kind ever made, and it will remain on record, a monument and a proof of the evils and folly of such an attempt. Idleness, fraud, insubordination, disorder were developed on a gigantic scale, and at a fearfully accelerating rate, so that the Government were compelled hastily to abandon a plan of relief, which was rapidly generating evils greater even than those it sought to remove.

Such a result might have been, indeed was by many, anticipated, yet the experience of what actually happened must have taught a lesson to many, which there seems no little tendency to forget. Those who talk of always securing a fair day's wages for a fair day's work, of the right of every man willing to work to get it, seek to cast a duty on the community of finding work and wages for everybody, which it cannot fulfil; for this simple reason, that it is impossible.

The very attempt to do it stimulates and increases the evil, the deficiency of other means of employment, which is thus sought to be remedied. The means which are taken from the taxpayers, to be squandered by the Government in making holes and filling them up again, and in paying a host of people to see this properly done, are a diminution, to an exactly equivalent extent, of the means which those taxpayers otherwise would possess, and would use in giving employment to independent and productive industry.

THE WORLD OVERSEAS

Italians Face the Future

(From Our Rome Correspondent)

EVEN before the official statement of the Government's programme, which was read by the Premier to both houses of Parliament last Tuesday, it was possible to discern what the important issues would be. In foreign affairs the question is whether Italy is to involve itself politically as well as economically in the union of the West. In home affairs the questions are: whether the sure and certain hope of Marshall aid justifies an expansionist economic programme; how the programme is to be administered; whether the opposition of the General Confederation of Labour should be foiled by the powers of the State or overcome by political suasion; and finally whether a major land reform should be carried out to make more room in the peninsula for the teeming population.

A clear and binding answer to these questions cannot be expected. The bright façade of postwar Italian life, which makes the visitor to Rome and Milan ask himself time and again if it was not Italy which won the war, masks a deeply divided national mind. On Italy's place in Europe it is only a shared horror of the Eastern leviathan that produces a common language of enthusiasm for the West. In a political situation dominated by fervent sons of the Church, it is worth remembering with what reluctance the diplomacy of the unarmed Holy See came to the point of an actual breach with a power that has earned its condemnation. The present Government has come into power in consequence of an overwhelming distaste for the domestic and foreign aspects of Communism, but it is the Roman tradition to defer blunt and final acts until action is forced upon them. It is certainly uncomfortable to be attached to the West without being integrally engaged in the Western system of alliances, but weighing the disadvantage of a more rigid opposition to the East against the gain in security which might come from an alliance with the West, the disadvantage seems to many more solid than the gain. For the moment, the limitation of Italy's armaments by the Peace Treaty gives an alibi (for how could a State, kept forcibly weak, be asked to pledge its strength?), and it will be a definite change in policy should the Italian Government seek to join the Brussels Pact. If Signor de Gasperi's plan to make Count Sforza President of the Republic had succeeded, he would, it seems, himself have taken over the Foreign Office. While using the strongest language against local and international Communism, Signor de Gasperi has hitherto always sought to hold Italy outside the contests of the major Powers. There is at present a feeling at the Italian Foreign Office that this position is better understood in London than in Washington.

Cheerful Anarchists

The major local problem confronting the de Gasperi Government is unemployment. Taken together, the officially unemployed, those on part-time work, the redundant hands carried on factory payrolls and the superfluous members of peasant families, total five million Italians out of work. Meanwhile the race is growing at the rate of nearly half a million a year.

Italy's great weakness—that it is living on charity or near-charity for about half of its imports—suggests at once that these five million involuntary idlers ought to be producing a substitute for these imports or something to sell against them. But Italy, like other countries, is not endowed with the coal, oil and mineral deposits which could render the bulk of the charity shipments superfluous. Any programme for throwing sufficient exports into markets which would earn the hard currencies must—like all great economic transformations—be achieved by dint of hard sacrifices and bitter uprootings. These are going to be laid to the book of the government which orders them, and such a government, to be stable, must convince the people by winning sympathy or by forcing respect. The holiday maker in Italy may well get the impression that this cheerfully anarchic people, with

its irrepressible belief in good luck, the main chance, and Providence, will never be got to make a self-conscious collective effort. This view, however, underrates both the impatience which the Italians feel with their own volatility, and the capacity which the Italians have shown in the past for self organisation. In 1848 the prospect of a tolerably smooth-running United Italy appeared at least as dim as does the prospect today of an economically balanced and socially healthy Italy in ten years' time.

Divided Opinions on Use of ERP

Meanwhile, it is clear that the Government is united in the desire to make of the Marshall Plan a cure for the nation's weaknesses and discontents. What deeply divides the ranks of the Government's supporters is how the 700 million dollars' worth of products to be received in the first Marshall Plan Year, and the corresponding quotas in later years, are to be used. Is this new wealth to provide the existing Italian economic system with the strength necessary to face the task of its own adaptation to the new national and world conditions? Or, as the other school holds, is this wealth a unique opportunity for the state, as the supreme planner, to direct the reshaping of the economic structure by granting or withholding publicly owned supplies?

To employers of the traditional outlook, planners would be busybodies intent upon destroying the great opportunity of a natural economic recovery offered by the coincidence of American aid with the weakening of labour truculence through the elections. To the planners it seems clear that the organised working classes are going to determine what can and what cannot be done in Italy in the next five years. If they are to be won away from the destructive rebelliousness with which the Communists and official Socialists, dragging the Trade Unions with them, preached the rejection of ERP, that can only be by showing that social and economic objectives are being simultaneously pursued with the wealth which the Communists have refused to handle.

It is typical of the present conditions of Italy that in a month largely devoted to ceremonial proceedings, the debate on the ideology of ERP should have been conducted in grand style in the newspapers, while hardly a Minister or a high official could be found with time to attend to the detailed list of ERP requirements. Zealous junior officials appear to have saved millions of dollars while Alcide de Gasperi was mustering the strength to assign to the planners, mainly represented by the Independent Socialists, sufficient places and authority in the Government to obtain their co-operation, upon which he sets great store. So far as the share obtained in the Government truly foreshadows the influence which they will be able to exert, the planners have done well. Signor Ivan Matteo Lombardo as Minister of Industry and Trade, and Dr Tremelloni as Minister without Portfolio and Vice-President of CIRERP (Interministerial Committee for Reconstruction through ERP) hold two of the commanding positions. (The President of CIRERP is the Premier.)

Control of Marshal Dollars

There are two stages at which the flow of ERP wealth is centralised in the hands of CIRERP, or of the Ministry working through it. The first stage is that of the drawing up of the periodical lists of requirements. The second is when the financial proceeds of the goods received and sold to the nation flow into the coffers of the State and are free for spending within the categories required by the ERP Agreements. The amount of money available at the second stage depends upon the extent to which the dollars are spent to procure goods which are resold in Italy at a "political price" (as in the case of cereals) thus passing the bulk of the benefit directly to the private consumer.

While the more robust planners cry out for the purchasing programme to be planned without any regard to the advice and

THE BUSINESS WORLD

Soft Pedal for the Deficit

SIR Stafford Cripps has appeared this week in a new role—and one which befits neither his character nor his record. The high-priest of austerity, the stern prophet who believes in the healthy doctrine that the public ought to know and understand the worst, has assumed for the moment the mantle of the public relations officer. The clumsy tailoring of this garment had indeed been evident for some weeks past. The Government has lately shown a new sensitiveness to criticism of its economic policy or to any tendency by public commentators to present the picture in too sombre a hue. Only a fortnight ago, after the April trade returns had shown a further disquieting rise in imports which a few press comments had misinterpreted, the Treasury's public relations department rushed into action with a particularly gauche explanatory statement. Each of its points was reasonable in itself, but its clumsy technique created the worst possible impression. *Qui s'excuse, s'accuse* was the only possible comment, and people were left wondering how such a document could have escaped the vigilance of the Chancellor. When, therefore, it became known that Sir Stafford himself had summoned a full-dress press conference on the balance of payments, the natural assumption was that the blunder was to be obliterated by a dose of honest realism. Yet the Chancellor's long statement proved to be little more than an amplification of the original departmental version—more elegant and diplomatic, it is true, but still all too reminiscent of it in tone.

Its primary purpose, plainly, was not to underline the dangers of the trend in the balance of payments, but simply to make sure that the progress (or lack of progress) towards the Government's targets is not misjudged by too close an alignment of two sets of statistics which are not in fact comparable—the monthly trade returns on the one hand and the "Economic Survey" estimates on the other. No full-dress conference was needed to drive home the points, which the Treasury statement had made quite plain, that the former always value imports cif and take no account of the moment at which the goods are paid for, whereas the "Survey" valued them fob and related to actual payments. Two months ago the Government suspended publication of the monthly gold statement which the Treasury had inaugurated last autumn to ensure that false conclusions were not drawn from the scrappy information that was filtering through about gold shipments. The suspension was defended on the ground that monthly statements would be misleading during the opening phase of the European Recovery Programme; and the retort that any misapprehension could easily be removed by supplementary explanation was brushed aside. Now, in the course of precisely such an explanation—made for a purpose which suits the Government—the original defence is repeated, and the only additional excuse is that some of the gold Britain is now losing may later be refunded under ERP. The Government, it seems, wants to reserve news of progress in the battle of the balance of payments for its own spasmodic communiqués. It suppresses the gold figures, gives no information about the probable course of invisible items or about sterling area demands on the central pool, and then says, in effect, that

public and press should in this context ignore the trade returns. If the Government is really so concerned at the dangers of public misapprehension, its only remedy is to publish more and better statistics, regularly and in standardised form. Irregular and variable statements, such as those issued this week, may be valuable supplements to a regular series; but if they stand alone they are all too likely to become mere instruments of propaganda—and always there will be the suspicion, whether well-founded or not, that this is their only purpose.

It is to be hoped that the Chancellor will give further thought to these matters, for they are far from trivial. As it is, the new drift of policy is hardly less disquieting than the trend of the balance of payments itself. After all the official qualifications have been made, it is clear that the total deficit for 1948 will exceed the £250 million which the "Economic Survey" projected, and unless there is a sudden change in the terms of trade the excess may be very large. The really disturbing feature is that this prospect arises despite the quite healthy

* Average values per unit derived from the Board of Trade monthly returns.

performance of exports in recent months. In the first four months of this year, total exports were £500 million, compared with £433 million in the last four months of 1947, and they were actually running at an annual rate some £90 million better than the "Economic Survey" estimate for the first half of this year. Most of this excess was, of course, attributable to the rise in prices, but even in terms of physical volume the performance has been well up to expectation. Nor does the deterioration in the visible deficit, by comparison with the estimates, arise from the availability of Marshall Aid. The "Economic Survey" made it plain that, if such aid were not eventually forthcoming, the rate of imports would have to be cut drastically from the level of the programme planned for the first half year. But it also stated that Marshall Aid had not been taken into account in the statistical estimates. Most people assumed, therefore, that the launching of ERP would mean that Britain this year would be importing some goods not included in the original programme so that, apart from any other grounds for revising the estimates, the forecast of the year's total deficit would be correspondingly raised. Sir Stafford now says that this is not so. So far as the influence of ERP is concerned, the original estimate stands.

The whole cause of the upsetting of the estimates of the deficit therefore lies in the expansion of imports. Table I shows the distribution of this expansion between the main currency areas. It reproduces the official figures, which convert cif imports, as shown in the trade returns, into fob values by deducting 10 per cent for freight and insurance—a conservative allowance—but they are not adjusted for the fact that imports are not necessarily paid for in the periods covered by those returns. Despite the drastic cuts in the import programme, the total cost of imports in these four months was £607 million, or £57 million more than in the previous four months. This represents an annual rate of no less than £1,820 million, which exceeds the annual rate assumed in the "Survey" by £236 million. Allowing for the improvement in exports upon original estimates, the visible deficit is running at £320 million per annum, or £146 million worse than the estimate. If the "Survey's" estimates of net invisible outgoings were realised, the indicated total deficit on current account would be roughly £400 million. The official comparisons of performance with estimate are shown in Table II.

There is no doubt that most of this deterioration arises from the worsening of the terms of trade. At the time of the issue of the "Economic Survey" the Chancellor assumed that its estimates contained a large margin in hand, because the forecasts were based on prices ruling at the end of 1947, whereas by February the break had occurred in American grain prices and further declines were widely expected. Since then, however, the tide in the markets has turned. The price index for British imports in April was 6 per cent above the end-1947

level, while the export index had risen by only 3 per cent. Despite this rise, last year's cuts in the dollar import programme have produced a substantial decline in the total cost of imports from the Western Hemisphere, as Table I shows. But, in contrast with the saving of £42 million in expenditure in the Western Hemisphere, there has been an additional expenditure of roughly £100 million elsewhere—divided almost equally between the sterling area and the rest of the (mainly soft currency) world. Most of this expansion results from higher prices, but, especially in the rest of the world—imports from which exceeded estimate by 33 per cent—it also reflects the policy of trying to diversify Britain's diet by making additional purchases of food in soft currency areas.

The one heartening aspect of this sombre picture is the significant narrowing of the gap in the hard currency account. During the four-months period, the deficit with the Western Hemisphere has been reduced by £53 million to £107 million—which represents an annual rate roughly equivalent to the amount of Marshall aid expected in the first year. At this stage, there is no need to labour the critical importance of the dollar problem, but the official attitude does seem to assume that any progress in this direction excuses deterioration elsewhere. It has been a large deterioration. Whereas in the last four months of 1947 Britain was running a visible surplus at an annual rate of £130 million on trade outside the Western Hemisphere, now the account is in equilibrium. Measured in rates per annum, the surplus with the sterling area has run down from £108 million to £54 million and the surplus of £21 million with the rest of the world has turned into a deficit of £54 million. Sir Stafford commented that the fall in the surplus with the sterling area was "small enough to be capable of correction by the normal monthly fluctuations of trade." But is this a mere fluctuation? The Chancellor gave no reason to suggest that this may be so. On the contrary, he admitted that, unless the terms of trade improve materially, there can be no hope of achieving the target of overall equilibrium by the end of this year.

The trend of import prices, indeed, is now the decisive consideration. Sir Stafford, in reply to a question, said he was satisfied that the Government is pursuing a consistent policy designed to restore equilibrium before the reserves and external aid run out—but his confidence, it seems, is subject to the proviso that providence is kind: the Government "could not guarantee" that the terms of trade would move in such a way as to ensure the success of its policy. There is one consideration, and one only, which can justify such an attitude—the possibility of good harvests this year. If present hopes are realised, they could have an important effect upon food prices, though they would offer no relief from the pressure in the markets for basic raw materials. But the worsening of the terms of trade have imposed such a huge strain upon Britain's

economy in the past two years that the relief from quite a moderate change would be substantial. Given the fact that further import cuts now would have very grave effects upon production and the export drive, it is reasonable to wait a little while to see whether the hoped-for alleviation can be expected.

The Film Agreement

THE tax on foreign films, imposed by Mr Dalton last year in a tardy effort to stem the dollar drain, has not proved a happy expedient; stop-gap expedients, addressed to a situation which is already out of hand, rarely do. Its purpose was to reduce the net dollar cost of films to this country from about \$70 million to about \$17 million a year. In March, after long and acrimonious negotiation, the Board of Trade and the American film industry reached an agreement which, at first sight, appeared to achieve the purpose. The text was published this week. It does not answer all the questions that are being asked. Controversial points are still under negotiation, nearly two months after the agreement was signed, and the memorandum now published is preceded by a cautionary statement:

Discussions are proceeding on various points of interpretation in connection with this text, and on the methods of giving effect to its provisions. As agreement is reached on these points, it will be recorded in a schedule of interpretations attached to this Agreement. These undisclosed "points of interpretation" are no trifles. If the direct conversion of American film earnings from sterling into dollars is to be limited, the surplus will remain to be invested in this country or converted by indirect means, and the agreement implies the further entry of American capital into film production and distribution in Britain. Naturally the British film trade is anxious to know what degree and kind of American intervention it has to expect. It has had from the President of the Board of Trade a statement in Parliament on April 30th that in the negotiations "the figure of something like twelve films a year was freely mentioned by the American representatives" as the number of films they thought of making in Britain. It has a vague reassurance in the agreement itself that the permitted American expenditure in Britain for film business purposes "shall not go beyond the limits of fair competition, or be otherwise harmful to the legitimate interests of the British film industry." How are statements of this kind to be interpreted? Do the American producers accept Mr Wilson's recollection of what was intended? It is not clear. Would the parties concerned automatically agree on the point at which American competition ceases to be "fair" and British interests begin to be "legitimate"? It seems unlikely. The agreement is published at last, but still nobody knows what will happen. Light is shed here and there, but only at random. The agreement cannot be described as a triumph of negotiating skill. It leaves too much to subsequent argument. It is only possible to deduce from the agreement—and from the situation, still essentially unchanged, which produced it—an estimate of probabilities.

The situation which has given rise to the agreement is simply that Britain, though unable to afford American films, is not prepared to do without them. To talk of "the very serious effect on the morale of our workers and on industrial production" if cinemas had to be closed is merely a rather solemn way of saying the same thing. Last autumn the American film companies, in protest against the import duty, stopped sending films to Britain; the British film industry, if it had been strong enough, could have stepped in and filled the screens. But the British industry was not strong enough, its productive resources were too small and its finance depended largely, as the events of the winter showed, on box-office takings which fell away as the supply of American films dried up. Production costs in the British studios had reached a point of inflation at

Sir Stafford, despite this latest effort to put the best face on the figures that can be contrived, is obviously alive to the realities of this particular problem. If, he declared, the terms of trade continue to deteriorate, "we shall obviously have to examine our import programmes again." We shall, indeed.

which a foreign market was essential even to make the difference between financial failure and financial loss. And the best potential foreign market was virtually closed, for (so long as the dispute continued, at least) few British films had any chance of reaching American screens. Financial backing became harder to get than it had been for many years, and British production too began to die away. The choice before Mr Wilson in February was, therefore, to obtain a resumption of imports of American films or to face the prospect of closing cinemas and upsetting the cinema workers' union. He chose the former alternative, and the American companies, in agreeing to send their films again, agreed also to various restrictions on the use they could make of the earnings.

They had been withholding their films altogether rather than lose three-quarters of their British earnings in tax; they now accepted \$17 million a year as the basic rate of remittance. But it would be too simple to suppose that they had become reconciled to receiving only a quarter of the earnings of their films. The agreement provided ways in which their effective receipts could be substantially greater than \$17 million. There seems no reason for supposing that those receipts will not involve outgoings from the British economy; the payment may be postponed a little, or it may be made in unobtrusive and indirect ways, but it can hardly be avoided.

As a beginning, the American companies may convert into dollars—over and above their basic \$17 million a year—an amount of their British earnings equal to the dollar revenues accruing to British interests from the showing of films in the United States of America, its territories and possessions and the Philippines. The British film industry might be expected to derive some hope and comfort from this clause, which gives the Americans a certain interest in promoting the distribution of British films in the United States. But other features of the agreement make it a questionable hope. Three schedules of permitted uses for the remaining sterling earned by American films are attached to the agreement. The first refers to uses "arising from the normal operations of the film industry." These include the purchase, construction, leasing, or equipment of studios. They cover most of the requisites for the production and distribution of films. They also cover the acquisition of domestic or foreign rights of films produced in the sterling area, "either by outright purchase or by participation in whole or in part in the cost of production of the films in question." This is worth studying. If any British film earns dollars in the United States, those dollars will be, in effect, a dollar gain to the American film companies. They will not benefit the British balance of payments, though the extended distribution of British films should (if they are good enough) make it easier to sell British films in the future.

The American producer can, however, get his dollars out in other ways if he prefers to do so. To an undefined extent (an extent which, Mr Wilson has said, will be limited) he can produce films in Britain himself. But he can also—without entering production directly—invest money in British film production, receiving as his payment the foreign rights in the product, or merely the dollar rights, or any rights he chooses. Two American producers, Mr Selznick and Mr Goldwyn, have already made arrangements of this kind with Sir Alexander Korda. Others will follow, no doubt; few British film producers—perhaps none—would cheerfully turn down an offer of finance

as things are at present. And it is hard to believe that the investment of money will carry with it no rights of control and supervision.

One consequence of the agreement will clearly be that the line of demarcation between British films and films produced in Britain on American initiative or under American control will become almost hopelessly blurred. The significance of the Films Act which recently passed into law, the task of the new Films Council, the meaning of the quota system—none of these can be unaffected by this tendency. What is a British film? Definitions for quota purposes depend on where the film is made and on the nationality of the bulk of the persons employed in making it. Under the agreement, films will be made in the United Kingdom with American capital and under American supervision as a means, primarily, of converting sterling into dollars. Will they be accepted for registration for the British quota? The point has been under discussion, and the trade is now assuming that they will. If this is merely a matter of a dozen feature films a year, it may not have any great significance. But the signs are that the total may be greater, and that American participation may take various forms apart from direct production by American teams on location. British production is desperately short of money, and the American companies whatever their embarrassments on Wall Street, can look forward to having ample funds to invest in film properties in Britain. The amount of such investment is not limited by the agreement, though investments in the other enterprises described in the second schedule are limited to £2,500,000. "Investment in film properties" is a wide category, though for certain uses (the purchase of cinemas is one) the prior consent of a Control Committee, representing the British Government and the American film industry, will be required. By implication, the purchase of studios, the acquisition of film rights and other copyrights, and the production of films do not need the prior assent of the Control Committee; control will be after the event.

It would be a mistake to project too far the possibilities latent in an agreement which has yet to be "interpreted." But a strong possibility, at least, is that a greatly extended American influence in film affairs in this country will be one of the first penalties to pay for the innocent desire to have American films without paying dollars. If the film business is considered as an employer of labour only, this may have advantages. To those who are interested in an indigenous and independent British film-making activity, it will be less welcome.

Investment Seesaw

With the opening of the new Stock Exchange account, the investment markets seem to have returned to their condition of a month ago. Gilt-edged securities have now taken up the running, and equities are once again on the falling plank of the seesaw. This might be called the basic market trend, and its temporary interruption owes much to the force of reinvestment of Argentine railway moneys. That factor has not completely spent its force—further repayments have to be made in due course to junior stockholders—but obviously it has failed to stimulate any sustained demand for ordinary shares. For their restraint, equity investors can find plenty of good reasons. First, there is the impact of further limitation on bumper earnings (though that has not prevented some modest gleams of joy in the oil share market this week, if only because the Anglo-Iranian results were so incredibly good). Secondly, the weight of new industrial finance seems to be regarded as a threat to the industrial share market. Indeed, the calls are likely to be heavy, and they will absorb much money which would otherwise seek a home in the broader avenues of the industrial share market as a whole. Yet there is some sense of doubt about the capacity of investors to provide the needed

Considered as a device for saving dollars, the agreement is open to question at other points. The claim made for it is that it reduces the country's net dollar expenditure on films to \$17 million a year for the next four years. Is this so? The American companies may use the remainder of their sterling to buy "literary, dramatic, and musical properties and rights"—some of which, it may be supposed, they might otherwise have bought for dollars. They may buy radio and television rights. They may use their sterling to meet travel, freight and shipping charges and the cost of communications between their various offices "in so far as they can be paid in sterling"—services which are, perhaps, among the dollar-earning assets of Britain. They may pay sterling debts and mortgages. They may pay off obligations owed to persons or corporations resident in the United Kingdom: in so far as the latter are under an obligation to offer such payments for sale to the British Government if paid in a foreign currency, the British Government will take the necessary steps to permit payment in sterling. And what of "motion picture patents and processes," which may also be bought with the Hollywood balances? Are they not likely to produce dollar claims in the future? These are the more obvious examples. It is, indeed, optimistic to suppose that the whole body of property which may be acquired in this country—real estate, industrial equities, hotels and the rest—will not come home to roost, sooner or later, as dollar claims.

The cost of American films will not, then, be trifling over the next four years; the Board of Trade has extricated itself for the moment from an undignified scrape, but it has not got away scot-free. It is time now to consider what is to happen when the agreement comes to an end: is the British film industry to be as hapless then as it has been in the last few months? The future may require some original thinking in the film world. The new Films Act has become law, the new Films Council has been nominated, and the trade is waiting anxiously to see what quota the Council will recommend for the coming year. The figure which the trade thinks most probable is 30 per cent; and neither the present state of film production nor the high total of defaults on last year's quota appears to justify anything higher. But, if the American agreement works in the most obvious and probable ways, the Films Act and the fixing of the quota will cease to have any decisive importance for the future of the British film industry. They could protect it, within severe limits, from straightforward competition in the familiar sense. But against financial infiltration only its own energy and character can now preserve it; and they have yet to be demonstrated.

Business Notes

funds—doubts which, at this stage, can hardly be rationally accepted. This tenderness, however, was marked by a general rumour on Wednesday that the new Imperial Chemicals issue (of one new share for five, as it was disclosed after last week's issue of *The Economist* had gone to press) might be offered at 40s.—a figure which lacked any official confirmation, though it quickly depressed the leading industrials.

There is little doubt that professional dealers see no reason to change their bearish mood. They observe the less favourable experience of some companies at home—a disinflationary forerunner, perhaps, to the shape of industrial company reports to come. In the flood of bumper earnings and handsome company reports, there are some rocks below the surface—difficult selling conditions in the consumers' goods trades at home, the absorption of an ever-growing volume of working capital in inventories at ominously high prices, and perhaps some threat to the supply of industrial raw materials, despite ERP.

In these conditions, the response of gilt-edged stocks is natural enough. British Electricity stock is again at 99½. But perhaps the best indication of the change in spirit is the conclusive success of the Australian conversion. Holders of the £14.6 million of 4 per cent loans called for redemption converted £8,000,000 into

the new 3 per cent 1964-66 stock, and the balance was handsomely covered by cash subscriptions amounting to between £10 million and £11 million. This success will provide an auspicious background for New Zealand's conversion-cum-repayment of the outstanding £19,225,465 of 4½ per cent stock, 1948-58. Mr Walter Nash, the Finance Minister, indicated last week that the New Zealand Government intends to repay about one-fifth of the outstanding amount, and to convert the remainder.

* * *

South Africa's Boom Borrowing

City imagination has been fertile this week in its effort to guess what financial measures Dr Malan's government might devise to advance the cause of Union nationalism or parade its independence. This exercise has encompassed the formal departure of the Union from the sterling area, the devaluation of the South African pound (either with or without a relinking to the dollar), and a ban on further imports of British capital. While so much is obscure about the new Government's intentions, speculation on such matters is unfruitful. But whatever the Government's political wishes may be, its financial and economic policy, if based on sober judgment of what is desirable and necessary, is likely to be narrowly conditioned by the hard facts of South Africa's balance of payments. They are harder facts than they were ten days ago. General Smuts's government had latterly shown increasing realism in its economic policy, but it had still not been forced to confront the full problem, which for two years has been blurred by the huge inflow of funds from overseas. The political shock which Dr Malan's advent has caused abroad, and especially in London, may or may not drastically reverse that movement, but it will certainly curtail it greatly. There will be no blurring of the external problem which he confronts. It will be one of compelling urgency.

South Africa's postwar boom has been founded upon a lavish import programme which, like Britain's more austere programme, has been sustained only by heavy borrowing abroad. If rough allowance is made for the contrasting sizes of the two economies, South Africa's borrowings or drafts upon reserves have been comparable, in each of the past two years, to the scale of Britain's borrowings last year. No official figures of the Union's balance of payments and capital imports are available, but some estimates made by a well-informed contributor to the current issue of *The Banker* can probably be accepted as a reliable measure of the approximate shape of the problem. During the seven years 1939-45, it is estimated, the Union had a cumulative surplus on current account of £294 million which, after the expenditure on repatriation of overseas debt, permitted an addition of £212 million to gold and exchange reserves. In the first two postwar years this strongly favourable trend was abruptly reversed. After taking credit for the whole gold output (i.e., treating it as if wholly exported) there was in 1947-48 a visible deficit of £100 million which, the writer estimates, was raised to £217 million by invisible payments (some of which were non-recurring). Yet in these two years the reserves of gold and foreign exchange declined by only £35 million. This vast two-year deficit, in short, was supported by a capital inflow which, on these estimates, must have exceeded £180 million—and a significant part of that sum represented "hot" money which sought South Africa as a haven of refuge from the troubles which beset capital in Britain.

In the past twelve months, the trend of the current account has been even less favourable. *The Banker* puts the deficit for that period (to mid-May) at £140 million, and guesses the capital inflow at £200 million. If the visible deficit in 1948 runs at the same rate as in 1946-47, the total deficit for 1948, after allowing for the non-recurring invisible payments in the earlier period, might be of the order of £85 million. The gold reserve stood at £109½ million on April 30th, but the reserve ratio, at 40 per cent, showed only a moderate margin over the present legal limit of 30 per cent. To promote a Bill to reduce the limit would hardly be the best way of relieving the shock to confidence, nor would it be regarded as good salesmanship for a gold-producing economy. There are, of course, substantial reserves in sterling, which are available to meet the deficit with the sterling area, whether on current or capital account; but they would run down quickly if the tide of funds were reversed. And the problem of the Union's dollar deficit would remain—unless the undertaking not to draw on the sterling area dollar pool were to be waived. Dr Malan, it seems, cannot escape the unpleasant task of drastically pruning imports, with all the repercussions which that must involve for an economy geared to a boom rate of development.

South African Shares Now

In the markets, second thoughts on Dr Malan's victory have had little effect on prices either of gold shares or South African industrial issues. If the more extreme reactions to the election results have been somewhat tempered this week, they have not wholly disappeared, and there is still the same absence of any tangible evidence about the new Administration's intentions which explained, in such a large measure, the initial sense of shock. Opinion seems fairly sharply divided, in London, between the spokesmen for the Rand mining industry and the banks. The former, clinging to their conviction that eventually the price of gold in South Africa must rise if the mining industry is to make any progress in surmounting the ever-rising level of costs and the heavy burden of taxation, argue that devaluation of the South African pound has been brought nearer by the election results. The latter argue that even a Nationalist Government in South Africa would not lightly contemplate the severing of links with the sterling area—perhaps under-emphasising the extent to which those links had already been weakened by the agreement of last October.

But there is general agreement, at least, on the proposition that the boom in industrial shares in Johannesburg has received a rude check from which it will be difficult to recover. The new

SOUTH AFRICAN GOLD AND INDUSTRIAL SHARE PRICES

	1945-47		May 26, 1948	May 28, 1948	May 30, 1948	June 2, 1948	Fall this Week

administration, whatever else it may do, is not likely to regard with favour some of the cruder manifestations of that market in the last year or two. But, if it decides to impose stronger checks on the influx of capital into the Union, it would exacerbate the problem of the deficit. Indeed, it has yet to be revealed whether steps in the opposite sense—of blocking "flight money" in the Union—may be taken. The gold mining industry may not be directly threatened, but its labour problems are not likely to become any easier, and its gains from devaluation—if indeed that step were taken—might well be partial and only transient. As for the industrial boom, its foundation on a large external inclination to accept the implications of large capital imports than the old, and those with balances in other parts of the sterling area will have less inclination to transfer further funds to the Union. On these arguments, the prices of South African industrials must still be reckoned to be vulnerable.

* * *

Bumper Oil Profits

As the holder of a majority interest in the Anglo-Iranian Oil Company, the British Government has this week itself suffered the consequences of voluntary dividend limitation. There is to be no increase in the dividend on the £20,137,500 ordinary stock of £18,564,857, and are nearly double those of the previous year. A final dividend of 25 per cent is to be paid making 30 per cent for the year. The prosperity of the oil companies over the past year has been well advertised, but few observers can have expected such convincing evidence of it as the profits of Anglo-Iranian, Burmah Oil and Venezuelan Oil Concessions have now output, from 19,189,551 tons to around 20,000,000 tons over the year; last year's results, therefore, can be regarded as a mere foretaste of the ultimate rate of expansion and of the advantage of cheap production.

Undoubtedly the most important factor in the results has been the steep rise in crude oil prices last year. Some optimists in the City believed that the company would raise its dividend to mark such obviously excellent trading results. But this was never a serious possibility in view of the interpretation that would have been put on such a move by other companies, such as Union-

Castle which has recently revealed an even more striking rise in its rate of earnings. In fact Anglo-Iranian will need all the funds it can put by—and probably more—to finance the expansion of its activities both in Iran and in the distributing and refinery branches of the business. Anglo-Iranian has been able to plough back no less than £11,452,373 as a result of its operations in 1947 compared with £2,512,454 in 1946. These are enormous reserves, and they will go a good way towards meeting capital expenditure in the next year or so.

The profits of Venezuelan Oil Concessions and Burmah Oil are dwarfed by comparison with Anglo-Iranian, yet they represent equally remarkable achievements. The net profit of VOC was trebled in 1947, and the board, though uninhibited by any Government-nominated directors in its midst, decided to make no change in the dividend. Burmah Oil Company, which has at present to confine its activities largely to distribution, virtually trebled its operating profit. It will be some time before production can be restarted in Burma, and the completion of the refinery is expected to be delayed another year until 1951.

Falling Bank Deposits

At last the volume of money is beginning to reflect the change in the budgetary position. In March and April the underlying trend of bank deposits was obscured by the distorting effects of the redemption of the 3 per cent Conversion Loan and, more largely, by the payment of the Argentine rail purchase moneys to the companies concerned—operations which raised net bank deposits in March by nearly £150 million. Last month was free from any such distortions, so that the Government's budget surplus was able to exert its effects through repayment of indebtedness to the banking system. Indeed, this deflationary influence upon the volume of money may have been reinforced by the first stages of reinvestment of the Argentine rail funds, for during the month the companies completed their disbursements to holders of the debenture stocks. The impact of these influences upon the clearing banks is clearly shown in their statement of the "make-up" of May 19th, which reveals a decline in net deposits by £32.2 million, to £5,868.8 million. Published deposits, it is true, were actually £8,000,000 higher than in April, but this was wholly due to the temporary increase in items in course of

collection in consequence of uncleared payments to the Argentine rail stockholders.

Necessarily, the main counterpart of this cancellation of credit is to be found in the items which reflect Government borrowings from the banking system. Bill portfolios have been reduced by £55.5 million, call money is down by £8,600,000, and Treasury deposit receipts are up by £8,000,000. The net contraction in these three items together is therefore £56 million—actually a somewhat smaller movement than might have been expected, for, during the four weeks most nearly comparable to the period covered by the banks' statements, the Government's above-line surplus amounted to no less than £140 million, and only about £60 million of this was offset by net outgoings below the line—without allowing, of course, for the undisclosed net receipts in sterling from sales of gold. The increase in TDRs reflects the first stages of the unwinding of the Argentine operation, for, as the railway companies disburse the large moneys temporarily immobilised on their accounts, the special bill issues made to the recipient banks last March are being redeemed, and are being refinanced by issue of TDRs allocated to the banks in the usual way. The greater part of the decline in the banks' bill holdings may therefore be presumed to reflect a reduction in tap bills; during the period covered by the banks' statement, the total issue of tender bills rose by £50 million.

It has been suggested in some quarters that this change of trend in deposits ought to be regarded as an inflationary tendency, on the ground that the deposits created in March were formerly immobilised but are now going into general circulation; the published figures of deposits showed an increase of £88 million in current account balances and a decline of £80 million in those on deposit account (this last movement of course reflecting the withdrawals by the railway companies). This looks a sophisticated comment, but in fact it is not sophisticated enough. The banks' statements were made up in the very midst of the process of disbursement to stockholders, so that only a very small part of the funds could have already found a permanent home. Even so, the expansion of bank advances, at £18 million, though much larger than in the previous month, was far smaller than in the corresponding month last year; and the banks' investment portfolios were further reduced, by £5,000,000. Both these movements suggest that re-employment of the Argentine proceeds is producing some cancellation of the initial creation of money

The spectacular ruins of Great Zimbabwe present archaeologists with an intriguing puzzle. When and by whom they were built has yet to be finally established, but all observers agree that the ruins are surrounded by extensive workings where once the mining of gold took place on a large scale. A pleasingly romantic explanation suggests that round Zimbabwe lay the greatest goldfields of the ancient world—King Solomon's Mines—from which was obtained the gold used in the adornment of the Great Temple in Jerusalem. Another theory identifies the ruins as Bantu work of the 14th or 15th century A.D. when Zimbabwe may have served as a centre for the gold trade with the Mohammedans of the coast. Whatever their origin, the ruins remain an interesting link in the history of mining in Southern Rhodesia, for today the mining of gold, chrome and of coal continues to contribute to the prosperity of the country. Full and up-to-date information from our branches in Southern Rhodesia, covering the mining industry and other commercial activities, is readily obtainable on request.

which the purchase operation involved. The money which still remains uninvested will have inflationary effects only if the recipients divert their capital to current consumption or embark upon capital developments which would not otherwise have been undertaken and which are not reckoned in the programme assumed by the Chancellor in his recent budgeting.

Credit to France

The negotiations for an urgently needed sterling credit to the French Government have been two-thirds successful. The original intention was to open a credit of £15 million, of which £10 million was to be provided directly by Great Britain and the other £5,000,000 was to be made available out of the sterling balances accumulated by Belgium. Provisional agreement on both aspects of the operation was reached when the three Finance Ministers met in Brussels last month. The triangular credit has, unfortunately, fallen through. There appears to have been some misunderstanding on the exact nature of the sterling which Belgium would make available to France. Britain thought the sterling would come out of Belgium's current account, which for so long has shown a chronic tendency to grow beyond the gold convertibility ceiling of £27 million. A reduction of £5,000,000 in this account would, therefore, have been particularly welcome in London. Belgium, however, saw the position in a different light, and wished to make its part of the credit to France without encroaching on the sterling held in the current account. For the time being, therefore, this part of the French credit negotiations has reached a deadlock. The matter may be revived later as part of an extension of the wider intra-European clearing scheme.

The direct credit of £10,000,000 to France was finally arranged this week. It will take the form of sales of sterling by the Bank of England, acting on behalf of the British Government, to the Bank of France up to an amount of £10,000,000 at any time between now and September 30th next. The Bank of France will resell this sterling for forward delivery not later than September 30th. This forward exchange operation will put sterling immediately at the disposal of the French Government and will provide for repayment of the credit by a specific date. It will also protect the British Government from any exchange risk in respect of the francs it will acquire through sales of sterling. There is a clause in the agreement providing that the currency of the credit may be extended if both parties are willing. The official announcement issued in London states that "the intention of the arrangement is to provide short-term facilities to the French Government in overcoming their immediate balance of payments difficulties during the next few months until the work of the Organisation for European Economic Co-operation can have effect." It was estimated recently that the deficit which France was running with the sterling area as a whole would amount to about £70 million for 1948. France began the year with about £40 million in hand. Unless, therefore, a considerable improvement takes place in the French balance of payments in the near future, the facilities just granted will prove insufficient, and will have to be extended both in time and amount.

Finance Bill Amendments

Two amendments—one from the Government and the other to be moved by the Opposition—have been tabled to the Finance Bill. The first gives relief to whole time working directors of private companies in respect of their income from shareholdings, and thus recognises the force of the criticism about the inclusion of such dividends as "investment income" for the purpose of the Special Contribution. The relief is limited to £2,000 or 15 per cent of the profits (up to a limit of £15,000, corresponding to profits of £100,000 or more) divided by the number of working directors. Any salaries or other emoluments will be offset against these allowances in computing "investment income" of working directors. This is a material improvement to the original Finance Bill, and covers the main point of complaint, though it does not meet the case of the private company which earns large profits through the skill of its working directors but may have only modest assets.

The second amendment—it has yet to be seen whether it will be called—is intended to rectify a gap in the Income Tax Act of 1945 to which the British Overseas Mining Association has lately called attention. It seeks relief for taxation purposes for oil and mining companies, registered in the United Kingdom but operating abroad, in respect of capital expenditure which is exhausted in the course of working a mineral deposit. Such depletion is not covered by the Income Tax Act; expenditure incurred on prospecting is allowed, but not the amortisation of

capital expended in acquiring mining properties. Again, if a vendor accepts a royalty instead of a capital sum, the royalty is allowable for income tax purposes. As the law now stands, a mining company can only amortise its expenditure on acquiring mining properties from its taxed profits. The logical case for the Opposition amendment is clear enough, and it deserves sympathetic consideration in the interest of British mining development overseas.

Dunlop's Reserves

The increase from £8,263,279 to £9,426,396 in the operating profit of the Dunlop Rubber group for 1947 provides an impressive background to the chairman's statement which accompanies the full accounts for 1947—these are analysed in detail in the *Records and Statistics Supplement*. As the company has subscribed to voluntary dividend limitation, none of these additional earnings is distributed and the group as a whole has been able to increase its reserves by about £2,500,000 to a total of £13,882,297. Ploughing back is a familiar policy of the Dunlop group. In the past ten years some £21½ million has been placed to reserves out of profits. In addition, £5,000,000 of debenture capital was raised in this period, making a total of £26½ million of extra capital available for new investment. Of this amount £15½ million has been spent on fixed assets and the remainder used as working capital. The 110,000 shareholders of its various classes of capital must derive satisfaction from the impressive financial strength of the group, though ordinary stockholders may be excused a touch of chagrin that they cannot immediately share in the increase of profits. The wisdom of the group's reserve policy has in fact been amply justified by the ease with which it has been able to finance a wide expansion in its activities in recent years. There are now seventy-one subsidiaries, of which thirty-seven are situated in this country. The total sales turnover, including inter-group transactions, has risen from £40 million in 1937 to £102 million in 1947, of which 45 per cent represented sales in the United Kingdom and 55 per cent in overseas countries.

But the accounts are beginning to reflect the dual strain of carrying the cost of expanding inventories at rising prices and financing a heavy programme of capital development. The value of inventories increased from £16,443,912 to £22,549,114 last year while some £4,770,000 gross was expended on capital projects. Finance was comfortably provided from internal resources but at a rate which even Dunlop Rubber might find it difficult to maintain if prices continued to rise. The assurances given by the chairman that there is no need at present to consider raising more capital are doubtless based on the knowledge that Dunlop Rubber has already carried out its major capital projects, and that any further rise in stock values is likely to be kept within bounds. Orders have so far been placed involving additional fixed capital commitments of £3,900,000, a sum which is not far below the present net cash balance of £4,337,733. Net current assets amount to nearly £22 million—a manifest source of strength, though the total is largely represented by working capital employed in the business.

Austrian Guaranteed Loan Position

Holders of Belgian, British, French, Netherlands, Swedish and Swiss tranches of the Austrian Guaranteed Conversion Loan, 1934-59, are to receive 79 per cent of the face value of coupons due on June 1, 1948. This is the same proportionate rate of payment which bondholders received last year. That the loan is not to be serviced in full, despite Austria's inability to meet external commitments, is due to Italy's attitude towards this, and indeed its other, sterling obligations. The Austrian loan, when issued in 1934, carried a joint guarantee for service and redemption by Britain, France and Czechoslovakia to the extent of 24½ per cent each, Italy 20½ per cent, and the balance by Belgium, Sweden, Holland and Denmark. The British part of the loan consisted of £10,163,900 4½ per cent guaranteed sterling bonds 1934-59, of which £6,836,900 is still outstanding, excluding bonds on which only partial repayment has been made.

The Czech Government was this year unable to meet its guarantee of redemption payments—as distinct from interest payments—on account of its own "urgent need for foreign exchange for food and raw materials" but by implication it subscribed to its obligation in principle to meet this payment too. Prior to the Italian elections Italy took the purely legalistic stand that Austria's inability to meet its obligations had not been proved, and therefore that the Italian guarantee had not become operative. However, it has now been announced that the Italian Treasury will shortly be sending a representative to this country for dis-

cussions regarding the Italian Government's attitude to the guarantee. To this announcement the Stock Exchange responded with a rise in the Austrian loan on Monday from 64½ to 69. It is to be hoped that the whole question of Italy's sterling debt obligations will be reviewed with the Italian representative when he arrives in this country.

Nationalised Sphinx

The second of the annual reports which the Bank of England, since its nationalisation, has been required to publish is even more disappointing than the first. The Bank had been given a great opportunity to provide authoritative analysis—and even comment—upon matters of public policy which properly fall within the sphere of a central bank, as well as a chance to fill some of the wide gaps in monetary statistics. Nationalisation itself was purely a political act; and since Labour had always assailed the Bank for its secretiveness, Labour Ministers might have been expected to make sure that these opportunities were not thrown away. Yet the only result seems to have been to make the Old Lady more Sphinx-like than before. As a private institution the Bank did at least hold a half-yearly General Court and submitted a profit statement which, in theory at least, could be challenged by any stockholder. But now that the proprietors are the whole body of British taxpayers, no information whatever is given of the financial results of the Bank's activities. In the accounting data the only novelty is the issue of a Bank return compiled in traditional form but dated for the last day of the Bank's financial year—which means that, in most years, there will be two Bank returns relating to that particular week.

The general material, though it extends to sixteen pages and provides a convenient summary of information already available elsewhere, could hardly be more pedestrian. Nobody would imagine, from a scrutiny of these pages, that in the period they purport to survey the whole climate of monetary and financial policy in Britain had changed or that in the gilt-edged market there had been a dramatic reversal of the violent trends of the previous year. Indeed, there is even a hint of deliberate obscurantism on this vexed question of cheap money: the table of comparative yields which appeared in last year's report does not reappear this time. But while the report is silent on these vital issues, it devotes two pages to listing the changes in Bank rate since 1927 and in the fiduciary issue since 1931, and to reproducing the clearing banks' classification of bank advances. Attention is drawn to the change of trend in the note circulation, but not one word is said of its probable causes; in this matter the only interesting fact which emerges is that, of the £144 million decline in the total circulation, £136 million occurred in the circulation of £1 notes. As for relationships with the commercial banking system, the Bank contents itself with the remark that there has been "close and intimate co-operation" and that the "credit facilities provided by the clearing banks have conformed with the general policy of the Government."

This year, as last, the only really useful section of the report is that which summarises the financial and payments agreements concluded during the year. But the dollar crisis and the dramatic failure of the convertibility experiment are dismissed in the colourless and formal language of exchange control, which relates in a dozen words that "the right of transfer from Transferable Accounts to American Accounts was rescinded." Is this really the limit of enlightenment that the public can expect of the authorities? Do objectivity and reasonable caution really demand such futilities of restraint? Must all official utterance upon the

vital economic and financial issues of the day be the close preserve of Ministers and their public relations officers? That is not the way to objectivity, or to informed discussion of public affairs. The Treasury, which presumably plays the larger part in deciding the nature and general content of this report, should reflect upon the publications of the Federal Reserve Board and upon the merits of revealing some of the fruits of official research. Indeed, it will find object lessons even in the activities of some of the youthful central banks of Latin America.

An Error by the Coal Board

But for the other troubles of the National Coal Board and the resentment felt by the press over the allotment of dollars for newsprint, little might have been heard of the costly error which the Coal Board made last year in estimating its needs of conveyor belting. This probability makes the incident the more alarming, and it underlines the question whether requests for dollars by public boards are scrutinised as closely as requests by companies and traders. On the reported facts, it is hard to credit that they are.

The programme of installing more belt-conveyors in the mines was begun by the Coal Board last year, in a hurry and under the influence of the coal crisis. No doubt it seemed, at the time, meritorious to make a quick estimate of requirements of belting for the following twelve months and to make it (as the Board admitted in a statement last weekend) "deliberately on the generous side." The estimate was 13½ million feet. Since the production of British belting available for the British coal mines in the first half of 1947 was less than 4,000,000 feet, the Board ordered 2,000,000 feet, at about four dollars a foot, from the United States. British production rose with a swiftness which upset these calculations; by the end of 1947 it had reached the rate of 10 million feet a year and was still rising. At the same time "the introduction of conveyors into the pits was not going forward as fast as had been hoped." The Coal Board decided that it did not need the American belting after all, and asked the American manufacturers to reduce the contracts; but few, it appears, were willing to do so, for the Board is taking delivery in 1948 and 1949 of 1,900,000 feet from America, which, apparently, it cannot at the moment use. The surplus will be put into stock until needed—but it could equally well have been bought in Britain when it was required.

That the Board should attempt a more rapid mechanisation than it could, as things turned out, achieve was natural enough in the circumstances of last year. The failure to estimate correctly what could be produced at home is less excusable. An estimate of that kind was, perhaps, for the Ministry of Supply to make, rather than the Coal Board. But where was the planner's eye which should, in a planned economy, look with equal sharpness at the inflated needs of the mines and the under-estimated possibilities of the engineering factories? Where was the vigilance of the foreign exchange control which might have been expected to scrutinise such precipitate demands for dollars? Large centralised boards have the disadvantage that their mistakes are liable to be large and costly. If planning has a virtue, it should surely lie in its ability to correct such mistakes in time.

Steel Companies Face the Future

A step which anticipates the possible nationalisation of the steel industry is being taken by Guest Keen and Nettlefolds. This company is to repay its 4 per cent debenture stock at 102, and

INFORMATION AND COMMENT

The services of *The Economist's* staff of specialists can be put at the disposal of business and other organisations in many ways. Below we give two examples.

Overseas Territories

To enable the paper to comment on events abroad, a regular flow of information from our overseas correspondents and contacts is required. This information, and the judgments that are based on it, can be applied to commercial problems.

Industries and Commodities

Our research staff and statisticians are constantly studying the world's chief industries and commodities. This specialisation, and the sources of information to which we have access, enable us to report with authority on these subjects.

The Economist Intelligence Unit

22, RYDER STREET, ST. JAMES'S, LONDON, S.W.1.

Telephone: WHITEhall 1511, Ext. 13

offers the holders an option to convert into new 4½ per cent cumulative £1 preference shares at the rate of 97 preference shares for each £100 of debenture stock held. When the offer was announced two weeks ago, no reason was given for the move which, on the face of it, would involve the company in an extra taxation charge, since the dividend on the new preference shares would attract profits tax, whereas interest on the debenture stock does not. In a circular now issued by the company the reason is made plain. It is the intention to make the parent company purely a holding concern, and to concentrate the producing side of the business in the subsidiaries. This object cannot be achieved while the 4 per cent debenture remains outstanding, since it is secured by a floating charge on the assets of the company. Before the transfer of assets to subsidiaries can be effected the debenture must be removed.

Steel companies—of which Guest Keen and Nettlefolds would hardly rank as the most vulnerable—are in fact becoming increasingly conscious of the possibility that the industry may be nationalised, and many are now making dispositions of assets and tidying up their capital structures while they are still free to do so. Thos. Firth and John Brown has recently entered into an agreement with its subsidiary, Firth, Brown Tools, to transfer to that company its assets engaged in producing tungsten carbide and allied industrial processes in consideration of a share issue. Although no mention was made of nationalisation in connection with the transfer, that may well have inspired it. Another group to indicate the way the industry is thinking was Vickers, which switched reserves from certain subsidiaries, notably English Steel Corporation, to the parent company, thus immunising considerable resources in the event of nationalisation being confined to operating companies alone. This assumption may not, of course, be justified by events. The Electricity Act provides a precedent for preventing companies from carrying on business after nationalisation, but in that case the structure of the industry and of the companies themselves was more clearly defined than in the case of steel. Obviously, the steel industry's calculations are based on a comparison with the position of the coal companies which are free to carry on business in other spheres, as indeed some are doing with success.

Trade With Japan

New arrangements have been concluded with the Supreme Commander of the Allied Powers in Japan for conducting trade between the United Kingdom and the Colonies and Japan in terms of sterling. Under these arrangements sterling acquired by SCAP in excess of the amount which "it can reasonably expect to be able to spend in the near future" will be convertible into dollars. These conversions will be made at regular half-yearly dates, and though the texts so far published make no mention of the amount of sterling which SCAP will be prepared to accumulate it may be assumed that it will in fact be no more than an adequate working balance. For all practical purposes, therefore, Japan remains a hard currency country, and the London announcement of the new arrangements emphasised that all proposals to purchase from Japan must be considered in the light of this contingent liability of sterling accumulated by SCAP being convertible into dollars.

The constraints which this provision may place on the expansion of trade between sterling countries and Japan are increased by the fact that for the time being exports of textile goods from Japan have had to be excluded from these arrangements. These textiles are manufactured with American cotton, the greater part of which is provided by the US Commodities Corporation. Since this raw material has to be paid for in dollars the USCC has made it a condition that Japanese textile exports must be sold in terms of dollars and the proceeds earmarked to repay the amounts due for raw cotton. At one stroke this removes from the new arrangements by far the biggest single item in potential Japanese trade with the sterling area. This, in other words, is an agreement from which little encouragement or gratification can be derived. If trade between Japan and sterling countries expands in the near future it will be in spite of and not because of the financial arrangements just announced.

Development Councils in Practice

The draft order for the Hosiery Development Council has been published, and suggestions for amendments have to reach the Board of Trade by June 30th. This follows close on the TUC's demand for action, but the response is a little bitter to trade union taste. The council is to have three representatives of the employees, six representatives of firms engaged in the industry, and three independent members. One of the independents will be chairman. Thus the trade unionists have not achieved "equal

representation" with the employers, and the recommendations of the dissenting minority on the working party have been accepted. But industry has been notoriously shy of the Industrial Organisation Act, and in the circumstances the TUC has been wise to concede the point of representation in order to get the councils into existence at all. When the Industrial Organisation Act was debated in the Commons, Government spokesmen gave assurances that every effort would be made, before a development council was set up, to get agreement within the industry concerned.

This is, indeed, essential if councils are to perform the task expected of them with the circumscribed powers they will possess. The process of seeking agreement is going on in a number of industries—in the hosiery industry itself it is, indeed, not yet completed—and accommodation will not be helped by muddled statements of the matters at issue. One such statement came last week from Dame Anne Loughlin, general secretary of the National Union of Tailors and Garment Workers, who suggested that a development council in her industry would have seen that the industry was "effectively organised" and would therefore have avoided the recent piling up of clothing stocks; the employers were opposing the establishment of a council because they were against "planned production."

If it is true that the employers are opposing, and the trade unions supporting, development councils in the belief that they have something to do with "planned production," then it is high time that both sides re-read the Act and the Government statements that explained it in Parliament. Development councils will not plan production. Their general object will be to promote the efficiency and usefulness of their industries, and the schedule of functions in the Act makes it clear that this is to be done primarily by such relatively modest activities as the promotion of research, the study of ways of improving industrial conditions, certification, standards, and the exchange of knowledge. Their powers are carefully drawn to exclude restrictive practices, and Sir Stafford Cripps (then President of the Board of Trade) made it clear in the debate early last year that if any council strayed in the direction of restriction it would quickly be brought back to its proper work. This was clearly borne in mind when the schedules to the Act were drawn up, and the effect was that any powers to direct or restrict production were excluded. This will need to be borne in mind if there is not to be exaggerated alarm among employers and, later, needless disappointment among the unions. No development council on the present model can turn an industry into a planned industry.

Cutting the Cake

A number of important companies now show how each pound of revenue which they receive is paid out in the various costs of manufacture or remains as profits. In the United States this technique has been widespread for many years and its adoption in Britain has largely waited until profits came under political fire. The attack on profits has always been based on their absolute size, not on their relation to costs of manufacture and selling prices. Hence the widespread notion that profits alone could absorb increases in wages or reductions in prices.

The accompanying table shows how far this idea differs from the facts. It shows the percentage division of the total revenue of some eighteen companies between cost of materials, wages, other costs, taxation, reserves and dividends. An industrial observer could in many cases give some explanation of the variation between the relative cost of materials and wages to different groups of industry. Mass production, as exemplified by Ford and Vauxhall, requires proportionately lower labour cost than the manufacture of precision tools and instruments, of which Coventry Gauge and Tool is a convenient illustration. Steel production, to judge from John Summers, Colvilles and United Steel, stand intermediately between the two extremes. The similarity in the cost structure of Rugby Portland Cement and British Portland Cement is noteworthy. In most cases, with the particular exception of Doulton, the incidence of taxation is remarkably consistent between 5 and 7½ per cent of total revenue. When excise and materials are separated there is probably little difference in the cost structure of the two breweries in the list.

The column provided for overheads and administration costs is rather a residual item and no attempt should be made to assess a company's efficiency from this—or indeed any other—percentage figure. The table is not an attempt at comparative cost accounting but it approaches more clearly the notions of the classical economists about the division of a product between the three factors of production—land, labour and capital. The table does indeed clearly demonstrate that the rewards of equity capital are the marginal item. The fairly wide variation shown

by the share taken by dividends is explained by many causes, including the relation between capital and turnover.

This factor division is like a "still" in a motion picture; the money absorbed by materials, wages, taxes, savings and all the other items, joins eventually in the main stream of the national income and represents its constituent shares. It would be useful if more industrial companies were to adopt this form of analysis of their total costs, and if some standard procedure could be adopted. Over-much detail is as baffling as the lumping

Company	DIVISION OF TOTAL REVENUE

together of items that have nothing in common. Indeed, the accompanying table has involved some regrouping which a standard division of items would avoid. The chairman of Rolls Razor recently commented on the "practice which is finding some favour to give an analysis showing how the company's turnover is split into its component parts"; he decided against it because the conditions for any two companies even in the same trade are not sufficiently alike. That is a fair point—but it presupposes comparisons between the figures of different companies which should not be made without the most careful study of the facts behind the figures.

Accountants and the Companies Act

The Council of the Institute of Chartered Accountants is to be commended for putting a booklet on the new Companies Act* on sale to the public. The booklet contains recommendations of the Council and joint opinion of counsel on matters of

* The Companies Act, 1947. Institute of Chartered Accountants. 5s.

CANADA

This Bank's services are at the disposal of British business men for the development of two-way trade between Great Britain and Canada.

Enquiries welcomed by:

BANK OF MONTREAL
47 Threadneedle Street, London, E.C.2

Over 500 Branches throughout Canada.

Assets Exceed \$1,800,000,000

Incorporated in Canada in 1817 with Limited Liability.

difficulty for accountants and auditors which may arise under the new Act; it has been devised for the assistance of members of the Institute, but it obviously concerns the whole profession and those outside it—directors, secretaries and investors—who are affected by the new company law.

The new accounting provisions govern all accounts presented in annual general meeting on or after July 1st, notwithstanding that they may be made up to an earlier date. There is no provision in the Act to cover the transition between the old order and the new; any accounts presented from July 1st onwards must conform with the requirements of the new Act, though it will be impossible to follow some of the latter—for example, the valuation of assets on July 1st—in accounts prepared before that date but presented after it. The Council proposes three forms of auditors' report to cover the several types of accounts which may be issued—first, where no group accounts are provided; secondly, where consolidated accounts are provided; and thirdly, where other forms of group accounts are provided. A modification has been secured to the simple division of all assets between "fixed" and "current"; certain assets do not naturally fall into either class (like advances to subsidiaries or a debit balance on profit and loss account); the Council has obtained authorisation from the Board of Trade to state that no objection will be taken to an asset not being described as "fixed" or "current" if to do so would not be a true and fair description, provided that the nature of the asset is clearly stated. This assurance from the Board of Trade may presumably be an administrative anticipation of their statutory power of amendment under Section 120 (1).

The section of the booklet on the valuation of fixed assets is of particular value. The underlying principle in the Act is that fixed assets are to be shown at cost or valuation, less the depreciation provisions which have been accumulated against them. For many companies, however, the separation of such figures may not be possible without unreasonable expense or delay. Hence the statement of fixed asset values may follow one of two methods—the normal method, as defined above, or the "net book amount basis," which the Act permits as an alternative. The Council suggests four different forms of statement for showing fixed assets. It is counsel's opinion, further, that where depreciation has hitherto been provided in one account, without dividing it among the various asset headings, such a division will be necessary in future—a point of some importance for companies which have set up central depreciation funds. An important series of opinions and recommendations on depreciation practice suggests that excess reserves must be shown separately, but that excessive writing-off in the past need not be written back. It is not clear whether in all circumstances additional sums for depreciation intended to cover the replacement of fixed assets at a higher price-level would rank technically as "reserves" or "provisions." The border line between the two classes of account is always difficult to draw, and the restricted definition of the latter word in the Act has caused the Council to amend certain earlier recommendations on the treatment of sums set aside for future income tax, which in future become "reserves."

Building Society Problems

Mr. Andrew Stewart's address from the chair to the annual conference of the Building Societies' Association last week celebrated a record year, measured both by the total resources entrusted with the movement and by its new mortgage lending.

THE "N.P.I." POLICY

not only creates capital out of income, but at a chosen retirement age the fortunate policyholder can apply this capital to provide an income for the rest of his life, without the anxieties of investment. And for fifteen years this income is tax-free.

Please write for the fully descriptive leaflet.

NATIONAL PROVIDENT INSTITUTION
FOR MUTUAL LIFE ASSURANCE

— ESTABLISHED 1835 —

48 Gracechurch Street, London, E.C.3.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2½ per cent free of income tax. Yield worked on 15 per cent basis. (g) Fifteen months to March 31 1947 (yield basis 7·6 per cent.). (h) To latest redemption date. (i) Free of tax.

cent. of a much larger premium income.

The net interest at £427,796 has increased by £40,809, and exceeds the dividend by over £100,000. Including a transfer from the life department of £39,963 the net contribution from the trading departments amounts to £127,963.

The total assets now amount to £44,948,681, an increase of over £3,000,000.

The dividends require £310,532 as last year. The profit and loss carry forward, after transferring £500,000 to general reserve, is £1,135,320.

It has been a year of expansion in all departments, our premium income has increased by over £2,750,000 and we have opened 20 new home branches.

GUARDIAN ASSURANCE COMPANY, LIMITED

ANNUAL GENERAL MEETING,
MAY 31, 1948

EXTRACTS FROM THE DIRECTORS' REPORT

CHAIRMAN: C. D. MEDLEY, ESQ.

LIFE DEPARTMENT

Net sums assured amounted to £3,419,026, being an increase over the previous year of £724,600. There was a profit from mortality during the year.

The net rate of interest earned on the fund was £3 14s. 4d. per cent. per annum.

FIRE DEPARTMENT

The net premium income at £2,220,702 showed an increase of £597,388 over the previous year, overseas business again contributing substantially to the increase. The loss ratio was 43.6 per cent. and the amount transferred to profit and loss £33,231.

ACCIDENT AND GENERAL DEPARTMENTS

The net premium income at £1,728,934, has increased by £457,702. The loss ratio was 49.4 per cent. and the amount transferred to profit and loss, after providing for unexpired risks, £31,897.

MARINE DEPARTMENT

The net premiums amounted to £853,845, an increase of £349,705 over the previous year, and the first year settlements were 27.2 per cent. of the premiums.

After transferring £90,000 to profit and loss the marine fund at the end of the year stood at £981,188, representing 115 per cent. of the premium income.

REDEMPTION ASSURANCES ACCOUNT

A valuation made at the end of the year reveals a surplus of £22,214, of which £10,000 has been transferred to profit and loss. The amount of the fund at the end of the year after making this transfer was £1,330,103.

PROFIT AND LOSS

After providing for all taxation, including that in respect of the profits for the year, and transferring £41,500 to the staff pension fund and £42,000 to the general reserve, and providing for the final dividend recommended by the directors of 2s. (less income tax) on each ordinary share and staff share, the balance of profit carried forward was £204,017.

BALANCE SHEET

A valuation of the Stock Exchange securities was made at December 31st last, and again shows a substantial surplus over the total figures at which they appear in the balance sheet.

ALL THE PRINCIPAL CLASSES OF INSURANCE
TRANSACTIONED; ALSO TRUSTEE AND EXECUTOR
BUSINESS

HEAD OFFICE:

68, King William St., London, E.C.4.

FRIENDS' PROVIDENT AND CENTURY INSURANCE OFFICES

RECORD GROWTH IN ALL DEPARTMENTS

The annual general meeting of the Friends' Provident and Century Life Offices was held, on the 2nd instant, in London. The chairman (Mr Herbert G. Tanner, J.P.) said:—

The year 1947 has, once again, shown record growth in all departments.

In the life department the new sums assured amounted to £7,015,569, an increase of 77 per cent. over the preceding year. We continue to make excellent progress in our group life and pension schemes, and many well-known firms in the United Kingdom and Eire continue to take advantage of the service which this well-equipped section of our life department can offer. Increasing numbers of members are taking advantage of our family income and personal security schemes.

Further very satisfactory progress has been made in the continuous disability department. The new business written made another record.

In the fire department net premiums for our group of companies exceeded £1,382,000, an increase of 30 per cent. on the preceding year. Members will note that our fire department reserve funds now exceed £900,000 representing more than 65 per cent. of the premium income.

The total premium income for our home and foreign accident business is more than £180,000 above the corresponding total for 1946.

The premium income in the marine, aviation and transit account has increased by £190,000 to a total of £706,132, and we are able to transfer £54,487 to profit and loss account.

Our subsidiary company, the Southern Industrial Trust, has again made marked progress and we are able to report a profit of £20,909 as against £8,476 in 1946, in both cases after charging interest.

The consolidated trading accounts show transfers of £64,712 to profit and loss.

INVESTMENTS

With regard to our investments, despite a rise during 1947 in the yield on British Government Securities by about one-half per cent. and some consequent improvement in yield on other securities, the return obtainable on new investments was such that we consider it very satisfactory that the gross rate of interest earned on the Friends' Provident Funds was, at £5 3s. 3d. per cent., very little below the rate of £5 4s. 7d. per cent. for 1946. I might also refer to the fact that the net return after deduction of tax shows an ample margin over the rate which we assume we shall earn when calculating actuarial liabilities.

Included in the balance sheets, however, were railway debentures and stocks, and electricity securities which have since been converted into British Government Guaranteed Stock; the difference will mean only a reduction in yield on our mean funds of 1s. 4d. per cent. gross.

Market values at the end of the year exceeded by a substantial margin, the amount at which these investments stand in our balance sheet.

Under our house purchase schemes we advanced in 1947 £740,000, an increase of £380,000 over the previous year.

The total profits of The Century, including interest and after deducting expenses but not income tax, were £182,860. A dividend of £150,000 has been declared (the same as the previous year) and a balance of £426,048 has been carried forward. The aggregate funds of the Friends' Provident and Century and Associated Companies are now over £28,000,000.

The report was adopted.

THE EVER READY COMPANY (GREAT BRITAIN) LIMITED

PRODUCTION AND SALES RECORD

The forty-sixth annual general meeting of The Ever Ready Company (Great Britain), Limited, was held on the 31st ultimo, at the head office, Hercules Place, Holloway, London, N.7. The following are the comments of the chairman, Mr Magnus Goodfellow, on the report and accounts for the eleven months ended February 29, 1948, which was circulated to stockholders.

The accounts before you are drawn for the eleven months ended on February 29, 1948.

Your board found it necessary to secure a longer period of time for the preparation of accounts, which include stocktaking and accounts of ten mass production factories situated in greater London and the Midlands, depots throughout the country and various subsidiary companies. You will observe that we treat the eleven months of this year as if it was a full year for the purpose of dividends, and that in future our full year will end on the last day of February instead of the last day of March.

INCREASED PROFITS

The eleven months' manufacture and trading resulted in a net profit of £531,370, which compares with a net profit for the year ended March 31, 1947, of £381,968 (to which was added the claim for refund of excess profits tax of £150,000).

This welcome recovery in our business was achieved by an all-time record of production and sales on the home domestic market and on the export markets, and was only made possible by two years' work on the rehabilitation of our plants. After six years of war, when our plants worked incessantly and were maintained with greatly reduced maintenance staffs, this was essential, and we tackled it immediately after the cessation of hostilities. The cost was high as the plant is of a special kind and peculiar to our business. Broadly speaking this work was completed in the autumn of 1947 at a total cost, including buildings, of £1,248,670.

Costs of production again rose during the year and, as a consequence, profit margins contracted. We hope that costs will be more stable during the present year.

No settlement of taxation has yet been accomplished. Apart from purchase tax (which takes a large sum annually from our consumers on the domestic market), the taxes awaiting settlement include national defence contribution, excess profits tax, income tax, and, latterly, profits tax. I am hopeful that a settlement will be come to during the present year and, meanwhile, we have made the necessary provisions in the accounts before you.

INCREASED RESERVES

Turning to the accounts you will observe that reserves and carry forward have risen from £1,525,967 to £1,668,656. The balance of liquid assets over liabilities is lower than last year and is reflected in the expenditure on rehabilitation. Stocks are high, but this is rendered inevitable by the maintenance of the numerous raw material controls.

The report was adopted, and final dividend of 5 per cent. on 200,000 preference stock units of £1 each, making the maximum of 10 per cent. and final dividend of 25 per cent. on 4,041,609 ordinary stock units of 5s. each, making 40 per cent. for the period, were approved. At the subsequent extraordinary general meeting, the special resolution concerning directors' fees was also approved.

DAILY NEWS LIMITED

THE CUT IN NEWSPRINT SUPPLIES

MR L. J. CADBURY'S SPEECH

The annual general meeting of The Daily News, Limited, was held on the 26th ultimo in London.

Mr L. J. Cadbury (chairman of the company), in the course of his speech, said: Gentlemen,—Last year I was able to record the return of competition to the newspaper industry.

Alas! With the growing dollar stringencies of 1947 newsprint supplies were cut and we have returned to a state of stabilised sales. From July last year we have had to keep within a circulation quota of 1,623,000 for the *News Chronicle* and 1,070,000 for the *Star*.

These stationary conditions are not good for our industry. They are bound to affect the recruitment of the young men and women of ability and enterprise on whom the future of the Press depends. If we are to remain efficient we must get back to conditions where incentives are restored and the spirit of vigorous competition and initiative recovered. Otherwise the standard of the profession will be permanently lowered and the best minds will be discouraged from entering a field of activity so limited, and where the rewards are so uncertain.

It is a pity that the impact of short newsprint supplies on the prospects of the journalistic profession has received so little attention from the journalists in the House of Commons. They form a considerable professional body of 38, of whom the great majority are supporters of the Government.

But the shortage of newsprint is not only a matter of domestic importance to the newspapers. It is of the greatest public concern. The British public is definitely becoming an ill-informed public as many instances reveal, and this must be viewed as a major political and social question when we remember our problems at home and our responsibilities abroad.

FUNCTION OF THE PRESS

It is sometimes argued that the Press wastes its newsprint on sport and what some austere critics may call frivolous news. It is true both have their share of the small space available. And why should this not be so? "Humani nil a me alienum puto."

It is a function of the Press to mirror all aspects of life and to entertain all classes of the community as well as provide them with information and instruction.

As a matter of fact it is remarkable how much space is devoted to serious topics and how this varies with the size of papers. This can be illustrated by an examination of papers that was carried out when we were allowed an average of five pages (four and sixes on alternate days) from September, 1946, until July of last year. Between these dates the papers were also on free sale. The items that gained most over these nine months were political and foreign news, as well as the increased advertising area that was necessary to pay for the additional newsprint. In actual figures of measured space for the *News Chronicle*, *Daily Mail* and *Daily Express* (the *Herald* has a different size of column), we found that the space devoted to Parliamentary reports was two and a-half times as great when they had the extra page available.

A FEELING OF FRUSTRATION

Here may I mention one other point—the feeling of frustration that inadequate news space gives to the reporting staff. They are news gathering all the time and yet see little of what they send in appear in the paper. Those of us who have visited our foreign correspondents realise how in particular this applies to overseas staff. I fear that if this situation continues for a long time the news-

papers will gradually allow their overseas corps of correspondents to run down. That, from the public point of view, would be most regrettable, for we should lose the major guarantee against incorrect or biased reporting that is furnished by a number of independent correspondents sending in news. Further, if we are going to let the number of our overseas correspondents be seriously depleted then many varied facets of foreign news will cease to find their way into the Press.

Before making any more comments on the newsprint position, may I say a word about the Newsprint Supply Company?

Since 1940 this co-operative venture on behalf of the national and provincial Press has negotiated contracts, bought, transported, stored and arranged the allocation of our newsprint from overseas, in addition to supervising the task of rationing newsprint to all the newspapers of the country.

A REMARKABLE ACHIEVEMENT

I do not know of any other industry that has shown such a remarkable achievement, and I suggest that many of them now subject to bureaucratic buying by their respective Ministries might with advantage study its operation.

We may be in desperate straits for newsprint, but we should have suffered a great deal more acutely if it had not been for the N.S. Company's efforts, particularly in keeping the needs of the Press and reading public before the Board of Trade and H.M. Treasury.

As much of the work of the company is done in the room immediately adjacent to my own office, I know from practical observation what has been involved in the way of conferences, negotiations, visits, cables and telephone discussions. Those concerned with the practical running of the company and its committees deserve the most sincere thanks from the industry.

Our imports from Canada are subject to British Government control, and under that control the N.S. company has more than once had to repudiate its agreements. Despite this unbusinesslike treatment to which our Canadian friends have been subjected they have done all in their power to help us and adjust their British allocations of newsprint to the various changes British controls have forced upon them.

THE OVERSHADOWING PROBLEM

The securing of its newsprint supplies overshadows every other problem before the British Press. We are operating on a lower percentage of our prewar consumption than the newspapers of any other country in the world, excepting Japan and Hungary. Our papers on their standard basis of four pages are almost the smallest in the world and probably the only newspapers in the world that remain at their lowest wartime size.

The present calamitous position of supplies to the British Press is only partially due to world shortage of newsprint. There is a world shortage, but the disparity between world demand and world supply is not very great—probably of the order of 10 per cent. to 12 per cent.

The reason we get less than one-third of our prewar supply of newsprint, while almost every other country in the world gets a far higher proportion, is the low priority given to this particular import as compared with other necessary imports. The low priority was right in wartime and was accepted by the Press. But the conditions of peace are totally different.

The time has come when the relative priority of newsprint and pulp among Britain's necessary imports should be recon-

sidered, so that the long-term plans for the gradual enlargement of the newspapers and the unfreezing of their sales can be restored. The question of a re-arrangement of priorities is entirely in the hands of the Government.

It is sometimes suggested that the newsprint shortage is deliberately designed to oppress the Opposition and prevent them from putting their case to the country. This theory, however, ignores the fact that the newspapers of the Left suffer equally with the newspapers of the Right.

INTEMPERATE ATTACKS

But one is certainly not reassured about the readiness of the Government to play fair with the Press when one reads such intemperate attacks as those made recently by Mr Aneurin Bevan or the sweeping allegations of inaccuracy, made by Mr G. S. Lindgren. One begins to wonder if the attitude of some members of the Government to the Press is not that represented by the old couplet:—

"Thou shalt not kill, but need'st not strive
Officiously to keep alive."

I was glad to note that the president of the Institute of Journalists replied to Mr Bevan in a letter to *The Times*. He pointed out that it must have a damaging effect on our reputation abroad for a Cabinet Minister to say we had "the most prostituted Press in the world." Also that it is hardly fitting to make such an accusation when the Royal Commission is sitting.

By way of contrast to these exhibitions of hostility it is encouraging when important persons voice their appreciation of British newspapers and journalists. Mr McNeil, for example, told the World Conference on Freedom of Information at Geneva that "there may be imperfections in the British Press, but it is as free and vigorous as any other Press represented at this conference." I have had the honour this year to be chairman of the Newspaper Press Fund and presided at their annual dinner a short time ago. Our principal guest was Mr Justice Birkett. In the course of his remarks he said "I cannot but deplore that a great instrument like the Press, of such immense value not merely in our national but in our international affairs, should be hampered because they lack the space to report those matters which it is so vitally important should be known."

In the House of Commons debate that has just taken place the President of the Board of Trade adopted an attitude on the newspaper situation that appears to modify the severity of the recent letter from Sir Stafford Cripps. Mr Wilson now holds out hopes that there will be no further cuts in paper supplies; there is even a faint hope that we may get back to occasional 6-page papers sometime during 1949.

If supplies of paper are to be secure, the Government will have to recognise that Canadian newsprint has a permanent and integral part in the British supply system. For security reasons and for reasons of Empire policy we must have long-term Canadian contracts for paper, and they must be kept.

The hope of some improvement which Mr Wilson holds out is welcome, but we would like something more specific. What is needed as a minimum is the allotment of £3,000,000 worth of dollars for the priority purchase of Canadian paper. Out of the hundreds of millions that we spend in the dollar area, this is surely not too much to pay for ensuring the future of the British Press.

THE ROYAL COMMISSION

During 1947 the Royal Commission on the Press began its hearings and is now nearing the end of its list of witnesses.

Those who have read the evidence so far given to the Commission will have found it very enlightening. The inquiry should result in many misconceptions concerning the Press, its proprietors and how it functions, being removed.

The report and accounts were unanimously adopted.

H. P. SAUCE, LIMITED

FINANCIAL STABILITY OF THE GROUP

The twenty-third annual general meeting of H.P. Sauce, Limited, was held at the Queen's Hotel, Birmingham, on the 27th ultimo. Sir Patrick Hannen, M.P., the chairman, in the course of his speech said:

The facts set forth in the consolidated balance sheet indicate an eminently satisfactory situation from the shareholders' point of view. The fixed assets have been valued on a rigidly conservative basis and are shown at cost less depreciation. Investments and current assets less current liabilities and provisions amount to £1,536,827. In the consolidated account the total interests of the shareholders, including paid up capital of £911,427, are shown at £2,219,520. These figures will be regarded, I am confident, as a wholesome and stimulating indication of the financial stability of our group of companies.

YEAR'S RESULTS

The total trading profit and other income of the group amounts to £562,165. After deducting United Kingdom, Dominion and Foreign Taxation at £281,632, directors' fees, depreciation, etc., and including £40,000 income tax recoverable in respect of prior years under conventions for the avoidance of double taxation, the net profits of the group amount to £268,365. Of this figure £48,553 is attributable to outside shareholdings of the two subsidiary companies, the shares of which are not wholly owned; and of which £60,882, representing excess of net profits of subsidiary companies over dividends declared, have been retained in the accounts of the subsidiary companies. The net profit of £158,930, brought into the accounts of the parent company, is £10,300 less than for 1946. The profit appropriation statement for the year 1947 is self-explanatory and the recommended appropriations of £15,000 to reserve for re-equipment and development, and £107,484 to final dividend, leave a balance of £107,119 to be carried forward to next year.

The substantial premiums for the maintenance of comprehensive staff and works pension schemes have been charged against trading profit. It is anticipated that in future years the financial obligation involved will be met partly from revenue and partly from reserves accumulated consequent upon appropriations made in previous years. Allocations in subsequent years from profits available for dividend and reserve are therefore not contemplated.

The acquisition of Macks Limited, Walsall, and Fletchers Sauce Company Limited, Selby, has been attended with favourable results, and business activities of all subsidiaries are very satisfactory, subject only to limitations of supply of raw material. Lea and Perrins Inc., in the U.S.A., retains its high standard of prestige. Our Australian company makes steady progress.

SUBSTANTIAL INCREASE IN EXPORTS

I think it desirable to emphasise the fact that the last year was in every branch of enterprise a difficult and embarrassing time. Business expansion in the presence of restrictions is an acute commercial problem, but I am proud to report a substantial increase in the export, largely to dollar markets, of the products of both the parent company and Lea and Perrins, Limited, notwithstanding exchange difficulties and import regulations.

The accounts as presented indicate that we have been in accord with proposals submitted by His Majesty's Government for the reduction or stabilisation of dividends, and are therefore recommending a total distribution of 2s. per unit, less tax, corresponding with a total distribution last year of 1s. 9d. less tax, plus 3d. tax free.

The report and accounts were adopted unanimously.

LANCASHIRE STEEL CORPORATION, LIMITED

NATIONALISATION THREAT

The eighteenth ordinary general meeting of The Lancashire Steel Corporation, Limited, was held at Warrington on the 31st ultimo.

Mr John E. James, chairman and managing director, in the course of his speech, said: The earnings from operations for the year 1947, which included the earnings of the subsidiary companies, Rylands Brothers, Limited; Whitecross Company, Limited; and the Pearson and Knowles Engineering Company, Limited, amounted to £1,562,468, from which fell to be deducted income tax thereon of £515,000, together with £180,000 to cover the full liability for profits tax. The net earnings, therefore, amounted to £867,468. The accounts for the previous period were for fourteen months, and the net earnings amounted to £960,486, representing, if brought to a yearly basis, £823,274. Your board recommends payment of a dividend at the rate of 5½ per cent. per annum on the second preference stock and 8 per cent. per annum on the "A" and "B" ordinary stocks.

The sum falling to be paid to the Inland Revenue in respect of income tax and profits tax amounts to £695,000, representing 55½ per cent. of these earnings. The stockholders, on the other hand, receive as dividends, after deduction of income tax, £214,992, or 17½ per cent. of these earnings.

The general reserve now stands at £1,150,000, the reserve for possible losses due to reduction of output or present prices of trading stocks at £500,000, the reserve for increased cost of plant and buildings at £500,000, while that for depreciation of fixed assets amounts to £3,000,000. The excess of current assets over current liabilities and provisions amounts to £3,715,873.

DEVELOPMENT AND RECONSTRUCTION

We have been proceeding with the schemes of development and reconstruction to which I referred at our last meeting, although, owing to the increased difficulties experienced in obtaining the necessary workpeople, materials, machinery and plant, our progress has not been as rapid as I could have wished.

The corporation has produced its full share of the larger tonnage of steel produced throughout the industry during the past six months, and in that respect the introduction of the continuous working week in our Open Hearth plant has been of great assistance. I would like to pay tribute to the efforts of the management and operatives, which have resulted in the higher outputs obtained.

The threat of nationalisation of our great and vital industry still hangs over our heads, with all the inevitable disruption it would involve, whatever method of change of ownership might be contemplated. None of the many serious objections to the nationalisation of the industry has been answered in a manner calculated to relieve the apprehensions of those who have an intimate knowledge of the industry's manufacturing processes, and I cannot help feeling that this period of crisis in the economic affairs of our country is surely not the time to carry out a dangerous experiment of that kind. I am proud in the knowledge that this complicated and intricate industry, in which all my life has been spent, has not departed from its national duty to proceed with the work of repairing the ravages of years of war on its machinery and equipment, and, in addition, to go forward with extensive agreed plans to improve its efficiency. The industry has done all these things, knowing full well that unless iron and steel production runs at its highest level and is obtained at competitive world prices this country cannot hope to maintain and improve its present standard of living.

The report was adopted.

AUTOMATIC TELEPHONE AND ELECTRIC COMPANY, LIMITED

EXPANSION OF PROFIT

The twenty-eighth ordinary general meeting of this Company will be held at Liverpool on the 24th instant.

The following is an extract from the statement by the chairman, Sir Alexander Roger, K.C.I.E., circulated with the report for the year 1947:—

The trading profit and other income total £843,222, against £456,942 in 1946. This considerable rise is partly due to expansion of factory activity and partly to price adjustments, some of which still remain provisional. At the end of the year orders in hand represented a peak in the company's history, although our principal customer, the Post Office, has reduced its orders to a minimum.

It is gratifying to report that at January 1, 1948, orders from overseas represented slightly more than half the value of our total orders in hand. It is encouraging to know that the Government, with the support of the trade unions, has taken steps to stabilise costs and thus attract export customers who want reasonable price protection if their orders are to come to England. Despite Government exhortations, people do not yet realise the desperate straits to which the country has been and is being reduced. I find much lack of understanding and a complete failure to recognise the extent to which redoubled effort is needed.

Efficiency of industry in this country is not being helped by the severe curtailment in capital expenditure, particularly at a time when war-time arrears need to be overtaken. I feel that we are only putting off the evil day when we shall have to face the tremendous expenditure which will be required if we are to retain our place as an industrial and exporting nation.

MORRIS MOTORS, LIMITED

DEVELOPMENT OF OVERSEAS TRADE

The twenty-second annual general meeting of Morris Motors, Limited, was held on the 28th ultimo at Oxford, the Viscount Nuffield, G.B.E., F.R.S., M.A., D.C.L., L.D. (the chairman), presiding.

The following is an extract from his circulated statement:—

Since last autumn the vital importance of export has rightly been stressed to the utmost. There are, however, certain outstanding facts regarding our own activities to which I feel the attention of stockholders should be drawn. On January 1st last we announced large reductions in our export prices. These reductions involve a sacrifice of profit which is likely to amount to a million pounds in a full year. I am glad to report that our intake of export orders during the current year has proved this policy to be abundantly justified. Deliveries for the first three months of 1948 have shown an increase of 8,000 units over the corresponding period for 1947, and we are now shipping a steady average of over 1,000 vehicles per week.

The starvation of the home market is regretted by no one more keenly than ourselves. The goodwill of our legion of regular customers, which has been fostered for more than a quarter of a century, is a possession that we treasure indeed, and we deplore the present impossibility of satisfying more than a trifling proportion of their needs.

Within a few months we shall begin the progressive release of a comprehensive range of new models. These include a diesel commercial vehicle. Another addition to our range is the Nuffield Universal Tractor, which will be marketed in the near future. It is apparent that early deliveries will be on a modest scale until increased steel allocations are made available to us.

The report was adopted.

GOVERNMENT RETURNS

For the week ended May 29, 1948, total ordinary revenue was £68,013,000, against ordinary expenditure of £43,248,000 and issues to sinking funds £40,000. Thus, including sinking fund allocations of £1,414,000 the surplus accrued since April 1st is £172,196,483 against £233,366,052 for the corresponding period a year ago.

On May 28th applications for bills to be paid on Monday, Tuesday, Wednesday, Thursday and Friday were accepted as to about 50 per cent. of the amount applied for at £99 17s. 5d. and applications at £99 17s. 6d. and above were accepted in full. £170 million (maximum) of Treasury Bills are being offered for June 4th. For the week ended June 5th the Banks will be asked for Treasury deposits to the amount of £70 million (maximum).

lose labour were building, clothing and local government service. They were to lose 18,800 workers a month throughout the year; in the first three months they actually gained 800 a month. Three of the biggest labour-gainers (coal, agriculture and textiles) were to gain 16,400 a month; they have actually only gained 8,600 a month.

Another major object of the disinflationary policy is to restore to the British people some sense of the value of money. The slogan of policy during, and for two years after, the war was "Production at All Costs." As a result, the level of production is high, but it is nothing like as high as the level of costs. A prompt and drastic reduction in the present unconscionably swollen level of costs of production is an absolutely essential condition of economic balance at home and of solvency abroad. The level of weekly wage-rates, according to the official index, is now about 75 per cent above the prewar figure; and that is bad enough, in all conscience. But the index of the prices of British manufactured exports—the most realistic test of selling price levels—is about 148 per cent above the prewar level, and is still rising month by month. Some part of this can be excused by the even more monstrous prices of imported raw materials—but not all of it by any means. If only as the means of maintaining the vital volume of exports, costs of production must be got down. This need not mean any reduction in the level of weekly wages; it will be enough if the average rise in total costs of production can be pulled down to the average rise in weekly wages. But it does mean that fair value will have to be given for the weekly wage. Every industrialist—and every trade union leader—knows why there is this yawning gap between the 75 per cent and the 148 per cent. It is because hours have been shortened without any corresponding reduction in the weekly wage. It is because there is too much slacking during the week and working at overtime rates at other times. It is because there is still too much hoarding of manpower. It is because, under the pressure of relentless demand, every profit margin all the way along the chain of transactions from first material to final use is still swollen, because discounts are suspended and premiums regularly exacted. It is because the unproductive overhead staffs of industry have swollen and there has not yet been any strong pressure to reduce them. It is, in short, because both Capital and Labour have been doing themselves proud.

*

Here, then are two practical tests of the effectiveness of the disinflationary policy, which can be regularly followed in the *Monthly Digest of Statistics*. When the manpower targets are being met, and when the index number of the price of manufactured exports begins to fall, the policy will be beginning to have the effect that was intended. There are signs of things happening that may before long lead to such results. But the policy is still in its earliest infancy and if it was the right policy in the first place, it would be folly to reverse it now. It is true that, as it develops, the policy will have some painful effects. Some profits will be reduced and some jobs will disappear. In themselves, these things are to be deplored. But the whole reason for the disinflationary policy is that the painless method of restoring balance and sanity by moral exhortation had failed to produce any result at all, and that if the British economy was not to become a shapeless anarchy, some compulsive pressure—the pressure of falling total demand—would have to be exerted upon it. Democracy is a system of government that will never work unless the public is prepared to accept a measure of self-discipline. There never has been a clearer case, in the general interest, for an economic policy than there was for disinflation last year and this. Almost alone of the countries of the world, public opinion in Great Britain both saw the necessity and took steps to provide for it. But the pride that one can legitimately feel in this would evaporate if

the policy were to be abandoned as soon as it began to tread on a few corns.

Continued self-restraint at home is the more necessary because abroad the economic horizon continues to darken. There was a moment in February when it seemed that the world market might at last be on the turn. But that hope was disappointed and all over the world the prices that Britain has to pay for its purchases are once again steadily rising. Some day the tide will assuredly turn, and there is something in the very frenzy of the recent price increases that suggests the beginning of the end. But for the moment the terms of trade are still swinging sharply against Britain. So far from Marshall dollars providing any relaxation from the stringencies of the position, it is the prospect of receiving them that alone holds out any hope at all of working through the next twelve months without disaster. Even with Marshall dollars, further painful cuts in British imports—and that now means cuts in the British standard of living—will be necessary very soon. Without Marshall dollars, the cuts would have to be cataclysmic. The position is bad enough with ERP; without it, the outlook would be hopeless. Yet even Marshall dollars, as last week's vote in the House of Representatives showed, cannot yet be relied upon.

Mr Taber is quite sure that the appalling position in which Britain finds itself is Britain's own fault. There have, indeed, been mistakes in British policy, which have been pointed out by British writers far more promptly and with much more knowledge of the facts than Mr Taber has displayed. But if Britain's present shortage of dollars is mainly due to mistakes in British policy, then it is a most singular coincidence that every other Government in the world, Socialist, Liberal or Conservative—save only the Government of the United States itself, which can create its dollars—has apparently made exactly the same mistakes. Moreover, for a full year past the whole energies of the British Government have been directed towards increasing the country's dollar earnings and reducing its dollar spendings. It is quite safe to say that Mr Taber, who does not believe in controls, could not have accomplished one tenth part as much, if he had been in charge. Indeed, the claim can be made that no other democratic country could have achieved as much.

Nevertheless, it behoves every Englishman to ask himself whether there is anything more that can be done in this island to help close the gap in the balance of payments and reduce the present dangerous degree of dependence on Mr Taber's intelligence and goodwill. In the long run, there are plenty of things that can and must be done—most of them coming under the head of a sustained effort by British industry to sell the world goods and services of the highest quality at the lowest prices. But to have virtue for the present extremity, any device must produce its effects in a month or two. The only one that has been suggested is a devaluation of the pound, and there would certainly be no prejudice against that in this country if it would do the trick. But among those who are competent, by possession of all the relevant facts, to form a judgment upon its effects, the conclusion has been reached—almost unanimously in London and, it is believed, by a clear majority in Washington—that, in present circumstances, it would do more harm than good. Apart from this, it is very difficult to think of any further acts of policy that could be taken to correct the position. Something more will indeed have to be done if the drain on the last reserves continues, and much more will have to be done if they are exhausted. But these will not be acts of policy, they will be acts of desperation. Any further cuts in British imports will either reduce the standard of nutrition below what is necessary permanently to maintain the health of the people or else they will deprive British industry of the raw materials it needs to keep active. They may become necessary, but they will hinder rather than help the aim of restoring the British economy to solvency and self-support.

France and Germany

THE terms of the agreement reached between the United States, Britain, France and the Benelux countries on the next stage in Germany have now been published. The essence of the proposals is that Western Germany shall receive most of the attributes of statehood—as the Piedmont of a future free and united Germany—and that in return economic and strategic safeguards shall be granted to its Western neighbours. The emphasis in the Agreement is on the federal structure of the new Germany. It is as states that the Western German community will prepare for a Constituent Assembly, and the Constitution which this Assembly is to prepare, and if possible present to the German people in the Spring of 1949, is to be federal in form so that the "states" in Soviet-occupied Germany can later adhere to it.

Once the new federal constitution is at work Allied control will be reduced to a minimum, and it is this prospect which naturally raises the question of safeguards for those who have suffered in the past from German aggression. The economic safeguard proposed is an International Authority to control the allocation of coal, coke and steel from the Ruhr. Britain, France, the United States and the Benelux Union will each have three votes but for the time being—surely an unnecessary and wounding precaution—the German votes will be exercised by the Allied Military Governors. The military safeguards are twofold. In the first place, no Allied troops will be withdrawn without prior consultation and they will be maintained until "peace is secured"; then, when this happy epoch is felt to have opened, concerted measures for the continued control of demilitarisation in Germany will be worked out.

This agreement appears to represent a very real advance in understanding among the Allies on Germany's future. The Benelux countries are fully associated with the proposals. The French have persuaded the other Powers to go along with them in plans for a measure of internationalisation in the Ruhr. In return, it looks as though the French Zone may be fully associated with the plans for transferring political responsibility to the German people. Above all, specific American commitments on safeguards against future German aggression have been included in an international document. All this seems progress enough. Unhappily, however, these hopeful signs are contradicted by the reactions to the Agreement in Paris. Even if it can scrape through the Assembly, there is little doubt that ratification will be sullen and unwilling.

This unfortunate reaction springs from the deep rooted fear of Germany which haunts the back of every French mind. But the fear might be a less active factor in politics if it were not so disastrously caught up in France's internal divisions. The

Communists see in the average Frenchman's instinctive fear of Germany a priceless weapon in the fight to destroy the Marshall Plan and weaken Western association. Every device of propaganda is being used to suggest that America is only interested in a strong capitalist Germany and that the Agreement is the first step towards it. Thus M. Bidault, so the argument runs, has simply capitulated to American capital and the German "trusts." But General de Gaulle, whose total lack of a concrete programme compels him to rely on emotion and *mystique*, cannot leave the strongest emotion of all—fear—as the monopoly of the Communists. He has chosen the moment of the Government's great embarrassment to launch a virulent attack upon the agreement. The extent to which General de Gaulle's attack was demagogic and designed to serve his overriding aim—his return to power—is shown by the fact that the proposals which he put forward as an alternative are almost precisely those which the agreement in fact secures. He asked for "separate federated states," international control of the Ruhr and the "division of German coal among those who need it." The Six Power agreement in fact represents the first step to all these.

Tragic as this exploitation of French fears may be, the fears themselves cannot be exorcised with a simple dismissal. Invaded three times in seventy years, the French cannot slough off their apprehension because it is internationally inconvenient. In a word, French fears run deep; they are natural, and indeed inevitable. The question is therefore not how to dismiss them but how best to appease them by a workable German settlement.

*

There are only three possible frameworks for a German policy—the continuation of occupation with Allied political control, the integration of a German state into Western Europe or the absorption of Germany into the Soviet system. The first of these possibilities has an undoubted attraction for France. A Carthaginian peace imposed for generations by the victors is the only really emotionally satisfying solution for a nation as exposed and distrustful as are the French. But clearly such a policy is ruled out. The Allies have already abandoned direct military government. They cannot return to it now. In any case, the will to maintain a long drawn-out occupation will certainly disappear. Germany will become again a normal sovereign state, either under Western or Eastern auspices. The real issue before France is to decide which of these two alternatives offers the lesser risk.

The criticisms the French can make of the "Western policy"

It costs less

whose foundations are now being laid are obvious enough. Industrial power is being recreated on German soil. Frankfurt is the embryo of a central government. The chief guarantee of future security—American participation—depends upon the staying power of a nation whose past record is one of withdrawal and isolation. All this must be admitted. Yet it would be grossly unjust to the Six Power agreement—and to the developments in Western Europe in the last year—to neglect the more hopeful features of Western policy.

There is a risk in reviving German industry, but the new agreement gives France a specific voice in the use of its products, and the wider plan of European Recovery gives great scope for methods of integrating German heavy industry more closely with that of Western Europe, provided the French and the Benelux countries—and indeed Great Britain—do not hold back from schemes of internationalisation which would touch their own national industries. There is a risk of the over-centralisation of German political power, but the constitutional safeguard of the federal form is being built into the foundations of the new Germany. There is, last of all, a risk of American withdrawal; but the more speedily and definitely an agreed policy for Germany can be set in motion, and the more obviously that policy is geared into a wider Western European grouping, the more the Americans will feel committed to a venture they have done so much to launch.

These risks were frankly discussed in London and no partisan misrepresentation from Paris should be allowed to suggest that France has not played a dominant, even a decisive part in the recent negotiations. Those Frenchmen who constantly complain that France is misused by its "powerful allies" do their country no service. On the contrary they suggest to the outside world a temperamental and hysterical Marianne quite at variance with the patience and quiet tenacity consistently shown by M. Bidault and the Quai d'Orsay.

The real question is, however, the alternative. Even if the integration of Germany into Western Europe is a

hazardous business, can the French believe that the passing of Germany under Russian control will free them of the nightmare of German domination? A moment's reflection is enough to show that no policy will so quickly ensure German domination of France as the integration of a Communist Germany in the Soviet system. It is the Russians and their Communist supporters who are the keenest advocates of a unified, centralised, German Reich, as is shown in an article elsewhere in this issue (p. 973). Can any Frenchman wish to see the new Germany built up round a Prussian nucleus directed from Berlin?

*

Nor is the other line of argument, which General de Gaulle has made his own, any more convincing. It is simply not true that the building up of Frankfurt as a centre of genuine authority will lead the Russians to compete more violently for the allegiance of the Western Germans. That competition began long ago. If the West followed de Gaulle in seeking to impose a solution based on "separate German states," the Russians would press with even more success for their own version of a centralised Reich. There is one way and one way only of securing German adherence to the Western world and at the same time, of safeguarding that world against German domination. It is to press forward with the creation of a genuine Western European community within which Germany can without risk be included as an equal member. The new agreements are France's opportunity. If they are received in distrust and division, their growing points will be crushed, their development retarded and the chance of securing America's permanent support diminished. But, accepted boldly and made the starting point of a constructive co-operative Western European programme, the unity formed by the Brussels Pact, the Marshall Plan and the agreement on Germany offers France the chance of genuine leadership in Western Europe.

Above the Law

LATE last week the public was offered a relief from the usual homely fare of Parliamentary discussion. The proposal to abolish the death penalty had already excited far more popular interest than its intrinsic importance warranted. But nobody was expecting to have the sinister shadow of James II and Judge Jeffreys cast across the debate. Lord Goddard, the Lord Chief Justice, in the midst of an otherwise stale debate in the Lords, accused the Home Secretary of exercising the suspensory power of the Royal prerogative, whose use without the consent of both Houses had been expressly forbidden by the Bill of Rights of 1688.

On April 16th, after the House of Commons had voted by a narrow margin for the trial abolition of the death penalty, Mr Chuter Ede, the Home Secretary, announced that pending the passage of the Bill into law he would advise the King to commute any death sentences passed by the courts to penal servitude for life. In so doing it would appear that he was using the Royal prerogative to suspend the operation of a statute whereas if he had merely, without formal announcement, exercised the prerogative of mercy in each individual case, he would have been within his constitutional rights. The essential difference is between the commutation of a number of individual penalties after each case has been heard and sentence passed, and the general announcement that, even before the crime has been committed, the law will not be allowed to take its course. The Home Secretary can, however, hardly be blamed

for wishing to make his course of action plain in rather embarrassing circumstances; his action is, in any case, not a heinous crime, and the indignation of the Conservatives in the Commons (who did not realise that the Constitution was in danger until the Lord Chief Justice said so) is more than a little synthetic. If any Minister is to be blamed, it is surely the Lord Chancellor, the anomaly of whose position in the Cabinet is only justified by the fact that he is supposed to be the link between executive and judiciary, and the guardian of the Constitution.

Nevertheless, the incident will have served a useful purpose if it once more directs the attention of the public to the limitations that should wisely be set to the power of the Executive to do as it likes. It is seldom that constitutional questions have the spotlight turned upon them, and it is easy for the average citizen, forgetting about the Constitution for years at a time, to believe that it is a static framework which has been erected for the permanent admiration of mankind. Because it is not codified into a single instrument, but is embodied in countless statutes, legal judgments, and customs, it is exceedingly hard to perceive the alterations which are constantly taking place. Moreover the English are "a very quiet people" and the confidence they place in the integrity of those who frame and administer the laws is without parallel in any other democracy. Deep inroads can be made upon the fundamental principles of personal security and liberty of which the mass of the people only become aware after they have begun to take effect. Students

may be still taught to accept Dicey's panegyric of the rule of law even while it is being continuously attenuated.

The British Constitution never possessed, as Montesquieu thought it did, a proper system of checks and balances. For the best part of three hundred years, the Executive has been gaining ground over both legislature and judiciary, and though the people have, from time to time, rebelled against some particular wielder of executive power, or the expedients he has used, they have, in general, acquiesced in the trend of events. The executive's power to say what the law should be has grown step by step with the people's power to say who should constitute the executive. In this way, Parliament has become an electoral college, a sounding board for grievances and a ministerial training ground rather than a legislature. At most, it is today a law-appraising body, in no real sense a law-making body. The unfettered sovereignty of the Cabinet has almost become, in the phrase that Hobbes used of the Crown "as great as men can possibly make it."

Nevertheless, it is right that there should be limits on what the Cabinet can do, and it is even more right that there should be severe limits on what it can do without stating its case and explaining its actions. The aspect of this whole subject that has been most in the public eye in recent decades has been the great extension of delegated legislation, the habit of Ministers giving themselves *carte blanche* to frame by means of Orders the actual laws they are to administer. This is, by now, an old argument and one which most people now realise cannot be solved by extremist solutions. It is obvious, on the one hand, that the state could not get on without delegated legislation, and on the other hand, there are a number of signs that Parliament is feeling its way towards a technique of bringing under discussion those examples of delegated legislation that most require it.

*

But there is another aspect of the powers of the Executive that has not yet received more than a very small part of the attention it deserves. This is the tendency of Ministers, not merely to write the laws, but to write them in such a way that they are themselves placed above the law. Moreover, although by legal convention it is Ministers who issue the Orders and administer the law, it is, in fact, civil servants who do both. In the old days it was the pride of the English to look down upon the French notion of *droit administratif*, which placed the official above the law. It was regarded as one of the foundations of liberty that the servant of the Crown, from the Lord Chancellor down to the village constable, had exactly the same position in the eyes of the law as the meanest citizen.

In criminal matters, that is still the case. The police are not allowed in this country to break the law in the course of enforcing it. No Chief Constable can disregard traffic lights or keep an unlicensed dog. But in the great extension of economic law-making, the civil servant is now regularly, and almost as a matter of course, put above the law. He does not have to secure the same licences and permits for his activities as plague the private entrepreneur. It is taken for granted that everything he does is *ipso facto* in the public interest and more necessary than anything that a private person may want to do.

A few recent examples of this habit of mind will make clear how far it has gone. The Economic Information Unit of the Treasury has decided to issue a magazine to convey news about production to factory managers. No doubt it is an excellent idea; no doubt it will do something that the hundreds of existing technical journals do not do. But the point is that the Economic Information Unit does not have to submit to any disinterested assessment of the merits of its idea. Figures published last week show that four government departments are now each consuming a greater quantity of paper than

is allotted to *The Times*. This may, conceivably, be a right allocation of resources. But it is safe to wager that no impartial body has ever decided the matter. It has simply been assumed that Government departments must have all the paper that, "with due regard for economy," they say they need, and the public must share what is left. In effect, this is to assume that the least important Government circular or buff form is more important than the most important unofficial publication. The recent case of the Coal Board's unnecessary purchase of belting from the United States—at a cost sufficient to buy a great deal of newsprint—suggests that the same doctrine is spreading to the new Boards. No doubt there was some scrutiny of the Board's application for dollars; but it was obviously nothing like the scrutiny to which the private applicant has to submit. Or again, the Monopoly Bill that is now before Parliament creates machinery for the most rigorous investigation of the actions of alleged monopolists. But no part of it is to apply either to the acts of Ministers or even to statutory corporations. In all these instances, the Government is putting itself above the law that others have to obey.

*

The new doctrine can be seen at its most arrogant in the powers that Government Departments have given themselves to acquire land. If they want any land, for themselves or their satellites, they take it, with little or no respect for the Town and Country Planning Acts. The utmost protection that the private owner has is the right to an inquiry, which means that an official decides between the claims of the citizen and of a brother official, the Minister in any case reserving to himself the right of decision. Over an increasing range of subjects, Ministers are acquiring powers to tamper with the rights and property of private citizens without any provision for impartial appeal. Naboth's vineyard has almost become a British legal precedent.

A large part of this is due to the war. War reverses the traditional position of the subject at law, and presumes in favour of the Executive. "A war could not be carried on according to the principles of Magna Carta" said Lord Justice Scrutton. What has now to be determined is whether the principles of British justice are to be set upon a permanent wartime footing; or whether a *modus operandi* can be found which will introduce a greater element of equity into the relations of the citizen with the State. As with delegated legislation, it would be foolish to advocate a root and branch solution. The Government, in a modern community, must have some powers that are not open to the private citizen. The problem is not to stop the exercise of those powers, but to see that they are executed with justice and to stop Government departments from being judges in their own cases. A solution might be found in an adaptation of the jury system. If a Government Department wants to use paper, or other scarce resources, let it convince twelve good men and true that its purpose is at least as essential as other applicants'. When there is an outcry over Government requisitioning of land, let the case be referred to an independent, unofficial, impartial tribunal, and let its decision be final. Indeed, is there any sufficient reason why inquiries, wherever they are prescribed by law, should not always be impartial? What, after all, is the point of them if they are not?

It is hopeless to expect that Ministers, once they are in office and working in their departments, will ever move in the direction of reforming these abuses, and if Ministers will not move, Parliament cannot. The way in which reform can be brought about is for the Opposition, while out of office, to pledge themselves to strike this blow for liberty, and then to insist on redeeming their promise once they are in. The Conservative Party, in their new Liberal mantle, and Mr Churchill in particular, ought to feel a special sympathy for such a libertarian project. Will they take a practical step to set the people free?

Latin-American Scene

THE twenty Latin-American states which attended the Bogotá Conference in March learnt some unpleasant facts there. Since then they have come to realise, first, that their aims as now conceived seem to conflict at almost every point with European interests and, secondly, that the United States gives priority to Europe. They had spent an active winter testing how far the machinery of pan-American collaboration could be used to further the ambitions of the individual States. Chile and Argentina, emboldened by the inclusion in the pan-American sphere at the Rio Conference of the territories they covet, had intensified their annual activities in the Antarctic. Guatemala laid claim to British Honduras. Their fellow republics, Brazil being an outspoken exception, on the whole supported their claims—but not the United States. Propaganda for an ambitious scheme for a Pan-American Bank, for which the United States was to provide \$5,000 million, ran a similar course. Anti-Communist campaigns in the individual states—a sure dollar-earner, to judge from Europe's experience—were intensified. All this, and the apparently generous mood of Congress, had kept high the hope that, when the economic and financial matters left over from the Rio Conference in October came up for decision at Bogotá, a Marshall Plan for Latin America might appear.

Yet Mr Truman himself had given clear notice at Rio that United States resources were not limitless and that Europe had first claim on them. In the circumstances it seems surprising that the Latin-American recoil from the United States refusal to make available the large credits they had hoped for should have been so strong. Indeed, this refusal has been interpreted as a serious setback to the work of inter-American co-operation. It is not unnatural that the Latin-American delegates should be chagrined at the diminution of their ambitious claims. There was an attempt to make the riots which interrupted their work at Bogotá serve as a reminder of how fruitful a field for agitation is provided by the discontented poor who comprise a large section of the Latin-American peoples. It was represented to the United States delegation that mere repression could not solve the Communist problem; that the poverty in which it is rooted could be cured only by the fuller exploitation of all the resources of the Latin-American countries—of course with US aid.

In so far as such developments require a large amount of foreign capital—which in present circumstances means dollars—Mr Marshall's announcement that \$500 million would be made available by the United States Government for loans to Latin America through the Export-Import Bank was a bitter disappointment. To some extent it has been offset by the fact that the World Bank has set aside \$1,600 million for Latin-American projects, and made its first loan—\$16 million to Chile—in March. The total demand, however, is estimated at about \$10,000 million and the Latin-American countries' own holdings of dollars—even if it be supposed that these reserves could be used for financing long term capital projects—amount to no more than some \$4,000 million. Official loans clearly will not suffice for all needs.

What then are the prospects for private loans? The Bogotá delegates heard Mr McCloy, head of the World Bank, announce that it was to private lenders that their countries must look for most of their foreign capital. And one of their last acts was to sign an agreement giving foreign investors fairer treatment and fuller facilities than hitherto, and safeguarding their rights in certain important respects. There are few signs that private investors in the United States are even nibbling at the

bait. Equally, there are few signs that the Latin-American countries are in fact modifying the practices which keep foreign capital away. For example, the recently proposed terms on which Brazilian oil, if found, may be worked by foreign companies are hardly conducive to that industry's rapid expansion; and even these proposals may conflict too strongly with nationalist feeling to be practicable. In any event, in Brazil, as elsewhere, the foreign investor is hampered by the provisions of the national constitutions. Similarly, Argentina's present attempts to extort further dollar credits by means such as banning dollar payments for United States imports (the implications being that they will be resumed when the Argentine till is replenished by a loan) or stopping imports from Switzerland until the Swiss agree to supply more dollars, will not increase confidence on the international capital market.

Such attitudes and policies, however well grounded they may be in nationalist ideology, ignore the triangular nature of so much of Latin America's normal trade: exports to Europe, European payments converted to dollars, dollars spent on imports from the United States. The condition for restoring this pattern is that the European countries should recover sufficiently to be able to permit at least a partial conversion of their payments into dollars. This is why, as Mr Truman and Mr Marshall have proclaimed, it is very much in the interest of Latin America that the European Recovery Programme should have enough priority to ensure its success. And the programme itself provides for purchases from countries outside the United States to an extent which should bring about \$700 million to Latin America.

On a longer and more realistic view it would therefore seem that the set-back suffered at Bogotá by Latin-American hopes of Pan-American co-operation is less serious than first reactions indicated. Nor is finance the only nexus between the United States and the Latin-American republics. In promoting that collaboration by the creation of the Organisation of the American States (a new regional organisation within the framework of Uno), and in easing lesser strains among its members by signing the Pact of Bogotá—which provides, among other things, for compulsory arbitration and the peaceful settlement of disputes—the Bogotá Conference set its seal on work which will remain valuable long after Latin-American pique at supposed US parsimony has been forgotten.

Inside Latin America the political pattern is changing. In particular, Argentina, the leading Power, has altered its position and adopted different tactics. Its agreement to supply Chile with food and industrial goods in return for raw materials is a dead letter; and the two countries' joint and well-publicised stand on their Antarctic claims against Britain does not mask the failure of the more important plan. If, however, trouble should arise again over Bolivia's claim to an outlet to the Pacific in Northern Chile, Argentina's strong influence on Bolivia may be counted on to bring Chile close to Argentina again in a hope of restraining Bolivian irredentism. Other spheres where Argentine activity remains strong are in its virtual dependency Paraguay, in which Brazil too is interested, and in Uruguay, which has been subject to considerable pressure.

A year or so ago these schemes of self-aggrandisement were going well. Argentina was on the offensive, diplomatically and economically; it had even tweaked Uncle Sam's nose. This performance earned some instinctive applause from the other republics, in spite of their dislike of Argentina. United States policy since then has tended to revive the traditional distrust of "Yankee imperialism." Yet weakness and corruption at

home have prevented the Argentine regime from taking advantage of a climate more favourable to its ambitions. On several occasions, as at the ITO talks at Havana, it has querulously asserted its national sovereignty. But on the whole its direct pressure has failed, and it has been relaxed almost *pari passu* with the increase in Argentina's own economic difficulties. If the United States Administration stands by its refusal to buy any ERP commodities from Argentina at present prices, and if, as is possible, a good harvest this year brings agricultural prices down, Argentina's international position will weaken rapidly.

The internal position of the Perón regime, however, is stronger. It is founded on the support of the industrial proletariat, whose lot it has undoubtedly improved. This improvement is being used to impress on other Latin-American states, which also have growing industries the benefits of Perónism; and an efficient corps of Argentine labour attachés works assiduously to this end. It also puts Perón at an advantage in dealing with the Communists. In the other republics, in spite of attempts to imitate Perón and to organise resistance to Communism around the Church, there is plenty of scope for

NOTES OF THE WEEK

Lords and Parliament Bill

On Wednesday the House of Lords rejected by a vote of 177 to 81 the Parliament Bill, whose second reading had been postponed since February 4th in an attempt to find a solution that would be acceptable to all parties. The leaders of the three parties so nearly reached agreement on the powers and on the reformed composition of the House, as to create bewilderment when the conference broke down. The Conservative leaders were prepared to accept a measure which left the Lords with the power of twelve months' delay from the third reading of a Bill in the Commons. The Government offered a period of nine months. The difference is of course material: the longer period enables the Upper House to postpone until after a general election any measure sent up from the Commons in the last two years of a parliament: the shorter period would confine this power to the last session only, and that is the utmost concession that the Government would make.

The dignified conduct of the debate could not conceal a deep division of opinion between Socialists and Conservatives on the role of the House of Lords. The Conservative view is that the function of the delaying power is to force a reference to the electorate of a question on which the Lords consider that the Government has outstripped or misinterpreted its mandate. The Government seems to believe that its importance lies in the opportunity which it gives to the House of Commons to change its mind in view of the arguments in the House of Lords and in face of any definite change in public opinion which develops during the period of discussion. In other words, the Conservatives regard the House of Lords as a vital counterbalance to the power of the Executive wielded through its domination of the House of Commons, while Socialists (that is the more moderate, for the Left wing is avowedly in favour of single chamber government) believe that the popular basis of election to the Commons gives it an unquestioned predominance in the Constitution.

The sharpness of their division of opinion is due to the fact that both sides have weakened their own case; the Conservative peers by their subservience to the executive in the inter-war years when their own party was in power; the Socialists by using Lords reform in order to force the passage of the steel nationalisation Bill. Consequently the best opportunity that has or will occur for many years to re-establish the Lords upon a more logical basis has, despite the best efforts of the Liberals, been jettisoned.

Battle is now finally joined. The procedure of the 1911 Act, which has not been invoked since it put Irish Home Rule on the Statute Book (but not into effect) in 1914, followed by Welsh Disestablishment, now comes into operation. The earliest date at which it can bring the new Parliament Bill up for the Royal Assent will be late November or early December, 1949, the two-year veto period running from the time of the Second Reading in the Commons on November 11, 1947. There is, it is true,

Communist tactics, notably in Chile, Brazil and Colombia. Their governments tend to use the Communist threat as an excuse for repressive and inequitable policies which perpetuate conditions favourable to Communism.

It is the persistence of these conditions outside Argentina which may provide Perón with opportunities to play a continental rôle. The main features in the policy of any demagogue in that rôle would be a nationalist abroad policy and at home the encouragement of industrialisation as a means to self-sufficiency. The two policies quickly come into conflict when it is only from countries affronted by the nationalism that the capital for industrialisation can come. Even Perón may find it necessary to finance by further foreign loans his five-year plan to free Argentina from dependence on vital supplies from abroad. Yet Argentina is the strongest of the Latin-American countries. The only way out of the dilemma is to moderate the nationalism. There are a few reluctant signs that the necessity of this is being accepted. How strong is this trend away from nationalism will be better judged after the next Inter-American Conference at Havana in the autumn.

one loophole in the present Act through which an earlier settlement might be reached—the provision that an amendment agreed between the two Houses could be incorporated into the Bill during the interim period. But the tone in which the Conservative speakers wound up the debate on Wednesday rules out the likelihood of any such development. There is, indeed, no reason why the Government should now give way. When they brought up the constitutional issue in the autumn, public opinion was against them. But either by luck or by skill they have out-maneuvred the Conservatives, who now bear the blame for the failure of the attempt to find a compromise. A quarrel between the Houses on the death penalty might tilt the balance back. And so may the Steel Bill.

The Government is now considering an early fourth session, to begin in September. The object of this would apparently be to get the Steel Bill started on its way so that it, too, can come into operation in time to clear the decks for a General Election in the spring of 1950—the earliest practicable date which the delay to the Parliament Bill will now permit.

* * *

Compromise on the Death Penalty

Mr Herbert Morrison's sense of political strategy has reasserted itself in time to prevent a battle with the Lords on two fronts at once. On Wednesday morning, shortly before the vote in the House of Lords on the second reading of the Parliament Bill was due to be taken, he persuaded a special meeting of the Parliamentary Labour Party to support a plan for a compromise clause on capital punishment, to be inserted in the Criminal Justice Bill when it returns to the Commons at the end of this month. The case for compromise was strongly advocated by Sir Stafford Cripps, who led the passive resistance of more than forty Ministers and Whips when the free vote was taken in April. Even the strongest advocates of the complete abolition of the death penalty appear to have been won over by the argument that the purely sociological issue was now in danger of being swallowed up in the constitutional struggle between the two Houses. They have also had the assurance that in drafting the new clause the Home Secretary will take due note of the views of those who led the revolt from the Labour back benches against the penalty.

This compromise extricates the Government from the embarrassing situation into which it had drifted by its attempt to avoid committing itself on this issue last April. It is clear that on a matter of this magnitude it was essential that the Government should have made up its mind at the time. This type of leadership, which is necessary on any major policy measure, becomes all the more important in these days when the Government, by appropriating to itself all Private Members' time, holds in its grasp the initiative on all legislation in the Commons.

The new clause is likely to confine the death penalty to certain specific types of murder, of which political assassination and

attacks on the police or warders have been frequently mentioned. This change, together with the continued exercise of the Royal Prerogative, would provide a considerable inroad on the use of the death penalty. There still remains the chance that the compromise, once adopted by the Commons, may still be rejected by the Lords. But if that happens the Government will be on surer ground for their further battle with the Lords than if they had stood by the original decision.

Looked at out of its political context and purely on the merits or otherwise of abolishing capital punishment, the compromise achieves nothing at all. Already by the use of the prerogative of mercy the Home Secretary commutes the death penalty in many cases for which, it seems, the penalty is now to be abolished by Statute. All that the compromise will do is to absolve the judge from the duty of going through the farcical process of pronouncing the death sentence in cases where it is well known it will not be carried out. But these cases are not the ones in which the effectiveness of the death penalty as a deterrent needs to be tested; they are indeed the sort of crime for which no effective deterrent probably exists. It is the effect of the death penalty on the gangster murderer that needs to be tested—for if it is not a deterrent the case for retaining the death penalty goes altogether—and it is precisely this that, by the Government's compromise, cannot now be tested. Why was not a compromise attempted by the simple process of postponing the appointed day when abolition of capital punishment should come into force? By this means the abolitionists would have the satisfaction of seeing abolition on the Statute Book and of knowing that in a few years time it would come into force. The Government and a great many of the present opponents of abolition would be relieved that abolition would not be brought into effect in the present period of lawlessness and scanty police forces. Only those who look upon hanging as a sacred rite of the state would be dissatisfied.

* * *

Handing Over in Germany

After a long period of controversy, the Anglo-American authorities in Frankfurt are putting the final touches to a decree which will give to German "industry groups," that is, to the industrial associations, the right to allocate raw materials until they can be freed from control altogether.

The implications of this measure are far-reaching. It is only the beginning of a programme for handing over control of the German economy from the state bureaucracies to private business. The main points in this programme, which was recently outlined by the Christian-Democrat head of the German Economics Administration, Dr Erhard, are to restrict the rôle of the state to formulating general policy and to leave its execution to so-called "autonomous industry." The swollen ranks of the state and central administrations will be drastically reduced in order to balance budgets. Direction of the economy will eventually be exercised not by control of distribution or prices, but by fiscal means, through the dispensation of credits to a business community which will be starved of capital after currency reform. It is intended—and this may allay fears about re-armament if not anxiety about German competition—to foster light industries producing consumer goods rather than heavy industry.

The dangers inherent in this programme are serious. Before controls go altogether, the power to exercise them is being given to the industrial associations, which are bodies responsible to their members and not to the people. The record of German industrialists justifies fears that they will re-form cartels, with the immense power that goes with the right to allocate raw materials in an economy of scarcity. To meet this objection, a representative of the Anglo-American authorities, as well as of the Frankfurt Administration, will attend meetings of the industry groups—but who can think that even the most zealous decarteliser would be able to keep his eye on all the devious manipulations open to the industrial associations?

Perhaps the most important point is that an important element of power is being removed from decentralised *Land* Governments (who have hitherto allocated raw materials) to centralised industrial associations. This may make for efficiency, though it may merely remove the red tape from Frankfurt to the head offices of the business federations, but it will not allay French fears. For all concerned, it is to be hoped that the day will not be long delayed when controls can be removed from the hands of the German industrialists. The decree allocating these powers to industrialists should be accompanied by an emphatic assurance that the arrangement is provisional and subject to review when a German Assembly can express its views about it.

End of the Benes Epoch

The resignation of President Benes of Czechoslovakia has, like the abdication of King Michael of Roumania which preceded it by six months, a truly symbolic significance. Both events marked the formal close of an epoch which had in fact ended some time before; but both caused a very real anguish to the nations which saw in them the final proof that their independence was lost.

The last time that Dr Benes resigned the Presidency was in October, 1938, after the *Diktat* of Munich had reduced his country to vassal status. He was succeeded by the docile Hacha, and five months later the rump republic was formally incorporated, with a limited degree of autonomy, in the Greater German Reich. The analogy will not be lost on thoughtful Czechs, who will see in it a guide not only to the recent past, but to the immediate future.

Czech supporters of the present regime point out that there are no foreign troops on Czechoslovak soil, that the Communists were the keenest opponents of Munich, and that the Soviet Union is the only Power capable of defending Bohemia from a resurgent Germany. They add that the policy of the Western Powers, at this very time planning together the economic recovery of Western Germany, proves German resurgence to be no unreal bogey. So eager are Czechs of this type to save their independence from German attack in the far future that they enthusiastically hand over this same independence in the present to the accredited agents of their Russian liberators. To some extent at least Dr Benes appears to have shared their view.

The argument "Russia is our defence against Germany" has long been one of the main principles of Dr Benes. Alone among the East European émigré leaders in London during the war, he insisted on good relations with Moscow, and was the first to sign a treaty with the Soviets. This enabled him, and the democrats who followed him into exile, to return home with Communist blessings. It made it possible to maintain political democracy for nearly three years. Now the experiment has failed. Among the Polish and Yugoslav émigrés, and their British admirers, there will be plenty of *Schadenfreude*. In his own country there is bitterness that he did not give the order to resist the Gottwald coup in February. The bitterness leads to doubts about his whole past foreign policy.

The President's letter to Gottwald made it clear that the main grounds for his resignation were political. It was timed to spare him the duty of approving the new Constitution, which was brought into operation on May 9th before the elections were held. But the reference to his health as a secondary cause was not an excuse. At the age of 64 he has been under intense nervous strain which he could share with very few.

* * *

Tory Trumpet Calls

Irresponsibility flourishes in opposition; and where opposition was traditional, as with the Labour Party, the reaping of the ensuing crop of wild oats has been a painful business for all concerned. But opposition has a countervailing advantage; one need not worry nearly so much about pressure groups. The two latest pamphlets of the Conservative Political Centre ("Return to Greatness," by R. A. Butler, and "Forward from the Industrial Charter," by David Eccles) show a Conservatism wonderfully purged, for the time being at all events, of its Brummagem big-business elements; harking back to Disraeli's idea of harmony in diversity, proclaiming the virtues of decentralisation, both political and economic, championing the small man against bureaucrat and combine, underlining the notion (once a palladium of the Liberals) of a "property-owning democracy." Mr Eccles adds to the brew (with a couple of paragraphs which might have come straight out of the 1929 Liberal "Yellow Book") a plea for a concerted and co-operative attempt to master the "blind economic forces" the desire for whose control he very rightly recognises as the chief contemporary motive of democratic sovereignty. It is true that he gives no conclusive reasons for supposing that Conservatives would be better than Socialists at mastering the forbidding—and in some opinions insurmountable—difficulties of planning *per se*; but one can hardly refute Professors Jewkes and Hayek in a couple of pages of a nine-page pamphlet.

Altogether, Conservatism as thus delineated is enough, or nearly enough, to send Sir Waldron Smithers into an apoplectic fit and win the disgruntled floating voter over in his millions. But how closely, if at all, does it correspond with the sort of policy which a Conservative Government would actually pursue? Does the

leopard change his spots so painlessly? The Right in opposition always woos the small man, the promising beginner, the dynamic element; the Right in power is on the side of the big battalions of finance and industry just as the Left is on the side of the big battalions of the TUC. The Right in opposition is reformist; the Right in power stands by privilege and vested interest. It does move, little by little and generation by generation; indeed, its capacity for learning, compared with the wooden-headed Bourbonism of most Conservative groups in other lands, is one of the major reasons for the comparative sanity and absence of bitterness in British politics. But such professions of good intentions as those of Mr Butler and Mr Eccles may yet prove to be as remote from the Conservatism of the Tory press, the back-benchers and the constituencies as is the sweet reasonableness of Mr Herbert Morrison from the Socialism of the Scarborough rank and file.

* * *

Crime, Punished and Unpunished

So much has been heard since the war of the growth in crime and of the shortage of policemen, that it will come as a surprise to most people to discover from the Report of the Commissioner of Police of the Metropolis for 1947 (Cmd. 7406) that the same proportion of crimes were "cleared up" as in 1938. This is the more surprising since the Metropolitan police force was only three-quarters of its prewar size, and the number of crimes

was 127,000, compared to 95,000 in 1938. With a 34 per cent increase in the number of crimes and a 25 per cent decrease in the size of police force, it is really very creditable that the police have managed to do as well as they have.

So much is shown in the report, but there is a more depressing side to this picture. An analysis of the figures given in previous reports shows that whereas 27 per cent of crimes were cleared up in 1938 and 1947, 30.9 per cent were cleared up in 1940 and 33.7 per cent in 1941. Although 1945 was the worst year from all points of view the position is still a good deal worse than during the war years.

The report claims that the number of crimes cleared up per policeman has nearly doubled since 1933—a new version of increased productivity. If this is the case, then the deterrent effect of detection might have quite startling results if the Metropolitan police force could reach its full strength of 20,000, instead of having a deficit of nearly 5,000. With 20,000 policemen the "screwmen" and "dragging larks" would no longer have a three-to-one chance of escape. This is unfortunately wishful thinking unless the policeman's pay and conditions of service are improved. During 1947, 2,607 men rejoined the Metropolitan police service, and 1,907 left, a large proportion being new recruits. It is feared that at the present rate of recruitment and wastage the police force of London may be still smaller by the end of the year.

* * *

Doubting Dominions

There now seem to be doubts whether all the Dominion Prime Ministers will attend a Commonwealth conference this year. What support there has been for the proposal has come, not surprisingly, from the new Dominions—India, Pakistan and Ceylon—and from the usually reluctant Mr Mackenzie King. Mr Chifley is still considering whether he will attend in person or not, and Dr Malan has so far committed himself only to send-

ing observers. Moreover, it is now being suggested that bilateral talks between Britain and each Dominion should be a substitute, instead of a preparation for a full conference.

It may well be that the business of government makes it difficult for Dominion Prime Ministers to absent themselves from their countries for long. But the plea of pressure can be even more overworked than the Ministers. If the conference were carefully prepared, as it should be, the Prime Ministers would not necessarily be long detained in London. It is more likely that Australian and South African doubts arise out of fears of what they may be asked to do for other members of the Commonwealth. The advantages of closer Commonwealth co-operation are at times more obvious in London than in Canberra or Pretoria. Difficult relationships between individual Dominions, such as those between India and South Africa, might cause some awkward situations and impede the discussion of matters of common interest.

But this juncture in Commonwealth affairs and British policy is of quite exceptional importance. Europe awaits a clear statement of whether the Dominions accept Mr Bevin's Western Union policy or not. America waits to see how strong and flexible are the ties binding its principal ally to the affairs of the Indian Ocean and the Pacific. The British public wishes to know whether there is or is not a Commonwealth policy for defence, of which a quite disproportionate share of the burden falls on its aching shoulders. The new Dominions wish to make their bow to the assembled company. To postpone discussion of these and other matters is to shirk them. It is surely Mr Noel Baker's task to throw off the usual Whitehall timidity towards the Dominions, to visit Mr Malan and Mr Chifley if necessary, to initiate bilateral conversations with the Dominions, to clear the ground of petty obstacles to a conference, and bring every member of the Commonwealth face to face with the novelty and urgency of its post-war problems. This may involve postponing the full conference, but not *sine die*.

* * *

Truce in Palestine

The Palestine truce agreement does great credit to all those concerned in its negotiation. It will, if it works, be worth a red letter in the black record of international relations. It will, at last, score a notable success for the United Nations. It signifies that the British and the Americans have at last pulled together on a point to do with Palestine. Unqualified satisfaction, unfortunately, is premature. Here is a means of stopping the fighting for a spell, but it is a means that casts a tremendous amount of responsibility on Count Bernadotte. Can he carry so much?

By its terms, the mediator is to regulate immigration. He is to determine whether or no immigrants are "fighting personnel." If they are such, he is to detain them in camps under surveillance by his observers. He is, for a week beyond the truce, to control all immigration irrespective of age or sex. These clauses alone leave upon him the onus of deciding an issue that has so far broken every would-be mediator in the past: the problem of fixing numbers of immigrants that both communities will accept as fair. The other clauses of the Bernadotte terms cover prohibitions, during the period of the truce, of all movement of troops and war materials in and near Palestine, and of all import of war materials by any interested party. (There is no provision for

THE ECONOMIST BY AIR EXPRESS

We hope to announce during the next few months the introduction of an Air Express Service of The Economist to a number of overseas countries, similar to that already in operation across the Atlantic.

TO AUSTRALIA AND NEW ZEALAND

We start with an Air Express Service to Australia and New Zealand as from the beginning of August next. On existing airline schedules copies will be posted in Sydney within one week of publication in London, thus reaching subscribers some five weeks earlier than by surface mail.

The cost of this service will be £6.0.0 sterling per annum, and if you wish to enter a subscription to an address in Australia or New Zealand please send your instructions to:

The PUBLISHER,
The ECONOMIST, 22 Ryder Street, London, S.W.1.

enforcement of these two conditions.) Other clauses stabilise present fighting fronts and provide for Red Cross relief to "populations of both sides in municipal areas."

It is already plain that the truce will stand or fall by the mediator's capacity to regulate the question of numbers of immigrants. The conundrum that this represents in connection with the Cyprus camps alone is reviewed in an article on page 974. Both sides, he has reported to Lake Success, have accepted his terms "unconditionally," but what they mean by "unconditionally" is at once called in question, if not invalidated, when Mr Shertok, speaking in Tel Aviv, simultaneously states that Israel, while prepared to co-operate with the mediator, "will regard as unjustified any attempt to interfere with the normal flow of Jewish immigration." The forecast is no better than bright periods, with further outlook unsettled.

* * *

Puzzle for the Arab League

The truce clause that covers international assistance to refugees may help the Arab League with a human problem of dimensions with which it is not equipped to cope. Quite apart from the sheer question of relief of multitudes, it is at grips with a political difficulty: how to organise civil administration in the areas its armies now occupy. Does it not, if it establishes any regime there, give tacit recognition to partition?

Our correspondent telegraphs from Amman: "This question is already urgent because the former administration had collapsed completely even before the end of the Mandate. For nearly two months the country has been without a central authority, without the majority of public services, banks, imports and exports, hospitals, schools, postal services—all the attributes of a modern State with which 30 years of British administration equipped Palestine."

"In the larger towns, such as Nablus, Hebron and Gaza, the existing municipalities have managed to maintain some kind of civic organisation. But they have run out of funds, and there is no prospect of getting more. In the smaller villages, the problems are possibly not so urgent; life is much simpler. But on top of the breakdown of administration, there is the additional problem of tens, and probably hundreds, of thousands of refugees from Haifa, Jaffa, Tiberias, Acre, and all the smaller towns and villages conquered by the Jews. Some have crossed into Lebanon, Syria, and Transjordan, but others, mainly the poorer ones, have flocked into areas where the Jews have not penetrated. Thousands of Palestinians are now without possessions or jobs. There are 10,000 such in Nablus alone."

"The Arab League has to decide whether to tackle this problem with a central 'Palestine' administration or with separate local areas of responsibility assigned to different Arab States. They are reluctant to establish anything which would imply recognition of partition. They are too poor to be able to do much with a territory which has virtually no funds of its own. One possibility is a form of administration by the Arab League, using the hundreds of excellent Palestinian trained officials, and with the exercise of special powers by the Egyptian, Transjordan, and other armed forces in the areas where they have been operating." Obviously, the Red Cross can help them out, but it cannot answer all the questions with which they are faced.

* * *

Cost of Scholarships

Hitherto very little has been known about the cost to the state and local authorities of the large number of university scholarships and grants now being used by students at the universities, nor about the future policy to be adopted when the present very large number of Further Education and Training grants cease to be awarded. Two answers to questions in the House of Commons last week threw some light on both these matters.

As far as the number of present awards is concerned the figures given in Parliament and expanded subsequently show that a large majority of students now in the universities are receiving state aid in one form or another. (They are reproduced in the accompanying table.) At present there are 26,000 ex-Service students in the universities receiving special Further Education and Training grants, and this number will be larger still next year when the third year's intake of ex-service students arrives. That will be the peak year and the numbers will then fall rapidly, since the national service conscripts are not eligible for these special grants. The fourteenfold increase in the amount contributed by the state is startling, and shows that this form of contribution to university education is almost exactly equal to the amount paid by

the Exchequer direct to the universities. For the current financial year the direct Exchequer grant is estimated at over £10.5 million (compared to £2.5 million in 1938). Local authority grants have increased much less, for LEAs have understandably left it to the state to finance ex-service students, and the number of school entrants has been sharply restricted.

When the ex-service grants come to an end what is to replace them? There are now 76,000 places instead of the 50,000 in 1938, and it is hoped to reach 88,000 places in due course. The number of students who will be able to afford to come to the universities without assistance will almost certainly be fewer than

NUMBER AND COST OF UNIVERSITY AWARDS

	1937-8*		1946-7*		1947-8†	
	Number	£	Number	£	Number	£
1.—State Awards						
Further education and training grants (ex-service).....	...	...	12,500	5,416,000	13,500	9,764,000
State scholarships.....	360	129,000	360	142,000	870	185,000
Open scholarships.....	1,200	£	1,200	58,000	1,200	138,000
Teacher training grants (4 years).....	1,298	627,500	1,874	412,000	1,776	400,000
Science awards.....	30	11,000	31	8,000	31	8,500
State bursaries.....	...	...	†	279,000	†	146,000
	2,888	767,000	15,965	6,315,000	17,377	10,641,500
2.—Local Authority Awards						
	1,700	340,000	3,900	463,000	4,300†	500,000†
GRAND TOTAL.....	4,588	1,007,500	19,865	6,778,000	21,677	11,141,500

* The figures for number and cost are not exactly comparable except in the case of local authority awards and teacher training grants. For State awards the cost is related to the financial year; the numbers relate to academic years.

† None were awarded in these years, but 420 were still current in 1947-8.

‡ Estimate. § Not State aided.

before the war when taxation was less crippling. It was announced last week that a Working Party in the Ministry of Education is now considering this matter, and is to recommend what new grants should take the place of the FET grants. There can be no cast iron estimate of the numbers who will need assistance, but it is probable that something between a half and three-quarters of each year's entry will be unable to pay their way, as compared to about a third before the war. Even if it proved that three-quarters of the students received grants the cost would be lower than at present, since so many ex-service students are receiving maintenance grants to cover their families, which would not be payable to younger students.

* * *

The Fifty Millions

The guess made in *The Economist* of May 22nd that the official estimates of the population of the United Kingdom would soon show a figure of over 50 million is confirmed in the latest issue of the *Monthly Digest of Statistics*. Indeed, the line was crossed before the end of last year, for it is the estimate for December 31, 1947, that reaches the figure of 50,015,000. Of this total, males make up 24,223,000 and females 25,791,000. England and Wales contribute 43,534,000, Scotland 5,140,000 and Northern Ireland 1,341,000. The age distribution is also of interest:—

	Numbers (Thousands)	Percentage
0-14	10,906	21.8
15-29	10,761	21.5
30-44	11,416	22.8
45-59	9,249	18.5
60 and over	7,687	15.4
Active ages (15-65)	33,851	67.7
Dependent ages	16,168	32.3

These figures show clearly how the "largest generation"—those born in the years of maximum births in the first decade of this century—is now in the middle of the population. The largest single five-year group is of those born in the years 1943-47. But the next three largest are 1908-12, 1903-07 and 1918-22, in that order. The biggest ten-year group is of those who were born in the years 1903 to 1912 and are now between 35 and 45. For the present it is an advantage to the community to have its largest generation in the prime of life. It is in some 25 years' time, when this largest generation is in its sixties, that the trouble will be really serious.

Incentives for Specialists

The Spens Committee on the remuneration of consultants and specialists in the national health service had a triple task to perform. It had to frame proposals which, while giving

specialists an adequate reward, would not intensify the present rush away from general practice into the specialities. Secondly, it had to bear in mind the need to spread consultants and specialists more evenly over the country. Thirdly, and most difficult, it had to draw up scales of remuneration which would not be extravagant for the bulk of specialists but would encourage outstanding specialists to enter the Health Service by holding out more than the ordinary rewards for more than ordinary ability.

The first objective does not seem to have been achieved in its report (Cmd. 7420). General practitioners in the National Health Service will receive net payments (after allowing for expenses) of £1,090, £1,606 or £2,222 a year according to whether they have 2,000, 3,000 or 4,000 patients on their lists. For whole-time work (on the staff of a hospital) the Spens Committee recommends a starting salary of £1,500 per annum at the age of 32 rising by £125 a year to a maximum of £2,500, but these recommendations have to be adjusted upwards as they are based on 1939 prices. The gap between the pay of general practitioners and specialists is not, however, so big as it seems. A good general practitioner can reach his maximum at an earlier age than can a specialist and, moreover, may be able to earn private fees and extra payments as well. A specialist, on the other hand, may not obtain an appointment to the staff of a hospital, for which high academic qualifications are now required, and will then have to be content with a maximum of £1,200 (1939 prices).

The committee has attempted to achieve its second objective simply by recommending that its scale of salaries should be adopted throughout the country, for the staff of teaching and non-teaching hospitals alike. Its way out of its third difficulty is, however, more dubious. Outstanding distinction is to be given an award of £2,500 (based on 1939 prices) a year in addition to the ordinary salary, second-grade distinction one of £1,500, and a third-grade one of £500. The awards are to be limited to a fixed percentage of eligible specialists, with the effect that one-third will receive more than the basic maximum of £2,500.

This is an ingenious proposal by which security and enterprise can be combined in a salary policy. What is dubious about it is the means of putting it into effect. The Spens Committee recommends that the grant of the awards should be in the hands

of a predominantly professional body largely nominated by the Royal Colleges—in other words, a body of men themselves most likely to be candidates for the awards. Surely this would try their impartiality a bit too hard.

Egyptian Thoughts on the Sudan

Heavy responsibilities lie with the Egyptian Cabinet at its meeting this weekend. At a moment when it is involved to the hilt in Palestine, it must come to a decision on what to do about increased self-government for the Sudan. Is it to take the imperialistic line that will please the crowd at home, or the longer-term view that constitutes, in present conditions, a more practical foreign policy?

It will be remembered that the joint rulers in the Sudan—Great Britain and Egypt—have for nearly a year been exchanging correspondence about the form that a greater measure of Sudanese self-government is to take. The Sudanese are now hotly impatient for something to happen. A serious railway strike in March was a measure of their impatience. But progress has not got beyond the paper stage because London and Cairo have so far failed to agree. In March, when the time came round for the regular meeting of the Sudan's Northern Advisory Council, the Governor-General kept his promise to proceed with developments by submitting to the Council's vote a British draft ordinance for the country's future government. He was careful to warn them that their vote was necessarily provisional because the document had not been agreed to by the Condominium Powers. The draft was accepted by a majority that caused surprise and some consternation in Cairo.

It can be argued—indeed, it was argued by a correspondent in *The Economist* of March 27th—that if Egypt continues to produce nothing more than vague slogans and makes no concrete suggestion that shows grasp of current Sudanese opinion, the Sudan Administration cannot but go ahead on its own. But the issue is not so simple. Can it justifiably do so without first showing that the Condominium Agreement has become unworkable, and may need scrapping? That agreement of 1899 is of the loose type that works well so long as the parties agree, but makes

control the flow of milk from the farm to the town buyer, but that retail distribution should be left to private enterprise acting under really competitive conditions—attempts by distributors to fix minimum prices locally should be prohibited, and the central authority should be enabled to operate as a retailer itself if it considered it could do so more cheaply than existing retailers. The committee's concentration on rationalising distributive channels in the interests of the consumer and its insistence on the need to cut distributive margins are welcome. Reactions from the Government and the trade will be awaited with interest.

* * *

Mr Bevin on Steel

Apologists for the nationalisation of steel are having to go farther and farther afield for their arguments, and the reward of their journeyings grows progressively more meagre. It was, alas, Mr Bevin, not Mr Bevan (from whom this sort of thing is common form), who in a speech to the Amalgamated Union of Building Trade Workers last week blamed private enterprise because Britain did not have an annual capacity of 20 million tons of steel before the war. Had such a capacity existed, he thought, the postwar story would have been different; and he concluded that steel development could not be left to "idle disputes" (between whom?) and "the uncontrolled rivalry of private individuals" when the nation stood in need. This, while a fair sample of Labour argument on such topics, is so far below Mr Bevin's usual form as to call for comment. The comparatively uncontrolled rivalry of private enterprise in steel continues, week by week, to break output records; while the all-too-meticulously controlled coal industry continues, week by week, to lag farther behind its standard output, not to mention the "capacity" of pre-war years. One really cannot have it both ways. If output, the full use of existing capacity, is the criterion, then private enterprise is at the moment scoring heavily over public; if mere capacity is the criterion, then the whole time-honoured Labour indictment of the iniquity of "idle resources" falls to the ground. The fact is—as earlier passages in Mr Bevin's speech make

clear—that socialisation is not a policy in whose support Labour in its inmost heart feels bound to adduce strictly logical arguments, as it does for any particular measure of taxation, rationing or constitutional change. It is an ultimate good, in Mr Bevin's words, a "guiding principle," to be bracketed with the preservation of freedom, liberty, equality and the nationalisation of the means of production, distribution and exchange; the last term of this inspiring slogan is not less dear than the others. It is one thing to "see no reason," in Mr Bevin's words, "why public ownership should destroy the freedom of association, the right to think, to act, and all the human rights expressed in the four freedoms"; it is quite another to enshrine State ownership on a level with, if not above, those human rights. The first argues merely a certain obtuseness and unwillingness to look at arguments or evidence; the other is a frankly appalling distortion of human values which Mr Bevin has the reputation of holding in honour.

Shorter Notes

The House of Lords debate of May 26th on Empire immigration added very little to public knowledge on the question. The Opposition keeps needling the Government on the subject, but until there has been some really comprehensive and authoritative study of the manifold factors of defence, shipping, location of industry and population trends the British public may be pardoned for feeling bewildered amid all the competing alternatives. It was useful, however, to the extent of eliciting from Lord Addison the figures of emigration to the Dominions since 1946, which are: Canada, 75,439; Australia, 22,604 (which will be more than doubled in the present year); New Zealand, 11,346; South Africa, 37,269.

*

The Honours List issued on Thursday will cause less comment than the cancellation of the Trooping the Colour on the same day. A 93-year-old peer, a Civil Service Dame and a knighthood for Mr C. B. Cochran are the outstanding items in a dull list.

AMERICAN SURVEY

The Forgotten Man

(From Our US Editorial Staff)

THE circuses provided by the struggle of three uninspiring Republicans to win their party's nomination has diverted attention from the bread and butter of the Democrats, the President of the United States. In spite of the arguments of the enthusiasts who, with pencil and tablecloth, are prepared to explain ingenious methods of drafting General Eisenhower by acclamation, and despite the frantic attempts of embittered Southerners to find their private Dr Malan, there is little doubt that Mr Truman will win the nomination rather comfortably on the first ballot. But, as President, he has made no overt move until now to collect either delegates or votes.

This month he is getting down to the job. A providential invitation to give an address at the University of California in Los Angeles has made it possible for him to take a non-political trip to the West Coast. With subsequent requests for speeches from intermediate points, he will be able to stop at many places on the way out and back in the very States where his chance of ensuring loyal support among the delegates is best. Under a law passed in 1907, the President is allowed \$25,000 annually for travelling expenses "to be expended at his discretion and accounted for by his certificate solely." The \$25,000 is not available to a candidate for the Presidency but, before the conventions, it is always possible to argue that Mr Truman is more President than candidate. The cries of "Politics" from the Republican National Committee will get them nothing but partisan sympathy as long as Mr Truman's public appearances are limited to non-political organisations.

How many cross-country trips the Democrats will be able to afford for their candidate after nomination day is very doubtful. During the first two months of the year they collected less than \$16,000, compared with \$90,000 which came into the Republican fund and over \$87,000 into Mr Wallace's campaign chest. It is difficult to see how they are going to do much better between now and October. Nobody likes to back a horse which is fading in the straight, even if its collapse is caused (as Mr Truman's largely was) by a bump from an outsider with no chance itself. Gamblers can always be found to support a long shot—the large sums invested in Mr Stassen over the last eighteen months are an example—but at moments like this, prudent party men keep their money for next time. Democrats who contributed to Mr Roosevelt's four campaigns have done enough to assure their places in the sun—in the unlikely event that their sun should shine for four more years. They will still be good Democrats if they do no more until 1952.

*

It is unfortunate for the party that Mr Truman has no very positive qualities which can be dramatised. For over three years he has been playing out Mr Roosevelt's time, a task which would have tried a more experienced man. Even Mr Roosevelt himself, had he lived, would probably have found his reputation tarnished—at least in the eyes of the electorate—as Woodrow Wilson and Lloyd George did. The President is not a commanding speaker and is often boring when his somewhat rasping voice is ploughing up manuscripts prepared by someone else and the meaning of which he only dimly realises. But, as he has proved once or twice lately, he can speak with great charm and sincerity when allowed to roam impromptu over the lowlands where he feels at home. His tendency to make major pronouncements of policy without being aware of their import has, up to now, scared his advisers into providing him with set speeches from which he departed at his, his party's, and sometimes the country's perils. But, with the position desperate and nothing to lose, he will be allowed to speak many times on this trip without a manuscript—if he promises to keep off certain

subjects. If he does as well as he did before the American Society of Newspaper Editors (not an easy body to impress), who were unanimous in his praise when he spoke to them off the record six weeks ago, he will begin the long climb back to popularity.

Mr Truman has, to those who are prepared to study the last three years and can forgive him for not being Mr Roosevelt, some very solid achievements to his credit. He has not, whatever Mr Wallace may say, betrayed the Roosevelt ideals—certainly not to the extent that Mr Wallace himself has. His liberalism is as genuine as his predecessor's, though it springs from different roots. Mr Roosevelt was always an aristocrat with a dash of condescension in his sympathy. Mr Truman's sympathy with the underdog comes from identification. He has been a failure himself. When he became a success it was in a world of political manoeuvring and he knows no other way of getting things done. Mr Roosevelt was well aware of the value of playing politics, but, to him, it was only one of many ways of reaching his objective.

It is this instinctive sympathy and his obstinacy in following every trail down which it leads him which have brought Mr Truman most of his political headaches. His civil rights programme, to which he holds with dogged persistence, was never merely a device for winning votes. If it had been, it would have been quietly dropped when, far from proving of political advantage, it split his party in two. His attitude to labour comes from the same source. He vetoed the Taft-Hartley Bill because he did not like seeing employees at the mercy of big business. But he has fought Mr John L. Lewis and other union leaders—and done it more successfully than his predecessor—when he saw danger of the public suffering for their wilfulness. Even his Palestine policy is based on genuine emotion—his parallel insistence, disregarded by Congress, that this country should take its share of displaced persons is the proof—though his advisers have led him astray whenever he has made a move.

*

It has become an axiom that the level of Cabinet appointments has fallen disastrously since 1945 and that the country is now being run by second-raters. There is a case for the argument that a Truman needs a better Cabinet than a Roosevelt; but it is hard to maintain, when examining the individual appointments, that he has had a worse one. Each has had two Secretaries of State. Mr Marshall is criticised, and probably with some justification, for having the naiveté of the professional soldier. But Mr Cordell Hull, when he first came to office, was not so much naïve about the facts of international life (with the single exception of tariffs) as abysmally ignorant of them. At the end of ten years, as his autobiography proves, he had made a large collection of facts, but all he did with them was to construct a set of prejudices, which did duty for a philosophy in his mind, and to which he clung with dogmatic vindictiveness. Mr Marshall is infinitely more aware and more flexible. On the

relative merits of Messrs Byrnes and Stettinius there can be only one opinion. This game goes to Mr Truman by a comfortable margin.

The second—a much closer one—is at the Treasury. Except for those disciples who shared Mr Morgenthau's doctrinal beliefs, there would be few who would not prefer Mr Snyder's more limited but less careless approach to financial problems. This game also goes to Mr Truman—on the last green, perhaps.

Mr Roosevelt wins the third and fourth without difficulty. His easiest victory is in the War Department, where the descent from Mr Stimson, through Judge Patterson, to Mr Royall is a steep one; while any of his four Attorneys-General are the equal of Mr Tom Clark and two, at least—the present Justices of the Supreme Court, Mr Frank Murphy and Mr Robert Jackson—are his superiors. Mr Roosevelt loses the fifth, however, to become one down again for two frankly political appointments to the Postmaster-Generalship. Mr Truman made one of the same kind, but recovered to win the match with the original and imaginative idea of choosing a man who had been a postman all his life.

Mr Truman wins again at the Navy Department for having kept throughout his Presidency, and promoted to be Minister of Defence when that office was created to co-ordinate the three Services, the last and best of Mr Roosevelt's appointees—Mr Forrestal.

Mr Roosevelt gets a match back at the Interior Department where Mr Ickes, for all his peculiarities, has a slight lead over Mr Krug, but he loses again at the Department of Commerce where Mr Harriman was clearly an improvement on Mr Daniel Roper, Mr Jesse Jones or Mr Wallace. The Labour Department—Mrs Perkins versus Mr Schwellenbach—can be counted a dull draw and, in the last match, while there is probably little to choose between Mr Claude Wickard and Mr Clinton Anderson, as Secretaries of Agriculture, the earlier appointment of Mr Wallace gives Mr Roosevelt the advantage. Mr Truman finishes, therefore, one up.

It is never easy for a President who has lost control of Congress to look more than a muddling amateur. Congress itself sees to that. But over the last two difficult years, Mr Truman's record is far better than that of the Republican Congress. He has given his Secretary of State a free hand—except on Palestine—and backed him to the limit. He has tried to work with a hostile legislature and used the veto sparingly. But unspectacular achievement cannot compete with popular myth. The myth is that Mr Truman has failed. If the recent Republican action on reciprocal trade and appropriations for European recovery is a taste of what is coming during the next four years, it may not be long before the Truman administration is remembered with nostalgia.

American Notes

Mr. Taber's Warning

The first anniversary of Mr Marshall's Harvard speech was given a wry celebration when the House of Representatives voted to reduce by approximately 25 per cent the funds authorised for European Recovery. Despite the virtual certainty that the Senate will succeed in restoring much of the cut, the warning that some elements in the Republican Party remain unconverted to Mr Marshall's policy will not be lost on Europe, the Administration, and the Republican leaders themselves. But the most significant aspect of the whole episode is the violence of the reaction against "Taberism."

The protests of Mr Marshall and Mr Hoffman have been supported by three of the leading contenders for the Republican nomination, Governor Dewey, Mr Stassen, and of course Senator Vandenberg. Mr Taber, the chairman of the committee which originated the cuts, has been isolated for doing his duty—as he sees it. The bulk of the press, undeterred by the malicious accusation that it hoped to profit under the Plan from a guarantee of the convertibility of its foreign earnings, has assailed the seniority system which entrenches in a position of great power a parsimonious and parish-pump minded politician. Europe is not the only victim of Mr Taber's eagle eye. The Administration is accustomed to Mr Taber's passion for economy at any price. It was he who "saved" \$20 million on the staff of the Internal

Revenue Bureau, with the result that sums many times as large escape the tax-gatherer.

Under the compromise suggested by Senator Vandenberg, the Administration had agreed to cutting down the authorisation of the Marshall plan from 15 months to a year in return for keeping monthly expenditures near the original level. Of the \$5.3 billion authorised for European recovery, \$1 billion could not be touched; it is to come from the sale of ECA notes to the Treasury to finance loans. It is the \$4,250 million available for grants which the House has cut to \$4 billion and decided must be stretched over 15 months. This is equivalent to a reduction of \$1,745 million, and cuts in funds for China, Greece, Turkey, Trieste and the occupied countries bring the total reduction in the foreign aid programme to \$2,160 million.

The Role of the Senate

Under the influence of the Czech coup, the House voted for the Economic Co-operation Act with a speed and a majority which seemed, alas only too correctly, to be too good to be true. Last week's vote was the revenge of Mr Taber and other members of his committee who had fought against the plan to the last ditch, though a revenge which consists of voting \$4 billion for Europe must leave a sour taste in their mouths. The House as a whole is, of course, under heavy pressure to demonstrate, just before the election, its devotion to the Republican ideal of economy, particularly when it is at the expense of foreigners who have no votes. And some Republican Representatives cast their votes with the assurance that the Senate would soften the blow. The Senate has already begun to retrieve the House's excesses on the Trade Agreements Act, Senators Taft and Millikin at the eleventh hour voting in committee with the Democrats and against their Republican colleagues to remove the Congressional veto over tariff negotiations. The "little group of wilful men" celebrated by Woodrow Wilson now sit on the purse-strings in the House, rather than on the treaty rights of the Senate. At a time when foreign policy is so largely shaped by dollar deficits abroad, this gives the House a new and unintended authority over foreign relations.

The final bargain will be struck by House and Senate conferees; and their hands will be strengthened in proportion to the size of the vote in each House. The coalition of Democrats and progressive Republicans substantially weakened Mr Taber's case for a pound of flesh by rallying 113 votes against the 148 for the committee Bill.

The incident has been a healthy lesson all round. It ought to have shown Mr Taber and Mr Halleck that America's "private business" now reverberates around the world. It has reminded Europe of the dangers of too complacent a reliance upon the good intentions of the United States. And it has shown the Republican internationalists the chasm at their feet. They will enter the Republican Convention determined to prevent a public recurrence of the breach which has cast doubt on the sincerity of the party's conversion and on the stability of American policy. If Mr Taber is not firmly over-ruled, his use of a financial veto will also remind the American public of the risks of believing that on foreign policy there are no significant differences between the two parties.

Accent on Recovery

Ever since he was appointed, Mr Hoffman has made it clear that the touchstone he will apply to all aspects of ECA policy is the degree of economic recovery they promote. The Appropriation Bill passed by the House not only threatens this concept by reducing the money available, but by its proposal that, as far as possible, free grants should be made only for relief goods, and that Europe should repay the funds advanced for industrial recovery. The demand that at least 10 per cent of the local currency funds should be devoted to financing the sale of commodities for the strategic stock-pile endangers the normal dollar earnings of the Marshall countries. The provision that at least \$65 million of Marshall money be spent on the export of skim milk is the camel's head, or rather the cow's head, of American surpluses; and the reduction of the farm mechanisation programme a reminder that any shortage in America will inevitably be attributed to European purchases.

It is Mr Hoffman's view that even the nationalisation of industries should be no bar to American aid, unless it retards recovery. He even went so far as to say that a cartel—and nothing can exaggerate the sinister connotation of that word in America—would be entitled to aid if it held out a good promise of doubling production. This accent on economic measures has led to the

raising of the ban on American exports to Finland. Mr Hoffman looks to Eastern Europe for coal, wheat and timber; the present Finnish purchases of \$3,890,000 are chiefly to increase timber production. Some \$40 million has also been allocated to buy Polish coal for Austria. As Mr Harriman said, there is no desire to erect an economic wall along the Iron Curtain. Consumer goods will move freely; war commodities will be banned; and the export of goods which fall in an intermediate category, like industrial equipment, will be judged on its merits and according to what is offered in return.

Of all off-shore purchases, those in Latin America require the most delicate handling. ECA has three aims in Latin America; to persuade these countries to extend some credit to Europe; to induce them to take soft as well as hard currencies in payment for their foodstuffs and raw materials (despite the "bellyful of sterling" they hold), and to ensure that excessive prices are not charged. The dollar starvation of Latin America makes the distribution of Marshall dollars a powerful weapon. But its use is complicated by the desire of the State Department not to drive Brazil and Argentina too hard; and the insistence of American businessmen with investments or debts in South America that the restrictions on dollar remittances should be lifted as a condition of ECA purchases. The House has forbidden off-shore purchases at prices higher than those in the United States. Argentina has already conceded that she will charge no more than market prices for her grain, but added hastily that she has no wheat to sell. An American purchasing mission will soon show, in the progress of its negotiations, which famine is the most compelling: that of dollars in Argentina or that of commodities in Europe.

The Voice That Failed

The Senators who deplored a comparison between Nevada and the Siberian steppes, on the ground that it suggested a resemblance between the United States and Russia, were perhaps carrying patriotism too far, but there was some justification for their indignation at statements such as that Pennsylvania's Quakers were a "social problem" and that "New England was founded by hypocrisy and Texas by sin." Flippant simplification of this type, at least when read in translation and out of its context, seems unsuitable to a series of broadcasts produced under the auspices of the State Department and intended to explain the United States to Latin American listeners. But the only obvious wounds inflicted by the poisoned pen of Mr Borgia, the Venezuelan scriptwriter employed by the National Broadcasting Company and since discharged, were to the local pride of members of Congress from the discredited States, and these wounds have been soothed by the balm of Congressional investigations. Mr Borgia himself, aware that he was less expert than his forebears in the detection of potential poison, had been reluctant to write the "undignified" scripts demanded by his superiors in NBC, who, in his opinion, "lacked culture." Having little knowledge of his subject, he relied mainly on Mr John Gunther's *Inside America*. "My only guilt," said Mr Borgia, "was in taking seriously an American writer, a best seller."

Out of the welter of buck-passing in the Congressional investigations, it became clear that the chain of responsibility for these broadcasts, both within NBC and between NBC and the State Department, was not only weak but tangled, and that the basic cause of both these faults lay in the limitations imposed by Congress last year on its appropriations for overseas broadcasting. The sum allocated was only half that requested by the State Department and it was in a form which forced the Department to put into practice the Congressional theory that private broadcasting companies could give America a more effective and efficient Voice than could the Department. All entertainment programmes and all news programmes, except those to critical areas such as Eastern Europe, have had to be farmed out to private broadcasters, and the combination of shortage of staff and division of authority meant that there was no adequate supervision.

The evidence that the Voice of America was distorted, at least when produced by Mr Borgia last winter, was conveniently disclosed just as new appropriations for the Voice were going through Congress, and \$28 million, more than twice last year's appropriation, has apparently been approved for the State Department's information programme. Some of the broadcasting and other activities abandoned last year will now presumably be resumed; the Department also plans to enlist its own radio staff to edit and distribute all its news bulletins and news commentaries and to supervise all entertainment programmes produced on its behalf, in order to ensure that the Voice of America remains in tune.

Government by Injunction?

The representatives of the railroad workers have demanded nationalisation of the American railways, but this is a move in the dispute in which three of their unions are at present involved, rather than a statement of long-term policy. It is argued that the Government, by its purely technical seizure of the railways in order to prevent a strike by these three key unions, has become a strike-breaking agency: if it is going to coerce the employees, it should also coerce the employers, assume full control of railroad revenues as well as of railroad labour and proceed to bargain upon wages and working conditions. The unions are apparently confident that the Government would offer them better terms than the companies are prepared to do and that, if not, they could strike against the Government, although the Taft-Hartley Act forbids strikes by Government employees. Negotiations with the companies have finally broken down and it will hardly be possible to postpone any longer hearings on the Court injunction which has been issued against the strike and which the unions are determined to fight.

Labour as a whole is said to be very disturbed at the absence of public condemnation of the Government's interference with the right to strike. This complacency is explained, in part at least, by uncomfortable memories of the last railway strike and by the disrepute which Mr Lewis has attached to the rest of the labour movement. He has now further embarrassed it by his refusal to bargain with the Southern Coal Owners Association over the new contract for his mineworkers. His intention was to negotiate a contract first with the more amenable coal owners and thereby to bring pressure on the always recalcitrant Southerners. The outstanding example of a labour monopolist is thus denying to the employers the right of industry-wide bargaining on which labour insists. The lack of any restrictions on this right is one of the great weaknesses of the Taft-Hartley Act, according to the enemies of labour. Mr Lewis, as so often before, is providing those enemies with a new weapon, just as the railway unions are presenting them with arguments for bringing railway labour under the Act.

To labour some of the most objectionable features of that Act are the powers of legal injunction which it gives to the Government. These powers have been used to oblige Mr Lewis to resume negotiations with the Southern Coal Owners and they may be used to postpone the maritime strike which threatens on June 15th. This latter injunction would probably be obtained under the section of the Act on strikes imperilling the national health and welfare. The procedure laid down for dealing with strikes of this kind has just been carried through all its stages for the first time in a dispute over wages and welfare schemes at the Oak Ridge Atomic Laboratory. The 80-day injunction against the strike, during which negotiations were carried on, has now expired and the 800 members of the Atomic Trades and Labour Council have voted on, and rejected, the management's final offer. They are now free to strike, although it is not certain that they will do so, and the President must report to Congress on the dispute.

Shorter Notes

The House Foreign Affairs Committee has now passed a Bill favouring a loan of \$65 million for the construction of a headquarters for the United Nations. It contains a statement on the strengthening of the United Nations and the possible eventual association of the United States with regional defence pacts similar to that embodied in the Vandenberg resolution passed by the Senate Foreign Relations Committee. It is hoped that these parallel statements of policy may be approved by both House and Senate before Congress adjourns.

Congress has approved the Reed-Bulwinkle Bill, which exempts from the anti-trust laws certain agreements on railroad rates, classifications and so forth. Supporters of the Bill argue that it will lead to increased efficiency, while its opponents claim that it restricts competition and legalises practices which are being attacked in two anti-trust suits now pending in the Courts. President Truman may veto the Bill.

The Census Bureau estimates that by election day next November there will be 94,815,000 persons of voting age in the United States, although a certain number of these, which cannot be estimated accurately, will not be eligible to vote.

Letters to the Editor

Malthus Regained

SIR,—Your article on Malthusianism disturbs me. It is so obviously right and so completely wrong. Malthus surely mis-judged the immediate population problem, because he did not take into account the enormous increase in world production of food and raw materials which was possible, chiefly in the Western Hemisphere. His theory was perfect—applied to Britain, assuming that Britain were not to have her entire situation altered by events outside of Britain.

You, I fear, as surely misjudge the population outlook a century and a half later, because you, in turn, concentrate your attention on the internal situation of Britain, and assume, as he did, that there has not been a complete alteration in Britain's position as a result of events in the outer world.

The great expansion in production of food and raw materials is over. The next century and a half will not be a period of careless exploitation of virgin forests and fields, such as confuted Malthus, but, if civilisation is to be preserved, a time of laborious and costly restoration and conservation of plundered natural resources.

I am alarmed to see the increasing concentration of British thought on the internal affairs of Britain; the failure to realise that Britain can only survive as a great nation by the same method which made her one—constant adaptation of the domestic life of Britain to the economic conditions of the world as a whole.—

Yours faithfully,
P. C. ARMSTRONG
610 Dominion Square Bldg., Montreal, Canada

Whose War in Palestine?

SIR,—You use the words "pious hypocrisy" as a term of abuse of people who think differently from yourself on the Palestine question. But, in fact, is not your own attitude highly hypocritical? You say "that this country is not prepared to enforce a solution on either party." If this means anything it means complete neutrality. In fact, every act of His Majesty's Government is calculated to assist actively or passively the Arabs to impose their solution on the Jews. Against most categorical denials the Arab Legion has been allowed to occupy vantage points from which to attack Jerusalem as soon as the mandate ended. The Arab Legion's operations in Palestine at this moment are, of course, entirely financed by His Majesty's Government and the whole existence of the Legion is dependent on British money. On top of this the Legion is, of course, British officered and all its arms come from British subsidy. All the arms of the neighbouring five states now attacking Palestine are British. As against all this, there is an embargo on the supply of arms to the Jews.—Yours faithfully,
PAUL ELEK
"Guilkins," Courtenay Avenue, Highgate, N.6

No Uno for Hyderabad

SIR,—Your editorial note published in your issue of April 24th is rather a deviation from the usual moderation of *The Economist*. You state that Uno is not concerned with Hyderabad. The need for Uno's concern does not arise at all, for neither Hyderabad nor the Indian Union has ever expressed the desire to refer the issues under dispute to the United Nations. The Governments of both states are still confident that an amicable settlement of the relationship between them will ultimately be arrived at by peaceful discussions between them. But if the present standstill agreement is abrogated and an armed conflict is threatened, there is nothing to prevent reference to Uno of a question affecting peace between two states whether both are members of the United Nations or not.

There is no clause in either the Cabinet Mission's plan or HM Government's announcement of June 3rd or the Indian Independence Act forcing accession to a Dominion on any state of what was British India. The many statements of the Prime Minister in the course of the passage of the Indian Independence Bill through Parliament bear out the fact that after the lapse of paramountcy the Indian states are at liberty either to stay independent or to accede to one or the other Dominion. If the Nizam, in order to preserve the tradition of amity and peace among all sections of his subjects, which has been the hall-mark of his rule, decides not to merge the distinctive identity of

Hyderabad with either Dominion created as a result of the communal division of India, and in deference to the dictates of reason and the wishes of a fairly large section of his subjects retains the independent status of his state which existed before the advent of paramountcy, the validity and justness of his stand are indisputable. Why should Hyderabad be absorbed in the Indian Union? Do small states, because of their smallness, forfeit the right to an independent existence? Hyderabad, as big as prewar Germany in size and having a population as large as Turkey's, has every legitimate claim to be allowed to enjoy the blessings of freedom and independence, in full collaboration with the neighbouring Dominion.

The geographical factor as the determinant in the accession of a state to either Dominion has been almost shattered by the Government of India's acceptance of the "decision" of the Maharajah of Kashmir to accede to the Indian Union. The greater part of the frontiers of Kashmir are contiguous to Pakistan, and, but for a small stretch of unpassable hilly territory in the East Punjab, Kashmir has practically no contact with India; yet the Indian States Ministry has no qualms of conscience in approving of the accession of the Maharajah to the Indian Union. On the contrary, the Nizam and his Government have never harboured the desire to accede to Pakistan. In fact, the ruler and his Government have repeatedly stressed that in "harmony and co-operation with the Indian Union lies the good of Hyderabad and India." The Moslems of Hyderabad are in no way hostile to the Indian Union. Their political leader, Quasim Rizvi, stands for an honourable settlement with India.—Yours faithfully,

Tavistock Place, W.C.

MAHMUD ALI

The Middle Way

SIR,—Can you or any of your readers enlighten me as to the solution of the following problem?

Is there any possible ultimate choice in the half-controlled economy such as we now have other than between either (a) maintaining full employment and having competitive money-wage pressures cause such inflation as finally to break the currency, or (b) using a high interest rate and other contractive devices to create so much depression and unemployment as to break the bargaining power of the trade unions?

The point seems to be more than of mere academic interest.—Yours faithfully,
A. JOHN WHITESIDE
Selwyn College, Cambridge

From *The Economist* of 1848

June 10, 1848

PERHAPS, of all sums of money spent and now spending by England, those wasted in interference with the policy of other countries may be considered as the most utterly mis-employed and thrown away. Their amount, too, is and has been enormous. A vast proportion of our debt has been entailed upon us, and a great part of our naval force necessitated, by our national habit of intermeddling, and the various quarrels and guarantees in which it has involved us. Formerly the country was too readily disposed to regard this as a proof of our national power and greatness. But of late sounder and soberer notions have found entrance into the public mind. We are beginning to see that our interference has seldom either done good or obtained gratitude—to feel that we can no longer afford this costly and ostentatious patronage—and to think that we should nationally be both more powerful and more popular were we to cease to involve ourselves in the affairs of others. On no subject has such a radical change taken place in the feelings of Englishmen as on this; and, while prepared at all times vigorously to defend their rights, and promptly to repel both injury and insult, they are resolved to tolerate no more foreign intermeddling; and not to permit themselves, on any pretext, either of ancient alliances or present expediency, to be dragged into disputes with which they have no concern. Any Ministry which should continue to entangle England in a war for continental interests, or which should even bring on the imminent risk of such, would, we are convinced, be driven from power by an expression of public feeling too prompt and universal to be misconceived.

Books and Publications

Who Rides on the Tiger?

"The Amazing Story of John Law." By H. Montgomery Hyde. Home and Van Thal. 200 pages. 16s.

... His impetuosity, of course, was not his only fault. His economic policy was not always consistent with the theories which he had enunciated. ... He thought unwisely that people could be compelled against their will to maintain their confidence. ... He placed too much faith in the arbitrary power of ... authority, and too little in the influence of public opinion in money matters. ...

It is almost enough to make one believe in reincarnation; but there never could have been a John Law in any other century than the eighteenth. As portrayed by Mr Montgomery Hyde, he was fundamentally an honest man; in private life a successful gambler, but not a cheat; an inveterate gallant, but not a debauchee; in his public career the originator and victim of a good idea—paper credit—which got out of hand through no fault of his. The story is well told and the thesis of Law's good will convincingly maintained. The account of the rise and fall of the "system"—the *Banque Générale* and the *Compagnie de l'Occident*—raises some curious economic queries. How was it that, at the height of the "Mississippi" boom, prices of consumer goods throughout France were actually falling fast? Had the boom taken place at a time of monetary stability, had it been financed by accumulated savings, this would be natural enough; but it was in fact accompanied and sustained by a huge outpouring of paper money. One must conclude that the depths of depression to which the French economy had previously sunk were so extreme that even a tremendous overdose of purchasing power could do, at first, less harm along the traditional lines of inflation than good by freeing commerce and stimulating production.

The problem has the theoretic fascination of the limiting case. The "system's" collapse is less surprising, and there seems no reason to assign the blame, as does Mr Montgomery Hyde, to a single fatal step taken, for selfish and corrupt motives, by Law's adversaries in high places. There is always a trigger, sooner or later, to touch off such an explosive situation; the system had become hopelessly unstable, as indeed it was bound to do since it contained no self-stabilising elements. Fundamentally Law may have been honest enough, but only, one suspects, because of the absence of those technical regulations whose infraction would have unmistakably signified dishonesty. He mounted the tiger Inflation with the best motives; he was not the last to discover the difficulty of getting off again without disaster and disgrace.

A Historian's Reflections

"The End of an Epoch." Reflections on Contemporary History. By A. L. Rowse. Macmillan. 15s.

THE interest of this published collection of essays, book reviews and letters to the press written between 1930 and 1943 lies in the coherent critical outlook on society and politics which they express. Mr Rowse has added an "Apology by way of Preface" dated 1946 giving his retrospective view of what he regards as a

closed period and of its lessons for the present. Comparison of this preface with the earliest writings included in the book show a considerable development of thought and some changes of opinion, particularly in the estimate of Russian Communism, but a fundamental consistency—a theoretical reflectiveness which is exceptional among political writers in English-speaking countries and yet avoids the schematism and unreality of a Germanic *Weltanschauung*.

Mr Rowse's political ideas are rooted in historical studies, and this awareness of historical background continually shows itself in his comments on current events; it has also given him an intellectual position which does not easily fit in with the dichotomy of Left and Right. A man of the Left and a Labour parliamentary candidate all through the 'thirties, Mr Rowse nevertheless denounced the appeasement of Nazi Germany above all as a departure from traditional British foreign policy, and records that he "received a private word of encouragement from the Foreign Office" for doing so. Mr Rowse was indeed one of the first in the Labour Party to link Labour's social programme with a mature and responsible conception of a national foreign policy—something which hardly existed in the Labour movement twenty years ago and is deficient in some sections of the party even to-day. Mr Rowse is an admirer of Mr Bevin and dedicates the book to him, a "fellow West Countryman and a great Englishman." He can justly claim, on the evidence of this book, that he was "wholly and consistently opposed to the course and conduct of our foreign policy throughout those years from 1931 onwards," and his "Reflections on Lord Baldwin," written in 1941, deserves to rank among the classics of English political invective.

Looking back from a post-war year, he is more lenient in his judgment and allows that "nobody can say that they (Baldwin and Chamberlain) were bad men; they were merely not up to the job." But this, after all, is the problem of the period; why was this country so long content to be led by men of such mediocrity? Mr Rowse believes that that epoch has indeed ended and that Britain "redeemed itself in the tremendous trial of the war"; he sees "the years 1940-45 that we have lived through as the most heroic in our history," with "the heart of English people uncorrupted and unshaken."

Economic History

"British Economy of the Nineteenth Century." By W. W. Rostow. Oxford, Clarendon Press. 235 pages. 15s.

THIS collection of essays is a very good example of what can be achieved by combining the disciplines of historical research and abstract economic analysis. The combination is surprisingly rare; for the most part, historians even of predominantly economic events write as historians, using a minimum of theory, and economists prefer to dip into history for illustrations of their theoretical constructions rather than to examine any one period or sequence as a laboratory specimen. One may add that the inquirers who do in fact combine the natural history and the physiology, so to speak, of economic affairs in their purview—the econometrists—almost invariably express their findings in a

c/o 7, PRINCES STREET, LONDON, E.C.2

(Attention Mr. H. B. Chappell)

form unintelligible to any reader not sharing their qualifications to the full; a perhaps inevitable, but certainly regrettable, fact which gives an added scarcity value to such books as "British Economy of the Nineteenth Century."

The essays fall into four groups: the first, dealing with trends in the British economy from 1790 to 1914, with cycles over the same period, with the course of investment during the Great Depression, and with the relation between real wages and investment, is predominantly analytical; the second broadens its scope to examine the impact of economic events on political thought and action; the third compares, and tests against the facts, rival economic theories relating to the period under review; and the fourth (which some readers may feel would have been better placed first) consists of a single long essay in the narrative handling of concurrent events—a kind of four-in-hand historical technique displayed with considerable virtuosity. Mr Rostow's standards are high; he regards this book as a mere preliminary sketch, an essay in methodology rather than a serious example of historical and analytical research. It should, however, be as useful as a work of reference and as a guide to the significance of the events of its period as it is stimulating as a specimen of intellectual technique. Mr Rostow's full-scale treatment of his period, when his perfectionism allows him to produce it, should prove to be something worth waiting for.

Shorter Notices

"Insurance Companies' Accounts." An Economic Interpretation and Analysis. By S. J. Lengyel, M.A. F. W. Cheshire Pty., Limited, Melbourne and London. London Agents, Wadley and Ginn, Dominion House, Bartholomew Close, E.C.1. Price 25s. net.

THIS analysis of insurance accounting, by the editor of the prewar *Assekuranz Jahrbuch*, draws attention to the lamentable state of the published information on insurance companies' business and points to the main directions in which advance must be made. The author's explanation of the statutory requirements in the U.S.A. shows the gaps in the Assurance Companies Act in this country. It is not clear, however, whether or not he would advocate following the American system, which demands extremely detailed returns on all facets of insurance business, though a logical conclusion of his case would be that at least some of the American rules should be applied in this

country. The elaboration of numerous inadequacies of British insurance accounts is undertaken in a manner which pre-supposes no previous knowledge of this rather specialist subject. A few sections of the book are tantalisingly brief—for example, a more comprehensive treatment of the problems of inflation and interest trends would have been welcome—but even on these subjects sufficient is said to throw up in relief the urgency of removing archaisms in insurance accounts. The book is a succinct guide to the peculiarities of insurance accounting, which will be useful to professional accountants as well as to those inexperienced in accountancy. The investor in insurance shares will derive special benefit from the chapter on the analysis and interpretation of insurance accounts.

"The Middle East—1948." Europa Publications. 377 pages. 50s.

THIS is a new reference book, well set out on large paper and covering the thirteen major countries of the Middle East. A standard method of presentation is adopted for each country. Its headings run through geography, history, the government (up to April, 1948), communications, economic life, education, places of interest, the press, a bibliography, and a map. There is also a general Who's Who. The facts are authoritative, and will be found particularly useful by government officials, journalists, bankers, merchants, shipowners, and librarians. Perhaps the weakest feature of this impressive work are the maps; in an effort to be gay they appear a little indecisive.

"Marketing Survey of the United Kingdom." Business Publications Limited. 540 pages. Three Guineas.

THE first postwar edition of the Marketing Survey is a very comprehensive one. The main part of the book is given over to local statistics for all the main market towns—data on population, employment, public services, numbers and types of shops and general facts about the standard of living. A lot of the information is not new but has been collected together in a useful form. Some of it is published for the first time, including an analysis of employment by industry for individual towns. The statistics are well presented and some useful comparisons are made between the present day and prewar.

"Production in the United States, 1860-1914." By Edwin Frickey. Harvard University Press. 257 pages. \$4.00.

THIS rather misleadingly named volume deals not with production, but with the technical problems of the measurement of production, and brings to light the methods used in handling the statistical data for a previous study, "Economic Fluctuations in the United States." It should be of interest to statisticians in general, but its technicalities are far outside the range of the ordinary economist or historian.

THE WORLD OVERSEAS

The East Bids For Germany

(By a Correspondent)

PUBLICATION this week of the Six Power Agreement on what is to be done next in western Germany does not find the Russian Zone unready to take its counter measures. On the contrary, ever since the last attempt of the Foreign Ministers to agree on their German policy broke down in December, the Russian occupation authorities and their German agents in the dominant Socialist Unity Party (SED) have been hurrying on political, economic and administrative preparations for the new situation. If they wished, they could probably establish an "eastern government" in Berlin tomorrow, not on an elected basis, but with effective powers over the economic and administrative machine of the Zone. And that government would be virtually under Communist control, with members of the SED in all key positions, and with opponents occupying other posts to give the appearance of a balanced coalition. It would have the threefold task—self-contradictory to any but Communists—of satisfying all Russian demands for reparations, tightening the grip of "popular democracy" on the eighteen million Germans in the Zone (20 million when the Russian sector of Berlin is incorporated), and at the same time competing with democratic, nationalist and anti-Western slogans for the favour and loyalty of 45 million Germans in the Western Zones.

There is little doubt that the Eastern Germans would be equal to the triple requirements. They have had time and opportunity to practise in all three directions; and behind the practice has always been the idea that if, by some unexpected turn of events, there should be Allied agreement to keep Germany united, then the organisation built by the SED in and around Berlin would be ready to embrace, split and finally digest the parties and politicians of the West. For example, as the *Berliner Zeitung* has said, rather indiscreetly, the withdrawal of foreign troops might "produce a sudden solution of the problem of German unity."

Propaganda for German Unity

The signal for the present Communist drive to gain the leadership of nationalist forces in Germany was given by Mr Molotov during the London conference last December. It was then that the "People's Congress for Unity and a Just Peace," drummed up in the Russian Zone, came into prominence with its claim to represent the aspirations of the whole German people. Since then it has been developed fast, not only as a propaganda machine, but as a potential instrument of national government. At its second meeting in Berlin in March the Congress boasted 1,117 "delegates" from the Russian Zone, with only 512 from the three Western Zones, none of them authorised delegates of the leading Western parties. Its leading figures, Pieck and Grotewohl, made it clear that everything possible would be done by threat and argument to dissuade the Western Powers from pursuing their plans for the organisation of a West German State, and to frighten Western Germans from co-operating ("collaborating") with the Americans, British and French. The spearhead of this attack has been the "popular initiative for German unity," or the campaign to collect signatures for a petition in favour of what is called a "bill." This bill states:—

Germany is an indivisible democratic republic in which the *Laender* shall have rights similar to those in the constitution of the German Reich of August, 1919.

The signatures will have been collected by this Sunday, June 13th; and it was the original intention to present the "petition of the people" (*Volksbegehren*) this month to the Control Council, and demand either its acceptance or the holding of a nation-wide plebiscite.

In the Western Zones no official facilities have been allowed for the collection of signatures, because Germans realise, as well as the occupation authorities, that this mock plebiscite is a Communist-directed move, support for which among the vast majority of Germans in the Eastern Zone can be taken for granted. By May 29th, according to Tass, over 8,600,000 Germans in the

Russian Zone had already signed in favour (72 per cent of those entitled to do so), and an impressive final figure is a foregone conclusion. Signatures have been invited from young Germans between 14 and 20, and among the lighter inducements has been the public sale of a badge, with which at a cost of 10 pfennigs the wearer can show he has toed the zonal line.

The purpose of the campaign is quite clear; it is designed to present Russia and the Communist-controlled SED Party as the champions of German unity against the "attempt of American imperialism to tear Germany apart." As Pieck, one of the three chairmen of the People's Council Præsidium, has put it more than once:

The fact that the Soviet Government received its mandate from the greatest popular revolution in history explains why it is the consistent champion of German unity. The USSR is the only Power to have pledged full support for the popular initiative in Germany.

Puppet Government in the Making

The People's Congress, from which this clever and well-organised campaign emerged, elected in March a People's Council of 400 members, on top of which was appointed a Præsidium, which has some of the appearance of a shadow cabinet. Of the 29 members of this Præsidium, 20 were elected from the Russian Zone and Berlin, while nine members for the three Western Zones were nominated *in camera*. This Council has since appointed a number of consultative committees, of which the most significant seem to be the constitution committee—preparing a constitution for a united Germany—and the peace treaty committee—preparing a draft peace treaty.

When the People's Council met last month, on the anniversary of the 1848 revolution, speeches were made which virtually asserted the Council's right to represent the interests of the whole German people. In fact, there is little doubt that this Council and its Præsidium look forward to something more than a zonal future. In the two bodies are all the makings of a puppet government, without a broad elective basis. And it was just after this meeting (on May 25th) that one of the Council's chairmen, Grotewohl, made to the constitution committee the back-handed statement that "national resistance" would come into play if a Western State were created "in violation of Allied agreements."

The inflammatory and misleading vocabulary of the People's Congress movement has had so far no marked effects in the Western Zones, and concern about its lack of success has been reflected in a request from the Communist Party to change its name to "Socialist People's Party of Germany," a request which Military Government in Bizonia rejected. It has embarrassed particularly the Social Democrats, who find themselves outplaced in the advocacy of German unity by their rivals for working-class leadership. But the appeal does not stop at propaganda.

Parallel with the development of this nationalist movement has come a series of gestures by the Russian occupation authorities, calculated to impress Germans outside as well as within the eastern zone. Occupation costs for this year are being lowered, although reparations remain unchanged. On May Day it was announced that Marshal Sokolovsky had promised 20,000 tons of bread grain and 20,000 tons of fodder grain to cover the zonal food deficit until the harvest. The fact that this is a loan to be repaid by German industrial production received less notice than the fact that something was at last being done to meet the serious food shortage, in which Russian requisitioning has been a contributory factor. It has also been announced that 40,000 tons of fertiliser would be sent from Russia, and that further quantities would be delivered from the synthetic oil works at Leuna, now owned by the Russians. Even more impressive in its conciliatory intent is the recent Russian decision to stop confiscation of businesses belonging to "war criminals," a definition which has enabled the Russians and German collaborators to gain control of over 40 per cent of the entire productive capacity of the zone.

Control of Trade and Industry

Even more significant in its implications for the future is the total economic machinery which has been established in recent months. There are certain superficial resemblances with Bizonia—with this important difference, that the Economic Council of the western Zones had an elective basis and fair representation of *Land* and party interests which the Economic Commission of the Russian Zone has not.

An overhaul of the previously existing machinery by the Russians produced in March the following results. At the top, with authority over the States, an Economic Commission with 16 main administrative sections. Decisions of the plenary session of this body are known as decrees; decisions of its secretariat are known as directives. Directive and decree are equally binding on the whole Zone. Its power lies in its authority to direct the distribution of goods and materials within the Zone; its attention is specially directed to the control of industrial production, in which the Russians are chiefly interested—for the key plants are owned by the Russian State through the Soviet AGs. It is from industry that come the reparations goods which find their way into world markets and earn dollars for Moscow.

Chairman of this Economic Commission is Heinrich Rau, a veteran Communist; Director of Planning is Wilhelm Leuschner of the Communist-controlled SED; industry is under the control of Selbmann, also of the SED; agriculture is under Luitpold Steidle, a member of the Moscow branch of German officers, who claims to be a Christian Democrat but is disowned by his party in Berlin as a Russian puppet. Key positions in the Economic Commission therefore are in Communist or near-Communist hands; and to them is entrusted execution of Marshal Sokolovsky's latest wish, that the Zone should work to a two-year economic plan for the years 1949-50.

In the economic field none of the measures so far taken in the East to woo the Germans stand comparison with the material aid which is now about to flow into Western Germany under ERP. As long as Russia continues to milk its zone in reparations, and put only negligible quantities of raw materials back into its economy, there need be no fear of the Communists competing with Frankfurt in the economic field. But the whole aspect would change if Moscow decided to forgo reparations, and—still more important—to return the Polish-occupied territories to the Germans. It must not be forgotten that "unity" to Germans, in the East and, above all, in the refugee-packed West, means unity of a Reich stretching to Königsberg. This fact has again been emphasised by the Executive of the Christian-Democrat Party, which has demanded that the forthcoming German Assembly in the West must have deputies elected from among the refugees who will represent the "Polish-occupied German territories." Russia's real strength in the long-term struggle for Germany lies in its possession of power to offer this gigantic bribe.

From Cyprus to Israel

[FROM OUR SPECIAL CORRESPONDENT]

WHAT difference will the Bernadotte truce make to the Jewish camps in Cyprus? For ten days past these have been seething with disappointment, uncertainty, and resentment against anyone who might baulk chances of immediate departure. Those inmates who are outside the 18-45 age group—they form a majority of the total—are not affected. Since May 15th they have been free and are still free to leave as fast as the Israeli authorities can send ships for them. But families do not want to be split up. And the exodus of the rest is in doubt. Without question, the 18-45 group are "fighting personnel"; they have been drilling daily while detained, and are at least part trained. Their departure is now governable by one or both of two binding international undertakings. The first is the Security Council's truce resolution, with its provision that "all governments concerned" must "undertake that they will not introduce fighting personnel into Palestine." This, it will be remembered, caused the British authorities at once to decree that no one between the ages of 18 and 45 should leave during the truce period. The second is the paragraph of the Bernadotte truce conditions which rules that men of military age can be introduced only if the mediator is satisfied that they are not arriving "in such numbers as to give either side a military advantage."

It is plain to anyone who knows the Arabs that the merest dribble of these semi-trainees from Cyprus would in their eyes constitute "a military advantage," and would entail an appeal by them to the Security Council. It follows that the fate of the

truce hangs in large part upon Count Bernadotte's operation of its clause about numbers of fighting age.

A question of moment to Britain as the guardian of the Cyprus Camps is: on whose authority are the men and women of fighting age to be further detained? If that authority is only Britain's, the camp inmates will make trouble. They have already threatened "consequences." These are likely to entail fracas and shooting of the type that invariably proves a dead loss to Anglo-American relations. But what if that authority is also Count Bernadotte's? What if he is endowed with the strength and foresight to maintain to the Israeli authorities that, if they want the truce to work, they must hold their hand over immigration because the introduction, now, of fighting-fit youth from Cyprus will break it? From the British point of view, there would be immense advantage in leaving the matter to regulation by his authority backed by the Israelis who have accepted his terms. To do so would be to cause the internees to wait their turn without engineering the resistance that they were preparing to offer the British authorities.

For a recent visit to the camps suggests that, though the sense of frustration and bitter disappointment that will afflict them will be colossal, subservience to orders from Israel is complete. Tel Aviv can keep their temper in bounds if it has a mind to do so.

The camps are situated at three points in the island, mainly out of Cypriot sight, though the dingy tentings of one—Caralos—can be seen from the walls of Famagusta. Outside the wire but inside an outer palisade, a British military contingent conducts duties that are too like those of a gaoler to be pleasant. It does its best, with limited facilities, to provide for water, the collection of refuse, arrangements for ritual slaughter, and for conveniences such as the official registration of births (which are numerous) and of marriages (of which there are quite a few). It supplies free clothing, washing and shaving gear, some tools for trades (though not all that the inmates would like) and food in the shape of bulk rations from the army. Its issues are supplemented on a large scale by the American Joint Distribution Committee serviced by a staff of 100 white coated American Jewish workers.

Discipline in the Camps

Inside the inner wire all is managed by the Jews themselves. Discipline seems to be rigid, authority complete. The leaders who exercise it are not identifiable. They are certainly not the spokesmen who, because they know halting English, are chosen to negotiate with the military. Occasionally, trouble has arisen between this Zionist political faction and that. Fisticuffs, black eyes, and knife wounds have ensued. But such fracas are dealt with swiftly and without reference to the British guards, who are left to guess the details. The organisation of the inflow and outflow (subject only to British regulation of actual numbers) has been handled by the Jewish authorities themselves. Since Cyprus became the recognised queue, the Agency representatives there have known in advance exactly who was coming. And there has been no audible questioning by disappointed inmates of their decision as to who must be the first to go. In theory, their criterion was first in, first out. In practice, potential fighting men and technicians have lately jumped the queue, particularly since the arrival of the 14,500 picked souls who travelled from the Black Sea in the *Pan York* and *Pan Crescent* in January last. The preference given to them was hard on the old stagers, but these acquiesced. Very occasionally, the totalitarian nature of the management seems to have frightened a backslider. A small number of applications for return to the country of origin have identical terms, the applications have later been cancelled by a letter "written of my own free will."

In general the camps greatly impress by their tidiness and the keenness with which their inmates invent tasks and pursue duties as the days go by. Tents are shabby but wonderfully neat. Health is magnificent, doctors abound, so does brawn. Here on the netball ground a squad of both sexes drills with sticks to staccato Hebrew orders of command. There, in the library, a class is as she bangs her way, with her empty petrol tin, into the water queue that demands some hours of each uneventful day. The babel of tongues makes the adoption of Hebrew understandable. Seated among the tent ropes, a Sephardi North African Jew (selected, no doubt, because he can speak Arabic) picks at the frayed edge of his robe and looks eastern and out of place.

For the waiting Jews today, the burning question is How Long? For the Arabs it is, How Many? To the British both questions are apt. For the first puts a term to a duty which has never been pleasant. The second, if answered satisfactorily by Count Bernadotte, will avoid allegations of partisan handling of this unhappy legacy of the Mandate.

Electors' Verdict in Australia

[FROM OUR MELBOURNE CORRESPONDENT]

THE defeat of the referendum in Australia on May 29th, in which electors were asked by the Federal Government to vest in the Commonwealth Parliament the power to control permanently rents and prices, was three days later followed by a decision of the Federal Cabinet to hand over controls of rents, land sales and prices to the State Governments within three months. This decision, generally unexpected, has caused a mild political sensation in the Commonwealth, for it was widely believed that the Federal Government would maintain wartime control of rents and prices at least until the end of the year, when the enabling legislation expires. It was thought that they would even extend the controls for a further twelve months with the support of the Parliamentary Opposition.

The Federal Government has apparently interpreted the decisive rejection of its proposals—a "No" vote was recorded in each of the six States—as a direction to withdraw from the prices field altogether. The decision, moreover, has taken the Opposition parties by surprise. The leader of the Federal Opposition, Mr Menzies, said four days before the poll that "everyone is doubtless aware that whatever the result of the vote, the present Federal controls will continue for some considerable time." There is grave danger that there may be serious disturbance to the domestic economy unless the six separate states are able within three months to set up administrative machinery providing for uniformity of decision and continued co-operation between state and state, on the lines already established after nine years of Federal direction.

The defeat of the referendum raises important political issues which transcend the simple question of whether the Federal or States authorities should control rents and prices in Australia. The Prime Minister, Mr Chifley, said in the campaign that he did not regard the issue as a political one. He stated categorically that "price control does not advance the political programme of my Government one inch." On the other hand, Mr Menzies was equally emphatic that "the Federal Government is seeking to secure these permanent controls for Canberra as part of its long-range policy for the destruction of Federation and the States, and for the establishment of the complete Socialist State in Australia."

As usual, the truth probably lies halfway between these two views. The Federal Government regards the control of prices and rents as necessary for the postwar development of primary and secondary industries and for maintaining stability in an economy which is particularly sensitive to fluctuations overseas. The Opposition parties, knowing full well the spectre which any suggestion of "this grasp for further Federal power" raises in the public mind, made the issue not so much as one of price control as such, but as another step in Labour's programme of gaining complete control of the means of production, distribution, and exchange.

The Opposition parties are claiming that the verdict shows that "the electors are determined that the Chifley-Evatt Ministry shall not be allowed to further its socialist policy, with its attendant danger of the abolition of the arbitration system and industrial conscription"—to quote the leader of the Federal Country Party, Mr Fadden, who, with Mr Menzies, led the campaign against the Government's proposals. The *Sydney Morning Herald* went even further and claimed that "so overwhelming is the referendum verdict that any Government less contemptuous of public opinion than the Chifley régime has shown itself to be, would feel honour-bound to resign in order to submit its whole programme to the country."

Threat to Remove Subsidies

But although the Government did not resign, it nevertheless took prompt notice of the electors' verdict by deciding to withdraw from the prices field altogether with the result that it is being accused of being both "petulant and impetuous in its natural disappointment at the referendum vote." In reply to a question, however, Mr Chifley told Parliament that he had received assurances that the States were fully prepared to take over rent and price controls.

A very interesting post-referendum announcement by the Government is the fact that a Cabinet sub-committee has been appointed to consider the question of the subsidies which have been paid as part of the general plan to hold prices down. This announcement

is particularly interesting because during the campaign the Prime Minister said: "Obviously the Commonwealth could not continue to provide subsidies for goods the prices for which are to be fixed by a State authority which would have no financial responsibility to find the money."

If Mr Chifley's threat to discontinue payment of subsidies were carried out, it could precipitate a serious crisis, for subsidies, amounting to £40 million per annum, are an integral part of the present price-fixing system. Tea, which costs Australia 5s. 3d. per lb. overseas, is sold at 2s. 9d. per lb. in the domestic market. Wool is made available to Australian mills at prices much below world parity in order to assist in keeping prices of woollen apparel down, while prices of a wide range of imported goods, particularly textiles, are subsidised back to approximately 1943 levels. Raw cotton is purchased overseas by the Commonwealth Government and released to spinners at prices well below world parity. Withdrawal of these subsidies would undoubtedly cause an immediate rise in prices with disastrous effects on the cost of living.

The Government's actions will clearly be influenced by the knowledge that there will be a general election next year. It knows full well that nothing would alienate it more from its supporters than a deliberate withdrawal of subsidies, an action which would smack of spite and recrimination. An "I-told-you-so" attitude is not good tactics in party politics. It would be surprising if the Government, despite Mr Chifley's threat, abruptly discontinued paying subsidies, although there will probably be some tapering off of payments for commodities of lesser significance in the cost of living index, which shows an increase of about 34 per cent in retail prices since 1939.

Voting Not On Party Lines

Experience of the past has shown that in Australia, the verdict of the people at referendum polls is not necessarily a clear indication of public approval or disapproval of Government policy as a whole. That electors do not vote on usual party lines is shown by the fact that in this last poll both Mr Chifley and the Deputy Prime Minister (Dr Evatt) had "No" majorities in their own electorates. The only areas where majorities were received for transfer of powers were the blue ribbon industrial strongholds in the large cities. In 1944 an earlier referendum on the transfer of financial powers was defeated after a sweeping victory of the Curtin Labour Government in 1943; in 1946, Labour was again returned with a substantial majority in both Houses of Parliament.

But the temptation to draw the conclusion that the referendum verdict is another indication of growing dissatisfaction with Mr Chifley's administration is strong when various pointers over the last nine months are also considered. First and most significant of these was public reaction to the Government's surprise decision to nationalise the Australian trading banks. This led to a general election in the State of Victoria to resolve a crisis precipitated by the Upper House, the Legislative Council, in its refusal to grant supply on the banking issue. The State Labour Government, led by Mr Cain, was defeated and a Liberal Administration, led by Mr Hollway, returned. It was generally agreed that the Federal Government's stocks fell to a low point at that time and that it probably would not have been returned had it gone to the country on banking.

More recently, Labour has suffered two lesser political reverses in the States. In a Legislative Assembly by-election in New South Wales, the Liberal Party candidate took the Coogee seat from Labour, and in Tasmania the Minister for Forests (Mr Worsley) was defeated in the Legislative Council elections. The Federal Government itself might not survive a general election now, but its three-year term does not expire until September next year, and much can happen before then.

The referendum verdict is undoubtedly a check to the trend toward greater centralised control in Australia, which has been growing steadily for many years and received a tremendous impetus during the war. The Australian States, after 47 years of Federation, are still very jealous of their rights, and they resent any assumption by the Commonwealth of powers which they consider are rightly theirs. The war, however, saw the establishment of Uniform Income Tax under which the Commonwealth has become the sole income-tax authority in Australia, dispensing grants in return to the States. The Commonwealth is sustained in this power by a High Court judgment, and it is certain that, despite protests from the States, as long as there is a Labour Administration in the Federal Assembly benches, the Central Government will maintain a tight hold on income tax. In the long run, the authority which pays the piper calls the tune, and it is improbable that the present or any other government will lightly relinquish this great accretion of power which the war brought to it.

Something in the City

Cellular Comfort

Our ecru cellular nette underwear is of fine quality cotton—pleasant to the touch and sufficiently absorbent. Sleeveless athletic vests. Roomily fashioned trunks with elastic tops. Prices vary with size. 38" vest, 16/-; 36" trunks, 16/9. 3 coupons apiece.

Travelling Light

There could be no better incentive for slipping away for a quiet weekend than one of our lightweight canvas zip suitcases. With reinforced sides and strong leather straps all round. Patent lock. 22", £6.18.0; 24", £7.10.6; 26", £8.3.3. (Fenchurch Street only).

THE BUSINESS WORLD

What are Profits?

IN the early hours of Tuesday morning, Mr Spearman moved an amendment to the Finance Bill to allow the extra cost of replacing industrial assets due to rising prices as a deduction from profits for income tax purposes. The point is not a simple one, but it is of the highest importance, and although the Solicitor-General and the Chancellor of the Exchequer declared in turn that it was fully covered by the provisions of the Income Tax Act 1945, this claim suggests that they had not grasped its full implications.

A simple example may make the argument a little clearer. During the deterioration of the mark in the 'twenties, the German businessman reached the evident conclusion that to buy an article one day for ten marks and to sell it the next day for twenty did not produce a real profit if the value of the mark had fallen meanwhile by fifty per cent. The increased money margin merely reflected the further depreciation of the currency, and the dealer's so-called profit represented the extra number of marks which he would require to replace the article which he had sold—in other words, to maintain his real capital intact. That conclusion was obvious enough in a period of rapid inflation. But it is more easily overlooked when, as in postwar Britain, inflation and rising prices have been kept under some measure of restraint. The point that handsome profits, in money terms, may be largely spurious in real terms is still unfamiliar.

Accounting practice is a compromise between a logically based technique on the one hand and expediency on the other—with a certain bias towards expediency by reason of the essentially practical purpose of the art. The idea largely persists amongst businessmen that if an outlay of £100 results in revenue of £150 there is necessarily a clear profit of £50. But if the outlay were incurred in 1938, and the revenue did not come in until 1948, it is clear that £150 in 1948 will not buy as much as £100 in 1938. The sales proceeds are smaller, in real terms, than the original cost of plant or stocks, and the original real capital of the business is not being maintained. What purports to be a generous increase in profits actually represents the consumption of capital. When any form of outlay is such that its yield accrues only over a long period, the consequences of rising prices are extremely important. Depreciation on plant is generally calculated on original cost, but prices of machinery ten years ago were scarcely more than half present prices. In fact, no business can carry on unless it can replace its real assets and it ought to be able to do so from its income. To have to raise fresh capital to replace such assets is ultimately unsound. The limitation of the Income Tax Act is that its reliefs apply when money is spent on new assets, whether that money is raised on the market or provided out of profits; they do not directly help a business to provide fully for replacing its assets out of current earnings.

In a continuing business, profit strictly defined is the excess of the proceeds of sales over the money needed to replace the assets which have been used up—not the excess of such proceeds over original outlay on the exhausted assets. This suggests that an important psychological readjustment is needed in the minds of businessmen. And a similar adjustment is needed in taxation legislation, which may be even more important. For the weight of taxation on high "profits"—as the accountant

defines them—represents a levy on "capital"—as the economist understands that term. The result is that many businesses feel unable to "afford" to make full provision for the increased money cost of replacing their assets; to do so would take away a large slice of their apparent earnings on which they have been taxed. There has, of course, been some rise in the depreciation provisions allowed for tax purposes (owing to the initial allowance of 25 per cent on new machinery and plant under the Income Tax Act of 1945) and also in undistributed company profits. But it is virtually certain that industry as a whole has not put aside sufficient out of its apparent profits to keep its real resources intact—much less to increase them. For several years past, industry has been distributing to the tax collector and its shareholders more than the real profits which it was earning. EPT was designed—in both wars—to mop up the adventitious surpluses resulting from inflation. In effect, because plant and stocks could not be replaced—or only at much higher cost—it has been a tax on industrial capital. And the same effect has resulted from the combination of a high postwar level of taxation with a continuing rise in replacement costs.

In this country, adherence to orthodox views about profits was so single-minded during the crucial years of Excess Profits Tax that there was little criticism of the tax in principle. In the United States, on the other hand, a partial compromise has been devised between the old and new viewpoints. Any American business concern which wished to avoid swelling its reported earnings by any artificial surplus on stocks could adopt a method of stock valuation largely based on prewar prices which therefore eliminated the effects of the rise in prices. But that is only one part of the problem, and a solution of the question of relating depreciation provisions to the cost of capital replacement is still being discussed in America. Mr George O. May, the eminent American accountant explored this question in the *New York Certified Public Accountant* last January, and gave some significant figures showing the measure of the spurious "inventory profits", and of the deficiency in depreciation provisions to meet replacement costs. Mr May suggested that the true reward of capital in 1947 compared with 1929 as follows:

	\$ billion
Reported profits	17.0
Deduct: "Profits" representing only increase in inventory valuations	5.3
Adjustment to meet full plant depreciation	2.0 7.3
True profits of 1947 (in 1947 dollars)	9.7
1929 profits were	8.7
1947 profits in 1929 dollars, after allowing for fall of one-third in the value of the \$	6.5

Thus, an apparent doubling of profits in this period actually hides a 25 per cent diminution in real earnings. But a large sector of industry was still basing its dividends on reported profits of \$17 billion and not on its true profits of \$9.7 billion. Thus, the extent to which a defective economic outlook and accounting technique clouds the true measurement of profits is considerable, even in the United States. Accounting opinion in the United Kingdom has even more to learn on this problem. It will have to be solved from first principles, for there

are few reliable statistics to illustrate the point. The economists who compile the National Income estimates are certainly aware of it but they abandoned their earlier attempts to correct the figures for changes in prices. Profits computed according to taxation practice are the only available data. Yet this argument about the nature of profits, though it is apparently only statistical in character, has most important repercussions on national policy. It is easy to overestimate the superficially favourable comparison between an apparent net addition to the nation's capital resources representing 14 per cent of last year's National Income, and the corresponding figure of 7 per cent in 1938. Such confusions are inevitable so long as postwar pounds are treated as being equivalent for accounting purposes to pre-war pounds. But the point is at least obliquely taken in the "Economic Survey" for 1948, which shows that the increased proportion of net capital formation is partly due to the method of calculating depreciation, which has not kept pace with the rise in the National Income.

Thus, the ugly possibility arises that in 1948, apparent additions to productive capacity—reduced as they were by the capital investment cuts of last autumn—may prove to be largely unreal, in the sense that what purports to be a genuine addition to the nation's productive resources should, on a stricter calculation, be regarded mainly as capital replacement. This broad conclusion has important consequences for industrial re-equipment and expansion which cannot be pursued in detail here. The remedy will have to await revolutions of thought in accounting practice (which in the past has often tended to reflect business opinion, rather than to set its own standards), in methods of taxing profits, and in popular notions about the meaning of the word "profits." These wider issues find a particular illustration in the case of the tobacco companies. Since 1939, the value of tobacco stocks, including duty, has been greatly increased; whenever the tobacco duty was raised, selling prices were also raised almost immediately. Some manufacturers may have felt that they did well out of these increases in duty—certainly their critics held that view—but in truth the increased proceeds on stocks on which a lower duty had already been paid were no more than sufficient to finance the maintenance of factory stocks at the same physical level; there was, in short, no real surplus. But that principle is not recognised by the Treasury, either in EPT or in the new Excise duty on factory stocks imposed by the Budget. In consequence the Imperial Tobacco Company, which before the war had extensive liquid resources, has now so far suffered from taxation on its real capital that it has had to resort to borrowing on a spectacular scale.

Imperial Tobacco is an exceptional case only because increases

in duty have raised the price of cigarettes and tobacco far beyond the rise in the general price level. But the consequences of sudden increases in manufacturers' costs by way of additional duty do not differ in significance—so far as the calculation of true profits are concerned—from an advance in costs and prices in, say, the furniture industry. It is odd that businessmen in this country have been so backward in recognising that rising prices have challenged their conventional ideas about accountancy practice, for the point is probably much more important at the present time than a cut of a shilling or so in Income Tax. During the 1914-18 war, much pressure was put on the Government to make allowance for increases in stock valuation resulting from a similar rise in prices, but nothing came of these representations, and the point has remained largely in oblivion ever since. As a result, a part of the tax revenue which the Government derives from business profits represents a mere consequence of increased paper values of inventories and inadequate depreciation allowances to meet the cost of replacement.

To measure this over-taxation statistically is far from easy, but some hazardous guesses can be made. The Solicitor-General estimated that Mr Spearman's proposals would cost the Exchequer between £100 million and £150 million a year. The other factor—changes in stock prices—is much more difficult to estimate, and it varies more widely from year to year. But with taxation on profits absorbing about 11s. in the £, it is obviously heavy. If industry has so far met its taxes without recourse to borrowing, it has been possible only because its physical resources have perforce been run down. Large arrears of plant replacement and even of normal repairs still exist. Shipping companies, for instance, finished the war with considerable liquid resources, supplemented by Government compensation for lost tonnage, but the process of rebuilding their fleets is a long-term operation, for which existing resources may prove to be inadequate in several cases. Already there is increasing evidence from recent company reports that liquid resources for new capital investment are being rapidly exhausted; the pinch is coming when it is too late to rectify the over-taxation of past years. But businessmen and accountants cannot lay all the blame at the Chancellor's door. They should have made their mental adjustments long ago, and recognised that a business is a continuing thing from which no profit arises until the cost of keeping it going has been met in full. Had this revision of thought been made, the Chancellor might have responded more sympathetically this week. One day Chancellors and accountants may learn to modify their passion for accurate arithmetic and precise procedure, and to admit informed judgment on the effect of large price movements on profits. When that happens industry will be more fairly treated.

Wages in Cotton Weaving

AN experiment is to be undertaken in the cotton and rayon weaving industry to test the practical effects of replacing the old "Uniform List of Prices in the Cotton Manufacturing Industry" by a new wages structure. The extent to which the Uniform List hampers productivity and distorts trading policy in the cotton weaving industry has become increasingly plain in recent years, and the Cotton Manufacturing Commission, under the chairmanship of Mr Ronw Moelwyn Hughes, presented an interim report* to the industry in March, urging in the strongest terms that the Uniform List must go. The Commission proposed a new system designed to relate wages to skill, effort, and efficiency, and designed also to serve as an

integral feature of redeployment in the weaving sheds. The report claimed that a new system was essential to the success of any reorganisation of methods of work. After fifteen months of study, drawing on the knowledge of the trade, the Shirley Institute, and a firm of industrial consultants, the Commission produced a scheme which it believed would serve these purposes. In view of the urgent national need for greater production it urged that the scheme should at once be put into operation voluntarily over the largest possible field of the industry, without waiting for the protracted negotiations which would have to precede any attempt to apply it universally.

Convincing though the arguments are, the hope of swift action is not likely to be realised. The Uniform List is a bad system of payment, but it is a system that the weavers know, and their unions (though they were, of course, represented on

The Smithfield, Shrewsbury

THE ENGLISH COUNTRY market grew up with the land and those who work on it. Produce is sold and needs are supplied through its agency and even in this age of centralisation the farmer still finds much that he values in his own market town. It is in market towns that the Local Head Offices of Barclays Bank have been established in many cases. This has enabled the Local Directors—themselves men who know the district well—to keep in constant touch with the problems and needs of the farming community. It is through this long tradition of service to farmers that the Bank is known in many parts of the country as the "Farmer's Bank".

BARCLAYS BANK LIMITED

Eastern Enterprise

For over three hundred years men of enterprise and initiative have engaged in trade with the East. For nearly a century The Chartered Bank of India, Australia and China has supplied them with the specialised banking services that this trade demands. Today, in addition to these services, the Bank's wide network of branches ensures that a wealth of information on local needs for products and services is readily available to customers. Those planning to enter the markets of the East are cordially invited to discuss their problems with the Managers of the Bank in London, Manchester or Liverpool.

LIMITED

LIVERPOOL, LONDON AND 600 BRANCHES

* Cotton Manufacturing Commission: Interim Report of an Inquiry into Wages Arrangements and Methods of Organization of Work in the Cotton Manufacturing Industry. Stationery Office. 1s. 3d.

the Commission which made the report) are in no hurry to try conclusions with the unknown. The new system is calculated to raise earnings in the weaving trade as a whole, but it is also calculated to correct anomalies. Many workers have been losing by the anomalies and will therefore be better off through their correction; but others—a substantial minority—have been gaining and will therefore be worse off unless they increase their working effort. There is a natural feeling that it is better to avoid disturbance, and the opening discussions between the employers and the unions have not gone too auspiciously. Both sides have agreed to try the proposals—but their agreement is of the most guarded kind: it is to be a paper trial only. The manufacturers' association has asked all cotton and rayon weaving firms to express their willingness to take part; from those who agree a small number will be asked to keep special records for a period of twelve weeks. The selected firms, though they will continue to pay their workers on the old system, will keep dummy wage-sheets to show what the earnings would be if the new system were in force instead. These returns, together with computations of work-loads and reports on working conditions which would affect wages on the new scale, will form the body of evidence on which, when the trial is completed, negotiations will be resumed. It is not going to be a lightning process.

"Present methods of work and payment," said the Moelwyn Hughes interim report, "hamper all attempts to increase production." The problem of a rigid and out-of-date system of rewards is nowhere more acute than in textiles, though it is also encountered over a widespread field of industry. The boot and shoe industry of the Midlands suffers severely from the same trouble: with a fixed price for each operation in the trade, employers find that reorganising their methods of work produces no effect whatever on costs of production, and efficiency pays no dividend. They hesitate to suggest any of the incentive systems of payment which have been worked out in recent years to match the technical changes which have taken place since the old lists were made. They hesitate to upset old-established scales; it is easier to take things as they are and to rely for profits on price controls and the sellers' market. But as the sellers' market becomes a memory, the pressure to reorganise outmoded systems of payment is sure to grow. The weaving industry, faced with the demand for greatly expanded production and a heavy contribution to the export drive, has at last been moved to experiment. The result will be watched by other branches of industry with more than academic interest.

The task of the Moelwyn Hughes Commission was, in its own words, "to find an answer to the question: Under what conditions will four men or women produce as much as or more than five do now?" It took the increase of productivity as its fundamental object. It assumed that a substantial increase in manpower in the industry—which has cause for concern already in the high average age of its workers—is out of the question now and for many years to come. It assumed, too, that no substantial increase in productivity can be expected in the next few years through the employment of more automatic looms:

Even on the most optimistic estimate, it seems unlikely that the present rate of production (of automatic looms) can be increased much beyond 6,000 automatic looms per annum, a rate which, after making provision for export trade and for other branches of the textile industries, would be insufficient to re-equip the cotton industry within the present century. Even if this rate could, by the use of extraordinary methods, be substantially increased, considerable modification to buildings and power supply would be necessary before automatic looms could be installed on a wide scale.

The report dealt only with the section of the cotton and rayon weaving industry which operates ordinary looms on which the shuttle is changed by hand; it left the automatic section to separate study. Existing systems of payment in the non-automatic industry are based on a number of piece-price lists. By far the most important of these lists is the Uniform

List, which by virtue of an Order made under the Cotton Manufacturing Industry (Temporary Provisions) Act of 1934 is legally enforceable on all employers in the specified areas who weave the kinds of cloth which the List covers. The Uniform List appears to have begun in 1892 as a compromise between three of the old district lists; it has, with the passage of time and the accretion of new agreements, attained great complexity, so that variation or amendment is an arduous matter. It bases the weaver's earnings on the number of picks put in by the loom—a reasonable method in the hand-loom days, when the major part of the weaver's work was to throw the shuttle by hand across the loom. In mechanical (but non-automatic) weaving, however, the factors which determine the weaver's effort are different: his main tasks are the changing of the shuttle and the repairing of broken threads. But the Uniform List, which provides additions to or deductions from the weaver's earnings for different types of cloth, almost ignores the length of weft in the shuttle and entirely ignores differences in the quality of the warp. For these reasons, the report concludes, "if the proper aim of a wages system for cotton weaving is to relate reward to effort, then the Uniform List is fundamentally unsound." On this unsound foundation there has been erected in the course of years a superstructure of percentage additions, each one aggravating the basic anomalies—"the whole structure being regarded as too sacred, or too unsafe, to undergo any material change." Additions for the weaving of different structures of cloth have been made haphazard, according to the trading conditions of a particular year, and they have since been sacrosanct. When rayon was a novel yarn it was probably reasonable to pay the weaver more for handling it. Today, as the report points out, it is generally true that rayon is easier to weave than cotton. But the addition for weaving rayon yarn persists and may be as high as 40 per cent. Coloured yarn provides another anomaly. "As the list now stands," to quote again, "the introduction of even a small percentage of colour in a cloth may bring an addition to the piece-rate price out of all proportion to the extra work involved. We have had instances where a small percentage of colour has been unnecessarily introduced in order to provide the weaver with a more tempting pick-up."

The general effect of this system is that normal cloth structures are ill-paid by comparison with abnormal structures; for it is the variations that have prompted additions to the Uniform List. Structures which do not vary greatly from the standard cloth in the Uniform List carry a relatively low piece-rate, with the result that "the most poorly paid weavers in the industry are those employed on plain grey cloths with medium counts of yarn, such as Burnley printers." But these variations may run directly counter to the public interest. The weaver handling poor quality yarn is ill-paid in relation to his effort; but it is not desirable to limit the industry to expensive yarns. Managements and workers understand that, under the Uniform List, "good sorts" pay the weaver well and "bad sorts" require from him more effort for less pay. One of the functions of good management is to mix the good and bad sorts in distributing work to the weavers, so that no man suffers injustice. But this may by no means fit the best interests of the trade or of the trade's customers. There has been comment on the disposition of producers to produce fancy cloths in preference to plain cloths, though the fancy cloths may prove the harder to sell. At present there are conspicuous deficiencies in production of cloths required by certain industries: electrical insulation, cloths for the rubber industry (a large consumer of plain cloths), and cloths for footwear are examples. Shortages and difficulties are created for industries which are also trying to hit their export targets.

Thus industry generally would be better served in cotton products if the weaving industry had an intelligible system of

payment. But the consumer of cotton goods, and the average worker in the weaving industry, would be better served too:

That it should determine the weaver's earnings with little regard to the skill or effort required of her is obviously unjust, but the List has another and equally undesirable result. It prescribes a fixed price for a particular length of cloth without regard to many of the factors which determine how long it will take to weave that length of cloth. Whatever steps the employer may take to enable his weavers to increase their rate of output, e.g., by the use of a better-quality yarn, or by a longer length of weft in the shuttle, or by improvements to the loom, the piece-rate for any particular cloth remains the same. The result is that . . . the weaving wages cost per unit of production remains the same, however efficient or inefficient may be the methods of production in the shed.

To find an alternative to the list, the Cotton Manufacturing Commission took two schemes—one prepared by the Shirley Institute, the other prepared for the rayon manufacturers by a firm of industrial consultants, and later modified to fit cotton weaving as well—and combined what appeared to be the soundest elements in each. Both schemes proceeded from an analysis of the weaver's work into three heads—weft work (which can be computed in terms of shuttle changes), warp work (which can be computed in terms of warp breaks) and "rest, supervision, and ancillary duties." The Commission finally adopted a straight piece-rate based on two elements: one to vary only in accordance with the weaver's efficiency, and to represent payment for "supervision, relaxation and other duties not associated with warp and weft work"; the other directly related to the number of shuttle changes and warp breaks. The new piece-rate, if it is adopted, will thus vary with managerial efficiency; if a management finds ways of reducing breakages and shuttle changes, its labour costs per yard of cloth will be automatically reduced. The Commission believed that it had found "a sound,

Business Notes

A Firmer Appearance

When the market closed at the end of last week, it was in the deepest throes of doubt about the threatened cuts in the European Recovery Programme. Equities, which had been resistant enough to signs of disinflation at home—so long, at least, as Argentine railway money was flowing in to their support—suddenly saw the red light. At one bound, calculations were being revised in the mood of the "Economic Survey" last February, before American aid was approved by Congress. And in thin sensitive markets, ordinary share prices, as measured by the *Financial Times* index, fell from their recent intermediate "high" of 121.4, recorded on May 25th, to 115.3 last Monday—the lowest point since the middle of March.

Recovery this week has carried the index to the slightly firmer level of 116.6. Reasons for the recovery are not difficult to find. Some of the recent selling, particularly of retail trade and tobacco shares, was evidently overdone, and it proved slightly costly to cover—another demonstration of the disproportionate effect on prices caused by a relatively unimportant change in the direction of dealings. Second thoughts on American aid, coupled with livelier expectations that the cuts inflicted by the Taber amendments would be largely restored, have lifted the threat of reduced supplies of industrial raw materials which was overhanging the market a week ago. So, it is held, industries enjoying a sellers' market are in no danger. As for those industries which are less happily placed, the market is beginning to make much of the Purchase Tax concessions which the Chancellor of the Exchequer has promised, though it will take more than cuts in purchase tax to restore some consumer goods industries—whose products were already overcrowding the shelves of retail stores before the new Chancellor's monetary policy was introduced—to full output and bumper earnings. Apart from the wider aspects of policy on the purchase tax, concessions are bound to make some difference to the earnings prospects for particular shares. But if investors take these concessions as a bull point for equities generally, it can only be because they infer that the Chancellor's policy of financial austerity, counter-inflation, and maximum encourage-

workable, and intelligible system, which will give enterprise, efficiency and hard work its due reward." It now remains to conduct the experiment and measure its reception by employers and workers.

The Commission has now turned to the automatic section of the weaving industry, which presents different problems. Action or inaction on the interim report is left with the trade. As a general comment on the prospects and state of mind of the cotton industry, however, two assumptions of the interim report are worth repeating: neither increased manpower nor automatic looms can be expected to solve the problem. Those assumptions may be disconcerting to a public which has become attuned to Ministerial optimism about manpower targets and re-equipment. They reflect the feeling which is becoming general, not among pessimists or defeatists, but among realists in the cotton industry as a whole: that, in broad terms, hope for the next few years does not lie in large schemes of expansion or costly programmes of re-equipment, but in the efficient use of the resources which are ready to hand. "We believe," states the Moelwyn Hughes report, "that the existing manpower in weaving can rapidly produce, without any addition to its numbers, another 20 per cent and more." Examples given in the report suggest indeed that the improvement can be much greater. But the assertion is conditional: the condition is that the new wages system should be adopted, and redeployment applied, by workers and manufacturers "and that the policy is actively pursued immediately over the field we recommend." The simple and obvious remedy thus becomes an aspiration, only to be reached across ground bristling with obstacles. Nothing can be harder than to persuade ordinary people to accept logical changes in the basis of their livelihood. But it has been shown to be necessary.

ment for exports, is in course of modification. Perhaps there have been enough small links in the chain of evidence not to laugh such an assumption out of court. But it can hardly yet be accepted as plausible.

A slight trimming of sails, for whatever reason, cannot be taken as indication of a coming change of direction. And if some of the Chancellor's recent utterances have been more mollifying than austere, it is proper to record that he has this week shown a readiness to reconsider, before next year's Budget, the incidence of the profits tax and also the tax on bonus share issues. The former has played little part in this week's share movements, because the uncertain question of voluntary dividend limitation is uppermost in the investor's mind. But the possibility of some amendment to the bonus issues tax has assisted the recovery. Yet all these factors in this week's improvement are small in relation to the broader economic problems which industry faces during the next twelve months. A policy which based itself on nostalgic hopes that the policy of disinflation will be abandoned before it has really got going would be far from sensible. Perhaps, on those calculations, the further advance in the Funds—with Electricity Stock within $\frac{1}{4}$ of par—is more logical than the recovery in equities.

* * *

Purchase Tax Concessions and Policy

One long session in Committee, until the early hours of Wednesday morning, was needed to discuss 159 amendments to the Finance Bill for reductions in purchase tax. They covered, as the Chancellor of the Exchequer pointed out, practically the whole range of the tax, and if all were accepted no purchase tax would remain. But the Chancellor showed himself anxious to make reductions—within a range of possibilities which he did not define, though he claimed that it was small—"on those items which obviously need them most." And the Committee then settled down to fifteen hours of the most diverse discussion, beginning with the case for reduction of purchase tax on rabbit and mole

skins; this quickly met the answer that administrative difficulty prevented a concession "by reference to the type of animal from which the skin is produced," though a case was conceded for reducing the purchase tax on utility fur coats—which, on the demonstration of Mr Piratin, are largely made up of rabbit skins.

So the debate proceeded—on uniforms, scout hats, leather laces (another difficulty here, because to give them relief would involve invidious discrimination against other articles of haberdashery like sewing needles or thimbles), built-in kitchen furniture (on which the Chancellor felt that a strong case had been made), water-heaters using gas (though not electricity), watches and clocks (even if they use electricity), wireless and television sets and parts (on which the Chancellor promised to consider reduction of the tax to 33½ per cent) and the differential taxation of walking sticks and umbrellas.

The cost of the concessions which the Chancellor eventually decides to make—he has so far promised only consideration of the various proposals—will not, presumably, be very large. But this large-scale battle over every detailed article and rate of tax is a symptom of the growing feeling that purchase tax, which was originally created as a deterrent to consumption, should not be allowed to generate positive under-consumption by reducing demand and causing unemployment of machinery and labour. That, however, is too simple a view of the tax. Nor does it follow that because over-production in some goods is taking place the fault lies in a reduction of demand caused by the purchase tax and nothing else—a point which the Chancellor rightly made in discussing the proposed reduction of tax on radio and television sets.

This week's demonstration must, nevertheless, be accepted as a blow to those who would like to use the tax as an instrument of planning—on which the most conspicuous failure is to be found in the giddy changes in the tax on water-heaters during the past eighteen months. Nor is the use of purchase tax politically acceptable as a means of contracting an industry which is too large to meet normal home and export demands. Here the wireless industry is a case in point; immediately the threat of unemployment could be fastened, even plausibly, on the purchase tax, the Chancellor was ready to bow to criticism. This is a sobering conclusion, for the sellers' market is only at the beginning of the end. A choice will have to be made, without much delay, between two quite separate policies. The first would be greatly to modify and simplify the tax, at a much lower and largely uniform rate; the second would be to reassert the need for continued discouragement of consumer demand for less essential goods coupled with encouragement to switch production to more essential uses. The former must indeed be the eventual method of dealing with a regressive and discriminatory tax; but the latter would show greater recognition of the need of the times.

* * *

South Africa's Reserves—

It is still too soon to gauge the effect of South Africa's change of Government upon British and other overseas holders of funds in the Union, but already the reserve position of the South African Reserve Bank seems to be reflecting the anxieties of investors. The latest bank return, dated June 4th, covers the first week since the election, and cabled summaries indicate that in that period the rise in the Bank's holdings of foreign exchange—consisting almost exclusively of sterling—was checked. In the first half of last year, the sterling holding was no more than £10 million, and during last summer was running at about £20 million; but thereafter it began to rise steeply, despite the Union's heavy expenditure required to meet the large deficit on its current balance of payments (discussed in these columns last week). By end-January it had reached £52 million, and an accelerated rise during May carried it to nearly £81½ million, of which £4,000,000 was added in the week preceding the election.

This expansion has coincided with heavy—and, latterly, continuous—strain upon the gold reserve. After the revaluation of the gold holding in the summer of 1946, the total stood at £257 million, and the ratio of gold to the Bank's liabilities to the public was 87 per cent. By February last, after the £80 million transfer to Britain under the terms of the gold loan agreement, the holding was only £111 million, and, now that the Union is no longer drawing upon the sterling area dollar pool, its gold reserve has to provide for its dollar deficit. This dollar financing is producing a steady erosion of reserves which, at the time of the negotiation of the loan to Britain, still looked adequate. Now they are down to just over £95 million, and roughly £6,000,000 has been lost in the past fortnight. Since

end-April the reserve ratio has fallen from 40.4 per cent to 35.7 per cent. At the recent rate of deterioration it would reach the legal minimum of 30 per cent in two months.

* * *

—And "Hot" Money

Evidently, the most pressing task which confronts the new Finance Minister, the experienced Mr Havenga, is to find a means of relieving this pressure pending the formulation of longer-term plans for dealing with the problem of the balance of payments as a whole. The London markets in South African securities have been disturbed this week by reports that the Union authorities are contemplating a reinforcement of the recent restraints upon "hot money" movements. It was suggested—though without confirmation—that overseas holders of bank deposits in the Union would be confronted with an ultimatum, requiring them either to withdraw their funds or "invest" them within 30 days. Such rumours have an unpleasant, even ominous, sound. Within the limits set by the freedom of the local security market, money "invested" would be just as freely withdrawable as the overseas funds which are already employed; and the only means of preventing withdrawal would be by some means of exchange blocking which could scarcely be applied discriminately so as to affect only the funds "invested" in response to the ultimatum. But an ultimatum of this kind would not, in any case, ease the Union's problem. It would run down the reserves of sterling, but this reduction would not even raise the reserve ratio unless the authorities allowed it to produce a quite sharp deflation of the internal banking position, with possible repercussions upon domestic industry.

For the time being, reports such as this should be treated with reserve; but unless fundamental measures are taken soon to narrow the current deficit on the balance of payments, some defensive measures against withdrawal of foreign funds may become unavoidable. The Government might take the view that legal action to reduce or waive the minimum reserve ratio might aggravate the problem by providing a fresh shock to confidence; but if such action had to be ruled out, most of the present gold reserve would not be available for the immediate purpose of dollar financing. It is small wonder that already there is discussion about the possibility of seeking dollar loans. But neither the International Bank nor the hard-headed bankers of Wall Street are likely to be anxious to lend unless they see evidence that the Union is preparing some homely measures of retrenchment.

The Engineers' Claim

The engineering employers, as was expected, have rejected the claim of the Confederation of Shipbuilding and Engineering Unions for a new consolidated national minimum rate of pay in the engineering trades. The claim, if conceded, would have secured an increase of about 13s. a week in the basic pay of workers, whose claim is to be answered separately by the employers on June 18th. Even so, it is the most important claim for increased pay put forward by any group of unions since the White Paper on Personal Incomes. It was not put forward precipitately. As the engineers' representatives have often pointed out, it was formulated under instructions from the membership well before the White Paper appeared. But (unfortunately, from the engineers' point of view) it has come to be regarded as a test incomes is to be applied seriously in industry or not. The unions are aware of the extent to which this strengthens the employers' hand and the difficult position in which they themselves are placed. The Amalgamated Engineering Union has pointed out that, when the meeting of trade union executives discussed the White Paper, But this does no more than clear the AEU of any charge of inconsistency; in so far as it affects the issue of public policy unions with the necessity of deciding their next move; their representatives were meeting at York as this issue of *The Economist* went to press.

India's Sterling

The London discussions on India's and Pakistan's sterling balances which began last week with preparatory talks among officials have this week shifted to the Ministerial level. The dis-

June

June is a month for quarterly payments. Many payments occur regularly and are usually fixed in amount—rent, insurance premiums, subscriptions, transfers from your own account to those of your family or dependants. The Bank can save you the trouble of dealing with such payments and the inconvenience which follows if they are overlooked. It will do your 'remembering' for you. Every month the Midland Bank makes thousands of such payments, ranging in amount from a few shillings to hundreds of pounds, the customers' instructions being known as "standing orders".

MIDLAND BANK LIMITED

A FIRST CHOICE for the Investor

INVESTING in National Savings adds brightness to your future and strengthens the Nation's resources. And now the transaction is made more simple by a new service offered by your Bank. Whether you want to make a block purchase of National Savings Certificates, or whether you wish to invest a regular monthly sum for as long as you like, you have only to sign a Banker's Order form. The Bank will do the rest—without trouble to you, and without charge. In 'ten years' time each 10s. Certificate will be worth 13s.—an increase equivalent to a taxable yield of £4.16.8%. To the surtax payer the Savings Certificate is even more profitable. You can now hold 1,000 units of the new issue, in addition to permitted existing holdings of Certificates of earlier issues. So call on your Bank Manager to-day.

cussions so far have not gone beyond the stage of exposition. The two sides have stated their positions and outlined certain proposals. It need hardly be stressed that these have shown very considerable divergences. The differences are now being studied, and during the coming week the negotiators should come to grips with their problem. It is still uncertain whether the talks will lead to a long-term agreement or whether the negotiators will have to be content with makeshift arrangements covering the next six or twelve months. It is probable that in such matters as the release of sterling balances and allocations of dollars from the sterling area dollar pool to the two dominions the commitments will have to be restricted to a comparatively short period. It would be pointless at this stage to enter into long-term commitments on these issues.

One of the most important aspects of the present negotiations concerns the valuation to be placed on sales of British military stores and other installations to the Governments of India and Pakistan and the capitalisation of pensions to British members of the Indian Civil Service; the British Government is to bear the cost of these pensions in return for a reduction in the sterling balances of the two dominions. Capital transactions of this character may range in amount between £350-500 million. These, together with that part of the sterling assets which may be regarded as immobilised as currency reserve for the two dominions, should account for a considerable part of the accumulated sterling balances that form the principal topic of discussion in the current negotiations. The Indian and Pakistan delegations may suggest that part of these sterling balances be earmarked for the ultimate repatriation of British capital invested in the two dominions. There will no doubt be scope for operations of this kind, but if the subject is discussed without political prejudice it will surely be found that continued co-operation of British capital and enterprise in the dominions of India and Pakistan will redound to the interests of all concerned.

Imperial Tobacco and the Bonus Issues Tax

The intimation by the board of Imperial Tobacco that it is considering ways and means of raising further funds to cover its increased requirements of working capital hardly comes as a surprise. As is pointed out in a leading article on page 977 of this issue, increases in the book value of stocks in recent years have already involved the company in heavy short-term borrowing. In 1944-45, £10 million was borrowed on Ten Year Notes to finance an approximately equal rise in the value of stocks which had largely resulted from increases in the Tobacco Duty. In the following year the company reverted to the normal prewar practice of paying for leaf tobacco at the time of purchase, which caused a striking jump from £57,512,085 to £78,509,370 in stocks. Again, the group resorted to short-term borrowing; £10 million was borrowed on acceptance credits and the bank overdraft was increased from £14,366,731 to £26,239,900. Assistance was also received from a postwar refund of EPT amounting to some £4,000,000. In 1946-47 the burden was further raised, following the increase in the Tobacco Duty in April, though it was kept within more moderate limits because of a reduction in the physical quantity of leaf held in stock.

Imperial Tobacco has so far been thwarted in its desire to put this enormous amount of temporary finance on a more permanent footing. There was first the disagreement with the Capital Issues Committee over the price of the issue of new capital mooted two years ago, which still rankles. But a more telling factor is the Bonus Issues Tax which would take a large slice of a new issue of the size now required. On this second point a gleam of hope for the company may be visible in Sir Stafford Cripps's undertaking in the House of Commons on Monday that he would be reconsidering the question of the Bonus Issues Tax before the next Budget. It is something, as an Opposition speaker claimed, that the Chancellor, unlike his predecessor, does not talk of bonus issues as if they were damned by original sin, and may be prepared to admit that the tax on them might under changed circumstances have become an evil and not a good thing. In the meantime, presumably, the immediate plans of Imperial Tobacco to raise more short-term capital are unlikely to be affected. These are not yet definite, but a further issue of Ten Year Notes amounting to £10 million has been suggested as a probable step.

* * *

Cotton Commission Follows Alexandria

The reduction in the home issue prices for Egyptian Zagora and Ashmouni cottons (both relatively short staple), announced last week by the Raw Cotton Commission, caused little surprise

in Lancashire. The prices of these two types had already fallen quite sharply in Alexandria, and the British cotton textile industry was waiting to see what interval would elapse before British prices were brought down in conformity. If anything, the reduction came sooner than had been expected, and this prompt action by the Commission will no doubt inspire some confidence in its avowed policy of following world price trends. The latest reduction of 9d. a lb. for Zagora brings its price to 34.90d. a lb. compared with 22.40d. in July, 1947, while the fall of 5d. a lb. for Ashmouni gives a new price of 39.75d. a lb., against 22.25d. Prices of other Egyptian cottons remain unchanged. Any fall in price naturally creates a certain uneasiness among traders; in Manchester buyers are a little cautious in placing orders for goods manufactured from Egyptian cotton in case any further decline should take place, whereas a few weeks ago, when raw cotton prices jumped, they were worried lest consumers would resist higher prices.

Cotton production in Egypt has shown a steady increase since 1944, though last year, which was not particularly good, total output (604 million lb.) was 27 per cent below the 1938 figure. Cotton acreage is also recovering; this season it may be 15 to 20 per cent larger than in 1947, when 1,300,000 acres were planted compared with 1,000,000 acres in 1938. The present crop, however, is reported to be one to two weeks late, and the dangerous part of the season is not yet over. The provision of Marshall funds may relieve some of the pressure of demand for Egyptian cotton, but supplies are still expected to be tight. World cotton consumption in 1947-48 has been estimated by the International Cotton Advisory Committee at 28 million bales (approximately equivalent to 13,430 million lb.) against a world production of nearly 25 million bales (11,925 million lb.). Since world cotton stocks on August 1, 1948, are likely to be down to only 14½ million bales (6,950 million lb.), the existence of an acute cotton shortage is unquestionable. Details of the International Cotton Advisory Committee's estimates are given in this week's issue of the *Records and Statistics* Supplement.

This does not necessarily mean that world, and in particular Egyptian, cotton prices will remain at their present high level. Much depends on the course of inflation throughout the world and on the level of industrial activity in the major cotton consuming countries. In Egypt, however, there is a further problem. Current Alexandrian prices are well above the Egyptian Government's guaranteed minimum prices which are the basis on which credit facilities are granted to cotton growers. If these minimum prices are not raised, growers may have to market a larger part of their crop at the beginning of the season, causing a relative dearth in later months. A similar situation was experienced in 1947-48. If importers have sufficient funds available for buying there need be no serious disturbance to the market. Britain did not avail itself of the opportunity to buy in the early months of the season owing to the transfer of buying operations from Cotton Control to the Raw Cotton Commission; it seems that no large-scale purchases of Egyptian cotton were made until February, when prices in Alexandria moved up sharply. This mistake is unlikely to be repeated this year.

* * *

The Jute Working Party Report

The jute spinning and weaving industry in east Scotland is temporarily secured from external competition by the persistence of wartime controls. The report of the Jute Working Party, which was published on Thursday*, points out that once these disappear the industry will have to face competition even more severe than before the war from its larger rival in Calcutta. In the first thirty years of this century the British industry was virtually driven out of both the home and export markets in standard and coarser products by Calcutta. It survived on a reduced scale by specialising in non-standard and higher-grade cloths and by the sale of yarn; this is the field which Calcutta threatens to invade. The Indian mills will now supply any weight and width of cloth, have overcome the technical difficulties of producing higher-grade cloths and are willing to produce a surplus of yarn over their weaving requirements. Calcutta has more than enough manufacturing capacity to meet total world demand.

The British jute industry consists of 44 firms in Scotland engaged in the spinning and/or weaving of jute in 66 establishments; most of them are in the congested quarters of Dundee. All their buildings but one were built in the last century; and their heavy stone, many-storeyed construction give little scope

* Board of Trade Working Party Reports: Jute. Stationery Office. 2s. 6d.

for a change in lay-out. About 60 per cent of existing spindles are of types introduced since 1927; in weaving there have been no major technical changes in this century. The bulk of the industry (77 per cent of the spindles and 65 per cent of the looms) is organised in firms which combine spinning and weaving; and most of those (55 per cent of the spindles in the industry and 44 per cent of the looms) carry on spinning and weaving in the same factory.

Output in 1946 (the latest year given in the Report) was about half the prewar level and the restriction was due to a shortage of labour. New industries established in Dundee under the Distribution of Industry Act, 1945, have broken the jute industry's former monopoly of an isolated labour pool. The number of insured persons in the industry was 41,000 in 1942 (4,000 unemployed) and 30,000 in 1939 (5,000 unemployed); in 1946, with unemployment negligible, it was only 16,000.

In these circumstances the Working Party proposes that the industry should be assisted to recapture from Calcutta the home market in all goods except heavy sacks. It estimates that half the export market will be lost, but that home production can still be increased to three times the 1946 figure—a level the industry has not approached since 1900. The Report assumes without discussion that the necessary jute will be obtainable.

* * *

Is a Tariff Justified?

To exclude Indian manufactures the Working Party proposes a tariff, which is to be conditional on an undertaking by the industry to reorganise; that is, 100,000 of its 166,000 spindles should be grouped in units of not less than 15,000 spindles each, all of modern type. (One firm has already 41,000 and another 16,000 spindles.) The industry, since it is badly housed and cannot be rehoused on its present sites, should be given subsidised accommodation under the Development Scheme for Dundee. Financial assistance will also be required to the extent of £3,250,000 for further equipment and to carry stocks of raw jute when the Control ceases to perform this function. The Report also makes a contingent claim for finance for the weaving section if and when a satisfactory automatic loom is invented. By the double-shift working of the new equipment and a 20 per cent tariff, the Working Party believes that the industry could be prosperous.

Few external observers will quarrel with the serious view the Working Party takes of the future of the industry—though it should be mentioned that certain leading members have had enough confidence in its future to invest heavily in new equipment since the war. But there is little evidence relevant to the remedies proposed, and that little is not in their favour. The new groups are to concentrate 15,000 or more spindles in one mill; but no evidence is given to show that this will lead to economies. Only the two firms already mentioned possess more than 10,000 spindles, and no mill of the size proposed exists. The typical mill has between 2,000 and 5,000 spindles, and some of those reputedly most efficient are of this size.

Again, it is recommended that the "groups" should combine spinning and weaving; but the evidence on profits for the years 1934-38 shows the trading profit, after deducting depreciation at the basic Inland Revenue rates, to be 7.1 per cent for spinners, 4.5 per cent for weavers and 2.4 per cent for combined concerns. There may be excellent reasons for these proposals, but none is given: can they perhaps be based on crude comparisons, ignoring different conditions, between Dundee and Calcutta? Clearly a considerable increase in productivity is necessary if an industry which had a net output per employed person of only £117 per annum prewar has now to compete for labour.

The claim for a tariff of 20 per cent is based on a comparison with India's costs which appears no better than guesswork. The Working Party could get no information from the Indian mills; so it computed wage costs from wage rates, and used British figures for other costs. Twenty per cent, it suggests, is a minimum figure. But is it not the maximum figure that interests consumers? This might easily be 40 or 60 per cent. What is the justification for the proposal to use a tariff to recapture the home trade in standard cloths? None is given in the report, beyond the unsupported statement that a substantial background of standard hessian trade is necessary for the economical production of special weights and widths. Could it be explained how mass production of standard lines can assist smaller-scale production of specialities?

Much of the report is merely an elaboration of the case for a tariff presented by the employers and the Trade Union in the 1930's. The arguments in the case are presented as self-evident truths; there is little sign of an attempt to collect the evidence that would have enabled it to discuss them. Were these matters discussed to the satisfaction of the independent members? The

primary function of independent members on such a committee is presumably to ensure that the report does not merely represent the views of interested parties.

* * *

Making TDRs More Flexible

The Treasury deserves congratulation for its second thoughts on the technical arrangements for issuing Treasury deposit receipts. Three months ago, when asked whether he would consider certain improvements in the Treasury bill and deposit receipt systems, the Chancellor rebuffed the suggestions on the grounds that existing arrangements had worked satisfactorily for a number of years and that the banks and money market did not desire any change. That was not, in fact, the predominant opinion in the circles most closely concerned: the feeling was that a "satisfactory" system could be made to work even better. The Chancellor has now decided that, as from next Monday, TDRs "shall be issued with a currency of five and seven months in addition to the existing currency of six months." Six months has been the only life of TDRs ever since their introduction in the summer of 1940. In future, when making their calls upon the banks for money against new issues of TDRs, the authorities will decide which currency—five, six or seven months—is most appropriate for the particular week's issue. There is no intention, however, of giving the banks any option in the matter; and it is expected that, in general, the whole of each week's issue will have the same life. "Until further notice" the interest rate of $\frac{3}{8}$ per cent per annum which applies to six months' receipts will apply also to those of five and seven months.

The sole object of this change is to give added flexibility to the authorities' arrangements for keeping the short money market on an even keel. It should, in fact, remove an irritating source of dislocation. Since the weekly tender issue of Treasury bills has come to be a highly stable element in the floating debt—changes in the amount allotted are infrequent and small—the full force of the ebb and flow of the Treasury's cash requirements falls upon the TDR issue. Necessarily, the Treasury borrows on TDRs only when it needs money; and, desirably, the TDRs should mature at a time when the Treasury has a surplus (and when, correspondingly, the money market and banks are short of cash). But the seasonal cycle of Treasury deficits and surpluses does not conform to a six-monthly pattern. During the period of heavy tax-gatherings last January and February, maturing TDRs were paid off and no new issues were made for five consecutive weeks; hence there will be similar gaps in July and August which, if the six-monthly system remained, would reappear in the main tax season early in 1949. In such conditions, given the desirability of avoiding any large reduction in the tender issue of bills, the only means of relieving the resultant pressures in the money market was for the authorities to make *ad hoc* purchases of existing bills. Under the new system, the TDR maturities should be spaced out so as to align with the phases of Treasury surplus, thereby reducing the need for *ad hoc* action while avoiding the tendency for spasms of difficulty to recur automatically at six-monthly intervals.

The new device looks preferable to the alternative improvement, which had been suggested by money market circles, of issuing nine-month TDRs in the April-June quarter (normally a lean period for the Exchequer), as a means of ensuring maturities in the fat January-March quarter. This evidence of official receptiveness to constructive suggestions from outside is very welcome. But, in view of the thought which has evidently been given to this matter, it is a little surprising that the authorities are still not agreed upon the further improvement of this character which is needed—namely, to issue Treasury bills with lives expressed in an even number of weeks instead of months, and thus to avoid the dislocations caused by the oddities of the calendar. Under the present system, there are many days in the year on which no Treasury bills mature; yet the smooth functioning of the credit machine depends upon an even flow of such maturities. For the present, it seems, the authorities are not concerning themselves with these sources of friction from day to day. Had they done so, they would surely have made the TDR change the occasion for expressing the life even of TDRs in weeks instead of months. As it is, even under the new system TDRs will continue to produce short-term dislocations analogous to those produced by bills.

Coal Exports and Production

The Minister of Fuel and Power, who discussed the coal position on Thursday, was reassuring neither in his account of pro-

duction trends nor in the course of action he appeared to contemplate if production did not improve. The winter's record, he said, was "pretty fair," but since Easter there had been disturbing tendencies both in production and in consumption. "The whole outlook is not so good as it was." Taking the five weeks since May 1st, he said that the target required 19.2 million tons from the mines during that period; but in fact only 18.6 million tons were produced; this was more than 100,000 tons a week short. Before Easter deep-mined output was averaging nearly 300,000 tons a week more than in the corresponding weeks of 1947. But after Easter the excess fell to 50,000 tons. If last week's improvement meant that the upward movement in coal production was being resumed, then the target could still be reached—but "only by a great effort by all concerned."

In the normal way the present is an unpropitious time of year to look for the beginning of a "steady upward movement" in coal output; the summer holidays are too near. Mr Gaitskell's statement can therefore only be disquieting. He went on to say that stocks, which should have risen by 625,000 tons in the past four weeks, had in fact risen by only 170,000 tons. Not only lower output, but higher consumption, were to blame for this. And the consequence? It would seem most reasonable to cut domestic consumption or to relax the required level of coal stocks for the winter; Mr Gaitskell had admitted that stocks at the end of last winter were higher than at any time since 1943. But he went on to declare:

Since we must have sufficient stocks at the end of the summer to meet our winter needs, if output is lower, or inland consumption is higher, than it should be, we shall have no alternative but to reduce the rate of coal exports.

Some, but only some, of the devastating effect of this statement was removed when Mr Gaitskell, answering a question, indicated that domestic consumption as well as exports might have to take some of the burden. But do not British responsibilities to Europe (to say nothing of the balance of payments) demand that in 1948 exports should be cut last?

Silver Currency for China.

The currency situation in China has turned full circle during the past fourteen years. In 1934 China was pushed off the silver standard as one of the minor incidentals of legislation passed in the United States in order to put a few more million dollars in the pockets of American silver producers. Since then China has grappled with the problem of managing a paper currency. China claims to have been the inventor of the bank note, but long experience has not, in this case, made for proficiency, or at least for moderation, and the Chinese national dollar, or fapi, is now sinking fast in a welter of inflation. Successive official devaluations have carried its rate to 1,400,000 to the US dollar and all attempts to stabilise and save this currency are clearly doomed to failure. This fact has now been admitted, and the Chinese authorities have decided that only by a return to a metallic standard can stable conditions be restored. Reports from Nanking suggest that a new silver dollar with an exchange rate of four to the US dollar will be introduced by the end of this month. To coin a sufficient supply of the new currency to provide for the needs of the country and to convert the old paper currency into silver would be a prodigious task. What is in prospect, therefore, is in fact a dual currency, the paper fapi making up the bulk of the circulation, the silver dollar being gradually introduced and the relation between the two being at first left to the determination of a free market.

The success of the experiment depends on the readiness of the Chinese authorities to set their financial house in order and to establish some semblance of balance between their receipts and expenditure. If the recent havoc in the public finances continues, and the inflation of the currency provides the main source of revenue for the Government, the silver that will be put into circulation will go straight into hoards. Gresham's law will operate. But even if the Chinese Government performs the miracle of stabilising its public finances, the reversion to a silver standard will set some immense problems. The first is the mobilisation of an adequate supply of silver. Chinese officials have spoken optimistically of finding the required stocks in the United States. The US Treasury has a free silver reserve of some 160 million ounces, but the greater part of this must be earmarked against future domestic coinage requirements. There must be immense hoards of silver underground in China, but they will not emerge until political and financial stability are clearly in sight. All this considered, it will be far more difficult to rebuild the silver standard in China than it was to destroy it. Since the United States took so prominent a part in the work of destruction they owe it to China to

offer some help in that of restoration. If China is in earnest about the return to silver, a new and potent factor has arrived in the world silver situation.

Malayan Rubber and the United States

The rubber market has shown considerable stability in recent months and spot prices in London remain firm, being quoted on Wednesday last at 1s. 1½d. a lb. World production of natural rubber continues to expand: for the four months to April it amounted to 475,000 tons compared with 405,000 tons for the corresponding period of 1947. Output is thus running at an annual rate of 1,425,000 tons, compared with actual production of 1,260,000 tons in 1947. Consumption of natural rubber is no less encouraging; between January and April of this year it totalled 445,000 tons, compared with 325,000 tons in the same period of 1947, the latest figures correspond to an annual rate of 1,335,000 tons against last year's actual consumption of 1,100,000 tons. These comparisons of output and consumption are encouraging, though it is well to emphasise that they refer only to the first four months of the year. Statistics for synthetic rubber production and consumption show an equally welcome decline. Up to April, output totalled 178,500 tons against 249,500 tons for the first four months of 1947, while consumption amounted to 165,000 tons, against 250,000 tons last year.

Rubber prospects depend on two main factors: the first is the scale of consumption in the United States, which last year absorbed more than half the world's total consumption of natural rubber; and the second is economic and political stability in Malaya, which last year supplied over half of the world's total output. Under recent American legislation, the minimum annual consumption of general purpose synthetic rubber has been fixed at 225,000 tons. The annual rate for 1948, if figures for the first four months are maintained, would be nearly 500,000 tons, or more than twice the required minimum. That American demand for synthetic rubber has remained so high without direct enforcement is due mainly to its low price. As Sir John Hay has pointed out to the shareholders of United Sua Betong Rubber Estates, synthetic rubber is supplied to manufacturers at a fixed price of 18½ cents a lb.—equivalent to 11d. a lb. against the London spot price of nearly 1s. 2d. a lb. for natural rubber. No objection could be raised against this official price if it is unsubsidised and if it covers not only direct costs of production but also amortization costs. This question has never been satisfactorily answered. Meanwhile, the market for natural rubber is dependent on the maintenance of industrial activity in the United States, where consumers still think in terms of "20 cent rubber." Any recession there might have serious political repercussions in Malaya, although a fall in commercial demand for rubber in America might conceivably be partially offset by stockpiling purchases.

Political conditions in Malaya are none too happy. Sir John referred to recent labour troubles culminating in the destruction of property and in the threat to human lives on estates where employed labour has been well treated. Such outbreaks are due as much to political as to economic causes, though they are inflamed by the high cost of rice. The All-Malayan Council of Joint Action and the People's United Front are both reported to be under the influence of the Communist-dominated Malayan Federation of Trade Unions. If economic conditions deteriorate, political strife may increase and perhaps threaten a wider area than Malaya. The importance of a free rubber market in the United States lies therefore not only in affording the sterling area a means of earning scarce dollars, but also in safeguarding South-East Asia from political disruption.

Remittances from Argentina

Of commercial and financial negotiations with Argentina there is no end. No sooner is the ink on one agreement dry than Señor Miguel Miranda can be depended upon to find room for further manoeuvre in the discovery of gaps to be filled or in the reinterpretation of loosely drawn clauses. The permanent British Food Mission now in Buenos Aires has recently begun to battle again on the food contracts. The main issue is the insistence by Argentina that Britain should take the chaff with the wheat and the offal with the meat. Britain's unwillingness to take such by-products of meat exports as cattle horns has now been followed by threats that exports of meat may have to be restricted, by a much more selective grant of import licences for British goods, and by increased difficulties and delays in authorising sterling remittances by British companies in Argentina to their shareholders in the United Kingdom. Señor Miranda has said that

Argentina cannot afford such inessentials as whisky and toys from Britain. Even motor cars and lorries will not be bought unless Britain is prepared to send more petrol with which to drive them. This last suggestion is an interesting indication of the extreme difficulty in which Argentina now finds itself owing to the exhaustion of its dollar reserves. The fall of its dollar income continues, and hopes that off-shore purchases financed with Marshall dollars might come to the rescue of this taut situation have had to be postponed. Argentina, therefore, would welcome a diversion of oil imports from dollar to sterling sources.

In dealing with Señor Miranda it is always difficult to judge how far these wider issues may be introduced merely in order to gain victory on a comparatively small point—in this case how far the substance of the recent agreement may be menaced in order to overcome British unwillingness to take some of the by-products of the Argentine meat industry. The Andes agreement provided neither for the sale of Argentine meat by-products nor for the problem of remittances on British capital invested in Argentina. These two omissions are now being compensated in a typical haggle which Señor Miranda has aptly described as "hard bargaining."

Royal Dutch-Shell Group Dividends

Until "Shell" Transport and Trading presents a figure for consolidated profits the inner significance of the net profit declared by the parent company alone must remain a matter of conjecture. In the past it has been the practice for "Shell" to call on the profits of the operating subsidiaries only to the approximate extent of the amount necessary to meet its own dividends, and the remaining earnings of the group have been discreetly retained in the accounts of subsidiaries. There has been some departure from this practice in 1947. Disclosed net profits have risen from £2,587,219 to £3,924,292. Net preference dividends absorb £440,000. The previous year's rate of ordinary dividend is maintained at 7½ per cent tax free, but the 5 per cent final dividend is payable on an ordinary capital of £38,594,177—it was increased from £28,945,633 by the recent share issue. Hence the total dividend absorbs £2,653,000 net, leaving £831,000 of net profit undistributed.

This result, which follows from the exceedingly favourable operating conditions enjoyed by oil companies in 1947, bears out the optimistic expectations in the prospectus for the new issue last December, when the directors expected "at least to maintain" the dividend at the 1946 rate. The disclosure of earnings equivalent to some 9 per cent tax free is perhaps an indication that a higher dividend could have been paid if voluntary dividend limitation had not barred the way. That would have been a notable achievement immediately after the increase in capital and it might have found some justification in the reduced rate of dividend in recent years compared with prewar. As it is, shareholders must wait.

It is right that "Shell" should at this stage conserve every penny of its surplus profits, in view of the magnitude of the capital projects which it has in train. This week, the other member of the diarchy, Royal Dutch Petroleum Company, though now freed from the restraint of dividend limitation, has also announced its adherence to last year's dividend rate of 9 per cent on the increased capital. According to the estimates of six months ago, the extension plans now being implemented by the Royal Dutch-Shell group will absorb £105 million of new capital. Even after the successful new issue, it was calculated that "Shell" Transport and Trading would have to find a further £14 million to complete its contribution of two-fifths of the total. The latest profits figures suggest that the task should be within the compass of the group's profit-earning potential, but unless the rising trend of costs is checked, the sum ultimately required to finish the extensions may indeed exceed last year's expectations.

Quicker Turn-round of Ships

The working party report on the turn-round of shipping in British ports, which was published on Tuesday, paints a disturbing picture. Last year, 50 per cent of the ships bringing iron ore to the Tees had to wait an average of 3 days for a berth. The squeezing of timber traffic into the short season allowed by the Baltic climate is not a new problem, but increased imports last year found merchants unprepared. Many were unable to handle their timber allocations; barges and wagons were kept in use and held up the discharge from subsequent ships. There are also complaints of slowness in unloading food cargoes. Since the Ministry of Transport has two million tons of dry cargo shipping under charter from foreign owners, the speed of turn-round has a direct bearing on the balance of payments. Yet it is only recently that the Ministry of Food has been prevailed on to

make overtime a universal practice where grain ships are to be unloaded, and it has not yet adopted double shifts; the working party recommends that it should do so.

War damage and arrears of maintenance are responsible for a great deal of the delay. Half the warehouses and transit sheds in Liverpool, 60 per cent in Southampton and Hull (which has also lost a dock) and one-third in London were destroyed. Shortages of labour and materials have retarded repairs, and the Minister of Transport's careful statements at a press conference on Tuesday scarcely held out promise of the urgent action which is recommended in the report. Meanwhile some ports are congested and others, on the Bristol Channel and the Clyde, for instance, are not working to full capacity. It is easy to demand efficient planning of the use of the ports, but can the importers who queue to use the straightened facilities of Hull be blamed if it would not pay them to import through Cardiff? No doubt this year's timber import programme (which is smaller) can be better planned throughout the season on the lines recommended by the working party; the Timber Controller has also made arrangements for stacking timber in the port areas.

The working party offers some reserved comments on the dock labourers' readiness to work, and their pursuit of restrictive practices—on the latter, it was satisfied that there was substance in "some of the complaints as regards both sides of the industry." Late starts, early finishes, and unauthorised morning and afternoon breaks come naturally to the docker, to whom the advantages and decasualisation are new and untested. The working party "feels that there is a need for improving the standard of supervision in the docks." It is able to point to Manchester, where an energetic campaign has rid the port of bad timekeeping. The 1946 Act has made for rigidity in dock labour. Employers and men must agree before labour can be transferred or reasonable overtime worked. Meanwhile, seasonal movements of imports which originally lead to casual dock work have impelled the National Dock Labour Board to institute seasonal registers for the employment of extra men at peak periods. Detailed recommendations relating to each port in the working party's report reveal a complex of problems such as shortage of weighing machines, major schemes for new cranes, sorting of fruit cargoes and Customs clearances. Many organisations and interests are concerned with the work of the docks, and the report rightly emphasises that each can play a part in reducing the present waste of shipping space and foreign exchange which is resulting from present delays to shipping in the ports.

Fifty Years on the Rand

The annual statements of the chairman of the Rand mining houses so far made this year have added some useful statistical material on the South African gold mining industry. Mr Brendan Bracken, speaking recently in Johannesburg at the fiftieth anniversary of Union Corporation, showed that from its inception in 1898 until 1923 the output of the group was double, and in the subsequent twenty-five years was again almost trebled. In 1947 the group produced 1,609,987 fine ounces, representing some 15 per cent of the total Witwatersrand production. Over the fifty years of operations output has exceeded 34 million fine ounces. Gross profit last year increased by £286,765 to £1,372,119.

The uneven experience of the "shops" in share dealing over the past year is demonstrated by the increase of £165,587 in the profits made by Central Mining and Investment from this source, which accounted for the whole of the total rise in profits from £711,947 to £842,487. On the other hand, General Mining and Finance profits decreased by £58,944 to £385,345, largely owing to the more restricted scope for share dealings. In his statement to Central Mining shareholders, Sir Clive Baillieu makes some interesting comparisons of costs in recent years. He has taken 1938 as the most suitable basis for comparison with 1947 since the tonnage milled on the Rand amounted to approximately 53½ million tons in each year. In 1947 the revenue of the industry was some £9.3 million more than in 1938 as the price of gold was 30s. higher. Against this Sir Clive has calculated that total costs have risen by around £19.5 million, of which European labour has accounted for £8,900,000, coloured wages £2,200,000 and stores and other costs £8,400,000. Moreover, the rise in total costs between the two years has been mitigated by the lower tonnage of ore developed in 1947 and the lag in the increased cost of stores due to accounting methods. This rise in costs has received considerable emphasis in the reports of the mining houses in recent years, and the policy of the new Government in the negotiations with the labour organisations which were interrupted by the elections will be of decisive importance for the future of the industry.

Anglo-Russian Trade

The Anglo-Russian Trade Agreement of last December stipulated that if "by May 31, 1948, the total value of Soviet orders placed for equipment . . . does not reach half of the whole value of this equipment, then the Government of the USSR will have the right to reconsider its undertaking relating to the making available to the United Kingdom of the last 200,000 tons out of the 750,000 tons of grain. . . ." Little information has filtered through about the progress of placing Russian contracts, apart from some inspired and unflattering guesses. Last week, however, Mr Bottomley, Secretary for Overseas Trade, presented Parliament with a progress report. Up to the end of May, Russia had shipped 337,500 tons of grain, and a further 137,000 tons were due for shipment in June. Under the agreement, Russia has agreed to deliver before the end of September, 750,000 tons of grain consisting of 450,000 tons of barley, 200,000 tons of maize and 100,000 tons of oats.

Britain in return agreed to deliver 25,000 tons of light rails of which not less than 10,000 tons were to come from new production. Some 12,000 tons of rails have already been shipped from stocks and negotiations are proceeding to supply the balance from new production. As for other equipment required by Russia, Mr Bottomley announced that tenders amounting to approximately 90 per cent of the total supplies contemplated under the Agreement have been submitted by British manufacturers to the Soviet Trade Delegation, though contracts have been signed so far for less than £1,000,000. The total value of the scheduled equipment has never been disclosed, but the total value of trade is probably of the order £20-25 million each way. Russia has also made large purchases of wool, rubber, cocoa beans and coffee; no information on the amounts bought has been given, but further contracts are in course of negotiation.

Mr Bottomley refrained from expressing an opinion whether, in this situation, the waiver clause might be applied. The Agreement states that "the value of contracts actually concluded and prepared for concluding . . . would be taken into account." It is unlikely that tenders submitted could be considered as "contracts prepared for concluding," even though the delay in accepting them is Moscow's responsibility, rather than Britain's. Mr Wilson has been in touch with the Soviet Ambassador about the resumption of the trade talks, but as yet no date has been fixed. Under the Agreement, representatives of the two Governments were to meet not later than May to review the progress of trade between the two countries and to expand the scope of the Agreement. Perhaps the President of the Board of Trade has yet to complete his training for a renewed bout with Russian conviviality.

West African Groundnuts

Publicity for the East African groundnuts scheme has overshadowed the importance of West Africa as a source of ground-

nuts. Before the war, Nigeria was second only to India among Empire producers; during the war and after, production more than doubled—from 145,000 tons (shelled weight) in 1939-40 to 313,000 tons in 1947-48. West Africa was an obvious region for possible development. The Report* of the Colonial Office Mission which has been studying conditions on the spot recommends that five areas should be developed covering in all 5,000,000 acres, of which 2,750,000 acres should be under cultivation. Two areas are on the Gold Coast, two in Northern Nigeria and one in Gambia. These districts are well suited for mechanised cultivation and the Mission recommends that they should be developed in entirely new forms of communities. Group farming should be based on "tractor units" of 600 acre blocks, which would become the basis for small hamlet communities. In each unit, 200 acres would be devoted to groundnuts, 200 acres to guinea corn or millet and 200 acres to grass ley, the whole being worked on a six-course rotation. In the initial stages natives would be employed as paid labour but eventually, the report suggests, they should be settled by permanent peasant communities cultivating the land co-operatively.

The Mission estimate that the total capital cost will be about £25 million, which is far in excess of the financial resources of the West African Governments. If the scheme is to materialise, it must therefore be carried out with the strong support of the Colonial Development Corporation. Annual production of not less than 225,000 tons (shelled weight) is believed to be possible at a cost per ton ranging from £16 7s. to £21 12s. fob West African ports. These estimates include interest charges and the amortisation of capital, but the West African Governments think that the actual cost will in fact be much higher.

Such a scheme would undoubtedly bring great benefits to the West African people. But many difficult problems remain—the provision of mechanised equipment, adequate transport facilities and the resettlement of native populations. Last week, the Colonial Secretary admitted that in Northern Nigeria 303,000 tons of groundnuts had accumulated out of a total crop of 313,000 tons, while on May 20th stocks still amounted to nearly 280,000 tons. Nigeria's railway facilities are quite unable to handle the present bumper harvests, and a radical improvement will be needed before the new scheme is started.

For these reasons, the Colonial Development Corporation is unlikely to accept the recommendations light-heartedly, despite the world shortage of oilseeds. The East African project has run into many unforeseen difficulties and its cost has far outstripped original intentions. Even now it apparently needs the constant personal supervision of Ministers. With that experience fresh in mind, a scheme for West Africa must first be worked out in detail, and co-ordinated with Britain's industrial programme. It will—if it is finally approved—be competing for scarce steel and machinery, and this time no dollars will be available for it as they were for East Africa.

* Report of Mission on West African Oilseeds. HMSO. 1s. 6d.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports appear in the Supplement: Hawker-Siddeley; Automatic Telephone; Siemens.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked '2'), and those paying 3 per cent or less will be repaid at the latest date (marked '1'). (a) Net yields are calculated after allowing for tax at 9% in the U.K. (b) Flat yield. (c) Assumed average life 15 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2 1/2 per cent free of income tax. Yield worked out on 15 per cent basis. (g) Fifteen months to March 31, 1947 (yield basis 7.6 per cent.). (h) To latest redemption date. (i) 15 months. Yield basis 25%. (j) Free of tax.

COMPANY MEETINGS

THE HAWKER SIDDELEY AIRCRAFT COMPANY, LIMITED

PROGRESS IN RESEARCH AND DEVELOPMENT

The twelfth annual meeting of Hawker Siddeley Aircraft Company, Limited, was held, on the 9th instant, in London. Mr T. O. M. Sopwith, C.B.E., F.R.Ae.S. (chairman) in the course of his speech said: "I am pleased to be able to report another year of successful operation by your group. It reveals steady progress in our policy of intensive research and development in aircraft and engines and continued expansion of the foundations and scope of your business, both at home and abroad. The development of the non-aircraft side has been particularly marked."

The Gloster "Meteor," the fastest fighter in squadron service in the world, is being supplied to the R.A.F. as their standard interceptor. The Hawker "Sea Fury" has been adopted by the Royal Navy and has also been selected by the Royal Canadian Navy, the Royal Australian Navy and the first Canadian Squadron is already in service. In the heavy bomber field the Avro "Lincoln," successor to the world famous "Lancaster," is being produced by Sir W. G. Armstrong Whitworth Aircraft Limited, both for the R.A.F. and abroad. A. V. Roe & Company, Limited are also completing another four-engined military aircraft, shortly to have its initial flight tests.

COMMERCIAL AIRCRAFT

In the commercial field we have the Avro "Tudor" series covering a range from 30- to 70-seaters. We are building under Government contract 50 "Tudor II" aircraft, 32 of which have already been allotted to two

British Corporations. Four "Tudor IV's" have already been delivered and 16 are being prepared.

On their gas turbine side, the "Mamba" has successfully completed its full military and civil type test. A larger gas turbine, the "Python," is now being prepared for type tests. A. V. Roe, Canada, Limited, an axial flow jet engine the "Chinook," has been designed and built, and is running satisfactorily—a remarkable achievement for about two years' work.

PREFABRICATED HOUSES

A. W. Hawksley, Limited, has helped considerably in widening our interests and up to date has made over 12,000 factory-built prefabricated houses. Our new designs for overseas are attracting considerable attention.

The motor car section of our business carried on by Armstrong Siddeley Motors, Limited, is working to capacity within the limits of material allocation. The cars are quality types which for almost half a century have upheld the tradition of British engineering standards all over the world. We have no intention of lowering these standards.

Dividends totalling 3 1/2 per cent. (less tax) for the year, have already been paid leaving £409,893 to be carried forward. An interest is being acquired, in conjunction with Leyland Motors, Limited, in a new Canadian company for the assembly and manufacture of motor commercial vehicles. Your group is engaged on export contracts to a value exceeding £14 million, thereby earning substantial sums of foreign currency.

In addition to Hawker Siddeley Aircraft Company, Limited and Armstrong Siddeley Development Company, Limited the group comprises 20 wholly-owned and 3 partly-owned subsidiary companies, and 11 associated companies. I look forward to the future with confidence.

The report was adopted and the resolution to change the company's name to Hawker Siddeley Group, Limited was approved.

ASSAM RAILWAYS AND TRADING COMPANY, LIMITED

DIFFICULT CONDITIONS

The sixty-seventh ordinary general meeting of this company was held, on the 9th instant, in London.

Col. C. F. Birney, D.S.O. (the chairman) said that the gross trading profit was nearly £35,000 less than the previous year's figure. Their revenue was derived mainly from the sale of coal and timber products, and the fall was almost entirely on the coal side. In common with all other industries, costs had increased not only on wages, both European and Indian, but also on all purchased materials, and unfortunately the Government of India had so far declined to permit any increase in the selling price of their coal. The final result disclosed a balance of £31,991, to which must be added £26,365 carried over from the previous year.

The selling price of their coal was fixed by the Government of India in 1944, and in spite of greatly increased costs of every kind, they could not make any increase in their selling price. They were much concerned at the position and were pursuing the matter energetically with the Government of India. On the timber side, the steady demand for their tea chests continued.

At the present time they were passing through a difficult period when considerable capital expenditure was essential and the controlled selling price of their coal left no margin of profit. The directors regretted they could not recommend any dividend on the B Stock and they had also decided to pass the dividend on the A Stock which would ordinarily have been paid on July 1st next.

He was not yet able to report any satisfactory issue of their approach to the Government of Assam for new forest leases.

The report and accounts were adopted.

British National Income 1870-1946

The current issue of the *Economic Journal* contains an important set of estimates of the national income of the United Kingdom from 1870 to 1946 by Mr A. R. Prest of the Department of Applied Economics at Cambridge. Mr Prest does not claim for his figures that they are more than first approximations, subject to a considerable margin of error. But he has nevertheless rendered a very great service in providing a continuous series of figures for such a long period. The estimates are charted in the

accompanying diagram, both in terms of current money and also in terms of pounds of the purchasing power of 1900. The figures of total national income include the whole of Ireland up to 1919, but only the six counties of Northern Ireland thereafter. The figures of income per head made an automatic correction for this discontinuity. Mr Prest has drawn heavily on previous estimates, on Professor Bowley's estimates of wages for the earlier period and on the national income estimates of Professor Brown, Mr Stone and the official White Papers for the later period. For the

purpose of deflating current-money figures to a constant-price basis, an index of the cost of living has been used throughout.

Those who are interested in the rate of economic progress will turn most eagerly to the estimates of "income per head at 1900 prices." Over the whole period from 1870 to 1938, the increase was from £24.63 to £57.37 per head per annum. This is an average rate of increase of almost exactly 1 1/2 per cent per annum compound. Possibly this understates the real rise, for it is probable that, over a period as long as 68 years, the prices of things-in-general rose very much less than those of the basic necessities included in an index of the cost of living. If this argument is acceptable, then it would seem permissible to go on using the figure of 1 1/2 per cent compound as the average annual rate of economic progress under free capitalism. Incidentally, Mr Prest's figures show a slightly more rapid rate of progress in the 38 years after 1900 than in the 30 years before that date.

Shorter Note

During 1947 the Zinc Corporation sold between 55 and 60 per cent of its total output of lead to the British Government, representing about 80 per cent of its total overseas sales. The price paid by the British Government was not disclosed, but Mr. John R. Govett, the Chairman, mentioned in his statement that while the 1947 prices were higher than the previous year they were less than those ruling in the other export markets. The average export price was £71 7s. 9d. a ton so that the British price must have been somewhat below this figure. On the other hand the Ministry of Supply's selling price for lead is £90 a ton. The Zinc Corporation has still to sell lead in Australia at a "ceiling price" of £17 12s. a ton, which according to Mr Govett is much less than half the current cost of production and now less than 20 per cent of the export price. The low Australian price for lead has caused a great increase in domestic consumption, although the rest of the world is suffering from a shortage of this metal. The Commonwealth Government has also made an appeal for an increase in sales of lead to dollar countries and a substantial quantity is expected to be shipped to the United States during 1948. This redirection of exports will mean a reduction in supplies to other overseas markets, though Britain will not be affected.

THE BURMAH OIL COMPANY, LIMITED

SATISFACTORY RESULTS—INCREASED PROFIT

BURDEN OF TAXATION

CONDITIONS IN INDIA AND BURMA

SIR KENNETH B. HARPER'S STATEMENT

The forty-sixth annual general meeting of the members of The Burmah Oil Company, Limited, was held on Friday, the 4th instant, in the Merchants' Hall, 30, George Square, Glasgow.

Sir Kenneth B. Harper, chairman and managing director, presided.

The following statement by the chairman was circulated with the directors' report and accounts:—

THE BOARD

In accordance with the announcement made by him in his chairman's statement last year, Mr Robert I. Watson retired from the leadership of your group of companies and from all his other business interests on December 31st last, but to the great regret of us all he was spared only three weeks to enjoy rest from the burdens he had laid down. His death came suddenly on January 26th. The Burmah Oil Company's interests were Mr Watson's life's work and no tribute we could pay him would be too high.

I am glad to inform you that Mr Thomas Taylor McCreath has accepted your directors' invitation to join the board. Mr McCreath has a long experience of the oil industry in Burma and India which will be a source of strength to us in our deliberations. His appointment will come up for confirmation at the annual general meeting and I am confident it will receive stockholders' warm approval.

PROFIT AND LOSS ACCOUNT

It is a matter for satisfaction to your board and one upon which the staff in the East are to be congratulated that in spite of difficulties which still persist to a considerable degree in Burma we are able to present the accounts to you in time to hold the annual general meeting in early June as was our prewar practice.

The group's profit for the year from trading in petroleum products was £1,603,227, as compared with £560,276 in 1946. The volume of sales increased in both Burma and India in 1947 and the profit shown also includes trading adjustments from previous years. In 1946 the profit from Burma trading was for nine months only. The figure of profit for 1947 is struck after charging all expenditure on prospecting and exploration, both in India and Burma. This item was £498,287 higher than in 1946.

Interest and dividends totalling £2,570,601 are almost the same as for 1946, being £1,565 down. The increased dividend received from Anglo-Iranian Oil Company, Limited, in respect of 1946 is offset by a reduction in dividend from Burmah-Shell Oil Storage and Distributing Company of India, Limited, and by the loss of dividends from investments realised to provide the finance referred to below in my remarks on the balance sheet. Total income therefore consisting of trading and investment profits and transfer fees amounted to £4,175,754.

On the debit side provision for taxation at £1,798,840 is £1,149,142 higher than for

1946. Much of this increase naturally follows from the higher profits, but it is to be noted that the incidence of income taxation in Burma and India is now greater than in the United Kingdom, and we have also to provide for business profits tax in India and profits tax in the United Kingdom.

The balance of profit for the year amounts to £2,366,498. Adding £470,285 brought forward from the previous year, the sum for disposal amounts to £2,836,783, out of which the board has allocated £250,000 to general reserve (bringing this reserve up to £4,600,000). If their recommendation of a final dividend of 10 per cent. is approved, preference and ordinary stock dividends will absorb £2,017,064 and allocations to provident funds will be £103,916. This will leave £465,803, which sum the board recommends should be carried forward.

THE BALANCE SHEET

The most noticeable item in the balance sheet is a drop in our investments of some £11,300,000, of which realisations from the sale of Government securities represents £10,400,000. The sums realised were used to reduce the amounts owing to subsidiary companies by £8,350,000 and to increase advances, mainly to our Burma subsidiaries, by £2,600,000. The Consolidated statement shows that the drop of £11,300,000 in our investments is accounted for by an increase in cash balances of £1,200,000, an increase in advances of £900,000, a reduction of creditors by £5,300,000, and an increase in stocks of stores and materials of £1,400,000. The year's expenditure on rehabilitation of our Burma properties was £2,500,000.

CONSTITUTIONAL CHANGES—BURMA AND INDIA

Within the past twelve months fundamental political changes have taken place both in Burma and India. From August 15, 1947, the old British India has been divided into two Dominions, India and Pakistan, each with complete self-government within the British Commonwealth. Burma has chosen to leave the Commonwealth and became an independent self-governing nation on January 4th this year. To all three countries we wish peace and progress in the evolution of their new independence.

As was natural, all three countries have immediately become engaged in formulating their social and economic policies, and as was to be expected these policies have a strong national bias.

Under an interim treaty, signed in October, 1947, between the Government of the United Kingdom and the then provisional Government of Burma, the latter undertook to respect contracts "made in the exercise of the executive authority in Burma before the coming into force of the constitution of the Union of Burma," a phrase which covers the concessionary rights of your Burma subsidiary companies.

The Government of the Union are in process of formulating the policy which will guide the future grant of petroleum conces-

sions for development by private enterprise, and we have reason to believe that under that policy our existing concessions will be fully recognised. The development of all natural resources in Burma is subject to the right of nationalisation, in which event the Government undertake to pay equitable compensation.

WAR DAMAGE AND DENIAL CLAIMS, BURMA

I need not remind stockholders of the circumstances in which, as a war measure, our group's Burma properties were destroyed under official instructions in 1942, following the Japanese invasion. In his recently published report, General Hutton states that "at that time all the information available pointed to the fact that, if it was not possible to hold Rangoon and the oilfields, the greatest service that could be rendered to the Allied cause would be a complete denial of the oil and refinery resources of Burma." The destruction of these properties was accordingly ordered and was effectively carried out, involving a heavy loss to our companies for which compensation is due to us. No settlement of our claims has yet been made, and the companies have now been compelled in view of limitation statutes to file suits in the appropriate Burma courts. As these cases are now *sub judice*, I feel I should not say anything more meantime except that we regret it has been necessary to take action which may have even an appearance of unfriendliness to the Union Government so soon after it has come into office. Such action, which was legally unavoidable, does not alter in the slightest our desire to maintain the most cordial relationship with the new Government of Burma. We feel that our companies have in the past rendered good service to Burma, and we hope to be able to continue to do so.

RECONSTRUCTION IN BURMA

Continuing to rely on our legitimate denial claims being met and on a square deal from the Government of the Union, we have proceeded with reconstruction of our plant and facilities in Burma according to plan. This reconstruction work falls into four parts:

- (a) The rebuilding of our installation, depots and other facilities for the distribution of oil products.
- (b) The re-starting of crude oil production at the oilfields.
- (c) Rehabilitation of the main pipeline to enable crude oil when produced to be pumped to Rangoon.
- (d) Rebuilding of the refinery.

Work on the first of these was begun as soon as we were allowed to go back to Burma after the war. Good progress was made and by the end of 1947 our organisation was in full swing. Work is in hand under the other three heads, but it is the rebuilding of the refinery which, because of its intricate nature and because of the long delays which are today inseparable from the provision of new plant, will inevitably take longest and will determine the date, now I fear not before 1951, when oilfields, pipeline and refinery will all be in operation. The scale of operation as now planned will be less than our prewar throughput, but the refinery is being rebuilt in such a way that its capacity can be increased if and when additional oil resources are discovered.

EXPLORATION AND DEVELOPMENT

This brings me to the subject of exploration. Although we have had no return from the very large sums of money which we have expended in the past in Burma in geological work and testing new areas, we are not yet satisfied that further oil deposits do not remain to be discovered by the most modern methods available, and we are ready to proceed with the further examination and testing of possible areas as soon as the terms on

which we shall hold prospecting licences and mining leases have been agreed. This matter is under discussion with the Government of the Union of Burma.

Our exploration programme includes also in its scope both Pakistan and the Union of India, in both of which countries we have been very active throughout the year and have large programmes of work ahead of us, subject again to our being able to agree reasonable terms, especially as regards security of tenure, with the Governments concerned.

UNIFICATION OF INTERESTS IN BURMA

Reconstruction of our properties in Burma has proceeded on the assumption that, as stated by the late chairman last year, there will be joint working of the concessions of The Burmah Oil Company (Burma Concessions), Limited, The Indo-Burma Petroleum Company, Limited, and The British Burmah Petroleum Company, Limited, and refining of the crude oil from them in a refinery jointly owned by the latter two companies and The Burmah Oil Company (Refineries), Limited. The formalities for this unification of interests are approaching completion. The marketing of the products of the joint refinery is not being merged and will continue as formerly, The British Burmah Petroleum Company's share of the products being marketed for them by The Burmah Oil Company (Burma Trading), Limited, and The Indo-Burma Petroleum Company maintaining their own separate organisation.

LABOUR SITUATION IN BURMA AND INDIA

In Burma the clerical staff abstained from work for a month and installation labour went out on two occasions during the year. These strikes were a part of the settling down process in the disturbed conditions following the war, but labour troubles in Burma have up to the present had a strongly political flavour. Although the labour situation throughout India and Pakistan was a troubled one, there were no strikes in our subsidiary companies in either country during the year. There are signs of a growing realisation that wages and conditions of employment in our companies are too good to be lightly thrown away.

The act of partitioning India was accompanied, as stockholders will remember, by attacks and reprisals by one community on another with very severe loss of lives. It has been a matter for relief and satisfaction that our staff, British and Asiatic, all came through safely. In Burma certain areas have remained disturbed ever since the country was recovered from the Japanese, but on the whole good progress has been made in the restoration of law and order.

As can be imagined, the political changes to which I have referred and the disturbances and problems which accompanied them have added complications to the lives and work of our staff in the East. They have taken these in their stride in the most admirable spirit, and I am sure stock holders will wish to join the board in an expression of appreciation and thanks to them. The staff at home have had their own difficulties of a different nature. Our thanks are due to them also for an admirable year's work.

The report and accounts were unanimously adopted.

The final dividend of 10 per cent. (2s. per £1 unit) on the ordinary stock for the year 1947, recommended by the directors, was approved and declared payable on June 11th, 1948.

Mr Thomas T. McCreath, who was recently appointed to the board, and Colonel Hugh E. Spens, C.B.E., D.S.O., D.L., the director retiring by rotation, were unanimously re-elected.

The auditors, Messrs Brown, Fleming and Murray, C.A., were re-appointed for the current year.

UNION CORPORATION, LIMITED

FIFTIETH ANNIVERSARY

THE RT. HON. BRENDAN BRACKEN'S ADDRESS

The ordinary general meeting of shareholders of the Union Corporation, Limited, was held in Johannesburg recently, the Rt. Hon. Brendan Bracken presiding. The chairman said:—

Gentlemen,—Perhaps this is an occasion for a little pride. We meet to-day not only to transact our ordinary affairs but also to celebrate the fiftieth anniversary of this business. Small indeed was the company registered by our founders at Pretoria in 1897. If we can claim that for many years our affairs have prospered, we must remember with thanksgiving the labours and trials of those adventurous founders who, in many lands, sought opportunities for our shareholders. They were indeed men of vision and daring, full of intelligence and resourcefulness. In South Africa they were pioneers in opening up the Far East Rand, and to them also we owe our participation in manifold enterprises in the Union and other countries.

A COMPARISON

Some idea of the expansion that has taken place in our activities is given by a comparison of the gold output of the mines of the Union Corporation group now and in the past. In 1898 the mines of the group produced 259,698 ounces fine of gold; in 1923, 538,674 ounces, equivalent to 6 per cent. of the total Witwatersrand output; last year, 1947, their production was 1,609,987 ounces fine, and represented 15 per cent. of the total Witwatersrand production. The total production of the group for the half-century has amounted to over 34,000,000 ounces fine.

As marked as the expansion in the gold production of the mines of the group has been the broadening in the scope and field of the Corporation's activities. Its original interests were gold mining and exploration in South Africa; we are now interested in industries in many parts of the world. The most have prospered, though some have required years of anxious nursing.

ORANGE FREE STATE

In recent times we have been pioneers in large-scale mining operations in the Orange Free State. I know not what fate has in store for us in this venture. All I shall say to you now is that if the thought, experience, and skills of our managers and engineers are of any account, we can claim to have taken a carefully measured risk which may well be rewarding.

Risk-taking is the life of mining. Poor indeed will be the prospect of this corporation if through timidity or complacency we ever cease to take risks in searching for new business in Africa and in other parts of the world. Our jubilee has been marked by many kindly references in the Press to our earning power and prosperity. While it is pleasant to dilate on our great gains, it is healthy to remember that they have frequently been diminished by losses. We would have made few gains without a willingness to incur losses.

SIR HENRY STRAKOSCH

Fortunately the long and sure set policy of our late chairman, Sir Henry Strakosch, the principal architect of our fortunes, was to be bold in adventure but conservative in finance. And so we have long been well prepared to meet losses or disappointments. In all our future doings we must always strive to abide by his policy. So far it has been rewarding.

If our post-war experience is of any value, we can aver that there are plenty of opportunities for hopeful new ventures. Perhaps in these strange times it will be denied that growth is the only evidence of life. We, the shareholders in Union Cor-

poration, know of no better evidence. This belief is our best hope for a prosperous century.

MR ANDERSON'S SERVICES

Of the many men whose work has built the Corporation from small beginnings to its present position, I should like to mention only three: Mr Goetz, who founded the Corporation in 1897; Sir Henry Strakosch, who served it devotedly for 46 years from its inception, as manager, managing director, and chairman; and finally Mr P. M. Anderson, our deputy chairman and managing director. Mr Anderson joined the Union Corporation group in 1911. He became our consulting engineer in 1917, manager in Johannesburg in 1922, and in 1927 was elected to the Board of directors. I cannot overestimate all we owe to him. His wisdom and knowledge must be counted among the best of our assets. Rare indeed are the services he has rendered to South Africa and to this Corporation.

THE ACCOUNTS

And now let me deal briefly with the accounts of the Corporation for the year 1947 and your directors' report, which are submitted for your approval. The gross profit for the year was £1,372,119, an increase of £286,765 over the preceding year. The provision for taxation had, however, to be increased by £247,000 from £423,100 last year to £670,100 this year partly to provide for the increased profits tax payable for the year. The net profit for the year, after charging expenses and providing for taxation, was thus £663,458.

In the light of the Corporation's commitments for various new businesses, your directors have considered it desirable to transfer from profit and loss account £75,000 to reserve account and £100,000 to exploration reserve account.

NON-RESIDENT TAX

Of the remaining £488,548 profit for the year, £488,400 has been used for the payment of dividends totalling 6s. per share, free of United Kingdom income tax, or the same amount as in 1946.

The Union of South Africa Commissioner for Inland Revenue has now agreed under the terms of the double taxation relief agreement between the Union and the United Kingdom that non-resident shareholders' tax is no longer required to be deducted from dividends paid by the Corporation to its shareholders resident outside the Union.

Largely as the result of investments in the Orange Free State, South-West Africa and Tanganyika, share and debenture holdings have increased by £359,370.

WITWATERSRAND

Operations on the Witwatersrand in 1947 were disadvantaged by a 41-day strike of a section of the mineworkers' union. This strike was caused by dissension within the union and was in no way due to controversy between workers and their employers. Without the right to strike there can be no real freedom for workers. But this essential freedom is diminished by strife between power-seeking men in a large trade union. For the price of their personal squabbles is paid in full by the hardships of the men they throw out of work.

The tonnage milled by the industry in 1947 at 53,712,300 tons was 3,215,200 tons less than the previous year and the working revenue declined by over £6,500,000 to £92,740,023. Working costs rose by a further 1s. per ton milled and totalled £71,309,136, so that the working profit of the large Witwatersrand gold mines at £21,430,887 was

lower by nearly five million pounds than in 1946.

A POSTPONEMENT

Out of this amount shareholders received in dividend £11,268,022, which is £1,500,000 less than the previous year. It is estimated that the Government will receive £6,400,000 in taxation and share of profits, as compared with £10,600,000 in 1946. This decrease in taxation is due to the lower working profit, to a further step in the reduction of special war taxation and to the more rapid amortisation of capital expenditure incurred subsequent to the commencement of milling, which became effective on January 1, 1947. It must be remembered, however, that this provision for more rapid redemption of post-production capital expenditure is not a reduction in taxation, but it merely a postponement of taxation collections.

The amount of development footage carried out in 1947 decreased slightly and was again insufficient to maintain ore reserves, which declined by over 3,000,000 tons to 169,863,554 tons.

The shortage of labour, both European and native, from which the industry has been suffering in recent years, was no less marked in 1947. The average native labour strength was 10,600 less than in 1946, and 75,000 less than in the peak year, 1941. As regards European labour, the industry is particularly hampered by the shortage of underground productive labour, of artisans, and of suitable officials.

COSTS AND SHORTAGES

To some extent the reduction in operations of the Witwatersrand mines in 1946 and 1947 was due to the interruption caused by strikes. But the roots of the industry's troubles go deeper and are to be sought in rising costs and in shortages, both of materials and labour, which have grown steadily worse in recent years. These in their turn are the result of post-war inflation, from the effects of which neither South Africa nor the gold mining industry could expect to escape.

The gold mining industry cannot, as other industries do, pass on some of these inflated costs. It is squeezed between the upper millstone of a fixed price for its product and the nether millstone of high costs and shortages of materials and labour. Such suggestions as an increase in the price of gold, or subsidies for the gold mining industry, which have been much ventilated of late, are mere palliatives. Inflation is a polite name for the process of skinning the thrifty and diminishing the real earnings of those who work by mind or hand. It cannot be curbed save by co-operation between Government, employers and workers. And that co-operation cannot be achieved without a spirit of moderation in these three great partners in the community. One of the worst handicaps to recovery is the world-wide illusion that everyone can have more without producing more.

ORANGE FREE STATE

Progress to date in the testing and opening-up of this new field has been encouraging. In 1947, in addition to further extensive drilling of the area, the sinking of eight new shafts was begun on five separate properties. The railway line has now reached Odenaalsrus and is partially open to traffic. The transmission lines from the Vaal generating station have been erected and electric power is now available. Work has also started on laying the pipeline from the Vaal River to supply water to the gold mines in the area. As the full development of these mines depends very largely on their having an ample water supply, it is to be hoped that the Government will make every effort to complete this service as soon as possible.

While there are hopeful signs that much gold will come from the Orange Free State, you need hardly be reminded that the existence of gold is not always synonymous with large profits for producers.

HEAVY BURDEN

The problems of the industry on the Witwatersrand cannot be isolated from the Orange Free State. The high costs of production and shortages of labour to which I have already referred must react on the mines of the Free State as they have on the mines of the Witwatersrand. Moreover, the mines of the Orange Free State, in common with other mines, will be confronted with a very heavy burden of capital expenditure owing to present very high costs of plant, equipment and transport.

I will now deal briefly with the affairs of the companies in which we are chiefly interested.

GOLD INTERESTS EAST GEDULD MINES LIMITED

The amount of ore milled in 1947 was lower at 1,722,000 tons but the net profit was £1,302,202, or £155,202 more than in 1946. Dividends totalling 12s. 6d. per share, or 9d. more than in 1946, were declared, and the carry-forward was increased by £75,750 to £571,117.

GEDULD-PROPRIETARY MINES, LIMITED

The ore milled was 1,197,000 tons, or 68,000 tons less than in 1946. The working profit was £625,076, and the addition of dividend income from holdings in East Geduld Mines, Limited, and the Grootvlei Proprietary Mines, Limited, together with sundry revenue, brought the total profit to £1,078,384. The net profit was £786,364 and dividends declared totalling 10s. 3d. per share, a decrease of 3d. per share. The amount carried forward was £368,999, being an increase of £32,100.

THE GROOTVLEI PROPRIETARY MINES, LIMITED

The tonnage milled, namely, 1,785,000 tons, was 137,000 tons lower than the record figure set up in 1946. The net profit rose by £102,109 to £1,174,755. Dividends declared were equivalent to 1s. 7½d. per 5s. unit of stock, being three farthings per unit less than in 1946. The amount carried forward was £475,069, or an increase of £106,078 over the previous year. The extension to the reduction plant, referred to last year, is unlikely to be available before next year owing to delays in delivery of equipment.

MARIEVALE CONSOLIDATED MINES, LIMITED

The tonnage milled in 1947 at 617,000 tons showed a decrease of 32,000 tons over the previous year. The net profit rose from £308,917 to £402,918. Dividends declared totalling 10d. per share, or 2d. less than the previous year, and the carry-forward was increased by £79,798 to £339,247.

VAN DYK CONSOLIDATED MINES, LIMITED

The tonnage milled at 1,145,300 tons showed a reduction of 42,700 tons as compared with the previous year. The working profit was £236,575. Capital expenditure, principally in connection with the new deep level No. 5 shaft in the southern section of the property, absorbed £370,636 and the amount carried forward was £291,743.

THE WITKOP PROPRIETARY COMPANY, LIMITED

The company is continuing its policy of waiting until further information becomes available from the development of adjacent areas.

THE MODDERFONTEIN DEEP LEVELS, LIMITED (IN LIQUIDATION)

During the year ended March 31, 1948, the ore milled was 353,500 tons and the working profit was £77,250. A liquidation distribution of 9d. per share was declared, making a total of 8s. 4½d. per share since the company went into liquidation.

ST. HELENA GOLD MINES, LIMITED

No. 3 shaft, a 30 degree incline, had by the end of March, 1948 reached a depth of 2,161 ft. from the collar. It is expected that this shaft, which will have a final incline depth of 3,000 ft., will be completed and equipped by the end of this year, whereupon development on reef will be commenced. No. 4 vertical shaft at the end of March had reached a depth of 432 ft. The headgear is nearly complete. This shaft will be completed to a final depth of about 2,750 ft. Many of the necessary mine buildings, houses for employees and accommodation for natives have been completed.

POTCHEFSTROOM MINING AREAS, LIMITED

The company continues to hold prospecting contracts over a large area in the Potchefstroom and Klerksdorp districts. A number of borcholes are in progress, including the one on the farm Doornplaat No. 70, referred to last year.

OTHER INTERESTS

Bay Hall Trust had another satisfactory year. It maintained its dividend of 6 per cent., free of tax, while the appreciation of its holdings over book cost increased from £1,298,708 to £1,310,989.

The working profit of British Enka was increased from £215,101 in 1946 to £348,361 in 1947. A dividend of 7½ per cent. has again been declared, and the opportunity has been taken of writing down the book value of patents, etc., to £1.

The Corporation continued to mine chrome ore from two of its properties and substantial tonnages were sold abroad. But for the shortage of local railway transport facilities sales would have been greater. During the year a subsidiary company, Uni-chrome Mines, Limited, was formed to handle the Corporation's chrome business. Since the close of the year the name of this company has been changed to Chrome Mines of South Africa, Limited, and amalgamation with other interests is under discussion.

San Francisco Mines of Mexico earned large profits, but rising costs of materials and wages, together with heavy taxation, absorbed a large proportion of the increased gross earnings.

S.A. PULP AND PAPER

South African Pulp and Paper Industries, Limited, continued to operate successfully. The profit earned, after providing for depreciation, was £180,790, as compared with £152,862 for the previous year. Taxation amounted to £58,000. Dividends declared totalling 1s 3d. per share, being an increase of 3d. per share over the previous year.

The Tsumeb Corporation, Limited, has made good progress in unwatering and opening up the mine of the former Otavi Mines and Railway Company at Tsumeb in South-West Africa. In 1947 the company made satisfactory profits from the sale of ore from dumps on the property.

The Ultramar Company has maintained its 50 per cent. interest in S.A.P. Las Mercedes, which company continued its active drilling programme in Venezuela during the year. Substantial additional reserves of oil have been proved. The construction of the pipelines is nearing completion and it is expected that oil will be flowing to the coast before the end of June.

In the lease areas of Uruwira Minerals, Limited, the Corporation was unable, owing to factors beyond its control, to carry out the full exploration programme which it had recommended. The period of prospecting and the option which your Corporation holds over a further block of shares of Uruwira Minerals, Limited, has, therefore, by agreement with the latter company, been extended till September 30, 1948.

The report and accounts were adopted and the retiring directors re-elected.

SECOND MANAGED INVESTMENTS (UNIT SECURITIES), LIMITED

GRATIFYING RESULTS

APPRECIATION OF HOLDINGS

MR R. K. FRAAY'S REVIEW

The third annual general meeting of Second Managed Investments (Unit Securities), Limited, was held in Johannesburg on the 28th ultimo.

Mr R. K. Fraay, the chairman, in the course of his speech, said: The total revenue received during the year under review was £297,629 (£170,986 in the previous year), sub-divided as follows: Dividends received and accrued, £154,903; profits less losses on investments realised, £142,531; sundry revenue, £195. You will agree with me that these results are very gratifying indeed. I am especially pleased that the revenue under "dividends received and accrued" showed such a satisfactory increase because I feel that an increase under this heading shows more convincingly than anything else the strength of an investment company such as yours.

DIVIDENDS TO SHAREHOLDERS

During the financial period ended December 31, 1945, a total dividend of 6 per cent. was declared. The dividend was increased to 7½ per cent. in 1946, while your directors were able to declare two dividends totalling 10 per cent. during the year under review; a truly remarkable record for a company with such a short history. I fully expect that it will be possible to maintain dividends totalling 10 per cent. during the current year.

It has been possible to increase the unappropriated balance of profits from £42,027 at January 1, 1948, to £143,903 at April 30, 1948. In arriving at this balance, no provision has been made for taxation for the first four months of the current year.

INVESTMENTS

The investments of your company at December 31, 1947, consisting of fully paid up stocks and shares in 111 companies, appear in the balance sheet at £2,438,574 which represents their cost including brokerage. The market value of these securities, based on the ex-dividend quotations on January 5, 1948 (the first business day in 1948 on the Johannesburg Stock Exchange) was £2,638,200. At the end of the year under review, there was therefore an appreciation of £199,626 in the market value of your holdings as compared with cost.

ANALYSIS OF HOLDINGS

An analysis of the holding of your company at December 31, 1947, gives the following position:—

Type of Company	Number of Companies	Amount Invested £	Percentage of Total Holding
Gold Mining Companies.	24	667,969	27.39%
Land and Financial Co's (excl. our Assoc. Co's)	17	330,100	13.53%
Holding in Assoc. Co's	7	672,230	27.57%
Industrial & Commercial Companies	51	706,615	28.98%
Coal, Diamond and Base Metal Companies	6	61,660	2.53%
	111	2,438,574	100.00%

93.48 per cent. of the holding was invested in quoted dividend-paying securities; 4.61 per cent. in quoted securities which had not yet reached the dividend-paying stage, and only 1.91 per cent. in shares not quoted on the Stock Exchange.

TOTAL VALUES

The chairman then gave a full list of the company's holdings at May 20, 1948, and continued: The total book value of the holding of shares in 15 land and other financial

companies at May 20, 1948, was £319,002, being 12.93 per cent. of the total holding.

The investments of your company at May 20, 1948, consisted of shares in 105 companies, with a total book value of £2,467,166, inclusive of brokerage, and a market value of £2,727,389.

INVESTMENT POLICY OF THE GROUP

The present period of opposing stresses and strains calls for great courage and initiative on the part of investment managers. It seems to me that we have nowadays to approach investment problems with a certain amount of audacity, tempered by caution based on long experience.

I addressed you at length at the last annual general meeting in connection with the investment policy followed by our group of investment companies. I would refer you to what I said then about our general policy, as I wish today to deal specifically with one point in our investment policy which is sometimes criticised, namely, the valuation of our investments for balance sheet purposes. The basis of valuation which we have adopted is the average cost price of shares on hand, and this basis has been consistently maintained. It has been suggested that the basis of valuation of our investments for balance sheet purposes should be cost or market value, whichever is the lower, or alternatively that we should transfer each year from our total profits to a reserve account, a sufficiently large amount to cover any depreciation on our holdings.

EIGHT COMPANIES FORMED

I hope that you will bear with me if I make the points at issue quite clear to you. The following companies forming part of our group, were established to enable holders of Unit Certificates as issued by the Unit Securities and Trust Company of South Africa, Limited, to convert their certificates into shares in managed investment companies.—Managed Investments (Unit Securities), Limited, Second Managed Investments (Unit Securities), Limited, Affiliated Investments (Unit Securities), Limited, Huguenot Investments (Unit Securities), Limited, Drakensberg Investments (Unit Securities), Limited, while recently (May 7, 1948), a sixth company was formed for the same purpose, namely Tugela Investments, Limited. Our group includes in addition:—Nassau Investment Corporation, Limited, and Second Nassau Investment Corporation, Limited.

These eight investment companies follow the same principles of investment and are, in effect, nothing but partnerships with limited liability of a great number of investors, who entrust to the directors of their companies part or the whole of their resources in order to invest their combined funds to common advantage, and in such manner that these companies can do better for their shareholders than individual investors could do. It is well known that our companies have been highly successful, notwithstanding difficult times.

Our shareholders have not only obtained satisfactory dividends, but the shares of our companies are among the best known investment securities on the local market. The market prices of these shares move within narrow limits, as first class investment securities should do.

The revenue of these companies consists of:—

1. Dividends received.
2. Profits less losses on investments realised.

3. Other revenue (such as underwriting commission, etc.). In arriving at the revenue under item 2, only profits and losses on securities actually sold during the year are taken into account.

The net profits of our companies are allocated in such a manner that, whenever possible, substantial amounts are appropriated for building up strong reserves over a period of years.

METHOD OF SHOWING VALUES

The value of the holding of our investments at the end of the year is shown at cost, while information is also given on the balance sheet and in the directors' report about the market value of the holding, based on the market prices in force on the first business day on the Johannesburg Stock Exchange following the date of the balance sheet. There is, of course, bound to be a difference between cost and market value due to market fluctuations, and I have repeatedly told the shareholders of all the companies in our group, as I have told you today, not to attach undue importance to market fluctuations in the prices of the securities held. Investment companies such as yours acquire their investments mainly for investment purposes; that is, to obtain an income from dividends.

It is necessary to effect more changes in one's investment portfolio in these uncertain times than in more normal times, and profits or losses result from such changes, but the main function of our companies is to act as investment companies, and to obtain a regular income for our shareholders.

BOARD'S POLICY

Under our policy it is, of course, possible at the end of the year that certain investments may have a market value below cost, while others show an appreciation over cost. In the case of the holding of your company, for instance, some dividend-paying gold mining shares had a market value below cost at the end of the financial year, while other securities show an appreciation above cost. The total market value of your holding, however, showed an appreciation over cost, as is clear from the accounts now before you.

I wish to impress upon you, however, that market values of securities are not a true standard of value, subject as these market prices are, to fluctuations due to a variety of causes which have nothing whatsoever to do with intrinsic values.

The fact that there are these variations in market value was the main reason why it was decided by our directors and the directors of our associated companies to show investments on the balance sheets at cost, accompanied by a statement as to the market value, and only to take account in our profit and loss accounts of profits and losses when these are actually made on realisation.

VALUATION OF HOLDINGS

In my opinion the practice of valuing the holdings of an investment company for balance sheet purposes at cost or market value, whichever is the lower, would be against the interests of those shareholders who rely upon dividend income. I submit that such a policy would be based on fear, and would reduce the responsibility of directors and other interested parties, because it would have the effect of retaining in the companies, part of the profits each year to cover possible losses which might never occur. The directors of all the companies of our group are opposed to undue variations in the dividends declared by our companies. I claim that our system of investment has been highly successful. The report was adopted.

A copy of the full speech, which contains a complete list of holdings at May 20, 1948, may be obtained from the company's office, Unit Security House., Cor. Fox and Sauer Sts, Johannesburg, or Dorland (City), Ltd., 1, Royal Exchange Avenue, London, E.C.3.

PHENIX ASSURANCE COMPANY, LIMITED

MR. R. Y. SKETCH'S STATEMENT

The ordinary general meeting of the Phoenix Assurance Company, Limited, was held, on the 2nd instant, at Phoenix House, King William Street, London, E.C., Mr R. Y. Sketch, F.C.I.I., the chairman, presiding.

The following is his statement circulated with the report and accounts for the year 1947:—Since our last annual general meeting, the board has appointed two new directors, Mr A. C. Barnes and the Rt. Hon. Anthony Eden. Each of these gentlemen brings to our counsel's exceptional gifts and wide international experience of men and affairs.

1947, the 166th year of the company's existence, has been one of exceptional difficulties. It has been characterised by an abnormal growth of premium income accompanied by excessive fire damage and enhanced claims for casualties. These conditions have necessitated substantial additions to the respective reserves, the outcome being that we have an adverse balance on our total underwriting revenue accounts. Our anticipation is that when these reserves are run off, a much better result of our 1947 transactions will develop, but that is for the future to disclose.

RATE OF EXCHANGE

Part of the increase in income has arisen from the alteration that has been made in the rate of exchange of the United States and Canadian dollars. Having regard to the fact that early in 1947 the International Monetary Fund began exchange transactions based on the revised par value of currencies determined in the manner laid down in the Fund Agreement, it was decided that there was no longer any justification for the retention of our fixed book rate of this exchange at \$5 to the £. In place of this, the obvious course was to adopt the official rate of \$4.03 to the £ for the year 1947. In all items of the revenue accounts, United States and Canadian figures have therefore been converted at the new rate, and appropriate adjustments are shown in the respective accounts. In the profit and loss account, necessary provisions have been made by transfers from the exchange reserve and investment inner reserve, both of these reserves already containing profits arising respectively from remittances of dollar funds, and from the sale of dollar investments which have been accumulated for such a purpose.

Although it was felt to be essential to treat the revenue transactions in this way, the directors held the view that the sterling equivalent of our investments in the United States and Canada should not be written up, and they thus remain in the books at their previous values. As and when any such investments are sold, the net profit on realisation will be consequently increased. In the meantime, the appreciation on our assets is strengthened. The wisdom of this course will doubtless commend itself to you.

FIRE ACCOUNT

Our fire premium income has increased by £1,192,000; more than 50 per cent. of this increase arises from the higher sterling value of our dollar income. The rest of the increase is derived from our trading in all parts of the world. The loss ratio at 53.3 per cent. is higher by five points than in 1946. The worldwide fire wastage was very heavy in 1947. The U.S.A. suffered an estimated loss of over \$692,000,000—the greatest in its history. There were three major catastrophes in that country; the chemical explosion at Texas City, the New England forest fires, and the Florida and Gulf Coast hurricanes. The total damage arising from these occurrences is put at some \$60,000,000.

At home, the estimated damage is £18,500,000, but it is probably considerably

higher than that; in any case, it is also the heaviest year for losses that this country has experienced. It is difficult to say how much of this increase is due to a greater number of fires or to the higher values of commodities and property. Probably the rising cost of claims settlements accounts largely for the sharp increase in fire waste figures, and because of this inflationary tendency it may be unwise to make too close comparisons with previous years. The prognostications made last year that fire losses would tend to increase have proved correct. The many difficulties under which industry laboured during the crises of 1947 have left their mark on insurance, and our important home account must necessarily bear its share. A feature of the year's losses was the number of fires reported as total in circumstances in which one would have expected something less than complete destruction.

Our expenses are up by slightly more than 1 per cent., towards which higher salary costs is the main contributor. The reserve for unexpired risks calls for an additional £476,000. Under such conditions it is not surprising that the amount of profit obtained from this account should represent such a small margin of the premiums. The alteration in the rate of exchange has reduced that percentage of profit below what it would otherwise have been.

ACCIDENT FIGURES

In the accident account we show an increase in premium income of rather more than £2,750,000, of which slightly less than half is attributable to the adoption of the official American dollar rate of exchange. Had this alteration not been made, the increase would still have been just over £1,500,000—a quite unprecedented figure. As in the fire department, we have a 5 per cent. increase in our claims ratio. The very large increase in income already referred to has enabled a drop of approximately 1 per cent. in the expenses to be secured.

Our reserve for unexpired risks called for an increase of £1,105,000. The result of all this is that we have a debit balance on this account of just over 5 per cent. In common with all our figures, this loss is exaggerated owing to the alteration in the rate of the dollar exchange. As our reserves for unexpired liability and for outstanding claims together amount to £8,891,000, it is reasonable to anticipate that in the running off, the position of this account will be a very different one.

I have on more than one occasion drawn attention to the way in which this business runs in cycles. During the last quinquennium we have had three good years and two bad years. The good years produced profits totalling £1,065,300. The two bad years produced losses of £710,950; so that over the quinquennium, in spite of the exceptional conditions prevailing, we have made over £354,000.

The main cause of the present unsatisfactory position is motor business, heavy losses in this section being common to most parts of the world and of particular severity in the United States and Canada. It seems clear that, broadly speaking and in present circumstances, rates for motor insurance throughout the world are too low.

MARINE ACCOUNT

Once again this department has made a handsome contribution to the profit and loss account, but it is hardly likely that substantial transfers on the scale either of last year or this year can be repeated in the near future. In carrying on marine business it is essential to see that ample provision is made for future liabilities arising out of past

transactions, and I need hardly assure you that this necessary precaution has been exercised by us.

The premium income of this account has increased from £1,393,000 to £1,987,000. The total outgo for claims is up by some £470,000. The funds at the end of the year of £2,810,000 are just over 141 per cent. of the premium income, and we are satisfied that in this figure there is not only sufficient for our liabilities, but material additional protection.

LIFE ACCOUNT

Turning from these three revenue accounts which affect the general funds of the company, we now come to the life department. Here the year's operations have resulted in an increase in funds of nearly £700,000. The premiums show a reasonable and healthy increase—a remark that also applies to the interest, dividends and rents. The net rate of interest on our life fund has gone from £2 18s. 10d. per cent. to £3 0s. 3d. per cent. Death claims increased by £98,000, but are still within the anticipated mortality.

PROFIT AND LOSS ACCOUNT

Although the balance carried forward has been reduced by £215,000, it still amounts to the impressive figure of £1,373,920. This has accumulated during prosperous years in order to protect in adverse years not only our policy-holders but our shareholders, and having regard to the very difficult times through which we are passing the reduction referred to does not unduly perturb us.

Our interest, dividends and rents, plus the life department contribution, total £430,000. Our outgo for dividends and interest on debenture stocks amounts to £380,000. We should be therefore in a strong position to maintain our present rate of dividend.

BALANCE SHEET

Our investments in mortgages have been increased to the extent of some £700,000 during 1947. During the year, as is well known, there has been steady depreciation in the market value of Stock Exchange securities. In our case the average reduction over all invested funds can be put at 4½ per cent., and this trend has continued into 1948.

Nevertheless, we can report that the company's position as regards appreciation is very satisfactory. In the life funds the market values of our securities exceed our balance sheet values by very nearly 13 per cent. In the general funds the market values exceed our balance sheet values by a substantially greater figure than that at the end of 1946. In this case we have been assisted by the fact that our American investments, as I have already mentioned, have not been written up. You will therefore see that the important item of our investment and contingencies reserve totalling £1,833,124 is not impinged upon but continues to be a free reserve.

INVESTMENT CATEGORIES

In our Stock Exchange securities, the item for British Government securities at over £14,000,000 is still the largest individual holding although it is lower by £1,189,000 than the corresponding figure in 1946. This year we have sub-divided the heading of foreign government securities into U.S.A. and other government securities. The U.S.A. figure stands at £7,972,000, an increase during the year of £1,214,000. There has been a drop in our debenture holdings of rather over £500,000, a number of securities of this class having been repaid. Preference stocks and ordinary stocks have each been increased by approximately £600,000, from which alteration it is anticipated that interest earnings will benefit.

Our outstanding accounts at £2,542,616 are down by approximately £1,000,000. This is principally due to the payment of tax, including excess profits tax, coupled with the fact that the reserve for taxation which goes into this account is this year on a lower level than hitherto. Our total assets at £53,184,759 are up by no less than £3,000,000.

It will be obvious from consideration of the figures submitted that we are well able to sustain any temporary buffeting of misfortune with the knowledge that we have an admirable organisation of ample financial strength to take care of any responsibility placed on our shoulders by our policyholders, and, at the same time, to be able to look with confidence to the maintenance of our shareholders' interests.

TRIBUTE TO EXECUTIVES AND STAFF

Once again it is my privilege to refer appreciatively to the efforts put forward by the executive and staff both at home and abroad.

It has been an anxious and difficult period for all those in authority and although worldwide conditions have conspired to defeat the skill and concentration that have been devoted to our affairs, we can none the less, be grateful for those efforts, feeling confident that the ability that has enabled us to maintain the outstanding position which this company occupies will once again bear good fruit.

The report and accounts were unanimously adopted.

SPEAR AND JACKSON, LIMITED

UNDIMINISHED DEMAND

Mr A. K. WILSON'S STATEMENT

The forty-third ordinary general meeting of Spear and Jackson, Limited, was held, on the 10th instant, at the staff dining room, Aetna Works, Savile Street East, Sheffield.

Mr A. K. Wilson (the chairman and managing director) presided. The following statement was circulated with the report and accounts:—

Due to existing conditions it is still as difficult as ever for most of our shareholders to attend our annual meeting and I am, therefore, continuing my practice of issuing a statement with the directors' report and accounts as I have done for several years.

THE ACCOUNTS

As regards the accounts: their presentation is similar in form to that of the last two years. The net profit is £45,749, which shows an increase of £8,399 compared with the year 1946. While bearing in mind the Chancellor's request regarding the limitation of dividends the directors still feel justified in recommending that the dividend for the year shall again be 15 per cent. and that a further £5,000 be added to general reserve, which report shows a balance to be carried forward to next year of £24,329 against £12,330 for the year 1946.

Fixed Assets.—The increase of £8,603 in the value of freehold land and buildings is represented by the purchase of buildings which were erected on our premises by the Government during the war.

Floating Assets.—These show an increase of £13,706, which is made up of: Increases in stock on hand and work in progress £43,633, sundry debtors, bills receivable and prepayments £8,988. Trade and other investments £39,000, and cash in hand and at bank on current account £8,025, less decreases in debt due by subsidiary company £1,314 and cash at bank on deposit £84,626.

SOUTH AFRICAN INTERESTS

Towards the end of the year your company availed itself of an opportunity to obtain

a considerable interest in two South African companies, one of which has been in production for a number of years, and has shown consistently good profits. The other company is at present building a factory for the manufacture of various tools in good demand in South Africa. One of our directors has visited the site of the new factory and his report of the progress made justifies your directors in believing that the prospects appear very satisfactory. It is hoped to be in production before the end of 1948.

Turning to the liabilities side of the balance-sheet the capital and the capital reserve show no alteration and the general reserve and profit and loss accounts have been dealt with above. The only other item is current liabilities. Under this heading are included the reserves for deferred repairs and rehabilitation, and although restrictions on supplies of materials and shortage of labour render the execution of these items very difficult, I am pleased to say we are making reasonable progress. As regards the provision for taxation, I would draw your attention to the fact that this covers not only the current taxes, but also the estimated liability to income-tax and profits tax on the profits of the year under review. This liability was largely covered by the holding of tax reserve certificates at December 31, 1947.

SUBSIDIARY WORKS IN AMERICA

Our subsidiary works in Vancouver and Eugene (U.S.A.) have again had a most successful year and the prospects for the current year are good. During 1947 a dividend was declared out of the profits of the year 1946 by the Vancouver Company and is included in these accounts.

I am glad to say that the year 1947 has proved somewhat less exacting than anticipated as regards stoppages due to cuts in fuel and power supplies. On the other hand, supplies of raw materials continue to worry us and we are still short of labour of all descriptions.

SUPPLIES RATIONED

The demand for our products continues undiminished. In order to retain our valuable goodwill we have been forced to ration supplies. This has been done on the basis of sending as much as possible to old and valued customers, although many new ones have been anxious to obtain our branded tools. It has not been possible for us to produce the wide variety of tools as was the case prior to 1939, and we have had to concentrate on those essential to the needs of this country and the overseas markets.

During the year we have been pleased to receive visits from a larger number of our overseas representatives than has been possible for a number of years and this has been of great benefit to the company and I believe to them also.

Mr J. E. Whitten, the chairman and managing director of our Vancouver subsidiary, has also visited us quite recently.

RESEARCH

While under today's conditions all efforts must be directed to achieving the greatest possible output, research is not overlooked and is being carried on continually in our modern laboratories.

The relations between the management and the workers still continue good, and I once again, in all sincerity, express the Board's appreciation to the company's management, staff and employees for their efforts to overcome the many difficulties which have arisen during the year and congratulate them on the results achieved.

The report and accounts were unanimously adopted and the dividend of 15 per cent. on the ordinary shares was approved.

UNION INSURANCE SOCIETY OF CANTON, LIMITED

CONTINUED EXPANSION

The ordinary yearly meeting of this Company was held at the society's head office, Hong Kong, on the 21st ultimo, Mr N. O. C. Marsh, the chairman, presiding.

THE DIRECTORS' REPORT

The following are extracts from the directors' report:—

Marine.—The net premiums for the year amounted to £2,390,646. After providing £100,000 for taxation and transferring £200,000 to profit and loss account, the marine fund stands at £2,120,349.

Fire.—The net premiums for the year amounted to £1,501,083. £14,914 has been transferred to profit and loss account. The fire fund stands at £718,433.

Accident and General.—The net premiums for the year amounted to £498,480. £47,134 has been transferred to profit and loss account. The accident and general fund stands at £255,892.

Profit and Loss Account.—The amount at credit of the profit and loss account at the beginning of the year was £301,939, to which have been added interest and dividends £179,635 (which includes £7,734 in respect of previous years) and transfers from underwriting accounts £262,048. After providing for the dividend, charging taxation and other outgoings, and transferring £25,000 to staff pension fund, there remains a balance of £309,904 to be carried forward.

CHAIRMAN'S STATEMENT

The following is an extract from the chairman's circulated statement: The chief matter of importance and interest to shareholders which occurred during 1947 was the transfer of the society's head and registered offices back to Hong Kong. You will recall the board's decision reported to shareholders at the ordinary yearly meeting held in Sydney, New South Wales, in May last year, to transfer the head and registered offices of the society back to Hong Kong as soon as possible following that meeting. I am pleased to be able to tell you that the transfer was completed and the registered office officially reopened in Hong Kong on July 17, 1947.

Turning now to the accounts for the year, you will observe that our business shows a further considerable expansion in all departments. Trading results were satisfactory and the total of the assets shown in the consolidated balance-sheet now exceeds £9,000,000 sterling.

I now come to another matter of importance to shareholders. It is the opinion of your board that the paid-up capital of the society would be more in keeping with the volume of the premium income and the importance of the undertaking if it were augmented, and consequently a decision has been reached to capitalise the sum of £540,000 by the transfer of this amount from the "Exchange and investment fluctuation account" to "Capital account."

This sum will be utilised in the payment of a call of £4 per share, representing the balance of the unpaid liability at present outstanding on each share, and following this transfer the paid-up capital will stand in the balance-sheet at £1,350,000. The steps necessary to accomplish this have been set out in the notice of an extraordinary general meeting to be held at the conclusion of the ordinary yearly meeting. I am sure this step will have the approval of all shareholders.

The report was adopted and the resolution capitalising the sum of £540,000 was confirmed.

OLYMPIA LIMITED

RETURN TO NORMAL TRADING

A SATISFACTORY RESULT

MR LOUIS NICHOLAS'S STATEMENT

The nineteenth ordinary general meeting of Olympia, Limited, was held, on the 2nd instant, at 55-56 Pall Mall, London, S.W., Mr Louis Nicholas, J.P., F.C.A., the chairman, presiding.

The following is the chairman's statement circulated with the report and accounts:—

Shareholders will observe from the annexed accounts that the year ended December 31st last has proved to be a successful return to normal trading. The profit of the company as shown in the directors' report amounts to £163,193 before charging debenture and bank interest, trustees' and directors' fees, depreciation, amount payable under management agreement to the company's wholly owned subsidiary, the Kensington Property Company, Limited, and provision for taxation. After providing these sums there is a net profit available of £64,367, from which should be deducted the accumulated loss at December 31, 1946, of £45,435 (which shareholders are aware arose during the suspension of the company's trading as a result of the war and the occupation of its buildings by the Government from 1939 to the middle of the year 1946); leaving a balance of £18,932, which your directors recommend should be carried forward.

EXCEPTIONAL DIFFICULTIES

The satisfactory result shown by the accounts before you has been achieved notwithstanding quite exceptional difficulties which had to be met during the periods exhibitions were in preparation. War damage repairs were in progress, dilapidations were being made good, the general organisation of Olympia was being built up from a skeleton staff, and last but not least, the fuel crisis nearly brought the whole organisation to a standstill, but notwithstanding all these troubles, none of our tenants lost a single day through the closing of the halls to the public. This was only rendered possible by the hard work and loyal support of the company's executives and staff.

It will be of interest to shareholders to know that the company's standfitting and constructional department has considerably expanded during the past year, and that never in the company's history have exhibitions at Olympia attracted so many members of the public, thus showing that Olympia is once again the exhibition centre of the country. The company has made some considerable contribution to the export trade, as in addition to the British Industries Fair, eight other exhibitions of a trade character have been successfully held during the year, these attracting a considerable number of foreign buyers.

IMPROVEMENTS

After a blank period of nearly seven years it is important that Olympia should be brought up to date to meet the needs and comfort of our tenants, their exhibitors and the public—this has and will continue to involve capital expenditure. These improvements include a reserve bank of twelve generators to ensure a supply of electricity should other sources fail, and canteens for the use not only of the company's employees but for the employees of sub-contractors working in the building. There are a number of other improvements under consideration which are necessary but which are held up

for the time being owing to the difficulty of obtaining licences.

In common with all other businesses, salaries, wages and the cost of materials have considerably increased, and we hope that our tenants will bear these matters in mind, together with the improved services and amenities now available, when they are considering the higher rental charges that we have been forced to quote for future lettings. The company's claims in respect of the cost of repairing war damage, making good the dilapidations caused to the buildings during the Government occupation and the loss of rental sustained by the company during the period of rehabilitation have not yet been agreed, but it is considered that the amount shown in the balance-sheet as being recoverable is approximately correct.

BALANCE-SHEET ITEMS

Shareholders will notice from the balance-sheet that full provision has been made for debenture interest in arrear. The figure mentioned is the gross amount of this interest which will be subject to deduction of income-tax when paid. They will also notice that the amount due to the company's bankers has slightly increased, but on the other side they will see that the company had in hand and with its bankers on current accounts the sum of £98,170. I must remind the shareholders that the £100,000 advanced by the company's bankers, secured in priority to the First Mortgage debenture stock, is subject to an arrangement with the debenture stock holders committee that this loan is to be repaid before any dividends are paid upon the share capital of the company. The addition to plant, machinery and office furniture reflects the cost of the generators mentioned above, together with other plant and machinery that has been purchased during the year and, although these additions are practically new, this item has been fully depreciated.

The investment in subsidiary companies includes the shares in and loan to our wholly owned subsidiary, Kensington Property Company, Limited. Shareholders will be aware that the main asset of this company is some 3½ acres of freehold land in Kensington High Street, close to Olympia, which was purchased many years ago. During the year under review active negotiations for the sale of this land at a satisfactory price were in progress, but unfortunately when the provisions of the Town and Country Planning Act, 1947, became known, the proposed purchasers retired from the negotiations. Recently negotiations have been revived but I regret I am unable to express any opinion as to the likelihood of these resulting in a sale. Shareholders may be assured that the directors are pursuing the matter with diligence.

DIVIDEND OUTLOOK

I do not think any other items in the balance-sheet require explanation, but shareholders will naturally desire some information with regard to the possibility of the company resuming payment of dividends. This, of course, depends largely upon future progress, and in addition I would ask them to bear the following in mind: The interest upon the debenture stock is some two years in arrear, but subject to any unforeseen circumstances arising it is intended to discharge these arrears together with the half-year's interest due on June 1, 1948, on that date. The

sinking fund payments upon the stock are nine years in arrear, and your directors are considering the best method of dealing with the matter in the interest of the shareholders. The dividend upon the preference shares is also nine years in arrear and although the company shows every sign of having returned to a reasonable profit-earning basis, its prior commitments as mentioned above may prevent resumption of these dividends for the time being.

In September last, Mr R. G. Heaton, who had been managing director of the company since its formation, felt compelled owing to advancing years to tender his resignation, which was reluctantly accepted by the board, but he has agreed to act as advisory director for such period as the company may require his services. Mr C. P. Heselden, who has acted as secretary since 1931, has relinquished his post, but as he has now joined your board, the company will continue to receive the benefit of his long experience in its affairs.

In closing I wish to pay tribute to the work of the company's staff, from the highest to the lowest, who have responded most loyally to the demands made upon them, and I am sure the shareholders would desire me to express their thanks for the admirable services which these employees have rendered.

The report and accounts were unanimously adopted; the retiring directors, Mr Charles P. Heselden, Mr R. G. Heaton and Mr Hugh M. Clowes, were re-elected; and the auditors, Messrs Price Waterhouse and Company, were reappointed.

At a subsequent separate meeting of the holders of the cumulative preference shares a resolution was passed sanctioning the creation by the company of £1,200,000 4 per cent. first mortgage debenture stock.

The proceedings terminated with a vote of thanks to the chairman, directors and staff.

APOLLINARIS AND PRESTA, LIMITED

PROPRIETARY BRANDS AGAIN

The 51st ordinary general meeting of Apollinaris & Presta, Limited, was held, on the 3rd instant, in London.

Mr J. Douglas Broad, the chairman, in the course of his speech, said: Since January 31st last, when the Concentration Scheme ended, we have been able to re-introduce our own proprietary lines, and to use our Presta labels. Although absent from the market for five years, the demand for these high quality beverages is already in excess of the quantities which we are able to produce owing to the restricted quantities of sugar allotted to the Soft Drinks Industry. The sales of Sparkling Buxton Water have increased, as since October last, we have been able to supply this Water to our customers throughout the whole of the country.

We are now in full operational control of both the Spring and Bottle Works in Germany. The Spring has throughout been in production, and it is hoped early in June to light the first furnace at the Bottle Works and re-start production of bottles, so urgently needed. We do not, however, expect any immediate financial advantage on this side, owing to currency regulations. In order to facilitate export sales and operations a French company has been formed, with headquarters in Paris.

It was not sufficient to arrange with the French Authorities the terms upon which Apollinaris could be exported to England; we also had to get an import permit here, and I am glad to advise you that, after some negotiations, we have just succeeded in obtaining a permit to import a restricted supply of Apollinaris Water into the United Kingdom, which will be rationed amongst our many customers.

The report was adopted.

TARRAN INDUSTRIES, LIMITED

SUCCESS OF THE "NEWLAND" HOUSE

EXTENSION OF ACTIVITIES

Lt-Col. A. RIDLEY MARTIN'S SURVEY

The thirteenth annual general meeting of Tarran Industries, Limited, was held, on the 4th instant, at Hull, Lt-Col. A. Ridley Martin, O.B.E. (chairman of the company), presiding.

The Chairman, in moving the adoption of the report and accounts, said: During the year under review your board and the management of the company generally have been largely reconstituted. Following the resignation of Mr S. A. Lane, the managing director, and Mr V. J. Chalwin and Mr E. McCann from their executive positions and seats on the board, Mr G. H. West was appointed managing director and our Scottish manager, Mr Edgar Richards, was appointed general manager. Both these executives of proved experience have already shown our selection to have been a wise one in every respect.

We were also fortunate in bringing to the board the experience of Mr W. E. Sykes, and he joined us on November 11, 1947. He is a chartered accountant with a wide commercial experience and a director of many important companies, some of which carry on business of a nature allied to our own. We have also been fortunate to obtain the services as a director of Captain H. D. Tolle-mache, R.N. He is a director of the Carlton Main Colliery Company, Limited, with experience in the housing of colliery operatives and of constructional engineering in general. Under the articles of association these two gentlemen retire, but we shall invite you to reappoint them.

CHANGE OF NAME

For reasons which will be readily understood we have decided to recommend a change in the name of the company, and in order to maintain our close association with this ancient city and county, we have adopted the suggestion of one of its leading citizens to take the old Saxon name of Myton as the new name of the company. As a matter of interest, this name covered that part of the city in olden times in which our factory and head office are now situated. If the resolution is approved at the extraordinary general meeting, to which I shall refer later, the company will henceforth be known as Myton, Limited.

Now as regards the company's results for the 15 months ended December 31, 1947, the loss of £95,422 disclosed in the accounts was chiefly incurred during the first half of 1947. During this period, although orders were forthcoming, no sites were available. Production costs, maintenance, salaries and wages were, however, continued at the previous high level.

When the Newland House was introduced it met with immediate success, as I informed you at the meeting in July, 1947. Orders were received under the Government's 1947 programme for 2,153 houses, and, in spite of the initial delay of several months before work could be started on sites, 300 houses have already been handed over to the various local authorities; 1,600 are now in the process of erection, leaving a balance of 253 to be completed when the necessary sites become available.

It is fair to say, as pointed out in the directors' report, that it was only in the last six months of 1947 that site construction and factory production could be welded together on a reasonably balanced level.

1948 PROGRAMME

For the 1948 programme the company is in receipt of provisional orders from local authorities for approximately 2,000 houses. These, of course, require the sanction of the Ministry of Health, and, while we do not

yet know what allocation of this number will be granted to us, we are hopeful that a substantial proportion of these orders will be approved. On February 2, 1948, the company's factory at Bellshill, near Glasgow, having been modernised and re-equipped, was reopened by the Under-Secretary of State for Scotland, and provided a valuable extension of our business in Scotland. The Clyde House (the Scottish equivalent of the Newland House) is in production at that factory and an initial order has been received from the Department of Health for Scotland for 250 houses for the mining areas of Lanarkshire. These houses are now in the process of erection.

A demand for a factory-made bungalow has led the company to produce a building of the type required for Scotland, of which plans and specifications have been approved and is known as the "Solway" bungalow. We are hoping to receive a pilot order to demonstrate the advantages of this type of building in the west and south west areas of Scotland.

SCHOOL CONSTRUCTION

I now wish to refer to schools, for which our system of construction is so eminently suitable. Here your company has been in the forefront and buildings erected at Paisley, Glasgow, and in several villages in Lanarkshire, have met with the approval of the educational authorities. In addition, further orders have been received for similar buildings both in England and Scotland.

The company has maintained and extended its activities in traditional building, and we have received orders for 390 traditional houses, of which 270 have been completed. In addition, an order in traditional building for a large block of municipal flats in Porter Street, Hull, has been received and work thereon commenced. Similarly, our traditional building activities have been extended in the south, and orders for 75 houses and a block of flats for erection in the London and suburban areas have been received.

THE FUTURE AND CAPITAL RECONSTRUCTION

With the above volume of business on hand and in prospect, together with the large savings in overhead expenses resulting from the very thorough overhaul and re-organisation of all departments which has taken place during the past six months, the board feels that, provided a reasonable price is approved by the Ministry for our Newland houses, your company can look forward to satisfactory trading results in the future. If, as we have reason to hope, the year 1948 shows at its close that the company has turned the corner, then, but not before then, will your directors place before the shareholders a scheme of capital reconstruction. It is quite apparent that, with the deficiency of £450,162 shown in the balance-sheet under review, more than the whole of the share capital has been lost. On the other hand, we are advised that the present value of our freehold and leasehold properties and the fixed plant and machinery is in excess of the figures at which they appear in the company's books. All these are factors which must be taken into consideration, in conjunction with the prospective earning capacity of the business, when considering a capital reconstruction scheme, and your board believes that the time to formulate a definite scheme will be at the end of the current financial year.

In the meantime, as you will appreciate, the company requires further financial resources to enable it to carry through its present programme. I am happy to be able to tell you that arrangements have been made which will ensure the continued support of the company's bankers. To regularise this position, you will be asked at an extraordinary general meeting to be held on June 29, 1948, to increase the company's borrowing powers to £1,300,000 and to change the name of the company as already mentioned.

TRIBUTE TO EXECUTIVES AND STAFF

I cannot close my remarks without expressing the thanks of the board to the executives and to the whole of our employees for their loyal support during a very difficult period. The shareholders will appreciate the problems with which the board has been faced, but I am happy to be able to tell them that the members of the board have the utmost confidence in the present executives, all of whom are working with the board in the closest harmony for the future prosperity of the company.

The report and accounts were adopted.

THE UNITED SUA BETONG RUBBER ESTATES, LIMITED

SIR JOHN HAY'S STATEMENT

RUBBER AND THE SYNTHETIC SUBSTITUTE

In the course of his statement circulated with the report and accounts to be submitted at the annual general meeting (52/54 Gracechurch Street, E.C.3, on the 17th instant, at noon), the chairman, Sir John Hay, states:— It has been frequently stated that natural rubber has now to compete with the synthetic product, made chiefly in the U.S.A. Such a statement is only a half-truth masking the true position. Our American friends' devotion to the system of private enterprise and free competition is not so unqualified as to prevent them from departing from it when it seems to serve their interests to do so. Synthetic rubber has been put under the shelter of protective legislation well beyond the reach of the cold, blasting winds of free competition. Its use up to a minimum of 225,000 tons per annum is enforced by law and it is supplied to manufacturers from Government-owned factories at the fixed price of 18½ cents (U.S.A.) per lb. The manufacturer, in his turn, is protected against the competition of tyres made from natural rubber by the prohibition of the import of tyres the content of which does not include a specified quantity of the synthetic substitute. So safeguarded from the competition of any superior tyre made from natural rubber, U.S.A. manufacturers can and do, by arrangement amongst themselves, use more than the prescribed minimum of synthetic. There may at the present time be some degree of justification for that, since the amount of natural rubber now available would be hardly sufficient to meet all trade requirements in excess of the specified minimum as well as demands for stockpiling in which the U.S.A. Government is now engaged. But the original impulse to do this comes from a determined intention to keep down the price of the natural product.

AMERICAN ATTITUDE

In the course of evidence given before a Congressional Committee, which led up to the present legislation, the view was expressed that the price of natural rubber should not be allowed to go above 20 cents (U.S.A.) per lb., and it seemed to be a matter for indignation, of varying degree, that it should have ever done so. This figure of 20 cents (U.S.A.) per lb. was not reached by any careful computation based on the ascertained cost of production, nor by reference to prevailing values, nor, so far as one can detect, by any recognisable process of reasoning. It was an expression of emotion directed against the idea that the U.S.A. should have to buy an essential raw material from an overseas territory and at a price necessary to give the producer a profit. It so happens that the present price of rubber has gone beyond this mystical figure of 20 cents, but this is not due to any relenting on the part of our American friends. In the expectation of lower prices resulting from greater quantities of rubber coming from Indonesia, there was a general holding off of buying by manu-

facturers. Owing to continuing unsettlement in that territory these expectations have not been realised. Trade buying can no longer be postponed and the rubber available to meet these deferred purchases, as well as for stockpiling, is for the time being hardly adequate. This fortuitous combination of circumstances may continue for some time and rubber producers, after a long interval, may enjoy the now somewhat strange experience of making some profit, although barely sufficient to permit of adequate sums being set aside for replanting and other prudent provisions, and of a fair payment to stockholders who, for the most part, have had no return for seven years.

TRANSCENDING IMPORTANCE OF RUBBER EXPORTS

Viewed in their wider context, these are matters which transcend the interests of the rubber-producing industry. Rubber is still our greatest export to the U.S.A. and exceeds in value the total of all domestic exports from the U.K. Even at the present improved price, which is largely fortuitous, calculated in terms of wheat and cotton, two of our chief imports from the U.S.A., it is only worth one-third of its 1940 value. With this continuing wide disparity in prices as between our chief export to and our main imports from the U.S.A., it is vain to expect that we can fill the gap in our transatlantic trading account. The official reason given for the present U.S.A. policy in the matter of rubber is national security. To serve that high purpose it is conceivable that other steps could be taken which would not entail a twin measure of total protection permitting practices which distort seriously our already ill-balanced international trade which, if not adjusted, will be productive of widespread distress.

Full copies of Sir John Hay's statement may be obtained from the Secretaries, 52/54 Gracechurch Street, E.C.3.

JAMES W. COOK AND COMPANY, LIMITED

YEAR OF FULL ACTIVITY

The fifty-first annual general meeting of James W. Cook and Company, Limited, was held, on the 4th instant, in London.

Mr W. J. Clarke (chairman and managing director) said that he was glad to be able to present accounts for 1947 showing a profit figure of £80,145. That had been secured after a year of full activity in every direction.

Their shipyard at Wivenhoe had now reached full production and during the last part of the year had begun to function well. The activity was enabling them to repair and recondition their own craft and tankers and take in outside work as well. Their wharves and showrooms had been busy during the year and the lighterage business had been good both in London and Hull. Their new lighterage concern had done quite well, too.

The combined figure of profit on baulage last year was satisfactory. The Transport Act being now in existence, it was obvious that sooner or later some of their businesses would be lost to them. They had registered a small company under the name of "Eastern Roadways (Engineers), Limited," for the purpose of the sale and servicing of agricultural implements as that was a promising field for development. Another small venture was "Eastern Auto Electrical Services, Limited," a business to supply and service electrical equipment. They had further established a forwarding agency under the name of "Eurocook, Limited," dealing with the importation of continental fruit and vegetables. To make up for the possible loss of income from their baulage, they had established and developed those new concerns and strengthened the older ones.

The report was adopted.

ENGLISH AND CALEDONIAN INVESTMENT COMPANY, LIMITED

DIVIDEND MAINTAINED

The twenty-fifth annual general meeting of the English and Caledonian Investment Company, Limited, was held in London, on the 4th instant, Mr Henry S. Loebl, the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts for the year to March 31, 1948:—

The company's investments at March 31, 1948, stood in the balance sheet at £909,987, which compares with £923,064 at March 31st of the previous year. The value, however, of the investments at March 31, 1948, on the basis mentioned in the directors' report was £1,286,656, which showed an appreciation of £376,669, which expressed as a percentage is 41.39, compared with 46.37 per cent. at March 31, 1947. The changes in the company's investments during the year have again resulted in a surplus which has been added to the contingency fund. The figures disclose a further increase in the proportion of the company's funds invested within the Empire.

The company's interest in its subsidiary, Encal Estates, Limited, has been increased from £12,500 to £63,000 by subscribing for a further 17,500 £1 shares and a loan to that company of £33,000. This additional finance was required by our subsidiary to purchase two more properties, making three properties in all. Any dividend which may be paid by Encal Estates, Limited, will be included in the income of your company for the current year. The general reserve has been increased from £52,000 to £55,000 by the appropriation of £3,000 from undistributed revenue.

INCREASED INCOME

Turning to the revenue account, it will be noted that our income for the year excluding transfer fees amounted to £63,340, being some £1,100 more than the income for the previous year. That the increase in our income is not greater is explained by the fact that we had during the year substantial sums in cash and gilt-edged securities, and that the income for the past year did not include any dividend from Encal Estates, Limited. You may recall that I indicated last year that our very conservative policy might have an adverse effect on our income.

After deducting administrative and sundry expenses and also interest on borrowed monies including the debenture stocks, the net revenue for the year was £40,778 against £39,861 for the previous year. After charging the sum of £17,522 for taxation and deducting the dividend on the preference stock for the year to March 31, 1948, the amount earned on the ordinary stock amounted to £15,006, equivalent to 13.64 per cent. as against 12.62 per cent. for the previous year.

An interim dividend of 1½ per cent. has already been paid on the ordinary stock, and the payment of a final dividend of 5 per cent. is now recommended, making 6½ per cent. for the year, being the same dividend as for the previous year. Your directors have transferred the sum of £3,000 to general reserve, leaving a sum of £10,178 to be carried forward.

Since I referred last year to the intolerable burden of taxation which the community is bearing, we have been presented with another Budget, still further increasing taxation, which is now substantially greater than it was at the height of the war. Until Government expenditure is reduced, and with it taxation, it is unlikely that inflation will be checked and the full energies of the nation released.

The report was adopted.

CENTRAL MINING AND INVESTMENT CORPORATION LIMITED

INCREASED PROFIT

The 43rd annual general meeting of the Central Mining and Investment Corporation, Limited, will be held, on the 15th instant, in London.

The following is an extract from the statement by the chairman, Sir Clive Baillicu, K.B.E., C.M.G., circulated with the report and accounts for the year 1947:—

Our operations yielded a profit of £842,487, representing an increase of £130,540 in comparison with 1946. Income from dividends was higher by some £31,000. Net receipts from interest, however, showed a further contraction due to the effects throughout the full year of the reduced rates allowed on bank deposits in South Africa and to the lower rate of interest carried by short-dated gilt-edged securities. On the other hand, a special receipt under the heading of interest was a sum of about £17,000 from the Anglo-Spanish Construction Company, in reduction of outstanding interest on our holding of debentures of that company. Profits on realisation of shares at £432,815 show an increase of £165,587. In considering this satisfactory improvement I must remark that it reflects in part certain special transactions which should be regarded as non-recurring.

EXPENSES GREATER

The net expenses of the Corporation's organisation have increased by almost £14,000 to £106,001, due, in the main, to increase in salaries and administration costs and to the cost of visits between London and Johannesburg of executives and officials. I attach great importance to personal consultations between those responsible for the conduct of our business. The problems of administration and control of our group with such wide-flung and diverse activities are manifold and complex. The smooth and efficient conduct of our affairs will be greatly helped by the closer and more frequent contact between the staffs of the Corporation here and overseas which modern means of travel now make possible. In determining the provision for writing down the value of shares, investments and interests at £139,916 we have pursued our normal policy of ensuring that these assets are carried in our books at prudent levels.

There is a large increase in the provision for taxation due for the most part to the incidence of the increased profits tax, which alone will absorb some £95,000 more than last year. The net benefit to the Corporation of the increased profits of £130,000 is only £23,000 after providing for taxation. I call your attention to this heavy burden, with the penalty which it imposes on enterprise and the obstacle which it creates to the ploughing back of profits for the financing of new ventures. This is of particular importance to a Corporation such as ours, whose assets in the main are wasting assets.

EXPLORATION RESERVE

The board has felt it wise that the surplus remaining after allowing for dividends should be used to strengthen the exploration reserve. An amount of £193,080 has therefore been transferred to the credit of that reserve, which now stands at £480,000 after meeting expenditure of £73,080 during the year. It is very necessary that we should continue to have ample resources to finance our exploratory work.

Your board proposes that the final distribution on the ordinary capital for 1947 should be 9s. 3d. per share plus a bonus of 4s. 9d. subject to United Kingdom income tax. The total ordinary distribution for 1947 would then amount to 18s. 6d. per £8 share, or 11.56 per cent., which is the same as for 1946. Expressed in terms of capital actually employed in the business the return is no more than 5.95 per cent.

GOVERNMENT RETURNS

For the week ended June 5, 1948, total ordinary revenue was £58,991,000, against ordinary expenditure of £63,993,000 and issues to sinking funds £250,000. Thus, including sinking fund allocations of £1,664,000 the surplus accrued since April 1st is £166,944,460 against £202,563,881 for the corresponding period a year ago.

INVICTA WORKS, GRANTHAM, Lincs

NOTICE IS HEREBY GIVEN that the Fifty-third Annual Ordinary General Meeting of the Company will be held at the Registered Office, Invicta Works, Grantam, Lincs, on Tuesday, 15th June, 1948, at 3 o'clock in the afternoon to transact the following business:

1. To receive the Profit and Loss Account for the Eighteen months ended 27th September, 1947, and the Balance Sheet as at that date with the Reports of the Directors and Auditors attached thereto.
2. To sanction the declaration and payment of Dividends.
3. To elect a Director in place of the one retiring.
4. To appoint Auditors for the ensuing year.
5. To transact any other ordinary business that may be lawfully dealt with at a General Meeting of the Company.

Dated this 4th day of June, 1948.

By Order of the Board,

H. C. RYAN, Secretary.

Invicta Works, Grantam.

URWICK ORR AND PARTNERS, LIMITED

Consulting Specialists in Organisation and Management, invite applications from suitable candidates for appointment as Resident Consultants in their Distribution Division.

Age: 28-35.

Good professional qualification or University Degree in Commerce, etc. Good executive commercial experience in Manufacturing or Retailing. The appointment offers considerable scope and a particularly interesting type of work to the selected candidate. Remuneration is commensurate with the high degree of responsibility involved. Applications, which will be treated in confidence, to Company's offices, 7 Park Lane, London, W.1.

UNIVERSITY OF LONDON

The Stamp Memorial Lecture, entitled "The Press—A Neglected Factor in Economic Development Since 1900," will be given by Professor H. A. Innis (University of Toronto) at the University of London: Senate House (entrance from Russell Square or Malet Street, W.C.1), on Thursday, 17th June, at 5.30 p.m.

ADMISSION FREE, WITHOUT TICKET.

JAMES HENDERSON, Academic Registrar.

DERBY TECHNICAL COLLEGE

Intermediate and Final Courses for B.Com. and B.Sc.(Econ.) degrees of the University of London.

Students can be accepted for admission to these courses in the session commencing September 20, 1948.

Enquiries should be made to the Head of the Commerce and Economics Department.

YOUNG business man (29) seeks responsible appointment as present position offers limited opportunities. Good commercial experience, excellent fighting record during the war. The post required is one that will offer scope for a genuine desire for hard work coupled with initiative, ability and enthusiasm, leading to a career as executive. Scope and prospects offered are primary consideration.—Box 730.

Old Boss Writ Large

THE domestic propaganda of the Labour Party on the one hand, and the resolutions of the trade union conferences on the other, show that one of the most haunting skeletons in the cupboard at Transport House is again rattling its bones. Nearly three years of Socialist government have passed, and yet organised labour feels deeply conscious that the worker has too little say in the direction of industry, and that even in nationalised industries the old boss has merely been exchanged for a new one. The rattle is unmistakable; it is loudest in coal-mining but was plainly audible in the resolution which was proposed by the Amalgamated Engineering Union at Scarborough, supported by several other unions, for a larger proportion of workers' representation in the nationalised industries. This resolution was opposed from the platform, but the Conference referred it to the Executive for discussion with the Trades Union Congress, and there are signs that the section of the party that believes in direct workers' control—that is, in the main, the unions—will not allow the matter to drop. Moreover, when, and if, the economic tide turns, and the nationalised Boards are compelled to play such dirty employers' tricks as dismissing labour and asking for lower wages, the skeleton will step right out of the cupboard.

There is nothing very surprising about the persistence of demand for workers' control of industry. Whatever its present biological basis may be, the springs which fed the British Labour movement were the orthodoxies of Marx and Engels, and among them "ownership by the workers of the means of production, distribution and exchange." That is a golden ideal which became implanted in the minds of working class Socialists while this century was still young, and it has done as much as anything to keep the movement alive throughout its lean times. Many years ago, however, the impossibility of its achievement, except in the sense of "ownership by the state, as trustee for the people" became apparent (partly as the result of the lessons of Russian industry after 1917) and the official policy of the party moved quietly away from syndicalism towards nationalisation—or, as some would say, from democratic socialism to state capitalism. But the leaders never dared make explicit to the rank and file of Labour that they had abandoned workers' ownership; it was too useful as a forced draught to keep the fires burning. The divergence of thought has been severe, as the Grimethorpe and Waleswood coal strikes demonstrated. It is significant that the most extreme advocate among the unions of complete syndicalism is the Union of Post Office Workers, which has more experience of nationalisation than any other.

The main argument against the direct control of industries by those who work in them—whether the doctrine is christened syndicalism or guild socialism—is that it does not work, any more than the various experiments that have been made throughout history to run an army by delegates from the ranks have ever worked. There is a more sophisticated doctrine which calls for a joint Parliament of Industry as part of the Constitution, but no democrat who has thought the matter out wants to exalt the authority of mutually conflicting, monopoly-minded special

interests above that of citizenship in general. There is room for corporatism, of the Left or of the Right, in an authoritarian state where corporations are only the instrument of the Leader's or the Party's will, but not in a democracy, which has quite enough difficulty as it is in asserting the general interest of the whole community against the much more articulate and persistent representatives of special interests. There are, undoubtedly, elements in the Labour Party for whom the authoritarian bias of syndicalism tells in its favour; and just over the border into Communism it is not unlikely that some support for "workers' control" is motivated by the possibilities which it offers for trouble-making. Mr Arthur Horner's old threat that the mines would close in the event of war with Russia would be easier to carry out if the right people, from his point of view, were in authority on the Coal Board.

★

But because workers' control would, as the leaders of the Labour Party have long recognised, result in massive impoverishment and economic chaos does not mean that the human aspirations from which the demand for it arises can be ignored. They were touched on by Mr Herbert Morrison in his speech at Cardiff last Sunday. "One of the worst crimes which the Victorian capitalists committed" he said

was to devise a system which robbed large numbers of workers of the satisfaction and human respect which should always go with doing a job well. They pretended that fear of starvation or a craving for more money were the only forces that make people work . . . While not rejecting individual material incentives, we assert the need for the great incentive of public service:

Here is the sound and positive argument for industrial democracy; that it can restore some, at least, of the destruction wrought by the machine age on human personality. Ideally, it should turn the mere "hand" back into a man or woman and harness to the cause of general betterment those qualities which, denied by the nineteenth-century industrial system, found their expression in the great trade union movements. The British working man, convinced by the industrial history of the early nineteenth-century of the helplessness of the individual employee, sank his individuality in the stern collective discipline of the union. But some of the early idealism of the union movement has vanished, and instead of being a breeding ground for new ideas on the technical and human progress of industry, the unions have become almost entirely absorbed in the question of getting more money for less work. To the extent that this is so, they have become a purely negative element in the industrial structure of the country, demanding much and contributing little.

For a generation past, the supporters of Socialism have been taught by their party to pin their hopes of a new and positive industrial democracy on the device of nationalisation. But the fact is that nationalisation in practice makes that democracy harder to attain. Mr Morrison's officially expressed preference for guiding things "upwards from the bottom instead of downwards from the top" is invariably overridden, in practice, by the tendency to centralise all decisions at the top. It is much more difficult to bring either a grievance or a constructive suggestion to the attention of the National Coal Board where it sits in the stratosphere than to that of Mr Z, the colliery owner. Even if one has a well-founded loathing of Mr Z, and his deputies, they are at least there to be shot at; whether in a stand-up fight or in co-operative effort, the worker is attacking a human target. Nationalisation has in this sense brought the worst of both worlds; as likely as not (since there is no one else technically qualified) the old enemy remains in immediate authority, but behind him there looms a huge and sluggish hierarchy in whose mazes (as the worker sees them) either grievance or constructive contribution are likely to get permanently lost. This has the natural result of strengthening the demand, already strong enough, for control at the higher

levels, through seats on the controlling Board elected representatives of the workers. This is to be satisfied, in the form in which it is put, for all the reasons which make syndicalism undesirable. And it cannot at present be satisfied in any form because (as Sir Stafford Cripps got into trouble for saying) there are not enough workers qualified to do managerial jobs.

To say this is not to deny the existence of enormous funds of latent ability, hitherto tragically wasted, in the lower ranks of industry. What, however, is wanted is not latent ability but ability trained, experienced and ready to contribute here and now to the solution of problems which will not wait. The training ground for that ability is precisely in that smaller-scale day-to-day co-operation of workers and management for which Mr Morrison pleaded, and which such organisations as the Joint Production Councils were devised to provide. Nor is the problem confined to the nationalised industries. It is inherent in all large scale industries, and it is particularly severe where the industrial process demands, as in engineering, a high degree of technical knowledge on the part of management. But it is aggravated in the nationalised industries, partly because of the enormous size of the management unit and partly because the workers expected something better.

★

Neither management nor labour has any right to dogmatise upon the problem of industrial democracy since neither has yet found a solution to it. Joint consultation between management and labour at the workshop level breaks down unless there is an unusually high calibre of men on both sides. Capital-sharing and profit-sharing have only a limited application to a working population that is prepared to enjoy the fruits but not to bear the risks of capitalism. Many useful experiments have been made, but no one can pretend that the problem is solved, or that principles of general validity have been worked out.

The greatest obstacle to participation by the workers in the direction of industry is, as Mr Morrison pointed out, their own habit "of behaving as if there were some sinister boss in the background whom it was necessary to defeat by achieving as little as possible." That is exactly what Mr Morrison's party has been telling its supporters for the past two generations. It is this fantastic belief that the worker can punish the boss by working less, without hurting himself in the process, that marks the essential difference between the teaching of the American and British labour movements. Mr John L. Lewis will fight the employers for a larger share of the proceeds of production with at least as much ferocity as any British trade unionist. But he is under no illusion about the necessity for output; on the contrary, he is wont to make scornful comparisons between his union's and the British unions' attitudes to production and efficiency. Every American worker knows that his standard of living is directly dependent on his standard of production. The British worker has been taught that there is such a thick cushion of "exploitation" in the economic system that there is virtually no connection between the effort he puts out and the reward that he can demand.

The British Labour Party, having for so long sown the seeds of workers' control cannot now complain if they reap the harvest of industrial sluggishness and a growing disillusionment with the effects of nationalisation upon the lot of the worker. The tragedy is that the leadership of the Labour Party, having progressed from syndicalism and guild socialism to a more workable policy, has not educated its rank and file to accept the realities of industrial organisation. Mr Morrison must devote much of his time to breaking down an attitude which his party, deliberately or by implication, has done everything to foster. The British Labour Party inculcated the unnatural attitude of the British worker towards his work; the British Labour Party will have to solve the problem it has created.

Communism in South-East Asia

SUDDENLY, in a matter of days, the European nations with vital interests in Asia have been warned that the attack on them which has been held in the West is being switched to the East. The warning has come as a shock to those who have been allowed to forget—by the lack of space in their newspapers for regular news from the other side of the world—that for three years now there has been continuous or intermittent war in China, French Indo-China, Dutch Indonesia. And the shock has come in the form of most disturbing news about what appears to be concerted disorder and violence in Malaya and Burma. It is not "cold war" that has been declared, but a campaign to bring to fever heat the violent and jealous passions which have racked South-east Asia since the Japanese occupation left the whole area unsettled and disorganised.

In this stage the campaign can only be met by force, by the emergency military and police measures which Mr Creech Jones spoke of in the House of Commons on Wednesday when questioned about the murders of British planters in Malaya. It will not be overlooked that to apply this force and to maintain order in South-east Asia will place a new strain on the resources of western Europe, a commitment which has already involved important numbers of French troops in Indo-China and Dutch troops in Indonesia. In fact the challenge in South-east Asia is not only to government and order in India and China, but to the common interests of the Powers which signed the Brussels Pact. And if it is not met firmly, now by repression and in the future by constructive common action, the economic health of Europe and many of the assumptions of the European Recovery Programme may be undermined.

South-east Asia is today a region of primary importance in world economy as a supplier of foodstuffs and raw materials. In rice, sugar, copra and coconut oil, palm oil, coffee, spices, rubber, petroleum, tin and tungsten, South-east Asia is one of the principal providers of the world market. Above all, it is in part, and potentially to a much greater extent than now, a dollar-earning area, as indicated in the table overleaf. In 1938 three of the five countries of South-east Asia listed in the table—namely, Malaya, Indonesia and Indo-China—had favourable balances of trade with the United States. In 1947, 30 per cent of Malayan exports were sent to the United States, representing 5 per cent of total American imports and equivalent to 24 per cent of the United Kingdom's deficit in visible trade with the United States. The condition of developing still further this capacity to earn dollars and meet the world demand for food and raw materials is that

stability and order should be maintained in the face of nationalist demands.

★

The great economic development of South-east Asia in recent times has been brought about almost entirely by investment of foreign capital, which was formerly everywhere, except in Siam, under the protection of colonial administrations of European states. The foreign capital coming from Western sources and financing most of the larger enterprises of production and transport has been in the past mainly, but by no means exclusively, drawn from the "metropolitan" countries respectively concerned in each part of the region. In addition there has been much capital investment by Indians and Chinese in smaller enterprises, but there has hitherto been hardly any significant business activity (except in one or two areas, such as southern Celebes) carried on by natives of the region, whether Burmese, Siamese, Vietnamese, Cambodians, Malays or Indonesians.

The rise of nationalism in South-east Asia was therefore bound to have a marked economic as well as a political aspect. It involved a challenge to foreign capital, with demands that in each country it should conform to an overriding national economic policy, contribute more through taxation to national revenues and provide for the training and employment of increasing numbers of natives in administrative and technical posts. Wherever nationalists gained power, however devoted to capitalist economics, they could be expected to have a special regard for the business enterprises of their own fellow-countrymen and voters. Beyond this, if the nationalists were also Socialists—as would be the more natural in the absence of any considerable native capitalist class—the question of nationalisation of foreign concerns would be bound to arise. And, finally, it could be foreseen that there would be extremist politicians who would urge complete expropriation of foreign property without payment of compensation. All these degrees of action against foreign capital would become theoretically possible if the European sovereignties were to come to an end.

Nevertheless, wherever a nationalist movement took a normal course, there were, and are, certain sanctions against extreme policies of expropriation, quite apart from the use of military force. An economically backward people whose rulers go too far in the first enthusiasm of independence finds that it can no longer profitably operate the expropriated enterprises and that

It costs less

to effect a With-Profit Endowment Assurance as you may now take advantage of the reduced rates of premium recently announced. The Society's With-Profit Policies provide OUTSTANDING VALUE IN LIFE ASSURANCE.

it cannot obtain fresh capital from abroad. The rulers generally see that such a policy does not pay, even when their ignorant followers do not. Thus, in spite of tension and mutual recriminations, there is a tendency towards a new adjustment, a more or less satisfactory compromise, between the new nationalist regime and the foreign capitalist. But this only happens if the rulers, or dominant political group, really want to raise the productivity and standard of living of their country and see the need to come to terms with foreign interests if their revenues and credit are to be maintained.

It is quite otherwise if policies are determined or largely influenced by ideological and world-political considerations for which certain politicians are prepared to inflict most serious damage on the national economy and actually to impoverish the people they profess to benefit. Unfortunately it looks as if the infiltration of Moscow-trained Communists into South-East Asia and their manipulation of organised nationalist movements have involved just such a subordination of real national and local interests to the grand strategy of the Kremlin. Its declared aim is to weaken and cripple the Western democratic nations, and one of the most effective ways of doing this is to disrupt their financial and commercial relations with parts of the world which are emerging from a colonial or semi-colonial status—what Mr Zhdanov has called the “rear of the capitalist system.”

The influence of the Communists has had just this effect and has prevented the success of solutions by negotiation both in Indonesia, where the Moscow-trained Communist Alimin has been one of the most influential personalities of the revolution, and in Indo-China, where the Communists were absorbed into the Viet Minh amalgamation of parties, but have remained the most active element within it. Even when they have formally consented to the making of agreements with the French or Dutch, the Communist leaders have proclaimed that these are to be regarded only as “breathing spaces” preliminary to further violent struggle. Immediately after the Vietnam agreement with France, concluded on March 6th, 1946, the Viet Minh Central Committee circulated to its local branches instructions which were quoted in a debate on Indo-China in the French National Assembly:—

We must act in such a way that, in two years at the most, all Frenchmen will have left Vietnam, by their own free will or otherwise. To attain these ends, we must endeavour to make their private and public lives a burden to them. No servants, hence no comfort; no benefits for France, hence French trade, industry, plantations and technicians are to be boycotted. No coolies or workmen are to work on French plants, whatever the agreements that may be concluded in the future. If we are compelled to provide workers, let sabotage render all French plants unproductive.

Such a spirit goes far beyond what is to be expected in mere nationalism; in the determination utterly to destroy all assets of the metropolitan state as well as in the cynical intention of violating the terms of whatever agreements may be made, the ascendancy of Communist influence is clearly apparent. In pursuing their policy the ruling clique of the Viet Minh did not shrink from consequences which, even without the renewal of active hostilities, must have been economically disastrous for

the Vietnamese as well as for the French. The Communists would certainly act in the same way in Burma and Malaya if they had a sufficient degree of political control.

The Communists have attained their present influence in South-east Asian countries, not by reason of their numbers—for their party membership has never been large—but by their discipline and by the use of a highly developed tactical technique among inexperienced peoples entering suddenly into political life. Numerous parties have sprung up, centred on personalities and lacking organisation, coherence or principles; it has not been difficult for the Communists to penetrate them and make their leaders dependent on the Communist apparatus for their political advancement.

Nevertheless, there are notable differences between the various countries concerned. In spite of the precarious position of the present Burmese Government, the Communists have so far no such hold on Burma as they have on the regimes of Soekarno and Ho Chi Minh. It may appear to some observers in this country that the policy of conceding full independence to Burma has not justified itself by results. Yet, if the state of affairs in Burma (described in an article on p. 1022) is compared with the troubles which still afflict the French and the Dutch in Indo-China and Indonesia, we should count ourselves fortunate.

The very fact that the Burmese Communists have had to resort to open revolt has been due to their failure to manipulate the AFPFL Government.

In the long run the extreme revolutionary trends in South-east Asia cannot be overcome by European action alone. The only hopeful prospect of moderation and compromise lies in the emergence of strong native parties, independent of European support, yet willing to bargain with the metropolitan nations for mutual economic benefit.

Britain and America, as the countries which made the greatest sacrifices in liberating South-east Asia from the Japanese, should recognise the problem for what it is—a problem affecting the prosperity, strength and prestige of the West in an area on which its recovery depends. The machinery for their consultation with France and Holland lies ready to hand: in the first place in the Brussels Pact, and in the second in the United Nations, where India and China too have their contribution to make.

sequence of its policies towards India and Burma since the war, and while armed violence must be suppressed, no misgivings should be allowed to halt orderly progress towards self-government in Malaya. Yet more cessions of political power from London, Paris and The Hague are by themselves not enough. In London it should be the policy to try to work with the responsible elements of Burmese and Malayan nationalism by inviting their participation in plans of long-term economic development. Into these plans—which would need American support—particular items of capital investment, whether from private or public funds or from an international agency, could be fitted as parts of an ordered scheme, with the emphasis no longer on European convenience, but on the raising of living standards in South-east Asia.

Development under the Planning Act

THE Town and Country Planning Act comes fully into force on July 1st. Its complex financial provisions are to be administered by a Central Land Board, and Mr Silkin—very wisely—has called on the stalwarts of the War Damage Commission to essay a still harder task. The chairman, Sir Malcolm Trustram Eve, remarked on Tuesday

I am seriously worried only about one thing in this new work of ours—the complete ignorance at the present time of nearly everyone that in two weeks from now a new Act of Parliament comes into force which will affect very many owners of land, houses, and other buildings. It produces changes in land tenure and in land practice probably greater than any statute for several centuries past.

Sir Malcolm is undoubtedly right; yet even his eyes must find it hard to penetrate through the encircling gloom to the full shape of things to come.

The general aim of the Act is to give the State effective control over all material changes in the use of land. It does this by restricting the owners' interest in his land to the enjoyment of its existing use, whatever that may be, and transferring to the State the exclusive right to derive financial benefit from the development of land or from changes in its use. Land-owners are to be compensated, once and for all, for the loss of the right to develop their land as they please (or to work it for minerals or sell it for development) out of a very inadequate global fund of £300 million. The scheme for the distribution of this sum may not be issued for some years (payment will be by 1953 at latest) so as to enable owners' claims to be analysed, but the claims must be in by March 31st next. Any owner who thinks his land is capable of being put to a more profitable use should make a claim. The smallness of the fund means that in many cases the award may be very much less than the agreed claim—unless, indeed, some future Government takes advantage of the delay to increase it.

All development rights being in this way publicly vested, the State will be in a position to sell back its interest in the land to any one who gets the permission of the planning authorities to change the land's use. It equally follows that, if permission to change use is refused by the local authority (or on appeal by the Minister), no compensation will normally be payable. The levying of these development charges, and also the administration of the compensation scheme, is the job of the Central Land Board, acting under the general guidance of the Minister and the Treasury. Now that the Board's general intentions have been clarified, it is possible to venture some estimate of how the scheme will operate.

In the first place, it is to be noticed that a private developer has two hurdles to cross before he can start operations—or three in the case of factory building, for a certificate must also be secured from the Board of Trade. An arrangement has been made whereby a single application will suffice both for securing planning permission and for ascertaining the amount of development charge. Fears that enterprise will be slowed down should, to some extent, be quieted by the Land Board's promise to settle the amount of development charge within one month of getting an application, and by Sir Malcolm's categorical statement that “above all we must not hold up approved development—that will be our main aim, and we intend to succeed in it.” This, at least, is a good start for the Board.

The list of exemptions from development charge has also been drawn fairly sensibly, although it could profitably concede more to the ordinary householder. He is, indeed, allowed to rebuild or enlarge his house, or add a garage, without payment, but only so long as the existing cubic capacity is not increased by more than 10 per cent, or 1,750 cubic feet. (Does this mean

that a claim for compensation will lie in the case of every dwelling-house that could be enlarged by one-tenth? If so, the £300 million will be more inadequate than ever.) He can add buildings without limit for the enjoyment of his garden. The construction of farm buildings is exempt, and also of rural cottages so long as these are occupied by farm workers. A general or light industrial building or a shop can, generally speaking, be changed from one use to another without charge. Planning permission is still necessary, however, in many of these cases.

★

The chief controversy to date concerns the rate at which development charge should be levied. Originally it was intended to keep this extremely flexible, but in the end a change was made imposing a stiff uniform rate, amounting to the full 100 per cent of the anticipated increase in land value arising from the proposed development. The case for this rests partly on grounds of pure equity, and partly on technical considerations of simplicity and convenience of collection, although the effect may merely be that haggling goes on over what value will really be created by development instead of over what rate of incidence to impose. It is also claimed, however, that the levying of the full rate is essential to the whole conception of the Act, which is to ensure that land changes hands freely in the open market at its existing use value, without containing any element of profit on possible development. It is further argued that the developer will be quite ready to pay the 100 per cent charge, since existing value *plus* development value should add up to no more than the old free market price.

This is all very well in theory. But land values have always been elusive and particularly susceptible to boom and slump. If developers had usually had to pay for their land a sum equal to the full value it would have after they had developed it, much development would have been stillborn. The actual price paid has usually been somewhere between the existing use value and the ultimate developed value. Conditions can be imagined in which private builders will be quite unwilling to pay the full development value to the Board, and others—of which the present time may furnish an example—in which owners will be reluctant to sell to developers at “existing use” value. Possibly such difficulties will be overcome through infusing considerable flexibility into the actual practice of valuation. But the scheme may be brought to work smoothly only through some dilution of the purity of its original intentions.

It will readily be seen that the Act puts the public authorities in a greatly strengthened position and private owners and builders in a much weakened one. Local authorities and Government departments are their own masters where planning decisions are concerned; but private developers can be chased from pillar to post by the planning pundits and told to lay their bricks on certain sites or lump it. Some of them may sometimes choose to lump it. On this point, Professor Sir Arnold Plant, writing in the *Westminster Bank Review*, argues strongly against the idea that this island contains a fixed fund of land values which planning will redistribute but not diminish. He can, at least, claim with some plausibility that “if development is prohibited in an area which enjoys both potentiality and the favourable interest of a risk bearer, an equivalent result will not erupt automatically elsewhere.”

The Act counters this possibility by attempting to ensure that, in so far as private enterprise refuses to play ball, public enterprise will supplant it. Both the local planning authorities and the Central Land Board possess a number of coercive powers, including that of compulsory purchase, for removing impediments to desirable development such as a recalcitrant vendor

TRADE BETWEEN THE UNITED STATES AND SOUTH EASTERN ASIA (in million dollars)						
	1938			1947		
	Imports from U.S.A.	Exports to U.S.A.	Balance with U.S.A.	Imports from U.S.A.	Exports to U.S.A.	Balance with U.S.A.

Ceylon	1	16	+ 15	47	30	— 17
United Kingdom	521	118	— 403	1,112	205	— 907
Europe	1,326	567	— 759	5,202	817	— 4,385
All Countries	3,094	1,960	— 1,134	14,456	5,739	— 8,717

might present. The local authorities have much wider powers than heretofore to purchase land compulsorily, and to undertake most types of building activity themselves. Local authorities are normally liable to development charges on the same basis as private builders—a fact which should suffice to ensure that revenue from this source eventually exceeds, perhaps far surpasses, the £300 million which the taxpayer must find immediately for the compensation fund. But some important categories of public land escape the net of the development charge—notably those large areas of “blitzed” and “blighted” land earmarked for comprehensive redevelopment and also the land of New Town Development Corporations.

To the local authorities, and especially for “blitzed” and overcrowded cities, the Act brings many benefits. It is no doubt good, even though it is a century late, that they should at last be given the powers to replan and to rebuild their areas as they like, subject only to Ministerial supervision and to the annoying intrusions of other Government departments. But the close restrictions which this entails on the private owner can only possibly be justified if these powers are well used. The Act is based on the assumption that public planning of land use will be wise and good, where unregulated private development has proved to be mischievous and irresponsible. But a glance round the countryside at what is going up at the present time by no means confirms this belief—while to listen to a typical Council debate on the subject of land use is none too encouraging. Undoubtedly, it is still too early to pass judgment. But the medley of public authorities must greatly improve their judgment, taste, dispatch, and harmonics for the Act, even on its planning side, to be accounted a real blessing.

The long-term effect of the Act on the rate of building activity must largely depend on how much is expected of private enterprise. If local authorities are permanently to be responsible for the great bulk of housebuilding; if they are prepared to step

in with their reserve powers whenever private developers are obdurate—then, although few development charges will be collected from private sources, the curtailment of activity envisaged in Sir Arnold Plant's criticisms will certainly not take place. But it is doubtful whether such a complete *bouleversement* of public and private roles, or such a large-scale eclipse of private enterprise is really likely—or is even fully intended by the Act's framers. What happens when the Conservatives return to power, as one day they will? What happens when the taxpayer and ratepayer finally jib at shouldering the heavy cost of providing an expanding volume of subsidised municipal housing? When these things occur, to lay off public enterprise without laying on private enterprise would mean ruining the building industry and bringing grave unpopularity on the Government of the day. But private enterprise cannot be turned on at will if its tap has been choked.

For the moment these problems are hidden. Private enterprise can, in any case, do little at present. But a time will come when the services of private enterprise will be badly needed. They will not be forthcoming unless planning control is administered with moderation and dispatch, development charges are levied with some degree of imagination and flexibility, and the whole scheme is operated with the maximum of encouragement and the minimum of intimidation. The Central Land Board has indicated that it means to operate the scheme in the right sort of spirit. But the Board must realise that the cards are now stacked very strongly on the side of the public authorities. To some extent, no doubt, this change of emphasis is desirable—but it can easily be pushed too far. There needs to be more opportunity to give private enterprise its due share of encouragement; and one possibility that commends itself, whatever the technical difficulties, is that the rate of levy of development charge should be lowered at times of falling business activity to give a necessary stimulus to development.

NOTES OF THE WEEK

Growing Pains in the West?

It looks as if the caps were thrown in the air too soon about the materialisation of the Marshall Plan. American policy has a curious habit of moving two steps forward and then one back, and ever since the passage of the Economic Co-operation Act, which seemed to catch a fine flowing tide of enthusiasm and gratitude, the nations of Western Europe have been making one painful discovery after another of the many strings that are attached to American generosity.

In the nine months from the Harvard speech in June of last year to the passage of the Act in March, the Western world seemed to acquire at least the outline of a grand strategy. The European Recovery Programme, the project of Western Association and the integration of a German state into both represent a comprehensive plan for the revival of Europe and for its close partnership with the United States in the making of a free world. But the very scale of the project, which, on the one hand, is its best hope of success, on the other lays it open to hazards and risks with which more modest policies would never be plagued. The larger the operation, the more it demands flexibility in its method, genuine confidence between its partners and a fund of energy and enthusiasm to maintain its momentum. None of these qualities has been in much evidence in the West in recent weeks. The grand strategy is passing through its first crisis of growing pains.

The first shock was the discovery that free grants of Marshall dollars would not be made unless the recipient countries took loans as well, the proportion of loan to grant varying from country to country. The second shock was the cut in the appropriation made by Mr Taber's Committee—though this was mitigated by the belief that the Senate would restore the full amount. But there are further shocks in the conditions proposed in the American draft treaty laying down the conditions of aid, which has been handed in almost identical terms to each government. The most unacceptable clauses cover the problems of international trade, of exchange rates and currency stabilisation, and the use

of local currency funds. The American draft requires the Sixteen to return to the strict American trade philosophy of unfettered free trade such as it appeared in the original American draft Charter for ITO; the escape clauses and compromises introduced into the Charter at Geneva and Havana, at the cost of lengthy negotiation, which enabled nations less favourably situated than the United States to accept it, appear to have been left out.

The conditions laid down for currency stabilisation are so rigid as to surpass any standard of achievement possible in France or Italy for some time to come; one of them, which all Sixteen will reject, appears to transfer the power of fixing European rates of exchange to the American Government. Lastly, the most unfavourable feature of the local currency stipulations lays it down that the funds built up by the sale of American goods and materials may later be used to “purchase” vital raw materials for the United States, thus withdrawing these materials from the category of normal commercial sales to the United States and correspondingly weakening the European countries' ability to earn dollars and achieve independence.

The provisions taken separately are disturbing enough, but they will presumably be modified once detailed bilateral negotiations are under way in Washington. What the Sixteen find much more disquieting is the general American attitude of mind revealed by the conditions. They point to a continued failure in America to understand the nature of Europe's economic crisis and a continued belief, even in the most friendly circles of the Administration, that the European countries really could pay their way at once if only they would obey the Golden Rule and adopt the American Way of Life. If it were simply a matter of a conflict between what the Americans want to do and what the Europeans want to do, it might be enough to shrug the shoulders and say that beggars cannot be choosers. What is so distressing to Europeans is to see all the generosity of the helping hand stultified, and its purposes frustrated, by conditions that postpone the date when Europe can stand on its own feet.

Grudging Yes from France

The need for greater confidence between the Western Allies has been dramatically illustrated in the last weeks not only by such American actions as Mr Taber's in cutting back the appropriations for Marshall aid, but also by the remarkably bad reception accorded in France to the Six Power proposals for Germany.

The essence of France's objections to the proposals is a fundamental lack of confidence in the staying power, if not in the intentions, of its allies. This lack of confidence betrays itself in three ways: in the demand that any revival of German industry should be balanced by complete international control of the Ruhr; in the proposal—pressed with especial emphasis by M. Blum—that another effort should be made to associate the Russians with the new proposals for Germany; and in the demand that the United States should give more precise military guarantees to France before the French people are asked to risk a revival of German power.

Behind each of these demands lurks the suspicion that America cannot be relied on in the long run to maintain its interest in Europe, that a separate Western German state may either become dominant in its own right (through control of the Ruhr) or be absorbed by a more powerful and more sustained Russian effort into a single unified Reich under Communist control. Through all these objections runs the single thread of distrust—the fear that Western European Association, German integration and American partnership are ventures built on sand.

These fears explain the Assembly debate upon the Six Power proposals. Throughout the three days of discussion, it was the old hesitations, not the new possibilities, that filled men's minds. One speaker alone—M. Reynaud—tried to draw the debate into the realm of reality. He pointed out that France was not facing the situation of 1919. A new world had come into being and the problem was to integrate Western Germany into a European Union, without which Europe would in any case succumb. France's role, therefore, should not be to hesitate and hold back but take the lead in the movement towards unity.

It is doubtful whether M. Reynaud swayed many votes. A tiny majority was finally secured for a grudging and confused acceptance of the terms, provided the Government undertook to modify them by continued negotiation. And even this meagre success was secured less on the merits of the proposals than on anti-Communist fears, fanned to new strength by the news of strikes and rioting at Clermont-Ferrand and other industrial centres.

Challenge to Europe

These French delays and uncertainties are all the more tragic in that they contribute to what is probably the greatest of all dangers to the West's Grand Strategy—the danger that its momentum will be lost. The European governments should have no illusions about the extent to which their own performance will provide the test for future American appropriations. The majority in the House of Representatives in favour of Mr Taber's cuts is a reminder of how easily, even in the enthusiasm of the first year, American support may slacken. But perhaps even more ominous are the words of the Recovery Programme's chief supporters. One of Mr Vandenberg's strongest pleas in urging the restoration of the Taber cuts was his contention that ECA had not been given time to prove itself. He urged Congress to give the programme the benefit of the doubt,

until next January when we shall know whereof we speak. When the second annual appropriation impends . . . we shall know to what extent self-help and mutual co-operation are meeting our expectations.

Notice could not be more clearly served that next year's appropriations depend upon Europe's showing this year.

In one sense, this American expectation is unjust and excessive. The calculations of the Paris Report at their most optimistic only forecast a return to the standards of 1938 after four years of the Plan. And these calculations have already been upset in two vital instances: the aid offered by America is much less and world prices, far from falling, have continued to rise. But, even supposing that the goal of 1938 standards can be attained, it is clearly a very modest goal compared with the new federal heaven and the new co-operative earth envisaged by many American supporters of the Plan. The economic results in particular cannot fail, after only six months, to appear very meagre indeed next January.

Is there then no way out of the dilemma—that America demands as a condition of further aid a degree of progress which present aid is insufficient to secure? The answer lies surely in the political and psychological field. Even if economic revival must be slow, political co-operation could be full and immediate. If the Western Union Defence Pact were already such that its

terms could be published and American participation invited; if plans for regular Prime Ministers' meetings in Western Europe were already laid; above all, if France were a trusting not a hesitant partner in all Western schemes, including those for Germany, the atmosphere both in Europe and in Washington could be changed overnight. It is precisely the present fears of the West that are breeding future distrust. As Mr Walter Lippmann put it, the “unprecedented venture” of the Western Powers “can be sustained only if they contribute . . . not merely sweat and austerity, but also audacity and faith.”

Parliamentary Timetable

The rejection of the Parliament Bill by the House of Lords last week makes it possible to map out a rough timetable for the remainder of this Parliament's life. The presumption is that the Government will force the Parliament Bill through under the machinery of the existing Parliament Act of 1911, which it is designed to amend, in order that the Steel Nationalisation Bill—to which they are committed up to the hilt, much as most of them hate it—may follow on as quickly as possible.

The existing Parliament Act provides that a Bill can be presented for the royal assent without the concurrence of the Lords if four conditions are met—(a) that it has been passed three times by the Commons and rejected three times by the Lords, (b) that this has happened in three consecutive sessions, (c) that it has on each occasion been sent up to the Lords at least one month before the end of the session, and (d) that at least two years have elapsed between the second reading in the Commons on the first round and the third reading on the third round. The Parliament Bill would change the three sessions in conditions (b) into two, and the two years in condition (d) into one. The Parliament Bill received its second reading in the Commons on November 11, 1947. It will therefore presumably be given its third reading on the third round on November 11, 1949. But to be valid, this must be in the third of three consecutive sessions, and the current session is still the same one as that in which the Bill passed the Commons for the first time. It follows that between now and November 11, 1949, there must be one complete session (other than the present one) and another one must be started in sufficient time to get the Parliament Bill to third reading by that date. This is why Mr Morrison is considering an extra session for this autumn, to be completed before the regular session of 1948-49 begins.

The fun will really begin on November 11, 1949, when the Lords get the Parliament Bill for the third time. Condition (c) means that their Lordships may safely delay a month, until December 1, 1949 (December 11 will be a Sunday). Curiously enough, the Parliament Act of 1911 did not say what constitutes “rejection” of a Bill by the Lords. One authority has committed himself to the view that delay of over one month by itself constitutes rejection, but the text of the Act does not support this. It seems to be the general belief that the only way the Government could force the Lords to come to a decision would be to end the session by prorogation, sacrificing all other legislation still in process at that date. If this is so, then presumably the session will be prorogued on December 12, 1949, the Bill will be deemed rejected for the third time by the Lords and will become law without their consent.

The Parliament Bill has a retrospective clause by which any Bill which, at the time of the Parliament Bill's passing into law, has already fulfilled the conditions as amended by the Parliament Bill may become law immediately. What this appears to mean is that if the Steel Bill is passed by the Commons and rejected by the Lords for the first time at the extra session this autumn and passed a second time by the Commons a year later (but before November 11, 1949), it would become law on the same day as the Parliament Bill itself—that is, before Christmas next year. If, on the other hand, the Steel Bill is not brought forward at the extra session but is kept for the regular session of 1948-49, it cannot become law until March, 1950, at the very earliest and more probably not until the Dissolution immediately before the election. According to some reports, the Cabinet is divided between these courses. The slower would formally redeem the promise to pass the Steel Bill into law during the present Parliament, but would leave its fate to be settled at the election itself, since if the Opposition were to be returned to power, they would have time to repeal it before it took effect. The quicker timetable might leave just enough time to bring the nationalisation of the steel industry actually into force before the election, but at the cost of subordinating the whole Parliamentary timetable to that one object.

Representation of the People

The report stage of the Representation of the People Bill makes sorry reading. On Monday the House of Commons debated a new clause inserted by the Government which limits the number of cars which a candidate may use to one for every 1,500 electors in county seats, and one for every 2,500 in borough constituencies. The avowed intention of this is to limit the advantage which rich Tory candidates with Rolls-Royces apparently enjoy over their humble Labour brethren. The objectionable provision is to declare it illegal for a citizen—not the candidate himself or any of his agents—to use a motor-car (outside the permitted number) to convey persons to the polls for the purpose of promoting the election of a particular candidate. You may give your political enemies lifts but not your friends—a completely bogus crime by any standard of British justice, and moreover unenforceable.

After Tuesday's debate upon the redistribution of seats the opposition has a genuine cause for bitterness. In March the Government during the committee stage obtained the Boundary Commission's approval for the addition of seventeen urban seats to the original redistribution plan. The opposition asked for the Boundary Commission's blessing to the creation of eight new rural and suburban seats and obtained it for five of them. On Tuesday the seventeen were voted in and the five rejected.

It is true that the Boundary Commission's original proposals were slightly weighted towards the rural areas, and that there was a case for some of the additional seventeen seats. It is also true that some of the opposition's proposals were rather sketchy. But coupled with the Parliament Bill, the abolition of the City of London constituency, and of the University seats the Government's action can only be represented as a determination to weight the constitution in their favour while they have the chance. Because Parliament is sovereign, the constitution can only be upheld by the self-restraint of the political parties, and the Socialist Party may well find that they have set a precedent which will boomerang upon themselves. If they find that the next Tory government (and the Tories have no claim to be considered scrupulously constitutional) restores the University members and introduces another electoral reform Bill, the Socialists will have only themselves to blame. The British constitution will then have become merely whatever the party with a majority chooses to make of it, and instead of evolving smoothly with the times, it will—like the rolling English drunkard—reel from left to right and back again.

Regrets in the Desert

In the Palestine talks which Count Bernadotte is arranging at Rhodes, the problem of Jerusalem will be the first to be attacked. After Jerusalem Haifa will probably give most trouble. In neither case will it be easy to find any common ground between Arabs and Jews.

An important difficulty is that both Arab and Jewish delegates will be looking over their shoulders to see the effect on the public opinion behind them of anything to which they may agree. Neither can count on broad popular backing of their credentials. The Jews will represent a provisional government which is not

completely master of its own house of Israel. The Irgun Zvai Leumi continues its activities—its requisitionings and arrests—and although its relative failure in the recent organised fighting is reported to have lessened its prestige somewhat, its membership is swollen to about 20,000 members. If the Government were to make a false move, Irgun would be the first to exploit it. The majority leaders and the Hagana will try not to risk a show-down with the Irgun while any Arab opposition is still to be feared. But the show-down will have to come.

On the Arab side, there have lately been some more encouraging developments. From Amman comes the news that more friendly relations are now shaping between the traditional rivals King Ibn Saud and King Abdullah than have existed for a generation. At the critical meeting of the Arab League political committee which accepted the truce proposals, it was Egypt and Saudi Arabia which supported Transjordan's efforts in favour of a cease-fire. This alignment of moderates, who represented most of the armed force at the League's disposal, was too strong for those in favour of fighting on. Increasingly polite notes have been exchanged between the Saudi and Hashimi rulers during the past few months, since King Ibn Saud asked for permission to send troops through Transjordan to Palestine. The war-shyness of Egypt, the hopeless weakness of Syria, the great access of prestige to King Abdullah through the relative efficiency of the Arab Legion and the obliteration of the Mufti, have caused a shift in the Arab balance of power which may have important consequences.

Who Gets the Coal?

Mr Bevin's use of the first person singular in his speeches suggests more magisterial powers than he in fact wields. In Sheffield on Saturday he told an audience of Labour women that in international politics Britain was working "on a bilateral system" and went on to say

I must be satisfied when I put my hand to an agreement that the departments advising me are in a position to deliver the goods I am contracting to supply.

This suggests that the power behind the trade agreements which Britain signs with foreign countries lies in the Foreign Office and not in the Board of Trade, that politics play in them a larger part than is admitted. It is arguable that Mr Bevin should play the decisive rôle—as Mr Molotov appears to in Russian export policy—but before he attempts to do so on any important scale there will have to be some tightening up of Cabinet consultation on such statements as the Minister of Fuel and Power made earlier in the week.

For European countries, which count on getting sterling coal from Britain instead of dollar coal from the United States, will understand Mr Gaitskell as meaning only one thing: that exports of coal may not have priority over domestic consumption of all kinds. The threat is all the more unwelcome because the British export drive started well and by the end of the winter had risen to two million tons above the figure hoped for. Now, with production running 100,000 tons a week below requirements, Mr Gaitskell sees the prospect of attaining the necessary weekly exports of 350,000 tons fading as the holiday season draws near. First priority goes to building up stocks to meet Britain's winter needs; therefore, argued Mr Gaitskell,

if output is lower or consumption higher than it should be, we shall have no alternative but to reduce the rate of coal exports.

It will be interesting to see just what happens in Paris when the British representative on OEEC is questioned on this matter by his 16 collaborators in the European Recovery Plan. Eleven of them will be affected in varying degrees, and they expect altogether this year just under seven million tons of coal from Britain under existing trade agreements—at least half of it deep-mined coal. Will they and their American colleagues say flatly that ERP should come first in British calculations? They would be entitled to do so. Will they suggest certain measures by which domestic consumption in this country could be cut so that the British household would be using power, light and gas on a scale less extravagant by present continental standards? Some such test case is bound to arise out of ERP sooner or later. It will be a pity if the first one should arise over the raw material in which Britain is richest. On the Continent people have not forgotten Mr Harriman's estimate that their expenditure on American coal could be cut by over \$700 million a year if British exports were what they should be.

On the same day that Mr Gaitskell spoke, the Economic Commission for Europe issued from Geneva figures which showed a steady improvement in Europe's coal production. The deficit

to be met from American shipments in the third quarter of this year—7,600,000 metric tons—is the lowest since the war, and 1,400,000 tons less than in the quarter ending on June 30. The main contributor to the improvement was Poland, which offered 5,100,000 tons for allocation in the third quarter. The Ruhr offered 3,500,000 tons and Belgium nearly a million. The British offer was 2,720,000 tons.

Defence of Norway

Deep differences of opinion between Norway and Sweden over the international rôle to be played by the Scandinavian states have come into the open in the last two weeks. It had been obvious for some time that the conflicting views of the prospective members of any Scandinavian bloc could be reconciled only on terms which would strip it of real military value. At their frequent meetings, however, the Premiers of Denmark, Norway and Sweden and their colleagues kept up a brave show of the closest collaboration and of a unified policy towards the outside world. Then they went home and reaffirmed national policies which, on balance, intensified their differences.

The basic conflict is between Norway and Denmark on the one hand and Sweden on the other. The first two—and particularly Norway—consider that a Scandinavian bloc must be in fact, if not in form, part of a wider system of alliances. Sweden rejects this view and prefers to work for an independent northern alliance strong enough to defend itself—a possibility which the other states doubt. In spite of agreement to differ there was also a growing understanding that useful but limited collaboration was possible without depriving any of the three governments of their right to enter into wider commitments. Sweden seems then to have gone further, and proposed to Norway what amounted to a formal military alliance; but the offer stipulated that Norway should undertake not to enter into any engagements with other Powers. In other words, Norway was not to bind itself to Britain or America.

The Norwegians had for some time been quietly exasperated with the Swedes. Exasperation had increased when Russia's ostentatiously mild treatment of Finland encouraged in Sweden the advocacy of policies which Norway had hoped were being discredited. The reaction to these Swedish overtures was therefore strong and unfavourable. It culminated in the proposal of the non-party, but pro-British Oslo newspaper *Verdens Gang*, that Norway should ally itself with England "if it becomes necessary to obtain security through agreement with another Power."

The proviso is wise. It would be rash to rush into an alliance now as a result of pique with Sweden. It is surely better for all concerned to work for the largest measure of co-operation now, even if that may be inadequate in a more dangerous international situation. But this country should be the last to forget that Norway holds a key position in the control of the North Atlantic. Its security was shown by the last war to be as vital a British and American interest as that of the Low Countries. Unfortunately Norway cannot simply choose between being a Scandinavian power and being an Atlantic power. It is both. The Swedish proposal that it should confine itself to Scandinavia is obviously unreasonable.

Lowlands and Highlands

Most of the population problems which can afflict any country press with especial severity on Scotland. A field study by the Scottish Council of Social Service on *Scotland's Changing Population* is therefore very valuable. The facts are not new, but their recital gives, in this case, much food for thought—and, it is to be hoped, for Government action. Scotland over the last seventy-five years has exhibited two exceptionally strong and persistent population trends—a mass exodus from the country which has hardly been equalled elsewhere in Europe, and an internal migration from the large rural areas of the Highlands and Border to the narrow industrial belt in the centre. Migration out of the country caused a net loss of some 1,250,000 between 1871 and 1931; and the procedure is not yet reversed. At the same time, despite its vast stretches of open country, Scotland's population is more heavily concentrated even than is England's. Over one-fifth of the inhabitants live in Glasgow and its conurbation, and over three-fifths within 30 miles of either Glasgow or Edinburgh. While the population of this small area has steadily grown, that of the Highland and Border counties has dimly dwindled, and in consequence most parts of Scotland are either overcrowded or else underpopulated.

Overcrowding presents the more tractable problem. The ap-

proaching exhaustion of parts of the coalfield is both a danger and an opportunity, if industry can be fostered in the right places with sufficient skill. But the problems of the rural communities in the Highlands will not bear postponing, for many of them—especially those on the numerous small peninsulas where communications are especially bad—will be dead within a generation. There comes a point in the depopulation of a village below which the economic wheels are unable to turn.

The prospect is still not hopeless. The agricultural expansion plan, the vast Scottish planting programme of the Forestry Commission, the development of the Scottish tourist industry, and the power of the North of Scotland Hydro-Electric Board to provide cheap subsidised electricity are four big potential aids to recovery, although their benefits will be spread somewhat unevenly. Orkney and the Hebrides could supply England with many food delicacies, if suitable light air transport were developed. Elsewhere the expense of sea transport has virtually closed many market outlets, and has driven the crofter back on a subsistence farming, whose poverty is at present partly masked by the high price of tweed and livestock. Only in such areas as Lewis, with developed industries, has decay up to now been arrested.

In one Highland parish, by no means untypical, a survey found that of 64 houses, 38 are in ruins and 22 are definitely unfit. The decayed housing conditions are partly due to the strange fact that the crofter, being at law the owner of his house, cannot be provided with a new one by the county council. Such conditions, together with the great paucity of social centres (due in part to ancient pruderies) will soon drive the last young Scotsmen and women out from a society whose population is already rapidly ageing. A Highlands and Islands Advisory Panel was recently instituted. But advice is no substitute for action, and only concerted attack on the social and economic maladies of the Highlands can prevent a large part of Britain from falling into disuse.

Ten-a-Penny

The Ministry of Education is about to launch a campaign to recruit more of the women teachers so urgently needed for junior and infant schools. In an unguarded moment Mr Tomlinson said recently that men teachers were "ten-a-penny" and deeply wounded their susceptibilities. Though this is an exaggeration, it is true that in most areas there are now sufficient men teachers to go round and that it is possible for local authorities to be reasonably selective when they make appointments.

To explain the position to local education authorities, the Ministry have estimated the number of teachers of both sexes required in maintained secondary and primary schools over the next five years. The estimates allow for the rise in the birthrate and for the reduction of the size of classes to 30 for children over eleven and to 40 for those under

ESTIMATED REQUIREMENTS OF TEACHERS IN MAINTAINED SECONDARY AND PRIMARY (INCLUDING NURSERY) SCHOOLS IN JANUARY OF EACH OF THE YEARS 1949-53 ('000)

Teachers of	1948 (Est'd. Actual)	Required in				
		1949	1950	1951	1952	1953
Seniors	79.5	97.0	97.5	98.0	98.0	98.0
Juniors	66.5	67.5	67.5	67.5	69.5	73.5
Infants and under 5's ...	50.0	53.0	58.0	59.0	62.5	66.0
TOTALS	196.0	217.5	223.0	224.5	230.0	237.5

eleven. There are at the present time 196,000 teachers in England and Wales in maintained schools compared to 187,000 in 1938: the objective is to reach 237,000 by 1953. This means training 96,000 teachers during these five years, half to make good wastage and half to increase numbers. The table above shows the increased demand for teachers in the younger classes as the new generation enters at the bottom. No difficulty is expected in recruiting the male teachers, whose numbers will rise only slightly over the five years. Women, however, have not entered the emergency training scheme in anything like the same numbers. Hence the new recruiting campaign. To ease the position further, local authorities are being pressed to employ a larger proportion of men, particularly in the junior classes, in order to release women for the infant classes. In 1938 32 per cent of teachers were men, now 34.8 per cent are; by 1951 it is expected that 37 per cent will be men.

But for the rise in the birthrate, the position in the schools would be much more satisfactory than was anticipated two years

THE ECONOMIST BY AIR EXPRESS

We hope to announce during the next few months the introduction of an Air Express Service of The Economist to a number of overseas countries, similar to that already in operation across the Atlantic.

TO AUSTRALIA
AND NEW ZEALAND

We start with an Air Express Service to Australia and New Zealand as from the beginning of August next. On existing airline schedules copies will be posted in Sydney within one week of publication in London, thus reaching subscribers some five weeks earlier than by surface mail.

The cost of this service will be £6.0.0 sterling per annum, and if you wish to enter a subscription to an address in Australia or New Zealand please send your instructions to:

THE PUBLISHER,
THE ECONOMIST, 22 Ryder Street, London, S.W.1.

ago. Until very recently all attention was concentrated on meeting the claims of the extra age group: now, however, most authorities have enough teachers to meet the raising of the school-leaving age, and huts and equipment are on the whole arriving just in time. The weight of anxiety has now shifted from the problem of a single age group of 390,000 at the top to the more difficult one of absorbing successive waves of youngsters at the bottom. In 1939 there were in England and Wales 2.8 million children under five: in 1947 there were 3.6 million. With this increase in the child population women teachers are worth not copper but gold.

Commonwealth Conference

There are now better prospects of a conference of Dominion Prime Ministers in London next October. It is unlikely to be a full-dress Commonwealth meeting, prepared to discuss the broadest constitutional questions; but it may well be a conference full enough to discuss Mr Bevin's western union policy and the questions of defence and trade which it raises now and for the future. If attention is concentrated on this vast matter it should be possible to avoid discussion of some less important questions on which some Dominions do not see eye to eye. Even for a meeting of this limited scope there is a great deal of preparatory work to be done, and it would be both courteous and useful if the Ministers in charge of Commonwealth Relations could perform some of it in flying visits to the Dominion capitals.

There has been some rather petty criticism of Mr Noel Baker for spending so much time at Uno; although time spent in trying to prevent war between India and Pakistan over Kashmir can hardly be called wasted. This criticism is less likely to deter Mr Noel Baker from leaving London than the persistent rumour that Mr Dalton is to deal with some aspects of Commonwealth affairs. He uttered some very correct sentiments on the subject during the Labour Party conference and has since developed them elsewhere. But it would be difficult to imagine a sphere of Cabinet activity (outside the Treasury and the Foreign Office) in which his intrusion would do more harm. *Bonhomie* and bright ideas are not popular among Dominion statesmen, and the only voice from overseas which has been heard to hail the prospect of the ex-Chancellor's sharing Mr Noel Baker's mantle is that of Mr Calwell, Australian Minister of Immigration.

There is a special reason for this. Mr Calwell shares with Mr Dalton the bright idea of the migration of millions from Britain to the Dominions, with a "planned dispersal" of vital industries and skilled workers over the Commonwealth. This still theoretical proposal, the economic implications of which have received no detailed and serious study, is one to which some Socialist Ministers tend to turn in moments of despair about the problems of feeding and defending Britain. It should be recognised for the defeatist, strategically unsound idea that it is. A concentrated, closely-knit industrial system is the foundation of striking power in modern war; to diffuse it is to weaken it mortally. And to set in motion and carry through such a mass migration, over whatever period, would need such tyrannical powers of direction over human beings and their property as even Mr Dalton would hardly dare to ask for.

New Brooms in South Africa

Dr Malan's first moves as South Africa's new Prime Minister could hardly have been more unfortunate. Last Friday, his government released five "political prisoners," among whom were three Nazi agents—one convicted of sabotage, the other two of blowing up a post office and killing a passer-by. On Tuesday, it was announced that the training of natives as artisans was to stop immediately. Such measures must cause uneasiness among all moderate South Africans—and, indeed, throughout the Commonwealth. For they not only weaken the Commonwealth's greatest asset, the moral prestige of its liberal and tolerant traditions, but also give the Communists a piece of news and an argument useful all over the world.

But these moves by a Nationalist government still in the first, fine flush of power are neither surprising, nor necessarily even alarming. Dr Malan has included in his cabinet of otherwise moderate and experienced men three individuals whose records of extremist activities leads one to expect such measures from them now that they are in office. Mr Strydom, who takes over the Department of Lands, has a long reputation of near-Fascist policies; Mr Eric Louw, in charge of Economic Development and Mines, has, in spite of an early record of good work in the diplomatic service, developed violent anti-semitic views; Mr

Swart, as Minister of Justice, was originally in General Hertzog's government, but, when General Hertzog joined General Smuts, became one of the coalition's bitterest opponents and will presumably for a time continue to oppose closer ties between English-speaking and Afrikaans-speaking South Africans. It has to be remembered that in South Africa joint Cabinet responsibility is not so marked as in the other Dominions. It is possible for one Minister to recommend publicly and, to some extent, even to carry out policies with which his colleagues do not agree.

But it is still early to read the portents accurately. Dr Malan has a working majority of only four. He cannot constitutionally, therefore, carry out an extreme policy, and he has frequently expressed his firm belief in constitutional methods of government. Moreover, once the exhilaration of taking office has subsided, Dr Malan and his ministers, like other ministers new to power, may well find the onerous duties of administration a strong antidote to extremism.

Dr Malan has an abler team of ministers than General Smuts had, but judgment on their intentions must be reserved until it is certain that they have rid themselves of the extremist faction for which the Nationalist Party has been notorious.

Prison Labour

Freed from the passions released by the proposal to abolish capital punishment, the House of Lords has resumed the committee stage of the Criminal Justice Bill in a less emotional atmosphere. The controversy over capital punishment has, in fact, obscured from public view the far more valuable parts of the Bill. In the long run it is much more important to society that no one under seventeen years of age should be sentenced to prison, and that imprisonment for anyone under twenty-one is to be a last resort, than that eleven murderers a year should or should not escape hanging.

In Tuesday's debate, Lord Templewood brought out the reformative aspects of the Bill by his amendment to specify employment among the subjects upon which the Home Secretary can make regulations for the management of prisons. It is a technical amendment, for the power is clearly covered by the original wording, but Lord Templewood, by moving it, and the Lord Chancellor, by accepting it, showed that in their view the employment of prisoners is the key to their reformation. Surely they are right. A great deal is proposed by the Bill to prevent people from being sent to prison at all—by the extension of the probation system, with psychiatric treatment, and by the provision of remand centres and detention centres. The tacit assumption behind these proposals is that a prison sentence is likely to do more harm than good. But whatever provision there may be for special methods, there will always remain the problem of the prison inmates, whose reformation, notwithstanding the bad conditions of the prison service today, must always be attempted.

Nothing [said Lord Jowitt] is more likely to give a man back his self-respect than to be able to get down to work which is worth doing—work in which he can feel some pride.

During the war work of this sort was readily forthcoming from the Services and elsewhere, and the effect on the prisoners who were employed was most marked. Now, however, conditions are becoming more difficult again. It is impossible to obtain the machinery needed for employment inside prisons and there are not enough prison officers to supervise prisoners taken to work outside, on farms and in the forests. Yet Lord Templewood was certainly right in insisting that far more could be done within the present limitations. Earnings, for instance, have only recently been increased from 6d. to 9d. a week—hardly enough to earn a cigarette a day, totally inadequate to provide anything for their families. If a return is made to the pre-war practice of spreading work to enable it to go round, of encouraging prisoners—in the words of a committee of 1933—to waste time unobtrusively, a large part of the purpose of the Criminal Justice Bill will be frustrated. Hard labour must be replaced by hard work.

Light on the Economy

Statistics in the past have notoriously been a by-product of administration; the building up of a quantitatively accurate and complete picture, month by month and year by year, of social and economic conditions and trends, has only lately become an aim in itself. It is an aim still very imperfectly fulfilled; as witness the controversy between Mr Harrod and the official statisticians on the question whether national consumption has increased

remained the same, or severely diminished since 1939—a question so obviously fundamental that any doubt as to the answer, in a community bent on controlling its own economic destiny, is almost ridiculous. Or the difficulties faced by the London and Cambridge Economic Service in computing movements in the volume of production, for the prewar period, in such a way as to present a continuous series with today's figures. Most European countries, it is safe to say, are more thoroughly blinkered by bad or inadequate statistics than is Britain; it is to America, to free enterprise, bureaucracy-hating America, that one must turn to see economic control working with reasonably full data and economists able to check their theoretical constructions against a reliable political arithmetic. The National Bureau of Economic Research, whose twenty-eighth Annual Report has just been published under the title of *The Cumulation of Economic Knowledge*, comprises a formidable team of research workers whose combined efforts have illuminated the American economy to an extent which planners—or academic inquirers—in this country must envy in vain. No criticism of British economists, or rather econometricians, whether inside, or outside the Central Statistical Office, is implied in this comparison; one cannot make bricks without straw, though some people will always try.

It is more reasonable to criticise the light-headed optimism of a Government which, claiming an overriding wisdom and authority in economic matters and dismissing with scorn the old self-balancing mechanisms of free enterprise, neglects to provide itself with that first requisite of genuine planning, a full set of data. But the blame cannot justly be laid on the Government alone. Every attempt which it has made to improve those data has been fought tooth and nail by trade interests; the reception accorded to the "pilot census" on distribution is a recent case in point. Party feeling no doubt entered in, but no party proposes a return to economic passivity, and any positive policy, Socialist or not, demands adequate statistical illumination. The British public has itself at least partly to blame if its economic affairs are conducted by an administration working by the lightning-flashes of its own intuition.

Rod in Pickle for Turkey

Direct Russian pressure upon Turkey has been less in evidence in recent months, but there are more ways of keeping a small neighbour in constant disquiet than by the straightforward methods of threats and propaganda. A disturbance on Turkey's Balkan flank has developed since the turn of the year and may be used to embitter still further Turkey's relations with the Slav bloc.

Last February, two Turkish Spitfires were shot down in the sea off the Bulgarian Black Sea port of Sozopol, some 30 miles north of the Turkish-Bulgarian frontier. It is common knowledge in Bulgaria that the Turkish planes were shot down by Soviet manned anti-aircraft guns, with which the Russians have fortified the whole of the Bulgarian Black Sea coast. Both Spitfires were destroyed and only one of the Turkish pilots escaped by swimming to the shore, where he was first arrested and then packed back to Turkey. The Communist press in Sofia played up this incident to the full as a sign of the "aggressive designs of the Anglo-American imperialists and their Turkish allies."

Two months later the Communist Militia in Sofia published in the press the "confessions" of a Bulgarian ex-Army officer, who was said to have admitted that he had been in touch with the Turkish Military Attaché in Bulgaria, and had supplied him with information on the Soviet Army as well as on Bulgarian military secrets. Dimitrov's Foreign Minister requested that the Turkish Military Attaché should leave Bulgaria. The Turks retaliated by expelling from Turkey the Bulgarian Military Attaché and all his staff.

Then last week, under the glare of a well organised publicity campaign, a special Turkish delegation, representing "the Turkish minority in Bulgaria," visited the President of the Republic in Sofia and expressed its feelings of "unlimited loyalty" towards the "new regime of the people's republic under the great leadership of the teacher of the nation, George Dimitrov." The delegation sent its "brotherly greetings of sympathy and encouragement" to the Turks in Turkey, who were "living under awful conditions of capitalist exploitation and Anglo-American military oppression." The formation of a special Turkish "voluntary" brigade to work during the summer on the railways and other public works was announced. It is expected that this brigade will number about 20,000 young Turks.

There are over 800,000 Turks living in Bulgaria, mostly in the north-eastern parts of the country. In the past they have been

poor, hard working and loyal peasants, who enjoyed full religious and cultural freedom, and never caused any trouble to the Bulgarian governments. Now, however, their schools and all their other cultural organisations and clubs have been put under strict Communist control. In this way the Communists may build up a considerable army of fanatically indoctrinated young Turks, ready to do anything for the "liberation" of their brethren in Turkey from the "oppression of the imperialist and reactionary powers."

Limited Self-Government for the Sudan

The British Government have at last made public their support for the reforms in the Sudan. For too long this support has been tacit rather than avowed. It made relations with Egypt even more complicated than they already were and imposed a severe strain on the Sudan Government. In his statement in the House of Commons on Monday, Mr Mayhew, Under-Secretary for Foreign Affairs, made it clear that the Governor-General was now free to promulgate his ordinance for an increased measure of self-government "in accordance with his duties and obligations for the good government of the Sudan under the Agreement of 1899." The international status of the Sudan must still remain a matter for argument and negotiation between Britain and Egypt, but at least the internal affairs of the Sudanese should now be removed from the diplomatic arena.

It can and doubtless will be argued by Egypt that Britain had no right to take this unilateral step. But Mr Mayhew has pointed out that the Egyptian Government was given more than two weeks to ratify the agreement reached on May 28th with the Egyptian Minister for Foreign Affairs. The Egyptian Senate has rejected the Agreement, but the Egyptian Government itself has made no comment in spite of urgent telegrams from Britain. Presumably, also, the Governor-General's offer to accept the same number of Egyptian as British advisers on his Executive Council still holds good, in which case Egypt has no legitimate grounds of complaint.

Music Slump?

Opinions differ sharply about the state of the music market. There are those who, like Sir Thomas Beecham, get into a pet when a concert hall is half empty and bitterly decry the musical ignorance of the public. Others are happy enough because a well-known name or a well-known symphony can provide an audience of 6,000 at the Royal Albert Hall and make a handsome profit for the promoters. A glance at the figures show, however, that while concert audiences are smaller than a year ago, there has been a steady rise in concerts and concert goers over the past thirty years.

The primary cause of the present change is quite simply that people have less money to spend than a year ago, and cannot go to concerts, or for that matter plays or films, so often. This was bound to happen. Assuming, then, the natural result that they now go to two concerts for every three that they used to attend, what is the present picture? There are no reliable statistics for comparison, but it is obvious that more serious music is being played, and is being listened to by more people than ten years ago. To take a very rough guide: on Sunday, May 28, 1938, nine concerts were advertised in *The Times*; ten years later, on Saturday, May 29, 1948, thirty-two concerts were advertised. This is no small increase. Or, again, one hears a great deal about empty seats at the Albert Hall, but if the Queen's Hall could be rebuilt overnight it would be found to be much too small. Without counting the variable number of seats behind the orchestra, the normal seating of the Queen's Hall was 2,000; only on a few nights in the year was it sold out. The Albert Hall has 5,000 seats and 1,000 standing places: the present average attendance is in excess of 3,000. This does not look like a depression.

Another loud complaint is the poor quality of the programmes. Orchestras of repute lament that a year ago it was possible to make a concert meet its expenses with a programme of the less-hackneyed symphonies and concertos, but that now it is necessary to take the lowest common denominator of the less-scrupulous concert promoters and select a programme at their level. There is, of course, a lot in this: in boom conditions there are enough concert goers to listen to new music as well as old; outside the boom the selective concert-goers are too few. But it is unnecessary to be depressed about this. The fashion for Tchaikovsky, which now bores the orchestras to desperation, will wear off; it is no new phenomenon. In the 1920s Schubert's Unfinished Symphony filled the concert halls for years. In the 1930s it was Bach, who, by the way, drew a larger male audience than any other composer. By 1950 there may be a new fashion.

To inherit the earth is not enough

Millions will starve this year, while millions more go hungry. Although two-thirds of the people of the world are normally engaged in producing food, two-thirds of the people of the world do not have enough to eat.

The majority of the world's farmers are fighting a losing battle. Their production methods are antiquated and have not kept pace with the mechanisation of industry. They are attempting to solve the world's food crisis with the ancient methods of only scratching the reluctant land with an implement trailing from either animal or vehicle. This is as fruitless as ploughing the sea.

THE SOLUTION

With the revolutionary Ferguson System of complete farm mechanisation, enough food can be produced. The Ferguson System enables farmers to produce more food from every available acre, and so help to prevent the otherwise inevitable starvation of millions. It can actually produce as much as ten times more food from some areas of the land. By producing more food more efficiently and at less cost, the Ferguson System can also help to check the present world-wide increase in the cost of living.

* Every week more than 1,000 Ferguson Tractors are produced by the Standard Motor Co. Ltd. Every week more than 5,000 Ferguson Implements are produced by the foremost British manufacturers. Every week more than 100,000 acres somewhere in the world are beginning to produce more food at less cost.

**The fable of the
restive horse**

There was once a Horse who frisked and capered, side-stepped, frolicked or loitered as the fancy took him. 'Why not?' quoth he, 'so long as I've a bagful of oats and the sun shines down.' Just then from a nearby wood came the howl of wolves. 'Nay now,' cried the Horse, as he sprang forward, 'it shall never be said that I couldn't take a hint.'

As a nation slow starters, once the race is on we show both speed and endurance. TI have as much faith in Britain's power to outstrip economic calamity as they have in their own manufactures. The one is expressed in the other, for thousands of people abroad have reason to think of Britain in terms of steel tubes, electric cables and equipment, bicycles, light-alloys or paint from TI.

AMERICAN SURVEY

Control of Western Water

(From Our US Editorial Staff)

IF the House action on the European recovery plan has given Senator Vandenberg an opportunity, just before the Republican Convention, to rush funds to stave off disaster and thereby look every inch a President, the Columbia River has supplied Mr Truman with a somewhat similar, if more localised, opportunity in the course of his Western tour. The President's speech of June 10th at Seattle, in which he deplored the cuts made last year by the Republicans in Congress in the appropriations for Western river development, was made as 60,000 people were homeless in the flooded Columbia River Valley, and as the third successive crest poured through barriers washed out by previous high water.

Most of the Western rivers are supplied from melted snow. This year, the high mountains were unusually heavily laden. Unseasonably, the temperature shot up—to the nineties—and the waters correspondingly shot down. On June 9th, at Vancouver, on the Columbia River in the State of Washington, where the flood stage on the river markers begins at 15, the current reading was 29.9. The Columbia, even in a normal year, discharges more water than all the other great western rivers—the Sacramento, the San Joaquin, the Colorado, the Rio Grande—combined; 160,000,000 acre feet go into the Pacific after all withdrawals along the way.

Loss of lives, homes, crops and urban properties on a scale such as the present flood has occasioned inevitably intensifies the search for means of control. Today, Washington and Oregon are suffering from too much water. Yet only yesterday the disaster news on the West Coast was the prolonged drought in the great Central Valley of California. How can the water supplies of the West be equalized? Mr Truman has proposed the Tennessee Valley Authority as the model to be followed in the development of the other great river basins.

Certainly the record of the TVA is impressive. In 1946 and 1947 the Tennessee Valley had the fifth and sixth highest volumes of water on record. But its flood control system, except for some work on minor tributaries of chiefly local importance, is complete. Because of the operation of this system of dams, a crest in 1946 that would have reached 45.8 feet at Chattanooga was kept down to 35.7 feet, and damage which it was estimated would have been around \$10 million without flood control was held to \$90,000.

The TVA has done a comparable job on the other functions it was established to perform, including the creation of a navigable channel as far up as Knoxville, the production of power for agricultural, urban, and industrial uses—the last includes provision of power for the Oak Ridge atomic plant—and co-operation in the development of a soil conservation programme and recreational facilities which have very considerably increased the income of the area. Over the years, moreover, early antagonisms to the undertaking have been reduced; until even Senator McKellar has been forced to abate his virulence. Why then, given the TVA's thirteen year record of performance, is the Valley Authority model not gaining more rapid acceptance farther West?

The reasons are many. The TVA covers no mean territory, including sizable parts of seven states. But the Missouri River Valley, which it is often urged should be developed on the TVA model, includes one sixth of the entire area of the United States. The problems which the TVA was created to handle, moreover, were fairly uniform throughout the course of the Tennessee river. On the Western rivers, the claims of irrigation and reclamation in the upper reaches, and flood control and navigation in the lower reaches, differ and usually clash. And in the Great Plains the political antagonism to the Federal

Government, which in the South took the form of a jealous defence of states rights, is multiplied in the rugged government-be-damned individualism of the sons of yesterday's pioneers.

But perhaps the greatest difference is that the TVA's problems concern a valley where there is a yearly average of 40 inches of rainfall to control, whereas in the Western country there is less than 20 inches a year to distribute. West of the 97th meridian, which runs through Kansas and Nebraska, water is the limiting factor on life and growth. Land is there in abundance: 20 million acres of it have been brought from desert to high production by adding water, and current projects imply the ultimate availability of at least that much more. But there is not enough water to go around. In the Central Valley of California, when the water level falls in the Sacramento and the San Joaquin rivers, the danger is not only that of drought: the sea backs in from San Francisco Bay and acres carefully prepared for special crops are ruined by salinity.

The cold war between California and Arizona over the waters of the Colorado is mitigated solely by their common antagonism to the 1944 treaty between the United States and Mexico which guarantees a flow of 1,500,000 acre feet per year over the

boundary at Yuma. Either the expansion of the recently irrigated area around Phoenix, Arizona, must be restricted, or the Chamber of Commerce of Los Angeles must accept the fact that there is a limit to that city's growth.

The bitterness with which water rights are contested is complicated again in areas like the Missouri and Columbia valleys by the conflict of water laws in the several states: as a drop of water crosses a border a complete reversal in its legal disposition may, and in numerous instances does, take place. The differences in water law symbolise how great are the great open spaces, and how their size, during the period of settlement, obscured the ultimate necessity of treating the total resources of the rivers by unified means if their potential yield is to be fully realised.

Similarly, the public agencies—Federal and State—created in the area were concerned with one, or at most a few, of the factors in the life of a valley. The two major Federal agencies are the army engineers, traditionally charged with facilitating river navigation and flood control, and the Reclamation Service of the Department of the Interior, established in 1902 as a result

of the first Roosevelt's enthusiasm for the West. Partly because in their case there is usually a rivalry of function as well as a normal bureaucratic rivalry, little love is lost between them; their relations range from those of a marriage of convenience to those of a shotgun wedding. A variety of other Federal agencies have important interests in the West—the Forest Service and the Soil Conservation Service of the Department of Agriculture, the Bureau of Indian Affairs and the Fish and Wildlife Service of the Department of the Interior, the Commerce Department, and the Federal Power Commission. Then on the State level, there are the interests of the several states, represented in their general form by their Governors, and the specialised agencies representing agricultural, grazing, power, industrial and municipal uses.

Progress in obtaining a unified programme has gone furthest in respect to the Missouri Basin. The TVA plan for unified river development was executive in origin: it was drawn up by the Authority's Board under a very general mandate; it went to Congress merely in the form of a report. Congress has what amounts to a veto power on construction, exercised in connection with the TVA's annual appropriations for new work. But it does not pass on plans in detail, and the execution of those plans, since it all takes place under a single authority, raises no questions of interagency jurisdiction.

But, in sharp contrast, the present authority for Missouri river development is legislative in origin. It arises from the Flood Control Act of 1944, based on a report on the Missouri basin, which was initiated by the Bureau of Reclamation and cleared with the other Federal agencies concerned. The Act sets forth the functions to be performed by each agency, the priorities of the various types of water claims along the river, and a set of very specific plans for development by annual stages. (A similar, though even more voluminous, report on the Columbia River Basin is now in process of circulation round the agencies of the Government.)

The means of unifying the approach to the Western rivers which has so far been acceptable is thus a Congressional plan, under whose paper unity particular tasks are assigned to particular agencies. Such an arrangement vests overall concern for river development in Congress, whose interest is only fitful. By contrast to such an arrangement, the efficiency of the River Valley Authority seems demonstrable. Pressure, either from repeated spectacular disaster, from the long attrition of falling water tables, or from limitations on economic or municipal growth, may, in the years to come, induce a willingness to adapt the TVA approach to Western conditions. But at the moment there is great reluctance to concentrate, in a small executive group, so much power over the existing variety, intensity and conflict of claims for water in a dry land.

Electoral Geography—III: Pennsylvania

[FROM A CORRESPONDENT IN PHILADELPHIA]

THE political prophets who have been wrong so often in the various State Presidential primaries may now safely join in one prediction: the next President of the United States will be nominated in Philadelphia. The Republican Party opens its nominating convention in Pennsylvania's largest city on June 21st. The Democrats will converge on the city on July 12th and the members of Mr Wallace's Third Party on July 23rd. In the case of the Republicans and Democrats, the choice of Philadelphia was influenced by a certified cheque for \$200,000 to each party for convention expenses, plus an additional \$50,000 for the entertainment of delegates, alternates and other visitors. Mr Wallace's convention is coming to Philadelphia unbidden, but will get the use of the Municipal Convention Auditorium rent free and will find the hall completely and expensively equipped with facilities for the press, radio, television and newsreels, thanks to lavish outlays by the Republicans and Democrats.

Mere money and convenience, however, were only attractive incidentals to an important objective—the winning of Penn-

sylvania's 35 electoral votes, a prize second only to New York's bloc of 47 votes. Pennsylvania, with its 10,000,000 inhabitants, is an empire in itself and is sometimes described as the Ruhr of America. Stretching 350 miles from the Delaware River to the Ohio line, bordered on the north by New York State and on the south by Delaware, Maryland and West Virginia, it is bisected by the Allegheny range of the Appalachian Mountains. In the south-eastern corner of the state is the old industrial city of Philadelphia, the third city of the nation, with a population of slightly more than 2,000,000. Fifty to sixty miles to the north-east are the rich anthracite coal fields. Over the Alleghenies, in the far western part of the State, is Pittsburgh, centre of the nation's steel industry, and immediately adjacent and extending south-westward is the busy and booming bituminous coal area. Between the industrial and mining regions of eastern and western Pennsylvania are fertile, rolling agricultural areas, here and there dotted with small but thriving manufacturing towns.

Pennsylvania has been a political battleground since the advent of Mr Roosevelt's New Deal. Before that, for generations, the State was overwhelmingly Republican, and was known as "the Gibraltar of Republicanism." In those days the Republican Party in Pennsylvania was ruled by wealthy industrialists, who believed in a high protective tariff for industry and "the full dinner pail" (which tended in practice to mean steady employment at low wages and long hours) for the working man and woman. This is still true to a large extent. But with the emergence of Mr Roosevelt's New Deal, workers from the mines, the mills and the factories deserted the Republican Party and flocked to the Democrats. They were joined by many sincere liberals of the intellectual classes and by many more opportunists who saw and seized an opportunity to make personal profit out of the revitalised Democratic Party. In the national elections of 1936, 1940 and 1944 Mr Roosevelt and his party swept the State, but in the State elections since his death the Republicans have won by large majorities. Now on the eve of the national nominating conventions and with the Presidential election only five months away, there is no indication of any reversal of the clear Republican trend.

Pennsylvania's Republican leaders are confident of state-wide victory to the point of over-confidence. But they are divided in their preferences for a Presidential candidate. The State's delegation of 73 members to the Republican National Convention is committed to the favourite son candidacy of Senator Edward Martin, a former Governor of Pennsylvania. (He is not the Mr Martin of Massachusetts, Speaker of the House, whose chances of securing the nomination were discussed in the issue of May 1, 1948.) But the Pennsylvania delegation's pledge to support Senator Martin may not last beyond the first ballot. Admittedly, he is the darkest kind of a dark horse. His candidacy is mainly a device to hold the Pennsylvania group together as a potent force in the final selection of a Presidential nominee. In 1940, while the Pennsylvania delegation was still trying to decide whether it should desert its favourite son, Mr Willkie was nominated on the sixth ballot. The Pennsylvania Republicans do not want to "miss the bus" again this year. But there is a possibility that they may, if their leaders on the floor of the convention are not on the alert and cling too long to the Martin candidacy. Pennsylvania comes thirty-eighth in the alphabetical roll call of the 48 States. Its leaders must be quick to anticipate trends in the balloting if their delegation is to assert its power either by leading or by blocking their development. This can only be achieved if the State's voting strength is kept intact and cast at the psychological moment, which may involve inducing one of the States near the top of the roll call—such as

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

Alabama, Arizona or Arkansas—to yield its place to Pennsylvania.

The Pennsylvania Republican faction, headed by the venerable Mr Joseph R. Grundy, is reported to favour the candidacy of Senator Taft. Mr Grundy, a retired woollen mill owner and a silver-haired bachelor, is as vigorous at the age of 85 as a man of 50. He knows all the tricks of the political trade from first-hand experience. Since the days of President McKinley, Mr Grundy has been the country's outstanding advocate of the protective tariff. As an astute practical politician, accustomed to keeping a finger on the public pulse, he, of course, knows that Mr Taft lacks glamour and political vote appeal. Senator Martin is a close political and personal friend of Mr Grundy and shares his political and economic views. Conceivably, these two gentlemen might easily be induced to switch to Mr Dewey, particularly if in doing so they could blight the chances of Mr Stassen.

The big question in the Pennsylvania delegation is posed by its chairman, Governor James H. Duff. He comes from Scotch-Presbyterian stock, is red-headed, stubborn, independent and, though he is a party man who owes his present political position to Mr Grundy and Senator Martin, he has a vein of liberalism that is disturbing to his conservative colleagues. Before America's entry into the war, he upset many of his fellow Republicans by forcing his party's State Committee to endorse Mr Roosevelt's proposal for aid to Britain. It is no secret in Pennsylvania that Governor Duff does not take Senator Martin's candidacy seriously. Some of Mr Martin's friends say that Governor Duff is hopeful that the political lightning may strike him in the event of a deadlock, but the Governor insists that he has no Presidential ambitions. It is no secret either that Governor Duff is not over fond of Mr Dewey, and definitely dislikes Mr Stassen. However, he is outspoken in his admiration for Michigan's Senator Arthur H. Vandenberg—and that makes Mr Vandenberg a man to be reckoned with at the convention.

Mr Stassen's candidacy occupies a peculiar status in Pennsyl-

vania. Although he defeated the other candidates, including the home favourite, Senator Martin, in a light vote in the State's preferential primary last April, the result was in no way binding on the delegates. Very few of the State's old-line Republican leaders are for him. They regard him as a radical New Dealer masquerading as a Republican. His manager in Pennsylvania is Colonel Jay Cooke, a wounded war veteran and multi-millionaire banker from Chestnut Hill, a Philadelphia suburb. Curiously enough, as a member of the Pennsylvania convention delegation, Col. Cooke is pledged to support Senator Martin. Many of the other State supporters of Mr Stassen are also men of wealth: he is popular as well with young Republicans, notably college groups. There are reports that Mr Joseph N. Pew, Jr., of a multi-millionaire oil and shipbuilding family, may join with his close friend, Col. Cooke, in bolting the Martin candidacy after the first ballot and swinging over to Mr Stassen. But the hostility of the regular Republican leaders will make it difficult, if not impossible, for him to find substantial support in the Pennsylvania delegation.

Whatever the outcome of the Republican convention, it is a reasonably safe bet that at the November election Pennsylvania will give its 35 electoral votes to the Republican nominee. The Democratic convention is expected to nominate President Truman, whose Pennsylvania popularity is very far from that enjoyed by Mr Roosevelt. Mr Truman's party may carry Pittsburgh and some of the adjoining soft coal districts next autumn, but Philadelphia and the anthracite area seem sure to return Republican majorities. Although he will not have the support of organised labour, Mr Wallace may poll a fair sized vote in Pennsylvania. But he will take more votes away from the Democrats than from the Republicans and thereby will help the Republican cause. His supporters in the State belong chiefly to the extreme left, and he is reported to be surprisingly strong among college students. His candidacy may have the effect of defeating Democratic candidates for Congress in districts where the voting strength of the two major parties is close.

American Notes

Philadelphia Pilgrimage

This weekend the Republican pilgrims are converging on Philadelphia by every modern form of transport, and conceivably also on elephant-back, if the local zoo can provide a specimen of the Party's emblem. On Monday they will gather in the Convention Hall which is their temporary temple to go through the customary quadrennial ritual of building a platform and choosing their candidates for the Presidency and Vice-Presidency. There are 1,094 official pilgrims, organised in State delegations, and they have numerous unofficial companions—Presidential candidates, members of Congress, party bosses—all of whom have vital parts to play in the secret rites which are essential to the ceremony.

The first two days will be spent in approving reports and agreeing on the statement of party policy, now being drafted by a committee whose chairman is Senator Lodge, Senator Vandenberg's right-hand man during the original debates on the European Recovery Programme. The choice of a young and internationally-minded Republican for this important post does something to offset that of a party hack—Representative Martin—for the chairmanship of the convention and of the *Chicago Tribune's* war-horse—Governor Green—to give the "keynote" speech. Once these tasks are over, the pilgrims must fulfil the vows they took before they left home, vows to support the Presidential aspirations of either the favourite son of their own State or one of the contenders from elsewhere.

But not all the delegates have made vows and many of the others are pledged only to a token support on the first ballot. It seems improbable, in the present confused state of the Republican candidacies, that any one will obtain the necessary clear majority of 548 votes on that ballot. On the second ballot, many delegations are free to desert their favourite sons, which explains the competition among candidates for promises of second ballot support, and it becomes possible to judge relative strengths. Senator Taft, Governor Dewey and Mr Stassen all make substantial and conflicting claims of guaranteed votes on these ballots, but on the long view Mr Stassen is now the weakest of the three, since he has neither the popularity of Mr Taft among the professional politicians nor, on the accumulated evidence of the primaries, any more public appeal than Mr Dewey.

*

At this point the well-known smoke begins to fill rooms and this year the political promises of which it is composed will be given unusual solidity by the Republican certainty of victory. On the third ballot the State delegations with big blocks of votes and uncertain allegiances—Pennsylvania, New Jersey, Illinois—begin to use their power. If at this point Governor Warren allows the important California delegation to abandon him, it may well be decisive. If the established candidates do not consolidate their position now, they may find new competitors emerging, as Wendell Willkie did in 1940. No comparable irregularity will be permitted this year: it is doubtful if even General Eisenhower would be allowed to become a threat at this stage, in spite of his overwhelming and unsought popularity with voters of both parties, as shown by a recent poll. But this is the moment when the scaffolding may be removed to reveal that Senator Vandenberg's refusal to declare his candidacy has not prevented his supporters from constructing one for him, especially since he is believed to be the second choice of many "favourite son" delegations.

If after the fifth ballot no clear majority is yet in sight, and none of the leaders will withdraw in favour of one of the others, an entirely new candidate, possibly Representative Martin, may be hastily prefabricated behind the scenes and there is a serious danger that, sooner or later, as the balloting drags on and as delegates become exhausted and home-sick, they will accept this factory-made model, however shoddy it may be. Then all that will remain is to agree on a Vice-President, who is usually selected in advance by the Presidential candidate—often as part of a bargain for votes—and to gather strength for the battle ahead.

* * *

The Appropriations Tug-of-War

By a vote of 60 to 9 the Senate has voted to restore most of the cuts made in foreign relief funds and to remove most of the restrictive amendments proposed by the House. The Senate has approved a total for the seven foreign aid programmes of

\$6.125.7 million, \$408 million below the figure requested by the Administration, but \$145 million above that appropriated by the House. The most important step taken by the Senate, however, was to restore the right to spend the recovery funds in 12 months. The House had effected the greater part of its cut by requiring that the appropriations be stretched to cover 15 months. Over \$1 billion was cut from the European recovery funds by this device. Senator Vandenberg insisted that a vote be taken on this critical provision, and he was supported by a majority of 65 to 15.

The House has refused to accept the revisions of the Senate, and a tug-of-war will now take place between the Senate conferees, headed by Senator Bridges, and those of the House, led by Mr Taber. Senator Bridges is supported by a much larger majority than his opponent; but it is equally clear that the Senate decision was more an act of faith in Senator Vandenberg than an act of conviction. The Senate Appropriations Committee criticised the Administration severely for the inadequacy of the figures presented to it as a basis of judging the appropriations, and suggested that it would be much more rigorous in its demands next year.

Mr Vandenberg defended the Marshall funds on the ground that the expressed will of Congress should not be vetoed through the abuse of the appropriating function. But he accompanied his attack on the "dangerous and improvident" decision of the House with a warning of his own. He insisted that the time to overhaul the recovery programme is not now when it is still struggling to be born, but in January, 1949. Then, both the friends and enemies of European Recovery who agreed, in effect, to a year's trial of the plan, will feel they have a legitimate right to weigh its achievements in the balance.

The Economic Co-operation Act is merely the first, and the most important, example of the freedom the Republicans have reserved to reconsider policy decisions after the sweeping victory they expect to enjoy in November. Thus the compromise Mr Vandenberg arranged on the Reciprocal Trade Agreements Act, and which has been accepted by both Houses, provides only for a one year extension, though it eliminates the Congressional veto of tariff cuts which was inserted by the House. But Mr Vandenberg showed no disposition to compromise on funds for the Marshall Plan. He has broadened and flood-lit the breach between the two wings of the party. His firmness is said, even by Senator Vandenberg himself, to diminish the likelihood that he may be chosen as the Republican candidate; it has made him too many enemies in the party. But if the intention behind the House raid on foreign assistance funds was designed, as some believe, to set the scenes for an isolationist candidate like Mr Martin, who stood at Mr Taber's right hand, the scheme may have gone awry. The alarm bells are ringing madly in the office of the *Herald-Tribune* and wherever internationally minded Republicans meet. After the events of the past fortnight, even a party as confident of victory as the Republicans may well hesitate to nominate a candidate who clearly repudiates the bi-partisan foreign policy built up by Senator Vandenberg and Mr Marshall.

* * *

Interim Balance on Inflation

Political rather than economic considerations inspire the President's continued insistence on the need for measures against inflation and Congress's equally unrelenting refusal to consider them, but election strategy has little to do with the disagreement between the Department of the Treasury and the Federal Reserve Board on the imminence of the inflationary danger. This disagreement was brought into the open a month ago when the Treasury, contrary to both business expectations and the advice of the FRB, announced that interest rates on one-year Treasury certificates would remain at 1½ per cent until the end of September. This move was interpreted as a suspension of the official policy of restraining credit expansion and the FRB answered it two weeks later by applying almost its last remaining brake on that expansion. It raised its reserve requirements for its member banks in New York and Chicago from 22 to 24 per cent of each bank's demand deposits, only two per cent below the limit allowed by law; this limit had already been reached in other cities, where maximum reserve requirements are lower. New York and Chicago bankers maintain that their successful efforts to restrict credit voluntarily make this new curb unnecessary and that they are the victims of the feud between the Treasury and the FRB.

The FRB believes that the full weight of inflationary pressures will be felt only in the coming months when, for the first time this year, the expenditure of the Government will exceed its income and when tax reductions and the European recovery and defence programmes will begin to affect the national economy. The

Treasury evidently holds that these pressures, although definitely present, will be counterbalanced by the deflationary elements in the economy: the beginning of consumer resistances, possible falls in farm prices if the promise of a record harvest is fulfilled, difficulties which the defence programme may bring to industries not directly involved in it, and so on.

Even the third round of wage increases, now well under way, does not seem to be regarded as more than mildly inflationary, although it has already led to some price increases. If, however, the coal negotiations end in higher wages for the miners, the implications will be much more serious. The comparative lack of concern about the present wage increases is explained, at least partly, by the fact that on the whole they are not so high as in previous years and are not taking a set pattern, but are being varied to suit individual circumstances. The automobile companies are following not the General Motors formula, with its interesting provisions for cost-of-living adjustments and an annual wage increase, but the more orthodox agreement for a rise of 13 cents an hour which ended the United Automobile Workers' strike against the Chrysler Company. The United Electrical Workers, on the other hand, have been advised by their leaders to accept the General Electric Company's offer of an increase of 8 per cent on all wages, which means rises of from 9 to 15 cents an hour. Labour's amenability is almost as surprising as is industry's abandonment of its firm stand against wage increases, which is evidence that its uncertainties of last spring have been replaced by a renewed confidence in the future, a confidence which is shared by Wall Street.

* * *

Bi-Partisan Blueprint

When the Senate passed, by a vote of 64 to 4, the Vandenberg Resolution advocating American association with regional defence pacts under the Charter of the United Nations, the blueprint of America's new international foreign policy was complete, however shaky some of its foundations may have turned out to be. In March, Mr Truman had promised that the United States would find appropriate means of aiding the defence of the democracies. The Senate has now approved, in principle, co-operation in defence, as a supplement to economic assistance and American rearmament.

No one has been more anxious than Senator Vandenberg to explain what the Resolution does not do. It is not an alliance, it is not a commitment to form an alliance. It does not revive military Lend-Lease. The treaty to which it may give a green light would be modelled on the Inter-American Treaty of Reciprocal Assistance, which, though it declares that an attack upon one signatory is to be considered an attack upon all, does not provide for automatic military assistance. The rights of the Senate have been most zealously safeguarded.

This good resolution is unlikely to be put to the test until after the election, if then. But peace-time conscription, which Mr Truman asked as an earnest of Congressional intentions, has now passed the Senate by 78 to 10. The Senate Bill authorises the conscription of up to 250,000 men of 19-25 for duty anywhere in the world, for two years. It exempts veterans with more than 18 months' service, married men, and essential workers. It authorises the enlistment of 25,000 aliens who, after five years' service, may be rewarded by American citizenship. The authorised strength of the Services is raised from 1,446,000 to 1,795,000 and the reserve units are also expanded. The only vestige of Universal Military Training, which Mr Truman also requested, is the provision that 161,000 18-year olds may volunteer for a year's training, which will exempt them from conscription.

To its credit, the Senate refused to allow the conscription issue to be confused by other considerations. Senator Langer was defeated in his attempt to sink the Bill by weighting it down with civil rights riders which would have antagonised the South, while the Southern effort to authorise voluntary segregation of whites and negroes was also repulsed. The Armed Services Committee could not prevent the life of the Bill from being cut down from five to two years, but it prevailed upon the Senate to reject a proposal to pass the Bill, but leave the President the political onus of "pulling the trigger."

This method of evading responsibility has recommended itself to the Armed Services Committee of the House. But the chief obstacle in the House has been the unremitting hostility of the Rules Committee, which has kept the Bill off the floor until four days before adjournment, and virtually defied the House to debate forty amendments in a space of four hours.

Letters to the Editor

Long-Term Economic Problems

SIR,—Your article "The Supply of Savings" and its predecessor "The Importance of Capital," is in danger of playing into the hands of reactionaries. The creation of capital and the creation of the savings to finance it should not be considered apart from the general conditions of trade and demand which determine the attractiveness or otherwise of capital creation from the point of view of the man who has to bear the risk of mistakes. You referred in the earlier article to the unsatisfactory level of capital creation in the 'thirties. Unless we are quite gratuitously to insult business enterprise in this country and indeed throughout the world, including the United States during that period, there was only one explanation for this and it lay in the absence of profitable outlets for the employment of new capital due to a worldwide shortage of consumer purchasing power. It certainly did not lie in the absence of finance on cheap terms—for that was a period of unusually cheap money the like of which may not return for many a year to come. True, if there had been more capital creation it might have proved to be as self liquidating as much of the capital creation during the nineteenth century proved to be. But that is doubtful. The root cause was the maldistribution of purchasing power which left large sections of the people in all parts of the world, undernourished, underclad, and underhoused.

Because that problem of undernourishment, etc., is now being tackled at least in some countries and because of necessary repairs of the ravages of war, conditions of trade and demand are now good throughout the world. There is accordingly a strong incentive on the part of business men to expand and re-equip. The demand for consumer goods and the demand for capital goods go hand in hand under conditions of free enterprise and not in opposition to one another. We must be careful therefore—and that is where I would join issue with you—not to lose sight of the need to maintain general demand, in our anxiety to build up capital. Otherwise we may find that having got the capital it is not of relation to what we truly need. A tricky rationing problem seems to be involved somewhere to which targets of 20 per cent "for the 1950s" is unlikely to be the answer.—Yours faithfully,

Hill House, Cuckfield, Sussex

W. H. B. FAIRWEATHER

From The Economist of 1848

June 17, 1848

It would be folly . . . to conceal from ourselves, and still greater folly to deny in the face of the public that the condition of the workers in factories, men, women, and children, influenced by all the general causes that deteriorate the condition of the whole working population, is a hard one in comparison to the ease enjoyed by the opulent classes. In comparison to children, women, and men engaged in agricultural operations, or to the majority of servants of all-work, sempstresses in the metropolis, young milliners, or to the Irish peasantry, their condition is by no means a hard one. To be discontented and complain is common to humanity. Almost every class and description of men, almost every individual as well as the factory worker, seeks to improve his condition; and it would be a delightful, if not an easy task, if legislation could gratify the yearning after ease and comfort of every man, woman, and child in the empire.

Unable to perform that equally and justly, it being even very doubtful whether its efforts to gratify any one class or individual do not invariably tend to injure in a greater degree some other class or individual, the legislature is apt to pay most attention to those classes who, being collected in masses, having opportunities of communicating one with another, and sufficient leisure to acquire considerable instruction, can make their grievances known, and interest in their behalf the demagogues of various classes, who are continually on the look out for sufferings and complaints, by an advocacy of which they may gain popular favour. Not denying, therefore, that there are hardships in the condition of the factory workers . . . we attribute the paternal attention they have received from the legislature much more to their power to make themselves heard and felt . . . than to any peculiar hardships in their condition compared to other workpeople.

Too Much Equality

SIR,—In your article "Too Much Equality" you say, "It can be seen in their (i.e., the Labour Party's) administration of the national educational system, which has to date destroyed more values than it has created." Such a serious charge should surely be supported by some evidence.—Yours faithfully,

SIBENA D. SIMON

Broomcroft, Ford Lane, Didsbury, Manchester 20

[It was a statement of opinion to which we adhere. Most of the good things that have been done in education in the past three years derive from the Coalition Government's Act. The Labour Party's own approach, both nationally and in the localities, can be seen in such things as the treatment of the direct grant schools and the new imposition of a minimum age for examinations. It seems to be inspired by a dangerous passion for "levelling down." The Government deserve a good mark for their attitude to the universities, but that is outside the scope of the remark which Lady Simon of Wythenshawe quotes.—EDITOR.]

SIR,—In your admirable article headed "Too Much Equality" you say that Socialism was born of the desire for greater economic equality, to secure greater equality of income and welfare among the citizens of the state, even at the cost of some reduction in the total income available to be divided among them, and you say that equality and efficiency often pull in opposite directions, as they are pulling now.

My object in writing is to point out that there need be no conflict between equality and efficiency, if equality is confined to the field of unearned income, where it should belong, in the form of a minimum or basic income payable through the state to every member of the community; this would leave the field of earned income entirely to individual initiative and enterprise.

The amount of the basic income would have to be determined by experiment, there seems to be no reason why it should not be as large as possible, provided it did not cause inflation, the effect of an equal basic income would however be reductions in wages, prices and profits the reverse process to inflation.

Basic incomes for all as a first charge on national assets seems to be the only practical way to ensure the greatest possible measure of economic equality consistent with the retention of the fullest possible incentive to individual initiative and enterprise in industry and otherwise.

Basic incomes would very materially reduce the need for state expenditure on social services and being equal in amount would avoid any feelings of jealousy and encourage independence of character.—Yours faithfully,

R. ARNOLD PRICE.

Rodenhurst, Oxted, Surrey.

"Coupons for Sale"

SIR,—It is true that the "Right to Buy" may often seem to be distributed in an arbitrary fashion; but your correspondent's suggestion for making it marketable would hardly correct this tendency, and raises other problems. For example, he maintains that the "Right to Buy" petrol could be bought and sold within the "necessary limits" of total imports. But we have not cut down to the minimum of petrol imports that we can really afford. If the Right to Buy were freely traded, this would mean that enough people could do without their ration to make further import cuts possible. What about free trading in the Right to Buy imports? If this were possible, part at least of the extra cost would be passed on to the consumer. He, poor fellow, could

hardly care less who imports his goods, so long as he gets them, and could hardly be expected to enjoy paying for his supplier's privilege of cornering the market.

The present system can be justified more often than your correspondent would allow. It is a strange argument that the desirable distribution of steel could be effected in a free market by means of "the superior sucking power of the expanded dollar market and the decline of a deflated home market." There are very few signs of that "superior sucking power," which is so often hidden discreetly behind tariff walls.

In fact, any approach to "rationing by the purse" of scarce commodities (quite apart from the filip it would give to black marketeers) carries with it the danger of inflation, and thus of fresh injustices in distribution. Controls must be dismantled before we have forgotten how to exercise choice; but not before there is plenty for us to choose from.—Yours faithfully,

HELEN RANKIN

Textile Stocks and Capital Investments

SIR,—Your leading articles have made clear the vital need for this country to devote an increased proportion of its resources for internal and external capital investment. The fact that the Marshall aid appropriations are most carefully scrutinised to prevent an unnecessary diversion of the United States help to unproductive purposes is an added reason for the utmost care and rigour in British policy.

The repeated retreats of the Board of Trade, under the pressure of unwanted stocks, along the line of least resistance towards higher home consumption of textiles (albeit only temporary in order to liquidate the "hump") is as disconcerting as the delay in permitting the export of utility products without licence. Textile exports command a ready market and are among the most remunerative. The chance of regaining a firm foothold in foreign markets is, moreover, rapidly waning. The obvious failure of the Treasury to appraise correctly the investment capacity of the country—due mainly to an underestimate of the productivity and to lack of knowledge of the intentions of the holders of liquid assets—might easily result in the increased productive potential being allowed to run to waste in unemployment and in demands to permit an increased consumption of durable goods by way of house repairs. Yet it should obviously be concentrated in productive investment in factories and their equipment.

It is noteworthy that the textile muddle could not have occurred had the wartime control over the utilisation of raw materials and semi-manufactures not been relaxed or abandoned in 1945-46. It is also clear that the statistical information at the disposal of the Government is both scanty and belated. In view of the differences of opinion between the authorities and the trade (as well as the complete ignorance of outside experts of ascertainable facts), the institution of periodic sample inquiries of an objective character would be highly desirable. Such inquiries of the means and intentions of the producers and ultimate consumers are being undertaken in the United States with increasing precision. They throw light not merely on the demand for specific commodities but also on the level of savings, and hence of permissible investment. Thus an objective basis would be provided not merely for the formulation of policy but for intelligent discussion of it.

It is hardly possible to decide on policy (not to say to plan, without such statistical evidence as would enable the Government to resist pressure groups and to prevent investment taking

the nonsensical form of unwanted stocks. In the absence of effective co-ordination we shall have to rely on scarcity of demand and unemployment to bring about readjustment. But this would further weaken the incentive to invest and the national power of recovery. There is no time to lose if our industrial house is to be put in order and if we are to secure, by concerted action with other countries, an expansion of the supply of raw materials and food—all of which requires a substantial increase in investment.—Yours faithfully,

T. BALOGH

Balliol College, Oxford

What are Profits?

SIR,—Your article deserves even wider circulation than it will get. If I might mix my thanks with a gentle reprimand, I would say that as well as Chancellors and auditors needing to modify their thoughts *The Economist* might have lent its weight on this important aspect of manufacturers' costs and profits at an earlier date.

Many industrialists and company cost accountants have acutely appreciated, for some years, the points you now make, and have vainly endeavoured to persuade Government officials of the falsity of balance sheets and profit computations based on Income Tax wear and tear allowances. The Income Tax Act of 1945 does not give a greater total depreciation allowance than before—it only gives it more quickly. It does not allow of sufficient money being put on one side to replace a 1940 machine in 1950.

This false accountancy, which auditors insist on under Income Tax regulations, bears particularly heavily on industries whose profits are regulated by Government control orders. Profits are made to seem higher than they really are, since depreciation at replacement value of plant and buildings is not allowed. Thus there is a tendency for the Government to press for reduction of the profit margin to a figure which is uneconomic and could only lead to an over-capitalised or ill-equipped industry.

The problem is, of course, most serious in those industries which have a high value of buildings, plant, and machinery in relation to turnover.—Yours faithfully,

Exporting British Cars

SIR,—Your article entitled "Exporting British Cars," of March 20th, is somewhat marred by the inclusion of incorrect prices for cars sold in New Zealand. The table on page 463 purports to give the price of British cars in sterling. Actually, the prices are nearer to New Zealand prices in New Zealand currency, and the current rate of exchange is approximately £100 sterling equals £125 N.Z. For the information of your readers I am appending current prices for cars sold here, in New Zealand currency:—

Morris 8, 4-door	£606	Standard 14	£1,070
Standard 8	620	Austin 16	1,038
Hillman 10	690	Ford V-8, de luxe	761
Morris 10	704	super	778
Austin 12	956	Chevrolet, Stylemaster	731
Vauxhall 14	703	Fleetmaster	810

—Yours faithfully,

Box 1155, Wellington, N.Z.

MARTIN NESTOR

Cutting the Cake

SIR,—If, as your Note suggests, the information given by various companies as to the absorption of their gross receipts is for the purpose of countering the attack on profits I doubt if it is likely to be successful. The arrangement chosen savours too much of special pleading, and on all the relevant items too many questions remain unanswered.

What is included in depreciation, the amount allowed for income tax purposes or something more? Does taxation include tax deducted from dividends, and if so, why? To which column are preference dividends allocated?

The really relevant figure is the total amount of profit assessed to tax. Provided this is given further subdivision is all to the good. But if it is carefully hidden, suspicious minds will only become more suspicious.—Yours faithfully,

House of Commons, London, S.W.1

THE FEW MORE...

A few more visitors were with us for Whitsun than came for Easter, and a very good time was enjoyed by all.

As we've said before, even without a car this lovely island is very easy to get to. There are plenty of fast, comfortable trains to Plymouth, whence an Hotel car can meet you. Once you have arrived, the charm of your surroundings, the excellent service and sheer comfort of its modern Hotel make Burgh Island unrivalled as a resort at which to relax and enjoy yourself, if only for a few days.

So why don't you come for a week-end, a week or a month? Come now, when the climate is so mild, and enjoy the beauties of early summer in South Devon.

THE WORLD OVERSEAS

French Progress Report

(From Our Paris Correspondent)

"AFTER initial progress, France's condition is now stationary and its ultimate recovery is still in doubt." This is the bulletin to be inferred from an illuminating report* on the state of the French economy just published by M. Jean Monnet's Planning Commissariat.

The planners have produced what amounts to a comparison between the projects and the achievements so far of the Five Year Plan. Statistically, the document is already out of date as the tables carry the story only until the end of 1947—that is, for the first year of the plan. Nevertheless the report, drawn up by some of France's leading economic and financial experts, is of far more than historical interest. Besides tabulating essential facts, it draws conclusions about the present and future trends of French economy and analyses the obstacles to recovery. It also warns the country and the Government in no uncertain terms of the far-reaching sacrifices and of the radical changes in habit, organisation and financial management which will have to be made if the French economic machine is to compete on equal terms with the modern world.

On the credit side of the balance sheet, one fact stands out: French industry is today producing up to 115 per cent of its 1938 level. This represents a strenuous effort by an exhausted and often undernourished working population, labouring under difficult conditions with worn-out machinery, while their hours of work have risen, on an average, from 39 to 45 hours per week.

The increased production has been used largely for reconstruction and re-equipment. On the other hand the total amount of goods and services (representing home production plus exports) available for the public rose by only four per cent, and by the end of 1947 was still seven per cent below the prewar level; it is scarcely higher today. These facts correct the superficial picture of prosperity which visitors to France tend to carry away with them and which are based on their own comfortable but strictly limited experiences. In fact the ordinary French family is living far more uncomfortably than before the war. Individuals have, of course, profited from national disasters in a country where egalitarianism is traditionally preached rather than practised, but as a whole the country is still suffering severe material hardships from the accumulated losses of two world wars.

This productive effort has been accompanied by the first serious attempt to bridge the inflationary gap and to stop the spiral of prices and wages. The present Government followed up the rise in wages—which had become socially and politically imperative—by deliberately cutting the spending power of the wage-earning classes. (The planners would have preferred the *prélèvement* to have been even twice as heavy.)

Finally, on the credit side, is Marshall aid, which, if American intentions do not change, means that production need not be decreased for lack of food, fuel and raw materials. It provides a much needed opportunity to overhaul France's productive machinery.

Worn-out Equipment

Nevertheless, the conclusion which the planners reach is far from reassuring: the initial impetus of recovery has slowed down and since October production has barely risen. The object of the Monnet Plan—to increase French productive capacity—has not yet been realised. Labour productivity is still about 20 per cent lower than in 1938. The planners argue that, even allowing for social conflicts, absenteeism, war weariness and the shortage of trained specialists, the principal reason for this is the worn-out and antiquated French industrial and agricultural equipment, which remains for the most part grotesque anachronisms in this Machine Age.

The difficulty is how to finance what has obviously become the imperative and urgent task of bringing French economy up to

date. The monetary problem is becoming increasingly acute as material resources become available and other bottlenecks show signs of giving way. Last year, investments in the essential sectors of industry and agriculture were 16 per cent short of the estimate.

The planners themselves make no secret of their view that the French private investor is not expected to meet the deficiency. On the contrary, the general trend is away from long-term investments in sectors which either have been or might be nationalised. Accumulated wealth today is being transferred into the hands of new classes, unaccustomed to saving, and who prefer to raise their standard of living and scale of comforts rather than invest their money with a view to distant returns. Uncertainty about the future encourages the hoarding of gold or precious stones, easy to conceal and if necessary to run away with. The old-fashioned investor is himself unable to live today on the returns of capital invested yesterday—a state of affairs hardly designed *pour encourager les autres*. In short, the planners believe that if an adequate flow of investments is to be maintained and directed into the right channels—without which economy will continue to stagnate—the state must resign itself to financing it.

Another Dose of Inflation?

The difficulty is that once you drag in the Government, you introduce political, and more specifically, electoral factors which are hardly compatible with long-term planning. For the time being the French Government is seeking to make electors forget the *prélèvement*, and are aiming at budgetary equilibrium by cutting expenditure rather than by raising taxation (although it is calculated that fiscal pressure in terms of national revenue in France is barely half what it is in Britain). In these circumstances it is very hard to avoid the impression that another dose of inflation, which would dangerously compromise the results so far achieved, is being prepared.

The problem, in the planners' view, is not insoluble. The first requirement, they argue, is for a thorough reform of the fiscal system to make it more equitable and more remunerative. On the retrenchment side, they advocate international co-ordination of defence projects to relieve France of some of its crushing military burden which has become incompatible with economic recovery. Electoral pressure for the restoration of industrial and food subsidies will have to be resisted.

Even so, in the immediate future some exceptional device must be discovered to carry the country over the "last lap" towards monetary stabilisation. The Treasury's exceptional resources—which have given an impression of stability during the last few months—have already been largely overspent.

If stabilisation can be achieved and if prices as well as wages are kept under control—the time is fast approaching when wages will no longer yield to unilateral controls—the modernisation programme can be realised. Indeed, the immediate problem of financing such a programme can, the planners believe, be almost entirely solved by allocating to it the entire resources accruing to the Government from the sale of commodities provided under Marshall aid. The equipment and machinery can be largely manufactured in France and paid for in francs. The Americans have already indicated they will have no objection to this use of the aid, as long as the single but overriding condition of monetary stabilisation is first assured.

For the time being the internal stabilisation on which everything else depends remains the dominant and still unknown factor. The imperative "last lap" has become the immediate concern and it may cost the present coalition government its life. The state of emotional tension and panic (which inclined the middle classes to bow to the capital levy immediately after the general strike and when they feared an imminent Communist triumph in Italy) have now subsided. On the approach of municipal elections the majority parties will not support fiscal or financial reforms costing votes. That is why French recovery—and with it the whole European programme—is still hanging in precarious balance.

Burma and the Foreigner

[BY A CORRESPONDENT]

AFTER a period of peace there has again been disturbing news from Burma. The Government of Thakin Nu, which took over from the victims of the machine-gunning last summer, continues the rule of the coalition of parties known as AFPFL (Anti-Fascist People's Freedom League). But now Thakin Nu has announced his resignation, due to take effect on July 20th, and has made two conflicting statements on his policy towards Communism. The political future of Burma is now overclouded with threats of further violent upheaval, and it has become doubtful whether AFPFL can hold together any longer. Without a solid parliamentary majority supporting the Government, the administration may easily lose what strength and stability it now has.

The resignation of Thakin Nu has not been the result of pressure or of any Cabinet crisis, but has been premeditated for a long time; it is due to a religious vow, for Thakin Nu, as a devout Buddhist, has wished to dedicate the later years of his life to religion. This does not mean, however, a complete withdrawal from politics; on the contrary, as the career of Mahatma Gandhi so clearly showed, a religious life can be combined with a position of great political influence and authority, and Thakin Nu evidently desires to guide the political development of Burma without being distracted by the cares of day-to-day administration. He has announced his intention of creating a new United Left Party, which is intended to incorporate the Socialists and the People's Volunteer Party (PVP), the two main constituents of AFPFL, together with the more "moderate" Communists; the new party is meant to be a substitute for AFPFL, to provide a more disciplined following for the Government and to draw away support from the Left opposition now led by the Communists.

The significance of this manoeuvre is only apparent if considered in relation to the background of Burmese politics. In this country there is a widespread idea that the problems of Burma are similar to those of India, each country having recently emerged into full national independence and being now faced with the tasks of administration and solution of internal social conflicts in place of the nationalist struggle against foreign rule. But India and Burma differ fundamentally in that India has for many years now had a strong and wealthy bourgeoisie of its own, with British and other foreign capital playing a diminishing role in the national economy, whereas in Burma almost all capital has been in British, Indian or Chinese hands. Thus in India independence has meant the emergence of a bourgeois regime, with the Congress Party under the decisive leadership of Mr Patel turning to the Right and the Socialists as well as the Communists going into opposition. But in Burma nationalism has remained in alliance with social revolution because the property-owner is, with negligible exceptions, a foreigner. It is not possible to imagine a Burmese Tata. The Burmese, who have never hitherto shown any aptitude for commerce or finance, have remained a poor people in their own naturally rich country. But now that they have political power as a sovereign nation and the foreigners are at their mercy, it seems to the ordinary Burmese that it is the turn of the native inhabitants to live on the fat of the land. For this happy state of affairs to come about they believe that all that is needed is to pass a few bills through parliament expropriating foreign property interests in land, transport, oil, timber or minerals.

A Nation of the Left

This can be called socialism or nationalism equally well; in either case it means in practice soaking the non-Burmese. The Burmese are a Left nation; there is really no Burmese Right. What makes the difference among Burmese politicians between less and more Left is the degree of severity to be adopted towards the foreigner. The least Left would like to go slow, letting the foreign companies operate for a time under various restrictions and only nationalising concerns one by one over a period of years; the more radical would nationalise everything quickly, but would on principle pay "equitable compensation" to the owners; while on the extreme Left the Communists demand wholesale expropriation without any compensation at all.

The political leaders who have had experience of administrative office and are acquainted with the facts of international trade and capital movement are the most reluctant to use drastic methods, for they know that if Burma were to act in such a way as to preclude any further foreign investment or business enterprise in the country, its wealth would rapidly diminish. But the Burmese student, workman or peasant, who patriotically supposes that all means of production or distribution can simply

be taken over without economic loss, has no such fears, nor does he see any reason for paying compensation which would for years eat up the proceeds of export surpluses whereby Burma might purchase at will in all the markets of the world. Hence the appeal of the Burmese Communists, who today form a most serious threat to the stability of the AFPFL Government.

Survival of Trotskyism

The Burmese Communists are divided into "Red Flag" and "White Flag" factions. The latter are, or were, the more extreme, having a "Trotskyite" tinge (Ceylon, which is closely in touch with Burma, is today the one country of the world where Trotskyism remains an important political force, surviving like a religious sect). The Red Flags were in active armed rebellion while the White Flags participated in the elections for the Constituent Assembly and won seven seats. But since then the White Flags, too, have become more and more violent and have been subjected to severe repression by the Government. The Communists have also penetrated the People's Volunteer Party, one of the AFPFL parties, and its para-military organisation, which used to be Aung San's private army. In Arakan and central Burma the Communist armed bands control wide areas of the countryside and have to a great extent disrupted communications. Although the army and police have so far remained loyal to the Government, the general political trend has been so adverse that Thakin Nu has felt the need to placate the rebels and halt the swing of popular support to the Communists. He has therefore passed through parliament a bill for the nationalisation of the British-owned Irrawaddy Flotilla as from June 1st, and about a third of the foreign-owned teak forests, in which Indian as well as British capital is invested, are also to be taken over this year. Having thus shown himself sincere in his zeal for expropriation, Thakin Nu has set forth a programme for his new party which is specially designed to attract Communists, including as it does items such as the development of political and economic relations with the Soviet Union and the new regimes of Eastern Europe, the socialisation of foreign trade and the transformation of the army into a "people's democratic army." The Communist leaders, however, are suspicious of Thakin Nu's advances; they want power for themselves and not lip-service to Communist principles from a man who has never managed to achieve the reputation of being really fierce with foreigners.

India's Vital Interests

Important British economic interests are at stake in Burma, but so also today are Indian; and the Burmese may well find India less long-suffering than the departed British rulers at the foreigner-soaking rivalry of Burmese politicians. For India not only has the property interests of its nationals in Burma to defend, but also a great and urgent interest in the regular availability of Burmese rice, imports of which become each year more essential to India's precarious food supply. The crop this year has been excellent, and it is hoped that as much as 1,800,000 tons will be exported by the end of the year, with targets of 2,000,000 tons in 1949 and 3,000,000 in 1950. But rice exports depend on efficiency and security of transport within Burma, and a serious deterioration of the railway and river shipping services, and, still more, conditions of serious civil war, might almost eliminate them in a short time. The recently-appointed first Indian Ambassador to Burma, in congratulating the Burmese on their independence, also spoke words about the Indian minority in Burma which seemed to contain a note of warning to Rangoon's ultra-nationalists. India will certainly watch with a vigilant concern the stormy politics of its small, but defiant, neighbour.

Party Politics for Spain?

[BY A SPECIAL CORRESPONDENT]

RECENT economic agreements between Spain and France and Britain respectively cannot altogether be divorced from the attempts, both subterranean and overt, to re-establish a party political system in Spain. It is quite possible that they may pave the way for a gradual emergence of Spain into European affairs quite irrespective of the ban on ERP aid.

There are warring schools of thought which cut across even Catholic public opinion in Spain at the moment. There is the right-wing Catholicism, which distrusts Christian Democracy in France and Italy, has no wish to compromise with socialism and which prefers the idea of a Latin-American-Iberian bloc to ERP. At the same time these protagonists illogically denounce the United States and Western European nations for denying ERP to

Spain. Then there is a coalition of moderate Catholics, Royalists, and some ex-Falangists, who believe that Spain must bring itself back into the European family in a dignified manner and by means of gradual concessions, at the same time consolidating and unifying Catholic opinion throughout Europe, whether it be of the left or of the right.

The idea of making a move towards a return to a more democratic way of life first emanated from Royalist circles close to Don Juan. It is a policy that has since found favour among members of the Cortes close to Franco as well as with moderate ex-Republicans. Had these people been allowed to pursue the project in their own way, it is likely that a measure of success would already have been achieved. Unfortunately, foreign influences intervened and certain American diplomats favoured the idea of sponsoring the scheme as a bait for leading Spain back to the democratic camp. Foreign intervention in the internal affairs of Spain has never succeeded, and is the worst method of convincing Spaniards. The clumsy attempts to urge the recognition of a party which was not even in being had the immediate effect of hardening official opinion against the idea.

Chilly Reception for American Ideas

Accordingly, when Mr Myron Taylor, in his role of personal representative of President Truman, raised the proposal unofficially with the Caudillo—that is, to allow the creation of a Christian Democrat Party—his reception was chilly. It was hardly good timing for the proposal to be made when President Truman in Washington was emphatically denying that ERP would be extended to Franco Spain.

The Caudillo had a ready-enough answer. The need for a Christian Democrat Party might be acute elsewhere in Europe where Communism threatened to engulf whole countries, but it was quite redundant in Spain, where all were Catholics and where Communism did not exist. "We are one party," said the Caudillo, "and that is a Christian party."

Nevertheless, providing there are no more external attempts to force a decision on Franco, a Christian Democrat Party may become a reality in the near future. Whether it will mean a step towards democracy is another matter. That will depend upon whether the Vatican or Franco has the greater influence in shaping events.

The Italian elections were watched with great interest in Spain. The Church's intervention in politics during the election was understandable, but it is felt that it should now withdraw from the political arena. If the Vatican withdraws this influence it may be that no attempt will be made to intervene in Spanish affairs.

Señor Angel Herrera, former director of the Catholic paper, *El Debate*, has been mentioned as a probable leader of any Spanish Christian Democratic Party. He has been closely linked with Gil Robles, and is favoured in Monarchist circles. The critics of Franco in official circles—and there are more than is generally supposed—believe that Spain can be assisted by constructive criticism from within the country. They feel that many reforms are long overdue and that a Catholic policy with a popular appeal for the masses, based on a programme of social amelioration, would stabilise Spain.

The opponents of this idea are mostly Falangists, who suggest as a counter-proposal the creation of a Labour Party on the Argentine model. It is odd what political contortions a near Fascist entourage will indulge in to disrupt anything which smells of liberalism.

It has been suggested, too, that the functions of Chief of State in Spain should be separated from those of Chief of Government. If this compromise were adopted party politics might be introduced and the chief of Government might be the present Minister of Foreign Affairs, Señor Artajo. This could lead to the creation of two parties, Christian Democrat and Nationalist-Syndicalist.

The latest development in connection with the party plan has been the *démarche* made in a letter from France by Señor Villalonga to Mgr Enrique Pla y Deniel, Cardinal Archbishop of Toledo and Primate of Spain. This letter informed the Cardinal of the desire of "numerous Spanish Catholics for the organisation of a party calling itself the Union of Middle Classes and Liberals." But the important part of the letter lay in this statement: "We ask only to be permitted to organise now for the day when the country will need new men and new methods."

That is the crux of the matter inside Spain. Franco may be firmly in the saddle through the grace of Stalin, but his reitera-

Prosperity in the Dutch West Indies

[BY A CORRESPONDENT]

THE smell of oil, the continuous stream of ocean going tankers, the tropical heat and the feverish activities of about two hundred thousand people from forty-five different nationalities and races strikes the visitor to Curacao and Aruba, the two main islands of the Dutch West Indies. Only 25 years ago the six islands—Curacao, Aruba, Bonaire, St. Maarten, St. Eustatius and Saba—which form the Dutch West Indies, were merely tropical islands with little prospect of future development. Curacao, the largest of the islands, discovered in 1499, had a dwindling population of 30,000 and Aruba of only about 8,000 people. The islands had no vegetation, no raw materials and no industries; the native population was frustrated and had no hopes of economic progress.

The discovery of oil in Venezuela changed the whole situation. The population of the two islands increased to over 45,000 in Aruba, and very nearly reached 120,000 in Curacao. Prosperity reigns everywhere; houses are being built by the thousands; new schools and hospitals, welfare centres, ports and warehouses are being expanded; new quays and wharves are being erected; new luxury hotels, clubs and casinos are being built at feverish speed. Money is no object. Sterling and dollars are available in plenty and the shops are full with British and American goods. People of all races, colours and creeds are living together in harmony, and the general health of the people is the highest in the Caribbean in spite of the lack of vegetation. Racial discrimination against coloured people is hardly known, and the Dutch colonial administration can claim high credit for the way these prosperous islands are governed.

This prosperity is still more remarkable because neither Aruba nor Curacao possesses any oil wells. They do possess, however, good natural harbours, while the nearby Venezuela has none. So, the natural ports of Aruba and Curacao tempted British and American capital to build the world's largest oil refineries on these two islands.

British and American Oil Interests

The British were first in the field. The Shell Company started to build an oil refinery in Curacao in 1918, but this refinery was not expanded until 1929, when its capacity was increased to the present figure of over 300,000 barrels daily.

American capital came to the Dutch West Indies in 1945, when the Lago Corporation, which is now controlled by the Standard Oil Company of New Jersey, started to build a refinery at San Nicolas, Aruba. The Lago Refinery is larger than the Shell Refinery in Curacao, and is able to handle over 400,000 barrels of oil daily. British capital followed American to Aruba, and the Shell Company has also started a new refinery, called the Eagle Refinery, at Oranjestad. The two Shell refineries have a potential output equal to the Lago refinery.

The whole economic life of the islands is dependent on the refineries. Over 10,000 people in Aruba, out of a total population of 45,000, work in them. Wages are good, social insurance and health schemes are in operation and there are no signs of any labour trouble or any basic friction between employers and workers. The islands have no shortage of foreign currency. The Dutch West Indies is, perhaps, the only area in the world where no import licence is required for importing British goods. But this does not apply to the United States. The Dutch Government do their utmost to preserve the dollar resources, but in spite of that, American exports are predominant. This is hardly surprising, for America is much better situated than Britain for shipping consumer goods to these islands. American manufacturers are spending large amounts on advertising their products. The shops are crammed with American goods and the public is "America" conscious. But in recent years the barrier has broken down. British goods are becoming more and more predominant, and there are great potential possibilities for the shipment of all types of British consumer goods.

The Dutch administration has comparatively few local problems. There is no friction between the administration and the local population. The only political development has been a tendency to local rivalry between the various islands.

IN the 1820's Courtaulds' Essex-made silks were beginning to find their way to world markets through the country's textile merchanting centres. Several Manchester houses have been continuously supplied by the firm with piecegoods for more than a century.

In 1886 the late Sir Thomas Latham was appointed the firm's Lancashire sales agent in the cotton capital and he subsequently played a leading part in the foundation and development of the rayon industry, becoming deputy chairman of Courtaulds in 1917. Today the Company has two sales offices in the city—one at 36 Church Street for its piecegoods; the other at 28 Princess Street for its rayon yarn and staple.

Since the 1914-1918 War, however, Courtaulds' activities in the Manchester area have been industrial as well as commercial.

Firstly, in 1916, the shortage of chemical supplies led to Courtaulds building their own factory at Trafford Park, which produces chemicals for use in the Company's other works. It is the largest producer of carbon bisulphide in the country, and makes large quantities of sulphuric acid by the most modern process.

Secondly, in 1920, the Company acquired a site at Droylsden on which was erected a yarn dyehouse, where improved techniques for dyeing rayon, today universally accepted, have been developed and demonstrated commercially.

These two factories on the city fringe undertook important additional tasks during the Second World War. Trafford Park manufactured chemicals for munitions, while Droylsden dyed, camouflaged and proofed military equipment.

Of more than 23,000 people now directly employed by Courtaulds in the United Kingdom, about 600 serve the Company in this great textile centre of Manchester, each doing his part in the national interest of putting more and better rayons into the ships and shops.

This is one of a series of statements to inform the public of some part of the contribution made by Courtaulds' industrial enterprise to economic well-being in various districts of the United Kingdom.

THE BUSINESS WORLD

The Tide of Prices

EARLY this year there were high hopes that, at last, the ever-rising tide of prices for Britain's imports of raw materials and food might be turning. The appearance of the "Economic Survey" last March followed soon after a severe jolt to grain and cotton prices in the United States; for the first time since the war there were perceptible grounds for expecting an improvement in the terms on which Britain had been trading with the rest of the world—and in particular with the New World. The Chancellor of the Exchequer has lately disclosed that such an improvement was taken into account when the import and export programmes for 1948 were prepared; the "overall deficit" of £250 million for 1948 was an estimate which, it was hoped, left a margin in hand.

But, once again, history has confounded optimism. The hopes were reasonable, but prices have refused to conform to them, as they have so often refused in the past. The result is that the deficit during the first four months of this year was running at an annual rate higher by £150 million than the "Survey" suggested. And for this, as Sir Stafford Cripps has recently shown, the principal cause is the further rise in the cost of imports. Last year, according to the "Economic Survey," the fact that import prices had risen more rapidly than export prices since 1938 "cost us an addition of nearly £250 million to our 1947 import bill." That is a simple way of measuring the consequences of the deterioration in Britain's terms of trade with the outside world. The same point can be more formally put: at the end of 1946 the average price of imports was 223, taking 1938 as 100, and of exports 210 per cent. In other words, it was then costing 64 per cent more exports to obtain a given volume of imports than it did in 1938. At the end of last year this same percentage had increased to 74. But by April this year the index of import prices had risen to 283 (1938 = 100) and export prices to only 251, with the result that a given volume of imports last April would have cost nearly 13 per cent more exports than it did before the war. These figures measure the galloping deterioration in Britain's terms of trade; they show—it scarcely needs proof—how vulnerable is this country to a further rise in world prices; and they explain the heart-breaking anxiety which each successive rise in prices must cause.

Will relief from this dilemma of prices ever come? Expectations have so often been cheated in the past, and now American demand seems to have acquired a new lease of life. Moreover, the full force of the increase in world prices has yet to be felt by Britain—which, for example, is still getting wheat under existing contracts much below the world price, though it will shortly cost appreciably more under new contracts. If the prices of primary commodities were suddenly to break on the world markets, Britain would enjoy no immediate relief for those supplies which had already been bought forward at fixed prices. But the signs of such a break which it was possible to discern last February have vanished; the world is still short of food and raw materials, and at this moment there is little evidence of a sharp check to inflation, particularly in countries producing primary materials, or to the fantastically high level of industrial activity in the United States.

Until these conditions change there is little hope of that correction of the disparity between the prices of primary commodities and of manufactured goods for which Britain—and indeed Western Europe—has so earnestly hoped. But to

measure the likelihood of such a change, it is necessary to keep the two factors logically separated in the mind—to distinguish between an absolute shortage of supplies of certain commodities owing to the dislocation of war on the one hand and, on the other hand, a relative shortage of supplies due to total demand outstripping production, even though output may be on a scale which in normal times would be regarded as being good and sufficient. The accompanying table attempts to measure these separate factors. It includes a representative list of primary commodities which, apart from rayon, feature prominently in world trade. The first section of the table shows world production of these commodities before the war, and in 1946 and 1947; for certain commodities, production in Russia, Japan, and some countries in Eastern Europe is excluded because postwar figures are not known. The prewar figures for production are five-year averages, except for rayon and synthetic rubber where 1938 has been chosen because output was rising rapidly during the period. The last column of this section shows output last year as a percentage of prewar output,

but it should be borne in mind that the world's population has increased during the period by about 12½ per cent.

This part of the table shows that the world output of certain commodities has greatly expanded compared with prewar years. Sugar is one example; production was not seriously upset by the war, and the problem here is not one of increasing total supplies, but of finding sufficient dollars to buy the present production. Supplies of rubber seem highly satisfactory. Thirty per cent more natural rubber was produced last year than in prewar years, though the comparison of flush yields last year with restricted output before the war is perhaps open to question. But, comparisons apart, supplies have been good, and yet despite the high output of synthetic rubber in the United States, prices have been steadily rising, because demand has expanded even more. Nearly one-quarter more copper was produced last year than before the war, despite the interruption of supplies from Northern Rhodesia. But this expansion in output only palely reflects the increase in demand and the rise in prices; for several reasons (including high cost of mine development and the treatment of lower grade ores) supplies of non-ferrous metals have not responded proportionately to prices.

Apart from these three cases, supplies of primary commodities have not shown an adequate expansion since 1945. Wheat and rice, affected by major dislocation of war, are well below and maize no higher than the prewar output. World output of cotton and wool is still appreciably below the prewar levels, and, moreover, the quality of wool has deteriorated. All the major cotton producers restricted their planting during the war to produce more food, and they have been slow to change back to cotton because food has since been even dearer than cotton. Australia reduced its grain shipments to feed more livestock, and reduced its output of merino wool to provide more mutton. Among the textile fibres, rayon alone has regained the prewar level of output, because the prodigious stride in American output has more than offset the loss of Germany, Japan and Italy; yet this expansion is far too small to offset the reduced supplies of other textile fibres. Of the non-ferrous metals—apart from copper—tin is still recovering from the effects of war, while production of lead in the United States is declining through the exhaustion of deposits and Australian lead development has yet to bear full fruit.

So much for world supplies. In some respects, the picture is not unfavourable, but in others it shows a painfully slow recovery from the effects of war. The next stage is to relate these supplies to the two principal consuming countries, the United States and Britain, as in sections two and three of the table. The ubiquitous character of American demand is obvious. Of the twelve commodities listed, the only falls are in the consumption of sugar and tin, and in the former case the decline may be something of a statistical illusion. Wheat consumption is 12 per cent higher than before the war—which is in step with the increase in population—and maize consumption, despite short supplies, 14 per cent higher. But the most remarkable figures relate to the consumption of industrial materials—cotton consumption up by nearly 60 per cent, wool by 70 per cent, and rayon two and a half times as large. American consumption of natural rubber shows only a modest increase, but last year it was equalled by consumption of synthetic rubber. Last year, again, American industry used more than twice as much copper than before the war, though world production was only 24 per cent higher. Consumption of other non-ferrous metals showed a much smaller expansion—indeed, tin was down—but in each case American consumption was significantly greater, in relative terms, than the movement in world production.

The third part of the table deals with British consumption of the same commodities. The figures for wheat relate to human consumption, and exclude wheat fed to livestock. With this single exception among foodstuffs—a monument to the British capacity to absorb a farinaceous diet—and of natural rubber among industrial raw materials—where comparison is vitiated by American use of synthetic rubber—each commodity reflects a smaller recovery in consumption last year, compared with the United States. This part of the table shows the total

effect, on the British economy, of rising import prices, world shortages, and an extremely high level of demand in the United States. These are matters not of complaint, but of fact. In the competitive struggle for supplies Britain has been at a serious disadvantage, and so it is likely to remain until supplies become easier.

What are the prospects? History proves the unwisdom of measuring grain crops until they are safely gathered, but this year, unless there is unexpected bad fortune with the weather, there is every promise of bumper crops. Another large yield, estimated at 1,200 million bushels, is expected in the United States and the European crops are most promising. Indeed, it is conceivable that world grain supplies this year may exceed the prewar volume—though satisfaction at this prospect must be tempered by the stark truth that a failure of the American wheat crop, after a long spell of good harvests, might jeopardise world food supplies in some future year. Rice, too, is showing an improvement, though it remains to be seen whether, and how far, the willingness of Burma's rulers to follow the way of Russia will impede the restoration of the Asiatic rice economy, which must be based on a large export surplus from Burma. Supplies of sugar will certainly outstrip the supply of dollars to pay for them. World cotton production may show an expansion of the order of 5 per cent, which would still leave it below the prewar level. This year's wool clip may reach 1,590 million lb., and there should be a bigger rise next season, with a bigger proportion of high quality merino wool. World output of natural rubber this year is put at 1,391,000 tons (and 1,547,000 tons next year), and with, say, 500,000 tons of synthetic output, total supplies in 1948 would show an increase of 6 per cent. Output of non-ferrous metals for the first quarter of this year suggests a welcome expansion in supplies for the whole year; the forecast for tin is 150,000 tons (with 170,000 tons next year and 200,000 tons in 1950), but supplies of lead are likely to continue very short.

*

Thus there is some evidence that physical shortages are being slowly overcome. But the expansion which is in sight does not weaken the force of the truism that the key to world prices—and therefore to the prices of British imports—rests upon the tempo of industrial activity in the United States. Is the latest sharp rise in prices there the final spasm in the orgy of inflation? It is difficult to reach a firm conclusion, but at least the pipe-lines are full, stocks seem to be adequate, and there are signs of resistance to higher prices for certain lines of goods. If a break in prices were to occur, it might go some distance, for the demand for industrial raw materials might well be considerably curtailed until stocks were reduced to a lower level. The break of prices in February did not go very far—indeed, it scarcely affected raw materials—but it might be a portent of what is to come if this year's grain harvests are as good as they promise to be.

But that is not the whole story. The American defence programme, increased purchases of strategic raw materials by the Government, and Marshall Aid are three powerful factors pointing in the other direction. A defence programme costing between \$3 and \$4 billion could have important effects on commodity prices, this year and next. As for stockpiling, the pure doctrine is that purchases should be made only to absorb unwanted supplies, but where are they to be found today? The effects of the European Recovery Programme on commodity prices will depend to some extent on the spreading of supplies by "offshore" purchases. In April the Council of Economic Advisers informed the President that the United States could absorb the expenditure for defence and ERP without undue strain, on the ground that it would act as "an offset to softening tendencies which might be developing in 1948, rather than as a further stimulus to our already strong inflationary situation."

European Trade and Payments

THE problem of restoring the flow of trade between European countries was given high priority at the recent meeting of the Council of the Organisation for European Economic Co-operation in Paris. It is hardly surprising that this should be so. The European Recovery Programme demands the fullest utilisation of Europe's economic resources. In recent months an increasing part of these resources has been under-employed because of the creeping paralysis that has spread over intra-European trade. Italian fruit has been rotting because other countries, although short of fruit, have not regarded it as an essential item of import. Some Belgian steel and textile capacity is idle because France and other European countries have exhausted their facilities for buying on credit from Belgium. British coal is beginning to meet some sales resistance in Europe, partly on grounds of poor quality and high prices but also because here and there sterling is becoming an extremely scarce currency. Even in their traditional markets, Turkish and Greek tobaccos are meeting growing difficulty.

The fault in nearly every case is the seizing up of the machinery of payments. Creditor countries among the European trading nations have gone about as far as could be expected in exporting their substance in exchange for paper claims against the others. The debtor countries have no gold and hence the creditors have no convertible means of payment to meet their own deficits with the United States. Another influence which is tending to restrict European trade is the promise of American assistance. France, for example, has exerted less energy to obtain Belgian steel than it might have displayed had there been no hope of getting steel from the United States under the European Recovery Programme. Britain might have made more attractive offers for Turkish and Balkan tobacco had there been less assurance about getting American leaf. The consequent contraction of European trade for this particular reason is doubly deplorable, because it is tending to perpetuate the dependence of Europe on the Western Hemisphere. It is hardening into permanence certain channels of trade between the United States and Europe which owe their origin to the ravages of war, which are being maintained by gift or loan dollars, and which, therefore, are wholly artificial. This stimulation of trade with the Western Hemisphere at a time when resources in Europe are under-employed runs counter to the basic conception of the European Recovery Programme, which is to restore the solvency of Europe, vis-a-vis the dollar area.

This subject had an obvious bearing on the Paris talks, for they were concerned with requirements for the June-September quarter and the ensuing twelve months of the European

The balance of this judgment seems to be less secure now than it was three months ago. And with the renewed emphasis on rising prices which has occurred in the meantime, British hopes for an improvement in the terms of trade have again been frustrated. At present there are only vague signs of a check to the tide of prices, and the hope lies, as it always has done, in some reduction, though a moderate one, in the scale of American demand. Whether such a contraction will follow this autumn's crop reports remains to be seen. All that can be said is that such changes, when they take place, can occur with surprising speed. If they do not occur, Britain will have to wait for some years before world output expands on a scale sufficient to bring down the prices of British imports to more tolerable levels. And even then, an improvement in the terms of trade will not solve Britain's problem on its external account; it will only provide some relief from present strains.

Recovery Programme. The needs of Europe that may have to be satisfied by the United States will obviously vary according to the success with which Europe employs its own resources and exchanges its own products. Hence, before the questionnaire on Marshall Aid for the coming year can be completed and the needs of the 16 countries can be drawn up, this problem of lubricating the machinery to finance intra-European trade must be tackled. It is being discussed in Paris at this moment by the executive committee of the OEEC with the help of observers from the International Monetary Fund and of American representatives taken from the staff of Mr Averill Harriman, the United States Special Representative in Europe.

It would be wrong if these discussions were to put the entire emphasis on financial machinery. It is true that the seizing up of this mechanism appears to be directly responsible for most of the contraction in intra-European trade. For example, because France is at the limit of its credit facilities with Belgium and has no gold to enable it to exceed this limit, France is no longer buying Belgian steel. But this failure of the machinery is little more than an indication of a deeper disequilibrium. No mechanism of international payments—other than one based on the grant of unconditional and limitless credit—could have withstood the chaos caused by the physical losses and economic disruption inherited from the war; but the chances of moving towards equilibrium have been lessened by the wide discrepancies of prices and costs that have since been part of the economic scene. As a result, both the volume and the direction of the foreign trade of European nations has been distorted, and these distortions have led to the gradual paralysis of the machinery of payments. If the distortions disappeared—if the countries of Europe found it possible, first to re-establish some order and stability in their domestic finances, and secondly to arrive at some rational system of stable relative values for their currencies—much of the present, and apparently chronic, disequilibrium in European balances of payments would disappear. This, in its turn, would help to loosen the now congealed payments machinery. It is, therefore, to be hoped that in the Paris discussions the symptom of payments difficulties will not be mistaken for the substance of the problem. In the field of financial policy, the problem, first and foremost, is to restore stability and reasonable equilibrium in the structure of European costs, prices and exchanges.

But obviously first-aid measures cannot be deferred until that major operation is completed. The anaemia which afflicts Europe's trade will kill the patient unless it is quickly relieved. The most urgent task is to provide some extension of the mutual credit facilities by which trade among European countries is now financed. Most clearing accounts are stretched to their

* Clean basis. † 1935-39. ‡ 1938

limits and trade between each set of two countries is thus restricted to the dimensions allowed by strict bilateral barter or by the balances that can still be settled in gold. Improvement of the clearing mechanism is not enough. All that can be achieved by compensating the debits and credits which arise from intra-European trade has in fact been accomplished during the past six months by the scheme operated by the Bank for International Settlements. Its limitations were rapidly revealed; they derived, not from any inherent defects in the scheme itself, but from the plain fact that there can be no scope for compensation when certain members of a clearing system are persistent debtors and others are persistent creditors. In such circumstances, a creditor may, for a time, be prepared to exchange his claim on one member of the debtor group for a similar claim upon another debtor, but even that procedure is soon apt to lose its usefulness and attraction.

To get the machinery functioning again, there must be an extension of the overdraft limits. The creditors must be induced, for a time at least, to go on making unrequited exports to the debtor members of the European community. The creditors have, not unnaturally, shown some hesitation about following this course. Their attitude can best be illustrated by that of the most difficult, and certainly the most vocal, of them all—Belgium. In the past year, Belgium has extended international credit to the amount of 13 billion Belgian francs. Adjusted for population and national income, this sum would be equivalent to about 5 billion dollars for the United States, or about the whole of the first year's Marshall Aid. Belgium claims that it has gone to the limits of making such unrequited exports, that these exports are intensifying inflationary tendencies in Belgium itself, and that they leave unresolved the real and urgent problem of Belgium's deficit with the Western Hemisphere.

This point of view gives the key to the solutions for this problem that have been proposed by the creditors. Most of these solutions look to the provision of some dollar reserve to ease the operation of clearing arrangements between the trading nations of Europe. Three ways in which these dollars might be provided have been suggested: by a specific allocation of ERP dollars for this purpose, by "offshore" expenditure of ERP dollars in Europe itself, and by inviting the International Monetary Fund to exchange into dollars the balances left uncleared by European compensation arrangements. None of the three proposals holds out much promise of being realised. There is no prospect of direct allocation of ERP dollars to a European clearing. This would have been the easiest way to clear the stoppage in intra-European trade, and it might have proved one of the most constructive ways in which to lay out ERP funds. It has not, however, found favour in Washington. The main reason for the American attitude is that expenditure of dollars allocated in this way could not be "followed

through" with the detailed precision apparently required by the Economic Co-operation Administrator, and by Congress.

The second suggestion—that ERP dollars should be used for purchases from European countries of such commodities as Belgian steel and textiles, German coal, and Greek tobacco—hardly matches the scale of the problem. The first year's appropriations for ERP—which are not secure yet—will not suffice to cover the deficits of the 16 with the Western Hemisphere; and, therefore, they leave very little margin for "off-shore" purchases in Europe. Some purchases will take place and they will prove of assistance; but they cannot go far towards solving the problem of European payments. There remains the intervention of the IMF. This issue has already been decided by the edict from the Fund that during the course of the European Recovery Programme it will not sell dollars to participating countries in other than quite exceptional circumstances. It is unlikely that the Fund will go back on a decision which must have been reached with the concurrence and probably at the instigation of the United States Administration.

One other proposed solution should be mentioned, namely, that part of the domestic currencies deposited against ERP grants should be put into intra-European circulation—for example, that sterling deposited against grants to the United Kingdom should be put at France's disposal to finance its deficit with the sterling area. Such advantages as could be advanced for this scheme—and they were in any case plausible rather than real—must remain untested. The proposal was found to be stillborn when the Economic Co-operation Administration in Washington decided that assistance to the creditor countries in European trade is to be given largely or wholly in the form of loans and not of grants. As a result, there could be no adequate deposits of the very European currencies that are needed to balance European trade.

The problem now being discussed is, therefore, of a particularly intransigent character. In the end, it can be solved only by the willingness of the creditor countries to raise still further the ceilings of the credits which they have extended to the debtors. To encourage them to do so, the inducement of international guarantees may be provided. But the guarantee of convertibility into dollars seems, for the time being, out of the question. It is right that the solution of the technical problem should be difficult to achieve, and for two important reasons. The first, already mentioned, is that payments difficulties are merely the symptom of deeper economic disorders. An easy solution of the immediate problem—such as a large injection of dollars into the BIS compensation scheme—would tend to weaken the urgent and more fundamental need to stabilise prices, to determine normal exchange rates and to arrive at some semblance of balanced payments.

The second reason is equally important. The partial under-

employment of European resources at this moment is in some respects a parallel phenomenon to the deflationary symptoms that are beginning to affect the British economy. In their European context, these difficulties are an indication of the immense task of adjustment which is called for if Europe is to work towards solvency with the Western Hemisphere. Substantial changes will have to take place in the structure and location of European industry and agriculture if that solvency is to be ultimately reached. Much of the resources now producing the "frills" that enter into intra-European trade will have to be devoted to producing for the Western Hemisphere. The

Business Notes

Is Money Short?

The ill-matched chorus of critics who lately have been calling for a reversal of the Government's dis-inflationary policy seems to be swelling in volume. Last week its attentions were concentrated upon the purchase tax. But now the argument seems to be that increased releases of coupons and tax concessions will not by themselves be sufficient to check the recession of public demand, and that what is needed, therefore, is more "money." The particular arguments of these amateur economists are as fallacious as the policy which they advocate. The volume of money is not, at least in the short period, a measure even of income, and is certainly no reliable guide to the amount of public spending. But if the critics have to be met on their own ground, they need to be reminded that bank deposits are still running at almost £300 million above their last year's level and are some £200 million higher than they were three months ago. But the arguments of the new reflationists conveniently ignore the banking figures and concentrate instead upon the movement of the note circulation, pointing out that this has fallen by some £150 million since the middle of last year (if seasonal influences are ignored).

This is the flimsiest and most tendentious argument of all. It is well known that this large movement resulted, not from any genuine decline in the natural requirements of the public for currency, but from special and non-recurring factors—ostensibly, the fear among black market operators and tax evaders that the Government might make a currency exchange. Recently, there have been signs that these abnormal influences have now exhausted themselves, so that the true underlying trend of public demand for currency is again becoming discernible. It seems that this trend, despite the recession in public spending, is still upwards.

Since end-April, the active note circulation, as shown by the Bank returns, has risen by £12 million, to £1,250 million, or by roughly twice the amount by which it rose in the corresponding period of 1947. The average circulation for May was £5,000,000 above the April average, whereas a similar comparison for 1947 shows a decline of £3,000,000. These, it should be noted, are unadjusted figures and make no allowance for any changes in the till money of the commercial banks which they include. The banks last month may have been further augmenting their own currency holdings in readiness for the seasonal demands, which this month are probably being accentuated by a resumption of the pleasure motoring. But the latest figures of till money—those for April—show so large an increase that a further strengthening may have been unnecessary. Indeed, this purely banking action explained the whole of the apparent modest expansion which occurred in the active note circulation during April. The estimated net circulation of currency in the hands of the public dropped in that month by £3,000,000 to £1,230 million, compared with £1,377 million in April, 1947. In the four months from the December peak there was a decline of £95 million, in contrast with one of only £3,000,000 in the similar period a year earlier; but of this £92 million accelerated fall, no less than £85 million was compressed within the first three months of the year. That is the justification for the assumption that the special influences have spent their force. On that assumption, the future trend of the adjusted figures will more faithfully reflect the true demand for currency. As yet, there is no sign that currency movements are reflecting the anti-inflationary influences which are now causing such controversy.

Meanwhile, the demand for coin is still a contrary movement within the demand for currency as a whole. General observation shows that the acute shortage of silver has now abated, thanks

present under-employment of European resources is in part a symbol of the need for this adjustment and an opportunity that should be seized in order to achieve it. The payments experts in Paris would indeed do real harm to the cause of permanent European reconstruction if they were to evolve a new payments machinery so smooth and efficient that it would keep in being trade that should not be taking place at all. These payments problems, important though they are in the short run, must not be allowed to obscure the need for that fundamental adjustment of the European economy which alone will enable the yawning dollar gap to be filled.

to the increased minting and release of new coins. In recent years, the total supply of coin outside the Bank of England has been rising at an average rate of rather less than three-quarter million pounds a month. In the first four months of 1947, it rose by only £1,000,000, but in the similar period of this year, the expansion was £5,000,000, and £2,000,000 was added both in March and April. The total now stands at £152 million, showing an increase of 6.3 per cent in twelve months and one of 97 per cent since 1938. The net circulation since 1938 has risen by 175 per cent.

* * *

The Decline in Savings

The adverse trend of National Savings, discussed here on June 5th, is becoming more pronounced. In the latest fortnight for which figures are available, withdrawals of past savings exceeded new savings by just over £2,000,000, before allowing for £5,630,000 of Defence Bonds redeemed at maturity and £1,000,000 of interest disbursed on encashed Savings Certificates. In the first ten weeks of this financial year, net savings as officially computed (and therefore with similar exclusions) have totalled merely £4,873,000, in contrast with roughly £58 million in the corresponding period of 1947. Then, however, Dr Dalton's devices for boosting the figures were still operating. The National Savings Committee this week has in effect pointed this out, by a reminder that in the early part of 1947-48 sales of savings certificates were largely increased in response to the raising of the limit on individual holdings. The much smaller sales of certificates this year account for most of the fall in total gross savings—from roughly £215 million to £151 million in the two ten-week periods. Aggregate withdrawals, it is pointed out, have actually fallen by £9,527,000 (to £146,254,000), and are now running at the rate of about 14 per cent of the total amount of accumulated savings.

Reminders that this year's figures are free from the extreme distortions of last year are no consolation, however, for the fact that National Savings are now, in effect, making net demands upon savings accumulating through other channels. The apparent small credit for the ten weeks is far surpassed by the redemptions of maturing Defence Bonds (nearly £24 million) and the interest disbursements on certificates, so that the National "savers" as a whole are absorbing part of the budget surplus. That would be of little account if it were certain that individuals were otherwise accumulating funds out of income. After all, the Committee's acknowledged role this year is to promote "abstention from spending" and not necessarily to sell its securities. But this realistic slogan becomes increasingly difficult to put across as the foolish murmurings about the supposed dangers of a "buyers' strike" become more widespread.

* * *

Lord Mackintosh on Industrial Savings

It is well that the Chancellor's prudent budgeting counted, in effect, upon only a very small volume of saving by individuals. Plainly, most of this year's saving will be corporate saving from taxes and profits; and the more the Chancellor was persuaded to whittle down his surplus—which represents forced and centralised saving—or otherwise to dilute the policy of wise austerity, the more important would industry's saving become. In this context, it is interesting to observe that Lord Mackintosh, who in his official capacity recently blamed the capital levy for the slump in National Savings, has now, in his private capacity, drawn attention to the effects of Government policy upon company saving. His statement to the shareholders of John Mackintosh and Sons, Ltd., applauds the recent improvements in depreciation allowances for tax purposes, and tactfully remarks that "in this

respect the present Government has been more favourable to private enterprise than previous Governments." This bouquet, however, is but a prelude to a brick-bat—well aimed at the absurd tax on bonus issues. "The issue of 'bonus' shares," he points out, "far from being a distribution of 'money,' is an act which makes it legally impossible to pay that amount of profits in the form of cash dividends either now or in the future." Such issues "are an encouragement to careful directors and should be encouraged rather than otherwise." Hence he concludes that the tax "goes quite a long way to discourage the conservation of profits in the business."

Undoubtedly, this is a sound diagnosis. The follies of this tax have been repeatedly expounded in these columns, and the Chancellor's undertaking to look at the tax before next year's budget deserves interim applause. But it ought to be pointed out that, where so-called "free" bonuses are concerned, the particular effects which Lord Mackintosh fears are likely for the time being to be prevented—quite fortuitously, no doubt—by the combined influence of dividend limitation and the discriminatory tax upon distributed profits. For the present, inability to make "free" bonus issues is unlikely to reduce the volume of industry's savings. From a social point of view, the main danger from the tax arises from its incidence on issues of new capital on so-called "bonus terms." Much evidence has accumulated recently of the way in which it is preventing companies from raising the resources they need for capital development. For the short run, the real risk is that it will deter, not saving, but investment.

South Africa's Hot Money

No further measures to deal with South Africa's hot money problem have been announced this week, but some of the confusion caused by last week's rumours of an impending "ultimatum" to overseas holders of deposits in the Union have been shown to be based upon a misapprehension. The source of the confusion was a letter from the South African Treasury to the Johannesburg stock exchange laying down the principle that shares may be sold on behalf of non-residents only for the purpose of re-investment within thirty days, in other securities quoted on the exchange. The first cabled interpretations of this rule apparently assumed that in this case the term "non-resident" was used in its most restricted sense to mean resident outside South Africa. It now appears that the term is used in the normal exchange control sense, meaning resident outside the Sterling Area. In consequence, the new rule has virtually no significance for the London market. Moreover, non-residents will themselves be free from the compulsion to re-invest if the securities which they sell had been bought originally with funds remitted direct to the Union from their country of residence. The proceeds of non-resident sales of securities will also be freely available for re-transfer to the country in which the seller is resident. In other words, South Africa appears to be introducing a system of control of non-resident funds which is closely analogous to the "Form M" procedure which, until recently, was followed by the British exchange control.

Odeon-Gaumont Pool

The trend towards complete integration and unification of control of the British film industry is taken one step farther by proposals announced this week to pool the receipts of the major part of the group of cinemas in the Odeon and Gaumont-British circuits. The two groups of cinemas are, of course, closely inter-linked within the J. Arthur Rank Organisation but they have hitherto retained their financial autonomy and independent management. Much of this independence will disappear if the proposals made this week to shareholders in some 20 companies concerned are accepted. These proposals envisage the complete centralisation of management and the 564 theatres in the Gaumont-British and Odeon groups in the hands of Circuits Managements Association Limited (CMA). This is a newly created, non-profit making concern with a board representative of the Odeon and Gaumont-British groups.

CMA, in addition to managing substantially all the theatres of the two groups, will operate a pooling arrangement for the benefit of 20 of the principal theatre-owning companies which between them own 519 theatres. The gross receipts of these companies, after deduction of certain expenses, will be pooled and then divided in proportions calculated by the auditors of each group. These shares are based on the results of the three years 1944 to 1946; for Gaumont-British, the share is 41.3124 per cent and for Odeon 58.6876 per cent. The advantages claimed for the pooling arrangement are that it will simplify managerial

problems, result in substantial economies and provide each company concerned with protection against the risk of adverse conditions in its particular locality.

Such proposals must be judged in the light of the claim that they will lead to greater efficiency. On this score it is to be hoped that more detailed information will be given at the meetings which have been called to authorise them than is provided in the circulars issued to shareholders. It is impossible to judge the relative financial impact of the proposals on the two main companies concerned, Odeon Theatres and Gaumont-British. That will depend on the management policy which will be superimposed on the two circuits. The circular talks in terms of the need for a "balanced programme of British and American pictures" and of "a balanced allocation of the available British films." This emphasis on the box-office returns from British films comes appropriately after the decision to fix the exhibitors' quota for the year from October 1st at 45 per cent for feature films and 25 per cent for supporting films. Mr Rank is reported to have said that he will see that the quota is observed by every cinema, but many exhibitors have declared that it means even greater defaults than in the past. Perhaps without this pooling arrangement even the cinemas within Mr Rank's group would not have found its observance an easy matter.

Presumably it is intended to allocate films between the two circuits in order to maximise exhibiting revenues, though they will still be booked as separate and distinct circuits. If, as a result of the fall in cinema attendances, to which, incidentally, the circular makes oblique reference, it should be decided to close certain redundant theatres, the financial consequences would be distributed over the two groups. The same point would apply to first and second release bookings: what the first circuit gained, and the second lost, would be shared in the stated proportions. Obviously, the net consequence of such arrangements for individual shareholders cannot be determined in advance. Meanwhile, the Board of Trade has raised no objection to the scheme, which does not in its view affect Mr Rank's undertaking of 1944 to go no further in the control of cinemas.

A. C. Cossor's Difficulties

The full accounts of A. C. Cossor, the radio and electronics company, for the year to March 31, 1948, reveal a much more serious position than was generally expected when the passing of the interim preference dividend was announced some weeks ago. The parent company actually shows a trading loss of £22,043 compared with the previous year's profit of £214,145. Comment should be directed, however, to the consolidated accounts, and here the only grain of comfort is the fact that trading results of the group were still on the right side. Yet the fall from £320,921 to £70,763 in consolidated trading profit masks matters of even greater concern; for the group's net profit of £127,014 for 1946-47 has been transformed into a loss of some £110,480.

The main factor responsible for this unhappy situation is the provision of £150,000 to cover a possible fall in the value of stocks. This provision appears all the more necessary in view of the increase in the value placed on the group's stocks, work in progress and completed work from £1,284,628 to £2,143,555 during the course of 1947-48; this great expansion has been followed in the first three months of the current financial year by a sharp contraction in demand for the group's products at home and overseas. Moreover the inflated level of stocks has placed an intolerable strain on liquid resources. The group's cash resources have contracted to a mere £17,083 compared with £577,891 a year earlier, and bank overdrafts of no less than £780,933 have been obtained. The deterioration of trading conditions since the end of the financial year has presumably made the present situation even worse; it would be surprising if the revaluation of stocks on March 31st represented the final solution of the problems which confront the new board.

The increases in purchase tax first from 33½ per cent to 50 per cent last November and again to 66½ per cent in April this year naturally receive much emphasis in Lord Burghley's review of a calamitous year. But the new board has to find a solution not only for the lag in home and export sales of radio sets but also for full employment of its greatly expanded capacity in ancillary lines of production. It is idle to suppose that these problems could be solved quickly. To a material extent the outlook for the company—and for the industry of which it forms part—depends on establishing the right scale, under normal trading conditions, for production capacity which was greatly expanded during the war. Lord Burghley's review puts no gloss on these problems, but the facts of the present and the mistakes of the past will not be easy to surmount.

Warning Light in Engineering

As expected, the engineers have reacted strongly to the employers' rejection of their wage claim. Threats of direct action have been made by shop stewards in the leading engineering centres, and this resentment is undoubtedly being whipped up for political purposes. Even if they were localised, strikes at this juncture could seriously dislocate the export programme. Mr Gavin Martin, Secretary of the Confederation of Engineering and Shipbuilding Unions, addressing the engineers' conference this week, certainly added fuel to the flames which Mr Tanner, the president of the Amalgamated Engineering Union, was trying to damp down. Mr Martin based his case on the well-worn thesis that the employers could afford to pay for the increase out of their higher profits, while Mr Tanner's plea for patience and "responsibility" was not well received. Since the engineers opposed the TUC's policy of accepting the principles of the White Paper on Personal Incomes, they no doubt feel logically justified in pressing their full claim to the limit—and some moral superiority over other unions which supported the TUC, but are nevertheless putting forward new wage claims. Nevertheless there is a disagreeable flavour of industrial blackmail in their present threats to withdraw labour.

No decision about future action can be expected before the meeting of engineering executives in York on July 14th. They will then have to decide between four courses—whether to reopen negotiations with the employers, to refer the claim to arbitration, to take direct action, or to seek an independent enquiry into the industry's wage structure. This latter course is favoured by the more moderate leaders, but there is a feeling among the rank and file that it would merely be a stalling device.

Foundry workers have taken the same line as the engineers at their annual conference. The shipbuilding employers' reply to the unions' claim will be given this weekend, but as it is likely to follow that of the engineering employers, the shipbuilding workers will soon be adding their protests to those of the engineers. On present signs, a good deal of unrest in the workshops and shipyards must be expected in the coming months. The engineers' claim is a test case in wages policy and it will be hard fought.

Aftermath of the Engineering Boom

Within a short space of time, six light engineering companies have passed their preference dividends. Last February, Henry Meadows foreshadowed events to come by announcing that the preference dividend due on March 1st must be deferred. On May 15th Specialoid passed the preference dividend due on that day, and followed this step by a further statement that "certain reserves should be made in respect of investments and stock which should still leave the company in a fully solvent position" and that reorganisation of production was under way. May 29th was a fateful day for three companies. Vactric announced that the position of the company did not justify payment of the preference dividend due on June 1st. British Rola, announcing a similar decision, disclosed that after various provisions there would be a net loss of £10,543 for the year to March 31st against a net profit of £12,582 in 1946-47, and on June 2nd a receiver was appointed by the debenture holders. And thirdly, Douglas (Kingswood) reported a net loss of £512,504 for 1947. On June 12th Richard Crittall decided to defer payment on the interim preference dividends due on June 30th pending completion of the audit for 1947.

The sums involved in these various cases are not so large that they are likely to cause serious financial injury. But the revelations gains importance for three reasons. First, all the companies involved are in the same industrial group: Meadows makes petrol and diesel engines, and gear boxes; Specialoid manufactures pistons; Vactric makes vacuum cleaners; British Rola makes general engineering and radio components; Richard Crittall is well known for its heating and ventilation equipment, and, lastly, Douglas produces motor cycles and other engines. Secondly, the general engineering industry expanded greatly during the war, and the recent revelation of financial difficulty represents in part a delayed adjustment to more normal peacetime conditions. In this adjustment lies the explanation of the rapid change in fortune which these companies, recently looking so prosperous, have experienced. Thirdly, all these companies, with the exception of Vactric, have comparatively recently increased their capital or placed their shares on the market. Specialoid obtained further finance in 1944 by a private placing, but in the case of Henry Meadows, Richard Crittall, British Rola and Douglas (Kingswood) the public was invited to take a bigger financial interest. A com-

This question of Exports

We are all of us striving to increase the sale of British goods in foreign markets. But trading abroad is a specialized business and the manufacturer who enters the field for the first time treads unfamiliar ground in more ways than one. To help him, the Westminster Bank has issued a booklet which deals in non-technical language with the intricate business of export finance. It describes, too, some of the ways in which the services and resources of the Bank can be used to advantage by the manufacturer and trader. Do you trade with AUSTRALIA

As a market for British manufactures and as a source of food and raw materials, Australia plays an important part in Britain's economy. Whether your interest is in imports or exports, the services of the Commonwealth Bank of Australia can be of considerable assistance. With over 400 Branches in the Commonwealth and New Guinea, and guaranteed by the Australian Government, the Bank can provide the British trader with up-to-date, authoritative information on every aspect of Australian commerce.

pany has every right to seek a favourable time for its issues and Stock Exchange debut, but the postwar boom in small engineering shares has come home to roost with disconcerting speed.

Courtauld's Dividend

For the second year in succession, the published results of Courtaulds, as revealed in the preliminary profits statement for 1947-48, do not afford a strict comparison with previous periods. This year there are two complications. The first follows from the change made last year in the date of the accounting period from December 31st to March 31st, as a result of which the accounts for 1946-47 covered a period of fifteen months. The latest figures relate to the twelve months ending March 31, 1948. The second complication arises from the implementation of the provisions of the Companies Act, 1947. Courtaulds have decided to issue consolidated accounts for 1947-48 without comparative figures and not to publish accounts for the parent company. Thus the only comparison that can be made from the figures provided in the preliminary statement is between the dividend on the parent company's ordinary capital of 9 per cent for 15 months to March 31, 1947, which is equivalent to a payment of 7.6 per cent for a twelve months' period, and the payment of 7½ per cent for the year ending March 31, 1948, announced at the end of last week. It may be presumed that the latest payment is not meant to represent a reduction in dividend but rather a rounding off to a more precise figure. The declaration of a higher dividend has been ruled out by voluntary dividend limitation, but an increase may well have been possible since the preliminary profits statement suggests that the trading results of the group were better than in the previous year. The preliminary statement is not without further interest. Its clarity and expansiveness give a palatable foretaste of what may be expected in future years when comparative figures will be available. For instance it reveals that out of group profits of £4,581,723, a sum of £2,808,484 has been provided for taxation which has absorbed a materially larger sum than the increase in profits. In addition, out of a net profit of £1,740,635, some £137,690 has been appropriated to meet under provisions for taxation in previous years; of the remainder, £304,613 has been retained by subsidiaries, £1210,000 has been paid in dividends and £88,326 added to carry forward. A further point is that minority interests in profits in 1947-48 amounted to only £32,604.

British Companies in Burma

Jobbers lost no time on Monday morning in marking down their quotations for the shares of British companies with interests in Burma. This step was taken following the weekend outburst of Thakin Nu, the Burmese premier, in which he expressed the intention of the United Left party to throw off the yoke of capitalism and follow Russian ideology. Only small amounts of stock have come on offer during the week and, as the accompanying table shows, prices of some issues have been duly marked up again on the deeper reflection that the Government of Burma has treaty obligations to provide equitable compensation for

foreign-owned property in Burma which may be taken over by the State.

Nevertheless, developments in Rangoon must considerably deflate the hopes recently expressed in the report of Burmah Oil Company that a new era of Anglo-Burmese commercial co-operation might be possible. The continuation of foreign commercial enterprise of which Burmah Oil is the most important is certainly likely to become increasingly difficult if Thakin Nu's sentiments find expression in day-to-day dealings with representatives of foreign countries operating in Burma. In any case, private enterprise as such appears to be incompatible with the

form of economy now being planned for the country. The latest developments must also call in question the advisability of pursuing the present capital programme on which Burmah Oil has expended considerable sums in the past two years. At least more tangible guarantees seem to be required before further amounts are spent than have been given up to now. Burmah Oil is not, of course, financially dependent upon activities in Burma itself—a point which some investors temporarily lost sight of earlier this week.

Bank for International Settlements

The 18th annual report of the Bank for International Settlements contains the usual balanced and well-informed survey of world economic affairs. Interest in the report will, however, be attracted by comments on two developments in which the BIS has a more direct concern. The first is the agreement signed in Washington last May which provided for the unblocking of the BIS assets in the United States and the return of gold looted by the Germans and paid to the BIS during the war. During the war years the Reichsbank continued to make transfers of gold or Swiss francs to the BIS in respect of the interest earned on the Bank's investments in Germany. When payments of gold were received from Germany the BIS asked for assurances that the gold had belonged to the Reichsbank since before the war. These assurances had to be taken on their face value but when full investigation about the origin of this gold became possible after the war, it was found that 3,740 kilos of fine gold did in effect represent looted metal, which had to be restored. Of this, 10 per cent had been received by the BIS for a third party. Even after this restitution, the BIS holding of net gold and currency assets (other than reichsmarks) increased by over 21 million Swiss francs between September 1, 1939 and March 31, 1948.

The second development is the European compensation scheme. On this, the report shows that at the end of the war European countries had, by their payments agreements, granted mutual credit equivalent to \$1,500 million. In the course of time these credits were largely used up and the creditor countries soon found it increasingly difficult to extend further compensation. Owing to the growing need for dollars, European self-help in this particular form seems to have reached its practical limits. The BIS points out that the results so far obtained in the working of the compensation scheme are limited but that they are of importance for more general reasons. A mechanism has been set up and this in itself has required the surmounting of many obstacles. Moreover, in the words of the report, the practical experience gained month by month in the multilateral clearings "may, if a reasonable amount of outside aid is forthcoming, lead to an easing of the present monetary restrictions and provide an opportunity for erecting a new and stronger monetary structure better suited to intra-European trade and to relations with other continents."

Floating Debt Policy

The Treasury, as expected, has lost no time in resorting to the new arrangement whereby Treasury deposit receipts may be issued with a life of five or seven months in addition to the six months which has been customary in the past. The £80 million of TDRs issued this week comprised £20 million with six-months' life and £60 million with seven months. These proportions, as foreshadowed in these columns last week, were determined by the authorities themselves: the banks were not given any choice. The spreading of the maturities in this week's issue will have the useful result of ensuring that there are some TDRs maturing in mid-January when the banks will be making large transfers of tax revenue to the Exchequer. Without this arrangement, the authorities could not have avoided a gap next January, because in the last few weeks of last January no TDR issues were made, with the result that the Treasury will have no replacement demands to meet in the corresponding weeks of next month. This week's arrangement, while it will thus exert a useful smoothing effect over the long period, is however a good illustration of the inadequacy of the innovation as a means of ensuring the maximum of smoothness from day-to-day. During the main tax-gathering season, the heaviest transfers of revenue from the banks to the authorities take place on Thursdays. But none of the TDRs issued this week will mature on that day of the week, because they run for seven calendar months precisely, and to have matured on the Thursday seven months hence, this week's TDRs would have had to have been issued on a Sunday.

One other aspect of the new arrangement is that it tends to confirm the assumption that the authorities now regard the Treasury deposit receipt as a permanent instrument of floating

debt borrowing. During the war it was quite widely assumed that the TDR issue would be gradually extinguished in the post-war period; and, until recently, a few bankers had cherished hopes that this might still happen. The total issue now is, of course, far below the peak of £2,225 million touched in 1945. But it has risen appreciably above the postwar low level of £1,201 million reached at end-February last. It now stands at £1,423.5 million, and is likely to rise further when the Argentine rail companies complete their disbursements to stockholders. On the other hand, there is little doubt that the Echequer surplus which should result this year from Sir Stafford Cripps's prudent budgeting will be applied to redeem this portion of the floating debt rather than to reduce the outstanding issue of tender Treasury bills. This now stands at £2,210 million, a little below the peak of a few months ago.

Rehabilitation in Indonesia

The importance of Indonesia to Europe—and to the United Kingdom—as a source of foodstuffs and raw materials was sharply emphasised during the war when trade connections were severed. Since the war, rehabilitation has been slow owing to internal strife. Even now, some ten months after the truce, conditions are far from normal and Indonesia is unlikely to regain its position as a major supplier of tea, rubber and oil at least until 1950. Sir John R. Hobhouse, Chairman of the British Chamber of Commerce of the Netherlands East Indies, has this week given an account, based on direct evidence, of the difficulties which have still to be overcome in rehabilitating the plantations in Indonesia. Output of tea in Java during the current year has been estimated at between 20 and 25 million lb.—before the war it was 130 million lb.—and output next year will probably be doubled. A number of factories were destroyed by the natives last year, but the machinery was only damaged and is capable of repair. Once the buildings can be replaced—which may take some years—output should expand rapidly.

Rubber production in 1947, which totalled 275,000 tons compared with 451,000 tons in 1937, came largely from smallholders. Some European estates were re-occupied towards the end of the year and their output this year is expected to reach 80,000 tons. Again, damage to planted areas has been less serious than to buildings and equipment. The Rubber Study Group has estimated Indonesian output for 1948 at 370,000 tons and for 1949 at 460,000 tons. As in Malaya, costs of rubber production have increased considerably compared with prewar. Indonesia also possesses large resources of oil but at the moment only the prewar fields in Palembang and Balikpapan are producing. Their output has steadily increased and is now over 200,000 tons a month, but this is well below the 1938 average of 600,000 tons a month. Possession has yet to be regained of the fields in other parts of Sumatra as well as those in Java. If political stability could be secured, the Indonesians would benefit through the development of their native resources, and the world would be relieved of some of its critical shortages.

Safety of Life at Sea

After six weeks of deliberation in London almost every maritime nation in the world has signed a new International Convention on Safety of Life at Sea—apart from Yugoslavia which refused to agree, and Russia, which asked for thirty days to consider its decision. That so much was achieved in so short a time was due mainly to arduous preparatory work, particularly in Great Britain and the United States, during the last three years. Since the 1929 Convention was signed, many advances have been made in structural design, life-saving and fire appliances, radio and navigational aids; the new science of electronics, vastly developed during the war, has transformed the whole problem of safety for shipping.

Details of the revised convention have not yet been published, but perhaps the most important step is to extend to cargo vessels many provisions which previously applied only to passenger ships, mainly about fire appliances, lifeboats and other life-saving equipment. Some of these have already been covered by the Ministry of Transport in recent statutory orders. Direction finders must be fitted to all sea-going ships and continuous wireless watch on the "SOS" frequency must be kept by at least one radio officer assisted by an automatic warning device. Coastal ships will generally be required to carry radiotelephone apparatus. The collision rules have been revised; requirements for navigating lights have been altered; and recommendations have been made about the use of radar.

The new convention will come into effect in 1951, if it has by then been ratified by 15 signatories, including seven nations having more than 1,000,000 tons gross of shipping. Its acceptance can indeed be taken for granted, and shipowners will have good time to consider its effects on the building and running costs of their ships. Under the new convention, supervisory powers will be given to the proposed Maritime Safety Committee of IMCO (Intergovernmental Maritime Consultative Organisation); paradoxically enough, private shipowners in the west find themselves in agreement with the Soviet Government in their lack of enthusiasm for this move.

Free Market for Sisal?

The East African sisal crop has been the mainstay of British hemp supplies since 1942, when Japan overran the Philippines and Indonesia. To secure supplies, the Board of Trade signed a long-term contract with the growers buying their entire exportable surplus. This contract expired last December but as no other marketing arrangements had been agreed upon, it was extended first up to the end of June and more recently until December, 1948. The East African growers are divided on the question of the appropriate marketing organisation after government purchasing ceases. Indian and Greek planters would like a central marketing board and pooling of supplies, while European growers, who in the past have produced much higher quality sisal, would prefer to return to the prewar system of free marketing. This division, however, runs on political as much as economic lines. Under the ordinances of the East African Government, a marketing scheme cannot be introduced unless it is approved by a two-thirds majority of the growers, based on the quantity of sisal produced in the previous year. At growers' meetings held in both Kenya and Tanganyika last month, the two-thirds majority needed for setting up a marketing board was not obtained.

But a return to free marketing would not be without its problems. So long as manila from the Philippines can only be bought for dollars, sisal produced by sterling countries is likely to enjoy a good market—with the result that adequate supplies for Britain may be difficult to secure. Long-term contracts with a colonial "trustee" area, as distinct from a dominion, might be open to criticism as an act of "discrimination"—a point on which Britain is still bound by the terms of the U.S. Loan Agreement, although the Americans have in the past interpreted its meaning quite liberally. In any event, the United States is in a position to buy both manila hemp and Central American sisal, and supplies from sterling sources are unlikely for that reason to be diverted to dollar markets to any material extent.

One crucial problem in returning to free marketing would be the location of the terminal market. Before the war London was the trading centre for hemp, as it was for many other commodities. But the Indian and Greek growers in East Africa want to set up a market at Dar-es-Salaam, and they account for over half the output of Kenya and Tanganyika combined. There appears to be a general tendency for primary markets to move to the main sources of supply, although London could count on retaining a useful part of its prewar trade so long as it was more efficient than any new African market. That should not prove to be an impossible task, for London has available all the financial and service facilities which must accompany the successful operation of an international commodity market.

Agreement on Indian Transit Trade

Negotiations between the Governments of Pakistan and India have been successfully concluded on the free transit of goods between the two Dominions. The matter was brought to a head last autumn when Pakistan levied an export tax on jute crossing its land frontiers. Since that time, both sides have imposed levies on goods entering the territory of the one in transit to the other, with the inevitable result that trade has been seriously damaged and wasteful burdens have been imposed on transport. It says much for the good sense of both dominions that these differences have at last been overcome and that a reciprocal agreement granting free transit for goods has come into force at the beginning of this month. Pakistan jute may now pass freely through the port of Calcutta without paying a doubtful export duty, while petroleum for India can be freely imported through Karachi. The agreement, of course, covers all commodities which must pass through one dominion to the other, but petroleum and jute were the two main items.

This news is encouraging both in its wider political aspects, and from the narrower viewpoint that jute exports should be more readily accessible. The Pakistan port of Chittagong, as was expected, proved to be quite inadequate to handle Pakistan's exports of jute, and much of it had still to be shipped through Calcutta. The Indian Government from time to time held up shipments in order to husband adequate supplies for the Calcutta mills and overseas manufacturers suffered in consequence. At the end of April, stocks of raw jute in Britain amounted to only 39,400 tons—or a little under five months' supply at the current rate of consumption. This indeed represented an improvement compared with the end of 1947 when stocks had fallen as low as 33,600 tons, but in April last year they totalled 70,400 tons—and that was not a peak month. Larger imports are due to arrive in the next two months, and Dundee should have no fears about an immediate shortage of raw material. During the past two years, it has apparently been the policy of the Jute Control to reduce its stocks, for imports have been considerably lower than consumption. But it is questionable whether they can be reduced much more without affecting the smooth running of the industry.

CWS Bank Expansion Checked

The latest balance sheet of the Co-operative Wholesale Society bears out the recent indications that the aggressive phase in the expansion of its banking department has ceased—at least for the time being. In 1946-47 total deposits of the CWS "Bank" rose from £226.7 million to £249.3 million; in the following year (to January 10th last) there was a fractional decline—to £248.5 million. During the year the number of local authorities having accounts with the "Bank" rose from 95 to 151, but there is little doubt that most of this new municipal business was attracted in the earlier part of the period. Although the drift of such business to the CWS has not entirely ceased, there were signs towards the end of 1947—as a Note in these columns on February 21st pointed out—that the CWS was becoming much less enthusiastic in its efforts to attract the local authorities. Deposit allowances, though still well above the maximum which a clearing bank is permitted to offer, had fallen appreciably below the extravagant rates that were being paid early last year. It seems evident that these local authority accounts cannot have brought to the "Bank" any large volume of deposits, for the balances of the CWS itself still comprised 68 per cent of the total deposits in its banking department, and no less than 78 per cent of its balances on deposit account. It will be noted, however, that the CWS deposits as a whole fell by some £10 million, so that other deposits rose during the year.

The balance sheet still shows an extreme preponderance of investments. These, at £228 million, are £9,000,000 less than in the previous year—a decline which possibly reflects a writing-down to provide for the heavy depreciation which must have been suffered. Excluding £10 million earmarked as specific security for employees' pension funds, investments are still equivalent to 92 per cent of the "bank's" deposits. The reduction in the investment portfolio has not perceptibly improved the liquid position, because £7 million has been required to finance additional advances, now standing at £11 million. Cash has been raised from £2.2 million to £6.4 million, but almost wholly at the expense of money at call and short notice. These two items together are equivalent to 7.7 per cent of deposits. The bank does not hold Treasury bills and is not within the ambit of the Treasury deposit receipt system.

Builders' Bonus

Payment by results was never popular with the building trade union leaders; they regarded it as something wished upon them by the Minister of Health, and accepted it only as the price for the wage increase of 3d. an hour last November. This week's annual conference of the National Federation of Building Trade Operatives showed that the system is still disliked by many union members, but a resolution that it should be abandoned at the end of the two-year trial period, was decisively rejected. This opposition is in part due to the operatives' traditional dislike of change, and in part to the unsatisfactory nature of many of the incentive schemes.

Precise information about the schemes, which vary according to particular projects and sites, is not easy to obtain. Some employers have shown little interest in introducing payment by results; estimates suggest that only about one-fifth of the total number of firms are actually operating such schemes. Where schemes have been introduced—typically by the larger building

firms—they make a big difference both to speed of output and to the operatives' earnings. The case is quoted of one firm which has distributed £3,000 in bonuses among 140 men during the six months since the scheme was introduced. The resulting increase in production was estimated by the employers at 45 per cent, and by the union representatives at 70 per cent. Similar examples of increased production could probably be given by all the larger firms which are paying by results. This long overdue incentive scheme should not be allowed to collapse at the end of the trial period for lack of interest either by employers or operatives.

Meanwhile, the proposed enquiry into the efficiency of the building industry is hanging fire, and the members of the committee have not yet been appointed. Statistics about the industry are very incomplete, and since much of the talk about its inefficiency is based on hearsay, an enquiry can do no harm, even if it makes no very material contribution to increased efficiency. The building industry does not need investigation (and certainly not nationalisation which so many of the unions still harp on) so much as rationalisation. Typical of the men's conservatism are the difficulties in amalgamating the various unions which cater for building workers. This is agreed in principle, but in practice the vested interests and prejudices of the smaller craft unions stand in the way.

Fur Finance

Several months have passed since the Board of Trade revoked the open general import licence granted to the fur trade in August, 1945, on the understanding that the trade would make every effort to earn its keep in foreign exchange. Many firms undoubtedly tried to fulfil this agreement, but the table below shows that losses of foreign exchange on the fur trade were intolerably high. Part of this drain may be reflected in the rebuilding of stocks, but a good deal of it represents the cost—despite the barriers of clothing coupons and high purchase tax—of unjustifiably large supplies diverted to the home market. On slightly differing definitions the table below might present an even more unfavourable picture.

BALANCE OF TRADE IN FURS

	1938	1946	1947	1st 4 months 1948
Imports	13,518,820	12,370,185	9,549,128	4,801,813
Exports	2,516,206	4,187,297	3,275,003	1,671,769
Re-exports	9,096,786	3,989,694	3,833,057	1,794,891
Import surplus	- 1,905,828	- 4,193,194	- 2,441,068	- 1,380,153

During the convertibility crisis the general open licence for the trade was rescinded, except for four main brokers, of which Hudson's Bay is the most prominent. By this means it was possible to keep the London auctions open. Other merchants have to show that they have exported furs to the same value before

IT has been said that there are three kinds of intelligence:

INTELLIGENCE, HUMAN
INTELLIGENCE, ANIMAL
INTELLIGENCE, MILITARY

The Economist Intelligence Unit, however, is concerned with a fourth category: INTELLIGENCE, ECONOMIC. Our specialist staff of research workers and statisticians can provide information on industries, agriculture, commodities, banking, finance and commerce, at home and abroad. If you will send us details of your needs, we shall be glad to put our services at your disposal.

Telephone: WHItchall 1511, Ext. 13.

they can obtain an import licence. The Fur Trade Emergency Committee, which was formed last autumn, links the market with the Board of Trade, and issues import quota certificates. A merchant who continues to sell to the home market is unable to replace his stocks. But it is permissible to make a single transfer of an import quota certificate to another merchant; they are in practice being dealt in at 50 per cent of their face value. This week the Board of Trade warned importers in general that such practices which doubtless are not confined to the fur trade are illegal.

At first sight it would seem that the foreign exchange drain is continuing at a higher rate than in 1947. This is misleading as imports tend to be biggest in the early months and exports expand seasonally later in the year. In fact, as the volume of exports and imports has expanded, 1948 should show a much needed improvement on the foreign exchange performance of 1947. But the scheme introduced to meet last year's emergency is by no means free from criticism. If an exporter receives an order which he cannot meet out of stock, he has to approach one of the brokers. If the broker cannot supply out of stock, he can import under his open general licence and charge the merchant up to 3 per cent commission for doing so. The merchant resents losing contact with his overseas suppliers, and sometimes having to tell the broker where the particular furs which his own client wishes to purchase may be found. Consignment business which in terms of foreign exchange earnings had previously been one of the most profitable branches of the London fur market is virtually impossible. There are moves afoot at present which will reduce the number of merchants who may do direct business with Russia. Fur traders are almost as individualistic as their wares, and they do not warm to control. But the need to earn foreign exchange is as great as to conserve it. The quota system must indeed be enforced—if anything, enforced more strictly; but there are practical reasons for believing that the exporter's task could be made more profitable if the system were amended so that he could receive part of his quota *ex ante* rather than *ex post*.

Shorter Notes

The net profit of the Royal Dutch Petroleum Company fell from Fls. 72,607,500 to Fls. 66,992,288 in 1947 despite the rise from Fls. 74,754,408 to Fls. 75,922,249 in dividends on shares and interest on investments less tax received by the company. Administration and other expenses for the year amounted to Fls. 6,670,869 against Fls. 1,436,736 and service of the new 3½ per cent debenture loan to Fls. 1,250,263. The dividend has been maintained at 9 per cent on the old ordinary capital.

The legal schemes of arrangement for the disposal of the net proceeds of the sale of the British railways in Uruguay have been

published this week. In the case of Central Uruguay which has at its disposal some £5,591,000 of the total purchase price for the railways of £7,150,000, an additional amount of £196,487 for assets not included in the sale is available bringing the total funds of the company up to £5,787,487. Of this amount £523,049 is required to meet various deductions before arriving at the figure of £5,264,438 available for distribution. The deductions consist of £287,517 for creditors not affected by the scheme, £194,046 for pensions and compensation to staff, and £41,486 for pensions and compensation to directors.

As from August 3rd, the Stock Exchange will provide facilities for centralised delivery and collection of transfers and cheques in respect of registered securities. Brokers' messengers will be able to complete the process at three counters in a special part of the Settling Room. For a payment of £3 annually by each active member, the Stock Exchange authorities will at last make possible the elimination of a great deal of expensive and wasteful work which messengers have had to carry out hitherto.

At a luncheon on Tuesday Mr Harold Wilson announced that trade negotiations with Russia were to be reopened soon. The President of the Board of Trade would be dealing with the discussion in London and if it became necessary, Mr A. G. Bottomley, Secretary for Overseas Trade, would go to Moscow. Any expansion of trade with Russia, Mr Wilson said, would have to take place on a wider basis as regards the goods this country would in future send to the Soviet. He had sent a list of goods to the Russian authorities which covers practically everything this country exported.

On Monday Mr Justice Wynn-Parry sanctioned the scheme of arrangement between Miles Aircraft, its shareholders and two classes of unsecured creditors. The Company's capital is to be reduced from £1,000,000 to £70,000. This reduction will be effected by cancelling paid up share capital to the extent of 16s. 8d. per share on each of the 350,000 issued £1 preference shares, by cancelling 4s. 10d. per share in 1,400,000 issued 5s. ordinary shares and cancelling all unissued capital. Following the reduction, authorised capital will be restored to £1,000,000 by creation of preference and ordinary shares of 1s. each. Barclays Bank will receive payment in respect of £93,820 advanced for wages and the Inland Revenue £345,590. Unsecured creditors with claims exceeding £19 will receive, in respect of each £1 claimed, unsecured stock to the amount of 6s., four 5 per cent non cumulative preference shares of 1s. each, and one ordinary share of 1s.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports appear in the Supplement: Marks and Spencer; Metal Box; Fine Spinners and Doublers; Harland and Wolff.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'e'), and those paying 3 per cent or less will be repaid at the latest date (marked 'f'). (m) Net yields are calculated after allowing for tax at 9% in the £. (f) Flat yield. * Assumed average life 15 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 24 per cent free of income tax. (m) 15 months. (n) 15 months. Basis 25%. † Free of tax.

I FEEL LIKE AN ANGEL, up here, winging on my way to be with you... It's the sense of riding on a big friendly cloud that makes her feel like that. Quietness, a tranquil atmosphere—she writes her letter easily, naturally, and in perfect comfort in the lounge cabin of the Short flying boat.

IN THE EVENING

After an excellent dinner, it is a pleasure to sit in the quiet, roomy cabins. The steward will bring the drinks—and through the wide window is a dreamlike view of the passing world below. And then, to bed in cloud-pillow comfort, to dream of breakfast in Augusta.

The romance of flying, to all parts of the world, is catered for in a big way by Shorts. Flying boats leave the U.K. regularly for India and China, South Africa, Australia, and New Zealand. Short flying boats operate also in South America and Scandinavia. Your travel agent has details.

It's fun to fly by flying boat!
Shorts THE FIRST MANUFACTURERS OF AIRCRAFT IN THE WORLD

for the brightness in washing

Among the many materials Shell Chemicals have developed from petroleum are the new detergents. Used extensively in factories, ships, hospitals, public buildings and laundries, these versatile products also form the 'active element' in a great number of the best washing agents available today.

Shell Chemicals Limited (Distributors).

STOPPED—FOR REPAIRS

Water can be a major nuisance to industry for it may cause scale deposits or corrosion which reduce efficiency in heating and cooling systems or block the main supply. The introduction of minute quantities of 'Calgon' (sodium metaphosphate) into industrial water systems is now a recognised way of preventing scale formation, corrosion, and the troubles which follow in their wake.

ALBRIGHT & WILSON LTD
CHEMICALS
CALGON, MICROMET—
TRADE NAMES FOR SODIUM METAPHOSPHATE

This amazing new development provides easy, quick correspondence by magnetic-electronic recording and reproducing the human voice on inexpensive recording discs. IT OFFERS FEATURES NO OTHER DICTATION UNIT ON THE MARKET CAN MATCH and presents an entirely new and vastly improved concept of magnetic-electronic dictation equipment. Recordings can be transcribed, filed, mailed and played back at any time. No cylinders to shave. Recording discs can be instantly erased and used over and over again. At its low cost of £45 it will pay for itself many times over. Made in England.

THE UNION-CASTLE MAIL STEAMSHIP COMPANY, LIMITED

REASONS FOR MARKED IMPROVEMENT

PASSENGER ACCOMMODATION FILLED

HEAVY COST OF NEW TONNAGE

SIR VERNON THOMSON ON THE OUTLOOK

The annual general meeting of the Union-Castle Mail Steamship Company, Limited, was held, on the 10th instant, at the offices, 3, Fenchurch Street, London, E.C.

Sir F. Vernon Thomson, Bt., G.B.E., the chairman, who presided, in the course of his speech, said: The balance sheet and profit and loss account for the year 1947, read in conjunction with the report, set out clearly the position of the company. You will recall that the Union-Castle Company completed a very extensive shipbuilding and re-engining programme only just prior to the outbreak of the late war, with the fortunate result that our large and efficient fleet was fully available to the Allied cause at that crisis in our country's history. Last year was the first since 1939 in which all but two of our passenger and cargo vessels have been trading in their normal services. As this coincided with a period of very active world demand for shipping, our company has now for the first time reaped the full benefit of its prewar and subsequent shipbuilding policy. Our earnings this year are really the first fruits of our work and expenditure over the last twelve years.

DEMAND FOR SPACE

During 1947 our passenger accommodation has generally been filled to capacity, but this is contrary to normal peacetime experience, when there has usually been a considerable margin of empty berths except in the seasonal periods. Beyond a certain point every additional passenger carried naturally adds to the profits of the voyage, but had not our passenger carryings ship by ship far exceeded the prewar average, the rates charged would have proved uneconomic with costs at their present level.

Throughout the year there was also a steady demand for cargo space and we were able usefully to supplement our own ships by tonnage taken on charter. Our subsidiary companies made satisfactory profits during the year and the value of our investments in these and elsewhere is considerably in excess of the figure at which they appear in the balance sheet. In these circumstances the results now submitted to you, with a net profit of £1,885,921, naturally show a marked improvement upon the earnings of our fleet while requisitioned.

NEW VESSELS

A great liner company like ours cannot be long without some new tonnage on the stocks. Even when the two new mail vessels which we expect to be ready within the next few weeks are delivered, we still require three more intermediate vessels to complete the replacement of wartime losses, without making any allowance for possible new developments. To this end we have recently placed a contract for a vessel of similar dimensions to the *Durban Castle*.

Stockholders will readily appreciate that as ships are wasting assets it is necessary, in order to renew these assets and maintain our capital intact, to set aside annually sufficient depreciation to equal a vessel's original cost by the end of her life. In addition, however, there are at present the greatly enhanced postwar costs of replacement; these affect obsolescent tonnage also. Without burdening you with details, a passenger vessel of the same size and speed as one of ours built just before the war would cost to-day about two and a half times the prewar figure. The cost of one of our new mail vessels to-day would be in the neighbourhood of £3,000,000.

Efficient tonnage is essential to provide the efficient service which it is our constant aim and pride to give to Britain and Africa. As has been seen to-day this means very costly tonnage. The cost affects the annual depreciation to be set aside for replacement, also the running expenses throughout the lifetime of the vessel: whereas earnings are not static at their present high level; they fluctuate. Thus it is doubly important to build up adequate financial reserves while we may. Accordingly, the directors have added £1,000,000 to the general reserve account, which now amounts to £1,500,000. Used in development of our business this is additional productive capital.

DIVIDEND MAINTAINED

The earnings for 1947 would normally warrant an increased distribution to stockholders, particularly in view of the lean years during which the ordinary stockholders received no return whatsoever. Having regard, however, to the extent to which the increased earnings are due to exceptional conditions which may prove to be largely of a temporary character, and bearing in mind the government request that dividends should not be increased in present circumstances, the board felt that stockholders would approve of the dividend upon the company's ordinary stock being maintained at the level of last year's distribution (that is 6 per cent., plus a bonus of 2 per cent.) and that advantage be taken of the opportunity to strengthen the company's power to cope satisfactorily with any future development which may arise in the fortunes of the shipping industry.

Shipping ranks as a speculative investment, dependent as it so largely is upon the course of overseas world trade. Experience shows that shipping has periods of prosperity and of depression. We cannot insulate ourselves from the general level of world trade, but we can modify the impact of these events by endeavouring to pay a reasonable, steady dividend through good periods and bad. This also is best achieved by setting aside reserves when trading permits.

For many years now the Union-Castle Company has had, in addition to a staff superannuation fund association, a widows' and orphans' fund association. To the latter we have contributed an annual sum of £10,000. To promote further the welfare of our staffs ashore and afloat, the directors have this year set aside the large sum of £312,693, which, while commuting the com-

pany's annual contribution, will also strengthen and add to the usefulness of the fund. After making these allocations and providing for the dividend, the increased balance of £831,480 is carried forward.

FLEET

There has been no change during the year in the company's fleet, which consists of 24 vessels of 315,145 gross register tons. It has been maintained in a state of high efficiency, and has been operated without serious accident. Although less rapid than we had hoped, good progress was made during the year with the two new mail vessels building at Belfast, and the launching of these fine ships constituted events of exceptional interest.

The launch of the *Pretoria Castle* on August 19, 1947, was unique in that the vessel was named and launched by radio-telephony by Mrs J. C. Smuts, wife of Field-Marshal Smuts, from her home near Pretoria. The company was further honoured when H.R.H. Princess Margaret graciously visited Belfast to name and launch the *Edinburgh Castle* on October 16, 1947. This was the first public function undertaken by Her Royal Highness. Both ceremonies, which were broadcast in the Home and Overseas Services, were completely successful.

It is expected that the *Pretoria Castle* will be delivered to the company early next month and will sail on her maiden voyage on July 22nd. The *Edinburgh Castle* should be completed about two months later and sail on her first voyage in the first half of October.

MAIL SERVICE

We have maintained a weekly mail sailing between Southampton and Cape Town throughout the year. As our passenger vessels returned to trade we were able to increase the number of passenger ships employed in this service, until, by October, five out of every eight weekly sailings were taken by passenger ships, the remaining three sailings being performed temporarily by fast cargo vessels.

The advent of the *Pretoria Castle* and *Edinburgh Castle* will result in only one sailing in eight being taken by a cargo ship and this remaining gap will be filled when the *Winchester Castle* re-enters service in the spring of 1949.

CARGO SERVICES

Our cargo vessels were employed during 1947 in our regular services between the United Kingdom and Continent and South and East Africa, as well as between the U.S.A. and South and East Africa.

PASSENGER TRAFFIC

The increasing number of passenger vessels available enabled us to make progress in carrying a large number of the passengers whose names had been on our waiting lists for a long time. The list of those waiting to travel homeward from South Africa was worked off by August last, and from then until towards the end of the year our vessels sailed for the United Kingdom with some vacant accommodation.

The position outwards is still difficult owing to the large numbers who wish either to take up permanent residence in South Africa or to spend the English winter there, but, with the advent of the *Pretoria Castle* and *Edinburgh Castle*, further progress should be made in reducing the outward waiting lists.

CARGO TRAFFIC

Throughout the year we secured good outward cargoes, but return cargoes, which are subject to seasonal fluctuations, sometimes fell short of our hopes, particularly later in the year. We are, of course, taking our full part in shipping the highly important United Kingdom exports to South Africa.

The agreement under which the Union lends £80,000,000 to the United Kingdom and the latter continues to buy South African products is very welcome as an outstanding example of mutual good will and of trade within the Commonwealth.

Cargoes from the U.S.A., which earn much-needed dollars, proved disappointing from time to time. We employ vessels of large cargo capacity in this important trade in which we have been engaged for so long and in which we intend to maintain our position in spite of severe competition from vessels of other flags.

Delays in port both in this country and overseas, have become accentuated since I mentioned them at our last annual meeting. I cannot too strongly emphasise the importance of the swift handling of vessels and quick turn-round in ports in order to obtain the maximum value from the available shipping resources.

SOUTHAMPTON DOCK FACILITIES

Last year I mentioned the proposal that we should transfer our mail vessel operations entirely to the new docks at Southampton, where it was expected that better facilities for handling passengers and cargo would be provided. Owing to the restrictions on capital expenditure which have been imposed temporarily, further progress has not yet been possible with this project.

DEVELOPMENTS IN SOUTH AND EAST AFRICA

The Union of South Africa continues to enjoy general prosperity and is still Britain's best customer. Expansion of secondary industries continues and many British firms are opening factories in the Union.

Important developments are also taking place in the Rhodesias and in East Africa, where great schemes are already taking shape. The company hopes by providing suitable shipping facilities to play its full part in the furtherance of plans for the greater utilisation of the vast natural resources of these territories, but it is plain that considerable development will be needed at some of the ports and in internal communications before any great expansion can be achieved.

While the mail and intermediate services to the Union must have our primary attention, we are fully alive to the needs of the other territories we serve. Now that the full resumption of the mail service is in sight we shall proceed to restore and, if necessary, augment our other services with particular reference to developments in the British territories of East Africa.

PROSPECTS

Immediate prospects for passenger traffic continue good and it is not yet possible to say how far air competition may be felt in more normal times. There are no signs at present of any falling-off in cargo. Every effort is being devoted to the expansion of the United Kingdom export trade. Operating costs, however, continue to rise. Our stockholders already know something from previous meetings of the post-war inflation of running and maintenance expenses of shipping. Since the end of 1947 oil fuel has again considerably increased in price and this item alone will involve the company in an increased expenditure of over £600,000 for 1948.

STAFF

Once again I have pleasure in expressing on your behalf and on behalf of the board warm appreciation of the services rendered throughout the year by the company's staff ashore and afloat.

The report and accounts were unanimously adopted; the retiring directors were re-elected; the auditors were reappointed and the proceedings terminated with a vote of thanks to the chairman, directors and staff.

ST. HELENA GOLD MINES, LIMITED

(Incorporated in the Union of South Africa)

GOOD PROGRESS IN TWO YEARS

MR P. M. ANDERSON'S SURVEY

The second ordinary general meeting of St. Helena Gold Mines, Limited, was held, on the 4th ultimo, at Johannesburg.

Mr P. M. Anderson, the chairman of the company, presided, and in the course of his remarks said:—

During the year a call of 4s. per share was made in respect of the 2,616,000 partly paid shares, and since the close of the year the balance of 5s. per share has been called up, so that the issued capital is now £2,500,000 in 5,000,000 10s. shares fully paid.

Expenditure since the inception of the company totalled £1,475,722, leaving on hand a balance of cash and cash assets less liabilities amounting to £370,278 as at December 31st last, to which must be added £654,000 in respect of the call on the partly-paid shares to which I have already referred.

NO. 3 SHAFT

No. 3 shaft (30 degree incline) had, by the end of the year, been sunk to an incline depth of 1,418 ft. Progress was slow, owing to the soft and friable nature of the Karoo shales through which the shaft was being sunk during the greater part of the year, and the consequent necessity for concrete-lining the shaft. Since December, when the harder Witwatersrand quartzites were entered, sinking has been much faster, and by the end of the first quarter of 1948 the shaft had reached a depth of 2,161 ft. from the collar. It is expected that this shaft, which will have a final incline depth of about 3,000 ft., will be completed and equipped by the end of this year, whereupon crosscutting to the reef will be commenced.

Three routine boreholes, which were put down from this shaft between 1,527 ft. and 2,042 ft. from the collar, show that the Leader and Basal reef horizons occur about 60 ft. and 90 ft. respectively below the incline. All three boreholes intersected the Leader reef, the values being 3.7 dwts. over 5 ins., 9.12 dwts. over 17 ins. and 6.5 dwts. over 14 ins. In the lowest of these boreholes the Basal reef also was intersected, the value being 450 dwts. over 4.5 ins.

No. 4 vertical shaft (formerly known as No. 1 shaft) was sunk with temporary equipment to a depth of 116 ft. during 1947, and at the end of the first quarter of the current year had reached a depth of 432 ft. The headgear is nearly complete and work has begun on erection of the first of the main winders. This shaft will be sunk to a final depth of about 2,750 ft.

A GREAT DEAL ACCOMPLISHED

When your company began operations two years ago, it did so in the middle of the open veld, with its employees camped in tents. Before any other work could be started it had to build roads, sink boreholes for water, erect its own electric power plant, and provide accommodation for its employees.

A great deal has been done since that time. Apart from the erection of many of the necessary mine buildings, 108 houses for employees have been completed and are now occupied, and a further 46 are under construction; compound rooms for 720 natives

are completed and more are being built. The permanent native hospital is nearing completion, and the company has provided a temporary nursing home for European employees, since there are no hospital facilities nearby. Much has also been done to provide social and recreational facilities for employees, as well as the planting of trees and gardens to relieve the tedium of the bare veld on which the property is situated.

THE RAILWAY LINE

The railway line, which the South African Railways are constructing to serve the mines in the area, has reached Odendaalsrus and is partially open to traffic. Electric power for your company's requirements has up to now been provided by its own small plant, but power from the Victoria Falls and Transvaal Power Company, Limited's, transmission line from their Vaal generating station will be available shortly. While the supply of water, from surface boreholes which your company has drilled, seems assured for the near future, full development of your company's property and of the other mines in the area depends on the speed with which the Government complete the pipeline from the Vaal River, some 50 miles away. It is therefore to be hoped that every effort will be made to press on with the completion of this service.

With a view to straightening the common boundary for the St. Helena Lease Area and Welkom Lease Area No. 3, your company has entered into an agreement with African and European Investment Company, Limited, and Welkom Gold Mining Company, Limited, for an exchange of an equal area of reef-bearing ground. The agreement, which now awaits the approval of the Minister of Mines, provides for the transfer of the under-mining rights of a portion of the farm Marnageli No. 663 from the St. Helena Lease Area to form part of the Welkom No. 3 Lease Area. In return, portions of the farm Welkom No. 680 and of the farm Stuurman-span No. 692, which are at present part of the Welkom No. 3 Lease Area, will be included in the St. Helena Lease Area. This agreement also includes provision for an adjustment of the areas transferred in the event of any serious loss of reef-bearing ground by either company through faulting.

NEW PRINCIPLE IN GOLD LAW

I referred last year to the fact that your company had been unable to reach agreement with the Government over the manner in which proclamation of your company's mining lease area and the determination of surface owners' reservations were to be effected, and that it had been mutually decided to test the issue in the Courts, with the object of obtaining the correct interpretation of the law. As shareholders may have seen in the press, the company won its case, but within a few weeks of judgment being given, and just prior to the close of the 1947 session of Parliament, the Government put through an Act amending the Gold Law, the effect of which was to undermine the result of the Court's decision.

The law as amended lays down that compensation must be paid by the mineral right holder to the surface owner for any portions of ground excised by the Government Mining Engineer and not granted to the surface owner as an owner's reservation. This introduces an entirely new principle into the Gold Law, which already makes provision for the surface owner being compensated for the loss of the use of his surface through the payment to him of claim licence moneys. You will appreciate that, in the face of such action by the Government, there was nothing further that your directors could do about the matter.

In reply to a shareholder, the chairman stated that it had been reported in the Press that limited supplies of water through the Government water pipeline would not be available until 1950.

The report and accounts were adopted.

LAPORTE CHEMICALS, LIMITED

SATISFACTORY LEVEL OF TURNOVER

The forty-first ordinary general meeting of Laporte Chemicals, Limited, was held, on the 16th instant, at Luton, Mr L. P. O'Brien (chairman of the company) presiding.

The following is an extract from the chairman's circulated statement:—

For the first time we meet at an annual general meeting under our new name—Laporte Chemicals, Limited. The change was effected quite smoothly and met with approval from stockholders, customers and others concerned.

The sub-division of the ordinary shares from units of £1 each to units of 5s. each was also welcomed.

For the year ended March 31, 1948, the profits of the company, including dividends from subsidiaries, amounted to £239,469—an increase of £91,925 over the previous year.

Operating conditions throughout our plants were generally more favourable, with less involuntary stoppages than were experienced during the previous twelve months.

Major extensions and improvements to the electrolytic hydrogen peroxide plant and the titanium oxide manufacturing plant of our subsidiary, National Titanium Pigments, Limited, were completed during the period under review. It is not expected that there will be further extension of hydrogen peroxide manufacture or titanium oxide manufacture at Luton, owing to limitations imposed by the site.

ADDITIONAL MANUFACTURING CAPACITY

The present output of hydrogen peroxide of your company alone is now sufficient to meet current industrial home demands. Nevertheless, new works have been commenced at Warrington for additional manufacturing capacity.

When the Warrington plant is completed the company will be in a position to gauge, according to the sales possibilities at home and abroad, whether they can at that point cease operating some of the older hydrogen peroxide plant at Luton.

The first stage of development at Warrington is estimated to cost about £715,000 and will be paid for out of the proceeds of the recent capital issue. The value of contracts and orders given in connection with the Warrington Works at March 31, 1948, was £503,136.

A site for a new titanium oxide plant has been acquired at Grimsby by National Titanium Pigments, Limited, and application made to the Board of Trade for permission to proceed with the erection of the necessary works. The Grimsby site is considered more suitable for the manufacture and distribution of titanium oxide than is Luton, where the present extended plant is regarded as more or less of a large-scale pilot plant, which should be written off and closed in due course as and when the proposed new works is adequate to meet the growing demand for this product.

Our subsidiary companies have made good progress since we last met, and particularly the larger ones—National Titanium Pigments, Limited, and John Nicholson and Sons, Limited.

The manufacture of barium chloride is to be undertaken at Nicholson's works at Monk Bretton, Barnsley, within the next two or three months.

BALANCE SHEET OF PARENT COMPANY

The new capital created by the recent issue of 1,010,400 ordinary shares of 5s. each at 18s. 6d. each is not yet reflected in the accounts and does not rank for dividend in respect of the year ended March 31, 1948.

The amount of the fixed assets shows an increase of £136,000 after making provisions at the usual rates for depreciation and for obsolescence.

Increase of £42,200 in investments arises from the completion of acquisition of the share capital of John Nicholson and Sons, Limited, amounting nominally to £7,200; and additional preference capital of £35,000 subscribed to National Titanium Pigments, Limited.

The current assets amount to £69,000 more than for the previous year.

When the accounts were made up in 1947 the company was feeling the effects of the February/March enforced stoppages, and at that time stocks ran lower than usual, and lower sales were reflected in the amount owing by sundry debtors and subsidiary companies.

It will be noted that loans were made to subsidiary companies, amounting to £57,000; £45,000 of this was to National Titanium Pigments, Limited, and has since been discharged by a further issue of preference shares of that company; £12,000 was loaned to Genoxide, Limited.

The issued ordinary stock has increased by the amount of £4,800 required to complete the Nicholson share purchase, and capital reserve now stands at £140,263, the slight increase arising from the same transaction.

The general reserve has increased to £170,000 by an allocation of £10,000, as has been usual during recent years.

The profit and loss account balance carried to the balance sheet is increased this year by £35,762 to £122,200.

Referring to the current liabilities, the increase of £75,000 reflects both the increased business of the company and liabilities on capital account.

Loans from subsidiary companies have increased by £70,000 to £115,000 and these will be repaid out of the proceeds of the new capital issue.

It will be noted that the company has been able to undertake some of the deferred repairs for which the provision is now reduced to £10,000, and of course, current repairs, which are heavy in the chemical industry, have been effected and dealt with in the ordinary way in the accounts.

Provision for taxation at £151,895 should be adequate to meet any liabilities which will arise from the present accounts, unless there is created any new retrospective liability.

Finally, there is provision for a proposed final ordinary dividend of 12½ per cent., which amounts to the same as distributed for last year, making a total of 17½ per cent. for the year.

THE PRESENT AND THE FUTURE

The turnover throughout our group for the current financial year continues at increasingly satisfactory levels and, as far as can be foreseen, your directors expect to be able to maintain the present rate of distribution on the increased capital.

In the meantime, selling prices of our products are under constant review, and reductions have been made in regard to several of the more important chemicals.

Your companies are gathering advantage from research work of past years and will extend their activities in this field.

PENSION FUND

A new company has been formed, named "Laporte Pension Fund Trustees Limited," to undertake the management of a pension scheme applicable to all employees (including executive directors) in the Laporte group of companies, to commence from July 1, 1948.

I would like to express the thanks of the board to all employees for their co-operation and good service throughout the past year.

The report and accounts were unanimously adopted.

TIMOTHY WHITES AND TAYLORS, LIMITED

INCREASED SALES

The nineteenth ordinary general meeting of this company was held, on the 15th instant, in London, Mr Louis Nicholas, J.P., F.C.A., the chairman, presiding.

The following is an extract from his circulated statement:—

The total sales of your company and its subsidiaries for the year ending December 27, 1947, show a satisfactory increase over those of the year ending December, 1946, but as the profit margin slightly decreased, and salaries, wages and other expenses considerably increased, the result is a slight fall in the total trading profits, etc., compared with that year.

The net profits of the group, however, are £592,973, as against £440,637 last year. This increase is mainly due to the saving in mortgage and debenture interest and the reduction in taxation. The dividend upon the ordinary share capital has been restricted, as suggested by the Chancellor and the Federation of British Industries, to the same figure as that of the previous year—namely, 32½ per cent., less tax.

The total amount now provided for taxation is sufficient to cover the whole of the estimated tax payable in the future on profits earned to date. The group's claim for post-war refund of E.P.T. has not yet been finally settled, but the estimated total of this refund as shown in the consolidated balance sheet is £260,052 after deduction of income tax.

As to the current year, the total sales of the group are being maintained, but, in common with many other businesses, the consumer demand is showing signs of decreasing, as I foreshadowed in my statement last year, while, on the other hand, salaries, wages and other expenses still continue to rise.

The report was adopted.

VIROL, LIMITED

SUCCESSFUL RESULTS

The forty-eighth annual general meeting of Virol, Limited, was held recently in London. In the unavoidable absence overseas of the chairman, Mr L. F. Matthews (managing director) presided and read Lord Luke's speech to the shareholders.

The directors feel certain you will agree that the results reflect the very satisfactory condition of your company.

We are still a long way from fulfilling the present-day demand, and the pressure on us for supplies from the hospitals, sanatoria, maternity and welfare centres, and public health institutions, as well as the trade, continues to make it necessary for us to distribute equitably the available supplies.

Our export trade during the year showed a marked improvement, and we shipped abroad 63 per cent. more than the previous year, thereby reaching in volume something approaching our prewar trade. The improvement in the gross profit on trading is the result of an increase in sales, but operating expenses were up by approximately £14,000, resulting in a net profit of £50,022, against £46,553 last year. Taxation takes £23,000, including the 25 per cent. profits tax on the dividends, leaving £27,022, against £22,553 in 1947: the directors recommend after paying the Preference dividend and transferring £15,000 to reserve, against £10,000 last year, that the Ordinary shares receive a dividend of 17½ per cent., less income tax, as against last year's 15 per cent., and 2½ per cent. bonus. The amount carried forward is, therefore, practically the same as last year.

A higher rate of dividend could be distributed, but having regard to the Chancellor's request that dividends should be limited we do not propose to recommend any increase. The report and accounts were unanimously adopted.

DUNLOP RUBBER COMPANY, LIMITED

A DECADE OF PROGRESS

SIR GEORGE BEHARRELL'S SURVEY

The forty-ninth ordinary general meeting of this company was held, on the 10th instant, in London. Sir J. George Beharrell, D.S.O., the chairman, presided.

The following is an extract from the chairman's statement which has been circulated with the report and accounts for the year ended December 31, 1947:—

The consolidated operating profit of the group (excluding Germany and Japan) for 1947 amounted to £9,426,000, compared with £8,263,000 in the previous year. This reflects the considerably increased production and sales volume during the year both at home and abroad. Abnormal profits not attributable to the current year at £134,000 show little change from the previous year.

The total depreciation provided by the group, £2,169,000, shows an increase of £254,000 as a result of the substantial additions to fixed assets under the post-war expansion plans.

The net profit for the year amounts to £6,728,000, an increase of £734,000 on 1946. To the net profit there is added a special credit of £750,000 representing a further partial refund of excess profits tax paid by the parent company during the war years in respect of companies formerly in enemy territories. The negotiations with the Inland Revenue regarding these companies have progressed satisfactorily during the year, but full information is still not yet available in respect of our Japanese company. When negotiations have been finalised it is anticipated that a further substantial sum may be recovered.

It will be seen from the accounts that United Kingdom taxation adjustments for previous years are now shown as a separate item, the group's total for the year being a credit of £157,000. Such adjustments must inevitably arise each year in a large group of companies and, for some time to come, these may be appreciable until excess profits tax items such as deferred repairs and terminal losses have been finally settled. The total taxation charge for the year is £3,841,000, as compared with £3,826,000 for 1946. The cessation of special war taxes and slightly lower rates of taxation have largely offset the current taxation on the increased profits.

The board's policy of conserving the financial strength of the group later is evidenced by the increase in revenue reserves of £2,307,000 transferred from the 1947 profits. The balances carried forward are also increased by £227,000 from £1,408,000 to £1,635,000.

CONSOLIDATED BALANCE SHEET

During the year the total expenditure of the group on fixed assets has been £4,770,000, of which £2,408,000 was expended in factories and premises of the parent and subsidiary companies in the United Kingdom and £2,362,000 in factories overseas. After deducting the depreciation provision of £2,169,000 the net increase in fixed assets is £2,601,000, giving a total book value of £17,090,000.

A note on the balance sheet indicates there are outstanding capital commitments of £3,900,000. This refers to fixed assets but only to the extent of actual contracts placed. The expansion plans formulated by the board as far back as 1944 are already achieving remarkable results as evidenced by the increased production now flowing from new or extended factories at home and abroad.

Under investments there again appears an amount of £633,000 representing the book value of our investments in the German and Japanese subsidiary companies, the accounts of which cannot yet be consolidated. The German company is now restored to our full ownership and negotiations are proceeding.

ing for the release to us of the Japanese company by the occupation authorities.

Under current assets inventories show an increase of £6,105,000 from £16,444,000 to £22,549,000, reflecting the increased production and sales volume and the high level of costs which prevail throughout the world. Sundry debtors on the other hand have increased to a far less extent, largely due to the more prompt payment by customers at home. The liquid funds represented by securities, tax reserve certificates, and bank balances are consequently lower.

IMPORTANT FACTORS

On the left hand side of the consolidated balance sheet there are several important features. Compared with the position at the end of 1946 total reserves and surplus attributable to Dunlop Rubber Company Limited, have increased from £11,385,000 to £13,882,000. Over £12 millions of this total is profit retained in the business over a long period and the entire £13,882,000 is actively employed as assets of the group.

The interest of minority shareholders has increased by £1,568,000 to £3,742,000 as a result of further investment by the public in subsidiary companies overseas, principally Dunlop New Zealand, Limited, Dunlop France, the Irish Dunlop Company Limited, and Dunlop Rubber Company (India), Limited.

The total debenture and loan capital of the group has increased by £865,000 mainly due to the receipt by the parent company of the final calls on the issue of debenture stock during 1946.

Current liabilities and provisions, including taxation at home and abroad, of £17,153,000 show an increase of £2,538,000 on 1946.

GENERAL REVIEW

I have reviewed the results of the year and feel that it is desirable, particularly at this time to give pertinent facts of the group's position and progress. For this purpose I refer to the figures of the past ten years.

The total funds accruing to the group from profits and depreciation provisions, after deducting taxation and dividends distributed, amounted in the ten years to £21½ millions—this representing the profits which have been ploughed back into the business. In addition, £5 millions was subscribed by the public for shares and debentures issued by overseas subsidiary companies and the recent debenture issue of the parent company. In total, therefore, £26½ million additional funds have accrued during the past ten years and have been invested by your board as follows. We have expended £15½ millions on new buildings, plant and other fixed assets and £11½ millions on working capital, represented by increased inventories, debtors and bank, etc., balances. As a result of this financial policy the total capital from all sources now employed by the Dunlop group amounts to £59½ millions—as shown by the total of the consolidated balance sheet.

In 1937 the consolidated sales of the group (including supplies and services within the group) amounted to £40 millions. In 1947 this total increased to £102 millions.

In 1937 the consolidated net profit before charging taxation and interest was £2,558,000 and in 1947 the comparable figure was £7,058,000. It is also interesting to note that after deducting taxation these figures were reduced to £1,699,000 and £3,217,000 respectively, an increase from 34 per cent. to 54 per cent. in taxation on profits at home and abroad.

The net profit of the group in 1937, after deducting all charges and taxation, was 4.9 per cent. of sales (excluding supplies and services within the group). The comparable figure for 1947 is 3.9 per cent.

GROSVENOR HOUSE (PARK LANE) LIMITED

RECORD INCOME

The twentieth ordinary general meeting of Grosvenor House (Park Lane), Limited, will be held on the 28th instant.

The following is an extract from the statement of the chairman (Mr C. Hughes, LL.B., F.C.) circulated with the report and accounts for the year ended March 31, 1948:—

The net profit for the year amounted to £216,832. The board has pleasure in recommending the payment of a final dividend on the ordinary stock of 3½ per cent. (less tax), making 6 per cent. for the year, and a bonus of 2 per cent. (less tax).

As from March 1st the first wages regulations in the hotel industry were introduced. These regulations laid down minimum rates of pay and prescribed overtime rates for more than 100 different categories of hotel employee. I have no doubt that the intentions underlying the Wages Board Order are excellent, although mainly owing to their inelasticity, the actual regulations in practice leave a good deal to be desired. Some adjustments are urgently necessary, and I can see no reason why they should not be made, wherever the industry can establish a case for revision.

In the year under review the income from hotel rooms and flats and from catering were the highest for any year of the company's existence. But there were signs of consumer resistance to present prices. The abnormal pressure of business towards the end of the war and subsequently is decreasing, while costs of living are increasing. Add to these factors the increased cost of overheads, of wages, and indeed of everything that has to be purchased, and it will be seen that the optimism which is derived from our current success must be tempered with caution.

TRADING DIFFICULTIES

The law which prohibits the serving of bread with a meal (except as a course) causes intense irritation to clients—especially to visitors from overseas—and all the more so because the law is by no means universally observed. It is now accepted economics that some system of wages regulation, in default of wage agreements, may be necessary.

It is manifestly impracticable to lay down the same conditions of service, for an hotel like Grosvenor House, with a staff of more than 1,150, as for a small country hotel employing half a dozen people and doing an entirely different kind of trade. The provisions for spread-over of hours of work and for public holidays are not realistic, unless it is intended that service to patrons shall be reduced, an unthinkable proposition in view of the country's vital need to attract overseas visitors.

A national agreement has been signed by the trade unions and the hotel associations; the Hotels and Restaurants Association and the Residential Hotels Association are combining into one body; education for the hotel industry is developing. These three changes will, I believe, make for the stabilisation of the industry and lay solid foundations for progress and success. The Government, acting through the British Tourist and Holidays Board, has recognised in theory and in practice that the hotels of this country contribute materially to the export drive and can do more in this direction as and when it is possible to grant further facilities and remove certain restrictions. The board has already played a very effective part in helping hotels to obtain new equipment, and a tribute is due to it for the indefatigable efforts it is making.

LONDON AND MANCHESTER ASSURANCE COMPANY, LIMITED

CONTINUED EXPANSION

Mr A. H. Dawes, chairman, presiding at the seventy-ninth ordinary general meeting, held on the 16th instant, at the Chief Office, Finsbury Square, London, E.C.2, in the course of his speech said:—

The accounts afford gratifying evidence of the continued progress of the company during the past year. For the first time the combined premium income in the life branches reached the 5,000,000 mark, having increased during the year by the record sum of £334,000. The total assets increased by over £2,200,000 to £36 million, a figure which compares with £19 million 10 years ago.

The premium income in the Ordinary branch increased by £173,570 to £2,262,093. The amount of new business written, though not reaching the previous year's record, was again well over £5,000,000, the total being £5,353,401. In the Industrial branch the premium income amounted to £2,741,505, showing a record increase of £160,429.

The directors have again declared a reversionary bonus of £1 per cent. on the sum assured in respect of Ordinary branch with profits policies. Out of the Industrial branch surplus £211,465 (compared with £165,897 a year ago) is being allocated to Industrial branch policyholders (1) in the form of an increased reversionary bonus; (2) by relieving from payment of further premiums whole life assurances where before the next annual meeting the life assured attains 80 years of age and the policy has been in force for not less than 10 years; and (3) by increasing the sum assured under certain maturing endowment assurance policies.

The report was adopted.

SAN FRANCISCO MINES OF MEXICO, LIMITED

OPERATING PROFIT DOUBLED

The thirty-fifth ordinary general meeting of San Francisco Mines of Mexico, Limited, was held on the 11th instant in London.

Col. C. E. Temperley, O.B.E., M.C., presiding in the absence abroad of the chairman of the company, Mr C. T. Pott.

The following is an extract from the chairman's circulated statement:—

The net profit for the year amounts to £238,327. The directors recommend the payment of a dividend of 3s. per unit. The gross operating profit for the year was £1,153,000, or just over double the previous year's figure of £573,000. The net operating profit, however, was virtually unchanged at £238,000 against £241,000. The doubling of our gross profit was due to treating a greater tonnage of ore and to the higher level of metal prices. The fact that our net operating profit was not correspondingly increased was due to an unavoidable increase in our provision for British and Mexican taxes.

Last year we pressed forward with underground development to make up for the deficiencies of the war years, when development was sacrificed in order to produce the maximum tonnage of metals. In all, we completed a record length of 10,065 metres with encouraging results on all principal veins. Our sulphide ore reserves as at September 30th last amounted to 3,865,000 tons, averaging 15.8 per cent. combined lead and zinc compared with 3,217,000 tons averaging 15.3 per cent. a year previously. Last year we milled 532,000 tons compared with 450,000 tons in the year before, which, however, because of strikes, only covered 10 months' operations, so that the rate in both periods was much the same at 45,000 tons a month.

The report was adopted.

INDUSTRIAL AND GENERAL TRUST, LIMITED

EXPANSION OF INCOME

The sixtieth annual general meeting of the Industrial and General Trust, Limited, was held on the 10th instant in London.

Mr L. A. Stride (the chairman) said that the accounts had been drawn this year in a form which the directors expected would facilitate compliance with the provisions of the Companies Act, 1947. Last year there was a surplus on valuation of over 75 per cent. The note on the present balance sheet showed that at March 31st last there was an overall appreciation on the investments of 67½ per cent. The valuation surplus indicated that their capital position was at the moment satisfactorily secure.

The Nationalisation of electricity undertakings would contribute a large addition to their holdings in Government stocks in the current financial year. Industrial securities showed an increase last year of 6.21 per cent. and this year they had again increased by 6.66 per cent. to 72.13 per cent. They now had 85.52 per cent. invested in Great Britain and the British Dominions and Dependencies against 80.76 per cent. last year. The percentage of their holdings in equity stocks continued to grow. On the basis of the valuation at March 31st last their break-up value of the ordinary stock was easily calculated at 559 per cent.

The gross income from investments showed a satisfactory expansion of some £36,000. Arrears of income received amounted to £18,442, or £12,780 less than last year. They had decided to recommend that last year's dividend and bonus on the Ordinary Stock should be repeated. The proposed dividend of 16 per cent. was only 6.8 per cent. on the ordinary stockholders' capital actually employed in the business.

The report was adopted.

AULT AND WIBORG, LIMITED

INCREASED TURNOVER

The fourteenth annual general meeting of Ault and Wiborg, Limited, was held on the 11th instant in London, Mr Gerald Wellesley, the chairman, presiding.

The following is an extract from his circulated speech:—

Twelve months ago I gave you particulars of five businesses which we had acquired. Since that date, all your companies have made considerable progress in the manufacture of inks, paints, industrial finishes and metal decorating products, with the result that the total turnover of the group is almost two and a half times greater than for the previous year.

Under these circumstances it will not surprise you that, despite a much-reduced margin of profit on sales, the earnings of your company and its subsidiaries before taxation amount to £356,035. £53,579 of this has been left with the subsidiaries, and a profit of £302,456 is shown in your company's accounts. The board recommends that a further dividend of 23½ per cent. be paid on the ordinary stock, making 30 per cent. in all. Judged by its purchasing power, the value of this dividend is not in excess of the dividend which we were distributing ten years ago.

In our printing ink and roller industry we have made very substantial progress with regard to new developments which are of interest to the printing industry and its many branches. In common with all other manufacturers we know that there are still years of difficulty ahead, but with the help of our good friends in the newspaper and printing world, as well as the innumerable industries which now use our paints, varnishes, industrial finishes and other products, we look forward to continued progress and expansion.

The report was adopted.

AVELING-BARFORD, LIMITED

IMPORTANCE OF COSTS

The fifty-third annual ordinary general meeting of Aveling-Barford, Limited, was held on the 15th instant, at Grantham.

Mr Edward Barford, M.C. (chairman and managing director), in the course of his speech said:—After taxation, the net profit for the eighteen-month period to September 30th last was £111,866. The total distribution for the year and a half is equivalent to slightly over 15 per cent. per annum. These dividends, paid to some 2,200 shareholders, represent about 4d. in the £ on turnover and slightly over 3 per cent. on the real capital employed in the business.

To represent capital as a grasping and avaricious ogre is a mischievous misrepresentation. Though the cost of living and wages have nearly doubled, capital alone works for prewar wages; yet the risk has increased, and increased substantially, for today a business can be bankrupted by Government edict.

One of the requirements of your company is further capital. We propose that all three partners in this business, the existing shareholders, the management and employees shall be given the opportunity to participate in the future fortunes of this company.

From now onwards the cost of production is of paramount importance. Even if sold at cost many British goods are too expensive to find buyers in export markets. More able chairmen than I have given lucid examples of the frustration and real damage to export trade directly resulting from this mass bureaucracy. Browbeat and hamstringing British industry and its management, continue to stir up discord and strife, maintain the army of bureaucracy—and the answer will be misery and empty bellies. Straight words, but do not think "it cannot happen here." It can.

The report was adopted.

MOTAPA GOLD MINING COMPANY, LIMITED

CHAIRMAN'S ADDRESS

The second annual general meeting of this company was held on the 11th instant, in Bulawayo, Col. E. Tulloch, D.S.O., M.C., presiding. The following extracts are taken from the chairman's speech:—

Good progress has been made with operations on the company's property.

The development footage advanced during the year totalled 5,084 ft. The footage measured along the strike of the orebodies and fully proved by crosscutting or diamond drilling amounted to 2,885 ft., of which 925 ft. averaging 4.2 dwt. per ton over a width of 12.1 ft. was payable in the Western Section and 1,105 ft. averaging 2.5 dwt. per ton over a width of 25.6 feet proved payable in the Eastern Section.

The fully developed ore reserve at December 31, 1947, was estimated to be 348,000 tons averaging 3.5 dwt. per ton over a width of 18.5 ft.

Both the No. 1 and No. 2 shafts are now fully equipped and capable of dealing with all requirements.

The reduction plant, it is expected, will be ready to be put in operation some time next month. Initial milling operations will be confined to trial runs and no declaration of results can be expected until the month of August, 1948.

Milling will commence at 10,000 tons per month and it is intended to increase this to the full capacity of the plant, namely, 25,000 tons per month, as soon as possible but the attainment of this rate of crushing is entirely dependent upon the water supply.

The report of the proceedings at this meeting will not be issued to shareholders, but copies will be available on application to the Head Office, Johannesburg Office, or London Office of the company.

GOVERNMENT RETURNS

For the week ended June 12, 1948, total ordinary revenue was £43,460,000, against ordinary expenditure of £33,132,000 and issues to sinking funds £530,000. Thus, including sinking fund allocations of £2,194,000 the surplus accrued since April 1st is £176,742,570 against £202,951,204 for the corresponding period a year ago.

ORDINARY AND SELF-BALANCING REVENUE AND EXPENDITURE

Revenue	Estimate, 1948-49	Receipts into the Exchequer (£ thousand)			
		April 1 to June 14, 1947	April 1 to June 12, 1948	Week ended June 12, 1947	Week ended June 12, 1948
ORDINARY REVENUE					
Income Tax	13,091,500	159,576	176,386	7,551	12,704
Stamp Duty	90,000	11,080	16,600	570	850
Stamp Duty Reserve	160,000	33,853	37,600	3,000	4,200
Stamps	55,000	8,970	12,285	400	1,200

SERVICE

Founded over a century ago, The Union Bank of Australia, at its Branches throughout Australia and New Zealand, offers a comprehensive Banking Service covering every modern requirement.

This extensive organisation is placed at the disposal of visitors desirous of transacting any description of banking business.

We invite you to discuss your travel and banking problems with our specialised departments.

Head Office:
71, CORNHILL,
LONDON, E.C.3.

The
**UNION BANK
OF AUSTRALIA**
LIMITED

Branches throughout
Australia
and New Zealand.

ANNUITIES

(Single lives: Last survivor: "Capital-protected": "Capital-redemption": Reversionary: Certain: Deferred, etc.)

Circumstances have made annuities an attractive proposition to an increasingly large number of people, particularly now that the capital invested in them can be safeguarded against loss due to premature death. Very considerable loss (up to £1,000 and over in individual cases) has been and is being sustained by the public due to their entrusting the purchase of their annuities to inexperienced and unrepresentative part-time agents. The undersigned has specialised for many years in every kind of annuity issued by the various Life Offices (for all of which he acts impartially and in the sole interests of his clients), and is therefore in a position to advise on those giving the highest NET yield with complete safety.

BEDFORDSHIRE EDUCATION COMMITTEE

LUTON TECHNICAL COLLEGE.

Principal: T. HEAP, Ph.D., M.Sc., F.R.I.C.

Applications are invited for the post of full-time lecturer in the Commerce Department, duties to commence on September 1st next. Candidates should be graduates of a British University in Economics or Commerce, or hold comparable professional qualifications. Preference will be given to an applicant holding special qualifications in Costing. Burnham Scale includes increments for previous teaching and approved industrial experience.

Full particulars and application form (stamped addressed envelope) may be obtained from the Principal, Technical College, Luton, Beds., by whom applications should be received within three weeks of the appearance of this advertisement.

T. S. LUCKING, M.A., Director of Education,
Shire Hall, Bedford.

ESSEX EDUCATION COMMITTEE

MID-ESSEX TECHNICAL COLLEGE & SCHOOL OF ART.

Applications are invited for the post of full-time LECTURER in ACCOUNTANCY SUBJECTS or COMMERCE to take up duty on the 1st September, 1948. Candidates should possess a Degree in Commerce, and Accountancy or Secretarial qualification, or the equivalent. The lecturer would be required to prepare students for the Intermediate and Final Examinations of the Secretarial and Accountancy bodies and/or for the National Certificate in Commerce and the Examinations of the Institute of Industrial Administration.

Salary in accordance with the Burnham Technical Scale for Assistants, with increments, if applicable, for Graduate qualifications and training and approved professional or industrial experience.

Further particulars and forms of application may be obtained from the Clerk to the Governors, Mid-Essex Technical College & School of Art, Market Road, Chelmsford, to whom applications should be returned within 14 days of the appearance of this advertisement.

B. E. LAWRENCE,
Chief Education Officer.

HEMEL HEMPSTEAD DEVELOPMENT CORPORATION

Applications are invited for the appointment of General Assistant in the Public Relations Department. Candidates should be under 35 and have had University or Secondary education, and some experience in Public Relations and general office routine with an interest in the problems attaching to new town development. There will be considerable scope for initiative and freedom of action under the supervision of the Public Relations Officer.

Salary according to age, experience and qualifications within the range £400-£525 a year. The post will be superannuable, and there are prospects of advancement. Applications, giving full personal particulars, together with the names of three responsible persons to whom reference can be made, should be endorsed "General Assistant" and addressed to reach the undersigned not later than July 19th.

Westbrook Hay, Hemel Hempstead, Herts. W. O. HART,
General Manager.

A NORTH OF ENGLAND Engineering Company, specialising in small metal fancy products, seeks a first-class Managing Engineer to take complete charge of factory employing 200, and ultimately also of Home and Export Sales. This position of considerable responsibility calls for expert technical knowledge of friction and toggle presses, plating, polishing, spraying and tool-making plant. Applications, which will be treated in strictest confidence, are invited from men who have occupied a comparable position, are conversant with the latest technique in small metal work, and possess such trade contacts as would facilitate the extension of business. Age not over 50. Salary £2,000 and share of profits. Particulars of age, qualifications, experience, to Box 757.

BUSINESS EXECUTIVE (33), with extensive commercial and publicity experience, ability to apply knowledge international and economic affairs to export matters, equally happy in delicate negotiations and hard paper work, seeks responsible appointment in publicity, sales organisation, economic intelligence or similar activity. Ex-Foreign Office, widely travelled, lucid pen, fluent French, German, Serbo-Croat, some Italian, Spanish, Greek.—Box 738.

CAMBRIDGE Undergraduate, 23, ex-staff Captain, speaks fluent French, requires interesting work, July until beginning September. Box 745.

The End of Potsdam

THE bisection of Germany is for the time being complete. Politically, Germany has been cut in two ever since Potsdam, and economic partition has become more and more apparent as the policies of the Eastern and Western Powers have diverged. The only new thing that has happened is that partition has been formalised and fixed by the introduction of separate currency reforms, first in the Western zones and then in the East (the Western reforms are discussed in an article on page 1072). With different money circulating on either side of the zonal frontier, it acquires the definition of a national boundary. The economic and indeed the political fabric of a single German State has been torn in two; for the time being at least there are two Germanies, East and West.

This is an outcome so obviously unsatisfactory and so fraught with danger for the future that, having reached this last decisive stage, some people in the West are inclined to draw back and question the whole Allied policy which, they say, has led to this consummation. Voices have been raised in America protesting against the creation of a separate state in the West and urging further delay before any more irrevocable steps are taken. French opinion appears almost unanimous in preferring the old quasi-colonial status for Germany with all-pervasive Allied control and almost no organs of German government. In Britain, a group of Labour Members have urged Mr Bevin to make one more attempt to secure Four Power agreement and to work out policies common to the whole Reich. Through all these reactions runs the underlying suggestion that the Western Powers are responsible for the failure of the policy of unity and that their "precipitate action" has brought into being this dangerous monster of a dual Germany. And this in turn is precisely the accusation that Soviet propaganda is dinning into the ears of the German people; if left unchallenged, it may end by leaving the Germans with the impression that Russia alone is the champion of German unity.

The first point to clarify in discussing the Allies' German policy is that the division they are accused of now creating has in fact existed for nearly three years. Russian tactics since Potsdam have made the division inevitable. Within six months of the formal beginning of occupation, the Russians had suppressed the Socialists in their zone, created the totalitarian control of a single party and introduced most of the political forms of "Eastern democracy." They also pursued their own economic policy with equally little respect for their allies' wishes. After stripping their zone of a large part of its industrial equipment, they set the remainder to work on reparations from current production—expressly excluded from the Allied agreement on reparations—and took over a number of key undertakings as Soviet concerns. This process of using the Soviet zone as an annexe of the Russian economy led inevitably to a Russian refusal to join the Western Allies in a single import-export policy. Two years of these economics divided the zones so completely that currency reform now merely formalises an existing situation. During all this time, the Western Allies have waited, hoped, negotiated, protested; only when economic collapse in their own zones could be staved off no longer, did they begin to pursue independent policies.

The second point to be made is that the Western Powers have sought throughout to secure German unity. At any time from Potsdam to the London Conference last November the Russians could have had unity if they had been prepared to accept the Western Allies' reasonable conditions—an end to the stripping of the Soviet zone, an end to unagreed and unilateral reparations policies, the restoration of German undertakings transferred to Soviet ownership, a common import-export programme and above all, an end to the political tyranny of the Socialist Unity Party. Without these conditions, German unity and democracy would in any case have been a farce. The Western Allies can hardly be blamed for failing to achieve a unity to which Russia was prepared to pay lip service only.

*

It is against this background that Allied policy in Germany must be judged. Nobody in his senses would have divided Germany for choice. Of all the frontiers between the Eastern and Western worlds, the frontier running through the heart of Germany is the most unstable. But, given the fact that the division of Germany was a pre-existing, Soviet-ordained fact, it can at least be said that the policy now being pursued by the Allies in Germany is making the best of a very bad job. The problem facing the Western Allies has not altered. Today as on the morrow of victory it is how to make Germany into a decent viable member of the European community, with sufficient safeguards to satisfy its much-tried neighbours, but without penalties calculated to rouse all its old nationalist phobias. The problem is now infinitely more difficult to solve than at the time of Potsdam, for three years have passed during which a policy of "pastoralisation" and repression has been tried and abandoned, and during which such miseries have battered on the German community—at a time of Allied responsibility—that the phobias and the resentment are already barely below the surface. But even when all these limiting factors—division, misery, false Allied policies in the past—are admitted, the claim can still be made that the present Western strategy is at last beginning to make political and economic sense.

The decision has been taken that the Germans shall be given a reasonable economy and full political responsibility as quickly as possible. The currency reforms, the extension of credits to German industry, the decision to revive production in the Ruhr, the proposals for a constitution, the new Occupation Statute, are all steps in the direction of building a stable, self-governing community in as much of Germany as is open to the control of the Western Allies. At the same time, over and above the safeguard of complete disarmament for Germany, the further safeguard is proposed that the revived German economy shall be integrated as rapidly as possible into the wider Western European economy which, it is hoped, the Marshall Plan will help to bring about. This safeguard is for the time being formally expressed in the agreement that there shall be Six-Power control of the allocation of coal, coke and steel from the Ruhr, but clearly more appropriate forms of integration may emerge as the Plan develops. This, then, is the broad outline of the policy which has replaced the follies of Potsdam and of which last week's currency reforms are a small but vital part.

It is undoubtedly a sane and comprehensive strategy. It is a vast improvement on anything that has gone before and, given the wretched circumstances of division and ruin in Germany, it is without doubt, in general, the best policy that could be devised. But the Allies would be deceiving themselves if they did not recognise that it is also a very great gamble. It is a gamble first of all in the limited technical sense that, unless sufficient goods and enough work and production are forthcoming in the next months, the currency reform may fail and the feeble German economy be exposed to the risks of re-inflation. It is an economic gamble in the wider sense that the truncated Western German economy—which now resembles

Britain in its dependence upon outside supplies of foodstuffs and raw materials—needs to be integrated with all speed into a wider economic framework, and the pace and determination with which the Western Allies are advancing towards the goal of a Western European economy are hardly reassuring. It is a political gamble because the Germans themselves are an unreliable factor. It is clear that they have cleaned from their conscience—always supposing it was ever there—responsibility for the ruin wrought by Hitler. On the other hand, they are preoccupied with the "evils" of the Allies and resent as exploitation any suggestion that their economy has any contribution to make to the Marshall Plan. Dr Adenauer, the Christian Democrat leader, has said as far as to say that unless Allied policy on the Ruhr and Germany will be obliged "by refusing co-operation to bring honour before posterity." The tendency of the Germans at the moment appears to be to seek to grab for themselves the substance of economic power so as to serve their narrowest national interest. But political power is not easily and some might even be ready to leave the Allies to carry that uncomfortable burden. Of genuine responsibility both towards their own people and towards Europe and their neighbours, the German leaders so far show little trace.

*

The Allied policy is a gamble in the political sense above all because its success depends upon speed—not only speed in creating a European framework into which Germany can be fitted but speed in securing for Germany the substance of a normal viable existence before frustration and resentment make the Germans incapable of normality. This is one case where compromise policies may be disastrous. There are no halfway houses between repression and co-operation, and whichever policy is adopted its only chance of success is to be pursued without adulteration. Now that repression has been decisively abandoned, co-operation must be introduced as fully and speedily as may be. It is in this context that French fears, understandable as they may be, are likely to produce exactly the result France fears—the chance that when Germany revives, as revive it will, its mood will be too savage and resentful to make it anything but a bad neighbour. To let Germany rise again, but in a mood of revenge, is the one certainly disastrous policy. The right course for France and its allies is to push resolutely and speedily ahead with the creation of a Western Union and to seek by every means to associate the United States with it. The fatal course is to allow fears and hesitations to block and delay the restoration of reasonable relations between Germany and the West.

The greatest gamble, however, is the fate of the new policy in the face of Russia's envenomed hostility. May not the Allies after all be saddled with the "crime" of splitting Germany and may not the desire for unity forcibly drive the Germans into the Russian camp? These are the hardest questions of all to answer, for they depend upon the ultimate success of the whole Allied venture. If currency reform and economic revival fail, if the integration of Western Europe becomes an empty dream, if a crisis of deflation strikes the West, if the workers in the Ruhr faces unemployment while a black market revives and flourishes, then, certainly, the Germans will begin to look to the East. But the Western Allies should realise that, if they wish it, they have for the time being most of the cards in their own hands. The economic misery and political servitude of the Soviet zone are no secret to the Germans. One reason why the cry for unity is loudest in the East is because the Soviet Germans hope by unity to escape from Russian control. If a sort of normal political and economic revival can be achieved in Western Germany, it can become what every effort of political and propaganda should try to make it, the Piedmont of a peaceful, law-abiding, united Reich.

The World and the Dollar

Dollar Shortage for Ever

MR TABER's raid on the funds for ERP has been beaten back. After gruelling negotiations, which allowed leaders of the Senate only thirty minutes' sleep in two days, the cuts were in the main restored and the President was left with the power to reduce the time during which the \$5 billion could be spent from fifteen months to twelve—that is, to speed up the rate of expenditure in the same proportion. The confidence of those who believed in the ability of America's responsible leaders to overcome the ignorant and obstinate obstruction of the isolationist fringe is now rewarded.

Mr Taber's activities raised the dollar problem in its most acute and immediate form. The obstacle he threw up was so spectacular that it diverted attention from other problems brought to light by negotiations that have been proceeding between the United States and the sixteen beneficiary nations on the conditions and obligations involved in American foreign assistance. These problems are not of today or tomorrow. The spectres they conjure up will haunt the world of the fifties. But in some ways they are more grave than Mr Taber's excursions. He made no secret of the fact that he opposed the philosophy of the Marshall Plan in principle; as such he is in a minority and can be overruled. But the officials of the State Department who drafted the bilateral treaties proposed by the United States to the Sixteen must be presumed to be convinced adherents of the Marshall philosophy and to be inspired both by great knowledge of Western Europe and by a sympathetic attitude towards its problems. Reports of the conditions they proposed have caused some perturbation in the House of Commons and the debate upon them, which the Government has promised, may be stormy. Some part of the objection lies along the line of affronted sovereignty, and on this it would be as well to await the finally agreed text before giving indignation a free rein. But there is also an economic argument involved which is of more permanent significance. Among the conditions that have been reported to have been proposed was one making the receipt of grants dependent upon the simultaneous taking of loans; another providing that part of the local currency funds to be set aside by the recipient countries should be used to "purchase" strategic raw materials for America, and another which would, in substance, set aside many of the compromises on rules of international commerce so painfully achieved by lengthy negotiation at Geneva and Havana and commit the recipient nations, after a short interval, to something much closer to the full

rigidities of multilateral, non-discriminating, unrestricted commerce as laid down in the original American draft of a Charter for the International Trade Organisation.

It will undoubtedly be found that these conditions have been much softened in the course of the negotiations of the last few weeks. But what is more than a little alarming is that they were ever proposed, for they show that even the chief architects of the European Recovery Programme still fail to understand the true nature of the problem that has to be met. They still regard the present emergency entirely as something temporary that has happened to Western Europe. That it certainly is, in part. But it is also something permanent that has happened to the United States. How little this is realised can be seen by asking what would be the effect of the conditions that have been mentioned, if they were embodied in the treaties. The suggestion that part of the ERP funds should take the form of loans would place on the Sixteen an obligation of repayment for which they would have to find extra dollars in the fifties. The provision reserving some local currency funds for the later purchase of raw materials by the United States would, by removing some valuable dollar earners from the sphere of normal commercial exchange, make the dollars more difficult to secure. And the clauses which seek to push the European nations back to complete non-discriminatory free trade serve notice on them that in making both ends meet they must not avail themselves, save in minor degree, of such devices as quotas, import licences and exchange control, nor must they apply to their dollar trade any restrictions that are not equally applied to dealings with all other currencies.

*

These things are not done with the intention of setting an impossible obstacle race for Europe to run. Nor are they inspired, to more than a perfectly legitimate extent, by the desire to protect American interests. And yet these conditions, put forward by the most reasonable and friendly Americans, seem to many Europeans to be wholly impossible, so preposterously unrealistic that they cannot be seriously proposed except for reasons of malice or out of a desire to profit by others' misfortunes. The explanation lies in a complete divergence of view about the shape of things to come. Americans—virtually all Americans—believe that in a few years' time it will be possible to return to "normal" conditions, in which all international transactions can be carried out according to the principles of the free market, in which

any nation will be able to balance its international accounts by comparatively slight adjustments of currency values, tariff levels or wage rates, in which any nation that is earning its living can acquire dollars just as easily as any other form of money. In short, they believe that, in so far as there is a "dollar problem," it is a purely temporary phenomenon, and that, in a few years' time, the dollar will raise no problems that ordinary traditional methods of free trading will not be able to solve.

All Europeans will heartily wish that it were so. But they think this American view—which is but the younger brother of a similar view that was held after the first war—vastly underestimates the dislocations from which the world is suffering. It is true that the free market and its automatic mechanisms of adjustment scored many triumphs in the nineteenth century. But it surely did so only because there was in the world a natural equilibrium, so that the adjustments that were necessary to restore balance were not too large or too painful for democracies to stomach. The smoothness with which free trade worked in the nineteenth century was due, more than anything, to the fact that Britain, the dominant economic country, was a little island which was compelled to buy its food and raw materials abroad and had no such attractive opportunities for capital investment at home as presented themselves in the outside world. This was the basis of the natural balance, which was easily restored whenever it was disturbed. But once the United States replaced Britain as the cheapest producer of manufactured goods and the largest potential exporter of capital, no such "natural harmony" developed in relation to the dollar. It is not a matter of relative skill or clumsiness in managing an international system, or of relative willingness or unwillingness to "act as a creditor should." It is a simple matter of geography. The continental United States, unlike the tiny British Isles, can produce all the food and most of the raw materials it needs. There is no compelling natural reason embedded in its geography to make it purchase supplies in large quantities overseas. America does not, as Britain did even in the days of its ascendancy, inevitably buy as much abroad as it sells there. Any economic equilibrium between America and the rest of the world is naturally precarious and if it is once upset is difficult to restore.

Turkey—Bastion of the Middle East

A MAP of the Marshall Plan countries produces a strange outline. It is the reverse of compact. South-eastwards, it sprawls, until it ends in the solid bulk of Turkey. Its western members, who are more solidly grouped, need to know what life is like in the outposts. What, for instance, was the significance of last week's changes in the Turkish Cabinet?

The Prime Minister, Mr Hasan Saka, remains in office. So do his deputy and other key ministers, such as the Ministers for Interior and Finance. Nearly all the changes are in the field of economics. Mr Sadak remains at the Ministry of Foreign Affairs. It is safe to say that, in present European conditions, Turkish foreign policy would be the same whether government or opposition—that is, whether Republican People's Party or Democratic Party—were in power. Its cornerstone is traditional and unflinching hostility to Russia. Since the war, the Russians have kept this hostility at simmering point by their intermittent pressure for advantages on the Black Sea straits, by their claims to Kars and Ardahan, and by their arrival, via Bulgaria, on Turkey's European frontier. The Turks today are forced to keep more men under arms, and more hands away from plough and loom, than suits any nation's economy.

This does not daunt them. They know their mind, and plump without hesitation for links with the West. They employ a British military mission, and have over the last fifteen months

The inter-war years were, in this respect as in so many others, a period of transition. The causes that make for chronic dollar shortage were present only just below the surface. But they were masked by large American loans to Europe and South America. The dollar shortage was not larger than could be met out of the world's gold reserves. As between North America and Western Europe, however, it is now clear, on looking back, that the strain was already heavy. There would have been an officially declared "dollar shortage" in Europe long before the outbreak of war in 1939 if it had not been for the large gold reserves that the European nations still held, for their still substantial incomes from past overseas investments and for the dollars that were secured for them by the primary producers of their colonial dependencies, particularly in South-East Asia.

Hitler's war not only brought its massive temporary dislocations, which can be expected to have vanished by 1952; it pushed this permanent shift in relationships a good bit further. The gold reserves have gone; the investment income has almost gone; and South-East Asia is one of the world's dislocated areas. What is more, the United States, cut off from these areas during the war, was forced to make alternative arrangements for supplies. The synthetic rubber plants and the tin smelter on the Texas coast are two excellent reasons for believing that Malaya and the Netherlands Indies are unlikely to be as good dollar-earners in the future as in the past. Thus the former pivots of world trade were destroyed at a time of supreme economic weakness in Europe and of supreme economic strength in the United States. No one can foresee the future exactly. But, in European eyes, it seems overwhelmingly probable that the dollar shortage will last for a generation to come.

A great deal depends on which of these views of the future is likely to be the more correct. If the dollar shortage is temporary, then the European Recovery Programme is an attempt to restore, and perhaps to improve upon, a state of "normality" that existed before the war. But if the dollar shortage is likely to be permanent, the Marshall Plan should be regarded as a transition to some different pattern of international economic relationships. In subsequent articles an attempt will be made to set out some of the evidence and to discuss its implications.

accepted an American gift of a nominal value of \$175,000,000 for military and road-building equipment. (The real value is considerably higher.) Their firmness of purpose offers a complete contrast to the vague and inconsequent thinking that characterises the parliamentary democracies that lie beyond them—Syria, Iraq, Egypt, Persia. To reach Turkey from the Middle East is like stepping out of a morass on to a firm tuft.

Again, in contrast to the Middle Eastern countries, Turkey is a land of relative social equality. No one is any longer very rich. The worker has no feeling that he is being exploited. There is poverty, of course, and, in the larger towns, real want. But in a land where the biggest shot is the higher official and the newspaper owner-editor, there is not much elbow room for Russian propaganda. There is no Communism in Turkey except in a few Bloomsbury-ish drawing-rooms on the Bosphorus.

This is not to say that all Turks are of one pattern. They maintain an opposition, and it is vigorously led. But the basic question on which it joins issue with the Government is not ideological. It is whether or no more liberties will lead to quarrels and weakness of a type that a frontier people cannot afford. Politically, last week's cabinet changes are a continuation of the move away from the die-hards who regret the one-party era—a move which began when, late last summer, the

President read the public mind and dismissed Mr Peker, so encouraging the moderates and "rebels" in his own party. By the latest changes four of the then "rebels" hold office.

In the interval between the two changes, President İnönü has divested himself of the chairmanship of the government party, though he is still, judging by its new officers, its virtual controller. This spring, the Democratic party has also undergone changes. It has lost or, as some prefer to say, shed some dissident elements. The effect of these reshuffles on popular support for the two main parties cannot be gauged until by-elections take place in two months' time. (In Turkey, these accumulate and are held *en bloc*.) But at a guess, and unless economic conditions greatly change meanwhile, the government will continue to hold its own in the provinces, and the Democrats, who represent the desire for greater freedom for private enterprise among the merchants of Istanbul and Smyrna, will keep their hold on the main towns.

The independent press greets Mr Saka's new choices with only modified rapture. It is mistrustful of untried men. The old Cabinet fell upon the score of press and parliamentary criticism of its economic policy: its failure to reduce prices; its bad management of exports, last year of too much wheat, this year of too little tobacco; its inability to root out the undue bureaucracy that retards all action upon development projects. The new brooms include the Ministers for Commerce, Communications, Agriculture and Public Works, and the three last—Mr Kasim Gulek, Mr Javit Oral and Mr Nihad Erim—are young by Turkish standards. All three belong to last year's rebels.

To understand the background against which these men will work, it is necessary to dispel some illusions about the state of Turkey today. One is that its revolution as engineered by the Ghazi was a violent movement that is over. In fact it is a slow process and is not half done. It has changed the face of cities, and notably of Ankara, where the queues for purring trolley buses might, by their clothes and demeanour, be waiting in Kensington; but outside the towns it is only now beginning to be able to provide all villages with schoolmasters. Conscription has helped to spread literacy, but nevertheless only 40 per cent of these under 25 are literate in rural areas. And only 4,000 doctors as yet practise, where 10,000 are needed. These figures are not surprising. In a country so vast and so mountainous, and in which only 1,500,000 out of 17,500,000 inhabitants live in towns, miracles have been worked in the time available.

Another fallacy is that Turkish state management of industry has taken the place of all private enterprise and that there is no chance of efficiency unless the process is reversed. Turkish state enterprises are by no means all inefficient. The sugar monopoly is run well and on an economic basis. The government's industrial undertakings, particularly in textiles, have made great headway in the matter of quality. Cost of production is another story. This is unduly high and has been shuffled off on to the taxpayer and consumer. The very considerable private enterprise which exists alongside it has not brought about an adjustment of prices because it is prevented by taxation from undercutting state enterprises, and because the government, which taxes profits and sales on a percentage basis, has so far been interested in letting industry charge what it can.

Turkey's current economic problems should be viewed against this background. Some, but by no means all of them, are of Turkish making. High internal prices, for instance, could have been reduced by cutting state production costs, and, in particular, by spending at an earlier stage on improving transport. Too little thought was directed along these lines during the heyday when rival belligerents were tumbling over

one another to buy and pre-empt. And since the war, price adjustments have nowhere been easy. They have been governed, in Turkey as elsewhere, by uncontrollable factors such as hard currency shortages and American price levels. It is not all the fault of the Turks, therefore, that the 50 per cent devaluation of the Turkish pound in 1946 and a simultaneous encouragement of imports entirely failed to bring about a fall in internal prices.

The heyday is over now, however, and one of the most difficult tasks before the new government is to make the Turkish exporter realise this, and to calm the public discontent that must follow when the collapse of the sellers' market leads to less earnings for the Turkish producer and grower. The peasant of the Anatolian highlands is self sufficient and virtually proof against crises, but the blow will fall hard upon the coastal tobacco grower and the town worker. The knell has sounded over tobacco. A recent trade mission to Germany, eager to sell last year's very considerable stocks, impressed all who met it as still living in the clouds, and failing to see that it would do better to face a small loss now rather than to wait upon a falling market. It failed to sell its wares, and the fault was not all America's.

In the longer run, the most effective economic innovation possible would be the establishment by the President of some method of deciding which of the many capital developments at present scheduled are true priorities—that is, are pre-requisites of other projects, and must therefore have first call upon such funds as are available. Tugs of war between departments for credits are common to all countries, but few are so prone as the Turks to make a mass of beginnings and to start operations, whether the way to the end is visible or no. There are many monuments to this defect: unfinished factories; a major coalfield without a port; a steel works that is only now achieving a railway direct from the source of its ore. The present fifteen-year plan is an impressive document and contains remedies for most of the defects. Time and money could both be saved if it were tackled in a more logical order than past ministries were contemplating. If Turkey is to fill the role it could play in the Marshall arrangements, the most important developments are, probably, the modernisation of its coal fields, the improvement of its roads in order to cut transport costs, and the development of flood prevention in order to prevent devastation of its valley crops. In time development of the wheat, meat and dairy produce that western Europe needs might offset its present dependence upon tobacco. All the developments envisaged will cost money, of which there is a fair amount lying idle in Turkey, because its owners will not consider investment except at exorbitant interest rates. Some aid will be available under the Marshall Plan. The American Export-Import Bank has already advanced some \$30 million. Private American lenders may come forward if, as is now happening, the state relaxes the stringency of the conditions upon which it is ready to admit new foreign industrialists.

All told, therefore, though some short-term economic problems are formidable, the long term outlook is good. The country's economy is very broadly based; production ranges from fuel—oil in workable quantities, and containing a high asphalt content for roads, was discovered recently in the south-east—through metals to essential foodstuffs. Its leaders are aware of the difference that rural education will make to their economic prospects. Above all, its people are politically sturdy, and well fitted to support the peculiarly testing position of being one of Russia's "unassimilated" neighbours. Their steadiness and internal soundness make them an oasis of stability in an uncertain and divided Middle East. As such Turkey is not only a member of the Marshall Team. It is a bastion of every legitimate Western interest throughout the Middle East.

The Burden of Taxation

THE basic trouble with the British national economy, now and for the next decade or so, is that the national income is too small. The capacity of the British community to produce wealth is insufficient to provide all the material resources that are required. This has not always been so. Throughout the two inter-war decades, for example, an even more pressing problem was to discover means by which sufficient demand could be generated to keep actual output up to capacity. And it may be that at some future time the emphasis will shift again. But for the present, it is clear that the major problem is one of inadequacy of output. To say this is not to imply that an all-round increase of output of all kinds indiscriminately would solve the nation's economic problem, because it is obvious that the most urgent need is for more goods of the kinds that can be exported or that will permit imports to be reduced. But the issue of the balance of payments is only a special aspect—which conditions in the outside world have made critically urgent—of the general proposition that the British community appears to be committed to using up each year more economic resources than it is producing. In 1947, the main heads of gross expenditure were as follows:—

Personal Consumption	£7,421 million
Government activities	2,168 "
Maintenance, replacement and increase of domestic capital	2,020 "

No one of the three categories was as large as it should have been. Many people still felt their personal consumption to be unduly restricted; some schemes of Government expenditure had to be curtailed for lack of resources; and the expenditure on gross capital formation, large as it was, made alarmingly little progress against the arrears. Nevertheless, the total of £11,609 million exceeded by no less than £675 million the total output of the British community itself, working under conditions of more than full employment.

The main objective of economic policy must therefore be to increase the national income as rapidly as possible. But until this can be done (and there is no quick-action specific available) there must inevitably be rivalry and competition for the division of the available resources among the alternative forms of expenditure. The first group of articles in this series stated the case for according an effective priority to expenditure on the formation of new capital equipment, precisely because it is the best way—indeed, in the long run almost the only way—of securing an increase in the national output. The present article moves on to consider the allocation of resources to the activities of the Government—by which is meant not only the central Government but also the local authorities and such semi-autonomous taxing authorities as the National Insurance funds.

*

It is unlikely that there would be any dissent in this country at the present time from the proposition that the level of taxation is altogether too high. The days when only the rich felt the incidence of taxes and the poor paid them without knowing it, have gone, if they ever existed. Few can be unconscious of income tax, and fewer still of Purchase Tax and of the duties on beer and tobacco. The level of taxation is too high not merely because it is unpleasant for the taxpayers, but also for the strictly economic reason that it has an unhealthy reaction on the output of the community. All down the line, from the surtax payer to the unskilled labourer, the disincentive effect of high taxation is plainly visible. Even more damage is probably being done by the rapid depletion of the free working capital of

business enterprises, and by the virtual stoppage of private savings available for venture capital.

That taxes are far too high is obvious. But to draw the line at which they would be just tolerable, at which the economic harm done could be dismissed as inconsiderable, is much more difficult. Some three years ago, Mr Colin Clark advanced the thesis that no country could collect in taxes more than 25 per cent of its national income without running into all the perils of chronic inflation. The figure of 25 per cent is, of course, too round to have any exact scientific validity. But every economist—indeed, every person of commonsense—knows that there is some fiscal Plimsoll Line beyond which the economy cannot safely be loaded, and it cannot be very far from 25 per cent. In the United Kingdom in 1947, the total of private income before tax (that is, the taxable corpus) was £9,911 million and the combined tax revenue of all public authorities was £3,616 million, a ratio of no less than 36½ per cent. By any test, this is far too high. Moreover, there are some special reasons why it has been easier to collect this outrageous total in present conditions than it would be in more normal times. Nearly £1,000 million of the total is collected on tobacco and alcohol, on which the public was spending in 1947 no less than 18.4 per cent of its total consumption expenditure—3s. 8d. out of every pound spent. Clearly, when there is a greater variety of consumer goods available, this will not continue. But the Chancellor of the Exchequer will find it politically impossible to impose the same crushing rates of duty on the other objects of expenditure to which the public will turn. There is nothing else on which the rate of tax can be raised to several hundred per cent of the cost price. It follows that the revenue must fall as more food, clothes and other things now scarce come forward, and that the raising of the present total tax revenue would involve some increase in the present tax rates.

But if the present burden of taxation is more than the economy can bear and maintain its economic health, then it follows inexorably that the level of Government expenditure is also too high—or, to put the same thing in another way, too much of the available supply of goods and services is being allocated to the execution of the various activities of governmental bodies. One of the primary objects of economic policy must therefore be to reduce the total volume of these activities. This is a conclusion which will be hotly contested between the political parties. It may perhaps help to make it more palatable to point out that what is here discussed is the various activities of the Government that are financed by taxation. To say that these are too large is not, in itself, an argument against the nationalisation of industry—unless, indeed, nationalised industries make a habit of running at a loss and have to be subsidised by the taxpayer. What is here argued is not that a stop should be put to the transfer to public ownership of the commercial activities of the community—which is an entirely different argument—but that several steps will have to be retraced in the financing of economic activities by compulsory levies. But even with this concession, the conclusion is not likely to be very acceptable on the Left, since it appears to be one of the most firmly held convictions of the Labour Party that government expenditure can never be too large. Yet those who view the present level of expenditure with equanimity must convince themselves either that a community can go on paying some 40 per cent of its national income in taxes or else that a permanent and large budget deficit does not matter. On the latter point, it will be remembered that one of the conclusions of the earlier

group of articles was that, if there is to be an adequate flow of capital creation, the state will itself have to supply some of the savings—that is, pile up a surplus of revenue, on the average of years, above its current expenditure.

The conclusion is really quite inescapable and wholly divorced from party polemics. The activities of the Government in this country are at present far larger than the national economy can

NOTES OF THE WEEK

Dockers and Discipline

The world's greatest port has been paralysed for ten days by a strike of 19,000 dockers which has underlined one of the most difficult of contemporary problems—that of industrial discipline under full employment. No great human principle is involved: the strike was simply a chain reaction from a dispute between the Dock Labour Board and eleven men who demanded a higher wage for unloading a "dirty cargo" of zinc oxide. Undoubtedly the employers had been negligent in supplying this group with proper protective clothing, and the arrangements for viewing and pricing the job were very cursory. Moreover, the original penalty of thirteen weeks' suspension for refusing to accept the board's wage offer was unduly severe, although not criminally harsh in view of the excellent money they had been earning in the past. When this was reduced to two weeks the case of the eleven men might be deemed to have been settled.

This little dispute was only the *casus belli* for the expression of a *malaise* which must have been gathering in strength for months past. The causes are twofold. First, as *The Economist* has often pointed out, there is a master-and-man relationship inherent in industrial organisation whether the master is the private employer or a state board. The dockers, after over fifty years of struggle, have at last acquired a charter of employment and a victory over the hazards of casual labour. But their new master, the Dock Labour Board, is more exacting, demanding a steadier flow of work and putting an end to the old game of playing off one small employer against another. The London dockers are suffering from the frustration bred of reconciling the unpleasant alternative of industrial discipline with the yet more unpleasant alternative of casual labour.

There is an even more powerful reason for the spread of the strike and the refusal of the dockers to accept the advice of the Transport and General Workers' Union to return to work. Mr Bevin created a machine too big for Mr Deakin (or anyone else except Mr Bevin) to handle. This union has the worst record of unofficial strikes, because its enormous size, wealth and power place its leaders in a position so exalted that only an exceptional man could keep in close touch with the rank and file. Consequently the Union has, in the minds of its members, become an entity as remote as the Government or the employers, and in fact largely identified with them. This was clearly exemplified on Tuesday when the official union meeting at the Albert Hall voted for a return to work, while a far larger unofficial meeting in Victoria Park voted with equal confidence to stay out. No promises from Mr Deakin to review the disciplinary clauses of the dock employment scheme, nor the use of troops, have as yet had any marked effect.

A dock strike on this scale loses this country vast quantities of foreign exchange as well as jeopardising London food supplies. In so far as the strike is a product of a nostalgic desire to reconcile freedom and authority, there is nothing very much that can be done to prevent a recurrence. In so far as it is an expression of dissatisfaction with the machinery of discipline and of the union's relations to the employers and to the workers and their shop stewards, swift action must be taken. Although the Communists have undoubtedly been the mainstay of the unofficial strike Mr Deakin would be well advised to carry his review of conditions within the union further than a mere witch hunt.

* * *

Blackmail in Berlin

The position of the Russians in Berlin this week-end is less triumphant and more anxious than appears at first sight. For months the chief motive behind their moves against the Western Powers has been the hope that the Americans, British and French might be deterred from going ahead with the political and economic reorganisation of western Germany—which Moscow

sustain, and they ought therefore to be reduced. But to say this is one thing and to show how it can be done is entirely another. In the next article an attempt will be made to shed some light on the problem by analysing the constituents of tax-financed expenditure.

(To be continued)

sees as the decisive step towards re-establishing a balance of power in Europe. The deterrents have failed, as have the gentler inducements of the little peace offensive of the last six weeks. The Six Power proposals for Germany and the currency reform just carried out represent in Russian eyes the severest diplomatic defeat suffered since the end of the war.

Moscow is now bound to hit back, and the gathering of East European Foreign Ministers around Mr Molotov this week end in Warsaw suggests that the diplomatic riposte may be sharp and skilful. It has certainly been long prepared. But the satellite Ministers realise as clearly as anybody the inherent contradictions in Russian policy towards Germany. It cannot at one and the same time exploit the eastern zone and make it challenge the western zones to a race for prosperity. It cannot denounce German resurgence and at the same time bid for the German nationalist following. Above all, it cannot at the same time maintain "Slav solidarity" behind the curtain and hold out to Germany the hope of a readjustment of the eastern frontiers with Poland. In the general game for power in Germany the Russian hand is at present weak and Mr Molotov knows it.

In Berlin his hand is much stronger—in fact overwhelmingly strong. The squeeze on the Western Powers now being brought to throttling point in the city can be exerted through financial, economic and political sanctions to which there is no adequate Western reply short of the threat to use force. Token garrisons of Western troops could be maintained in Berlin by air; but 2,500,000 Germans under British, American and French authority can be neither fed nor employed if the Russians determine they shall not be.

It appears, however, that there is still some room for manoeuvre; Marshal Sokolovsky has lately been courteous if not helpful, the most recent interruptions to road and rail communications have been justified on technical rather than political grounds, and the Russians have nothing to gain from economic collapse in Berlin. It has to be assumed that the British and Americans know exactly what they intend to do if the blackmail goes on. They have had six months' notice of its imminence and have presumably used that time for something more than statements that they intend to stay in Berlin by right. In particular it is to be hoped that General Clay's instructions from Washington are specific and firm and that London knows precisely what they are. If not, the situation might become perilous.

Irgun Challenges Israel

"If you do not co-operate with the Government of Palestine to root out terrorism," in effect said the British High Commissioner to the Jewish Agency last year, "you will one day have to do the job for yourselves." That day has now come. The Government of Israel has ahead of it the tough job of rooting out habits of violent resistance and opposition to authority which many Jews brought with them from the lands of their oppression. The young bloods of the Irgun and Stern gang will not be easily crushed. They will not be daunted—they may even be strengthened for the moment by what happened on Tuesday last. On that day, the Irgun Zvai Leumi attempted clandestinely to run a cargo of arms and reinforcements ashore. They were baulked by Government forces, orthodoxly observing the truce. They refused to negotiate and decided instead to stage a show down. They ran their cargo ashore on the esplanade at Tel Aviv. The Government fought them and destroyed their cargo. It decided, it seems unanimously, to start crushing an element which it must deal with sometime, and which it prefers to tackle on a semi-external issue—as is the truce—than on an issue of internal disagreement.

Yet that internal disagreement exists. The Haganah, which is the army of the present Israeli Government, is Socialist, and accepts the Uno verdict on partition. The Irgun has the backing

of elements to the right of the present Government—the Jewish Farmers Federation, the big citrus growers, the industrialists. These relish the existence of a potential bodyguard. To that extent, the Irgun is Fascist. But these classic distinctions—left, right, socialist, Fascist—apply so far and no further. The Irgun, when it agreed, two months ago, to co-operate with Haganah did so with a reservation. This was that its co-operation was purely internal, that it did not recognise partition and that outside Israel it considered itself free to conduct operations according to its own lights. "Outside Israel" includes Jerusalem. To get on with these external jobs it needs arms from somewhere. It also needs men, for its numbers (estimated, as suits the argument, at anywhere between 2,000 and 6,000 souls) are very small. Its resources are American money, but recruits and arms it can get only in Eastern Europe. Its leanings at home may be right wing but they are, inevitably, red in the matter of support from abroad. To say that Irgun is relying on Russia and Haganah on America is, however, an over-simplification. Both must, of necessity, get their money from one side of the iron curtain and spend it on men and arms from the other.

Clearly it is in the interests of the West that established government should assert complete authority over the activists, as they call themselves. Outside watchers of Israel's struggle to subdue Irgun must therefore accept several facts. The first is that the contest will be long because, except on occasional issues like that of the truce, it is not clear cut. Though most Israelis deplore Irgun's methods, many hanker after its aims. The second is that if the contest flares repeatedly it will cause trouble with the Arabs, who will interpret it as a sign of Jewish weakness and try to meddle in a smouldering feud. A third is that to contribute anything—whether money, men or guns—towards maintenance of the feud is to favour nobody but Russia, which likes keeping quarrels at boiling point at places where they embarrass the West. The longer the quarrel lasts, therefore, the more it is likely to cause Israel to lean eastwards. Does the White House, and do the American Jewish almsgivers, appreciate these points? Presumably not.

Congress Casualty

Among the pieces of unfinished business left behind by Congress in its rush to adjourn in time for the Republican Convention was a composite Bill covering various aspects of America's international relations. Its provisions had secured Senatorial approval and it is little short of tragic that it now vanishes for six months at least and may achieve only the slowest possible resurrection in the next Congress. The clause in the Bill of most concern to Western Europe authorised the United States to support and participate in regional defence schemes within the framework of the United Nations. It had been Senator Vandenberg's intention in supporting this legislation to secure firm American backing for the Brussels Pact. Whether or not the Five Powers could by more explicit and precipitate action have encouraged the House of Representatives to give support for the Brussels Pact a higher priority, the opportunity is lost for the time being and, short of a special session in the autumn which Senator Taft thinks "is not necessary," January or February of 1949 is the earliest period at which Congressional support for American participation in Western Defence can be reconsidered. This delay is all the more unfortunate in that the American Government has announced that the United States will be prepared in the course of the next months to consult the signatories of the Brussels Pact on the question of American participation. The American Defence Department would be in a stronger position if Congress had already agreed in principle.

The other clauses in the lost Bill concerned the United States' relations with the United Nations and called for various ways of strengthening the Uno machine and limiting the use of the veto. But the saddest casualty in this context is the \$65 million interest-free loan for building the permanent United Nations headquarters in Manhattan. Six more months have been irrevocably added to the discomforts of thousands of Uno officials who must continue to labour underground at Lake Success. Another blow—small but irksome—has been directed at Uno's prestige and efficiency. And all this when half an hour on the floor of the House would have been sufficient to settle the issue.

Truth in Danger

Professor J. D. Bernal has dropped a heavy stone into the usually calm pool of discussion upon the methodology of science. He has submitted to an International Conference on Scientific Information, summoned by the Royal Society and deliberating

this week, proposals for the creation of a central secretariat to control the publication and distribution of scientific papers and documents. The reason is that among a large number of scientific journals mostly controlled by learned societies, the individual scientist finds it very difficult to keep in touch with all the ideas upon which his, and his colleagues, scientific progress depends. Reprints and space are difficult to obtain and consecutive scientific thought on a particular subject may be overlooked or unnecessarily delayed. A central secretariat, by distributing scientific papers to the relevant societies and journals, would, Professor Bernal argues, improve scientific communication and bring order into chaos.

He is probably right, but the objection to his proposal is nevertheless a fundamental one. Scientific truth (and by the same token the progress of applied science and industrial efficiency) depends for its growth upon a spirit of free inquiry, of a willingness to treat evidence upon its merits, and to permit all qualified persons to make their own deductions from the evidence. Wasteful though the present means of communication may be, the very existence of numerous and overlapping scientific journals guarantees freedom from censorship; a central secretariat would inevitably restrict that freedom. Professor Bernal argues speciously that it would act only as a post office; but if it was manned by clerks it would be pointless; if it was manned by scientists it would occupy a position of such power as to be virtually the arbiter of the direction—and thereby the destroyer of the spirit—of free scientific inquiry.

"Scientific Financiers"

This week the Institute of Actuaries has been celebrating its centenary in company with members of the sister Faculty of Actuaries in Scotland and kindred societies from overseas. In the public's mind, the actuary has always been a man of mystery, practising his craft in a remote atmosphere of advanced mathematics, which in some vague way has a practical bearing on insurance. But though his mathematics may lie beyond the non-specialist's grasp, the actuary's business is concerned with the eminently workaday problem of calculating the incidence of risk, and the proper financial provision to be made against it.

These problems have existed for a much longer period than the Institute's century, in the particular case of life assurance. That they were so successfully solved during the middle of last century is due in no small measure to the insistence of the Institute, and the Faculty, on high standards of professional attainment. In those times, as the early records of the Institute show, an "actuary" might be any person who was minded so to describe himself, and it is not surprising that the affairs of some insurance offices and friendly societies were conducted on anything but strict actuarial lines. In the course of the century—and armed for the past 64 years with the authority of its Royal Charter—the Institute has encouraged the great development of the statistical techniques which serve the actuary; his main raw material—vital statistics—has been vastly increased in scope and refined in quality; his professional attainments have been amply safeguarded by what is openly conceded to be the stiffest examination test in any profession; and the range of the actuary's work has spread well beyond the confines of life assurance, into social and mutual insurance, and into more general statistical work in the Government service and industry.

The importance of the actuary's skill is out of all proportion to his numbers. There are about 475 Fellows of the Institute in active employment, and 200 members of the Faculty, and there are too few qualified actuaries to fill the openings at home and abroad. Increasing use of the actuary's services in Government service and industry (though it still absorbs a minority of actuaries, compared with the 80 per cent employed in insurance) marks the fuller recognition of the actuary's professional capacity as a statistician. But he is usually much else besides: a demographer, a shrewd judge of economic trends and investment problems, a man who can use the certainties of past experience as an instrument for measuring and insuring against the uncertainties of the future—in short, a man of whom the description "scientific financier," first applied in 1884, is still true.

The Dentists' Grievances

Alone among the professional bodies the British Dental Association is recommending its members not to take part in the National Health Service. Its decision, taken at this late hour and after the bodies representing the doctors, chemists and opticians have all agreed to co-operate, is worth examining. Are dentists

to have a worse deal than doctors? The levels of income proposed by the Spens Committee and accepted by the Ministry of Health are, dentists agree, generous enough. What they object to is the method to be employed for putting the committee's recommendations into force.

It is the old difficulty. How is more than ordinary skill to get its reward in a publicly remunerated service? In private practice, a successful dentist attracts more patients and is able to raise his fees. The British Dental Association, therefore, asked that in the National Health Service the essence of this system should be retained. Dentists would announce their fees to their patients who, if they agreed to them, would pay the difference between them and a grant-in-aid to be provided from public funds. The measure of a dentist's success would be the size of the difference. Mr Bevan, however, has firmly refused this proposal, pointing out, with reason, that it was inconsistent with the principle of a free health service that people should be asked to pay fees. Instead there is to be a fixed scale of fees, to be paid from public funds, for each dental treatment. A patient may pay the difference where an expensive treatment is desired but is not clinically necessary—for instance, a gold filling—and treatment requiring special skill will be given a higher rate of remuneration from public funds. But the general rule will be that a dentist who can drill painlessly will earn no more than a dentist who hurts. The public will soon realise to what painful necessities its demand for a free service has brought it.

The second grievance concerns clinical freedom. Ordinary fillings and extractions and emergency treatment can be carried out immediately. But for a prescribed list of treatments the dentist has first to have the approval of a Dental Estimates Board. Because it is desired to curb some dentists who might carry out unnecessarily expensive treatment, control has to be placed on all. The dentists thus have a strong case in asking that the treatment for which prior approval has to be sought should be reduced. The prescribed list is so long that, it appears, either approval will have to be given by a clerk—in which case it is clearly unnecessary—or, if it has to await scrutiny by a professional member of the Board, it will be an unreasonably long time in coming. The right course would surely be to allow dentists as free a hand as possible to begin with and only to impose control when it is shown to be necessary.

Departure from Delhi

The time has come for the last of the Viceroy's and the last British Governor-General to leave the city which was the capital of the Moguls and is now the seat of a purely Indian Government. In recent years observers of the Indian scene who were aware of the tensions created by the nationalist movement and the explosive possibilities of the situation would hardly have dared to predict that in the hour of British withdrawal from India, and even after it, an Englishman could achieve as much as Lord Mountbatten has done and depart from office amid so much goodwill and esteem. Throughout his tenure of office he has shown just the right combination of vigour and patience for surmounting one crisis after another, where any rash or ill-tempered move might have had the most catastrophic consequences. He has set an example of friendly and unreserved British co-operation with the leaders of the new India which, it is to be hoped, will be followed in another role by the British High Commissioner in Delhi.

Meanwhile Lord Mountbatten's office passes to the distinguished Indian scholar and statesman Mr Rajagopalachari, who has been appointed on the recommendation of Mr Nehru's Government and now represents the link of independent India with the Commonwealth. Whether India is to perpetuate that link or sever it is a matter which is solely for the Indian people to decide for themselves; it is the sincere hope of Britain that this bond of unity, which is now between equals, will not finally be dissolved; but it would be an impertinence to urge or exhort Indians to maintain it unless it is of their own free will. One thing, however, is certain—that in recommending Mr Rajagopalachari for the office of Governor-General, the Indian Government has shown the desire to fill it with honour and dignity, for its new holder is certainly one of the most eminent of living Indians. In his succession he has the good wishes of everyone in this country.

Blockade of Hyderabad

If there is one great disappointment which clouds Lord Mountbatten's departure from India, it is undoubtedly the failure of the prolonged efforts which he has made to bring about agree-

ment between India and Hyderabad. The negotiations having broken down, Hyderabad, though not subjected to armed invasion, is under blockade. It is in fact the only state in the world claiming to be independent which not only has no access to the sea, but is entirely surrounded by the territory of a single neighbour. It is just for this reason that Hyderabad has been at such a disadvantage for making a settlement with India; the possibility of economic blockade must always have been present in the minds of the negotiators, and whatever initial arrangement had been made, this fundamental factor would have worked in time to integrate Hyderabad more and more closely with India, both economically and politically. But the fact that Hyderabad was in any case so far "in the bag" makes Indian impatience and intransigence appear entirely reprehensible, especially in view of the inconsistency of the Indian attitude to Hyderabad with the policy towards Kashmir.

India's claim to have been in the right in accepting the accession of Kashmir, in spite of the Moslem majority in its population, is incompatible with the Indian demands for changes in the internal administration of Hyderabad on account of its Hindu majority. If the right of the ruler is valid in one case, it is also valid in the other. It is true that India additionally claims the accession of Kashmir on the ground of Moslem support for Sheikh Abdullah, but there has so far been no way of knowing whether a majority of Kashmir Moslems support him or not; and if there are pro-Congress Moslems in Kashmir, there are also anti-Congress Hindus in Hyderabad who are not without influence. The present Indian tactics with regard to Hyderabad suggest a desire for a spectacular victory of prestige to compensate for the failure to break the deadlock in Kashmir; it may be, nevertheless, an unwise policy, for the Hindu-Moslem conflict remains latent all over the sub-continent and it would be folly at this time to provoke a fresh conflagration.

Italian Colonies under the Hammer

This week-end all nineteen governments which signed the Peace Treaty with Italy should be in possession of each of the three reports prepared by the Four Power Commission on the Italian colonies. The Commission has spent six months touring Somaliland, Eritrea and Libya, and recently returned to London, after a stop in Rome. In a fortnight's time the Deputies of the Big Four, America, Britain, France and Russia, meet again to hear any further views that the other interested Powers may care to express after digesting the reports; all fourteen of these Powers have already had a preliminary hearing. Then on July 20th, the Deputies begin to discuss their final recommendations about the disposal of the colonies.

No one, except Ethiopia, strongly opposes returning Eritrea and Somaliland to the Italians, in the form of a trusteeship under Uno. The Russians are backing this course, with the understandable proviso that Ethiopia should at least secure an outlet to the sea, probably through eastern Eritrea. The British want any reasonable solution that is economically workable. The Americans and French are non-committal.

But Libya is different. It has great strategic importance in the centre of the southern Mediterranean littoral. It is the scene of mounting Arab nationalism. The British pledged themselves in 1942 never to let its eastern territory, Cyrenaica, return to the Italians. And the French have made claims on economic grounds to bits of the western and southern territories, Tripolitania and the Fezzan. The French have furthermore administered the Fezzan since the war and regard it, as indeed they also regard Tripolitania, as a flank guard to their North African empire.

The British have administered all the territories, except the Fezzan, during this long interim period. But, like all caretaking governments, they have been unable to make long term plans and have been very short of money. This has been particularly felt in Libya, where in spite of very efficient local British administration, economic uncertainty has been added to political crystal-gazing. The local populations have watched the Americans establish a large air base at Mellaha near Tripoli, and the British evacuate troops from Palestine to Cyrenaica, while across the sea in Italy the popular press has been turning the whole colonial issue more and more into a question of prestige—although Italian sovereignty was formally abandoned two years ago in Paris.

None of these events makes settlement easier. If the Deputies of the Big Four cannot agree by September 15th, they have to refer the matter to the General Assembly of Uno. All who know the colonies would welcome a fair settlement, whoever it comes from. But they want it soon.

Commonwealth—much of the present talk of natural emigration from this country may become unreal.

Much more important, however, was Mr Griffiths's reference to a possible change in the whole system of national insurance—though this is clearly not immediate. Speaking of the relation of insurance benefits to national assistance, and confessing his anxiety about the narrow margin between them, he said that

we have about reached the limit of what can be done by means of flat rate contributions and in future we shall have . . . to see whether some method of financing the insurance scheme other than by flat rate contributions can be found.

Does this mean that Britain may eventually adopt the system in force in most other countries, under which contributions and benefits vary with earnings? In favour of the British practice of flat rates Lord Beveridge argued that it enabled benefits to be placed on a subsistence level, leaving the individual free to provide for himself above that level by supplementary voluntary insurance. Under the alternative system the benefits of the lowest paid workers would fall below subsistence. Mr Griffiths's remark would seem to indicate that the flat rate system is not so flexible as Lord Beveridge held it to be, and that if benefits fall below subsistence—and a comparison of the new benefits with the Assistance Board's new scales of assistance shows that this is beginning to happen—it will not be possible to restore them to the subsistence level simply by a flat increase in contributions. The contributions that come into force next month will, it is evidently recognised, place as big a burden on the lowest paid workers as they can be asked to bear.

The arrival of the *Empire Windrush* at Tilbury carrying 492 West Indians to this country has concentrated public attention upon an aspect of the Commonwealth migration problem which is frequently overlooked and which was completely ignored in last Friday's debate in the House of Commons—namely, that emigration as a solution to overcrowding in this country is not a simple deduction from the total population, but only part of a profit and loss account. While Great Britain may seem to some of its native sons a land of oppression and frustrated enterprise, to other of His Majesty's subjects beyond the seas it appears as a paradise of economic security and racial toleration. The migration balance of the inter-war years shows the ebb and flow of this tide. In 1924 155,000 British subjects emigrated and 64,000 arrived, leaving an outward balance of 91,000. The outward balance declined very slightly during the 1920s and was 87,500 in 1929, but in 1930 it was only 26,000. By 1931 it had changed to an inward balance of 37,000. Immigration reached a peak of 75,595 in 1932, in spite of the vast unemployment figure in this country, creating an inward balance of 48,607, and declined slowly during the thirties as employment conditions in the United States and the Dominions improved, but in 1938 there was still an inward balance of 6,500 British nationals. The effect of the war as a spur to migration can be readily seen by the fact that although immigration in 1946 was 63,000 (the highest figure since 1932), there was a net outward balance of 103,509 people (a large proportion of which were war brides). In the first nine months of 1947 43,000 British subjects immigrated to Great Britain and 88,000 emigrated.

It is too early to say what the postwar balance of migration will be, for many combinations of motives draw people to or drive them from this country. The most obvious magnet is full employment and social security, and, in the case of the 40,000 coloured people now estimated to be dwelling in Britain, racial toleration. With the interchangeability of security benefits for migrants between Britain and the Dominions, the former factor may have lost some of its force, but if there is any similarity between the pattern of the 1950s and the 1930s—if, that is to say, Britain takes the knock of a world recession in purchasing power and employment less hardly than the United States and the rest of the

There are considerable merits in Mr Trygve Lie's suggestion, made at Harvard a week ago, that the United Nations should be provided with a small international force for police work and for use in sudden emergencies. Hitherto the discussion of how "to put teeth into Uno" has been conducted on the assumption that the international force provided should be large enough to intervene in sizable conflicts and indeed wage a war against any but the great Powers. The events of the last year, however, suggest that for the time being at least, any risk of large scale fighting is likely to be limited by the uneasy equilibrium between the Powers. The dangers to peace come rather from minor but envenomed disputes—Palestine, Kashmir, Hyderabad, Indonesia—where a small international force might be used with great advantage to keep each side from the other's throat during a "cooling off" period, thus enabling a United Nations mediator or Good Offices Commission to work out an acceptable compromise. For some time to come, discussions on armies and navies and air forces for the United Nations will prove fruitless, but a small compact, efficient, utterly impartial international police unit might be the nucleus for later expansion. As in many other international operations, the working model may prove more effective than the comprehensive paper plan.

In country after country behind the Iron Curtain, the Communists are coming to grips with the one force powerful enough, dogmatic enough and stubborn enough to resist the Communist steam roller—the Catholic Church. On June 16th the Hungarian Parliament passed, by 230 votes to 63, the law for the nationalisation of schools. It was strongly opposed by the Democratic People's Party of Mr Barankovics, and especially by the independent Catholic Miss M. Shahta, who in the words of the Communist paper "unmasked herself" as having a "treacherous mentality" and was therefore suspended from Parliament for a year. Meanwhile a priest has been sentenced to death for inciting a crowd to disorders which resulted in the death of a policeman, and a second priest arrested for denouncing the regime from the pulpit. The attitudes of both the Minister of Education, Mr Ortutay, and the Primate, Cardinal Mindszenty, have stiffened. It remains to be seen how many of the teachers in the nationalised schools will remain at their jobs against the Church's orders and what the Government will do to those who resign.

In Czechoslovakia, the Archbishop of Prague has suspended the Catholic priest Plojhar, who stood for Parliament in the recent elections and is serving as a Minister on behalf of the rump People's Party. In reply, the Government has suppressed a Catholic weekly paper. In Poland, polemics continue against the Vatican for its allegedly pro-German policy, and the Senate of Warsaw University has sent a message to Cardinal Hlond protesting against the Pope's letter to German bishops.

On June 6th the new Patriarch of the Rumanian Orthodox Church was enthroned in Bucarest, and made a speech appealing to Rumanian members of the Greek Catholic (Uniate) Church—which is strong in parts of Transylvania—to “return to the church of their forefathers, the Rumanian Orthodox Church.” It will be remembered that two years ago, in the other main stronghold of the Uniate Church in Europe, Eastern Galicia, the Soviet authorities forced the Ukrainian population, by imprisoning Church leaders and suborning individuals, to be converted to Orthodoxy. Those architects of Orthodox repression in Czarist days, Stolypin and Pobedonostsev, might well be pleased with the work of the ex-seminarist, Stalin.

The Dominions seem slowly to be feeling their way towards solving the knotty problem of how much armed support they can usefully give to Western Union. Last Saturday, in an able and clear-sighted speech, Mr St. Laurent, Canadian Secretary of State for External Affairs, discussed the implications for Canada of a "North Atlantic Pact." On Tuesday, the Governor-General of New Zealand, Sir Bernard Freyberg, opened Parliament with a speech from the Throne calling for a closer "economic, defensive and spiritual union" with Britain and Europe. These are both welcome signs of the gathering interest in the hitherto apathetic

Mr St. Laurent outlined his now familiar ideas for a regional security pact between the countries of Western Europe, Britain, the United States and Canada. He suggested that defence resources should be pooled and that forces should be co-ordinated immediately. But, with a welcome touch of realism, he pointed out that Canada's adhesion to such a pact without the United States would add very little to it. This fact was worth emphasising. It is too often glibly assumed that Dominion contributions to defence would alone tip the scales in Western Union's favour. With a total white population of roughly only 23 million in Canada, Australia, New Zealand and South Africa, such an assumption is obviously false. It is to be hoped that Mr St. Laurent's statement will be carefully noted in both Washington and Whitehall. A North Atlantic Pact in the form which he suggests would be an effective contribution to security, and should also calm the fluttering nerves of Western Europe.

The importance of what was said by the Governor-General of New Zealand lies in its recognition of the need of changes in the economic life of the Dominion, if the association of the Commonwealth and a Western Union is to have any practical value. While the New Zealand government does not go so far as to commit itself in advance to whatever changes may be necessary, it does show a willingness to consider such changes. This is farther than any other Dominion has yet gone publicly. It should stimulate London to a more determined and clear-headed effort to educate public opinion in the meaning of Mr Bevin's foreign policy and in the changes of attitude it implies.

It is exactly a year since it was announced that colonial development would be accelerated by the formation of the Colonial Development Corporation. Since then no Minister seems to have been quite clear whether the main purpose of the new policy is to develop the colonies for their own good or to help Britain's balance of payments. It is constantly emphasised that colonial development is primarily undertaken in the interests of the colonial peoples, but after lip service has been paid to this principle, official speakers then go on to enumerate in detail the advantages for this country. This is doubly unfortunate; it makes the colonial peoples suspect that they are being "exploited," and it strengthens the criticisms in this country that the whole policy is doubtful and that from the point of view of Britain's balance of payments it would be more fruitful to export agricultural machinery to Denmark than to Tanganyika.

This week, Lord Trefgarne, chairman of the Colonial Development Corporation, again put forward the balance of payments arguments—but from a different angle. Colonial development will help to solve the dollar problem, not so much by enabling Britain to buy more foods and raw materials from the colonies, instead of from hard currency areas, as by enabling the colonies to export more of certain products to the United States, where they will find a market far more readily than will British manufactures. But even this development will take time—ten years, said Lord Trefgarne—and he did not attempt to justify colonial development as an immediate dollar earner.

Specialists and research workers, statisticians and overseas correspondents: all these contribute to the columns of *The Economist* each week. Through The Economist Intelligence Unit, the same sources can be put at the disposal of business firms and other organisations. Perhaps you could obtain the facts and appreciations that you need by applying to:

22, Ryder Street, St. James's, London, S.W.1
(Telephone : WHItchall 1511, Ext. 13.)

He did, however, make one startling *obiter dictum*. He would, he said, hesitate to recommend to the Board that large investments should be made in colonies "with a political obsession against the good faith of the United Kingdom," and his subsequent remarks showed that he had in mind the Communist-inspired riots in Malaya and—possibly—in the Gold Coast. But to rule out colonies politically obsessed against this country would not only rule out large parts of Africa from colonial development. It would also be the best possible means of fostering Communism in the colonies.

It is almost too good to be true that Mr Arthur Horner, speaking at Deal, should attribute the financial losses of the National Coal Board to the higher earnings of the mineworkers and to the high cost of materials. That he should hand the Board such a welcome shield and buckler is due presumably to his fear that coal nationalisation will suffer a damaging attack when the first annual report is published in the middle of July, and of which Thursday's debate is but a foretaste of criticisms to come. Mr Horner must maintain a difficult balance between a desire to defend the Coal Board from the Tories, and a desire to express the resentment of his followers at its policy of over-centralisation and at the lack of workers' control. It is to be hoped that when the Coal Board has weathered its crisis and Mr Horner returns to destructive criticism of it, his remarks on costs will not be forgotten. On his own estimate the improvements granted to the workers during the first year were at the rate of £62 million a year—no small slice of the cake.

While costs will be the main battleground in Parliament, the closing of pits will be the big problem locally. In Yorkshire, Mr J. Hall, president of the Yorkshire Union, forecast the closing of 30 to 40 pits in Yorkshire and urged the miners to accept the necessity. This is an overestimate, as the chairman of the North-Eastern Divisional Coal Board subsequently announced, but all the Divisional Boards are now getting on with their plans and large numbers of closures must be expected. The Waleswood strike is an example of the cleavage of point of view between the men and their leaders. The announcement of a decision to close a pit is a very delicate matter. Government Departments such as the Ministry of Town and Country Planning are pressing the Coal Board to declare which districts will cease to employ coalminers, and their anxiety to ascertain this, several years in advance, is understandable. On the other hand the Board's policy is to discuss closures first with the men on the spot ; to do so years ahead of the actual closing makes present work in these mines doubly difficult. What young worker is going to stay in a doomed mine ? In such cases workers may disappear faster than the economic working of the mine declines, and areas may become derelict before they need.

When the Easthampstead Rural District Council early this spring sent a demolition squad to pull down Mr Ralph Kirby's unauthorised bungalow, "Briar Patch," the outburst of popular indignation was such that the Ministry of Town and Country Planning halted the proceedings for an official enquiry. The report of that enquiry has now confirmed the sentence on Briar Patch, with a six months' stay of execution; the unamenable Mr Kirby has announced that he is staying put and the matter will presumably rest where it is until, some time around Christmas Eve, the demolition squad turns up again—with what appetite for its job may be imagined. The report does not make impressive reading. Mr Kirby was disrespectful of regulations, cheeky to inspectors, and negligent of his legal opportunities for protest and redress; so he deserved all that was coming to him. His bungalow was built in an area already afflicted with "undesirable developments" and was therefore, according to official logic, worthier of destruction than if it had been the solitary and conspicuous blemish on a beauty spot. Moreover, to allow him to get away with anything would make it impossible to prevent other unruly persons from doing likewise. But the whole argument exudes the characteristic smell of official solidarity. It is a small none the better for mingling just now with another, even more familiar odour; the odour of that retail licence in Reading granted, in defiance of all regulations and over the objections of the local Food Committee, to a relative of a member of the Government.

Because the Briar Patch decision retains all its original appearance of vindictive idocy, it does not mean that Mr Kirby should get off scot-free. He may deserve a severe fine; or the compul-

sory destruction of his bungalow when other housing becomes available. But a case such as this should not be decided entirely in terms of forms filled or unfilled, regulations regarded or disregarded, or even of principles satisfied or outraged. It is essentially a neighbourhood case, demanding a just balance between the rights of the individual and the needs of the community, a balance which any panel of upright men and women is capable of striking. As the free territory between the forbidden and the compulsory grows ever narrower, the need increases for an institution filling, in disputes such as this, the role of the common-law jury. Regulation may be inevitable; but the old question of *quis custodiet custodes* cannot be brushed aside.

The Snag in Snock

The Ministry of Food has followed up its snock-tasting party recently given to the press by a publicity campaign to boost snock recipes. All this expense has been made necessary because this South African tinned fish has not been a popular success. Why should it have been? Why should people buy these half-pound tins of a not particularly attractive fish at 1s. 4d. each at a time when prawns are plentiful and cheap—and free of points.

The snock campaign would be less important if it were an isolated example of the Ministry of Food's failure to appreciate the importance of popular demand. But other unbought tinned foods are piling up in the shops either because they are too expensive in money or in points, or because they are simply not wanted. The truth is that people are now discriminating in their purchases of food just as they are discriminating in their purchases of other things. They will buy tinned *pâté de foie* imported from Argentina but not tinned potted meat imported from the same source. They will buy home-produced spaghetti in tomato sauce but not spaghetti with gravy or meat sauce—and who can blame them?

Who allows the Ministry of Food to make these commercial howlers? It may sometimes be necessary to import expensive foods from countries with which Great Britain has a favourable balance of payments. Fruit from Italy is one example, French cheese is another. But there is a ready market for these, which does not exist for the potted meats on which hard currency has been spent. Or is snock just another folly of bi-lateral bargaining? It may not be practicable to allow the people a greater

say in what foods should be imported, and, therefore, piles of unwanted tins will continue to rise in the shops as a monument to faulty Ministerial planning. But in the circumstances Dr Summerskill's reported remark at the snock party—that snock had been canned by private firms "who do not understand the public taste as the Ministry does"—will draw tears not laughter. Private traders would not have plunged into snock before they had first tested the public demand, and would consequently avoid the pitfalls to which Government bulk sales are necessarily prone. Is the Ministry aware of a system called market research?

Shorter Notes

As was predicted and feared in *The Economist* of May 15th, the amount of private building work that can be done without a licence has been raised from £10 to £100. The Government's justification is the availability of labour and materials. But how could they not be available once cuts had been made in the housing programme? To squeeze labour and materials out of new house building in order to provide greater flexibility in the distribution of manpower, and then to permit them to be sucked in again in the much less controllable field of private repair work make nonsense of the Government's alleged intentions.

*

The House of Lords on June 21st deleted from the Nationality Bill the clause making the status of "Commonwealth citizen" equivalent to that of "British subject." The debate showed considerable strength of feeling on the subject, but little understanding of the purpose of the clause, which is expected to be restored by the House of Commons. The arguments used by the Opposition did not recognise the problem raised by the feelings of the new Dominions.

*

The third reading of the Representation of the People Bill produced a regular Brock's benefit of insults and expletives. The net result of the Government's refusal to compromise with the Opposition upon electoral representation, and the University seats, will be to make it quite certain that the Conservatives will reverse large parts of this Bill at the first opportunity, thus introducing an element of party vindictiveness into the evolution of the constitution.

Letters to the Editor

Russian Gold

SIR,—I read with interest, and I must add, some incredulity, the estimate of Russian gold production which appeared in *The Economist* of May 29th. I have since been trying, in vain, to find any corroboration of it.

Your contributor writes: "It (Russian gold production) is reported to have risen from about 11 million ounces in 1940 to 16 or 18 million ounces last year." I should like to know to what reports these figures, to which the authority of *The Economist* has now been given, are attributed. Information on such matters from Soviet Russia is notoriously difficult to obtain but your estimate is so much at variance with those made in other responsible quarters that I take leave to challenge it.

Eighteen million ounces a year is about three-quarters more than is produced by South Africa. It is appreciably more than half the estimated world production of gold. According to your correspondent this enormous expansion in gold production has taken place in one of the most inhospitable regions of the world, where temperatures are sometimes 94 degrees below zero, where the whole subsoil is frozen, and where the work is said to be done by convict labour, much of which has had to be devoted to opening up primitive road communications, with the nearest port 400 miles away, during a period when capital equipment for such expansion schemes has been notoriously difficult to come by.

If Russian gold production were at anywhere near the figure you suggest we would undoubtedly have had evidence of large sales of gold by Russia to the rest of the world. The sales which have taken place, mostly to the United States, are much more in keeping with the estimated production of about 4,000,000 ounces a year, which is the figure at which it is put by the Bank for International Settlements in its latest report, or with the even more modest figure of 2,000,000 ounces which appears in the careful and conservative estimates made every year by the Union Corporation.—Yours faithfully,

DAVID KESWICK

114 Old Broad Street, London, E.C.2

[The article was "By a Correspondent" and the estimate of production was given as "reported." It is therefore two stages removed from having "the authority of *The Economist*." Undoubtedly it is an exaggeration; but its significance lies in the fact that the only people who have been to this goldfield and have emerged to the outer world to tell their tale—some of whom are engineers, drafted into the Polish or Soviet armies—put the production at a very high figure. Where there are no official figures or facilities for investigation, but it is known that a great productive effort is being made, it is reasonable to make a greater allowance for concealment under Russian conditions of secrecy than bodies such as the Union Corporation may be prepared to admit.—EDITOR.]

Capital Shyness

SIR,—Your article explains why there was so little productive capital investment in industry before the war, but there is, I think, one other reason for this shyness, in addition to those you have mentioned.

The level of wages in many of the industries which should have been installing labour-saving devices was much less than that of the engineering industry, and it was difficult for the managers (and the accountants) to see any promise of substantial savings by substituting products of highly paid engineers for the hands of the cheap labour used by them. It would appear that, in countries of a low wage level the formation of productive capital is relatively slow, but that as soon as a high wage level is reached, management seeks ways of making savings by the introduction of labour-saving devices, and it may be that, with the complete change of wage levels in this country, conditions in future will be much more conducive to the growth of labour-saving devices than they have been in the past.—Yours faithfully,

IAN T. MORROW

59 New Cavendish Street, London, W.1

Egyptian Thoughts on the Sudan

SIR,—I hope that you will permit me to draw the attention of your readers to what I consider to be misleading statements in the paragraph headed "Egyptian Thoughts on the Sudan" on page 963 of your issue of June 12th.

It is not true that the ordinance setting up a Legislative Assembly and Executive Council in the Sudan was drafted by the British Government. It was, in fact, drafted by the Sudan Government. Its provisions were based on the recommendations of a special conference set up for that purpose, consisting of Sudan Government officials and private Sudanese citizens. His Majesty's Government's part was confined to the three suggestions mentioned by your correspondent and of the detailed examination of the draft ordinance by the Anglo-Egyptian Committee in Cairo.

It would seem incorrect to imply, as does your correspondent, that if agreement between His Majesty's Government were not forthcoming as a result of the Cairo talks, the Governor General would, by promulgating the ordinance, exceed his functions. In fact, in view of the circumstances obtaining in the Sudan, had the Governor General failed to do so, he would have been guilty of defaulting in his obligations. This view is, I submit, supported by the words used by the Under Secretary of State for Foreign Affairs in the House of Commons on June 14th, when he said, "His Majesty's Government therefore fear that they can no longer stand in the way of the Governor General doing as he thinks fit regarding the promulgation of the ordinance with his duties and obligations for the good Government of the Sudan under the Agreement of 1899."—Yours faithfully,

R. C. MAYALL,

Sudan Agent in London.

Industrial and Economic Democracy

SIR,—Even economists who rarely share the same views, will have to admit the fundamental truth of the statement expressed in the excellent leader in *The Economist* last week that "neither management nor labour has any right to dogmatise upon the problems of industrial democracy, since neither has yet found a solution to it."

The problem seems to originate from a constant confusion that exists between *industrial* democracy and *economic* democracy. It is true that the formation of works councils, joint production committees and the like bodies set up to promote

From *The Economist* of 1848

June 24, 1848

OUR anticipation and hopes of Germany, which were much more favourable than for France, seem not likely to be speedily realised. The suicidal war in the north continues. It was begun in hot haste; and, though all parties are tired of it, there is not sagacity enough to put an end to it. To the commerce and prosperity of Hamburg, and to the general prosperity of Germany, its lingering disorders and petty battles are most injurious. It is furnishing, too, a pretext for the Emperor of Russia to interfere, and it teems with general war. Nor do events march satisfactorily in Berlin. The representative body there and the Ministry have been overawed by the mob. The city has been again the prey of disorders, the arsenal has been plundered, and Government seems almost as much at fault at Berlin as at Paris. The Germans themselves look with much hope to the diet at Frankfurt; but we see no means of its forming and exercising an executive power, which would not set aside the reigning princes, and cause many a struggle to retain an old dominion. The demand of the Germans for a political national unity encounters great difficulties, and will be attained, if at all, only by means of terrible dissension. Their efforts, too, are raising up counter pretensions; and the Slaves and the Czechs, who have latterly been almost unheard of, have started into a kind of national existence, and propose in Bohemia, Moravia, and other territories of Austria, to form a power apart and distinct from the Germans. . . . The Emperor of Austria has declined to open the national assembly of Austria at Vienna in person. His capital is still in possession of the students and the national guard; and he seems quite denuded of imperial power. There is, in truth, we regret to say, at present as little prospect of a restoration of public tranquillity in Germany as in France.

Britain's Way Out

By A. Grant McGregor

WRONG WAGE POLICY IS THE ENEMY,
NOT THE PROFIT MOTIVE

GRAHAM HUTTON

in his broadcast reported in "The Listener" said: "What we need really is something like what the American and British Engineer, A. G. McGregor, calls prosperity wages"

32 pages 1/9 net

efficiency through co-operation in individual firms is to be welcomed. Organised industry, however, is but a part of the national economy, essential as this part may be. Neither "public control," irrespective of whether by nationalisation of planning, nor "combined operations" of organised industry and labour, will serve as substitutes for those new methods of public co-operation and co-ordination which functional democracy requires. Within the framework of a parliamentary democracy, "industrial democracy" can have no other meaning than of being part of a system of "Economic self-government," running parallel with "political self-government," and like the latter under parliamentary control. As hardly a single profession or trade exists in the United Kingdom which is not organised collectively both as to its owners and its workers, such a system of economic self-government, as visualised by Winston Churchill in his Romanes lecture as early as 1930, could easily be embraced by the British flexible constitutional system. With its roots drawing sustenance and knowledge from every humble producer and consumer, it might give

real meaning to the phrase "economic democracy".—Yours faithfully,
LEON ZEITLIN

Too Much Equality

SIR.—In reply to your note to my letter, may I say that the new regulations for direct grant schools, which resulted from the Education Act, 1944, were introduced by the Coalition Government? (Circular 32, March 16, 1945.)

The decision to make sixteen the minimum age for the new examination was taken by Mr Tomlinson on the unanimous recommendation of the Secondary Schools Examination Council, an entirely non-political body (see *Hansard*, June 3, 1948).—Yours faithfully,
SHEENA D. SIMON

Books and Publications

Jeremiah the Prophet

"From Smoke to Smoother." By Douglas Reid. Jonathan Cape. 317 pages. 10s. 6d.

"INSANITY FAIR" over again; this is the best description of Mr Reid's new outburst, and it has the advantage of being the author's own. *From Smoke to Smoother* has all the qualities of its predecessor; it is brilliantly written, penetrating in argument, knowledgeable beyond belief (in more senses than one), vibrant with passionate conviction, unanswerably right, quite extraordinarily wrong, and more than a little dotty. For a man who foretold practically every move that Hitler made one has a necessary respect—a respect which extends itself to his subsequent judgments on Stalin and on events in Palestine.

But what is one to make of the propositions which follow? That the emigration of Russian and Polish Jews to America at the turn of the century, and the concentration of those Jews in New York, was the result of deliberate planning by the "managers" of nihilism, who intended all along to use the Jewish vote as a lever as they are now doing. That Hitler was trained in Russia, by the inner Communist circle which represents the current generation of "managers" especially so that he might destroy Europe; that this destruction, not the establishment of the millenary Third Reich, was his aim from the beginning; and that he almost certainly survived the siege of Berlin (Trevor-Roper and all other authorities notwithstanding) and is now in Russia along with his fellow-managers. That the "managers" managed the dollar crisis, purely in order that this might be made an excuse for a general assault upon the liberties of Englishmen. (To read Mr Reid on the subject of bread rationing, one can only conclude that they also managed the harvest weather of 1946.) That their ability to "manage" these economic pressures rests on the fact that they control not merely the Cominform and the Zionist movement but the American money-power; the devil sits on the gold of Fort Knox. That the whole movement for world government is a device of these same "managers" who by its establishment would find themselves enabled to destroy liberty, nationality, Christianity, and the family, and to impose their nihilist ideals (first outlined by Adam Weishaupt at Munich in 1776, and first embodied in the French Revolution) of degradation, depopulation and death. After all this, it is hardly astonishing

ing to learn that the Fabian Society, the London School of Economics, and PEP are all screens for the "managers"—Mrs Nesta Webster's researches on the subject are quoted with approval—and one is only surprised—and a little indignant—that *The Economist* is not somehow included.

That there are, in all conscience, sinister forces enough at work in the world, no one will be disposed to deny; and leaving the devil at Fort Knox and the many devils at Lake Success out of the picture, one need not diverge too far from Mr Reid in one's views of where those forces have their headquarters. But that these descend by deliberate plan and initiation from the *Illuminati* of the eighteenth century, or that their motives are so different from the normal, all too normal, desire for power and national wealth, is harder to believe. It is possible to explain the world's present troubles quite adequately without insisting that these have been planned for 150 years by a sanhedrin of Stavrogins.

The Problem of Pace

"The Economics of Disturbance." David McCord Wright. Macmillan (New York). 109 pages. 12s. 6d.

PROFESSOR WRIGHT analyses the problems of a growing society "in terms of overlapping rates of change," and his closely-reasoned, often difficult but always stimulating essay achieves, in spite of a high degree of abstraction, a realism denied to those whose argument is couched in terms of particular institutions, particular monetary systems, or particular national circumstances—still more, of course, to those who like Major Douglas have failed to understand the processes which they discuss. The "disturbance" of his title is not the upheaval of war, demobilisation, revolution or even major technical change; it is merely that deviation from the nearly stationary which is bound to occur in any society, capitalist or planned, which pays any attention to the wishes of consumers. Of course, the greater the changeability of taste, and the complication of the economic system, and the speed of technical advance, the greater the "disturbance"; but any live system will, in one form or another, encounter the problems which Professor Wright analyses. There is the problem of the right or socially desirable rate of real saving—how, in any given society, can it be evaluated and what mechanism adjusts actual monetary saving to this optimum? (The answer is, none.) There is the conflict, particularly acute in the durable goods industries, and equally real in planned and unplanned societies, between the ideal of stability and the ideal of giving the consumer what he wants when he wants it. This analysis casts a vivid and indeed rather painful light on those aspects of the British housing problem which are now pushed into the background by the balance of payments crisis, but are only waiting to pop out into the limelight again in more propitious times; the dilemma of over-expansion to meet present needs or neglect of those needs in the interests of stability of employment. There are the besetting minor problems of readjustment: "if we assume," says Professor Wright, "that it is easier to get men into an expanding line than it is to get them out of it, and if we assume that the expanding industry or, more likely, its suppliers, collapse faster than others rise, we have the seeds for a depression." Had he been writing in Britain instead of in America he would probably have phrased this differently; politics being what they are, the more likely secondary assumption is an inflationary stimulus to employment. But in any case the result is disequilibrium.

The general conclusion of his argument, it is probably not unfair to say, is that stability is probably unattainable—certainly not worth attaining at the price it would entail; although compensatory public action can greatly reduce the instability which is the inevitable accompaniment not merely of capitalism but of democracy and science. With beautiful objectivity he disclaims for that argument any conclusive value as regards social choice; but he hopes, with justification, that "it will help us to make it more reasonably."

The Miracle of America

"A New History of the United States." By Andre Maurois. John Lane; The Bodley Head, 1948. 456 pages. 15s.

THIS "new" history of the United States by a Frenchman is remarkable chiefly for the liveliness of its presentation and M. Maurois' happy turn of style. The author makes no pretence of having gathered new facts; and his pages do not often justify the claims of the dust-cover that they achieve a wider perspective than that attained by British and American historians. The emphasis on the rôle of the French explorers in North America and the reasons for the collapse of French Canada and Louisiana give a glimpse of early America from a new corner of the compass, but for the most part the book follows the conventional outline.

Written chiefly for French readers, the book will cause no heart-burnings in the United States; the title of the American edition is "The Miracle of America." In the main it provides a balanced account for the general reader with no special knowledge of the States, and it is eminently readable. But it is precisely the general reader who will be most disappointed to find the "miracle" one of the remote past. M. Maurois has devoted three-quarters of his book to the period before 1865. On the excuse that it still belongs to the field of polemics rather than history, the absorbing story of the last twenty years is dismissed with a few careless and in some cases misleading generalities. Twenty years ago another eminent Frenchman, M. Andre Siegfried, wrote "America Comes of Age." M. Maurois has been content to retell the familiar story of America's adolescence without any of the penetrating assessments which distinguished the earlier book.

Caribbean and US Relations

"The United States and the Caribbean." By Dexter Perkins. The American Foreign Policy Library. Harvard U.P. (London: Geoffrey Cumberledge), 1947. xii+253 pages. 12s. 6d.

THE literature on the Caribbean and on United States relations with that area is already large. But there was room for a short book, on the borderland between history and contemporary affairs, which should re-appraise, in the light of changing political, economic and social conditions, the national and international problems of the American Mediterranean; and Mr Sumner Welles was fortunate to find so able a pen as that of Professor Dexter Perkins, perhaps the most distinguished of American diplomatic historians, to write the first Latin-American volume in his new American Foreign Policy Library.

Professor Perkins is always lucid, he is often penetrating, and he is anxious to be scrupulously fair. Some readers may feel that this anxiety leads to an excessive tolerance when he surveys the records of the dictators who have ruled, and still rule, a number of the Caribbean states, or to an undue optimism when he considers the economic record of the Good Neighbour policy. Nor do his statements on pages 67 and 68 square, at first sight,

very happily with recent events in Costa Rica. Yet it is possible that this discrepancy is more apparent than real. All in all no better introduction to the Caribbean area for the generality of readers could be found than this all too brief survey.

Shorter Notices

"Matters of Life and Death." HMSO. 20 pages. 6d.

THE Registrar-General is to be congratulated on this attempt to provide a small guide to the immense collection of statistics compiled in his office. This booklet, concisely but lucidly written, contains the main facts about the growth of the population of England and Wales, the birth, death and fertility rates and the comparative mortality from various diseases. A useful Appendix lists all the Registrar-General's publications and gives a brief description of their contents.

"Voluntary Social Services." Handbook of Information and Directory of Organisations. Published by the National Council of Social Services. 197 pages. 7s. 6d.

THIS very useful and comprehensive handbook is now available for the first time since 1939 and covers every possible aspect of Social and Voluntary Services. It gives an historical survey of the Voluntary Social Services of this country and their progress since 1650, when only three existed, to the present day when, with the growth of the public conscience, there are thirty. Any student of social services will find it invaluable and more ordinary mortals cannot but be impressed by the magnitude and diversity of the work undertaken by private citizens who were not content to await State legislation to come to the aid of other people.

"Economics: An Introductory Analysis." By Paul A. Samuelson. McGraw Hill. 608 pages. 27s.

"Fundamentals of Economics." By Myron H. Umbriet, Elgin F. Hunt and Charles V. Kinter. McGraw Hill. 448 pages. 3s. 75.

THESE two formidable volumes illustrate the American tendency to let the textbook do the teacher's job—and a great deal of the student's job too—instead of merely providing a framework to be filled out in classroom or tutorial or by specialised reading. Granted (a lay assumption) that this really is the best way to teach either economics or anything else, both are competent and practical jobs, and Professor Samuelson's even conceals within its bulk some good and stimulating writing. The combination of theoretical soundness with solid detailed down-to-earth realism has, moreover, advantages which it ought to be possible to achieve within a smaller compass, but which are certainly favoured by room to manoeuvre.

"Atomic Energy. Its International Implications." A Discussion by a Chatham House Study Group. Royal Institute of International Affairs. 128 pages. 4s.

THIS little book was prepared as an Interim Report, mainly of an informative character, for the guidance of the general public, and consists of nine papers contributed individually by the eminent members of the group; four of them are concerned with the scientific and technical facts, the remainder discuss the wider aspects. It forms a useful compendium on the present situation, giving an unemotional and, on the whole, impartial comparison of the various plans for control which have been put forward officially and unofficially, and discussing at length the practical difficulties in the way of realising them. The group has cautiously avoided making any very definite recommendations, or attempting to foresee the probable political developments of the future; the only speculative papers are contributed by the Rapporteur, Dr H. E. Wimperis, who on the one hand impersonally discusses the horrifying characteristics of an atomic war, and on the other draws an inspiring picture of an international atomic research organisation. Lord Hankey provides a pessimistic tailpiece, saying in effect, "None of your schemes will work—they will wreck the United Nations if it is burdened with them. We shall have to leave the matter to settle itself, and hope that we come to our senses in time."

for 1947

A REVIEW OF EVENTS AT HOME AND ABROAD

First edited by Edmund Burke in 1758, this historic volume appears this year under the editorship of Ivison S. Macadam, Director-General of the Royal Institute of International Affairs, and an Advisory Board nominated by Britain's leading societies of learning and of the arts.

Authoritative, comprehensive and impartial, it embraces a review of political and social history in British, Imperial and International affairs, as well as of events and developments in science, the arts, law, commerce and trade, etc. 42s. net.

LONGMANS

AMERICAN SURVEY

A Policy for Wages

(From Our US Editorial Staff)

UNTIL the end of May, many Americans hoped that, despite the effects of the Marshall plan and the arms programme, the inflationary drama was nearly played out. For this reason, the 11-cent wage increase granted by General Motors in the latter part of May was popularly considered a surprise surrender to the "third round" of union demands. Actually, it is merely a continuation of the rise in wages which has been going on since before the war, with only a slight interruption in 1945, and which has elevated weekly earnings in manufacturing industries from an average of \$23.86 in 1939 to \$52.07 in March of this year.

Before General Motors gave way, the newspaper headlines had made much of the decision of the US Steel Corporation, the General Electric Company, and other large corporations to cut their prices as a substitute for advances in workers' pay. But even then, increases were being quietly granted in a number of smaller industries; and price indices are once more approaching the high levels reached just before the drop in February.

These wage increases contribute to the upward trend of prices both on the demand and the cost sides, but the first is probably the more important. Because demand for both consumer and investment goods is so high, an increase in wage rates produces a similar increase in the total wage bill, instead of unemployment. Total consumer expenditures go up, not only by the amount of the wage increases, but by the amount of savings which the less fortunate must draw upon in order to keep up appearances.

Wage increases also leave their mark on prices through their effect on costs. It is true that productivity has been improving; a recent survey showed physical output per man-hour higher than it was a year ago, and also higher than the immediate prewar level, in almost two-thirds of the companies reporting. The increase in productivity, however, has probably fallen short of wage increases. Management has not resisted wage increases violently, however, because there is a strong desire to keep production going—and profits flowing—when sales are easy and costs can be passed on. "Industrial statesmanship" does not—and perhaps cannot—extend to more than a very slight absorption of higher costs, since profits, excluding inventory gains, are modest in relation to the gross national product for a period of prosperity.

Labour's arguments for higher wages are now avowedly based on the cost of living. This wages policy, which resembles a dog chasing his own tail in an atmosphere filled with the intoxicating fumes of inflation, is the result of some deep-seated forces in this country, and others are developing from it. The organisation of labour undoubtedly has increased the responsiveness of wages to the state of the labour market. Furthermore, union leaders are under even stronger compulsion than business managements to demonstrate their accomplishments every year in order to retain the allegiance of the rank and file. The workers, still suffering psychologically from the awful 'thirties, cannot escape the feeling that the reaction is bound to come very soon.

Hence the continued emphasis on the need to maintain purchasing power in a period when effective demand is already excessive. Government policy suffers from the same kind of contradictions and the present monetary inflation, providing easy credit for both consumption and investment purposes, encourages the dog to go on chasing its tail.

The profound changes which are developing include a major redistribution of income and the economic decline of the white-collar workers and the middle class; training and education in particular are selling at a discount. The implications of this are both cyclical and long-term. Because of the political as well as the economic strength of the labour organisations, it is unlikely that in a recession this income pattern will be reversed as it was in the past. The labour market has now developed rigid price sectors just as did industry before the 1930's. Not only may this accentuate fluctuations in employment within these sectors, but it may mean that in the next depression the unorganised groups will take the place of the farmers in the last, bearing the brunt of readjustment of incomes while buying in markets where the terms of trade are against them. Such a situation might obviously in the long run discourage training and education and have unfavourable effects on economic, social and political progress.

The high fixed costs to which industry is committed are likely to be increased to an unpredictable extent by a recent ruling of the National Labour Relations Board that companies must now bargain on pension plans as well as on wages; if their employees demand it. The prominence of pension considerations in both the coal and rail disputes indicates that their importance may continue to grow.

Higher wage rates have also exerted immediate pressure for mechanisation, which has increased productivity, but has pushed up overhead costs as well and has thus contributed to further rigidities.

The stresses and strains which must inevitably accompany the emergence of an economy of highly organised groups are only thinly glossed over by the veneer of boom conditions. The possibility, in an election year, of bringing political pressures to bear on economic problems, which Mr. John L. Lewis exploited recently, hastens developments which will produce future problems.

The United States needs a mature wage-price policy, and perhaps also a new way of formulating it. The present policy was born in depression, has lived through a time of troubles, and is a peculiar *potpourri* of ideas, emotions and customs. It is compounded of some remnants of the competitive-market-marginal-productivity myth, some medieval ideas of the just price, and more recent concepts of welfare economics, and a liberal seasoning of power politics. Too often the interests of the organisations involved, whether they are labour unions, corporations or the government, appear to assume an identity of their own, independent of the interests of the individuals they are supposed to represent. Pattern and custom exert their own independent influence, too; the General Motors increase of 11 cents will probably set a standard for other demands, even though its basis was supposed to be the relationship between General Motors wages alone and changes in the cost of living, with an annual addition for improving the standard of living of the workers.

A more mature policy would lay greater stress on productivity, noting perhaps that wages in England average about half those in the United States, but that selling prices are not more

than competitive, if that; wages and wage costs are very different things. This moral for management could be matched by one for labour; if wages had been directly linked to prices during the last century, labour would have been deprived of its share of the real gains resulting from increased productivity. On the other hand, the inclusion in wage agreements of an arbitrary "improvement factor," unrelated to productivity, as in the General Motors settlement, may kill the incentive to greater productivity. A long-term credit policy could be designed to offset rising costs by ever-rising prices, but it would penalise saving, and might eventually lead to the financing of all investment by bank credit and perhaps even the complete socialisation of investment. A more mature labour policy would reward skill and training instead of discouraging them. It would protect the interests of consumers and of unorganised labour groups. It would be a policy designed to achieve an equitable balance of interests among, and for the benefit of, the many groups which together make the nation.

American Notes

Dewey for President?

Dewey buttons were reportedly the best sellers in Philadelphia on the opening day of the Republican convention and the odds in favour of this fancied candidate improved steadily until on Wednesday evening, with balloting due to start next day, it looked as if Governor Dewey was almost unbeatable. This was, of course, the impression which his campaign was planned to produce and it was achieved, as was to be expected from a politician who prides himself on his modernity, by a jet-propelled version of psychological warfare, which does not however differ very much in its essentials from the more traditional methods.

The convention opened in an atmosphere of greater uncertainty than usual and Mr Dewey's undercover agents found it easy to foster anxious fears both behind the enemy lines and amongst the neutrals. The latter's greatest fear, in a year when the Republicans are convinced that they are choosing not only a candidate but a President, is that of remaining neutral so long that they will forfeit their share in the spoils of victory. It is here that Mr Dewey's unorthodox campaign achieved its great success. Senator Edward Martin was induced to abandon his "favourite son" candidacy before the conventional first ballot and to lead over half the important Pennsylvania delegation into Mr Dewey's camp at once, instead of later. Governor Driscoll of New Jersey followed quickly after, with a similar proportion of his State's 35 delegates, and with these additions to Mr Dewey's strength the advantages of being on his side became almost irresistible. In spite of Mr Dewey's insistence that no deals were involved, it will cause little surprise if these names appear again amongst his Cabinet appointments.

Mr Dewey is staking all on a quick and overwhelming victory and if his opponents can prevent this, Senator Taft's hopeful forecast that the Dewey reserves have been brought up too quickly may prove correct. As far as is known at the time of writing, Mr Dewey has not yet collected the full 548 votes needed for nomination, and during Wednesday night his opponents may have gained some strength and carried out some surprise reorganisations. But they showed no signs of being able to achieve the unity which is essential to even a successful holding action, in spite of frequent meetings between Mr Taft and Mr Stassen, the leaders of the two best-organised sections of the opposition. Mr Stassen, of the two best-organised sections of the opposition, refused unwillingly to sacrifice both his ideals and his independence, and Mr Taft's offer of the Vice-Presidency, as well as Mr Dewey's, but Mr Taft was prepared to accept a similar offer from Senator Vandenberg. The senator is the most serious menace to Mr Dewey, but it has been rumoured that he may put not only the votes which are pledged to him, but also his influence in the party, behind Mr Dewey, whose victory would then be assured. Governor Warren of California has as yet given no indication of his position, and of further uncertainty arises from the absence of reports on the activities of the leaders of the party machine, who are certainly not idle.

The delegates to the convention have meanwhile been entertained by, amongst other things, elephants, ranging from a live baby to an inflated rubber one, frequent renderings of the national anthem, the personal appearance of the only living Republican ex-President and the glad news that their sole enemy is the Communist Party. But they do not seem to have found the customary variety show as absorbing as usual. It may be that they are growing more sophisticated, or perhaps the know-

ledge that they are being televised discourages the old abandon. But it may also be that they are conscious that the eyes of the world are on them this week and that they would prefer to take a more serious share in the responsible business that brought them to Philadelphia, the business of choosing a leader not only for their party but for their country.

* * *

Rain-check for ECA—

On the North American continent, if an outdoor entertainment is spoiled by rain, ticket-holders are given a "rain-check," allowing them to make a second visit free, and the expression has become part of the language. The Senate, not altogether unwillingly, agreed to the inclusion of rain-checks in both the foreign assistance appropriation and the selective service Bills, in order to save the face of the House of Representatives and to get the Bills passed before Congress adjourned. These rain-checks not only insure the Republicans against any change before November in the climate of public opinion, now set at least mainly fair for internationalism, but will also enable them, if a storm breaks, to take shelter at the electoral expense of the Democrats.

In the case of the foreign assistance appropriations, the rain-check is the compromise on the vital question of whether the funds for the European Co-operation Administration should last for 15 months, as the House decided, or for 12, as laid down in the original authorisation and reaffirmed by the Senate. After negotiations dragging on for three days, through breakdowns and deadlocks, and finally an unprecedented visit to the conference room by Mr Hoffman and Mr Lovett (in the absence of Mr Marshall), it was agreed that the appropriation should ostensibly cover the 15-month period, ending on June 30, 1949, but that it could be spent by April 2, 1949, if the President and the Administrator considered it necessary. There seems little doubt that it will be so spent, since Mr Hoffman has always insisted that the full amount is urgently needed and has already authorised procurements amounting to over half the \$1 billion originally made available. Indeed, in his evidence before Congress, he said that if the appropriation had to be spread over 15 months, it would mean the virtual abandonment of the constructive aspects of the European recovery programme, which distinguish this programme from earlier relief plans. Unless Mr Hoffman can point to real progress in this field, he will find it difficult to justify his Administration when he is called upon to do so by the new Congress in January. Already there are signs that faith in the ability of ECA to accomplish its task is beginning to decline.

This decline of faith gave added force to the House attack on ECA, although Mr Taber himself found his inspiration in his fetish of economy. He remained recalcitrant to the end and finally gave in without grace and presumably only temporarily. Apart from the victory for the Senate's more liberal attitude, represented by the arrangement over the duration of the appropriation for ECA, this appropriation was cut in the final Bill by \$245 million to \$4 billion. This does not appear to endanger the programme, however, and the various restrictions on the use of the funds, on which the House had insisted, were much modified. The full appropriation, the largest single foreign aid appropriation in the history of the country, was for \$6,030,710,228, which is \$503 million below the original request, \$95 million below the Senate's recommendation and \$50 million above the House version.

* * *

—And for Selective Service

The ECA appropriation will begin to run out only after the new President takes office, but at least the Republicans have left themselves free, if they so desire, to accuse the Democrats of extravagance in this respect during the election campaign. On selective service their rain-check is more specific. The House Bill, which was finally passed by 283 to 130, was watered down to little more than a token gesture, in order to get it through quickly after the months of delay imposed by the Rules Committee. One of its weakest features was the provision that the men were not to be called up until next February. In conference it was, however, agreed that conscription could start in three months, the time needed to set up the necessary machinery, but that the final decision that the draft must begin should be left to the President. He will hardly be able to decide otherwise, in view of his past pronouncements, even though the decision must be made just one month before the election. But if the Republicans find, as they have always feared (although the grounds for their fear have never been clear), that their support of selective service is losing votes, they have provided themselves with a scapegoat.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

The second weak feature of the House Bill was that the men were to be drafted for only one year, which is considered to be useless by the military authorities, while the Senate favoured two years. Agreement was reached on 21 months. All men from 19 up to and including 25 years old must register and it is expected that about 230,000 will be called up in the next year, in order to bring the strength of the Army up to 790,000. The authorised strength of the armed forces is increased to 2,005,882 by the Bill. The Senate's provision for the enlistment of 25,000 aliens was eliminated in the final version, but its provision for the voluntary enlistment of 161,000 18-year-olds was retained, the only surviving vestige of Universal Military Training.

* * *

Contribution to Peace

The Republican members of Congress went to Philadelphia exhausted by their efforts to make their contribution to the peace of the world. Their exhaustion was largely the result of the nerve-racking attempts of Mr Wallace's supporters, notably Senator Taylor, to prevent the passage of measures which, in their view, are an inevitable prelude to war: in practice, Mr Taylor succeeded in making it quite certain that those measures would not get lost in the last rush. "We're not going to let Glen Taylor run the Senate," said Senator Taft, announcing that if Congress did not complete action on ECA and selective service, it would have to resume work after the convention. The House did not, however, manage to take final action on the loan for the United Nations headquarters, which has been given more significance than is warranted by the sum involved, since it is regarded as the one practical way in which, at the moment, the United States can show its faith in the United Nations.

The Republicans have made their contribution to peace, but it is a contribution which is open to varying interpretations in the future, and the same is true of the foreign policy plank in their platform. It was not to be expected that Senator Lodge, in spite of his growing resemblance to Senator Vandenberg, would induce the Resolutions Committee of the party convention, of which he is chairman, to forsake precedent and propose that the party commit itself irretrievably on this issue. Nevertheless the plank shows more evidence of his influence than of Mr Taft's, although the latter is not entirely absent, and it is surprisingly strong for a statement which has been accepted by the whole party. The Republicans promise co-operation on the basis of self-help and mutual aid to assist other peace-loving nations, within the limits of prudence and "our own economic welfare," and with insistence on business-like administration of all foreign aid. They affirm their belief in collective security and in the United Nations and particularly commend the value of regional arrangements under the Charter. They will support a system of reciprocal trade, although "safeguarding our own industry and agriculture" at all times.

The real meaning of this plank will, as always, depend upon the choice of Presidential candidate. That choice, and the course of the campaign, may demonstrate also the reliability of the Republican contribution to peace and will give Europe some guidance as to the real value of the diplomatic talks on the strengthening of Western Union which, from this week's announcement, will begin just when the election campaign is at its height. Senator Vandenberg and his colleagues have delayed the birth of the new isolationism, but they have not yet guaranteed that it will be still-born.

* * *

Whistling in the West

The myth that President Truman's tour was non-political seems to have deceived no one, except perhaps the managers of the trip, who arranged such politically unprofitable occasions as a speech to Swedish Americans who are largely Republican, and who, further West, allowed the President to address a virtually empty hall. The crop of Presidential boners was well up to average, to the satisfaction of the press. Among the minor mishaps must be counted the cold-shouldering of local Democratic bosses, who were deprived of their coveted privilege of a *tête-à-tête* with the President and a ride across the state in his train.

But Mr Truman refused to allow even the gloom and inefficiency of his own party machine to dampen his high spirits and it is generally conceded that, after a bad start, the President made a recognisable come-back. Mr Truman may only be armed with a pea-shooter, compared with Mr Roosevelt's thunderbolts, but with a target the size of Congress, he was bound to find some thin skin on the Republican elephant. Except in California, where his speech on foreign policy was one of the best non-party

addresses of his career, he has flayed Congress unmercifully. He has denounced it as the worst in history or at least the second worst. He has asked why Congress failed to pass a long range housing bill, with provision for low-cost rental housing; a true extension of social security rather than the bogus measure the President unsuccessfully vetoed; a health insurance Act, federal aid to schools, price control, more money for land reclamation, public power, and irrigation. He pointed out that, instead, Congress passed a "Rich Man's tax bill" and the Taft-Hartley Act. Senator Taft, conveniently forgetting his own sponsorship of the housing and education Bills blocked by the House, fell into the trap of admitting that "here in Washington we are still fighting the New Deal" and arraigned the President for his passion for extravagance and bureaucracy.

Any resemblance between Mr Truman's domestic programme and that of Mr Wallace is probably more than a coincidence. It is Mr Truman's tragedy that he has enemies both to right and to left; and Mr Wallace's claim to have inherited the Roosevelt mantle is quite as deadly to the Democrats as the Republican attempt to tear it to tatters. In stoning Congress, Mr Truman hoped to hit two birds, one of which was the Third Party.

Mr Truman may be a "gone goose," as Mrs Luce assured the Republicans, but he is determined to go down honking. The only exception is in the South, where Mr Truman has prudently concluded that absence makes the heart grow fonder. The President's belligerence belies the suggestion that he will gracefully decline the reluctant nomination of an ungrateful party. And if the Democrats are to be defeated, it is surely better, for the future, that they should go down flying the flag of the New Deal, their most priceless asset.

* * *

Congressional Record

By the skin of its teeth, on the last day of the session, Congress achieved the compromises on foreign assistance funds, on conscription, and on farm price supports which were, by general agreement, the very minimum it must accomplish if it was to adjourn without the grisly prospect of returning to Washington between or after the conventions. The first Republican record in sixteen years is complete, barring an emergency which would require Congress to reconvene. Even some Republicans are assailed by doubts whether it can be pointed to in the coming campaign with more than the conventional party pride.

On foreign issues there is no doubt that the 80th Congress has been historic, both because the measures it passed registered the defeat, if not the final rout, of isolation as the touch-stone of American policy, and because it recognised that America's international role no longer permits a deadlock even when the President and Congress represent opposing parties. The 80th Congress has a secure place in history for its passage of the Marshall plan, the Vandenberg resolution, the extension (though with amendments and only for one year) of the Reciprocal Trade Agreements Act; military and economic aid to China, Greece and Turkey; and the support it gave Mr Marshall through the revival of conscription and an enlarged defence budget, not only in time of peace, but in an election year.

These were measures wrung from Congress by history. On domestic legislation, there has been a double deadlock, that between the President and Congress, and that between the Senate and House. Of the two, the latter, reflecting the splits inside the Republican party, is the more significant for the future. Once the Party had achieved its negative aims of abolishing rationing and controls, reducing taxes, and curbing labour unions, the mildly progressive wing of the party found its way blocked, all too often, by the authoritarian chairmen of the House of Committees, mastodons who had escaped the Reorganisation Act. Congress managed, in the end, to extend the term of the Commissioners for Atomic Energy for two years, to continue aid to private housing, to make a small increase in some social security payments though this was offset by taking away coverage from a large group of independent agents, and to increase the pay of government employees. But the list of the Bills that failed gives a clearer picture of the urgent business of Congress.

The ghosts on Congress's cutting room floor are not all the ghosts of good Bills. The Bills that died included not only the civil rights programme, long-range public housing, Federal aid to education, the increased minimum wage, and statehood for Alaska and Hawaii, but also the return to the states of the title to tidelands oil, and the Bill to control Communists. This is some compensation, but no excuse, for a system which at the end saw the House passing 73 Bills in a day, patchwork accepted in the name of compromise, and important principles denied a hearing.

THE WORLD OVERSEAS

India's Mountbatten Year

(From Our Bombay Correspondent)

PROBABLY more events have been crammed into the fifteen months during which Earl Mountbatten of Burma has occupied Government House, New Delhi, than in any two generations of India's long and very varied history. A few of the major events include the declaration of India's independence, the partitioning of the sub-continent into the Indian Union and Pakistan, the Punjab holocaust and its sequel of unparalleled migrations of population, the assassination of Mahatma Gandhi, the "war" in Kashmir, the virtual disappearance of the princely states and the holding of two great international gatherings in India—the Asian Conference in New Delhi and the Economic Commission for Asia and the Far East (ECAFE) conference in Ootacamund.

Less spectacular, but equally important from the country's viewpoint, are the slow but steady removal of war conditions; the initiation of decontrol policies and progress in social and industrial reforms such as industrial insurance; the 48-hour week; industrial conciliation and such matters as the introduction of total prohibition and the outlawing of bigamy. It is significant of Lord Mountbatten's handling of the situation that, despite the disaster which followed the partition of the country, his popularity in India, far from suffering, has increased.

But the past year's events have given observers plenty of reason for thought and some are frankly depressed. They raise the question: Is India going to emerge as a modern state, unlike anything Asia has seen before, or is it going the way of China?

They consider that, if the Hyderabad and Kashmir disputes are not settled soon, permanently disturbed areas may be established and give rise to a form of warlordism. Even more serious is the risk that these disputes will precipitate another Hindu-Muslim clash. In Kashmir, despite Sheikh Abdulla's attempts to raise a defence army of Kashmiris (who are predominantly Muslim), the fighting is almost entirely between the Muslim tribesmen who have invaded the State from the North-West Frontier Province, and Hindu and Sikh troops sent from India to repel them. There is also a strong impression in India that despite the tribesmen's invasion, the majority of Kashmiris would vote for joining Pakistan if a free referendum could be held.

In Hyderabad tension springs from the fact that a Muslim ruling group holds sway over a predominantly Hindu population. New Delhi demands that the Nizam should establish a responsible government (which means a Hindu majority) and should hand over to the Indian Government control of defence, external affairs and communications. The situation has been made tenser in recent weeks by the emergence in Hyderabad of an extremist Muslim private army, the Razakars, led by Kasim Razvi, whose ostensible aim is to preserve the Nizam's sovereignty. The result has been a long series of border incidents and attacks on trains, one of which caused suspension of the Bombay-Madras service till armed guards could be provided.

Even the Razakars would be unimportant if their activities did not arouse Hindu-Muslim tension inside the Indian Union, where responsible people feel that another widespread outbreak would ruin the state. At the time of writing, this tension has reached serious proportions.

Puritanism in High Places

Regarding the background to the present state of affairs, adverse critics of the Indian Government make the following points: Since it took over last August the Nehru Government has made little headway in administering the country. It is mainly concerned with such trimmings as sending out expensive embassies and missions, quarrelling about a national language, rearrangement of the provinces on a linguistic basis, and the generation of such crises as those of Kashmir and Hyderabad which, say the critics, could have been dealt with later. They allege that, while New Delhi is unable to promulgate a coherent economic policy, big business is having everything its own way through its alleged friend, the Deputy Prime Minister, Sardar Vallabhbhai Patel. It is also claimed that, by allowing provincial governments to enact

a variety of public safety laws, the ordinary citizen has become actually much less free than he was under the British regime. The cost of living has continued to rise, while production has not yet shown much sign of improving. There is a feeling that there is too much dogmatic puritanism in high places and too much corruption only a little lower down the scale.

This is a formidable list of shortcomings, but the ten-month old government also has some very solid achievements to its credit. The first is the very fact that it is still in the saddle and that its leaders enjoy the support and respect of the majority of the people, in spite of the crises following partition and the assassination of Mr Gandhi. Both those crises showed that there were well organised forces inside the country whose ambition it was to remove Congress administrations from power by the crudest methods. Precautions recently taken in Delhi and elsewhere suggest that further attempts to produce chaos may be made—if the opportunity arises. But obviously the longer the present administration remains in power the more difficult it will be to destroy it.

A United Government

The main reason for the present Indian Government's success is that in spite of rumours to the contrary, Pandit Nehru and Sardar Patel are at one in their aims, and India probably boasts the most united government in Asia.

Nearly as important as staying in the saddle has been the Nehru government's achievements in restoring order in the ravaged East Punjab and the handling of more than four and a half million refugees. The refugee problem has by no means been solved, but at least these people are being resettled by degrees and being provided with food, clothes and shelter.

Progressive decontrol of two essential commodities—cotton cloth and food—though causing much controversy, has not caused the confusion which was forecast. If it is possible finally to dispense with these controls the Government will have rid itself of considerable embarrassment, because the control agencies have been the main targets for charges of corruption.

The five-year industrial truce, negotiated with the trade unions early in the year, is at last showing signs of working. The industrial courts are still choked with disputes sent for adjudication, but the flood of strike notices is ebbing. This does not mean, however, that labour is working more willingly—most factory managements complain that morale is low, go-slow tactics are common and the 48-hour week, which practically prohibits overtime, automatically limits production in a country where even semi-skilled labour is far from plentiful.

Limited working hours can only be compensated by satisfactory mechanisation and the urgent necessity for more capital goods was at the forefront of all the Asian countries' cases at this month's ECAFE meeting. It was the keynote of Pandit Nehru's speech at the opening of the conference, though he made it clear that capital goods and technical assistance would not be accepted at the cost of economic domination.

Attitude to Foreign Capital

Pandit Nehru's thesis was to some extent countered by Dr Henry Grady, American Ambassador in India. He told the conference flatly that countries in need of foreign capital assistance should have clear-cut policies giving security and reasonable returns to foreign investors. It is this lack of clarity in the whole of Asia's economic future which worries Asian countries like India as much as it does Dr Grady. Dr Grady's remarks were much resented by the extremist Indian press which claimed to see in them indications of the new "Anglo-American Imperialism." The fact is that the atmosphere of newly won freedom is extremely nervous, and every move by western countries will be subjected to the closest scrutiny for signs of an attempt to reimpose foreign dominance.

So far as Britain is concerned, the results of the sterling balance

talks can do much to clear the air and should make possible the formation of a definite import-export policy. In the last few months there has been considerable confusion regarding imports, though recently there has been some loosening of licensing arrangements for soft currency countries. A freer flow of imports could do much to arrest soaring prices.

Though foreign offers of economic aid may still be viewed with suspicion, opinions are perhaps less strident than they were a year ago. At the ECAFE meeting Pandit Nehru deprecated talk of India's "leadership of Asia," yet this was a dominant theme at the time of the Asian Conference. With the exception of the Kashmir issue, there is also a tendency towards better relations with Pakistan, at any rate in the economic sphere. Agreements for the interchange of goods and food have recently been made with a minimum of controversy.

Finally, India's internal administration is likely to be considerably simplified by the virtual disappearance of the princely states. Some 500 of these have been amalgamated into 20 unions, each about the size of a former British Indian province. Each union is headed by a Rajpramukh (equivalent to a provincial governor) who is usually the most prominent prince in the group, while the administration is in the hands of a popularly elected government. The rest of the ruling families have been pensioned off with ten per cent of their states' revenues as privy purses, to be paid during good behaviour. Many observers consider it a reform long overdue.

India's most urgent need is a period of complete calm during which time the work already begun can be consolidated. It is apparent that Lord Mountbatten worked hard behind the scenes to settle the Kashmir and Hyderabad disputes before he left. Future economic as well as political progress must depend on speedy settlements, because both disputes are costing the Indian Union heavily in men and money, quite apart from their stimulating effect on irresponsible elements.

Political Upsets in Canada

[FROM OUR CANADIAN CORRESPONDENT]

POLITICALLY, this summer promises to be about the hottest in Canada's history. It started to warm up in May when the Socialist Co-operative Commonwealth Federation (CCF) party won a federal by-election in a British Columbia riding (Yale) which had been strongly conservative. Next, on June 7th, Ontario held its provincial elections. The Conservative government, headed by Premier Drew, chose to go to the province only two years after the previous election which had given him 66 out of the 90 seats in the legislature. The public responded by reducing his seats to 53, by defeating him in his own constituency, by raising the CCF seats from 8 to 22 and by making that party the official opposition in place of the Liberals whose representation rose only from 11 to 12. (Two communists kept their seats, and one instead of three Liberal-Labour candidates was elected.) Next day there were two more federal by-elections. Both were for seats previously held by Liberals, one in the west (Vancouver Centre) and the other, also largely urban, in Ontario. The CCF won them both—and has naturally been riding on political clouds ever since.

But the summer has only just begun. There are the results of three more provincial elections to come. On June 24th in Saskatchewan the first CCF government in Canada asked the voters to send it back for a second term. Its chances, already good because of a mixture of good administration and good times, were further improved by the sweeping CCF successes elsewhere. In two days' time the Liberal government of the Maritime province of New Brunswick will ask for re-election; the CCF is not strong in that part of the country and the Liberals will probably succeed. Next, on July 28th, Premier Duplessis will ask the voters of Quebec to re-elect him and his *Union Nationale* party. By that time the federal Conservative party (properly styled Progressive Conservative) should have put forward its new party platform. And finally, in the first week in August, the federal Liberal party will gather in Ottawa to decide who shall take the place of Mr Mackenzie King as its leader.

Progress of the Socialists

The cloud on the political horizon that is being studied by all party prognosticators is the success of the CCF. The first point that comes out of this study is that every seat that the CCF has won recently with the possible exception of Yale, is largely or entirely urban. CCF gains result in part from the entry of the Canadian Congress of Labour (affiliated with the CIO in the

United States) into politics and the active campaigning that is going on through the trade unions. Nevertheless, a good deal of the progress of the CCF in Ontario is simply a result of the uncertain workings of a three-party system. The system favoured them before in 1943 when they won 34 out of 90 seats in Ontario with only 31 per cent of the votes; in the 1945 election it ran strongly against them when they only got 8 seats as a result of 22 per cent of the votes; now they have 22 seats on the basis of 27 per cent of the votes. The Ontario Liberals are, of course, emphasising this because they got 29 per cent of the votes—more than the CCF—but only 12 seats.

The CCF now appears to be within striking distance of becoming the official opposition in Ottawa after the next election. In Ontario, and in the West, with a couple of seats in the Maritimes, they might very well muster enough strength to be the second-largest group; and, learning from the early experience of the British Labour party, they might be very coy about joining a coalition government with either of the old parties. On the other hand, they seem to have little chance of forming a government at Ottawa because, so far at least, they have not been able to muster practically any following east of Ontario. The coming elections in Quebec and New Brunswick will be watched closely for any signs of CCF gains. Even in Ontario the CCF can scarcely expect to form a government. They have no rural representation there. Unlike the western farmer, who is an exporter and believes in centralised and controlled marketing schemes, the Ontario farmer sells largely in the home market where the field for socialist policies is less fertile.

Two or Three Parties?

Although the CCF may not be able to form a government in Ottawa or in Toronto for some time to come, people are beginning to ask whether the time has not come for the two anti-socialist parties to get together in the federal field and in Ontario, as the CCF has already forced them to do, to hold on to the provincial governments in Manitoba and British Columbia. So far, however, this is just talk. The politicians and their followers in the old parties find it hard to think in any terms except mutual opposition. Many other people, more aloof yet deeply opposed to socialism, are unwilling to accord to the CCF the position of official opposition in a two-party system because such an opposition is sure to come into power some day. Nevertheless, since Canada has not yet gone as far as most countries towards state control, it is doubtful whether the CCF can be kept permanently in the position of a junior partner in a three-party system. Looking to the longer future, Canada will have to decide which party or group of parties is to oppose the CCF. Each of the older parties will, as time goes on, vie more and more for this position; its success will depend on its structure and its leadership.

Until the Ontario elections there was a growing chance that the leadership of the Progressive Conservative party would change. The leader, Mr Bracken, who had been tempted from a secure political position at the head of Manitoba's Progressive party, has been dogged by misfortune. A solid, unspectacular person, he has not commanded universal support and has lost a number of by-elections culminating in the one at Yale. If Mr Drew could have shown a spectacular success in Ontario a section of the party, especially strong in the traditional Tory stronghold of Toronto, would have pressed for him as a vigorous, vote-getting leader who could count on strong support in Ontario. But now he is considerably discredited as a leader and as a strategist. The election which he called resulted in the loss of most of his majority and in the loss of his own seat; worst of all, he only carried four out of the seventeen seats in the Toronto area—all the rest went to socialists or communists. On the other hand his chances for national leadership are not entirely dead. It was especially significant that he brought into the Conservative camp four traditionally Liberal seats on the Quebec border—seats where most of the voters are French-Canadian. Mr Drew was most outspoken for conscription during the war, and is the heir to the rabid Orange-Protestant tradition in many parts of Ontario; up to the present he has not been at all popular either with the average French-Canadian or with the Catholic hierarchy and the support of both is needed to get candidates elected in most French-speaking constituencies.

The Next Prime Minister

The Progressive Conservatives are not running candidates in the Quebec provincial elections but are supporting Mr Duplessis and the *Union Nationale*. There is no particular love between him and Mr Bracken, but between him and Mr Drew a sort of entente has grown up. They hold diametrically opposite views on many fundamental issues, including the British connection and

LIMITED.
OXFORD STREET, LONDON, W.1.

conscription (Mr Duplessis opposed Canadian participation in the last war), but they both want to beat the Liberals, whose stronghold is in Ottawa, and they both cordially dislike Mr Mackenzie King. Both their provincial elections, and especially that of Mr Duplessis, have been called in the hope of muddying the political waters before the Liberal convention in August. That convention is likely to name a French-Canadian, Mr St. Laurent, as the next prime minister of Canada. He might well make Quebec safe for the Liberal party for the next fifty years—just as another French-Canadian, Sir Wilfrid Laurier, did fifty years ago. Mr Duplessis, who in spite of all his racial protestations is far more of a politician than a French-Canadian, is launching the weight of his attack against Mr St. Laurent. (The fact that Mr St. Laurent happens to be in federal politics is no obstacle to this sort of a campaign in Quebec.)

There is no doubt that the parties of the Right have a lot of strength—Conservatives in Ontario, *Union Nationale* in Quebec, and Social Credit in Alberta. They all make working arrangements with each other. They all show certain reactionary tendencies: the most outstanding anti-semitics in the country are Social Crediters; the *Union Nationale* has little regard for civil liberties; and even a federal Conservative who has led a campaign for a Canadian Bill of Rights can be found urging censorship when he comes across a book ("The Sexual Behaviour of the Human Male"), of which he happens to disapprove. But these isolated instances of anti-liberal (as well as anti-Liberal) beliefs are no foundation for a national policy or a national party.

Warning to Liberals

The Liberal party, which can in its own name get support in every province, can claim to be a national party. It is well represented in Ottawa. The Prime Minister has boasted that there are a dozen Liberals sitting with him in the House of Commons who could take his place when he retires. This is true; but it is also an indication of the extent to which the federal Liberal party has drained good men from the provincial Liberal parties and left the party as a whole very vulnerable at the provincial level. This is a grave weakness, for while it is theoretically possible for a national party to be successful in Ottawa without any representation in the ranks of the provincial governments, in practice this situation is very unlikely. It is doubtful whether the federal Liberal party is paying enough attention to its provincial fences. Perhaps this failure stems in part from the great and growing power of the civil service in Ottawa in shaping federal government policies.

If the Liberals are to oust the Conservatives and their allies as the main opposition to CCF socialism they will have to take a leaf out of the CCF book: they will have to work hard and continuously, not only at the federal level, but also at the provincial level and probably at the municipal level as well. In Canada party considerations are not normally supposed to enter into municipal politics, but the CCF has ignored this tradition and is busily training candidates there for higher political offices. This is a far-sighted policy that will greatly strengthen them in the long run—and they are going to need all the strength they can muster.

Crime in Malaya

[FROM A CORRESPONDENT IN SINGAPORE]

THERE is a spate of lawlessness in Malaya. Whether it is due to normal postwar crime or to Communist inspiration is being debated. The politically knowing see a synchronisation of events which cannot be fortuitous. They point out that after the iron curtain was rung down in Czechoslovakia, the Communists halted their advances in Europe and have now opened a second front in the Far East, that similar troubles are being experienced in Burma, Siam, India and the Netherlands East Indies, and that lawlessness in Malaya is country wide. The Commissioner General in a broadcast on June 6th shared the view that the extreme Left is making a trial of strength. He has called attention to the distinctive trademarks of the outbreak, and to the type of propaganda that has been made. Communists insinuate themselves into any group and warmly espouse it whether it be nationalist, anti-imperialist, anti-capitalist, democratic, communal, labour, or a trades union, and get a divorce when domination has been attained and the group swung to Communism.

The broadcast was more a diagnosis than a prescription, and the precise nature of the action to be taken is under discussion.

There is no need for panic. The trade and production of the country as a whole continue with amazing vitality. Though panic measures must be avoided, constant vigilance and repression must be exercised. The Malayan left wing is far less orderly than its opposite number in England, and the trades unions have little if any experience of negotiation. Many of the leaders are *déracinés*. One, a Chinese who has been in the country for over twenty years, has not yet learned one word of the easy language of the country. In Singapore incidents are rare because the Government has a more compact area to control and because it has kept a firmer grip on the lawless by banishing the most reckless criminals. It has had only two clashes with large groups who attempted to defy the law on a grand scale in February, 1946, and in May, 1948.

Singapore followed the example of the ancient Roman who lopped off the heads of the tallest poppies, but the Federation, hampered by distance, absorbed in constitution-making, and administratively over-strained, allowed the fever to spread before it applied the quinine of banishment and stern sentences. It has now banned all Federations of Trades Unions and has denied admission to a Trades Union of a man who does not follow the relevant trade. Road blocks to facilitate the search of cars, trucks and lorries have been fixed round the villages. Planters on lonely and remote estates have been given guns. But the Communist Party has not been banned.

In the first five months of this year Singapore lost 102,222 man-days through strikes involving 20,269 workers. This does not include protest strikes for political purpose. For example, on May 24th, 60,000 downed tools as a protest against the arrest of leading trades union officials. In May there were 33 reported cases of terrorism in the Federation. Not all cases are reported and such is the terror inspired that in one Johore village on June 13th when guns were drawn on Kuomintang leaders—three were murdered—people who actually saw the gun battle and watched two of the gangsters escaping, would not give assistance to the police. Earlier in the year companies of soldiers were called upon several times to fight bandits near the Siamese border and in the jungles of Perak and Johore.

Gangsters and Secret Societies

It is difficult to avoid the conclusion that a directing staff is co-ordinating the activity. It has refractory material. There is the ordinary labourer whose rice is far beyond its prewar cost and who can readily be excited to mass hysteria. There is the gangster who, after a Robin Hood existence during the Japanese occupation, is now a gang robber pure and simple who infests country areas and is well armed with rifles, bombs, sten- and tommy-guns. There are the Indonesians who in many cases were imported by the Japanese for forced labour, and who suffered horribly, and in other cases who are political extremists from the ranks of the Netherlands East Indies republicans and are embittered. There are the Chinese secret societies and there are some idealists who objected to the new constitution, and there is the Kuomintang party.

But the co-ordinating staff can claim a fairly satisfactory outcome. It secured the infiltration of the Trades Unions. It formed the Singapore Federation of Trades Unions and the Pan-Malayan Federation of Trades Unions in both of which Communist influence is strong and in the premises of one of which bombs have been discovered during a police search. It had enough voice in the leftist societies like the Malayan Democratic Union to make them scarcely even perfunctory in deprecating violence while noisy in protesting about police interference.

The addiction of Chinese to membership of secret societies is well known. The societies practise extortion and run protection rackets for gambling, smuggling and prostitution. They have, like the Chicago rum-runners, their own pitches, and they frequently clash. The Communists endeavoured to merge the warring societies by mass-initiations under the age-old ritual of the Triad Society. Forty-nine arrests were made at one such initiation and it is extremely doubtful whether the Secret Society men will sacrifice their societies to any person or party. The leaders of the Communists are usually foreign-born, but many of them have gone underground and have handed over their duties to local born deputies who are legally exempt from banishment. Much Communist activity is devoted to the struggle against the Kuomintang. Both Kuomintang and Communists are well equipped with arms and they will come to terms with each other when oil mixes with water or when China ceases to have civil war.

Meanwhile, the peaceful citizen is stung beyond endurance by these gad-flies, and will give a moral though not co-operative support to any action that will destroy the pest.

BALKAN SOBRANIE CIGARETTES & TOBACCO

THIS ENGLAND . . . No. Fifteen

EVERY Englishman fancies himself as a farmer. He loves the countryside with all the zest of the confirmed townee. Yet the hedgerows of England are indeed the very warp of the national scene and an English country garden is the perfect setting for all idyllic dreams. In many a village rectory, hall and inn there are discerning folk who long ago discovered the virtues of *Balkan Sobranie*, and who wisely never changed. The economy of long smoking, the pleasure of an aroma that even the ladies appreciate, the gentle satisfaction which makes smoking a pleasure that never cloy—these are the gifts of *Balkan Sobranie* in pipe or cigarette . . .

SOBRANIE LTD. LONDON. E.C.1.

For the man of to-day

Little time to think about correct posture, even when you do get a chance to sit down! Result—stomach muscles soft, slack and no longer a protection. A Linia Belt gives just the support you need. It tones up the muscles and helps a lot in keeping you fit and energetic.

THE BUSINESS WORLD

The Deutschemark

THE monetary reform which is now proceeding in Western Germany must be viewed as far bigger in scope, far more fundamental in its economic significance, than the mere substitution of one currency for another. The old Reichsmark had lost all claims to be an effective currency. It commanded no confidence. It was issued by many authorities, between whom little collaboration, and in some cases positive antagonism existed. No one could say, therefore, to what extent the old currency had been inflated. Official prices and wages were fixed without relation to the true value of the currency, and economic activity consisted largely of barter transactions—refined here and there by the introduction of the cigarette as a currency standard—and by other payments in kind. The currency reform must, therefore, be regarded as the reintroduction of Western Germany to a money economy. The mere exchange of new notes for old must be viewed as part of a greater financial design. Another aspect of that design is the banking reform, which can come to life now that a real currency exists to sustain it. Others are the revision of the taxation system, wholesale changes in rationing and price control, and the progress which is now being made to give the German currency some international status.

It should be said at once that this revolution in the economy of Western Germany will, like all revolutions, have its painful episodes. Any economy will adjust itself to the environment, however harsh and crude, in which it is called upon to work. In this respect, Germany has proved no exception. Three years of barter, of the cigarette standard, of an Alice in Wonderland structure of official prices and wages, of black markets, have moulded the German economy to a certain pattern, absurdly inefficient by any normal standards but designed to make the best of the prevailing circumstances. To subject that economy to a cold douche of financial orthodoxy and of hard money, may be an essential condition of ultimate reconstruction and indeed of survival; but the immediate shock is bound to cause much friction, local unemployment and hardship. It would be well for the Allied and German authorities now launching the reform to emphasise and publicise this aspect of the problem from the outset. Propaganda blaring from the East will not fail to seize on each symptom of transitional difficulty in order to persuade the German public in the Western zones that they are being made to suffer for some sordid design of Anglo-Saxon manufacture. Indeed the blast has started already. There will be plenty of material for it to exploit, for in truth the more the new regime hurts in its early stages the better it will do its job.

The reform has been launched on the basis of three laws promulgated by the military governments of Great Britain, the United States and France, two of which have already been published, while the third is imminent at the time of writing. The first law came into effect on Sunday, June 20th. It sets up the new currency, the Deutschemark, which is to be divided into 100 pfennigs. The old money, the reichsmarks, rentenmarks, and the mark notes issued by the Allied military authorities, became invalid on June 21st. The only exceptions are notes and coins up to a denomination of one mark, which will remain valid at one-tenth of their old or nominal value.

Each inhabitant of the three Western zones is to receive, as a first issue of new currency, 60 Deutschemarks against an equal

sum of old bank notes; 40 marks were paid out last Sunday through the food rationing offices, and the remaining 20 marks are due to be paid one month later. Each individual and business enterprise has been asked to hand in and register by June 26th all holdings of old currency and bank deposits. Any amounts not surrendered or registered by that date will become worthless. This cash and credit will be converted into Deutschemarks at a later date at a rate which has yet to be officially announced, but which is understood to be one in ten, the ratio indicated by the devaluation of small change in old currency. In order to provide cash required for wage and salary payments in the first few days, employers will receive bank advances in the new currency on the basis of 60 marks per employee, provided that the total so advanced to any firm does not exceed its holding of old currency. To clear the decks for the currency reform, a moratorium was declared for this week on all money obligations in reichsmarks.

The immediate impression left by this first instalment of the currency exchange is its severity. The initial ration of new currency issued to the population is small. Sixty marks per head, together with the new currency provided through bank advances for wage payments, are expected to produce an initial circulation of about 3,600 million Deutschemarks. The subsequent supply of currency will be fed firstly by advances from the banking system to provide working capital for trade and industry, and secondly by the one-in-ten conversion of the cash and credit paid in or declared this week. It is impossible to predict how rapid this re-expansion will be, since it must depend first on the policy to be pursued by the German banks in extending credit to their customers and secondly on the rate of releases under the conversion scheme, of which details have yet to be issued. It should not be long, however, before the proposed ceiling of the new Deutschemark circulation is reached. This ceiling, as defined in the second of the three laws already mentioned, is ten billion Deutschemarks. A further issue of one billion may be made if it has the sanction of three-fourths of the directors of the Central Bank and is agreed to by at least six of the states.

The new ceiling of ten billion Deutschemarks compares with a Reichsbank circulation of approximately the same size immediately before the outbreak of the war. That circulation had, admittedly, been inflated by the rearmament boom in Germany, and had risen from about Rm. 7 billion in 1937. The prewar circulation, however, applied to the whole of Germany and not to the much smaller area over which the Deutschemark will circulate. Allowing for this fact, and for the poverty of German resources today as compared with 1939, it cannot be said that the ten billion marks ceiling is unduly restrictive. It compares with a total circulation in the three zones before June 21, 1948, estimated by the Allied military authorities at between 60 and 80 billion marks, but many Germans put the figure twice as high.

Much of this inflated circulation will never be presented for conversion. There will be an inquisition on all declared holdings of more than 300 marks. Many such holdings, which are the product of illegal black market operations, will never be declared at all; the notes will either be destroyed or, if it can be done, smuggled into the Russian zone. There would be some poetic

justice in the latter development since much of the inflated currency has come from that zone and a certain "reverse lend-lease" would not be out of place. The Russians, however, are well aware of this possibility and have already strengthened their defences against it.

Apart from this destruction of a considerable part of the old circulation, much of the notes and deposits that are being declared will be skimmed off by the taxation proposals which accompany the German monetary reform. There will be a graded tax on all capital assets, designed to spread the burden of financial reform over all holders of property and not to confine it to holders of cash and bank deposits. In addition, there is to be a 100 per cent tax on all increments of capital value, taking 1939 as a basis. Finally, there is to be a complete suspension of payments on the old Reich debt, and German banks have been requested to remove such debt from their balance sheets. It is thus evident that the financial reforms will squeeze most of the water out of the dropsical financial condition of the Western zones and that the Allied and German authorities will have effective control over the subsequent re-expansion of currency. How they will exercise that control is another matter.

One of the most urgent and complex tasks that await the authorities in the western zones is to adjust the price structure. At the time the price stop was clamped on the German economy in 1936 in order to check the inflationary effect of Hitler's rearmament programme, prices bore some relation to one another within related groups of industries, and to world prices. This has long ceased to be the case. A beginning was made last April in adjusting these distortions in anticipation of currency reform. At that time, prices of coal and steel were raised, and the German economic authorities were instructed to fix new price schedules duly related to costs of production. It was intended that prices should be raised within each industrial group.

Simultaneously, the system whereby the German importer and exporter paid and received only the internal 1936 price for goods bought or sold abroad through the Joint Import-Export Agency was abolished. Instead, the German importer has normally been paying the full value of imported raw materials, converted for the time being into marks at the rate of one mark to 30 cents (or 1s. 6d.). For exports, the arrangement is flexible, since it is recognised that for some goods, but by no means all, the mark is too highly valued at 30 cents to enable the German exporter to find a market. For this reason, the exporter receives the foreign exchange price converted at the 30-cent rate, or the internal mark price, whichever is the higher. German exporters estimate that about half the goods which Germany now sells abroad would be too dear to compete if the 30-cent rate were used to convert a price based on present production costs, because the latter are particularly high owing to the low productivity of labour.

Staple foodstuffs, except potatoes, were exempted from the price-raising order last April, in the hope that a steep rise in the cost of living might be avoided. The adjustments to industrial prices should not mean a very great average rise. With this in mind, the Anglo-American authorities authorised the trade unions to negotiate wage contracts which would give a maximum increase of only 15 per cent for each industrial group. It is too early to judge whether an increase of this order will be sufficient. Normal methods of estimating costs of production and adequate wages have hitherto been impossible, owing to the prevailing barter system. Once the bloated currency is finally reduced, this process of adjustment of prices to one another and to world prices can be undertaken seriously. Until this is done, no exchange rate for the mark will be fixed. Hitherto, despite Military Government instructions, nothing much has been done to alter the legal, controlled level of prices. Now the Frankfurt authorities have begun, by removing price

controls altogether from a fairly wide range of consumer goods, though not from foodstuffs.

Another aspect of this problem is the reintroduction of clothes rationing. This had been abolished in 1942 for the good and sufficient reason that there were no adequate supplies of clothing with which any nation-wide rationing scheme, however meagre, could be operated. Clothes were issued only on dockets to those with high priority claims, such as the bombed-out. During the past two years, there has been considerable inflation of the issue of these dockets and it has been decided to replace them by clothing coupons which will be issued, on a very modest scale at first, to the whole population. It is hoped that the release of hoarded stocks, which are probably considerable, will enable the ration to be met until more adequate supplies, manufactured from Germany's large imports of cotton and wool, are forthcoming.

The introduction of a separate currency in the west was bound to have serious implications for Berlin. If the monetary reform could have been achieved on a quadripartite basis (of which there has long been no serious hope), the particular problem of Berlin would not have arisen. That problem, for better or worse, must eventually be solved by a single currency, since it is impossible even to begin to control the movement of population and of currency between the Russian and non-Russian sectors of Berlin if different currencies are to circulate in each. The Russians, who were holding out for an all-German reform, because of its great advantages for them, have been jostled by the action of the western powers into carrying out a hasty reform in their zone, and have demanded that their currency alone shall circulate in Berlin. There can scarcely be serious objection on economic grounds to this as a general proposition, provided that the currency circulating in Berlin is subject to effective quadripartite control. Unfortunately, the suggested means of putting the Russian plan into operation, and the question of prestige, have brought the most serious challenge yet to four-power government in Berlin. Whether the western Allies will insist on the new Deutschemark in their zones in Berlin—which will bring about economic confusion of an extreme kind—or whether agreement can even now be reached with the Russians about a single currency remains to be seen. The problem involves much more than the mark; it involves the entire future of Germany under four-power Government.

MATTERS OF FACT

Ever since its earliest days, over a century ago, THE ECONOMIST has taken as its task, not merely to comment on the passing scene of events, but also to provide a permanent record of facts, both statistical and documentary.

In these days of paper shortage, this task cannot be adequately performed within THE ECONOMIST itself. Accordingly the RECORDS AND STATISTICS Supplement to THE ECONOMIST was started early last year to take over this function and perform it in a fully adequate, specialist form.

Each issue of RECORDS AND STATISTICS is the equivalent of 20 to 24 pages (and sometimes more) of THE ECONOMIST, entirely devoted to the recording of factual information. Nowhere else in the world are so many facts put so promptly on record.

RECORDS AND STATISTICS is available on postal subscription only. The present subscription rates are 30s. a year for RECORDS AND STATISTICS alone or £4 together with THE ECONOMIST. On and after July 1st, these rates will be raised to £2 10s. and £5 respectively.

The Economist

Sufficient Iron Ore?

SIX months ago, the Committee of European Economic Co-operation examined the prospective supplies of raw materials which would be needed to provide the planned increase of 16 per cent in steel production between 1948 and 1951. Coke supplies were recognised as a serious obstacle, but the Committee reported that world supplies of rich iron ore would be adequate up to 1950, though in 1951 supplies would fall short of demand. The estimate of three years' grace, however, is already proving too optimistic; iron ore is joining the long list of raw materials which are scarce. It has suffered, like so many primary raw materials, from the disruption of war; labour has been difficult to recruit for the hard and uncongenial work of iron ore mining; but the main cause of the emergent shortage of rich iron ore is due precisely to the same cause as other shortages of key materials—demand continues to run at a much higher level than in pre-war years. Despite the elimination of German demand for rich ores—though that is now reviving in order to increase German steel production—the world is consuming more rich iron ore than it did before the war. And it is doing so mainly, though not entirely, because coal and coke are short—because more steel can be smelted with less coke from rich ores than from leaner ores.

Before the war the bulk of the world's steel was produced in four areas, all in the Northern Hemisphere: the United States, West Germany, France and Belgium-Luxemburg, the United Kingdom, and Russia. America and Russia produced almost all the iron ore they needed, but the European steel industries imported large quantities of rich ore from Sweden, Spain, North and West Africa, Newfoundland and Brazil. A table which charted and measured this prewar trade and compared it with the postwar pattern, would be most instructive; but unfortunately it is impossible to compile. Many of the necessary figures are not available, and many of those which are published deal only in crude tonnages which need to be corrected for their iron content, which may vary from 25-30 per cent for Lincolnshire, Northamptonshire and Lorraine ores, to 60 per cent for Swedish ores. A systematic series of figures is given in Volume II of the Report of the Committee of European Economic Co-operation, but while this serves the Committee's purpose quite adequately it has too many gaps, when assembled, to reveal the full pattern of the trade in rich iron ore, even within the limited area of the sixteen co-operating countries.

But though changes in the pattern since the war cannot be exactly measured, the main features are quite clear, and in the case of the United Kingdom for which good statistics are available, they admit of no doubt. There is a physical limit to the quantity of ore which can be imported at present, for the bulk of this trade has to be carried in a limited number of small vessels which can load at the Mediterranean and West African ore ports, and unload at equally shallow berths in this country. Freight charges are high, even allowing for the Government subsidy, and they are likely to remain high until the export trade in coal revives to provide return cargoes. Recently, however, increased foreign purchases of ore have presented a further threat to supplies for Britain. Dollars have been made available to purchase 1½ million tons of ore for Germany; and the significance of this transaction lies not in its size but in the fact that it represents the re-entry of the German steel industry into the iron ore market. Britain's requirements in 1948 are put at 9,000,000 tons, compared with 7,000,000 tons in 1947 (and 1937): arrivals in the first quarter were at a rate of 8½ millions, though that is a bad season for shipping, and during the winter certain ores cannot be shipped.

Home ore production is running at the target rate of 12½ million tons, and it might be expanded if necessary. In 1942, output reached 20 million tons, but to switch to home ore would reduce pig iron output and increase coke consumption; there would be a serious fall in the quality of the pig iron; and any such scheme would involve immense difficulties of labour supply and transport. According to the "Economic Survey," stocks of imported ore stood at 900,000 tons at the end of 1947, and these would support a spurt in iron production this year, even if imports should lag a little. Supplies of manganese ore, to make the ferro-manganese and spiegel needed in steelmaking, are causing anxiety in many parts of the world. The largest resources are in Russia, India, South and West Africa, but supplies from Soviet sources are uncertain and demand for the output of the other sources is outrunning the supply. Here again America's needs have increased its imports much above prewar levels. But, though difficulties about manganese ores are acute, they are different in kind from those which affect the much larger physical problem of obtaining sufficient ore for making pig iron.

Undoubtedly a substantial increase in pig iron production could be obtained now if the quantity and quality of blast furnace coke could be increased. If the quality of coke and coking coal was as high as it was before the war, pig iron production could be increased by 5 per cent without using any more coke than at present. Half a million tons of iron would make a most welcome contribution towards alleviating the steel shortage. More steel now means more pig iron, unless German scrap begins to flow in freely; in twelve months' time, more steel will probably mean more pig iron without the option. For this reason, it is not too soon to give serious thought to prospective supplies of iron ore for Britain and Western Europe. The trade in rich European ore is at present distorted by the dislocation of war and the dollar shortage. European ore is being shipped to America, for dollars, as return cargo in coal boats. The Germans have been given dollars so that they can replace lean French ore by rich Swedish ore, and thus counteract, in part, their lack of coke. Marshall Aid is then left to ease the financial strains which result from this distortion of normal trade. Thus the confusion of intra-European trade which Marshall Aid is intended to resolve, seems in this case to be increased by American action. Moreover, accessible supplies of rich ore have more than a temporary attraction because Europe's coal production is now inadequate; for America has joined Britain, Germany and Belgium-Luxemburg as an importer of iron ore. As the exhaustion of the easily won Lake Superior ores approaches, imported rich ore is becoming more competitive with American domestic ore. Supplies are being drawn from Brazil, Venezuela, Chile and Cuba as well as Europe, and great interest has been aroused by the discovery of a large field of rich ore in Labrador.

Thus, the world faces a prospective shortage of rich ore during the next decade. How is the British steel industry likely to react to this situation? An increase in the output of home ore can hardly solve the problem; before many years elapse iron ore mining by the present open cast methods will have to give way to drift mining, which will involve a steep rise in costs. Every rise in the price of coal and every increase in the cost of inland transport (for a large part of the British orefield is relatively distant from coal and steel plants) will absorb some of the technical economies which are being achieved by careful ore preparation. Considerable improvements in iron making efficiency have been gained from crushing, grading and sintering home produced ore, and it is quite possible that an economical

method of concentration may be developed that will enable lean British ores to be charged into the blast furnace in a form that is almost as rich as imported ore.

It is too early to say if these developments will keep pace with the increasing cost of mining home ore, and higher rail charges and coal prices. At present, the high capital cost of new plant favours the blast furnace which uses rich ore, and therefore can show a greater throughput and a lower capital cost per ton of iron produced. Furthermore, the continued expansion of the demand for flat steel products increases the advantages of a rich and purer ore. Promising changes in production technique may also favour the purer ore; and this is especially likely to prove true if the use of oxygen revives the Bessemer process. More home ore, more scientifically prepared, may be the best and only answer to the problem in the short run; but it is unlikely to be the permanent answer. The first task is clearly to develop existing foreign sources and to ensure that all the economies of ore mining which have been contrived, say, in the Northamptonshire quarries, are applied to the mines abroad. This policy is particularly appropriate in West Africa; the reserves are high, the quality is good, and they can be developed under British auspices. It is not necessary to be near the ore to make steel cheaply, provided that the ore can be transported cheaply by water; the economics of steel production of Pittsburgh and New South Wales prove that point completely. But a fleet of special ore ships may well be required eventually to replace the returning collier.

For this reason, if no other, the authors of the steel industry's five year plan seem to have decided wisely in proposing that new blast furnaces should be erected mainly at coastal sites. Whether the British steel industry should be expected to go beyond this stage of developing existing resources of iron ore overseas depends mainly on the view which is taken of its permanent scale. If the present target of 16 million ingot tons is regarded by the industry and the Iron and Steel Board as a permanent ceiling—and so far the Board have found no quarrel with this major premise in the five year scheme—then the first job is to work existing home and foreign ore resources as economically as possible. But if the present shortage of steel is to be taken as a sign of permanent buoyancy of demand, and if the British engineering industry continues to increase its contribution to the national product, much wider views will have to be taken.

During eighty years of steel development, Britain has progressed from self sufficiency in ore and coal to a position where it has been necessary to import first ore and then semi-finished steel. America is following the same cycle. That Britain never imported much pig iron was partly due to the technical virtues of the hot metal process of steelmaking and partly, in past years, to the quality and cheapness of British coal. Cheapness is still vital if Britain's export economy is to be competitive. But without discounting its importance, other factors must also be considered. These are strategic problems of great moment. There is also the problem of avoiding the fluctuations in steel output which in the past imperilled the industry's finances during slump, and now in time of boom threaten its imports of iron and steel making materials. No business can afford to leave its supplies of raw materials in jeopardy. No sensible economy would take the risk of ten engineers having to stand idle for want of the steel which one man could produce if he had the materials. There is a strong case for an adequate potential supply of steel and iron and, therefore, of ore and steel materials. Where can adequate supplies be found at lowest cost?

The resources of S. Rhodesia have recently received some publicity, and the public has heard of a scheme (which has still to be examined in detail and set going) to use Wankie coal and the hydro-electric power of the Kariba Gorge to produce hematite iron, ferro-chrome, and steel from the rich ores of that country. There may be other places in the Southern Hemisphere where a similar project might be planned. The ore resources of Africa and Australia have still to be proved and recorded in full. Australia, with its high grade ore, has already shown the possibilities by producing two million tons of steel per annum at about half the cost of British or American steel. In addition to developing accessible iron ore supplies in West Africa, should Britain also arrange over the next ten or twenty years to feed its steel and engineering industry with 3 or 5 million tons of pig iron or "semis" from plants established in Commonwealth countries of the Southern Hemisphere? What is the economic balance between such new sources of supply and the scale of the British steel industry? These are the elements in really long-term planning for steel, and they cannot be answered without a far-reaching assessment of future costs and future demand. The tight position in iron ore supplies, however, is a portent of difficulties in store which wise planning should seek to minimise if not wholly to avoid.

Business Notes

Investments in Brazil

Publication of the text of the Trade and Payments Agreement with Brazil [Cmd. 7438], has been followed by considerable fluctuations in the prices of Brazilian railway and utility stocks in London. The reason is negative—namely the absence of any specific provision in the agreement about the purchase of British investments in Brazil. There can be very few informed quarters in which such details can have been seriously expected. All earlier indications about the contents of the agreement suggested that it would do no more than give in general outline the various ways in which Brazil would be allowed to use its accumulated sterling. Specific negotiations about the taking over of British assets could not be anticipated in the inter-Governmental agreement.

The relevant clause in the Agreement, Article 19, states that the accumulated sterling in Brazil's "A" account, in which the immobilised funds are held, may be employed in five types of operations: (1) for the repatriation of Brazilian sterling loans, federal, state or municipal; (2) for taking over the San Paulo Railway; (3) in payment "for such other British owned railways or utility companies operating in Brazil as the Government of Brazil may decide to purchase by agreement with the entities concerned"; (4) for the settlement of claims by persons or companies resident in the United Kingdom outstanding since April 1, 1947, the amounts so paid being "whatever the Government of Brazil or

the Brazilian courts may agree"; (5) up to £250,000 for embassy buildings in Britain.

The sum from which these expenditures may be financed can be calculated from the agreement. Brazil's sterling balances, which amounted to £61.5 million on March 31, 1947, had fallen to £50 million by May 21, 1948, the date of the new agreement. From this sum there remains to be deducted £8,500,000 representing the balance of the £10 million to be released from the "A" to the No. 1 account under the latest agreement. These releases will be spread over the next three years. The amount in question, now in the "A" account, will clearly be left earmarked for use in financing current transactions. There remains, therefore, £41.5 million to meet expenditure under the five heads mentioned above. It is open to anyone to guess how that sum will be distributed. The negotiations in Rio de Janeiro made no attempt to go into such details; they merely cleared the lines for specific negotiations between the Brazilian Government and each of the companies concerned.

* * *

Eire Trade Pact

A new trade agreement with Eire has been reached after a week of friendly but difficult negotiation. Eire has been importing more British goods than it could pay for by its export of domestic produce to this country, and its adverse visible deficit

£9,000,000 less than the amended total for April of almost £185 million; originally this was given at over £186 million, but the total has been reduced by a correction for the value of raw cotton imports. A high level of imports might be justified, on the ground that stocks are being built up so that imports can be reduced in later months. Despite the present day wealth of statistical data, it is still difficult to get up-to-date and comparable figures for stocks. In the accompanying table, average monthly consumption and average monthly imports of certain raw materials and foodstuffs have been calculated. For raw materials, consumption refers only to the first three months of 1948 and for foodstuffs to the first four months; average imports in both groups refer to five months. Such a comparison, although not strictly accurate, should be sufficiently reliable, taken in conjunction with earlier stock figures, to indicate the recent movement in stocks. Generally, raw material stocks have risen. Although cotton stocks showed a decline of 21,000 tons in the first quarter of the year, the large gap between imports and consumption reflects heavy arrivals after March. Stocks of hemp, jute and rubber, increased up to March and expanded still further in April and May.

BRITISH IMPORTS AND ESTIMATED MOVEMENT OF STOCKS
('000 TONS)

	1948		Stocks		Increase (+) or Decrease (-) Compared with End of 1947
	Average Monthly Consumption	Average Monthly Imports	End of Month	Quantity	
Raw Materials:—					
Cotton	35.7	41.0	March	310.0	-21.0
Hemp	7.9	7.9	March	29.6	+0.3
Jute	8.4	10.2	April	39.4	+5.8
Rubber	18.4	19.8	March	137.1	+9.9
Foodstuffs:—					
Wheat*	381.0	340.0	April	...	-199.0
Butter	21.0	26.7	April	...	+26.7
Cheese	16.2	14.5	April	...	-8.5
Meat	105.4	81.8	April	...	-89.9
Bacon and Hams	13.0	17.3	April	...	+4.2
Sugar	193.0	141.4	April	...	-357.9
Tea	15.0	14.2	April	...	+3.25

* In terms of flour.

For foodstuffs, the problem is complicated by the absence of published stock figures; nevertheless, some indication can be obtained by comparing consumption and imports. Allowance for home production has been made in the consumption figures for wheat, butter, cheese, meat, bacon and hams and sugar. Wheat stocks appear to have been reduced by nearly 200,000 tons over the first four months of this year. Butter stocks appear to have increased by 27,000 tons up to April and the rise continued during May though at a lower rate. Stocks of cheese have declined. There is a serious discrepancy between average monthly imports and average monthly consumption of meat, even after allowing for domestic production, which may be partially due to statistical method; but the figures show, as the meat trade already knows, that a considerable reduction in meat stocks occurred up to the end of April, and the reduction may have become larger during May. Stocks of bacon and hams up to the end of April increased by 4,000 tons and during May imports exceeded consumption. Sugar stocks, however, apparently declined by 338,000 tons in the first four months of 1948 although imports in both April and May have risen significantly. Stocks of tea showed a net increase of over 3,000 tons by the end of April but last month's imports were only half the average monthly consumption.

In general, raw material stocks have been built up, whereas food stocks in certain cases have risen and in others fallen. The level of imports in coming months could be reduced to some extent without affecting the general level of consumption. But such a policy could not be carried very far—certainly not to the point of rectifying the adverse balance of payment unless food rations were drastically reduced or industry starved of its raw materials. Hope lies more in maintaining the impetus of the export drive. After eliminating insurance and freight from the import figures, the visible trade deficit for January to May, 1948 amounted to £128 million compared with £145 million in the same period last year. In spite of record exports, the visible trade deficit is being reduced only at the rate of £40 million a year. The "Economic Survey" postulated a reduction of the order of £280 million in 1948.

Steel and Thunder

Mr G. D. H. Cole's essay* in steel leaves the intelligent man—the reader whose attention he has on occasions in the past

* Why Nationalize Steel? By G. D. H. Cole. New Statesman Pamphlet. 2s.

invited—in more doubt than ever why the industry should be nationalised. Mr Cole's reasons for nationalisation are his "particular belief that in the national interest and in the cause of speedy industrial recovery the steel industry ought to be brought as soon as possible under public ownership and operation." This is a statement, not a reason. There need be little dispute about Mr Cole's indictment of the industry's record between the wars. He cites the ugly deal between the Import Duty Advisory Council and the industry, the Richard Thomas episode of 1937, and the restrictive price and production policies of those times. But something more than old history is required to support new policy. And a history which ignores the functions of the Iron and Steel Board and the Government's control of prices is very old indeed.

Mr Cole wants to do away with high prices, restriction of output and shortage of plant by removing any vestige of competition. He will have nothing of the present system where the Government supplies the control and the industry undertakes the risk. His method is to create a state monopoly which must pay its own way—except when it does not. There will be subsidies instead of protection, ramifications instead of competition. On that indefinable borderline where nationalisation ends and private ownership remains, there is to be competition, unless "for any reason a particular product is to be sold below cost" when "a subsidy shall be made available to the private as well as the public producer." Mr Cole does not call for any "doctrinaire" rupture of the vertical structure of most important firms; but he does not explain in detail how the national steel authority will "sort out" the industry. On nationalisation for exports and specialised products, the argument is vague indeed.

On its postwar performance, Mr Cole condemns the industry for not planning in terms of an expansion to 26 million tons a year, and for contemplating a more modest increase in capacity to 17 million tons by 1953. In almost the same breath he argues that not even nationalisation would provide the resources required for such an expansion. Is it so unrealistic to suggest that by 1953 the country may be able to make do—perhaps all too easily—with 17 million tons of crude steel a year? Or that if more steel is needed, it may not be obtainable more cheaply from new sources in the Commonwealth? The present level of production is attributed to "death-bed repentance"; and the low output of the interwar period to artificial restraint. Granted, there was some restraint. But is it any more reasonable to condemn the industry for making little steel when little was wanted than to make large unverifiable guesses about future demand?

Wheat Agreement Stillborn?

Fate has always looked a little unkindly on international wheat agreements. It took the major wheat exporting and importing countries fifteen years to settle their differences and formulate an agreement which was acceptable to all. That was last March, when even Britain, which in the past had always been a stumbling-block, agreed to sign. The luckless infant is now in peril of its life. Under Article 20 of the Agreement, signatures had to be completed by April 1st, and formal instruments of acceptance by the signatory Governments were to be deposited with the Government of the United States by July 1st. Although it is believed that all thirty-six participating countries signed the Agreement, only a few have in fact given it formal ratification. The British Government, it is announced, will formally accept the Agreement, but the American Congress adjourned last week until next January, so that ratification before July 1st is to all intents and purposes impossible. The Agreement included a provision which allowed importing countries to deposit their instruments of acceptance after the scheduled date "if they are prevented by a recess of their respective Legislatures from accepting this Agreement by July 1, 1948." But apparently it was taken for granted that the three major exporters would adhere to it.

The United States' action—or rather inaction—will postpone the Wheat Agreement for at least a year and conceivably it may mean its final abandonment. An article on the Agreement which appeared in *The Economist* of March 27th showed that, if anything, it favoured the importers, and exporting countries were not slow to realise this. But American opposition came more from grain traders than from farmers, because the Agreement increased the scope for Government trading. Hence the prompt action on the Agreement, for which the President asked, was not forthcoming. If the general level of prices remains high in the United States, the domestic support price for wheat—that is, the price at which the US Government undertakes to buy, and which is calculated broadly by reference to farming costs—is likely to remain higher than the maximum of \$2 a bushel which was con-

templated in the Agreement. If the Wheat Agreement is in fact stillborn, Marshall Aid countries will, it is presumed, pay the support price and not the "world" price for their wheat supplies under ECA, but this question of price is still under discussion. This distinction is of particular importance, since the market price may, before very long, fall below the support price.

With good harvest prospects this year on both sides of the Atlantic, importing countries are not as anxious as they were about supplies. Import requirements will certainly be less than last season's, while dollars to pay for them will be made available under ECA. If domestic wheat prices in the United States are kept artificially high by the support price programme, the sixteen Western European countries may receive a smaller quantity of wheat under ECA than would have been the case had the International Wheat Agreement been accepted. Britain, however, is little affected either way. Under the Canadian contract, the price will be raised to \$2 a bushel as from July 1st in any case, whilst the unshipped portion of the Australian contract will continue to be sold at the agreed price instead of being reduced to conform to the maximum limit under the Agreement. Nevertheless, if grain crops fulfil their present promise, the world wheat price may fall below the \$2 level next season and quotations are already declining in Chicago. One encouraging sign of the end of peak prices is the report from Buenos Aires that the Argentine Government has reduced its export price for wheat from 60 pesos a quintal to 45 pesos—equivalent to a reduction from \$3.20 a bushel to \$2.40 compared with the current Chicago price of \$2.30.

Argentina's Exchange Policy

The past week has brought important changes in Argentina's exchange and commercial policies. Driven by the virtual depletion of its gold and dollar reserves and by the abundance of its holdings of certain other foreign currencies, notably sterling, the Argentine Government has decided to increase the attractions for American capital coming into the country and to liberalise its import licensing for goods from soft currency countries. The attraction of new foreign capital (in the prevailing circumstances it can apply only to capital from the United States) is to be achieved first by guaranteeing the free convertibility of any capital that has entered Argentina since the beginning of the year, and secondly by offering this capital a more favourable rate of exchange into pesos. The free market rates quoted in Buenos Aires have been raised by approximately 20 per cent, that for the US dollar rising from 403 to 480 pesos per \$100 and that for sterling from 16.21 to 19.38 pesos to the £. The new rates will apply to all overseas transactions except those for which special rates are arranged, as for example, the rates applying to meat and cereal exports. This depreciation of the free rate will thus widen the disparity in Argentina's complex structure of differential exchange rates. It may help the influx of new foreign capital to which the more favourable conversion rate will apply, though as a weapon of attraction exchange depreciation is decidedly two-edged. There is no suggestion of offering an exchange guarantee to supplement the free withdrawal of that capital from Argentina. The exchange risks involved in investing capital on a peso basis in Argentina will, in fact, be emphasised by this latest move, and as a deterrent this may more than neutralise the intended effect of the depreciation of the free rate.

That depreciation should, however, give unqualified help to the export from Argentina of the wide range of goods to which the free rate applies. Unfortunately, it will leave unaffected the prices of the basic food contracts in which Britain and other European countries are mainly interested. The relaxation of import licensing for goods imported from soft currency countries represents a real change in the attitude which Sr Miranda was adopting recently in the negotiations with Britain. "Inessentials" such as whisky, motor-cars, mechanical toys and bicycles will henceforth be imported without restriction if they come from countries with whose currency Argentina is adequately supplied. These countries include Britain, Belgium, France, Italy, the Netherlands and Spain.

The announcement from the Argentine Central Bank leaves in considerable uncertainty the fate of remittances on foreign capital invested in Argentina before 1948. Such capital will, according to the official communiqué, be accorded "more favourable treatment," but this comparative is not defined. There is a provision about retained profits being classed as capital for the purpose of remittances from Argentina, but the existing delays on such remittances are evidently not to disappear. The communiqué explains that remittances on old capital must be authorised "in accordance with the availability of foreign exchange"—a qualification which may excuse anything. Even if financial remittances, which have been banned for the past year, are again allowed, they

will cost 20 per cent more in pesos. Is this what Sr Miranda means by "more favourable" treatment?

Foreign Capital in Hungary

To judge from the meagre particulars available, there is a danger that the terms of the Hungarian Government's nationalisation arrangements may in some cases involve confiscation of foreign capital. On Saturday last the Hungarian authorities advertised in the *London Financial Times* an announcement that three "recent" decrees had been made requiring registration of interests in Hungarian undertakings. Three distinct processes of registration are provided for, and the Hungarian Legation points out that registration under one of the decrees does not carry exemption from the obligation to register also in accordance with the other decrees; but it is not made plain what distinct purpose these separate registrations serve. The third, however, relates specifically to undertakings which have been nationalised, and requires a declaration of title and nationality of the owner of any shares. These declarations are to be made at the Hungarian Legation (46 Eaton Place, S.W. 1).

Almost simultaneously with this advertisement, the Board of Trade pointed out that the recent Hungarian Nationalisation Law, which provided for nationalisation of all industrial, mining and similar undertakings employing more than 100 persons, contains provisions for the exemption of such concerns in those cases in which there is a "genuine foreign interest" of more than 50 per cent. It now appears, however, that, in order to rank for such exemption, all shares in such companies held by foreign persons or corporate bodies, must be registered before the end of this month with the Hungarian National Bank or with a Hungarian Legation. The Board states that other interests in such companies must also be similarly reported by that date. The penalty for non-registration is a forfeiture not only of the right of exemption from nationalisation of the assets represented by the shares, but of the right to compensation for the nationalised property, as well as invalidation of the unregistered shares.

The unreasonableness of allowing a mere ten days between the moment of the announcement and the expiry of the period for registration is enhanced by the ambiguity and inadequacy of

LONDON TRANSPORT

CENTRAL
LINE

WITH MORE AND LONGER TRAINS

the official announcement by the Hungarian authorities. This, indeed, made no reference to the fact, revealed by the Board of Trade, that failure to register within so short a period would involve such extreme penalties. Nor is it clear whether registration under the only decree which refers to nationalisation will be sufficient to avoid the penalties unless it is supported by registration under either or both of the other decrees. The Council of Foreign Bondholders has requested the Government to obtain an extension of the time limit for registration, but meanwhile persons in this country with interests in Hungary are advised to register with the Hungarian Legation forthwith, and if a single registration only is required of them by the authorities there, it would be prudent to obtain a written confirmation that declarations under the other decrees are unnecessary.

German Assets in Switzerland

The question of releasing German assets in Switzerland for reparations purposes has again been raised in Parliament this week, and occasion has been taken to express once more the disappointment of the British Government at the wholly negative attitude of Switzerland in this matter. Switzerland undertook, by an agreement signed in May, 1946, to liquidate the assets of German nationals in Switzerland and to hand over one half of the proceeds to their former owners and the other half to the Allies. The amount involved has been estimated at the equivalent of about £30 million. So far no distribution of any kind has been made, although a very considerable sum is in liquid form and held by the Swiss Government.

A joint note was presented to the Swiss last May by the British, US and French Governments calling attention to this unsatisfactory state of affairs and asking the Swiss Government to make available immediately a sum of 100 million Swiss francs which, through its distribution among the European countries entitled to reparations, would make a real contribution to European reconstruction. By an earlier note, sent in February of this year, the Swiss Government had been asked to make a sum of 20 million Swiss francs available out of these German assets as an advance to the International Refugee Organisation. So far no reply has been received to either note. The excuse advanced in the past by the Swiss for their inability to implement the agreement of May, 1946, was that the Swiss Government are not in a position to pay the amounts due under that agreement to the German owners because there is no exchange value or market for the mark. The excuse is not particularly convincing. The Swiss could readily have kept in a separate account the amounts due to German owners, postponing the transfers until such time as the machinery for making them was restored. The Swiss record in this matter is in significant contrast to that of two other ex-neutrals, Spain and Sweden, whose governments have made satisfactory progress in liquidating and distributing German assets held in their respective countries.

Institutional Investment Problems

The Centenary Assembly of the Institute of Actuaries has provided occasion not merely for social meeting, but also for a series of papers as impressive in their scope and content as any in the history of the Institute. To select among them involves invidious choice, but there are two which illustrate the force of the nineteenth century description of the actuary as a "scientific financier." The first is Mr Weaver's paper on the changing background of institutional investment in this country; the second is a joint paper by Messrs. McAndless and McDiarmid on life insurance investments in the United States. Both papers are illustrated by tables showing the distribution of investments which show decided similarities of trend, particularly in the great expansion, relatively and absolutely, of holdings of Government securities.

Mr Weaver shows that this expansion has been consonant with the increase in Government borrowing during and since the war; he points out that nationalisation has further reduced the scope for insurance offices to find suitable investments outside the Government field—scope which has again been narrowed as a result of the repatriation of debt and British-held investments by Dominions and foreign countries. Thus, the "rather warped" distribution of insurance funds at the end of the war has been little changed, if at all. Mr Weaver expresses some scepticism about the equity theory of investment as a protection against inflation, on the ground that controls and taxation can greatly reduce the benefits which accrue to ordinary shareholders from inflationary conditions. Few investors will quarrel with that

statement, except to point out that under voluntary dividend limitation, even control is no longer necessary.

Mr Weaver makes some suggestive comments about the scale of the gilt-edged market. He declares that the very large amount of Government stocks in issue justifies a market "much more broadly based than at present," and suggests that close working between the market and the largest holders—principally insurance offices—"or the provision of institutional equity capital for the gilt-edged market" might lead to more stable gilt-edged prices and an outlet for surplus funds. The links are of course already close, and the germ of the idea which Mr Weaver suggests will certainly provoke discussion. So will his closing comments on investment policy. On this, two quotations must suffice:

DISTRIBUTION OF ASSETS OF 12 BRITISH INSURANCE COMPANIES

TOTAL	249,428	100	660,100	100	900,399	100	1,170,446	100

"A great deal of what has been written on 'scientific investment' is much nearer to astrology than to objective deductions from clearly enunciated principles. Even the best of it has little regard for the needs of the institutional investor who cannot, except perhaps in Government stocks, deal with the large blocks of securities and shares which he holds with the same facility as the financial journalist can deal with index numbers." It is a salutary reminder. Yet both the actuary and the more sober elements in financial journalism have to "take a view" based on past experience and the best judgment of future trends; both in their respective spheres are concerned with that "masterful administration of the unforeseen" which Mr Weaver neatly quotes to summarise the actuary's art.

American Life Insurance Investments

The problems of the American life offices, outlined in the second of the two papers mentioned above, are in many respects closely parallel to those of the British offices. The table below shows that the expansion in holdings of Government bonds has been comparable with the expansion of gilt-edged holdings in this country. Cheap money has affected the American scarcely less than the British offices. They are limited much more severely than the British by legal limitations on the proportion of equity stocks which they can hold.

Where are they, then to turn for new investments? Their assets are increasing at a net rate considerably exceeding \$3 billion a year; that rate would absorb, starting from scratch, the whole

DISTRIBUTION OF ASSETS OF 49 AMERICAN LIFE INSURANCE COMPANIES

Is your FIRE COVERAGE out-dated, too?

Out-of-date fire-fighting methods raise a smile now, but out-of-date fire insurance can be a very serious matter. To-day's increased values make it advisable to check up your policies and keep your cover right up to date. Do it now—tomorrow may be too late!

Famous for every type of insurance—

GENERAL ACCIDENT FIRE AND LIFE ASSURANCE CORPORATION LIMITED

Chief Offices: General Buildings, Perth, Scotland
General Buildings, Aldwych, London, W.C.2

THE STANDARD LIFE ASSURANCE COMPANY

For Mutual Assurance

Established 1825

Assets exceed £54,000,000

SPECIAL ATTENTION IS DRAWN TO THE FOLLOWING CONTRACTS:—

1. **BUSINESS MAN'S POLICY** Inexpensive Life Assurance with options to convert at a later date to an endowment assurance either with or without profits.

2. **FAMILY INCOME POLICY** The ideal contract for a young married man: maximum life cover at minimum cost.

3. **POLICIES FOR CHILDREN** (a) "Public Schools" Policy. Provision for education by means of premiums spread over the early years of a child's life.

(b) "Early Thrift" Policy. Should be effected as soon after birth as possible to provide a splendid life or endowment assurance policy when the child attains the age of 21.

(c) "Family Protection" Policy. A policy on the life of a parent, incorporating valuable options on the life of his child at age 21. Income tax rebate is allowed on the premiums.

An enquiry will bring full particulars.

NOTICE TO SHAREHOLDERS

DECLARATION OF DIVIDENDS

NOTICE IS HEREBY GIVEN that the following Interim Dividends have been declared in respect of the financial year ending 31st December, 1948, and are payable to Shareholders registered in the books of the undermentioned Companies at the close of business on the 30th June, 1948.

These dividends are declared in the currency of the Union of South Africa. Cheques in payment of such dividends will be posted on or about 21st August, 1948, to registered Shareholders.

The Transfer Books and Registers of Members of the Companies will be closed from 1st to 10th July, 1948, both days inclusive. **SPECIAL NOTE.**—Although it has been advertised that the Transfer Books and Register of Members of Nassau Investment Corporation Limited will be closed from the 23rd to 30th June, 1948 (both days inclusive), to determine the persons entitled to attend the General Meetings of that Corporation to be held on the 30th June, 1948, they will be re-opened on 30th June, 1948, at 2 p.m., and during the period 23rd to 30th June, 1948, the Transfer Secretaries will accept shares lodged for transfer, so that such transfers may be registered between 2 p.m. and 5 p.m. on 30th June, 1948, and thus entitle the transferees to receive from the Corporation Dividend No. 18 referred to below.

Name of Company.	Dividend Number.	Rate Per Cent.	Nominal Value of Share.	Amount of Dividend Per Share.
ORDINARY SHARES:				
Affiliated Investments (Unit Securities) Limited	5	3½	10/-	4.2d.
Drakensberg Investments (Unit Securities) Limited	2	3½	10/-	4.2d.
Huguenot Investments (Unit Securities) Limited	5	3½	10/-	4.2d.
Managed Investments (Unit Securities) Limited	7	4½	10/-	5.1d.
Nassau Investment Corporation Limited	18	12½	5/-	7.5d.
Second Managed Investments (Unit Securities) Limited	7	5	10/-	6.0d.
Second Nassau Investment Corporation Limited	7	7½	20/-	1.6d.
PREFERENCE SHARES:				
Dinic Investments Limited	4	3	20/-	7.2d.
Second Nassau Investment Corporation Limited	7	2	20/-	4.8d.

In terms of the Union of South Africa Income Tax Act 1941 (as amended) a non-resident Shareholders' Tax of 7½ per cent. is imposed on dividends payable to Shareholders whose registered addresses are outside the Union. The Companies will accordingly deduct this tax from dividends payable to such Shareholders.

TUGELA INVESTMENTS LIMITED.

Shareholders in the above Company are reminded that in terms of the Prospectus, dated 10th May, 1948, it is the intention of the Directors to declare the first dividend of Tugela Investments Limited, in respect of the period from the date of incorporation, 7th May, 1948, to the 31st December, 1948, during August, 1948. Shareholders will be notified in due course of the dividend declared.

OPTION CERTIFICATES.

Holders of Option Certificates issued by Second Nassau Investment Corporation Limited, entitling them to take up during July, 1948, Ordinary Shares at 40/- per Share, are reminded that such Options must be exercised on or before 31st July, 1948, and if not exercised by that date will lapse and be of no value.

By Order of the Boards,

UNIT SECURITIES AND TRUST COMPANY OF SOUTH AFRICA, LIMITED,
Secretaries.

debt of electricity concerns in less than two years, and the entire telephone and gas utilities in less than one; it would embrace all railroad debt within three years, and all real estate mortgage debt, urban and farm, in about ten years. And, of course, the offices do not start from scratch, but have to meet the competition of other investors.

Outlets are likely to be found in corporate and mortgage debt—there will be an acute demand for new capital, particularly in the utility field, for several years, which should provide several hundred million dollars a year of potential new life company investments. Industry is also issuing more securities, but the most important increase which these authors expect in life insurance media is likely to be in urban mortgages. The scope for such expansion is clearly evident from the table above.

* * *

Shell Expansion

The fiftieth annual report of Shell Transport and Trading has been examined with added interest this week for news of the progress of capital projects, towards the finance of which some £64 million was recently raised by the Royal Dutch-Shell group from new issues. The greatest urgency has rightly been attached by Shell to the plans for establishing new refineries in this country. Sir Frederick Godber is able to report that although delays in obtaining the necessary steel and building licences have retarded the start of construction, much ground work has already been done at the Stanlow and Shell Haven sites. It is now hoped to commence partial operations at Stanlow by mid-1950 and at Shell Haven a year later, while the refineries are expected to be completed in three to four years' time. It is no fault of the company that these dates are a good deal later than was originally hoped, and the new refineries will be ready none too soon to deal with the rapidly expanding supplies of crude oil from the Middle East. To its other three refineries in this country on the Clyde, Thames and Manchester Ship Canal which have a total annual intake of some 2,000,000 tons of oil and produce nearly 70 per cent of the total lubricating oil of this country, Shell has added a fourth during the year by its purchase from the Government of the refinery sections of the aviation fuel plant at Heysham. After modification, this refinery will be able to treat 1,500,000 tons of crude oil a year, and though this tonnage will not represent a corresponding net addition to the country's refinery capacity it will mitigate to some extent the present shortage and add considerably to the refining resources of Shell.

*

Shell does not open any new vistas for its shareholders by publishing consolidated accounts for the past year, but confines its accounts to those of the parent company only. Moreover, the chairman has stated that "at this time publication of consolidated accounts is not feasible but the matter will be kept under constant review"; perhaps it is permissible to infer that the company may be considering an application to the Board of Trade for exemption from the obligation to provide consolidated accounts. Such a claim might have some justification in view of the complexity and strategic importance of the group's international interests. The accounts of the parent company show that income from associated companies increased from £2,685,181 to £4,183,187 before the deduction of administration and office expenses and reached the highest level since 1938. Earnings on the issued ordinary capital, as increased to £38,594,177 since the date of the accounts, were equivalent to 9.1 per cent. It seems reasonable to presume in the light of the bumper trading profits of other oil companies that group earnings rose considerably more than the parent company's figures alone would suggest. For example, profits of Venezuelan Oil Concessions, one of the progressive subsidiaries of the group rose by some £19 million to £35.6 million in 1947. Sir Frederick Godber, in his statement to Shell stockholders, makes it clear that the decision not to increase the final dividend was dictated by the need to conserve resources for the expansion of the business, and he makes no mention of voluntary dividend limitation.

* * *

Anglo-Iranian Development Progress

The potentialities of Anglo-Iranian are amply demonstrated by the full accounts for 1947 which reveal a record expansion in trading profit from £12,199,247 to £33,412,939. If consolidated accounts were provided, they would enhance the demonstration of the group's strength, for its interests in subsidiary undertakings

appear at a book value of £18,624,946 in the latest balance sheet, compared with £12,810,263 at the end of 1946.

Increased activity by subsidiaries and allied undertakings has been mainly centred on the expansion of production in Iraq and Kuwait and the extension of marketing operations in Europe. The Kuwait Oil Company, in which Anglo-Iranian has a 50 per cent interest, is making good progress. Following the initial shipment of oil from the country in June, 1946, output rose to 2,185,308 tons last year and is expected to exceed this figure considerably in the current year. Capital expenditure in Kuwait has apparently been heavy, since facilities to enable six tankers to load simultaneously are being installed to replace the present submarine lines; in addition, housing and ancillary services are being expanded; no figures for expenditure on this account are given for Kuwait, but the parent company spent some £4,000,000 on various amenities in Iran during the year. The construction activities of the Iraq Petroleum Company in which the group has a direct interest of 23½ per cent were advanced in 1947.

The expansion of the tanker fleet is also entailing heavy capital expenditure. Tanker tonnage belonging to the wholly owned subsidiary British Tanker has been increased by 144,000 dead weight tons in the past year and now totals 1,244,000 dwt. Additional tonnage now on order in British shipyards, amounting to 49 ships of 600,000 dwt will replace equivalent tonnage which the group now has to run on charter. The extension of refinery capacity both in this country and overseas has also proceeded satisfactorily. Throughput at the Llandarcy refinery in the past year exceeded normal capacity; in 1948 it is expected to be more than doubled at 850,000 tons with a further rise to 3,000,000 tons by the end of next year. At Grangemouth the current year's rate of 600,000 tons is to be increased to 1,500,000 tons. The refinery at Abadan achieved a record output of 18,565,507 tons in 1947. New refineries are projected at Dunkirk and on a site to be chosen in the Eastern Mediterranean. The construction of the pipeline from the Persian Gulf to the Mediterranean in conjunction with the Standard Oil Company of New Jersey and Socony Vacuum has been retarded by disturbances in Palestine. Obviously the capital outlay required for present development plans will make heavy inroads on internal resources, even if they continue to be supplemented out of profits on the same scale as last year. An even more important consideration on which the whole plan hinges is the adequacy of steel supplies.

* * *

Trends in Bank Advances

At first glance, the latest quarterly figures of bank advances in Great Britain seem to bear out the fears, widely felt in banking circles last year, that the cuts in the nation's investment programme might produce a sharp deceleration of the strong upward movement of the past two years. The total of outstanding advances of all members of the British Bankers' Association in May was £1,351 million, compared with £1,307 million in February and £1,094 million twelve months earlier. The increase in the latest quarter, at £44 million, was only half that shown in the previous three months and barely two-thirds of that for the similar period of 1947. It has to be borne in mind, however, that the expansion in the early months of this year was abnormally heavy, apparently in consequence of the record rate of inflow of taxes to the Exchequer. On the other hand, during May the first distributions of the Argentine Rail monies were being made to stockholders, and the receipt of these funds probably slowed down the demand for advances. It is noteworthy that the large Personal and Professional group, which in the early postwar period represented nearly one-third of total advances, has expanded in this past quarter by a mere £7,000,000 (to £363 million), and now accounts for only 26.9 per cent of the total. Only six of the twenty-five classification groups show declines, and some of these are fractional; but most of the quarter's net new borrowings have been concentrated within three groups. Agriculture and Fishing, which in the similar quarter in 1947 rose by only £4,000,000, has this time jumped by nearly £10 million to £111.5 million, in contrast with only £66.5 million in February, 1946 (the earliest date for which these classified figures are available). The Retail Trade group, reflecting the tendency for stocks to accumulate, has expanded from £131 million to £141 million, and is now nearly £80 million above its level of early 1946. The largest expansion, both absolutely and relatively, has occurred in the Public Utilities group (this excludes Transport, which rose only moderately); the expansion here was from £13.9 million to £26.4 million. Moderate increases are shown by Engineering, Chemicals, Iron and Steel, "Other"

In the few idle minutes before dinner is served, the conversation has turned to last night's radio programme, and a difference of opinion has arisen about one of the items. Was it Chopin's first or his second concerto? "I don't know why we should argue so long about a matter that can be settled in a moment," says the mother, "just look it up in the Radio Times." You see, more than half the homes of Britain take the Radio Times regularly.

Average weekly sale for 1947, 6,273,926. A.B.C. figures.

COMPANY MEETINGS

OTTOMAN BANK

GOOD WORKING RESULT

THE HON T. B. MONEY-COUTTS'S REVIEW

The eighty-first annual general meeting of the Ottoman Bank was held on the 23rd instant at Winchester House, Old Broad Street, London E.C.

The Hon. T. B. Money-Coutts (the chairman) presided.

The chairman in the course of his speech said:

In January of this year I was elected chairman of the London half of the general committee. I greatly appreciate this honour and I shall do my best to sustain the high traditions of the bank.

Our former chairman, Colonel Sir Eric Gore Browne, joined the London committee in 1943 and was chairman from 1944 until 1947. During this difficult period he spared no time or effort in furthering the interests of the bank, and his energy and enthusiasm were of infinite value to all with whom he came in contact. The welfare of the staff at home and abroad was ever present in his mind. In expressing our very sincere gratitude to him, I know I am voicing your wishes as well as those of his colleagues of the general committee.

It was during Sir Eric Gore Browne's years of office that we were able, after the war years of separation, to renew contact with our colleagues in Paris, and the mutual confidence and co-operation which that reunion immediately revived has continued unchecked and stands to-day, strengthened by a frequent exchange of visits, as strong as it has ever been.

As was our custom before the war, certain of our directors from Paris and London recently paid a visit to Ankara, accompanied by our director general for Turkey. They were very courteously received by the President of the Council and by the Minister of Finance, and had interesting conversations with a number of officials, including the general managers of the principal Turkish banks.

THE BANK IN PALESTINE

No doubt you would wish me, before proceeding further, to give you some more recent information concerning the bank in Palestine. Naturally, business has had to be severely curtailed, but we have endeavoured to give service to our clientele while it has been possible to do so.

Our main Jerusalem branch had to close down in May last and our regional manager has moved to Amman, in Transjordan. Our sub-branch in Jerusalem West, however, which was only reopened a few months ago, is working normally, and the staff are all well except one messenger, who has been slightly wounded. The Jaffa branch has also had to be closed early in May, but the Tel Aviv, Haifa and Nablus branches are open for business at the present time. Although slight damage has been reported to the buildings in both Jaffa and Jerusalem, I am happy to state that according to our latest information they are still standing, and the strong rooms are intact.

May I now refer to the balance-sheet, which is already in your hands?

The figures for 1947 reflect an active and successful working year, though I would ask you to bear in mind that subsequent events will in due course have an adverse effect upon certain sections of our business. The balance-sheet total of £61,640,000 shows a small decrease of some £2,500,000 on the figure at December, 1946, attributable to a contraction of a similar amount in clients' balances with us.

On the assets side of the balance-sheet, cash has fallen by £1,700,000, money at call by £6,600,000 and bills receivable by

£2,500,000. On the other hand there is an increase in the more remunerative employments, investments having risen by nearly £2,000,000 and advances by over £6,000,000.

You will see that investments stand in the balance-sheet at £19,086,702 13s. 9d. and that of this amount no less than £18,146,332 12s. 6d. is invested in British Government securities. You may perhaps be interested to know that by far the larger part of these securities is represented by short-dated stocks.

RESULT OF YEAR'S OPERATIONS

The profit and loss account records a result for the year of £257,641 15s. 4d., an increase of over £70,000 on the previous year's figure. We have also been able to bring into account £81,054 7s. 2d. in respect of further remittances of profits from previous years.

Adding the amount brought forward from 1946, there is, therefore, a total available of £357,185 10s. 11d.

We may, therefore, reasonably claim to have achieved a good working result in 1947. The committee has, however, decided to transfer a sum of £18,000 to "reserve for contingencies," which, I think you will agree, is justified by present circumstances.

I shall shortly be submitting to you the committee's proposals for the disposal of the available balance; but before doing so, I shall endeavour to review conditions during 1947, in various countries where we are established.

CONDITIONS IN TURKEY

The activity and prosperity which were so strong a feature of Turkey's economy in 1946 continued into the first half of 1947 and indeed, the trade figures for the year both in volume and value (imports Ltq. 685,000,000; exports Ltq. 625,000,000), show a marked advance. However, during the latter half, the country's trade began to feel the full effect of a decline in the purchasing power of a number of European countries, normally purchasers of her produce.

Nineteen forty-seven may be said to mark a point at which these countries, whose policy under stress of war had been to obtain provisions at all costs, began to revert to a more strictly balanced economy, even at the cost of severe restrictions imposed upon their peoples. The dollar shortage in these countries, which were numbered among Turkey's principal customers, and the measures they were obliged to take for the protection of their currency, prevented Turkey achieving her 1947 export target, which would have ensured for her sufficient dollars to cover essential imports. Thus, the trade for the year results in the deficit shown in the above figures.

TURKEY'S VITAL OBJECTIVE

The Turkish Government is fully aware of the position, and has already, towards the end of last year, taken the appropriate measures to meet the situation. The concentration of all her resources in an effort to bring internal prices down below world levels, or, at the very least, into line with world levels and thus to ensure an export market for her produce, is Turkey's immediate and vital objective.

May I now revert to the balance-sheet? The balance remaining on profit and loss account is £177,185 10s. 11d., and your general committee propose that a dividend of 6s. per share be paid again this year, absorbing £150,000 and leaving £27,185 10s. 11d. to be carried forward to 1948.

The report was adopted.

CITY OF SAN PAULO
IMPROVEMENTS AND
FREEHOLD LAND COMPANY,
LIMITEDSATISFACTORY FINANCIAL
POSITION

The thirty-sixth ordinary general meeting of this Company was held on the 24th instant, in London, Mr R. G. Mills (chairman of the company) presiding.

The following is an extract from his statement for the year ended February 29, 1948:—

The amounts in Brazilian currency for assets, liabilities, profits and outgoings have been taken, as usual, at a fixed exchange rate of 3d. per cruzeiro (that is, 80 cruzeiros to the £), but throughout the year under review the effective rate of remittance of sterling under permit was 75.3948 cruzeiros to the £, which is, of course, a better rate from this company's point of view.

COMPULSORY DEPOSITS IN BRAZIL

The directors have decided that the profits which have to be compulsorily deposited with the Banco do Brasil and retained undistributed in Brazil by the company should be segregated and a new account, "Profits retained under Brazilian decree No. 9159," amounting to £122,910, has been set up.

On the assets side of the balance-sheet the "long-term deposits with the Banco do Brasil" had increased to £65,347, at the date of the balance-sheet, and to £75,735 after a final deposit made in March, 1948. A part of the compulsory deposit with the Banco do Brasil has been made in the form of Brazilian war bonds, for which the company was obliged to subscribe under previous legislation.

FREEHOLD LAND

The amount representing freehold land has been reduced from £253,297 to £218,898 by reason of sales made during the year. Land becomes enhanced in value not only by expenditure on development, which is shown separately in the balance-sheet, but by the effect of nearby development, and many other influences.

It has been suggested that if the whole of the land could be sold at today's prices for cash the proceeds would show a considerable increase on that figure. However, as there is no possibility of selling the whole of the company's holding of land upon a given date for cash, the result of implementing such a suggestion would be entirely notional.

The company's financial position is satisfactory. During the financial year under review remittances totalling £150,000 have been received. At the date of the balance-sheet the available resources in London included £150,000 Exchequer bonds and cash at bank of £126,834. In San Paulo the cash balance was the equivalent of £172,011, of which £10,388 has since been deposited with the Banco do Brasil, and £47,174 (although remaining in the company's possession) is frozen for a limited period, except that it can be used for the purchase of land.

The profit realised in San Paulo amounted to £160,068 (compared with £157,820 last year), after adjustments made in London, notwithstanding further increases in administrative charges. The net profit for the year, after charging interest on debenture stock for four months until it was paid off, and interest and sinking fund service of the income stock, and transfer of £55,404 to profits retained account, amounts to £72,897. Profits in suspense, receivable over varying periods in future years, have increased from £1,501,694 to £1,934,381, taking exchange at Cr. \$80 to the £.

The company's business is in a healthy condition, and during the current year sales have continued at a satisfactory level.

The report and accounts were unanimously adopted.

STEEL BROTHERS AND COMPANY, LIMITED

WIDER FIELD OF ACTIVITY

BEST RESULTS SINCE 1941

POSITION IN BURMA

MR J. K. MICHE'S REVIEW

The fifty-seventh annual ordinary general meeting of Steel Brothers and Company, Limited, will be held, on the 30th instant at Winchester House, Old Broad Street, London, E.C.

The following is the statement of the chairman and joint managing director, Mr J. K. Miché, which has been circulated with the report and accounts for the year to December 31, 1947:—

It is difficult to give a concise and clear word picture of the circumstances in which your business has been carried on during the financial year which ended on December 31, 1947, for they have been indeed complex. During 1947 trading conditions generally throughout the world were relatively easy once goods and licences had been secured and this is reflected in our figures.

WAR DAMAGE CLAIMS

Results as shown in the profit and loss account are the best we have had since 1941 and I would emphasise they have come from a wider field of activity than we then covered. Floating assets to the value of £3,733 were recovered in Burma last year but there were no receipts in respect of war damage claims. It is true the Burma War Damage Assessing Commission has completed its labours and I believe has been disbanded but we are without knowledge of the results. We do know that the question of war damage came into the financial conversations which were part of the treaty made in October, 1947, between this country and Burma known as the "Attlee/Nu Agreement" but unfortunately the only agreement reached on this question was to leave it open for further discussion. This, of course, did not help the sufferers.

Responsibility for damage done under "denial" operations is unfortunately in the first instance a legal question and with the encouragement of His Majesty's Government and in the assurance that a test case would be regarded by the Government of Burma as by His Majesty's Government as a necessary and friendly action, we in conjunction with others similarly placed, took the actions necessary to protect your interests by filing claims in the appropriate Burmese courts. Since then, however, the Government of the Union of Burma, which came into being as an independent sovereign state on January 4, 1948, has stated in writing that it will not commit itself to be bound by any decision in a test case and that it will take all necessary measures to avoid payment. Further the House of Representatives of the Union of Burma by a resolution passed on March 26, 1948, unanimously agreed that a claim should be made on His Majesty's Government for all war damage losses suffered in Burma by Burmese nationals.

UNSATISFACTORY POSITION

From this it will be seen that the situation of this company and of those in similar case continues to be most unsatisfactory. We wish to have no part in any disagreement between the governments concerned in this question and legal action is the last step we wished to take, but it is unfortunately one we could not avoid as trustees for our stockholders. This we have endeavoured to make clear to the Government of Burma. In the meantime His Majesty's Government has announced the terms of the settlements to be

made in respect of war damage in Malaya and Hongkong.

All I can add now is that your board in concert with others continues to pursue this matter through the appropriate channels in the hope that before we again report to you justice will be done. Until this question is settled we must keep our balance sheet assets in the present divided form.

BALANCE SHEET ITEMS

An outstanding feature of the balance sheet is the radical change in our stocks and cash positions. At the end of 1945 our stocks of merchandise and stores were negligible at £24,824; in 1946 these had increased to £444,473 and at the end of 1947 to £1,006,987. Our cash resources, which stood at £1,179,970 in 1945 are now fully employed and as you will see, we had a small overdraft of £32,815 (net) at the end of 1947, after paying off all arrears of Preference dividends. The improved trading account is of course a reflection of the active use of our resources.

The board is glad to have been able to bring up to date the payment of dividends on our cumulative preference stocks, a satisfaction I am sure we share with the stockholders of these classes of our capital. The holders of preferred ordinary and deferred ordinary stock I regret are still without recompense for their six years of patience and we can but hope that seven will be the total of their lean years.

TAXATION

That brings me to the subject of taxation. Last year I mentioned that the then profits tax of 12½ per cent. on our inescapable prior charges was in a normal year the equivalent of a 5 per cent. dividend on our deferred ordinary capital. As the tax has since been doubled it is now the equivalent of a 10 per cent. yield on our unfortunate risk bearing stockholders. But that is not all. In the year 1947 we paid out in preference dividends a gross sum of £348,000, of which £225,000 represented arrears on the 7½ per cent. second preference stock. On these dividends profits tax cost us £47,850 net, so that but for that payment we could have made a considerable though not a full distribution to our eight per cent., preferred ordinary stockholders. I heartily endorse the recent writings of an expert on taxation who said, *inter alia*, "of all the taxes on enterprise the profits tax is from the incentive angle easily the worst." To some the inequity of this tax may pale into comparative insignificance with the recent capital levy, but to those of us who suffer so severely from the former that we are saved from the latter, this offers no consolation.

NATIONALISATION IN BURMA

As I have mentioned, Burma achieved independent status on January 4, 1948, and one of her first actions was to take steps to nationalise part of industry of the country. The teak industry, in which we have considerable interests, is one of the chosen fields and on June 1, 1948, about 40 per cent. of our forest areas were taken over by the state. So far we have not been paid for the assets and stocks taken over and this is now the subject of negotiations.

According to the Government of Burma the balance of our forest areas and our timber mills will be nationalised within the next

two years, and it will be our immediate aim to try to reach agreement with the Government of Burma on a common plan whereby the transfer may be made smoothly and in the best interests of both parties. The terms of handing over should include equitable compensation paid not later than the date of transfer.

Burma is still struggling to increase her crops and revive her basic industries which indeed is the only means of ensuring a sound economic balance. Trading opportunities are therefore still limited and in certain respects, because of Government policy, are becoming more so. We hope, however, the Government will see the benefits to them of using world markets and the services of those who have in the past helped Burma to market her produce to the best advantage. But if purchasing countries continue to use Ministries as sole buying agencies there is little hope of the re-establishment of commodity markets and so of standards of quality and of business morality; for it is noticeable that the more Governments intervene the lower these standards sink.

OTHER COUNTRIES

In Palestine our staff have had a trying time. Our contract with the late Government automatically expired on May 15th, but at the request of U.N., the Jewish Agency and the Arab Higher Committee we are with the assistance of H.M. Ministry of Food continuing to the best of our ability to import foodstuffs to feed the populations of that distracted country. To assist in this aim we have opened an office in Limassol, Cyprus, which should ease the problems of storage and distribution. Our branches in India, Hongkong and Bangkok made satisfactory contributions to our results as did our wholly owned subsidiary in this country, Messrs Carbott and Company (1928), Limited.

FURTHER DEVELOPMENTS

I have now pleasure in reporting further developments. In order of sequence these are:—

The opening in June, 1947, of an agency in Rio de Janeiro, Brazil, with the intention of establishing a trading business in and with that country.

The acquisition of a majority interest in Messrs Mactaggart and Evans, Limited, whose business is chemical and industrial research in Great Britain and who have acquired, equipped and staffed an up-to-date research laboratory at Dorking, Surrey. The laboratory, we believe, will serve a long-standing need in this country and we therefore regard this business as having both interesting and wide possibilities. It is, however, purely an investment, as the technical side of the business will be run entirely independently of Steel Brothers and Company, Limited, who will rank as ordinary customers for their own researches. This is, of course, essential in a business of this kind which must ensure secrecy and protection to its clients. It will be formally opened on June 18, 1948.

The opening of a branch in Karachi, now the capital of Pakistan, where we have already established valuable trading connections.

The acquisition of a majority interest in the old-established Colombo business of Messrs E. B. Creasy and Company, Limited, a connection we hope will develop to the advantage of both companies.

The acquisition of an interest in the well-known East African business of Messrs A. Baumann and Company, Limited, which was formed on April 1, 1948, to take over the partnership previously run under the name of A. Baumann and Company. We are very pleased indeed to have been able to make this investment in a progressive company and to us a new territory, for we feel there are considerable potentialities for expansion and for mutual advantage.

As I write we are also opening a branch in British North Borneo, another Colonial territory new to us but in which developments are likely to happen.

THE OUTLOOK

We cannot expect to repeat 1947 figures this year, but unless unforeseen catastrophe hits us we look forward to a reasonably successful year. Again I wish to pay special tribute to the work of the staff throughout our business at home and abroad and in our subsidiaries as well as in the parent company. These results have not been earned without much toil and sweat or without an enthusiastic interest by the staff in the company's well-being and development.

As a matter of interest we record that we now employ thirty-two Asiatic covenanted assistants, which is a considerable percentage of our total covenanted staff.

SUNDAY PICTORIAL NEWS-PAPERS (1920) LIMITED

MR H. GUY BARTHOLOMEW'S STATEMENT

The twenty-eighth annual general meeting of Sunday Pictorial Newspapers (1920) Limited was held on the 24th instant.

The following is an extract from the statement by the Chairman:—

The accounts for the year ended February 29, 1948, record that the gross profit for the year at £661,483 shows an increase of £164,057 when compared with the figures for the previous year and after providing fully for taxation the net profit is some £73,000 greater.

We recommend payment of a Final Ordinary dividend at the rate of 17½ per cent. and thus maintain the annual rate at 30 per cent.

The amount to be carried forward to the next accounts will be £187,912.

The increase in the profit from trading is in great part due to the maintained demand for your publication.

When I addressed you last year the *Sunday Pictorial* had a circulation of over 3,800,000 copies. Throughout the early part of the financial year, sales continued to advance and by the time paper rationing was re-instituted in July last it had reached a Sunday sale in excess of 4,140,000 copies.

The sale was then pegged at the average sale for the four weeks of June previous and we had to revert to 12 and 16 pages on alternate Sundays. It is at this "pegged" figure of 4,000,000 that its circulation is maintained.

The adjustment in advertisement rates, together with the introduction of a seven columned page in September, has also assisted in off-setting the quite substantial rise in costs that took place during the course of the year.

The great demand for advertising space in the *Sunday Pictorial* is such that we have had to institute our own form of rationing so as to allow as many of our advertisers as possible to receive some part of their needs for space.

The increased provision for pensions is in part made necessary by the greater number of employees on the mechanical side of the business who have served over twenty years continuously in the employ of the Company. They are not covered by the scheme under which the "Mirror & Pictorial Pension Fund" was established and therefore are provided for separately.

By the transfer of £75,000 to reserve for contingencies that reserve will be made up to £400,000 and with other amounts of undivided profits will represent a cushion

against the effects on future profits of increased costs of production, particularly that for newsprint.

The current equalised price for newsprint, which is obtained by averaging the cost of imported with that of home-produced newsprint, is substantially higher than the average cost of the newsprint consumed by us during the year. If imports from North America are further reduced it would appear inevitable that the equalised price will go above the present level.

During the year under review one of our trade investments was sold and interests were acquired in association with The Daily Mirror Newspapers Limited, in Companies publishing weekly papers and a monthly paper.

The amount invested in these new interests is not large. As they are in the stage of development income from them is not anticipated for a while, but I consider that they offer favourable potentialities in the future progress of your company.

Our interest in quoted other investments, representing a diversified number of easily marketable securities having a market value at the date of the accounts of over £297,000, with the increases in other assets of a liquid nature, indicate the healthy state of the Company's finances.

It is appropriate at this stage for me to record to the staff as a whole my thanks for their work during a year that has not been devoid of difficulties. The continued progress of the business is in no small measure due to their keenness and conscientious efforts.

So far, the profits for the current period, although affected by the higher price paid for newsprint, are not unsatisfactory. Given maintenance of supplies of this, to us, most essential commodity, the next accounts to be submitted to you should not, I feel, be unfavourable.

THE LONDON ELECTRIC WIRE COMPANY AND SMITHS, LIMITED

DIVIDEND MAINTAINED

The thirty-ninth annual general meeting of this Company was held, on the 16th inst., in London, Mr. W. J. Terry (chairman and managing director) presiding.

The chairman, in the course of his speech, said: The profit and loss account of the parent company shows a trading profit of £529,868, which with income from investments and transfer fees makes a total of £570,516.

This company continues its connection with a number of trade associations which operate to the benefit of all parties, manufacturers and consumers alike, notwithstanding anything which may be said to the contrary. These associations also provide a means of negotiating with trade unions and facilitate the provision of information to Government Departments.

The British Non-Ferrous Metals Federation has developed records of inestimable value to the trade and maintains a close contact with the Raw Materials Section of the Ministry of Supply. It gives me great pleasure to acknowledge the loyal support of the company's employees during a year when conditions have continued to be very difficult and also to express the sincere appreciation and thanks of the board.

In my view, any further steps towards Nationalisation should be postponed pending an improvement in the present state of affairs in this country and to prove by experience whether the industries already nationalised are rendering better services to the public at economic rates.

The board recommends payment of the same total dividend on the ordinary stock as last year—10 per cent., less tax.

The report was adopted.

BRITISH INSULATED CALLENDER'S CABLES, LIMITED

ACHIEVEMENTS DESPITE DIFFICULTIES

The third ordinary general meeting of British Insulated Callender's Cables, Limited, will be held, on the 30th instant, in London.

The following is an extract from the circulated statement of the chairman, Sir Alexander Roger, K.C.I.E.:—

It is a pleasure to record that despite difficulties, the financial results of our operations were most satisfactory. Largely due to the introduction of greater productive capacity and improved processes turnover was substantially higher both in quantity and value. Profit on trading totalled £2,271,629, as compared with £1,632,993 for our first trading period of 18 months to December 31, 1946. The total dividend proposed on the Ordinary capital for 1947 is 6½ per cent., which is the same annual rate as that paid for the previous period of 18 months to December 31, 1946, and represents a return of only some 4 per cent. on the equity capital employed in the business.

HOME AND EXPORT BUSINESS

Our total sales for 1947, home and overseas, showed an increase in value of over 40 per cent., as compared with the 12 months to December 31, 1946. Some of this increase is, of course, due to increased wages and the higher prices ruling for copper, lead and other constituents, but even allowing for this, the physical output has risen very substantially.

The demand for many of our products which incidentally in total involve over 150 different main categories has exceeded our immediate ability to supply, and we have often been forced to turn down orders from potential new customers and to quote extended deliveries even to our old connections.

In some products this position is due to what, on past experience, can only be described as an exceptional demand. Where we feel this demand will be continued we are taking every practical step under existing conditions to remedy the position. But where the demand is essentially of a temporary and abnormal nature we are not increasing productive capacity which might become redundant on a return to more normal conditions.

RAW MATERIAL SUPPLIES

In other products, and particularly in the case of our power cables, delays in deliveries again arise wholly from the irregular and inadequate supplies of raw materials. Prior to the war manufacturers and assembly factories were in the happy position of being at the receiving end of markets and pipelines full of component parts, raw materials, imports of every kind arriving regularly and frequently at our home ports. The international business, manufacturing, exporting and importing, shipping and transporting machine, moved smoothly with the experience gained over many years, but I am afraid we have a long way to go to recover this position on which the prosperity and strength of Britain was built.

Our main efforts in 1947 have of necessity been concentrated on maintaining supplies to friends of 30, 40 and even 50 years' standing, and we have not neglected potential future developments.

The demand for most of our products remains at a high level, and we have in consequence a full order book in some cases for two years ahead.

WIGGINS, TEAPE AND COMPANY (1919), LIMITED

OUTPUT INCREASED DESPITE DIFFICULTIES

EXPANDED EXPORT TRADE

MR L. W. FARROW ON THE OUTLOOK

The twenty-ninth annual general meeting of Wiggins, Teape and Company (1919), Limited, was held, on the 25th instant, at Winchester House, Old Broad Street, London, E.C.4. Mr L. W. Farrow, C.B.E., the chairman, presiding.

The secretary (Mr W. Barnes) read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement circulated with the report and accounts for the year 1947:—

In my statement last year, commenting on the prospects for 1947, I referred to the fact that the output of our mills had been affected by the coal crisis in the early part of that year. I am glad to say that through the united efforts of everyone concerned the output for the whole year showed an increase of 1½ per cent. over that for 1946. Having regard to the fact that by the end of April, 1947, the output had dropped by over 8½ per cent. compared with the similar period of 1946, and to the fact that we had two reductions in the allocations of woodpulp during 1947, we have a great deal to be thankful for. You may well ask, how was this done? It was accomplished so far as the supply of raw materials was concerned, by the acquisition of a larger supply of unrationed raw materials and with regard to the rate of output, by the more efficient working of our machines and by working overtime.

NO CHANGE IN CONTROL

There has been no change in the control of our industry by the Board of Trade, to which reference has been made in the chairman's statement for some years past, and I cannot see how any substantial change can be made until raw materials are in ample supply, a state of affairs which I am unable to envisage for some time to come. As previously mentioned, this control extends to the allocation of our principal raw materials, to the type and quantity of paper we make, to the uses to which our products can be put and finally, to the maximum prices we can charge our customers. We can, however, acquire materials not rationed and contrive to use all our materials to the best advantage within the limits imposed. Those are the directions in which we can use the resources available to our group.

Notwithstanding import restrictions imposed by many countries, our export trade to our overseas markets has been expanded during 1947, both in regard to our own products and to the products which we sell through the merchanting side of our business. In fact, the turnover of our merchanting business abroad was the largest for many years past.

PIRIE APPLETON AND COMPANY

Our subsidiary company, Pirie Appleton and Company, Limited, showed a consider-

able increase in the production of envelopes and manufactured stationery. The turnover was an all-time record, both at home and abroad. I referred last year to the two new factories which that company will equip in the Union of South Africa. The land has been acquired, the buildings designed, and most of the plant ordered. It is hoped that the building of both these factories will be commenced in the near future.

I reported last year that we had postponed the project for installing a new paper machine at our Stoneywood Paper Mills. During the past year we have had reluctantly to take a similar decision with regard to the project to instal a new paper machine at our Ford Paper Mills.

PROGRESS WITH NEW PROJECTS

You will no doubt wish to know what progress is being made with the remaining new projects.

1. The alterations to the buildings of our Chatham mill and the manufacture of the new plant and machinery specially designed for making tracing paper, are proceeding satisfactorily, if somewhat slowly.

2. The buildings for the new mill at Wootton Green, which, as you know, is to enable us to double the normal output of photographic paper, are making satisfactory progress, but I am afraid the delivery of the plant and machinery will be delayed owing to the shortage of steel.

3. The project to erect the new mill in South Wales for the manufacture of tissue paper, is going very slowly, but the preparation of the site is finished, and the foundation work is completed. The manufacture of the plant and machinery is proceeding.

SHARE ACQUISITIONS

During the year, we have acquired the whole of the preference shares in our subsidiary company, Wm. Howard and Sons, Limited, and the remaining minority ordinary shares in our main subsidiary company, Alex Pirie and Sons, Limited. In both cases the consideration was mainly satisfied by the allotment of shares issued as fully paid in your company. In the first case, the shares allotted were 31,403 of our seven per cent. preference shares, and in the second case, the shares allotted were 17,181 of our ordinary shares. I am pleased to state that, with the exception of a very minor company, formed to hold certain patents, where outside shareholders hold 260 shares, your company now own all the equity shares of its subsidiary companies. The training courses to which reference was made last year, continue to be held and are much appreciated by those attending them and are of great benefit to the company.

In my last year's statement, I stated that certain repairs at our mills, which had of necessity been postponed during the war period, had been executed during 1946. This policy was continued during 1947 when the charge against profits for repairs amounted to £440,971. We have again not charged any of the expenditure representing deferred repairs to the reserves created during the war years for that purpose. We prefer to keep these reserves intact until we can estimate finally the ultimate cost of the expenditure

necessary to restore our mills and plant to their pre-war condition. We have added a further £18,285 to these reserves in respect of deferred repairs arising on certain water-houses.

LARGER TRADING PROFITS

The trading profits of the group for 1947 (which include the results for 53 weeks) show an increase of £421,164. These improved profits are due mainly to our increased export business, the increased merchanting turnover at home, and to the increased business of Pirie Appleton and Company, Limited. The amounts added to specific reserves which have in the past been charged before arriving at the amount of the trading profits are now disclosed and you will see that they amount to £165,352, compared with £25,416 charged in 1946. After allowing for these charges, pensions, etc., depreciation and dependants' allowances, etc., the profit before charging taxation amounted to £1,248,781, compared with £1,003,895. The deductions for taxation, dividends applicable to outside shareholders and profits retained in subsidiary companies, etc., are higher by £186,895. After providing for interest on debentures and dividends on the preference and ordinary stocks, your directors have transferred the sum of £184,024 to the reserve account, bringing the amount of that account up to £1,200,000.

It will be seen that your directors are recommending a final dividend of 5½ per cent., free of tax, making with the interim dividend, a total dividend of 7½ per cent., free of tax, on the ordinary stock for 1947, being at the same rate as was paid for 1946.

THE REAL DIVIDEND

I consider it most important to emphasise what my predecessors and I have stated on several occasions, with regard to the relationship of the dividend we pay on the ordinary stock to the equity book value of the ordinary capital working in the business. I referred last year to the reserves which had been ploughed back into the business. To those reserves considerable amounts have been added in 1947, in addition to which the share premium account has increased by the transfer of the premiums, less expenses, on the shares allotted in 1947. The total of the reserve accounts, share premiums and specific reserves now amounts to the substantial figure of £4,066,382. It is important to bear in mind that the gross ordinary dividend for the year is only equivalent to 4.4 per cent. on the ordinary capital plus these reserves.

The summary of balance-sheets presents the financial position of our group of companies regarded as a single undertaking. The net liquid position of the group on January 3, 1948, is strong and should enable the company to complete the expenditure on its new projects despite the considerable increase in prices of building materials and labour and the cost of plant and machinery which have taken place since these projects were decided upon.

CURRENT YEAR'S GOOD START

With regard to the prospects for the current year, the results for the first four months of the year compare favourably with those for the same period of 1947 which were affected by the coal crisis. There is every hope that the results for the year should be as good as those for 1947. In conclusion, I take this opportunity of thanking our staff and employees, both at home and abroad, for their loyal work and co-operation during the past year.

The report and accounts were unanimously adopted; the retiring directors, Commander W. B. Pirie, D.S.O., D.L., and Mr F. S. Portal, were re-elected; Messrs Price Waterhouse and Company were reappointed auditors and Messrs Wade Harrison and Company were appointed joint auditors.

THE SUEZ CANAL COMPANY

SOUND AND PROSPEROUS POSITION

MR F. CHARLES-ROUX ON THE NEW TRAFFIC RECORDS

The annual general meeting of the Suez Canal Company was held on the 8th instant in Paris.

Mr François Charles-Roux (the chairman), who presided, in the course of his speech said:

The company's financial situation is sound and prosperous. Its moral position is equal to the enviable reputation it has gained by the manner in which it has always been administered.

The results of the financial year 1947 are very satisfactory, since the volume of traffic was greater than before the war, thus breaking its own records for the most prosperous years of peace; the first five months of 1948 indicate a probable further increase in traffic and consequently in receipts, for the current year.

How long will this increase in traffic continue at its present rate? He would be a bold man who would venture to give an accurate forecast. In our commercial traffic, oil transports occupy a very important place: 61 per cent. of the south-north traffic. Although it seems that this intense tanker traffic will be sustained, if not increased, for another two or three years, it is to be presumed, on the other hand, that it will subsequently be affected by the opening of the pipelines now under construction in Arabia—unless, of course, the output of the Persian Gulf oil-fields increases to such an extent that both means of transport, by land and by sea, will benefit simultaneously.

Be that as it may, the excess of our receipts over our expenditure allows us to view without alarm the increases in our expenses. This does not mean, however, that we must not pay due heed to them: in 1947 the proportion of increase in expenditure was appreciably higher than in receipts.

DUTY TO EGYPT

Our own duties towards Egypt and the Egyptian Government are ever present in our minds. Our bonds with them form part of our historic heritage, as well as of our legal status and, I would add, of the natural background of our undertaking.

The form in which our founder, that man of genius, Ferdinand de Lesseps, constituted our company—an Egyptian and at the same time a universal company—is consistent with the permanent conditions of the task it fulfils; the company is Egyptian, because, as I have said, it is, after all, an auxiliary of the concessionary power and it is universal because the services it renders are international, services in which the whole world is interested in the highest degree. Thus do we see justified today, as in the past, the two fundamental principles of the statutes under which the company functions.

At its prosperity, that will doubtless depend in the future, as in the past, on the ability with which it is managed. But it will not depend on that alone; the Suez Canal is a work of peace. It was conceived and built for peace and as an integral part of peace.

EXTRACT FROM DIRECTORS' REPORT

For the first time since the war your company, in 1947, fully regained its pre-war appearance. The gradual resumption of normal commercial exchanges, among other things, has taken the graph of Canal traffic above the level reached before the war.

As regards canal traffic, there were 5,972 transits representing 36,577,000 net tons. This tonnage exceeds by 6.3 per cent. that of 1938 and even surpasses that of 1937, until then the highest on record. Our satisfaction at this increase in our activities would be unmitigated were it not for the simultaneous and very serious difficulties we are encountering in the matter of keeping our pilot-strength consistent with the expansion of traffic; these

are due to the long delays to which our applications for entry visas of staff engaged outside Egypt are at present being subjected. We sincerely hope this question can be solved without our having to impose certain restrictions on traffic, a procedure which we have always been able to avoid in peace time; discussions are now taking place on this matter with the Egyptian authorities.

In all probability, traffic in 1947 would not have reached the figures already indicated had not the volume of military traffic maintained itself at five times its average pre-war level. This exceptional military traffic is nevertheless only half of what it was in 1946, and it is to commercial traffic, alone on the up grade, that the overall increase of 11.7 per cent. recorded between the two years is due.

FAVOURABLE PROSPECTS

The trend towards the resumption of normal traffic combined with the continuance of post-war traffic of an exceptional nature therefore enables us, barring the unforeseen, to take a favourable view of the prospects for 1948.

Receipts for 1947 amounted to Frs. 6,754,467,862, an increase of Frs. 230,682,063, or 3½ per cent. on 1946. Working expenses reached Frs. 2,625,176,638, an increase of Frs. 540,725,333, or 26 per cent. on 1946. From the profits capital interest and redemption amounting to Frs. 392,238,209 must be deducted, leaving as available profits for the year a sum of Frs. 3,737,053,014. Receipts from transiting ships have increased by 8 per cent. over 1946.

To the available profit of Frs. 3,737,053,014 should be added Frs. 49,929,753 brought forward from the previous year. In comparing this figure with last year's distribution, which amounted to Frs. 6,494,295,950, it should be remembered that Frs. 3,127,807,536 were in respect of profits for the years 1943, 1944 and 1945, placed in reserve pending the outcome of the lawsuit, and Frs. 3,366,488,414 represented the profits attributable to the year 1946; thus profits for 1947 are slightly higher than in the previous year. We recommend transferring to the various reserve accounts this year only those amounts which are needed immediately and to leave for next year all allocations not required in the very near future. Thus we could this year limit our allocation to the reserve fund for improvements to a sum of 120,000,000 francs.

Taking this allocation into account, you would have available for distribution a sum of Frs. 3,666,982,768. The proposed distribution amounting to Frs. 3,605,633,803 would leave a balance of Frs. 61,348,965, which we suggest be carried forward.

The distribution we have suggested brings the gross dividend to Frs. 3,200. To this dividend must be added, in the case of the capital shares, statutory interest for the relevant period of Frs. 486.38.

THE NEW CHAIRMAN

To take the place of the president we mourn, your directors have unanimously called upon M. François Charles-Roux. The son of M. Jules Charles-Roux, at one time a vice-president of the company, M. François Charles-Roux has filled diplomatic posts for some 40 years, successively at St. Petersburg, Constantinople, Cairo, London and Rome, on the European Commission and on the International Danube Commission, then at Prague. Elevated to the rank of French Ambassador in 1932 and appointed to the Vatican, he remained in Rome until May 20, 1940.

A copy of the full report will be sent on application to the company, 1, Rue d'Asorg, Paris (8), or 6, Bishopsgate, London, E.C.2.

THE BRITISH ELECTRIC TRACTION COMPANY, LIMITED

RECORD NET PROFIT

The fifty-second annual general meeting of the British Electric Traction Company, Limited, was held in London on the 18th instant.

Mr H. C. Drayton, the chairman, in the course of his speech, said: The gross revenue for the year to March 31, 1948, exceeded the million pounds mark, the actual figure being £1,206,000. After deducting expenses, taxation, which naturally shows a large increase, and debenture interest, we are left with a net profit of £574,000, the highest in our history.

The book value of our quoted investments at March 31, 1948, was £4,853,000 and their middle market price at the same date was £19,586,000. I think I may add that the value of our unquoted securities, which stand in the books at £2,859,000, is more than this figure.

ELECTRICITY AND GAS

On April 1st last, our electricity supply undertakings were taken over by the appropriate authorities under the Electricity Act of 1947. These interests were held through the B.E.T. Electricity Supply and National Electric Construction Companies, of which your company holds the capital. The takeover prices had to be arranged as the stocks did not have a Stock Exchange quotation. The basis was to take a percentage of the earnings, and to capitalise this percentage on a varying yield basis. This was not a particularly satisfactory method of arriving at a valuation of an undertaking. The amount of electricity stock received was £1,408,000.

The other asset we had in the B.E.T. Electricity Supply Company was a controlling interest in Antrim Electricity Supply. This undertaking has been acquired by the Electricity Board for Northern Ireland under a vesting order and the B.E.T. Electricity Supply share of the consideration is approximately £790,000.

TRANSPORT

The effect of the Transport Act in its application to passenger road transport undertakings, in which your company is so largely interested, is dealt with in the directors' report. In the event of the undertakings of our associated companies being acquired by the British Transport Commission under the provisions of the Act, compensation would be based on asset values plus from two to seven years' purchase of the average profits for the last three financial years ending within the year 1948. We have always taken and still take the view that the operation of provincial omnibus services is not a job for Whitehall planners. Under the present system of company and municipally owned undertakings, the public are provided with efficient services at low fares, and local consideration is given to local traffic needs. It would be a sorry day for the travelling public if the bus services of this country were nationalised.

Our laundry businesses have turned the corner and the results are now more satisfactory. Last year I mentioned that we had increased our holding in Broadcast Relay Service. During the year your company, together with its associates, has taken an interest in South African industry. The results to date are satisfactory. We have put money in South Africa because we believe in the industrial future of that country. We have entered a new field; we have advanced certain moneys to film companies on a profit-sharing basis after the film is finished. We once again have a small investment in civil aviation.

The report was adopted.

MARKS AND SPENCER, LIMITED

INCREASED PROFIT

The twenty-second annual general meeting of Marks and Spencer, Limited, was held, on the 24th instant, in London.

Sir Simon Marks (chairman and managing director), in the course of his speech, said: The profit, before providing for taxation, amounts to £3,169,000 (against £2,576,000). Provision of £1,850,000 for taxation leaves the net profit of £1,319,000 (£1,176,000 last year).

We recommend a final dividend on the ordinary and "A" ordinary shares of 45 per cent, making 60 per cent. for the year.

In accordance with the request of the Chancellor of the Exchequer, we are recommending the maintenance of our rate of dividend, although our profits justified an increase.

GENERAL SURVEY

The spiral of increasing prices raises serious and difficult problems for producers and distributors alike. Sales become more and more governed by price and quality. Improved methods and layout of production can do much to raise productivity.

There is an increasingly closer collaboration between our suppliers and our own scientific technical staff. The function of that staff is to study quality through the various stages of production. Our suppliers appreciate the importance of quality and upgrading wherever possible. We have been able to extend our range of goods and the public have been prompt to recognise the values we offer; that is the short explanation of the substantial increase in our business during the past year. Our thanks are due to our manufacturers for their co-operation and for the happy relationships we continue to enjoy with them.

The national necessity for export has made it our duty to develop export trade. We are making a determined effort to expand exports, mainly to our Chain Store friends in the following countries:—Switzerland, Belgium, Sweden, Australia, New Zealand, Canada and South Africa.

I have visited South Africa to examine Woolworth's (Pty) Limited. I am satisfied that this organisation is capable of considerable development as the economy of South Africa promises much expansion.

DEVELOPMENT

Our Catering Section has continued to win increasing public appreciation. We have now 107 Catering Units in operation. Quality control of the food we sell is exercised by a team of experts.

We strive to maintain the highest standards of hygiene and cleanliness in our cafeterias. Much time and attention is devoted to the training of our staff, who realise that the reputation and the success of the business depend not only upon good quality food, but also on the practice of hygiene and cleanliness in relation to food handling, food preparation and service.

We have some progress with the renovation of a number of Stores. Some time must elapse before we can restore them all to the condition in which we would wish to have them.

Sympathy, understanding and all that constitutes good human relations are essential to efficient co-operation between management and labour. That has long been a guiding principle in the administration of your Company. We have created and developed a comprehensive system of welfare, which is at the service of our staff in health or sickness, at work or leisure.

We propose to double this year the allocation to the Benevolent Fund, the benefits of which are much appreciated. It is with great pleasure and sincerity that your Board express their thanks to all grades of our staff for their work during the past year.

The report was adopted.

ODHAMS PRESS, LIMITED

PROGRESS DESPITE DIFFICULTIES

The twenty-eighth annual general meeting of Odhams Press, Limited, was held, in London, on the 18th instant.

Mr Arthur G. Cousins, C.B.E., the chairman, in the course of his speech, said that the trading profit of Odhams Press, Limited, was £1,043,374 and the dividends and interest receivable from subsidiary companies and other investments was up by £9,000. There was a net profit of £968,082 as against the previous year's profit of £963,495. He was sure that stockholders were proud of the success of the newspapers, periodicals and other publications for which they were responsible. The consolidated accounts showed that the gross revenue received during the year was £12,637,275 as against £11,208,270 for the year 1946. It gave stockholders an opportunity to appreciate that the House of Odhams and its subsidiaries had made some progress during the past year notwithstanding the difficulties.

The House of Odhams was organised on a broad basis. They had with their subsidiary companies some of the most up-to-date printing machinery in the world, and in that respect he particularly referred to the high-speed colour printing machinery owned by their subsidiary company, Odhams (Warford), Limited. They had a large outside poster and advertising organisation; they ranked amongst the largest book publishers in the country; and they owned newspapers and periodicals with a total circulation of over 22 million copies printed and published by them each week.

Notwithstanding the wide basis of their business, they were dependent to a very large extent on the supply of paper. It might be the Marshall Plan would help, but he doubted whether they would get larger supplies for many months.

The report was adopted.

LUNUVA (CEYLON) TEA AND RUBBER

SOUND POSITION

The forty-first ordinary general meeting of The Lunuva (Ceylon) Tea & Rubber Estates, Limited, was held on the 23rd instant in London, Mr H. J. Welch, the chairman, presiding.

The following is an extract from his circulated statement:—

The net profit for the year 1947 is £103,455. The proposed final dividend of 10 per cent., will, with the 5 per cent. interim dividend, make the total 15 per cent. for the year.

The crop for the year was 7,751,697 lb. and showed an increase over 1946 of 260,912 lb. The yield per acre in bearing was 723 against 698 lb. The crop, however, was short of the estimate and the deficiency is attributable in part to the cumulative effect of reduced supplies of artificial manure as a result of the war, and in part to attacks of Blister Blight.

The f.o.b. cost of production of tea at 1s.9.94d. showed an increase of 3.43d. on the cost for 1946, but this was more than offset by an increase of 4.43d. in the average net selling price which was 2s.2.94d. compared with the previous year's average of 1s.10.51d.

The rubber crop for the year was 1,986,368 lb. as compared with 1,712,887 lb. in 1946. The yields per tapped and per mature acre were considerably increased. Cost of production was lower than that of the previous year, the average selling price was 11.33d. per lb.

For the current year crop estimates are 8,074,200 lb. tea and 2,157,700 lb. rubber. The company is in a strong financial position and the present prices for its products are such as should ensure satisfactory results for 1948.

The report was adopted.

THE DAILY MIRROR NEWSPAPERS, LIMITED

MR H. GUY BARTHOLOMEW'S STATEMENT

The annual general meeting of The Daily Mirror Newspapers, Limited, was held, on the 24th instant. The following is an extract from the statement by the chairman.

The net profit of £270,128 for the year ended February 29, 1948, is not unsatisfactory bearing in mind the full provision made for taxation, pensions and the transfer to reserve for contingencies.

Your board decided to recommend the payment of a final ordinary dividend at the rate of 17½ per cent. which with the interim dividend of 12½ per cent. paid in December last maintains the annual rate at 30 per cent. The amount of the carry forward to the next accounts will be £145,561.

The increase in gross profit is in the main due to the continued demand for the *Daily Mirror*. In July, 1947, circulation had reached a figure exceeding 3,800,000 copies, but newspaper rationing caused sales to be pegged to a daily sale of 3,700,000 copies.

Advertisement revenue has been most satisfactory and as a medium for advertising the columns of the *Daily Mirror* are in as great a demand as ever.

The larger amount provided for pensions is explained by the increase in the number of employees on the mechanical side of the business who have given twenty years' continuous service to the company but are not covered by the "Mirror and Pictorial Pension Fund."

The transfer to the reserve for contingencies increases that reserve to £250,000. In making this transfer we had particularly in mind the effect on future profits of the rise in costs that has been so noticeable during the year under review.

The net surplus from investments sold during this year and last amounting to £801,822, has been credited to an investment reserve account. Last year, the comparative figure of £729,772 was deducted from the total of investments in subsidiary companies.

The provision for taxation covers fully our liability on the current year's profits and for all outstanding amounts in respect of past years.

The additions during the year to our interest in freehold and leasehold properties mainly relate to the purchase of further freehold properties adjacent to the site we own in Holborn.

We have approved in principle plans of the building we propose to erect on the area and we are hopeful that these will be found acceptable to the appropriate authorities. We have also authorised the placing of orders for some of the new machinery and equipment which we envisage will be required for the new building.

I have recently returned from Canada, where I visited the Anglo-Canadian Pulp and Paper Company's Mill in Quebec and saw some of its timber limits. I took the opportunity of seeing in operation the new methods of mechanical logging that they have introduced. I was more than impressed with the enthusiasm and teamwork that prevails throughout the organisation. All that I saw has made me more than ever convinced of the value to be attached to this investment of ours.

We sold one trade investment and acquired, in association with the Sunday Pictorial Newspapers (1920) Limited, interests in two small newspaper companies. In view of the developments that are necessary we do not anticipate any benefit from these acquisitions to be reflected in our accounts for some while.

The increased price to be paid for newspaper makes me hesitate to express a view as to the current year's results, but I am hopeful that when next I address you the results to be considered will not be held to be unsatisfactory.

GOVERNMENT RETURNS

For the week ended June 19, 1948, total ordinary revenue was £37,570,000, against ordinary expenditure of £63,300,000 and issues to sinking funds £70,000. Thus, including sinking fund allocations of £2,264,000 the surplus accrued since April 1st is £150,942,566 against £182,546,542 for the corresponding period a year ago.

PUBLIC RELATIONS

The Directors of a professional Company concerned with Industrial Management require the services of a man with wide experience in top level Public Relations work. He would be required to prepare and execute a plan for publicising the Company's activities and to create the right impression in the highest management circles. The work would entail the preparation of printed matter, public speaking, membership of professional associations and the development of a wide circle of personal contacts. Applications from men of proved experience, either to work on a whole-time or part-time basis, will receive immediate and strictly confidential consideration. This is an outstanding opportunity for public relations work in a new and interesting field.—Box 754.

SOUTH AFRICAN INDUSTRIES

Two Directors (financial and technical) of The Industrial Research Association, Ltd., Industrial Consultants Cape Town, Johannesburg and Rhodesia, will be in London during July and available for consultations on financial, technical and economic aspects with industrialists desirous of commencing business activities in South Africa or Rhodesia. Appointments may be made through Stoy Hayward & Co., Chartered Accountants, 5, Giltspur Street, London, E.C.1. Telephone: City 6627.

URWICK, Orr and Partners are still seeking additional staff for their professional work as Consulting Specialists in Organisation and Management. Essential requirements:—

- (1) University and/or professional qualification in engineering, textiles, accountancy, or other technology.
 - (2) Some years in responsible appointments, with particular reference to production, accounting or distribution. Older candidates should have had 5-6 years as senior executive.
 - (3) Sound basic general education and wide interest in contemporary affairs.
 - (4) Age 28-40 years. Service in H.M. Forces will be taken into consideration.
- Applications should be addressed in writing to the Company's offices at 7, Park Lane, London, W.1, quoting reference No. 1014.

SCOTTISH COUNCIL (Development and Industry).—London Secretary. Energetic man, 30 to 40, with business experience, wanted as Secretary for the London Committee. Initial salary £1,500, superannuable. Apply with full particulars and names of three referees to the Secretary, Scottish Council (Development and Industry), 20, George Street, Edinburgh 2.

THE Northern Industrial Group require a senior research worker to undertake investigations concerned with the economic and social aspects of industrial location. For further particulars apply before June 30th to The Secretary, Northern Industrial Group, 9, Eldon Square, Newcastle-upon-Tyne, 1.

ECONOMIST (35 years of age), graduate in Commerce, seeks a senior position with a large organisation. Experienced in direction and planning of research into the current world food and raw material situation and in compiling concise reports. Accustomed to responsibility and the organising of staff. Would consider a position (e.g., assistant to managing director), where a knowledge of economics, statistics, accountancy and a considerable commercial background would lead to promotion to an executive position.—Box 751.

MARKET RESEARCH.—Senior executive, woman, 40, able to work on own initiative, with good wide experience in all branches of market research, particularly formulation of research required, administration and interpretation of results, seeks senior position with agency or manufacturing firm. Good knowledge German, French, Dutch. Salary by arrangement.—Box 744.

London, W.C.2. Published weekly by THE ECONOMIST NEWSPAPER, LTD., R. S. Farley, 111 Broadway, New York, 6.—Saturday, June 26, 1948.
