STATISTICAL SUMMARY - - -

Strategy for Greece

SOME seven months have passed since M. Porphyrogannis, the Greek Communist leader, told the annual conference of the French Communist Party at Strasbourg that the insurgents in Greece intended to set up their own "government." Now they have done so. On Christmas Day, General Markos, chief of all the guerillas, announced that a Government had been formed, with himself as Prime Minister and Minister of War, to free Greece of "Anglo-American imperialist intervention," to reorganise the country on "democratic" lines and to establish close relations with Greece's Balkan neighbours. The announcement of the new government coincided with an attack in strength across the Albanian border, probably with the aim of capturing the town of Konitza and making it the seat of the new government.

Various reasons have been put forward for the seven months' delay in setting up a rival centre of authority—a step which could have been taken at any time in the last eighteen months. It is believed that efforts were made to include in the "government" all sections of opinion formerly represented in EAM. But the negotiations failed for, in fact, apart from a couple of fellow travellers, the Markos government is entirely Communist. The real reason for the new move has, however, little to do with the internal politics of Greece. The decisive factor is Russia's general policy in Eastern Europe and the move in Greece is only one aspect of the measures the Russians believe necessary to ensure the failure of the Marshall Plan. Like the dismissal of King Michael of Rumania and the attempt to break the last independence of the Christian Democrats in the Russian zone of Germany, the intensification of the Greek struggle has one aim only in view—to stamp out Western influence in Eastern Europe.

American strategy has already had more success than the Russians find comfortable. Long before any direct economic benefit can be obtained from the Marshall Plan, it has had the vital effect of restoring some self-confidence to the moderate forces in Europe. The collapse of the French strike and the ineptitude of the Communist manoeuvres in Italy cannot fail to suggest to the Kremlin that economic sabotage, trade union action and general, but unco-ordinated, political agitation are not sufficient to secure the halting of the Plan. But if minor disruptions do not have the hoped-for effect, the Russians face this dilemma: can they afford to see the Plan succeed in the face of their much advertised opposition, if not, what stronger steps can they take to destroy it?

It is on this issue that the Greek civil war may become the test case. Greece is the only area in Europe in which the Russians can initiate armed intervention by remote control, and with limited liability to themselves. The Balkan satellites can be the immediate agents, and weapons and troops can be supplied without directly implicating the Russians. At the same time, a really serious military threat on the northern frontiers of Greece would touch the weakest spot in the Truman-Marshall policy. It is clear that the American people are now fairly well committed to the idea that

economic aid must be given to Europe on a big scale but their attitude towards the general strategy of assisting the European countries to hold their own against Communism can best be summed up in the old phrase, "all aid short of war." Far from being ravening imperialists spoiling for a fight, the Americans simply do not entertain the idea of direct military intervention. But in all diplomatic action, there must be some ultimate sanction. To have none is to make certain that, however stern and unyielding one may be over minor types of pressure, the real threat will always be met with surrender or appeasement. If the Russians intensify military action in Greece (it is hard to see what other course they can pursue) the Americans will be faced with the most vital and most difficult problem of their diplomacy. They will have to face the choice between two risks, the risk of standing firm at the cost of a military commitment, and the risk of allowing the Communists to capture a position which has been publicly declared to be vital.

President Truman made a step in the direction of clarifying this problem when he told the Italian Government that the United States was not prepared to see the democratic regime overthrown in Italy. The implication of his remark was that, if

necessary, the American troops of occupation, which were at the time in course of withdrawal, would be sent back. But it is doubtful whether the President's statement sprang from a genuine survey of America's strategic risks and interests and a hard decision upon how they should best be protected. It is precisely this survey and this decision that are most needed now that the Russians are showing signs of throwing down the military gauntlet in Greece. The only certainly effective response would be an unequivocal American statement that the maintenance of an independent Greece is a vital American interest, and that the steps necessary to clear out the rebels—not simply to contain them—will be taken, even if military action is involved.

This necessity will not be lightly accepted. One set of critics will protest that it means war, another that it would represent direct unilateral American intervention in support of an irresponsible and corrupt Greek regime. To the first set of critics it can only be said that in a world divided between two hostile systems of power, war is unhappily always possible, but that there are at least good reasons for supposing that a firm stand in Greece will not lead to general war—local war is already an inescapable fact. From the Crimea to the first World War, Britain was chronically troubled by the "Eastern Question." It was provoked by Russia's persistent efforts to secure control of the Dardanelles, to which the British reply was a readiness to take military action to prevent it, should it be necessary. It never was necessary—but it well might have been, if the British attitude had been less clear and firm, for the Russians might then have been misled into going so far that they could not withdraw. Similarly there is no reason to suppose that in the new "Eastern Question"—basically the same—Russia is ready to risk a general struggle if such a struggle is indeed the price of a local

adventure. Of, to take a more depressing analogy, the Spanish civil war, although it constantly threatened to precipitate a general European war, did not do so, because both sides made it clear where they stood. (That it was not the spark that fired the train is shown by the fact that the chief adversaries of the Spanish war, Germany and Russia, began World War II in alliance.) A struggle can be localised, if none of the Great Powers involved desires a general war, and this, surely, is the case today.

To the second set of critics, it can be said that direct unilateral American intervention is neither the only, nor the most desirable method of shoring up Greek resistance. The Greek army will, obviously, be the chief instrument of defence. What is needed is to secure it the equipment, the mobility, the air and fire power it requires to deal effectively with what is, so far, only a small guerilla force. It is a question of doing more rapidly and on a bigger scale what has already been started.

Nor need the responsibility be entirely American. The Balkan Commission of the United Nations, centred on Salonika, has sent observers to the Konitza battlefield and the Greek Government has sent an official protest to the United Nations on the establishment of the Markos regime. Since the territorial integrity and independence of a member nation are one of the interests which the United Nations are pledged to protect, there is no reason why the Greek Government should not put before the "Little Assembly" when it meets next month new proposals for international supervision of the northern frontiers, but, this time, with teeth in them. If some foreign contingents under the ægis of the United Nations were added to the Greek troops already policing the frontier, some of the sting would be taken out of American intervention and some check imposed upon any Russian military plans. It is true that the Soviet Six would vote against the proposals, but a measure can be international even if all the nations are not included. The British, who have a contingent in Greece as it is, could take a useful lead in promoting action through the United Nations.

The critics' distaste for the Greek Government will certainly be shared by those Britons who have struggled and those Americans who are now struggling with that slippery but plausible team. By all accounts, the economic situation is little better than it was in the spring and reconstruction goes forward at a snail's pace while some ten million gold sovereigns lie hoarded in private safes or are spent uproariously in Cairo and New York. The political parties continue to jockey for power, Liberals and Populists attempting to oust each other; only a direct American reprimand prevented a cabinet crisis from coinciding with General Markos's proclamation. There is thus no reason to be content with or even to accept the Greek *status quo*. The effort to widen and liberalise the Government must go on. New attempts must be made to create a responsible, tax-paying business community. The proposal, frequently made, that Mr John Varvaressos should be brought back to oversee the country's economic reformation has fallen so far on deaf ears. But it is doubtful whether any but a Greek can cope with the combined intelligence and irresponsibility of the Greek official and business class.

The pattern for Greece—a firm stand on really vital interests, the maximum use of the United Nations, and vigorous attempts to get local reconstruction on to a firm and liberal basis—is really the strategy for the Marshall Plan as a whole. The application of the strategy may vary from place to place, just as the nature of Russian opposition will vary, but the underlying issues are the same. Nor is it likely that the Soviet counter offensive can be successfully met unless a general strategy is developed and accepted. Piecemeal, unsustained, erratic diplomacy cannot carry through a project on so vast a scale nor meet opposition so sustained and violent. The new phase in Greece offers in every way a test case, not only for the survival of Greek independence but for the success throughout Europe of the Marshall Plan.

Wages Impolicy

AFTER two months of discussion with the Government, the General Council of the Trades Union Congress has decided to stand pat on wages policy. The interim report issued this week embodies no concession at all to the needs of national economic policy. It says that its constituent unions must be left free to negotiate whatever wages agreements they can, that the food subsidies must be maintained and prices must be kept stable. The TUC, it should be noted, does not say that wages must be free to rise if prices rise; it says that wages must be free to rise even if prices remain stable. The unions are not content with what they have got; they want more. After this, to throw in a few sentences about the need for increased production and for a sense of responsibility hardly amounts even to lip service to the national interest.

It was, perhaps, foolish to expect anything better of the trade union movement. The TUC, after all, cannot bind its constituent unions. And the officials of the separate unions, in their turn, are always looking over their shoulders at the ambitious rivals rising from the ranks to displace them. Just at present, they are very nervous about Communists in the unions, and they cannot afford to present them with such a golden opportunity to appeal to prejudice as would be provided by a decision to stabilise wages. It would be wrong to blame the individual trade union officials who are responsible for this latest statement. They do not have much liberty of action. But it would be equally wrong for anybody any longer to entertain any notions about the trade unions being a force for progressive initiative in the nation. They are an incubus, an inertia. So far from representing in some special way the noblest instincts of mankind (as Labour mythology has so often inferred) they are in reality only the most securely entrenched of the vested interests.

Lest these statements be thought too strong, it is as well to recall what has happened in recent years to the distribution of incomes in this country. The statistical evidence was examined in an article in *The Economist* of November 15th. The conclusion then reached was that, after making full allowance for changes in prices and in taxation, the real net income of the average wage-earner is between 10 and 35 per cent higher than in 1938. The total amount paid out in wages in 1946, after the deduction of taxes, was 60 per cent higher than before the war, although there were still in that year many hundreds of thousands of men and women in the armed forces. The obverse of this great increase in wage incomes has been a slump in other incomes. The same article reached the conclusion that the average salary, in real net purchasing power, has fallen by anything from 20 to 30 per cent, while the real net value of

profit incomes has fallen by a quarter; other forms of property income (from gilt-edged securities or from rents, for example) have suffered even more severely. At least ten per cent of the national consuming power has been forcefully transferred from the middle classes and the rich to the wage earners.

A gradual approach towards greater equality of incomes is an ideal that appeals to many people even among those classes who would suffer from it. But there has been nothing gradual about this transfer. There has been no attempt to analyse the consequences of such a sudden wrenching of the social mechanism, with all that it implies in the removal of incentives to effort and ambition. There has been no attempt even to discuss the question whether it is right that a war in which all classes contributed what they could should leave behind it as an accidental by-product, a social revolution of these dimensions. There has been no attempt to base the changes on the merits of those who have gained and the demerits of those who have lost: the sentimental assumption has simply been made that anybody who is paid by the week is always noble and right, while anyone who is paid by the month is inevitably an exploiter. To any suggestion that these subjects should be discussed, the TUC merely rejoins "What we have we hold—and as much more as we can get."

The object of all economic policy is to raise the standard of living of the people—of all the people. That ought to go without saying. But does it really follow from the acceptance of this principle that wage rates can never, by any accident, be too high, that there must never be any but upward moves, that other forms of income must always give ground, regardless of the consequences, before the weekly wage-earner? If this becomes the accepted doctrine of the Labour Party, then of course it puts an end to any hope of any deliberate or sensible planning of the national economy so long as the party is in power. "Planning" will then become (what it is rapidly becoming) the manipulation of all the other elements in the national income in the attempt to make them fit in with the sacred real wage-level. The result is "not the regulation of the economy on the basis of the appropriate financial reform and the complete abolition of rationing, but the universal introduction of all kinds of rationing." The quotation is from *Pravda*, and it is distressingly true.

It is fashionable nowadays in Labour circles to regard *The Economist* as being converted by some necromancy to the blackest kind of reaction. That is just silly nonsense. This journal has never been Socialist in its views, that is true enough; but it has always been well to the Left of centre and that is where it stands today. We conceive ourselves to be

The Gap between

pleading for the things for which the Labour Party, as well as the Liberals, has always said it stood, for the principle of reason in public affairs, for thinking things through to their consequences, for choosing the right policy not according to its momentary popularity or the weight of vested interests that can be mobilised behind it, but according to the effects it can be expected to have. We hope we shall always stand for restraint in inflationary conditions, and for expansion in times of slump; that is also what Socialist economists have always said they believed in. At this moment it is as plain as a pikestaff that inflation is rampant all over the world and that it is eating away a bit more each week of the hope of attaining to any degree of

economic stability within this generation. Never were the seeds of slump being more clearly sown than they are today. At such a time there are two possible courses of action. One is to take the unpleasant steps necessary to re-assert some control over affairs, no matter what rosy dreams may be shattered in the process. The other course is for everybody who does well out of inflation to cherish for a few months longer the illusion that it can last for ever. The trade unions have made their choice. They have turned their thumbs down on forethought. They prefer to let things take their "natural" course. They can be quite certain that their own members will be the worst sufferers in the end.

Canada's Problem—II

Prices, Politics and Dollars

(From Our Canadian Correspondent)

IN the course of 1947 Canada virtually dismantled the wartime system of price control. Relatively little decontrol had been attempted up to twelve months ago, but by the end of the year there was practically nothing left. The cost of living index, which had been held almost steady between 1942 and 1945 around the level of 117 to 119 (1935-1939 = 100), stood at 127.0 in January 1947; by November it stood at 143.6. During the same months the index of retail food prices (on the same base) rose from 145.5 to 173.6.

The Government had announced at the beginning of the year that controls would be abandoned as soon as this could be done in an "orderly" manner. This policy was based partly on the general outcry against control, which at that time was by no means confined to business groups, partly on the hope that United States prices would recede in the summer of 1947, and partly on the knowledge that the extremely efficient wartime price control organisation simply would not hold together much longer because so many of its staff were getting back into ordinary peacetime pursuits. The decontrol may have been orderly, season by season, but it has been accompanied by so sharp a rise in prices that there is now a widespread demand for renewed price controls.

In the special session of Parliament which was called on December 5th, the only members who were not embarrassed by the demand for price control were those in the CCF (Socialist) party. They had steadily opposed the dismantling of the Canadian price ceiling and they are now in a position to say "we told you so." The fact that in 1946 the CCF was equally vigorous in demanding the abolition of the wage ceiling, which had been an integral part of wartime price control, is conveniently forgotten.

The Liberals, who have only a small majority in the House of Commons, are trying to steer a middle path between what seems desirable and what seems practicable. Many Liberal members, with their eyes on their electorates, would be happy to see general price controls brought back, but members of the Government are convinced that it is not possible to re-establish the machinery and are steadfastly resisting this pressure. The new emergency restrictions on imports, together with the rest of the dollar-conserving programme, go as far as they feel is safe in re-introducing wartime controls.

The Progressive Conservative party, which constitutes the official opposition, is even more embarrassed by the course of prices than the Liberal party, for ever since the end of the war it has urged more rapid decontrol, and practically all the other economic policies it has supported would lead to higher prices rather than lower. However, the Progressive Conservatives are doing their best to capitalise on the public reaction

against the Government's import controls. They have proposed, as a partial if not complete alternative to the Government's dollar-conservation programme, the following measures: (1) that all export embargoes on goods—particularly farm products—which might be sold in the United States should be rescinded and that the country should take all possible advantage of the Geneva trade agreements. (This would obviously lead to sharply increased prices in Canada. It would also interfere materially with exports to other countries, including the United Kingdom.) (2) The Canadian dollar should be put back to the level of 90 cents in terms of American dollars thus "correcting the mistake that was made on July 5, 1946" when the Government raised the Canadian dollar to parity.

The proposal to devalue the Canadian dollar by 10 per cent is getting a great deal of attention, not all of it very intelligent. It will be recalled that in September, 1939, when foreign exchange control was established, the Canadian dollar was fixed at 90 US cents, which placed Canadian currency in its traditional position half way between sterling and the US dollar. These exchange relations were continued until July, 1946, when, with price control breaking down in the United States, the Canadian dollar was put back to parity in order to insulate Canada from rising prices there.

To some extent, obviously, the change in the exchange rate must have succeeded in its purpose, but American prices swept upward at such a rate that no stability was possible in Canada. However, two factors emerged in the Canadian balance of payments in 1946 which drained Canadian reserves of gold and US dollars—a deterioration of the balance of payments on current account with the United States, and a cessation of the inflow of American capital. The Progressive Conservatives are, rightly or wrongly, attributing both these changes to the change in the exchange rate and are thus claiming that this change was largely responsible for the import restrictions which have become necessary. These arguments deserve examination.

*

Traditionally, Canada has always had an unfavourable balance with the United States. According to statistical records, this adverse balance has varied between \$1 million (in 1936) and \$437 million (in 1929); it is almost always large in boom periods. In 1944 and 1945, however, Canada achieved for the first time in statistical history a favourable balance on current account with the United States amounting to about \$30 million each year. This favourable position was produced partly by heavy demands for Canadian products, including purchases of Canadian wheat by the US Government, and partly by difficulties in obtaining supplies in the United States by reason of continuing wartime controls in that country.

In 1946 the situation changed completely; Canada ran an adverse balance on current account with the United States which reached the unprecedented total of \$603 million. In 1947 the deficit has been officially estimated at \$1,100 million for the first ten and a half months. The most important factor contributing to these deficits has been heavy imports of capital goods, but there has also been an increase in consumer goods and, of course, there have been substantial price increases all along the line—although these have been partly, if not largely, offset (in the trade balance) by increases in the prices of Canadian exports to the United States.

As for the flow of capital between the United States and Canada, from the beginning of the war to the end of 1945 there was an inflow exceeding \$1,000 million. In part this movement was a result of an exchange rate which seemed to under-value the Canadian currency, thereby holding out the hope of a capital gain for Americans who placed or re-invested money in Canada. This capital gain actually occurred when the Canadian dollar went back to parity in July 1946. Immediately much of the attraction of placing or leaving money in Canada disappeared. Indeed, the opposite attraction developed. In so far as the Canadian foreign exchange control permitted it, capital began to move out of the country; this was reflected in the sharply falling value of the Canadian dollar in the "outside" market in New York.

It seems very doubtful whether the change in the exchange rate materially influenced the shift in the current account balance which began in 1946. The 10 per cent reduction in the cost of imports (below what they otherwise would have been) can scarcely have been a very important factor, since price increases of far larger amounts were taking place at the same time in the United States. As for exports, Canadian industries were operating to capacity, and in many cases the Government was restricting free export in order to keep a reasonable volume of supplies at home in Canada at reasonable prices, so there is no reason to believe that a 10 per cent premium on exports would have earned many extra dollars.

The change in the exchange rate did, however, affect the capital position—probably a good deal more than the authorities expected. But this does not mean that a reversion to 90 cents would correct that position now. The discount of the Canadian dollar in the "outside" market has been running at 12 or 13 per cent, and the discount on Canadian securities in New York has been running from 16 to 22 per cent, depending on the type of security. It seems doubtful whether an official

depreciation of 10 per cent would suffice to interest American investors in putting their money into Canada, particularly in the light of the restrictions that have now had to be put on trade, travel, etc. But any depreciation, whether of 10 per cent or more, would aggravate price increases and, while helping to correct the balance with the United States, would create an even greater unbalance in Canada's international accounts with Great Britain and other countries. Hence the Government is most insistent that it will not devalue at present.

Whatever may be the cause, Canadian reserves of gold and US dollars have fallen very quickly. They reached an all-time peak in April 1946 of \$1,667 million; by the end of that year they were down to \$1,245 million. By April 1947 they had fallen to \$700 million, after which they continued to deteriorate, although at a somewhat less rapid rate until, at the end of November, they stood at \$480 million.

The total loss during the year 1947 has been something like \$800 million. The economies that are now in effect (the import bans and quotas) are not likely to produce savings of more than about \$300 million per annum; apparently they do not go half far enough to meet the deficits experienced last year. However, there are other factors to take into consideration. Most of the deficit in 1947 occurred in the first four months; after that the deterioration was less rapid. Further, the Government has announced other plans in addition to those which are already in effect: restriction on the import of capital goods, materials and components from the United States, increased exports of manufactures to that country, and finally special assistance to the gold mining industry. It is impossible to say how far these will go to fill in the gap. It is clear, however, that the gap is not completely filled and that the Government must rely on other sources of US dollars more heavily than in the past. It must arrange for more exports for cash and less on credit.

The great question is: How much Marshall Plan money will be spent in Canada? If Congress adopts President Truman's recommendations, the amount to be spent in Canada over four and a half years might exceed \$3,000 million. This would certainly solve Canada's dollar problem. But it cannot be counted on until Congress has voted. And even so, it would raise another problem. How can Canada make available for export under the Marshall Plan goods worth \$3,000 million without either a very sharp further inflation or else a general reintroduction of price control, allocations and rationing?

(This is the second of three articles.)

Old Moore and the New Diplomacy

IT has been reported from Rangoon that the Burmese Government recently altered the date originally chosen for Independence Day on the advice of an astrologer. Such a regard for correct timing sets an example which puts Whitehall to shame. In spite of the continual growth of the bureaucracy and the vast ramifications of planning, there is no evidence that the British Government has as yet taken thought how to obtain from experts a knowledge of the future sufficient for its plans or to choose lucky days for burning its boats or re-crossing the Rubicon.

In the old days of *laissez faire*, self-adjusting economy and automatic progress, it was possible to ignore the need for foreknowledge and even to indulge in a sophisticated rationalist disbelief in the claims of the prophetic science, without grave consequences to the body politico-economic. But when everything depends on planning, the lack of correct foreknowledge may bring the most appalling catastrophe; without information of what the stars foretell or the crystal bowl reveals,

the best-intentioned planners may go astray, like the man who introduced the rabbit into Australia. Moreover, the habit has been acquired of fixing in advance definite dates and time-limits for major political and economic operations and, in this field above all, decisions are not to be taken lightly. At present, the British public is not told at all how such decisions are taken. Why was August 15th, rather than August 16th, chosen for the transfer of power in India? Was it because it was Napoleon's birthday? And why has May 15th been chosen as the date for the backhanding of the Palestine Mandate? The date-fixing is done in the utmost secrecy and we have no means of knowing without breach of the Official Secrets Act whether civil servants assembled in an inter-departmental committee perform shamanistic dances until inspiration comes, or whether the responsible Minister merely selects a date by pricking a calendar blindfold without any resort to occult wisdom. On circumstantial evidence we cannot but suspect that the latter course is the one usually followed.

But there are grave perils in choosing an unlucky day for so momentous an occasion as the quitting of the Holy Land. Since the war British policy has developed a technique of what may be called the ultimatum in reverse. Formerly, the ultimatum in diplomacy was associated with aggression or at least with coercive military or naval action after the devices of pacific diplomacy had failed to bring satisfaction. The aggrieved state, to stop stalling and evasion of its demands, set a time limit for a sufficient reply, without which it would "take whatever action it deemed necessary"—words preliminary to the forward march of troops across a frontier. But the time limits of British post-war policy threaten no British attacks and prepare no onslaughts, whether for expansion or for redress; they are threats of renunciation and withdrawal. Britain convulses the world with its retreats and menaces mankind with surrenders of power. Such a policy, however bold in conception and skilfully executed, is fraught with dangers; it is liable to create much ill will. Just as American politicians, anticipating the electoral votes of New York State, were about to place the last straw on the back of the British camel, they were suddenly confronted with the shocking prospect of there being no camel; indeed, the camel is not only refusing to carry any more straws, but has announced its intention of pitching the whole White Man's Burden overboard into the sand. Such unwonted recalcitrance on the part of the camel can only be justified by a successful outcome, and this makes it all the more essential to ascertain whether May 15th has been well chosen as the date for the release of what is coming to Palestine.

To obtain some guidance on this and other problems looming ahead, it is natural to refer to Old Moore, the doyen of astrological almanacs in this country. It is disappointing, therefore, on looking up the predictions for May, 1948, to find no mention of events in Palestine. There is, indeed, no reference to the subject until November when we read that "in industry more oil is required and that affects our views on matters arising in Palestine." This sounds rather sordid after all the lofty considerations of moral principle which have hitherto, as everyone knows, exclusively determined the policies of the British and American Governments with regard to Palestine; is it really possible that our standards will have deteriorated so rapidly between now and next November? But perhaps, on the principle that "no news is good news," we should be greatly encouraged by the lack of further mention of Palestine in the list of predictions. On the other hand, we cannot be sure that the prophet's silence is not due to a lack of attention to this particular field for interpretation. The Delphic oracle in antiquity never talked unless questions were put to it, and the message of the stars is likewise withheld from those who do not seek it.

Old Moore's own interest seems to be mainly in home affairs, though there are some useful indications in the international field. For January we are told: "As forecast in our pages during the past few years, the influence of the so-called 'New World' is much more marked. Uncle Sam has his feet and his money firmly planted in the fount of the Old World, usually referred to as the Middle East." This is reassuring, as it guarantees that the United States is not going to bolt into isolationism within the next few weeks. More disquieting is an allusion to a disturbance of the peace in the Caucasus and the statement that "our views on the actions of Turkey undergo a change." However, the repercussions of this episode seem to have faded out in February, when the centre of interest moves westward; we learn that the influence of the Pope is growing, "especially in this country," and that in Spain "the head of the State reacts more readily to constitutional requirements than for many years." March is apparently empty of important events abroad except that there is a hint of trouble in the prediction that in the United States "more equitable conditions are demanded by many sections."

In April a cheerful note on Eastern Europe is struck with the news that "shipping on the Danube is now more active." The iron curtain appears to have loosened somewhat, for we read that "the competing interests have decided that trade must go on and the division of the spoils settled later." This sounds like the beginnings of a reasonable compromise between Russia and the Western Powers, but the prophecy goes on to declare that "Russian influence is very strong," so, perhaps, the Kremlin is not so much coming to terms as pulling a fast one. On the other hand, in May, we find that "more influence"—apparently British—"is exerted in events taking place in the north of the Continent"; this may or may not be connected with June's rather sensational disclosure of rivalry for control of the North Polar regions. This fortunately is not carried to extremes, for although "the frontiers between competing interests are not yet clearly defined, some notable advances are made in their demarcation." Perhaps the ice of these high latitudes chills ideological passions and renders it easier to reach agreement, for further south the picture is still much less encouraging. Uno "has a whole crop of undecided problems before it and the hoped-for peace on the Continent does not materialise. France is particularly unsettled, while Germany is still split in two."

There is, apparently, a lull in foreign affairs from July to September, but they liven up again in October with restlessness in the Ruhr and the question being "frequently asked": Who is getting the benefit of this increased output? France is dissatisfied and "even Russia has some comment to make on the distribution of the output." That Russia should comment on anything not strictly its own business is, indeed, surprising, and we can only hope that the remarks will not transgress the bounds of Moscow's customary fairness and restraint.

In November "our newspapers, now able to devote more space to events outside this country, have much to say about Uncle Sam." This certainly implies that more newsprint is going to be available, and if so, *The Economist* will, indeed, be glad of the opportunity to report more fully than would otherwise be possible on the election then due to take place in the United States. Old Moore hints darkly at the result with the prediction that "new men responsive to new pressure groups appear on the stage, though the leader has been tried in the saddle for some time." These words suggest that Mr Truman will be re-elected, but, of course, it depends what you mean by a saddle; it might be a cryptic hint of a "man on horseback."

The predictions for December are exceptionally mysterious. We learn that Uno is concerning itself with atomic energy—which is nothing new—but that "suspicions about atomic use have not yet been laid to rest"—a phrase which seems to imply a degree of progress unimaginable in December, 1947. Again, we are told that "our position at Shanghai is further clarified." But the British firms now trying to do business in China are not aware that it has so far been clarified at all. There seem to be in these and in other matters serious gaps and omissions in the tale of events, so that we often get an effect like that of skipping pages in a book and reading on in ignorance of intermediate developments. It must be admitted that, in spite of its great tradition and antique charm, Old Moore today is not entirely satisfactory as a guide for the politician or diplomat who wishes to be adequately informed about the future. What is needed is a Government plan for mobilising the astrological talent of this country—which is more plentiful than is generally realised—and providing each Ministry with a Stellar Relations Officer who would be responsible for advice in the corresponding field of interpretation. For the Foreign Office particularly the need is urgent, so that next time Britain threatens to evacuate some portion of the globe, we may be sure that Z-Dav has the approval of all the signs of the zodiac.

NOTES OF THE WEEK

Forty-Eight

The new year gives promise of being a year of note, not one of those anonymous years that are remembered only as the year after something or the year before something else—years like 1788, 1816 or 1913. But 1948 will have to start early and work hard to come near equalling the record of 1848. What a crowded year that was, with the "Communist Manifesto" in February, the Great Charter in April, and revolutions and counter-revolutions covering almost the whole year, from the revolt against King Bomba in Sicily in January and the flight of Louis Philippe in February to the stamping out of the last sparks in Italy in the autumn. March was the great month, when revolution broke out in Vienna, Berlin, Munich, Milan and Rome, and every throne in Europe trembled—except Czar Nicholas's and Queen Victoria's, and there were plenty of people who thought the Charter threatened that too.

With all its flurry, 1848 was not a very decisive year. Professor Namier has called it "the revolution of the intellectuals," and that class has never shown more clearly its surfeit of ideas and its lack of political effectiveness. By the end of the year nearly everything was back in its former place, with very little apparent progress made, unless it was progress to substitute Francis Joseph for Metternich, Louis Napoleon for Louis Philippe. Yet progress there was nevertheless. Reaction, which had been put back in the saddle in 1815, was in 1848 given its final notice to quit in favour of the dawning Liberal era. The real man of the year was not Lamartine in Paris, nor Manin in Venice, nor Mazzini in Rome, nor Gagarin in Frankfurt, but John Stuart Mill publishing his "Principles of Political Economy" in London.

Historical parallels are irresistible and plenty will be drawn between 1848 and 1948. There is an obvious candidate in Paris for the parallel to Louis Napoleon; there will be a new Frankfurt Parliament; and there may well be another Communist manifesto. But where is the parallel to Metternich, the ruler of a whole generation, who began the year invincibly secure behind his secret police, and yet was a fugitive before Easter? There is only one Government in Europe that is thirty years old; but it will take more than a historical parallel to run Stalin out of Moscow.

The truth is that there is nothing but numerology in common between 1848 and 1948. The one was the explosion of forces long fermenting under a surface of apparent tranquillity; the other will be a year when a frantic world searches for a sedative. Contrasts with 1848 will be more welcome than parallels; 1848 was a year of much disturbance and little decision. Let us hope that 1948 will be a year of decisions without disturbance.

Will Frenchmen Foot the Bill?

Day by day the problem of inflation grows more urgent in France. In the introduction to the recently published National Balance Sheet, M. Jean Monnet said that inflation "has reached the acute phase which may soon prove fatal," and another French economist has published the graph of the German mark between 1921 and 1923 and the French franc between 1945 and 1947. The franc follows the mark, leap by leap, save that the franc stops short at the December figure whereas the mark shoots on to climb out of the graph altogether at the bitter end. A further spin to the spiral has, moreover, been given in the last few days, for minimum wages have been raised from 7,564 francs a month to 9,590 francs, the change to be retrospective to December 1st; and this new purchasing power is almost certain to have an immediate effect upon food prices, since so much of the worker's budget is in any case spent on food. Civil servants are also to receive increases in their salaries, and nobody believes that the recent increases in price authorised for industrial goods will mop up more than a fraction of the new purchasing power.

The hope of countering inflation depends, therefore, upon M. René Mayer's anti-inflationary measures, and it must be admitted that their progress through the Assembly has not been very encouraging. The essence of the proposals, it will be recalled, was to absorb the surplus purchasing power pressing upon every price in France by a special levy upon incomes and profits exceeding 450,000 francs a year. The levy would bring in—it was hoped—150,000 million francs and the gap between revenue and expenditure would also be bridged by a poll tax on the idle, increased prices for fuel and transport and other miscellaneous measures.

Unhappily the Assembly set to work to emasculate the Bill. They reduced the number of farmers and shopkeepers who would be liable to the tax and it was clear from their manoeuvres that, far from thinking of inflation, they had their eyes fixed only on votes at the next election. The Gaullists were particularly irresponsible. It is true that the Council of the Republic—the Upper Chamber—restored some of the cuts, and the Lower House accepted their verdict, but only after proving that most of France's elected leaders are more interested in the political game than in national survival.

And behind the Assembly are great non-taxpaying, anti-social classes, both in town and country, who never have pulled their weight in the Republic and show little sign of doing so now. While they hoard and the workers starve, there can be no stability for the country. If this latest battle for the franc is lost, it is the battle for France itself that will begin.

Sins of a Good German

Berlin has offered in the last fortnight a preview of what could happen to a central German government established at the heart of the Russian Zone. The Russian political administrators have used every means short of force—or the threat to use force—to oust from leadership of the Christian Democratic Union (CDU) in Berlin and the Russian Zone, Jakob Kaiser and his deputy Ernst Lemmer. Both have stood firm on the principle that parties are independent and their leaders removable only by the freely expressed decision of their followers. Behind them Christian Democrats all over Germany have rallied, and the conference held in Berlin this week asserted their claim, as the largest party in Germany, to a special and independent role in the building of German unity and development of democracy. On the immediate issue before them they declared that Dr Kaiser and Herr Lemmer could be removed only by decision of the zonal conference that elected them.

The next step lies with the Russians. They may swallow the defiance, or they may persist in the attempt to get the two CDU leaders removed or made powerless by their followers in the Zone, who are divided in their attitude to Russia. Whichever course they choose, its effects will be felt all over Germany; for the principle at stake is one in which all parties in every zone are interested.

The CDU, and Dr Kaiser in particular, have been under fire since last summer, for obstructing Russian efforts to increase the Communists' dominant role in the State governments. The Soviet political administration has hitherto shown forbearance; it has attempted to gain, rather than extort, support. For the very good reason that the CDU is the only party which extends, with some variations in policy, over the whole of Germany. But matters came to a head when Dr Kaiser recently committed two mortal sins. He declared publicly that the Oder-Neisse frontier was a threat to future peace; and he prevented the CDU from being represented as a party at the so-called "People's Congress" in Berlin, convened four weeks ago at Russian instigation to demand unity à la Molotov. In short, he exposed the fact that to most Germans unity is an empty phrase unless it means the unity of a Reich to which the eastern provinces have been restored.

The CDU's boycott of the "People's Congress" threatens to cripple Mr Molotov's campaign to persuade the German people that the Russians are the best friends of German unity and independence. In this campaign the all-party "People's Congress" was to have been the spearhead, with branches all over Germany. Thanks largely to Dr Kaiser, and to the remarkably courageous stand of his followers, that body is unlikely to represent anything more than the Communist-directed Socialist Unity Party of the Russian Zone.

Reparations Muddle

One of the pictures spread most assiduously round Europe by the Russians since the breakdown of the London talks is that of Britain and America acting in the closest concert in all aspects of their German policy. It would perhaps be better for the Western Powers if the picture in any way resembled the truth. The fact is that the workings of British and American policy

for Germany manage to be co-operative only after long and arduous effort; and then disagreement seems to spring up naturally and luxuriantly on any point which has not been the subject of detailed examination.

The latest instance concerns the vexed question of reparations. In the last year, slowly—very slowly—but steadily, the Potsdam policy of dismantlement has continued, with 25 per cent of the machinery earmarked for Russia and the rest allotted to the countries covered by the agreement setting up the Inter-Allied Reparation Agency (IARA). This body, broadly speaking, represents the interests of the Western Powers, but—rather inconveniently from their point of view—includes Yugoslavia and Albania. In the spring of 1946 the Americans, for a time, refused to make any new allocations to Russia from their zone until the Russians fulfilled their obligations under the Potsdam agreement. The British did not follow suit. Deliveries to Russia continued and pressure was put upon the Soviet Government to ensure that they in return fulfilled their part of the reparations bargain, according to which food and raw materials to the value of 15 per cent of the deliveries from the West should be dispatched from the Eastern Zone. Such was the position at the time of the London Conference.

Immediately after its breakdown Mr Marshall threw out the hint that America would again consider stopping all reparations to Russia. But almost simultaneously the Russians announced that they were ready to begin their deliveries of the promised raw materials. This conjunction places the British Government in a very awkward predicament. The interests of the Marshall Plan and the desirability of keeping in step with America suggest that the British should follow the American lead. The interest of the IARA countries in receiving their share of the reparations now to come from the Russian area pushes them towards the continuance of reparations deliveries to Russia. It is an unwelcome predicament, but at least it should explode once and for all the idea of a concerted Anglo-American strategy in Germany.

Mr Isaacs Spreads his Net

Details of the Registration for Employment Order—more popularly known as the “Spivs and Drones” Order—issued by the Ministry of Labour this week, suggest that Mr Isaacs is spreading his net far and wide without any very clear idea whether he will catch a minnow or a whale. The Ministry cannot give any estimate of the numbers who will register under any of the three categories—the street traders, employers in betting and gambling undertakings, night clubs and amusement arcades, and the “not gainfully employed or occupied.” The potential number of registrations under at any rate the third of these headings is enormous, but the numbers likely to become available for useful productive employment are surely very small. In any case, a number of convenient loopholes are provided which the inveterate spivs and work-dodgers will be quick to use.

A barrow boy must register if he has a regular site in a street market, but if he moves up and down the street knocking at door to door he will be exempt. A poet or a free-lance journalist who can prove that he is “spending 30 hours a week in writing with the intention of selling” need not register, but an actor who is “resting” must apparently conform. People who are doing voluntary work must register, but if they are doing useful work for 30 hours a week they will not be called upon to take up other work. Those who can think of a good reason why they should not work at all, and can persuade the Ministry of Labour officials—or, in the case of women, the special Women’s Panels—will be left alone.

An enormous and altogether unfair responsibility is being placed on the Ministry’s local officials, both in the interpretation of the Order and in any action following registration. How can an employment exchange manager determine who is, or is not, a genuine writer, and why should a 30-hour week be the criterion? And even if a man cannot, or does not wish to, sell his work, why should he be disturbed? The impression is left that a vast administrative façade is being set up, for what is mainly the window-dressing purpose of satisfying the TUC that there will be genuine “equality of sacrifice” and that the “idle rich” as well as the manual workers are being subjected to labour control. An unattractive aspect of the whole business is the encouragement which may be given to unofficial snoopers and informers. The Ministry of Labour itself has no direct means of checking up on registrations: it does not intend to invoke the aid of the police, but however much it may disclaim the desire to encourage informers, it cannot very well ignore representations it may receive from any quarter.

Newsprint and Newspaper Prices

The price of British newsprint is to be increased by another £9 a ton next week. The reasons given are the general rise in all costs, but particularly of British coal and Scandinavian wood pulp. The particular interest in this increase lies in its effect on the press. Will it tip the balance against the continuance of the penny press at a penny? This last increase, following a rise of £7 last July, brings the total price per ton to over £48 compared with £11 10s. in 1939. To have kept the selling price of most of the papers at the pre-war figure in the face of such an increase in costs is quite an achievement; and if it is continued it will eat into profits very severely.

Fortunately for the public three forces are operating against an increase in the price of the national dailies. The first is the need for unanimity: no one paper is going to be so suicidal as to take unilateral action in raising its price. The *Daily Express* and the *Daily Mirror*, the competitive pace-makers of the last decade, are well enough content with the present price, and the rest must follow suit. But some of the others would like to go to 1½d.; some (of which the *Daily Herald* is said to be one) because they have difficulty in making ends meet, others (for example the *Daily Mail*) because of their responsibilities to their numerous public shareholders.

The second factor making for stability is the very smallness of the coins for which a British newspaper sells. An increase of a halfpenny is the smallest that is practicable (there are not enough farthings in the country to make a price of 1½d. possible). But an increase of a halfpenny would be an increase of 50 per cent and it would provide far more revenue than is needed at the moment. It would therefore certainly bring an enormous number of complicated readjustments in its train—in particular, further demands for still higher wages—which would inflate the level of costs to a degree that cannot be permanently sustained. And thirdly, so long as the papers are restricted to four pages, the burden of dearer newsprint is at a minimum, while the competition for such advertising space as is offered is so keen that advertisers will pay high rates. For the present the national dailies will probably stay at a penny. But the issue will arise again in an acute form as soon as there is sufficient newsprint to permit the popular dailies to expand to six or eight pages. Dearer newspapers will then be inevitable if newsprint is then selling at anything like today’s prices. Meanwhile almost every day brings news of increases among the more expensive dailies, the weeklies and periodicals. Some of the Sunday papers rose to threepence in the summer and the *Financial Times* succumbed on January 1st. Others are following suit. *The Economist* has no intention of increasing its price—at present.

BEA’s First Year

In the first eight months of their Continental operations and the first two of their internal flying, British European Airways have lost £2,157,937. Giving these figures last week, the first annual report showed with depressing clarity the perverse and difficult conditions that caused them. In the Corporation’s formative period a heavy initial outlay with but little return was expected. But it has proved heavier than anticipated. About three-quarters of the staff had had no previous experience of work in civil airlines: technical training of aircrews cost nearly £600,000. Accommodation was difficult to find and inconveniently sited: the supplies depot had to be extended over a widely dispersed area some 20 miles from the main engineering base. This has meant a dissipation of effort, increased rentals and communication costs, and waste of working time—all of which have added to operating costs.

Nor has the Corporation been fortunate in technical matters. Sometimes nearly a quarter of the Dakotas, which formed the backbone of its Continental fleet for most of the period under review, were grounded through lack of spare parts. A reasonable supply was finally assured by the establishment of a buying office in America; but this increased their cost by 50 per cent. The eagerly awaited Vikings had to be grounded only three months after their introduction. They stayed on the ground beyond the period under review. Navigational aids were generally inadequate to meet the Corporation’s standards of safety, and three out of every ten Continental flights scheduled for February and March were cancelled as too dangerous. On those completed, extra fuel was carried to provide an ample safety margin—but at the expense of the payload and, consequently, of revenue. Seats reserved for VIPs, which were not cancelled early enough to permit their resale, cost £26,000, irrecoverable duties on fuel £14,900—they are expected to be £100,000 in a full year—landing fees £36,398—

they are so high in the UK that short routes are made “quite uneconomic.”

The list seems endless. Yet such disadvantages had been foreseen. To meet them the Civil Aviation Act provides for a loss of not more than £10,000,000 for each of the first two years of the Air Corporations’ existence. It had been obvious for some time that their first year’s deficit would not be less than this sum. Admittedly the present economy drive underlines its size, just as the dispute about the Tudor focuses attention on the whole organisation of British civil aviation. But to show undue concern at a deficit different only in degree from that expected and to hint of revolutionary changes in organisation appears unnecessary. The amalgamation of the three Corporations into one would, of itself, be of no advantage. The special requirements of each would have to be duplicated in separate divisions of the larger body. And it is extremely doubtful whether the financial benefits would be large enough to offset the loss of individuality and the spirit of emulation encouraged by the existence of separate Corporations. Yet this is not the main issue. So long as the Corporations—or, for that matter, a single Corporation—are the chosen monopoly instrument of the British Government, commercial considerations are liable to yield to political. The introduction of modern machines should reduce costs. But the situation will always be potentially uneconomic.

Ex-King Michael

The abdication of King Michael has made Rumania a “People’s Republic,” bringing it formally into the same category as Yugoslavia, Albania, Bulgaria and Mongolia, the “most progressive states in the world after the USSR.”

The wartime Allies owe a great debt to King Michael for one of the decisive actions of the war. On August 23, 1944, he made his country break with the Axis. Thereby he opened the German south-eastern front to the Russians and shortened the war by many months. But he also ensured that the whole of Central Europe would be “liberated” by Soviet, and not Anglo-American troops. Marshal Stalin showed both a deep historical understanding and a pretty sense of humour when he awarded the king the highest Soviet decoration, the Victory Order. For King Michael’s brave blow at the Germans who were exploiting his country set in motion the Sovietisation of Eastern Europe which has now driven him from his throne.

The abdication is only a formality. The *Gleichschaltung* of Rumania was completed two months ago, when Mr Maniu was sentenced to life imprisonment, and when the non-Communist parties in the Government (Socialists and Liberals) lost the last remnants of independence. For two years King Michael has had no power. His formal opposition to the Groza Government had to be abandoned when the Western Powers recognised it early in 1946. Even his personal household had long been filled with men considered “safe” by the Communist Party. So his position has been equally embarrassing to himself and to the Communists.

The decision to abdicate was announced suddenly, without any of the anti-monarchy propaganda which was used before the proclamation of a republic in Yugoslavia and Bulgaria. It may be hoped that the regime will now have the decency to leave him free to go where he will and marry whom he wishes.

Though not affecting the real balance of power in the country, the abdication will greatly depress the average Rumanian, who still saw in the King the symbol of a national independence which he could not admit to himself had utterly disappeared. The leading figures of the regime are now the Foreign Minister, Anna Pauker, and the War Minister Emil Bodnarash. Mrs Pauker is a Polish Jewess who, while in exile in the Soviet Union in the thirties, denounced her husband as a Trotskyist and has never looked back since. Bodnarash is a former Rumanian regular army officer of Ukrainian extraction, who fled to Russia when his work as a Communist agent in the army was discovered, and who has directed for the last two years the Special Security Service, Rumania’s second and most secret political police. He will doubtless use his position to speed up the recruitment of Rumanian volunteers for the Greek rebel forces, for which propaganda has been conducted in Bucharest for some months.

Question for the Commonwealth

In their decision to appeal to Uno against Pakistan over the Kashmir conflict, the Indian Government are fully within their rights as a Dominion. It is nevertheless surprising that the dispute should be brought before Uno without any serious attempt

to find a solution within the limits of the Commonwealth. The situation in the world being what it is, the Indian appeal to Uno, whatever its result, is only too likely to involve Indian affairs in the whirlpool of current Great Power rivalries and to afford certain nations a golden opportunity for fishing in troubled waters. It is indeed deplorable that there exists in the Commonwealth no machinery for dealing with disputes between its members, which could be used as a means of settlement within the family before appeal to Uno is made as a last resort.

It may be granted that any kind of compulsory British jurisdiction, like that formerly exercised by the Judicial Committee of the Privy Council, is unsuitable for countries as new to Dominion status and as jealous of their independence as are India and Pakistan. But some attempt might have been made to set up a system of arbitration in Commonwealth affairs, with panels drawn from all the Dominions. A body with an Irish chairman, for example, might inspire in members of the Congress Party a confidence which they cannot yet feel able to extend to the departed British Raj. A Commonwealth arbitration system need not in any way reduce the independence of the Dominions, but it would greatly diminish the risk of loosening Commonwealth ties, which must result from public displays of mutual abuse and manoeuvre in the larger international arena. Kashmir is not the first, and is not likely to be the last, issue that to confound the Commonwealth in the eyes of the world, if no attempt is made to remedy the present state of affairs.

Local Government in Committee

Mr Bevan has so far defended his Local Government Bill with considerable skill during its progress through standing committee. The chief bone of contention, up to the time that Parliament adjourned, has been whether the new equalisation grants of £33 million to local authorities will be enough and will be fairly distributed. The Opposition has urged a rather indiscriminate generosity on the Minister. The Bill provides that the total sum payable shall not fall; but one suggestion, rightly rejected, would have given the Minister power to raise it by any amount at his own discretion. An attempt to increase substantially the transitional grants, which are payable for five years only to the richer local authorities to ease the Bill’s impact on them, was stiller still. Now, when state expenditure needs curtailing, is emphatically not the time to pump extra money into the pockets of local councils. The Bill already meets their immediate needs by confirming a total net relief to the rates of about £38 million.

However, it is true that this relief is only temporary, and that as the cost of education, fire and other local services rises, fresh Exchequer aid is likely to be unavoidable, and probably the best way to give it will be in the form of higher equalisation grants, which amount to a much smaller percentage of local authority income than did the discarded block grant. But it is difficult to legislate now for this future contingency. It is wiser on the whole to wait and see how fairly the new system of grants operates and what happens to the general structure of local government, which even Mr Bevan now admits to be in for drastic changes.

The fairness of the equalisation grants will depend almost exclusively upon the degree of rating uniformity throughout the country which the coming revaluation attains. Factors other than that of rateable value will in future be of very minor importance in settling the distribution of Exchequer aid. For the next few years, until the new valuation lists are ready, there will be much unfairness in the distribution of the new grants because of grave local distortions in existing rateable values. How completely the distortions will then be eliminated remains to be seen.

Mr Bevan Speaks too Soon

It was unfortunate for Mr Bevan that in his Christmas Eve message to the National Federation of Building Operatives he should have committed himself to the statement that “The rate at which permanent houses are being completed is increasing...” which a week later the Housing Returns for November [Cmd. 7288, 7289] showed a slight decrease—from 15,445 houses in October to 15,203 in November. The decrease is itself small, but it is disappointing when so much effort is supposed to be going into accelerating the rate of completions, and so many houses are on the eve of readiness.

In another place—in the House of Commons debate on December 18th on the cuts in the investment programme—Mr Bevan

piped a rather different tune. He then saw no reason why a rate of 15,000 permanent houses completed a month could not be maintained: perhaps the experience of the great freeze last winter

induced special caution. But with 216,000 houses under construction and so many all but complete, it should really be possible to complete more than 15,000 a month—even in winter.

Good Offices at Batavia

The "good offices" of the Uno Commission of three, which has come between the Dutch and the Republicans in Indonesia, are having very much the effects that were foreseen. In the talks on board the *Renville* off Batavia, now entering their fourth week, the Belgian delegate is pro-Dutch and the Australian is pro-Republican. The American appears to falter between good-hearted sympathy for the "nationalists" and hard-headed acknowledgement of two facts: that short-term American interests call for friendship with the Dutch—in Europe as well as in South-east Asia—and for the quickest possible return to normal planting and trading of the products of the Indies. The effect of these divisions on the Dutch is to fortify their natural obstinacy and tempt them into legalistic quibbling, which gains them the time they feel they need to get their own way. On the Republicans the effect is to make them pitch their demands high, to keep "moral considerations" well to the front and hope that Uno's influence and American opinion—a very different thing from State Department policy—will see them through.

The Dutch are emboldened by the success of their policy of divide and rule, and by the deteriorating military position of the Republicans. Their Prime Minister, Dr Beel, felt strong enough during his recent visit to Indonesia to threaten the Republicans with an ultimatum: come into the United States of Indonesia on our terms or you will lose whatever position you have gained. Time is clearly on the side of the Dutch. The Republicans would do well to realise how the movement of opinion in Holland has been affected, not only by the irresponsibility of some of their leaders and the atrocities of some of their wild men, but also by European events which have strengthened the politicians of Right and Centre. Of the Republicans' chief supporters Australia has retired from the Security Council and India has failed to get on to it. They stand therefore to gain little by tactics which would force the goodwill commission to refer the question back to the Council.

The interested Great Powers would certainly not try to force the Dutch to concede the Republican demand for a special independent status in the United States of Indonesia. But they probably would be prepared to offer an international guarantee of the Republic's "integrity" within a federal state sponsored by the Dutch. The dilemma of the Dutch is a tragic one. They dare not lose their grip on "the cork by which Holland floats." By defying international opinion and the findings of Uno—like Jugoslavia and Bulgaria—and by using force quickly and ruthlessly now, they could probably win a short respite and get American capital to help them in the Indies. But in the long run the strength of Asiatic nationalism would be too much for them. What has happened in India and Burma is an organised retreat from imperialism in which the Dutch cannot afford to get left on their own.

China's Parliament

China's new Constitution, adopted a year ago by a Constituent Assembly, came into force on Christmas Day. China should in theory now have a freely-elected national parliament as the ultimate repository of political power. Three factors have been exerting pressure for parliamentary democracy: the democratic aspirations and discontent among the people, particularly the intelligentsia; the American requirement of at least an attempt at liberalism as a condition for American support of the Nanking regime; and last, but not least, the doctrine of the Kuomintang itself, which has always claimed that single-party "tutelage" is merely a preliminary to a multi-party parliamentary system.

Unfortunately, the Nanking Government, holding elections in the midst of civil war, has not been able, even if it wished, to go far towards the ideal of free popular choice. In a great part of the country it has not been possible to hold elections at all because of the Communist occupation or local disorder; and though the Constitution allows the National Assembly to be convened when two-thirds of its seats have been filled, the absence of the Communists, the principal opposition party, means that the elections have provided no test of their relative strength in the country.

Even without the Communists, there might have been a substantial opposition within the Assembly to provide the element of political competition by which the present Nanking leadership could be called to account and reforms carried through. But shortly before the elections the Government outlawed the Democratic League, the rather exiguous, but quite respectable, "third force" in China, which was openly opposed to the Kuomintang. Two sections of the Democratic League, the so-called Social Democrats and the Young China party, which broke away from it and entered into coalition with the Kuomintang, not only received certain offices, but also, by an electoral bargain, a number of uncontested seats in the Assembly. Chiang Kai-shek tried to set a good example by openly recording his vote for a non-Kuomintang candidate. But many local Kuomintang committees, long accustomed to the party's monopoly of power, have repudiated electoral pacts made in Nanking, and have used the devices of open voting for their own ends, upsetting the compromise list. As a result, election returns are not yet complete and the Assembly is not yet able to enter on its duties.

Payment of Doctors

The new battle between Mr Bevan and the British Medical Association over the national health service has been joined, and this month doctors will be asked through the BMA to say whether they intend to join the service or not. The BMA is putting it to them as a matter of principle, not as a matter of individual self-interest, but clearly a doctor's decision will be influenced by the terms and conditions of service, as well as by the question whether the independence of the medical profession is at stake. Unfortunately, a great deal about the terms of service is still unknown. For instance, the proposed salaries for specialists will not be announced until the Spens Committee inquiring into their present earnings has reported.

On the information given, the proposed remuneration of general practitioners seems generous, and it is worth noting that the BMA has not so far objected to it. The Minister of Health proposes that a central fund should be established equal to a capitation fee of 18s. multiplied by 95 per cent of the population—this being an estimate of the number of people who will wish to use the service. A first charge on this fund, which would amount to £40,826,000, would be the payment of a basic salary of £300 a year to every doctor in the service, and also mileage payments. This would leave a net amount to be distributed of £34,456,000, which, again on the assumption that 95 per cent of the population were on doctors' lists, would work out at a capitation fee of 15s. 2d. in addition to the basic salary. The capitation fee today, when there is no basic salary, is 15s.; before the war it was 9s. A doctor with 1,000 public patients on his list would therefore have a gross income from the public service of £1,058 (£300 plus £758) exclusive of what he could earn outside it. With 4,000 patients, which would probably prevent him from doing any other work, he would earn £3,332. If he is working in a "difficult" or "unpopular" area he will be paid an additional inducement from a special fund of £400,000.

Unfortunately, the Ministry's calculations are based on two unknowns—the number of people using the service and the number of doctors entering it. Therefore no doctor can work out how he himself will fare. All that can be said is that the

proposals seem generous without being extravagant. And as the basic salary will clearly form such a small part of a doctor's income, why is Mr Bevan insisting on it as a general rule for every doctor, at the cost of antagonising the BMA and a great many doctors as well?

The Toll of Emigration

Last week it was announced that 550 young men and women, all single, and between the ages of 20 and 35, were leaving this country to emigrate to New Zealand. This number in itself is small—though it must be noted that it represents a highly valuable and unrepresentative sample of the population—but it is a useful reminder of the drain of manpower which this country is suffering for the benefit of the Commonwealth. So much stress has been laid on the restrictions of shipping space that it is not generally realised that, even with transport difficulties, 166,000 people emigrated in 1946 compared with 34,000 in 1938, and that 88,000 had emigrated during the first nine months of 1947. One has to go back to 1930, when the emigration boom of the nineteen-twenties ended, to meet such large movements.

The distribution of these emigrants over the world depends very much on the accidents of ownership and war losses among shipping companies, but it is worth noting that during the first nine months of 1947, 19,000 people travelled to South Africa, compared with 14,000 to Canada and a similar number to the USA, 8,000 to Australia and 4,500 to New Zealand. The popularity of South Africa is overwhelming, for there are said to be 95,000 people waiting to go to South Africa, compared with 50,000 to Canada and 25,000 to Australia and New Zealand together.

It is difficult to account for this dominant popularity of one of the Dominions, particularly as the colour problem might have acted as a deterrent. The Royal Tour may have influenced some people, to others Cape Town seems less remote than the Antipodes, and the climate less rigorous than in Canada. General Smuts may be a more popular figure than Mr Mackenzie King or Mr Chifley. Even so, these explanations are not really adequate. What is it that makes the veldt more attractive than the bush or the prairies or the beauties of New Zealand?

The Lords on Marriage

The Judicial Committee of the House of Lords finished the autumn term with a decision on marriage which is of considerable importance. In the petition before the court, the petitioner, the husband, claimed that his wife had refused to consummate the marriage because she only permitted him to have intercourse with her if he first took precautions to prevent any conception resulting. In consequence he asked for a decree of nullity. This the House of Lords refused, and the substantial ground on which the decision was based was that the procreation of children is not such a fundamental purpose of marriage that denial of the possibility of it by one spouse nullifies the whole marriage itself. Marriage is the union of one man with one woman, and such a union can have many purposes and many facets. Procreation of children is a main purpose, but not *the* main purpose.

Such a decision is in the main stream of English canon law. In effect, it is based on a judgment given in 1691. But the English canon law retains to the full the principle that a marriage between a man and a woman changes their status. Marriage is not only a matter of contract; in fact, there is very little of what a lawyer would call a contract about it. Inherent physical or mental inability in one spouse to consummate the marriage is ground for a decree of nullity because, in effect, it prevents the change in status from ever taking place. Refusal to consummate the marriage from conscious mental decision is not a ground for a nullity decree, even though it may be a breach of a pre-marital contract or arrangement. Misconduct or cruelty, similarly, are not grounds for divorce because they are breaches of a marriage contract. They are grounds because the continued existence of the marriage status is inconsistent with such behaviour.

This is not to say that such a view of marriage today is either just to the individual or advantageous to society. There is a strong secular argument that if a man and a woman accept, explicitly or implicitly, that children are a natural end of marriage and one of them subsequently breaks that understanding, then the other should be entitled to a release from the obligations of marriage that he or she still has to bear, and should be set free to marry someone of a different and more common turn of mind. But it is useless to expect lawyers to make this change.

SHOW WINDOW OF THE WORLD IN CANADA -1948

During the period of Canada's first International Trade Fair, in Toronto, from May 31 to June 12, 1948, Canada will be the show window for the world's goods. Manufacturers from many countries will exhibit their goods at this post-war Trade Fair. You will get new ideas, find new products, make valuable contacts. Plan NOW to attend the Fair, or to send a representative. To ensure that accommodation will await you in Toronto, fill out and mail immediately the reservation form enclosed with the official invitation.

Obtain details from

LONDON: R. P. Bower, Commercial Secretary, Office of the High Commissioner for Canada, Canada House, Trafalgar Square, S.W.1.

LIVERPOOL: M. J. Vechler, Canadian Government Trade Commissioner, Martins Bank Building, Water Street.

GLASGOW: G. F. G. Hughes, Acting Canadian Government Trade Commissioner, 200 St. Vincent Street.

BELFAST: H. L. E. Priestman, Canadian Government Trade Commissioner, 36 Victoria Square.

ATTEND THE CANADIAN INTERNATIONAL TRADE FAIR AT TORONTO
MAY 31—JUNE 12, 1948

Letters to the Editor

Money's Revenge

SIR,—May I suggest that the article on "Money's Revenge" in *The Economist* of December 20th does not draw quite the right morals from the recent monetary measures of the Soviet Union?

In the first place, there is nothing in those measures contrary to Marxist doctrine. If a Communist state uses money at all, it must be prepared to deal with the contingency of too much money coming into circulation in proportion to its scale of income and prices. If it gets tired of keeping down excessive spending by controls it will naturally resort to extinguishing the redundant money. Capitalist states, Belgium, Holland and Norway, have done this by way of a forced loan, so that those whose money is extinguished receive an equivalent. The Soviet Union, in extinguishing nine-tenths of the currency without compensation, is not only running counter to the fundamental principles of capitalist economics, but is risking an irremediable discredit of a currency thus liable to confiscation.

In holding up the Soviet example to ourselves, the article recommends a "disinflationary" policy, calculated "to reduce the money incomes, or at least the money expenditures, of the people," and especially of the wage-earners. But is it not essential to distinguish between a policy which is to reduce money incomes and one which would be content to prevent the further progress of inflation and the resulting further increase in incomes, outlays and prices? The only way known to us of bringing about a general reduction of money wages is by general unemployment. It may be regrettable that money wages have nearly doubled since 1939, but there is apparently nothing to be done about it.

The danger that threatens us is that our stock of money (currency and bank credit) is excessive in relation to our existing scale of incomes and prices, and there results an unceasing pressure which tends to swell outlays and incomes, to exhaust supplies and to raise prices. Is not the remedy to be found in the Belgian example of a forced loan, rather than in the Soviet example of confiscation?

The article does not suggest that we ought to follow the American example to "let things rip," and trust to demand ultimately being adjusted to supply, "indeed probably far below it." Yet it has nothing to say as to the "muddle-mindedness" of committing ourselves to this very course by linking the pound to the dollar at a fixed rate of exchange, and at the same time looking to our apparatus of controls to preserve the pound from the downward course upon which the dollar has entered.—Yours faithfully,

R. G. HAWTREY

29 Argyll Road, London, W.8

Can Germany Afford Reparations?

SIR,—The London Conference broke down allegedly over the question of whether countries that were attacked and devastated by Hitler, the Soviet Union amongst them, should or should not receive reparations from Germany's current production.

Permit me to remind your readers of a few known facts concerning this issue. In the course of the last seventy years, the rulers of Germany have started three big aggressive wars—in 1870, 1914 and 1939. The first of these they won. Although the war did not cause any devastation in Germany, they squeezed an indemnity to the extent of 5,000 million gold francs from France, a sum that economically had a value of at least \$2,000 million present-day dollars.

In the first world war Germany was defeated. She had to pay reparations. But she paid practically nothing. She paid reparations from loans and credits which she got from the USA, Britain and France, the bulk of which she never paid back. In 1931, the Allies renounced their claim to further payments. Germany could have made payments from current production only by exporting manufactured goods. But after the outbreak of the great over-production crisis in 1919, this would have been very much against the interests of French, British and American industrialists. Hence the renunciation of both reparations and inter-Allied debts.

During the second world war, Hitler's armies deliberately and systematically plundered and ravaged huge areas of the Soviet Union, Poland, Hungary, Yugoslavia, France, etc. Nobody doubts that it would be only just if Germany were to make good at least part of the damage done. The only question is—to what extent is this possible?

My territory
is the world

There's a new sort of commercial traveller about. You'll meet him across the City boardroom table on

Friday, run across him in Wall

Street on Saturday, bump into him in Sydney the next week-end.

He's a man who moves around and moves with the times.

Envy him if you must—but concede his value. He's a key man;

the last link in the chain that anchors British factories to the

markets of the world. It's as well for all of us that B.O.A.C.

is here to make his job possible. With America 21 hours away,

India 2 days, Australia 4 days, the

whole wide world has become his

'personal territory'.

IT'S A SMALL WORLD BY SPEEDBIRD B.O.A.C.

BRITISH OVERSEAS AIRWAYS CORPORATION IN ASSOCIATION WITH Q.E.A., S.A.A., T.E.A.L.

We believe that a united Germany with her industries (except war industries) again working at full capacity could easily pay annually between \$500 million and \$1,000 million in reparations and at the same time could pay for her food imports. Our conviction is based on the following facts.

1. During the last six years before the war, Germany spent 90,000 million marks on her war preparations. That is about \$4,000 million a year.

2. New capital investments in Germany—over and above the normal coverage for depreciation—constituted on an average about \$1,000 million annually in the prewar period (with the exception of the three worst crisis years). (See *Statistisches Jahrbuch für das Deutsche Reich*, 1938, page 565.)

3. Before the war the living standard of the Germans was substantially higher than that of their neighbours. Here are a few figures (taken from the League of Nations Memorandum *Le Problème d'Alimentation*, Volume 4, 1936. The figures refer to the year 1934).

The annual per capita consumption of milk and milk products (in terms of milk) in litres:—

Germany, 353; France, 320; Belgium, 318; Poland, 240; Italy, 109.

Annual per capita consumption of meat in kilogramme:—

Germany, 54; France, 34; Belgium, 41; Poland, 19; Italy, 15.

In respect of clothing and housing, the Germans also enjoyed higher standards than their neighbours in Europe.

Germany's production capacity is today undoubtedly much lower than it was before the war. The determining factors in production, however—manpower, land and factory equipment—have been retained. (Many buildings were destroyed by war operations, but relatively little damage was done to machinery.) If peace industries are again set working at full pressure and the living standard of the German people is maintained during the period of reparations payments at the average level of neighbouring countries—which would be no more than just—the country,

From *The Economist* of 1848

January 1, 1848

With or without reason, however, a great alarm is generated and generating amongst the upper classes—amongst great generals and captains—amongst admirals and earls—and proceeding from them, through the newspapers, is frightening all economic reformers, and making them forswear all resistance to demands on the public purse for national defence. As far as we can ascertain the cause of this wonderful change in the sentiments of our countrymen, from boasting confidence to the most pusillanimous dread, it is the application of steam to navigation. It is supposed . . . that it is quite at the option of France . . . to wait 50,000 men in steamers to our shores, and march at once to London. So great is the apprehension, that means are already talked of for concentrating our forces, or for the household troops evacuating the metropolis, and leaving it to be the prey of the French spoilers. . . .

We are required . . . to suppose that . . . the French have embarked their 50,000 men in the most applepie order (and the French soldiers are not renowned for that on board ship)—we are to suppose the steam fleet of England driven away by some storm, or lured away by some stratagem, and the coast of England left free for the disembarkation of the French troops. How and when will they land? . . . The disembarking an army, with its baggage and guns, on a friendly coast, is not a matter to be accomplished as easily as a Gravesend steamer lands its passengers at Blackwall. To disembark an army on an unfriendly coast is a work of great difficulty. Would the Frenchmen run their vessels ashore under Dover cliff? Would they select Deal beach? Would they prefer Beachy Head? Would Dungeness suit them? . . . But to disembark a large army on an unfriendly coast in the face of a fleet more effective and numerous, manned by more skilful seamen than France can collect, is such a task as no French general or admiral would undertake, and in undertaking which he and all his followers would be most likely to perish. Till we see some feasible plan developed for collecting and embarking a large army in France, which will find us, so much superior in maritime resources, unprepared to meet it, for conveying that army across the channel . . . and a feasible plan for disembarking that army . . . we must regard the apprehensions of invasion . . . as perfectly visionary.

freed from the enormous unproductiveness of military expenditure of prewar years, would easily be able to pay \$500 million in reparations annually. This would still be only one-eighth of what Germany spent annually on arms before the war. Consequently sober economic calculations show that Germany is quite able, within a short historical period, to pay her reparations to the Soviet Union. In this way she can at least partially compensate for the damage caused by invading German troops and thereby satisfy the just reparations claims of the Soviet Union, representing only a fraction of the losses suffered.

Contrary to the industrialists of the USA, Great Britain and France, who today fear competition from German industrial goods paid by way of reparations just as they did after the first world war, the Soviet Union on account of its planned economy is able to accept as reparations those manufactured goods that Germany can produce to greatest advantage.—Yours faithfully,

E. VARGA,

Member of the Academy of Sciences, USSR

[Since long before the beginning of the war, and consistently throughout its course, *The Economist* has held the opposite of the thesis here maintained. It would take more than a dutiful letter from Moscow to change our opinion—or, we fancy, that of the British people.—EDITOR.]

Books and Publications

The Great Befuddlement

"The Fall of the Spanish-American Empire." By Salvador de Madariaga. Hollis and Carter. 378 pages. 21s.

WITH this volume Señor de Madariaga completes the story begun earlier this year in his fascinating "Rise of the Spanish-American Empire," both books being merely the prelude to his proposed Life of Bolivar. The focus shifts this time from Spanish policy as a whole, with its world-wide influence and comparisons, to the drift of opinion within the Empire itself. And, though the author's pen glides as smoothly as ever, a good deal of the inspiration of the previous volume inevitably falls by the way.

It is a discouraging descent from the "style" of the age of the Conquerors. At one end of the road stand figures such as the Greek, Peter of Candia, pacing alone, mail-clad and Cross in hand, into the centre of an enemy town, worshipped by the people as a god; and at the other appears the over-luxuriant Creole civilisation of the late eighteenth century. God and Mammon have each their advantages; and, while it may not be possible to serve both, the eighteenth-century Spanish Empire was an only too solid proof of the devastating consequences of serving neither. Spain and the Empire alike were spiritually and politically rotted from within by the great befuddlement misnamed the Enlightenment, and were temperamentally unsuited to find a substitute for lost principles in enthusiasm for the new industrial and commercial techniques. And so, when the crash came, there was little but petty politics left behind the fine façade of revolutionary phrases.

No one who reads this study is likely to be surprised by the contrast in the nineteenth century between the astonishing upsurge of North America and the backwardness of the South. Perhaps, as Miranda commented in his travels, the tailors and innkeepers of the Legislative Assembly at Boston lacked the broad sweep of aristocratic Spanish-American culture. But at least they had a belief of sorts, even if its destined end was the philosophy of Babbitt, and by this belief they prospered. Call it philosophy, world outlook, or any other name you like—the clear moral of this book, whatever its author's original intention, is that religion makes men and principles make a nation. Wealth, luxury and scepticism are not a recipe for leadership, and it took a clear-cut doctrine which dominated men's lives to produce the hard nobility of the Conquerors. The moral of Señor de Madariaga's last book was for the historian, a warning against an insularity incapable of standing the test of international comparison. The moral of this volume, with its only too convincing picture of the sapping, in the name of progress, of the power to think and to lead, comes perhaps a little nearer home.

Biography of Flora Shaw

"Flora Shaw." By E. Moberley Bell. Constable. 310 pages and 5 plates. 15s.

FLORA SHAW'S name is inevitably associated with those of Lord Lugard and of Mary Kingsley, her younger but no less intrepid

Black Market?

SIR,—Much has been heard of late about those who operate the Black Market and the wickedness of those who assist its growth by their patronage. A large percentage of the production of the company with which I am associated is for export, and recently I had to face the decision of whether or not to "Buy Black" in order to export or die.

Wooden export cases, essential for our product, were as rare in Britain as the Great Bustard. Permits to purchase the necessary timber were plentiful enough to paper a pre-fab, at least. Unfortunately, permits do not produce timber, and despite the efforts of ourselves and our case makers the only source of supply was the Black Market. Steamers were available and shipment promised to our customers. A large capital sum was involved—valuable floor space was being occupied. There is an export target for my company. The goods were ready, except for cases. Where did my duty lie? The views of your readers would be interesting.

May I, Sir, in the circumstances, be permitted to sign myself

AN EXPORTER

contemporary and fellow-explorer of the Empire. A biography of Flora Shaw, relating her intellectual but far-sighted preoccupation with British imperial policies, at the high level of what we should now call Commonwealth Relations, to the administrative genius personified in Lugard and the humanitarian passion that inspired Mary Kingsley would throw valuable light on the evolution of the present phase of British imperialism. Miss Bell has perhaps neither the specialised knowledge nor the emotional detachment for such a task. She has limited herself to a straightforward chronological story, which is also a tribute of affection and admiration. But this is not the only reason why there is no note of criticism in the book. For the nobility of character and integrity of mind, without which no woman could have attained the distinction of Flora Shaw in the 1880's, comes out vividly in Miss Bell's story.

Flora was one of the fourteen children of an Irish general and a French mother. Her mother's early death placed on her responsibilities for her brothers and sisters which she fulfilled with devotion and generosity to the end of her long life. A visit to Gibraltar, and later to Morocco and to Egypt, led her into the career as a journalist which culminated in 1890, through the agency of Moberley Bell, in her appointment as *The Times* correspondent on Colonial affairs. She became a recognised authority, and her prestige was increased by her arduous travels in Australia, South Africa and Canada. Confidant of Rhodes and friend of statesmen, she had considerable influence, both in her public capacity and behind the scenes, on imperial policy. In a sense, the Statute of Westminster gave final form to her vision of the Empire. At the age of 50 she married Lugard, who was then hammering out the structure of Indirect Rule in Northern Nigeria. Twenty years later he dedicated his book *The Dual Mandate* to her, and though she was prevented by the climate from seeing much of Nigeria she undoubtedly influenced his thinking. Her own history of Nigeria, *A Tropical Dependency*, is a classic, as yet unsurpassed. If she is now remembered chiefly as Lady Lugard, this is an accident of history. It does not detract from her claim to respect for her own achievement. This much is made clear in Miss Bell's book. A final assessment of that achievement still however, remains to be made.

Anthology, 1947

"Current British Thought, No. 1." Introduction by Ivor Brown. Nicholas Kaye. 461 pages. 21s.

THIS volume is the second in an ambitious series, launched in America, designed to further "an international exchange of important current world thought" by offering, in the shape of selected reprints of articles, short stories, poems or plays "a representative synthesis of what has been thought on vitally important aspects of life and culture in the various areas considered in the one-year periods under review." It is part, in fact, of a new approach to the World Brain—not the basic apparatus of card-index, calculating machine, and primary research, but the World Brain in a conversational, urbane, as it were, house-party aspect.

a meeting place of civilised people bent as much on mutual entertainment as on enlightenment or uplift. Evidently an excellent idea, though dependent on skilful execution—that is, choice of material; in this instance, the choice appears excellent, though it would take a polymath of encyclopaedic competence to know whether it was the best possible.

Thirty-seven items are included; Maxwell Fry writes a letter on Architecture, J. B. Priestley a tribute to Raimu, R. F. Harrod analyses the results of the Nationalisation of the Bank of England, Brian Fitzgerald provides some notes on Vipers, Anthony Asquith traces the Tenth Muse's ascent of Parnassus, Kenneth Adams anatomises Butlin. There is a goodish short story by Mervyn Wall and a poorish play—but good short plays, suitable for such a collection as this, must be scarce—by Stephen Williams. There are articles on astronautics, botany and biology (these two overlap rather regrettably), metaphysics (was this really the best available?) and international affairs. The material reprinted was drawn from publications as diverse as the *Fortnightly Review*, *New Writing*, the *Papers and Proceedings of the Hampshire Field Club*, and *Penguin Film Review*. The whole impression is unmistakably encouraging; the body of Britain may be battered, grubby and weary, but the mind is obviously alive and kicking with considerable gusto. *Current British Thought* will be a good ambassador; it is also a delightful bedside book.

Italy

"Italy." By Elizabeth Wiskemann. The World Today Series. Oxford University Press. 155 pages, with 12 pages of illustrations and 2 Maps. 5s.

COMBINING an historian's training with the live experience of a journalist, and possessing both political perception and aesthetic appreciation, Miss Wiskemann has produced a study which is an excellent introduction to an understanding of Italy's place in the pattern of Europe. As a key to the Italian character she stresses the fact that "the history of Italy has been convulsive and tumultuous, the most gloriously creative periods having alternated with periods of devastation and despair; above all, the dimensions of Italian history have been universal or municipal, but never, until the nineteenth century, national." She summarises this history, up to the rise of Fascism, in fifty illuminating pages, and concentrates on those features whose recurrence throws light on the present-day. Within these fifty pages she also finds space for a brilliant analysis of Italian psychology, a survey of the land itself and the developments of its economy, and of Italy's rich and varied contributions to art and thought.

With such compression, a uniformly adequate treatment of all the major strands could hardly be possible; the picture of relations with the Church, for instance, is not always in focus, and there are here even some inaccuracies. But any such insufficiencies are compensated for by the number of shrewd and original observations, so that even readers fully familiar with Italy and its story will find their knowledge enriched.

The Fascist period is admirably and objectively analysed. Historical truth here comes into its own after long banishment. But where Miss Wiskemann has still more to give is in her description of events after Italy's entry into the war—the spreading underground revolt against the regime, and the psychological miracle (as she rightly terms it) of Italian recovery after the Armistice of 1943. The exaltation of this second *Risorgimento*,

which the fate of uncounted Lidices could not crush, and which gave young men and girls such extraordinary fortitude under torture (some poignant examples are given), explains the subsequent period of "moral collapse and despair," when the Italians awoke from "the Resistance dream" into a hostile and uncomprehending world.

The trends and post-war climate of Italy, up to the proclamation of the Republic, where the story ends, are brought out vividly, and those who seek to rediscover a line of mental and moral approach to "the new Italy" (it is for such the book is written) will find in Miss Wiskemann a valuable guide.

Propaganda Per Penguin

"The Case for Conservatism." By Quintin Hogg. Penguin Books. 320 pages. 2s.

"Labour Marches On." By John Parker. Penguin Books. 220 pages. 1s.

THE purpose of both these books is declared in their titles and no further comment is necessary. Mr John Parker moves with smooth ease and achieves his level effects by avoiding any awkward chasms. Mr Quintin Hogg is much more passionate and comprehensive. On this occasion it is the Conservative who is on the soap-box, and on the whole his book gains more than it loses in consequence. Two more descriptive titles would be "Why I Am a Conservative" and "British Socialism as I Would Like It To Be." It only remains to add, in justice to the publishers, that they have a reasonable explanation for the difference in price between these two publications. They do not, however, explain why only one penguin appears on Mr Parker's book, looking correctly to his left, while Mr Hogg is given two penguins facing either way.

Shorter Notices

"The Banker's Almanac and Year Book, 1947-48." Thomas Skinner and Company. 2060 pages. 70s.

THE Almanac contains the essential particulars of nearly 3,000 banking institutions in all parts of the world, although details of German and Japanese banks and those of other "controlled" countries are not yet available.

A list of exporters and importers is again included, and there is also an Insurance Section which includes a survey of the development of Lloyd's and other insurance companies. The Almanac is as usual an invaluable book of reference.

"The Year Book of the United Nations, 1946-47." H.M. Stationery Office. 991 pages. £2 10s.

THE Yearbook is the first of a series of annual volumes to be produced by the United Nations. It gives a comprehensive account of the machinery of the United Nations and its work to date—so comprehensive that the book is of monumental proportions.

"Town and Country Planning." By James Kekwick. Stevens. 556 pages. 45s.

THIS volume sets out the text of the new Town and Country Planning Act of 1947, giving a general note of explanation to each section and detailed comment on certain more difficult passages. It will be a useful book of reference on the Act.

BRANCHES & AGENTS IN PRINCIPAL CENTRES

AMERICAN SURVEY

A More Perfect Union

(From Our US Editorial Staff)

SO much happened on the Friday on which the President submitted his "Outline of a European Recovery Programme" to Congress that only the most tentative comments were available, and most of the commentators had barely skimmed the 20 pages of the bill itself and the 226 pages of explanatory data the Administration provided with it. More studied views will be available after January 7th, when Senator Vandenberg starts hearings before the Foreign Relations Committee.

Meanwhile, the main concern of supporters of ERP is summed up in a paragraph from the statement issued on December 22nd by the Committee for the Marshall Plan, a private citizens' group reminiscent of the Fight for Freedom Committee of the early days of the war:

We must spend enough money and ship enough goods to make this a recovery, not a relief programme. . . . If the amount is reduced, or if we do not provide a reasonable share of goods in short supply, the European countries will be able merely to exist. They will not be able to expand their production on which their recovery depends.

Certainly if the initial appropriation were to be cut much below the State Department's figure, which it emphatically declares to contain no far, the substantive character of the programme would be altered. At that point, the future of Europe is indeed in the hands of Congress.

To some extent, this is also true of the decision that Congress will take on ERP's administrative structure. The President's Bill represents a compromise between the view held by the Department of State and the Bureau of the Budget, that authority for administration should be vested in the Secretary of State, and the known desire of important elements in Congress for a separate corporation directed by a Board. The proposal for an Economic Co-operation Administration, with a single head, but that head "subject to the direction and control of the Secretary of State" when performing functions which "affect the conduct of the foreign policy of the United States," has two purposes.

One is to find a structure through which the United States can speak abroad with a single voice. Among American representatives in Europe, the spotlight, next year, will inevitably be on the ERP staff. A situation could readily arise similar to the duality that existed in the 'twenties, when the Commercial Attachés, set up under Mr Hoover's Secretaryship of Commerce in separate offices and with pipelines direct to the centres of Washington power, were the objects of wistful envy on the part of the regular Embassy staff.

In Washington, an orderly chain of command is even more requisite, and the difficulties of establishing it are complicated by the exigencies of an election year. If the public had the confidence in the State Department staff as a whole that it

has in the top group of administrators developed by Mr Marshall, the Department's case for unitary control of the programme would have been much better. But the country is not so sure of the efficiency of the State Department at all levels, and specifically of its competence in business matters.

But if the fate of the first appropriation and the structure of the American side of ERP's administration are now in the hands of public opinion and its representatives in Congress, the basis for the second appropriation and the European part of its administration are not. Unquestionably, the general American public approves the ERP primarily as a means of containing Communism. Without Russian pressure, European aid of minor proportions might be politically feasible, but no Administration, least of all in an election year and a year of tight supplies of many products, would be proposing to recognise foreign claims to some 17 billion dollars' worth of goods. When the time comes for the appropriation of ERP's second instalment, the American public will have a definite impression of the extent to which Europe, with American aid, is or is not on its way to becoming a going concern. If responsibility for the voting of the first ERP funds is on the people of the United States, influencing Congress, responsibility for the voting of the second lot is on the people of Europe, influencing the people of the United States.

By the people of Europe, Americans will not mean sixteen different peoples. A recovery which restored the economies of the Sixteen—plus whatever is done with Trizonia—to something like pre-war output, however great an improvement on the present situation, would in the eyes of Americans be a restoration, not a recovery, a restoration as backward looking and as fragile as the restorations that followed the defeat of Napoleon.

Many Americans feel that the choice before Western Europe is a choice between capitalism and communism, but the capitalism they mean is twentieth-century capitalism. If the choice is put in terms of nineteenth-century capitalism—production of a small number of units for distribution to a limited market—they feel that communism's promise of high production has a good chance of outweighing it in attractiveness to the average man. If the ERP does not make possible a continental co-operation which has in view this broader yield, if no larger framework becomes visible, the second appropriation for ERP is going to come hard.

So far, sentiment in favour of the Continent making plans on a continental scale is mostly in the inchoate stage. But forerunners of more precise criteria of ERP performance can be found in the remarks of Senator Elbert Thomas of Utah, that in his opinion economic recovery in Europe cannot be achieved without some kind of political federation of European States under the United States, and the advocacy of "some kind of unification" by Senator Henry Cabot Lodge, Jr., of Massachusetts during the hearings on the Interim Aid Bill.

One obvious place for such a unification to start is in the administrative structure of ERP on its European end. In the President's "Outline" and its supporting data, mention is made almost from page to page of the "European organisation of participating countries which may be established by the participating countries to further a joint programme for European

recovery." In the section on the agreements to be concluded by participating countries with the United States, two of the eight categories proposed for inclusion are "co-operating with other participating countries in facilitating and stimulating an increasing interchange of goods and services among the participating countries and with other countries and co-operating to reduce barriers to trade among themselves and with other countries"; and "making efficient use, within the framework of a joint programme for European recovery, of the resources of such participating country, including any commodities, facilitations or services furnished under this Act."

Americans are aware that no joint administrative machinery now exists in Europe, and that the first steps will have to be taken bilaterally, *faute de mieux*. But they see this as a moment for economic boldness comparable to the political boldness that made the United States a hundred and sixty years ago. They over-simplify the problem. Having themselves made a whole out of many parts, they discount the difficulties of doing the same in Europe. But it is also true that today there are new incentives to co-operative effort, one of which is the existence not only of Russia but of the United States. Without European initiative toward co-operation, toward making a modern economic entity out of a mass of resources and populations wholly capable of being so organised, Europe has every prospect of becoming what Africa was in the nineteenth century, an area of colonisation by eager forces outside.

American Notes

Third Party

Mr Henry Wallace has taken the plunge to a third party, and finds the water very cold indeed. The only welcome comes from the Republicans, who, like the Democrats in 1912, see in a third party their surest guarantee of a return, too long deferred, to the seats of the mighty. The precedent of the Bull Moose campaign, which under Theodore Roosevelt opened the way to the election of President Wilson, is, indeed, no happy omen for the Democrats today.

There are no signs, however, that Mr Wallace's campaign will meet with even the modest success that attended those of Theodore Roosevelt or Senator LaFollette, who broke away twelve years later. Both of these had their roots in bitter and very real economic grievances; but even so they only carried six states in 1912 and one (Wisconsin) in 1924. The Wallace platform, while it is couched in all the ringing phrases of the Populist revolts of the past sixty years, from the "Great Commoner" down, for the first time in American history proposes to establish a third party on differences over foreign, rather than domestic, policy. The United States may certainly be said to have come of age when even its political revolts are international, rather than domestic; but where are the thousands that will spring up to follow a policy which even its author admits looks perilously like appeasement of Russia?

It is Mr Wallace's contention that both existing parties are war parties, and that there is nothing to choose between them; that a new party must be created to forge a people's peace. Mr Wallace's pacifism and his denunciation of "American imperialism" cannot fail to arouse certain over-tender consciences, but his appeal to American labour, which must provide the solid backbone of any new party, has gone sadly awry. A year in which Senator Taft fathered a restrictive labour law and President Truman vetoed it is the wrong year to convince labour that there is nothing to choose between them. It may be that the demand for a third party, based on the time-honoured alliance between labour, farmers, and consumers, is growing; and labour's new political arms are unlikely to wither. But Mr Wallace's totally unrealistic bid for power in 1948 is throwing away any chance he may have had of leading a soundly-based third party when the time is ripe for it to appear.

Mr Wallace is a famous spell-binder, and even with his only organised support coming from the Communists, it would be wrong to under-estimate his power of decisively influencing the result in close and crucial states like New York and California. The effect of his candidacy, however ineffectual, must be to lessen pressures on the Republicans to nominate a man capable, like General Eisenhower or Mr Stassen, of swinging the independent vote; it brightens the prospects of Senator Taft and Governor Dewey. This might, of course, have been Mr Truman's salvation.

It is the hope of Mr Wallace—and certainly of his backers—that four years of Senator Taft would lead, in 1952, to revolutionary political changes. Seldom have confused idealism and good will been capable of causing so much mischief.

CEA's Hopes and Fears

In its first annual report to the President, in December, 1946, the Council of Economic Advisers was generally reassuring on the 1947 prospect, and turned out to be right. The second review, published just before the Christmas holiday, recognises that the United States has not succeeded in escaping from a prolonged period of inflationary pressure, with almost every symptom characteristic of earlier "boom and bust" cycles—and that the corrective phase of deflation, when it comes, may prove to be very disturbing indeed.

The CEA makes no predictions concerning the onset of depression. Indeed, the summarised versions of the report so far available on this side do not admit, at least explicitly, that depression is at all inevitable. And, following the official report, Dr Edwin Nourse, chairman of the CEA, has declared that additional production, coupled with good crops, and "labour-management restraint," may "abate inflation," and thus, presumably, permit industry to avoid the worst consequences of past and present inflation.

The view that good 1948 crops, and co-operation between labour and management, can avert further price adjustments, however, seems to be very debatable, to say the least. It is now quite plain that the bulk of the unions are determined to press for a third round of wage advances. Their full demands will not accrue immediately, and labour, with industry, is fairly well conscious of present danger. But labour wants a third round, while the going is good, and no national labour leader believes that the Government can hold down prices in the face of present demand. Industry, equally, will presumably pay little attention to the CEA at a time when commodity price trends are still highly uncertain, and at a time when labour demands are still reinforced by full employment.

The CEA report gives a great deal of excellent advice, the bulk of which will be suitably ignored because it sets out to admonish combatant pressure groups, all of whom assert (with considerable factual evidence) that they alone exist on an island of virtue in an ocean of greed. The Council wants a "return to real price competition," an end to labour restrictions on output, the correction of income anomalies, and a Federal housing plan. A decidedly rambling essay concludes that "the real problem is what price, income and property value adjustments have to be made to strike an internally consistent or stable equilibrium."

But while it does declare that wage anomalies must be corrected, that many prices must come down, and that many rates of profit must subside, the Council does not begin to discuss the machinery by which these adjustments can take place. There are, disappointingly, no specific comments on short-term policy. Here the Council may plead that the recent Presidential Message to Congress was based almost entirely on its advice, and that it was asked to frame the annual survey to cover long-term trends. But it can only be said that a survey of short-term possibilities at this stage, however hastily assembled, might have been of inestimably greater value than such a platitudinous report.

Output and Demand

On one or two points the CEA certainly makes some valuable comments. It condemns, for example, the current theory that bigger and still bigger production is an automatic stabilising force. An acceleration of output alone, it declares, can serve only to "advance the time when we shall face price, income and property value adjustments." The Council thus gives implicit recognition to the fact that the business turn will follow from a relapse in demand as credit tightens, and as price anomalies and increasing uncertainties slow down the feverish pace of re-stocking and re-

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

equipment. But on the pressing need for a reinforcement of fiscal controls CEA says not a word.

In the meantime, President Truman has given his reluctant approval to the anti-inflationary measures passed by Congress. In denouncing this "pitifully inadequate weapon," the President noted that even those limited powers which he has now obtained for the conservation of scarce materials are subject to detailed review by Congress. He has, therefore, renewed his appeal that more substantial controls shall be instituted when the regular session gets under way next week. For the failure of his own programme, however, Mr Truman must place some of the blame upon his own Cabinet officers and advisers, who displayed a most disconcerting lack of agreement in their evidence before Congressional committees. Despite this failure in the Special Session, it is worth noting that the Republican majority clearly decided that inaction alone would not be sufficient, in the absence of any break in the trend, to save the party from a damaging electoral reaction next November. Republican spokesmen stressed their willingness to grant further powers to the President should voluntary arrangements fail, and Mr Joseph Martin, Speaker of the House of Representatives, went so far as to declare that his party had "only made a start" on the anti-inflation programme.

A clause in the new law which seems to have escaped general comment is one which permits the Commodity Credit Corporation to assist farm output in non-European foreign countries by financial assistance, price guarantees, and the provision of seed, fertiliser, equipment and materials. It remains to be seen how far funds will be available for this project, but the grant of such powers in peacetime is a major victory for the Department of Agriculture. For the rest, the voluntary agreements authorised between Government and industry do not legalise price-fixing, but cover priority and inventory controls. Voluntary allocations have been made for some time in a number of industries (steel and other metals are typical examples), and the new law can assist and fortify this work. Agreements, however, are now to cover a much wider and much more complex field. For many sections of industry they will be very unpopular, and they will take some time to get under way. Meanwhile, "anticipatory buying" may be accelerated, and thus provide a spur for fresh Congressional action before 1948 is very old.

Panama's Revenge

The Republic of Panama, which the United States created 44 years ago, took its revenge last week on the "Colossus of the North" when the Assembly voted not to ratify the agreement permitting American occupation of 14 air bases, including Rio Hato, for the defence of the Panama Canal. Panama, sitting on

US Business Bulletin

THE ECONOMIST receives every week, from its own correspondents and from other sources, a great deal more information on business conditions and economic developments in the United States than can possibly be used for "American Survey."

It is therefore proposed to issue for private circulation a fortnightly "U.S. Business Bulletin" which will contain a more extensive digest and analysis of this information than can appear in the paper. It will be designed to be of value both to exporters and also to those more generally interested in economic affairs in America.

Detailed information on this bulletin will be available shortly and will be sent to any reader who would like to receive it. Please address your request to:

Manager, The Economist Intelligence Unit, 22 Ryder Street,

a powder-keg which might well blow it sky-high in the event of another war, has exercised its inalienable right to cut off its nose to spite its face. The United States, the doughty champion of the rights of small nations, however exasperating and wrong-headed they may be, has had no choice but to withdraw its 2,000 troops at once into the Canal Zone (which is under full American sovereignty); and it is hoped that this meticulous observance of Panamanian sovereignty will soothe the tempers inflamed at Yankee Imperialism.

The post-mortems on the failure of American policy have been searching. There is no doubt that the ghost of Teddy Roosevelt still hangs about the Canal Zone. It was he who inspired the revolution which created Panama when Colombia proved dilatory in granting the canal concession to the United States; in 1911 he wrote candidly, "I took the Canal Zone and let Congress debate, and while the debate goes on, the canal does too." Not even the \$25 million of conscience money voted to Colombia during the Wilson Administration, or the spectacular American achievements in public health have quite wiped out the memory. It has been easy for officials to suggest that it is not American policy, but Communist intrigue, which is behind this slap in the face. But even Communist propaganda must have something to build on; in Panama it unquestionably was the humiliating discrimination practised against Panamanians by Americans on the spot.

It is no doubt healthy that the United States should be reminded that popularity and admiration are not the automatic lot of a great power, however well intentioned, and that conferences and an official Good Neighbour policy by themselves cannot heal all that is wrong with Pan-American relations. But the problem of defending the Canal remains. A number of suggestions will be given new life. These include the re-engineering of the present canal on a water-level route, to eliminate the vulnerable locks; and the building of a new canal, either through Colombia, or through Nicaragua. The latter route was favoured by three American Commissions at the turn of the century, before Panama was chosen. None of these alternatives is a real substitute, however, for the sense of identity of interest in common defence problems which was so conspicuously lacking in Panama City last week.

Shorter Notes

In advance of the Congressional investigation of "inside speculation" on the commodity exchanges, Mr Clinton Anderson, Secretary of Agriculture, has published a list of rather more than 700 traders in grain and other commodities. This initial list, at least, does not support earlier charges of substantial trading on the part of important officials in or near the executive branch of government, apart from Mr Edwin Pauley, whose interests have already been disclosed. Nor does the list contain the names of prominent Congressmen, as recently alleged. The report dealt exclusively with future trading and included names of reporting traders on October 31, 1946, and October 31, 1947. Subsequent reports are expected to cover 13,000 names, and may be more revealing.

*

Foreign trade totals rose substantially in October with a reversal of the recently declining export trend. Exports at \$1.22 billion compare with the September figure of \$1.09 billion, while imports were up from \$481 million to \$491 million.

*

In a preliminary survey of 1947, the Department of Commerce notes that output is again at peak levels with the November index of industrial production (1935-39) at the new post-war peak of 192. Output continued to rise in December with steel operations near capacity. The dollar value of construction for the year, at \$12 billion, exceeds all previous records.

*

It is worth recording that in the special session the Republicans voted supplemental sums totalling over \$32 million for work on western dams and irrigation projects such as Central Valley, Davis Dam and the Columbia Basin project in the State of Washington. These sums bring appropriations up to what the Administration originally requested and wipe out the cuts imposed last session which, as Governor Warren reminded his party, "seriously imperil" Republican election chances in the West.

NOW OPEN TO SERVE YOU IN TOKYO . . . A NEW BANK OF AMERICA BRANCH

Bank of America is pleased to announce the opening of its new Branch in Tokyo, Japan. This Branch is fully prepared and equipped to provide all banking services now permitted in Japan.

The new Tokyo Branch and the Manila and London Branches of Bank of America provide a direct banking service between the United States of America, Europe and important Far Eastern Markets.

The NEED for SPEED in present-day accounting routine

The Underwood Sundstrand Class 'D' Accounting Machine illustrated is an all-purpose, fully automatic Machine, equipped with two cross-computing Registers, eight accumulating Registers and Front Feed Carriage, designed for comprehensive Accounting requirements demanding the simultaneous posting of a number of related records with the cross-computation of any series of New Balances and the automatic accumulation of a large number of inter-related totals.

Ideally suited to Comprehensive Pay Roll, Costing, Sales, Purchase, and Stores Ledger Accounting, these machines are the effective answer to the vital need for speed and accuracy to-day. Demonstration arranged without obligation.

The System of the Flying Clippers

THE WORLD OVERSEAS

Turkey under the \$ Sign

(From a Correspondent in Ankara)

THE political climate in this no-man's land between East and West is growing steadily milder under gentle dollar showers and breezes of approval from the West. For some time the aging Republican People's Party (RPP) stood up to the Democrats' pelting without much obvious sign of strain. But suddenly last September the crusty old dictator Premier, Recep Peker, was brought down by nothing deadlier than a backbenchers' rebellion and the President's announcement of his personal neutrality in party politics. And after brief negotiations, a more moderate RPP Cabinet moved in under the previous Foreign Minister, Hasan Saka, a westernised ex-diplomat being appointed to the Foreign Office.

Outwardly the change did not differ much from the customary periodic "changes of the guard" of Atatürk's day. No open concessions to the Democratic Party's demands were made. But the very fact that public criticism, no longer so easily suppressed by newspaper bans and arrests, could undermine an RPP Cabinet and overthrow it with the collusion of its own official chairman, İsmet İnönü, was sensational enough. The ruling party had clearly become unsure of its support in the country and of its hold on the President—a fact which throws a curious light on the controversial election returns of 1946, which gave the RPP a majority of 85 per cent.

The new Government's programme, announced at a special session of the Assembly on October 13th, is more remarkable for its discreet overtures to American capital than for its platonic tributes to the democratic form of government, or its reaffirmation of the "middle-of-the-road" principle in domestic and foreign politics. Announcing the Government's intention to establish a clear division between state planning and private enterprise—in itself an important though oblique concession to economic liberalism—the Premier alluded briefly to various public investment plans. He mentioned irrigation, electrification, mechanisation of mining, construction of roads, railways and ports, and drives for increased agricultural productivity and industrial efficiency. He ended with an unemphatic invitation to foreign capital and foreign "specialists."

Anglo-American Co-operation

To appreciate the full meaning of this gesture, one must call to mind the fierce economic nationalism hitherto practised by Republican Turkey, and the sad fate which in the twenties and thirties overtook foreign companies in Turkey. Their profits were restricted, frozen, and taxed out of existence, and their fixed capital was finally nationalised for a nominal compensation. But it was soon found that the nationalist projects of industrialisation could not make headway without foreign capital, however much the controls and guarantees associated with it might offend nationalist pride and smack of the "capitulations" of the hated past. The political situation which produced the American loan seemed to offer, incidentally, a dignified way out of the straits of nationalist economics. Closer relations with the one Power not suspected of imperialist designs and addicted to *laissez faire* principles would make the return to a regime of capital imports and freer trade a plausible move. In 1947 even a Kemalist could make it without loss of face. But as American aid enters upon the phase of execution it seems to be undergoing a subtle change in character, which is worth analysing more closely.

President Truman's speech in March had been belligerent. Many listening Europeans must have been troubled by uneasy memories of the luckless British "guarantees" of 1939. A few people in Turkey more vividly recollected the secret withdrawal of the Turkish armies to shorter interior lines at the height of the Azerbaijan crisis of 1946, which, unknown to most, was the real climax of the Russo-Turkish war of nerves. To all the loan was a strategic move, and for three months or so following its uneasy beginning the military aspect monopolised

comment in Turkey and elsewhere. What information was published referred to war equipment and strategy—AA guns, rapid-firing arms, motor transport, mechanisation of the Army, fortification of the Straits. US Army and Navy missions followed one another in close succession, and Turkish staff delegations, the latest under the Chief of Staff, Gen. Salih Omurtak, commuted between Ankara and Washington.

It would be wrong to deduce from this picture that Turkey has jettisoned all former allies and is leaning exclusively on the United States. While American buyers are purchasing the equipment on behalf of the Turks, and American instructors are teaching them how to use it, the military, naval and air missions which are responsible for the overall training of the Turkish armed forces are, as they have for long years been, British. Hence General Omurtak's recent visit to Britain also. It would be difficult to find anywhere a better sample of Anglo-American dovetailing than that which is to be seen in Turkey today.

Much of this emphasis on military first-aid was accounted for by the natural desire felt here at the time to make martial gestures in a northerly direction. But as American parties landed at Turkish ports, travelled on Turkish railways and roads, inspected Turkish farms, mines and factories, they learnt that the ports could not handle the material they proposed to send; that the road system would have to be rebuilt before a modern army could deploy; that there was no industry capable of sustaining the efficient war machine to be created. Gradually the Soviet menace seemed to recede from Turkish minds and the emphasis began to shift from guns and trucks to ports and roads. American delegations called at the Ministries of Public Works and Communications. They were told that the new five-year plan of industrialisation, only one of several big public projects, would alone increase road traffic by an estimated 500,000 tons p.a. But the latest road construction plan of the Ministry of Public Works showed that, even on paper, it would take 15 years at the planned annual expenditure rate of £40 million to construct and repair the 12,500 miles of highway required to raise the Turkish network to the average European level of 100 years ago. The Americans inspected ore mines—without smelting furnaces; new blast-furnaces—without coke ovens; potential oil fields—without wells. They carried off the impression of an undeveloped, inexpertly striving country, rich in economic potential and paper planning, but lacking capital, skilled labour and engineering, and, above all, economic common sense and organisation.

Reconstruction or Rearmament?

The whole "set-up" must appeal strongly to the pioneering free-enterpriser concealed under many a US colonel's uniform. On the Turkish side, too, powerful influences are working in favour of a translation of a larger part of the aid from purely military into general economic terms. Indeed, the flexibility achieved in the wording of the Aid-to-Turkey Agreement of July 12th is such that no formal obstacle opposes such a transformation. Yet owing to the international situation, and to the demands that arise from Turkish military circles on account of it, no one can at present contemplate a large-scale transfer of funds from the rearmament to the reconstruction category. The proportion of the whole at present allocated to communications, as opposed to strictly military requirements, is, at a guess, not much more than five per cent. The answer to the "powerful influences" described above is, clearly, that they must attract other American investment. But the American private investor is wary. He has plenty of fields for his activity that are both nearer home and less at the mercy of political accident. Further, in spite of President İnönü's recent vague call to foreign capitalists, the inducement to the foreign investor to sink money in Turkey is still negligible. For one thing, he cannot export his profits, except in the form of products. Even his local employment of them is

still hedged about with restrictions. It must, for instance, be "beneficial to Turkey's economy." The Turkish government is far too apt to sit upon initiative. The reason is that too much of this would show up the uneconomic basis on which some (though not quite all) of the state's own enterprises are run.

During the summer of 1947, the American Twentieth Century Fund conducted a private enquiry into Turkey's resources and potentialities. (The Fund is an American concern privately endowed by philanthropists who have an eye to the future of American business overseas.) Its report, which was prepared by Professor Thornbury and Mr Graham Spry, is not yet out, but the former disclosed some of its key points to the Turkish newspaper *Vatan* before he left the country in July. In this interview, Professor Thornbury reveals, amongst other facts, that, owing to the lack of public encouragement to the private investor the somewhat shocking total of £T800 million-worth of Turkish savings is immobile in State Bonds and in savings accounts. He concludes his remarks as follows:

It is obvious that as long as the spirit of private enterprise is not developed in Turkey, there is no place for United States private enterprise in your country. First of all you must exploit your own natural resources, and then you can receive foreign capital.

Some Turks, naturally enough, write off his attitude to private enterprise as "just what one would expect of an American"; nevertheless his criticism of a state enterprise which is practised with seldom or never a pause to review costs is worth their attention. The Turks are certainly anxious to obtain financial help for their national development schemes, and the Export-Import Bank, or an extension of inter-governmental aid, may provide it. But the plans will have to be recast and co-ordinated so as to make sense to men who are used to thinking in terms of cost, efficiency and optimum returns.

Split in the French Unions

[FROM OUR PARIS CORRESPONDENT]

THE fight between the Communists and the "reformists" in the French *Confédération Générale du Travail* has been waged psychologically since the liberation, and physically during the recent disorders. Now it has culminated in the collective withdrawal of the "reformists," leaving the Communists in sole, unchallenged control.

The decision to withdraw from the CGT was taken at a national conference of the trade union reformists, who, in the last few months have been producing their own newspaper *La Force Ouvrière*, under M. Léon Jouhaux's leadership. The resolution in favour of collective withdrawal was voted by 52 to 5, with 14 abstentions. It represented a victory for democratic procedure; nearly all the Paris leaders had formerly favoured remaining inside the old CGT organisation, but submitted to the will of the provincial rank and file.

M. Jouhaux himself, who had been for almost 40 years secretary-general of the organisation he is now compelled to abandon (although since 1945 he has had to share the privilege with the Communist, M. Benoit Frachon), pleaded in vain against the schism.

This is not the first time that the French trade union movement has split: the rounding up of hostile groups into a reunified organisation during the heroic days of resistance and *union sacrée* never dispelled the profound mistrust which had divided the two sectors for a quarter of a century. This distrust had grown into passionate hostility when they divided on the question of whether they should support or oppose the declaration of war in 1939. The Communist adherents of the Third International found themselves as early as 1920 in conflict with the non-political traditions of French syndicalism. Then, however, they were obliged to take the initiative, to break away and form a separate CGT, thus violating the tradition of working-class unity and depriving themselves of the prestige and loyalties which the older organisation commanded.

Communists Hold the Funds

This time, the tables have been adroitly turned: the Communists remain in uncontested control of the CGT itself, with its funds, its reputation and the substantial majority of its declining membership. The minority are expected to rally under a million workers, although it will be some time before a reliable estimate can be made. On Wednesday the autonomous trade unions, which began to form during the summer to avoid Communist control, decided to join forces with the followers of *Force Ouvrière*.

In the opinion of most of the reformist minority of the CGT executive, who have now had to resign, the time has been badly chosen for setting up a splinter trade union group. The administrative and financial problems of establishing new central and local offices on a national scale would be considerable at any time; but they are all the more so at a moment when trade unionism has not recovered from the unfavourable results of an unsuccessful and controversial strike, and when the political pendulum is swinging visibly to the right. In the last two years, although the CGT had attained a membership of over 6,000,000, there has been no improvement in the workers' standard of living, and social inequality has never been so glaringly apparent.

In a number of provinces the moving force behind the cleavage was the RPF (Gaullist) movement, which was organising factory groups, distributing free of charge its workers' newspaper *L'Étincelle* (the spark) and exhorting unionists to break with Communist leaders. Thus, while the leaders of the *Force Ouvrière* in Paris shared the view of M. Léon Blum and supporters of the "Third Force" that the fight must be waged simultaneously against the Communists and Gaullists, in many of the provincial centres the Gaullists were subsidising and assisting *Force Ouvrière* propaganda. The division in the CGT is, in any case, likely to facilitate rather than hinder the General's accession to power.

There seems little doubt that the Communist leaders welcome the decision of the *Force Ouvrière* to quit their posts in the CGT, for which they have indeed long been preparing. It would have been embarrassing to expel the minority leaders; it was a good deal easier to outvote and outmanoeuvre them, but better still to obtain their voluntary withdrawal. In future, the CGT will be smaller in numbers, but more pliable and efficient; and above all quicker to manipulate and more reliable in a revolutionary crisis.

Straight Fight with the Right

The split within the CGT follows the pattern of the Communist rupture with the Socialists in national and local politics; the time has evidently come when safety is sought not in numbers but in unity of purpose and undivided loyalty to Soviet leadership. To weaken and divide the Left, to isolate the Social Democrats, and thus clear the ring for a straight fight between the Communists and the Right, appears as the immediate objective of Cominform action in France today. A revival of Western Europe through American aid, in which a powerful and united labour movement secured a fair share of returning prosperity for the industrial workers, would plainly create an impossible situation for the Communists.

The methods by which life in the local trade unions was made intolerable for non-Communists varied from slander and allegations of collaboration to use of threats and violence. In the north, reformist leaders declare that many of the prominent non-Communist unionists were murdered in unexplained "incidents" before and during the Liberation. Snap elections for trade union jobs, held in the presence of a selected minority, often enabled the Communists to place their own men in key posts, even where they commanded only a small numerical support. During the recent troubles workers were incited to beat up blacklegs, and in several cases strike-breakers were kidnapped from their homes or assaulted on their way to work.

The unity of purpose and discipline with which the Communists have worked to achieve their successive objects—first the domination, then the complete control of the CGT—has been all the more remarkable because their effort has lasted over a period of years. A consistent policy has been imposed on and executed by countless anonymous local Communist militants.

For the time being the French trade union movement has been gravely, perhaps irreparably, weakened. But the Cominform has retained the initiative.

New Start in Indo-China

[FROM A SPECIAL CORRESPONDENT]

THE decision of the French Council of Ministers to grant full powers to M. Bollaert, the French High Commissioner for Indo-China, "to pursue all negotiations necessary for the re-establishment of peace" may end the deadlock between France and Viet-Nam. This has persisted since the outbreak of fighting in Hanoi on December 19, 1946. The only restriction on M. Bollaert's mandate is that such negotiations shall not include Ho Chi-min's government.

M. Bollaert is now in Paris for consultation with his Government. Before leaving Indo-China he held his first conversation with Bao Dai, the ex-Emperor of Annam, who had flown from

Hongkong to meet him. Bao Dai has this week arrived in London on his way to Switzerland for medical treatment, and it would thus be easy to arrange a further meeting on neutral soil. For several months it has been French policy to encourage all nationalist parties in Viet-Nam, opposed to the totalitarian methods of the Viet-Minh, to use the ex-Emperor as a rallying-point. The specific exclusion of Ho Chi-min from the approaching negotiations—the first time that he has been officially ignored—suggests that the French are now confident of success. French optimism is based on the severe military defeat recently inflicted on Ho Chi-min. According to French reports, the operations begun on October 9th have driven Viet-Minh forces back into the mountain districts of northern Tonkin, and cut off their supply of arms from China, so that elsewhere only the coastal town of Vinh in northern Annam remains in Viet-Minh hands.

By his prolonged hesitation in consenting to come forward as a mediator, Bao Dai has shown that he does not intend to return to Indo-China in any capacity as a French puppet. In the early stages of the negotiations he was reported to have taken up a more uncompromising attitude than Ho Chi-min by claiming complete independence, a demand never advanced by the Viet-Minh leader. It may be safely assumed that, in the recent course of negotiations at Hongkong, he was offered by the French more liberal terms than were contained in M. Bollaert's speech at Hadong on September 10th. The opinion is now privately expressed in official French circles that to draw off nationalist support from the Viet-Minh, Bao Dai will have to be offered more generous terms than were secured by Ho Chi-min in the French agreement with Viet-Nam of March 6, 1946. At the same time the adhesion of Laos and Cambodia to the Federation of Indo-China has just been announced.

Whatever plan emerges from the forthcoming negotiations will be scrutinised, especially in Indo-China, against the background of earlier attempts at settlement. The first step towards constitutional reforms was the scheme for a Federation of Indo-China as part of the French Union outlined by General de Gaulle on March 25, 1945. Though supreme authority was to rest as formerly with the Governor-General, there was to be a Council of State, partly French and partly Indo-Chinese, and an Assembly elected by all five countries of the Federation, having full control of the budget. Control of foreign affairs was expressly reserved to France.

Illusions about the French

The capitulation of Japan was quickly followed by the proclamation of the Republic of Viet-Nam, claiming to comprise all three seaboard territories (Tonkin, Annam and Cochinchina) of the former Empire of Annam and by the abdication of the Emperor in July, 1945. North of the 16th parallel 150,000 Chinese troops swarmed in to take over from the Japanese, who were never made to appear to the local population as a beaten army. Because the Chinese Central Government was at first nervous of the Communist tendencies of the Viet-Minh Government, the Japanese troops were allowed to retain to per cent of their small arms, while French officers were not even allowed to carry revolvers. The fact that the Viet-Minh never saw a victorious European army undoubtedly gave them a false impression of the French position. To strengthen their hold upon Ho Chi-min the Chinese compelled him in December to reform his Government so as to include representatives of the nationalist parties opposed to and rivals of the Viet-Minh, both armed and subsidised from China. Eventually the Chinese were outmanoeuvred by Ho Chi-min, who submitted to this coalition only until the agreement with France of March 6, 1946, was completed.

This agreement, the yardstick of all subsequent proposals, made a spectacular advance in recognising the Viet-Minh Republic as a "Free State having its own government, parliament, army and finances within the French Union." When Ho Chi-min visited France a few months later he was received as a head of state. But its execution broke down. That picturesque, if reactionary, eighteenth-century figure, Admiral d'Argenlieu, as High Commissioner of Indo-China, gave his staff to understand that failure to fulfil the agreement could be considered inevitable, and a large share of the blame for the ultimate rupture undoubtedly rests with him. Disagreement occurred mainly over what territory the republic of Viet-Nam comprised and the control of customs. The republic claimed all three territories of Tonkin, Annam and Cochinchina, while the French failed to hold the promised referendum to settle this issue in Cochinchina. They also convened a conference at Dalat for the purpose of implementing the agreement without even inviting representatives from the Republic. Following the shooting at Haiphong, when the French tried to assert control of customs, the Viet-Nam Republic decided to risk all on one throw and on December 19th, without warning, launched a general attack on the French in Hanoi, making no

distinction between soldier and civilian or men, women and children. The greater part of the city was burned to the ground. When, after some weeks, the French gained full control, the Republican Government fled into the hills where they have since wandered.

Nationalist Aspirations

M. Bollaert's speech at Hadong in September disappointed all nationalist parties, even those opposed to the Viet-Minh, and also many Frenchmen. Presented in the form of an ultimatum, it postulated an Indo-Chinese Federation with French control of the army, foreign representation, customs and police, and as such seemed to revive the de Gaulle proposals of March, 1945, in place of the now abandoned "Free State" plan of March, 1946. Demonstrations organised immediately afterwards by the French to demand the return of Bao Dai gave no sign of spontaneity either in Hanoi or in Saigon. The belief is widely held that M. Bollaert would have offered more generous terms had he been allowed to do so and there is no doubt that his personal influence

has been on the side of compromise. Viet-Nam nationalists desire most of all to have their own representation in foreign countries. They fully understand that France must remain if the integrity of Indo-China is to be preserved. If the French Government would concede them a diplomatic service of their own, similar to that of a British Dominion, the prospect of a lasting settlement would come very much nearer.

Though French society in Indo-China, and especially military society, is predominantly Gaullist and *colonialiste*, there are many liberal Frenchmen in the administration and outside. The High Commissioner, M. Bollaert, and many of his entourage have a fine record in the Resistance, and are individually eager to bring to birth a self-governing Viet-Namese nation.

There is a healthy ferment of opinion, stimulated by café society and the local press which, despite a much criticised censorship, includes several influential opposition papers, both French and Viet-Namese. Between them they dissect local politics with a truly Parisian energy. In some respects the Paris-educated Cochinchinese seem intellectually more mature than their opposite numbers in the other countries of South-east Asia. (In training the majority in medicine instead of in law the French have set an example which might be imitated with advantage elsewhere.) But they are all people determined to struggle on for what they regard as the essentials of nationhood. Though French military action may have been successful in the north, the Viet-Namese "Resistance" has been growing stronger in the south. But both sides realise their interdependence and, if Bao Dai is offered terms amounting to a generous interpretation of the agreement of March, 1946, there is every chance that the new negotiations should succeed.

Trotskyism in Ceylon

[BY A SPECIAL CORRESPONDENT]

It is a curious phenomenon that the chief stronghold of Trotskyism in the world today should be in the island of Ceylon. At the recent elections the Trotskyite *Lanka Sama Samaj* party won ten seats out of a total of 95 elective seats, the so-called Bolshevik-Leninists won five and the Communist party of Ceylon also won five, the latter being joined later by two successful candidates who had stood as independents. These labels must have been puzzling to readers in England. To understand the divagations of Marxism in Ceylon it is necessary to trace the island's recent political history.

In the early thirties a group of young men, not more than a dozen in all, who had been studying in England, returned to Ceylon. They had come into contact with left-wing movements in England, and in 1935, after their return to Ceylon, they launched a party called the *Lanka Sama Samaj* (the words mean Ceylon Equal Society), a broad-based left-wing revolutionary party aiming at national independence. It was the first party to propagate the ideas of independence and socialism amongst the masses, and two of the four candidates they put up at the 1936 elections were returned. The world economic depression had hit Ceylon hard, and for the first time the people were receptive to radical ideas. There is a high literacy percentage in Ceylon (it is one of the few countries in Asia where the pamphlet is an effective form of propaganda) and the Donoughmore constitution, which came into force in 1931, had introduced universal suffrage. It must be appreciated, too, that there had never been any nationalist movement in Ceylon corresponding to the Indian National Congress, deriving its chief strength from the middle classes. There was a moderate reformist movement amongst the landed and monied upper classes, whose interests then, as now, dovetailed fairly closely with those of the British, and a very weak Labour movement, which, when the depression came, foundered on the rock of racialism and began to demand the repatriation of immigrant Indian labour. Conditions were favourable to the spread of views such as those propagated by the *Lanka Sama Samaj*.

Clash of Personalities

Among the founders of the party were Dr A. S. Wickremasinghe, who had come under the influence of Saklatvala while studying medicine in England; N. M. Perera, a graduate of the London School of Economics; Colvin R. de Silva, a lawyer who had studied history at King's College, London, and was the only member of the group to have visited the Soviet Union; and two brothers, Philip and Leslie Gunawardene, the elder a member of the British Communist Party, who had travelled extensively in America and Europe. Intelligent and strongly individualist, several of them had been critical of Stalin's leadership even in England, and this dissatisfaction grew after they returned to Ceylon. They disagreed with the official Soviet line over Spain, over Popular Fronts, and, at a later stage, over Finland. In 1938 they officially adopted Trotskyism and adhered to the 4th International which had been launched in Switzerland the previous year. In 1939 they expelled Dr Wickremasinghe, who led a small minority of "Stalinists," on the grounds that they were "working towards the disruption of the party from within." Although there have been many examples of 3rd Internationalists expelling 4th Internationalists, this is believed to have been the only case in which the reverse process occurred. The expelled Stalinists, in November, 1940, formed the United Socialist Party of Ceylon.

In June, 1940, Perera, de Silva and the Gunawardenes were arrested by the British authorities. Early in 1942 the *Lanka Sama Samaj* was declared to be an illegal organisation and eighteen more of its leading members were arrested. Simultaneously the United Socialist Party was illegalised and its members went underground, forming, on July 2, 1943, the *Ceylon Communist Party*.

Late in 1942, Perera, de Silva and the Gunawardenes escaped from the prison in Ceylon where they were held and made their way to India. Six months later they were rearrested in Bombay, but during their stay in India they had succeeded in creating a body known as the Bolshevik-Leninist Party of India. It incorporated various other small groups which differed from the official Communist line, such as the Revolutionary Socialist League of Bengal, the Bolshevik-Leninist Party of the United Provinces, and the Bolshevik-Mazdur Party of Bombay, all of which now became sections of the Bolshevik-Leninist Party of India. The *Lanka Sama Samaj* was henceforth to be the Ceylon section. They also launched what is now the most active of the Indian sections, the Madras-Madura section, under a forceful leader called Anthony Pillai, who last summer organised the big strikes at the Buckingham and Carnatic Mills at Madras.

It was during this brief period of liberty in 1942 and 1943 that differences began to make themselves felt among the leaders. After their final release in 1945, when all political parties in Ceylon were legalised again, these differences became more acute and led to a split. While de Silva and Leslie Gunawardene remained with the Bolshevik-Leninist Party, Perera and Philip Gunawardene re-formed the *Lanka Sama Samaj*. According to the leaders themselves, their main differences were organisational, centering round the application of "democratic centralism," but it is obvious that to a large extent it was a clash of personalities. The two groups came together for a few weeks last year, but the alliance did not last, although they agreed to put up a joint list of candidates for the elections and they did not run rival candidates for the same constituencies.

For and Against Stalin

It is not easy to detect any essential differences between the Trotskyites and the Leninists. Each accuses the other of being "centrist" and composed of "middle-class intellectuals." Each wants complete independence for Ceylon. Each claims to have as its ultimate objective a true "Workers' Revolution." Each wants, as its interim programme, nationalisation, social insurance, an eight-hour day, a minimum daily wage, "land for the landless," etc.

The gulf between these two groups is not very wide and there is always a possibility that they will reunite. A much deeper gulf is fixed between them and the Ceylon Communist Party. The Trotskyites accuse the Stalinists of being "willing to work within the framework of capitalism, which can only lead to a permanent collaboration with capitalism." They condemn Russia for having become "centrist" and label Stalin as a "bureaucratic dictator." The Stalinists deplore the "incorrect attitude" of their opponents and inveigh against the "pernicious theory" of Trotskyism.

These orthodox Communists are strong chiefly in the south-western coastal belt. The president of the party is Dr Wickremasinghe, but the two most influential leaders today are Peter Keuneman and A. Vaidialingam. Keuneman is a young Eurasian of Dutch descent, son of a High Court judge, who was president of the Cambridge Union in 1938. He is secretary of the party and leader of the Communist parliamentary group. Vaidialingam is a Tamil who is general secretary of the Ceylon Trades Union Federation. The party's programme follows orthodox lines. Currently it is demanding that all British forces should be withdrawn from Ceylon, that Trincomalee and the British air bases should be handed back to Ceylon and that all British property (estates, factories, banks, etc.) should be nationalised.

Three Marxist Parties

The extent to which these three Marxist parties will increase their influence during the next few years will depend on the success or failure of the right-wing parties, who at present hold a majority in the legislature, to meet the demands of the people for a higher standard of living. The economic outlook is not a cheerful one. Like Malaya, Ceylon produces less than half of its food requirements. Like Malaya, it has far too many eggs in one basket, the island being heavily dependent on three plantation products, rubber, tea and coconuts. Ceylon has large sterling balances, but they are not freely convertible into dollars, and America at present is the only country able to provide the capital equipment necessary to industrialise the island and increase agricultural production to the point of self-sufficiency. If the next few years are a period of economic stringency—and there is every prospect of their being so—the Marxist parties are certain to increase in strength, although he would be a rash prophet who would predict whether it will be Trotsky's, Lenin's or Stalin's statue which has most chance of one day crowning Mount Lavinia.

THE BUSINESS WORLD

British Transport Stock

SO, after months of speculation on what one Chancellor and then his successor might do, all doubts about the new British Transport Stock are resolved. It is, according to common surmise, a 3 per cent stock; it is repayable optionally in 1978 and finally in 1988; and it is issued at par. There is no choice between a 2½ per cent "short" and a 3 per cent "long" of the kind which had been so freely forecast. There is no fancy business or face-saving device to make a 3 per cent stock look like something different. The Treasury has wisely eschewed an issue at a premium or a discount—a move which could only have produced Bedlam on the Stock Exchange and no advantage for anyone else. It is a straightforward issue of a type which is the more refreshing because in the last year or two it had become unfamiliar.

For this relief, there will be much thanks. Yet there will be many who will regard the terms as being rather cheeseparing. The Treasury has not been unfair, but it has made the most of the steadfast character of 3 per cent Savings Bonds 1965-75 during a period when the gilt-edged market as a whole was falling. If it has erred at all, it has erred to its own advantage, by choosing a stock which is ten years longer than most investors would have expected. Sir Stafford Cripps, puritan rather magician, may have had nothing up his sleeve, but he has certainly not been open-handed. Yet even the austerity of a 3 per cent stock with a maximum life of forty years is an improvement on a contrived 2½ per cent. Indeed, the ledger-main and professional patter of his predecessor exercised their spell until the terms were announced. How, otherwise, is it possible to explain the persistence of wide discounts on the railway stocks, compared with their take-over prices, ranging up to 8 per cent only a week or two ago? Many holders were frankly fearful that the authorities might attempt even at the last hour to "pull a fast one."

That the Treasury has done no such thing is something in favour of the new Transport Stock. For there is not the slightest doubt that if the authorities had sought to dictate artificial terms (for example, a ten-year stock at 2½ per cent) or if they had indulged in noticeable market preparation during the last days of 1947 (they might, for instance, have groomed 3 per cent Redemption Stock 1986-96 to their fancy at very little cost) many railway stockholders would have been quick to get rid of their stock as soon as dealings began on Friday. In fact, the authorities have done little more than give stabilising support to 3 per cent Savings Bonds 1965-75 and the Redemption 3's, not with the object of promoting an artificial basis, but of keeping this pair of long-dated stocks on an even keel while the exchange of stocks was being arranged. Transport Stock neatly straddles the gap between these two stocks. Three per cent Savings Bonds, 1965-75, stood on New Year's Day at 101½, including £1 2s. 6d. of accrued interest, or 100¼ "clean." Three per cent Redemption Stock stood at 100, including 15s. accrued interest or 99¼ "clean," with a maximum life 21 years longer than Savings 3's. The new stock fits reasonably well into this context; its life is longer than had been expected, but no one can complain that its terms are forced or artificial.

By the time this article is read, dealings in Transport Stock will have been proceeding for some hours. With a stock priced

so closely as this, a fair amount of selling is only to be expected, though it should be kept within reasonable bounds by the realisation that it is, after all, a 3 per cent issue. Many intending sellers of the new stock were unwilling to wait for January 2nd and have been busy this week reinvesting in equities at ever-rising prices. Their impatience may partly explain the persistence of the high rate of discount on the railway stocks, for although institutional investors have provided plenty of support, selling has continued in such volume that railway stocks continued right to the last to provide a cheap backdoor to the gilt-edged market. But the discount, though it narrowed somewhat in the middle of the week, was also an expression of distrust about the prospective market value of Transport Stock on January 2nd. In its crudest form, this amounted to a suspicion that the authorities would take good care to make the stock conform to their own wishes on January 1st, and would then be ready to let it go hang on January 2nd.

That, at any rate, seems unlikely to happen, even granted the fact that Transport Stock has a longer life than some investors will welcome. But it remains true that £1,000 million of quasi-gilt-edged stock is a large block to absorb, even if the majority of holders of railway stocks are prepared to hold the new stock. Some selling is inescapable, even though it may be relatively modest in volume. Trustees and institutional investors who must have income will try to make do with 3 per cent, though they would probably have rejected 2½ per cent. But while there was no reason to expect a devastating flood of sales on Friday, the fact that the life of the stock had been pitched as long as forty years caused a last-minute revision of ideas about the opening price. As this article went to press, it was suggested that Transport Stock would open no better than 97½, and some observers were thinking in terms of 96½. The consequences for gilt-edged, if such prices are recorded in the opening dealings, will be obvious. In particular, Savings 3's and Redemption 3's will fall by a point or more. But it does not follow inevitably that the opening discount will be on this scale. Would the authorities, if they saw the possibility of a heavy opening discount and wide jobbers' margins of the "uncommercial" kind, feel disposed to lend a supporting hand? For a stock of this size, the selling of £50 or even £75 million of stock should not prove an impossible temporary burden, until firm buyers appeared. It must be remembered that a yield of £3 3s. per cent on a 40-year stock may have its attractions for institutional holders.

Hence, it would not be surprising, even if there were some initial disturbance of the market—inseparable from an issue of this size, though encouraged by its niggardly terms—to find that it will not be long before the "longs" and Transport Stock are on speaking terms. But it is likely that gilt-edged will have to unbend, and that Transport Stock will for the time being play the part of the poor relation. The Treasury have pitched the terms as high as they could justify by reference to the long-dated issues. By doing so, they have run the risk of upsetting the gilt-edged market more severely than would have happened had they been rather more generous.

There will be lamentations in some quarters that Mr Dalton's prophetic 2½ per cent for Transport Stock did not come to pass. A 3 per cent stock means that the annual capital cost of the rail-

ways and London Transport will be reduced from the £43 million hitherto paid under the wartime agreement to approximately £31 million, compared with £25½ million if the stock had carried 2½ per cent. An annual cost of £5 million for forty years is a small price to pay for an honest and reasonable exchange. (A final tribute to the belated wisdom of maintaining the guarantee for London Transport 3 per cent stock, 1967-72, is also merited.) The margin of £12 million left to the Transport Commission (which takes over a rates structure which is supposed to be approximately geared to the earning of £43 million) will provide a useful cushion against further increases in operating costs or any reduction in the volume of traffic.

The opening dealings in Transport Stock will have an important bearing both on gilt-edged prices and also on the boom in equities. But the consequences of the issue of Transport Stock upon the general level of equity prices are more difficult to determine. For several months past, the market has been discussing the operation on the assumption that January 2nd would see heavy selling of the new stock, and of other gilt-edged issues, and heavy buying of ordinary shares. The timetable, however, has not worked out quite in this way. Between June 20th and September 3rd, the *Financial Times* index of industrial ordinary shares (July 1, 1935 = 100) fell from 137.1 to 104.2. There were many who doubted whether, even at the September level, ordinary share prices adequately discounted the consequences of the economic crisis which burst upon the public consciousness late in August. But the market has disregarded such fears. After momentary hesitation in October,

equities again forged ahead until, on the last day of the Old Year, the index had reached 129.0. Recovery on this scale owes a good deal to the embarrassing shortage of stock in the market, and it certainly makes the most of the prospects of Marshall aid and of the recent increase in industrial production.

But it has to be asked whether, in the artificial markets of today, the present level of industrial shares is not itself as artificial as the rest. The yield differential between equities and long-dated gilt-edged stocks is little more than one per cent—it would thus take two years' income to offset the cost of the 2 per cent Stamp Duty on industrials. At no time during the past two years (save at the height of the boom at the end of 1946) has the margin between gilt-edged and equity yields been so low. But in 1946 the argument in favour of equities was that a great expansion of distributable earnings would follow the withdrawal of EPT and the end of postwar reconversion. What is the argument today? Can it be supposed that investors have heard the last of the profits tax? Are no difficulties to be anticipated in export markets in 1948? Is the prospect of Marshall aid so secure both in its timing and its amount? Can the rise in British industrial costs be regarded with equanimity? Some of these questions have obviously been obscured by the exodus of funds from home rails into equities. In a normal market, they would have been more prominent; in a closed market, where the supply of industrial securities is more or less fixed, the pressure of money is all-compelling. That fact ought to throw some doubt on the lighthearted boom in equities which has been seen in recent weeks.

The Coal Board's Task

BY stretching the statistical year to 53 weeks, coal output for 1947 will fall very little short of the production target of 200 million tons, proclaimed in the *Economic Survey* last February as "an indispensable minimum." But even by taking a 52-week year, the achievement of the mining industry has been far more favourable than there was any right to expect from the summer output, which showed a bare increase of 1½ million tons. In 52 weeks, total output has reached 196.6 million tons (of which 186.4 million tons is deep-mined and 10.2 million tons opencast) compared with 188.6 million tons for the corresponding weeks of 1946 (179.8 million tons deep-mined and 8.8 million tons opencast). Output has not scored a bull's-eye; but at least it qualifies for an "inner."

There is a disposition in some quarters to think that the coal problem has been solved by the efforts of the National Coal Board in its first year. It is doubtful if the Board shares this optimism. The chairman has observed that "with 1947 behind us, we can say that we have begun to turn the corner." Improvement in manpower, reduced absenteeism, increased output per manshift and, at long last, the resumption of coal exports on a modest but growing scale—all these provide ground for relief and thankfulness. But full-blown optimism would have to disregard some other cautionary signs like transport difficulties, shortage of equipment, and the advent of "bear" weeks in the New Year, with their aftermath of holidays, bad weather, illness and absenteeism. The test of the miners' capacity for sustained effort will come in the difficult weeks which lie ahead.

Nevertheless, the improvement in output has occurred during the first year's operations of the Coal Board—a body which few observers envied this time last year. How much credit does the Board deserve? It is obvious that output would not have recovered without the improved industrial relations, the increase

in recruitment and the extension of mechanisation which followed the transfer to public ownership. At the same time, the Board owes a good deal to private ownership for the efficiency of such pits as Comrie, and for new projects, such as the new sinkings at Rothes and Calverton. Its declared policy is to continue and extend schemes of this sort and to raise the general standard of efficiency in the industry. Even its harshest critics will admit that the Board has a sound technical blueprint for reconstruction in the Reid report, though it is doubtful whether it has had a chance to do much thinking about long-term development. In any event, shortages of manpower and materials stand in its way at present.

The main problem of the Board in working out its production programme is to strike the right balance between the urgent needs of the present and the best shape for long-term development. It has to decide how far it can concentrate on schemes which yield quick results in increased output, without running the risk of doing too little development work for the future. To some extent, the manpower required for necessary and overdue development projects can only be provided at the expense of immediate output. The Board is faced with precisely the same dilemma which confronted the official planners when they drew up the programme of capital cuts for 1948. It is trying—let us hope successfully—to pursue a middle course, so that its programme for 1948 can recognise the urgent demand for immediate output, and at the same time foster the advance of long-term projects on which future efficiency depends. The Board is concentrating in 1948 on measures for improving mechanisation, the marketing and preparation of coal, and increasing the industry's manpower. The prospective increase in the installation of coal cutters and conveyors in 1948 shows a useful expansion. Radical improvements in underground haulage—the weakest feature of British mining—will have to

await the completion of major reconstruction schemes, but the Board intends in the meantime to bring in 155 new locomotives, compared with 28 in 1946 and 77 in 1947. The experimental introduction of fluorescent lighting at Chislet in Kent has been so successful that it is to be extended to other collieries. The development of drift mining from shallow seams, which has only become possible with the abolition of artificial colliery boundaries, should yield results fairly quickly. In all, 50 or 60 projects for drift mining are on foot, and they should eventually add about 4 million tons a year to output. Output per manshift at some Scottish drift mines is three times the national average.

The Board has set itself the very ambitious manpower target for 1948 of 750,000 men. Since the 1947 target of 730,000 men was missed by 11,000, a figure of 750,000 for 1948 seems impossibly high. But there should be some compensations. The abnormal wastage of labour through the withdrawal of "Bevin boys" will not recur, and the labour force should become more stable and rather more balanced in its age composition, though the average age of the miners will still be high. During 1947, 90,000 men entered the industry (compared with 76,000 in 1946 and 48,000 in 1945) and there was a net increase in the labour force of 26,000. Now that the miners have withdrawn their objections to the employment of foreign labour, the absorption of Poles and Displaced Persons should be more rapid, despite the difficulties of training and housing. The main object now should be to increase the low proportion of productive to non-productive workers, which is only 25 per cent compared with 70 per cent in the United States—a margin too wide to be explained by differences in technical conditions.

In its plans for increasing production, the Board may come up against real conflict between the interests of production and labour. This conflict was typified in the controversy over the five-day week, which was pushed through by Mr Shinwell against the advice of the Board's advisers on production. Subsequent events have shown that the experts' views were right; after many weeks of low output in the summer, the production figures were only rescued by the overtime agreement, and this expires at the end of April. Other difficulties may arise in the concentration of production at the most efficient pits. Concentration has not been pressed to the fullest extent, because of lack of housing and of suitable employment for miners' wives and daughters. Such physical and social factors may impede the transfer of labour from the dying Lanarkshire coalfield to the richer coalfields of East Fife, which is not in the Development area. The Scottish plans to raise output from 6½ million tons in 1946 to 12 million tons by 1956 rest on the solution of this problem of distribution of manpower.

The main criticism of the Board, heard both inside and outside mining areas, is that its administration is over-centralised. Many mining managers complain that the chief consequence of

nationalisation is an increase in their paper work, that discipline has been weakened, and speed of decision slowed down by reference to divisional headquarters or to London. The dangers are recognised by Lord Hyndley's assurance that decentralisation will be pushed to the limit, compatible with safety. In theory, at any rate, so long as they conform to national policy, which must be laid down centrally, individual divisions and areas are given considerable responsibility and financial autonomy. For example, each division has been given the task of preparing reconstruction programmes, which will be collated, but not directed, by the planning authorities at headquarters. But there are risks as well as advantages in decentralisation. It is doubtful whether the Board should leave effective decisions on the crucial question of reconstruction to the separate divisions. Local enterprise is admirable, but local ambition could produce too much coal at the wrong places. Only the Board can decide, from its knowledge of divisional costs and its estimates of prospective demand, which the right places are.

Reforms, necessary though they may be, have to be paid for. Already the price of coal has been twice increased since nationalisation, through concessions on hours and wages, making an average increase of 26s. a ton since 1939. The Board has denied that its decision to increase the price of export coal by 25s. a ton will deter foreign purchasers. This may be true in the present coal-hungry sellers' market, but sooner or later, British coal will have to face competition from the Ruhr and Polish production, while British industry, whose costs are directly affected by coal prices, will have to compete in a buyers' market with other countries whose coal costs less. The Coal Board is entitled to its modest fanfare to celebrate increased production. But its reticence about costs and prices is remarkable. There is no indication that drastic measures are planned to attack rising costs. The review of coal prices and the reclassification of supplies which it has promised may restore some sense to the coal market, but they will not necessarily mean lower prices. In particular, the problem of a uniform national price for a given quality, which masks differences of production costs in different regions and has a direct bearing on industrial location, will have to be seriously tackled.

Hopes that rising costs will be offset by rising productivity have yet to materialise. Since the Board's report omits any reference to policy regarding prices and costs, it must be regarded merely as an interim statement. The financial report cannot be expected before the spring, and is not likely to make cheerful reading. It will not be long before "Coal at any price" gives way to the more normal slogan of "Coal at the right price." In the long run the Board will be judged as much by its price policy as by its achievements in production. Its major task over the years is to provide enough good and cheap coal. And 1948 will be none too early to get down to it.

months that the upward movement has been strongly resumed. Yet the average level of resources at the banks' command during the year—and it is averages, not net changes, which matter from the earnings' standpoint—has risen from £5,097 million for 1946 to £5,624 million for the first eleven months of 1947. In net deposits the average has risen by no less than 10.4 per cent.

actually a bigger increase than that for 1946 compared with 1945. In other words, the banks have had for a full year the benefit of the huge creation of deposits which Mr Dalton engineered in 1945-46—and of some additional deposits besides. The trend of investment holdings, moreover, shows a broadly similar pattern. Although the total portfolio has risen since end-1946 by only £73 million (in contrast with £193 million during 1946), the average holding for the eleven months has been £128 million (or nearly 10 per cent) above the 1946 average. Even more noteworthy, from the point of view of earnings, has been the improvement in advances business. The expansion in outstanding advances this year has been £215 million, compared with £166 million during 1946; but this year's increase in the average level of advances, as the accompanying table shows, has been almost twice that for 1946. Whereas previously the total had on only a few occasions touched £1,000 million, this year it has moved rapidly beyond that figure to nearly £1,200 million, and has averaged almost £1,100 million.

* * *

Bigger Gross Earnings

Although the banks have extensive inner reserves from which to provide for investment depreciation (their immunity from EPT, largely attributable to the heavy but undisclosed capital profits realised during the base years, is incidentally a clue to the size of these reserves) they are likely to show a much livelier interest than usual in the level of the gilt-edged market on balance-sheet date. If only for that reason the fruits of last year's big growth in the principal earning assets are unlikely to be discernible in the published profit statements. The gain in gross income, however, must have been substantial. Not only has there been this large increase in average deposits, but no less than 41 per cent of these additional resources has been employed in advances, and an additional 25 per cent in investments. The average ratio of advances to total deposits has thus risen from 17.4 per cent during 1946 to 19.5 per cent, while the combined ratio for advances and investments has been 45.7 per cent, compared with 43.8 per cent for 1946.

Investment depreciation and the continuing rise in costs are, of course, substantial adverse factors. But, these apart, the banks now have the best structure of assets from the point of view of current earnings that they have known since war finance first began to distort the traditional pattern. They are also finding in the miscellany of services to overseas trade a rapidly rising source of income. Some idea of this expansion can be gleaned from the movement of the omnibus item now so inaccurately described as "acceptances" (for actual acceptances form only a tiny proportion of the whole) which for nearly twelve months now has stood at the almost unprecedented level of well over £200 million, compared with less than £100 million when the war ended.

Retaliation in Jute

The Government of India has replied to Pakistan's imposition of an export duty on raw jute crossing its land frontier by levying a similar export duty on raw jute and on jute manufactures going from India to Pakistan. Measures are also being taken to ensure that adequate supplies of raw jute are kept within India. These measures have not yet been specified, but they may entail smaller export quotas of raw jute from Calcutta, or an increase in the sea-borne export duty, or a further expansion of jute production within the Dominion of India. The Indian Government's action is clearly retaliatory, in an attempt to induce Pakistan to come to an "amicable settlement." There are ample grounds for such a settlement and it is regrettable that one has not already been reached.

Pakistan's original move to levy an export duty undoubtedly had an eye on revenue needs—particularly the need for foreign exchange, which in the case of jute accrues in Calcutta. India had refused to pool and share the Customs revenue from jute exports during the first six months of partition, and Pakistan's imposition of an export duty was an attempt to force agreement by using its only trump card. India showed a very generous lead in the recent financial negotiations, and it was no doubt expected that Pakistan would reciprocate over jute. But that reciprocity is evidently not forthcoming. The Dominion of India is increasing its jute acreage and hopes to double it within a few years, so that the Calcutta mills would no longer be dependent on Pakistan supplies. Meanwhile, the Indian mills can only be fed by Pakistan jute, but it becomes daily more difficult for the Dominion of India to suggest a compromise, particularly one

which would involve the sharing with Pakistan of the Customs revenue and foreign exchange earnings from jute.

One consequence of the Pakistan export duty is a rise of £18 a ton in all British prices for raw jute. The price for the Daisee group has increased from £70 10s. to £88 10s. a ton, ex warehouse. All jute yarns have advanced by nearly £19 a ton—or a little over 2d. a lb., but no new prices for jute cloth have yet been specified. The home issue price for raw jute has for some time been below the Calcutta market quotations and the present rise not only allows for the new tax of £6 5s. a ton, but also brings the British price more into alignment with that in Calcutta, which for the week ending December 20th was £92 a ton (Daisee 2/3—good marks) for shipment c. and f. Dundee.

Devaluation Talk in France

The financial reform in France is making slow but steady progress. The anti-inflationary programme of M. Mayer suffered severe buffeting at the hands of the National Assembly, but most of the damage it suffered in the lower house has been made good by the Council of the Republic. The proposed special levy which had been considerably attenuated by the National Assembly has been brought back to the original design of M. Mayer. It will apply to all income over Frs. 450,000 (the National Assembly had raised the minimum to Frs. 750,000) and its incidence on the all important agricultural community will be broadened again so as to bring within its scope some 800,000 farmers, or double the number proposed by the Assembly. While re-tightening the general design of M. Mayer's plan, the Council of the Republic has offered some constructive amendments, including a proposal to overhaul the management methods in the nationalised industries. The losses being incurred in the nationalised sector of the French economy represent one of the principal drains on the budget.

The problem of the currency is still being discreetly avoided. Evidence accumulates of the glaring and growing overvaluation of the French franc in the exchange market. The most telling symptoms are the continuing deficits of the French balance of payments with other European countries. These have reached points at which France is being called upon to meet in gold any further debts to countries like Switzerland and Belgium. The French authorities, however, are convinced that the moment is far from propitious for an outright devaluation. Such a step, they argue, should only be taken when confidence has been restored in the currency; otherwise it will only aggravate the very difficulties from which France is suffering. The justification for an overvalued currency is also pleaded on the ground of the inevitable need for substantial imports into France. At the same time the urgent need for getting French export prices and costs into line with these of competitive countries cannot be disregarded. There are suggestions from Paris that the reconciliation between these clashing interests may be found by one of the various devices of underhand devaluation for which countries like Italy and Greece have recently set interesting precedents. Any such development, which would allow French exporters in a free market to sell either the whole or part of the proceeds of their sales abroad, would raise the question of France's obligations to the International Monetary Fund. Unlike Italy, France has notified an agreed parity to the Fund and would, therefore, find it more difficult to justify a *de facto* devaluation, or "devaluation the funny way" as it is now referred to in high quarters.

* * *

The Fund and the Lira

On the occasion of the recent devaluation of the lira, the International Monetary Fund issued an interesting justification of Italy's action. After pointing out that in common with eight other members, Italy has not agreed a par value for its currency with the Fund, the IMF statement describes the procedure under which Italian exporters now sell the proceeds of their foreign sales in the free market and then makes the following comment on the system:

Arrangements which, in fact, result in fluctuating exchange rates are not in accord with the long-term objectives of the Fund. The Fund recognises, however, that in some cases members may be required, for temporary periods, to institute extraordinary measures in an attempt to meet particular difficulties. The Fund will look on such measures for temporary periods with sympathy. In the case of Italy, the Fund feels sure that the Government is in agreement with the long-run purposes of the Fund and will, as soon as possible, move towards the establishment of fixed and stable exchange rates. The modifications in their exchange pro-

cedure instituted by the Italian Government bring the actual rate of exchange of the lira to the dollar nearer to the equilibrium of the internal and external price levels. They thus encourage Italy's ability to export. They narrow the gap between effective buying and selling rates and eliminate previous discrimination among different classes of commodity imports and exports.

Other countries may be relied upon to take note of this special pleading which, with due adjustments could be made to fit many unilateral decisions to change effective rates of exchange.

Ups and Downs in Short Bonds

The reports of the leading discount houses shortly to be published will survey a difficult, not to say an anxious, year in Lombard Street. The market's turnover has certainly been the greatest in its history, thanks to the 1946-47 wave of capital expansions which accompanied Mr Dalton's cheap money drive. But at times in 1947 the market must have felt that the new capital which it was raising was destined to plunge it into losses instead of providing for yet another increase in its profits. Necessarily, in some instances, the bonds for the financing of which the new issues were sanctioned must have been acquired near the top of the market; and at the year's worst the securities of interest to Lombard Street stood between 3 and 6 per cent below their peak levels. Since then the short bond market has enjoyed a significant recovery, and on balance the year's depreciation on the relevant securities ranges from about 1 per cent for the shortest bonds to rather more than 3½ per cent (on the 2½ per cent National War Bonds 1952-54, whose life is rather longer than is appropriate for the main bond business of the money market).

For businesses which are highly geared and which work on narrow margins, even a depreciation of no more than 1 per cent represents a material loss. On the other hand, since the rise in bond yields has not been accompanied by any perceptible rise in the cost of the short money on which the bonds are financed, the slump in gilt-edged has brought an important compensatory advantage to the market, whose running margins are now very comfortable—even if the bond yields are calculated to the earliest redemption date.

Partly for this reason, it is hard to guess where the balance of gain and loss lies. Obviously, the experience of different members of the market will vary widely, according to the extent of jobbing profits, the structure of the portfolio, and to whether the main expansion occurred early or late in the cheap money drive. At one extreme are the big houses, with their tradition of conservative accounting, which had been piling up large inner reserves through the whole cycle of rising prices and large jobbing profits. At the other extreme are some of the smaller houses, which had only modest reserves and have expanded their portfolios very rapidly in the past two years.

If, however, the effects of inner reserves and of income-tax complications are left out of account, a rough guide to the year's experience can be obtained by comparing the year's net depreciation and financing costs with the gross yield on particular securities. For example, the year's depreciation on 1½ per cent Exchequer Bonds is 1½ per cent and the average cost of bond money is about 1½ per cent. Hence, in this case, the total "cost" of running the bond through the year absorbs the whole of the gross interest return. On the 2½ per cent National War Bonds, 1949-51, a similar computation shows a net profit margin of about ½ per cent, but on the 1951-53 and 1952-54 issues there would be net losses of a little more than 1 and 2 per cent respectively.

These examples demonstrate how important it is for the discount houses to keep their portfolios short. If a house had been so rash as to put half its portfolio into the 1952-54 issue (which none would dream of doing, because these bonds are too long to be acceptable to the authorities) it would have made a loss, on this account alone, equal to 8 per cent of its total capital resources (inner reserves included)—assuming a ratio of eight-to-one between bond portfolios and capital resources. In fact, the market's portfolios have become progressively shorter during this difficult year, and probably four-fifths of the total comprises the two shortest issues mentioned above, one of which shows a nil return and the other a modest surplus. This, on the same basis of calculation and again taking an eight-to-one ratio, would roughly compensate the net losses on the longer bonds.

It should be emphasised that these are purely theoretical calculations; but they suffice to indicate the extent to which the market this year has had to depend for its profits upon its jobbing

margins and its shrewdness in dealing. These, however, should have ensured a fair surplus from bond business as a whole, without taking account of the fact that many houses will have written down their portfolios substantially out of the profits of previous years, and thus in effect will have augmented this year's true profits by drafts on inner reserves.

Foreign Bond Activity

Michaelmas has been a season of good cheer in the foreign bond market. Following the pre-Christmas revival of interest in Japanese issues, this week has seen an advance in Chilean Government bonds and a sharp rise in the Peru National 6 per cent issue. On his return from Japan, after his visit as a member of a British parliamentary delegation, Mr William Teeling revealed that the Finance Minister of Japan informed him that there would be a full payment of all accrued interest on Japanese bonds following the signing of peace with the United States. Furthermore, Mr Teeling had it confirmed by bankers and others that the rate of interest would not be the same as that paid at the outbreak of war, although the actual rate had not yet been decided. This disclosure in a letter to the press had been preceded by a revival in sentiment in this market on the view that United States assistance to Japan would possibly be extended as a result of the breakdown in the London conference of Foreign Ministers. The rise in prices of Japanese bonds that has ensued has been accentuated by a shortage of stock in the market and most of the issues have appreciated by around 20 per cent since the improvement began.

The advance in Chilean bonds seems to have been engendered by the recent visit of Chilean Government representatives to London for conversations with the Council of Foreign Bondholders, in order to revise the arrangements for the service of the debt. The market has taken seriously the suggestion that Chile intends to consolidate its debt but following the announcement that the interest payment on the bonds would be cut from £1 8s. 3.6d. per cent for 1946 to £1 0s. 7.10d. for 1947, prices of all issues reacted sharply. In the case of the two outstanding sterling bond issues of Peru, the 6 per cent bonds and the Provincial Council of Lima Municipal Loan 1911, an offer has been made by the Government of Peru to exchange them into new External Sinking Fund dollar bonds at the rate of \$4 principal amount of new bonds for each £1 principal amount of sterling. The new bonds are redeemable on January 1, 1997, and carry interest at a progressive rate after 1997 and 1998, for which years interest payments will be at the rate of 1 per cent, increasing to 3 per cent in 1953 and subsequent years. Prior to the announcement of this offer, the Peru National 6 per cent issue rose from 20 to 27, but reacted to 25 on the disclosure that the interest on the loan in the near future would be at a reduced rate.

Freight Rates Increased

The sharp rise in freight rates for deep-sea tramps agreed by the Ministry of Transport for controlled voyages beginning on New Year's Day has come as a surprise to many people who have examined the recent trading accounts of shipping companies with an envious eye. These are difficult, at first sight, to relate to the complaints of shipowners of increasing delays in ports, increasing operating costs and high costs of new ships. But recently published accounts reflect, of course, the results of voyages and trading completed many months ago. Since then, freight rates have remained fairly steady while operating costs have been mounting progressively. The decision of the National Coal Board to raise the price of UK coal bunkers by some 25s. per ton, though it may be justified in an export context, is the latest example of increased costs which shipowners must face in 1948.

The full schedule of revised freight rates has not yet been completed, but preliminary figures given for some of the principal trades show that the Ministry considers an average rise of about 7 or 8 per cent to be justified. Grain from the Plate, for example, is now rated at 86s. 6d. instead of 81s. and sugar from Cuba at 76s. instead of 70s. 6d. The rise in the cost of coal is partly offset for certain trades by the mere fact of its availability in United Kingdom ports. For a long-time coal-burning ships engaged on the Plate round have not been allowed to take on more than 500 tons—enough to steam as far as the Atlantic Islands, where they have been compelled to take on enough for the remainder of the round voyage at prices ranging from 123s. a ton at St. Vincent to about 147s. in the Plate. For the North Atlantic voyage ships have been able to coal in America for \$10 to \$12

a ton, but the necessity for coaling there for the round voyage has compelled them to exclude cargo and, therefore, to lose freight. The most serious effect of the increased coal costs will be felt by short-sea traders who have been accustomed to coaling at the 1947 domestic prices, and many of these may prefer to buy inferior Polish coal at about 58s. a ton, if it becomes available, as it may.

The heaviest increases in costs promised for 1948 will be borne by oil-burners, for the non-renewal of bunkering contracts means that ships will probably have to pay some 25s. extra per ton, and fuel costs form a large percentage of total outlays. But bunkering costs are by no means the only problems that 1948 will bring. Port dues everywhere are being increased. Stevedoring and towage charges are higher. Pilotage rates in the United Kingdom rose by 60 per cent on January 1st. Turnround of ships is slow everywhere, not only in Britain, where the Ministry of Transport has had a working party examining the problem for some time. The port of Beira is a notorious example, and Australian and New Zealand ports are among the worst offenders. Even the cost of dunnage, bags or shifting boards for grain is reaching unprecedented heights; in some ports even the materials are unobtainable, and full cargoes cannot be carried. The working details of ship management do not usually reach the public ear, largely owing to the traditional reticence of shipowners. But it is reasonable to assume that the Ministry's advance in schedule rates is not designed to shelter shipowners merely from high coal and oil costs.

Cotton Workers' Wages

This month, important groups of workers in the cotton spinning industry will get substantial improvements in wages, following an agreement reached just before Christmas. Operative spinners and their assistants will get 10s. a week more, bringing the flat rate payment, over and above piece rates, to 36s. a week. Juniors will get an increase of 5s. a week. These increases, it has been emphasised, are an interim measure, pending a final settlement on the Evershed proposals, which were made over two years ago. About 50,000 operatives in card, blowing and ring rooms will also get increases, following negotiations and investigations lasting more than a year. The agreement is highly complicated, but it can be said to represent a first step towards the rationalisation and simplification of the wages structure, as recommended by the Evershed committee. It should mean the operation of more looms per worker and the employment of men on machines hitherto reserved for women.

Encouraged by the example of the spinners, the weaving section of the industry has decided to press for wage increases, though no amount has been specified. Their claim, which is being discussed this week, will affect about 125,000 operatives. A separate committee is investigating the complicated wage structure in the weaving section, under the chairmanship of Mr Moelwyn Hughes, KC, but the unions are not apparently prepared to wait for its findings.

It is too early yet to form any estimate about the additional cost to the wages bill of the increases granted and proposed. But obviously they must add considerably to the cost of production, and already the Master Spinners have asked for wider profit margins to meet the rising costs. These increases will lead to higher prices for cotton goods (thus enhancing the effect of the withdrawal of the subsidy on utility products) and will hamper the industry's ability to compete in export markets—unless they evoke a substantial increase in the labour force and higher productivity.

Christmas Currency

The Christmas Eve bank return became available only after last week's issue of *The Economist* went to press, but the movement of the note circulation in the final week before the holiday conformed exactly to the forecast in these columns a fortnight ago. Once again the week's net efflux of currency, at £5,300,000, was equivalent to only about one-half the corresponding movement in 1946. Thus the total note circulation at the Christmas peak, at £1,368.4 million, was £60 million below the record figure touched twelve months earlier. The total seasonal drain of currency, measured from the low point reached in November, was only £27.9 million—by far the smallest figure since the second Christmas of the war. Indeed, if the expansion is expressed as a percentage of the total circulation—which is the rational method of comparing changes in seasonal demands—this year's movement must be one of the smallest ever recorded. As the accompanying table shows, it is much smaller than any comparable movement during the past eighteen years. It is evident, too, that the special influences upon the note circulation are still operating at least as strongly as they were before the holiday. In the three and a half working days after Christmas, no less than £18.7 million of notes returned from circulation, in contrast with only £6.6 million in the similar period a year ago.

1944-45.....	1,180.4	1,242.0	1,215.7	61.6	5.2
1945-46.....	1,324.6	1,379.9	1,322.6	55.3	4.2
1946-47.....	1,363.4	1,428.2	1,364.5	64.8	4.8
1947-48.....	1,340.5	1,368.4	...	27.9	2.1

The causes of this abnormal experience have already been sufficiently discussed in these columns. But despite this change in the trend of currency demands, the note circulation still shows a larger increase over its prewar level than is the case with bank deposits. By the last wartime Christmas the total note circulation was 144 per cent above its level at end-1938, whereas over the same period (taking November figures) net bank deposits showed an increase of only 95 per cent. Since then, however, the disparity between the two series has substantially narrowed. Since 1944 the note circulation has expanded by no more than 10 per cent, whereas bank deposits have risen by 31 per cent, making the respective increases, by comparison with 1938, 169 per cent and 155 per cent.

Nine Months' Revenue

The Revenue return for the third quarter of the financial year, which in normal times affords an important clue to the shape of the forthcoming Budget, is this time of little significance from this point of view. But it shows that the large "book" surplus for

Take every advantage of this attractive investment

which Mr Dalton budgeted last April is likely to be comfortably achieved. Even after the November Budget, the estimated increase in ordinary revenue for the full year was no more than £158 million, yet already—in the first nine months—there has been an expansion of £329 million. Ordinary expenditure seems to be keeping close to estimate. The April Budget provided for a reduction for the full year of £719 million, or 18.4 per cent; in the first nine months there has been a decline of £517 million, or 19.3 per cent. As the following table shows, the ordinary surplus for the nine months is equivalent to almost 80 per cent of that now estimated for the full year—although the principal tax-gathering season is only just opening.

	£ mil.		Estimates for Full Year 1947-48	
	Nine Months to Dec. 31	1947	April Budget	Nov. Budget
Ordinary Revenue....	2073.7	2409.1	3451.0	3499.0
Ordinary Expenditure	2681.4	2164.1	3181.4	3191.1
Surplus or Deficit....	-601.7	+245.0	+269.6	+307.9

Unfortunately, virtually the whole of this surplus of £245 million is attributable to the expansion in nominal or non-recurring items of revenue. A very large proportion of the credits which Mr Dalton proposed to "claw back" from unspent votes has already been brought into the account, and miscellaneous receipts show an expansion of no less than £167 million on the corresponding period of 1946. Surplus stores, which were expected to provide £60 million less in the full year, have already yielded £31 million more; indeed the nine months' yield, at £133 million, has actually surpassed the year's estimate by £38 million. Among the main sources of revenue, the most striking performance has been that in customs receipts which, despite the cuts in imports, already show a gain of £133 million—£11 million more than was expected in the full year. Below-line expenditure has been heavy: EPT refunds, war damage payments and postwar credits have absorbed £283 million, while £208 million has been provided for housing and loans to local authorities.

Rhodesian Tobacco Supplies

Southern Rhodesia is planning an impressive expansion of its production of flue-cured tobacco—a timely gesture in view of Britain's stop on the purchase of American supplies. Yet the new target of 70 million lb. a year compared with 55 million lb. in 1946-47 is less than a quarter of Britain's annual tobacco imports from America—approximately 300 million lb.—and not all of the Rhodesian crop will come to Britain. American tobacco

has already been included in the interim aid programmes for France, Italy and Austria and it is conceivable that it might also be included as an item of Marshall aid for Britain. Failing that, British tobacco manufacturers will have to rely almost entirely on Empire supplies, mainly from Southern Rhodesia.

Rhodesian production has developed considerably since 1938, and in 1946/47 it was more than two and a half times the prewar level. The crop consists largely of flue-cured Virginian type, suitable for the British market, but Turkish production, although still small, has also increased. Of the 55.8 million lb. of Virginian tobacco produced this season, 55 million lb. was flue-cured. The expansion in total exports has not been matched by any proportionate increase in shipments to the United Kingdom; in fact these have shown remarkably little change. Before the war, Britain took 84 per cent of Rhodesia's tobacco exports but in 1946/47 only 51 per cent. The growers maintain that during the

war, there was always more tobacco of a type suitable for the British market available than United Kingdom merchants and manufacturers were prepared to buy. Britain's purchases in the past have apparently been limited by blend specifications, and by the inclusion of American tobacco as a lend-lease item.

A delegation from the Southern Rhodesian Tobacco Marketing Board has lately discussed the expansion of supplies with British tobacco manufacturers. Britain has agreed to buy two-thirds—or 47 million lb.—of the planned annual output of 70 million lb. of flue-cured tobacco in suitable grades for the United Kingdom market over the next five years, compared with purchases in the current season of about 30 million lb. Consultations are to be

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent. will be redeemed at the earliest date (these are marked 'e'), and those paying 3 per cent. or less will be repaid at the latest date (marked 'f'). Net yields are calculated after allowing for tax at 9s. in the £. (f) Flat yield. * Assumed average life 17 years 6 months. † Notice given for redemption on March 1, 1948.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2½ per cent. free of income tax. † Yield worked out on 15 per cent. basis. (A) Fifteen months to March 31, 1947 (yield basis 7.6 per cent.). (B) To latest redemption date. — † Free of tax.

held each year to arrange the growers' programme five years ahead. If expansion of Rhodesian tobacco production is envisaged on a sufficient scale to replace on the British market the 300 million lb. hitherto purchased each year from America, a large development scheme would have to be instituted, including a native re-settlement plan. Even next season's expansion will involve great difficulty, for it will require 200,000 native workers; any long-term expansion in output will require not only additional labour but also increased curing and storage capacity.

Cotton Spinning Profits

The Lancashire Cotton Corporation is now reaping the first fruits of its modernisation programme. The full accounts of the Corporation for the year to October 31st show earnings on the ordinary capital of 27½ per cent compared with 17.7 per cent in 1945-46, a year in which trading revenue had to bear the cost of uneconomic production in the early stages of re-equipment. But the Board has no intention, for the time being, of passing the benefit of improved trading on to the ordinary shareholders whose dividend remains unchanged at 10 per cent. In justification of this policy the chairman has rightly said that it would be wrong to compare trading margins today with those of "the unfortunate past between the two wars" for it is necessary to bear in mind the new capital requirements for additional re-equipment, the need for adequate depreciation allowances and the interest burden to be carried on costly new plant.

Yet there is cause for satisfaction at the way in which the cotton industry, and the Lancashire Cotton Corporation in particular, is getting on its feet again, even though its post-war contribution to production and exports to date is far from what is expected of it in the future. Mr F. W. Tattersall, of Manchester, in an annual review of the cotton trade just published for 1947, indicates that the average profit of 73 cotton spinning mills for the year has been £14.058 per company compared with an average of £9.812 for 68 companies in 1946. The average dividend in 1947 for 108 concerns was 14.71 per cent compared with 12.56 the year before. This level has only been previously exceeded in 1907 and 1918-20—a statistical pointer for those who look to 1948 for an even better year in the cotton industry.

Shorter Notes

The agreement between the judicial managers of New Union Goldfields with Anglo-Transvaal Consolidated by which as from January 1, 1948, the judicial managers would hand over all secretarial, technical and management appointments to Anglo-Transvaal has been opposed in the courts by interests of the shareholders and creditors. In view of this opposition the South African Supreme Court has extended until February 10th the consideration of the application of the judicial managers to have the new agreement confirmed.

The International Emergency Food Council has made a "temporary exception" in its rule barring exports of rice to Europe. Britain has been allocated 24,500 tons, covering the first six months of 1948. This will be the first large-scale importation since 1944. In that year the consumption of rice for food in the United Kingdom totalled 80,000 tons, compared with 96,200 tons before the war. In 1946 consumption was only 6,700 tons; but in 1947 it rose slightly to over 8,000 tons.

The British contract price for Australian butter for the period July 1, 1947, to June 30, 1948, has been increased by £1 10s. to £10 3s. 6d. a cwt. The contract price for cheese has been raised by 15s. 6d. to £5 16s. 6d. a cwt.

Great Universal Stores have announced an offer to acquire the remainder of the preference and ordinary share capital of Polikoff, wholesale clothing manufacturers, following their recent acquisition of 41 per cent of the preference and 61 per cent of the ordinary capital. The offer is for an exchange of shares on the basis of two 5s. ordinary shares of General Universal Stores for every three 10s. preference stock units of Polikoff, holders retaining the right to the 8 per cent dividend payable on January 10th in respect of arrears of dividend up to June 30, 1939; one 5s. ordinary share in General Universal Stores is offered for every eighteen 1s. ordinary Polikoff stock units.

Ships Lanterns

Stern lanterns, lit by a great many candles, were useful for keeping station and were a means of computing direction and speed of other vessels. The Great Lantern carried by the "Sovereign of the Seas" (1637), "would hold ten persons to stand upright without shouldering or pressing one another."

TURNER AND NEWALL, LIMITED

INCREASED OUTPUT

GROWTH OF EXPORTS

MR W. W. F. SHEPHERD'S REVIEW

The annual general meeting of Turner and Newall Limited will be held, on the 22nd instant, at the Chartered Accountants Hall, Manchester, when it is expected that Mr W. W. F. Shepherd, the chairman of the company, will preside.

Mr Shepherd's statement to the stockholders has been circulated to them with the report and accounts and, after dealing with the accounts of the company, it contains a detailed review of the company's operations during the year to September 30, 1947, both at home and abroad. The following are extracts from the statement:—

It has been possible to increase somewhat the aggregate output from the Rochdale works of Turner Brothers Asbestos Company Limited during the past year. The number of workers available has improved, though it is still insufficient, and by various methods, some of a temporary and some of a permanent character, the volume of production has been raised independently of the size of the labour force. Improvement in output is expected to continue during the forthcoming year. The new factory at Hindley Green, which is to be operated by Turner Brothers Asbestos Company Limited for the purposes indicated in my report a year ago, is now actively in course of erection. Shortage of various types of building labour and some temporary deficiencies in material have resulted in slower progress than had originally been hoped, but production should not be delayed many months beyond the planned date. First priority will be given at the new factory to the production of rubber conveyor belting.

DEMAND FOR FERODO LININGS

Ferodo Limited has continued to experience during the past year a very substantial demand for its brake and clutch linings and other friction materials, and in spite of an enforced shut-down of production for some weeks early in 1947 as a result of coal shortage and lack of electrical power, its production was the highest ever recorded. The large building programme for expansion purposes is progressing satisfactorily, the extension of the building at Chapel-en-le-Frith in which Rubber V Belts are manufactured being completed, and the additional plant installed and in partial production. The output of such V Belts will be increased by more than fifty per cent. in the immediate future in comparison with the production capacity of a year ago.

The record production reached by Turners Asbestos Cement Company Limited principally arose out of increased efficiency of existing plant and methods, and has enabled the company to meet its obligations in regard to all Government-sponsored schemes, and yet to retain some balance to supply the more urgent demands of industry. One of the most welcome features during the year was the steady return of demand for "Everite"

asbestos-cement pressure pipes which, during the later war years, had been dormant owing to the impossibility of starting new water schemes in this country, and the difficulties of exporting this product to other countries owing to shipping restrictions. Throughout the year the plant involved in the manufacture of "Everite" pressure pipes has been occupied to the fullest capacity. It is important to realise that a very substantial portion of the output of pressure pipes is normally exported, and particular mention might be made of a large order which was booked, manufactured and despatched during the year for 45 miles of 12 in. and 15 in. diameter pipes for the water supply for the port of Jeddah in Saudi Arabia.

WASHINGTON CHEMICAL COMPANY

The Washington Chemical Company Limited has, during the year under review, been fortunate in that production was not affected to any considerable extent by shortage of electric power supply. Some difficulty has, however, been encountered as a result of the inferior quality and reduced quantity of coal obtainable, as the company is a very large user of this commodity. During the war a seawater magnesia plant was installed in order to produce synthetic calcined magnesite for Government purposes. This plant has now been turned over to peacetime production, with the result that the manufacture of magnesia of all grades has been substantially increased in volume.

Newalls Insulation Company Limited has been very active during the year in its normal sphere of contract work for heat, cold and sound insulation, both ashore and afloat, and the outstanding items in its current programme are in connection with the equipment of power stations, the treatment of new shipping tonnage, and the reconditioning of ships released from Government service. The company is also supplying substantial quantities of thermal insulation to oil fractionating plants overseas, and is co-operating with certain of the leading engineering companies in this country in the development of a new technique for thermal insulation as applied to gas turbines.

LARGER OVERSEA SHIPMENTS

It is pleasing to be able to report that our export trade from the United Kingdom has again increased significantly during the year. From all of our British factories whose products can be exported, the value of goods shipped overseas during the past twelve months has substantially exceeded that of the previous year, and in many cases is the highest ever recorded. Personal visits have been made to many markets by officials of our various companies, and the reaction in such markets, whether near or distant, has been uniformly favourable. We continue our efforts to improve even on this satisfactory state of affairs, as we are obviously anxious that the asbestos industry shall maintain its place amongst the leaders of those industries which are contributing so vitally to the national drive for exports which will help Britain to pay for its necessary imports of food and raw materials.

The Keasbey and Mattison Company has had a very satisfactory year. Its factories at Ambler, Pennsylvania, and St. Louis, Missouri, have operated throughout the year to capacity of available raw materials, and

its new asbestos-cement factory at New Orleans, Louisiana, has been brought into partial production. It is hoped that this new factory will be in full production early in 1948.

NEW CANADIAN FACTORY

Last year I outlined our reasons for deciding to build a new factory in Canada, in the city of Montreal, and intimated that the construction of this factory had begun. The building and civil engineering work is now practically completed, and the installation of machinery will begin in the near future. It will be appreciated, however, that under today's national and international financial conditions, and in view of the present prohibition of the export of capital from the United Kingdom, it was not possible for us to finance this new enterprise in the normal way, i.e., by the transfer of funds from England. We have accordingly made arrangements for local finance for a lengthy period.

In a world such as that in which we live today in which economics and politics are inextricably mixed, and in which international complications abound, it is quite impossible to forecast the future for more than a very short period ahead. I propose, therefore, as regards our company's future to confine myself to the statement that all our businesses have well-filled order books, adequate and up-to-date production facilities and enthusiastic personnel. Prospects, therefore, for the short term appear excellent, but the politico-economic situation is such that it is always possible, although we hope not likely, that some decision of one or more Governments might have adverse effects on our activities or those of the other industries on whom we so largely depend as outlets for our products. While I think that any serious problem of this kind is unlikely, we must recognise that the possibility exists, and any long term forecast would, therefore, be pointless.

CRYSTALATE LIMITED

INCREASED TURNOVER AND PROFITS

The annual general meeting of Crystalate Limited, was held, on the 19th ultimo, in London.

Sir Herbert E. Morgan, K.B.E. (the chairman), presided, and in the course of his speech said: You will all no doubt be gratified to see the improvement in the net profit this year, which amounts, after taxation, including the new profits tax, to £21,082, compared with £13,251 last year. It is particularly satisfactory to note that the profit on trading has increased from £17,075 to £37,229. You will have seen that the directors have declared a dividend of 7½ per cent., as compared with 6 per cent. last year.

The increased profit on trading is largely due to an increase in turnover, which is always, in my view, one of the soundest methods of increasing profits. Our order book throughout the year has been full, and continues to be full, and except for certain difficulties the results could have been even better.

In my speech last year I mentioned that supplies of raw materials were in short supply. I am pleased to say that for the immediate future, anyway, the outlook in this connection is much brighter.

In common with the rest of the trade moulders of the British plastic industry, we are making a contribution of importance, although indirect, to the nation's export drive.

In conclusion, I feel that our special thanks are due to our managing director, Mr Jack Lesser, who has made two journeys to America within the last few months, and for whom difficulties were only made to be overcome.

The report was unanimously adopted.

BANK OF MONTREAL

ONE HUNDRED AND THIRTIETH ANNIVERSARY

The one-hundred-and-thirtieth annual general meeting of the Bank of Montreal was held on the 1st ultimo in Montreal.

The president, Mr George W. Spinney, C.M.G., in moving the adoption of the report, said: After full provision for bad and doubtful debts has been made our profits for the year were \$10,163,000.

It is appropriate that I should make reference to the fact that November 3rd of this year marked the bank's 130th anniversary. We may well derive satisfaction from the knowledge that after 130 years of service in this new country the Bank of Montreal is strong and virile.

The year has seen production and employment at high levels. Anything more unlike the widely feared postwar period of deflation and unemployment could hardly be imagined. Indeed, many of our immediate and pressing problems are of an entirely different nature, arising as they have out of instabilities characteristic of a boom. The implications of these subtle dangers from within are by no means diminished by all too obvious complications in respect of our external trade.

While we in Canada have been spared the hardships of violent inflation, we have experienced enough of the consequences of a gradual depreciation of the internal purchasing power of our dollar to yearn for the advantages of a dependable standard of value in terms of a stable level of prices.

The problem of price stability is, for Canada, peculiarly complicated by outside influences and in particular by our close commercial and psychological contacts with the United States.

A national effort aimed at stabilisation of prices and avoidance of the cycle of boom and collapse requires more than the co-operation of prudent and far-sighted groups. Broader forces must also be brought to bear and, under conditions as they now exist, the role of fiscal and monetary policies in relation to the price level takes on a renewed and vital importance.

Mr B. C. Gardner, general manager, in the course of his remarks, said:—Total assets at the year-end amounted to \$1,898,000,000 compared with \$1,844,000,000 at the end of the previous year. The levelling off in these figures in contrast to the expanding trends of recent years is, in my view, a healthy development having regard to the background of economic events. Notice deposits at \$904,000,000 compare with \$814,000,000 at the end of the previous year. Deposits abroad at \$147,000,000 are slightly higher than the figures for the previous year.

Total deposits at \$1,783,000,000 compare with \$1,736,000,000 at the end of the previous year. Government deposits at \$101,000,000 show a reduction of \$17,000,000. Demand deposits by the public in Canada at \$577,000,000 are lower by \$32,000,000.

Current loans and discounts in Canada at \$382,000,000 have increased substantially over last year's figure of \$277,000,000. The increased loan requirements of almost all types of business reflect the more normal use of bank credit for the manufacture of goods and the movement of raw materials as well as the higher level of prices. While the general level of inventories does not appear to be out of relation to the volume of sales, there are signs that a careful scrutiny of commitments is essential in many lines.

The volume of banking transactions continued at a high level throughout the year. There has been a substantial increase in the number of current and savings accounts, and we have now more than 1,600,000 deposit accounts in our Canadian branches.

The report was adopted.

ROAN ANTELOPE COPPER MINES LIMITED

The twentieth annual general meeting of Roan Antelope Copper Mines Limited, was held on the 30th ultimo in London.

Mr R. L. Prain, O.B.E., managing director of the company, presided.

The following is an extract from the statement of the chairman, Mr A. Chester Beatty, which was circulated with the report and accounts for the year ended June 30, 1947:—

The main feature of the year was the continued shortage of coal due to the inability of the Rhodesia Railway to carry all our requirements. This situation has been and continues to be most unsatisfactory, and in order to supplement our coal receipts we have had to resort to importing coal at high cost through the port of Lobito Bay, and to extensive burning of wood.

COPPER PRODUCTION AND COSTS

The production of blister copper was 49,641 tons compared with 53,489 tons in the previous year and the cost per long ton f.o.b. Beira increased by £9 3s. 8d. per ton.

The average price received for our product was £80 10s. 8d. per long ton of blister copper f.o.b. Beira, so that our margin between costs and revenue was £28 10s. 4d. per ton, compared with £15 10s. per ton for the previous year.

THE YEAR'S RESULTS

The gross surplus was £1,485,675; to this has to be added interest earned during the year, and deducted the London expenses and loan stock interest: there is a balance of £1,396,668. We have deducted £350,000 as a transfer to the replacements and obsolescence reserve, an increase of £50,000 on previous years' provisions.

Provision for taxation on the profits for the year amounts to £627,000, leaving a net profit of £419,668. After deducting £51,000 transferred to loan stock redemption reserve the net balance for the year is £368,668, which, with £156,828 brought in, makes a sum of £525,496 available for distribution. The directors recommend a dividend of 9d. per share, less tax at 9s. in the £, which will absorb a net amount of £411,936, reducing the carry forward from £156,828 to £113,560.

EFFECT OF INFLATION

I wish to draw attention to the effect of inflation which is to be observed in these accounts, as, for instance, in the increased cost of our operating materials and supplies and in the greatly increased cost of our replacement equipment now on order. When we compare the value of the £ sterling at the time when the mine and plant were developed and built with the value of the £ sterling today, we are forced to the conclusion that the conventional system of presenting accounts and arriving at a profit for the year must inevitably lead to a distortion of relative values. The profit earned today in £'s sterling of current value is inevitably compared to the capital invested in the business at a time when the £ was worth very much more and the result is bound to give a misleading impression of the real earning power of the business and of the return on the capital employed in the business.

Ore reserve at June 30, 1947, was estimated at about 98,000,000 short tons of ore containing 3.27 per cent. total copper, of which 0.08 per cent. was oxide.

While the major development work was maintained at a satisfactory rate, the reserve of fully developed ore was barely maintained, due to labour shortages caused by strikes and the fuel situation.

The effect of our continued policy of selling production forward is that although the world price has fallen the average price receivable per ton for our production for the first half of the current year will be considerably higher than that for the year under review.

The report and accounts were adopted.

MUFULIRA COPPER MINES LIMITED

The eighteenth ordinary general meeting was held, on the 30th ultimo, in London, Mr R. L. Prain, O.B.E., the managing director, presided.

The following is an abridgment of the statement by the chairman, Mr A. Chester Beatty, for the year ended June 30, 1947:—

The main feature was the continued shortage of coal due to the inability of the Rhodesia railways to carry our requirements. To supplement our coal we had to import coal at high cost through Lobito Bay and to burn wood extensively.

PRODUCTION AND COSTS

Production was 47,498 long tons, compared with 50,040 tons for the previous year.

The average cost per long ton f.o.b. Beira increased by £5 4s. 8d. compared with the preceding year. The average price received was £83 7s. 7d. per long ton f.o.b. Beira, our margin between costs and revenue being £34 17s. 4d., compared with £15 0s. 7d. per ton for the previous year.

The gross surplus was £1,771,062, and after adding interest earned and deducting London expenses and loan stock interest there is a balance of £1,692,922. After transferring £300,000 to replacements reserve, an increase of £100,000 on previous years' provisions, and providing £822,000 for taxation there is a net profit of £570,922.

The City Commissioners have decided that our method of valuing stocks does not give a true statement of annual gains for tax purposes. In effect, they held that the gains should be calculated by reference to sales—and not production; and that stocks should be valued with reference to the actual cost and not a "standard" cost. The company has asked the Commissioners to state a case for the High Court.

Deducting £35,700 transferred to loan stock redemption reserve and adding £330,456 brought forward, there is a sum of £865,678 available for distribution. While there has been a great increase in our gross surplus, this has been absorbed very largely by taxation. The recent increase in profits tax has increased our tax liability by £81,000, and this has made our profit lower than that for the previous year. In spite of this the directors, having regard to the current favourable conditions and the fact that a considerable sum was added to the carry-forward for the previous year, have decided to pay a dividend of 5s., less income-tax at 5s., reducing the carry-forward to £193,458.

RETROACTIVE TAXATION

Retroactive taxation has hit us severely. It has always been regarded as one of the fundamental principles of taxation that it should be certain, and it is most disturbing if we are to be faced with a policy of creating new retroactive liabilities which render incorrect the accounts which we have prepared on the basis of the then existing law.

Another feature is the effect of inflation. The profit earned today in £'s of current value is inevitably compared to the capital invested in the business when the £ was worth more, and the result is bound to give a misleading impression of the real earning power of the business and of the return on the capital employed.

The estimated tonnage of ore reserves at June 30 was 134,571,000 short tons containing 3.84 per cent. copper.

The mine is in a position to produce 6,000 long tons per month, provided adequate coal and labour are available. It is expected that this capacity will be increased to 7,500 tons by the end of the present year.

The report and accounts were adopted.

TRADE OPPORTUNITIES**Australia and New Zealand**

Australia, New Zealand and Fiji are rapidly developing overseas trade connections.

BEDFORD COLLEGE FOR WOMEN

(UNIVERSITY OF LONDON) REGENT'S PARK, N.W.1.

The Council of Bedford College invites applications for the post of Secretary of the College, vacant as from 1st October, 1948. The post is open to women only, and the appointment will be made at a non-resident salary of £1,000-£1,200 per annum according to qualifications and experience. Candidates must hold a University degree. Last day for the Secretary.

IMPERIAL Chemical Industries, Ltd., Explosives Division, require a statistician to work at the undernoted address. Applicants should be aged 25/35, preferably have some industrial experience, able to forecast market trends. Salary commensurate with qualifications and experience. Applications to the Staff Manager, 25 Bothwell Street, Glasgow, C.2.

Freedom and Order

MR ATTLEE was more effective in his party broadcast of last Saturday than in any of his previous radio speeches since he became Prime Minister. What hit the headlines in the speech was his criticism—surprisingly harsh for him—of the Communists. But there was another aspect of the speech—indeed, its main thesis—which has not received the attention it deserves. This was partly due, no doubt, to the fact that its subject was the well-worn one of freedom and order in the democratic society and that much of what the Prime Minister had to say was the accepted currency of almost all schools of thought in this country. No one nowadays is startled to be told that, while Russia bases its economy on order with no freedom, and America on freedom with no order (a false picture of America, this, but one that Americans themselves love to paint), Britain must seek a middle way, "a system of a new and challenging kind, which combines individual freedom with a planned economy, democracy with social justice." There is, indeed, a very large measure of agreement on the desirability of a middle course for Britain. There are very few who would deny the need for a considerable measure of intervention by the state to ensure the stability of the national economy, to secure a standard of individual welfare and to regulate the external relations of the economy. Many would go further than this; but nearly all would go as far. And on the other side, equally few would push their advocacy of the planned economy to the lengths of turning it into a police state.

Underneath this widespread agreement, however, and largely concealed by it, there is still a most important conflict of principle. Granted unanimous agreement that what is needed is a reconciliation of authority and liberty, it is still possible to differ diametrically on the nature of the reconciliation to be aimed at. One conception is that, over the whole economy, in every form of activity, there should be an attempt to inject some element of order and to preserve some freedom of choice. No form of economic activity, anywhere in the economy, should be run on *laissez faire* pure and simple; no businessman should be allowed to operate without some form of control upon his actions; and conversely, the intervening power of the state should never be pressed so hard that it seriously discommodes the organised interests of those who are concerned. The other conception is that there should be a demarcation of spheres and that, without banning liberty from the one or authority from the other, there should nevertheless be only one dominant principle in each. Where the decision is reached to run, say, education on a non-economic basis (that is, without making it cover its costs) social considerations should be given a clear paramountcy over economic; but where another form of activity is to be left to the individual management of private incomes, these motives should be constrained by as little interference as possible. The second conception is of a society that recognises the difference between red and white; the first is of a society that is pink all over.

There ought to be no room for doubt which is the more appealing conception. The disadvantages of a society which seeks

to control virtually all activities, while taking the responsibility of initiative in none, can be seen today on every hand. The difficulty about any such conception is that freedom and order, however much it may be desired to reconcile them, are in fact conflicting principles. Each provides its own kind of incentive. Each, within its own limits, will work. It is possible to run an economy on the motives of a free system, on the hope for gain and the fear of loss. It is possible to run parts of an economy, and it may be possible to run a whole economy (though the Russians, the only people to make the experiment, have abandoned it) on the principle of "from each according to his means, to each according to his needs." But if the two sorts of motive power are introduced into the same problem at the same time, they will merely frustrate and oppose each other, as they are frustrating and opposing each other all over the economy today.

Nevertheless, in spite of all this evidence of the dangers of a dilute and frustrate mixture of authority and liberty, this seemed to be the conception that Mr Attlee favoured. He went out of his way to mock at Mr Churchill's admittedly sketchy outline of a discriminating system.

The Conservatives have reached the point of conceding the need for a minimum standard of life, but above that there is to be a scramble for the surplus.

No doubt many people would want to put far more into the "socialised sector" than Mr Churchill would accept. But surely, as a basic idea, the concept of a clear distinction between a socialised sector and one open to healthy individual enterprise (the polite version of "a scramble for the surplus") is a far more attractive one than the alternative of a dead level of frustrated equality. Mr Attlee made much of the necessity for political freedom. But as soon as it becomes difficult for a man who holds unpopular views to earn his living, political freedom is endangered; and the more planning there is, the more will nonconformity be penalised. Moreover, the planning and controlling resources of the state are strictly limited, and if they are spread thin, the planning and the controlling will be slow, stupid and ineffective. Of that also there are examples in everybody's daily experience. Those who wish to see a success made of the planned economy ought to be the most anxious to see its ambit reduced to a few essential functions, where planning can be intensive and intelligent.

★

Stated in abstract terms, this may seem to be a remote issue. But it is really at the heart of the practical politics of the moment—or if not of the moment (for the pressure of external events leaves little room for any deliberate policy), then of the immediate future. It will be at the centre of the stage just as soon

Local Currency Funds

AN interesting ceremony took place in Paris on January 2nd when Mr Caffery, for the United States, and M. Bidault, for France, signed the Interim Aid Agreement, by which France is to be given an undisclosed number of dollars—believed to be in the neighbourhood of \$300 million—to tide the country over until the wider Marshall Plan can come into operation. The interest of the occasion did not, however, lie in the actual signature of the Agreement, for the fact that it would be signed had been certain for some time. The interesting point is the possibility that the terms on which Interim Aid is being extended may to some extent set a precedent for the larger plan to follow. If this should be the case, the precedent is a favourable one.

as decontrol becomes a practical policy. The Socialists tease the Tories at present by asking them to name the controls they would abolish now. But the question can be thrown back with some justice. Are the Socialists really sincere when they say they hope eventually to dismantle part of the wartime structure of control? They do not give that impression. When one of their Ministers restores free trading in any corner of the economy, as Mr Strachey did recently, he is attacked, on principle, by his own party. The attitude of far too many Socialist MPs to the businessman is to "find out what he is doing, and tell him not to." The Socialist movement is not at present prepared to take over the responsibility and the initiative for more than a corner of the economy. It is not prepared to provide an alternative motive power in the great mass of economic activities to that provided by private enterprise. Does it really just how much damage it will do if, over four-fifths of the national economy, it consistently applies the brake to the only motive power there is?

It is wrong, nevertheless, to criticise the Labour Party only because it does not see enough value in economic freedom. It can also be criticised because of the timidity of its ideas about the part that economic authority can play. A member of the wartime Coalition Cabinet once remarked in public that if he was asked whether Britain required more freedom or more order in its economic affairs he would reply that it needed a great deal more of both. That is the right approach. There is a great scope for much more courageous and forthright planning than there is today. The great nationalisation schemes have no justification at all unless they result in some farsighted policy being followed that was not possible under conditions of private enterprise and the commercial-matching of costs and revenues. Where the state can really make a difference by intervening, it will receive plenty of support from public opinion for going ahead with courage and determination. But where it cannot supply the initiative and take the responsibility, the task of the next few years should be to cut down its interventions to the irreducible minimum.

The British people do not yet realise how fast they will have to run in the next few decades merely to keep their place among the nations of the earth. Never was there a greater need to preach the doctrine of liberating motive powers and taking the brakes off all forms of economic activity. There is no single motive power, but several, each appropriate in its own sphere. Let the social motive be exploited to the full wherever it can operate to advantage. And where the only conceivable motive powers are those of individual enterprise, let them also be encouraged. It is by this means, and not by the rancorous jealousy of dead-levellism, that it will be possible to achieve "a new conception of society, with a dynamic policy in accord with the needs of a new situation."

It is clear that the United States is not imposing onerous conditions. The French are free to spend the dollars as they think fit, although the United States administrators preserve a certain right to see that the purpose of Interim Aid—which is unequivocally relief—is not abused. The French Government is also free to spend the dollars in countries other than the United States. There is, however, one condition of real importance attached to Interim Aid, which, to judge by the proposals put forward for the full Marshall Plan by President Truman and by the views of so influential a Congressional body as the Herrer Committee, will almost certainly be incorporated in the final plan. This condition is that the French Government

should agree to establish a special fund with the Bank of France, and pay into it all the francs it earns by selling goods secured with America's free gift of dollars. This fund may be used to retire the French national debt, or to withdraw currency from circulation; other uses, which must be mutually agreed between the two Governments, might cover methods of stabilising the franc. A small part of it will be devoted to defraying any costs of administering the Interim Aid that are incurred by the United States in francs.

The idea of creating local currency funds out of money earned from the sale (by governments) of freely supplied American goods is not new. The agreement between the Italian Government and Unrra, for instance, provided for the establishment of a Lira Fund from the proceeds of the sale of Unrra goods. More recently, the Herter Committee carried the idea considerably further by proposing, on the one hand, that each of these "local currency" funds should be put under the control of a mixed board of trustees, part local, part American (with the Americans in the majority) and, on the other, that their purposes should be extended beyond purely financial transactions. For instance, a local currency fund might be used to finance necessary public works, or to expand the production of those local raw materials of which the United States is likely to be in some need in years to come. The President, in his recommendations to Congress, adopted a part of these suggestions; he proposed a fairly wide range of objects of expenditure, but he did not call for the appointment of trustees and left the actual expenditure of the funds to be agreed between the local government and the United States. It can perhaps be safely assumed that, since President and Congress seem agreed on the desirability of setting up local currency funds, a provision to this effect will be incorporated in the final Act.

★

It is easy to see why this conjunction of opinion has come about. The project has both logic and obvious attractions. The creation of funds in local currency to equal the sales made by governments of freely supplied American goods can, if these funds are at least under partially American control, make the reluctant Congressman and the reluctant American taxpayer feel that they are getting something for their dollars; they are not getting dollars, but they are getting some other kind of money. The rightness of any proposal to use Marshall Aid for the purpose of reducing inflation and increasing financial stability is almost too obvious to need argument. In most Western European countries, purchasing power is far in excess of available supplies and, if the sale of dollar goods can be used as a species of sponge to mop up some of the surplus local currency, the result cannot fail to be beneficial.

The present conditions of inflationary pressure, however, are not likely to last for ever, and one of the attractions of the proposals for a currency fund is that the reserves thus created might be used with good effect at some future time of deflation, when the problem will be not the excess of demand but the failure of demand to take up the slack of manpower and resources. In these circumstances, governments have in the past shown some timidity in the financing of large projects for public works or reconstruction and the opening up of new resources. The existence of large funds specifically designed for such purposes—combined, no doubt, with the American desire that they should be usefully employed—would tempt the local government to act in times of depression and could be a factor making for greater stability in the economic life of Western Europe. Visionaries go so far as to suggest that such local currency funds might, by agreement between the governments of the Sixteen Nations, be held in trust by all of them for projects of interest to Western Europe as a whole—hydro-electric development, for instance, improvements in transport or the joint financing of schemes for increasing the supplies

of foodstuffs and raw materials from Africa. The existence of such funds might breathe some life into the idea of an international full-employment policy.

★

Yet, attractive as some of these possibilities may be, they cannot mask the very real difficulties that would arise from the existence in each of the Western European countries of large funds owing their origin to American action and under some degree of American control in their expenditure. The chief difficulty is probably political. The United States and each of the Sixteen Nations are only on the verge of their Recovery Plan. They have yet to learn how delicate are the problems raised by the direct intervention of one nation in the economic life of another, how vulnerable the intervening government becomes, how sore and unreasonable the nation in which intervention takes place. These facts cannot be shirked, for some intervention there must be. A state cannot prepare to give away over four billion dollars in fifteen months without interesting itself in the results. But the path of wisdom is to confine direct control and intervention to the absolute strategic minimum and to avoid at all costs subsidiary essays into management and control which are not essential to the broad purpose of the plan, and can only create irritation and resentment. These precautions are especially important in Europe itself, where the Communist slogan of "American imperialist intervention" is already being daubed on the walls.

Nor are all the risks simply those of political psychology. If these trust funds were taken out of the control of the local government, it would be surrendering an important part of the reality of its sovereignty as well as the appearance. All European countries are committed to a policy of economic stabilisation, for which the main instruments must be found in controlling the flow of monetary funds, especially the flow of savings into capital. How could such a policy possibly be pursued if there were large funds in existence—and the "local currency" funds will be very large—which could be spent, or withheld from spending, outside the control of the stabilising government?

There are thus reasons, both of reality and of prestige, for approaching the subject with caution. It is tempting to say, from the European point of view, that, for reasons of political psychology, any local currency funds must remain the property of the local government, with no American trustees, and that the needs of economic policy similarly require that both the initiative and the final decision in any use of the funds should lie with the local government. The European government, in this view, should be prepared to agree in advance what categories of expenditure were proper to be met out of the fund, and it should keep the United States fully informed; but there should be no parting with either possession or control. This is an entirely reasonable view. There must, in any case, be a number of American administrators and watchdogs overseeing the broad development of the Recovery Programme, but it should be a point of principle to keep them to a minimum. The local funds are a side issue compared with the general development of the Plan and side issues should not be allowed to generate avoidable friction. Since, in the present inflationary state of Europe, the spending of the funds would in any case have to be postponed for many years, the placing over them of American trustees, particularly of trustees with a deciding vote, might bring about the almost ludicrous prospect of American delegates deciding in ten years' time whether France might reasonably electrify Morocco or Britain build the Severn Bridge.

★

But to develop this argument may be to reckon without the host—the host who provides all the good things from the sale of which the local currency funds will arise. What becomes of the argument that the Americans are getting some financial

return for their dollar outlay, if it is made clear that they are to have neither ownership nor control of anything? For psychological reasons, it seems important to Europeans that ownership should rest with them; but for psychological reasons it may seem important to Americans that there should be the symbolic gesture of a transfer of ownership, if not to the United States Government, at least to a body of impartial trustees.

There are all the makings here of an unfortunate clash of opinions and a compromise will have to be very carefully worked out. Such a compromise should not be impossible. The matter of who has title to the funds is of importance to the European governments; but their real interest is the use that can be made of them, in what conditions and on whose initiative. It may be that the Americans, on the other hand, are more interested in the formal legalities of ownership. There is the outline of a bargain here. But it is quite clear that there will have to be a very precise codification of the purposes for which, and the circumstances in which, any local currency funds can be spent—and the precision will have to be greater the further is the departure from complete ownership and control by the local government.

Here also it is possible to see the outlines of a satisfactory agreement by dividing possible forms of expenditure into three categories, the first permissible in any circumstances, the third permissible in no circumstances and the middle one permissible by specific agreement. The first would consist of purely financial transactions, which do not use up any real resources, such as the retirement of debt or the endowment of charitable foundations. There could be very little harm in conceding to a body independent of the local government—such as a board of trustees—the right to the final say (though not, of course, without consultation) in transactions of this kind.

In the second category, expenditure that uses up real domestic resources in the local country, the greatest weight in the actual decision on the timing, the scale and the actual form of such projects, would have to be left to the local government, since it

would be compelled to abandon all thought of rational economic planning, if the distribution of its national resources were not under its own control. Particular care would have to be taken with any proposal to use the funds to finance long-term projects of capital development.

The most important constituent item in the third category, consisting of those forms of expenditure that should not be permitted, is anything that would limit or reduce the local country's dollar-earning capacity. The various projects to use local currency funds for increasing America's supplies of raw materials would probably come under this ban. If, in ten years' time, America can buy tin with what would virtually be blocked sterling, then in twelve years' time, Britain will need another Marshall Plan. It is precisely the inability of the European nations to earn enough dollars that makes assistance necessary now. Any project which now or later reduces Europe's capacity to earn dollars will ensure the failure of the whole recovery programme. The local funds might indeed be used to finance domestic capital projects designed to secure an expansion of output of raw materials, but the output itself would need to be paid for in dollars, if it were to make any contribution to Europe's genuine recovery.

It is difficult to avoid the conclusion that the more the establishment of local currency funds can be governed by very simple and very direct conditions, the happier the consequences, both political and economic, are likely to be. It may be that the Americans will be content to leave the matter where it stands in the French Interim Aid Agreement, which confides the local currency fund, without trustees, to the Bank of France and virtually limits its functions to those of countering inflation. If this is the American decision, it is one that Europeans can applaud, not wholly out of self-interest. But if there is pressure from Washington for something more, the whole subject will have to be most soberly examined. It will be a disaster if there is any premature mounting of high horses on either side of the Atlantic.

Canada's Problem—III

Canada's Economic Future

(From Our Canadian Correspondent)

FROM the confusion surrounding Canada's new controls, and from the political controversies about their form and purpose, one central question emerges: is the dollar shortage temporary or permanent? This question is really a superficial way of posing a much more basic one: is the Canadian economy suited to the postwar world, or does it need a fundamental shift of trade and of industry? If the economy is well adapted to the postwar world, the dollar deficit will automatically disappear. In one way or another, Canadians will earn (or borrow) abroad enough money of the right sort to cover their foreign spending (and lending).

Official speeches by Cabinet Ministers show some apprehension that the problems they face are more than temporary. Part of the government's dollar-saving programme involves changes in Canadian industry; more manufactures are to be exported to the United States and less materials and components are to be imported. But the same Cabinet Ministers, when they are not speaking from or for the record, are apt to be naively optimistic; they hope to start taking controls off in a matter of months and show no willingness, let alone any desire, to face the future frankly.

Sober reflection suggests, surely, that Canada's present difficulties are permanent; that some very far-reaching changes in

trade and production are needed. It is not just a matter of tiding over a few months until the Marshall Plan comes into full operation; even if the Plan succeeds in its purpose of European Recovery this will not mean that Europe, including the United Kingdom, will be able to buy as much from Canada, and on the same sort of terms, as before the war. Nor does it mean that other countries like Argentina and Australia, whose prosperity before the war was always based on sales of food and raw materials to England and Europe, will be able to buy as much from Canada. For the indefinite future Canada's customers in Europe and elsewhere will not be able to pay in US dollars or, if at all, in limited amounts. "Convertibility of sterling," which had a month of life in the middle of 1947, is dead and shows no sign of complete resurrection. What, then, will Canada do?

The great dilemma can be put in a very simple—over-simplified—form. Will Canada shift its exports, sending less to the United Kingdom and other soft-currency countries and (if possible) more to the United States; or will it shift its imports, buying less from the United States and (if possible) more from other countries?

In the immediate dollar crisis the second alternative—the shift of imports—has been used. But all Canadians, not only Cabinet Ministers, recoil from the idea that import restrictions

against American goods should become permanent. The American way of life, or more accurately the North American standard of living, is too deeply ingrained in Canadian standards of consumption and ways of business and processes of production; to cut off imports of American products or components permanently is unthinkable. Every American magazine, every American radio broadcast, every American visitor, that comes across into Canada helps to mould Canadian minds into thinking that anything much less lavish and luxurious than American standards is intolerable. Thus the social pressure, which underlies the economic pressure, to accept the first alternative and reject the second is very strong.

It is these same pressures that limit Canada's ability to import more from the United Kingdom. Of course, Canada is ready and anxious to take a lot more than is available from Britain just at present, especially in the form of textiles, which have been the subject of recent discussions between the two governments. But Britain could never, in the foreseeable future, export nearly enough to Canada to pay for its pre-war or post-war imports from Canada. The consumer-preference and industry-preference in Canada for American-type goods is too strong; over a wide field, and on the basis of any probable prices, British goods are not acceptable substitutes for American goods. Canada's international balance of payments will not be corrected by importing a great deal less from the United States and a great deal more from the United Kingdom.

Thus, in seeking a long-term solution for Canada's problems, we are thrown back on the first alternative: the shift of a substantial volume of exports away from traditional markets such as Britain and towards the United States. This alternative is easier to applaud than to achieve. There are many difficulties, political and social as well as economic. The first difficulty arises from the fact that Canada is still, despite controls new and old, a private-enterprise country; it lies in the orbit of capitalist America, rather than of socialist England and Europe. The government cannot play a very active part in bringing about a shift of export trade. On the other hand, with most of the rest of the world subject to controls, free market forces, the forces of prices and profits, cannot be relied on very far to accomplish the shifts. There is little *prima facie* reason, with prices and exchange rates as they are in the world today, why exports to the United States should be more profitable than exports to other countries. Nor will a depreciation of the Canadian dollar alone help. It would, in some degree, encourage all exports; what is needed is a shift, with some increasing and others decreasing.

The problem of decreasing some exports is, for Canada, even more difficult and painful than the problem of increasing others. This was shown all too clearly in the results of discussions with the British delegation in Ottawa last month. The British, in effect, said they could pay out dollars only for wheat and cheese.

The Canadians, instead of jumping at the chance to divert cattle and hogs and dairy products to the United States, resisted most vigorously. In the end they succeeded in forcing these other products down unwilling British throats for 1948 and in getting, for the first three months, payment for about two-thirds of the trade balance in US dollars.

The resistance of the Canadians to cutting down their exports to the United Kingdom was, of course, political not economic. Since early in the war the Liberal party, in the face of increasing Conservative opposition after the end of hostilities, had followed a policy of selling food under contracts to the United Kingdom and charging considerably less than could have been obtained in other markets. Canadian farmers, especially Prairie farmers, accepted these lower prices in return for the promise of one thing: stability. The United Kingdom was going to provide a steady market for Canadian foodstuffs. No longer would Canadian farmers be subjected to the uncontrolled fluctuations of boom and depression, to the unrestricted forces of supply and demand. The new era was symbolised in the closing, early in the war, of the Winnipeg Grain Exchange.

If the British contracts were abandoned and foodstuffs, including wheat, were sold freely to the United States, the Grain Exchange would no doubt be reopened, the Federal Government would no longer be responsible for the welfare of Canadian farmers, and, worst of all, the farmers would be thrown on the mercy of the American market and the American Congress. Experience, gathered from the Fordney-McCumber tariff of 1922 and the Smoot-Hawley tariff of 1930, showed that no stability could be relied on in that direction. So it is natural enough that the Liberal Government, particularly those members of it who were chiefly responsible for persuading Canadian farmers to accept the low prices on the contracts with the United Kingdom, are most unwilling to see the contracts disappear and to revoke the associated export controls which prevent Canadian produce from being sold at high prices in the United States.

Nevertheless the government, or rather its officials with its full approval, have paved the way for some, perhaps all, of the needed shift of exports. This was done during the trade negotiations at Geneva. In those negotiations, most of the American tariffs on the products of Canadian farms, forests, and fisheries were reduced by one-third to one-half. Broadly speaking they are now back where they were before 1914. Ultimately, and perhaps in the not far distant future, Canada will have to take advantage of these US tariff concessions. They offer by far the most important means, by far the easiest means, of readjusting Canadian exports to postwar needs. With the high prices at present prevailing in the United States, this is one field where the profit motive will do the trick; all that is needed is to take off existing export controls. Unfortunately these controls not only serve to direct exports to the United Kingdom, they also keep prices low for the Canadian consumer. This is a further

reason why the government is putting off the evil day when economic realities are translated into political realities, when exports move freely to the United States and when Canadian prices move up into normal relationships with American.

Meanwhile, insistence on selling more food to soft-currency countries than they can really afford to buy is likely to have repercussions in unexpected quarters. Before and since the war Canada has built up a large volume of exports of American-type manufactures—radios, refrigerators, stoves, motor cars, tyres, shoes, dresses and so forth. Most of these manufactures have gone to soft currency countries; indeed, the trade has been largely built up as a result of Empire tariff preference. This preference was saved, at Geneva, from American attempts to get rid of it and thus these Canadian export markets were saved too. However, if Ottawa insists on selling excessive amounts of food to soft currency countries, they will have to cut even further than at present the amount of Canadian manufactures they will accept. Canadians who find their markets abroad further reduced by import restrictions in those markets should protest, not to the other Empire capitals, but to Ottawa.

The prospect of selling large amounts of Canadian manufac-

tures—either complete or in bits and pieces—to the United States does not seem very bright. The Minister of Reconstruction will no doubt do what he can to promote it, but his success in selling war supplies to the US Government (and thereby remedying the wartime shortage of dollars) is no measure of what he can get American industry to do in peacetime. There is not the same wartime incentive. Moreover, he was able to get the US Government to abolish all tariffs on war supplies, but there is (as the Geneva discussions indicated) no likelihood whatever that it will abolish tariffs on manufactured goods. If Canadian exports of manufactures are to be maintained they must continue to go to soft-currency countries.

One is forced back to the position that Canada must, for the foreseeable future, come to depend much more heavily on exports to the United States of the products of farms, forests and fisheries. The American market has proved unstable in the past; it may prove so again. But the British market, and other traditional markets abroad, must prove unstable. They cannot afford to pay the amount and the kind of money that Canadians will, in the long run, insist on getting.

(This is the last of three articles)

Towards a Bill of Human Rights?

(By a Correspondent)

THE fifty-seven member governments of the United Nations have just received three new documents on Human Rights. Fifty-seven sets of comment will, or ought to, emerge from this operation. Any wideawake state will find some room for criticism. Yet all are likely to admit that, with only two sessions behind it, the Human Rights Commission which they elected has made a brave enough start with its job.

The nature of some of the comment is not difficult to forecast. A preview of the principal schools of criticism was to be had at the meeting of the Human Rights Commission at Geneva in December. Broadly speaking, three main currents of opinion there moulded the documents that have now emerged. One sprang from the small states. Admitting that the protection of human rights is nearly always (though not, as the Russians would have it, quite always) synonymous with equality of treatment, small states find it easier than large ones to think generously about the subject. This is natural. Small states tend to harbour less variety in the shape of backward peoples, minorities, plural races and the like. They can couch their declarations in sweeping terms. Their tug in this direction—often successful—was manifest at all the recent meetings on Human Rights. They worked in obvious fear lest the Bill should be bereft of all idealism and be reduced simply to the lowest common multiple of concessions which the larger states felt able to make. Some of them are bound to go on criticising the final document on this score.

A second school of critics consists of the Russian bloc. Its members maintain a constant pull towards economic and social rights, and away from political ones. Here again the reason is obvious. They can without effort express the former in terms of their own constitutions. But political rights are agreeable to them only when the politics are agreeable. In a word, it is not rightful to use one's freedom of speech to preach violence against Stalin, but rightful to do so against General Franco.

A third school of thought, led by Great Britain with the United States in support, argues that if the ultimate Bill is to be of any use at all, the maximum possible number of its provisions must be codified into a Covenant of legal obligations, which shall both become a permanent part of international law

and be embodied in the domestic law of signatory states. The British school admits that many important rights—the right to education, for instance, or to freedom from want—cannot of their nature be forced into the Covenant. It admits that they must remain in a vaguer and unenforceable Declaration. But it opposes the Russian bloc, which says that a Covenant is premature until the Declaration is completed. The Russians seek to make the Covenant ultimately unnecessary by framing the Declaration as widely as possible, and by adding to it an international undertaking that anyone guilty of discrimination in any form is committing a crime and must be punished for it.

The documents born of these three currents of opinion are, therefore, a Covenant, a Declaration and a paper on implementation. The first has been described above; it covers legally enforceable rights ranging from *habeas corpus* and the right to a fair trial to that of "freedom of religion, conscience and belief." The Declaration is, by contrast, a statement of ideals. Some of these are already realised in most parts of the world. Others amount to aims designed to educate mankind to better practices. It contains articles providing man with the right to nationality, to sanctuary, to work and rest and leisure, to think what he likes and to say what he thinks. The chief defect of the Declaration as at present drafted is that it is much too long. Partly out of idealism—which could afford to be generous in an unenforceable document—and partly as insurance against the Russian view that there need be no Covenant, it is repetitive. It makes too many points that are better made in the Covenant. It can do with a deal of pruning if the latter survives.

Disagreement over the terms of the Covenant might, of course, never come into the open if it were not for the question of enforcing it. Here, what divides the states concerned into two schools of thought is not a mere line across central Europe, but a gulf of years. The difference between them is that of degree of maturity. On one side of the gulf are ranged states that feel sufficiently sure of themselves to cede a measure of sovereignty in order to better the lot of mankind throughout the world. On the other are a set of states—consisting chiefly

of the Slav bloc—that is ready only to "declare" human rights, much as they were declared in the Virginia Assembly of 1776 or the French Constituent Assembly of 1789. This group is still too jealous of its sovereignty to admit the newer conception that international machinery of enforcement is desirable.

This attitude is not unfamiliar and should not at once be treated with suspicion. Something very like it is displayed by other powers who are responsible for the welding together of mixed populations, and for bringing backward peoples to economic as well as political maturity. Such was the attitude of Great Britain, when at the 1947 Assembly it resisted attempts by India, backed by the USSR, to widen the Charter so as to cause it to cover routine international inspection of non-self-governing territories. At the same time, there is a difference between the British and the Russian attitudes. The difference is that, in the event of a claim that the Covenant of Human Rights has been infringed, the more mature British are ready to admit the intrusion of international machinery into their domain. The Russians are not.

By far the greater majority of members are in favour of implementing the Covenant. Some of them, notably the Australians, the Belgians, the Indians, the Lebanese and the British, have already put forward concrete suggestions for the procedures involved. These are contained in the third document—the proposals for implementation—now on its way round the world. It has so far received far less thought and study than either of the other two, and therefore merits the fuller consideration. There is general agreement that a breach of Human Rights can be aired internationally in one of two ways. Either it can be raised as an issue between state and state, or it can become the subject of a petition to the United Nations from a group or an individual. The former method offers relatively few procedural difficulties. It can be raised in the Assembly, as India raised its case against South Africa in 1946. It can with ease be limited to states signatory to the Convention. It can—since it would invariably involve the breach of an international legal obligation—be referred without difficulty to the International Court of Justice if an impartial legal opinion is required. Petitions from private groups or from individuals present a more difficult problem. They are piling up in the Secretariat's files. Who is going to decide whether they are valid, and merit an international hearing? Who is going to say whether the address of the petitioner shall be passed to his government which might, of course, put his wrongs right, but which might, on the other hand, punish him for telling tales? Who is going to say that only the nationals of signatory states may petition, and therefore to deny redress by international action to stateless persons—perhaps the category of human beings to need it most?

The whole subject bristles with difficulties. Nevertheless some useful suggestions have already been put forward. Most of the advocates of implementation agree that, given certain hard and fast rules about receivability, the United Nations Secretariat can be left to filter the petitions received—to sort those which are trivial from those which merit an international hearing. There is a measure of general agreement on several other points: that the Secretariat's first task shall be to communicate any petition of substance to the Government arraigned; that since a breach of international law is involved, provision must be made for reference, at all relevant stages, to the International Court; that, failing domestic redress at this stage, some international body junior to the Assembly must be charged with trying to remedy the ill by negotiation between the plaintiff and the state accused. There is, rightly enough, much doubting and debating upon the nature of the international body which shall try to negotiate a settlement. The document on implementation now in circulation calls it a "Standing Committee of the Economic

and Social Council." If it is to be this, it will consist of men representing their governments, some at least of whom may tend to judge cases on their political merits. Why should not the Human Rights Commission, which, under its present terms of reference, will become *functus officio* when it has drawn up its Bill, be transformed into a panel of experts appointed by the International Court of Justice and charged with this interim job of hearing and negotiation? Some such scheme as this was proposed by India (which has distinguished itself by sending delegates of real quality both to the Human Rights Commission and to its sub-commissions) and the Indian proposal, though it contains flaws, is likely to attract attention and support because it avoids the institution of a special Court of Human Rights. Many countries feel this last to be too great an innovation at the present untried stage of the affair.

If the new Human Rights Commission were given this duty, it would enable the individual petitioner, at the appropriate stage, to drop out and—if other means of securing redress have failed—his place could be taken by a representative of the Commission, who would turn official prosecutor before the Assembly. For if a petitioner's complaint has substance, there is every advantage to be gained in switching the side lines on which his procedure runs on to the main lines of procedure for dealing with allegations made by state against state.

Here is plenty of food for thought by governments. All would be at a great advantage if they were simultaneously able to consider the new Soviet Declaration of Human Rights which the Russians, who failed to vote in the end for the Declaration and opposed the Convention, have promised to submit in 1948. It is possible to foretell much of what that Declaration will embody; it is not possible to foretell how far it will go to meet the views of the rest of the world with which the Russian delegates to the Human Rights Commission have become familiar. Until it comes to hand, no government can finally make up its mind upon two questions which govern all planning for the future. Is it worth watering down the project for a Covenant that can be implemented and enforced in order to secure universal acceptance for a general Declaration? Or is it better for men of like mind to set up their international machinery, in the places where it will work forthwith, and to hope that, later, others will see virtue in it and adopt it? One reading of the promised Soviet Declaration should serve to show what the answer of the rest of the world must be.

The operating efficiency of the only section of the Corporation's work that is at all adequately equipped augurs well. But Constellations cost dollars. The costly dilemma of British air transport, which has undoubtedly been aggravated both by ill-luck and also by cumbersome supply policy, is thus underlined. Shall the Corporation be put on a sounder basis by the expenditure of scarce dollars? The reported plans to acquire on favourable terms Canadian-built Skymasters with Rolls-Royce engines partly solve the problem. Dollar costs will also be cut by the transfer next year of the Atlantic maintenance base from Montreal to Bristol. But the immediate prospect also would have been brighter, if the promising scheme to fit Bristol engines to Constellation air frames had been adopted, when it became clear that the Tudors would be delayed. Its somewhat peremptory rejection was not due to BOAC. Indeed one of the distressing features about the activities of both BOAC and BEAC is the slight control they have over many essential factors in their operations. Supply policy seems to be the most serious weakness, but the Courtnay Committee is expected to expand its investigations into the production of Tudors to cover this matter. On those matters over which BOAC has almost full control the report unobtrusively makes a remarkable claim. "The ratio of indirect costs [which are defined] to total expenditure is considerably lower than that shown by the available accounts of other operators concerned with a world-wide network of routes of comparable length and complexity." This claim to administrative efficiency could scarcely have been made unless it could be substantiated. It is a welcome omen for the days when operating conditions are more reasonable.

New Anglo-Egyptian Talks?

Great Britain and Egypt, like the brothers in some Victorian novel, often indulge in a certain amount of cutting in the club, but close their ranks whenever their common interests are immediately threatened. Mussolini's attack on Abyssinia created this unity in 1936. The state of affairs in Palestine may do so again in 1948. For the chief common interest of the two countries is tranquillity in the Levant. And this threatens to be disturbed if—when the British forces leave Palestine—that land turns, as is only too possible, into yet another battleground between American money and Russian ideas. Last week's news that Dr Sneh had resigned from the Haganah because the embryo Jewish State was looking west when it ought to be looking east is symptomatic. With other items of the same type, it has provoked Egyptian politicians to some serious thinking.

Some hold Nokrashy Pasha to blame for not seeing this situation looming ahead, and saving himself the trouble of a journey to Lake Success. His failure to make the right forecast sprang from the fact that he—and indeed every politician in all the Middle East—did not believe, until the final vote on partition, that the British were sincere in their affirmations that they meant to go. Now he has to act faster than he need have done.

This is the background to the news that both Sir Ronald Campbell, British Ambassador in Cairo, and Sir Robert Howe, the British Governor-General of the Sudan, have arrived in London for conversations this week. Sir Ronald has in his pocket the new financial agreement between Britain and Egypt (which is discussed in detail in a Note on page 72). The question the two British envoys will now discuss is whether and on what basis political negotiations between Britain and Egypt could be resumed. But in Egypt the question is whether Nokrashy Pasha will survive in office long enough to be the Egyptian negotiator. It is not easy for an Egyptian politician to backpedal. His personal enemies at once accuse him of weakening, and appeal to the volatile Egyptian crowd to turn him out. At present, they have at their disposal the infallible rallying cry that he is "not doing enough about Palestine." But if he were to fall, the only likely successor governments would be bound to feel as he does about Palestinian developments and would probably be no less ready to resume treaty talks with London. This would apply whether he were succeeded by a broadly based National Government or by another minority government headed by some royal nominee. From London's point of view the former would be preferable.

Meanwhile, Nokrashy Pasha is bound to go on proclaiming, as he is doing, that he cannot entertain the thought of a new Anglo-Egyptian treaty while a British soldier remains on Egyptian soil. But it is well to remember that this is not the issue over which Anglo-Egyptian treaty negotiations broke down last March. The British army was then prepared to go, on terms to which Nokrashy's predecessor, Sidky Pasha, had agreed. The only real snag to agreement was the future of the Sudan. Now, however, the fact that Egypt has submitted amendments to the proposals

for a new Sudanese Constitution gives a loophole for reopening the treaty talks on the really decisive issue. It is true that the Egyptians have said, so far, that the amendments must be accepted, but the new situation in Palestine may induce a change of attitude. Thus out of a very doubtful asset—a new period of tension in the Middle East—may spring a new chance for successful Anglo-Egyptian negotiations.

Fighting Ghosts in Greece

The garrison of Konitza has been relieved, but the rebels have vanished into the heights of Mount Grammos whence runs their escape route into Albania. The Greek Army has been unable to surround or capture any large rebel force and must face the fact that, re-armed and re-equipped by their Slav supporters, they may reappear at any point along Greece's northern frontier. The Greek soldiers complain that it is as though they were fighting ghosts.

Unhappily, the relief of Konitza, although its fall would have been a blow, is no positive assistance to the Greek Government. The aim of the rebels is not to take military control of Greece—that they know they cannot do. It is simply to destroy the already rickety economic structure of the country by ensuring that all American aid will be siphoned off into endless mountain campaigns against marauding and vanishing battalions. The rebels can therefore congratulate themselves that their Christmas offensive has had its effect. After a three-hour conference, Mr Griswold has permitted Mr. Sophoulis to devote to military purposes a further proportion of American aid to Greece, so that the army may be increased from 118,000 to 130,000 and the Greek National Guard from 20,000 to 50,000, thus creating a force capable of relieving the regular army of passive garrison duties.

In return Mr Sophoulis has undertaken new measures to deal with inflation, administrative incompetence and the iniquitable distribution of supplies. But behind both his promises and Mr Griswold's concessions lies the problem: will the Americans continue their aid after the expiry of the present appropriation in June and are they prepared to stake sufficient in Greece to see the situation stabilised? The despatch of some well-armed marines to the American Mediterranean task force may give comfort to the worried Athenians. The discussion of their plight in certain sections of the American press is less likely to dispel alarm and despondency.

* * *

Choice or Planning?

The frantically milling crowds of shoppers who have jammed the January sales are illuminating quite a batch of economic truths. They are asserting that battered and neglected right, the sovereignty of the consumer; or rather, they have been asserting that right in a quiet and unspectacular way for some time past, by refusing to buy things which they did not regard as fair money's or coupon's worth. They are demonstrating that that equally battered and neglected instrument both of consumers' sovereignty and of producers' efficiency, the price system, will still do its job if given a chance. They are—if the serious-minded insist—admitting that consumers' sovereignty has its irrational elements; for is there any good reason why the woman of England, having been square-shouldered and short-skirted for the last decade, should now unanimously decide that nothing short of gift price would induce them to buy another garment of similar shape?

But if consumers' choice is convicted of unreason, planned and controlled production does not show up too well either. The woman who triumphantly bears away a *négligée* which would have been very good value even in 1939, is very likely sick and tired of patching the clothes her husband is unable to replace and of vainly hunting for shirts for a son whose sleeves are retreating up to his elbows. Weather vagaries or fashion changes have contributed this year, as in other seasons, to the piling up of slow-moving or unsaleable stocks, and readjustment of errors is made more difficult by the rigidity of the coupon system. It is hard to see any good reason for the Board of Trade's refusal to consider a more elastic regime of valuation in points, such as that which has—on the whole very effectively—balanced supply and demand for foodstuffs. But on these contributory causes there has evidently been superimposed a massive miscalculation by the Board, whose price controls result in a differential profit margin which penalises the producer of men's clothes and rewards the producer of fashion goods. In the wicked old days of free enterprise, a big profit margin pointed to an unfilled need, a small or negative margin to a need already overfilled. Today the margin bears less relation to the consumer's desires than to someone's fifth-hand guess at what it would be least trouble to suppose him to want.

Red Light for Public Schools

The appointment of a non-academic layman to be headmaster of Rugby is an interesting reflection of the economic and social difficulties with which the public schools expect to be confronted. Sir Arthur Forde is an old Rugbyman, but his whole working life has been passed outside the academic circle, as a solicitor and during the war as a civil servant, and he has had no experience of teaching. His appointment is, therefore, a bold step.

The explanation is to be found in a statement by the chairman of the Governors which throws a very illuminating light on what all public school authorities must be fearing and hoping at the present time. Given a liberal and enlightened attitude towards education, the qualities most needed in a headmaster now are a sound judgment and experience of affairs which will enable him to steer towards two incompatible objectives—to make the school pay and to charge fees which are tolerable to the shrunken incomes of the middle classes.

To keep down costs requires a competent sense of administration and practical good sense. The second set of qualities required are more subtle. The country is passing through a social revolution, whose impact on the public schools has hardly begun to be felt. At present these schools are enjoying boom conditions, and the competition for entry is extremely keen. But how long will parents be either able to finance their children's education out of income or willing to meet it out of capital—if they have any? Social pressures are still very compelling. But if there is a real rise in the standards of the state-owned secondary schools, the public schools will feel the draught.

* * *

Flats, Furniture and Service

A recent decision of the House of Lords of considerable interest to the public is one which deals with that borderland where furnished and unfurnished lettings meet. Unfurnished lettings are controlled by the Rent Acts. Furnished lettings are not; nor are lettings where a substantial part of the

rent paid is fairly attributable to the supply by the landlord of furniture or attendance to the tenant, as part of the contract for letting. It is this third case which provides the greatest scope for dispute between landlord and tenant, and the changes in circumstances since the war have all tended to sharpen the disputes that arise. The cost of supplying service and attendance has increased, with the result that a rent still fixed by the Rent Acts provides many landlords with a still diminishing net return. The House of Lords, in a judgment given on two appeals, has now cleared up many misconceptions about what "furniture," "attendance," "service" and "a substantial part" of a rent mean in any such letting. In doing so it has, perhaps at the expense of some landlords but to the advantage of good law, refused to allow common words to be given a distorted meaning simply to remedy a hardship to one class of person. The word "furniture" referred to in the Rent Acts is furniture in its common meaning; it cannot be stretched to cover fixtures, such as built-in cupboards, that serve the purpose of furniture. "Attendance" means personal attendance on the tenant, the kind of attendance given by a lady's maid or a valet. It does not mean the service supplied by the porter in a block of flats, in maintaining the hot water installation, for example, which is common to everyone who lives in the building.

None the less, this decision (like an earlier one of the Court of Appeal, deciding that the Rent Acts cease to apply to a building when it is reconstructed after complete demolition by enemy action) does emphasise the need for a thorough overhaul of the Rent Acts by Parliament, and the new legislation proposed in respect of rating reform provides the opportunity. The Rent Acts by now are a patchwork that merits the description "crazy." The trouble is that the control of lettings of property has become something of a social poor relation. Scraps of attention are paid to it when the outcry becomes particularly acute. At other times landlord and tenant are left to struggle along from one legal decision to another, to the sole benefit of the lawyers, taking the good or bad luck of the draw with the exasperated frustration of one who can do nothing else. A hundred minor injustices are never as compelling as one major one.

Letters to the Editor

Money's Revenge

SIR,—Your leader-writer selects somewhat discriminatingly among the "basic truths about the springs of human action." Two which he ignores must be recognised in any objective analysis of the existing situation. First, the recognition by a large proportion of the wage-earners in Britain that their bargaining position is so weak that only by political action can their share of the national income be increased. Second, the strong dislike of "brutality," even when sanctified by logic, which is embodied in the British political tradition. Some may deplore the former, some may regret the latter. All must recognise both. They dominate the policy of the existing Government; they will circumscribe the action of any government.

What can be done in an inflationary situation? The flow of income can be lessened, or the amount of money lessened, or the price-level can be allowed to rise. A policy embodying any of these remedies will have effects which bear with different weight upon wage-earners and property-owners. Now Stalin is free from the necessity to avoid undue "brutality" to either of these categories (although the problem of holding the balance between wage-earners and peasants remains) because the latter have disappeared in Russia. Were the British government to parallel his action, the equivalent would be the cancellation of a large proportion of the note issue, plus a very substantial capital levy, while money wages were maintained at their previous level. This would involve the loss of the co-operation of privately-owned industry, and would drive them to further brutalities in order to maintain production. And it would place the whole burden of deflation upon property owners. Thus it would disrupt the British political tradition, for the destruction of which the Labour Party is certainly not prepared.

What of the alternatives? To allow prices to rise until "the available supply equals the demand" would involve no one in hardship if all prices rose equally and without any effect on the distribution of income. No one with the most elementary knowledge of economic theory now supposes that to be possible. Inevitably, the process would involve a fall in the real incomes of

wage-earners and a rise in those of property-owners. Moreover the forces generated by a rapidly rising price level are as destructive and as incalculable as those operating in a controlled or semi-controlled inflation. The burden of the charge would be concentrated upon those who elected the present government.

To reduce the flow of income by lessening capital expenditure is a more attractive solution. Its limitations are obvious. By pushing the rate of interest up to the level at which it *does* commence to work, suddenly, drastically and incalculably, by depressing the marginal efficiency of capital (below which level it is of little effect) enough unemployment may be caused to involve distress for the unemployed and to weaken the bargaining position of organised labour. These are both dangers of which a Labour government is, properly, acutely aware.

The policy of the government may be said to be to effect such economies in capital expenditure and in imports as can be embarked upon without undue danger to ultimate recovery or full employment, to lessen purchasing power by moderate increases in taxation, to hold the price level and to trust to an ultimate recovery in production at home and abroad to eliminate the inflationary elements in the situation. With many of the administrative details of their policy I find myself in disagreement. I am critical of their unwillingness to embark upon a capital levy. But what I cannot bring myself to criticise, given their premises, is the logic of their policy.

Not an insignificant proportion of British economists are either in the government or at its disposal. I would suggest that "their system is (not) wholly devoid of any humanity; but it is equally free from muddled thinking."—Yours faithfully,

HENRY SMITH

Vice-Principal's Lodging, Ruskin College, Oxford

China's Tepid War

SIR,—In the able article surveying "China's Tepid War" in your issue of December 20th you state: "The privilege of navigation on Chinese inland waters formerly enjoyed by the 'Treaty Powers' was indeed an abnormality in international commercial

relations, and it can well be understood that the Chinese have wished to abolish it along with extraterritoriality and other marks of an inferior status among nations."

This statement is presumably intended to refer to the domestic trade between Chinese ports on the river, but seems to me to need qualification in regard to the great international waterway of the Lower Yangtze as far as Hankow. Prior to the war ocean vessels from America and Europe made the passage up the Yangtze to Hankow in the high water season and, as these vessels were solely engaged in the China/Foreign trade and did not lift cargo between any two Chinese ports, there seems to be no reason why China should have regarded this as a mark of inferior status and have closed Hankow to foreign shipping. One need only point to waterways such as the St. Lawrence and the Amazon, and to the inland ports on the Great Lakes of North America, which are open to international shipping, to reassure any Chinese *amour-propre* that there may be in this regard.—Yours faithfully,

Stone Lodge, Ipswich

AILWYN

Old Moore and New Diplomacy

SIR,—I passed over a rather petulant reference to astrologers in *The Economist* during the fuel crisis last year, but this week's article shows that your enlightenment must be delayed no longer.

The fact is, that Astrology has better claims to be considered a science than Economics, a pretension the simpler to substantiate since the two subjects exhibit remarkable parallels:—

1. Both claim to study the phenomena which predominantly influence the multifarious transactions of mundane existence;
2. In consequence, both maintain that prophecy is possible;
3. The major cause of the disrepute in which both are held by many ordinary people is the eccentricity of particular individual exponents; for there are astrological determinists to counterbalance Marx, and astrological monomaniacs to balance Henry George and Proudhon.

As for Old Moore, who tackles a branch of Astrology where the factors to be taken into consideration are even more numerous than those affecting monetary policy, he has had his successes. Certainly, they once secured his employment by a national newspaper, and on the whole, it is doubtful if his record is any worse than *The Economist's*, whose predictions in the early twenties were recently derisively recalled in Prof. Pigou's "Aspects of British Economic History."

My own study of the birth-data of economists greatly helped to convince me of the validity of several basic astrological theories. But like the other critics, you will probably prefer to retain your own unfounded prejudices rather than the respect of an admirer of your objectivity in other directions.—Yours faithfully,

24 Claremont Gardens, Tunbridge Wells. BRIAN AUGARDE.

Black Market?

SIR,—Your correspondent "An Exporter" gave up too readily. Whatever the conditions may have been six months ago, at present there is no shortage either of timber or of case-making capacity.

Last year, it is true, there was an acute shortage of timber in February, March, April, and the licences granted by the Board of Trade could not be honoured; but the lesson has been learnt, and stocks are now adequate to provide the consumption of the next four months at least. Thereafter it is a question of dollars. Your correspondent should consult any reputable timber merchant (or the Editor of *The Economist*).—Yours faithfully,

TIMBER MERCHANT

Palestine Immigration

SIR,—There is surely a touch of optimism in the way in which the United Nations have allowed the economics of immigration into Palestine to creep out of consideration. From the Churchill statement of 1922 to the report of the Peel Commission, and in all our recent proposals for Palestine, the over-riding criterion of regulation has always been the economic absorptive capacity of the country. Originally applied with respect to the monthly rate of immigration, it now applies with even greater force to the overall limit to agricultural settlement that the water resources are likely to impose in the near future.

I have no knowledge of hydrological technicalities, but the published data are clear enough in their broad implications. The

Partition Commission, for example, reached certain conclusions regarding the possibilities of further irrigation and settlement;

... in the greater part of the area (the Negeb) there appears to be little hope of any improvement in agriculture by means of irrigation from wells. ...

... the additional agricultural population which the (Beisan) plain could support ... is not likely to exceed 4,000 persons.

... in the Jordan Valley, south of the Sea of Galilee ... say, 55,000 persons.

Concerning the hills, the Peel report says:

... we are satisfied that there can be no expectation of finding accommodation for any large increase in the rural Arab population in the hills.

And, more recently, a table prepared by the Palestine Government shows that, excluding the hills and the Negeb, the total of cultivable land still uncultivated is about 880,000 dunums; enough for some 35,000 families, say 170,000 persons.

The annual rate of natural increase, Arabs and Jews together, was already nearly 20,000 per annum in 1931, and today the figure is about 52,000 per annum. It is unnecessary to trudge through detailed statistical assumptions as to the size of the "lot viable," and the proportions of urban to agricultural settlers, and of new families today to the natural increase a generation back. The Chatham House review (*The World Today*), April, 1947, puts the conclusion in one sentence. "Palestine must be regarded as agriculturally saturated"; for, while there will surely be a large natural increase in the population during the next decade, even without immigration, the known water resources will barely suffice to provide cultivable land for it, and are unlikely to permit any great increase in the type of intensive agriculture that characterises Jewish settlement.

The United Nations scheme has given most of the possible new sources of irrigation water to the Jewish state, and, in particular, it will make practicable for the Jews their schemes for drawing off all they can from the Jordan to irrigate their coastal settlements. Nevertheless it is clear that the absorption of 60,000 immigrants a year—or more, as you have suggested—will involve a vigorous industrialisation such as will create, in the words of the Royal Commission, "a fringe of large towns along the coast out of all proportion to the narrow hinterland ... backed by a range of mountains which cannot be intensively cultivated."

The entire economic absorptive capacity, it seems, will then be taken up by immigration; and it is the implication of this for the Arab population and their future increase—40,000 per annum of the total of 52,000 per annum—which deprives the United Nations scheme, with its timid reference to "joint economic development ... in respect of irrigation ...," of any claim to moral support.—Yours faithfully,

MICHAEL THORNTON

The Heath, Weybridge

From *The Economist* of 1848

January 8, 1848

To the Editor of *The Economist*

SIR,—A recent number of your paper contained an interesting return of the produce of some of the gold mines of Russia. While I admit the vast wealth and power which that country derives from the above source—which, moreover, promises to be not only permanent, but increasing—I would remark that her immense cereal riches are still more deserving of the attention of the political economist.

Allow me to add that there is matter for grave reflection in the prospect, approaching to a moral certainty, that on two colossal states—both as yet in their youth, but assuredly destined, when years and augmented population shall have developed their expanding energies, to outstrip the older nations of the world—that on the United States of America and Russia, in the event of a penury of specie or a general dearth of food, will Europe be dependent for a supply of the precious metals, and of the still more valuable staff of life. So long as these two Powers, alike gigantic and ambitious, remain antipathetically antagonistic in their principles of government, and so counter-balance each other, the liberties of Europe have little to fear at the hand of either. But should they one day coalesce, and seek to supplant the present heptarchy, by constituting themselves "the two Great Powers," it will require united Europe to match the fleets of the Republic, supported by the legions of the Autocrat.—I have the honour to be, Sir, your obedient servant,

London, January 3, 1848

D. F. C.

AMERICAN SURVEY

The Wallace Announcement

(From Our US Editorial Staff)

THE cartoon by Mr Herblock in the *Washington Post* on the day after Mr Wallace's announcement of his candidacy covered practically all of its angles. A comrade labelled PCA (Progressive Citizens of America) is leading Mr Wallace along the street saying "Listen! Listen to the People Cheering!" The sidewalk and the windows of the opposite building are indeed crowded with delighted citizens. The building is labelled Republican Headquarters.

The Republicans have cause for rejoicing. Of the 531 votes that will be cast in the electoral college following next November's election, one more than half of which are enough to win, an even hundred will come from the three states of New York (47), Illinois (28), and California (25). If Mr Wallace gets his party on to the ballot in those states, and does not retire from the contest before Election Day, there is great probability of his drawing enough votes from the Democrats to let the Republicans in comfortably.

Getting on the ballot, as Mr Wilkie's advisers discovered last time, is no simple matter. Electoral laws vary widely from State to State as to the numbers of signatures and the qualifications of signers necessary in petitions to run candidates under new auspices, but all requirements postulate a very considerable amount of successful effort on the part of the would-be new party. In California, for instance, petitions must be filed by February 26th; then they will be scrutinised and the inevitable subtractions made, and only after that process is completed will it be known whether or not a sufficient percentage of voters is interested in having Mr Wallace offered for the people's choice.

In New-York, the situation has changed abruptly. There (but there only) the American Labour Party has enjoyed some success, although it made little headway in the last election for the Governorship, and has long suffered from a sharp clash between the left and right wings. Mr Wallace has now succeeded in splitting ALP in two; he has won endorsement from its State executive committee as a third party candidate, but the price of this endorsement was a refusal by three labour unions to accept the committee's decision. From these unions (the Amalgamated Clothing Workers, United Steel Workers, and United Automobile Workers) the ALP has in the past drawn most of its funds, and much of its executive capacity.

The entire failure, so far, to win organised labour will presumably direct PCA strategy on the basis of minority elements, following the promise in Mr Wallace's announcement speech that "segregation and discrimination of any kind or character have no place in America," rather than on the basis of trade union support, even though a number of the powerful unions in New York are dominantly Jewish in membership. Two hundred thousand votes, picked up in Harlem and various centres of New York Jewry would be enough to wipe out any foreseeable majority that the Democrats might hope for.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

Trade Union support is, indeed, likely to be spotty. The situation within the ALP typifies the reaction of the Labour movement as a whole—the Wallace candidacy will further exacerbate the left-right cleavage. A leader of the Congress of Industrial Organisations, whose experience in countering left-wing elements qualifies him to judge, has commented that the Communists currently offer the best valeting service available in the United States; they supply speeches, crowds, funds. The policy of CIO's Political Action Committee has been against a third party; an executive meeting in the next few weeks will take specific action on this one. The New York State executive board of the CIO, representing 277,760 union members, has already directed its unions to withdraw from the American Labour Party if it supports Mr Wallace's "piece of political adventurism which can only have disastrous consequences." The American Federation of Labour's tradition of treating with candidates one by one make any support by it of Mr Wallace out of the question.

★

Lack of unified backing is evident even within the Progressive Citizens. Dr Frank Kingdon, who resigned as co-chairman following the organisation's decision to support Mr Wallace, said that the announcement "will bring cheers from the National Republican Club and the Kremlin." The cheerfulness of the Republican National Committee is generally admitted; analysts are measuring the intensity of the cheers according to faction. If the Wallace forces show enough strength to promise to make a real difference in the vote—and it remains to be seen how much his support will be confined to the present core of eager partisans—which of the present Republican contenders will be likely to benefit?

It has been generally conceded that if either Mr Dewey or Mr Taft could be nominated early in the convention, General Eisenhower would remain President of Columbia University for at least four years. Among those who think such an outcome likely, two schools of prophets are audible: those who say it means Dewey, and those who say that if New York seems a Republican certainty, interest will shift to the doubtful State of Ohio (with its 25 electoral votes) and that means Taft.

Whatever the Wallace candidacy means to the Republicans, it requires a shoring up of the Democratic structure. Mr McGrath, the Chairman of the Democratic National Committee, is at present in California, bent on soothing the antagonisms between the respective followers of Mr Pauley and Mr James Roosevelt. Whom will Mr Truman choose as his running mate? How will the new situation affect the idea of drafting Mr Marshall, previously conceived as the one available means of stopping Eisenhower? (The one means, that is, short of a McArthur Republican candidacy?) Will there be cabinet changes? It has been rumoured that Mr Royall, the Secretary of the Army, was about to resign to run for Governor of North Carolina, and that Mr Draper, at present his Under-Secretary, would succeed. But it is now said that Mr Royall is not going to make the race; is he strong enough to remain where he is?

The third point on which analysts are speculating is, why did Mr Wallace do it? Those who regard him as primarily a tool of the Communists have easy going; the more reactionary the regime in the United States, the better the chances for failure of the Marshall Plan, for a domestic depression, and for the achievement of major Soviet objectives.

Others take a more complex view of a complex personality. The new party is clearly designed as a rallying point for Americans who for some reason or another feel they don't belong. Why does Mr Wallace not feel that he belongs? Not because of minority origin—that was made clear in the sentence in his speech which sounded somewhat different from the way it read: "All of my mother's and three-fourths of my father's ancestors came to this country before the American Revolution." But because of political experience?

Henry Wallace's father was Secretary of Agriculture in the early 1920s. Week after week, in contravention of his advice, he saw the Cabinet decisions made which started agriculture on the down grade of which 1929 was the jumping-off place. He died in office. For those decisions, Mr Hoover, then Secretary of Commerce, was mainly responsible. When Henry Wallace the younger became Secretary of Commerce in 1944, he hung his father's portrait over Mr Hoover's former desk. When the Roosevelt revolution was in the making, the first man the Brains Trust called on was Henry Wallace. But within two years, Harry Hopkins had taken his place as the ultimate insider. The disappointment of the 1944 convention when Mr Roosevelt dropped him from the Vice-Presidency in favour of Mr Truman, was the climax. If, on that Tuesday evening in Chicago four years ago, proceedings had not been summarily terminated on instructions from Washington, by the party machine, the Vice-Presidency, and as things worked out the Presidency, would have been his. If there is a Republican victory in 1948, the Presidency will at least no longer be his supplanter's.

So the case against Mr Wallace takes two forms. To some, he is a tool which may even some day turn a sharp edge against its current handlers, a mystic whose religious syncretism has been given a secular counterpart. To others, he is a far commoner American phenomenon, a disappointed politician eager for revenge. It remains to be seen just what form the case for Mr Wallace will take, and how many people will be found making it.

American Notes

The President's Programme

President Truman's cold reception in Congress on Wednesday was perhaps the most effective tribute to the electoral appeal of his Presidential Message on the State of the Union. The sharpening conflict between the major parties as the 1948 elections draw nearer leaves very little time for smoke-room philosophy on the common aspirations of the American people—at least so far as the more controversial domestic issues are concerned. The Presidential Message could not fail to be a major challenge to the Republican majority, which is grimly aware that Mr Truman has gained immeasurably in status, experience—and confidence—in the last two years, and that the 1948 battle may be very much sterner than seemed likely when they regained control of Congress two years ago.

The record from 1945 onwards, however, is quite sufficient to dispel the charge that Mr Truman has formulated a brand-new policy, specifically for electioneering purposes. Apart from the European Recovery Programme, and the new stress upon effective anti-inflationary measures, Wednesday's speech contained a vast programme of domestic legislation for which the President has appealed consistently both in and out of his present office. There can be no doubt of his sincere conviction that prosperity can be buttressed and continued only by the broad extension of social security cover, by national health and educational services, by Federal housing development, and last, but by no means least, by the extension of reclamation and conservation projects along lines already established, with success in the work of the Tennessee Valley Authority.

There is nothing new in the appeal for higher minimum wage rates, which the Republicans may this year decide to be a measure which might take away some of the hostility aroused in the ranks of organised labour by passage of the Taft-Hartley Act. Nor is there any extension of the executive programme in terms of farm price support, or rural development. The Republicans are naturally anxious to establish the charge that the President is concentrating purely upon November, 1948. But perhaps their

most cogent criticism would be that in a year which must be marked by fierce contention and eventual compromise, the President did not take the trouble to establish priorities for Congress along with industry. For with the best will in the world, Congress could accomplish but a fraction of the President's programme before the July adjournment.

Budget and ERP

On present indications, the Budget and the European Recovery Programme will alone prove sufficient to occupy Congress for very many weeks. For ERP, the Administration has already conceded that Congress shall not be asked to approve the total of \$17 billion for the full four-year programme—a reservation sought by Senator Taft and supported by Senator Vandenberg on the somewhat doubtful thesis that such an approval would tie the next President—and possibly a Republican President—for the whole of his first term.

This failure to secure more than a general blessing for the full programme, however, is not in itself so damaging as it may appear to be on this side of the Atlantic, since annual appropriations would in any case be necessary. Far more serious reservations concern the pace of the debate in Congress, and the restrictions which may be placed upon the control of the administrative body, or upon the terms of aid for the European nations.

Another major clash will take place on the Budget proposals, where the President has retreated a little way from his rigid refusal to concede any relief whatsoever for personal taxpayers. In strong contrast to the Republican Bill, which aims at reductions totalling \$5.6 billion over all grades, however, Mr Truman seeks to confine relief substantially to the lower income brackets and to recoup these concessions by higher taxation of company earnings. Opposition will no doubt be strengthened next week, when the Budget Message is now expected to include expenditure totals even higher than those for 1947-48.

Retreat from Cheap Money

(From our US Editorial Staff).—The Federal Reserve authorities chose the eve of the Christmas holiday for yet another sudden move in the long process of retreat from the ultra-cheap interest rates of the war years. The new development was a significant downward adjustment in the prices at which official support will be given for several of the Treasury Bond issues, and declines ranged from $\frac{1}{4}$ in the Victory Bond 2½s of 1967-72 (at 100½) to as much as 2½ on shorter maturities where the authorities clearly decided that there was no longer any gain attaching to substantial premiums which have little relevance to the immediate problems of debt management.

The timid, but none the less persistent, retreat from credit expansion has now lasted since March, 1946, when the peak of Treasury Bond values coincided with the decision to begin a large-scale programme of debt retirement financed from the Treasury cash holding. This was followed by the "unpegging" of Treasury Bill rates, and a general upward trend of short-term rates. So far, however, the authorities have been trying their hardest to ride in opposite directions. They have been fully aware of the inflationary dangers arising from the rapid expansion of business and personal credits, the renewed advance in commodity prices and the inflow of gold. But the policy of curbing inflation has been limited rigidly by the desire to protect the price of long-term bonds, in the interest both of the taxpayer who has to find the interest and of the banks which hold large blocks of the bonds.

In recent months it has become steadily more difficult to maintain this dual policy. Credit restraints, coupled with a vigorous demand for loans, brought sharply lower quotations for corporation bonds this autumn, and thus a strong incentive to sell Treasuries and seek higher yields elsewhere. This, in turn, brought a new threat to Treasuries, and when conditions in the bond market began to look disturbing, the Reserve Board stepped in again to buy Treasuries in the open market at fixed support levels.

The reduction of support levels is a move undertaken in the hope that private buyers will now come forward for long-term Treasuries and relieve the Reserve Board from its position as virtually the sole prop to this market. But the success of such a move is clearly debatable, and it remains to be seen whether the market can be assured that support will be sustained at the reduced levels. While the authorities still hope to hold a rate of 2½ per cent for long-term issues, they are quite clearly near a point where only a sudden reversal of the business trend can avert a decision to abandon that level. As a further restraint on inflationary pressure, the new move carries favourable implications for the European programme. On the other hand, the decline in Bond values will not assist the World Bank to raise new funds.

Typographers on Trial

Is it an unfair labour practice for a union to refuse to sign a written contract? This is the issue which is being debated before trial examiners in several American cities, will eventually be decided by the National Labour Relations Board, and then appealed to the courts. The ban on the closed shop, embodied in the Taft-Hartley Act, is also at stake, for the reason the defendants, the International Typographical Union, refuse to sign a contract is that it could not legally contain any provision for the closed shop they have enjoyed so long. Charges of unwillingness to bargain, of coercion, and of restrictive practices have been brought against the union by the American Association of Newspaper Publishers, the Southern Newspaper Publishers Association (represented by that ubiquitous New Deal firm of lawyers, Thurman Arnold, Abe Fortas and Paul Porter) and the Inland Press Association. The publishers have refused to take what in a time of full employment is the easy way, and countenance the "under the counter" contracts not unknown in other industries; and this has not unexpectedly been taken by the ITU as a determination to use the Taft-Hartley Act to smash the union by court decisions and court costs.

The typographical union is a tight monopoly, which for many years has sharply limited the new entrants to the trade, prescribed costly rules of work, padded employment and slowed down all processes. Mr Randolph, the president of the ITU, is the Petrillo of printing, moved by the same terror of technological unemployment. When the ban on the closed shop became law, the ITU, convinced that the closed shop was its life, voted at its convention to sign no contracts, but to force the publishers to continue the substance of the closed shop by posting union "rules of work," which include the provision that union printers may not be required to work with non-union printers. The publishers, however, stood upon their legal rights; they would grant no wage increases without a written contract. Strikes against 15 newspapers in eight cities followed, with Chicago dailies managing to side-step the consequences by using a photo-engraving process. This produces a paper with a typewritten look, larger print, and the incidental boon of somewhat shorter and sharper writing. The strike, that is, has helped to hasten those very technical changes which the printers so much fear, and which the high costs of printing, under present rules, make almost inevitable.

The Counsel to the Labour Board, Mr Denham, has supported the publishers by filing charges of coercion against the union. This case, the first of its kind on a national scale, will test many of those provisions of the Taft-Hartley Act which deal purely with industrial relations rather than side-lines such as political contributions or Communist affiliation. It is difficult to see how, if it is an unfair labour practice for an employer to refuse to sign a contract, the union can hope for more lenient treatment, particularly when the avowed purpose is to evade another provision of the law. Whether the decision will bring peace to printing, and even whether, once won, it will be observed, are other questions.

Eggless Thursday

It is blue Thursday no longer. The eggless and poultryless day is now free of all restrictions. Thursday abstinence was devised to reduce pressure on the prices of chickens and eggs, and thus discourage farmers from feeding grain, and particularly wheat, to poultry. It was part of the food programme launched by Mr. Charles Luckman to save an additional 100 million bushels of wheat for export to the hungry. The programme also included a meatless Tuesday, the request to save a slice of bread a day, economies by bakers and industrial users of grain, and reforms in livestock feeding. From the relaxation announced this week, it

might be assumed that voluntary rationing had been an unqualified success, and that the export goal was assured. It is true that winter wheat prospects have improved. But only last week the Department of Agriculture, looking at the revised crop figures for 1947, which are down, for grains, by more than 100 million bushels from earlier estimates, came to the conclusion that only 450 million bushels of wheat could be exported during this crop year, a cut of 50 million in the target.

The favours which have been shown the poultry-farmer contrast sharply with the successful campaign Mr Anderson, the Secretary of Agriculture, has waged against the distillers. The only new authority granted to the Government in the anti-inflation Bill passed by the special session was the power to restrict the use of grain by the liquor industry, and Mr Anderson has immediately cut their quota by a million bushels for the month of January.

In a country capable of Prohibition, turning good grain into alcohol is manifestly more sinful than turning it into eggs and fryers. It is also easier to control. But the obstinate fact remains that while the liquor industry uses 3 per cent of the nation's grain crops, 80 per cent of them is fed to livestock, and by far the most extravagant use of grain, per 1,000 calories of food value produced, is found in poultry feeding.

This gradual liquidation of the consumer side of food conservation arises partly from bad publicity at the beginning; to institute two days of abstinence simply invited the eating of poultry on Tuesday and meat on Thursday, if not more open lack of co-operation. The propaganda of the farm bloc has been much more skilful, with its deceptive argument that a dead chicken eats no grain. And the Administration may well be alarmed at the political consequences of another meat famine in the spring. But world food prospects suggest that this is all the more reason for a fresh and more effective start, with an even higher savings target, rather than the scuttling of food conservation.

Rail Rates Up

Rail freight rates were increased by a further 10 per cent from January 5th onwards, making with the "emergency" award granted by the Interstate Commerce Commission last October, a general advance of 20 per cent within a few months. The present award will last until June, and the ICC has stipulated that the railways must be prepared to grant rebates if the "final award" is below the levels now prevailing. Such a decision, however, seems unlikely, to say the least, and it is clear that the Interstate Commerce Commission has been impressed by the managements' evidence on rising costs.

The new advance will do little more than cover the recent increase in wage costs. The roads originally petitioned for an

U S Business Bulletin

THE ECONOMIST receives every week, from its own correspondents and from other sources, a great deal more information on business conditions and economic developments in the United States than can possibly be used for "American Survey."

It is therefore proposed to issue for private circulation a fortnightly "U S Business Bulletin" which will contain a more extensive digest and analysis of this information than can appear in the paper. It will be designed to be of value both to exporters and also to those more generally interested in economic affairs in America.

Detailed information on this bulletin will be available shortly and will be sent to any reader who would like to receive it. Please address your request to:

Manager, The Economist Intelligence Unit, 22 Ryder Street,
St. James's, London, S.W.1

advance of 17 per cent last summer, but this claim was quickly reinforced in the face of wage demands, and the overall rise requested from the ICC would amount to at least 30 per cent. Eastern railroads, however, have been especially affected by war-induced shifts in population, industrial output, and traffic trends, with the result that they are now taking a substantially smaller share of gross revenues than in the prewar years. For this reason, claims by Eastern railroads range up to more than 40 per cent on many commodities (excluding the awards given recently). It is this shift in traffic which has caused the ICC to defer a "final" award, since many abnormal factors still persist, and there has been insufficient time to study the permanency, or otherwise, of shifts in revenue. Railroads in western states, for example, have benefited enormously from bumper grain crops, and exceptionally profitable long-haul traffic. Although freight rates remained almost stationary from the outbreak of war in Europe until 1946, the grant of the full demands by railroad managements would bring the average level to more than 50 per cent above 1939 schedules.

Synthetic Rubber Debate

Recent moves in Congress suggest that the Administration is now determined (presumably on the advice of its service spokesmen) to maintain synthetic rubber output at the higher levels determined by present legislation, and by the agreement with Britain covering colonial preferences and imports of natural rubber.

No full programme has been presented, but Mr Arthur Hill, chairman of the National Resources Security Board, recently told a Congressional committee that plans had been put forward, and that the President "was generally in accord with them." He said that the US government proposes to maintain output of buna-type (GR-S) rubber "for at least two years" at a rate equal to one-third of the level of all natural and buna-type rubber consumed in the United States. This would stay as the maximum level, but after that time, the President would be empowered to reduce synthetic output.

"Stand-by" capacity will be maintained for at least 600,000 tons of buna-type rubber. For two years, four per cent of all new rubber consumed would be the specialised *Butyl* product, with provisions for lower future requirements, as for buna-types, to be established by Presidential decision. Regulatory powers over consumption will continue to cover tyres and tyre products, and latex foam cushions.

Conflicting evidence has been given on the issue of government ownership of the synthetic plants. The Resources Board wishes to sell, or lease, active factories to private industry, and to abandon patent pooling arrangements "so as to provide incentive for competitive research and development." The Reconstruction

THE WORLD OVERSEAS

European Coal Organisation

(By a Correspondent)

"IT is, perhaps, in respect of coal that international co-operation between European countries has been most effective since the end of the war." Such was the tribute paid to the European Coal Organisation (ECO) by the Sixteen in their final report last summer. Like so many of its contemporaries, ECO was a by-product of war and of Shaeef. After an initial period of informal activity, the organisation reached independent status in January, 1946. And it was in this shape—except for such operational improvements as experience dictated—that ECO survived up to its liquidation last week. On January 1, 1948, its functions became the responsibility of the Economic Commission for Europe (ECE); and Geneva succeeds London as the principal public forum for Europe's coal diplomacy.

It is surprising that international co-operation should have thus flourished in respect of the very commodity which, by its outstanding importance to every process of industrial production—not to mention its unequal geographical distribution—contains

Finance Corporation, which now controls the Federal plants, opposes their transfer, and declares that an operating deficit of \$44.7 million from 1942 to 1945, had been replaced since that time by earnings of \$109.8 million.

With a very full programme for 1948, many Congressmen would be willing to agree to a simple extension of present legislation which expires on March 31st this year. In the view of the State Department, however, the present Control Act, with its provisions for the admixture of natural and synthetic rubber runs counter to provisions of the charter for an International Trade Organisation. For some way ahead the scope for any fresh concessions to the rubber planters would seem to be very slight.

Shorter Notes

"There are few signs of any factors that would cause an economic collapse," declares Mr Ewan Clague, Commissioner of Labour Statistics, in a New Year survey of industrial prospects. He says that the nation has begun the year with "a very strong basic economy," and he believes that consumer prices will go still higher in the near future. Mr Clague last summer forecast the vigorous upturn in activity which followed the moderate setback from early spring peaks in prices and output.

A great deal of comment has been aroused by the decision of the General Electric Company to reduce prices from three to ten per cent on a wide range of products, including refrigerators, and radio and television receivers. Earlier attempts to beat the inflationary price spiral (by such industrial leaders as Ford and International Harvester) have proved quite unavailing. But there is in some quarters a disposition to believe that the GE move heralds a more competitive phase over many consumer goods industries.

The ban on the making of records imposed by Mr Petrillo, of the Musicians' Union, went into effect on January 1st, bringing a much-needed rest to musicians who have been working around the clock to build up the stocks of master-recordings with which the record companies hope to outlast the Petrillo siege. It is estimated that the companies now have enough stocks on hand to last for a year—if they prove to be the songs the country wants. After the last ban it took 27 months to reach an agreement. Mr Petrillo has suggested that the ban will be permanent this time—but he has also said it will last until a new deal is worked out for the union, which under the Taft-Hartley Act can no longer collect royalties on new recordings.

every ingredient of political dynamite. It is perhaps even more surprising that a commodity which yields to its possessor so rich a crop of bargaining power (and of prestige) should have let itself be multilateralized to the point of being treated as a commodity of any kind at all.

The problem of Ruhr coal has haunted the Council of Foreign Ministers more than once: it has also kept the experts busy in London, Washington and Berlin. In Paris last summer, the prospects of British coal were a vital factor in the deliberations of the Sixteen, while Poland has, since 1945, concluded a series of very remunerative bilateral agreements based on her growing exportable surpluses.

All this activity has struck the headlines from time to time ECO, on the other hand, except for its valuable statistic work, seldom ventured into the limelight. Its contribution to the maintenance of the "coal peace" was made largely behind the scenes. It was, however, a contribution which was no less powerful for being unsensational. The study of its work shows

some interesting light on the likely development of ECE's Coal Committee in the future.

The purpose of ECO, as set out in its Agreement, was to "promote the supply and equitable distribution of coal and scarce items of coal mining supplies and equipment," as well as to "safeguard, as far as possible, the interests of both producers and consumers." Its principal instruments were a General Purposes Committee which acted, in most respects, as the steering body, and an Allocation Purposes Committee which kept the supply and demand relationship under constant review and made the appropriate recommendations to the governments concerned. Full members of ECO were: Belgium, Czechoslovakia, Denmark, France, Greece, Luxembourg, Netherlands, Norway, Poland, Turkey, the United Kingdom and the United States. Finland, Italy, Portugal, Sweden and Switzerland participated as associate members. Austria was neither a member nor an associate, its coal requirements having in the past been met by a direct allocation from the Bizone of Germany.

Bargaining for Coal

In the field of allocations, the first objective was to secure for each country a minimum amount of coal. Coal committed by bilateral agreements (mainly Polish coal) was naturally taken into account in assessing each country's quota. This left Ruhr, Saar and American coal for direct allocation. The yardstick employed was a complicated allocations formula which made allowance for each country's internal production, its bilateral exports and imports, its war damage, its reconstruction plans, its development of hydro-electric and other sources of power and a number of lesser factors. On the basis of this formula—which was itself subject to frequent revision—governments consented each quarter to confine their purchases of Ruhr, Saar and American coal to within agreed percentages of the total quarterly supplies.

Allocations thus bore no resemblance whatever to the functions of the wartime priority boards. ECO quarterly agreements were in effect "treaties" freely negotiated among sovereign countries anxious to avoid a "free-for-all" scramble in a commodity the shortage of which set an effective limit to the rate of European recovery. Delegates' heads at an allocations meeting remained stuck together in tough, though friendly, bargaining until an agreed solution was finally evolved, acceptable to all parties. This agreement was in any case purely "permissive" in the sense that ECO never physically allocated tonnages of coal, but merely set maxima over and above which governments would not contract for imports. They were quite free to contract for tonnages below their respective maxima and a special procedure existed whereby unclaimed quantities could subsequently be offered for re-allocation.

Incentive Schemes

As Europe progressed from the phase of rehabilitation to that of reconstruction the need was felt to render the system more flexible. Small tonnages of coal were set aside each quarter for supplementary allocation to certain countries in respect of specific purposes. Belgium, for instance, would be granted a supplementary tonnage of coal to enable it to put into use some of its hitherto idle capacity for the production of nitrogenous fertiliser. In return Belgium undertook to deliver to certain other European countries specified tonnages of fertiliser representing the amount of extra coal it had received. For reasons largely connected with the general pattern of world trade, the potentialities of this coal incentive scheme were never in fact widely developed; the amount allocated to this end was of the order of half a million tons or less per quarter. Its administrative difficulties were immense, and it is easy to see how the system would be open to abuse.

ECO's other main function was that of making recommendations and assisting member countries on a variety of problems of production, chief among them those of manpower and of mining equipment. It was served for this purpose by a production sub-committee, assisted in turn by a number of working parties on special supplies such as pitch and pit props. Following on the Paris Conference, ECO also established an *ad hoc* working party on mining equipment to assess the detailed requirements for machinery of European coal producers. On the allocations side, it was similarly assisted by a movements working party which prepared—in close collaboration with the European Central Inland Transport Organisation—a transport programme for the tonnages allocated each quarter.

Initially the problem had posed itself in comparatively simple terms: a given supply of coal had to be equitably distributed

among a number of claimants whose aggregate demand vastly exceeded available supplies. Gradually, however, the problem began to assume more complicated shapes. Into the neat pattern of coal shortage there projected themselves two intruders: the shortage of dollars and the shortage of specific grades of coal. The dollar shortage proved to be an even more effective limitation on the amount of coal consumed than did the availability of coal itself. This made it essential for the dollar-starved importers to secure not only favourable general allocations, but favourable proportions from the most economical source. And as both German and American coal were payable in dollars, relative price levels became all-important.

As regards grades of coal, there has been for some while a similar tendency to shift the emphasis from general allocations to allocations of high-grade metallurgical coking fines (or hard coke itself), the lack of which is restricting European iron and steel output. France, the Benelux Union and others are clearly interested in any revision of the ECO allocation formula which would enable them to obtain a higher proportion of their quarterly imports in the form of metallurgical coal or coke. This could only happen if non-steel producing countries were willing to obtain equivalent amounts of ordinary coal from America or other sources, an arrangement which immediately encounters new difficulties in the form of existing bilateral agreements, price differentials and the increasingly important consideration of long-term markets and sources of supply.

This, briefly put, is the problem the Economic Commission for Europe will inherit from its predecessor. It will inherit with it a spirit of co-operation and a determination to succeed which have enabled ECO to surmount a host of difficulties in its two and a half years of existence. In theory, ECE will project ECO's activities into a wider geographical sphere, for all European countries, east as well as west, are invited to the meetings of its Coal Committee. But, in the prevailing political situation, this wider membership is likely to remain theoretical for some time, and the Coal Committee's membership for the present will not differ a great deal from that of ECO.

By and large, the Coal Committee proposes to follow the pattern of work and organisation which has hitherto served ECO. The comprehensive structure of the Economic Commission may, however, enable it to relate the problems of coal more closely to other economic problems than was the case in ECO: it may wish to relate it to the longer-term problems of transport, electric power development, timber and general industrial production. To what extent ECE will succeed in this depends primarily on the place the Commission will eventually occupy in European reconstruction. One thing, however, is fairly evident: with the emergence of the buyers' market, the emphasis will increasingly shift from the problems of simple allocation to those of productive efficiency.

Communist Setback in Czechoslovakia

[FROM OUR PRAGUE CORRESPONDENT]

THE course of true Communism which ran comparatively smoothly in Poland and Hungary this summer has come up against some unexpected obstacles in Czechoslovakia during the past two months. Indeed, the establishment of the Cominform last October, instead of being the prelude to the liquidation of right-wing Socialism in this country as had been widely predicted, has seen the Social Democrats stage their first come-back since their defeat at the polls in May, 1946. The other non-Communist parties have also begun to show signs of a returning and unexpected vigour.

Chronologically, the first major set-back the Communists received was when they failed to oust the Slovak Democrats from control of the Slovak Board of Trustees. This particular battle is not yet finished, but the Communists certainly lost the first round on points. They succeeded in making the former Board resign and they reduced the number of Democrats on its successor. They also established a precedent for giving the Premier of the Central Government the right to select members of the Board, thus increasing the dependence of the Board on Prague. But not one of the posts surrendered by the Democrats went to the Communists or to non-party organisations under Communist control. The only new "non-party" member—the Trustee for Justice—

has close affiliations with the Democrats and the other vacancies were filled by members of the Social Democratic and Freedom Parties. The Communist threat of a general strike if their demands were not accepted in full had to be dropped because it was suddenly realised that if the strike materialised, it would be the Communist Premier, Mr Gottwald, and not the Slovak Democrats who would have to deal with it. In fact the result of this particular fight was that what the Democrats lost in seats, they regained by agreeing to turn out the *Hlinka* elements in their ranks thereby making it possible at last for the Czech non-Communist parties to co-operate with them.

Stronger Socialist Leadership

A second blow for the Communists was when the Social Democrats decided to depose their leader Mr Fierlinger and appoint Mr Lausman in his stead. Under Mr Fierlinger, the party had put co-operation with the Communists first and had seldom dared to strike out a line for itself. Mr Lausman was elected on the platform of not trucking to anybody. Actually the change had been impending for some time, but it was speeded up by the attack on orthodox Socialism launched by the Cominform. Communist disappointment, not to say rage, at the defection of their allies has been reflected in *Rude Pravo's* acid campaign against Social Democratic "reactionaries"—a charge which Mr Lausman at any rate could afford to ignore seeing that he was the Minister who planned and carried out the nationalisation of industry in Czechoslovakia. Mr Lausman's paper, *Pravo Lidu*, has taken up the challenge and the sniping campaign between the two parties has only been interrupted by the Christmas holidays during which the Czech public had a blessed relief from newspaper polemics for four days. *Pravo Lidu's* counter-attack has concentrated on the alleged complicity of members of a "certain party" in the postal bomb affair last September. Two of the three Ministers to whom the bombs were posted were Czech Socialists—the third was Mr Masaryk—so *Pravo Lidu's* interest in the matter clearly foreshadows the possibility that the Social Democrats are prepared to resume their prewar alliance with the Czech Socialists. If this happens, the Communists will in future have to contend with an adverse majority in the Government and the National Assembly on most, if not all, contentious issues.

The Communists are on the defensive and the question of regaining the initiative and in particular the manner in which they set about doing so are matters of supreme importance. That this fact is realised can be seen by the country's reaction to President Benes's Christmas message in which he urged everyone to remember Karel Havlicek and praised the morale of the students. The President dotted no i's but everyone knew that Havlicek was the man who had stood up for freedom of speech under the Austrians and that the students had recently been warned by Mr Kopecky, the ebullient Minister of Information, that they might find themselves in gaol for their political opinions. Mr Kopecky added that "anti-Communism is high treason."

Political Arrests by Both Sides

At present, however, activity on both sides is confined to sniping. For example, the Communist Ministry of the Interior has arrested 36 people, mostly Czech Socialists, but with a sprinkling of Social Democrats, in connection with a spy plot said to have been discovered in Most and connected with an unnamed foreign state. The Czech Socialist Ministry of Justice has similarly arrested several people in connection with the bomb affair and has stated that one of them, Josef Stepanek, chairman of a local National Committee, is to be charged with trying to murder the Ministers in question, thereby endangering the Republic. Several other persons who were arrested on orders of the Ministry of Justice were subsequently released on orders of the Ministry of Interior only to be re-arrested a few days later. Several of the bomb suspects and all except one of the spy suspects have now been under arrest for nearly two months and there is no sign that their trial will soon begin. The lucky one is Major Polak, an employee of the British Council, against whom the prosecution found no evidence. It should be added that the authorities are under no legal obligation to release anybody or even to let him have legal assistance until the case for the prosecution is complete, so that the release of Major Polak can be regarded as a friendly gesture.

Whether either set of trials ever comes off remains to be seen. If they do they will provide a major political sensation. The cases would have to come before the ordinary courts which are accustomed to judge according to the law and the evidence and not according to the Communist theory of interpreting the will of the

people which was sometimes applied by the special—but now extinct—postwar courts for the trial of traitors and collaborators. In the circumstances, therefore, it is possible that both sets of accusations will be dropped.

There is little doubt that the spy arrests were intended to be the opening shots in a vigorous campaign to force the Czech Socialists and Social Democrats to purge themselves of elements which the Communists regard as treasonable. A purge brought about under Communist pressure would obviously mean a transfer of votes to the Communists in the elections next May and would tend to bring the Party concerned into a relationship with the Communists resembling that of the non-Communist Government parties in Hungary and Poland. But the rebuff the Communists suffered when they tried to disrupt the Slovak Democrats has clearly upset the plans of the Party's High Command. It had not been expected that the other parties would put up a united resistance and still less that they would win some initial successes. Any hope that they would prove as easy to subdue as similar parties in Hungary and Poland has been completely dispelled.

Queue Priority for Communists

Of course, the Communists are not relying solely on disruptive tactics in pursuing their objective of a 51 per cent majority at the polls. They are carrying on a vigorous recruiting campaign and claim to be winning over one member of the Czech Socialist Party every ten minutes. They also offer incentives, one of which is tickets to workers entitling them to be served in the shops before the mere intelligentsia and black coat wearers. Their popularity in the universities is at a very low ebb. The results of the elections to students' faculty committees last month invariably showed a decrease in the Communist vote and a corresponding increase in the votes cast for other parties, including the Social Democrats. At Brno there is not a single Communist on the Committee of the University Students' Union.

It is safe to say that many people who voted for the Communists at the last election would rather see them beaten now than see their country follow in the wake of Hungary or Poland. It is axiomatic and patent that the Soviet Government is determined for strategic reasons to keep Czechoslovakia in the Russian orbit. But it is not so widely realised that for the same reason this is also the policy of every Czech party, so that the USSR could well afford to sit back and let the Czechs go their own way. Nor do the Russians realise that their prestige would rise if they did so. The Soviet Union, in fact, stands to lose, not gain, if the Czech and Slovak Communist Parties use unconstitutional means to gain their 51 per cent majority.

Is Australia Moving Right?

[FROM OUR CANBERRA CORRESPONDENT]

THE Federal Labour Party's dreams of ruling Australia until the 1960's have been rudely shattered by Mr Chifley's decision to nationalise all the trading banks and absorb them in the Commonwealth Bank of Australia. It was largely a personal decision by the Prime Minister which stunned the Cabinet; but it has since received full and unanimous support from all Ministers and the party rank and file, whose loyalty to and confidence in Mr Chifley are profound.

No other Federal Labour member could have induced the Labour Party to put its bank nationalisation plan—so long on the Party's platform—into action. No other Federal Labour leader would have maintained the unity of all sections of the Labour Movement, because only Mr Chifley can combine in correct proportions personal charm, disarming appearances of moderation, deep-rooted obduracy and a sincere conviction that he is acting in the best interests of "the ordinary bloke who looks to the Labour Party for a light on the hill, to lead him to security and freedom from exploitation." Only a private member, the elderly Frank Brennan, Attorney General in the Scullin Ministry, rose in the secret party meetings later to warn that "Australian Labour has foundered on the rock of experimental financial policy before."

The steadily growing hostility to the Chifley Government, since the bank nationalisation plan was announced, has exceeded the worst secret fears of Labour members with "doubtful" seats. As late as July, according to the singularly accurate Australian Public Opinion Polls, the political barometer was set steady for a return of Labour to power in 1949. It has now oscillated violently. From the results of recent by-elections, the Victorian State elections and

A supreme shaving instrument

Men of discernment, who value fine things, will appreciate Personna, the precision blade. It is the finest double-edged safety razor blade ever devised. Made by experienced master cutlers

from finest selected steel. Hollow-ground, and leather-stropped, each blade passes 17 rigid inspections in the factory, and is specially wrapped to preserve its two perfect edges. The Personna precision blade is rendered rust-resistant by the Krausman process. It is a masterpiece. On sale at the best barbers, chemists, and stores.

"I think I'd like a
White Horse better than anything"

MAXIMUM PRICES:—Bottles 31/-, ½-Bottles 16/3
as fixed by the Scotch Whisky Association

HOW DO
HERRINGS
AFFECT
YOUR TEETH?

We all know that the herring is wholesome fare. But did you know that the herring is good for the teeth—particularly young

teeth. Herrings supply us with plenty of vitamin D. And this 'sunshine' vitamin is absolutely essential to bone-formation. Without enough of it, there is risk of rickets. We also need plenty of vitamin A, the 'protective' vitamin, to withstand our treacherous winter. And as A and D together are found in really rich concentration in Crookes Halibut Oil, a daily dose of this is a wise winter rule. **FREE:** Why not get to know the vitamin-value of the foods you eat every day? Our free illustrated booklet tells you this in an easy interesting way. Write to The Crookes Laboratories Ltd., Dept. F193, Park Royal, London, N.W.10.

CROOKES HALIBUT OIL

OBTAINABLE ONLY FROM CHEMISTS

If this is any omen, their honeymoon in their new home will be one never to be forgotten. Comfort and luxury

on the ground are one thing, but in the wonderful interior of a Short flying boat they have an added charm. From the long, cool drinks from the cocktail bar to the idle hours of watching the world go by from the generous windows of Cabin 'E,' these short three days will be ones to remember.

The last meal aboard—honeymooners can become sentimental even over dinner, and this of all good meals will be one to recall among the best. There'll be time for one last stroll on the promenade deck, then comes the tight touch-down and a new chapter begins.

Short flying boats are flying all over the globe. From Great Britain to Australia, Africa, India and the Far East. Between Bermuda and Baltimore. In Scandinavia D.N.L., and in South America A.L.F.A. and C.A.U.S.A. are using Short flying boats, too. Your travel agent will give you details.

*It's fun to fly
by flying boat!*

Shorts

THE FIRST MANUFACTURERS
OF AIRCRAFT IN THE WORLD

The Biblical exhortation to "praise famous men and our fathers that begat us" is one which Britain may well take to heart, especially in the field of the Sciences. She has ever been too ready to acquiesce in the claims of other nations to lead the world in scientific resource and invention, when history reveals that Britons stand second to none among the world's scientific pathfinders and pioneers. It is with the object of demonstrating that Britain has always been in the van of scientific progress that this series of announcements, under the title "Ancestors of an Industry", has been prepared. It will tell the story from Robert of Chester, the English monk who in 1144 opened the door of Eastern chemical knowledge to Western Europe, up through the centuries to Sir William Bragg and Lord Rutherford, whose researches in the present century led to the liberation of atomic energy. These announcements will, it is hoped, serve to give the people of Britain a new sense of the richness of their heritage, and nations overseas some idea of the debt the world owes to British scientists and chemists.

60 Years of Continuous Leadership -

The world's master tyre

8H/197

from the unpleasant atmosphere surrounding disturbed politics in Tasmania—where the Labour Premier (Mr Cosgrove) is facing criminal proceedings arising from allegations of bribery—there is no doubt that at a Federal election now, the Chifley Government would be defeated overwhelmingly, with little hope of Labour's return for many years.

In 1946, Mr Chifley spoke emphatically against making promises. He claims now that the Menzies-Fadden opposition induced the people to give him a blank cheque. In his policy speech he offered no more than that wartime controls would be slowly "tapered off," and that a close check would be kept on central banking policy under the Banking Act, 1945 which gave enormous powers to the Treasurer to direct the trading banks in credit policy, abolishing the Bank Board which administered the Commonwealth Bank). In 1946, Mr Chifley met the newspaper clamour for tax cuts with agreement to "consider reviewing taxation from year to year." Against the rousing eloquence of the Leader of the Opposition (Mr R. G. Menzies) at crowded meetings throughout Australia, and in spite of the glowing promises of heavy reductions in personal taxation from the leader of the Country Party (Mr A.W. Fadden), the slow-speaking, husky-voiced Chifley retained the Labour strength won by John Curtin in 1943. In fact, Labour not only polled as well as in 1943 on the old basis of enrolment, but also obtained more than half the new votes. The combined vote of the Liberal and Country Opposition Parties increased from 1,325,000 in 1943 to 1,900,000, the extra votes being won at the expense of independents.

What Mr Menzies calls "the myth of the moderate Ben Chifley" is now being dispelled with all the resources of modern propaganda. The Australia-wide whispering campaign against Mr Menzies, the disloyalty within his own ranks, and the Australian electoral opinion that only Labour had the strength to rally the working people behind the war effort have disappeared.

Landslide in Victoria State Elections

Labour Party losses were noted in two earlier State elections ; in Western Australia, where the Labour Government was defeated, and in South Australia, where the Playford Liberal-Country Party Government was returned with stronger support. But these reverses were not taken very seriously by Federal Labour, because there were 20 unopposed seats in Western Australia and 55 per cent of the electorate did not vote.

In the Victorian elections, which were forced as a direct result of the Bank Nationalisation Bill then before the House of Representatives, there was a very different story. The elections were forced upon the Lower House, based on popular representation, by an Upper House, elected by limited property franchise. The latter refused to grant Supply unless the Government tested public opinion on bank nationalisation. Such methods could not be tolerated by the electorate normally, but in spite of desperate efforts by the Cain Labour Government to fight the election on this issue and to command support for its legislation, which was not questioned by the Opposition on the hustings, the people voted on bank nationalisation. Labour in Victoria was routed. . . .

The Federal Prime Minister, contrary to practice in most State elections, refused to comment or to participate in the campaign. The Victorians did not want to be embarrassed by Mr Chifley. He and his supporters were being heard on the national radio in direct broadcasts from Parliament of the debate on the banking bill. But Mr Menzies and Mr Fadden took an active part, supported by the President of the Liberal Party, Mr R. G. Casey, the former Treasurer and former Governor of Bengal, who is expected to contest the next general elections. His future and the choice of a non-Labour leader is another question of Australian politics which must be resolved quite clearly, if there is to be a clean-cut contest in 1949.

Meanwhile Labour members have tried to take consolation from the fact that the Victorian State electoral system, which gives a higher value to country voters, weighs unfairly against Labour. They argue that the people were stampeded into a fear of losing their money and that the force of the arguments of Government members in the debate on the bill did not have time to be effective. Mr Chifley told his followers: "the hysteria will die down before 1949."

Illusions about Public Confidence

With the passage of the nationalisation Act to the High Court, where State Governments and private banking companies are challenging its constitutional validity, public interest cooled. Labour members left for the recess confident of a happy Christmas and a bright New Year, which would usher in a 40-hour week for the workers, greater social benefits and a steady return of con-

fidence in the Labour movement. They said, "Victoria was always a conservative area. New South Wales would be a different story."

Two events have shattered this illusion. Ten days before Christmas there was a by-election for the New South Wales Parliament in the Labour stronghold of Hartley, held for many years by a Labour member who recently retired from politics. The Opposition campaign concentrated on the banking issue. The Labour member was returned, but there was a 12 per cent swing against Labour. If such a swing was sustained throughout Australia, it would be disastrous for the Chifley Government in both Houses of the Federal Parliament.

The second event was in the Prime Minister's own preserve of Macquarie, New South Wales. For many years he has been a councillor of the Abercrombie Shire Council in one corner of his electorate. Throughout the war he retained this municipal interest. It helped him to "keep his ear to the ground" and to understand problems of local Government. A week before the Hartley by-election Councillor Chifley was defeated because, his opponents said, "he is too busy with banking to attend to our affairs." Attempts have been made to explain this away, but in the context of recent happenings it is significant of a general move away from confidence in the Chifley Administration. People recall that the Macquarie electorate has been lost by Labour before when Labour Governments have been doomed.

The banking issue will determine the 1949 elections. Labour places all its hopes on the strenuous efforts of the Attorney-General's department to expedite the High Court hearing, so that the banking adjustments may be made, and the fears of the public allayed before September, 1949. If the Act is declared invalid, then repercussions within the Labour Party are certain. Members, unswerving in their belief in their nationalised industry, will have no further faith in the parliamentary method of achieving public ownership in Australia. The pressure of state interests against the Federal tendency to centralise power will also re-assert itself. The confidence of the Prime Minister and of the Attorney-General, Dr Evatt, in the Commonwealth's power to nationalise the banks will be undermined and, with that, party confidence in their judgment.

Fears of Small Business Men

The Labour Government at present, however, remains solid, and will introduce legislation during 1948 which the rank and file hope will retrieve the electoral position, whatever happens to banking. The subjects under discussion include proposals for a larger Federal Parliament and a general redistribution of seats, the latter being required as a result of the changes in population revealed by the 1947 census. Whatever proposals are brought to Parliament, the Chifley Government will be accused of jerry-mandering the electorates; and whatever the Cabinet attempts the Labour Party will expect a strengthening of their electoral possibilities. Debates on these issues alone, the Opposition believes, will weaken Labour's election chances.

During 1948 the Australian Federal Government also intends to widen the scope of social services, introduce a national medical system and endeavour to abolish the means test on all rights to social services. Cuts in income tax are also regarded as certain, and cynics forecast that these will operate on the pay-as-you-earn system a few weeks before polling day.

Mr Chifley himself is known to regard maintenance of the "full employment" policy and Australian ability to meet the repercussions of any overseas economic catastrophes as the main plank of the Government's popularity with the wage earners. Hence the Government's reluctance to apply the restrictions involved in the present dollar exchange crisis. This distaste is all the more bitter because, however carefully the full impact is shielded from the majority of wage earners, the import restrictions hit the middle classes whose swinging votes and non-party allegiance make and break Governments. And these middle classes have been critical for some time of taxation policy—a criticism which has been subdued mainly because the Chifley Ministry has been expected to keep industry stable.

Bank nationalisation and the forecasts of the Opposition parties of "more nationalisation to follow" have resurrected these criticisms and killed their expectations. However much Labour is able to show that, "contrary to the idea that bank nationalisation is a Socialist move for Socialism's sake, it is a public move to make private enterprise possible," the small business man is worried.

All these tendencies should not be exaggerated, however, nor should it be thought that Mr Chifley will stop at nothing to keep his party in office. He is an astute and sincere parliamentarian who believes "public opinion is usually some years behind its knowledge of the value of measures designed for the public good."

THE BUSINESS WORLD

Cheap Money Epilogue

TWO events in the past ten days write *finis* to the campaign for cheaper money, as waged in its extreme form by Mr Dalton. The first is the abandonment of any attempt to place the British Transport Stock at a rate below 3 per cent. And the second is the notice to local authorities that loans from the Local Loans Fund of more than 15 years' duration will until further notice carry interest at 3 per cent. It is commonly believed that policy is thought out by officials, and that Ministers have only to endorse it. But who can believe that these two events would have taken place, at least in the same unspectacular way, if Mr Dalton had remained in the saddle? The opening days of 1948 have produced a clear admission of defeat for the ex-Chancellor's policy which he would have striven—though, perhaps, unsuccessfully—to avert. At any rate, he was always enough of a salesman to avoid giving the appearance of an abject surrender.

Surrenders deserve their epilogue. Of Mr Dalton's campaign it can be written that he succeeded for a time in bending interest rates to his will, at the expense of a prodigious increase in bank deposits. He was prepared to monetise the National Debt on a scale which added quite unnecessary fuel to the postwar inflation. At a time when demand for consumption and capital goods was already clamant, and the physical controls none too secure for their task of ensuring that physical resources were devoted to the urgent needs of postwar reconstruction, he acquiesced in the creation of more credit—more effective money demand—in order to drive the price of Government borrowing down to 2½ per cent and lower. And what is the direct fruit of these efforts? The issue of £753 million of 2½ per cent Savings Bonds, 1964-67, which now stand at 95½, and of £482 million 2½ per cent Treasury Stock, repayable at Government option from 1975, which has lost its original subscribers 18 points in twelve months, which is equivalent to about 13 years' net income after tax at 9s. in the £. Two and a-half per cent Consols—the Goschen prototype against which Mr Dalton once measured his task—now yield £3 1s. 4d. per cent flat; in the Autumn of 1945, before he started upon it, they yielded £2 16s. 9d. per cent.

Apart from the floating debt, on which appreciable economies have been gained from the halving of short-term money rates in October, 1945, it is difficult to find benefits from the policy of ultra-cheap money which even begin to match the harm which the policy has wrought upon the British economy as a whole. The local authorities might be quoted as an exception to this statement. They, at any rate, enjoyed a series of conversion issues at 2½ per cent during the high summer of the cheap money campaign. But it was not long before that patient herbivore, the public stag, was being compelled to absorb anything up to 90 per cent of loans which the ordinary investor, in his die-hard way, still refused to accept on the same credit rating as Government stocks. Then in May, 1946, the Treasury cut the rate on loans from the Local Loans Fund by one-half per cent (broadly speaking) to 1½ per cent for 5 years or less, 2 per cent for 5 to 15 years, and 2½ per cent for more than 15 years. These rates have now been increased by one-half per cent, but in the meantime a good deal of local authority borrowing from the Local Loans Fund has already been carried out, in anticipation of the final cost of schemes which will take some time to complete. More than one local accountant has taken Mr Dalton

at less than his face value, and borrowed as much as possible from the Local Loans Board at 2½ per cent, in anticipation of a rise in rates and it is suspected that some, at least, of this money is now temporarily invested in the gilt-edged market at 3 per cent. What the public lose as taxpayers by this devious process, they may perhaps make good as ratepayers.

This review of achievement suggests that the exotic phase of cheap money promotion, so far from being a proud matter for patriots, has produced unhealthy and debilitating consequences for the British economy. The abandonment of the doctrine that 2½ per cent is the appropriate long-term rate for Government

† Called for repayment March 1, 1948.

borrowing may only be tacit, but it is certainly complete. It marks the first positive action by Sir Stafford Cripps in a matter of policy where, as recently as two months ago, he was content to follow, and to justify, the line of his predecessor. Any other view of the events of the past ten days would have to rest on the assumption that it represents only a temporary reverse for ultra-cheap money—that 3 per cent may, somehow, provide a spring-board from which 2½ per cent can be regained. But Sir Stafford Cripps is not personally committed to cheap money *à outrance*, and in his preoccupation with physical planning it is likely to have occurred to him that Mr Dalton's policy was a hindrance, and not a help. Cheap money promotion on the scale of 1946 would be entirely out of character for the new Chancellor.

In due course, no doubt, Sir Stafford will give his views on interest rates. It is quite certain that he would be heard with respect in the City, which at the moment feels some lack of sober guidance on this crucial matter. The terms of the Transport Stock issue did not suggest that he is moved by any undue solicitude for the investor, though there is no need to alter in any material respect the necessarily quick judgment which was offered on the stock in last week's issue of *The Economist*. The Treasury has done very well for the Transport Commission (and contingently for itself, if the Government should, at any future

time be called upon to implement its guarantee of interest). But there is no general feeling among railway stockholders that the terms present them with a raw deal—not even, let it be said, among those who objected from the first to the method of compensation based on Stock Exchange prices. That fact alone accounts for the limited measure of selling which has been recorded this week. Even on the first day of dealings on January 2nd, pressure to sell was never so intense that prices gave way; indeed, once the first flush of selling had been absorbed, the discount on Transport Stock improved from 3¼ to 2¼, and this week, in quiet dealings, the price has further improved to 98.

A stock of this size, issued slightly above the market, is bound to take some time to settle down with its peers in the gilt-edged list. At the moment, the gilt-edged market is a happy hunting ground for switching operations. It presents more anomalies than at any time since last August. The accompanying table of gross redemption yields prompts any number of questions. If 3 per cent Transport Stock is properly priced to yield £3 1s. 10d. per cent over its maximum term of forty years, are 3 per cent Savings Bonds 1960-70 fairly valued to yield only 1s. 5d. per cent less over a mere twenty-two years? Again, is a date—even a forty-year date—now of such little account that Transport Stock should yield more than the “irredeemables” like Old Consols and 2½ per cent Treasury Stock? What, again, is the institutional investor to think of the relatively violent fluctuations in 3½ per cent War Loan, which now yields only two shillings less than 3 per cent, assuming redemption in 1952? Is a rise in interest rates to 3½ per cent or more on the cards in the next five years? If it were, of course, the peg which now keeps War Loan as stable as it is would be removed, and its status would lapse to that of a one-way option stock of a distinctly speculative flavour.

Again, the compression of yields between short bonds and long-dated stocks which was such a marked feature of the peak of the cheap money drive has been noticeably modified by recent events. There was a time fourteen months ago when the yield differential between shorts and longs was little more than one per cent; today, it is nearer 1½ per cent. Indeed, the behaviour of the shorts in recent months has been particularly instructive.

Steel in 1948

OF all the recent encouraging signs of expanding industrial production, the determined rate of increase in steel is, perhaps, the most heartening. The industry has not enjoyed the same public attention and encouragement that has been given to coal, but it has hit its production target for 1947 all the same. Indeed, in the first three weeks of December, output was running at the equivalent rate of 14.4 million ingot tons a year. Thus, before the end of the Old Year, it was showing that it was well in train towards achieving, and, perhaps, exceeding, the target set for 1948 of 14 million ingot tons.

A provisional estimate of home steel output for 1947 shows that 12.7 million tons was produced—a figure almost identical with that of 1946. A year ago, the steel industry hoped to produce between 13 and 13½ million ingot tons, but before many weeks had passed its target was hastily revised to 12½ million tons, owing to the shortage of coal. Coal has dogged the industry right up to the end of the year. It has been a common cause of complaint ever since the summer, when production began to show its paces, that the blast furnaces were not receiving enough metallurgical coke. For many weeks, a brand new blast furnace has remained idle at the Colvilles works in Scotland solely because coke could not be provided for it. Perhaps steel output might have been increased by as much as 250,000 tons during the second half of the year if sufficient coke had been available to increase the output of pig iron. Yet it was not until quite

late in the year that the output of metallurgical coke began to be stepped up towards the limit of coke oven capacity. During the autumn, despite the urgent need for steel, weekly deliveries of coal to the coke ovens were below 400,000 tons, and in some weeks well below; if there had been more emphasis on the need for coke, and less on the need for building up coal stocks, another 40,000 tons of coal could have been coked each week. The shortage of coke, however, should now be rectified, for the industry appears to have been promised a weekly allocation of 200,000 tons. Hence, it should be able further to expand its pig iron production, which rose from a weekly average of 123,100 tons during the fuel crisis last year to 167,000 tons in the first three weeks of December. Greater output is still urgently needed, for stocks have been heavily drawn upon in order to raise the output of steel as high as possible, and the present level of stocks amounts to a mere week's supply on the average. To face the steel target for the current year with real confidence, the industry requires some 9.4 million tons of pig iron, of which 7 million tons would be used for steel, and the remainder for foundries and ferro-alloys. Even at the recently increased rate of pig iron output, there is still a gap of three-quarters of a million tons to be filled if requirements are to be met, and stocks are now only one-third of what they were a year ago.

The encouraging output of recent weeks, then, has been

ADDISON

SUCCESSFUL business organisation, whether conditions are normal or abnormal, depends now more than ever on prompt decisions and intelligent employment of specialist knowledge and experience. That is why firms and individuals are making greater use of the expert departmental services of Martins Bank and why the Bank is fully organised and prepared to support well-founded enterprise.

work much more smoothly than the old—at least in its early stages. The new scheme is intended to be in working order by the end of this quarter. But only this week the Ministry of Supply has announced that forms will be sent out to nearly 20,000 steel-using firms during the course of next week asking for information about their receipts and consumption of steel during the last quarter of 1947, and their stocks at the end of the year. There is little doubt that some users have been able to build up useful stocks of steel, while others have gone relatively short; information about stocks is therefore an essential element in an efficient system of allocation. But to take a census at the very moment when the allocation system is in a state of flux is hardly calculated to make the introduction of the new system any smoother. On all present indications it will be many months before the system of steel control is turned into an efficient instrument for the allocation of scarce supplies. And if, on top of these changes, there should be superimposed the threatened new principle that supplies of raw materials will be

Business Notes

Sealed Lips on Contracts

Sealed Lips on Contracts

Although the new Canadian contracts may not cause British food prices to rise, the new prices agreed with Australia, and presumably New Zealand too—Britain's chief food suppliers—will undoubtedly do so, if the Government's limit on food subsidies of about £400 million a year is to be observed. Already, the rate of food subsidies is probably nearer £430 million and the new contract prices with the two southern Dominions are likely to add a further £5-£10 million. Yet, on the question of prices, the Ministry of Food still remains stubbornly silent. In the past, the excuse for secrecy was that it enabled differential contract prices to be negotiated with the various suppliers—an argument also used, but to less effect, by the Ministry of Supply. But contract prices have never been a secret except in the United Kingdom. Even during the war it was possible to find what prices Britain agreed to pay simply by reading the Dominion press. A classic example is, of course, the recent publication of the details of the Canadian contracts. Everything known so far in Britain has come from Canada. Not a word has emanated from Montague House despite its annual outlay of £27,000 on public relations. *Secrecy does not prevent would-be*

Why this reticence? Clearly, secrecy does not prevent would-be suppliers from making a quite accurate estimate of Britain's bargaining terms with the Dominions. Producers have the clearest knowledge of what they can expect to demand for their produce. Is official reticence in London, then, merely a cloak to prevent informed discussion of the Ministry's trading policy? The same point applies to the Ministry of Supply. No balanced judgment about either Ministry's purchasing policy can be made until detailed trading accounts are submitted to the scrutiny of Parliament and the electorate. It was once asked, unofficially, if *The Economist* was acting as an "agent provocateur" in the interest of some foreign power because it repeatedly asked for full information on Government contracts. No doubt the questioner intended a joke, but he surely overlooked the interest of voters and taxpayers in this matter. Of all monopolies, a Government monopoly whose lips are sealed can be the most menacing to the public interest.

Anglo-Danish Trade Dilemma

High hopes are entertained about the outcome of the Anglo-Danish food negotiations which opened this week in London. Britain has already agreed to pay higher food prices with Canada and Australia and has also made total concessions on the 1941 financial agreement with the Soviet Union in order to get coarse grains. The Danish talks broke down last October on the question of price. Denmark then asked 341s. 6d. a cwt. for butter, which Britain would not agree to pay. It remains to be seen whether Denmark will now be prepared to negotiate on the basis of this figure. Clearly, much depends on what Britain can offer in return by way of coal exports. Since October, world prices of feed grains and oilcakes have risen further and the Danes are likely to claim that their higher costs of feeding stuffs justify a price above 341s. 6d. Denmark has already sold butter to Belgium and

allocated to users in relation to their export performance, the danger of further confusion will be heightened.

This will be a critical year for steel, which has become a kind of economic maid of all work—an essential material whose supply is far below the potential demand for home and export uses, and whose control (as the recent White Paper on capital cuts demonstrated) has virtually become the modern substitute for the rate of interest. Control by reference to one scarce factor of production has its limitations and dangers—there have been examples enough in official planning during the past year to demonstrate that point. It may be that too much is expected of the industry, given present shortages of materials—or, if these are rectified, as everyone will hope, that the industry will still find it difficult to play its essential part in the new system of allocation. Those are the basic problems, and it will take all the skill and patience of Government, the industry, and its customers to solve them—or even to make their consequences tolerable.

Russia at 394s. a cwt. and more recently has arranged to supply Portugal and Switzerland at 420s. This figure will presumably provide the upper limit in the negotiations. The weakness in Denmark's bargaining position, however, lies in its inability at present to offer sufficiently large quantities of either butter or bacon. Some 50,000 tons of butter should be available for Britain in 1948—but the Ministry of Food is thought to require at least 80,000 tons. Moreover if Denmark is to build up its pig population to the prewar size over the next year or 18 months, only token quantities of bacon will be available for export meanwhile.

Britain hopes to export at least 11 million tons of coal this year, but most of this quantity has already been earmarked for the purchase of raw materials. Denmark would like at least a million tons—one-third of its annual requirements before the war—in order to curtail the domestic production of peat and so to release labour for agriculture. Yet Britain may not find it economic to offer such a large quantity in return for only 50,000 tons of butter and much less bacon. Denmark also requires supplies of steel—which despite the record British output scheduled for 1948 will still be very short—and facilities for purchasing dollar goods.

The relative bargaining powers of the two countries are probably much more equal on the present occasion than they have been in the past. That in itself may be its danger. Denmark may feel that it has only to hold out, in the hope that Britain will sooner or later agree. On the other hand Britain may think that even half a million tons of coal might be exchanged to better purpose elsewhere. If both sides are satisfied with the quantities of coal and butter offered, the bargaining about relative prices should present no insuperable obstacle. At least there is a mutual desire to come to an agreement, although perhaps not at any cost.

New Canadian Food Contracts

The terms of the new Canadian food contracts have caused little surprise. The higher prices, asked for and agreed to, have been counterbalanced by smaller quantities—a neat example of the effect of Britain's attempts both to stabilise retail food prices and at the same time to freeze the total amount of subsidies, in a world where inflation is rampant and dollars are scarce. Prices in each of the four contracts have been raised; bacon from 29 cents (1s. 5d.) to 36 cents (1s. 10d.) a lb., beef from an average 23 cents (1s. 1d.) to 26 cents (1s. 4d.) a lb.; eggs from about 45 cents (2s. 2d.) to 50 cents (2s. 6d.) a dozen, and cheese from 25 cents (1s. 5d.) to 27 cents (1s. 6d.) a lb. These increases reflect the higher costs of feeding ~~some~~ in Canada—caused in part by the revised wheat contract price and in part by the general shortage of grains. In fixing the new price levels, no attempt has been made to reach parity with American prices. The new contracts will, however, cause a rise in prices on the Canadian domestic market.

The Canadian agricultural stabilisation programme was first keyed to the British contracts during the war. British contracts with the other Dominions call for total output or the exportable surplus or specific quantities. With Canada, however, the contracts set output targets for the Canadian farmers. on two similar housing schemes before and after the war. These schemes were carried out in a town in the home counties; they were built under contract by the same concern and they had an almost identical proportion of parlour and non-parlour type of three-bedroom house. The prewar scheme of 116 houses was finished in 1936; the postwar scheme of 70 houses was begun at

the end of 1945 and finished in 1947. The houses were built to similar specifications though they differed in floor area, the pre-war houses having an average of 799 sq. ft. and the postwar scheme an average of 837 sq. ft., with some additional amenities. In each scheme the contractor used mainly a permanent staff resident in the locality.

Thus, in essentials, the two schemes are closely similar, and this similarity has enabled the contractor to make an objective analysis of the fall in the productivity of building labour compared with prewar years. His calculations show that the average house in the 1936 scheme was finished in 1,661 man-hours, while the postwar houses (with about 5 per cent greater floor space) took 2,795 man-hours. If allowance is made for this increase in floor area, the increase in man-hours required on the postwar project was approximately 50 per cent, representing a loss of efficiency of 33 per cent. The troughs shown on the graphs measure the effects of bad weather and holidays. One of the reasons for diminished output in the postwar scheme was the unusually severe winter of 1946-47. Indeed, the graph shows an almost complete stoppage of work for nearly 12 weeks; the contractor's records for the postwar scheme reveal that some work was lost owing to bad weather on no fewer than 140 days; and 392 additional man-hours per house were lost by bricklayers, carpenters, and labourers owing to weather alone, though these are not shown on the chart, which is concerned only with working hours.

The contractor (to whom *The Economist* is indebted for the provision of these interesting figures) asserts that neither shortage of materials nor any deficiency in management contributed to the poor rate of output in the postwar scheme. This was affected by unbalanced and inadequate gangs of labour—particularly of unskilled labour—though the contractor uses mechanical hoists and other devices to raise bricks, concrete blocks and other materials on the site. Mortar mixing was carried out entirely by machine, and it is claimed that mechanisation was carried to its economic limit. Even if all the mitigating circumstances of bad weather and insufficient labour are allowed for, the chart shows a remarkable decline in output per head in the postwar compared with the pre-war period. The analysis of man-hours spent per house by different trades gives some impression of the fall in productivity per head, which is particularly evident in bricklaying, carpentry, plastering and painting. Since these figures were prepared, of course, payment by results has been introduced in building. In some areas it is claimed that an increase of output of as much as 40 per cent has resulted, but 20-25 per cent is probably a fairer average.

Copper Refining without Dollars

Owing to the limited electrolytic refining capacity in sterling countries, the supply of an adequate quantity of electrolytic copper for Britain has necessitated fairly heavy dollar expenditure in the past, as most of this capacity lies in dollar areas. Some relief was obtained last year when the Ministry of Supply instituted the toll refining scheme. Copper scrap was shipped to the United States and the refined metal returned. Now the Ministry of Supply intends to go one step further.

According to American reports the British Government has arranged with the Phelps Dodge Corporation to refine 15,000-20,000 tons of blister copper to be shipped from Northern Rhodesia; the refining is to be carried out at their Laurel Hill plant. Britain has the option to pay the refining fees either in dollars or in the equivalent dollar value in the form of refined copper. The first shipments of Rhodesian blister copper are due to arrive in the United States in February and the first batch of refined metal should be on its way to the United Kingdom in April.

Britain has also agreed to buy 24,000 tons of refined copper from Canada during the first six months of 1948, the cost of which will be met mainly in dollars. Details of the 1948 Canadian copper contract have not been published, but it would appear to be for specified quantities, rather than like the 1947 contract, which called for 75 per cent of the Canadian output in excess of domestic requirements. Unless output in Rhodesia expands very sharply, Britain will probably be again forced to buy from Chile or other Latin American copper producers, in order to cover its 1948 requirements. Reports from Chile mention the probability of a new copper tax being levied to help reduce the budget deficit. With the world demand for copper remaining firm, part of this tax could no doubt be passed on to the consumer.

At the moment any dollar economy is worth while, and the new refining scheme is certainly worthy of trial. The copper sent to the United States to meet the refining fees will, however, have to be made up from supplies from non-sterling countries if British

manufacturers are not to go short, unless it is possible for the Rhodesian mines to step up output.

Silver Hoarding

The recent seasonal demand for currency has borne with special severity on silver coins and has been such as to suggest that a considerable amount of hoarding of silver coins has been taking place. The statistics of currency circulation show that during 1947 the coin circulation was increasing steadily up to last October (the last available figures) while the Bank of England notes in circulation were falling. The growth in the coin circulation, namely from £142 million in December, 1946, to £146 million in October, 1947, will undoubtedly have undergone substantial acceleration since then. The Bank of England return shows that between October 15th and the end of the year the coin holding in the banking department fell from £2,139,000 to £262,000. There was no comparable movement in 1946.

On the evidence of these figures it would appear that some of that strange band of people who normally keep large sums of cash about them have of late been shifting their hoards from paper money to silver coins. Silver must be a highly inconvenient medium to hoard, but the technical difficulties involved have evidently been outweighed by the fears attaching to the holding of notes. The greatest of these fears is that of a compulsory conversion operation, linked, perhaps, with a partial compulsory blocking *à la Gutt* or confiscation *à la Stalin*. Recent answers to Parliamentary questions have left some room for uncertainty on this point and have therefore encouraged the conversion of notes into coins, since the latter are bound to be kept outside the range of conversion operation.

There can be no substance in the suggestion that behind this hoarding of silver coin there lies the pursuit of profit. Silver would have to rise to about 120 pence per ounce before the silver content of the post-1921 coins became worth more than the nominal value of the coins in question. The present price is only 45d. Whatever may be the explanation of this abnormal demand for silver coin, it has caused considerable inconvenience. In many districts banks have been compelled to restrict the amount of silver coins they are prepared to pay to customers. In some parts of the country it has become difficult for large firms to accumulate sufficient supplies of coin for wage payments and the odd amounts have been left owing to employees. The hoarding movement is so absurd that it can in the long run be expected to correct itself. Meanwhile the Mint is doing its best to keep pace with the situation by increasing the coinage of cupro-nickel.

Wages in 1947

Any doubts about the existence of inflationary pressure would quickly be dispelled by reference to the current Ministry of Labour Gazette, which gives evidence of the rising trend of wages. During November, the wage advances granted to two large and important groups of workers—miners and building operatives—contributed powerfully to the increase of £665,000 in the weekly wages of 1,500,000 workers. This brought to £1,637,000 the cumulative increase in weekly wages for the first eleven months of 1947, affecting more than 4,500,000 workers. Admittedly, this increase is on a smaller scale than in 1946, when 7,600,000 workers benefited from an increase in their weekly wages of about £2,700,000. November's increases, however, brought the average wage rates to a level of 73 per cent above that of September, 1939, compared with 70 per cent at the end of October and 65 per cent at the beginning of the year.

At the same time, the trend towards shorter hours continued during November, though the number of people affected was only 52,000. Up to the end of November, just over 5,000,000 workers had their hours reduced by 3½ hours a week, on the average. The agreements in mining and some other industries to work overtime will mean that in fact a longer week is being worked, but only at the expense of a substantial increase in labour costs.

Where is this process to stop? A reasonable case can be made out for the increase in miners' wage rates. It is their first increase since 1944, and may prove to be justified on incentive grounds, both for output and recruitment. The builders' increase of 3d. an hour is more difficult to justify at a time when a contraction of the building labour force is called for. On the other hand, it appears to have been the necessary price to pay for the introduction of a system of payment by results. So each individual rise can be justified *prima facie*, but the total effect is a competitive scramble, when other groups of organised labour join in to restore the old margin between their rates and those of

Half the homes of Britain take the RADIO TIMES*

Plop goes the RADIO TIMES through the letter-box. Johnson Junior dashes to fetch it and glances through the Children's Hour programmes. Mother scans the Home Programme while Sister Sue begs to see what is promised in the Light. Father rings nearly every broadcast in the Third. The RADIO TIMES will live in the living room for nine whole days, making its impression on curious and receptive minds. This paper is an effective medium for a national advertising campaign.

SHOPPING THROUGH THE AGES

No such thing as Early Closing!

In an age that we like to think of as more leisurely and gracious than our own, when shopping was not regulated by the minute-hand of the clock, the shopkeeper and his customer met in a friendly relationship that sometimes lasted a lifetime. Different times demand different working conditions, but the value of the personal touch is still unchanged. A distinctive part of W. H. Smith & Son's service is the close personal attention that is given to every customer, and this, no doubt, accounts to a large extent for the popularity of the Firm's many branches.

The truth game

"Glad you like this sherry—it's South African."

It's extremely good. I got some South African wine the other day . . .

I know. A good wine, but not of this quality.

Precisely, but why the difference?

Well, this is a truly representative South African wine. You see, though the Cape has been for centuries one of the world's finest wine countries, it couldn't compete in Britain with European countries until Empire wines got a duty preference twenty years ago. That bucked up the South African industry.

But why haven't we tasted such wines before?

Because really fine wines are achieved by selectivity, experiment and slow maturing. South Africa has done as much in twenty years with some wines

as the Continent has in generations.

Only certain wines, then?

So far. All are good, but not all are fine. The improvement is naturally progressive.

Were South African wines well-known here before the preference twenty years ago?

Now you're delving into history. They used to be very popular. But in 1860 Mr. Gladstone removed the Colonial Preference and sent the South African wine industry into the wilderness.

Is that likely to happen again?

I hope not. Imperial Preference has encouraged the South African wine growers to tremendous efforts. The British Government is not likely to lead such an important Empire industry up the garden again. It wouldn't make sense.

So we can look forward to several kinds of really fine wines from South Africa?

You certainly can, and very soon too."

SOUTH AFRICAN WINE FARMERS ASSOCIATION
(LONDON) LIMITED

groups which have secured increases. Higher wages have just been granted to cotton spinners and a claim from the weavers is now under negotiation; one of the early tasks of the Transport Commission will be to work out a new wage structure for railway-men. There is also considerable dissatisfaction among engineers, once the aristocrats of labour, but now, like other aristocrats, displaced by other classes.

The TUC's decision to leave it to the good sense and restraint of individual unions not to press for wage increases until output is increased, may be inevitable, given the constitution of the TUC and the attitude of most trade union leaders. But this attitude of non-intervention, though it is no solution of the wages problem, will almost certainly be exploited by unscrupulous leaders; in particular, Communist elements, who have already announced their intention of pressing for higher wages, may well be ready to back up this policy by creating industrial trouble. The past year was one of relative industrial peace. Up to the end of November, 2,355,000 working days were lost through disputes, compared with 2,107,000 in the same period of 1946, and most of the trouble was confined to the mines and the docks. The total number of working days lost since the end of the war is just over 6,500,000, compared with over 89 million at the same period after the end of the 1914-18 war. The coming year may prove rather more difficult.

Money Velocity Falling?

A complaint in these columns twelve months ago that the figures of bank clearings, as then presented, were misleading, evidently did not fall upon deaf ears. The Bankers' Clearing House published for 1946 its customary, elaborate series of statistics, but made no attempt to show how far comparison between 1946 and earlier years was vitiated by the fact that during 1945-46 the clearing mechanism was in process of readjustment towards its prewar system, involving a reincorporation of many items into the internal clearings of the individual banks, which under the wartime arrangement passed through the general clearing. For 1947, the main statistical series and chart are again presented in unadjusted form (any attempt at precise adjustment would presumably have been impracticable), but the accompanying report is this time at great pains to point out which figures are comparable and which are not. Indeed, in dealing with the figures of the provincial clearings, estimated adjustment factors are given for the enlargement which occurred during the year in the areas embraced by the Manchester, Nottingham and Sheffield clearings. The Clearing House is to be congratulated on this change in its traditional habits of compilation and presentation. These figures afford virtually the only means of measuring the velocity of money turnover, and any effort that can be made to ensure comparability and statistical (as distinct from merely arithmetical) reliability is well worth while.

The readjustment of the main clearing mechanism was not completed until August, 1946, so that the only figures for 1947 which can be compared with those for the previous year are those for the past four months. This comparison suggests that the rate of money turnover lately has been perceptibly slower than it was at the end of 1946. Total clearings in these four months were £24,333 million, compared with £23,343 million in 1946, an increase of only 4.3 per cent. For the three months

BANK DEPOSITS AND CLEARINGS
1947 compared with 1946

	Gross Bank Deposits %	Bank Clearings Total %	"General" %
September.....	+ 5.9	+11.6	+12.8
October.....	+ 5.4	- 1.8	+11.8
November.....	+ 4.8	- 6.2	+ 6.6
December.....	...	+16.0	+16.9
September/November.....	+ 5.4	+ 0.7	+10.3

for which comparison can be made with the movement in bank deposits (that is, the period September to November, since the December deposit figures are not yet available), the aggregate clearings were a mere 0.7 per cent above the similar 1946 total, whereas bank deposits showed an average increase of nearly 5½ per cent. On the average during the three months, the aggregate of bank deposits was turned over 3.18 times, compared with 3.32 times in the similar period of 1946.

It appears, however, that this slackening of velocity was wholly attributable to the reduction in financial activity which followed

the suspension of sterling convertibility and the break in stock markets, for in two months out of the three the turnover in the Town Clearing, which is always dominated by financial transactions, was actually below that for 1946. In this connection it should be noted that the period with which comparison is made was that which marked the most feverish phase of the activity engendered by Mr Dalton's cheaper money drive. Turnover in the general clearing, which is less affected by purely financial business, showed a substantial increase over 1946 in each of the four months. The double comparison is summarised in the accompanying table.

Changes in the turnover of the provincial clearing houses tend to support this conclusion that the general, as distinct from the financial, circulation of money has actually increased in velocity, for nearly all of them show for the full year a larger increase than has occurred in the average level of bank deposits during the year.

Dollar Silver

Silver required in Britain for essential industrial purposes has, since the first week of December, ceased to be obtainable from dollar sources. The official market in silver had been freed from control in February of last year. At that time, the Bank of England withdrew from the market and allowed silver required for essential uses to be obtained in the cheapest market, even if this was the United States. In effect the bulk of the silver made available for authorised industrial users in Britain during 1947 was dollar silver. No less than 23 million of the 34½ million ounces imported into Britain last year came from the United States, Canada and Mexico. Most of these purchases were made under open licences granted to recognised firms in the bullion market. Owing to the shortage of dollars, these open licences were withdrawn last month, and no further purchases of silver from the dollar area were sanctioned. This meant that the Bank of England had to return to the official market and for the past five weeks the bulk of the metal sold to essential users through that market has, in fact, been provided through the Bank.

The supplies out of which the authorities can satisfy this demand are being steadily expanded by the substitution of cupro-nickel for silver coins. The manufacture of the former is being steadily increased at the Mint and the conversion is now well under way. Ultimately this conversion is expected to yield some 250 million ounces of silver. But no less than 88 million ounces of this will be required to repay silver obtained from the United States under lend lease.

Repaying TDRs

The opening of the main tax-gathering season of the year has reversed the recent trend of the floating debt, discussed in these columns a fortnight ago. In the past week the "active" portion of the debt—the part financed through the banking system and money market—has fallen even more steeply than it did, last August, at the peak of the drafts on the dollar credits. The change of trend actually began in the previous week, when the issue of "tender" Treasury bills fell short of maturities by £10 million and Treasury deposit receipts held by the banks were reduced by £1,000,000. This week's repayments have amounted to £20 million and £17½ million respectively. So far, therefore, the brunt of the seasonal influence has fallen upon the supply of bills, but this does not mean that the authorities have abandoned their postwar policy of progressively shifting the emphasis of floating debt finance from TDRs to bills.

In each of the past six years the weekly offering of bills has been increased in the autumn so as to provide the banks with bigger maturities during the period when they are called upon to make large transfers of tax monies to the Exchequer. Last autumn's additional bill issue, however, was relatively small, amounting to £60 million, and of this only £40 million was attributable to issues beyond the present "basic" offering of £170 million per week. In the ordinary course, the seasonal reduction of the bill supply would be roughly limited to the additional maturities (last year, indeed, there was hardly any reduction at all), but this year a technical complication arises from the fact that impending maturities of TDRs are abnormally small. Next week there are nominal maturities of £40 million, but thereafter there are three weeks without any maturities at all. Up to mid-February, indeed, this year's maturities will total no more than £220 million, in contrast with £460 million in the similar period of 1947. It will be surprising, therefore, if in this period the surplus of revenue does not force the authorities to reduce the weekly Treasury bill issue, by under-allotments or

14th January, 1948, for an

OFFER FOR SALE

by
PHILIP HILL & PARTNERS LIMITED
of
**760,000 Shares of 5s. each at
13s. 6d. per share**

The Offer for Sale shows (inter alia) that:

- (1) The Company was incorporated in England on 4th December, 1917, as a Private Company and was converted into a Public Company on 5th January, 1948. The Company has agreed to acquire as from 1st March, 1947, the undertakings, assets and liabilities of Thomas Hope, Limited, and Sankey Hudson & Co., Limited.
- (2) THOMAS HOPE, LIMITED, carried on the business, established in 1899, of manufacturing scholastic stationers and was one of the largest of its type in the country. There are contracts, some of which have been held for over forty years, for the supply of school materials to a number of Education Authorities. SANKEY HUDSON & CO., LIMITED, was a wholly owned subsidiary of Thomas Hope, Limited, and carried on the business of envelope makers, book publishers and stationery manufacturers.
- (3) The products of these two businesses are in great demand all over the country. The export trade which had to be considerably reduced during the war has been revived and is rapidly increasing. The Directors are of opinion that sufficient labour and materials are available for the Company's present output and do not anticipate difficulty in increasing the labour force when larger supplies of materials are available.
- (4) The combined net assets of these Companies excluding goodwill, based as to the freehold and leasehold properties, plant, machinery, etc., upon professional valuations and as to the balance of the assets upon the Accountants' Report, amount to £674,230.
- (5) The combined profits of these companies for the year ended 28th February, 1947, amounted before deducting profits tax and income tax to £200,795. The Directors anticipate that the profits for the period from the 4th December, 1947, to 30th November, 1948, in the absence of circumstances beyond their control (after taking into account the increased charges for depreciation on the new basis) will exceed those earned during the year ended 28th February, 1947. In this event, the Directors intend to recommend the payment of dividends for the period ending 30th November, 1948, at the rate of at least 18 per cent. per annum in all on the capital of the Company. The Directors intend to declare an interim dividend in June, 1948. A dividend of 18 per cent. will require £72,000 (before deducting income tax) and is equivalent to 56 13s. 4d. per cent. on the price at which the Shares are being Offered for Sale.

Full Offers for Sale, on the terms of which alone applications will be considered, and application forms are obtainable from:

BANKERS:
MIDLAND BANK LIMITED, New Issue Dept., Poultry, London, E.C.2, and Branches.

otherwise, below the basic figure of £170 million, which is the level at which bill maturities will be running after the end of next week.

After the middle of February, however, TDR maturities will be large (in the last six weeks of the financial year they will total £580 million), so that there should be no further encroachment upon the bill issue. Indeed, they should afford sufficient latitude to enable the authorities to replace, should they wish to do so, some of the bills repaid in the early weeks of the year, although that would involve an increase in the weekly issue beyond £170 million. In view of the prospect of a genuine budget surplus in the new financial year (even after allowing for below-line items), the authorities may conceivably be reluctant to concede such an increase, although, from the point of view of promoting flexibility of the banking system, there is every justification for raising still further the proportion of the floating debt which is maintained in the form of bills. If past policy is any guide, however, the net repayment of TDRs in this last quarter of the financial year is likely to be much smaller than the £250 million repayment which occurred last year. Indeed, throughout the main period of heavy revenue inflow there will be a contrary influence upon the floating debt, arising from continued absorption by the authorities of the Conversion Loan due to be repaid on March 1st. This factor will act as a brake on the reduction of TDRs over the whole period, and will also tend to prevent any substantial repayments of bills in the period when TDR maturities are light.

Dearer Cocoa and Chocolate

A week ago the Ministry of Food announced that the selling price of West African cocoa in the United Kingdom would be raised from 119s. to 225s. 6d. a cwt. (plus duty) ex store. It added that "this unavoidable increase will result in higher retail prices for chocolate and chocolate confectionery." The world cocoa market is dominated by American demand. Ceiling prices in the United States were removed in autumn 1946, and the impact of a large American demand on a relatively small and inelastic supply caused prices to move sharply upwards. Last October the New York price touched £255 a ton; since then there has been a slight fall from this peak, but prices are still high at around £235 a ton.

West Africa supplies about 70 per cent of the world's cocoa production, and output there has been declining. The cocoa trees are affected by disease and require replanting, although in 1946-47 drought also played havoc with the crop. It takes about four years before new plantings become productive, so that re-stocking is no simple operation in a semi-primitive community. High prices to West African growers, where cocoa production is carried out on family holdings and not usually on a plantation scale, may even act as a deterrent to replanting. World cocoa output is fairly rigidly localised and new production requires long-term investment and the solution of difficult native problems. On balance, therefore, it is unlikely that the present high cocoa price will induce a greater supply. Under such conditions, price will be determined more by the demand factors.

With the institution of the West African cocoa marketing scheme, the Ministry of Food has agreed to buy at world prices. Movements in the British cocoa price have hitherto been fairly infrequent, though they have been sharp. The price of 45s. a cwt. was fixed in 1941. In July, 1946, it was raised to 51s., and in March, 1947, to 119s. a cwt. It remained at this level until last week, when it rose to 225s. 6d.

The effect of the new cocoa price on the price of chocolate and chocolate confectionery is being negotiated with the trade. It is generally believed that retail prices will have to be increased by 50 per cent. On a strict calculation of costs, the rise should perhaps lie between 33½ and 50 per cent, but such fine adjustments are difficult to make when retail prices have to be fixed to the nearest halfpenny.

Tin Enigma

One of the great disadvantages of state trading lies in the impossibility of forecasting future governmental action with any certainty. Under free market conditions, consumers can make their future arrangements on the firm basis of current prices and information about prospective supply and demand. But in some manifestations of a planned economy, it does not pay to assume that the central authority will necessarily act rationally. Recent developments in the tin market tend to underline this warning.

Three weeks ago, the Ministry of Supply decided to raise the home issue price of tin from £437 to £510 a ton. This decision was made before the new US-Bolivian contract was completed. There was, naturally, some speculation among tin consumers about

the reason for this new departure. Hitherto, the British price moved in sympathy with the US-Bolivian price. The announcement, however, showed that Britain was not attempting to become independent of the American market, for it included a rider that if the new Bolivian price proved to be higher than the home issue price, an adjustment would be made. In fact, the new Bolivian price of 90 cents a lb. (equivalent to about £500 5s. a ton) agreed with the lowest forecasts, and it seemed that no further increase of the British price would be necessary.

Yet within a week of the announcement of the US-Bolivian contract the Ministry of Supply has raised the home issue price of tin by a further £9 to £519 a ton. Was an error of calculation made in the previous price, or was adjustment for the British-Bolivian contracts forgotten? Nor does the mystery end here. Under the December price increase the Malayan producers were paid £500 a ton and Nigerian £477. Nigerian producers were apparently satisfied, but Malaya producers certainly were not; in particular, they claimed that the Chinese section of the industry would be unable to maintain production at the new price. Yet this week's announcement of a further increase in tin prices for home consumers has been accompanied by the announcement that Nigerian tin prices are again to be raised by £8 10s. to £485 10s. a ton, although the Malayan price is to remain unchanged. The price structure for the three main producers in 1947 was Malaya £423, Bolivia £422 and Nigeria £405 15s. The new one is Bolivia £500 5s., Malaya £500 and Nigeria £485 10s.

It is impossible to attempt to analyse the Ministry of Supply's price policy. Mr Creech Jones, the Colonial Secretary, has assured Malaya that if the present price proves to be uneconomic, a revision can be discussed. If the Malayan price is raised again within the coming months, presumably the home issue price will also be adjusted. Or does the new level already make allowance for that possibility? The Ministry of Supply has been particularly unfortunate in its policy on base metal prices, and the tin enigma requires a fuller explanation.

Peru Sterling Bonds

The offer by the Government of Peru to holders of the Republic of Peru 6 per cent National Sinking Fund Gold Loan 1928 and the City of Lima 5 per cent Sterling Loan 1911, its two outstanding sterling issues, to exchange into new External Sinking Fund Dollar bonds of the 1947 series "E," has had a most unsympathetic reception in London. The Council of Foreign Bondholders has in fact recommended its unqualified rejection. Its United States counterpart, the Foreign Bondholders Protective Council did likewise when a similar offer was made to the holders of Peru's external dollar debt in June last year—yet the offer to dollar bondholders did not involve them in a capital loss as does the present offer to sterling bondholders. Criticism on this side has centred on the low rates of interest on the new bonds and in the cancellation of all arrears of interest without consulting the holders.

These objections seem to have a good deal of substance in them, especially as the action taken by Peru has been taken unilaterally. The maximum rate of 3 per cent interest to be paid on the new bonds will be reached in 1953 and in the interim, payments will be at the rate of 1 per cent for 1947 and 1948 (not 1997 and 1998 as incorrectly printed in *The Economist* last week), 1½ per cent for 1949 and 1950 and 2 per cent in 1951 and 1952. Of course these rates are figures of expediency rather than a measure of the present international credit standing of Peru. Yet since the service on the whole of the Peruvian public debt has been suspended since 1931, it is something that a Government of Peru has decided at long last to resume payments at even these low rates to its long suffering overseas creditors. In view of Peru's record as a creditor it seems pointless to cavil at the lack of any mention of arrears of interest and, at this stage, at the non-observance of the dollar clause in the loans, although, in view of the relatively small extra charge that higher rates of interest would put on exports from Peru, it may be worth while to hold out for better terms. Peru appears bent on giving the minimum, and it is up to sterling bondholders to press for all they can get.

Shorter Note

A reduction in the fiduciary issue, already confidently anticipated before Christmas, is reflected in this week's Bank Return. The reduction is from £1,450 million to £1,400 million, and is the first to be made for exactly nine years. During the war period and since, there have been no fewer than seventeen increases in the fiduciary issue.

ESTABLISHED 1837

With a network of branches throughout every important pastoral, agricultural, commercial and industrial area in

AUSTRALIA and NEW ZEALAND

and with Agents in the principal cities throughout the world, The Union Bank of Australia, Limited, is able to offer the facilities of a most comprehensive banking service.

Head Office:

71, CORNHILL LONDON, E.C.3.

West End Agency:

15 CARLOS PLACE LONDON, W.1.

REFUGE ASSURANCE COMPANY, LTD.

Chief Office: OXFORD STREET, MANCHESTER, 1

ANNUAL INCOME EXCEEDS £16,300,000
ASSETS EXCEED £97,000,000
CLAIMS PAID EXCEED £181,600,000
(1946 Accounts)

UNIVERSITY OF LONDON

Applications are invited for the post of Director of the Department of Extra-Mural Studies, which will become vacant on August 1, 1948. In making the appointment, due consideration will be given to academic qualifications, administrative experience and interest in the field of adult education. Salary not less than £1,250 p.a., plus superannuation and family allowances. Further particulars will be supplied on request. Applications, stating age, qualifications, experience, etc., accompanied by two testimonials and the names of two persons to whom reference may be made, should be sent to the Principal, University of London, Senate House, W.C.1, not later than February 7, 1948.

THE UNIVERSITY OF MANCHESTER**CHAIR OF GOVERNMENT AND ADMINISTRATION**

Applications are invited for appointment to a newly instituted Chair of Government and Administration. Salary £1,450 per annum, with superannuation under the F.S.S.U. A children's allowance scheme is in operation. It is hoped that the person appointed will be able to enter upon his duties in September, 1948.

Applications, which must be received on or before February 25th, 1948, should be sent to the Registrar, the University, Manchester, 13, from whom further information may be obtained.

LEVERHULME RESEARCH FELLOWSHIPS, 1948

Application is invited for Fellowships and Grants in aid of research. The Fellowships and Grants are intended for senior workers who are prevented by routine duties or pressure of other work from carrying out research. They are limited to British-born subjects normally resident in the United Kingdom. In exceptional circumstances the Trustees may waive the condition as to residence.

The Trustees are also prepared to consider applications from groups of workers engaged upon co-operative programmes of research, particularly from those engaged upon long-distance programmes or in institutions in which the normal facilities for research have been curtailed by the war.

The duration of the awards will not normally extend over more than two years or less than three months and the amount will depend on the nature of the research and the circumstances of the applicant.

Forms of application may be obtained from the Secretary, Dr. L. Haden Guest, M.C., M.P., Leverhulme Research Fellowships, 7, Bedford Row, London, W.C.1.

Applications must be received on or before March 1st, 1948. Awards will be announced in July and will date from September 1st, 1948.

ACCOUNTANTS.—Robson, Morrow and Co. have vacancies on their staff for outstanding Chartered or Incorporated Accountants, not over 37, who have held appointments in industry, and who are interested in being trained in the installation of modern industrial accounting methods. Four-figure commencing salary and good prospects. Special arrangements may be made for ex-members of the Armed Forces. Send full particulars of age, education, qualifications, experience and present salary to 59, New Cavendish Street, London, W.1, marking envelope "Application."

BANK OF SCOTLAND

Constituted by Act of Parliament 1695

AUTHORISED CAPITAL ... £4,500,000
CAPITAL FULLY PAID ... £2,400,000
RESERVE FUND & BALANCE carried forward ... £2,765,948
DEPOSITS & CREDIT BALANCES
as at 28th February, 1947 ... £87,073,848

Head Office: THE MOUND, EDINBURGH

Over 200 Branches and Sub-Branches throughout Scotland.

London Offices:

CITY OFFICE, 30, BISHOPSGATE, E.C.

PICCADILLY CIRCUS BRANCH, 16/18, PICCADILLY, W.

THE BANK OF NOVA SCOTIA

(Incorporated in Canada with Limited Liability.)

Established 1832.

General Office: Toronto, Canada.

Paid-up Capital ... \$12,000,000
Reserve Fund ... \$24,000,000
Total Assets over ... \$700,000,000

Special facilities are available to the public through the Branches of this Bank for the transaction of business with Canada, Newfoundland, Cuba, Puerto Rico, Dominican Republic, Jamaica and the United States at New York.

Address enquiries to London Branch:
108, OLD BROAD STREET, E.C.2.

C. G. WEBSTER, Manager.

SOUTH AFRICA

BOROUGH OF NEWCASTLE, NATAL, midway between Johannesburg and Durban, have fine sites available, ripe for industrial development, at the low price of £50 per acre to approved firms. Plentiful coal available at pit-head prices, good quota pig iron, plentiful water, road access and rail sidings, power and labour available.

Asada, Limited, wish to announce that they offer complete co-ordination for industrial settlement and development. We can put you in touch with the Town Clerk for the purchase, and arrange for design, equipping, financing and building of your new branch in this Borough or elsewhere in the Union. Our associate company in South Africa have directors and representatives in all principal cities and many towns, and we arrange for representatives to meet you when you visit the Union and assist in all negotiations. The Asada Group embraces architects, surveyors, engineers, builders, contractors, merchants and suppliers, both at home and in South Africa, and your problem of disposing of your present premises, the shipping of machinery and equipment, the building of the new premises, the housing of the executive staff you wish to take with you, and all the various details, can be looked after by arrangement with us. Our fees are quite reasonable. Kindly make an appointment for interview with Asada, Ltd. (Dept. 335), 55 Pall Mall, London, S.W.1.

APPLICATIONS are invited from Chartered or Incorporated Accountants by approved (Government) Accountants in Calcutta. Salary not less than £1,800 p.a. Applicants must be medically fit for service in the East and should not be over 55 years of age. Contract 3 or 4 years, passages paid both ways. Local leave and 4 months' leave on full pay on termination of contract.

Written applications giving age, full details of career, qualifications and experience including dates, should be addressed to the Appointments Officer, Ministry of Labour and National Service, 1-6, Tavistock Square, London, W.C.1, quoting reference number F.A.907.

Original testimonials should not be sent.

Only candidates selected for interview will be advised.

WORKS MANAGER. Production Manager, General Manager.—Advertiser, early 40s, university education and extensive practical experience, including design, costing, production control, standards, personnel, etc., at present engaged in senior executive position, seeks change to post offering greater scope in a firm where the real meaning of modern good management and control on a professional basis is understood and appreciated; would carry out a programme of modernisation or fit into a well-organised firm; only interested in an opening in London area carrying real responsibility under clear-cut terms of reference; light or medium engineering industry preferred.—Box 6.

LITERARY and scientific translations from French, German, Polish, Italian, Czech into English accepted. 30/- per 1000 words. All promptly dealt with. Send to: Miss E. Norton, St. John's Parsonage, Hurst Green, nr. Oxted, Surrey.

A BUSINESS man (Wykehamist) of proved ability and adaptability, with a successful record in peace (sales and advertising administration) and war (Lt.-Col.—Staff), seeks a permanent appointment. Up-to-date knowledge of management, marketing, etc.—Box 630.

THE CHARTERED INSTITUTE OF SECRETARIES.—Directors requiring the services of CHARTERED SECRETARIES to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 16, George Street, Mansion House, E.C.4.

A Capital Levy?

SLOWLY, very slowly, public opinion is coming round to the view that one of the things that is wrong with the British economy—and almost the only thing that is within the control of the British Government—is the inflationary pressure that is distorting it. Several things are contributing to this gradual conversion. For one thing, it is obviously true that inflation is the great problem everywhere else in the world. In Russia, in America, in France, steps of varying effectiveness are being taken against it and the task of believing that Britain alone is exempt from this world-wide plague is proving to be beyond the powers of even the most obtuse complacency. Moreover, the inflation in Britain, so long suppressed, is beginning to come out. The prices that have to be paid for food, whether to the British farmer or to the overseas producer, are rocketing up. The price of coal has just been raised to more than double the prewar level, and still the Coal Board runs at a loss. Transport wages are going up, and the surplus with which the Transport Commission hoped to start looks like turning into a deficit. There is hardly a price in the list that is not being pushed up. Not merely is there an obvious inflation, but it is also clearly reaching the rampant stage.

Hitherto, the argument for disinflation has been mainly concentrated on the flow of incomes arising from wages. This primary attention can be justified, because wage-incomes are not only the overwhelmingly largest part of all private incomes but also the only category which is substantially greater now, in real terms, than it was before the war. Clearly, if there is to be a disinflationary effort it must concern itself with wage incomes much more than with any other forms of income. But it is not right that other incomes should be excluded from its purview; and even if it were right, it would not be politically possible, especially with a Labour Government in office. It is very difficult, however, for even the most determined defender of the working class to make out a convincing argument to the effect that other classes of income as a whole are bloated. The statistics are all against him. The real net value of the average salary is clearly down; so, even more obviously, is the real net value of incomes derived from rents or fixed interest. Even profits, in spite of the unsupported assertions to the contrary, are almost certainly lower, in real purchasing power after taxation, than they were before the war. The argument is therefore concentrated on spending out of capital. Some of this there undoubtedly is, and much of what there is makes a conspicuous splash in austerity conditions. There is also, unquestionably, a certain amount of spending out of expense accounts, which is also very visible in the West End of London.

It is doubtful whether the sum total of all these kinds of sumptuary expenditure amounts to very much; but it exists, and it cannot be ignored. It is perhaps to be taken as a good sign that Labour MPs are beginning to think about ways in which this flow of excess demand from "the rich" could be stopped, since it shows that their minds are moving in a disinflationary direction. In general, the argument can be conceded. In a rounded policy of disinflation, which covered a sharp reduction in Government expenditure (including, inevitably, a curtailment of

subsidies), a smaller reduction in taxes and therefore an increase in the surplus, and a check to the rise in wages—in such a rounded policy, measures to reduce other forms of unnecessary spending should certainly find a place. So far the argument is easy; the problem is, what measures?

The favourite weapon of the Left is a capital levy. It appeals to all their instincts; and it has, indeed, a respectable lineage of support outside the circles of the Left, narrowly so-called. But for achieving the purposes that are now needed, it is a very blunt instrument indeed. It is not fashionable to inquire whether a levy on capital, which has suffered from the war and its attendant circumstances, while wage incomes have gained, would be just. There might be some justification for a levy on all those holdings of capital that have increased since 1939—certainly on those that have increased by more than the rise in the general price level. But there is no way of identifying them now, since there is no record of capital holdings before the war. The only practicable form of capital levy would be one that penalised all capital, whether it has risen or fallen, whether or not it is being drawn upon to sustain an excessive flow of spending. Any such project, apart from its questionable justice, would give rise to endless anomalies. If there were no exemption limit, administration would be difficult; and if there were a limit, the levy would lose still more of its justification and of its efficacy. How would it be proposed to treat the hundreds of thousands of persons whose entire capital is locked up in the houses they live in? Would they be compelled to seek additional mortgages, at a time when mortgages were also compelled to seek ready cash? And what about people whose whole capital is actively employed in their business? These difficulties are not perhaps insuperable, and the effort to overcome them would be worth while if the capital levy were likely to be supremely effective. But is it? It has long been recognised that in these days of heavy progressive taxation, a capital levy, the proceeds of which were used to redeem debt, would bring only negligible benefits on balance to the Budget owing to the loss of income tax revenue that it would involve. But if the net benefit to the state's income is small, surely it follows that the net loss to private incomes would also be small? And as for the capital levy's effect on spending out of capital, is it not as likely to be bad as good? Is not the average capitalist likely to conclude that he had better make haste to spend his capital before the levy is re-

peated? And whether or not this is so, it is virtually certain that a capital levy would discourage savings.

Another possible device would be a blocking operation, such as that by which M. Gutt won fame in Belgium. This is theoretically much more attractive than a capital levy. It applies only to those forms of capital that are likely to give rise to excessive spending—that is, to the more liquid forms. Moreover, it is not a permanent confiscation so much as a temporary forced loan, and the unblocking might at a later stage serve as useful a purpose of economic policy as the blocking would now. But a blocking operation is nevertheless a very difficult matter to carry through, and likely to be particularly difficult in Great Britain, where banking and credit trading are both much more developed than in Continental countries. It would give rise to many of the anomalies of a capital levy, and to a host of hard cases which could neither be ignored nor be dealt with except at the cost of a formidable administrative apparatus. It would not be impossible to carry out, and it would be likely to be fairly effective for its purpose. But it should certainly not be lightly embarked upon.

Must it therefore be concluded that there is no comparatively simple and certainly effective method by which capital can play its part in a disinflationary policy? That would be a most unfortunate conclusion. There is unfortunately little enough likelihood of a Labour Government taking the need for disinflation seriously, and the prospect would disappear completely if capital had to be left out of the programme. It happens that there is a method, which is likely to be effective, which requires no administrative apparatus, which will encourage thrift and discourage capital expenditure, which will lower the market value of all forms of capital and therefore discourage realisations of capital to finance current expenditure, which will equally discourage all forms of extension of credit for trading purposes. This is, of course, the old-fashioned remedy of a sharp temporary rise in interest rates. But unfortunately, as everybody knows, higher rates of interest are a reactionary device of baleful Bourbons. By a strange twist of logic, the classical device for whipping capital into line has come to be regarded as a concession to the very capitalists who would be constrained by it. But if the Chancellor of the Exchequer wishes to make sure that capital plays its part in a disinflationary policy, this is obviously the way to do it.

Refugees without Refuge

NIGHT by night new refugees are still crossing frontiers and throwing themselves on other people's charity. Those in Europe, most of whom pass their last sentry somewhere in Austria, prevent themselves at the care and maintenance centres run by the Preparatory Commission for the International Refugee Organisation—PCIRO. The governments which compose this organisation are due to hold another "preparatory" meeting on January 20th. At it they will learn some disagreeable facts. One is that their organisation cannot come of age until March at the earliest. Of the fifteen ratified signatures required, only twelve have been deposited. (The twelfth ratification—that of France—was received only this week.) Another concerns finance. The contributions due from the twenty states which have signed the instrument constituting IRO should total \$122,347,049 for the financial year July, 1947, to June, 1948. Of this sum the Organisation had on November 30th last received only \$38,239,838. A third is that this lack of funds, combined with the influx of new refugees, has forced the PCIRO administration to restrict admissions to its camps in a way that was not foreseen in its constitution.

Next week's commission must therefore reach a conclusion on a point which it passed over when it met in October. Is the

money that is available to be used for a job of quality on a limited number of refugees, or on a job of quantity and duration unspecified? Is it a fund contributed to solve a wartime problem, or is it the start of a foundation for helping the refugees of all time? To judge by the IRO's constitution it is simply the former. The preamble to that document specifically mentions a "non-permanent organisation." Ought the constitution to be amended, and, if not, where and when is the organisation to draw the line?

That a line must be drawn, and drawn soon, is the lesson of all the experience accumulated since PCIRO took over from Unrra last July. For one thing, the western taxpayer, who is the chief contributor to the funds available, is clearly paying for what he believes to be the clearing-up of a wartime tragedy. He will be dismayed to learn that almost as fast as his money empties the refugee camps through one door, they fill up through another. By the end of October—that is, at the end of four months' work under PCIRO—the organisation had settled or repatriated 76,000 refugees out of a total of some 700,000 originally placed in its care. But in the same period the number of persons receiving its care and maintenance decreased by only 32,353. And even this decrease does not reflect the scale on

which new applicants are seeking admission, for the administration, obliged through lack of funds to place its own interpretation on the IRO constitution, turned many refugees away. What else was it to do? The IRO constitution is lamentably loose. It defines "refugees" in terms that would fit anyone from a genuine seeker of sanctuary to a disgruntled crank. It covers all who are "unable or unwilling" to return to their country of nationality or former nationality. The administration was forced to stem the rising tide before the camps were swamped. It therefore halted new admissions, except in cases considered to be of real hardship. Had it not taken this arbitrary but unavoidable decision, the results achieved through repatriation and resettlement would have been cancelled out.

There is more than one possible remedy to this state of affairs. The ideal is, of course, a stoppage of the flow by the creation of better world conditions. But these are beyond the Organisation's powers to produce. And there are no signs that they are coming about by other means. Indeed not only in Europe but in Asia the number of refugees is increasing; the latter contingent now includes not only Europeans awaiting repatriation and Chinese outside China but also the new homeless of India and Pakistan, while in Europe a flow, chiefly of *Volksdeutsche* and Jews from east to west, continues steadily. Another remedy would be the provision of additional funds. But is it desirable to offer unlimited protection? It is extremely difficult to distinguish those whose movement from their homelands was spontaneous and individual from those whose refugee status was in whole or in part an organised movement. It is also difficult to tell those whose departure was justified from those who left in pique. To say this is not to suggest that all postwar refugees are less genuine cases than those who began their trek in the war years. But it is now clear that unless the problem is reduced to the dimensions of one created by the last war, there is no special reason why the present contributors should be the only states to pay for it.

The one manageable way out of the present impasse is for the governments attending the forthcoming meeting to steel their hearts and to make an arrangement whereby IRO can, at a moment of its members' choice, turn off the tap. It must fix, at a minimum of public notice, a date line after which no new refugees can be admitted under present arrangements. To do this is at least to define the problem. But it can only be solved if governments are ready to make a much brisker contribution than hitherto to the problem of resettling refugees.

The immigrant-receiving nations must make a fresh effort, and each accept a share of the 800,000 to one million persons who have refused to be repatriated and who cannot find permanent homes in their present countries of refuge, which are principally Germany, Austria and Italy.

Who are the immigrant-receiving nations? The total figures are misleading, since so many countries show an unfortunate though understandable readiness to take only the young, the able bodied and the skilled, and to leave their dependants behind. This is revealed as soon as the figures are even slightly broken down:—

REFUGEES DEPARTED FOR RESETTLEMENT UNDER PCIRO AUSPICES.			
Country of Destination		Country of Destination	
Belgium		Canada	
Individual	30	Individual	35
Minors	3,012	Lumbermen	766
Individual	58	Close Relatives	136
United Kingdom		Domestic Servants	152
Westward Ho Scheme	3,026	Unspecified	98
France	2,045	Venezuela	718
USA	1,707	Netherlands	439
Italy	158	Argentina	173
Palestine	130	Switzerland	114

There are often good, if temporary reasons, for this predilection. The United Kingdom and Holland, for instance, at present prefer the single worker to the family man on account of their housing crisis. France, always conscious of the problem of its birthrate, is ready to make every effort to take couples of

an age to breed children. For instance, the French offer a free home to the miner and his family, and a free gift of coal ranging from three to six tons per annum according to the size of that family. Australia, also, offers attractive endowments to child-bearers. Some areas in South America provide opportunities for a pioneering existence which suit only the young and able-bodied. It follows that if national selection missions continue to skim off the young, the physically fit and, in particular, the single men, there will remain, for long years, as a charge on the present member governments, a hard core of stateless people composed entirely of those who are not thought to be a good economic risk. The proportion of such risks is in fact small. The old and infirm for whom permanent international care would have to be arranged are relatively few. For, on the whole, the aged have not survived the hardships of recent years. The inmates enjoy some of the best health care in the world, thanks to the provision of one doctor to every 700 patients. The tuberculosis rate among them is only slightly above that shown for the Royal Navy in the last decade. An excess of births over deaths is being registered at a rate of 20,000 per annum. Physically, their state is good; only the psychological climate disturbs it.

There is only one way to avoid a permanent rump of vigorous but unwanted refugees and that is a share-out, by agreement between the receiving states, of all the elements in the total number of people to be resettled. Any such agreement must of course be subject to a standard process of sifting whereby the small percentage of thoroughly undesirable people can be eliminated. It is plain that unless governments will take the rough with the smooth—the dependants with the workers—they will be left with about half the present inmates of the camps on their joint hands as international guardians of these people. If they agree now to take a share of all the elements in the total number of people to be resettled, less than 100,000 refugees will remain—and that largely composed of people who would qualify for care under existing charitable foundations.

Here, then, is a two-fold programme for the forthcoming meeting—the fixing of a date line, plus the acceptance by states members and by others in need of immigrants of a rule whereby the picked men and women do not arrive alone. This suggestion is bound to meet with some opposition. It is likely to be encouraged by the principal payers for the present arrangement—the Americans, the British, the Canadians. (Of the \$38 million so far paid into PCIRO's coffers, 77.4 per cent was subscribed by the United States, 7.5 per cent by the United Kingdom and 12 per cent by other members.) It is likely to be opposed by some countries who have a strong feeling of humanitarianism but lack the will or the means to pay for unlimited refugees, by others whose tradition in the field of social work causes them to wish for a long period of re-education before they will accept immigrants, and by still others who see in the present dollar financing of resettlement a small but useful source of hard currency. No doubt the critics will contend that those at present paying can well afford to go on doing so, or that the organisation could perhaps be run more cheaply. In fact, it spends on administration at the rate of only \$16,500,000 per annum out of its budget of \$122 million—a sum which is small in view of the number of offices it is obliged to maintain all over the world. There is no doubt that if it were richer or knew more about its future it could do better. No staff can maintain its calibre in an atmosphere of uncertainty, and many good men have left. By setting a determined course for the future, the governments concerned could help everybody—from high administrator to old-timer refugee—to play a better role in the organisation while it continues. This last participant in the scene is mentioned with a purpose, for he is the man who, perhaps, merits the greatest consideration of all. Unless the stream of newcomers applying for the present funds is cut short, the older inhabitants are doomed to a life of hoping for a settlement that is permanently deferred.

Mr Bevan and the Doctors

A SPECIAL representative meeting of the British Medical Association, held on January 8th, issued a unanimous recommendation that the National Health Service Act should be rejected absolutely by all medical practitioners. It also discussed the form of the plebiscite of the profession, to be taken at the end of the month, and what majority against the health service would justify the British Medical Association in taking further action. If at least 13,000 general practitioners oppose the scheme, out of a total of 21,000, it is considered that Mr Bevan would be unable to start the general practitioner part of the service on July 5th, the appointed day for the social security scheme as a whole.

How is the voting likely to go, now that the results of last year's negotiations are known? It can be taken for granted that there will be many doctors, including general practitioners and specialists, whose minds have been made up all along. These include, at the one extreme, the out-and-out individualists, who are completely convinced that the intervention of the state in the practice of medicine is a disaster, both for medicine and the patient. Because this type of doctor often happens to be very successful, it is sometimes unfairly alleged that all he wants is to protect his pocket. Many such doctors are, however, genuinely concerned with the integrity of their work. They are not the sort that will compromise—and the National Health Service Act is a supreme compromise—but they are of inestimable value to medicine.

At the other extreme are the doctors who are convinced members of the Labour Party and who will back Labour's official policy through thick and thin. They cannot see the objections to a full-time state medical service. Surely, they argue, a good doctor will work just as well if he is paid by salary as if he relies on fees or capitation payments. At this extreme there are also doctors who, whether members of the Labour party or not, are appalled by the thought that some people cannot afford medical and hospital treatment. To this group of doctors, the essential principle, which should not be lost sight of, is that the National Health Service allows free treatment and drugs to everyone irrespective of their means. No one, after July 5th next, will have to count the cost—or at least the medical cost—of getting well. This is an ideal, to which, in the eyes of these doctors, all other considerations should give place.

In between the two extremes comes the floating vote. In the 1946 plebiscite, probably the majority of doctors, general practitioners and specialists, in this section voted for negotiations, and was in favour of taking Mr Bevan at his word and giving the health service a chance, or at least of waiting until its framework had been covered over before they finally decided to work for the service or not. How are they likely to react in this, more crucial, plebiscite?

It cannot be denied that there has been some stiffening of opinion against Mr Bevan among this middle section in the last few weeks, since the results of the negotiations became known. Moreover, it is as noticeable among the specialists as among the general practitioners who have, or consider they have, the bigger grievances. What has caused it? On the terms and conditions of service, the little that is known is not unfavourable to the doctors. The pension scheme seems adequate. The complete ignorance of specialists and consultants about the salaries they are to be paid—an ignorance which is apparently not likely to be dispelled until after the health service is due to begin—is no reason why they should fear the worst. The proposed remuneration for general practitioners, discussed in *The Economist* of January 3rd, page 10, is not, in the eyes of the BMA, nearly

so generous as the Minister makes out; in particular, it does not fully carry out the Spens Committee's recommendations. But no one has gone so far as to denounce it as niggardly. Whatever else the doctors are objecting to, the financial proposals seem to be taking second place.

On other matters, too, Mr Bevan has been sensible. The Regional Hospital Boards are not swamped by local authority nominees, but include a large number of practising doctors. Mr Bevan has kept his pledge that he would give the medical profession a large share in the administration of the health service as a whole. The old bogey—that, under a national health service doctors would have to submit to orders from the local authorities—has not been resurrected and cannot be the cause of their present discontent. To repeat—what is it all about?

*

Now, as a year ago and before the Bill became law, disagreement between the Minister and the profession—or rather the general practitioners represented by the BMA—has focused on four main issues:

- (1) the abolition of the sale and purchase of practices in the public service;
- (2) the basic salary;
- (3) “negative direction”; and
- (4) the refusal to allow doctors dismissed from the public service on the grounds of inefficiency the right of appeal to the courts.

In addition, there is considerable confusion regarding the validity of existing partnership agreements when the Act comes into force. The Minister's legal advisers take one view. Counsel's opinion, asked by the BMA, takes the opposite. But even if the Minister is right, the complications of allocating compensation in mixed public and private partnership practices will be formidable. The issue in fact can only be settled by the courts when a case arises. If, in consequence, hardship is caused, Mr Bevan has promised an amending Act. But he refuses to clear up the question in advance by producing now the very simple amending measure needed. Therefore, says the BMA, he has an ulterior motive in allowing the confusion to continue. He is using it as a lever to induce many doctors, appalled by the legal complications and costs they might otherwise be involved in, to join the public service on the appointed day, which is contrary to the principle that every doctor is free to join the service or not as he likes.

There may or may not be truth in the BMA's view. But Mr Bevan's stubbornness in this respect has done him no good. Nor has his stubbornness regarding a doctor's right of appeal to the courts. Such a right might well turn out to be a matter of principle rather than of practical value, but in the present conditions of mutual distrust and antipathy a concession to principle would have relaxed the tension. Similarly with regard to the basic salary. At £300 a year, it will form such a small part of most general practitioners' remuneration that it is not worth the opposition it causes. The wish to provide young doctors with a living before they earn capitation fees could have been secured by other means. If Mr Bevan had wished to conciliate the BMA, he would have dropped the basic salary altogether.

On the issue of “negative direction”—that is, whether the Medical Practices Committee should have the power to prevent doctors from engaging in public practice in “over-doctored” areas—Mr Bevan is right not to give way, and the BMA for its part would do well to drop the demand. It is true that consumers' choice is, by the Act, to a certain extent interfered with;

but it is protected to the extent that they are willing to pay for it, for nothing in the Act prevents a doctor from setting up in private practice where he likes.

There remains the abolition of the sale of public practices. Here again, apart from the confusion arising from the question of existing partnership agreements, Mr Bevan is on strong ground, and on theoretical considerations alone he would have the support of a large proportion of the floating vote. There is a good deal to be said for the view that patients should not be bought and sold and that young doctors should not have to borrow money to buy their way into practice. And it is particularly difficult to defend the sale of the right to take public money for public service. But another view is also gaining ground—that the ownership of the goodwill of a practice guarantees a doctor's professional independence. It means that he is self-employed, and that the state cannot come between him and his patient.

It is significant that this view should be gaining ground, for here perhaps is the key to the stiffening of opposition to the health service in recent months. May it not in large part be a reflection of growing public resentment at controls, at the ever-increasing interference of the state in everyday life? Is it not a symptom of the professional classes' revolt against being levelled down and directed out of existence? Even the “negative direction” of doctors allowed by the Act becomes ominous in the light of the Government's reimposition of labour controls.

There is also a personal factor. Mr Bevan has become suspect in the eyes of the profession because he has become identified as the leader of the extreme Socialist group in the Government. It consequently fears that his protestations of innocence cannot be relied upon. He is also accused by the BMA of attempting to split the profession. His attitude towards the consultant section represented by the BMA. It is certainly true that to the specialists and consultants he has made at least one concession that is far more debatable in principle than those he has refused to general practitioners.

Food and Politics in Japan

JAPAN'S new census, taken in October, 1947, has shown a total population of 78 million as compared with 69 million for the present area in the census of 1935. Thus, in spite of for the present area in the census of 1935. Thus, in spite of heavy military and civilian war casualties, the population has increased by 9,000,000 in twelve years, partly by natural growth and partly as a result of the compulsory repatriation of Japanese nationals from Korea, Formosa, China and elsewhere since the end of the war. This population cannot be supported exclusively on food produced within Japan; a substantial amount of food-stuffs must in any case be imported and paid for either from the proceeds of foreign trade or by credit or subsidy from abroad—probably about 10 per cent of the total required to prevent widespread malnutrition. However, though it is impossible to dispense with food imports, it is very important for Japan to obtain the maximum of food production at home, both in order to reduce the present adverse balance of trade, which threatens industry with paralysis from lack of raw materials, and in order to satisfy the Americans, whose aid is sought, that the Japanese are doing the best they can for themselves.

But Japan's capacity for food production and the actual willingness of farmers to produce are two very different things, as the Japanese Government and General MacArthur's Headquarters (commonly known as SCAP) have gradually discovered. The fact is that the part of Japan's population which lives in towns—approximately half of the total—has become to a great

The next few months, therefore, are not auspicious for the National Health Service. A vote at the plebiscite is not legally binding, and it may well be that many doctors who vote against joining it will be forced to when it comes to the point. Mr Bevan has the whip-hand. Compensation for loss of goodwill through the abolition of the sale of public practices will only be paid to general practitioners who join the service on the appointed day. Many of the younger generation of specialists, who served with the armed forces at a time when they would otherwise have been building up private practices, are dependent on the Ministry of Health for a living wage. A large vote against Mr Bevan at the plebiscite does not mean that the service will not be able to start. But even if, as seems unlikely at present, he obtains a majority, he will have stirred up enough resentment and opposition for doctors to want to find fault with the service instead of wanting to make it a success. *The Economist* has hitherto taken the view that, given the need and the demand for a national health service, the 1946 Act probably provided the best possible framework that could be devised. Mr Bevan's professions of good intentions, while the Act was passing through Parliament, were accepted at their face value. It will be a pity if it now has to be admitted that the BMA's suspicions, that he is working for the introduction of a full-time state medical service as soon as possible, were justified all along. In fact, the BMA, whose leaders often give the appearance of gloating at the prospect of a fight, may well be as responsible for the present impasse as is Mr Bevan. More sympathy would be felt for its case if it were to emphasise the good points in the service at the same time as it draws attention to the drawbacks. As it is, it constantly gives the impression that it is trumping up a case in order to denounce the service lock, stock and barrel. But it is on Mr Bevan, the Minister responsible for the success of the health service, that there lies the greater obligation to make a conciliatory gesture to show that his oft-professed intentions to use his powers sensibly, and in the true interests of doctors and patients, will be sincerely fulfilled. And if he wishes to regain the confidence of the floating voters he should make this move before January 31st.

extent parasitic on the other half which lives on the land and produces food, while the producers of food have become increasingly unwilling, in the absence of adequate incentives, to produce more than they need for their own consumption and local barter. This situation is a consequence of the war; it is a state of affairs for which analogies can be found in postwar Europe, especially in Germany, but in Japan it has taken a particularly acute form because of the highly artificial character of Japan's industrialisation. The growth of urban population during the last fifty years—which has accounted for by far the greater part of the total population increase—has corresponded to the growth of modern industry, which in turn has been bound up with the great expansion of foreign trade, including the economic integration of Japan with colonial areas now separated from it—Korea, Formosa and Manchuria.

This economic structure, built up under the stimulus of political motives of national power as much as for purposes of private capitalist enterprise, and involving an extreme degree of dependence on imported raw materials, has now collapsed. The industrial Humpty Dumpty has had a great fall and not all SCAP's horses and men have been able to put him together again. Since the war Japanese industry has been depressed by a variety of interrelated adverse factors—by lack of efficient capital equipment, owing to wartime destruction, deterioration or obsolescence of plant; by Allied demolitions of installations

classified as war potential and prohibitions of whole branches of industry for the same reason; by shortages of essential raw materials which can no longer be obtained from abroad; by uncertainty about the future owing to the prolonged delay in fixing reparations charges and permitted levels of industry; by the dissolution of the *Zaibatsu* business organisations and the absence so far of efficient substitutes for financing and marketing; by inflation and the diversion of capital from productive industry into commodity hoarding and speculation.

For the Japanese peasant the great development of modern industry in Japan has never brought any real advantage. It has been achieved largely at his expense, for the Government subsidies, with which industries deemed to be of national importance were promoted, came out of heavy taxation falling mainly on the land. The indebtedness of the peasants, arising out of their inability to pay their taxes, was the principal factor in destroying peasant ownership and promoting tenancy on onerous terms for the cultivator. Imports of food from Korea and elsewhere kept food prices down. The productivity of the land has indeed been greatly increased by the intensive use of artificial fertilisers, but taxes and rents took up the surplus, so that the peasant's standard of living hardly improved at all, and in years of bad harvest there was often semi-starvation in some rural areas while there was food in abundance in Tokyo or Osaka.

The war has brought a radical change in the relations of town and country. Almost all the important towns of Japan were devastated by bombing, while the countryside remained unscathed. The peasant's life is not affected by the disappearance of luxury goods which he has never known. At the same time there is a sellers' market for food, and well-to-do townspeople are ready to pay famine prices for farm produce or to buy it by barter in terms highly favourable to the peasant. The inflation has relieved indebted peasants of most of their liabilities. In addition, the democratising policy of the Allied Occupation authority has gained for the peasant, not only a freedom of political franchise which he has not enjoyed before, but also the promise and partial implementation of a land reform, whereby landlords must give up to the state for a nominal compensation all land over a small maximum holding and tenant cultivators can buy it on easy terms.

With the scales thus suddenly tipped in favour of the producers of food, postwar Japan has all the makings of a peasant's paradise. But if the peasant is thus to reap the advantage of Japan's military and industrial collapse, what is to happen to the industrial workers and low-salaried employees and minor officials who are unable to pay uncontrolled market prices for food? They cannot be allowed to starve and, even if the Government were indifferent to their fate, the political and trade union rights guaranteed to them by SCAP and the new American-sponsored Japanese Constitution have made them a national power to be reckoned with. The solution, of course, is rationing, at prices within the reach of urban wages and small salaries, and as the force of inflation in Japan is too great to allow the Government to pay large food subsidies, this means controlled buying from the peasants at prices which are too low to induce willing sales.

The resistance of the peasants to the grain collections necessary to maintain the rationing system has now become the most serious immediate problem before the Japanese Government, and it has far-reaching political implications. The tendency of the peasant, unable to obtain for his produce a yen price with sufficient purchasing power in terms of capital or consumers' goods, is either to decrease production—which means a fall in total national output of foodstuffs—or to consume more of his produce within his family, or to divert as much as he can to the black market, where prices fluctuate between 10 and 100 times the official rates. At present the black market is a flourishing institution, and although the ration system brings relief to the urban masses, everyone but the very poorest contrives to get some supplement to his rations by buying black. A police

survey in October revealed that the average Tokyo family spent 75 per cent of its income on black market purchases, and it was estimated that 30 per cent of all food consumed came through the black market. A certain Yamaguchi, a man of unique virtue, has achieved fame by refusing to eat anything except rationed food at official prices; he has consequently died of malnutrition. The Prime Minister, when interviewed by journalists, refused to comment on his "sad case."

There is a basic political conflict between the interest of the peasants in free market prices for food and the interest of the urban workers in rationing at low prices. This antagonism between town and country cuts across the division of Left and Right, in which a large part of the peasantry, with its interest in radical land reform, is drawn to the Left. The Social Democrats, who emerged from last year's general election as the strongest single party and are governing in coalition with the Democrats (one of the two main parties of the Right), represent primarily the industrial workers and low-salaried employees in the towns, but they have made a bid for peasant support as champions of the land reform against attempts of the Right parties to whittle it away. The Communists have tried to go one better by urging that the landlords should be expropriated without even the slender compensation guaranteed to them under the land reform law, and have had some success for their propaganda among the poorer peasants. But the hunger of the landless peasant for private landownership has basically nothing to do with Socialism or with a desire to produce food for bankrupt townsmen in return for worthless paper money.

The Communists, of course, have their own way of solving this kind of problem; having used land distribution as a bait for gaining the revolutionary support of the peasantry, their method is afterwards to use their dictatorial power to extract agricultural surpluses, safeguarding themselves against peasant disillusionment by destroying every kind of independent peasant party or association or electoral alternative. But under a political democracy it is not possible thus to deal with peasants when they are approximately half the electorate. The Social Democratic leadership in Japan is in a dilemma; if it raises official food prices in order to placate the peasants and ensure deliveries, it increases the hardships of its principal supporters, whereas if it keeps prices down and enforces deliveries by police action, it not only alienates the peasantry politically, but risks passive resistance, decrease of production, and perhaps even in the last resort, armed risings—for most of the ex-officers of the disbanded Imperial Army, the most embittered and subversive social element in Japan, are now dispersed throughout the countryside.

The dilemma has already produced a Cabinet crisis; the Minister of Agriculture, Hirano, held out for higher prices for the farmers than were provided in the plans drawn up by the Economic Stabilisation Board, and was finally dismissed by the Prime Minister, Katayama. The Government survived the crisis and is committed to the policy of cheap food, but the problem of getting it has not been solved, and there is still no sign that currency inflation has been brought under effective control. Political democracy in Japan is under extreme stress and strain of economic adversity, and there is much talk about the *Kuromaku* or "Black Curtain," a group of politicians with former militarist or *Zaibatsu* connections who are alleged to be waiting for the withdrawal of American troops from Japan in order to take power by a *coup d'état*. Until there is enough food in the towns for the workers to eat and enough goods in the villages to make it worth while for the peasant to produce, to feed the towns, there can be no firm foundation for the new regime in Japan. Large-scale American aid is probably the only means by which such a degree of economic recovery could be rapidly achieved, but projects of aid for Japan will have to compete with the Marshall Plan for Europe as well as with aid for China.

NOTES OF THE WEEK

Mr Lovett Disposes

In recent weeks, the British Government has been under fire from three quarters to show more signs of activity in the preparation of the Marshall Plan. There has been criticism at home from both Parties. A number of American Senators made it quite clear during the first hearings on the Administration's proposals for Marshall aid that they felt Europe was not doing enough to help itself. In particular, they criticised the failure to re-convene the committee of the Sixteen Nations. At the same time, the French Government made tentative suggestions that perhaps it would be wise to take some initiative and Sir Edmund Hall Patch went over to Paris to secure the views of the Cabinet and the Quai d'Orsay. Sufficient agreement was reached to make it seem worth while for M. Hervé Alphand, head of the economic division in the French Foreign Office, to bring a delegation to London to discuss the details of a new meeting of the Sixteen—provided the other fourteen should find the suggestion acceptable. The delegation duly arrived and discussions were to begin, when the American State Department performed one of those apparent *volte faces* that make American policy so difficult to follow. Mr Lovett, the Assistant Secretary of State, let it be known that the American Government considered a meeting inopportune until such time as Congress had decided the final form of the Plan.

The contradiction between American opinion as expressed by Congress and the leading American newspapers on the one hand and by the American Administration on the other springs from the old trouble of the separation of powers. The Administration cannot speak for Congress and it is also quite possible for different members of the American Cabinet to have different views on what is and what is not likely to be helpful in the Congressional debates. The present misunderstanding—which has sent M. Alphand back to Paris almost as soon as he arrived—is one to which the statesmen of Western Europe will no doubt be exposed over and over again in the course of the next four years and it is one of the most difficult psychological problems their diplomacy will encounter. Again and again, they will have to make up their minds when it is and when it is not advisable to conform exactly to American advice. But one lesson this week undoubtedly underlines—it is that quite independently of American views or American advice, Britain and France need to make up their own minds on the type of organisation in Europe they are prepared to support and the extent to which they are prepared to go in the way of co-operation on these subjects. To wait on American advice and instruction may mean relying on a body of opinion whose views will rarely be clear and may often be contradictory.

Calling a Halt in Greece

All reports are agreed that the withdrawal of the rebels in Northern Greece is only a prelude to renewed activity. Although Greece's neighbours have not recognised the Markos "government," they are making gestures of sympathy, gathering volunteers and in general making no secret of their support. In the case of Albania, in particular, the evidence is overwhelming that the frontier districts are simply the base camps of the insurgents,

where they enjoy every facility that the Albanian Government can provide.

In a word, Greece's Balkan neighbours are continuing to intervene in Greek affairs in the manner already fully documented and described by the United Nations' Balkan Commission. The question now is whether the nations outside the Soviet sphere of influence are prepared and can afford to watch this flouting of

Greece's right to its integrity and of the international Covenant guaranteeing that integrity—for the United Nations' Charter is nothing less. This issue is rendered even more urgent by the probability that behind the Balkan intervention in Greece lies the Russians' desire to know how far they can go in their aim of disrupting the Marshall Plan. The question the Russians are posing in Greece is an ugly but crucial question: does a threat of war deter the Western World from action, even on a relatively minor issue? If so, may not the threat of hostilities be extended to other areas—Trieste, Persia, Korea, Berlin—in the hope of inducing a similar retreat?

Naval manoeuvres by the American Mediterranean Squadron in the neighbourhood of Greece are not a sufficient answer. Nor is the despatch of trained American liaison officers. The issue is not simply an American issue. It is also a British obligation. Further it concerns the United Nations as a whole, before whose "Little Assembly" (minus its Russian bloc) the matter will now be brought. But an Anglo-American lead will be necessary if this body is to act with sufficient vigour and speed to check the present irresponsibly adventurous phase of Russian policy in Greece. A possible course for the British and Americans to take at this juncture would be to secure the moral support of the Little Assembly in issuing an ultimatum to Albania—so far the most in-

The Gap between

... inadequate capital and the provision of essential income for dependants may be bridged by the capital and income benefits secured through the Family Provision Scheme

criminated and in any case the most exposed of the Balkan aggressors—designed to secure the admission of the United Nations Commission to the Albanian side of the frontier and a permanent policing of that frontier by an international force. Nor should Albania be left in any doubt that a refusal would justify the taking of military action.

German Rations in Danger

If all went well with the Marshall Plan and if the planners had their way with the German farmer, the ration target for Bizonia up to 1951 would be an average of 2,550 calories, for the normal consumer 2,250 calories. This year it was hoped to raise the average ration from the present 1,650 calories (not always met) to 2,030. These targets are modest enough, in all conscience, considering what is expected of the German worker in the next four years; but they look bold and ample compared with the realities now emerging.

The Germans were warned on Monday that, unless their own farmers deliver their produce promptly and fully, the ration will be reduced to 1,200 calories. The warning springs directly from the official estimate that German deliveries of grain are over 200,000 tons below what they should be, with potato deliveries even worse. Unless it is followed by drastic action on the German authorities against recalcitrant farmers and black marketeers, Western Germany will have to prepare itself for a ration of between 1,000 and 1,200 calories a day from the end of this month until the gathering of the next harvest. That this could not be maintained without political and industrial disturbance is shown by the widespread strikes in the Ruhr and Hamburg, provoked by failure to meet the present rations.

It is deplorable that the long-standing crisis over food should have come to a head at the very moment when the British and American Governments are considering proposals for strengthening the authority of the Frankfurt Economic Council. The proposals are in any case timid and inadequate, giving the nominated Frankfurt authority no real fiscal or executive power over the elected *Länder* Governments. But it is too bad that Frankfurt should be faced straight away with the crucial domestic issue of Western Germany—whether the food-producing *Länder* of Bavaria, Lower Saxony and Schleswig-Holstein can be forced to deliver their surpluses to the big towns and industrial areas, and whether farmers everywhere can be forced to help their starving compatriots in the towns. On the other hand, this coincidence of near-famine with the first fumbblings towards a German Government in the West may help to convince the Americans—and Mr Bevin—that the men of Frankfurt can exercise no economic authority unless they have political authority with solid Allied backing.

The Americans have honoured their engagements generously and Bizonia has several weeks' stock of imported grain in hand. Pledged to deliver 3,600,000 tons (flour equivalent) for the year ending July 1, 1948, they have already shipped well over half that amount. The Germans have to learn this winter that the lack of public spirit in the *Länder* will not be compensated by premature release of the imported grain. And the lesson must be given by German politicians.

* * *

The Wages Spiral

London's busmen have cocked a snook at Sir Stafford Cripps, who only last week renewed his warnings of inflation, and at the General Council of the TUC itself, which issued pious advice to the unions to exercise restraint in pressing for wage increases. They have applied for increases ranging from 11s. to £1 a week for workers on central and country services respectively, with corresponding increases for men working in the engineering and maintenance shops. Similar claims by passenger transport workers in municipal services and private companies are being formulated. The main reason for the busmen's demand is that their particular section has been left behind in the general upward movement of wages.

The London men's claim confronts the Transport Commission with its first big labour problem. If the claim is conceded, it will add enormously to the wages bill and will be followed by similar demands from other sections of transport workers. If it is refused, there may well be trouble among the busmen, who are strongly under Communist influence and would not hesitate to disrupt London's transport services, as they did recently on the "no standing" issue. Moreover, to grant the claim would lead to further pressure from other industrial workers, on precisely the same ground that they were being "left behind." This com-

petitive scramble was bound to arise, as soon as the TUC made it clear that it would not give any lead on wages and would tolerate no interference with the normal course of events. Wage rates are now 73 per cent above their level in September, 1939, and, as Sir Stafford Cripps has pointed out, recent increases have not been confined to the undermanned industries, where they might be justified.

The claim of the London Society of Compositors for an increase of 22s. 6d. on their minimum of £6 10s., which was heard by the Arbitration Tribunal this week, is even more difficult to justify. Printers, especially in the London area, are among the most highly paid of any industrial workers, and they cannot be deemed to be making any special contribution to the productive effort at this juncture. However, they, too, are strongly organised, and can create considerable dislocation if they are dissatisfied with the Tribunal's award.

Another set of wage negotiations, affecting 100,000 weavers in the cotton industry, raises a more difficult problem. Their claim for a 10s. a week advance is more easy to justify, because the cotton industry is notoriously undermanned and because the spinning section has recently received a like increase. A case, too, can be made for the claim of the wool trade workers. Yet, here again, the consumer will pay, and further additions to the industry's wages will must have a damaging effect on exports at a time when reduction of costs is more necessary than ever, because the sellers' market is beginning to disappear. If this vicious inflationary spiral continues there can be only one ending, the devaluation of the currency, the final effects of which on the workers' standard of living could not fail to be extremely adverse.

* * *

House of Lords Reform

The Parliament Bill has inevitably revived—even if somewhat feebly—the interest of the public in the long dormant question of the reform of the House of Lords. The Conservative Peers, faced with the decision whether to veto the Bill or to let it pass, have been quietly preparing the ground. A Committee under the chairmanship of Lord Salisbury has agreed on a scheme of reform which has not yet been made public; but its general lines may be guessed from a pamphlet issued by the Conservative Political Centre which, though chiefly devoted to an essay in constitutional history, foreshadows reform along two main lines—the limitation of hereditary membership to those Lords who are likely to be useful in Parliament, and the creation of life peers. Hereditary peers would be elected like Scottish representative peers to-day, and in order to qualify for membership of the Upper House would have to show a record of public service. It is reported to be doubtful whether more than a hundred of the present peers would pass the drastic test to be introduced under Lord Salisbury's proposals. Life peers would be created on the recommendation of the Prime Minister of the day, in order to avoid a permanent party majority, and it is admitted that the Labour Party must be given much stronger representation in the new Chamber. Hence, it is understood that the scheme makes provision for the payment of members.

At first sight, it might appear as if there were here an admirable opportunity for a convenient deal between the two parties. But the possibility—to say nothing of the desirability—of such a neat and easy solution may perhaps be doubted. Until the details of Lord Salisbury's scheme are made public it is impossible to judge how far the composition of the reformed House is likely to win the approval of the Labour Party, the Liberals or the public. If the House is to be reformed, would it not be more logical to abandon the hereditary principle altogether? What possible justification is there for the perpetuation of such an anomaly? On the other hand, if the composition of the Chamber is to be reformed as suggested, what likelihood is there that the Conservative Party would agree to the limitation of the delaying power contained in the Parliament Bill?

Meanwhile, the need for a Second Chamber as a House, to quote Bagehot's phrase, of "temporary rejectors and palpable alterers," is certainly no less clear to-day than it was during the second half of last century, and whatever obvious objections may be brought against its present composition, there is no evidence whatever that the House of Lords has recently misused, or is likely to misuse, its delaying and revising powers. That does not mean that the reform should be postponed indefinitely; but it does mean that it can wait until calmer times; and that it should be undertaken, if possible, by consent of all parties, as the Conservative pamphlet suggests, after joint consultation, not by a disingenuous piece of tampering with the escapement of the constitutional watch.

Agrarianism in the City

Sir William Goodenough's first annual statement as chairman of Barclays Bank is enough to make it clear that he will play his part in restoring the bank chairmen's annual statements (they are no longer speeches) to the place they once held in the calendar of economic discussion. Sir William's particular subject this year was British agriculture. From much of what he had to say about the present and the future it would be very difficult to dissent. An increase in domestic food production is clearly, for the present, a necessity, whether or not its consequences, when they are fully visible, will be happy or not. The warning is also timely that "the character of development on the land should not be related merely to the immediate and short-term problem of our balance of payments."

But Sir William also took occasion to review the whole agricultural history of the past hundred years and to express a sweeping condemnation of the policy of free imports that was adopted in 1846. That Free Trade was bad for British agriculture is obvious; looking back, many people who would still call themselves free traders regret that nothing was done during the century to relieve the distress of domestic agriculture. But that the system of buying food wherever it could be got most cheaply was of inestimable benefit to the British economy as a whole—and that it would still be so today if it were possible to export enough to make payment—hardly admits of serious doubt. Sir William makes it clear that he would have preferred food to be dearer all these years. But, if so, what would have happened to the standard of living of the great mass of the people? How could the great industrial strength of Britain have been built up if British exports were not competitive? How could Britain have survived two world wars if it had not been able to serve as an arsenal for itself and its allies—however much better it might have been able to feed itself? What, in particular, would have happened to the City of London and its great financial houses?

It is, indeed, strange to hear a banker using the argument that the British industrial economy, built upon Free Trade, was "one-sided." Of course, it was; all wealth is built upon the division of labour, and if that division has now to be abandoned in search of labour, and the result will be impoverishment. Is Barclays of "balance," the result will be impoverishment. Is Barclays Bank to be condemned as "one-sided" because it does not sell milk in its branches? When Mr Artlee some time ago referred to the nineteenth-century pattern of trade, which served Britain so well, as "artificial," the remark could be passed over as the natural reaction of a Socialist to what was achieved under the banner of free enterprise. When a banker holds the same language, some expression of surprise and regret—and dissent—is called for. When, from time to time, *The Economist* seeks to submit agricultural policy to the test of economic analysis rather than of bucolic romanticism, it is angrily attacked in the agricultural press for presenting the "City view." Nothing could be farther from the truth. The fact is that, ever since the invention of the internal combustion engine enabled bankers and stock-brokers to live in the country and spend their profits on farming, the City has been as obstinate a stronghold of agrarianism as is to be found in the kingdom.

* * *

Must There be a War in Palestine?

Is there anything the British can do to avert an Arab-Jew war in Palestine? Is there any military or diplomatic action still possible which would make their withdrawal less open to the charge of scuttling? Clearly, with both communities full of sanguinary self-confidence, the soldiers and the police cannot undertake more than their present duties. Each week that passes will oblige the authorities to concentrate more and more on the protection of fewer key points, such as mixed cities, essential roads and services. So much is implied by the mere fact of withdrawal before next June. No Arab or Jewish leader would now dare to invite the British to delay or reverse the process. Indeed, the invitation would have to be ignored unless there were the clearest signs of a genuine attempt by Arabs and Jews to reach agreement by mutual concessions.

That possibility, too, can, on present evidence, be ruled out. The Arabs will never freely accept the partition scheme, and they are full of confidence in their ability to frustrate Jewish hopes. The Jews suffer from the same over-confidence, partly because they believe they may have the Americans and the Russians competing to help them. They still believe that their "tough guerilla fighters" can be detached indefinitely from their settlements and factories, carry out police duties and suppress the Arabs in their midst.

Is there then any hope in the international sphere? Can the Security Council, by imposing its authority, avert or stop war? It has been asked to "empower" the Assembly's five-man Commission and to provide for the execution of the partition scheme. So, when the Council comes to consider Palestine, the Russians are expected by Washington to press for direct military support of the Jewish State and to offer the help of Russian forces. The Americans, in their present mood, would certainly resist both proposals; but they would then come under pressure from the Zionists—in this election year—to agree to some device, like an international police force, by which the Security Council might legalise the despatch of arms and volunteers to the Jews. The State Department would probably fight hard even against this method of involving Russians—and Americans—in the fighting.

Supposing it was then proposed to invoke economic sanctions against the Arab States, under Article 41 of the Charter. The decisive factor here is that the Arabs hold a major economic hostage of the West—its oil—and only the Russians would be able to face an economic war with much equanimity. In any case, would the British, anxious to maintain the present policy of neutrality, vote for sanctions against the Arabs? Surely not. Are they then to use the veto in the Security Council, regardless of what the Americans do?

*

There is in fact little chance of the Security Council's taking decisions which would check Arab resistance and Jewish terrorism, unless Anglo-American support were put solidly behind the international authority. There remains the possibility that the pattern of the Spanish civil war will repeat itself in Palestine, with the Jews receiving by sea arms and supplies which the Palestine Arabs would find it harder to obtain from their neighbours in Syria, Transjordan and Iraq. Such a development would favour the Jews; but it would mark the bankruptcy of both British and Uno policy and might set the whole Middle East alight. These surely are the possibilities which should be brought to the attention of the Americans with all the skill and persistence British diplomacy can command. If Washington could restrain the Zionists, there would still be hope of London's restraining the Arabs. The risk of thereby annoying Congress and doing damage to the Marshall Plan must be taken, for without Arabian oil the policy of which the Plan is a part would be seriously handicapped. The Americans have yet to learn that Palestine is no further from Greece than is New York from Chicago.

* * *

New Treaty with Iraq

The new treaty between Britain and Iraq, which was signed in Portsmouth on Thursday, is a first step to putting Britain's Middle East relationships on a postwar footing. The 1930 treaty entitled Britain to maintain air bases in Iraq and to station forces at them. It also provided a joint Anglo-Iraqi Corporation to manage the railways (under Iraqi Government ownership) and certain rights were accorded to Britain in respect of a trust which was established to manage the port of Basra. In the new treaty the railway and port provisions are abolished and the virtual extra-territorial rights hitherto enjoyed by Britain in the air bases disappear. They are to be Iraqi bases, used and maintained by Britain in accordance with joint arrangements for defence, which have been, if anything, strengthened. A Joint Defence Board is to be set up, the British members on which will supersede the British Military Mission, and British assistance in training Iraqi air forces is guaranteed. Operational units of the RAF, however, will be retained in Iraq until peace treaties with all ex-enemy countries have been concluded.

This treaty, particularly as it is the outcome of Iraqi initiative, is a most satisfactory document. It could well serve as a model for regulating British relationships with other Middle East countries. But it remains important to remember that the orderly framework of British supremacy in the Middle East depends far more on mutual goodwill and interest than on any documents. British relations with the Middle East have just so much stability as the regimes which sustain them. In an opposition attack on the government of the day, Britain, the paramount power, is bound to be the first, as it is the most convenient, target. In Iraq opposition criticism of the new treaty is already loud on nationalist grounds. But this is a normal feature of relations between a great Power and a smaller ally. It need alarm no one provided the fact is kept constantly in view that Britain has a direct responsibility for the security, social advancement, and prosperity of the peoples of the Middle East.

Dominions Litigant

In bringing the Kashmir dispute before the Security Council, the Indian Union has begun a litigation which can hardly be limited to Kashmir. It may involve argument about the very foundations of the settlement reached in India last year by tripartite agreement between the British Government, Congress and the Moslem League. It was as a result of this agreement that the Indian Union and Pakistan came into being; and as both Dominions are sending eminent lawyers to plead their cases before Uno, it must be assumed that Uno is to be invited to determine the legal rights of the parties. But it is very doubtful whether the agreement can be regarded as an international treaty; it was a formula drafted in accordance with the British instinct for compromise, designed to avert civil war. Now that the danger of civil war has been renewed, the attempt of an international body to define what was left indefinite may—let it be frankly said—do more harm than good.

The basic agreement regarded the Indian States as independent entities capable of self-determination; but it did not settle the question whether the destiny of a State was to be decided by its monarch or by a popular plebiscite or, if by the latter, how it was to be held. It was clear from the outset that in States where the majority of the population was of different faith from the ruler, the two alternative courses would be likely to give different results; this situation existed in Hyderabad, Junagadh and Kashmir. As the Congress Party has always claimed that the peoples of the States, and not their autocratic monarchs, should decide the accessions—a principle which works in favour of the Indian Union in Hyderabad and Junagadh—it cannot logically base its claim to Kashmir, with its 78 per cent Moslem majority, on the legal rights of its Hindu Maharaja. In fact, it is now basing its claim on the contention that the Government of the Kashmir "National Conference Party" has a Moslem following sufficient to make it representative of the people of Kashmir as a whole irrespective of religion. But, without a plebiscite or elections supervised by a neutral authority, nobody can know for certain whether this is so or not. There is no sense in arguing the point before the Security Council. If both the Indian Union and Pakistan are agreed that the future of Kashmir should be decided by the will of the people, the Council can dispense with investigation of the rights and wrongs of what has already happened, and address itself at once to ways and means of holding the ring and taking a plebiscite. However, in view of the great difficulty of taking a plebiscite in a country where law and order are unlikely to be quickly restored, even if external intervention can be stopped, it would still be better if Delhi and Karachi would come to the commonsense solution of separating Jammu and Kashmir and agreeing on a division of the ramshackle Dogra inheritance. Without prejudice to the right of appeal to Uno, the Governments of the Commonwealth should make it clear—individually or collectively—that their good offices are available if the two Dominions wish to settle out of court.

Coal, Fish and Costs

Since other shortages leave fish as the one protein food in free supply, any threat of interruption to the fishing fleet's activities is a serious matter for the consumer. Last week that threat began to materialise with the refusal of a large number of the East Coast trawler owners to pay the enhanced prices demanded by the National Coal Board; and its disappearance, with the agreement by the Board to assimilate bunker coal prices for the fishing fleet to those ruling for coastwise shipping—i.e., an increase of 2s. 6d., instead of 25s., per ton—is unequivocally welcome. The anomaly, whereby the fishing companies found themselves penalised, dated back to the agreement concluded with the colliery owners in 1929, in which fishing vessel bunker coal was classed as coal for export, in order to take advantage of the railway rebate on coal for export under the Local Government Act of that year. Today coal for export is dearer, not cheaper, than coal for the home market, and the classification which once helped the fishing industry saddles it with a substantial impost. The Board have done well—while making it plain that they cannot in principle make piecemeal adjustments in prices according to the capacity to pay of the purchaser—to recognise the change in circumstances.

This happy termination of the East Coast "buyers' strike" should not conceal the fact that increased coal prices—even if they are of the order of 2s. 6d. rather than 25s. a ton—are bringing the pressure in the inflationary boiler uncomfortably high. Another

danger signal can be discerned in the shipbuilding industry, where the Ellerman Line has recently cancelled an order for six cargo liners on the ground of excessive building costs. Unlike the trawlers, shipping firms are not caught between the upper and nether millstones of rising costs and controlled prices—that typical dilemma of a semi-planned economy—but they do have to face, as the fishing industry does not, the exigencies of a competitive world market. The lesson of the 1920s and 1930s when ships built at the height of the postwar freight boom proved disastrously uneconomic once that boom was over, is not forgotten.

The notion that any buyers' strike will smoothly reverse the inflationary upsurge of prices is, of course, illusory. Acquiescence in rising costs, bred out of confidence that the final buyer will stomach proportionately rising prices, may indeed indicate that inflation has still some way to run; but rebellion against them, while the inflationary pressure lasts, is less a cure than a danger signal. Between upsurging and downsurging—or even stability—there must lie, in default of the most skilled and deliberate central management of finance and wage movements, all the discomforts of crisis, business losses, industrial strife and unemployment.

* * *

State Pools?

Over the last few days there has been a revival of activity in what may be called the field of state lotteries. A group of Conservative MPs are advocating the setting up of a pure state lottery; a group of Labour MPs would prefer to see the existing football pools taken over and operated by the state. In the latter instance the supposed profits of promoters no doubt may be regarded as the chief incentive, but in both cases there is a common thought. If the average man has formed the habit of spending a few shillings each week on some form of betting, why should not that tendency be harnessed to the service of the community as a whole?

Apart from the moral issue, there is no reason why the state should not run a lottery just as it runs a Post Office Savings Bank. Both are a device for saving and each requires no more than a foolproof calculating machine to make it an efficient instrument. In the Savings Bank each individual stores his shillings away and is content to collect the total at some future date plus interest. In the lottery each individual is content to allow a limited number of individuals to draw the total subscribed (or "saved") by the general body of contributors. Economically speaking, there may be something to be said in favour of football pools and lotteries at the present time. They drain off surplus cash which would otherwise bid for goods and services in short supply and divert it, in the form of capital gains, into the hands of the few promoters and prize-winners, some of whom at any rate are more likely to invest the money they receive than are the millions of individuals who built up the total fund. There has been little research into what use prize winners in the pools and lotteries make of their winnings, but in view of the difficulty of obtaining consumer goods a substantial proportion of the total money distributed as prizes may in fact be saved.

But none the less there is the moral issue. Betting belongs to that borderland of human activities which, while not demanding rigorous suppression by the state yet does not warrant official encouragement. If a people are to retain any moral standards at all in public life, it cannot afford to jettison its beliefs just because it would be financially or economically more convenient to do so. If betting is a vice—and most people would accept that as a general proposition—then it is not for the state to organise it.

New Types of Municipal Trading

An interesting situation has arisen in Birmingham over the City Council's attempts to extend the field of municipal trading. Conservative members joined with Labour on the Council to include two clauses in a private Bill which would empower the Corporation to operate hotels and to supply furniture and other household fittings. These proposals were reversed at a town meeting, and have now been decisively defeated at a plebiscite of electors, who voted four to one against the hotel project and five to one against the furniture project. The Liberal Party rallied the opposition, and the Conservatives, frightened of losing the retailers' vote, were less municipal-minded in public debate than they had been on the Council. However, the main reason for the clauses' overwhelming defeat was that less than 7 per cent of the electorate voted—partly, it is claimed, because polling arrange-

ments were inadequate. The ordinary citizen did not feel keenly enough to go to the polls, and left the result to the shopkeepers' vote.

Since local opinion has shown itself so apathetic, it would seem little use pressing the issue. Nevertheless, the result is regrettable in many ways. The traditional trading activities of municipalities, such as gas, electricity, and passenger transport, are progressively being assimilated into new national organisations. Now is the time and the opportunity for progressive municipalities to essay new ventures—and there is plenty of scope for doing so. The standard of hotel accommodation is pitifully poor in many large provincial cities. Public ownership of hotels is not a complete novelty, as the Transport Commission is already charged with it. The larger municipalities are quite as competent to do the job as the Commission, and have the big added spur of mutual competition in improving the attractiveness and prestige of their town. Why should not some of them have a try? They could hardly make the position worse.

The case for a municipal supply of furniture and fittings rests partly on the true accusation that existing supplies are often inferior in quality and exorbitant in price, partly on the more specious plea that the main recipients would be corporation tenants. In no case should the tenant be compelled or cajoled to buy these things from the Corporation. Other Councils are to seek wider powers than did Birmingham, such as the right to supply radio and run taxis. It must be remembered that these powers will only be sought and given sparingly, and that in most cases there will be no risk of a municipal monopoly. So long as competition is waged on fair and equal terms, there is much to be said for the larger municipalities branching out in a few new directions as their older limbs are chopped off by the Government.

Abd El Krim After Bigger Game

Complaints sent by Mohammed Ben Yussef, the Sultan of Morocco, to the French President, M. Auriol, on December 3rd about the attitude of General Juin, Resident-General of French Morocco, have been followed by a new demand from the veteran of the Riff wars, Abd el Krim. He asks for a fresh treaty between

France and Morocco. Of these two nationalist leaders, the Sultan is on stronger ground. For in his letter, the existence of which has only just been revealed, and to which the French have given an evasive answer, he is claimed to have angled for a revision of the Franco-Moroccan Agreement, signed at Fez as long ago as 1912. And in Moroccan eyes he is the only man who has the legal right to raise this issue of greater independence.

The Sultan's letter is the climax of a long series of grievances against the French, and of a policy of hostility actively and not unsuccessfully pursued at least since the Allies landed in North Africa in 1942. Three French Resident-Generals have come and gone since then, and now General Juin is in trouble over the restrictions he has placed on speech-making by the Sultan. The General, for his part, has countenanced a number of reforms which make for greater Moroccan freedom within the framework of the French Union. Elections, for instance, were held for the first time last November for regional consultative chambers to deal with agriculture, commerce and industry respectively. Yet none of these measures go any way towards satisfying hopes of actual independence, and it is because of this that the Sultan has consistently opposed the Resident-General.

Trouble between the Moroccans and the French is of long standing. But the reappearance of Abd el Krim in Egypt, after escaping from French captivity last year, adds fuel to the flames. He is now acting from Cairo in close alliance with Allal el Fassi, leader of *Istiqlal* (the Moroccan independence party), who has just agreed to Abd el Krim being president of a new Committee for North African Liberation. The committee issued a manifesto in Cairo early this month which, while calling on the Arab League for support, also declared that independence could not be achieved without the active support of every nationalist in Morocco. This threat to the peace of all North Africa has been increased by the participation in the Manifesto of representatives from Algeria and Tunisia as well. It looks, in fact, as if this time Abd el Krim may be out for bigger game than ever. If he succeeds, the Sultan's constant jabs at the French may appear like mere pinpricks. But if the fiery words from Cairo are not followed by serious action, the Sultan's prestige as a nationalist leader will have been considerably enhanced by the publicity given to his letter of December 3rd.

LIGHTING EVERY MATCH

A hundred years ago Arthur Albright's idea for making *Amorphous Phosphorus* on a commercial scale brought safety to workers in match factories, and gave the world its first safety match. Today Albright & Wilson's match phosphorus products light every match made in Britain and countless millions of others all over the world.

SIR,—The Covenant of the League of Nations made no reference to human rights. As a means of achieving international co-operation, peace and security first mention was given to the acceptance of obligations not to resort to war. In the Charter of the United Nations that place of honour is given to an affirmation of faith in fundamental human rights and in the dignity and value of the human person. Thus a negative concept was replaced by a positive one, and the truth recognised that the basis of any community is the acceptance of positive values requiring co-operation for their achievement as a common goal of policy. It is in no less fundamental a context that progress towards an International Bill of Human Rights needs to be considered.

operation between East and West ?

It is notable that the British delegation are in favour of a Covenant containing legally enforceable obligations. The "Slav *bloc*" is not. But the obligations deemed acceptable in the Foreign Office draft Bill of Human Rights are limited to those guaranteeing the existing common law rights of Englishmen. That is, they are obligations already accepted. In the Memorandum accompanying the text of the draft Bill it is argued that the right of all persons to work, to education, to social security, and similar social and economic rights cannot "by their nature" be defined in the form of legal obligations for states. But it is precisely these "unnatural" obligations—in their view the indispensable guarantees of true political freedom—which the Slav *bloc* might conceivably accept. It is hardly surprising, though regrettable, that the states of this *bloc* should be unwilling to guarantee those political rights regarded by the West as fundamental. But need we therefore invoke "nature" against the legal guarantee of at least the rights to education and social security ? This smacks, and needlessly, of insincerity, since Parliament in recent legislation has decided against this argument. Or is it deference to a Republican Congress ?

Pembroke College, Cambridge

BRYAN KING

SIR,—Your Canadian correspondent concludes that Canada must, for the foreseeable future come to depend much more heavily on exports to the United States of the products of farms, forests and fisheries. He does not mention two factors which should surely be taken into account in assessing Canada's dollar position.

In the background there are the bituminous sand deposits at McMurray, some four hundred miles north of Edmonton on the Athabaska River, which are described in the Canadian Year-book as the greatest known reserve of oil on the face of the earth, estimated by the United States Bureau of Mines to contain 250,000,000,000 barrels of oil, though Canadian geologists put it at only 100,000,000,000. Experiments in the processing of the sands are now being carried out. The field is remote but it is difficult to think that the time will not come when it will be exploited, especially in view of the anxiety felt by the United States about their own oil resources. The resulting saving in dollars to Canada would be considerable.

Until 1939 no iron ore was produced in Canada, but recently there have been developments in the Steep Rock Lake area, 140 miles west of Port Arthur in Ontario, and last year over a million tons of ore were exported to the United States. Of vastly greater importance are the haematite deposits astride the Quebec-Labrador border. Not only is the ore of very high grade, in the region of 60 per cent, but the quantity is comparable to the deposits at Inrabi in Minnesota from which as much as 60 million tons of ore in a year are mined. These deposits have not a very long life, and unless the United States steel industry can find some other source of ore, they will have to fall back on ore of poor quality. A charter has been granted to Canadian-American mining interests for the construction of a railway some three hundred and fifty miles in length from the Gulf of St. Lawrence to the site, and three survey parties were at work on the alignment last year. Harbour works will, of course, be necessary. Power can be

January 15, 1848.

THE property and income tax expires in April next. From what we have already said, it is evident that not only must it be renewed, but that it is the only source to which we can safely look for an increased income sufficient to meet the expenditure. A gradual approximation to direct taxation is in accordance with the intelligence of the age, which requires that our revenue should be collected with as little expense as possible, and, above all, in such a way as to interfere as little as possible with the accumulation of wealth. But in viewing an increase of the property and income tax as probable; and, moreover, in adopting the commonly received opinion, that it must now be considered a permanent source of revenue, it is impossible to overlook the necessity of now adjusting the charges on various classes of income, with a view to their relation to capital. The income tax, as it at present exists, imposing, as it does, the same charge upon the most casual and precarious incomes as it does upon the most permanent, commits a glaring and manifest injustice, which was tolerated by Parliament only on the ground that it was proposed as a temporary expedient. The income of a profession or a trade, which may not be worth two years' purchase is subject to the same charge as that derived from real property, worth at least thirty years' purchase; an income derived from terminable annuities . . . is treated the same as that derived from consols in perpetuity. We cannot believe that the renewal of this tax will be proposed without an adjustment of these striking inequalities being at the same time effected.

Brazil has taken the initiative against the Communists in a manner which is unlikely to be imitated outside South America. By a vote taken on January 7th the Chamber of Deputies passed a Bill removing the Communists from their seats in Congress and in State and municipal assemblies. The Government gained 169 votes for the measure and the Opposition—mainly the liberal National Democratic Union—74. Its effect is to remove from the Lower House 14 of the 16 Communist deputies; two who were not elected on the party ticket are unaffected. The rare appearances in the Senate of the Communist leader, Luiz Carlos Prestes, will cease. And the expelled Communist deputies will lose their Parliamentary immunity.

This anti-Communist drive in Latin America has been in progress since last spring. It is sometimes construed as an echo of the Truman Doctrine. Chile has just had a recent special session to discuss the suspension of a Communist Senator. The Perónista climate of Argentina is most unfavourable to their activities. Other countries too have maintained or re-imposed repressive measures. But in most of them the conditions which promote Communism or other extreme policies still exist.

In Brazil the cost of living is over four times its prewar level, and wages have not risen proportionately. Scarcities of essential commodities and other genuine grievances of the "submerged masses" have won many working-class followers for the Communists. It is not likely that they will now suddenly transfer their allegiance either to President Dutra's party or to the National Democratic Union—old-fashioned liberals whose moderate policy offers little appeal to the Left. Nor is the ex-President Getulio Vargas, likely to benefit. His power rested on the army and conservative elements who deposed him when he showed signs of angling for more popular support. The Brazilian Communists are likely to remain strong, even if they are silenced. For these attempts to suppress them remove only the symptoms, not the causes of the political unrest from which they derive their strength.

During the second reading of the Ministers of the Crown (Treasury Secretaries) Bill early in December, Sir Stafford Cripps described the new functions of Mr Marquand, the Paymaster-General. He had been asked to undertake "special work" in the three-fold task of extending the sale of British goods in hard currency markets, increasing Britain's sources of supply from soft currency countries, and developing new sources of supply in the colonies. This "special work" was to include visits to overseas countries, and it is now announced that Mr Marquand will leave for Africa on January 16th, visiting the Sudan, the East African dependencies, Central Africa and the Union of South Africa. In the colonies he will study on the spot their trading and economic problems and obtain first-hand knowledge of the development schemes, in progress or under contemplation, which are designed to increase the production of food and raw materials. In the Union and Southern Rhodesia he will be concerned with general trade developments. So runs the official explanation of his journey.

No doubt it is all strictly necessary. One only wonders how a man, even of Mr Marquand's abilities, can possibly obtain, in the six weeks he will be away, the first-hand knowledge of trading and economic problems of the eight countries he will visit. The progress and difficulties of the East African groundnut scheme alone ought to merit the greater part of his time. Moreover, where does the Colonial Office come into all this? Only a fortnight ago it was announced that Lord Listowel had been appointed Minister of State for Colonial Affairs, and it was understood that his appointment was to enable the Secretary of State or one of his junior Ministers to obtain first-hand information of developments, political and economic, in the colonies. Surely the Government could obtain all the information it needs from officials of the Colonial Office and Colonial Service, who should know their respective areas from A to Z.

It is true that the Sudan, Southern Rhodesia and the Union, countries on Mr Marquand's itinerary, are outside the Colonial Office's jurisdiction. But what are the functions of the Secretary for Overseas Trade if they do not include the expansion of trade

★ ★ ★

Mr Silkin is going ahead with his intention to create two development corporations, under the New Towns Act, for Hatfield and Welwyn Garden City, and has now made two draft orders designating the affected sites. Although the two places practically join, they are to be kept as distinct as possible. That is why there are to be two corporations, although their personnel will be identical.

The Minister has at least set down his reasons why the Garden City Company should not be allowed to carry through the expansion of Welwyn, which it was ready and anxious to do. They are, however, neither novel nor convincing. The co-ordination between the expansion of Welwyn and Hatfield, the provision of a joint sewerage scheme for the area, and the dovetailing with national plans for industrial dispersal—all these needs could easily have been met without replacing an existing body of experience, initiative and proved efficiency by a new one with much the same job to do. The Minister himself pays generous tribute to the Garden City Company, and admits in effect that it would probably have done the job very well. Shorn of special pleading, his case amounts to the abstract doctrine that it is

undesirable that a private company, however public-spirited, should, by virtue of its ownership of most of the land and buildings, be in a position to determine the character of a whole town. . . . Such power . . . should be vested not in a private concern, but in a body representing the people.

These words have already excited wholly unwarranted expectations on the part of the people of Welwyn as to the control and influence they will possess over a development corporation appointed in fact by Mr Silkin. And they give a very misleading picture of the dangers of private ownership in Welwyn's particular case. The Garden City Company has lodged an objection to the order, and a public inquiry will be held. But, to judge from the experience of the Stevenage objectors, Mr Silkin is not likely to give a fuller explanation of his case.

★ ★ ★

At last, the general population of the big towns is feeling the potato shortage. Ever since potato rationing was introduced early in November, so far as the consumer is concerned the green-grocers have worked the scheme according to their own sweet whim. Some have adhered strictly to the official ration. Others have allowed their customers more or less as many potatoes as they liked, and, as a result, many people have no doubt seized the opportunity to build up stocks in their own homes. Where rationing has so far been most severely felt is in residential establishments such as colleges, which have to cater for a very hungry section of the population for whom potatoes have hitherto been a main food.

Now, however, supplies are no longer reaching the shops in adequate quantities, and for the last week or two greengrocers have in many cases been unable to honour the ration. As usual, everybody blames somebody else. The Ministry of Food is blamed for not allowing the later varieties of potatoes, held for the normal seasonal shortage in the spring, to be released now. It is also blamed, with more justice, for not increasing the grower's and the retail price sufficiently to counteract, to some extent, the black market and the feeding of potatoes to poultry and livestock. The black market, as usual, gets its well merited share of the blame. The growers, for their part, are blamed for holding up supplies until their higher price comes into force on February 1.

The main reason for the shortage is, however, quite simple, first, that, as has been stressed often enough, this year's supply of potatoes is too small to meet a ration of 3 lb. a head, unless the Ministry of Food can supplement it by imports, and, secondly, that the Ministry only controls the disposal of about 20 per cent of the potato crop and cannot, therefore, carry out an efficient and equitable rationing scheme. Without large imports, the potato ration is therefore in danger from now until the new crop comes in. And what is likely to be the fate of next winter's supplies, unless some means are found of tightening up rationing between now and then, is anybody's guess.

obtained from hydro-electric stations on the Hamilton River in very large quantity. It is said that the interests concerned are prepared to spend \$300 million in development. There will be a ready market for the ore in the United States, the short sea voyage to which will be a great advantage. Here is another source of dollars which will be of great assistance to Canada in its difficulties, though not, of course, for some years yet—but in the foreseeable future.—Yours faithfully,
R. A. WILSON

The Athenaeum, Pall Mall, S.W.1

Last Chance in Palestine

SIR.—I hope that it is not too late for you to publish a comment on your leading article, "Last Chance in Palestine," of December 6th. That article contained two astonishing misstatements of fact: (1) that 270,000 Jews have entered Palestine since the White Paper quota became exhausted; (2) that the Sub-Committee of the General Assembly, composed of Muslim states, held discussions and presented a report based on the Minority (Federal) Plan of the United Nations Sub-Committee.

The first statement may be attributed to a clerical error; but even in this case it surely stands in need of correction. The second statement is entirely misleading. The Arab states rejected the Minority (Federal) Plan of UNSCOP with the same vehemence as they rejected the Majority Plan. The report of the Sub-Committee in question advocated a unitary Arab state with no Jewish immigration. This is identical with the plan submitted by the Arabs to the Royal Commission on Palestine, to the Permanent Mandate Commission, to the Anglo-American Commission of Inquiry, and to the UN Special Committee on Palestine. It was rejected unanimously by all these tribunals. You are quite entitled to regard this plan as "constructive" despite this clear evidence that it is abhorrent to the conscience of the world; but your readers are surely entitled to know on what plan your praises are being bestowed.

Your general theme that the territorial provisions of the UN project show undue generosity to the Jews is a purely subjective judgment to which your readers must apply their own standards of equity. The fact is that under the Palestine Mandate an area of 45,000 sq. miles was reserved from the area of complete Arab independence "for the primary purpose of establishing a Jewish National Home." On two-thirds of that area two independent sovereign Arab states are being established, apart from the six independent states established in countries outside the scope of the original Palestine Mandate. Thus the "primary purpose of the Mandate" is being expressed by the constitution of a predominantly Jewish state in less than one-third of the area originally set aside for Jewish development and immigration. If you consider this award to be unduly generous to the Jews, it

follows that you regard the rights of the Jewish people to self-determination to be overwhelmingly weaker than the corresponding right of the Arabs which has been so lavishly fulfilled. In setting your judgment on this issue against the declared verdict of the entire Western world, you would do a service in developing your territorial criticisms in greater detail.—Yours faithfully,

A. S. EBAN
Director, Political Information Dept.,
The Jewish Agency for Palestine.

(1) The figure 270,000 was in fact a misprint for 37,000.
(2) It was nowhere stated in the article that the Sub-Committee's Report was based on the Minority Scheme, but the terms of reference of the Sub-Committee were incorrectly quoted. The phrase should have read: "the Sub-Committee held discussions to draw up a report based on the proposals of Saudi-Arabia, Iraq and Syria."—EDITOR.]

The Doctors' Plebiscite

SIR.—Your comment on Health Service negotiations in your issue of December 27th is fair but shows less than your usual appreciation of the way great principles often underly, and are fought out by, financial arrangements. I agree that the negotiations do not make it very clear, but there is really only one issue—clinical freedom for doctors and patients. While this is promised by the Minister it cannot be maintained in practice under the Act.

At present the purchase price of a practice is the doctor's financial guarantee that he will serve his patients. When the state has bought this up, it inevitably has to impose all sorts of regulations or controls to take its place and ensure a satisfactory service. The doctor's service must be influenced by the owner of his goodwill, i.e., the state, instead of, as now, his personal obligation to his patients.

At present, when only 20 per cent to 40 per cent of his income comes from his insured patients, a doctor can resist bureaucratic interference in his practice without endangering his livelihood too much and get away with it. When medical practice is virtually a state monopoly, resistance may involve complete loss of employment. Days of financial stringency will surely come (your annotation on the LCC Health Scheme points out how over-optimistic the Government's figures of cost are), and they will occasion restrictions on prescribing, certification and many other aspects of clinical freedom and judgment, and the doctor will be powerless to protect his patients or his own standards of practice. Medical attention should be as free as possible to all, but any progressive service should strengthen rather than diminish the position of both doctors and patients *vis-à-vis* the state. This is where the Act fails, and Mr Bevan has done nothing to rectify it.

—Yours faithfully,

Dingle House, Winsford, Cheshire

W. N. LEAK

Books and Publications

The Economics of Freedom

"Economic Policy for a Free Society." Henry Simons.
University of Chicago Press. 344 pages. \$3.75.

THIS outstandingly sane, liberal and stimulating collection of essays inspires the preliminary reflection that the devil is apt to have all the best tunes and his adversaries, in economic matters at least, the worst styles. It is, over large stretches, very nearly unreadable; not because the matter is highly technical, but simply because the author has not troubled to translate out of his own mental shorthand—a fault rather widespread among his academic compatriots.

This is a very great pity, for Professor Simons's statement of neglected but fundamental economic truths, his collation of these with current events and political principles, his devastating analysis of popular errors, and his rational and coherent projects of reform, make this book one which the ordinary intelligent citizen no less than the economist ought to take seriously—and one which has far too few competitors. He appears as an old-fashioned liberal with a difference; with an old-fashioned respect for the rule of law, an old-fashioned desire for the decentralisation of power whether political or economic, an old-fashioned trust in the reasonable improbability of human society, but with an almost revolutionary ferocity in attacking those institutions which in his view are responsible for social injustice and economic waste. If he assails state intervention in price-fixing and the like, he assails

equally state abdication in the monetary field. His essay on Syndicalism (magnificently apposite to the dilemma of the Labour Government in its dealings with the TUC) is calculated to make the good trade unionist froth at the mouth; but the economic royalist must feel equally strongly about his views on large corporations and on taxation.

Book-tokens NOT accepted.

The essays here collected were, with the exception of the introductory *Political Credo*, published at various dates between 1933 and 1945 in various economic periodicals. They date, however, surprisingly little. It is hard to remember, when reading *A Positive Programme for Laissez Faire*, that it was written in 1934, in circumstances almost diametrically opposite to those of today. Nor could anything be more apposite to present perplexities than *Rules versus Authorities in Monetary Policy*, published in 1936. One regrets, reading *On Debt Policy*, that Professor Simon did not give more than a sidelong glance at the General Theory, with which his implied points both of agreement and of disagreement would have provided matter for a very lively debate indeed. The book ends with what is accurately entitled an *Unsympathetic Interpretation* of the Beveridge programme. Written in 1945, it wears painfully well.

Marx the Forerunner

"The Red Prussian" The Life and Legend of Karl Marx. By Leopold Schwarzschild. Hamish Hamilton. 382 pages. 16s.

INSTEAD of the flashy title which is only partly relevant to Mr Schwarzschild's thesis, this book might have followed the example of another on the subject and have been called not "What Marx Really Meant" but "What Marx Really Was." Mr Schwarzschild has two excuses for yet another book on this subject—that only now that Marx's legacy is revealed, can he be seen in his true colours, and that previous biographers for the most part came too early to use the wealth of material which the Soviet hagiographers have placed at their disposal, particularly in the full edition of the Marx-Engels correspondence. Both reasons are valid and the result is a brilliant and in many respects convincing piece of writing.

Brilliance is not, of course, adequate equipment for someone desiring to write an authoritative work on so central an historical figure as Marx; and it is to be feared that those who disagree with Mr Schwarzschild's point of view will be able to point out his rather inadequate equipment in general nineteenth century history, particularly where labour and socialist movements are concerned, his tendency to exaggerate the triumphs of liberalism in the period—at least a fault on the right side—and some startling inaccuracies. On the intellectual background of Marxism, Mr Schwarzschild's book is nothing like so useful as I. Berlin's *Karl Marx* with which Mr Schwarzschild appears to be unacquainted. On the other hand, Mr Schwarzschild has succeeded in proving a number of points of great consequence.

In the first place, he has shown to what an extent so-called Marxian science was a long and painful attempt to justify, after they were made, a series of dogmatic pronouncements put out by Marx in the years before 1848, and how much he needed a "scientific" reputation to make up for his gross failures in practical politics. In the second place, Mr Schwarzschild shows how grotesquely wrong Marx and Engels were in the prognostications and interpretations which they made concerning the events of their own times. One may cease to wonder at the failures of the Marxist analysis to tell Soviet theoreticians about the modern world when one sees the fantastic blunders into which the founders of the "science" were led. Finally, one can see how faithful in every respect has been modern communism to the legacy of Marx; everything is there already—sectarianism, purges, the use of false "fronts" to conceal communist purposes, the use of

personal slander as a political weapon, the encouragement of every form of violence, the all-embracing hatred of every decent liberal or humanitarian instinct. To the problem so often raised by students of Marx—why he never entered into a description of the future socialist state—Mr Schwarzschild has an answer. It was not because he was vaguely utopian, but because he knew that the super-Prussianism—the slave-state—of his dreams would never appeal to enough normal men to give him a chance of realising it. One fancies that it is here that the Marxists will deliver their counter-attack. It should be interesting.

Nihilism

"Farewell to European History." By Alfred Weber. Kegan Paul. 16s.

AS the war drew to its end and Germany's ruin crowned the European catastrophe she had wantonly provoked, Alfred Weber sought to tell his countrymen why it had all happened. Early deprived of his chair at Heidelberg by the Nazis Dr Weber, now an old man, had watched the cataclysm from within Germany. This book is his explanation. In it he is not concerned with immediate circumstances—Hitler's name is not mentioned—but with the deep-seated causes of the tragedy. For him these are comprehended under the term nihilism. By this he means that spiritual exhaustion, which has afflicted the European peoples during the last century as their material prosperity and technical competence waxed. This notion, in turn, only becomes fully significant in the light of Weber's view of history, which is the frame of the work.

He holds that the principal theme of history is found in men's strivings to apprehend the metaphysical forces behind the phenomenal world, and so to explore the recesses of their own being. In Europe from the Renaissance to Waterloo he detects great spiritual progress of this kind. It is chiefly manifest in the work of men like Leonardo, Shakespeare, Pascal, Goethe and Beethoven, but it also inspired the larger political and intellectual movements which culminated in the French Revolution. Then this promise withered, and what Weber calls the transcendental view of life suffered rapid eclipse. This leads him to a long, shrewd analysis of nineteenth century Europe. To show how nihilism was generated he probes the subtle interplay of political, economic and intellectual change. Marx and Nietzsche are revealed as prophets of the modern catastrophe which their disciples engineered. Human freedom evaporated as the great purpose it served dropped slowly out of sight. The future, we are told, depends wholly on the recovery of man's freedom and with it of his spiritual awareness.

Dr Weber's whole position is open to obvious criticism. He makes history a mere offshoot of philosophy. He is far more indebted to Nietzsche than he will admit. He assumes that Christianity is a myth, and then employs his assumption as if it were an established conclusion. Nevertheless, his book remains of outstanding importance because it proclaims a great truth. If lessons are still to be wrung from history, it is necessary to accept a far more profound view of life than is at present the fashion.

Finally it is necessary to add that an understanding of Dr Weber's work is not assisted by the English translation. Too many of its sentences aspire to the dignity of paragraphs. One monstrosity of 18 lines ends, not inappropriately, with the words "one's stomach turns."

This world-famed Sherry (formerly called Findlater's Fino) could not be registered under that name and thereby protected from imitators. For the safeguarding therefore of our world-wide clientele we have renamed it—Findlater's Dry Fly Sherry.

AMERICAN SURVEY

Capitalism—US 1948

(From Our US Editorial Staff)

IT is a fiction of American politics that when Congress convenes in January the public stands on tiptoe before a sheeted figure waiting for the President to loose the halyards and reveal the shape the nation is in. As a matter of fact, most of what he has to say in this respect is new only in the setting he gives it. President Truman's messages are political auguries rather than portraits of the economic whole.

That whole, called by politicians in dulcet tones "the American free enterprise system" and by Marxists "capitalism" with a snarl, is at the moment hardly to be recognised under either name. Quantitatively it is huge. At the end of a year persistently shadowed by threats of depression the gross national product is running at the rate of \$235 billion a year (against \$203.7 billion in 1946); net national income at a rate higher than \$200 billion (compared with \$178.2 billion in 1946). The index of industrial production stood at 192 in November (compared with 183 the year before) and net farm income, up by \$3 billion from 1946, stood at \$18 billion. Sixty million men and women have jobs, and only about a million and a-half are listed as unemployed—a figure well below the two million usually considered, in a labour force of this size, to be a fair figure to cover unemployables and workers moving between jobs.

Nor are the more detailed figures of trade and industrial activity such as to give business men undue pain. Production in the key industries—steel, oil, electric power, automobile manufacture—stood at figures substantially higher than those of 1946. Railway freight traffic, export trade, even imports were greater than in the previous year. Retail sales were up in money value, though measured in units they ran 10 per cent below 1946. With all this, gross private investment is being undertaken at double the value of the fabulous and portentous year 1929, and at two and a-half times that of 1940; the comparison is, of course, double-edged. High prices (and in food at least they are newly rising), which last year acted as a damper on investment demand, are now behaving as fuels to the fire.

But quantitative measures, like figures of gross production, tell only part of the story. The stresses and strains within the American economy are as symptomatic of its peculiar structure as is its girth at the moment. If, in New York, butter has again risen to a dollar a pound, a new apartment is, in proportion, even costlier; on the other hand electric toasters, radios and certain other consumer durables are disproportionately low. Money is easy and people are spending it; the rate of accumulation of savings is not high enough to meet the demand. The national government, which in 1938 was forced to a new fever of tinkering in the hope of getting the economic machine to move without limping, is now facing the problem of how to curb it before it gets completely out of hand and smashes itself to bits.

The "free competitive enterprise system" is certainly enterprising, but it is neither entirely free nor entirely competitive in any sense the classical economists recognised. The economic system that produced \$235 billion worth of goods in 1947 bears

little relation to the *laissez faire* of nineteenth century England, the monolithic state which looms over modern Europe, or the modified Socialism with which the Labour Party is experimenting in England today. The President's Council of Economic Advisers calls it a "conger of private and government efforts," and the phrase is good shorthand for a definition which could not be more precise without also being more clumsy.

It is mixed in many ways. Moreover, it always has been mixed. Shape and size have changed over the years, but its hybrid characteristics date, not, as many critics think, from socialistic tendencies lurking in the New Deal (which was more social than socialistic, and always preferred the traffic cop to Karl Marx) but from conditions implicit in the nation's birth. A people starting life on a continent where land was largely free for the taking, using that land to endow public universities and private railroad building as well as private citizens, did not at any time conduct its affairs in the pure realm of *laissez faire*.

*

A glance at classical factors in the capitalist ideal suggests how far the reality has, by now, departed from the theoretical pattern. Private ownership and control of the means of production? Yes, in large measure, but there is also public ownership and control in certain areas, and there are even power plants publicly owned and tied into private power lines. Production automatically governed by the profit motive? This question produces more questions than answers. Taxes on profits and private incomes soar with size and tend to act as a damper on the zest for unlimited amounts of either. Dependence on the price system as a means of allocating resources and equating supply and demand? The price system acts not freely, but under controls imposed by business, by labour, by governments, both state and federal. Rent controls are imposed by nation and state. The price of a fur coat in New York includes 20 per cent federal tax and 2 per cent city tax, while if the purchaser goes home with it to Connecticut she may also be liable to a 3 per cent state tax. Price agreements within industry are illegal, but General Electric's recent cut in prices shook the market. Prices on tooth brushes, shaving creams and other trade-marked articles may be set by the manufacturer and must be kept by the retailer under penalty of state law. The recent rise in the cost of travel between New York and Boston had to be approved by the Interstate Commerce Commission. The use of prefabricated houses to cut building costs has been blocked by the antiquated building codes of many towns.

Ideally, a capitalist economy should be composed of a large number of small competing units—this one is composed of such organised groups as US Steel, Standard Oil, the Farmers' Union, and two great labour federations with thirteen million members, as well as the corner grocery and small-town drug-stores. In the fields of industry, labour, agriculture, capital formation and control the familiar pattern is the large institution or the group of smaller units. Ideally, a capitalist economy should function without interference from government—this one has government interference on the federal, state and local levels.

If classical analysis breaks down, so does classical prophecy. In the short run, the various financial services which make a business of prophecy are still divided as to whether or not the present upward course can continue another year, and the political powers have come to no agreement as to whether inflation should be controlled and what steps could or should be

taken to what end. In the long run, the question of how to establish an economy that shall adequately serve a democracy of this size and kind is being newly pressed. The theory that this is a function of government is one to which the Council of Economic Advisers gave deep consideration in the report which served as the basis for the President's message. Ways and means are still matters on which there is no agreement.

Clearly the situation calls for a re-examination of what the goals of a mixed economy functioning in a democracy should be, and to this the Council pays lip service. Yet their report, framed to serve as background for the President's economic message, cannot forget old wounds. "Health and growth in our business life" is its dear dream, but whether this means more or less government participation the Council does not know. Meanwhile they recommend a search for that static heaven, "the pattern of reciprocally balanced consumption and production which could reasonably be expected to become established . . . and which could be maintained on a stable basis."

American Notes

Marshall Plan on Trial

The House and Senate Committee hearings on the European Recovery Programme, at which Mr Marshall and Mr Douglas are star witnesses, provide useful, though by no means exhaustive, signs of which way the wind is blowing. Neither Mr Marshall nor Mr Douglas indulged in any pyrotechnics or high-flown phrases; it was a businessman's beginning. In fact, at times they seemed more like witnesses for the defence than prophets with a mission. Thus pains were taken to point out that even with full acceptance of the Administration's plan, exports would not reach the level of the past 15 months; that the Administration's estimates are lower than the lowest figure recommended by the Harriman committee; that the European standard of living, even in 1952, would be lower than before the war. The statistical drabness of the testimony is no doubt deliberate; but it springs also from the healthy sense of the opposition ahead which last week prompted the Administration to forgo the inclusion of the \$17 billion total in the Bill.

The chief point on which Mr Marshall took the offensive was the amount; it must be all or nothing. "Undertake to meet the requirements of the problem or do not undertake it at all." The danger of severe cuts—the Republican Steering Committee of the House is already talking about halving the appropriation—is great enough for Mr Marshall to have taken the risk that Congress would resent this high and mighty tone; and to have intimidated, despite official denial, that if he is thwarted he may retire to Leesburg. The other point on which Mr Marshall was insistent was that no humiliating conditions should be imposed; the cure must not be at the expense of self-respect.

Senatorial inquiries, by such friendly examiners as Senators Lodge, Vandenberg and Connally, indicated, in the elevated atmosphere of the Foreign Relations Committee, some of the chief doubts which will find noisier and more insistent expression on the floors of both Houses. Mr Douglas was taxed to prove that Europe was not just sitting back waiting for the rescue squad; pressing inquiries were made about the likely activity of the Committee for European Economic Co-operation. Senator Vandenberg insisted that clearer and more explicit commitments to self-help must be written into the Bill. Senator Connally wanted reassurances that Marshall dollars would not go to pay foreign debts; fears were expressed that through agreements like that between Britain and Russia, additional equipment might reach the Soviet Union. Senator Lodge feared that after 1952 Europe might grow nostalgic for its ancient nationalisms.

These are reservations rather than outright material for opposition; but these arguments, and others, will be exploited to the full, particularly in the House, by a hard core of unrepentant isolationists. In the House 88 votes were cast against interim aid, which was small in amount and temporary in nature. Of these, 55 were from Congressmen from the Middle West, still relatively the most isolationist section of the country.

* * *

Two Secretaries of State?

The liveliest doubts expressed, however, concerned not the Marshall plan itself, but who is to control it. Senator Vandenberg has called this the most controversial issue involved. There are three major alternatives: that ERP should be wholly a State Department project; that an independent corporation should be

created, with a bi-partisan board (the proposal of the Herter Committee); or the Administration compromise, that a new agency should be created whose head would be independent of the State Department save on matters of foreign policy.

The House is still expected to favour the Herter proposal unless some more convincing compromise can be negotiated. The heart of the dispute is not over whether direction should be entrusted to one man or a bi-partisan board (though the latter would give the Republicans the share of the credit and control which they covet), but whether the administrator is to be subordinate to the Secretary of State. Mr Halleck, Senator Taft, Mr Martin and the other Republicans who favour independence, argue that the State Department has an inefficient record in the disbursement of relief; that businessmen, rather than career officials, are needed to make ERP a business success; and that endless frustrations await an administrator tied to the State Department routine.

But Mr Marshall is adamant on the question of his ultimate authority over the "most important single expression of US foreign relationships." There cannot, he insisted, be "two Secretaries of State," thus reviving the effective phrase with which Senator Vandenberg disposed of Mr Henry Wallace's pretensions to speak on foreign policy a year ago. It is necessary, Mr Marshall said, to entrust the programme to one man, who must be of outstanding ability and stature; he must be given wide freedom of decision; but on foreign policy he must be subject to the direction of the State Department. Senator Vandenberg added sharply that the confidence of the country in businesslike administration of the Marshall plan was even more important; without it the plan would be "sunk without trace." In his endeavour to keep an ostentatiously open mind on the issue which so sharply divides Senator Taft and his following from the Administration, Senator Vandenberg has recommended recourse to yet one more impartial report, from the Brookings Institution.

Any expert report must surely recognise two considerations: that a completely autonomous authority would gravely infringe the President's constitutional authority over foreign affairs (as one Republican, Mr Eaton, has argued); and that in practice America cannot speak abroad with two voices. It may be possible to guarantee that in the business decisions (which Mr Marshall estimates will make up 80 per cent of the Administrator's work) outside influences will be barred. It may be that Mr Lippmann's suggestion for considering control before the main Bill is discussed, and appointing an administrator (presumably Mr Douglas) who enjoys the confidence of Congress, may take the fire out of the legalistic arguments—though this is placing a heavy responsibility on one man. But to divorce the Marshall plan from Mr Marshall's foreign policy seems to be a very illogical enterprise.

* * *

Forty Billion Budget

The Budget proposals submitted by President Truman this week will again provide his Republican critics with a great deal of painstaking study if they are to justify the claim that tax reduction over the fiscal year 1948-49 can leave room simultaneously for a substantial retirement of government debt, and for more than a nominal contribution to the European Recovery Programme.

The suggested expenditure level, very little below the \$40 billion mark, compared with \$37.7 billion this year, is doubtless of appalling dimensions, when judged by the standard of prewar years. But, as Mr Truman was careful to emphasise, the proportion of these expenditures devoted to national defence, veterans' benefits, debt charges, and foreign affairs, now accounts for almost four-fifths of the Budget total, against less than one-third in 1939. The estimated surplus of \$4.8 billion for 1948-49, again, is high by normal standards; but it is scarcely generous in terms of present inflationary pressure, it presumes the continuance of current incomes and employment for fully eighteen months ahead, and it contrasts with Republican plans for tax reductions aggregating \$5.6 billion. Both parties are dealing with an explosive economic situation in which estimates can go very sadly astray, but it is hard to believe that, for the measurable future, the Republican schedule is more realistic than that of the President and his advisers.

Republican critics have fastened already on the Presidential admission that the expenditure total might have been held to

\$34 billion but for the European Programme, and for higher domestic allocations which cover compulsory military training, social security, health insurance, housing, and scientific research. The domestic items may well be trimmed, but the additional cost of these alone is not more than \$1.3 billion, and the majority party in Congress has already been forced to reinstate development expenditures which were hastily scaled down in the first exuberance of the 1947 economy drive.

The scope for substantial relief, apart from a questionable gamble on the longer-term future, is thus reduced almost entirely to expenditures on foreign policy account. Here, Mr. Truman explained that while Congress had been asked to appropriate \$6.8 billion for ERP over an initial period of fifteen months, the actual budgetary cost over the remainder of 1947-48 and 1948-49 would not be more than \$4.5 billion, owing mainly to the time-lag between appropriations, shipments, and eventual payment. The 1948-49 total for all US Government expenditure abroad will be \$7 billion, and will include "aid programmes for several countries, including China" with suggested appropriations of \$440 million. Further assistance for Greece is presumably included in that figure which no doubt acknowledges also the strength of recent Congressional pressure for more active support to the Chiang Kai-Shek regime.

In terms of the foreign aid programme, the stress of the Budget Message, justifiably enough, was upon the situation which would face any Congress in the event of economic breakdown in western Europe. By the standard of the defence programme that would then become necessary, \$4.5 billion for ERP next year seems modest enough. This argument, supported with clarity and vigour by Mr. George Marshall in his testimony before the House Foreign Affairs Committee, will no doubt make a broad appeal to Congressmen. But there are many not yet convinced that a process of "trimming ERP" would, in fact, present them with such a dire alternative.

Rediscount Rate-Up

One more step has been taken in the careful retreat by the Treasury and the Reserve Board from the pattern of cheap money established during the war. The Federal Reserve Bank of New York at the close of last week announced an advance from 1 to 1½ per cent in its rediscount rate. This was the first general adjustment since 1937, although the special ½ per cent rate applicable during the war years to advances secured by short-term Government securities was withdrawn many months ago.

The adjustment, forecast in December by Mr. Marriner Eccles, chairman of the Federal Reserve Board, is a logical sequel to the process of hardening short-term rates. Over recent weeks, the one-year interest rate has been well above 1 per cent, and maintenance of the reserve discount rate at the lower level was a standing invitation to member banks to borrow on profitable terms. The volume of such borrowing by member banks, however, is now at extremely low levels, and the change in the discount rate will thus have little practical effect.

It would, however, be wrong to dismiss the change in the discount rate as a technical gesture which can be forgotten overnight. At the moment, official efforts to restrain credit expansion are being nullified to a large degree by the desire to protect the long-term rate of 2½ per cent for Government borrowing. In the open market, the Reserve authorities have been selling short-term and buying long-term issues, and the net effect of this dual policy has been an actual expansion in the "excess" reserves of member banks which, reinforced by a seasonal return of currency, are at the highest level reached for two years.

Pressure on bank reserves, however, will soon return. The Treasury surplus of no less than \$7 billion for 1947-48, declared by Mr. Truman in his Budget Message, was a conservative estimate of the cash resources available for debt redemption within the next few months. To this extent, the authorities can exert a constant pressure on bank reserves, and upon the public money supply. It is true that the power of this deflationary weapon cannot exercise its full effect so long as no steps are taken to "sterilise" gold imports, and so long as the price level of long-term bonds has to be protected. In Mr. Eccles's view, however, this process of debt retirement may bring an effective check to the expansion of bank loans. And if it fails to check inflationary pressure, he will no doubt renew his request to Congress for the grant of more drastic powers for credit control. If by that time the price-level is still rising, there might easily be a different mood in Congress, which has so far rejected all such pleas.

Air Defence

Declaring that the United States needs "a new strategic concept for defence, which must be based upon air power" the

President's Air Policy Commission this week released its thorough survey of national aviation policies in terms which can bring very little consolation to Congressional students of Budget economy. It has been sufficient in the past, it declares, to hold the water approaches to the United States. From now on, both air and water approaches must be defended at a time when a government can rely only upon the relative security afforded by its own preparations against aggression from abroad.

The Commission holds that the present air force is inadequate to deal with potential aggression even during the next five years, when a probable monopoly of atomic weapons might be expected to give relative freedom from the danger of aerial attack. Beyond that point (from 1952 onwards) it declares that a "serious danger of atomic attack will exist" and that the air force must be increased from its present level of 55 groups to 70 (with 6,869 first-line aircraft), with an Air National Guard of 27 groups, and a 34-group Air Reserve. Beyond this, it calls for a rate of replacement sufficiently high to provide this force with modern equipment at all times, and for a further reserve of 8,000 aircraft.

Whatever may be the final verdict upon the political and strategic implications of this report, it will almost certainly provide the mainspring for a considerable expansion in aircraft manufacture over the next few years, and embracing the domestic transport companies. On this issue, incidentally, the Commission supports Mr. Harriman's claim for the transfer to the Department of Commerce of many control powers now held by the Civil Aeronautics Board.

For some time, service advisers have been concerned by the fact that the volume of orders from transport companies has been far from sufficient to maintain the profitable operation of key aircraft manufacturers. Some support has been given by research work for the army and navy, but postwar appropriations have held down service orders almost to the minimum level necessary for the completion of contracts already under way in 1945-6. The report of the Air Policy Commission accepts the manufacturers' contention that their industry can survive as an efficient unit only if it is given the security afforded by five-year contracts, and corresponding opportunities for development of experimental types.

The programme they recommend would bring substantially heavier Budget charges over 1948 and 1949, and a minimum rise of no less than \$8 billion in the annual burden of defence expenditures by 1952.

Shorter Notes

The devaluation rumours which developed in London this week were scarcely justified by Mr. John Snyder's evidence on ERP finance before the Senate Foreign Affairs Committee. President Truman has already said that agreement on currency stabilisation and monetary stability must be a primary condition of US aid, and in elaborating these comments, the US Secretary of the Treasury went no further than to declare that exchange adjustments would take place through the machinery of the International Fund when (in the opinion of the US government) (sic) exchange rates now current would impose an unjustified burden upon any recipient country.

President Truman's Economic Report to Congress on Wednesday repeated earlier demands for immediate action on the 10 point anti-inflation programme which he submitted in December. Unless such measures are taken, he declares, depression is "certain" and "will involve the government in far more pervasive intervention in economic life than the measures which are necessary to prevent it." The statistical report, which has been compiled by Mr. Truman's Council of Economic Advisers, gives a remarkable record of US productivity in 1947 with new peaks in employment, farm income, and gross national product. The CEA holds that, over the next ten years, it should be possible to push production to a level fully 80 per cent above that of 1937, and to increase employment from its present level of 60 million to 64 million.

The first formal move against the extension of the Reciprocal Trade Agreements Act has been made by Mr. Harold Knutson, chairman of the House Ways and Means Committee, who asserts that the State Department has so far failed to give a complete schedule of the countries concerned in each item of tariff revision. The Committee, which initiates tariff legislation, expressed strong hostility to renewal of this Act a year ago. Democrats believe, however, that it will be possible to obtain a renewal of present authority for tariff revision, although the Republican majority may this time enforce a shorter term.

SHOWING AT 6.15

'World markets' are sometimes in out-of-the-way places, and the story of the post-war selling of British films for export deserves a film script to itself.

In China, for instance, coolies are often employed as the quickest means of getting films from one city to another. They battle along the old caravan routes, by paddy field, mountain pass and river; carrying *Odd Man Out*, *Great Expectations* or *Black Narcissus*. Every day some far-off audience sees its first British film.

The game is worth the hazard. There is more at stake than a British export, vitally important though that may be. For at journey's end there are the richer rewards of good will and better acquaintance. Through the new British films Mr. Tang of China sees the British people, sees Mr. McLeod of Edinburgh, Mr. Smith of London.

Nowadays we are all so much 'involved in mankind', so much in need of this closer view of one another. Edinburgh may be eight thousand miles from Cheng-tu—but good films diminish the distance.

TI

and the boy in the boiler suit

Hundreds of boys, many of them fresh from school, earn their first real wages from one of the TI Group of Companies. From that moment, regardless of background, they enjoy equality of opportunity, for TI have decided that the only limit to their advancement shall be the capacity of the individual.

Opportunity is there from the beginning. Youngsters in TI are helped to continue their broad education for one day a week on full pay. Older boys, after an apprenticeship agreement with their Company, embark on a course of training in engineering or commerce which will lead the right lads as far as a university degree. At every stage they and their parents are advised by their Company Training Officer.

TI hold this policy to be at once a duty and an interest—for upon such opportunity depends the future, not just of TI, but of the whole nation.

TI is a team of engineering industries which serve in more ways than may be realised. The component companies have made their own reputations in the fields of precision tubes, bicycles, electrical appliances and cables, wrought light alloys, pressure vessels, metal furniture and paint—the whole is TI.

Socialism in Sweden

[FROM OUR STOCKHOLM CORRESPONDENT]

THERE is a close parallel between the postwar fortunes of Labour in England and in Sweden. In both countries the Socialists took over the government after the end of the war with good hopes of realising their political goals. Both nations have seen their internal economic situation gradually deteriorating, finally to end up in a crisis this autumn. Adverse international trends, it is true, have played an important part in this development. But the blame must be shared by the Governments in both countries, and especially in Sweden. As in England, one may, however, very well doubt if any other government would have done better. The English voter has already had an opportunity to express his opinion of a Labour Government; and the results have heartened the right-wing parties in Sweden. Discussions of the prospects of the Social Democrats both in the elections next autumn and in the longer run have accordingly been intensified.

The Social Democrats have been by far the largest party in Sweden since the beginning of the 1930s. During the greater part of the war they had an absolute majority in both Chambers and are still supported, according to the latest general elections in 1946, by almost half the Swedish voters. The dominating position that the Social Democrats have thus gained for themselves primarily reflects their progressive and farsighted policies. Most of their reforms, in spite of meeting with strong resistance from the Right at the time of their realisation, have later been unequivocally accepted from all quarters. Another big asset of Swedish Labour is the fact that, in direct contrast to the English Labour Party, the party has not shown a particularly doctrinaire approach to the question of socialisation. There is in fact a lot of truth in the saying of Professor Myrdal, a former Labour Minister of Commerce, that "when Labour came into power in Sweden socialisation stopped." There has, however, been a change in the last few years, a change that has been somewhat accentuated by the death of the former Premier, Per Albin Hansson, in the autumn of 1946. But in part the renewed interest in socialisation may be more of a tactical counter-measure to the Communist offensive than a sign of a real break with earlier policy.

Still another reason for the stability of the Labour vote is the failure of the Opposition to formulate an alternative policy. Every new reform has for so long been met with the cry of "wolf" that most Swedes have become sceptical of the Opposition's arguments, which the Labour leaders can wave away by pointing to their opponents' previous errors. Thus, in the beginning of the thirties, the Right protested against a Budget deficit of about 100 million kronor on the grounds that it would ruin the country. In 1944 there was little opposition to a Government proposal to run up a deficit of 1,000 million kronor in the event of a postwar depression. On other matters the Social Democrats have in the main proved themselves right.

The breakdown of the Government's postwar economic policy is nevertheless a major liability. This failure can no doubt to a great extent be explained by the fact that the Labour Government expected a postwar recession in the transition period and had laid all its plans accordingly. Another negative item on the record of the Labour Government is its inability or unwillingness to work out some sort of formula for co-operation with other groups. Not only has the Government failed to co-operate with business and industry but it has antagonised them by its total lack of interest in their opinions. In this respect the loss of Mr Hansson is especially felt, since his most prominent asset was his ability to even out political and economic disputes and work out compromises.

The Choice of a Leader

Leadership of the party is, indeed, the most acute of the Social Democrats' longer-term problems. It was generally thought that Per Albin Hansson's successor would be his old friend and fellow trade-unionist, Gustaf Möller, who would take over until a younger candidate had been found. Instead the Social Democratic parliamentary group chose as its leader young Tage Erlander, who had gained a reputation as an able administrator. The choice was surprising in so far as Erlander had not sprung from the ranks of the trade unions, which was thought to be a prerequisite for any Premier. By many observers this change in policy was given the interpretation that the potential gap between the intellectuals and the trade unionists in the party would be accentuated and that the intellectuals, the leader of

whom is the Minister of Finance, Wigforss, would play a more important part in shaping Government decisions. There is no doubt that the influence of Wigforss has increased and that the Labour Government is no longer as unanimous on policy-making as earlier. If Wigforss, as is rumoured, finally leaves the Government after the elections next year, another reshuffle in the party is not impossible. Should the elections go against Labour and some sort of coalition government be formed, this development is even probable. There is no doubt that the present economic crisis has meant a decrease in the party's confidence in the Wigforss-Erlander combination. On the other hand, the authority of the present Minister of Commerce, Gjöres, who has the support of the Consumers' Co-operatives, has grown steadily.

The second big problem for the Swedish Labour Party is its relations with the Communist Party, which now controls somewhat more than 10 per cent of the voters. Their vote, however, is not so much pro-Communist as anti-Government. They have been able to utilise the present inflation of prices and the high corporate profits in order to gather the votes of discontented trade unionists. Their propaganda may very well prove still more effective in the near future as the new economic policy will most certainly entail a real, even if not a formal, stop on wages. The danger that the Social Democrats see here is that the Communists will gain control of the trade unions. For Swedish Labour not only gets its voting strength but also its financial assistance from the trade unions.

This growing importance of the Communists poses the question whether the Social Democrats should co-operate with them. The Communists themselves would probably gladly join the Labour Party in a coalition government. Among the Social Democrats, however, the desire to take the Communists into the Government is not so pronounced, even if some prominent members have no doubt played with the idea. It is thus probably safe to say that they will try to avoid collaborating with them.

Trade Union Transformation

The trade unions offer a difficult problem in still another respect. As the Social Democrats no doubt will remain in government for many years, they must also attempt to solve the problem of collective bargaining in an economy of full employment. Experience during the war years and in the postwar period has shown that a full employment policy without some sort of check on wage demands will lead to inflationary pressure, which, in turn, will produce more and more restrictions. Under full employment not only have the trade unions an excellent bargaining position but the will to resist new wage increases on the part of the employers is at the same time very much weakened. Labour will therefore have to devise a formula, whereby the trade unions can be made to accept a weakening of their individual bargaining rights in favour of a somewhat more centralised wage bargaining system. It is perhaps against this background that one has to judge the Labour Party's growing interest in industrial democracy. The idea behind this is possibly that the labour unions, as a compensation for a more restrictive attitude in their wage bargaining should participate more fully in shaping the economic policy of industry.

These measures, however, have up to now shown little result. More important, however, than all these considerations is the stability of the Swedish electorate. And this inertia favours the Socialists. Moreover, there is no doubt that the non-voters are proportionately more numerous in Labour than in any other party. Probably only some 65 per cent of the potential Labour vote participates in the elections, while the corresponding figures for the Conservatives and Liberals could be estimated at 80 to 85 per cent and for the Communists still higher. Labour thus has the larger reserves. It also gains from the new agricultural policy, which involves the transfer of people from the farms into industry through mechanisation and the creation of bigger farm units. As the farmers have for a long time been one of the conservative forces and also the most class-conscious party, this policy will probably mean a decline in the right-wing voting strength and a corresponding increase in the Social Democrat ranks.

This, however, may be offset by the growing importance of administrative personnel and salaried employees, who traditionally vote Liberal. Moreover, restrictions will be worse next year: and present failures carry more weight with the general public than past successes. On the other hand, by chance or by conscious policy lower taxes, higher old-age pensions and increased child allowances will next year bring ample compensation to most people. It is thus probable that the Labour Party will lose only a fraction of its votes, and most of its losses will go to the Communists and not to the Right. Socialism is still strong in Sweden.

For the man of to-day

Little time to think about correct posture, even when you do get a chance to sit down! Result — stomach muscles soft, slack and no longer a protection. A Linia Belt gives just the support you need. It tones up the muscles and helps a lot in keeping you fit and energetic.

"EXPORT OR DIE"— but will they buy?

MAKING the goods for export, making enough, and making them right, is a tremendous task. British industry's first preoccupation is, naturally enough, to meet the set output quotas—rising all the time, in money terms, with the steady rise in world prices.

Yet merely making the goods and shipping them overseas won't save us, unless someone buys them. Our exports must be sold. Sold at a good price, not dumped. And sold in the right markets to earn the currencies we must have.

Customers make markets

Already, in some territories, we feel the growth of local industries, often protected, and the thrust of foreign competitors. This is a challenge: our products must win their way. If we make them to suit the foreign buyer, and take the trouble to tell him how and why he gets value for his money, he will buy. But if someone else speaks in his ear while we are silent, our goods will stay on the shelves.

The battle for a lasting, profitable export trade stretches out, then, from the factory gates to many distant markets. In each of them, sound plans for competitive merchandising and advertising depend on intimate local knowledge. How is the manufacturer at home, deep in the struggle for output, to win acceptance for his goods in all these markets?

The J. Walter Thompson Company

is well placed to help him. Long experienced in advertising on an international scale, it has fully staffed and equipped offices in the world's market centres—besides correspondent organizations working directly under JWT guidance.

A world-wide service

A special International Department in the London Office is at the disposal of advertisers. Marketing information on almost any territory is readily obtainable from trained and experienced men-on-the-spot.

The British manufacturer who employs the J. Walter Thompson Company to handle his advertising has the advantage of dealing with a single organization working in many countries. This places at his call a world-wide fund of advertising and selling experience, and provides central control. Some things, though, should not be centralized: the detailed planning and production of his advertising in each market will be in the hands of experts thoroughly familiar with the habits, feelings, and reactions of the people among whom they live and work.

International Department

J. WALTER THOMPSON COMPANY LTD.
40 Berkeley Square, London, W.1 (Tel. Mayfair 9496). And 29 offices abroad, serving the United States, Australia, Canada, South Africa, India, Argentina, Brazil, Chile, Mexico. The JWT office in Belgium is in full operation; for the present, 12 correspondent offices cover other European countries and Egypt.

THE BUSINESS WORLD

Patterns in Money

THE fiduciary note issue of the Bank of England was last week reduced from £1,450 million to £1,400 million, its first reduction since early 1939. Thus, at last, the long and steep upward trend of the war period, which had involved no fewer than seventeen increases in the fiduciary limit, has been reversed. Moreover, with one possible exception, this year's reduction is the first in the history of the Bank which has been made not to provide for merely seasonal variations or for the technical purposes of exchange control, but to reflect a definite decline in the public's demand for notes.

When the war ended in 1945, the active note circulation of the Bank of England had been raised from £529 million at end-August, 1939, to £1,367 million. It continued to rise, though at a slower rate, until the end of 1946 when, at the seasonal Christmas peak, the circulation reached an all-time record of £1,428 million. Even then, it was far from certain that this level would not be surpassed. At the height of last summer's holiday demands, the volume of notes in circulation was still more than £30 million greater than at the comparable date in 1946. But, thereafter, the underlying trend was violently reversed. Between the August and Christmas seasonal peaks, for the first time for many years, there was actually a large net reflux of currency from circulation: a net decline of £53 million in this period contrasted with an increase of £37 million in the similar period of 1946, and one of £53 million in 1945. In consequence of this striking change, the volume of unemployed notes in the Bank's reserve had by last week been raised to the unprecedented total of almost £120 million. Even after the cancellation of £50 million of these notes through the reduction in the fiduciary limit, the reserve still stood at the comfortable level of £70 million, or £20 million more than at the similar date last year—and this week the margin has widened to £29 million.

Regarded as statistical facts, these are highly interesting developments, and it would not have been surprising if the authorities had taken steps to draw attention to them. Actually this particular reduction in the fiduciary issue was one of the most unobtrusive changes ever made: it was not announced at all, but simply allowed to emerge from the usual weekly Bank return. This certainly shows commendable restraint. The authorities in Whitehall, as well as in the City, may be congratulated for resisting the temptation to represent this incident as a sign of a lessening of that inflationary pressure for which the Government has been so strongly criticised during the past year. In fact, the connection between the recent change in

direction of the note circulation and underlying monetary trends is very remote. Paradoxically, in so far as there is a connection, this decline in the demand for currency is, indeed, an indication, not of the lessening of inflationary pressure, but of the extent and nature of that pressure.

So little is known about the distribution of currency holdings—even by those who are best placed to observe their movements—that it is impossible to define with precision the sources of the recent large reflux of notes. But, as has several times been explained in these columns, competent observers all agree that most of the notes which are flowing back into the banks are coming from "spivs," black market operators and tax evaders, and from other persons who, since the war, have come to regard actual currency, as distinct from bank deposits, as the surest cloak for operations whose scale or nature they seek to hide. Needless to say, nearly all these operations are a direct consequence of inflation, and especially of that particular brand of inflation which is distorted and partially suppressed by prohibitions or rationing of certain types of expenditure, and by controls which keep official prices at artificially low levels.

The reflux of currency is not, unfortunately, any indication that the scale of black market dealings and other irregular activity is declining and, therefore, requiring less capital. The rising momentum of the reflux

results simply from the evident fear, among those who have been seeking thus to conceal their operations, that the authorities may be planning to recall the existing note issue, and to replace it by a new series, as a means of bringing such operations to light. If further evidence were needed of the abnormality of the behaviour of the circulation in recent months, it could readily be found in the fact that the return of notes has coincided with a wholly exceptional demand for silver coin, which some dishoarders of notes apparently regard as an alternative refuge for concealed savings.

Given the extent of the distortion which these peculiarities have produced in the very meagre currency statistics which are available, it is unfortunately impossible to discern how far, if at all, the natural currency habits of the public may be changing. It seems probable, however, that a minor element in the total reflux of currency may have taken the form of a progressive release of notes accumulated by small holders as a means of wartime savings—a dissaving movement which may well have been stimulated by influences similar to those which have produced the increase in encashments of Savings Certificates and withdrawals from savings banks.

The change of trend in the note circulation, though due to special influences, may none the less mark the beginning of a movement towards the prewar relationships between money and income. The currency habits of the public are normally surprisingly rigid—even more so, usually, than those which govern the conduct of bank deposits. Before the war, and especially before the cheap money period opened in 1932, the average volume of bank deposits rarely fell so fast as the national income when the latter was falling, or rose so fast as the national income when it was rising. This traditional tendency for the volume of money to lag behind the movement in national income became even more marked in the first two years of the war; but, as was demonstrated in an analysis in *The Economist* of May 4, 1946, the normal trend was sharply reversed after 1943. The ratio of the total stock of money (taking the aggregate of annual averages of clearing bank deposits and active note circulation) to gross national income at market price had in the sixteen prewar years never risen much above 50 per cent or dropped as low as 40 per cent, and thus showed a range of fluctuation of only about 20 per cent. But between 1938 and 1940, it fell from just over 48 per cent to 42 per cent, and since then has risen each year to the peak figure of almost 66 per cent for 1946; and there is little doubt that the proportion for 1947 will show a further moderate rise. In the wartime period, therefore, the range of fluctuation was approximately twice that which occurred in the substantially longer prewar period, and the proportion of income held in the form of money is now quite abnormally high.

This tendency for the community to keep a larger proportion of its income in money was, until 1946, much more pronounced in currency than in bank deposits. The ratio of currency to national income, though it rose at the outbreak of war, had by 1941 dropped to a little over 7½ per cent, approximately its prewar normal. Yet by 1946, it had risen almost to 14 per cent, proportionately a much bigger movement than that in the depo-

sits-income ratio, from 35 to 52 per cent, over the same period. Measured against the extreme stability of currency habits in normal times, these are violent changes. During the 'thirties, the extreme range of movement of the currency-income ratio was equivalent to only about 14 per cent of the average ratio for that period; but the corresponding fluctuation in 1938-46 was more than 60 per cent.

Similarly, the proportion of the money stock held in the form of notes, which before the war had shown an even higher degree of stability (with a range of fluctuation less than 10 per cent over a decade), rose steadily from an average of 16.4 per cent

in 1938 to 21.4 per cent in 1945. Thus, as the accompanying table shows, until 1945 the expansion of currency outpaced that in deposits, but deposits have since been catching up.

All these figures, however, being based on annual averages, tend to obscure the extent of recent movements. In fact, it

appears that the abnormal reflux of notes in recent months has had the effect of restoring the ratio of notes to total money virtually to the level at which it stood in the early years of the war. At the end of November, this ratio was only 18.9 per cent, apparently the lowest for this season since 1941. This abrupt reversal of the wartime trend of the currency-deposits relationship is not, of course, wholly attributable to the recent decline in currency. It reflects also the great acceleration of deposit-creation which resulted from Mr Dalton's adventures in cheap money. In the two years from November, 1945, clearing bank deposits rose by 20 per cent, while the note circulation (taken at the Christmas peaks) dropped by 1 per cent. The disparity between these movements was not, however, quite so marked as this particular comparison suggests, because the growth of deposits was mainly concentrated in 1946, when the note circulation was also rising. Hence the decline in the circulation has roughly coincided with the phase in which the expansion of deposits has markedly slackened.

It would be wrong to try to draw firm conclusions from these statistical patterns. Some of the changes are evidently fortuitous, and others can be surmised to be due to extraneous

factors far removed from the problem of inflation with which, in most discussions, the movements of these monetary indices are commonly—and sometimes too closely—linked. But, in view of the growing attention which is now being paid to the purely monetary aspects of inflation, these patterns in monetary statistics clearly ought to be studied. It is true, too, that the classical relationships, which might have been suppressed or distorted by the new environment of physical planning and controls, can sometimes still be seen from the statistical patterns—even though part of the pattern may demonstrably be due to special influences such as the present unease of holders of tainted notes. It is partly for that reason that on the chart which illustrates the monetary trends discussed in this article, an index has also been plotted of long-term interest rates—the yield on 2½ per cent Consols. Those who have followed the discussions in these columns of the Daltonian experiment will readily perceive that there is little that is fortuitous in the coincidence of the abnormal money and interest rate movements in 1946—or in the fact that the symmetrically opposite movement in interest rates in the past year has synchronised with a marked deceleration in money creation.

Rhodesian Copper Prospects

ALL the Rhodesian copper companies have now published their accounts for the year 1946-47. During this period the price of copper rose by about 55 per cent, but the companies' profits and dividends, though higher, have not shown a startling increase. In view of Britain's stringent dollar position, the possibility of increasing the copper output of Rhokana, Roan Antelope, Mufulira and Nchanga has assumed an urgency second only to that of the war period; Rhodesia is, in fact, the only substantial source of sterling copper. Mr A. Chester Beatty contends that the Rhodesian field promises eventually to meet all Britain's requirements of copper. At present Rhodesia accounts for between one-eighth and one-tenth of the world's total copper production. Practically the entire Rhodesian output is purchased by the British Ministry of Supply, though at present Rhodesia falls far short of covering all of Britain's requirements. In the 11 months to November last, the value of imported copper into Britain from sterling sources represented only 36 per cent of the total of £36.5 million. Imports from Northern Rhodesia totalled £12.8 million, against imports valued at £6,500,000 from the United States, £6,200,000 from Chile, £4,400,000 from Canada and £1,600,000 from the Belgian Congo.

Consumption of virgin copper in the United Kingdom last

year is estimated at about 375,000 tons, and total Rhodesian output at slightly over 200,000 tons. But of Britain's total copper consumption, approximately 220,000 tons a year is electrolytic copper, of which Rhodesia's recent rate of supply has amounted to only some 50,000 tons. Thus the gap in British requirements of electrolytic copper—indispensable to the flourishing electrical industry—is certainly not less than 160,000 tons a year at the current level of consumption, and it can only be made good from dollar sources. Little relief to the drain in dollars for purchasing electrolytic copper can be obtained from selling part of Rhodesia's output of blister copper—that is, fire refined copper of a lower standard of purity than electrolytic—for hard currencies. But during the first six months of 1948, some 20,000 tons of blister copper will be shipped from Rhodesia to the United States for electrolytic refining under a toll scheme, by which the costs of refining will be met in refined metal. On present indications, taking account of prospective imports from Canada and the United States later this year, electrolytic copper is likely to be short in the United Kingdom unless supplies can be increased from other sources—which will mean cutting further into dwindling reserves of dollars. The recent firmness in copper prices suggests that additional supplies of electrolytic copper are not likely to be obtained below present prices.

The revival of European demand and stockpiling purchases by the United States have belied the hopes of six months ago that copper prices might weaken towards the end of 1947.

Such is the context in which the latest results and the immediate prospects of the Rhodesian copper companies must be considered. The latest accounts of the companies do not reflect the full advance in copper prices in 1946-47, because it is their practice to sell their production at least three months forward. Rising prices, therefore, produce a delayed response in gross revenue. Even so, higher average prices over the year 1946-47 enabled the producers to show a big advance in sales revenue. But on the side of costs, their experience was not nearly so happy. The output of all the companies suffered heavily from the artisans' strike in July and August, 1946, when operations at the mines came to a standstill for more than four weeks. After that, no further interruptions were caused by labour trouble; nevertheless it was an inauspicious start. In subsequent arbitration proceedings the wage rates which were the cause of the strike were adjusted and an agreement between the companies and the Northern Rhodesia Mine Workers Association was signed early last March. No trouble has been experienced from African native labour, but the mining companies have spent considerable sums on improved accommodation for the senior African

of coal. The trouble in Northern Rhodesia last year was not lack of coal output, but a critical shortage of rolling stock to move it from the Wankie Colliery to the copper mining area. Traffic demands on the Rhodesia Railways have greatly increased in recent years in step with the country's economic expansion, especially in Southern Rhodesia, and during the past year the limited facilities of the system suffered extra strain because it had to provide transport for livestock from drought stricken areas. In addition, the transfer of the railways to government ownership has not made the situation any easier. The copper companies are at present in an unenviable position for their transport. By their contract with Rhodesia Railways they undertake to use the railways for the carriage of all their imports and exports and for such traffic as they require to be sent by rail—indeed there is no practical alternative. On their part the railways are under an obligation to forward such goods as are consigned to them, but when rolling stock is required for other purposes the copper companies appear to have no priority. Coal deliveries to Northern Rhodesia in the period April to August, 1947, represented 92 per cent of the 1939 rate of delivery, while deliveries to Southern Rhodesia for the same period represented 180 per cent. The chairman of Nchanga has estimated that, after making allowance for output lost by the strikes in the early part of the financial year, the shortage of coal was responsible for a reduction in copper output from the Northern Rhodesian mines last year of some 32,000 tons.

The Roan Antelope report provides an instructive comparison of rising costs and selling prices. Average costs per ton of blister copper f.o.b. Beira advanced by £9 3s. 8d. to £59 1s. 5d. over the year, whereas income per ton f.o.b. Beira increased by £25 10s. a ton to £83 7s. 7d. The increase per ton in the constituent items of costs were: wages £2 17s. 5d., royalties £2 8s. 4d., supplies £1 3s. 2d., power £1 0s. 6d., cash bonus and pension schemes 11s. 4d., and the remainder in miscellaneous items. Of the total increase in costs per ton, £3 16s. 11d. is attributable to mining costs, which rose by 17.3 per cent. Evidently the increase in total costs was by no means uniform, for the comparable rise for Mufulira was £5 4s. 8d. per ton; Rhokana and Nchanga have not published figures for costs since before the war.

To make good the loss of Rhodesian copper output last year, some \$12.7 million had to be expended on additional supplies from hard currency sources. But the effect of reduced output on the profits of the Rhodesian companies is also perturbing. It increases the burden of their overheads per ton of output. It also involves them in heavy charges for imported coal. Wankie coal costs the companies 27s. a ton, but the equivalent cost of imported South African and American coal, which was extensively used last year, is about £10 a ton. Nor has conversion to wood firing been much cheaper. Some plants have been adapted for wood, but the equivalent cost of substitution on the basis of two tons of wood to one of coal is £6 a ton.

Output was well below capacity over the whole field. Nchanga, whose financial year ends on March 31st, came off worst. Its production was 22,138 long tons of blister compared with a present annual capacity of 27,000 tons. The extension of this mine's capacity to 64,000 tons, planned for completion by the end of 1949, has so far been delayed by at least a year because of the shortage of constructional materials, and the company is seeking official support from the British Government to expedite their supply. In 1943 Nchanga received a grant of £650,000 from the Ministry of Supply to finance increased production, and in view of the dollar-saving potentialities of the mine it would seem desirable to follow the war time precedent by giving the company high priority for its necessary supplies. Equal urgency attaches to the doubling of the capacity of the electrolytic refinery which was transferred by Rhokana during the year to Rhodesian Copper Refineries, a new company incorporated on January 1, 1947, under the aegis of

employees and also in the construction of "boss boy" huts for labourers. The price of industrial peace has been an all-round increase in expenditure for welfare, housing and wages, but the outlook for continuity of labour supplies has undoubtedly been improved as a result.

The other restrictive factor on operations was shortage

Rhokana and Nchanga. Of the other mines Roan Antelope offset a larger part of its shortage of Wankie coal by heavy imports of coal and by using wood, and was thus able to keep its fall in production to 5,000 tons though the shortage of coal was equivalent to 15,000 tons of output. Mufulira was less successful, for of a loss of output of 27,000 tons directly due to the coal shortage, only 9,000 tons was made up. Even so, in relation to its capacity of 65,000 tons for the year (allowing for time lost from labour disputes) Mufulira was not so badly affected as Nchanga. Rhokana was more fortunate, for its loss of output was no more than 2,000 tons—enough, however, to be deplored both in terms of the company's trading profit and of dollars that might have been saved.

The Rhodesian copper companies have a particular taxation problem. The accompanying table shows that in each case the taxation charge rose sharply last year. These increases were the normal consequence of increased operating profit. Another liability is deemed by the City Commissioners of Income Tax to arise from the companies' method of valuing stocks of copper for taxation purposes. Briefly, this has had a dual basis; copper "in the pipe line" en route to the market has been valued at a "standard" cost; any stocks apart from these have been valued at sales cost. The Commissioners have held that this method of valuation understates the companies' liability for taxation, and litigation is proceeding in a case which Mufulira is taking to the High Court to test the Commissioners' ruling that the annual gains for tax purposes shall be calculated on completed sales

for the year and that stocks should all be valued at the annual cost of production and not on the "standard" cost. It is to be presumed that the companies have made sufficient provision to meet any retrospective liability, should the final judgment go against them.

Increased output from the Rhodesian copper mines would provide a greater contribution towards assisting Britain's balance of payments than would a mere rise in the world price for copper. This is no doubt possible, and it will increase the Rhodesian companies' profits. But if world copper prices rise, the drain on Britain's dollar reserves will rise too; the Rhodesian companies are not in a position to increase their output considerably and rapidly, and hence the cost of British imports of copper from hard currency countries would increase to the full extent of the rise in prices. The Rhodesian companies this year will reap fuller benefit from higher prices. So far they have been free of strikes and although coal supplies are still a serious factor in limiting output, the price of copper has been steady at over 21½ cents a pound for the first half of the year 1947-48 and is unlikely to fall from its present level. In such circumstances, provided that there is no new interruption to production and no unforeseen rise in costs, earnings a year hence should show a substantial improvement. And since the yields on "blue chip" ordinary shares are only a few shillings greater than the return on gilt-edged stocks, the merits of Rhodesian copper shares as speculative leaven in a mixed investment portfolio are worth consideration.

Business Notes

The Cost of Coal

The statements of costs issued by the Coal Board last week for the first two quarters of their stewardship have riveted public attention on the high price which the nation is beginning to pay for its coal supplies. Hitherto output has been the dominating anxiety; but the problem of coal costs, and their effect on industrial costs as a whole, is now scarcely less urgent.

The Coal Board's figures are not strictly comparable with those issued hitherto by the Ministry of Fuel and Power. They are based on saleable tonnage (which includes consumption by coal-mines and miners' coal) as distinct from commercially disposable tonnage (which does not). Nor are the figures an accurate guide to the Coal Board's financial results. They omit any charge for interim income to coalowners and interest on Treasury advances, as well as revenue from ancillary undertakings. If allowance is made for these items it is probable that the small profit for the first quarter shown in the table below would be turned into a small loss, and that the loss in the second quarter would be considerably greater. After adjusting the figures for the different method of calculation, they appear to show that costs per ton in the second quarter of 1947 were some 4s. higher than in the last quarter of 1946.

COSTS OF PRODUCTION, PROCEEDS AND PROFITS OF COLLIERIES					
Output (tons)		First Quarter, 1947		Second Quarter, 1947	
Commercially disposable		42,066,664		42,084,976	
Saleable		46,188,192		45,850,253	
Costs of Production		Amount £	Per Ton Saleable s. d.	Amount £	Per Ton Saleable s. d.
Wages		57,309,641	24 9.8	60,335,359	26 3.9
Roof supports, stores, repairs		11,604,144	5 0.3	13,529,460	5 10.8
Coal and power consumed		5,950,064	2 6.9	5,714,415	2 5.9
Other costs (including depreciation)		12,781,094	5 6.4	13,108,107	5 8.6
TOTAL COSTS		87,644,943	37 11.4	92,687,342	40 5.2
Proceeds		89,619,752	38 9.6	88,966,666	38 9.7
Profit (+) or Loss (-) (before charging interest)		+ 1,974,809	+ 10.2	- 3,720,676	- 1 7.5

The rise in costs during the second quarter was largely due to the introduction of the five-day week in May, and it was intended

to recoup this loss from the increase of 4s. a ton from September 1st. Since then costs have risen further—largely because of the reintroduction of the longer working week on an extremely expensive overtime basis—and coal prices were again increased by 2s. 6d. a ton on January 1st.

The results of the June quarter are far from uniform for the country as a whole. An examination of the costs of production of the divisions reveals great variations in their relative efficiency, and in their contribution to output. These differences are illustrated in the chart. Wales, with a second quarter's output of 5.3 million tons, lost 11s. 1d. a ton; Yorkshire production totalled 9.6 million tons at a loss of only 1.3d. a ton. These differences illustrate the wide variations in productivity in different regions and they underline the responsibility of the Coal Board for framing its development plan to get more coal more cheaply from the richer and easily accessible measures. This is not a matter which can be delegated to the different divisions to decide independently.

Are Coal Stocks Too High?

Meanwhile, coal stocks on January 3rd show a slight fall to 16,033,000 tons, compared with 16,391,000 tons on December 27th—a natural movement after the Christmas holiday. The

question which now demands serious consideration is whether the building up of stocks has not now been carried well beyond the limits of reasonable prudence. Gas undertakings have 4½ weeks' winter requirements in stock, and power stations 5½ weeks. Iron and steel works have 4.4 weeks' requirements, engineering and metal trades no less than 7.8 weeks, and "other industry" nearly 6 weeks' supply. Industry's stocks as a whole now stand at 5,688,000 tons, compared with a mere 1,987,000 tons at this time last year. At the end of September, 1945, distributed stocks amounted to 13,069,000 tons; a year later they had been allowed to fall to 10,314,000 tons, and crisis followed in the winter. But the present figure of just over 16 million tons is a mid-winter figure, not a pre-winter figure, and the margin of safety with the possibility, at the worst, of two months of severe weather, is now very high.

It would be embarrassing indeed if industrial consumers, in the middle of the winter, had to refuse deliveries of coal for want of storage space, but the idea is not altogether fanciful, given the present level of stocks. The steady determination with which stocks have been built up during the winter (at the expense, in part, of providing more coal to the coke ovens during the last three months of 1947) suggests that changes in the trend of coal production and home consumption have been followed less closely than they deserved. The sparing diversion of supplies to export could now be stepped up quite rapidly by allowing stocks to fall—and still be within a satisfactory margin of safety. It might be remembered that the equivalent of, say, 5,000,000 tons of present stocks represent earlier imports, either of American coal or of fuel oil used in coal conversion schemes. An extra allocation of that order to exports would be an act of economic wisdom; it would make restitution for the humiliating necessities of 1947, and it would give handsome assistance to European recovery and British trade.

Sir Stafford on Steel

The steel budget for 1948 which Sir Stafford Cripps presented last Monday endorsed with full authority the estimates which were put forward in *The Economist* a week ago. The target for 1948 is 14 million ingot tons for home production, to which there may be added 530,000 tons of imported ingots and "semis." The equivalent in finished steel of the projected 14½ million tons of ingots is 10½ million tons, but the estimate of requirements for 1948 (including direct exports of finished steel) is 11½ million tons "for essential purposes alone." On these figures, there will be a deficiency of at least 1,000,000 tons of finished steel this year, equivalent to just over 1,333,333 tons of ingot steel; direct exports, will absorb 1,000,000 tons of finished steel, and indirect exports, consisting of steel manufactures, about 2,000,000 tons. On paper, the home consumers' supplies will be increased by 1,500,000 tons to 9,600,000 tons, compared with 1947, but this latter figure includes the steel needed for indirect exports. The export burdens on the steel using industries are so heavy that many essential home consumers will go short.

This programme depends for its achievement on the fulfilment of the "approximate estimate" that something over 500,000 tons of ingot steel can be imported; it assumes further that the industry will get the 12 million tons of coke which it requires to increase the output of pig iron, and that sufficient steel scrap will be forthcoming. Sir Stafford disclosed that deliveries of scrap to steel works are now running 10 per cent higher than a year ago (when, of course, the output of ingot steel was some 25 per cent lower than the recent rate of production), but he was obviously in no mood to minimise the difficulties of getting increased supplies of scrap either from home sources or from Germany.

But when Sir Stafford turned to the distribution of steel supplies to consuming industries, he abandoned all arithmetic, and resorted to a series of imprecise synonyms. A direct comparison of the steel used by different industries in 1947 and what they may expect to get in 1948 is impossible—partly because the information for 1947 "is not available in comparable form" and partly because the allocations in 1948 "will probably vary from quarter to quarter in the light of the needs of the export market and other conditions." Hence the resort to broad indications, summarised below:—

Engineering and vehicles, certain mining and railway equipment (Ministry of Supply)	Rather more than 1947 deliveries.
Consumer goods (Board of Trade)	A little above last year.
Agricultural machinery	A very substantial increase, allocated to individual firms according to the contribution they can make.

Ministry of Transport	An important addition.
Coal Mines	A useful increase.
Electricity	A very substantial excess over 1947 deliveries.

Factory and Government building	A two-fifths reduction.
Shipbuilding	A reduction approaching one-fifth of 1947 deliveries.
Gas	A little less.

Of these changes, the cut in the shipbuilding allocation has caused great perturbation in the industry. Sir Stafford denied that the cut had any connection with American pressure to reduce the level of British shipbuilding activity, and declared that deliveries of steel to shipbuilding this year should equal the allocation made for 1947, which was considerably exceeded by actual deliveries. This added handicap—though it need not be exaggerated—will not make it easier for the shipbuilding industry to speed up the completion of its delayed programme of new building or to improve its already difficult costs situation.

The New Distribution Scheme

Sir Stafford disclosed that no major cuts were proposed in the progress of the steel reorganisation scheme this year—a point which the capital cuts White Paper had left open, since the programme is now being further reviewed. Since he remarked that it was "abundantly clear" that the long-term objective of installing capacity to produce 16 million ingot tons is not too high, it may be presumed that the programme is likely to go forward as a whole—more than half of it has been approved in detail—although part may need to be retimed.

The review included only a brief reference to the new distribution scheme for steel, but Sir Stafford's general remarks on this matter are more than compensated by the complexities of the circular which has gone out this week to steel users, together with census forms asking for a return of stocks at the end of 1947 and of receipts and usage of steel during the last quarter of the year. The new scheme does not apply to sheets, electrical sheet and tinplate. All other steel will, after March 31st, be delivered only against a new form, to be known as an IS Authorisation. During this month, the sponsoring departments will issue these authorisations to users, to cover steel already authorised by "M" forms for the second quarter or after and any additional tonnages which they may be able to permit. Each user will then have to review his outstanding orders which are likely to remain undelivered at March 31st, and also the orders placed for later periods and sub-authorisations given to his suppliers. He will then have to decide which orders he wants to retain, within the limit of the new IS Authorisation which he has received. Similarly, consumers of steel who hold sub-authorisations from holders of existing "M" forms will have to renew their authority from their principals.

Thus the broad effect of the scheme will be to cancel many outstanding orders and to retime others, so that the inflationary excess of authorisations for 2,000,000 tons of steel which is not available is, by one means or the other, squeezed out. The circular stresses the need for early notification by main and sub-contractors to the steel makers, so that the industry can "plan" the required production. It also insists that orders for delivery in any three-monthly period must not exceed the quantity authorised for that period. In the course of time (and particularly when the system of bulk allocation is extended, and sub-authorisation reduced) the new scheme may produce a better sense of order in steel supplies. But the task of those who have to get into working order will be quite unenviable. The present state of confusion suggests that a far longer period than three months may elapse before it is running smoothly. Meanwhile, the main burden will rest on the steel industry and its customers to iron out the innumerable difficulties that are bound to arise. And there is a chilly reference to the limited amount of assistance that the departments will be able to offer towards the solution of hard cases.

Bus and Road Haulage Negotiations

For some time past, it has been freely rumoured that the Tilling group and other leading road passenger transport concerns were prepared to treat, if not actually negotiating, with the Transport Commission for the transfer of their undertakings under the terms of the Transport Act. A circular issued to shareholders of Thomas Tilling, Ltd., discloses that the directors have agreed to the making of joint investigations (that is, with the

tive of bank assets—advances and investments. There is no doubt at all that gross earnings were substantially higher, and, at a guess, it appears probable that this improvement comfortably sufficed to provide for the further rise which has occurred in administrative costs, and especially in salaries.

* * *

Agreement with Portugal

The financial and commercial negotiations between the British and Portuguese Governments were brought to a successful conclusion some weeks ago. The results were published this week in blurred and uninformative outlines. A re-negotiation of the financial agreement between the two countries was called for as a result of the suspension of convertibility of sterling and the dismantling of the system of transferable sterling accounts, of which Portugal was an important member. Re-negotiation of the agreement was also required because payments in respect of current transactions had been moving steadily in favour of Portugal, with the result that the sterling balances of Portugal had exceeded the limit of £5,000,000 prescribed under the previous agreement. It should be added that the Portuguese authorities had behaved with admirable helpfulness in this matter and had abstained from demanding conversion into gold for the excess of their current sterling holdings over the £5,000,000 ceiling.

The result of the negotiations which took place in Lisbon has been to abrogate the supplementary monetary agreement of February, 1947, under which Portugal became a member of the transferable sterling account group of countries. This leaves the principal monetary agreement, that of April, 1946, in force, and it is this agreement which will provide the framework for payments in 1948. This agreement fixed a limit of £5,000,000 or its equivalent as the total of the other's currency which each party is prepared to hold, any excess being convertible into gold. In order to reduce the Portuguese holding of sterling to this figure of £5,000,000 it has been agreed that the proceeds of "certain exports" from the United Kingdom to Portugal which had been earmarked for a reduction of British debts (presumably the sterling balances of about £80,000,000 accumulated by the Portuguese Government prior to April, 1946) should in effect be used to reduce the Portuguese accumulation of current sterling and thus bring it below the prescribed £5,000,000 ceiling.

This being done, it will then behave the two countries to arrange the commercial exchanges between the two monetary areas in such a way as to maintain approximate balance and thus obviate movements of gold on either side. The commercial arrangements which were designed to give expression to this general objective provide for a considerable increase in British exports to Portugal. These will include machinery, motor-cars, agricultural equipment and, ultimately, coal. Britain is also supplying a substantial tonnage of tinplate, which will ultimately be reimported into Britain as containers of sardines. Under the new agreement Britain is also proposing to expand its imports of Portuguese wax, oil seeds, cork and wine.

* * *

2½ per Cent for Small Savers

The announcement this week that the Treasury, despite recent rumours, has no intention of raising the rate of interest on 2½ per cent Defence Bonds, must have come rather as a cold douche to the salesmen and publicity experts of the National Savings Committee. For months past, they have had an uphill task in their attempts to persuade the public to buy this particular bond. In the financial year to date total sales of the 2½ per cent Bonds have amounted to no more than £57 million in contrast with sales of £169 million of 2½ per cent and 3 per cent Bonds combined in the corresponding period of 1946/47. Moreover, in the current financial year £5,000,000 of 2½ per cent Bonds and £26 million of 3 per cent Bonds have been encashed before maturity and no less than £77 million of the earliest issue has been repaid at maturity. In nine months, therefore, total repayments of Defence Bonds have amounted to £108 million, and have exceeded sales by fully £50 million. In the similar period of 1946-47, repayments totalled less than £39 million, so that the net sales of Defence Bonds of both series amounted to £130 million.

The Defence Bonds have admittedly some advantages which are frequently overlooked when yield comparisons are made. If held for the full term of ten years from date of issue, they are repaid at a premium of one per cent. Yet, like Savings Certificates, they can be encashed at short notice. If the standard notice of six months is given, repayment is without loss of accrued interest, but of course no premium is paid. On the other hand, if repayment is made almost immediately (as it will be, if the Postmaster-General is satisfied that the cash is required to meet

a "private emergency") there is a deduction of twenty-five shillings per £100. These encashment facilities make it difficult to compare Savings Bonds on any level basis with marketable gilt-edged securities. But, even so, a yield of a little more than 2½ per cent is hardly generous at a time when nearly 2½ per cent can be obtained on a five-year security and approximately 2½ per cent on a ten-year.

Egypt's Reservations

The full text of the Anglo-Egyptian financial agreement was published this week, together with the letters exchanged between the representatives of the two Governments on signing the agreement. The most interesting points that emerge from the full documents are the reservations made by the Egyptian Government on points that were raised during the negotiations and on which they failed to get satisfaction. The most important point the Egyptian Government wish to put on record is their claim to be allotted a share of Britain's gold reserves. The chairman of the Egyptian Financial Delegation contends that these reserves were accumulated on behalf of the whole sterling area, of which Egypt was a member, and therefore stakes his country's claim to an unspecified share. The second point raised and put on record is that Egypt's sterling balances should have the benefit of a gold clause identical with that granted to some other countries.

In view of the vital importance of these two questions, the Egyptian Government reserve their right to raise them again in future negotiations regarding the sterling balances. The British representative, in his answer, merely notes the reservations, but makes no attempt to answer the points raised. There are valid answers which no doubt were made in the course of the negotiations. Under this and the preceding agreements Egypt is, in fact, being granted what appear to be generous hard currency allocations. As for the hard currency income earned by Egypt during the war and paid into the sterling area dollar pool, most of it arose from Allied military expenditure. Some of this might surely be earmarked as a counter-claim by the British Government for having defended Egypt against German and Italian invasion.

The Egyptian Government also ask that so long as sterling is inconvertible for current transactions, any arrangements entered between the United Kingdom and any third country which has important trade relations with Egypt ought to provide that sterling standing to the credit of an Egyptian transferable account should be given rights of transfer not less favourable than those accorded to sterling of any other country. This point was also noted without comment by the British representative. It was agreed, however, that in the event of the transferable account rights ceasing to apply to any particular country during 1948 the British Government will raise no objection to transfers of sterling from Egyptian transferable accounts to the sterling accounts of residents of the country concerned (or vice versa), provided the transfers relate to genuine trade or to financial transactions outstanding between Egypt and the country concerned at the date on which the transferable account rights cease to apply.

The text of the agreement formalises the entry of Egypt into the transferable account system, stating that "the Government of the United Kingdom will place no restrictions on, and will facilitate, the transferability of sterling standing to the credit of Egyptian transferable accounts for payment for current transactions to transferable accounts of any other country." Beyond this the British Government also promise to use their best endeavours to ensure that sterling in Egyptian transferable accounts shall be available to the widest possible extent for payments for current transactions outside the sterling area and the transferable account countries.

More Balance of Payments Statistics

At his press conference ten days ago the Chancellor added yet another series of figures to the long succession of official estimates of the prospective balance of payments. The subject is of such high importance that there can be no complaint at this statistical abundance. But those painstaking observers who seek to glean the maximum information about official policy and intentions by the customary device of correlating the successive releases will this time find themselves in quite un navigable waters. This bewilderment is understandable, for many of the figures given by Ministerial spokesmen at different times in recent months have been mutually exclusive or contradictory.

In the circumstances, the Government would perform a real service if it would publish as soon as possible—without waiting for this year's Economic Survey—a comprehensive and clearly-defined statement of the assumptions about the balance of pay-

ments upon which its 1948 programme is now based—distinguishing the hard currency from the soft currency position, the United Kingdom from the sterling area, and the estimates for 1948 from the annual rates scheduled to be achieved by the end of the year. This is not necessarily a request for additional information; data have been furnished already on all these matters, and what is most needed now is clear correlation.

In default of such a statement, the private seekers after truth would probably be well advised to ignore all—or nearly all—official estimates of the 1948 position given before Sir Stafford Cripps's speech on October 23 (the occasion on which the main dollar cuts were announced), and also to refrain from attempts at nice construction of much that was said even on that occasion. Whatever the Government may have hoped three months ago, it now seems clear that the "programme" assumption is that, after all cuts and economies already announced and after taking credit for exports at the target rate, there would be virtual equilibrium in Britain's overall balance of payments for the year 1948 as a whole. Britain's own net deficit in dollars and other hard currencies for the same period is put at £300 million, but no comparable estimate has been given of the rate of deficit expected to be reached by the end of the year. The figure of £250 million which has been given as the annual rate of net strain on gold and dollar reserves which is projected for the year-end relates, not to UK requirements alone, but to the strain imposed upon the central reserve from all sources.

So much is fairly clear. What is less clear, but is probably a fair deduction, is that the total net strain on reserves during 1948 (on the same "programme" assumptions) is put at around, or not much over, £400 million. From that figure it might be further deduced that the continuing dollar deficit in 1949, for the United Kingdom alone, would be put at appreciably less than £200 million, and perhaps not more than £150 million, out of the total projected deficit of £250 million. That is about as far as speculation upon the meaning of the official figures can reasonably be pressed. All of them, it should be emphasised, are "programme" assumptions only. Whether even the Government itself believes them to be attainable is perhaps open to doubt. Certainly no realistic outside observer is thus optimistic—except on the hypothesis of Marshall aid.

* * *

Trade with Bizonia

Since last month's Anglo-American agreement at Washington fixed the status of Bizonia as a dollar country, British trade policy towards Germany must now undergo a drastic revision. Bizonal exports to the sterling area (substantially, these are timber and steel scrap) have now to be balanced by imports from sterling sources; in so far as they are not, Britain has agreed to pay the difference in dollars. This trade, which will be balanced in the Joint Foreign Exchange Agency's new account at the Bank of England, is quite apart from the £17½ million worth of shipping services, foodstuffs, fertilizer and other goods which Britain has

undertaken to supply to Bizonia during 1948 as Category A supplies—"imports required to prevent disease and unrest." Britain will have to supply Category B goods—for the revival of the German economy—to Bizonia to the value of the goods it takes out.

During the first nine months of 1947 Britain was taking goods from Bizonia at the rate of £12½ million a year. In 1948, however, the same goods will cost more because the United Kingdom has been obliged to give up the privilege of fixing its own price for heavy steel scrap from the British Zone. This had been a sore subject with Germans and Americans for some time. The price was about £2 10s. a ton—far below what American buyers were willing and anxious to pay. In the past few weeks it has risen by two stages to £6 10s. This has made no difference to British demand for scrap; the British steel programme, as Sir Stafford Cripps explained on Monday, still requires a million tons of German scrap in 1948, and if it is forthcoming it will cost between £6,000,000 and £7,000,000—to be met by British exports to Bizonia or, if these are insufficient, by dollars. To this must be added timber. Timber imports from Bizonia cost £8,700,000 in the first eleven months of 1947. Steel scrap and timber together will make up the bulk of the £20 million at which it is hoped to balance trade between Bizonia and the sterling area in 1948.

For raw materials Britain will have to pay in raw materials. German importers are not likely to get licences from the Joint Export-Import Agency for British manufactured goods in substantial quantity. Wool, rubber, cotton and tin will probably be the main exports from the sterling area to Bizonia. Government bulk transactions will play a large part, but wool and other commodities are to be bought by JEIA at the auctions. Private traders who have these or similar commodities to offer are to be encouraged to approach the JEIA at Frankfurt or German private buyers with whom contracts are at last becoming possible.

Bizonia might also take such manufactures as tractors, specialised industrial equipment, and possibly commercial vehicles from Britain, though in small quantities. Loopholes for private initiative are beginning to appear: some German exporters will soon have a little sterling to spend under the JEIA bonus scheme. For the most part, however, Anglo-German trade is likely to be confined to the bulk exchange of raw materials until German buying becomes more elastic—as it may when the Germans at Frankfurt and Hoechst get control of their own trade. It is worth considering whether that prospect is near enough to justify establishing a branch of the Joint Export-Import Authority in London.

Payments with Russia

The exchange of letters between the British Ambassador in Moscow and Mr A. Mikoyan on the occasion of the signature of the Anglo-Russian trade and payments agreements gives details of the procedure that will be followed in effecting payments between the USSR and the sterling area. All such payments

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'e'), and those paying 3 per cent or less will be repaid at the latest date (marked 'l'). (a) Net yields are calculated after allowing for tax at 10s. in the £. (b) Flat rate. (c) Assumed average life 17 years 6 months. (d) Notice given for repayment on March 1, 1948. (e) Buying Price.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2½ per cent free of income tax. (g) Yield worked on 15 per cent basis. (h) Fifteen months to March 31, 1947 (yield basis 7-6 per cent). (i) To latest redemption date. (j) Free of tax.

"Suddenly we got
our materials...
and found we'd
neglected staff"

"YOU know the trouble we had for months—couldn't get this, couldn't get that, couldn't get going..."

"Well, suddenly our materials began to come through, and we found that we were at fault—we had a chance of real expansion, and we weren't ready with the executive staff we should need."

"Luckily, we were already in touch with our Regional Appointments Office, and I must say they impressed me. They found us three experienced men to take hold straight away, and I'm now seeing some very promising youngsters as possible trainees."

"What struck me was the saving in time and trouble. No floods of letters, no crowds of unsuitable people to see—just a short list of selected candidates, and full information about them. After all, it's the logical way. With 14 Regional Appointments Offices all linked by

teleprinter, you're offered what amounts to a national register of talent and experience to draw upon. If the type of man or woman you want is there, they'll find him for you. And they've already done the preliminary interviewing and classifying. All the men I saw were good—it was just a question of picking the best. It seems to me a most practical help for any employer needing people for responsible jobs."

Since V.E.-day, the Appointments Department has successfully filled over 58,000 responsible posts. If you have a staffing problem, your Regional Appointments Office is ready to help.

For highly qualified technical and scientific personnel—engineers, scientists, architects, etc.—appointments are dealt with centrally, in London, by the specialist staff of the Technical and Scientific Register, York House, Kingsway, W.C.2. Temple Bar 8020.

14 linked Appointments Offices cover the Nation's potential executive manpower

Issued by the Ministry of Labour and National Service, Appointments Dept., 1-6 Tavistock Sq., London, W.C.1

SEVEN MORE STATIONS

"Who first compounded this Mixture, Brothers,
I do not know, but I bless his memory. He
chose tobaccos from the Old World and the New,
and matching flavours and fragrances as if orchestrating
a chord, he made out of many one marvel—*e pluribus
unum*. Help yourself to a pipeful, Brother.

Such a happy discovery is philosophers' treasure indeed!"

COMPANY MEETINGS

BARCLAYS BANK LIMITED

GROUP'S STRONG AND LIQUID POSITION

TOTAL ASSETS NEARLY £1,800,000,000

NATIONAL INESCAPABLE PROBLEMS

LONG TERM POLICY ESSENTIAL

SIR WILLIAM GOODENOUGH'S STATEMENT

The fifty-third ordinary general meeting of Barclays Bank Limited will be held at the head office of the bank, 54, Lombard Street, London, E.C., on the 23rd instant.

The following is the statement by the chairman, Sir William Goodenough, Bart., which has been circulated with the report and accounts of the bank for the year ended December 31, 1947, and which will be presented at the ordinary general meeting.

I have decided to follow the practice of recent years by restricting the proceedings at the forthcoming annual general meeting to the transaction of formal business, and I have, therefore, prepared a brief statement on the affairs of the bank to be sent to every stockholder with the report and accounts.

TRIBUTE TO THE LATE MR EDWIN FISHER

The sudden and unexpected death last January of our late chairman, Mr. Edwin Fisher, was a great shock to us all and has been keenly felt throughout the whole of the bank. We owe him an incalculable debt for his unsparing devotion to the bank's interests over many years, and especially for his leadership in what was, perhaps, the most difficult period of its existence. The influence of his personality will linger in the minds of all who knew him, and he will long be thought of with gratitude for what he did and with affection for what he was. Mr. Fisher joined the bank as assistant secretary in 1908 and became secretary three years later. After serving in the First World War, he was appointed successively a local director of the bank at Birmingham and a general manager. In 1932 he was appointed to a seat on the board and elected a vice-chairman. In 1934 he became deputy chairman and, in October, 1936, succeeded the late Mr. William Favill Tuke as chairman of the bank.

ALTERATIONS ON THE BOARD

The board have done me the signal honour of electing me to succeed Mr. Fisher as chairman. I recognise that this is a great responsibility, and I will do my best to carry forward the tradition built up by my distinguished predecessors.

At the end of 1947 we lost the valued services of Sir Harold Edward Snagge, K.B.E., who decided to relinquish his seat on the board for reasons of health. He first entered the bank's service 50 years ago. He was secretary from 1903 to 1908 and assistant general manager from that year until 1911. He then left the bank, to which he returned in 1914 as a member of the board. We are grateful to him for all that he has done in the past and no less grateful for the rich enjoyment, his companionship has given and we wish him every happiness in retirement.

Mr. Walter Osborne Stevenson and Mr. Anthony William Tuke, formerly vice-chairman of the bank, are well known to stockholders, and their election as deputy chairmen is a cause of great satisfaction to all of us.

During the year, the board has been strengthened by the appointment as directors of The Right Hon. The Earl of Airlie, K.T., G.C.V.O., M.C., Mr. Julian Stanley Crossley, The Right Hon. Viscount Knollys, K.C.M.G., M.B.E., D.F.C., Commander Sir Robert Micklethorn, C.B.E., R.N., Marshal of the Royal Air Force The Right Hon. Viscount Portal of Hungerford, K.G., G.C.B., O.M., D.S.O., M.C., Mr. Frederic Seebohm and Mr. John Thomson. We consider ourselves fortunate in having secured the service of these gentlemen, and stockholders will be asked to confirm the appointments.

A vote of thanks to the staff will be proposed at the meeting. This is no mere formality. It has been a difficult year for them in many ways, and I know that the stockholders will welcome the opportunity of being concerned in an expression of a real sense of gratitude to them for all they have done in carrying on the work of the bank so well.

CURRENT DEPOSIT AND OTHER ACCOUNTS

At the close of 1947 our current deposit and other accounts totalled £1,247,866,975, against £1,171,726,109 at the end of 1946. This smaller change over the year, which is in keeping with the general trend of the Clearing Bank figures as a whole, contrasts strongly with the rapid expansion in the previous twelve months, associated with the extreme pressure for cheaper money. But, while it is a matter for satisfaction that the weight of potential inflation shown in this particular form has not so greatly increased, other forces have come into play which can hardly fail to add weight, at any rate for a time, to the pendent mass of purchasing power for which there is no corresponding supply of goods and services. The American credit can no longer exert a substantial mitigating influence, and, although there may be further aid from the United States, the very steps that Britain is obliged to take to solve the overriding problems of the balance of payments are bound to aggravate inflationary tendencies, in so far as they involve an increase in production and in exports coupled with a restriction of supplies for the home market. On the monetary side, the supplementary Budget went some way towards meeting the situation by reducing the pressure of spending power, but, whatever view may be held as to the wisdom or adequacy of this measure, it is hardly to be expected that any fiscal remedy by itself will suffice to effect a cure. Even

the monetary aspect of the problem has other facets as well. Savings is one of them, and an important one in which the further aid of the banks has now been enlisted under the new "Save the Bank Way" Plan, which we hope will be strongly supported. The disappointing results of the Savings campaign in the past year underline the urgent need to bring home to the mass of the people, at all levels, full realisation that it is a duty of the highest national importance, as it was during the war, for everybody to save as much as he can. Nothing will be more calculated to stimulate personal endeavour here than the example of the strictest economy in Government expenditure. The psychological factor is of great significance in the field of saving, just as it is a major and indispensable part of the means by which a universal and forthright effort to increase production must be stimulated.

DISTRIBUTION OF ASSETS

While the total of the bank's resources has not altered so greatly as in previous years, there have been interesting changes in the distribution of our assets. To some extent this has been due to the continued movement by the authorities in favour of the Treasury bill as a means of financing the floating debt. More bills have been issued in response to the weekly tenders, and our own holding of bills discounted had increased to £206,445,106 on December 31st last, against £156,015,890 at the end of 1946. On the other hand, the balance sheet shows a lower total of £279,000,600 in Treasury deposit receipts, compared with £339,000,000 a year earlier. At the end of 1945, we held £95,508,900 in bills discounted and £345,000,000 in Treasury deposit receipts. Taken as a whole, our specially liquid assets, namely, cash in hand and with the Bank of England; balances with other British banks and cheques in course of collection; money at call and short notice bills discounted; and Treasury deposit receipts amounted to £719,519,772 at the close of last year, representing no less than 57.6 per cent. of our current, deposit and other accounts. Besides being more flexible than it was before—a condition to which we attach great importance—our position is thus highly liquid.

INVESTMENTS

Amongst our other assets, we have made a further addition to our investments during the year, and the figure shown in the balance sheet, excluding investments in subsidiary banks, amounts to £297,088,881, which compares with £278,883,573 at the close of 1946. In March last, for the first time since they were overshadowed by Treasury deposit receipts in August, 1943, investments appeared in our published figures as the largest of our assets, and they have increased since then.

ADVANCES

I am pleased to say that our advances have again moved upward during the year. On December 31st they stood at £242,447,695, against £197,960,938 at the end of December, 1946, and they now stand at a level which is some £35 million higher than has ever been the case in any previous year. Of course, when the earlier record was set up in 1939, our deposits were much less than they are to-day, and, consequently, although advances are actually higher than they were

then, they represent far smaller proportion of our deposits: the ratio is now less than half of what it was at that time. Nevertheless, it is gratifying that even in this respect there has been a distinct improvement during 1947. At the same time, in arriving at an appreciation of the real meaning of the present level of our advances, we must not forget the influence of the rise in prices. Much more money is required to finance a given project now than was needed before the war and, consequently, the physical effect of our present lendings, pound for pound, is to that extent reduced.

PROFIT AND DIVIDENDS

The directors report that, after payment of all charges and after making provision for all bad and doubtful debts and for contingencies, the net profit for the year ended December 31, 1947, amounted to £1,637,706 5s. 8d., which is a reduction of £38,696 19s. 0d. compared with the figure for 1946. This fall was not unexpected for, although there was an increase in our investments and advances during the year, the level of our expenses has continued to rise and we have to meet the substantially higher rate of tax on profits. As will be seen from the report, the directors have allocated from the profit for the year £250,000 to contingency account and £250,000 to premises reserve account (for deferred repairs and reinstatement). Interim dividends at the same rates as in 1946 were paid on August 8th last. The directors now recommend the payment of final dividends of 5 per cent., making 10 per cent. for the year, on the "A" stock, and 7 per cent., making 14 per cent. for the year, on the "B" and "C" stock, less income tax in each case.

DIRECTORS' FEES

For a number of years, the directors of the bank have voluntarily abstained from taking the full amount of the tax-free fees to which they are entitled under the existing authority. The board feel that the time has now come when their remuneration should be a gross fee which will be subject to tax, as will be required by the new Companies Act when the relative provision becomes effective, but which, at present rates of tax, will produce a net sum smaller than they are now entitled to receive. Stockholders will find with the notice of meeting the text of an appropriate resolution, which they will be asked to approve at the meeting.

GROUP FIGURES

The new Companies Act will require us to publish a consolidated balance sheet incorporating the figures of the subsidiary banks. We are consulting with our auditors as to the form which this balance sheet shall take but, in the meantime, stockholders will be interested to know that, from figures available, the current, deposit and other accounts of the group amount to approximately £1,680 million. Of this sum £926 million is in cash in the tills, balances at central and other bankers, cheques in course of collection, money at call and short notice, bills discounted and Treasury deposit receipts, making a ratio of 55 per cent. in liquid assets. Cash and money at call are, of course, immediately available, while purchases of bills and Treasury deposit receipts are so arranged that a proportion of them matures

almost every day and, consequently, the resources employed in these ways are continually being turned over. The average maturity over the whole range of these assets, including the cash items, would be approximately one-and-a-half months. All these assets I have mentioned are apart from the investments of the group, amounting to more than £459 million, most of which are in British Government and Colonial Government securities, where our principal aim is to maintain a spread of maturity dates, but with special emphasis on short-dated securities.

I am sure that stockholders will appreciate the fact that the liquidity of the parent bank, to which I have already drawn attention, is characteristic of the group as a whole.

The total assets of the group are nearly £1,800 million—a striking indication of the wide ramifications of our bank. But even more striking is the thought of all that lies behind these figures—a great co-ordination of effort giving effective and indispensable service over a vast area of the world. The group is, indeed, a machine of precision which makes possible an immense economy of effort at home and throughout the whole sphere of its operations overseas, and it is a living and developing organisation. More than this, through its activities abroad, it is a substantial earning asset for this country.

NATION'S PROBLEMS—AGRICULTURE

The events of the past year have brought the nation abruptly to the point where urgent and far-reaching decisions have become inescapable. Our problems have overtaken us and at such a juncture there is no alternative to vigorous action. But I am impressed as much by the feeling that vigorous action must not be hasty or ill-considered action as I am by the momentous nature of the problems themselves, for what is done at this time in the stress of circumstances will profoundly influence our fortunes for many years to come. What is being determined by current decisions on matters of domestic policy in response to the pressing need of the hour is nothing less than the future shape and trend of the British economy—in particular of British agriculture and of British manufacturing industry in a competitive world. I have quite deliberately mentioned British agriculture first not only because in spite of all its vicissitudes, it has remained one of the greatest of all our industries but because I believe it has a most vital role for the future, both as a business which is at the same time a balancing factor in the make-up of the nation, and as a healthy and satisfying way of life for a large number of our people.

LESSON OF PAST HUNDRED YEARS

Almost exactly a hundred years ago there was just such a turning point as we have now, although the circumstances then were different. In those days men saw, or thought they saw, quite clearly what was wanted both for the moment and for the future. What they saw was simple and logical. By a series of measures, of which the most important was the repeal of the Corn Laws in 1846, the economic policy of the country was diverted from the course in which it had flowed for centuries. The feeling of the new age which prevailed in the adoption of this change and represented the ascendancy of the interests of manufacturing industry over those associated with the land is well expressed in the principle expounded by a contemporary statesman. The principle was "neither to foster one trade nor the other, neither to attempt to promote agriculture nor manufactures, but to leave them 'to flourish or to fade' according to the energies and skill of the people of this country."

It has been fairly said that the stars in their courses fought for the new system. A period of industrial expansion and rising prosperity, unexampled in duration and intensity, followed with the rapid develop-

ment of power and transport and the discovery of new sources of gold in California and Australia. Britain moved forward to secure her position as the workshop of the world, and the world became her granary. But, contrary to the expectation of those whose interests lay in the land, even agriculture prospered for a time. Great progress was made in stockbreeding, while the improvements in draining and fertilising, the introduction of machines and the pride taken in the development of landed estates brought more and more land into cultivation. By about 1870, after many flourishing years, agriculture stood at the zenith of its prosperity.

DRIFT FROM THE LAND

It is not surprising that the dazzling progress of the whole British economy should have become associated firmly in the public mind with the policy adopted in 1846. Nor is it strange, therefore, that the principle of free imports, regardless of wider considerations, should have persisted for many years after the first ominous sign of change. This came with the development of the vast American prairies for the mass production of crops, and the new railroads and steamships which combined to deliver them across the Atlantic. The abundance of low-cost food from new sources of supply was a factor of great value and importance to this country but, in the ten years following 1875, faltering under the impact of this flood of cheap grain, the elaborate and highly capitalised British agriculture, the result of generations of patient toil and good management, collapsed. So strongly rooted was the doctrine that left the fate of industries entirely to the mercy of events, and so wide by this time the mental gulf between town and country that no effective effort was made to save the countryside. Then, in the final decade of the century, came the frozen meat from Australia and New Zealand. The drift from the land was intensified and rural life fell away to a very low ebb.

COMPETITION AFTER FIRST WORLD WAR

But, soon after the turn of the century, it became evident that the great new competitors abroad in manufacturing industry were a rapidly growing force. Britain's overwhelming supremacy was challenged, and the consequence of the first world war in speeding up manufacture in countries overseas, in extending it to those hitherto concerned with primary products, and in leading to the erection of a formidable array of obstacles to trade, imparted a severe check to British industry, and the doctrine of 1846, already impaired, was swept away. Free imports, however desirable in the abstract, could not be sustained in the face of the massive impediments to the sale of British products abroad and the sort of competition encountered in world markets. The sacrifices of the second world war, so far as the economy of Britain is concerned, have advanced to a more acute form many of the ills suffered through the first, and now we stand, as we stood a hundred years ago, at a crucial point in our history. The underlying conditions are different and, indeed, in some ways quite opposite, but just as there was hunger in the land then, so hunger threatens now, and realisation of the fundamental need for an adequate supply of food, underlined by the experience of two great wars, has brought to the public mind an appreciation of the true significance of agriculture such as has not been known for generations. Thus has the wheel turned full circle.

I have touched briefly upon some of the salient points in our experience of the past hundred years because they illustrate how far-reaching an influence the adoption of a particular line of policy at a decisive moment can have on the national fortunes. Dominated by the nineteenth-century doctrine that I have tried to describe, the British economy became one-sided, and it is hardly to the

credit of judgment that agriculture was not utterly destroyed.

IMPORTANCE OF LONG-TERM POLICY

Clearly, then, experience tells us that in devising the means of solving our existing problems we should keep an eye on the long term: that we should look beyond the immediate future and see to it that the remedies we bring to bear for the easement of present difficulties are calculated also to produce a balanced economic pattern that will stand the test of time. If this is not done, if we allow the very magnitude of our problems to drive us into ill-chosen courses, then we incur the risk of developing a form of organisation which may prove to be out of harmony with future needs. We may thus sow the seeds of another process of major readjustment. I think what has happened in the past also helps us to visualise, however imperfectly, the direction in which our efforts should be bent. Let us consider some of the factors to be taken into account. We can see all too clearly how intense a degree of competition will eventually develop in world markets. We can see also, from the course of past events, that the growth of manufacture abroad will continue as the relatively undeveloped countries seek the added stability and higher living standards that they see in the possession of secondary industries. At a time not far distant, therefore, we must be ready for the disappearance of the outlet for some of the products that we have hitherto supplied in large quantities.

NECESSITY FOR GREATER DIVERSITY OF INDUSTRIAL DEVELOPMENT

Apart from showing how much our prosperity depends upon a growing volume of international trade in the future, these trends suggest two things, namely, that our industrial development must move towards a greater diversity than has been the case in the past, so as to become more broadly based and hence less vulnerable, and that it must be encouraged to sustain a strong progressive spirit, so that we may advance rapidly and freely to the initiation and exploitation of the new inventions and new techniques. In the new inventions and new techniques. In the field of war, we were unrivalled in the field of scientific invention, and it is vital to us that here this country should be and remain in the lead. Further, these trends suggest to me that we must prepare for a somewhat greater reliance upon agriculture for the future. But, if history teaches us anything, it is that the character of development on the land should not be related merely to the immediate and short-term problem of our balance of payments. Such a course might well lead in the wrong direction and, moreover, if we cast our minds back it must be clear that this industry has a far greater part to play than that. We must look further ahead and think in terms of a much more intensively developed and scientifically based agriculture, generating a high net output in keeping with a sound policy of nutrition and designed to fortify our economy in the long run and give balance to our national life.

PROVISION OF FINANCIAL AND OTHER SERVICES

There is one other direction in which, I think, there may be considerable scope for the United Kingdom in the future and that is in the provision of financial and other services for which she is so eminently fitted by long association with commerce and with international affairs. Here the line of policy should be to place no obstacles in the way of growth and wherever possible to encourage it. The restoration of sterling to full status as an international currency is, of course, a condition of success in this sphere.

As part of the pattern for the future, the general direction of development inherent in what I have said is associated in my own mind with the constant endeavour towards the strengthening of our ties within the

British Commonwealth in every possible way and with the idea of the United Kingdom as a great cultural centre attracting from all parts of the world a broad stream of people to her places of learning.

I have ventured at this time to take a wide view because I think it is important to remember that we can better solve the grave problems of the moment if we are mindful of our eventual purpose. I am firmly convinced that, if directed in this way, the maturity of British industrial and commercial experience, the traditionally high standard of our agricultural practice and the ready adaptability of the people of this country will find the way back to prosperity, given the will on the part of all sections of the community to make a sustained effort and, putting all other thoughts aside, to give of their best endeavours in the way that will undoubtedly be necessary.

BLYVOORUITZICHT GOLD MINING COMPANY, LIMITED

(Incorporated in the Union of South Africa)

CAPITAL INCREASE APPROVED

MR W. M. FRAMES ON EXPANSION PLANS

An extra-ordinary general meeting of Blyvooruitzicht Gold Mining Company, Limited, was held in Johannesburg on the 9th instant.

Mr W. M. Frames, the chairman, who presided, said that in his address at the ordinary general meeting of the company held on November 14, 1947, he had outlined to shareholders a contemplated scheme for expanding the scale of operations. A circular and notice convening an extra-ordinary general meeting had given full particulars of the proposals which were being submitted for approval and adoption today.

The company's present capital programme, which was commenced in 1945, had been undertaken in order to increase the milling capacity to 40,000 tons per month, to sink a ventilation shaft and thereafter to increase the monthly output of the mine to 80,000 mill tons as rapidly as possible. The programme was now nearing completion and it was anticipated that the monthly milling rate would be gradually increased to 80,000 tons by the last quarter of 1948.

INCREASING OUTPUT

It was estimated that an amount of approximately £1,100,000 in excess of capital funds on hand would be required to complete the current programme. That additional expenditure was due to unforeseen increases in the cost of equipment and constructions and the inclusion of additional items which had been found to be necessary after the original estimates had been made. With the completion of that programme in sight, the directors considered that steps should be taken for further expansion of operations at the mine.

The company's technical advisers were of the opinion that it would be advisable to fix the next expansion objective at a milling capacity of 120,000 tons per month and they recommended that the necessary plant and equipment be ordered and steps be taken to increase the output to that figure as soon as possible.

In order to achieve that increase and to maintain output at the higher level, it would be necessary to increase the winding capacity of the main shafts, to sink and equip two sub-vertical shafts and to equip five incline shafts from the 6th level. It would also be necessary to extend reduc-

TERMS OF NEW ISSUE

The board had decided that it would be in the best interests of the company to finance those capital requirements by means of the proposals which were being submitted to shareholders for adoption today. These proposals involved increasing the authorised capital of the company from £2,950,000 to £3,306,000 by the creation of 700,000 shares of a nominal value of 10s. each. Thereafter, 29,000 of the new shares together with 510,000 shares at present in reserve—a total of 539,000 shares—were to be offered to shareholders at £7 10s. per share in the proportion of one share for every ten shares held.

The Central Mining and Investment Corporation, Limited, New Consolidated Goldfields, Limited, and Anglo American Corporation of South Africa, Limited, had agreed to underwrite the issue, free of cash commission, but as a consideration those corporations would have the right and obligation to subscribe for 71,000 of the new shares at the same price as they were being issued to shareholders—that is, at £7 10s. 0d. per share.

It was proposed that the balance of 600,000 of the new shares be held in reserve and that the board be given power to issue such shares to shareholders of the company at such time and upon such terms and conditions as the directors may determine. The issue of 610,000 shares, which would rank for any dividend declared subsequent to the date of issue, would realise £4,575,000. The directors had no hesitation in recommending those proposals for shareholders' approval and adoption.

The formal resolutions were adopted.

THE UNION BANK OF AUSTRALIA, LIMITED

NATIONALISATION POSITION

The annual general meeting of The Union Bank of Australia, Limited, will be held in London on the 2nd proximo.

The following is an extract from the statement of the chairman, Major-General Sir John H. Davidson, K.C.M.G., C.B., D.S.O., circulated with the report for the year to August 30, 1947:—

In March it was decided that two of your directors should proceed to Australia to attend conferences and meetings on the question of the proposed amalgamation with The Bank of Australia. However, the Commonwealth Prime Minister, suddenly and surprisingly, on August 16th stated in Parliament that he intended to bring in a Bill almost immediately to nationalise all the trading banks and to pass the Bill through all its stages during the present session. It was clearly useless to proceed with the expenditure of time and money on the proposed amalgamation until the question of nationalisation had been settled one way or the other.

The Bill received the Royal Assent on November 27th. The major issue of constitutional validity is now to be submitted to the High Court and we must await the result of this action and possibly of a subsequent appeal to the Privy Council. The necessity of substituting a monopoly for an efficient and well-tryed system, which has served the Commonwealth well for over a century and has played its part in developing the country and its trade, is not apparent.

The position of the Bank remains sound and liquid. Gross profits are up by £290,000 and the net profits by £27,000. This has enabled the directors to recommend a slightly higher dividend—9 per cent. less tax.

APEX (TRINIDAD) OILFIELDS, LIMITED

SATISFACTORY DEVELOPMENTS.

The twenty-eighth ordinary general meeting of Apex (Trinidad) Oilfields, Limited, was held, on the 13th instant, in London. Mr Malcolm MacLachlan (chairman and joint managing director) said that the net profit amounted to £235,000, and the directors recommended a final dividend of one shilling free of income tax per 5s. unit of stock, making a total dividend for the year of one shilling and sixpence free of income tax per unit of stock.

The production for the year amounted to 3,151,000 barrels of crude oil and 3,358,000 gallons of casing head gasoline, and deliveries of approximately these amounts had been made to the refineries.

Both drilling and production operations continued to be adversely affected by the difficulties of obtaining supplies of materials and equipment.

During the year 65,287 feet had been drilled in accordance with the company's programme to obtain production and also to extend the tested areas of the property.

The interesting developments in the syndical zone had continued and Well No. 438 had been satisfactorily completed in March last and was proving an excellent producer. During the year under review a further well No. 458 had been drilled approximately 800 feet to the north of well No. 438. This further well promised to be of comparable calibre to the successful well No. 438.

During the year the company had benefited from the higher level of oil prices. At the same time the steady increase in the cost of labour and materials continued, in addition to which the greater part of the increase in the profits for the year had been absorbed by the charge for taxation which had risen from £210,000 to £320,000.

The report was adopted.

(Continued from page 113)

are to be made in sterling. On the Russian side they will be canalised through the State Bank of the USSR No. 1 accounts, one of which is kept with the Bank of England and a second with the Moscow Narodny Bank in London. Each of these accounts is to be a transferable account. The British Government has undertaken not to restrict the availability of sterling standing in these accounts for current payments to residents in the USSR, in the sterling area and in such other countries as may be agreed by the Bank of England and the State Bank of the USSR.

In other words, "administrative transferability" will apply to Soviet Russia. What has hitherto been known as the No. 1 account of the State Bank of the USSR at the Bank of England became No. 2 account as from January 15th. Following the precedent set in all other monetary and payments agreements involving the technique of No. 1 and No. 2 accounts, this may be regarded as temporarily immobilised sterling which is not available for current payments. The exchange of letters makes it clear that all transactions authorised by the State Bank for payment through the transferable accounts shall be in respect of current transactions. The Government of the USSR has also undertaken not to restrict the acceptance by residents of the USSR of sterling which is at the disposal of residents outside the sterling area provided that the payments have been agreed between the Bank of England and the State Bank of the USSR and are in settlement of current transactions.

Deadlock on the Film Tax

The talks between the Treasury and the American motion picture producers on the British 75 per cent tax on foreign films have come to a standstill—each side, apparently, regarding the other's attitude as summary and high-handed, and Mr Eric Johnston, on his return to the United States, has given voice to displeasure. The American film negotiators had apparently been told to discuss nothing except on the basis that the British Government would withdraw the tax. And since the Government had (in spite of first appearances) given some thought to the problem before it imposed the tax in August, it was not prepared to open negotiations by giving way. It does not want to have American

RADIO RENTALS LIMITED

SUSTAINED DEMAND

The eleventh annual general meeting of Radio Rentals, Limited, was held, on the 15th instant, in London, Mr H. F. Hunt, the chairman, presiding.

The following is an extract from his circulated statement for the year to August 31, 1947:—

I am very pleased that we are able to put before you once again a report and balance sheet which I have every confidence you will regard as very satisfactory. It is especially gratifying to have achieved these results in a year that proved to be one of exceptional difficulty—bad weather last winter, the fuel crisis, rising costs of materials and expenses and shortage of supplies could all have affected our efforts. The most pleasing feature, however, is that the improvement in our profit is due to an increase in the number of subscribers rather than to an increase of the rental charged to our subscribers at a time of rising costs, and we are very proud of the extremely economic terms we offer.

The trading profits have increased by about 25 per cent., or some £14,000, and after providing for taxation we have a net £51,355 available for distribution as compared with £42,835 last year. The company has a strong liquid position. Current assets exceed current liabilities by over £40,000, whilst the surplus of assets over liabilities is now £373,000 as against the issued capital of £218,392. I anticipate that the coming year will not be without its difficulties. Nevertheless, we have obtained a substantial increase in subscribers in the first four months to date, and you may be well assured that we shall do our best to present to you next year another picture of sound progress.

The report was adopted.

THE RIO DE JANEIRO FLOUR MILLS & GRANARIES, LIMITED

FAVOURABLE CROP PROSPECTS

The sixty-second ordinary general meeting of this company was held, on the 15th instant, in London.

Mr S. C. Sheppard, the Chairman, in his circulated statement, said that the board's recommendation of a final dividend of 1s. per £1 unit of stock, less tax at 9s., making a total dividend for the year of 8 per cent. less tax, was amply covered and the carry-forward was increased by £9,737 to £77,106.

At the meeting the chairman said that later news had just been received from Rio to the effect that, whilst difficulties would undoubtedly arise during the year in connection with supplies of raw material, the somewhat improved world position made it hopeful that a reasonable quantity would be obtainable during this financial year; the demand for all the products of the company and its subsidiaries continued satisfactory.

The chairman added that, whilst the prospects of the coming crop in the Northern Hemisphere presented perhaps a better outlook today than they did some little while ago, the crops in Argentina had made a remarkable progress. Thanks to the unusually favourable weather conditions during the latter stage of growth, an exceptionally high yield could be relied upon in that their total crop figures should be now between 6,700,000 and 6,900,000 tons and which, after providing for their seed and home requirements of 3,200,000 tons, would leave a satisfactory exportable balance.

Furthermore, good fortune and improved weather conditions had likewise helped the crops in the south of Brazil, which last year were almost a complete failure. Thus it was hoped that the Brazilian 1947/1948 crop would be not far short of 250,000 tons of wheat.

The report and accounts were adopted.

"blocked" earnings piling up in this country, and the more rational methods which might be used to restrict Britain's dollar expenditure on films are ruled out by the conditions attached to the American Loan.

American producers are still earning a useful revenue from films (including re-issues) which were already in this country when the tax was imposed. These supplies cannot last many months longer, but while they last, each side can take a little time to find out how serious is the plight of the other—the one to regain a profitable market and the other to get enough films to keep its cinemas open and hence to maintain its film production. There is a danger that the American film interests may use the interval to see what can be achieved by pressure in Washington—for the temptation might arise to attach conditions to the Marshall Plan which would ensure dollars for the American film industry.

From the British point of view, and probably from the American point of view, too, it would be better to make another attempt at agreement—but this time a serious attempt. If a compromise could be found which would keep the British net dollar outgoings on films within reasonable bounds, there seems no reason to suppose that the Treasury would be intransigent about it. The Treasury is not seeking to use the tax as a protection for the British film industry; it would rather find openings for British films in America than over-protect the home market. The structure of the American film industry makes it difficult to negotiate any two-way trade. Something might, however, be achieved in that direction by individual reciprocity agreements between British and American companies, of the kind that Mr Rank brought home some months ago.

Freight Rates Increased

The Business Note under this heading in *The Economist* of January 3rd reviewed the extent to which the operating costs of shipping concerns have been rising in recent months. The Note included a statement which should be corrected. It referred to an increase of 60 per cent in pilotage rates in the United Kingdom on January 1st. This increase refers, not to pilotage, but to towage. Certain increases in pilotage rates have been made in various districts, but these did not amount to 60 per cent over the 1947 level as the Note suggested.

GOVERNMENT RETURNS

For the 10 days ended January 10, 1948, total ordinary revenue was £145,916,000 against ordinary expenditure of £68,158,000, and issues to sinking funds £527,000. Thus, including sinking fund allocations of £11,857,000 the surplus accrued since April 1st is £310,885,200 against a deficit of £562,587,178 for the corresponding period a year ago.

Power for Frankfurt

FOR the third year in succession, a food crisis has reduced the Ruhr to rebellion and despair. The authorities' persistent failure in recent weeks to honour the fat ration has led to strike action in various towns, factories and mines. Had it not been for the remarkable restraint and responsibility shown by the leaders of the German trade unions, there might well have been a general stoppage of work. The mood of desperation was relieved a little last weekend by the news that at a hurriedly convened conference of officials from the *Länder* and from Military Government, it had been agreed to transfer to the Ruhr some of the fat rations earmarked for delivery elsewhere in the Zone. At the same time, the Americans and the British took steps to increase and hasten the arrival of supplies from abroad. But the crisis is not over. It has arisen earlier this year than last, and it is not certain whether the other States will in fact transfer their supplies to the North-West. It has behind it a greater weight of broken promises and hope deferred. It coincides with a Communist declaration of war on all Allied policies in the Western Zones. What lies ahead may well prove to be a serious challenge not only to the stability of Allied Government in Germany but to the whole conception of European recovery.

In the short run, there is little to be done about the crisis in the Ruhr save to divert more food there. The causes of the breakdown, which are described in greater detail in a survey on page 139, have deep roots in the policy and structure of the Zones and cannot be righted from one day to the next. One element—the loss of the agricultural lands beyond the Oder-Neisse line and the transfer of their population westwards—is a factor about which the Western Allies can do nothing for the present. But other factors are within their control and the crisis must be taken as the last warning the Allies are likely to receive if they hope to make Bizonia into a satisfied and workable community. This time they must draw the right conclusions and begin the necessary reforms, for it is almost impossible to believe they will be given another opportunity. The immediate cause of the food shortage is, by common consent, the failure of the central authority at Frankfurt to persuade or compel the agricultural areas, particularly in the south, to deliver their quotas of food to meet the ration in the big cities. Since the Ruhr contains a higher concentration of urban population, it is there—and in Hamburg—that the breakdown of deliveries from the farms has been felt first and most sharply. Last year, the Allied authorities carried a large part of the blame since they had failed to maintain the scheduled shipments of grain to Germany. This year there has been no such failure, the grain ships have arrived regularly and stocks are above schedule.

Nevertheless, the Allies cannot wash their hands of responsibility for the zonal authorities' failure; the Allies created the zonal structure and defined the powers of the central administration in Frankfurt. Moreover, simply by maintaining their present relationship with the German authorities, they help to keep alive a spirit of irresponsibility. If the Germans feel that ultimately, whatever mess they make of their own feeding arrangements, an Allied *deus ex machina* will step in with more

J. A. CLEZY, London Manager and Secretary

THE UNIVERSITY OF MANCHESTER CHAIR OF GOVERNMENT AND ADMINISTRATION

Applications are invited for appointment to a newly instituted Chair of Government and Administration. Salary £1,450 per annum, with superannuation under the F.S.S.U. A children's allowance scheme is in operation. It is hoped that the person appointed will be able to enter upon his duties in September, 1948.

Applications, which must be received on or before February 28th, 1948, should be sent to the Registrar, the University, Manchester, 13, from whom further information may be obtained.

BEDFORD COLLEGE FOR WOMEN

(UNIVERSITY OF LONDON) REGENT'S PARK, N.W.1.

The Council of Bedford College invites applications for the post of Secretary of the College, vacant as from 1st October, 1948. The post is open to women only, and the appointment will be made at a non-resident salary of £1,000–£1,200 per annum according to qualifications and experience. Candidates must hold a University degree. Last day for receiving applications 7th February, 1948. Further particulars from the Secretary.

UNIVERSITY OF SYDNEY

LECTURESHIP IN ECONOMIC STATISTICS

Applications are invited for appointment to the position of Lecturer in Economic Statistics in the Faculty of Economics. Salary range is £500 (Australian) per annum, rising by annual increments of £50 to £750 (Australian) per annum. Salary is subject to deductions under the State Superannuation Act. The commencing salary will be fixed according to qualifications and experience. Travelling expenses will be paid as arranged at time of appointment; generally speaking, they will cover first-class steamer fare in the case of a successful applicant coming from abroad. Applicants should have training in Economics and Mathematical qualifications. Duties include teaching of statistical theory and methods to both Pass and Honours students under the supervision of the Senior Lecturer in the subject. There will be opportunities for research. Duties commence as soon as practicable in 1948. Further information may be obtained from the Secretary, Universities Bureau of the British Empire, 8 Park Street, London, W.1. Applications supported by testimonials and giving the names of three referees close with the undersigned on 31st March, 1948.

G. DALE, Registrar, University, Sydney.

COMMONWEALTH OF AUSTRALIA

Applications are invited for the following temporary positions in the Division of Industrial Development, Department of Post-war Reconstruction located at Melbourne, Australia.
Project Officer (6 positions).

Salary: Within the range £834-£924 (Australian) according to qualifications.

Duties: To investigate and report upon the structure and development, markets and other aspects of selected industries, with a view to further development.

Qualifications: Experience associated with the establishment and development of industries, ability to write reports, to prepare critical analyses and to formulate policy proposals based upon such reports and analyses. Academic qualifications, particularly in science, engineering, economics or accountancy desirable.

Senior Research Officer (2 positions).
Salary: Within the range £718-£856 (Australian) according to qualifications.

Duties: The planning and carrying out under direction of economic research projects in relation to secondary industries and advising on the policy aspects of plans for development.

Qualifications: Practical experience in economic research and some knowledge of the structure of secondary industries in Australia or elsewhere. Suitable academic qualifications required. Subject to satisfactory service, selected applicants will be guaranteed not less than two years' employment in the service of the Commonwealth. In relation to travel to Australia, selected applicants will receive the benefits accorded to migrants under the assisted passage scheme.

As amongst applicants outside the Commonwealth Public Service preference will be given in accordance with the Australian Re-establishment and Employment Act (No. 11 of 1945) (relating to preference to discharged members of the Armed Forces).

Applications showing full name, date and place of birth, and nationality, specifying if British, whether natural born or naturalised, particulars of war service; full particulars of qualifications and experience, together with copies of references, should be forwarded in duplicate to J. R. Cochrane, Australia House, Strand, London, W.C.2, to reach him not later than February 4th, 1948.

SOUTH AFRICA

BOROUGH OF NEWCASTLE, NATAL, midway between Johannesburg and Durban, have fine sites available, ripe for industrial development, at the low price of £50 per acre to approved firms. Plentiful coal available at pit-head prices, good quota pig iron, plentiful water, road access and rail sidings, power and labour available.

Asada, Limited, wish to announce that they offer complete co-ordination for industrial settlement and development. We can put you in touch with the Town Clerk for the purchase, and arrange for design, equipping, financing and building of your new branch in this Borough or elsewhere in the Union. Our associate company in South Africa have directors and representatives in all principal cities and many towns; and we arrange for representatives to meet you when you visit the Union and assist in all negotiations. The Asada Group embraces architects, surveyors, engineers, builders, contractors, merchants and suppliers, both at home and in South Africa, and your problem of disposing of your present premises, the shipping of machinery and equipment, the building of the new premises, the housing of the executive staff you wish to take with you, and all the various details, can be looked after by arrangement with us. Our fees are quite reasonable.—Kindly make an appointment for interview with Asada, Ltd. (Dept. 335), 55 Pall Mall, London, S.W.1.

GENERAL MANAGER of small industrial group owned by merchant bankers seeks new outlet for his abilities, preferably in young expanding company where his knowledge of engineering and finance would be put to full use. Highest references.—Box 641.

DO IT NOW—your investment problem may be solved.—Write immediately to R. S. Greenhalgh, M.L.I., 1 Regent Street, London, S.W.1, for particulars of latest type of annuity, stating exact date of birth. Interview by appointment only.

ADDRESSOGRAPH Equipment wanted. Cabinet complete with trays or trays alone. Also hand Graphotype Embossing Machine. New or second-hand.—Box 639.

category "A" imports—those designed to check disease and unrest—then clearly they will not make the ultimate effort to solve their difficulties themselves. What is needed, therefore, to prevent a recurrence of the present crisis is a drastic reconsideration of the respective powers of the Central German authority and the *Länder*, and of the relationship of both to Military Government.

It may seem peculiar to propose "drastic reconsideration" of the structure of the central administration in Bizonia, when a quite drastic change has in fact been planned and proposed only a fortnight ago. But the present proposals for strengthening and enlarging the Economic Council at Frankfurt, for creating a Second Chamber to represent the *Länder* and for setting up a Supreme Court to adjudicate on any clash of power that may arise do not affect the real issue at all. Although the powers of the Central Council are increased, it has no executive agencies in the *Länder* and must depend for the carrying out of its orders on the officials of the *Länder* Governments, who naturally serve the immediate in preference to the remote authority. The planning of deliveries by the central agencies for food and agriculture has been adequate enough; the crucial failure lies with the regional authorities who are supposed to do the actual job of collection. It has not been done.

★

This situation will not be remedied until economic functions in Bizonia are firmly centralised. Taxation, which is barely a matter for the Frankfurt administration under existing arrangements, must be transferred to the central authority, while food and agriculture, foreign trade and industrial policy, which are already under the nominal control of the Frankfurt administration, must be reinforced by executive branches in the *Länder*, which will owe their allegiance not to Stuttgart or Munich or Hanover but to Frankfurt. Without such reorganisation the carrying through of the much-discussed currency reform can hardly even be envisaged. Indeed, in no other way will Bizonia achieve an economic structure upon which any sort of reform or recovery can be based. The division of Germany between East and West is already a sufficient handicap to economic revival. To complete the process by balkanising Bizonia's economy is to ensure disaster.

The difficulty in carrying through so obvious a reform lies in the Allied—particularly in the American—belief in federalism. It has been assumed that federalism would be possible only with the utmost decentralisation of power; and so a governmental structure was imposed on the Germans which gave full play to the narrow particularism which usually infects them at times of economic dislocation and crisis. To create a system which enables Bavaria to cease feeding the Ruhr at a time of near-famine is to make certain that Bavaria will in fact behave in that way. Yet the past history of German federalism has shown that it is possible to combine a very high measure of political decentralisation with centralised economic institutions. After 1870, single cartels for iron and steel and potash, a central banking system and a measure of federal taxation were combined with local particularism pushed to the point of separate dynasties. There is thus in recent German history a possible federal pattern which would avoid the frustrations of the existing structure. Admittedly, the Americans, who now have the deciding voice in Bizonia policy, have shown themselves very inflexible on this subject. A change of heart is made all the more difficult by the undecided battle between the War Department and the State Department to determine which shall control German policy. But it could perhaps be urged, both on Mr Marshall and Mr Forrestal, that to maintain in Western Germany an economic regime which is precisely designed to prevent the feeding of the most vital industrial area is neither good foreign policy nor good defence.

The problem of creating new relations between Bizonia and the occupying Powers offers even greater difficulties. So long as Britain and America bear direct responsibility for policy in the zones, they will by that fact alone ensure that any German administration is weak, vacillating and incompetent. The central authority will lack the will to govern, even if it has the means; and the present deplorable situation will continue, in which the Allies are reviled for the mistakes committed by Allied and German officials alike, and receive no recognition for the tremendous effort and outlay made by them year after year to save the Germans from starvation.

Yet control in Germany must be maintained—enforcement of total disarmament, protection of the citizens' civil rights, safeguards against any resurgence of Nazism. And when all due blame has been attached to the German authorities, the fact remains that Western Germany is not self-supporting and that, by its own unaided efforts, it cannot feed itself, any more than can France or Italy for the time being. Even if Western Germany were not under military government, it would still need aid—Marshall aid. This, then, is the dilemma. Allied control and assistance are necessary—yet their perpetuation undermines the Germans' capacity to govern themselves.

Can anything be done to square this circle, to combine sufficient control with the creation of genuine German responsibility? There seems only one solution: to reduce Allied control to the absolute essentials—the maintenance of armies of occupation and the establishment of a strong inspectorate, on the one hand to enforce disarmament and the ban on certain industrial activities, on the other to check any attempt to frustrate or overthrow the Bill of Rights which must be framed for German citizens. For the rest, it is becoming more and more evident that direct Allied control should be withdrawn and the German Government at Frankfurt given—with certain obvious exceptions in the foreign field—the attributes of effective government and independence.

In the economic field, German officials and the German business community should be given the task of directing the German economy and organising the foreign trade of Western Germany. The Export-Import Agency, for instance, should be dissolved as quickly as possible. Since, however, Bizonia is not yet viable, Germany should be entitled to the assistance it needs, not by way of separate Allied provision, but through the established organs of international economic co-operation. Germans should plead the cause of the Ruhr before whatever international agencies for food rationing continue to exist. Germans should work—even if not as fully equal members—on the Committee of Sixteen. Germans should be associated with the negotiations on Marshall Aid in Paris and Washington and should accept the conditions of aid laid down by Congress for all the participating countries. The special assistance the Western Zones now receive under Category "A" imports could then become part of their allocation under the Marshall Plan. Their need for extra assistance is undeniable; but a few more years of spoon feeding by military government will confirm them for ever in querulous incompetence.

The truth is that the politicians in Frankfurt and in the *Länder* do not yet know the facts of international life—of world food shortage, for instance, and of the desperate competition for scarce goods—and they cannot know them so long as they see the world through the distorting mirror of military government. The aim of America and Britain should thus be to end military government as quickly as possible, and to establish effective self-government in Western Germany—of course with full safeguards—if possible before the year is out. There is no other way of squaring the German circle. There is no other way of ending, both in the *Länder* and in Frankfurt itself, the basic political irresponsibility which is, in the last analysis, the cause of the crisis in Bizonia today.

Half-Way House.

A YEAR ago, the House of Commons reassembled to face the greatest programme of legislation which any Government in history had demanded of it. Spirits were high; the formula of nationalisation was still fresh; and the fuel crisis was nearly a month off. This week Parliament has resumed its task in a very different mood. The first half of its term is passed, and its second half beginning. This is a time when the Government benches are beginning to wonder whether Socialism is, after all, enough. It is a time, too, when the Opposition must be asking itself why it makes such a small impression on an electorate which might well be tired of the country's plight and of the Government's ineptitude which has helped to bring it about. Middle term government has a habit of being unspectacular, and even timid. To use these words of a programme which includes the Parliament Bill may sound far-fetched, except to those who recall the flashy streamlined legislation of earlier sessions. Yet, with this single exception of doctrinaire irrelevance, the programme of work before Parliament during the remainder of the session promises to be austere and utilitarian.

It is something of a relief to contemplate the Government's comparatively uncontroversial programme of legislation for the remainder of the session. A further instalment of nationalisation is, indeed, included, in the shape of the Gas Bill, which has been introduced this week. But this measure would be supported by many who are not professing Socialists, and it was actually recommended by a committee presided over by the chairman of one of the country's largest industrial concerns. The case for nationalisation of the gas industry must in any case be conceded, if only because coal has been, and electricity will shortly be taken over. Nor is the Electoral Reform Bill likely to raise tremendous controversy, at any rate so far as the redistribution of seats is concerned, though the abolition of the university vote—as if it were on all fours with the business vote—would bear the mark of unthinking egalitarianism. The Cinematograph Films Bill may be open to the criticism that it does not go far enough in the correction of monopoly (one of the questions, incidentally, in the Labour Party's electoral programme which has yet to be tackled) but it cannot touch more than the fringe of party controversy. The Children Bill, which is discussed on a later page, will win the general approval accorded everywhere to the Curtis Report.

This is doubtless a worthy programme, but it does not promise much political advantage for the Government. On the Parliament Bill, they may win at Westminster, but they will almost certainly be the losers in the country, which is aware of the arguments for an agreed measure of reform for the Upper House but still suspects, despite all the protestations of Ministers, that the Bill is a device for making certain that

the Government can nationalise the steel industry during the remainder of their term. If there was a consensus of opinion in favour of nationalising the industry, or if it was failing to make its maximum contribution to the nation's needs, no such artifice would be needed.

In every respect but this, the Government's programme shows a modest realism. For that, the narrow escapes from last year's crises of fuel and dollars may, perhaps, be thanked. The complacency of July and the demoralisation of August have given way to self-respect and to a regard for facts. Nothing has contributed to this salutary change so much as the emergence of Sir Stafford Cripps in full mastery of economic and financial policy. The new Chancellor is entitled to make the most of the signs of economic improvement and expanding output, but he would never be tempted to use them to disguise the truth. Indeed, if Sir Stafford has a fault, it is precisely the reverse of Mr Dalton's: for he is—quite rightly—so preoccupied with Britain's adverse balance of payments and the dollar deficit that he is willing to impose any strain on the British economy, even to the extent of denying it the new industrial plant which it so urgently needs. In a real sense, this will be the Chancellor's session, with the promise of an "Economic Survey" for 1948 next month, and his first Budget in April. And in the meantime, the routine but important process of supply will concentrate the attention of Government and taxpayers on critical questions of expenditure.

Thus the stage is set for fresh thinking on problems which were unimagined by the Government in the cheerful days of twelve months ago. Already, some fruits of a new realism are forming. There are signs of a more healthy atmosphere in the British economy—exhortations to work from the trades unions, an end (for the time being at least) of the move towards a shorter working week, some Stakhanovites among Welsh miners. Production is rising, slowly and painfully, though in some cases expansion is still using up scarce stocks of raw materials. The contribution which is being made towards paying our way—in other words, towards the day when the British people will eat only to the extent that they produce and sell—is still pitifully small. If the mass of the people now have some idea—even a vague idea—that their short commons are only partly due to the war and only partly due to the shortages of food and dollars, the credit for their enlightenment belongs to Sir Stafford Cripps.

But he is, in truth, only at the beginning of his task, and it remains to be seen whether even his independence of mind will prevail over his potential critics at Westminster and Transport House. Many of those who enjoyed Mr Dalton's tirade against the advocates of disinflation a year ago ("persons not of a representative quality given to irresponsible babblings") have come round to the view that inflation is, after all, rampant. Those who

ASSURANCE: INCORPORATED IN 1720

have changed their view about inflation now that it is no longer partially suppressed, will hardly quarrel with the Chancellor's willingness to let the long-term rate of interest on Government securities rise to 3 per cent and to abandon his predecessor's campaign of ultra-low interest rates. But that retreat cannot be more than a symptom of the Chancellor's attitude towards inflation. The test will come when he opens his first Budget. Will it aim at a large and genuine surplus? Will it make a start towards a reduction of the fantastic burden of the subsidies with all their distorting and inflationary consequences? Will the Chancellor be prepared to listen to the more thoughtful of the bankers—and to be charitable to those whose tempers seem to be wearing thin?

No one realises better than the Chancellor that time is running desperately short. Within a mere six months the country may be facing insolvency—unable to buy its minimum requirements of food and raw materials because its dollars have been drained away. The illusion of prosperity at home (which really means

easy profits and bulging wage packets) and difficulty abroad (which is due in large measure to the fact that the country is living beyond its means) has by no means vanished, and it will require all the skill which the Government can command to prepare the country to make the best use of Marshall Aid, if it is forthcoming, or to gird it to the decisive struggle for survival, if aid comes too late or is insufficient. These will be the tests of the coming months. On foreign policy, both parties are in large measure agreed, and except for a few dissident back-benchers, there is general support for the unequivocal line which Ministers have recently been taking about Russia and encouragement for their more hesitant steps towards European co-operation. It is on economic policy at home that the Government still runs its greatest risks. The British economy is frustrated and brittle. It can be made to work more smoothly if the Government will only realise that an honest financial policy is not something which will benefit a few hard-faced bankers in the City, but means, in truth, security and stability for their own supporters.

General Election in Eire

MR DE VALERA has kept his promise. As a result of the defeat of his party, *Fianna Fail*, at the by-elections held in the autumn in Dublin and Tipperary, Eire now faces a general election on February 4th. In Ireland political opinion always moves to the left, never to the right. The only question is: how great will the deflection be? In the last year a new party known as *Clann na Poblachta* has come into prominence. It has the necessary republican outlook and also the second asset essential to success in Irish politics—a personality. Mr MacBride, the leader of *Clann na Poblachta*, is a barrister by profession with an impeccable revolutionary background. His father was one of the leaders executed in 1916. At the by-elections Mr MacBride attacked the Government on its blind side. He outlined in spacious terms a progressive social programme; he appealed to extreme nationalist sentiment by suggesting that members for Northern Ireland should be invited to sit in the Dail; and in Tipperary he enlisted the support of the land-hungry by denouncing the wealthier English settlers who have acquired large properties in the south. All these ingredients bubbling in the retort of Irish politics may make an explosive compound which might not only put an end to Mr de Valera's sixteen years of authority but might also conceivably end the twenty-six years of peace in Eire. Mr de Valera has wisely got off the powder keg and allowed the gas of Mr MacBride's explosions to escape into the open air of a general election.

Since Mr de Valera first assumed office in 1932, Eire has passed through the economic war, the Second World War, and a measure of postwar austerity. In spite of neutrality and of a policy of political and economic isolationism, Eire has suffered much from the impact of events in the outside world. There was little improvement last year. The bad weather and the fuel crisis in the spring caused widespread inconvenience and hardship. The dollar crisis in the autumn brought additional shortage in its train, and Eire's share of the sterling area dollar pool has been drastically cut. The budget early in the year raised the duty on tobacco and entertainments. A supplementary budget in the autumn raised the duties on beer, whisky, and wines; raised the duty again on tobacco and entertainments, and increased the standard rate of income tax and the motor licence duties. All these events were the cause of popular discontent, but none of them has caused such widespread indignation as the rise in the cost of living for which Mr de Valera's government is, rightly or wrongly, blamed.

The end of the standstill orders on wages was followed by numerous demands for more pay and shorter hours. The cost of living rose much more rapidly than in Great Britain and real

wages undoubtedly fell severely. The trade unions alleged that prices were not sufficiently controlled and that shopkeepers and traders were profiteering at the expense of wage earners. There were many strikes, frequently in defiance of the Labour Court, and sometimes even before the Court had had an opportunity of investigating the workers' claims. Transport was disorganised for two months in the autumn, and the banks had to close their doors for a few days as a result of a stay-in strike. It was to stabilise the cost of living that the supplementary budget was introduced in October. Subsidies were provided for flour, tea, and sugar, but, as these subsidies were paid by increased taxes on beer and other conventional necessities, the average working class household experienced no real benefit.

For those with money almost everything except coal is readily obtainable in Eire; for the less fortunate the rising spiral of prices means great hardship, which is sharply accentuated by the improved but still comparatively low standard of social services. The contrast with Northern Ireland is not being overlooked. Old age pensions in Northern Ireland are 26s. per week at the age of 65; in Eire they are 12s. 6d. per week at the age of 70. During the long teachers' strike of 1946 the National Union of Teachers made effective play with the very marked difference between their salaries and those of their colleagues north of the Border. Most significant, and due mainly to the high cost of living, is the fact that only 18 per cent of the young men in the 29 age group in Eire are married. In England the percentage is 53; in the United States it is 64.

The growth of the tourist trade has also aroused some misgivings. Tourists consume a large amount of imports for which they practically all pay in sterling, and as part of the imports are from dollar areas, tourists increase the pressure on hard currencies. Moreover they put up prices in the country and add to the soaring cost of living. It is probable, too, that the tourist trade is purely temporary and will fade away when continental travel is resumed.

More serious still is the adverse account of the balance of payments. From January to October, 1947, imports amounted to £105,203,234 and exports to £30,824,851. An adverse balance of this size cannot long be maintained even by so strong a creditor country as Eire. There are, of course, substantial invisible exports which largely bridge the gap, but how large they are is difficult to say because the annual official estimates of the balance of payments for last year have not been published.

In the long run, however, Eire's balance of trade depends upon increasing its agricultural exports. During last year, Mr de Valera paid two visits to London and arranged a new Anglo-

Irish trade agreement. Great Britain undertook to supply coal, raw materials, fertilisers and agricultural machinery, while Eire promised in return to supply more cattle and other agricultural products. This agreement contains considerable possibilities for expanding Irish exports. Britain can absorb large quantities of food, and the prices fixed are generally regarded as satisfactory. The real limiting factor is the low productivity of Irish farming. The shortage of fertilisers and feeding-stuffs during the war was enough to account for a temporary shrinking of output, but what is disquieting is the absence of any long-term trend to increase production on the land. A policy of agricultural development based on improved technique is imperatively required. The stagnation of agriculture is the Achilles' heel of Eire's economic system.

★

It was against this economic background that the by-elections were held on October 29th. *Clann na Poblachta* won two of the three seats and Mr de Valera accepted the challenge by announcing the forthcoming general election. Hitherto, the division between the principal political parties has been based on the issues and personalities which split *Sinn Féin* a quarter of a century ago. General Richard Mulcahy, the leader of the Opposition party, *Fine Gael*, was Chief of Staff to Michael Collins, and his dispute with Mr de Valera has little to do with the present troubles in Eire. But a whole generation has grown up since 1921, a generation which is more interested in social problems than in the antagonism born in the civil war. Hence the popularity of Mr MacBride's *Clann na Poblachta* and the decline since 1932 of *Fine Gael*, whose fortunes are not likely to be revived.

The state of the parties in the Dail today is *Fianna Fail* (Mr de Valera), 76; *Fine Gael* (General Mulcahy), 27; *Clann na Talmhan* (Farmers), 11; Labour, 8; National Labour, 4; *Clann na Poblachta* (Mr MacBride), 2; and Independents, 10. It is quite impossible to forecast what the position will be after the elections. Mr MacBride is putting 92 candidates into the field, but few suppose that he will be able to form a government without outside support. On the other hand, if the by-elections are any guide at all, Mr de Valera may not secure an absolute majority. He has, however, a political and temperamental dislike of coalitions, and he has stated that he will not combine with any other party to form a government. Mr

The Middle Class—I

Plight of the Professions

(By a Correspondent)

IF the middle class is, as used to be said, the backbone of the country, then Great Britain is rapidly becoming invertebrate. In a sense, of course, the middle class is expanding and extending itself, as the wage-earner assumes bourgeois social habits and standards and the old upper class sheds inherited wealth and exclusiveness; and as it expands, so it grows less definite and homogeneous. Financial status, accent, habits and educational background no longer coincide. But the essential core of the middle class, the spinal cord in the backbone, the professional man as distinct from the profit-maker or wage-earner, does constitute a fairly recognisable social type. He holds a University degree, a qualification from a professional body, or at least he has gone through a recognised process of training extending over anything up to a dozen years beyond the legal school-leaving age. He lives on salary or fees, not on property. Until fairly lately his income, averaged over his working life, was—even allowing for his late start—much higher than that of the manual or clerical worker; now the overlap is so considerable that the distinction is blurred.

MacBride's prospects are much improved by the fact that the Labour party remains so deeply divided that each section proposes to run candidates against the other. But, while many consider Mr MacBride to be a Socialist leader intent alike on reform and national progress, others mistrust the sincerity of his democratic professions. It may be that Mr de Valera will be able to take full advantage of the doubts about Mr MacBride's ultimate intentions, but the probable result of the elections will be either a *Fianna Fail* government leaning reluctantly on Labour support, or a coalition of smaller parties. In either case Eire will have to face an unsettled period of uneasy coalitions and repeated elections.

The election is being fought on personalities rather than on political programmes, and the electorate will vote "pro-Dev" or "anti-Dev." Translated into broader terms, the choice is between a settled government and a coalition government. The latter would encourage political manoeuvre and would, at the same time, introduce a new vitality of a not very attractive kind into the political scene. Logically, all those in favour of settled government should vote for *Fianna Fail*, and many of the normal supporters of *Fine Gael*, whether former Unionists or large farmers, may transfer their allegiance to Mr de Valera. But whatever the gain on the Right, *Fianna Fail* will probably lose a good deal more on the Left.

One result of the birth of a new republican party may well be to bring into the open once again the question of Eire's relations with Britain and with the Commonwealth. The only formal link binding Eire to the Commonwealth is provided by the External Relations Act, under which letters of credence for representatives to foreign powers are signed by the King. This arrangement, always described as a matter of convenience by Mr de Valera, has been criticised rather irresponsibly from the Right in the Dail. It is possible that Mr de Valera, or his successor in office, in order to safeguard his position in the country, might seek an alternative arrangement. It is not, however, constitutional formalities, but co-operation in economic and social policy that matters. And in such spheres, as Irish participation in the Marshall Plan and the recent Trade Agreement have clearly shown, co-operation has been more intimate than at any time in recent years. It is to be hoped that nothing that results from the election will impair the new and friendlier relationship which has been built up since the war.

But if the class itself is hazy at the edges, both socially and economically, its particular role is less so. In a very real sense it is to the body politic what the spinal cord and central nervous system are to the physical body. A well-developed professional class distinguishes the civilised community as a well-developed nervous system distinguishes the higher animals. The professional man presumably has the usual dose of original sin to contend with; but professional training is calculated to check the hypertrophic acquisitive instincts of Economic Man, to widen civic horizons, to substitute for the grudging calculus of pay and effort the more generous ethic of the Scriptural second mile. It is, indeed, partly because of this attitude that the professional class as a whole now finds itself in such straits. It is too proud to fight; too proud, certainly, to enter wholeheartedly into the inflationary game of mutual blackmail.

The statistical evidence of its decline is striking. An article on "Wages and Profits," in *The Economist* of November 15th last, estimated that the real net level of wage earnings (that is, after allowing for the rise both in prices and in taxation) has

risen by between 10 and 35 per cent since before the war. But a corresponding figure for the representative salary income (if one were accurately obtainable) would show a loss of anything from 20 to 30 per cent in real net purchasing power. This is partly because the prices of those goods and services which are outside the scope of the cost-of-living index, and affect the middle-class consumer more than the wage-earner, have far outstripped those which the index subsumes. Out of any extra money income he may now be receiving (and the average increase is much lower than that of wages) the professional man must pay house-rent (unless he is lucky enough to have established prewar occupancy) at three or four times the prewar rate. His car, if he can run it, costs twice or three times as much now, up to ten times as much secondhand. Where the twentieth part of an £800-a-year salary would pay for a general maid, a full fifth is now needed. School fees are largely a matter of transfer between members of the professional class and their rise has been braked by that class's forbearance; but the pressure of other costs has forced them up faster than salaries in general. Without drawing on capital, the possession of which is by no means characteristic of the professional, it is now impossible for less than, say, £1,200 a year at least, even leaving prohibitions out of account, to enjoy the normal ingredients of a prewar professional family's life—the privacy implied for each member of the family by having a room of his or her own, the mobility and independence implied by a car, the leisure implied by even a part-time domestic—not to mention such other attributes of civilisation as concerts, theatres, books, the exchange of hospitality, and a modicum of foreign travel. It is impossible for such a family to give more than a single child the type of education they prefer—and which is still almost a conventional necessity. Whether it is rightly or wrongly so is another story, and a very long one; but the fact is that many professional and middle-class families would rather stint themselves on other things than accept the state's free education.

A cursory survey of salary scales shows that only a tiny minority, at the peak of their careers, attain or surpass the level of £1,200. The outstanding successful lawyer or doctor can, of course, do much better; so, occasionally, can the independent architect, whose percentages benefit automatically from each rise in building costs; on the fringes between the professions and business, large incomes are possible to the scientist, the technician, the publicist, the accountant and the professional manager. But the teacher, the university don, the civil servant or local government official, the social worker, the salaried doctor, scientist, architect or surveyor, the holder of His Majesty's commission, and above all the clergyman of almost any denomination, are otherwise placed. In academic life, one must be a full professor to surpass this figure—and few universities pay even their most distinguished members more than £1,500 a year. In teaching, the new Burnham scale provides a maximum, for the most highly qualified assistant teacher of £615. The civil servant must reach the rank of assistant secretary to pass the £1,200 mark by any noticeable margin. And everywhere, the loss relative to living costs and to the incomes of the rest of the community is heaviest in the upper reaches. The maximum salary of an assistant secretary, for instance, remains unchanged at £1,700; that of a principal is up by only 10 per cent.

There are temporary mitigations. Just as any given wage scale stands for higher earnings, thanks to full employment and overtime, so any given salary scale looks better to the present-day professional man because of the quick promotions of the last few years. If one has climbed three or four steps in half the usual time, one is less apt to notice that they are steps on a down-going escalator. But this very record of quick promotions darkens the prospects for today's juniors. The places at the top are now occupied not by seniors soon to retire but by men with twenty years' tenure ahead of them;

there are likely to be some starving horses while the next crop of promotions is maturing.

Of course the professional is less burdened by taxation, on paper, than the very rich; though surtax hits him at about the level where he might otherwise afford a cook, he does not qualify for an impost of 19s. 6d. in the £. But the very rich are generally so by reason of their capital, and can maintain their standards—on the principle of *après moi le déluge*, powerfully reinforced by the prospect of death duties—by simply spending it. Moreover, many a business man can, while remaining well within the law, work miracles of good living on his expense account—encouraged thereto by the profits tax; and he can cultivate a debatable terrain between income and capital gains where the professional has no consolatory foothold.

Both as compared with the wage-earner and the profit-maker, the salariat have in fact lost ground out of all proportion to the general fall in national wealth. Depressing as this may be for those affected, the community might, of course, view their decline with the same equanimity as it did that of the cab-driver ousted by the taxi, the officer robbed of promotion by the outbreak of peace, or any other interest damaged by the progress of social and economic events. After all, the professional classes are not actually starving or barefoot. But it is not consuming power alone which has suffered; it is, above all, leisure; and it is precisely the characteristic of intellectual work, particularly in its higher grades, that to be properly done it must have a certain amount of leisure surrounding it. The senior administrator cannot judge policy with his nose incessantly at the grindstone. The academic cannot contribute worthily to the advancement of knowledge when swamped with routine teaching. And outside actual working hours, when the professional man used to find time for the exchange of ideas, the cultivation of the humanities, voluntary social work, civic activities, and the attainment of that mental perspective in which alone the specialisations of professional life can be seen in true proportion, there is now merely the solitary struggle with the day's overspill from office or consulting room, and a multitude of domestic odd jobs. This is not a favourable climate for creative advances in any field—administrative, academic, scientific or cultural. And however low the abstract deserts of the professional, creative progress is not lightly to be sacrificed. If the Labour voter cannot see why a bishop should not shine his own shoes and stoke his own stove, and still less why a woman doctor should not scrub her own kitchen and fillet her own herrings, he should if possible be brought to understand that leisure, privacy, and the opportunity of external contacts is an essential to high intellectual activity as extra rations are to heavy manual labour.

That understanding is evidently remote. To the Left, the middle class is unmistakably—*pace* Mr. Morrison—a class enemy; the old slogan about workers by hand and brain does not comprehend the over-£500-a-year man. For him, two hoots and a tinker's curse are ample. Indeed, from almost every relevant action that the Government has taken there might be deduced a desire to hit the professional man harder than the plutocrat. Private building is impossible, and public building designed for the working class exclusively; the wealthy man can afford the quadrupled price of a prewar house, or dodge the dilemma in a service flat whose rent would absorb a headmaster's whole salary. He can take a Mediterranean holiday, by yacht or by air to Cyprus, while the professional man must forgo his fortnight in France. The rich man can obediently lay up his car and spend thrice its running costs on taxis and long distance hires; the salariat can tramp or queue. The winds of austerity are tempered for the wage-earner, and the capitalist has a fur coat of capital, but the professional class can, for all the Government cares, just shiver.

(To be continued)

NOTES OF THE WEEK

Third Force

Mr Bevin, preparing his speech for Thursday's debate, must have been a little puzzled to find some of the bitterest critics from his own party and some of Mr Churchill's closest friends tuning their voices to a common chant in favour of unity in western Europe. Those who were once urging him to keep left are now urging him to keep in the middle of the road, with the Russians on his left and the Americans on his right. Others are urging on him the practical and metaphysical attractions of the phrase "Third Force." Hardly anyone dares murmur the phrase "western bloc," which was fashionable for a time after Mr Churchill's Fulton speech but has since lost its respectability because it was thought too martial.

There is danger of confused thinking when so many slogans enter the field. Still more serious is the risk that bombardment with political slogans and phrases about "Western political integration" may divert the Foreign Secretary's attention from the more serious business of seeing that preparations for executing the Marshall Plan are given the priority in British policy that they deserve, in western Germany and elsewhere. It is after all desirable and likely that practical schemes of closer political and economic association—even integration—will grow naturally out of the work being done, and still to be done, on the Marshall Plan.

It is hardly necessary to point out the far-reaching consequences for British policy of any political integration of the United Kingdom with nations of western Europe. But it is necessary to point out that premature talk along these lines will certainly frighten the Swiss, and may frighten the Scandinavians out of the company of the Sixteen. They, and other interested Powers, wish to maintain a distinction between the European Recovery Plan and any European unity plan. And one can be reasonably certain that the members of the British Commonwealth would like the same distinction maintained, while they take time to think five or ten years ahead.

As for the "Third Force," there is really little to be gained by bringing this equivocal phrase out of the domestic into the international field. The words and the minority party that uses them were born in France out of fear and dislike of the two extremes which threatened to seize power: Communism and Gaullism. It implies a rather unsteady centre position, in which Socialists become slightly blue and men of the moderate Right become slightly pink. It further implies that the parties on each side of it are equally objectionable. Is it then seriously argued, at this stage of Anglo-American relations, that Britain and France should begin to move towards a position in which they express the same degree of antipathy to American policy and ideas as they do to Russian policy and ideas?

This is surely neither desirable nor possible, if only for the reason that the Third Force can only take root and flourish under American patronage. Admittedly, the declared object of the Marshall Plan is to put western Europe on its feet and give it reasonable economic independence. But it is a long way from this idea to the vision of a west European bloc holding the balance of power between America and Russia. And to start moving hurriedly in that direction is to run the risk of encouraging the Americans in five years' time to pull out their stakes in Europe and leave the Third Force looking more like a third eleven.

Copy for the Cold War

Why a French-sponsored newspaper in Berlin should be the first to publish in full Communist instructions for strikes and political resistance in the British Zone is a mystery still to be explained. The Foreign Office declares itself convinced of the authenticity of Protocol "M" which was published last week. It is said that the British authorities in Germany had been aware for some time of its existence. Why then was it not published under British auspices? The content was grave enough to justify such a course. If the document is genuine, it means that one occupying Power is conniving at and encouraging German Communist resistance against another occupying Power. If it is not genuine, it means that some Germans are interested in inciting one occupying Power against another. For it may presumably be taken for granted that no Allied authority is responsible for "planting" a document which is superfluous, indeed harmful, considering the genuine human distress which has provoked the latest strikes in the Ruhr. Whichever explanation is correct,

action should have been taken by the British: either to publish the document with the full authority of His Majesty's Government and with a formal protest in the Control Council; or to investigate and expose the train of events which led to its appearance in a "late extra" on the streets of Berlin.

Publications policy appears to receive less attention from the Foreign Office than it deserves. Why, for example, is it impossible for a member of the public to buy a copy of the declaration of Communist policy against the Marshall Plan made by Mr Zhdanov to the Cominform six months ago? It is a crucial document for the understanding of recent events in France, Italy, Greece and other countries where Britain has vital interests; it should have been made available in a White Paper. Why was the full infamy of the Petkov trial in Sofia not laid bare in a document backed by the moral authority of the British Government? Why are the main points of the United Nations Commission's repeated evidence of help given to the Greek rebels by Albania, Yugoslavia and Bulgaria not raised to public notice out of the welter of Uno documents which reach London late or in summary form?

The fact that the press has insufficient newsprint to do justice to the old-fashioned White Paper is an argument for—not against—giving the hard-reading few the documentation they need to provide the many with authentic information. The White Paper is immune from the objections so often made against newspaper reports—that their treatment and presentation reflect editorial policy. It has a dignified and effective part to play in the "cold war," which demands more skill and energy from British propaganda than seem now available.

* * *

Voice of the City

The latest pronouncements from the bank chairmen have run more nearly true to type than the essay in agrarian economics from Sir William Goodenough discussed here last week. But if ever there was a time of cohesive City opinion on the issues of the hour that certainly is not true today. Now the bankers speak with many voices, ranging from rather unconstructive political sniping at one extreme to laboured efforts to avoid even the semblance of criticism of official action. Happily, there are between these extremes some who, though speaking forthrightly, are plainly trying to make a real contribution towards the shaping of economic policy. At one wing is Captain Eric Smith, of the National Provincial, whose satire describes the fuel crisis as a "trifling interruption" and the convertibility arrangements as a "minor error of judgment . . . washed away in a spate of printer's ink." Such forced levity, complete with double exclamation marks (for the bankers' "speeches" are now printed statements), is surely out of place. And is it really wise for one who sits in the seats of the mighty in the City to voice the opinion that "the man who enjoys better food in a works canteen is accepting material charity from those not so favourably placed"—and then to imply that "no decent man should tolerate" being thus privileged?

Away at the other extreme is Lord Linlithgow, of the Midland Bank, who after weighty deliberation decides, amid much verbal sonority, that 1947 was a "year of solid progress" because of a moral revival and because we now understand just how exhausted we really are. Lord Balfour of Burleigh, who stands most prominently in the middle of the stage, denies us even this consolation. The public, he thinks, still does not understand the grim realities of Britain's plight. "In a matter of months," he says, "we may not have at our disposal the dollars wherewith to pay for our food and for the raw materials essential to our production for export." But Lord Balfour has a prescription for Britain's malady, and it is one with which all readers of these columns will already be familiar. Britain must tackle the inflation which is both sapping and dissipating its resources, must "harness the price mechanism to work with the physical controls instead of against them," and can do this only by a budget surplus achieved in spite of the reduction of direct taxation which is needed to give incentive. Moreover, there must be no more nonsense about cheap money: Lord Balfour thinks the long term rate ought to be "not under 3 per cent." In this matter of financial policy, the two Northern bankers, Sir Thomas Barlow of the District Bank and Mr Harold Bibby of Martins, think similarly. But Sir Thomas demonstrates again the engaging inconsistency of so many banking opinions. That any banker should deplore the

disappearance of the Liverpool Cotton Market is easy to understand, but this attitude hardly squares with the new protectionism which Sir Thomas would like to see for the industry which most nearly touches the interests of his own institution. He "devoutly" hopes that the Peace Treaty with Japan will impose some control upon the volume and price of Japanese production. What a counsel of despair.

* * *

Cracks from the Chief Whip

Astonishment, not to say alarm, was spread through National Savings circles last week-end—and, unhappily, far beyond them—by an extraordinary statement by the Government Chief Whip. Speaking at a "Silver Lining" meeting at Stanley (Durham), Mr Whiteley said:

Some fine morning these [note] hoarders, unpatriotic in the true sense, will wake up and find their hoard valueless. At short notice, it might be, a new issue of notes will be placed on the market and all old notes will then be worthless.

For irresponsibility this effort will be hard to surpass. Coming from one who bears the title of Parliamentary Secretary to the Treasury, a statement in such terms was bound to arouse the suspicion that a calculated indiscretion had been made. Indeed, even so responsible a journal as *The Times* headed its report "Hint" of a new note issue (as, on Mr. Whiteley's phrasing, it was fully entitled to do). And even the immediate interest which his speech provoked apparently failed to show Mr Whiteley the extent of his blunder. His denials of having "any official knowledge" merely made matters worse. One, at least, was coupled with the excuse "it is always a possibility." And Sir Stafford Cripps, when questioned on the matter, has risen to new heights of masterly evasiveness. These rumours, he said, "have no greater foundation than any other rumours."

Yet it ought not to be necessary to say that on no kind of day will note holders in this country awake to find their holdings valueless—and if they want to help to prevent any loss in their value, through a further rise in prices, they cannot do better than continue to hold them instead of spending them. This is not to say that an exchange of old notes for new, the possibility of which has lately been causing such concern to the "spivs" and tax evaders, is out of the question. But in such a case the note holders would get value for their money, and nobody who had come by his currency honestly would have any reason to fear the inquiries which might be made about the origin of any abnormally large holdings paid into the banks for the purpose of making the exchange. The fears of the dishonest are understandable, but unfortunately, even before Mr Whiteley's blunder, they had begun quite irrationally to infect the genuine note holders. Those among them who now are hurriedly denuding the banks of silver or turning their notes into goods would be well advised to think again. Nor need they fear any charge of "unpatriotism." If they can hold their savings in notes without giving way to the temptation to spend, they are more patriotic even than those who hand their money over to the National Savings Committee, for they save without being paid interest by the state for doing so. As for Mr Whiteley, if he has any more cracks in mind, let him save them for the Government's supporters on his hypothetical "fine day." An extraordinarily strong whip would certainly be needed then.

* * *

Children's Hour

The Children Bill, which was formally introduced in the House of Lords before the recess, is the long-expected measure for putting into force the main recommendations of the Curtis Committee on the care of children deprived of a normal home life. It also rounds off the social security programme of the present Government and its predecessor. The Family Allowances Act, the National Insurance and the Industrial Insurance Acts, and the National Health Service Act are comprehensive in that they apply to, or potentially apply to, the whole population. The two remaining measures now before Parliament—the National Assistance Bill and the Children Bill—are intended to tidy up the loose ends. They will apply to the small minority which, for one reason or another, falls outside the scope of the main social security agencies.

Even had there been no Curtis Committee, there would still have been need for a Children Bill; at least, similar provisions to those now brought forward would have had to be incorporated in the National Assistance Bill. For under the poor law a local authority is enabled to assume the parental rights of a child whose parents have abandoned him or are dead or are incapable or unfit

to have the care of him, and when the poor law is abolished by the National Assistance Bill, a similar provision will have to be made elsewhere. But the Children Bill goes much farther than this. Not only does it enable the local authority to assume parental rights—with the important new proviso that a parent or guardian may lodge an objection within a month which will be sufficient to defeat the local authority's resolution unless the court orders otherwise. It also imposes on the local authority parental duties in respect of a child committed to its care or for which it has assumed parental rights. Subject to the directions and supervision of the Home Secretary, local authorities will have to provide special accommodation for children not suitable for boarding out. Whether children are placed with foster parents or in Homes, the local authority concerned is obliged to see that they are brought up like ordinary children, go to the same schools as they and enjoy the same privileges. Local authorities are also enabled to provide hostel accommodation for young people aged 15-21 and to pay higher education and training grants to persons aged 18 or over who were in their care when they reached that age.

Those responsible for the Bill have, in fact, clearly tried hard to put some imagination into what might otherwise have been a mere matter of administration. Whether this imagination will survive the dead hand of Whitehall, town hall and county hall, and whether the tangle of red tape that at present enshrouds the welfare of these unfortunate children will be resolved by the appointment of children's committees by local authorities, remains to be seen. A great deal will depend on personalities, in particular on the personalities of the children's officers who will be the keystone of the whole new service. In work such as this, personality counts for far more than training.

* * *

Mr Gandhi's Fast

Mr Gandhi has never used his strange political weapon of refusing to eat in a better cause than in his most recent fast, which was undertaken to restore communal peace in Delhi and check the rising tide of agitation for war against Pakistan. The veneration in which he is held is so great as to deter any Indian politician from incurring responsibility for his self-imposed death by starvation, and he is thus able to make an effective stand against even the most popular chauvinism. Nor is he without secret allies in high places; most of India's political leaders probably deplore the strength of the current towards war, but the need to save the Mahatma's life is the only pretext on which they can justify moderation without exposing themselves to the charge of betraying the national or communal cause.

Not all Indians are ready to submit to coercion by Mr Gandhi's empty stomach, as was shown by the attempt to assassinate him made by a Hindu refugee from Pakistan. Feelings of hatred and revenge run high among the homeless refugees in India—as they do also among the Moslem refugees on the other side of the frontier—and Mr Gandhi's insistence that mosques occupied by refugee squatters should be evacuated and restored to local Moslem communities has caused the wrath of some of them to boil over. Nevertheless, the guarantees which Mr Gandhi demanded from communal leaders as a condition of ending his fast have been given, and an advantage has been gained over the forces of destruction which could have been won by no other means. Mr Gandhi's fast has not affected the India-Pakistan contest before the Security Council, but it has greatly reduced the risk of a fresh wave of bloodshed in India while diplomacy is at work.

Mr Gandhi's devotion to non-violence as a principle is genuine enough. But he is also a nationalist politician, and he believes that his policy is the best means of bringing about the reunion of India and Pakistan which he so greatly desires. India might conquer and annex Pakistan by war, but no stable unity could be thus achieved. If, on the other hand, India follows in practice over a period of time a policy of communal toleration and non-discrimination such as Mr Gandhi urges, the fear of Hindu Raj which has been the basis of Moslem separatism would be gradually dissipated and an ever closer association of India and Pakistan on a voluntary basis would be likely to ensue. This idea of Mr Gandhi's is indeed nationalist, but on the highest level of statesmanship.

Anti-British Riots in China

Anti-British riots in Canton and Shanghai have a prewar savour of the kind which even the most nostalgic reminiscence

of the twenties cannot welcome. It is indeed discouraging that, after all the British renunciations of treaty rights in China, it should be so easy for agitators to whip up anti-British feeling in Chinese mobs. But it is also discouraging that nothing has been done until now from the British side to settle the long-standing legal dispute out of which this humiliating trouble has arisen. China has not since the war challenged the British right to Hong-kong itself, which, together with a small area of the opposite mainland, is held by Britain in full sovereignty. Nor has there been a direct challenge to British administration of the leased territory on the mainland, though China has been inclined to claim certain residual rights in the leasehold area which are in conflict with administrative policies.

The small old walled town of Kowloon, however—not to be confused with the well-known city of Kowloon opposite Victoria—is a special case. By the treaty of 1898, this town, though within the borders of the Leased Territory, remained under Chinese civil administration. But in the following year, by an Order-in-Council, it was placed under British administration and the Chinese officials were expelled. The British case is that the behaviour of these officials was incompatible with the Chinese undertaking in the same treaty not to interfere with British measures for the military defence of the Leased Territory. It is questionable, however, whether an international treaty can thus be unilaterally abrogated by an Order-in-Council, and the Chinese have never recognised the validity of the British action. Shortly before the war the Chinese Foreign Minister of the time made it clear that China continued to regard British administration in Kowloon as a usurpation. It was, therefore, only to be expected that a crisis would occur sooner or later over the issue in the unstable postwar situation, and it would have been a wise act of policy if, when Britain resumed control of Hongkong in 1945, Kowloon had been handed back to Chinese administration. But this was not done, and last week the eviction of Chinese squatters in the ruins—for the Japanese destroyed the place during the war—provided the occasion for serious anti-British riots.

The nationalist excitement has no doubt been inflamed by certain politicians with ulterior motives, and the British Government cannot but protest strongly at the failure of the authorities to protect the Consulate in Canton. Nevertheless, an effort should be made without delay to clear up the legal dispute over Kowloon. It seems eminently suitable for reference to the International Court of Justice. Britain and China would together set an example to the world by prompt, honest and amicable submission of such a case to an impartial tribunal.

Report on the Tudor

In its attitude towards the development of the Tudor I aircraft the British Overseas Airways Corporation was lacking in enthusiasm and determination, deficient in leadership and administrative organisation—and not entirely fair in its treatment of the constructors, A. V. Roe Ltd., or accurate in the presentation of its case. Such is the pith of the Courtney Committee's interim report—a story of confusion so aptly compared by Lord Reading in last Wednesday's debate in the Lords to a recipe from Mrs Beeton. A. V. Roe's main fault was to risk unnecessary aerodynamic trouble by changing the well-proved Lancaster tail-unit for an untried design. In general, however, the firm's performance was satisfactory: only two and a-half years elapsed from the start of the design work to the issue of a certificate of airworthiness. But it was because every month was so important that one would have expected this period to have been reduced by the effective collaboration of all concerned. It was not. And the chief offender was BOAC.

The Corporation did not propose an unreasonable number of modifications, although it was responsible for 343 out of a total of 357. Nor did they involve delays as serious as those occasioned by aerodynamic modifications. But the manner in which they were put forward was extremely unfortunate. As modification succeeded modification, and as those modifications were themselves modified, relations between the firm and the Corporation deteriorated. The workpeople building the Tudor I became discouraged and worked more slowly. Finally, after trials which the Committee considers of doubtful validity and for economic reasons which are not wholly acceptable, BOAC last April informed the Ministry of Civil Aviation that

irrespective of whether the flying qualities of the Tudor I can be rectified, and whether its deficiency in performance can fully be recovered, there is no longer any justification for including Tudor I's in this Corporation's operating programme.

In reaching this decision, BOAC departed from the original

conception of the Tudor. It must have been influenced by the knowledge revealed in its recent annual report of the size of its deficit. But it cannot be denied that much of the delay and expense in developing the Tudor was due to the unrealistic and untimely search for perfection of its own project branch. Consequently the stop-gap was never ready to stop the gap.

The role of the other parties—the Ministries of Supply and of Civil Aviation—was somewhat inglorious. They did issue a warning against delay. But the unsatisfactory machinery of aircraft supply did not oblige them to go further. In the words of the report,

there was such an effective division of constitutional responsibility among the organisations concerned that each could find unimpeachable reasons for keeping its constructive activity within moderate limits; and on none of the parties was there such clear financial responsibility as would have impelled action.

Fortunately, the procedure for ordering aircraft has now been altered and the Air Corporations must now take full financial responsibility for machines ordered to their requirements. The next report of the Courtney Committee, which has had its terms of reference extended, is likely to propose further changes; and, as the Minister of Civil Aviation indicated in Wednesday's debate, the Government is in a mood to introduce them. Meanwhile, the Government has decided that BOAC must fly the Tudor I's, if they conform to original specifications, must buy and not hire them, and will not receive any special subsidy to meet losses incurred in their operation. So ends an unhappy chapter in British civil aviation for which there is ample explanation but little excuse.

* * *

A Profit for BSAA

The present system of ordering aircraft is also criticised in the first annual report of the British South American Airways Corporation, published in the middle of the week, as costly, cumbersome and the cause of avoidable delays and misunderstandings. Its modification is the first of the four prerequisites which the directors consider to be essential for effective competition with other air lines. The others are the removal of unreasonable restrictions on operations, the general recognition of the "fifth freedom" right of through air lines to traffic between intermediate points on their routes and the absence of any preferential treatment for competitors.

For the period under review, however—August 1, 1946, to March 31, 1947—BSAA showed a net profit of £20,507—a sum insufficient to bring the losses of the three Air Corporations within the statutory limit of £10 million, but nevertheless a satisfactory result. In achieving this, it carried 5,397 passengers 24,046,600 miles and its aircraft were 58 per cent full.

This success was in part due to the fact that its early start enabled the Corporation to take advantage of the abnormal demand for transport at a time when there was little competition either in the air or on the sea. This advantage no longer exists—and all costs are ominously rising. Yet credit is due to BSAA for seizing its opportunity. Indeed in its short career it seems to have missed few. Its drive and initiative in pressing the Tudor IVs into service, for example, received favourable comment from the Courtney Committee. And, in a different sphere of activity, the announcement that some scheme is being considered to foster among the staff a sense of responsibility and partnership like that provided by incentive bonus schemes in industry is very interesting. But it must be admitted that its problems are simpler than those of the other Corporations. With only two types of aircraft and with long stages on its routes, it has neither the disastrous variety of obsolescent types, which is the costly bugbear of both BOAC and BEAC, nor has it comparable overheads. To admit this, however, is not to detract from the merit of its performance; and it is especially welcome to note the stout assertion of its faith in British aircraft, on which it relies exclusively.

Health Service Skirmishing

The real battle between Mr Bevan and the medical profession has still to be joined. In the meantime, there has been a preliminary skirmish by both sides. Last week-end Mr Bevan issued a plea that doctors should be guided by their reason rather than by their emotions in the coming plebiscite, and that they should not defy the will of Parliament. He also promised a full statement at a later date. In its turn the British Medical Association points out that Parliament authorised the Minister to establish a national health service, not a state medical service which it accuses Mr Bevan of attempting to introduce, and that in any case

Tendencies to Monopoly in the Film Industry, published in 1944. This report assessed both the approaching dollar difficulty and its restrictionist outcome quite clearly:

It does not appear that the American industry has had occasion hitherto to take stock of the exchange problem facing this country . . . if for lack of exchange this country found itself compelled shortly after the war to clamp down on the importation of pictures in favour of more indispensable requirements. It is in the interests of both countries that relief from the existing exchange situation should, if possible, take the expansionist form of a return trade.

Instead, "relief" has taken a restrictionist form which, as the supply of American films dries up, is creating a complete set of new problems for the industry.

Mr. Wilson announced at the same time his intention to set up a Production Council and a new committee to inquire into monopoly. For the Production Council there is a good case—if it proves to be a reality and not another of the well-meaning institutions with which the film industry is becoming endowed. It could do something to speed up the "turn-round" of studio space. It could harry ostentatious expenditure, whenever expenditure loses sight of the goal of entertainment value. Whether it will do these things will depend on the backing it gets. As for the new committee of inquiry, it is of course admirable that the hindrances which face the independent producer should be investigated and published. But much is known about them already, and little has been done. The Palache Committee produced an excellent report in 1944, but only one or two of its recommendations have been taken up. A new report would add some new facts, and bring them up to date in detail, but if it had no better fate than its predecessor it would have little point.

Prices Referendum in Australia

First shots have been fired in Australia in the campaign for this year's referendum on Federal rent and price control. It has opened with the issue of the official "Yes" and "No" cases which will be distributed to all electors by the chief electoral officer. The "Yes" case was prepared under the supervision of the Attorney-General, Dr. Evatt, and the "No" case by the leader of the Federal Opposition, Mr. Menzies, and the leader of the Country Party, Mr. Fadden. During the war years, the Commonwealth Government administered control of prices and rents on an Australia-wide basis under the defence powers contained in the constitution; but, with the gradual move back to a peace time economy, there is grave doubt whether the Commonwealth can continue to exercise these controls and so the issue is being put to the electors by referendum.

The Commonwealth Government's case claims that a "Yes" vote will mean protection against inflation, fair rentals, security against eviction, real benefit from wage and salary increases, fair value for money, protection for savings and deferred pay, full value for life assurance, superannuation and social service benefits. It is claiming that a "No" vote would expose the public to inflation, boom and depression, profiteering, rack-renting and blackmarketing, eviction from homes, a scramble for houses and goods with the rich always winning, decrease in the real value of savings, and industrial unrest.

The "No" case says that the powers sought by the Chifley Government would enable Canberra to fix not only prices, but profits, house rents and everything associated with rents. It is pointed out in support of the "No" case that most of the states already have price control laws; the others could introduce them at a few hours' notice. The controls would be administered much more efficiently by state authorities. Prices, it is claimed, have never been higher, and blackmarketing is widespread under Canberra's price control, which is increasingly becoming profit control.

Since federation, the Australian elector has shown as great a disinclination as the American elector to alter the constitution. Appeals to the people to alter the constitution by referendum have failed almost without exception. The constitution in Australia seems almost to be sacrosanct. They have already rejected Federal control of prices and rents in the general powers referendum of 1944; but in the present instance the Federal Government is so seized with the importance of preventing unrestrained inflation as a threat to its economic policy, that it is presenting it as a single issue. There is bound to be great opposition, and already the Government is being told by the Press that it "should be divesting itself of wartime controls, not trying to rivet them permanently on the country."

New Ships for Old

When steel is scarce it may be necessary to scrap old warships to build new ones. More than once in the history of the Royal Navy timber shortage has forced this policy on the Admiralty. But there are other good reasons for the decision, announced on Wednesday in the House of Commons, to break up five old capital ships and provide the hungry steel industry with over 82,000 tons of scrap. The maintenance in reserve of 30,000 ton warships costs much money and diverts a thousand men from more useful duties. Moreover, the balance of naval power is now—and will remain in the immediate future—such that a cut in the strength of the Fleet is less open to nervous criticism than it would be later. Should that balance be seriously threatened, whether by developments in air warfare and long-distance projectiles or by the emergence of a new naval Power, the adaptation of old ships would be a poor substitute for new building.

The Civil Lord of the Admiralty has given an assurance that the battle training squadron at Portland will not be affected. Of the five up to date battleships now available the *Vanguard*, *King George V*, *Duke of York*, *Anson* and *Howe*, only two are in full commission. With the future of the battleship in doubt, the investment is large enough.

Six years ago two of the victims—the *Queen Elizabeth* and the *Valiant*, were maintaining naval supremacy in the eastern Mediterranean by the narrowest margin against torpedo bombers, submarines and under-water attack in harbour. And the *Rodney* was able to engage and batter the *Bismarck* only when carrier aircraft had lamed the ship which had kept the Home Fleet for long months in a state of nervous watchfulness. Everyone knew that these veterans and the *Nelson* and *Renown* could not stand up against their successors of the King George V class, planned before the last war. At that point they became due for scrapping at the first opportunity.

Shorter Notes

After last month's debate in the House of Commons, when over 160 Labour and Communist members voted for a reduction of £5,000 in the allowance to Princess Elizabeth, the passing of the second reading of the Annuities Bill with a minority of only 16 came as a welcome surprise. The Government were very wise in ignoring the amendment to be moved in committee, the purpose of which is to separate the personal allowances of the Princess and the Duke from their official expenditure. This would only create endless trouble and embarrassments and it is to be hoped that no more will be heard of it.

*

The Overseas Resources Development Bill passed its report stage and third reading in the House of Commons on Tuesday. As on earlier occasions, the sole point at issue was the Minister of Food's intervention, through the establishment of the Overseas Food Corporation, in matters that should be the responsibility of the Colonial Secretary. Mr. Strachey again rejected amendments designed to exclude the Overseas Food Corporation from colonial territories, or to enable its projects to be transferred to the Colonial Development Corporation; but the point is likely to be raised again in the Lords.

*

A correction is required to figures about composers' wages which appeared in a note on "The Wages Spiral" in last week's issue of *The Economist*. The claim of the London Society of Compositors called for an increase of 22s. on their minimum wage of £6 5s. It may be added that the Society has accepted the award of the National Arbitration Tribunal for an increase of 15s. per week.

*

As the situation in Greece has faded out of the news, that in Trieste has come into it. The sharp diplomatic exchanges between the British and the Americans on the one side and the Yugoslavs on the other about conditions in the occupied zones of the Free Territory may have had their effect on Marshal Tito, the only statesman in south-east Europe able to talk frankly to Moscow. Meanwhile after four months' effort, no governor has been found for this inflammable area, in spite of the high quality of candidates suggested. The chief reason for the failure is that none of the interested Powers wishes to withdraw its troops—which they would have to do once a governor had been installed.

Letters to the Editor

A Capital Levy?

SIR,—Your leading article of January 17th, having admitted the justification for a levy on those holdings of capital that have increased since 1939, was deterred from advocating such a tax in practice on the grounds of the difficulties involved in the identification of pre-war holdings. There is, however, a possible solution to this problem. Capital, for the purpose of the tax, could be computed by capitalising the unearned income as disclosed by the taxpayer's income tax returns, and provisional assessments could be based on the increase in such notional capital.

The Inland Revenue would extract from the income tax return for 1939-40 the taxpayer's total income for the year to April 5, 1939. There would be deducted therefrom the income from "trades, professions and vocations" and from "employments, offices and pensions," leaving the income derived from dividends, interest, property, etc. From this would be deducted interest, etc., payable and ground rents, to arrive at the net unearned income. The net unearned income would be multiplied by, say, 20, to give the notional capital in 1939. A similar calculation would be made for the year to April 5, 1947. The 1939 figure would be increased by, say, 40 per cent to allow for the rise in the cost of living, and the increase, if any, between the 1939 figure (plus 40 per cent) and the 1947 figure would be provisionally assessed as the capital increment during the war period, and would be taxed at whatever rate was decided upon.

Any taxpayer aggrieved by the somewhat summary treatment outlined above should be given the option of having an amended assessment made based on the actual figures of capital holdings in 1939 and 1947 computed on the same lines as for estate duty. In such case, the onus of substantiating the actual holdings should fall on the taxpayer.

It is appreciated that, in the case of the provisional assessment, many anomalies would arise, such as, for example, where a partnership has been converted into a limited company, but such anomalies would be rectified by the option to base the assessment on actual holdings. Furthermore, the provisional assessment would fail to gather into the net any increase in "portable property" which would escape unless the taxpayer opted to be assessed on the actual figures. No scheme, however, no matter how devised, could cope really effectively with such elusive assets.

As your leader pointed out, some form of capital tax is a political necessity if an attack is to be made on food subsidies. Its yield may well prove disappointing, but even so it would still be a most desirable measure if only to prove that capital does not, automatically accumulate in the way portrayed in the Marxist legend.—Yours faithfully,

A. P. W. SIMON

Palmerston House, Old Broad Street, London, E.C.

Danish Socialists Return

SIR,—The very instructive correspondence from Copenhagen, "The Danish Socialists Return to Office" (on page 1946 in your issue of December 27th), needs perhaps a supplement about the financial position of Denmark. In this field Denmark has made a great effort to put her house in order by reducing the overwhelm-

ing spending power created during the German occupation, and remarkable results have been achieved.

The costs of the German occupation were covered by the National Bank of Denmark under Government guarantee. After the liberation the guarantee naturally became effective, and at the end of 1945 the Bank's balance-sheet showed a Government debt of 7,611 mill. Kr. on the "Government Regulation Account." Since then the debt has been reduced to 5,609 mill. Kr., or by more than 2,000 mill. Kr. This reduction, which I think is unique, is due to a series of financial measures, including a tax on the increase of property and a general capital levy. Various Acts in force are expected to produce a further reduction.

This effort has, together with the restoration during the first half of 1946 of the equilibrium in the state budget, contributed very much to the re-establishment of sound monetary conditions in Denmark. We feel sure that the new Government will carry this development a further step forward.—Yours faithfully,

C. V. BRAMSNAES,

Copenhagen Governor of the National Bank of Denmark

Municipal Trading

SIR,—It is unfortunate that your short note in last week's issue should have so misrepresented the recent Birmingham plebiscite. In the first place, personal observation and first-hand information convince me that the 43,382 electors who voted against the furniture trading proposal were by no means merely members of the shopkeeping community. They were a very wide cross section of the general public, and, in fact, the closing of the poll at 8 p.m. prevented many small shopkeepers from recording their vote. The case for municipal participation in the trade was not based on dissatisfaction with existing quality or service—indeed the Council spokesman categorically denied any such motive.

As for hotels, the principal Birmingham hotel company has not so far been able to pay a dividend on its ordinary shares, and the industry here is seriously handicapped by the fact that only from Monday to Thursday is there any demand for accommodation. The likelihood of a municipal hotel being other than an expense to the ratepayers is therefore small.

This particular Bill would have empowered the Corporation to manufacture furniture and dispose of it at any price by hiring or selling. I cannot think that you would defend trading on such terms as fair competition with the heavily rated shopkeepers of the city.—Yours faithfully,

H. CLEGG

3 Newnham Road, Edgbaston, Birmingham

Palestine Immigration

SIR,—If there is a good case against the partition of Palestine, it is certainly not the one advanced by Mr. Michael Thornton in your issue of January 10th. He claims that the United Nations scheme is invalid because Jewish immigration will use up the country's water resources to the detriment of the Arabs. His assumption is not borne out either by irrigation experts or by the layman's observation in Palestine.

Issued by The National Savings Committee

On July 4, 1939, a deputation to the Colonial Office, headed by Sir Frank Sanderson, MP, and including Sir Murdoch McDonald, MP, Sir Thomas Moore, MP, and Admiral Taylor, MP—a deputation that no one could accuse of pro-Zionist bias—advanced the opinion of various authorities that the Negeb had, in the early centuries of the present era, maintained a considerable population (about half a million), and urged that the Jews should be given the opportunity of revitalising it through irrigation and water conservation.

From *The Economist* of 1848

January 22, 1848.

OUR peace-loving countrymen, who are extremely anxious to obtain a reduction of the window taxes, and a modification or abolition of the excise laws, must now see that the warlike aspirations of our journalists, at their comfortable firesides, are producing corresponding aspirations in the Paris journalists. Ministers in both countries will allow themselves to be coaxed by such writers, claiming to represent the public, into augmenting the military forces and extending their patronage. The naval superiority and complete security of England, however, being manifest, the demands here for additional armaments justify some alarm across the water. Our chimerical fears appear hypocritical there, and all the hostile population of France infer that our increase of force is to menace, insult, and invade their country. Had the good sense of our people therefore not detected the silly and extravagant fallacies of our war agitators, and laughed at their idle fears, England and France, like two angry men, would have gone on swearing and squaring at each other till some fancied opportunity of planting a successful blow had excited them to pummel each other to disfigurement, blindness and exhaustion. What a result for the Liberal press to boast of in the two most civilised nations of the earth! But neither in France nor in England do the invasion-fearing and war-provoking journals determine the opinion of the people; and we shall have at present neither invasion nor war. The budget presented to the French Chambers contains a reduction both in the army and navy estimates, and that example will supply no warrant for an increase here.

AMERICAN SURVEY •

The President's Programme

(From Our US Editorial Staff)

NOW that all three of the President's annual messages have been delivered to the Congress it is possible to assess not only the political and economic state of this nation as the Administration sees it, but also what the Administration proposes to do about it in this election year. The November elections explain a great deal. Gallup poll takers had felt the nation's pulse only three days earlier and discovered that Mr Truman's popularity compared with that of Mr Taft was as 63 is to 37. If the Presidential tone was warmed by that poll, the courtesy with which a Republican Congress listened was also cooled by it.

The first message was obviously framed as a campaign document. It is not enough for a Democratic President, facing this election year, to survey America's problems at home and abroad with the eye of a statesman. He must also state them with the guile of a candidate under fire from left as well as right. How well Mr Truman succeeded may be measured by Mr Taft's assertion to the microphones on the following night that Henry Wallace "would have a hard time to find anything to promise the people of this country that is not promised in this message."

The details of the President's goals, of how he aims to achieve them and 'to pay for them, are contained in the other two messages, delivered in printed form five and seven days later. Mr Truman went back ten years to draw from the "amazing

Anyone who has been in Palestine will know of the great volume of water which runs to waste during the heavy rains ; and how, when it is piped into desert regions, the barren land becomes fertile. During the last twenty-five years, Jewish irrigation schemes have brought visible benefits to the Arabs. They have created new areas of Arab settlement, and contributed to the reduction of the Arab mortality rate. I very much hope that under the Economic Council of Uno, a Joint Water Authority will be established with both Jewish and Arab representation, so that the advantages of modern irrigation may be equally available to each, and that the ample waters of the Jordan may join and not divide the two peoples.—Yours faithfully,

House of Commons, London, S.W.1 MAURICE EDELMAN.

Refugees without Refuge

SIR,—I have read with great interest the article in your issue for January 17th, in which the achievements and future hopes of the Preparatory Commission for the International Refugee Organisation are discussed. In the course of the article, however, you quote some figures of refugees who have departed for resettlement under PCIRO auspices, showing the countries of destination. In their present context, these figures could be construed as representing the total number of refugees resettled by PCIRO in the first four months of its existence, whereas, in fact, they are the totals for a selected list of countries for the month of September, 1947, only. The totals for the first four months for each country are, of course considerably in excess of those which you quote and amount in all to 76,000, the figure which is correctly given in an earlier part of your article. I hope you will allow me to correct this ambiguity in an otherwise accurate and well-informed article.

In the table of figures which I have mentioned, the total under the Westward Ho! Scheme is given as 3,026 but I think I should point out that the Westward Ho! Scheme was begun by the British Government in April, 1947, before PCIRO came into existence, and up to the present time nearly 40,000 volunteer workers have been admitted into this country under the scheme.—
Yours faithfully, LESLIE DOW.

Chief, PCIRO Office, United Kingdom

19 Hill Street, London, W.1

economic progress of the last ten years " an augury for the next ten. Here at home,

Fourteen million more people have jobs than in 1938. . . . The average income of our people measured in dollars of equal purchasing power has increased, after taxes, by more than 50 per cent. . . . In no other ten years have farmers, business men and wage-earners made such great gains.

In the future we may not be able to do so well because we start from a high plateau of production and from full employment. "But we can increase our annual output by at least one-third above the present level. We can lift our standard of living to nearly double what it was ten years ago." To achieve this, "agriculture, business and labour must move forward together." There must be for the farmer continued price support, crop insurance, improvement in crop distribution, further rural electrification; for labour, continued full employment and a rise in the minimum wage from 40 cents an hour to 75 cents; for industry, an atmosphere in which full production will flourish—"free competition is the key to industrial development," and "vigorous private enterprise is vital."

Abroad—and the importance to Europe of the achievement and its continuance needs no argument—Mr Truman rejoices that “we were able to provide aid to war torn and distressed countries.” He is confident of the ultimate success of the

United Nations; he reaffirms his faith in the soundness of the European Recovery Programme, and urges Congress to act promptly "on this decisive contribution to world peace."

What chiefly worries the President is the inflationary trend that accompanies this prosperity. He hopes to brake it without also slowing the wheels of industry, and he believes that his ten-point programme, of which Congress has accepted only three points, will do it. He wants prosperity stabilised at somewhere near the present peak, with full employment, full production (not yet achieved) and the price-income structure so adjusted as to stop the inflationary spiral without reducing production or extensive unemployment. Having achieved that miracle, he would like "to establish firmer foundations for the long-range growth and prosperity of our economy in the years ahead."

The estimated cost of such a programme for the fiscal year which runs from July 1, 1948, to June 30, 1949, is set at \$39.7 billion. The anticipated income (taxes to remain about the same) is \$44.5 billion, leaving a surplus of \$4.8 billion to take a minute tuck in the national debt. If none of Mr Truman's recommended new legislation is added, it will still cost \$34 billion to run the country as it is. The first figure is, as Mr Taft immediately complained, four times the amount spent before the war. It is also two billion more than the budget on which the Government is now operating, and while the former comparison may be more spectacular, the latter is more vulnerable to the criticisms of Congressmen.

The President calls attention to the grim fact that 79 per cent of this largest peacetime budget "directly reflects the cost of war, the effects of war, our efforts to prevent a future war." Defence alone takes 28 per cent of the budget, international affairs and finance 18 per cent. Compared with them, the social programmes, which provoked instant attack, cost very little. The President's new health, education, housing and social security programmes will cost \$452 million, which is a mere 1 per cent of the budget. It is not the warm heart that strains the purse, but the hot war and the cold one which has succeeded it.

Over the longer term the President's goals as set forth in his political message are five—

To secure fully the essential human rights of our citizens.

To protect and develop our human resources.
To conserve and use our natural resources so that they can
contribute most effectively to the welfare of our people.

To lift the standard of living for all our people by strengthening our economic system and sharing more broadly among our people the goods we produce.

To achieve world peace based on principles of freedom and justice and the equality of nations.

Those goals share in their language the unreality of a political platform—which promises all things to all citizens, but they cannot be entirely dismissed on that ground. They come at the end of fifteen years of Democratic success in saying what the people want to hear. They form a banner for the party, but they are also a wreath on a tomb, and a pledge that faith will be kept with the social aspirations of the New Deal even though the economic conditions which evoked it are long gone and the theories which supported it have changed. This is the voice of the welfare state—rich, powerful, aiming to do everything possible to raise the standard of its citizens' living still higher, wanting a peaceful world in which to do it, ready to help pay the costs of achieving that peace. In the process it even hopes—and this, implicit in the President's economic report, is spelled out in the earlier report of his Economic Advisers—to solve an ancient riddle of the economic sphinx, the problem of

balance between capital and consumer consumption of goods and services; the balance between output and absorption, or between supply and demand, which can be achieved only through an ever-improving management of the wage-price-profit structure by those who shape it; and the balance which depends upon economically efficient distribution of national income, not only between producers and consumers or between employers and workers, but also between industry and agriculture and among the various sections of the country.

Presumably the balance between Government and private enterprise would be set in the process.

These ideals may be illusory, but they are not puny. For all their verbiage, the messages cannot be accused of reflecting a short or a narrow view. That a depression may in 1948 mock their figures of achievement and render their aspirations for the future as insubstantial as a smoke ring in a gale is beside the point. The welfare state got its start in the deepest depression this country has ever known. It is Mr Hoover's phrase that Mr Truman echoed when he talked of "stamping out poverty in our generation." Poverty, that time, swept Mr Hoover out of office, and the Democrats in. That Mr Truman dares to snap his finger at what must still make the Republican shudder is a measure of his confidence that if the worst comes again, the pattern which his party established can again be invoked successfully.

The Oil Shortage

(FROM AN INDUSTRIAL CORRESPONDENT)

For the first time in a quarter of a century the United States is feeling the pinch of a peacetime oil shortage. After supplying the major part of the world's oil needs during the 88 years of its history, the industry is confessing by public advertisement its inability fully to supply its domestic market.

The shortage has not yet become a national catastrophe, or even a crisis; the Gulf, Rocky Mountain, and Pacific Coast States are not seriously affected. But in the mid-west and Atlantic coast States, where normally two-thirds of the nation's oil is consumed, the shortage generally is 15 per cent and much higher in some areas. Cold homes and schools, and closed factories, are freely forecast by the spring. An unusually severe or prolonged winter in that region could bring a repetition of the British experience of a year ago.

The industry is at present pointing not one but a whole handful of accusing fingers: one at the steel industry, another at transportation, a third at labour, and a fourth at the weather, leaving the thumb to pillory demand, which ironically is the result of the industry's own efforts to educate the public to the superior virtues of petroleum products.

With five so occupied, no digits are, naturally, left to point accusingly at several other pertinent factors, among which industrial myopia must be accorded a prominent position. The economists of the industry steadfastly refused, for a year after V-J Day, to appreciate adequately the popularity of their own wares, and for another year, after it became unmistakable, refused to believe that such popularity, deserved though it must be, would last. A business recession was counted on to provide relief from the necessity for doing much about it. Now, belatedly, a \$4 billion expansion campaign has been launched, which, because of the difficulty of obtaining sufficient steel, cannot be completed before some time in 1949, but which, started two years or even one year ago, would have contributed that much precious time toward meeting a demand now reproachfully described as "unprecedented." By 1949, of course, demand will be still higher. It is unlikely that supply can match it much before 1951 or 1952, and perhaps not then.

It is easy to account for the increased demand. More vehicles in 1946 used one-third more gasoline than in 1945; final figures for 1947, not yet available, are expected to show as large an increase, perhaps larger. Oil burner (furnace) installations, a record 500,000 units in 1946, approached 1,000,000 last year. Farm consumption, owing to mechanisation, was up 100

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

per cent last year over 1941. Increased use of diesel locomotives, and new uses, such as kerosene heaters for tobacco curing and butadiene for synthetic rubber, played a part in raising demand last year by 10 per cent above 1946, compared with an annual prewar increase of about 5 per cent.

The key to the shortage in the mid-west, where rationing was in effect unofficially a year ago, is the decline in production of the oilfields in that area, the second most heavily populated and industrialised region in the country. Before the last war, production in this district, which runs roughly from Oklahoma, Missouri, and Tennessee north to the Canadian border, was adequate for indigenous needs. Between 1941 and 1947, however, production fell from 404 million barrels annually to about 345 million, a decline of 15 per cent, while indigenous demand rose more than 30 per cent. The inevitable consequence was importation of crude oil from surplus areas as far away as west Texas. This brought on the shortage of tank cars, barges and pipe line capacity, of which the industry now complains, but it is the result of the mid-west oil shortage, not the cause.

The key to the Atlantic seaboard shortage is tankers. This district, the most heavily populated and industrialised of the nation, gets more than 95 per cent of its supply by water. As late as last June, war surplus tankers were going begging. After buying seven during the previous six months, industry spokesmen told the House Maritime and Fisheries Committee that it had plenty of tankers to supply the east coast and was not interested in buying more except on its own terms. In order to get rid of them, the Maritime Commission sold 83 abroad and delivered most of them, before the industry, only a few weeks ago, came to its senses and realised that the shortage it had hoped would be confined to the mid-west was spreading to the east coast. It is now moving heaven and earth, and hopes to move the State Department, to delay delivery of 22 vessels which have not yet actually changed hands, to keep them in service for the east coast.

Whatever its past shortsightedness, the industry is exerting prodigious efforts. Production has been raised from about 3,800,000 barrels a day in 1941 to nearly 5,600,000 barrels—far beyond the war peak of 4,900,000 barrels a day in July, 1945. Trainloads of tank cars are operating from the Gulf states to the mid-west. The Government is keeping inland waterways open this winter for barge movements as far north as the Great Lakes. Plans are under way for co-operation between Government and industry under the authority, granted by Congress at the recent special session, for industry agreements on pooling supplies. The chief bottleneck now is refining capacity, and will be for several years to come.

The Bureau of Mines points out in its January forecast that supply depends as much on refinery capacity as on transport facilities. Refinery runs, the Bureau reported, were 97 per cent of rated capacity, allowing for normal maintenance shutdowns, during December, and 103 per cent (5,636,000 barrels a day) during the week ending January 3rd. The January 3rd figure does not reflect the effect of a ten-day strike at a 100,000-barrels-a-day refinery in Texas. Other contingencies are likely to preclude miracles such as the 103 per cent operation from recurring often enough to reduce the estimated 15 per cent shortage in the mid-west and east coast materially.

Exports of 163 million barrels last year were still above imports of 157 million. The Bureau of Mines forecast for 1948, however, is 149 million barrels for exports and 166.8 million for imports, the first time the country has been a net importer since 1923.

Summarised briefly, the United States last year used nearly 2 billion barrels of oil, twice as much oil as all other nations of

the world combined. From present indications, its fields, owing to the declining discovery rate, can no longer supply the still rising domestic demand, much less exports. Imports can, and, unless the discovery rate improves radically, will have to meet the deficiency for a time. Far-sighted oilmen are talking seriously about synthetics.

American Notes

Witnesses for ERP

The past week has seen a steady stream of official and unofficial testimony for the Marshall Plan presented to the Congressional Committees. Military experts like Mr Forrestal and Mr Royall have insisted that the costs of no Marshall Plan in terms of increased defence appropriations and the return of Selective Service, would be far greater than those of the European relief and recovery programme. The Secretary of the Treasury, Mr Snyder, questioned closely about the hidden dollar assets of individual Europeans, agreed with Senator Lodge that it was outrageous to tax poor Americans while wealthy Europeans made no contribution to European recovery, but urged that it would be shortsighted to force a crippling liquidation of investments and gold and dollar balances as a condition of aid.

The witness upon whom Senators fastened with most enthusiasm was Mr McCloy, the president of the World Bank, not for his statement that the \$6.8 billion sought would be rather a "tight fit," but to find out whether it would not be possible to include in the Recovery Bill provisions for "following our dollars abroad" similar to those employed by the Bank after a loan is made. Some such protective device, Senator Vandenberg insisted, would dissolve half the opposition to the Marshall Plan.

The freshest testimony came, however, from 70-year-old Mr Bernard Baruch, the first of the eminent private witnesses to be summoned to the witness stand. Mr Baruch not only argued convincingly for the Recovery plan; he presented a whole supplementary programme of his own to increase its effectiveness. The appropriation of dollars, he said, was not enough; world recovery required new efforts in American production, military and political guarantees, and a much broader acceptance by the United States of world imports.

His programme included eleven specific points, including a solid American guarantee against aggression for European nations banding together into a political, economic and defence union under the United Nations; American anti-inflation programme centring on the reduction of farm prices in return for a three years' price guarantee to farmers; a two-year peace production drive in the United States; American purchase of all surplus of non-perishable raw material surpluses; the extension of the President's tariff authority for three years while allowing other countries to maintain their Empire preferences; the stabilisation of European currencies at a realistic level; and the realistic settlements of all prewar and wartime inter-governmental debt.

Congressmen, whose chief concern is to whittle down and safeguard the American investment in the Marshall Plan, did not seem impressed by Mr Baruch's much wider view of the commitments needed to make recovery a reality. But his testimony is a useful reminder that the Marshall Plan cannot operate in a vacuum; and the fruitfulness of the dollars will be conditioned as much by the fear of war, and American policy on trade, production, and inflation, as by bankers' checks and balances.

A Vandenberg Compromise?

Outside the committee rooms, the chief development in the Marshall Plan has been the formation of a body of twenty Republican Senators, most of them with isolationist backgrounds, to debate amendments to the Marshall Plan which they wish to submit to Senator Vandenberg. This is the source of rumours that there is to be another, more modest plan for European recovery bearing the Republican label. At the moment, however, even die-hards like Senators Wherry, Butler, and Brooks seem less concerned with voicing their opposition to ERP than with the danger of a split in the party between Senator Taft and Senator Vandenberg over foreign policy. Senator Vandenberg, even if he wished to, could hardly carry all the dissidents of his own party along the path indicated by the Administration. Their "constructive proposals" may well be the price of a bargain which would avoid a rupture in an election year when a common party policy is essential.

Republican doubts about the administration and control of the

plan still hang most heavily over its future. Senator Taft in a radio address this week suggested that the recovery administration be headed by an independent executive of Cabinet rank, who would be an equal of the Secretary of State, a hard-boiled representative of the American interest, who would put a brake on the State Department "which is only interested in giving American money away for foreign policy purposes." This is a far cry from the ultimate control over the foreign policy aspects of the Marshall Plan demanded by the Secretary of State.

The way seems to be open for another Vandenberg compromise, such as those which reconciled Congress and the Administration over control of atomic energy and tariff policy. The Senator is said to be considering a proposal which would give the Secretary of State only advisory powers over the recovery administration. Would this be acceptable to Mr Marshall? He may well realise, by now, that if he cannot convince Senator Vandenberg and the Senate Foreign Relations Committee of the soundness of the Administration scheme for control, the prospects are almost hopeless in the House. An acrimonious stalemate over the chain of command may easily endanger the adequacy of the appropriation and the success of the whole plan. The Administration may consider that a tactical retreat on this point would gain the substance and sacrifice only the shadow, for the President is unlikely to appoint an administrator unsympathetic to Mr Marshall. Such a concession, coupled with the checks on expenditure advocated by Mr Vandenberg, would probably meet most of the objections of the "Committee of Twenty" who, for all their isolationist past, show no open desire to face the tide of general approval for the Marshall Plan, and revive the "little group of wilful men" of the first world war. It would also carry good hopes of sidetracking the Herter proposals in the House, which would in real earnest create a second Secretary of State.

Budget Reactions

Budget Reactions

First reactions to Mr. Truman's \$40 billion Budget suggest that his own party leaders are scarcely enthusiastic about the proposal to relieve lower income groups at the expense of a higher charge against company revenues. Mr. Robert Doughton, who ranks as the senior Democratic member of the House Ways and Means Committee, has stated quite publicly that he "has not yet chosen" between the Presidential plan and that put forward by the majority party—for tax reductions that would take at least \$5.6 billion from present revenue estimates. And, contrary to the usual procedure, the new Tax Bill has been introduced by a junior member of the Democratic Party.

The proposal to raise the company tax charge, from 38 per cent to over 50 per cent is meeting with strenuous opposition, not only by reason of its contrast with the gift held out to personal taxpayers (who carry votes), but also because of its apparent clash with the President's own forceful recommendations for increasing productivity through capital expenditure. Actually, the clash is between the shorter-term objective and longer-range plans, but Mr Truman could hardly expect, in an election year, to get away with plans that carry such an obvious appeal to the Left-wing of the Democratic Party.

In turn, the Republican majority will probably have considerable difficulty in pressing their own plans for tax reduction. The most likely development seems to be a revival of the 1947 struggle between House and Senate, for Republican spokesmen in the Senate have already agreed that proposals for a "ceiling" on Federal expenditures cannot be very sensible, unless Congress has previously agreed upon a fairly narrow range of estimates for foreign aid. The President may at some later stage be willing to make modest concessions to win agreement in other fields. But the general impression now is that any major tax cut will have to survive a Presidential veto.

The danger of fastening upon foreign relief appropriations for economy work has been increased by the report, discussed last week, on air defence. Most Republican Congressmen will probably be unwilling to curtail many of the social welfare funds suggested, despite the display of righteous indignation which always accompanies a Budget Message. And they will, presumably, be more unwilling to cut defence estimates, which have risen from \$10.7 billion in 1947-48 to \$11 billion in 1948-49. Indeed, if Congress accepts the Air Policy Commission's figures, defence costs could easily rise by \$3 billion over the period to June 30th, 1949.

There is also controversy about the deflationary impact of the Treasury surplus over the next eighteen months. By adding together 1948 and 1949 surpluses, and by including government fund operations and Treasury Bond sales, it has been calculated that a total of \$22 billion may, possibly, be withdrawn from the

stream of incomes during that period. But with estimates pushed so far ahead, it is scarcely profitable to speculate about 1948-49. The \$7 billion surplus over the rest of 1947-48 could in itself have quite a salutary effect if it became available completely for debt reduction. But plans for cutting taxes may upset Treasury operations, and the Reserve Board can support long-term interest rates at the present low level only by offsetting the effects of reductions in the debt.

Voluntary Controls

The Department of Commerce, which recently received an extension and reinforcement of its powers of export control, last week declared that commercial shipments of all commodities to Europe would require individual licences. The new policy will operate from March 1st, and will embrace the United Kingdom, continental Europe, Turkey, the Soviet Union, and its Asiatic possessions. Much of the controversy attaching to this new regulation seems to have been resolved by the firm declaration that existing export agencies will not be penalised, that Government operations will be restricted to a necessary minimum, and that foreign Governments will not be given a dominant role in the selection of channels of supply. Closer supervision of possible supplies for Soviet Russia and its satellite states is one obvious feature of the plan, the primary purpose of which, however, is to establish the direct controls which will become necessary under the European Recovery Programme.

Over the wider industrial field, the process of securing agreements for the voluntary allocation of scarce materials is making much slower headway. The first moves rest with the Department itself which is responsible for all commodities, other than food and fuel, and which must determine priority programmes, especially for such products as freight cars, oil, farm and electrical power equipment, and fertilisers. Production quotas will be given to each producer, who must determine his material needs, and secure voluntary agreements with suppliers. The steel industry, as key supplier to all these industries, has naturally been first on the list of consultants. For that industry, voluntary allocation has been agreed. Production quotas, however, form only the initial link in a chain of curbs which may become necessary if domestic demands continue at their present level, and many spokesmen for steel have declared that they would resist strongly any "policing programme" in terms of trade quotas or inventory controls.

At the moment, official comments bless the informal approach, and stress the need for "minimum interference with industry." A belief seems to be prevalent that that much can be attained by plans for standardising equipment, using substitute materials, and securing maximum output, and there may well be a certain amount of official reliance upon some reduction in domestic demand in the months ahead. What does seem certain is that the pattern of agreement for industry will take some time to complete, and will become progressively harder as negotiations move away from those industries which have for long experienced some form of voluntary curb. In many quarters, there has been a loose comparison drawn between the new type of voluntary agreement, and those established by the National Recovery Act (the short-lived NRA codes). But while enforcement by Congress might now go much farther than seems to be generally recognised, such action could follow only from a complete refusal by producers to accept the minimum of control now authorised.

Wallace and the Wishful Thinkers

The first Gallup poll to be taken since Mr Wallace's announcement that he would run for President on a third-party ticket has given a rude jolt to the wishful thinkers in the Republican Party. In New York State, the poll taken on January 10th showed that even with Mr Wallace receiving 18 per cent of the total vote, Mr Truman could still beat Senator Taft quite comfortably: by 47 per cent to 31 per cent. On the other hand, if Governor Dewey is the Republican candidate, Mr. Wallace's intervention gives him a lead over the President of 44 per cent to 41 per cent. The greatest interest, however, lies in the suggestion that if the contest were between General Eisenhower and President Truman, the General would walk away with 56 per cent of the total votes, against 31 per cent for Mr Truman and 13 per cent for Mr Wallace.

It is a remarkable coincidence that, within a week of the publication of the poll, Governor Dewey announced that, although he would not campaign actively for the nomination, he had no objection to being pushed; and General Eisenhower, by neglecting to

disavow the filing of his name in the New Hampshire primaries, suggested to the cynics that he was of much the same mind. With the campaign shaping up so rapidly, it is evidently time for all good men to come to the aid of their candidacies.

A poll taken in New York may well exaggerate the national strength of Governor Dewey and the national weakness of Senator Taft; for Governor Dewey is New York's favourite son, and Senator Taft is no favourite with organised labour, which is strong in New York. Further public opinion polls, covering the whole country, and particularly Illinois and California, will be awaited with intense interest by both parties. But New York is the key State, both because it sends the largest delegation to the electoral college and the party conventions, and because it contains the core of Wallace strength. It is not too early to conclude that Mr Wallace's buzz is worse than his bite. His intervention can defeat the Democrats, but only if the Republicans have a strong candidate. It does not seem that he can assure the election of a Republican the people do not want; and the preference is very clear for new blood in the grand old party. Those Republicans who thought that the Wallace for President movement gave them a free rein to disregard public opinion in choosing a candidate will have to think again. The greatest danger of a Left Wing third party, that it would strengthen the likelihood of a reactionary Republican nomination, appears to have been averted.

Labour's Share of the Cake

The third round of wage increases for organised labour is now under way by the pace-makers of the Congress of Industrial Organisations. In Detroit Mr Walter Reuther has announced that the General Motors Corporation would be asked for an increase of 25 cents an hour, with an additional 5 cents an hour for health benefits, a guaranteed 44-hour week, and other fringe concessions. The United Electrical Workers, which represents the left wing of the CIO as Mr Reuther represents the right, had already announced that it meant to get back for its workers everything they had lost through price rises since 1945—amounting to \$13 a week. A wage and working rule dispute already exists between the railways and the three brotherhoods of operating employees, who are demanding a 30 per cent increase. The steelworkers are marshalling the arguments for rises in anticipation of the reopening of their contract on April 1st.

For the three CIO unions, these arguments are twofold: the bloated state of profits, and the steady sucking away of workers' purchasing power through price rises. Mr Reuther, for example, long an advocate of "looking at the books," has reckoned that the profits of General Motors, Chrysler, and six independents totalled \$450 million in 1947, after taxes, a return of 22.2 per cent on the capitalisation of the companies. If the present wage demands were granted, he estimated that the return would still

U S Business Bulletin

THE ECONOMIST receives every week, from its own correspondents and from other sources, a great deal more information on business conditions and economic developments in the United States than can possibly be used for "American Survey."

It is therefore proposed to issue for private circulation a fortnightly "U S Business Bulletin" which will contain a more extensive digest and analysis of this information than can appear in the paper. It will be designed to be of value both to exporters and also to those more generally interested in economic affairs in America.

Detailed information on this bulletin will be available shortly and will be sent to any reader who would like to receive it. Please address your request to:

Manager, The Economist Intelligence Unit, 22 Ryder Street,
St. James's, London, S.W.1

stand at 12.5 per cent in 1948. But the demands, he insisted, at least as to the first 25 cents, represented no increase in wages; they simply would enable the wage-earner to catch up with the cost of living. The other 5 cents is a demand for a "modest share in the nation's progress."

The Automobile Workers, the Electrical Workers, and the Steelworkers are three of the highest-paid groups of workers in manufacturing industry in the country. The Autoworkers—the best paid of the three—are at present receiving average hourly earnings of \$1.50; the new rise would give them approximately \$1.75 an hour. The Steelworkers receive \$1.38 an hour, electrical workers \$1.31, against an average manufacturing wage of \$1.24. These figures cast an illuminating light upon the President's request for a minimum wage of 75 cents an hour and the reported willingness of Congress to grant a 65 cent minimum.

Even in the automobile industry, however, hourly earnings amount, even with 52 weeks' work (not often received in 1947, on account of steel shortages) to \$2,860 a year. The Bureau of Labour Statistics recently compiled family budgets showing that the cost of a reasonable—by no means luxurious—standard of living for a family of four ranged, in major cities, from \$3,458 in Washington, DC, to \$3,004 in New Orleans. Many families, of course, have more than one wage-earner; many have fewer than three dependents. The shortness of the working week (37 hours in the automobile industry), though not altogether within the power either of the unions or the industry to change, is more the villain of the piece than the unions like to admit. Nevertheless, in Washington the cost of maintaining a family of four has risen by more than \$500 a year in just over eighteen months. Only the most stringent anti-inflation legislation could have diverted the unions' demand that the workers' slice of the cake be maintained.

Shorter Notices

Mr Truman's Economic Report to Congress foreshadowed a slower pace of shipbuilding than that suggested recently by the Shipping Advisory Committee. New funds sought in Congress total only \$24 million, in contrast with the four-year total of \$600 million for the full programme of forty-six passenger vessels recommended by the Committee. Amounts available for construction and improvement over 1948-49 will be as high as \$70 million, most of which represents work on contracts already under way in 1947. The President has asked for operating subsidies of \$30 million in 1948-49.

While the Administration has still to present formal bank control proposals to Congress, the President states quite clearly in his Economic Report that he "will not consider" proposals to "bring about an anti-inflationary contraction of credit, as in 1920." The Government Bond market will be supported, he says, and if voluntary action fails, "other and less dangerous methods to restrain bank credit" will be used. Mr Eccles, chairman of the Federal Reserve Board, is thus expected to renew his proposals for "secondary reserve" powers designed to protect Treasury Bond quotations while permitting a moderate rise in commercial loan rates.

Mr Petrillo, of the Musicians Union, has scored a resounding court victory over the "anti-Petrillo Act." Criminal charges were brought against him of violating the Lea Act, which prohibits the use of force, express or implied, to make a radio station employ more persons than it needs. The judge who tried the case in Chicago had at first declared the Lea Act unconstitutional, because it was so clearly aimed at Mr Petrillo. The Supreme Court disagreed and ordered the case to be retried. Mr Petrillo has now been acquitted; his counsel declares the Lea Act is dead; and Mr Petrillo is being hailed as the Houdini of the Labour Movement. To judge from the tempers of Congressmen, the Lea Act is likely, however, to be born again, this time with more cautious drafting.

The White House has announced that Mr George Allen, Ambassador to Iran, will succeed Mr Benton as Assistant Secretary of State in charge of public information policy. The post is very much more attractive than it was a year ago. The change of heart Congress has undergone over the "Voice of America" is an astonishing index of an altered international point of view. The Mundt Bill authorising the information services, which was hopelessly obstructed in the last session, will have an early debate and is scheduled for passage.

THE WORLD OVERSEAS

The German Economy in 1947

Bizonia's First Year

THE story is told in Frankfurt of a German business man in Hamburg who found the work of his factory held up for want of cement. So he set off in his car, and drove, on black market petrol, from Hamburg to Frankfurt. There he bought in the black market some packets of chocolate, such as are sold to G.P.'s in their stores for \$1.05 a box, and to Germans illegally for 250 marks. With these he drove to Munich, where he bartered the chocolate for silk stockings, smuggled in from the Soviet zone. He then went on to the Bavarian Alps, where he bartered the stockings to a peasant for butter. With the butter on board he drove all the way back to Hamburg. There he bartered his butter for cement.

The tale might be continued further. The Hamburg manufacturer would produce in his factory just enough to enable him to secure by barter sufficient food and goods to keep his workmen and his family, and to offset the losses which he had incurred through selling a part of his output legally at the prewar fixed price. Then, bearing in mind that currency reform is planned for the spring, and that a large proportion of his cash and bank account will be cancelled, he would store his remaining goods and raw materials as far away from the eyes of authority as possible.

The German situation is unique in the history of inflation. There is neither a runaway inflation, nor a valueless mark. Two organised, comparatively stable systems exist together, but independent of one another. In the legal system, a workman receives an average wage of 180 marks a month, pays his pennings for his tram fare and his starvation rations; the peasant receives 200 marks for a ton of wheat, and the Ruhr mining companies 15 marks for a ton of coal. In the parallel illegal system, a man earns as much in one deal as he would in a month in a factory; a cigarette costs 3 marks, a pound of butter 300 marks, and traders operate on a scale of prices of cigarettes for all the staple commodities.

It is impossible to say what proportion of the population lives entirely under the legal system ; it is probably a minority. The abnormal is becoming the normal. For this reason, many German conservative politicians—influenced by American advocates of free enterprise—attack the Socialists for trying to control everything, and for foundering in a welter of forms in the attempt. Certainly the situation is not one to be cured by issuing more regulations from the Frankfurt Economic Council, to be disregarded like the rest. It calls for a drastic curtailment of spending power, together with a revision of the wages and price structure, and reduction of the present prohibitive taxation on profits. This in turn depends for its success on public confidence in adequate food supplies, greater import of raw materials to replenish stocks, and on a competent administrative machine.

Critical Weeks in the Ruhr

Of these three essentials, only the second is likely to be achieved under the new plan for importing £25 million of raw materials in the first quarter of this year, drawn up by the now American-controlled Joint Export-Import Agency. The food situation may be better, but it is unlikely to have been overcome to the point where confidence in steady, assured and adequate rations is established. The Frankfurter "Government" has no body of competent, trained civil servants to administer its decrees. The best of those who were left after denazification are all in the administrations of the eight States (including Hamburg and Bremen) in this most over-governed and bureaucratic of countries. The Anglo-American zones have a population of just under 40 million; to realise how swollen the bureaucracy has become under the decentralised system, it is only necessary to imagine the situation if the Whitehall Ministries and Parliament were to reproduce themselves eightfold. Frankfurter will only attract good men if the service they are joining is permanent, and part of a fully responsible government. The Ruhr will be highly critical. Docu-

The next few weeks in the Ruhr will be highly critical. Documents such as "Protocol M" are not needed to provide evidence of Moscow-directed Communist efforts to sabotage Western German revival. The Social-Democrat Party knows all about them, and will use its power in the unions and works councils to frustrate

The big change that has taken place since the crisis of early 1947 is the new role of the Americans. Instead of being a purely British responsibility, the control of Ruhr coal is now a joint Anglo-American concern. More than that, the Americans have the greater responsibility, since in the division of functions the control of actual production was secured by them.

There is no point on which all the various American committees which examined the prospects for the Marshall Plan were so unanimous as the fact that the Ruhr is the key to the Plan, and that only better food, distributed partly as incentives, can secure its recovery. Hence the better prospects that this year's crisis may be overcome, even though—owing to the inadequacy of American grain supplies to meet all needs—other countries may suffer.

Failure of the Farmers

The Anglo-American authorities foresaw last autumn, after the effects of the drought were clear, that it would be possible to keep up the present low ration of 1,550 calories for the normal consumer only if the German farmers delivered their quotas, and if the States authorities obeyed the Frankfurt Council's distribution decrees. Both these provisos obviously would not be fulfilled. About half the potato crop had already been wrongly distributed by Bavaria, Lower Saxony and Schleswig-Holstein before the Frankfurt decree seizing it for fair allocation had even been issued. Quite ineffectually, the British and American authorities tried to convince the German authorities that they were not prepared to accept false returns and to subsidise thefts, black markets and inefficiency. The German estimates of the crop were rejected. Now that the revised estimates have been found to exceed the actual collections, the Anglo-American authorities are faced with the prospect of having to cut rations or weaken on their threat not to import more.

The German officials are under the illusion that it is a simple matter to buy food from Germany's neighbours. Even Herr Schlange-Schoeningen, the food and agriculture chief, has shown that he is innocent of the workings of the IEFC, or the Food and Agriculture Organisation which has taken over its work of international allocations. Nor does he realise that bulk contracts have mopped up most of the remaining fats supplies. He thinks that Bizonia's "surplus of exports over imports" might easily be used to secure supplies of butter from Denmark; and he has proposed in a widely publicised statement that Bizonia must import 600,000 tons of oilseeds, valued at \$300 to \$350 million a year, as well as 2,000,000 to 2,500,000 tons of fodder. This would suffice to give an average consumption of 13 ozs. of fats a week, which he declares is necessary to restore the working capacity of the population. Herr Schlange-Schoeningen sees that it must be "some years" before Germany can reach its prewar fat production, but declares roundly that the Anglo-Americans must now really make up their minds to give Germany an adequate diet "by granting credits for a few years."

Apart from the eight-year isolation of the Germans from the rest of the world, one reason for their present inability to grasp the realities of the food situation is the artificial division of imports into Category A goods, consisting of food, fertilisers, seeds and oil products—paid for out of British and US appropriated funds, and from now on to the extent of 80 per cent by America—and Category B goods, consisting of raw materials, financed by Anglo-American capital advances. The Germans simply ignore Category A, and believe that, since German exports have so far exceeded Category B imports, it is they who have been granting credits to the British and Americans. And, they conclude, it is high time this was changed. Though their arguments are in most ways illusory, it is true that a valuable psychological stimulus to production for export would be given if German manufactures were directly applied to imports of food.

There is nothing to be said against the German authorities' insistence on the vital need for better feeding. The physical capacity of the ordinary workman is not equal to his tasks. It is

THE BUSINESS WORLD

The Shape of Sterling Policy

A CERTAIN cohesion is beginning to return to the system of payments between the sterling area and the non-sterling world which broke into fragments on August 20, 1947. The suspension of convertibility of sterling undermined only one of the three legs on which the structure of Britain's overseas payments rested—namely, the agreements with non-sterling countries other than those in the dollar area. Payments with dollar countries were not affected; although their volume may have been reduced by conscious attempts to cut the dollar gap, through which \$40 million a week was still draining away last month, they still have to be made, as before, in dollars. Even though sterling may interpose itself in the transactions when it is paid into American accounts, such sterling remains today, as it was before August 20th, automatically and unconditionally convertible into dollars. So far as dollar payments are concerned, therefore, there are no changes in the mechanism.

The only new agreement which bears on payments with the dollar area is that with Canada. On the financial side, as distinct from the trade side, this agreement merely increases for a period of three months the proportion of the net sterling area deficit with Canada that has to be met in US dollars. Instead of the former ratio of one US dollar for every Canadian dollar obtained by drawing on the Canadian loan, the short term agreement provides that Britain will have to pay \$US100 million as a condition of drawing \$45 million from the Canadian credit.

The second leg of the tripod, payments with sterling area countries, is also substantially unaffected. Here the only changes to record result from the agreement with South Africa. This is important on two counts. First, South Africa, while still remaining a member of the sterling area, has undertaken to become directly responsible for its own hard currency requirements. These arrangements applied at first only to South Africa's US dollar requirements; but it was announced this week that they are also to apply to Canadian dollars. As a corollary of this direct responsibility for financing the Union's dollar expenditure, a dollar market has been set up in South Africa, where the commercial banks are now quoting rates on New York and Montreal instead of covering their exchange requirements through London. London, as the traditional banker to the sterling area, can hardly find this development palatable. These new arrangements, which divorce South Africa from the sterling area dollar pool, have also brought attendant changes in the arrangements for selling South African gold to Britain. An immediate loan of £80 million of gold (now under consideration by the South African Parliament) replaces the previous agreement for yearly sales which in each of the years 1946 and 1947 had involved shipments of about £80 million. The second point of substance in the agreement with South Africa is the proposal for exchange of information between the two Governments about movements of capital between their respective countries. Exchange of information is pointless unless the facts which are brought to light can, if necessary, be followed by appropriate restrictive action. This provision of the agreement with South Africa may, therefore, be regarded as a potential exception to the rule that funds can be freely moved within the sterling area even for capital transactions.

Apart from these reservations which arise from the new arrangements with South Africa, the mechanism of payments

with the sterling area remains unchanged. The need for dollar economy and for easing the strain on the central gold and dollar reserve of the sterling area has been brought home to all its members. At the meetings in London last autumn the general outlines of a dollar conservation policy were agreed by all the sterling countries concerned. Since then good work has been done in overhauling the mechanism of exchange control in various parts of the area and the necessary technical assistance has been provided by the British Treasury and the Bank of England.

It is in the third category—the payments arrangements with non-sterling countries other than the dollar area—that the main work of new negotiations had to be undertaken. The most important members of this group of countries are those that were linked together in the transferable account system. Within this group of countries* sterling was freely transferable for current transactions (as defined by their monetary authorities). Further, any sterling in transferable accounts could be paid into American accounts, provided again that the transfer was in payment of a current transaction. This latter right, which had made sterling in transferable accounts convertible five months before the obligation to convert became effective, was annulled with the suspension of convertibility on August 20th. But the right of automatic transferability within the original group of transferable account countries has been withdrawn only in certain specific instances, such as Egypt, Belgium and Portugal. It has been withdrawn from countries which, by virtue of their export surpluses with other transferable account countries, might be expected to receive current sterling and thus accumulate balances to the point at which they could claim convertibility into gold. The basis of the direct payments relationship between Britain and each of these non-sterling countries is a mutual undertaking to hold each other's currency up to a fixed ceiling, above which any excess accumulation is convertible into gold. This particular element of convertibility has become far more important since August 20th than it was before. The unwillingness of these countries to hold sterling beyond the "gold point" fixed in each of these agreements may be assumed to have grown with the suspension of general convertibility of current sterling.

In the negotiation of these agreements, the main objective of British policy has been to prevent the emergence of a situation in which particular countries, having accumulated current sterling to the limit, might begin to exercise their rights of convertibility. This risk has been safeguarded, as far as possible, through a combination of financial and commercial arrangements. On the financial front Belgium has been induced to raise the ceiling of its sterling holding from £5,000,000 to £27 million. Even so, Belgium has managed to accumulate some convertible sterling in recent months. In the case of Portugal, the accumulation of "current" sterling is being brought down to the stipulated £5,000,000 by inducing that country to pay in current sterling

* The initial list was Argentina, Canada and Newfoundland, and the Belgian, Netherlands and Portuguese monetary areas. Later additions included Anglo-Egyptian Sudan, Brazil, Czechoslovakia, Egypt, Ethiopia, Finland, Iran, Italian monetary area, Norway, Spanish monetary area, Siam, Sweden and Uruguay.

for certain types of exports from the United Kingdom which, under an earlier agreement, would have been paid for from sterling accumulated before 1946.

The next method used to keep the accumulation of sterling by these countries below the convertibility point has been to substitute "administrative" transferability for automatic transferability in cases where the latter spelt danger, as, for example, in Belgium and Portugal. Sterling cannot be paid to residents in those countries by residents in "transferable account" in those countries unless the Bank of England has sanctioned the countries unless that such sanction will not operation. It may be assumed that the transfers will cause the be given if there is any danger that the transfers will cause the recipient's sterling accumulations to rise beyond the convertibility point. Automatic transferability still obtains where it involves no conceivable danger, notably in countries which, at present, have no rights to convert their accumulated sterling—such, for example, as Argentina—or where the balance of current payments is in favour of the sterling monetary area.

The main lever in maintaining the equilibrium of payments is, however, to be found in the commercial negotiations which have gone hand in hand with the re-negotiation of the payments arrangements. The aim of these trade negotiations has been frankly and unashamedly stated in each agreement so far reached: to achieve an approximate equilibrium in current payments between the sterling monetary area and that of the country in question, but to establish that balance at the highest possible level of mutual trade. The policy has the defects of all bilateral barter: it involves the import of inessentials such as Belgian azaleas in order to obtain Belgian steel; it cannot possibly achieve the maximum expansion of trade that would occur under more normal conditions, when the advantages of specialisation and of the international division of labour could be properly exploited. But conditions are not normal. The bilateralism of the recent commercial agreements does at least make more than an empty obeisance to the principle of expansion of trade; and the agreements enable the British authorities to keep a strict watch on the accumulating claims on the exiguous gold and dollar reserves of the sterling group.

In the midst of the recasting of the overseas payments mechanism, the authorities appear to be keeping in sight the easy task, yet the concept of "transferable sterling accounts" is far from dead. It has, in fact, been extended recently to the agreement negotiated with the USSR, which provides that payments between the Soviet Union and sterling countries will be made through transferable accounts. Such transferability will also apply to payments with non-sterling countries, subject to the joint approval of every transaction concerned. The British authorities are necessarily feeling their way carefully, and here and there they may seem to show needless timidity. But they cannot be accused of having gone back completely on the principles of convertibility that were being pursued up to August 20th last.

The picture of the sterling system which emerges from these renegotiated agreements may be likened to three concentric circles. The centre piece, wholly homogeneous, is made up of the United Kingdom, the Colonies and dependencies which together have a common quota in the International Monetary Fund. Not only is there complete freedom of payments within this group, but there is also complete freedom to discriminate in monetary and commercial arrangements. Outside this inner ring are the rest of what the Exchange Control Act calls the "Scheduled territories." Here too, there is freedom in the movement of funds, but a far greater degree of monetary autonomy than is to be found in the inner circle which, with its currency boards, may be said to take its policy and technique of control from London. Thirdly, there is an outer ring of countries which though outside the sterling area are neverthe-

less prepared (in a few cases *compelled by circumstances*) to maintain a part of their external exchange reserves in sterling and to transact much of their foreign trade in sterling. It is a larger group than is generally supposed and comprises the greater part of South America, much of Western Europe and such near neighbours of the sterling area as Egypt. This group could be expanded and made more coherent than it is at present. Whether it expands and acquires organic cohesion depends

Sugar or Dollars?

LAST November Mr Strachey faced some strong criticism from the back benches when he reduced the weekly sugar ration from 10 oz. to 8oz., and simultaneously raised the price from 3d. to 5d. a lb. His critics urged that Britain's sugar stocks were ample and that the cut was unnecessary or, at least, premature. Mr Strachey did not deny that stocks were adequate; he fell back on the argument that sugar cost dollars and that it was necessary to husband supplies and to conserve stocks. This argument may have sounded plausible, but it does not go very far. A reduction of 2 oz. a week saves less than 160,000 tons a year—say, one-tenth of Britain's annual consumption. Moreover, the Ministry of Food had, already in July, bought forward substantial quantities of Cuban sugar for delivery this year—although at a high price. Hence Mr Strachey's unkind critics still suspect that the cut in the ration and the raising of the retail price may have some connection with the Ministry's desire to avoid a trading loss, or a higher subsidy. If the ration had been kept at 10 oz., weekly expenditure per person on sugar would have risen from 2d. to 3d. By reducing the quantity to 8 oz., weekly expenditure rose by only ½d. Dollars may have come into this calculation, but it seems likely that the Minister had one eye cocked on the cost of living.

The connection between British sugar supplies and dollars is worth examination. Before the war the internal consumption of sugar in the United Kingdom amounted to 2,110,000 tons. Domestic beet sugar production provided only 17 per cent of the total amount consumed, but one half of the imported supplies came from Empire sources—Australia, South Africa, Mauritius and British West Indies, in order of importance. Cuba and St. Domingo were the two most important foreign suppliers, and together accounted for 37 per cent of total imports. The war, however, changed this pattern considerably. Internal consumption declined to 1,750,000 tons a year between 1940 and 1945; in 1946, it was further reduced to 1,660,000 tons, but increased in 1947 to 1,780,000 tons. Home production expanded to 470,000 tons in 1946 and to 550,000 tons last year. But although

upon the future of sterling—in short, upon the capacity of Britain to regain its economic strength and to restore its overseas equilibrium. To suggest that the three rings may one day add up again to what was the sterling area before the war—an area extending far beyond the Commonwealth—might appear pretentious today; but it is a pretention which should not lie beyond the hopes and vision of those charged with the creation of the new system.

total imports declined, both the actual and the relative supplies from Cuba and St. Domingo increased, until last year they represented 77 per cent of total sugar imports.

The accompanying chart shows the changes in Britain's domestic production and consumption (calculated on a refined value), together with imports of unrefined sugar, for 1938, 1946 and 1947. Figures for home production are for calendar years and therefore comprise parts of two different seasons, which run from October to March. The chart shows that Britain has been forced to substitute dollar sugar for Empire sugar, at a time when it was vital to reduce dollar expenditure to the minimum. This change in the sources of British supplies may seem strange, viewed against the background of Britain's wartime purchasing policy. Then the aim was to secure Empire supplies by means of long-term contracts, which were made with Australia, Fiji, British West Indies, British Guiana, Mauritius, British East Africa and the Union of South Africa; in each case, the contracts provided that Britain should purchase the exportable surpluses at prices negotiated annually, and they do not expire until December, 1949. Yet, despite these arrangements, sugar production in these Empire countries has declined—except in South Africa, Jamaica and (up to 1944) Mauritius—owing partly to the disruptions of the war, shortages of labour and fertilisers, and the greater need for more essential agricultural products. A further factor—it is often contended—may have been the low prices which the Ministry of Food offered, though it is difficult to measure the incentive effects of a high price on producers who could not spend the proceeds on consumer goods owing to lack of supplies. South Africa was one of the few areas where sugar production increased substantially during the war, but the improved standard of living in the Union, particularly of the negro population, caused a reduction in the exportable surplus of sugar by more than 60 per cent.

The main cause of the changes in Britain's sources of sugar can be traced to the policy of the Combined Food Board—an Anglo-American organisation set up in 1942 to economise in

shipping by directing allied supplies to their nearest area of consumption. As a result, sugar from Mauritius was diverted to the Near and Middle East; South African supplies went to other parts of the African continent; Australian and Fiji sugar was reserved for the Pacific area; and Jamaican sugar went to Canada and Britain. Under this system the United Kingdom drew the largest part of its supplies—under Lend-Lease—from the two dollar producers, Cuba and St. Domingo, and the rest from West Indian colonies for sterling. The work of the Combined Food Board was constantly hampered by the International Sugar Agreement—a scheme drawn up in 1937 to support the prewar sugar market by fixing export quotas. This Agreement formally runs until August, 1948, but during the war it often became necessary to permit countries to export in excess of their quotas in order to secure a rational distribution of supplies, and in September, 1944, the quota system was finally suspended.

In 1946, the International Emergency Food Council succeeded the Combined Food Board and became responsible for the allocation of sugar and other foods among the various importing countries to ensure an equitable distribution of scarce supplies. But as Lend-Lease was no longer in operation, each country had to pay for its allotted quantity in the appropriate currency. And since the pattern of distribution was maintained on the lines laid down during the war, Britain and other European countries had to make payment in dollars for the supplies which were allocated by the IEFEC from Cuba and St. Domingo. Britain, of course, also received sugar from the West Indian colonies in return for sterling, but West Indies' sugar represented only 13 per cent of Britain's sugar imports in 1947. In the latter part of last year many countries could no longer spare the dollars to buy their share of Cuban sugar, and stocks began to accumulate. Since there were prospects of another good Cuban crop in 1948, the IEFEC allowed consuming countries to import Cuban sugar beyond their allocation and the international "rationing scheme" broke down.

It should not be assumed that Britain could import sufficient sugar from Empire sources even to satisfy the present low level of consumption despite the expansion of home produced beet sugar. Probably at least one third of its present annual requirements can be obtained only from dollar countries. Almost without exception, sugar consumption has increased in the Empire exporting countries; hence their output would have considerably to exceed the prewar level before they could increase their exports even to the prewar figures, though a relatively high export price might encourage them to do so. But the longer-term expansion of Empire production is not a simple matter. It would have to surmount the problems common to all colonial development schemes, and, granted the limited resources of capital and labour which are available, sugar is likely to rank for a much lower priority than more urgently needed foodstuffs and raw materials like oilseeds and fibres.

It follows, therefore, that criticism cannot be levelled against the Ministry of Food on the score of having to import dollar sugar. But the same absolutism can hardly be given to its purchasing policy, in view of recent developments in the sugar market. World production of white sugar in 1947-48 is estimated at about 25½ million tons (raw value) compared with 27 million tons in 1937-38. Consumption is believed to total about 25 million tons, compared with 26½ million tons before the war. This represents a significant decline in consumption per head, when account is taken of the increase of between 5 and 10 per cent in world population. Although the excess production of 1947-48 is put at only 500,000 tons, it may prove to be much larger. Moreover it follows a season which showed an estimated surplus of 1,500,000 tons. The accompanying table gives the geographical distribution of world production and consumption of sugar. It clearly shows the predominance of Cuba as the largest source of exports, with North America (mainly the United States) and the United Kingdom as the chief importers. Reduced world production, compared with prewar years, is due mainly to a smaller output in Europe and the Far East, but Cuba has almost doubled its production. Restriction in consumption has been caused mainly by the general shortage of dollars. Most countries are prepared to meet their basic sugar requirements at high cost—in Europe, basic supplies are generally assured by beet sugar production, so that dollar purchases can be, and have been, drastically reduced. Under such conditions, a fall in the price of sugar may induce little or no additional demand, simply because the saving in dollars resulting from a lower price would be applied to the purchase of more essential imports. In Britain, however, domestic production plays too small a part to afford any considerable reduction in dollar sugar expenditure; hence the British demand is a major factor in the world sugar market.

Dollar difficulties have recently had an important effect on the Cuban market and prices have tended to fall from nearly 24s. a cwt. to 22s. 3d., though the market is now steadier. If there is any truth in the reports that the Ministry of Food last summer bought well over 500,000 tons of Cuban sugar at about 28s. a cwt., for 1948 delivery, there would indeed be ground for strong criticism of the Ministry's trading policy—quite apart from its caution (or perhaps its face-saving) in reducing the ration. Sugar provides yet another example of the way in which the official policy of secrecy about trading operations prevents informed discussion of matters which are of great concern to British consumers. No Ministry is omniscient; nor, of course, is any private trader. But, in view of the claims which are put forward about the advantages of bulk purchase, it is surely reasonable to expect that those responsible should be in a position to make accurate market forecasts. If they have been made in the case of sugar, the Ministry has remained very modest about them.

Three Per Cent under Pressure?

Students of market psychology would have some difficulty in explaining why gilt-edged stocks, which stood up well enough to the choice of a 3 per cent issue for Transport Stock and to the raising of interest rates on local authority borrowing by one-half per cent, should have been so greatly unsettled this week by the discovery that the "public stag" had become tired of holding 2½ per cent Corporation stocks and was now selling them on the basis of 92½-93½. There was a time when the ex-Chancellor preened himself on the profit which the departments had made from their early support for 2½ per cent conversion issues by home corporations, when they were being issued during the most violent phase of the cheap money drive. Now the true losses are brought out into the open. But that fact alone would hardly account for the sharp fall which occurred in every section of the gilt-edged market on Tuesday and continued, though with some signs of greater steadiness, on Wednesday.

Obviously, the opportunity of switching into corporation stocks, with lives ranging up to 27 years and standing at a discount of seven points, to secure redemption yields to the latest dates a shilling or so below 3 per cent, was bound to have repercussions on the 40-year Transport Stock. At one time this newcomer had so far lost its attractions for institutional investors, who had been steadily supporting it since January 2nd, that the price fell below 98. It is hardly surprising that, in the present unsettled state of the market, some investors should already be asking whether the 3 per cent basis, which had generally been expected to command support, is now showing signs of vulnerability. Certainly, those who are doubtful about the future course of gilt-edged prices will not derive much consolation from the exchanges between Mr Piratin and Sir Stafford Cripps in Parliament on Tuesday. When pressed to explain what new circumstances had arisen since the ex-Chancellor introduced the "very welcome reduction in interest charges" payable by local authorities on their borrowing from the public Works Loan Board to necessitate an increase now, the Chancellor replied briefly that the Government's borrowing rates for comparable periods had "altered"—a perfectly simple position which required no further explanation.

The result of this week's setback finds undated stocks close to 80; 2½ per cent Treasury Stock is in fact below that price, after allowing for accrued interest, and now yields £3 2s. 7d. per cent, or £1 14s. 3d. per cent after deducting income tax at 9s. in the £. But one of the Corporation stocks which has come on the market this week—2½ per cent Southampton, 1970-75—offers a net redemption yield to the latest date of £1 14s. 7d. That the market should have succumbed to the relatively modest degree of competition introduced by the release of the unwanted corporation issues in the hands of the departments is, in itself, proof of the thin veneer of stability which it has acquired in recent weeks. There are some who hold that, once Marshall Aid is assured, the authorities will have an opportunity to renew their cheap money drive. But recent tactics almost suggest that cheap money is not a matter of primary concern of the Chancellor, and that he is not even as mindful as most investors would expect him to be of the desirability of maintaining the 3 per cent position.

Australia Converts

Certainly, there is no attempt at forcing tactics in the terms of the new Australian conversion loan, which was announced on Thursday. A year ago, Australia, under the wing of the ex-Chancellor, attempted to persuade investors to take a 2½ per cent stock, with a 24-29 year life. The new issue is a 3 per cent stock, redeemable optionally in 1963 and finally in 1965, and will be issued at 98½. The new stock will replace part of the New South Wales 5½ per cent loan, 1947-57; of the outstanding £17,870,500 of this stock, £5,000,000 will be paid off from the sterling balance held by Australia. Apart from the changes in the terms compared with a year ago—signalled by the yield to final redemption on the new stock of £3 2s. 3d. per cent—it is interesting to note that it will be underwritten in the market. Last year's precedent, when the Commonwealth Bank acted as underwriter and was left with the burden of a heavy under-subscription, is not repeated.

These terms were evidently designed to ensure success—on the basis of gilt-edged prices when they were announced. The cash lists open next Wednesday, and the conversion lists will close on or before February 9th. The new stock is perhaps most closely

comparable with 2½ per cent Savings Bonds, 1964-67, both in its life and the somewhat surprising narrowness of its dates. This stock, on the eve of the announcement of the Australian terms, stood at 95½, to yield £2 17s. 1d. to final redemption. A spread of a clear 5s. per cent gross in the yields shows the measure of Australia's willingness to attract the market. It is, at the same time, a symptom of the growing tendency for the yield structure to widen, and to lose some of the narrow constriction into which it was forced by ultra-cheap money. And it implies no disrespect to the status of Australia as a borrower on the London market to emphasise that such a change towards more normal yield differentials is entirely salutary.

Franc Devaluation

The moves which have led to the now imminent devaluation of the French franc hardly accord with those rules of secret diplomacy in which monetary affairs of this character and importance should be discussed. The approaches to the International Monetary Fund in Washington and the general character of the French requests for a devaluation of their currency have become common property, not only of the press commentators but of every speculator who has found ways of capitalising pending developments. That the French franc had to be devalued was a point on which no two opinions could be held. The currency has been overvalued so long and the underlying trend of wages, costs and prices in France is still so unmistakably upward that some official recognition of this loss of value in the currency was long overdue. The two points on which there might be some doubt are whether this is the proper time to proceed with the operation, i.e., would it not have been better to wait until underlying conditions were somewhat more stable before taking the leap of a formal devaluation, and, secondly, whether this is the most expedient form of devaluation.

On the first point, the pressure of events is proving stronger than any arguments that might suggest caution and delay. Some move must be made now. On the second point, the French have been so impressed by the apparent success of the Italian devaluation that they have decided to follow the same pattern. That is, while allowing a formal devaluation of the franc which would carry the official rate of the dollar, say, to 200 francs and that for sterling to 800 francs, they desire at the same time to see established in France a free market in which French exporters would be able to sell part at least of the foreign exchange proceeds of their sales abroad. The French argument is that only by allowing such a free market, in which both foreign currencies and gold would be quoted, would rates be established at which Frenchmen now hoarding currencies and bullion will be prepared to disband.

It was this problem which the French Finance Minister, M. René Mayer, brought to London on his recent visit and which provided the dominant, if not the exclusive, topic of his discussions with Sir Stafford Cripps. The British attitude to the French proposal seems to have been one of root and branch opposition. The case for the devaluation of the franc is not, and cannot be, contested. But the establishment of a free market and the consequent undermining of confidence in currency stability are thought to be an unduly high price to pay for the advantages of this particular type of devaluation. In particular, British authorities cannot ignore the fact that a free exchange market in France would almost certainly lead to cross rates between sterling and other currencies which would be seriously out of line with prevailing parities. The French appear to have suggested that British scruples on this score might be respected by forbidding free dealings in sterling. Apart altogether from the added restrictions on the free use of sterling which any such development would involve, it would in effect aggravate the situation from the point of view of the cross rate. Under the French proposal sterling would continue to be quoted at the official level of 800 francs, while dollars, allowed to find their own level, might rise to rates which would give quite fantastic sterling-dollar equivalents.

Monetary Fund and the Export Franc

British resistance to the French proposals must, however, be applied through the International Monetary Fund in Washington, with whom the ultimate responsibility for accept-

ing or rejecting the request rests. The request has been before the Fund for some time and has formed the topic of perhaps the longest and keenest debate yet held between the executives of that institution. The Fund has prejudiced its case in resisting the French demands by the precedent it has set in accepting multiple currency practices and fluctuating exchanges in the cases of Ecuador and Italy. In the former case the Fund announced in June of last year that it had approved a request by Ecuador to adapt its multiple currency practices through the imposition of a sur-charge on non-essential imports. The Fund announced at the time that the practices to which it was giving its sanction could be justified only as a short period device. But it went out of its way to stress that its attitude towards the use of multiple currency practices "cannot be doctrinaire." Again, in the case of Italy last December, the Fund announced that, although fluctuating exchanges did not accord with its long term objectives, it recognised "that in some cases members may be required for temporary periods to institute extraordinary measures in an attempt to meet particular difficulties." The Fund, therefore, gave its sanction to the Italian devaluation proposals which brought the exchange of the lira nearer to its economic parity, although it did so by tolerating, and indeed encouraging, a free market in which foreign exchange rates would fluctuate and might be quoted at rates which gave equivalents far removed from the official parities. In the case of Ecuador the Fund was merely sanctioning long standing multiple currency practices. In the case of Italy, the Fund could argue that no par value for the lira had yet been agreed and that this left room for some elasticity.

These particular arguments do not apply to the French case, since an official parity for the franc has been notified and agreed, and since there is no question of multiple currency practices other than the multiplicity which will be provided by a fluctuating free market. It cannot, however, be denied that the concessions given to these other countries regarding the rigid application of the articles of agreement of the Fund set precedents which are likely to make any resistance to the French request extremely difficult to maintain. The American attitude, which for some time past has been in favour of devaluation of European currencies, is likely to approve any move which conduces to that objective without bothering too much about the manner in which it is made. The British representatives on the Fund have, it is hoped, been resisting the particular devaluation technique proposed by the French Government. They must do so for a number of reasons. In particular, a widely fluctuating market would undermine confidence in all exchange stability, and the existence of such a market in France would make it necessary for Britain to tighten up on all its exchange controls and perhaps even consider the blocking of certain sterling assets.

Shipbuilding and the 1947 Target

The shipbuilding target for 1947 given in the Economic Survey was 1,250,000 tons gross, with a large repair programme in addition. Its achievement, it was said, "depends upon increased output per man-year and upon adequate supplies of materials, fittings and other components." Bad weather, lack of fuel and power, and supply difficulties early in the year led Ministers to hint that 750,000 tons might be the maximum attained. Actual tonnage completed during the year, so far as can yet be seen, was in the region of 950,000—a quite creditable figure, particularly when the large volume of reconversion work which has also been completed is taken into consideration. Tonnage launched during the year was more than 1,200,000 tons gross, the returns issued by Lloyd's Register during the year showing figures of 270,000 for the first quarter, 243,000 for the second, 302,000 for the third and 390,000 for the fourth. The high figure for the last quarter doubtless reflects the improvement in steel deliveries in the latter half of the year.

The total amount of work in British shipyards at the end of the year, according to Lloyd's Register, was 2,173,361 tons gross, an increase of 60,692 tons over September and of 236,299 tons over December, 1946. Work in shipyards abroad (excluding Russia, Germany and Japan) amounted to 1,808,996 tons gross, the so that the British share is 55 per cent of the world total. The busiest countries abroad are France (295,389), Sweden (261,605), Holland (255,199) and Italy (219,122 tons gross), while Canada is working on 148,250 tons gross compared with only 135,852 tons under construction in the United States. Out of eighty-four oil tankers totalling 742,084 tons, British yards are working on fifty, of 447,945 tons. The only vessels larger than 20,000 tons are in British yards; six of them under construction there account for about 190,000 tons gross.

Lloyd's Register also shows that Norway and France are at the moment by far the largest importers of ships. The former has

453,000 and the latter 233,000 tons building in other countries. Other importers are Portugal (121,000), Argentina (97,000) and Brazil (64,000). Britain remains by far the largest exporter of ships. The total of 671,000 tons building in British yards for foreign account compares with 163,800 tons in Sweden, 133,170 in the Dominions, 129,450 in Italy and 70,861 in Denmark. The British figure rose from 105,000 tons in March, 1946, to 478,000 tons at the end of 1946, and to 580,000 tons at the end of June last year. As many as 51 ships, totalling 146,832 tons, for foreign account were begun during the last quarter, bringing the export percentage to 30.9. This proportion is likely to increase still further; a considerable batch of export orders has been received, including ships for Panama and the United States. Large orders for tankers have been placed by British and foreign owners.

Too Little Steel for Ships?

In the light of the Lloyd's Register figures, questions are naturally being asked about the effect of the Government's decision to allocate steel to the shipbuilders at a rate of 20 per cent less than they received in 1947. Nobody knows what stocks the shipbuilders or their suppliers of fittings and components have. Nor is it possible to say whether actual deliveries of steel will be more or less than allocations; last year the shipbuilders received considerably more than they were allocated, but the allocations should be more efficient under the new system. What is known of the steel budget suggests that there may have been some under-allocation for the first two quarters of 1948, perhaps as a deliberate precaution.

Where are the shipbuilders' bottlenecks at the moment? From all accounts, they are not in bulk steel supplies but in other things—timber, fittings and small electric motors have been mentioned. This is borne out by Lloyd's Register, which gives the remarkably high figure of 2,173,361 tons gross for merchant shipping under construction—the highest for twenty-five years. Lloyd's Register itself comments that the increase "is necessarily influenced by the delays which present circumstances are imposing upon the completion of ships." Many hulls, it seems, are waiting for mechanical and electrical fittings and for finishing work of a minor sort. The completion of such tonnage does not depend on the immediate bulk supplies of steel to the shipyards. It ought, indeed, to be easier, not harder, if the new steel distribution scheme works well enough to clear the bottlenecks in the supplying industries. If so, shipbuilders will not lose output.

Yet the shipbuilders' protests are easy to understand. It is exasperating to be told to concentrate more on finishing tonnage under construction, and to be less concerned about starting new ships. Shipbuilders want to keep their platers, drillers and shipwrights working steadily, as well as their carpenters and painters. They want to keep all the processes of the industry running concurrently at an even pace, and they will see in any attempt to reduce the amount of new tonnage started the sign of American hints or even interference—for all Sir Stafford Cripps's denials. In the past year it seems that they have (in relation to the finishing work done) been rather over-employed in the primary construction of hulls. They do not want to see-saw to the other extreme.

Discount Market Profits

The reversal of the trend of the gilt-edged market last year—as a Note in these columns three weeks ago pointed out—made for difficult working conditions for the discount houses, although, of course, the effects upon them of the fall in prices is not to be gauged by the big slump which occurred in the irredeemable stocks, but by reference to the relatively moderate movements of the short bonds. The incidence of these changes upon individual houses must have been far from uniform, depending partly upon the structure of the bond portfolio and partly upon the date at which each house participated in the general expansion of discount market capital which the authorities permitted in 1946 and early 1947. It is not surprising, therefore, to find wide variations in the profit changes disclosed by the "Big Three" discount companies which make up their accounts at the year end. One house—the National Discount Company—reports an increase in net profits (from £239,000 to £262,000) while in the other two cases profits are lower. The decline reported by the Union Discount Company is trifling, but Alexanders' profits have fallen from £299,000 to £72,000.

It would probably be unwise, however, to assume that these contrasts are a true measure of the relative earnings experience of the three houses during the year. Alexanders' profits in 1946 rose much more steeply (from £89,000 to £299,000) than those of the Union and National, and this difference cannot have been

The Cattle Market, Canterbury

THE ENGLISH MARKET today is many things—a fair, a club, a discussion group. Above all it is a place where local men meet to buy and sell and plan for the future. It is to ensure that the Bank is constantly in touch with local affairs, and the needs of local firms and industries, that Barclays Bank have developed their unique system of Local Head Offices, covering England and Wales. The Local Directors of these Offices are men who know the district well, and their wide experience means that speedy and sympathetic consideration will be given to all matters brought before them.

There is a Local Head Office at Maidstone.

wholly attributable to the fact that Alexanders had then had the benefit of its new capital for almost twelve months. The inference seems to be that in 1946 Alexanders brought into its published figures a bigger proportion of the large earnings of that year than was true in the other cases. On the other hand, it should be noted that the only house to show increased profits for 1947 was the last to raise its capital—the increase was made as recently as last March. In all cases, investment depreciation appears to have been provided out of inner reserves—although the Union Discount Company, whose profit formula is somewhat different from that of the other companies, does not say so explicitly. Alexanders, elucidating the fall in its profits, explains that changes in its bond portfolio, with the object of shortening the average currency, were carried out on a falling market, and the realised losses on security sales were charged to profit and loss account. Each of the companies has maintained its dividend, but, for Alexanders, this has involved some reduction in the large sum carried forward.

* Including short-dated securities other than bills, except in the figures of the Union Discount Co. † Including carry forward.

As expected, the balance sheets—the principal items of which are compared in the accompanying table—show a much smaller expansion than the record movement shown twelve months ago. Aggregate loans and deposits of the three companies rose by only 3.9 per cent (in contrast with 41 per cent in 1946), and almost the whole of this movement was attributable to the house which raised new capital during the year. Unfortunately, neither Alexanders nor the National has followed last year's lead by the Union Discount in segregating bills discounted from bonds, so that in these two cases bills are merged with other short-dated maturities. The combined portfolio of bills and investments of the three companies rose from £430.7 million to £448.6 million. A notable feature of the balance sheets is the large expansion which has occurred in bills re-discounted, indicating the growth in the supply of commercial paper. The Union Discount, whose re-supply of commercial paper is the highest in its history, points out that almost the whole comprises inland bills, and remarks that these operations are at such fine rates that they afford little scope for profits—which is even more emphatically true of the vastly greater operations in Treasury bills.

More Wheat ?

There are faint signs of more favourable changes in world grain supplies, though they are not sufficient to justify any optimism. The Australian wheat crop is now estimated at 210 million bushels—an increase of 30 million bushels over the previous forecasts, when it was believed that serious damage had been wrought by the rains. Under the contracts signed recently with the Australian Government, Britain and India were to receive an additional 5,000,000 bushels each if the harvest proved to be larger than 210 million bushels, and it now seems that these additional supplies, beyond those already sold by Australia, may not be forthcoming.

No official information has been received about the Argentine crop, but trade estimates put it as high as 216 million bushels—an increase of 10 million bushels over the 1946-47 crop. If this estimate proves correct, Argentina's available export surplus should be in the region of 112 million bushels compared with 80 million bushels last season. There has also been some improvement in the general condition of winter cereals in the United States, but the crop will probably mature unevenly owing to the drought at sowing time.

An addition of some 40 million bushels of wheat to world supplies is indeed welcome, but it is not sufficient to change the outlook from acute shortage to plenty. Moreover, wheat cannot be regarded in isolation; the prospects of the other grain food crops are equally important. Supplies of feeding grains and potatoes are very short. It may require bumper crops in North America for at least two seasons—1948 and 1949—before the present world shortages can be eased. The portents suggest that wheat will not necessarily stay at its present price of over \$3 a bushel, but as yet there are no signs of any break in the market.

The most important market factor will be dollar stringency, and the extent to which it may be relieved by Marshall aid. The American authorities have purchased nearly 400 million bushels of wheat under the foreign relief (or "interim aid") programme, of which the bulk has already been shipped. But the critical food situation in Germany may cause a diversion of supplies originally intended for France and Italy.

Britain's position itself is far from favourable. It seems inevitable that the present potato ration will not be met in the near future, for there is little hope of importing large quantities. So far there has been no marked diversion of consumption to bread. But as soon as potatoes become really scarce, bread consumption is certain to increase, and that in turn will impose a strain on British wheat stocks. In that event, available supplies of wheat may only just see Britain through the season. Normally a large part of British-grown wheat moves off the farms in the early part of the year, but a substantial movement took place after the last harvest. This wheat is presumably now included in the Ministry of Food's stocks, and the "hidden reserve" which remains to be drawn upon has been correspondingly reduced.

* * *

Buyer's Market in Textiles ?

Is the seller's market in textiles coming to an end? Sir John Grey, in his chairman's speech at the annual meeting of the Lancashire Cotton Corporation, did not seem to think so. Sir John observed that distributors frequently suggest that the tide is turning, but that producers could find little evidence of it in their own experience of dealings; there were still clear signs that the demand for cotton yarn and cloth greatly exceeded the supply. Certainly this is still true of cotton yarn, in which the Lancashire Cotton Corporation does the bulk of its export business. But the reports of price resistance in the hard-currency markets for finished cloth are becoming too regular to be wholly ignored. In some European countries, British shirts appear side by side with American, and with the products of the continental textile industries, in the same shop window, and "excess of demand over supply" does not save the British product there from damaging price comparisons. Even the BBC "Progress Report" on Wednesday, touching as delicately as possible on the marketing of British textiles in Canada, brought out the uneasiness there over British prices.

Sir Thomas Barlow, in his first annual review as chairman of the District Bank, has spoken this week in a more general sense for the Lancashire trade. Sir Thomas shows a lively concern about the factors which are pushing up production costs in Lancashire, and he recognises that the seller's market will not continue indefinitely. Hence the need not only to ship the right sort of goods, but to ship them at competitive prices. He went on to make some observations on Japanese competition, and hoped ("devoutly") that some control would be imposed in the peace treaty on the volume and price of Japanese production. More will be heard, no doubt, of this suggestion as the seller's market nears its inevitable end. It seems, surely, to be a desperate counsel; can the Lancashire trade be assured of survival only by imposing political controls to prevent its competitors from competing? The international vistas which such a policy opens up are endless and forbidding, not least for one of the victors which itself depends entirely, in the long run, on its success in the export trade.

This proposal, and Sir John Grey's statement that the Lancashire Cotton Corporation's exports to North America are at present "restricted only by our capacity to produce" come within a few days of each other. No market is likely to remain insatiable for long. And the markets for finished cloth are already becoming more critical, both of quantities and prices.

* * *

Manpower Distribution

The Ministry of Labour's report for November records a further rise in the total working population and in the number

reduction in the rate of wastage and an increase in the numbers placed directly through the Employment Exchanges.

The most satisfactory feature of the November report is the continued increase in the rate of recruitment to the undermanned industries, which was achieved without any resort to the powers of direction. In fact, 42,574 people were placed in the "first preference" undermanned industries, only four people were directed under the new powers, compared with eleven in the previous month. The increase of 8,000 in the textiles, although less than in October, compared with an average of 2,700 a month between January and September. Manpower in mining and quarrying increased by 2,000, compared with a fall of 1,000 in October. Although the continuing increase in the numbers engaged in distribution is rather disquieting, there was a substantial drop in employment in building and in the hotel and entertainment trade, which was probably not due entirely to seasonal influences.

The Ministry of Labour may with some justification congratulate itself on the smooth working of the Control of Engagement Order. But there are two questions which it might well ask itself. Reports suggest that the first registration of this week of the "drones" has been a complete fiasco, while a fortnight ago it was the genuine "barrow boys" who registered and not the "spivs" who were really being sought. Have the results been worth all the fuss and bother about registration? Secondly, is it not time that an attempt was made to get a more scientific breakdown of the numbers engaged on manufacture for export and the home market? Mr Harold Wilson, who has some experience in statistical returns, had some caustic comments to offer this week on the accuracy of the much-vaunted increases in the numbers employed on exports. But confirmation from such an authoritative source of criticisms which have been voiced in *The Economist* and elsewhere suggests that the present figures should be improved—or suspended.

* * *

Seasonal Jump in Savings

The somewhat better trend of National Savings in recent weeks was apparently sharply accentuated in the week covered by the latest return—the week to January 10th. Gross receipts jumped from £14,465,000 to £24,194,000, and although withdrawals and encashments were rather larger, the net receipts amounted to £12,822,000 compared with only £3,868,000 in the previous week. This is the best performance since the first week of this financial year (when the figures were swollen by the final rush for the old series of Savings Certificates), and is only the second occasion on which the year's target rate of £7,000,000 per week has been surpassed. Unfortunately, this cannot be taken to mean that any significant change in the savings trend is in prospect. The improvement is purely seasonal, and results very largely from the fact that no more than a net £500 may be credited to any individual savings bank account in any one calendar year, subject to an absolute limit of £2,000 on the total balance on the account. In consequence, many people whose accounts stand below the maximum hasten to pay in further sums up to £500 immediately after the turn of the year—transactions which are plainly revealed in the fact that new deposits in the banks accounted for £17,674,000 of the £24,194,000 of total gross savings in the week in question. A further influence at this time of the year arises from the substantial dividend moneys, bonuses to employees and gifts which the recipients are paying into their accounts.

In addition, there is no doubt that the savings movement for some two months at least has been benefiting significantly from the uneasiness which popular discussion of a currency exchange or capital levy has aroused even among those who have least reason for concern at the possibility of such operations—the "little" men who, especially in rural districts, have preferred in the past to keep their holdings in the form of notes. After last week's indiscretion by the Government Whip (of which more is said in an earlier Note), it is perhaps questionable whether this particular influence upon savings subscriptions will be as noticeable in future as in the recent past, for such irresponsible statements are calculated to prejudice most monetary forms of saving and are more likely to provoke a new rush for goods than the savings subscriptions which Mr Whiteley sought so naively to aid. Meanwhile, despite these fortuitous aids, the net savings total for the 41 weeks of the current financial year is no more than £129 million, far short of the £366 million for the full year which was "written into" last April's budget. In the corresponding period of 1946-47, when the year's target was lower, net receipts amounted to £237 million.

Last Year's New Issues

New capital issues in 1947, of which a full analysis is published in this week's issue of the *Records and Statistics* Supplement, show that, including conversions, the aggregate for the year was £619 million compared with £1,660 million in 1946, when the figure was inflated by the issue of £418 million 2½ per cent Savings Bonds, 1964-67, and £149 million 2½ per cent Treasury Stock issued during the year. The total, excluding conversions, declined from £746 million to £527 million. Government borrowing, exclusive of conversions, was only £211 million, compared with £475 million in 1946. The figures reflect the fact that the Government had less need to resort to the open market, since it could finance itself largely from the proceeds of the American loan. There has, however, been an increase in borrowing, including "permission to deal" operations, by the private sector of the economy from £204 million to £240 million. Borrowing by Empire countries has remained around the same level, at £65 million, while that of foreign countries fell further to £3,000,000.

New company issues show a fall in "permission to deal," for the total excluding this item has risen from £119 million to £187 million, while the inclusive total has risen only from £271 million to £299 million. It should be noted that the "Shell" Transport and Trading issue to shareholders has contributed £29 million to both totals, although the first call on the new shares was not made until January 15th this year. If this issue is excluded, industrial borrowing for the year was on much the same scale as in 1946. There was a slight reduction in issues of ordinary capital, including conversions, from £210 million to £206 million, while debenture issues have increased from £18 million to £34 million and preference issues from £34 million to £58 million.

Fluctuations in capital issues always follow the course of stock exchange prices. The flow of conversions went on unabated until it was frozen by the fuel crisis, and it never recovered thereafter, despite the attempts of the authorities to revive it. A dearth of activity followed until the late autumn when a revival gathered pace until the closing stages of the year. The capital requirements of industry have apparently been met in this phase from its own liquid resources or from increased borrowing at the banks. The tax on bonus issues has certainly been a restraining factor on new issues to shareholders. The scope for capital expenditure has been further narrowed by physical shortages, but, so far, the re-direction of investment has not revealed any obvious change in pattern, although the Capital Issues Committee has been working to its new instructions for some months.

* * *

Electricity Stocks and Nationalisation

Home rails are now a thing of the past, and the investor's attention has recently been turning to other nationalisation counters, including road passenger companies' shares, gas, and electricity stocks. With the exception of the former (to which reference was made last week, the scope for active dealings seems to be quite limited—unless, indeed, compensation for the gas undertakings is based in the forthcoming Bill on maintainable net revenue, as is suggested in some quarters. In the

* It is assumed that the British Electricity Stock will be issued at 100; the equivalent price is calculated after allowing for full Commission and 2% Stamp.

case of electricity stocks, however, there appears to be no opportunity for cheap backdoor entry into the gilt-edged market on the lines practised by many buyers of home rail stocks during the last three months of 1947. There are, to be sure, some uncertainties about the precise amount of compensation payable in particular cases—the Electricity Act lays down the procedure to be followed on compensation for companies (other than hold-

THE BANK IS INTERESTED

It is interested in its customers, in their affairs and in their business ventures; it is ready, by direct assistance and friendly counsel, to help those affairs forward, for it recognises that the prosperity of the Bank is to be found in the prosperity of its customers. It is, therefore, good business to keep in touch with your Bank. The Manager at any branch of the Westminster Bank will be glad to discuss with you any problem in which the services of the Bank can usefully be employed.

WESTMINSTER BANK
LIMITED

TRADE WITH THE EAST

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA provides a complete banking service, backed by nearly a century's first-hand experience of Asiatic economic conditions, for every financial operation connected with TRADE, INVESTMENT AND TRAVEL IN THE EAST. The Bank's branch system, under British management directed from London, serves

INDIA • PAKISTAN • CEYLON • BURMA
SINGAPORE AND MALAYAN UNION
BRITISH NORTH BORNEO AND SARAWAK
INDONESIA • FRENCH INDO-CHINA • SLAM
THE PHILIPPINE REPUBLIC
HONGKONG • CHINA • JAPAN

Merchants and Manufacturers planning to establish, renew or extend business relations with the East are invited to consult the Managers in London or Manchester.

ing companies) by reference to the Stock Exchange value of their securities on given dates, but, unlike the Transport Act, it does not provide a schedule of prices to be paid to the stockholders.

It is, nevertheless, possible to make some estimate of the relation between present prices of representative electricity stocks and their prospects for compensation. In the accompanying table (which is largely reproduced from a recent list of stocks on offer by a leading firm of dealers in the electricity share market) the offered prices of six electricity stocks are compared with the estimated take-over prices, calculated in accordance with the terms of the Act as far as available information serves. The current prices of the electricity stocks are then transcribed into equivalent prices for British Electricity Stock, taking account of the value of the final dividend for 1947 and allowing for the cost of buyers' commission and Stamp Duty. On the assumption that the new stock is issued at par, the discounts represented by present prices for these stocks now on offer range from a mere one-eighth to 1.1. Since Transport Stock itself stands at 2 discount, it is evident that electricity stocks, at their present prices, are hardly competitive with gilt-edged.

Ceylon Asks for More

The Ministry of Food's offer to the Ceylon Government for a tea contract for 1948 has been rejected. The Ministry agreed to increase its buying price by 2d. a lb. but for a limited term of only one season. Last year, the price was raised by 3d. a lb. to induce an adequate offer of supplies from producers; in addition a sliding scale allowance was introduced to cover changes in direct labour costs. Britain also agreed to pay the export duty of 7d. a lb. The response, however, was disappointing and only 100 million lb. was tendered out of a total of 150 million lb. Those producers who preferred to take the risk of selling their tea at the Colombo auctions were better off for "free" prices averaged at least 4d. a lb. more than the Ministry of Food's tender price. The new offer, therefore, may not seem very tempting, yet producers represented by the Ceylon Association were prepared to accept the price provided that all the other clauses of the contract remained unaltered. Their tentative acceptance now becomes ineffectual, owing to the Ceylon Government's rejection of the proposal.

Both the Ministry of Food and the Ceylon Government have an eye on the Netherlands East Indies. Tea production in that area has not recovered, but it is possible that exports may begin to show some expansion towards the end of 1948. These increased supplies might constitute a threat to the stability of the Colombo market, and the Ceylon Government is therefore anxious that the Ministry of Food should offer a longer term contract, preferably for three years. The Ministry on the other hand, realises that any long-term contract for large supplies would effectively neutralise Indonesian competition. If no agreement is reached,

Ceylon may insist on all domestic teas passing through the Colombo market, which would force Britain into the market as a buyer. The advantage lies with Ceylon in the short-term, but time appears to be on the side of the British consumer.

Bridging the Trade Gap

The gross trade deficit for 1947—the year first of disappearing fuel and then of disappearing dollars—amounts to £591 million, equivalent to a net deficit of £420 million, after allowing for the cost of freight included in the value of imports. In the absence of multilateral trade, however, the crucial factor is the adverse balance with those countries whose currencies are scarce. Britain's gross deficit with Canada, the United States and Argentina—the three main hard currency markets—amounted to £480 million for the eleven months up to November. This figure indicates the gap which British exports must fill in hard currency markets.

Total imports in 1947 reached £1,787 million c.i.f. compared with the original programme of £1,450 million f.o.b.—an increase of about 10 per cent over the planned figure. Food, drink and tobacco totalled £805 million, raw materials £560 million and manufactures almost £400 million. Unfortunately it is not possible to make a direct comparison with the planned import programme, as the method of grouping the various items differs. Nevertheless, it seems that imports of manufactures were far larger than was originally intended. The volume of retained imports was probably only 80 per cent of the prewar figure, compared with 69 per cent for 1946, although in value it was double that of 1938.

Export recovery was seriously hampered by the winter fuel crisis and no marked improvement became apparent until the summer months. There has, however, been a steady rise in the value of exports since August culminating in December in the highest daily rate yet recorded although it was inflated by the Christmas parcel post. Total exports for the year were valued at £1,137 million, compared with the planned figure of £1,200 million. The discrepancy would in fact be greater but for the rise in export prices. The first target set for 1947 was 140 per cent of the 1938 volume to be reached by the end of 1947. The December volume of exports was in fact 120 per cent of 1938 and that for the fourth quarter 117 per cent against 114 per cent for the previous three months and 111 per cent in the last quarter of 1946. Last autumn, however, the end of year target for 1947 was postponed to mid-1948 so that industry has a six months' respite in which to expand output and to reach the export target.

Exports of manufactures last year amounted to £999 million, and accounted for 88 per cent of the total. Shipments of machinery formed the largest single group, with a value of £181 million followed by vehicles (£168 million), iron and steel (£84 million), cotton goods (£78 million), chemicals (£67 million) and wool goods (£58 million). On a value basis, the major brunt of

the export drive was shouldered by the machinery and vehicle groups; both showed a very large expansion over 1946. Exports of textiles also improved significantly during the year, but their volume is still small and a tenfold expansion in 1948 appears to be contemplated.

The chief markets for British machinery were (in order of importance) India, South Africa, Australia and Russia; together they took 36 per cent of the machinery exports. Vehicles went mainly to South Africa, India and Argentina, and iron and

steel to South Africa and India. There is, despite these occasional glimpses of encouragement, no cause for complacency about the improvement in exports. Last year, 36 per cent of Britain's imports came from the United States, Canada and Argentina, and they comprised mainly vital foodstuffs and raw materials; but only 11 per cent of Britain's total exports were shipped to these three markets. Until multilateral trade can be restored, it is this balance which must somehow be equated.

Speculation in Platinum

Platinum, which enjoyed a steep rise in 1946, and reacted to £14 per troy ounce last summer, has recovered to £17 in recent weeks. This rally, which originated in the United States, is due partly to restocking by the American jewellery trade, to purchases by hoarders, and to the drying up of Russian shipments. The recent demand by the American jewellery trade should contract with the passing of Christmas. The complete stoppage of Russian shipments since last July—United States imports from the Soviet Union reached 178,700 ounces in the preceding 18 months—was solely due to the fall in prices. Shipments might be revived if the market continued strong, but whether the present or even higher prices can be sustained, depends almost entirely on speculative demand.

Since the end of the war, speculative buying of platinum has been strong and it has been stimulated further by the contraction of the "free" markets for gold and silver since last summer. The hoarding of platinum at £17 per ounce undoubtedly entails considerable risk, yet the metal appears to have many friends among international speculators. There is, indeed, some danger that dealings in platinum might develop into a largely speculative market. This tendency is being watched by platinum producers with some concern. The International Nickel Company of Canada, the world's largest producer of platinum metals, has endeavoured for some time to prevent supplies from falling into

the hands of the speculative trade, and at the recent annual meeting of Johannesburg Consolidated (which has large investments in Rustenburg Platinum) the chairman referred to the unpopularity of the price fluctuations amongst industrialists, from whom, he added, a normal and stable demand ultimately stems.

Unfortunately it appears from the latest United States Bureau of Mines statistics, that sales to the chemical and electrical industries, the two largest users of platinum, have already suffered from the exaggerated movements and the high level of prices. Owing to the heavy expansion of world production during the past fifteen years, the platinum industry requires steady expansion in industrial demand. Wartime experience appeared to provide a sound foundation for such an expansion but for the present, at least, there is a threat that buying by speculators may prevent it from being realised.

Central London Assented

A necessarily truncated account of the position of Central London Assented stock, which appeared in a Business Note in last week's issue, appears quite innocently to have caused some confusion. The note attempted to define the limiting cases which might be used in valuing the stock, and it should have included a reference to the understanding which the trustees submitted to the Minister of Transport last year about the future payment of guaranteed interest, which was described in *The Economist* of April 26, 1947. To clear up any uncertainty, it should be recalled that, since the Minister did not dissent from their memorandum, the trustees assume that the Transport Commission will continue to guarantee the full 4 per cent interest on Central London Assented Stock, until Transport Stock itself is repaid—at latest by 1988. The Commission's liability (which has not been formally admitted) will not run beyond that date.

Shorter Notes

The Northern Ireland Road Transport Board have reached agreement with the directors of the Belfast and County Down Railway Company on a proposal for the purchase of the company's undertaking. The acquisition, which is subject to the approval both of shareholders and Parliament, is in pursuance of the White Paper policy to secure the merger of the principal railway undertakings in Northern Ireland with the Board. The agreed consideration will be £485,989 payable in cash. It is intended that a procedure for obtaining the agreement of the shareholders for the distribution of this sum will be written into the Bill to be introduced to Parliament later in the year; in default of agreement being reached a scale of compensation has been fixed for the seven classes of the company's stock ranging from £6½ per cent for the ordinary to £100 per cent for the 3 per cent baronial guaranteed stock.

Coal output for the week ending January 17th was 4,116,000 tons and deep-mined production topped the 4,000,000 ton level for the first time since before Christmas. Among the 20,800 recruited to the industry in the last quarter the proportion of juvenile entrants and ex-servicemen returning decreased while the proportion of new entrants from other industries and from residential training centres was considerably greater than a year ago.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports appear in the Supplement: R. A. Lister; F. W. Woolworth; Raleigh Industries; British American Tobacco; British Tyre and Rubber.

MIDLAND BANK LIMITED

PROGRESS TOWARDS REALISM

NATION RISING TO THE OCCASION

LORD LINLITHGOW'S REVIEW

The annual general meeting of the Midland Bank Limited will be held, on the 30th inst., at the Head Office, Poultry, London, E.C.

The following is the statement by the chairman, the Most Hon. the Marquess of Linlithgow, K.G., K.T., on the report of the directors and balance sheet for the year to December 31, 1947.

In national affairs, 1947 has been a year of progress in the sense that it has brought a more realistic appreciation of the resources and potentialities of our country. To-day, two-and-a-half years after the end of the fighting, we have clearer insight into the effects of war and the toll it took of our energies and inner resources. We emerged more exhausted than we then knew, and correspondingly more receptive to easy optimism about the immediate future. I believe it will be recorded that the period since then was marked by progressive enlightenment as to the facts of our situation, by the formation of more sober views of the tasks before us, and by the resurgence of a characteristic determination to overcome the difficulties in the way of full economic recovery. We have been living through a phase of readjustment, both material and psychological; and it is because we are seeing our problems more clearly, and showing ourselves readier to take the measure of them, that we can look back upon an eventful year with considered satisfaction, and forward to the promise of better times in years that lie ahead.

The first step towards solving a problem is to see it clearly, to assess its magnitude and to visualise its implications, and here a marked advance can be recorded; for hardly anyone now dissents from the view that the post-war programme of reconstruction and improvement had outrun the nation's resources, human, material and financial. The seemingly almost miraculous achievements of war had led perhaps to over-estimation of the effort that could be sustained when the extremity of peril had been passed. Possibly, moreover, the assistance extended by the United States and Canada—essential to any plan of full economic recovery—had made the task appear less gigantic than in fact it was, having regard to the inroads made by the war upon our physical capacity for production and our external financial assets. However that may be, the facts are no longer in dispute; and they have enforced a review of plans and programmes to bring them within the compass of the nation's powers and assets. Important steps have been taken towards equilibrium between total demands, as expressed in monetary terms and in capital plans, and the physical availability of materials, labour and productive capacity.

THE "CRISES" OF 1947

Let me remind you of events which laid bare the lack of balance in our situation. The record of the year is marked by two "crises" both of which, in their own ways, brought to a focus the stresses in our overstrained economy. The fuel crisis, while it was precipitated largely by an unusual combination of adversity beyond human control, would not have become acute but for deficiencies, thus made uncomfortably manifest, in generating capacity and transport equipment—both due to the postponement during the war of renewals and expansion which ordinarily would have been undertaken year by year. At the same time, the crisis brought home more vividly than had previously been

ground, emphasised the unbalanced deployment of the country's manpower, which in itself was wasteful and diminished the potentiality of "full employment." The facts were not new; but until 1947 they were insufficiently recognised in the shaping of national policy. In some ways, as by the smaller number in the distributive trades than in pre-war times of under-employment, the shift in the distribution of manpower had been favourable in terms of reconstruction needs. In agriculture, moreover, the acuteness of the labour shortage had been hidden by the employment of many thousands of prisoners of war—a labour force now quickly diminishing. On the other hand, the number of men in the forces was, and still is, far greater than before the war; the raising of the school-leaving age has reduced the natural inflow into employment; and the incidence of conscription is psychologically unsettling to many young men at the crucial point of starting out upon their careers. Then again, the enlargement of the social services and the wide range and detailed application of the controls require the continued engagement of far larger numbers of government employees. It must be added that the controls are bound to make larger demands upon clerical and administrative staffs in private business; in our own overseas branch, for example, a net increase of staff over the pre-war number has been unavoidable because of the weight of work resulting from exchange control. Thus the redistribution of manpower has to some extent offset the enlarged capacity of the British people—enlarged, that is to say, by the natural growth of the number within formerly accepted working-age limits—for producing goods and services which can be sold abroad to pay for imports, or applied to restoring their standard of living or to improving their economic and social capital, such as generating stations and houses. The underlying shortage of labour in basic industries, particularly coal, agriculture and textiles, has been a constant drag on recovery efforts in all directions, but how seriously the maldistribution of labour was impeding progress was not widely recognised until the crises yielded knowledge and understanding through actual discomfort or prospective hardship.

Experience and observation have brought home to all of us the simple but easily forgettable fact that our standards of living are in the end governed by our actual productive performance; the one must decline if the other be not raised. It has, further, come to be more widely understood that, somehow or other, unceasing adjustment has to be made of the allocation of the product of industry between current consumption, including exports to pay for imports, and capital renewal and improvement; the two together cannot indefinitely overstep the limits of our productive power. These are the cardinal lessons of the crises, and the facts are worth recounting, not in order to bemoan our hardships or to make any claim to wisdom after the event, but to show how inescapable facts have forced us to take afresh the measure of our resources, and in using them to make a more realistic choice between desirable ends.

This is not the place to record or comment upon the many corrective measures taken, in the light of the crises, with a view to adapting the physical controls to the needs of the situation as seen by His Majesty's Government. Many of them, in the field of rationing for instance, are familiar to every one of us. Many of them, no doubt, are as heartily disliked by those who apply and enforce them as by those who have to put up with their more unpleasant manifestations. To pass on, however, without noticing some recent industrial achievements would be to ignore one of the most encouraging features in our present situation. I have in mind such items as the bigger tonnage of coal output, the enlarged flow of steel from the mills, the recruitment of women in the textile factories, the strenuous effort of transport workers to quicken the turn-round of wagons, and the innumerable adjustments of working conditions to diminish

the peak of demand on electrical capacity. Many other facts could be cited to show how vigorous and sustained effort and ingenuity are putting into the productive system the momentum that is required to carry it through to a high level of continuous activity and smoothly operating efficiency.

FINANCIAL AIDS TO READJUSTMENT

Beyond this reassuring observation, I confine myself to the financial counterpart of the measures taken on the side of production and consumption. Figures indicative of an expanding flow of incomes, and massive totals of capital disbursements, all are illusory if goods and services are not made available in proportion to the effective demands they set up. Remembrance of the disastrous consequences of active monetary deflation after the first world war has made people rightly suspicious of financial proposals which, while presented as measures to combat inflation, might lead on to positive deflation; and thus has generated an understandable reluctance to adopt any measures of financial restraint, even though the widely different basic conditions ruling today might in themselves demand some system of orderly postponement of particular classes of outlay. Moreover, restrictive financial measures are habitually thought of, even now, as being associated with high interest rates, whereas "cheap money" has been insisted upon in order to ease the burden of the enlarged national debt and to aid in financing housing and other necessary capital projects. Too often it is forgotten that, in our modern monetary system, high interest rates are not the only method, nor even an indispensable part of the technique, for restraining the use of purchasing power. Indeed, it has been shown in the past that they are capable of inducing a thoroughly irrational order of priorities among capital projects.

Of the two crises of 1947, the second was financial in its manifestation, but the mere suspension of convertibility and the reimposition of more stringent exchange controls went only a small part of the way towards correcting the underlying lack of balance. May I quote to you a wise observation contained in the report of the Belgo-Luxembourg Exchange Institute: "The relaxation of exchange control," it says, "is possible only in a healthy financial economy in which the equilibrium is established between the monetary level, production, consumption, savings and investment. . . . It would therefore be a dangerous illusion to hold that exchange control can operate to support a currency instead and in place of a rigorous budgetary policy and of a credit policy designed to adjust investment to savings." Happily, here too some progress can be reported, though many people would have wished to see a much more rapid advance towards equilibrium. The urgency of the problem has been heightened by the sharp diversion of the flow of goods from the home market into export trade and by the reduced availability of external credit resources, both of which increase the severity of the measures required to restrain the activity of purchasing power in the home market.

From this point of view it is in some degree reassuring that over the past year the volume of bank deposits, though still expanding, did not grow at the pace recorded in 1946, while the amount of currency in circulation actually declined. It has to be added, however, that there is no sign so far of any diminution in retail spending by the individual consumer; meanwhile prices have been rising, and the volume of new saving out of personal incomes—even if we allow for forms of saving, as through life insurance, not included in the usual figures—has been smaller than had been counted upon earlier in the year as a contribution to financial stability. It is too early to judge the full effectiveness of measures taken since the convertibility crisis, but they are undoubtedly working in the right direction. On the budgetary side, current revenue and expenditure figures have a far healthier appearance

than a year ago, so that anxiety has come to be concentrated upon "below the line" expenditure, or, broadly speaking, the disbursement of capital funds from Government sources. Hence the importance of the cutting down of capital programmes, a process designed on the one hand to bring the quantitative plans within the compass of the available physical resources, and on the other to avoid the dissipation of scarce resources through competitive capital expenditure.

CUTTING DOWN CAPITAL PROGRAMMES

This is a task requiring the utmost objectiveness and wise discretion in deciding which projects shall go forward and which be deferred. Physical controls, like the licensing of building proposals and the adjustment of the programmes of Government departments, local authorities and other public bodies, have their place; but on the financial side, the new principles laid down for the guidance of the Capital Issues Committee will need to be observed with a high sense of responsibility by private industry, on whose appreciation of the national interest the Government explicitly relies. Each of the banks, too, will have a difficult task to perform in deciding, as requested by the Chancellor of the Exchequer, whether in any particular case credit should be withheld on the basis of its interpretation of the Government's statement of policy. Much is gained—and the Government has shown in practice its lively recognition of this fact—both in administrative efficiency and in co-operation between Government and business, by keeping private enterprise informed, in plain and up-to-date terms, on at least the broad lines of official policy in the exercise of its discretionary powers. The rest depends to a large extent on loyal observance of rules laid down in the interests of national recovery.

In these various ways, then, the financial side of the nation's business, both public and private, is being brought into closer conformity with productive realities. The task is rendered the more urgent because of the obstructive secondary effects of some of the very restrictions on capital work which the stringency of our circumstances entails, for example, the deferment of some sorely needed replacements and repairs on the railways. The transfer of resources to the more urgent projects, moreover, can hardly fail to leave some capital works unfinished with resultant deterioration. Hence we come back to the inescapable conclusion that the solution of our difficulties is to be found only to a subsidiary extent in financial measures, important though these in themselves may be. However successfully and speedily the financial elements may be shaped to conform with current stringencies, the triumph over our present troubles still has to be gained through wisdom and enterprise in the management of our industrial affairs, both public and private, and through steadily increasing productivity on the part of the individual worker, stimulated by a clear vision of national necessity in terms of individual welfare, aided by progressively improved equipment, and encouraged by gradually fructifying incentives. There is no other road to prosperity but by way of maximising, in terms of output of goods and services, the product of what has always been our greatest asset—the industry, the sense of responsibility and the inexhaustible resourcefulness of the British people.

THE ULTIMATE DETERMINANTS

Alongside the progress recorded in our domestic arrangements, encouraging signs are visible in the international field—where our problems are of more immediate urgency—inasmuch as plans calculated to support our own efforts are coming into practical operation. Once again, Great Britain has had cause, in her latest emergency, for unmeasured thankfulness for the practical goodwill of British countries overseas; while Britain's determination still to be great, in spite of all difficulties, is demonstrated by the farseeing

projects now launched for economic development and social improvement in colonial territories. Further afield, the assistance of the International Monetary Fund has already been enlisted, while the work of the International Bank has indirectly contributed to expanding possibilities of recovery. The international trade agreement is designed to loosen the restrictions upon commerce, and in particular to give wider opportunities, to countries within the sterling area among others, of enlarging their current earnings of hard currencies. The multiple clearing agreement between important European trading nations is a step towards expanding interchange of goods and services to the common benefit. The fact that the Marshall Plan is steadily taking shape and has come into partial operation presents a magnificent opportunity for a co-operative effort directed to the reinforcement of European economies in general. This last grand concept, however, cannot be fully effective unless the countries receiving help live up to the moral obligations accepted by them in the early stages of drafting the plan.

RECOVERY DEPENDENT ON NATION'S OWN EFFORT

We are thus brought back to the fact, which cannot be too often repeated by ourselves, that our recovery depends finally upon our own efforts. No one can save us if we lack the will to save ourselves. And it is just here that the territory of economics merges into that of human capacity and human behaviour. It has often been noted that the British people are at their best in moments of the gravest emergency. The enemy without is readily identified, and the response to his assaults has never been found wanting. But the enemy within is more subtle and far less readily repulsed. I believe that, however wide may be the issues that divide us in the realm of economic and political controversy, the real and ultimate struggle is on a moral and ethical plane. It is at this level that the decisive issues are raised and settled, and it is because I see behind the recorded events of the past year a trend towards a favourable outcome of this fundamental and never-ending struggle that I am prompted to describe 1947, admitting all its trials and disappointments and with no desire to minimise the difficulties that still confront us, as a year of solid progress. In the end it is character that counts, and the past year has provided cumulative evidence that the British people is once more rising to the occasion, prepared to exert itself yet again, in a thousand ways, to plant its own feet upon firm, unassailable ground and to play its part in aiding others to establish the foundations for a new advance.

THE BANK IN 1947

The data circulated with the annual report call for a few comments, chiefly by way of supplementary information. First as to the profit and loss account, the enlarged resources at our disposal and the increased demand for advances would by themselves have brought about an increase in our net profit. In fact, however, staff and other charges continued to grow, and the amount claimed for the Exchequer was increased by the higher rates of profits tax imposed by the autumn budget. The outcome is a net profit which differs by only a small sum from that for 1946. Out of it we pay the regular dividends and make two appropriations. As to the first of these, much remains to be done, since work is inevitably postponed, to put our premises in good order after the damage and deferred wear-and-tear of the past eight years, and in view of the continued upward trend of building costs we think it advisable to apply something more to the bank premises account. Secondly, although past provisions have been more than ample to cover the amounts of depreciation over the past year in our holdings of various Government securities, it is unquestionably prudent to strengthen the position still further against any future similar movements, or other un-

foreseeable adversity, by making a further addition to the reserve for future contingencies.

A feature of last year's figures, as already recorded, was the rising trend of advances, the great bulk of which consist of accommodation to industry and trade. The increase is well spread both geographically and according to the business of the borrower, and our consistent regard for the needs of the smaller customer is shown by the fact that the number of advances has risen in roughly the same proportion as their total amount. As a comment on official statements regarding the charges for advances to farmers in particular, no one, whether a farmer or anyone else, pays to this bank an interest rate as high as five per cent. on his borrowing.

EXPANSION OF OVERSEAS BUSINESS

In my statement a year ago I described at length the expanding activity of the overseas side of our business. During the past year this development has continued, notwithstanding the upheavals in international financial relations and the sharp contraction in one section—that concerned with foreign travel. Provisions concerning securities in the new Exchange Control Act entailed an exceptionally large volume of work; but, more important in the long run, the disturbances associated with the partial breakdown of "convertibility" of sterling did not check the remarkable post-war growth of world-wide resort to London bankers' credits. Meanwhile our activities in support of export trade have been still further developed. The pre-war shipping department of the Overseas Branch has been reopened and is handling, by special means ensuring utmost promptitude and security, a growing volume of transactions on behalf of customers, such as remittances to foreign ports to cover ships' disbursements, for bunkering, canal and harbour dues and so forth, and the issue of guarantees and bail bonds with regard to collisions and salvage. To the foreign trade information service has been added the availability of specially trained experts who are prepared to visit customers in any part of the country to discuss with them financial problems which they may have encountered in the expansion of their trade with markets abroad. Besides the permanent branches of the bank in Atlantic liners and now at principal airports, we have been represented at various trade exhibitions and fairs by, among others, officials well versed in matters of international trade finance and able to discuss problems with foreign visitors in their own languages. We continue to welcome many bankers and other business men from abroad, particularly at our Overseas Branch, and since the war we have resumed the practice of giving training to students from abroad, who come to us, usually for six months, under nomination from foreign banks. We regard ourselves as privileged in thus having many varied opportunities of making more widely known the services and methods of English banking. We regard it, moreover, as a primary duty to make every possible contribution to the success of the national campaign to put the country's balance of payments on a firm and lasting foundation.

EXECUTOR AND TRUSTEE COMPANY

The expansion of the business of our Executor and Trustee Company, which also I described a year ago, is continuing on a remarkable scale. During the past year a subsidiary company has been established in the Channel Islands to meet the special needs of customers there under the laws of Jersey and Guernsey, and we have ample evidence that this enterprise was warmly welcomed. Further, our affiliated bank in Northern Ireland, the Belfast Banking Company, has established a subsidiary Executor and Trustee Company, so that similar facilities are now available throughout the Midland group, covering all parts of the United Kingdom.

An important development has been the reorganisation of the administrative structure

of the Belfast Banking Company. The composition of the new board of directors, with Lord Alanbrooke as chairman, preserves full local autonomy while incorporating representation from the Midland Bank, and continuity is assured by the appointment of the three former directors as managing directors. Our two Scottish affiliations have gained still further in strength and activity during the past year, and I would like to take the opportunity, based upon my own observation, of congratulating all our affiliated undertakings on the maintenance of a uniformly high standard of service to the public.

TRIBUTE TO STAFF

It remains only for me, in my capacity as a representative of the shareholders, to say a word of appreciation of the fine work of our

staff. Through them the public are given a continuing, highly efficient service. In these matters satisfaction should never allow us to stand still, and it is in accord with our determination to keep up with modern requirements that we shall shortly be opening a new, residential training centre to facilitate the higher instruction of selected young officers of the bank. Our whole staff organisation is designed to ensure that every member of our staff shall be more than competent to discharge the duties which may be laid upon him, and that those with unusual gifts shall be given an opportunity to demonstrate their fitness for positions of higher responsibility. In the knowledge of these objectives and the confidence that they are consistently pursued we have, I am sure, one of the principal guarantees of a happy and enthusiastic staff.

LLOYDS BANK LIMITED

NATION'S ECONOMIC CRISIS

SOUND MONETARY POLICY REQUIRED

THE RT. HON. LORD BALFOUR OF BURLEIGH'S STATEMENT

BALANCE SHEET

Turning to our profit and loss account and to the changes in our balance sheet figures, our profit at £1,635,612 is £52,000 higher than last year. With the increase in loans and advances, to which I will refer later, a greater increase in our profits might have been anticipated; but against those additional earnings we have been faced with very considerable increases in our staff costs and overhead expenses. It was also considered prudent, in view of the instability of the gilt-edge market, to make some addition to our investment reserve account.

Taking the liabilities side of our balance sheet, our current, deposit and other accounts at £1,072 million show a further increase, and are £59 million higher than last year. This large increase materialised in the last two months of the year, and may well be only a temporary addition to our resources.

On the assets side, several important changes have occurred during the year. Money at call has increased by £15 million and our holding of Treasury bills by £27 million, while there has been a welcome reduction of £43 million in Treasury deposit receipts.

We increased our investments by £9 million, and it is gratifying to record the substantial increase of £50 million in our loans and advances.

We are ready and willing lenders to all those customers engaged in production for exports, industries essential to our national economy and to agriculture.

Of our total deposits there is approximately 55 per cent. held in the form of cash, money at call, Treasury bills and Treasury deposit receipts, the average earning on the aggregate of which is below a half of one per cent.

GRAVITY OF EXTERNAL CRISIS

When we met a year ago our economic difficulties were daily becoming clearer. Our adverse balance of trade, particularly with dollar countries, was turning out, for a variety of reasons, to be greater than had been foreseen, and we still had ahead of us the obligation to resume convertibility of currently earned sterling. We could not but feel then that, even with the exercise of considerable austerity, a crisis would arise in our affairs within two years. The twelve months that have passed since then have done nothing either to relieve our austerities or to allay our anxieties. I do not think the grim realities of the situation are understood by the great bulk of our population, and least of all by that large section whose money incomes have kept ahead of the rise in the cost of living.

Our total trading deficit for the first nine months of 1947 was £473 million, compared

with £246 million for the like period of 1946. Instead of diminishing, as we hoped would be the case, our hard currency adverse balance for the nine months increased by £113 million to £447 million, and this, of course, does not indicate the full deterioration in our external position. That is measured by our losses of close on £1,000 million of foreign exchange; and as Sir Stafford Cripps has pointed out, these are not our reserves alone but the ultimate reserves of the whole sterling area. In the first eight months of the year the drafts totalled £761 million, of which £352 million were concentrated in July and August, the period of the "convertibility crisis." In the remaining four months of the year they amounted (including gross sales of gold) to a further £253 million. On January 7th, Sir Stafford Cripps announced that during December the drain had abated to a rate of rather less than \$45 million per week, which is equivalent to about £580 million a year.

In his speeches of October last, Sir Stafford Cripps announced a programme designed to conserve dollars while raising exports to 160 per cent. of their pre-war volume. If these objectives are fully attained, our overall trade should be in balance by the end of 1948, but there will still remain a dollar deficit at the rate of some £250 million a year. Our situation is thus one of grave peril. The stark fact is that within a matter of months, in the absence of some new development, we may not have at our disposal the dollars wherewith to pay for our food and for the raw materials essential to our production for export. More than that, supposing additional dollars to become available by way of a subvention from the U.S.A., unless the balance of our external trade can be restored, the respite will be merely temporary, and short-lived at that.

This formidable situation is one which I believe can only be met if monetary policy is called in aid: for it is vital to realise that our external deficit, like so many of our problems, has been aggravated by inflation. That means an excess of demand in relation to the goods available. It follows that our urgent needs are two-fold: on the one hand increased production, of coal, of food, of manufactures both for export and for home consumption; on the other hand, increased savings.

MONETARY POLICY

Monetary policy rightly applied will do much to help in both these fields. Above all, of course, a large budget surplus is needed to mop up the excess purchasing power, and I would emphasise that any American aid we receive must be reflected in a corresponding addition to the surplus. What is sometimes overlooked, however, is that to cure inflation we must also stimulate the output of goods; and this means that the methods by which the surplus is achieved are no less important than the fact of the surplus itself. A really effective surplus, therefore, must satisfy three conditions:

(1) It must be achieved, as far as possible, by reduced public expenditure, since taxation already absorbs far too high a proportion of the national income.

(2) It must be achieved in spite of some reduction in direct taxation, especially P.A.Y.E., which adversely affects incentive. Hence it should be an object of policy to reduce and ultimately to do away with subsidies other than those which are directed to secure an increased agricultural production. Indirect taxation, on the other hand, should be increased.

(3) The surplus must be a genuine one, which means that it must reflect a curtailment of private spending; in other words, it is essential that the public should meet its tax liabilities by cutting down expenditure on consumption and not by saving less. To promote the necessary saving, I postulate a rate of interest not under three per cent. on long-term securities.

It is not sufficiently realised how largely our present troubles are due to the unhealthy monetary situation. So long as demand is excessive it is, for example, quite impossible

to build up adequate working stocks, whether of finished goods, component parts or raw materials. In particular, stocks of some basic home-produced raw materials have fallen dangerously low. At the end of 1946, stocks of coal dipped below three weeks' supply at the 1946 rate of consumption; the subsequent recovery is to five weeks' supply. An equally serious shortage at the moment is steel, where movements in the stock position have reversed those of coal; from four-and-a-half weeks' supply at the end of 1946 stocks have fallen to little more than three weeks' consumption at the current rate.

This lack of adequate working stocks of all kinds is undoubtedly responsible, as much as any other factor, for the widespread decline in productivity. But suppressed inflation also reduces productivity through its adverse effect on individual effort; for physical shortages and controlled prices, coupled with the expansion in money incomes, mean that the normal incentives to increased earnings are blunted. In short, though they have averted a runaway rise in prices, rationing and controls have not been able to prevent the more insidious but equally dangerous secondary effects of a state of inflation.

It has been made crystal clear that physical controls cannot possibly secure the maximum production, in the right proportions, of the things we need most urgently, particularly when extensive resort cannot be had to that most distasteful of all physical controls, the direction of labour. In wartime it is possible to direct people on a massive scale into employments that are unpleasant or unprofitable, because patriotism is pulling in the same direction and the authorities have formidable sanctions in reserve. In peacetime the sanctions are much weaker and the promptings of patriotism less compelling and more difficult to interpret. I, for one, cannot feel hopeful that we shall in fact bring about the necessary redistribution of our labour force so long as the inflation remains and the normal monetary incentives are either lacking or pulling in the wrong direction. That is one reason why it is essential to put the monetary situation right without delay.

EFFECT OF FOOD SUBSIDIES

This is the more urgent because, as we have seen, the physical controls have not achieved their basic object of holding in check the total demands on our resources, with the result that as a nation we have been consuming far more than we have produced. Excessive capital expenditures by Government and business alike have inflated the demand for imported raw materials while locking up manpower that ought to have been producing exports. On the side of consumption, the pressure of spending has been made still more acute by the cost-of-living subsidies. These have set free a great deal of spending power that cannot be used to buy the durable consumer goods denied to us during the war, because a large part of our manufacturing output has been diverted, quite rightly, to the export market, in the hope of paying for our imports of food. But the export drive has not been accompanied, as it should have been, by an equivalent curtailment of consumer spending; for in the absence of direction of labour it has been easy for the consumer to attract to his service resources that should also have been producing exports. To a large extent, therefore, the reduced food prices have merely deflected spending power from essential to inessential objects; and thus austerity has been largely wasted.

Quite apart, therefore, from the financial saving to be made, there are compelling economic reasons for an immediate reduction in food subsidies and for their ultimate extinction. Inevitably this will cause some initial hardship, which it will be the duty of the Government to mitigate, but if we can restore a healthy monetary situation with all its advantages the gains will soon outweigh the losses. For the wage-earner, in any case, the hardships will be progressively removed by higher real output. It is of far

greater benefit to the wage-earner to give him better value on which to spend his wages than to give him more money which buys progressively less goods. If, moreover, the withdrawal of subsidies were accompanied by some adjustment of P.A.Y.E., and by a concession such as a family allowance for the first child, any necessary upward adjustment of wages could be kept to a minimum.

It will be noted that I have throughout laid emphasis on the curtailment of spending, rather than contraction of the volume of money, as the basic cure for inflation. It goes without saying that our bank is anxious to do anything in its power to help in curbing inflation. In particular, we are in full accord with the Government's desire that our advance facilities should not be utilised for purposes which are considered to be contrary to the interests of our national economy. I would emphasise, too, that while advocating the gradual withdrawal of the consumer subsidies, I would regard the maintenance of the agricultural subsidies as essential in order to save dollars by maximum production of home-grown food.

SAVING

From the point of view of saving, the return of a 3 per cent. rate on long-term Government borrowing is welcome. The course of events during the past year has shown that the gulf between 2½ per cent. and 3 per cent. is much wider than is represented by ½ per cent. per annum. In present conditions, 3 per cent. seems to be a point at which the interests of the Government as a borrower and of the investor as a lender are about balanced, and leaves room for reasonable fluctuation on either side of the figure as events dictate. This is altogether healthier than a lower level at which the risk of capital loss outweighs the jejune attraction of the meagre yield. More particularly, of course, is this the case in combination with the present crushing rate of direct taxation. A genuine budget surplus, by absorbing purchasing power and thereby stabilising prices, will also allow the potential saver to feel that he will be able to spend the money to as good or better advantage in three or four years' time. One of the greatest hindrances to saving is the growing lack of confidence in the future purchasing power of money.

Nor do I believe that the additional burden on the Exchequer of 3 per cent. compared with 2½ per cent. would be serious over and above the extra cost already incurred in compensation under the Transport Act. That, in my opinion, was a mere act of justice. The total interest burden could and should be reduced by a series of budget surpluses.

Today no accumulation of capital by the private individual is possible except through speculation or some even less desirable operation. What I am asking for is a return to conditions in which it would be possible for a man to build up a big business by hard work from small beginnings, and to "make money" in the process. Nothing could be more beneficial either to the individual member of society or to the community as a whole, for nothing would conduce more to the production of real wealth; and it is production of wealth, rather than its redistribution, which now is our most important objective, whatever may have been the position in times past.

CONVERTIBILITY

To return to our external problems: the suspension of convertibility was a grave setback not only for Britain but for the whole attempt to rebuild world trade on a multi-lateral footing. It has compelled us inevitably to revert for the time being to bilateral trading and currency arrangements. That is purely a stopgap measure, as was reaffirmed when the United States placed at our disposal once more the undrawn balance of the loan. Since there are some people who would actually welcome bilateralism as a permanent system of trading, let me emphasise that it was not the policy of restoring convertibility that was wrong. Had the arrangements

worked as was intended, convertibility would have meant simply that this country would be paying in gold or dollars for its current import surplus from the rest of the world. That is not an unreasonable proposition, since no country can expect or desire indefinitely to receive goods on credit. Unfortunately, the drafts on our exchange resources have not been limited to payment for our current import surplus. We have also had to allow other countries to draw heavily on the abnormal sterling balances built up during the war, while in the weeks preceding the convertibility crisis there was an extensive running down of working balances formerly held in sterling. Even now, it is difficult to feel certain that all the loopholes have been closed.

It should be recognised that the dollar deficits of many countries have been aggravated by the prevailing inflationary conditions. But it would be unfair to lay the responsibility for the whole dollar shortage at the door of the deficit countries. The European economy has been devastated by war and cut in two by the "Iron Curtain," and must perforce rely heavily on the American continent for food and raw materials during the reconstruction era. Marshall aid, on whatever scale it may eventually be approved by Congress, will to that extent relieve the resulting scarcity of dollars. This country would thus benefit both directly and indirectly, for a dollar famine rules out any chance of that expanding world economy in which alone we can have any hope of attaining our export targets.

If we regarded it merely as a grant in aid or a temporary alleviation of the dollar problem, however, we should fail to grasp the Marshall conception. For American aid to be truly constructive, the recipient countries must treat it as a spur to greater efforts on their own part, and Europe as a whole must be enabled to stand on its own feet again. This calls for some method of encouraging the fullest trade between countries outside the hard currency area, in particular western Europe, while reducing the demands made by those countries on the American economy. That should not be regarded as in any way opposed to America's interests; it should be welcomed as helping to reduce the inflationary pressure inside the United States. American opinion is increasingly aware of this, and some closer integration of national economies in Europe may well be made a condition of Congress approving Marshall aid at all.

But the European nations should recognise that the objective is an eminently desirable one for its own sake. Indeed, the goal to which we must all direct our efforts is the most efficient use of the economic resources of Europe and the British Commonwealth taken as a whole; and that necessitates a gradual dismantling of trade barriers and some co-ordination of national policies. It remains to be seen whether this implies a full Customs Union for western Europe, or the Commonwealth, or both. Admittedly, that could only come about by slow degrees, but if it were practicable it would be a momentous step towards that freedom of world trade which is the ultimate ideal.

In the meantime, we should all welcome the success of the Geneva tariff negotiations, which was far greater than is generally realised in this country. The agreements made affect no less than two-thirds of the trade of the countries involved, which in 1938 accounted for three-quarters of all international trade. The United States in particular gave undertakings affecting close on four-fifths of their prewar imports, reducing the American tariff almost to its relatively low level of 1913. Since those concessions have immediate effect, whereas countries in balance of payments difficulties are allowed to regulate their imports by quotas, the agreements should afford some appreciable relief to the world dollar problem.

THE FUTURE

To sum up, the immediate future is one of great danger, all the greater for being

either unrealised or unavowed. On the credit side we have the increasing output of coal, the indispensable basis of all other improvement. But having regard to the depletion of our gold reserves and the disastrous consequences which must attend their exhaustion, everything possible must be done in the field of financial policy to diminish the risks that we are forced to run, and to assist in the process of recovery.

First and foremost, we must deal with the suppressed inflation that lies at the root of so many of our troubles, both of an internal and of an external kind. The remedy for inflation, I repeat, is to be found only through a budget surplus achieved by reduction of expenditure, in combination with measures to increase incentive both to production and to saving. A sound monetary policy of this kind would be of far greater ultimate benefit to the wage-earner than a mere continuance of the present wages spiral, and offers at the same time the best prospect of maintaining the competitive position of our export industries.

Difficult and perilous as our position is, if in these ways the price mechanism could be harnessed to work with the physical controls instead of against them, and if the people could be made aware of the dangers in which they stand, I should have no fear for the outcome.

COMPANIES ACT, 1947

We have decided to await the implementation of the Companies Act, 1947, which is to be consolidated with the Companies Act, 1929, before making the comparatively small changes in the form and layout of our balance sheet and profit and loss account that will be required, but next year the accounts will conform to the new legislation which so far as accounts are concerned will come into operation next July.

In welcoming the Act, I give a particularly warm welcome to the decision of the Government to abandon the very complicated proposals originally included in the Bill, designed to secure the disclosure of the beneficial ownership of shareholdings registered in the names of nominees. I offered some criticism of these clauses in my address to you last year, and I take this opportunity of stating my belief that the final decision of the Government in this difficult and controversial matter is a wise one. Other ample measures have been substituted enabling the Board of Trade, if they have good reason to do so, to obtain the information, and under certain conditions shareholders themselves have been granted an unqualified right to require the Board of Trade to set on foot an investigation to secure disclosure. No more was in my view practicable and no less was needed to deal with the situation created by the already wide and growing practice of the use of nominees; the retention of the system is essential to the business community and a great convenience to others.

INDIA, PAKISTAN AND BURMA

Since I last addressed you, momentous events have occurred in India, Pakistan and Burma. The jubilation over the attainment of independence was short-lived; within one month of the partitioning of the Punjab serious disturbances took place and thousands of Moslems and Hindus were massacred, cholera broke out in the refugee camps, and the ripening crops over many thousands of acres seemed likely to go to ruin. In the meantime, the situation in both Hyderabad and Kashmir was moving towards a crisis and the atmosphere between the two Dominions was tense.

Since then the massacres and floods have subsided and the two major Mohammedan and Hindu festivals of the year—usually an occasion and signal for trouble—have passed without incident; cholera has stopped and enough of the crop has been gathered in to keep the majority of the country from famine through the winter. The Hyderabad issue has been composed by a standstill agreement with the Indian Union. On the other hand, the situation in regard to Kashmir gives

cause for anxiety. It is to be hoped a solution will be found before long.

Tragic as these events have been, it must be remembered that the disturbances have not been widespread. I would remind you that the population involved in the massacres only represented some three per cent. of the total population of India and Pakistan; the remainder of the total population of over 400,000,000 have, for the most part, carried on their daily activities under relatively peaceful conditions.

The position of our staff and their families in India, Pakistan and Burma has caused us grave disquiet. It is true that during all the troubles the attitude of all parties towards the British has been extremely friendly. None of our European staff has been molested nor has any of our property suffered damage. This is not to say that the staff have escaped personal danger, and they and their families have endured extreme discomfort in a manner that is worthy of the highest British tradition. I should like to take this opportunity publicly to thank them for the part they have played and for the manner in which they have played it.

It has been difficult for banks to function normally in the disturbed areas but, in spite of a depleted indigenous staff owing to evacuation, service rendered to the public has been almost unbroken. Our main business is, of course, at the ports, where very little has been felt of the disturbances in the north.

In Burma, events have been relatively no less momentous. The new Burma Constitution as enacted by the Constituent Assembly on September 24th is to come into force not later than April 15, 1948. On October 17th a treaty recognising the new independent Republic was signed by the British Prime Minister and under the Burma Independence Bill the complete independence of that country took effect from January 4, 1948. Under the new constitution no security of tenure for British interests in Burma is assured, but the expressions of goodwill towards the British indicate that the Burma Government are desirous of the closest co-operation with Britain. It is to be hoped that nothing will occur to discourage British business interests from continuing their activities in Burma.

EXECUTOR AND TRUSTEE DEPARTMENT

This section of our business continues to expand in a satisfactory manner. Our policy of decentralisation has proved successful and we have now nineteen branches open. Arrangements are well advanced to establish a further four branches. During the year we have established Lloyds Bank Executor and Trustee Company (Channel Islands) Limited in Jersey.

STAFF COLLEGE

The establishment of our training college has been delayed by difficulty in obtaining building licences and other obstacles of a technical kind. Preparations are now well advanced and we confidently expect that the first course will be able to assemble at the beginning of March, and that the College will be in full operation by the summer. We plan to hold five courses, each of two months' duration, in a year, though we shall be ready to modify this plan in the light of experience. We are confident that great benefit will accrue to the bank and to the staff from this new departure.

STAFF

I have already expressed our appreciation of the work of our staff in the East, and I cannot conclude this statement without a word of warmest praise also for the men and women who serve the bank in this country. Our British banking system renders public service of the highest order, and I believe its value to this country is increasingly appreciated. Our thanks are due to all the individuals who by team work, often of a self-sacrificing kind, keep the machine running so smoothly and so efficiently.

MARTINS BANK LIMITED

CRITICAL ISSUES FOR THE NATION

PRODUCTION AND EXPORTS

THE BANK'S SUCCESSFUL YEAR

CHAIRMAN'S SURVEY

The one hundred and seventeenth annual general meeting of members of Martins Bank Limited will be held on Friday, the 30th instant, at head office, Liverpool.

In a statement issued, the new chairman, Mr A. Harold Bibby, D.S.O., D.L., says:—

It is with great regret that I have to record the death of Mr. Alfred Watkin, who, for many years, served both on the general board and on the Manchester board of the bank.

Owing to pressure of other business in London, Sir W. Nicholas Cayzer has found it necessary to retire from the board and we greatly regret the loss of his collaboration. His place has been taken by Major R. H. Thornton, a partner in Messrs. Alfred Holt & Company, whose wide experience in shipping and commercial life will be of great assistance to us. We are pleased also to welcome to our deliberations Mr. Christopher Holland-Martin, a member of a family which has been honourably associated with the bank for many years. Mr. Holland-Martin has occupied a seat on our London board since 1944.

I am happy in submitting the bank's annual report and balance sheet to be able to present a very satisfactory record of the year's trading. For the year ended December, 1946, we had the advantage of a reduction in taxation, whereas the autumn budget, introduced in November last, added substantially to our liability for taxes; also our expenses have increased by a cash payment to our staff which, we believe, is fully justified having regard to the increase in the cost of living. On the other hand, we have had the advantage of dealing with larger resources as increases have occurred in our deposits, advances and other items of our balance sheet.

My predecessor, a year ago, referred to the abnormal increase in deposits during the year 1946, which he deplored in so far as they were based on an unbalanced budget and further Government borrowing from the banks. During the past year, though there has been a substantial rise of £19 million in our deposits, this increase is very moderate in relation to the increase in 1946. In so far as this is due to the checking of inflationary tendencies, it is of course in the national interest. Nevertheless, the inflationary trend has continued.

SACRIFICED MATERIAL HERITAGE

It is now evident that the sacrifices made by this country were so great that the hopes that we could recover our position and rebuild our shattered cities within a short time were unreasonable. Our great buildings and works rose out of savings of the past, and it is only out of the accumulated surplus of the present and the future that our position can be restored, a task which may take a generation to complete. Western Europe,

including these islands, has not had sufficient time nor, in certain cases, sufficient help to retrieve its position. This has been most generously realised in the United States of America, and it now seems probable that additional help will be forthcoming, but that must not lead us to depend on external aid for the full restoration and subsequent maintenance of our economic equilibrium. This country is capable of standing upon its own feet, and it must reconcile itself to the necessity and urgency of so doing. We have sacrificed a great part of our material heritage: we must strenuously preserve the remainder and, in addition, more than make good what has been lost.

As bankers, our experience is that manufacturers, farmers and business men in general are exerting every effort and we, on our part, have been ready to give the necessary financial assistance, as is indicated by the increase of £12 million in our overdrafts and loans, but much remains to be done.

Owing to the lack of foreign exchange, it has been necessary to restrict our imports and to urge a greater effort in exports, but other nations are in precisely the same position and the limitation of our purchasing abroad has caused others to react similarly. Of all countries, we have the most to lose from an all-round contraction of trade, and it is from the loosening of this general constricting that we may derive our greatest benefit from the Marshall Plan and, eventually, from the agreements on tariffs and trade which were negotiated at Geneva and which may be incorporated in the more comprehensive international code to be drafted at Havana.

CRISIS NOT YET APPARENT TO ALL

This has been a year of crisis which is nothing new in the history of this country and, as we know from past records, we have always survived such storms and eventually reached calmer waters after disagreeable buffetings. Consequently, there is no lack of faith in the country that on this occasion of faith in the end our troubles will be successfully surmounted. Possibly this is a justifiable assumption on the part of the people who passed safely through the Battle of Britain when, to foreign eyes, we appeared to be in an impossible position. Unfortunately, however, the seriousness of the present crisis, which in some respects is more menacing than any previously experienced, is not apparent to the generality of the people of these islands. Certain sections of our people find it extremely difficult to appreciate that there is any crisis at all. To some there seems nothing the matter with the economic position of the country as there is still no general difficulty in selling goods or services at home and money is plentiful. By exercising the normal pressures available to them in a state of full employment, others have obtained a five-day week, holidays with pay and better food rations than their fellows.

ECONOMIC LIMITS TO SECTIONAL CLAIMS

It is highly proper that the country should be made to understand the futility of any section of the community seeking to improve its position permanently at the expense of the

rest, without a proportionate increase in production.

The economic limits of such processes are set by the productivity of the 20,000,000 people who constitute the working population of this country. The activities of these workers have to be allotted between defence requirements, the maintenance and expansion of our capital equipment and the output of consumption goods. Defence unfortunately entails a larger call on man-power than before the war. Our capital equipment suffered damage and deterioration during the war and, if we are to rehabilitate ourselves as a leading industrial nation and re-establish the conditions for a rising standard of living, we should devote a larger proportion of our efforts than before the war to the tasks of real capital creation. If adequate provision is made for defence and capital creation, it is only the remaining labour force that is available for the supply of the consumption goods which determine the contemporary standard of living. These three major fields of demand—defence, capital creation, consumption—are competing claims on the national effort and, given no increase in productivity, expansion in one field can only be at the expense of contraction in the other fields. This inexorable fact has manifested itself in the past year and it will manifest itself still more strongly as the aid from abroad, furnished by the loans from the United States and Canada, tapers off to vanishing point. We may mitigate the situation temporarily by sales of gold and purchases of dollars from the International Monetary Fund but these expedients are fleeting in their effect and duration.

DEFLATING DEMAND

I have said that this dilemma manifested itself in the past year and I will quote two outstanding examples. The revised programme of food imports involves a cut of no less than £210 million in a full year from the level of imports envisaged before the convertibility crisis of last August. The revised capital investment programme involves a cut of £280 million from the level anticipated for 1948. There could be no more startling illustration of the exigencies of our situation. In these two fields, nearly £500 million of demand has to be eliminated. Failing an increase in agricultural production at home or additional supplies from the soft currency areas, the food supply of the nation is to be reduced to the extent of 7s. per week per family. We must curtail new house building and industrial building while new commercial building will be almost eliminated. Many other schemes, eminently desirable in themselves, must be shelved, including civil airfield development, major road, bridge and railway construction and sundry desirable social developments. The unquestioned merits of these projects are of no avail against the impossibility of implementing them.

VITAL ROLE OF EXPORTS

It is useful to note the relation between these two items of food supply and capital projects. The cut in food imports is not sufficient in itself to correct our situation. To pay for the remaining imports, we have to devote more resources to exports and it is only by curtailing our activity on capital development that we can obtain the additional resources for the export trade. Let no one think that we are tightening our belts in order to export; we must increase our exports to prevent a further drastic tightening of our belts and to assure ourselves of the diminished food supply of the revised programme. Failure to achieve a sufficient volume of exports would threaten our ability to pay, not only for adequate food stuffs but for the essential raw materials for our industry, thus creating the mass unemployment we are all so anxious to avoid. To export, we must not only produce the goods that our customers wish to buy but produce them at

a price that they are able and willing to pay. Every shilling that raises the selling price of our manufactures, be it owing to out-of-date machinery, excessive overhead charges, heavy national or local taxation, or failure to give increased production directly related to increased wage costs, must curtail our ability to expand our exports.

It can be argued that the curtailment of capital projects has proceeded too far. If new capital creation, apart from repair and maintenance, is to be actually less in volume than in pre-war days, the provision must be regarded as inadequate for our long-term needs, but it must be realised that our short-term needs for consumption, which must be met, are responsible for the deficiency in capital outlay and, until the national output is increased, the unfortunate necessity for the curtailment of that outlay for a limited period must be admitted. Therefore, it is essential that our resources should be deployed in accordance with the prescribed programme and that the Government's financial policy should at all points aid and not hinder that programme, for we live in a monetary economy and the real processes to which I have referred are based on monetary calculations and are directed by, and operated through, the monetary mechanism. Whatever the views about the role and importance of finance, it is indisputable that the financial machine ought to work in complete harmony with the productive machine.

NEED FOR SOUND FINANCE

It was inevitable that the demands pent up during six years of war should outweigh the capacity of contemporary effort to satisfy them. All are aware of the disappointing results of more than two years of peace but, in spite of the many warnings we have received, it is still not sufficiently realised that even the amount of progress we have made has been endangered by inflation, open or suppressed, to a sufficient extent to distort our economy and seriously hamper our productive activities. Therefore, it is still necessary to emphasise that it should be the first task of financial policy to restrain demand within the practicable limits set by current productivity. To fail in that task is not only to retard recovery but to prevent it.

It is, of course, not only in this country that evidences of financial disorder are seen. The strain on national economies due to inflationary pressure is in evidence throughout the world and is seen even in the strongest countries, including the United States of America. This general disequilibrium is admittedly due to excessive demand arising from a relative superfluity of money and other restrictive measures will be of no avail if the financial remedy is not applied. It is significant and encouraging that one of the main lines of action recommended by the Paris Conference in its report on the Marshall offer was the creation of internal financial stability in the countries concerned. It was rightly emphasised that this was a necessary condition for the accomplishment of the other aims set out in the report. Sound finance and sound money are the requisites for a healthy and freer economy at home and also for a restoration of the international trade on which the well-being and prosperity of these islands depend.

LOYAL AND DILIGENT STAFF

To conclude on a more domestic note, during the past year I have received the fullest support from the members of the general board, the district boards and the general management and, in expressing my thanks to those with whom I am in closest contact, I am very conscious of how much the success of our efforts is due to the diligence and loyalty of thousands of our staff, many of whom work untiringly in remote places. To all these, I accord my warmest thanks for their contribution to the satisfactory progress of the bank.

NATIONAL PROVINCIAL BANK LIMITED

AN UNCOMFORTABLE YEAR

DETERIORATION OF INTERNATIONAL RELATIONS

BRITAIN'S STRONG EFFORT

NEED FOR REALISTIC ATTITUDE

CAPTAIN E. C. ERIC SMITH ON THE OUTLOOK

The 115th ordinary general meeting of the National Provincial Bank Limited will be held on the 29th instant at the head office, 15, Bishopsgate, London, E.C.2.

The following is the statement of the chairman, Capt. E. C. Eric Smith, M.C., circulated with the report and accounts for the year to December 31, 1947:—

Board of Directors.—It is with very great regret that I have to record the deaths, during the year, of two members of the Board, Mr James Cadman, D.S.C., D.L., and Col. Bertram Abel Smith, D.S.O., M.C., T.D. Mr Cadman joined the board in 1942, and his well known abilities as an industrialist in many spheres were of great value to the bank. His death was the tragic result of a motor accident. Col. Bertram Abel Smith became a local director for Nottingham and district in 1908, an extraordinary director in 1918, and a director in 1942. His activities in the City in financial and commercial circles were widely recognised and his intimate knowledge of affairs acquired over long years of experience was always at the disposal of the board. We regret also that the Rt. Hon. Lord Pender has had to relinquish his duties as a director of the bank because of ill-health.

On October 22nd we had the pleasure of announcing the election of Mr David John Robarts to a seat on the board. Nephew of our director, Mr John Robarts, our new member bears a name that has been prominently connected with banking for well over a century. He has been a director of Messrs Coutts and Company for some years and we are glad to welcome him as a colleague.

Management and Staff.—During the year Mr W. G. Craddock, one of the joint general managers, retired after 44 years' service, of which ten years had been spent as a joint general manager. Mr H. F. Willmot, formerly manager of our Princes Street office, has been appointed a joint general manager to fill the vacancy. Both management and staff continue to render conspicuously good service. The volume of work and the multiplicity of regulations which concern our day-to-day operations have continued to increase. Notwithstanding this, the high standard of our service to the public is more than maintained.

ASSOCIATED BANKS

Coutts and Company.—The balance sheet of this famous banking house, showing the position as at December 31st last, accompanies our own report and accounts. It is with very great regret that I have to record the death of Mr Frank Chaplin, for many years a director of Messrs Coutts and Company.

Grindlays Bank Limited.—The balance sheet of Grindlays Bank Limited which also accompanies our own, shows the position as at April 30th last. Business is conducted by this bank in London, in India, Pakistan, Ceylon and in Burma. In August, the two Dominions of India and Pakistan were created. It is greatly to be hoped that the immediate difficulties will be quickly resolved, for these two Dominions can make a very great contribution to the solution of world economic problems.

Whilst referring to these two affiliated banks, it is not inappropriate that I should express to you my high appreciation of the services rendered to us in the control of these two institutions by the chairmen, Sir Jasper

Ridley and Sir Trevor Matthews respectively, and by the directors, managers and staffs of these two progressive banks, each of which, in its own sphere, occupies a unique position.

STATEMENT OF ACCOUNTS

During the year just ended the principal item in our balance sheet, the liability on current and deposit accounts, has grown from £726 million to £754 million. The increase of £28 million is much less than the growth during 1946, and this is reflective in considerable measure of the monetary policy of the Government. On the assets side of the balance sheet before you, the more liquid assets comprising cash, discount market loans and bills (the latter principally Treasury bills) amount to £257 million, representing 34 per cent. of the deposit liabilities. Treasury deposit receipts stand at £166 million, or 22 per cent. of deposits, as against £206 million a year ago.

Investments are set out somewhat differently from the manner of last year, so that on this occasion they will be more in line with the requirements of the 1947 Companies Act when the relative sections of that Act come into force. The entries under the major heading of trade investments contain our holdings in subsidiary and associated institutions and certain miscellaneous items. The total holding of investments in our portfolio is £160 million as against £162 million at December 31, 1946.

There has been a considerable increase during the year in advances to customers and other accounts and the figure at the close of business on December 31st last was £185 million, equal to 24.5 per cent. of our deposits.

FACTORS AFFECTING PROFITS

Profit and Loss Account.—Many factors affect profit-earning capacity. Most important is the volume of resources employed; and next the margin between allowance rates and the rate of return on the money employed and the manner in which distribution of this money is spread amongst the various assets. Of these assets cash earns nothing but is a source of very considerable expense, and other large items earn one half of one per cent., or only a fraction more. A factor which can be of importance is the prudent setting aside of earnings where there is any doubt regarding the value of the principal sum involved. A much more important feature is the expenditure that is entailed in operating our business. Salaries and pensions have accounted for a very substantial increase over the charge for 1946. Rates, lighting and heating, stationery, printing and the varied miscellaneous expenditure involved in providing all the necessary elements for the efficient conduct of our business have all cost more. Last, but by no means least, the increase imposed last year in taxation of profits, both retained and distributed, has had an adverse effect upon our net trading results. In addition, no doubt should exist about the wisdom of providing now, to the best of our ability, against the hazards and vicissitudes which the future may hold.

The net profit for the year 1947 amounts to £1,347,929, which compares with £1,331,071 for the previous year. The amount brought forward from 1946 is £863,417, so making a disposable balance of

£2,211,346. In July an interim dividend of 7½ per cent. was paid, less tax, at a cost of £391,026, and it is proposed that a further payment at a similar rate should be made. In addition the following appropriations are recommended: to contingencies account, £300,000; to pension fund, £250,000, and if these proposals are accepted by you there will be a sum of £879,294 to carry into the accounts for 1948.

TRADE AGREEMENT WITH RUSSIA

The past year has been an uncomfortable one, mentally as well as physically. International relations which, even in January, 1947, could not be regarded with any degree of optimism, have steadily deteriorated. A consistent stream of vituperation and misrepresentation has flowed from Moscow and its representatives, and the satellite countries have indulged in a series of travesties of justice, culminating in some cases in judicial murder. The birth of the Cominform has been followed by inspired industrial troubles in France and Italy, accurately timed to synchronise with the ill-fated meeting of the Foreign Ministers in London. European convalescence is certainly not conspicuous. It would require a curious mentality to look back on 1947 as a year of diplomatic successes. In December a trade agreement was concluded between the United Kingdom and the Soviet Republics. It is to be hoped that the terms of this agreement will be carried out and that it will be the forerunner of further similar arrangements. Perhaps this commercial rapprochement may ultimately lead to improved political relations between the two countries, an end which is not only desirable, but vitally important.

THE CRISIS

In this country an unusually cold winter precipitated a crisis which those in possession of the facts must obviously have known was coming, although its impending arrival was screened from the public until it had virtually arrived. There followed a period of dislocation of industry, unemployment and discomfort, the full effect and cost of which has yet to be assessed. Much ingenuity was employed in minimising this trifling interruption of the nation's activities, and in May the five-day week was introduced in the British Mining Industry. On July 15, in accordance with the conditions of the American Loan, convertibility of sterling came into operation. In certain quarters it had been suggested, with some diffidence, that the country's trading position and dollar requirements were such that this step possessed considerable elements of danger. Assurances from the highest quarter were, however, forthcoming to the effect that every necessary precaution had been taken to safeguard our position and that risks existed only in the minds of the craven hearted. Thereupon began a drain on our dollars on a truly magnificent scale.

SUSPENSION OF CONVERTIBILITY

On August 21, by arrangement with the United States the convertibility of sterling was suspended and the balance of the American Loan became temporarily blocked until December. This minor error of judgment entailed considerable explanations, but an unkind fate and unforeseeable circumstances eventually shouldered the burden between them. The incident was washed away in a spate of printer's ink in time to make way for a fortified export programme and some further austerity.

The Autumn was crowded with unwelcome events. The Control of Motor Fuel Order came into force and the basic petrol ration perished miserably and extremely vocally. The Control of Engagements Order reared its contentious head, and the potato assumed a humble position on the list of rationed foods. This last, an event which was, of course, wholly unpredictable! The period was punctuated by sales of gold to meet our dollar

requirements. Let us, therefore, congratulate ourselves that 1947 is over.

CHANGE TO 3 PER CENT. BASIS

At the end of 1946 and the beginning of 1947 the cheap money policy culminated in the issue at par of 2½ per cent. Treasury stock 1975, but the necessary support to maintain the gilt-edged market on this basis was not forthcoming. During the year the market gradually relapsed until in December it had assumed a 3 per cent. complexion for long-dated stocks. The decline was accelerated by the uncertainty which overhung the terms of the Government Stock to be issued to the dispossessed railway stockholders. There can be little doubt that the position is healthier for this change. A 3 per cent. basis which is realistic is infinitely preferable to a 2½ per cent. basis which can be only precariously maintained by unpredictable manoeuvres. The process of passing from a 2½ per cent. to a 3 per cent. basis must, of necessity, be painful for institutions whose business compels them to be consistent purchasers of gilt-edged securities.

The growth of bank deposits has been on a much reduced scale, and this also is a satisfactory feature. Increased deposits which have increased wealth behind them are entirely respectable, but increased deposits which merely reflect the writing up of existing assets are poison in the body economic, and there can be little argument but that much of the increase in 1946 came into this latter category.

EXPANDING PRODUCTION

Increased advances and overseas credits have been a welcome sign of expanding production and trade, and it can never be repeated too often that without such expansion the country will be unable to maintain a reasonable standard of living. Such advances and credits are now carefully shepherded to where they can assist directly or indirectly the export industries of the country or necessary internal trade. This action is a corollary of the cut in capital expenditure and is of equal importance in concentrating available resources and labour on essentials.

Much has been written on the balance of trade, or the unbalance thereof. It is a problem we have to live with and manifestations of its unpleasant effects are repeatedly and forcibly brought to the notice of all of us. Herculean efforts have been and are being made to reduce the unbalance in the position, but unfortunately many of the most hopeful of these are long-term projects, benefit from which must lie in the future. The development of our own agriculture will ultimately make some contribution, but its fulfilment is largely dependent on an adequate labour force, which, again, is inextricably involved with rural housing, and the difficulties are aggravated by the progressive repatriation of prisoners of war. The creation of new sources of supply of commodities hitherto emanating from hard currency countries is a sound and reasonable proposition, but relief on any scale from such projects cannot be looked for immediately.

OVERSEAS MARKETS

The export of our manufactures has been vigorously pressed and the most conscientious efforts have been made to expand existing markets and develop new ones. Close study of the requirements of potential customers is being maintained and new entrants into the export trade are encouraged in every way. It can be said that the nation's effort has been commendably strong, and, up to a point, successful, but the adverse balance is still present, as our sales of gold and purchases of dollars from the International Monetary Fund emphasise.

Events have not been helpful. Recovery throughout the bulk of the world has been painfully slow. The prosperity of the United

States of America has served to put up the prices of our imports of food and raw materials, and in other places Government selling agencies, remote from the primary producer, have not been free from rapacity. It is doubtful whether bulk buying serves us most economically. Politics inevitably creep into inter-Governmental trading transactions, which should be matters of business pure and simple. In this country for too long our efforts were dissipated on possibly desirable developments we could not afford, when concentration on our very existence was essential.

REFUSAL TO FACE FACTS

We have suffered from a serious onset of appeasement. Refusal to face facts has been predominant and the greatest energy has been employed in inducing people to believe they are much better off than is really the case. Every shock suffered last year was sprung on the country at the last moment, when concealment was no longer possible, and was accompanied by explanations that the causes were unforeseen occurrences for which no one was to blame. Considerable progress has now been made in the descent to earth. Efforts are being made to point out, in words of few syllables, the precarious position in which the country stands, and some of the promised prizes have been postponed. The haze of make-believe has not, however, been entirely dispelled, and much effort is still directed towards shielding certain strata of the population from the effects of increased austerity. We are, in fact, still appeasing.

The autumn Budget provides an admirable example. After the big words that preceded it, it was almost farcical; a mere face-saving gesture to show that something had been done and that no one who mattered had been hurt. Fear rules our rulers. Fear of the trades unions, fear of increased wages, fear of stopping wage increases, fear of the electorate, fear to face any unpleasant situation.

NEED FOR REALISTIC VIEW

It is time every individual in the country realised his true position. No decent active man should tolerate the idea that he exists to some extent on charity, and yet for example the man who enjoys better food in a works canteen is accepting material charity from those not so favourably placed. The subsidies which keep down the price of food are in part provided by the beneficiary himself, and for the rest paid for by his fellow citizens. Let the man in the street realise that when he says "the State pays" it means that he himself is paying, and if he is not contributing his full share the balance is charity from another such as he.

The country has a long way to go before it achieves solvency. It will, in due course, arrive, but the longer the people remain drugged with the narcotics of make-believe the longer will be the journey.

THE MARSHALL PLAN

Before concluding this altogether unpleasant summary, mention must be made of the so-called Marshall Plan. The acceptance of the idea by the Senate and Congress of the United States is an act of the greatest realism—as realistic as Russia's bitter opposition to the Plan. But it is not the realism which calls for comment, it is the unprecedented generosity and its enormous scale. Never in the history of the world has there been such a gesture. With this example before us there are grounds to question the cynics' doubts as to the survival of human virtue.

As to the operation and result of the Plan, we all pray for its success, but its magnitude is such that there may prove to be, not a shortage of dollars, but a shortage of the material things those dollars are intended to provide. May these fears prove to be unfounded.

DISTRICT BANK LIMITED

SATISFACTORY RESULTS—INCREASED PROFIT

NATION'S ECONOMIC PROBLEMS

STATEMENT BY THE CHAIRMAN, SIR THOMAS D. BARLOW, G.B.E.

The chairman, Sir Thomas D. Barlow, G.B.E., has circulated, with the report and accounts, the following statement to the shareholders of District Bank Limited, prior to the 118th annual meeting to be held on 30th instant, at the Head Office, Spring Gardens, Manchester:—

Before dealing with more general matters I should like to pay tribute to the work of my predecessor, Sir R. Noton Barclay, who last January made known his intention to retire from the chairmanship of the bank. Sir Noton is our senior director and has occupied the chair with distinction for the past ten years. During his term of office the bank has not only consolidated its position but has also extended its activities to a much wider field. That Sir Noton has agreed to remain a member of the board is something which gives me great satisfaction, and my feelings are shared by my colleagues as his wide knowledge and long experience will still be available to us.

As your new chairman I am mindful of the responsibilities which are attached to the office, and I particularly regret that I shall be unable to preside at the first annual meeting since my appointment, as I shall be sailing for South Africa early in the New Year.

I am indeed pleased to have the help of Sir Robert Burrows, who has recently been elected a deputy chairman, and I am glad to say that Sir Samuel Turner will also continue to serve in that capacity. This further assistance is very valuable following the establishment of a London Committee responsible for the direction of the affairs of the bank in the London area and the South, where we now have a number of offices with steadily increasing business. Recently we have opened at Christchurch, whilst Hounslow will be ready shortly. These developments do not imply that our policy of expansion is limited only to that part of the country. Over the last twelve months we have opened at Huddersfield and Prestatyn and we have plans under way for new branches in other areas.

MANAGEMENT AND STAFF

Among the higher officials of the bank there are some changes to report. Mr William Cunliffe, who has been Joint General Manager since 1932, has retired on pension. Mr Cunliffe has been with the bank nearly forty-three years and on your behalf I would not only like to express appreciation of his long and valued service but also to extend to him our best wishes for the future. Mr Donald Farnham Pollard, manager of head office, has been appointed a joint general manager and Mr William Mitchell, previously sub-manager, becomes head office manager.

The task of fitting the members of the staff who have returned from the Forces into positions worthy of their abilities and service experience is proceeding. Much care is being given to training and as a result we

have at our disposal an increasing number of men suitable for positions which carry greater responsibilities.

Plans have been put in hand for a memorial to those members of the staff who lost their lives on National Service and the form this will take is being discussed with the staff association. In a spontaneous and voluntary desire to honour their fallen colleagues the staff themselves established a memorial fund. So generous was the response, in which the directors also participated, that the fund reached the total required to carry out its aims, which were to make an annual payment to each orphaned child until he or she reached the age of sixteen.

During the past year the bank has played its part in the task of reconversion and I wish to express very full appreciation of all that has been done by the management and staff. In particular I should like to mention the work of the staff association which deserves special acknowledgment.

THE ACCOUNTS

On reference to the balance sheet you will see that there is a slight increase in current, deposit and other accounts. But whilst these figures and the volume of our resources show only a small variation as compared with the figures for the previous year, important changes have occurred in the composition of our assets. Here the outstanding movement is the fall of £13,500,000 in treasury deposit receipts which during 1946 were increased by the intensive inflationary pressure exerted in support of the cheap money drive. It was only to be expected that this pressure would bring instability by adding to the weight of money, thus promoting rising wages, costs and prices.

Of the funds which we have had released from Treasury deposit receipts over £4,000,000 have gone into call money and bills of exchange (which in the main are Treasury bills), thereby increasing our liquidity, and more than £3,000,000 have been added to investments. These are mainly repayable at fixed dates and appear in the balance sheet at considerably less than their market value, despite the marked depreciation of gilt-edged securities during the year. The remainder of the sum made available from Treasury deposit receipts is reflected in the higher figure for advances. This item shows an increase of nearly £8,000,000, but the upward trend of lendings will probably be curbed by the Government's far-reaching plans to improve the country's international trading position.

It is satisfactory to know from the analysis which we periodically make of our advances that they are well spread over a wide range of industries and, I might add, all propositions coming before us, whether large or small, receive the most careful consideration. Here I would like to refer to the Finance Corporation for Industry Limited and the Industrial and Commercial Finance Corporation Limited, which, in providing long-term finance of a capital nature outside the scope of the joint stock banks, have in our experience rendered valuable service.

Closely associated with the higher figure for advances is the welcome increase of nearly £1,600,000 in liabilities of customers for acceptances, confirmed credits and other obligations which now stand at £6,472,079. This figure is particularly encouraging because it is largely attributable to the

THE ECONOMIST, January 24, 1948

increased activities of customers concerned with overseas trade.

PROFIT AND ALLOCATIONS

From this résumé of our principal asset items it will be seen that, as regards earnings, the most favourable factors are the increases in advances and investments. But on the other side there have been much heavier payments for salaries, due to the return of staff from the Forces and to a higher level of remuneration, and there has also been a general unavoidable increase in other expenses. After making full provision for bad and doubtful debts, taxation and contingencies, we show a net profit for the year of £503,796 which compares with £487,276 for the previous twelve months. Bringing in £399,640 from our 1946 accounts we have for disposal £903,436. Of this we propose to apply £120,000, the same amount as last year, to pensions and annuities fund and to allocate £100,000 to contingencies account against £75,000 last year. This we consider to be prudent in view of the uncertainty of the general business outlook. We also propose to transfer £23,572 to reserve fund to round that item off at £3,000,000. After allowing for these dispositions and providing for the dividend at the same rate as last year, there remains a sum of £374,224 to be carried to the next account.

During the year we have purchased the property in Spring Gardens adjoining head office with a view to facilitating future extensions as and when they become necessary. Other than this, few additions to property account have been made for some years, since there has been little opportunity for capital expenditure on existing premises or on prospective new branches. Because our properties stand at a figure well below their real value, further provision for depreciation at this time is not considered necessary.

SPECIALIST DEPARTMENTS

Whilst the profit and loss statement and balance sheet give a broad outline of our experience throughout the trading period, there are certain activities all-important to the bank's progress which call for separate comment. First I would refer to the greater volume of work which has devolved upon the foreign department. This, of course, was to have been expected in view of the larger responsibilities which have arisen in connection with Exchange Control, the critical and ever-changing foreign conditions and the strenuous endeavours to increase exports. In such circumstances it is not surprising that the enquiries from customers experienced in foreign trade have been both numerous and varied. But beyond these are the particular problems of the many firms who have had to send their products to overseas markets for the first time. Here so numerous are the difficulties presented that, in order to give the maximum help, we have inaugurated an exports information service which is designed to give practical guidance to all who need such assistance. In addition to supplying information on all matters of finance, this service aims at providing technical advice on the potentialities of overseas markets, on the specialised requirements of various countries and on the manifold intricacies involved in the shipment and distribution of goods abroad. During the year our representatives have renewed old connections by visiting a number of European countries as well as making an extensive tour of Canada and the United States from the Atlantic to the Pacific. The interchange of views and the discussions regarding potential markets for British goods have been of very great value.

The steady growth of our trustee business continues and the department's services have during the past year been in constant and increasing demand.

The nationalisation of the railways, which has been effective since January 1st, has further reduced the choice of investments authorised by the Trustee Act, 1925, while the pending liquidation of the Argentine

THE ECONOMIST, January 24, 1948

Railways and other nationalisation schemes in this country are increasing the flow of trustee funds seeking reinvestment. These factors alone make more pressing the case for an extension of the lists of authorised trustee investments.

OTHER ACTIVITIES

In a time of economic stress like the present we might well reflect on the stability of the banking position in this country and feel reassured by its great strength. But if in good times, because of the pressure of business, the banks are called upon to widen the scope of their services, even more is required of them in times of difficulty. Not only do they accept the duties demanded by emergency legislation, but voluntarily undertake additional responsibilities as their contribution to the national effort. So throughout the war and postwar years full support has been given to the Savings Movement. This year, however, the drive for savings has of necessity been intensified and all the banks are supporting the new campaign "Save the Bank Way." It is too early to say how successful this appeal will be, but, because saving is vital to the country's well-being, we gladly play our part.

Quite a different service, and one which is proving increasingly popular, is that provided by the District Bank Review. This not only makes a contribution to economic and financial discussion, but also brings to light the practical problems of industry, a side of national life with which this bank has been particularly closely associated for well over a century. Opinions expressed in the Review are not necessarily orthodox, and may even be controversial, since they are intended to stimulate constructive thought.

ECONOMIC DISORDERS AND REMEDIES

The predictions made last year by my predecessor have unhappily been more than justified by events, and it is perhaps permissible to set down some of the salient features of the situation in which the country now finds itself. Such analysis cannot be other than controversial. Although nobody can deny the gravity of our economic position, we are perhaps too near current events to assess them dispassionately. I do not think, however, that the present state of affairs can be viewed in proper perspective except as a logical consequence of developments operating over a long period. Man-made, having applied science to industry and thereby created the industrial revolution, was insufficiently conscious of its social consequences.

Yet, although we can clearly see the sequence of past events, do we realise the economic consequences of our recent actions? When it was imperative that the country should increase its output in order to redress its international trading position and also its domestic shortages, and when, because of this, there was full employment and full order books, we introduced the shorter working week. What could have been better calculated to produce an atmosphere of false prosperity, and what could have made it more difficult for others than the well informed to realise the critical situation confronting the nation? Indeed, one cannot but consider whether it was wise, when the country was exhausted by a terrible and prolonged war, to embark upon far-reaching schemes of a difficult and complex character when even their protagonists could only claim that the benefits were of a long-term nature. All are agreed that social security and full employment are desirable objectives, but can these be achieved except under an authoritarian system of direction? An optimistic view is perhaps permissible, but the difficulties and dangers cannot be ignored.

Leaving aside these aspects, there has recently been sent out a realistic directive to industry. This shows that it has been recognised, if all too tardily, how parlous the posi-

tion is. The Marshall Plan may give us some help, but even if we get this assistance it is the duty of everybody to give full support to all remedial measures, however vigorously applied and however unpleasant they be.

Unless a reasonable degree of confidence is engendered, capital will not seek employment at home, nor shall we be able to enlist aid from abroad. Admittedly it is not easy for us, so long accustomed to the role of creditor, to assume that of debtor. On the other hand, our long experience as an international lender should certainly make us appreciative of the need for creditworthiness. Many hard words have been uttered in the United States as to how we conduct our affairs. Can we maintain that these criticisms are without justification?

Whether they are or not, there remains the necessity for a keen analysis of economic problems and for more co-ordinated action in dealing with them. Indeed, our greatest danger is that we tackle separate and contradictory difficulties in the belief or hope that their disposal will rectify a whole range of fundamental disorders. To expand the volume of exports at the expense of domestic consumption is, however unpalatable, an essential policy. But in arresting the deterioration in our balance of payments position it is so easy to concentrate on an overall cut in imports and by so doing starve industry of vital materials. Similarly, record figures for exports can in the long run be a loss rather than a gain if in their attainment we pay inadequate regard to the type of export, and part with goods having little sterling content of labour or those which are needed for the production of other important exports.

FINANCIAL MEASURES

To take the matter further, corrective action is inconclusive which seeks to redress our balance of payments by cutting imports and by switching home trade production to exports regardless of the over-riding consideration of domestic inflation. Whether an increase in money is due to Budget deficits or increased wages, the effect, in the absence of goods, intensifies the demand for imports and retards exports, thus widening rather than narrowing the gap. So, lacking a comprehensive policy which recognises the interdependence of economics and finance, we couple more physical controls with exhortations, while we avoid both cuts in Government expenditure and harder work with longer hours—the real way of overcoming our payments difficulties.

It is undoubtedly a great misfortune that surplus money should continue to chase too few commodities and its reduction is an imperative necessity. Certainly the remedy is not to increase the volume of consumer goods in the home market if their presence results in inadequate food supplies, but to reduce premature and unessential capital expenditure and to stimulate savings. Capital expenditure should be primarily regarded as legitimate only if it spurs on exports or curtails imports. As regards savings, or even increased taxation, these can only assist in curbing inflation if the Government employs such receipts as far as possible in the retirement of National Debt.

In a well-balanced financial policy we have then the best medium for adjusting public and private expenditure to the volume of our productivity. But a proper use of the public purse should in addition permit a reduction in taxation, since this at its present level hampers enterprise. It should also permit a simplification of controls so expensive in manpower both to the Government and to all branches of industry.

THE EXPORT DRIVE

At present the outstanding difficulties of exporters are to obtain raw materials and components and to comply with innumerable

regulations and directional controls which make efficient production extremely difficult. Summed up, this points to the necessity for appropriate financial action to relieve the pressure on physical controls. But even assuming that more goods are made available for export, we cannot but regard the prospects of our overseas trade with apprehension. Our production costs are heavily swollen by increased charges for transport, fuel and wages. But we should not allow ourselves to become accustomed to a steady upward movement which has no relation to straitened economic circumstances. It is a commonplace to say that only a concurrent increase in the volume of production can justify an ever-ascending level of cost. Yet how unwise it is to ignore this in the knowledge that the sellers' market will not continue indefinitely. It would be a mistake to assume that other countries are open to receive British products whether they be good, bad or indifferent. On the contrary, markets will become more and more selective. Indeed, are there not already signs that, for non-essential goods, they are beginning to disappear? It is therefore necessary not only to ship the right sort of goods, but to do so at competitive prices, and this demands close attention to scientific technology, design and quality.

TEXTILES

Despite all the difficulties which attach to foreign trade the world demand for textiles is still substantial and will, we hope, continue; but remembering, as we do, the devastating consequences of Japanese competition in the prewar years, we must devoutly hope that some control will be imposed in the Peace Treaty upon the volume and price of Japanese production. Subject to this there is a real future for the industry, if it can grasp the opportunity which lies before it.

The disappearance of the Liverpool cotton market is a heavy war casualty. A complex and highly skilful organism built up by long experience, it made a valuable contribution to the country's external trade position: it also brought cotton to Liverpool in greater variety than was to be found in any other market. This varied stock is not now available to the same degree and the range of selection is much diminished. The Cotton Purchasing Commission, however, has hardly been in existence long enough to get into its stride and we must hope that it will be able to build up an organisation which will secure for the industry the cotton which it requires.

Many circumstances over which the cotton trade has had no control have militated against doing all that it would have wished in the way of re-equipment and reorganisation and, in so far as these have delayed progress, the industry has no need for self-reproach. None the less it is of the utmost importance that the trade should press on with schemes for readjustment and for the introduction of those modifications of existing machinery which can be made without insuperable difficulty or exorbitant cost at the present time.

AGRICULTURE

In the support which agriculture affords sterling and the contribution it makes towards an improved standard of living, as well as towards a better distribution of population in this country, it plays a role no less important than that of the export industries. In addition, our changed circumstances render it essential that agriculture should be permanently strengthened. With these points in mind it is satisfactory to know that agriculture will now have its fair share of support with due priorities as regards machinery and raw materials. We may, therefore, legitimately hope that the Government's Four-Year Plan will not only help to expand and modernise the industry, but also increase its productivity.

CROMPTON PARKINSON LIMITED

SATISFACTORY RESULTS

STEADY GROWTH OF EARNINGS

The 34th annual general meeting of this company was held on the 16th January, 1948, in London.

The chairman, Mr. Albert Parkinson, M.B.E., in the course of his speech, said:—

The year that has passed since last we met has been remarkable mainly for the growing national realisation of the difficult economic state of the country. The fuel crisis in the early part of the year underlined and accentuated the unbalanced industrial economy and created new and difficult problems of management, the effects of which are still with us and the total result of which can never be measured.

In a year of efforts increased by national difficulties, the continued shortages of materials and manpower and including the completion of our reconversion plans, I feel you would wish to join with your Board in expressing a full appreciation of the skill, energy and initiative with which the executives, staff and all workers throughout our organisation have met and solved their many problems with such commendable results.

THE YEAR'S ACCOUNTS

Your directors take pride in being able to present accounts showing results of the year's operations of your Company that continue still further the steady growth of earnings evident in recent years.

At this point I would mention the complications of company taxation during the year covered by your company's operations. The cessation of Excess Profits Tax, the introduction of an additional Profits Tax on distributed profits and the subsequent doubling, retrospectively, in the autumn Budget of the Profits Tax have created complexities of computation which are particularly involved in a company having worldwide ramifications and many subsidiary companies, whose financial periods do not coincide with that of the parent company. In completing the year's accounts we have followed our established practice of making full provision for all taxation liabilities on the profits earned.

The balance sheet shows clearly the changes that have taken place in the year, and it will be noted that further expenditure has been made on Fixed Assets. This represents a continuance of the policy of expansion and modernisation to which I referred last year. In the furtherance of this policy additional expenditure on Fixed Assets is likely to continue for several years.

AUSTIN-CROMPTON PARKINSON ELECTRIC VEHICLES, LIMITED

The partnership with the Austin Motor Company, Limited, to which I referred last year has been effected by the sale to that company of half the issued capital of what was one of our subsidiary companies and is now called "Austin-Crompton Parkinson Electric Vehicles, Limited." It now becomes an associated company, and this change is partly the cause of the reduction in the figure of shares in subsidiary companies and the increase in the figure of shares in associated companies. The excess of the price received over the value at which the shares stood in the balance sheet at September 30, 1946, has been used to write down the value of shares held by the company in other subsidiary companies.

CROMPTON ENGINEERING COMPANY (MADRAS), LIMITED

During the year your Company has acquired a half interest in Crompton Engineering Company (Madras), Limited, which has been our agent for many years in Southern India for the distribution of the products of our home and Indian factories

and which also carries on an extensive business as agents for other engineering products and as contractors for large power schemes in that territory. The partnership thus formed cements the friendly relationship which has always existed with our agents and affords us an opportunity to expand our interests in Southern India. The Madras Company thus becomes an associated company.

The increase in net liquid assets is largely due to the settlement, during the year, of outstanding claims in respect of work done by subsidiary companies for Government departments, which also accounts for the considerable reduction of the item of Subsidiary and Associated Companies and Trade Investments.

CONSOLIDATED ACCOUNTS

There are many difficulties inherent in the preparation of Consolidated Accounts for a group comprising a number of subsidiary and sub-subsidiary companies in many parts of the world, but nevertheless your Board has arranged to include with the published accounts this year and in the future, a consolidated statement of assets and liabilities and a consolidated profit and loss account which we believe will assist you in an understanding and an appreciation of the sound position of your Company. These consolidated accounts have been presented in the same form we have adopted for the parent company's accounts since 1935 in order to assist the comparisons you will, no doubt, wish to make. Such comparisons will reveal that, apart from the division into their component parts of the assets and liabilities of the subsidiary and sub-subsidiary companies, the consolidated accounts show a position which is very little different from that shown in the balance sheet and profit and loss account of the parent company.

The amount of £281,366 for goodwill arises incidentally from the purchase of shares in subsidiary companies at prices which exceeded in the aggregate the book value of their net assets at the respective dates of acquisition of such shares. The amount of this item in the consolidated accounts will change from time to time as your Company's investment in subsidiary companies increases or decreases. The decrease shown to have taken place in the year ended September 30, 1947, is mainly caused by the sale of shares in the electric vehicle and truck business to which I have already referred in these remarks.

In regard to the consolidated profit and loss account, I have no comments to make. The small excess which the group earnings show over the earnings of the parent company is, in the opinion of your Board, insufficient to warrant a change from the conservative policy out of which such excess arises.

OVERSEAS

Throughout the whole of its long history your Company has been imbued with the importance of overseas business and has been in the forefront of the development not only of the export of the products of the home factories, but also of the use of local resources for the generation and distribution of electricity and for the manufacture of electrical products similar to those made at home.

In the field of exports the national economic difficulties have emphasised the wisdom of our policy and we are now engaged on the task of expanding our overseas sales from the home factories. The nature of many of our products is such that a considerable proportion must remain in this country to meet the needs of our basic industries and to provide capital equipment for our exporting industries. Also, as I pointed out last year,

much of our output sold to home customers is later sent abroad as part of a larger unit (e.g., machine tool, refrigerator, pump, etc.) and thus contributes to the solution of the problem of our adverse balance of trade with other nations.

To make our maximum contribution to national recovery we are, firstly, working to obtain an increased output by every means in our power and secondly reorganising and strengthening our overseas sales forces so that the full effort of our senior executives is bent to this all-important task. Every potential market of the world has been brought under careful review to ensure, as far as possible, an adequate outlet for such of our available output as can be exported, whilst still meeting the priority needs of the home market. From time to time we are reminded that other countries of the world also have their economic and political problems. Such reminders take the form of high tariffs, import restrictions (and even embargoes) currency regulations and the like. The removal of such barriers to our export trade is a matter that can only be dealt with on a national level.

Throughout the year our overseas factories have continued to justify the initiative with which they were conceived and the energy with which they have been, and continue to be developed and run. I cannot praise too highly the devotion to their task which is displayed by the men who are charged with the difficult tasks of management in our factories in India, Australia and New Zealand.

TRAINING BURSARIES

For nearly seventy years the works, the offices and the research establishments of the company have been the training ground for three generations of engineers. The pioneering skill and enterprise which are the very foundations of your Company were provided in the beginning by Colonel R. E. Crompton and subsequently by our late chairman, Mr. Frank Parkinson.

What could be a more fitting memorial to these two illustrious names than that they should be allied to a means whereby the torch they lit and held so high may be passed on and on.

Your Board has inaugurated two new bursary schemes for this purpose.

The Colonel Crompton Bursaries will be awarded to enable suitable present employees of the company in Great Britain to gain knowledge or experience in universities, colleges, industry or elsewhere in any part of the world, and thus to fit themselves for wider responsibilities by the development of their powers.

Frank Parkinson Empire Bursaries will enable selected candidates from the Dominions and Empire to come to Britain and receive technical and practical training. Our late chairman held a strong belief in the value of the link between the Mother Country and the Empire and we believe each bursary-holder will add strength to that link.

The two new bursary schemes come into operation at once and your directors will watch with interest and with confidence the progress of those who are selected for training in the names of their past leaders.

DIVIDEND POLICY

Once again you are asked to approve the distribution by way of dividend and special cash bonus of 15 per cent. on the ordinary and "A" ordinary stocks, making, with the interim dividend already declared and paid, a total distribution of 22½ per cent. You are also asked to sanction the usual dividends on the preference stocks. Your directors have made these recommendations with the conviction that a maintenance of the policy of past years of retaining a considerable portion of the profits, is in the best interests of the company, enabling your Board to finance, out of the company's resources, the normal development of the business.

For reasons which have already been circulated to each stockholder of the com-

pany, it is necessary to defer the payment of these dividends and special cash bonus until seven days after the holding of the adjourned Annual General Meeting.

The Central Benevolent Fund continues to do excellent work and well merits the addition of a further sum of £5,000 which your directors have again allocated to it.

GENERAL OUTLOOK

Amid the vast uncertainties of this post-war world with political and economic winds of varying strength and temperature blowing across the four corners of the earth, prophecy is more than usually futile. I can say, however, with full confidence that your Company is well founded. It has diversity of products and a full order book; it has up-to-date works in many parts of the world; it has a reputation for the quality of its goods and the integrity of its dealings, and above all it has a team of workers in all branches of the organisation ready and able to cope with the many problems that arise in the changing times in which we live.

ALEXANDERS DISCOUNT COMPANY, LIMITED

MONEY MARKET CONDITIONS

The eightieth ordinary general meeting of this Company will be held at 24, Lombard Street, London, E.C., on the 28th instant.

The following is an extract from the statement of the chairman, The Rt. Hon. Lord Colgrain, circulated with the report and accounts for the year ended December 31, 1947:—

In reporting to the shareholders some account of the work of the company in 1947, as against 1946, the main feature lies in the great difference in conditions in the money market during 1947, compared with those of the two preceding years. During those two years we witnessed the gradual unfolding of the policy of the Chancellor of the Exchequer to establish 2½ per cent. as the effective rate of interest for Government securities in this country.

Early in 1947, however, doubts began to be expressed as to whether the public would be content to receive so moderate a return on their capital as 2½ per cent. for any prolonged period, and this doubt resulted in a gradual fall of prices which gathered momentum this year and resulted in 3 per cent. rather than 2½ per cent. being considered the effective rate for long-dated Government securities. This naturally had an effect on the values of the Government stocks, and the resulting depreciation on the securities held by us at the date of the balance sheet has been provided out of contingency account. This depreciation is not a cash loss as we continue to hold the securities. The large transfers to the inner reserves which we made during recent years have more than sufficed to provide for this depreciation, while the present margin of profit has been increased proportionately.

The turnover in Treasury bills was again very large, and in as much as little risk is involved in dealing with them, the profit is correspondingly small. Rates week by week varied by only a few pence while the rate for money continued unchanged at ½ per cent. throughout the year. There has been an increasing volume of commercial paper of which we have taken our full share.

The balance carried down to the balance sheet is £327,336 as against £376,985 a year ago and £219,949 two years ago. The dividends paid to the shareholders are at the same rates as in previous years. It would be foolish to attempt any forecast as to the money market during the year that has now begun, but we can say with all assurance that the company is well equipped to meet such changes as may arise from time to time.

CHARTERHOUSE INVESTMENT TRUST, LIMITED

POSITION NEVER STRONGER

The twenty-third annual general meeting of The Charterhouse Investment Trust, Limited, will be held at Winchester House, Old Broad Street, London, E.C., on the 28th instant.

The following is an extract from the review of the deputy chairman, Mr. C. M. Rait, M.C., T.D., circulated with the report and accounts for the year to November 11, 1947:

Without drawing on the Charterhouse Finance Corporation for any larger dividend than in the previous year, we are able to report a net profit of £120,061, against £115,965 last time. Most of our income is what the Finance Act describes as "franked investment income" and is therefore free from profits tax in our hands, but it is derived from companies themselves liable to the higher profits tax now in force and may therefore diminish in our current financial year; moreover, the activity of the Finance Corporation for the first eight months of its last year until the middle of July may not be repeated this year and, as our stockholders already know, profits from this source are liable to fluctuate considerably. Accordingly we do not think this is the occasion to increase our dividend beyond the 8 per cent. paid last year. A dividend of 8 per cent. represents a return of less than 5 per cent. on the equity capital actually employed in the company.

Our target is that the income from general investments together with the dividend from the Industrial Development Company shall provide the Trust's preference dividend and an adequate dividend on its ordinary stock. Last year's results achieve this objective to the extent of the preference dividend and 5½ per cent. on the ordinary stock, but if taxation remains at its present level it will obviously be some years before we can achieve our aim in full.

PUBLIC ISSUES SPONSORED

During its financial year the Finance Corporation sponsored 17 public issues, involving an aggregate of about £11,400,000. The proportion of issues representing new money for industrial expansion and development is increasing, although we must expect that liquidation of private investments in medium and large-sized industrial undertakings will for some years continue to constitute a substantial proportion of new issue business.

It is now ten years since management in industry has had to meet the full force of competition. Production for rearmament, which began actively in 1936, was followed first by war production itself, and then by the strong postwar sellers' market. This has really meant that during all this time the profit-earning capacity of industrial management, judged by the standards of, say, 1923-35, has not been under test.

MANAGEMENT INTEGRITY

When an issuing house is considering whether or not to sponsor an issue, the matter upon which it must chiefly concentrate is the integrity and skill of the management, and the period of ten years during which profits were able to be earned comparatively easily may be an unreliable guide to future profit-earning capacity and therefore to the efficiency of the business. If indeed the profits of those years were earned by a management which is not continuing, their use may be positively misleading. The public's assessment of the worth of an issue is often based on the short rather than the long view and for that reason they are apt to be influenced by the trading results of the then current year. We believe that the investor is entitled to a considered view of trading results over a much longer term and if the management's

belief is that profits will or may move to a lower level that fact should be stated.

Any issuing house is dependent for its goodwill on selling stocks and shares which will continue to yield satisfactory returns and in comparable market conditions will at least maintain their capital value. It is, of course, the endeavour of every reputable issuing house to sponsor only such issues, but the times through which we are passing make it extremely difficult even for them with all their facilities for investigation to be satisfied on this point. The ordinary investor who has not the same facilities for investigation is really left with little alternative but to select those issuing houses whom he can trust and to follow their judgment. In this context it is the genuine investor as distinct from the speculator to whom reference is intended.

THE DEVELOPMENT COMPANY

Charterhouse Industrial Development Company, Limited, was formed in 1934 as an experiment in which your directors believed and today that belief has been fully justified by the results. The company has a large volume of business constantly under investigation and as the result of many years' experience and thanks to the skill and loyalty of its managers and staff, it has built up the sound position disclosed by its balance-sheet and numbers among its holdings several which are worth considerably more than the figure at which they stand in the books.

During the year the capital resources of the Industrial Development Company have been enlarged by an issue of 500,000 shares at 30s per share, subscribed in proportion by the existing shareholders.

WIDENING SCOPE OF BUSINESS

Your directors believe that there will be substantial development throughout the British Commonwealth during the next several decades, and for that reason the company in South Africa which we have jointly owned with Messrs. Robert Benson Lonsdale and Company, Limited, since 1936 has recently been enlarged. This company will continue to do business as an issuing house in the African continent and also undertake finance of the kind conducted by our industrial development company. Our chairman is at present on a visit to Australia and New Zealand with the intention of similarly developing our business in that part of the world. We have also formed associations designed to produce business for our group in India and Pakistan and other parts of the British Commonwealth. We have recently opened an office in Belfast to deal with business which we believe to be available in Ulster and possibly in Eire.

This review will, we hope, show you that we are cautiously pushing out the tentacles of Charterhouse wherever we think sound business is to be found; but we are also mindful of the fact that many difficulties lie ahead and that while it is quite easy to add to the overhead charges it is far less easy to reduce them. It is still very difficult to visualise future conditions. On the one hand we see a world with huge arrears of demand for all kinds of goods to be overtaken and in which a conscious effort is being made by more people than ever before to enjoy a higher standard of living. It should be the manufacturer's and the salesman's paradise. But, on the other hand, the problems of co-ordinating the supplies of raw materials, transport, capital equipment, finance and foreign exchange have so far remained largely unsolved.

FUTURE PROBLEMS

It is unthinkable that trade between nations cannot be made to flow more freely

once the prejudices and disequilibrium resulting from the war have been overcome, but until that happens the responsibility which lies upon those engaged in the management of productive enterprise was never greater or more complex. Some measure of Government participation in trade and industry has come to stay, and a corresponding measure of co-operation by industry with Government will probably prove best for both in the long run. Organised labour can, we believe, be brought to understand that the so-called capitalist is essential to its own well-being and that by team work everyone can benefit. The attempt to bring down prices by increased mechanisation and production per man-hour is not some wicked plot to enrich proprietors but a vital necessity if we are to retain even our present standard of life, to say nothing of increasing it.

Experiments in ideology are giving way to a more realistic approach to the great problem of balancing production with consumption and to those other fundamental matters already mentioned above.

NEED FOR RESERVES

Applying all these thoughts to our own group of companies we feel that, while the desire to grow and develop within the limits we have set ourselves must always be before us, we must at the same time buttress that growth with adequate capital and reserves. It is difficult to forecast what the current year has in store for us in the way of finance profits, but we have much sound business in hand and today enjoy a wider circle than ever before of friends who are a potential source of business.

Our group of companies was never in a stronger or more healthy state, and it is your directors' sincere hope that they will be able to make you a satisfactory report at this time next year.

NATIONAL DISCOUNT COMPANY, LIMITED

GREATER ACTIVITY

The annual general meeting of the National Discount Company, Limited, will be held at 33, Cornhill, London, E.C., on the 28th instant.

The following is an extract from the statement by the chairman, Sir Charles D. Seligman, circulated with the report and accounts:

1947 from the point of view of the discounting of bills has run along on a more or less even keel. Partly owing to the substantial reduction in T.D.R.s, the banks were larger buyers of bills during the year, as a result of which the increased amount of the weekly tender for Treasury bills has been dealt with without undue strain.

We note with pleasure the gradual return to favour of the commercial bill on London, the volume of which has shown a gratifying increase during the year.

The past year has shown a further increase in our activities and the balance-sheet total amounts to £133 million, an increase of £14 million. Deposits have increased by £12 million and now total £123 million. Bills and short-dated securities have increased by £13 million to £115 million. Although the greater portion of our bills are Treasury bills, commercial and bank bills rediscounted have risen from £5,886,000 to £9,611,000, reflecting the gradual return of the bill on London.

The gross profits at £328,931 are greater by £25,063. There remains a net profit of £261,768 and it will be proposed at the meeting to pay dividends of 5 per cent., less tax, on the "A" stock, making 10 per cent. for the year, and 5 per cent., less tax, on the "B" stock, making 10 per cent. for the year, on the increased amount of this stock.

GLAXO LABORATORIES, LIMITED

STEADY EXPANSION

The thirteenth ordinary general meeting of Glaxo Laboratories, Limited, was held, on the 22nd instant, in London, Sir Harry Jephcott, M.Sc., F.R.I.C., Ph.C., chairman and managing director, presiding.

The following is an extract from his circulated statement for the year to September 30, 1947:—

The accounts show the effect of the decisions taken at the extra-ordinary general meeting of stockholders held in January last. It will be recalled that the issued capital of Glaxo Laboratories, Limited, was made identical with that of Joseph Nathan and Company, Limited, by the acquisition of the assets of that company (other than the shareholding in Glaxo) in consideration of the issue of ordinary stock to the nominal value of £29,635. In consequence, there has arisen a share premium to the extent to which the book value of these assets exceeds the nominal value of the stock issued. This share premium account amounts to £274,978.

The company's general reserve has been substantially increased from £250,000 to £544,695. This arises in part by appropriation of £100,000 from the current year's profits, but more considerably from the capitalisation by subsidiary companies of a proportion of their accumulated profits. These accumulated profits were required for the financing of the subsidiary companies' increased business.

INCREASED EXPORT BUSINESS

The provision against unsold stocks has been increased by £50,000 and fully covers the profits arising in this company's accounts from unsold stocks in the hands of subsidiary companies. Its increase reflects an increasing volume of export business, to which further reference will later be made.

Provision for income tax has been made upon a "pay as you earn" basis to the full extent of the estimated liability.

Fixed assets have increased by some £263,000 and will be further augmented as additional production facilities, at present in hand, are completed.

Investments in subsidiary companies have increased as a result of the matters to which reference has been made above, and the further investment of £153,000 by the parent company.

Dividends from subsidiary companies are a satisfactory return upon our investment.

In these days of uncertain exchange it is felt that all the assets of subsidiary companies should be converted for consolidation purposes at the rates of exchange ruling at the end of the company's financial year. Accordingly, we have written off £26,517 from our shareholding in order to achieve this purpose.

PLANT AND BUILDINGS—TODAY'S CONSIDERATIONS

The company's operations during the year under review have been most satisfactory, but there are features to which I feel I must especially direct your attention.

In the long-term interests of the business your directors cannot be content with such provision as can properly be made by way of depreciation upon existing book values, especially of plant and machinery. To do so would not be good husbandry. Plant acquired in pre-war days, much of it long before the war, will sooner or later need replacement. There is little likelihood that replacement can be made at less than twice the original cost, or many times the present book value.

In addition, the plant and buildings, which

are now being provided to meet the needs of the company's steadily expanding business are costing far more than is judged to be their true economic worth. Further, it must not be overlooked that the company has now a very substantial and increasing investment in the new field of antibiotics. This is a new industry and we must anticipate that new techniques will be developed resulting in changes of process—it may be unexpected and dramatic changes—with consequent obsolescence of plant.

For all these reasons the directors are of opinion that there is a considerable contingent liability of this nature for which provision should be made, especially in favourable trading years. This year they have allocated £200,000 as a provision for obsolescence. It will be desirable to add to this provision in future years.

PROGRESS IN DEVELOPMENT PROJECTS

The severe damage at Greenford from enemy action has been a very great inconvenience, but at long last we are in sight of the reinstatement of our packing facilities.

A price for the acquisition of the Ministry's assets in the penicillin factory at Barnard Castle has now been agreed and the factory will become the freehold property of the company. Further buildings and plant to meet the needs of increasing output will be completed early in 1948.

Development of the site at Ulverston steadily proceeds. The present scheme will cost about £700,000 and provide a considerable increase in facilities for the production of antibiotics. It is hoped that the first fermentation unit will come into production about the end of March, 1948.

Overseas, schemes for development to add to local production facilities are in progress in India, New Zealand, and Italy. Similar steps in other countries will follow.

It is expected that the company's financial resources will be adequate for all these projects.

EXPORT TARGET EXCEEDED

Turnover continues to increase, both in the home and export markets, and export sales, at 475 per cent. of 1938, have already reached the official target for the end of 1948. We appreciate that those who, like ourselves, are widely established in export markets have a duty to exceed, if possible greatly, the "industry target." Our present measure of success encourages us to hopes of still higher figures in this current year.

It is almost impossible to over-estimate the importance of research, particularly in the chemical and biological fields; it is fundamental to our progress. Excellent work continues in the company's laboratories to the limit of the physical space available. We are prepared to expend much larger sums than at present upon research and process development, but with the Government restriction upon capital expenditure there appears to be no prospect of extending our facilities for work of this nature for some time to come.

The excellent results are largely the product of the good relations between management and staff.

As to future prospects, the volume of business to date has been equal to that of the corresponding period in the last financial year. Schemes for social betterment, especially nutrition and medical services, should provide ever increasing opportunity for expansion of the company's business, if we accept fully that obligations for service rest upon us.

The report was adopted.

GOVERNMENT RETURNS

For the week ended January 17, 1948, the ordinary revenue was £125,180,000 and ordinary expenditure of £61,968,000, leaving a surplus of £63,212,000. Thus, issues to sinking funds £210,000. The surplus of £63,212,000 against a deficit of £373,887,000 against a deficit of £3,457,000 for the corresponding period a year ago.

subsidies), a smaller reduction in taxes and therefore an increase in the surplus, and a check to the rise in wages—in such a rounded policy, measures to reduce other forms of unnecessary spending should certainly find a place. So far the argument is easy; the problem is, what measures?

The favourite weapon of the Left is a capital levy. It appeals to all their instincts; and it has, indeed, a respectable lineage of support outside the circles of the Left, narrowly so-called. But for achieving the purposes that are now needed, it is a very blunt instrument indeed. It is not fashionable to inquire whether a levy on capital, which has suffered from the war and its attendant circumstances, while wage incomes have gained, would be just. There might be some justification for a levy on all those holdings of capital that have increased since 1939—certainly on those that have increased by more than the rise in the general price level. But there is no way of identifying them now, since there is no record of capital holdings before the war. The only practicable form of capital levy would be one that penalised all capital, whether it has risen or fallen, whether or not it is being drawn upon to sustain an excessive flow of spending. Any such project, apart from its questionable justice, would give rise to endless anomalies. If there were no exemption limit, administration would be difficult; and if there were a limit, the levy would lose still more of its justification and of its efficacy. How would it be proposed to treat the hundreds of thousands of persons whose entire capital is locked up in the houses they live in? Would they be compelled to seek additional mortgages, at a time when mortgages were also compelled to seek ready cash? And what about people whose whole capital is actively employed in their business? These difficulties are not perhaps insuperable, and the effort to overcome them would be worth while if the capital levy were likely to be supremely effective. But is it? It has long been recognised that in these days of heavy progressive taxation, a capital levy, the proceeds of which were used to redeem debt, would bring only negligible benefits on balance to the Budget owing to the loss of income tax revenue that it would involve. But if the net benefit to the state's income is small, surely it follows that the net loss to private incomes would also be small? And as for the capital levy's effect on spending out of capital, is it not as likely to be bad as good? Is not the average capitalist likely to conclude that he had better make haste to spend his capital before the levy is re-

peated? And whether or not this is so, it is virtually certain that a capital levy would discourage savings.

Another possible device would be a blocking operation, such as that by which M. Gutt won fame in Belgium. This is theoretically much more attractive than a capital levy. It applies only to those forms of capital that are likely to give rise to excessive spending—that is, to the more liquid forms. Moreover, it is not a permanent confiscation so much as a temporary forced loan, and the unblocking might at a later stage serve as useful a purpose of economic policy as the blocking would now. But a blocking operation is nevertheless a very difficult matter to carry through, and likely to be particularly difficult in Great Britain, where banking and credit trading are both much more developed than in Continental countries. It would give rise to many of the anomalies of a capital levy, and to a host of hard cases which could neither be ignored nor be dealt with except at the cost of a formidable administrative apparatus. It would not be impossible to carry out, and it would be likely to be fairly effective for its purpose. But it should certainly not be lightly embarked upon.

Must it therefore be concluded that there is no comparatively simple and certainly effective method by which capital can play its part in a disinflationary policy? That would be a most unfortunate conclusion. There is unfortunately little enough likelihood of a Labour Government taking the need for disinflation seriously, and the prospect would disappear completely if capital had to be left out of the programme. It happens that there is a method, which is likely to be effective, which requires no administrative apparatus, which will encourage thrift and discourage capital expenditure, which will lower the market value of all forms of capital and therefore discourage realisations of capital to finance current expenditure, which will equally discourage all forms of extension of credit for trading purposes. This is, of course, the old-fashioned remedy of a sharp temporary rise in interest rates. But unfortunately, as everybody knows, higher rates of interest are a reactionary device of baleful Bourbons. By a strange twist of logic, the classical device for whipping capital into line has come to be regarded as a concession to the very capitalists who would be constrained by it. But if the Chancellor of the Exchequer wishes to make sure that capital plays its part in a disinflationary policy, this is obviously the way to do it.

Refugees without Refuge

NIGHT by night new refugees are still crossing frontiers and throwing themselves on other people's charity. Those in Europe, most of whom pass their last sentry somewhere in Austria, present themselves at the care and maintenance centres run by the Preparatory Commission for the International Refugee Organisation—PCIRO. The governments which compose this organisation are due to hold another "preparatory" meeting on January 20th. At it they will learn some disagreeable facts. One is that their organisation cannot come of age until March at the earliest. Of the fifteen ratified signatures required, only twelve have been deposited. (The twelfth ratification—that of France—was received only this week.) Another concerns finance. The contributions due from the twenty states which have signed the instrument constituting IRO should total \$122,347,049 for the financial year July, 1947, to June, 1948. Of this sum the Organisation had on November 30th last received only \$38,239,838. A third is that this lack of funds, combined with the influx of new refugees, has forced the PCIRO administration to restrict admissions to its camps in a way that was not foreseen in its constitution.

Next week's commission must therefore reach a conclusion on a point which it passed over when it met in October. Is the

money that is available to be used for a job of quality on a limited number of refugees, or on a job of quantity and duration unspecified? Is it a fund contributed to solve a wartime problem, or is it the start of a foundation for helping the refugees of all time? To judge by the IRO's constitution it is simply the former. The preamble to that document specifically mentions a "non-permanent organisation." Ought the constitution to be amended, and, if not, where and when is the organisation to draw the line?

That a line must be drawn, and drawn soon, is the lesson of all the experience accumulated since PCIRO took over from Unrra last July. For one thing, the western taxpayer, who is the chief contributor to the funds available, is clearly paying for what he believes to be the clearing-up of a wartime tragedy. He will be dismayed to learn that almost as fast as his money empties the refugee camps through one door, they fill up through another. By the end of October—that is, at the end of four months' work under PCIRO—the organisation had settled or repatriated 76,000 refugees out of a total of some 700,000 originally placed in its care. But in the same period the number of persons receiving its care and maintenance decreased by only 32,353. And even this decrease does not reflect the scale on

which new applicants are seeking admission, for the administration, obliged through lack of funds to place its own interpretation on the IRO constitution, turned many refugees away. What else was it to do? The IRO constitution is lamentably loose. It defines "refugees" in terms that would fit anyone from a genuine seeker of sanctuary to a disgruntled crank. It covers all who are "unable or unwilling" to return to their country of nationality or former nationality. The administration was forced to stem the rising tide before the camps were swamped. It therefore halted new admissions, except in cases considered to be of real hardship. Had it not taken this arbitrary but unavoidable decision, the results achieved through repatriation and resettlement would have been cancelled out.

There is more than one possible remedy to this state of affairs. The ideal is, of course, a stoppage of the flow by the creation of better world conditions. But these are beyond the Organisation's powers to produce. And there are no signs that they are coming about by other means. Indeed not only in Europe but in Asia the number of refugees is increasing; the latter contingent now includes not only Europeans awaiting repatriation and Chinese outside China but also the new homeless of India and Pakistan, while in Europe a flow, chiefly of *Volksdeutsche* and Jews from east to west, continues steadily. Another remedy would be the provision of additional funds. But is it desirable to offer unlimited protection? It is extremely difficult to distinguish those whose movement from their homelands was spontaneous and individual from those whose refugee status was in whole or in part an organised movement. It is also difficult to tell those whose departure was justified from those who left in pique. To say this is not to suggest that all postwar refugees are less genuine cases than those who began their trek in the war years. But it is now clear that unless the problem is reduced to the dimensions of one created by the last war, there is no special reason why the present contributors should be the only states to pay for it.

The one manageable way out of the present impasse is for the governments attending the forthcoming meeting to steel their hearts and to make an arrangement whereby IRO can, at a moment of its members' choice, turn off the tap. It must fix, at a minimum of public notice, a date line after which no new refugees can be admitted under present arrangements. To do this is at least to define the problem. But it can only be solved if governments are ready to make a much brisker contribution than hitherto to the problem of resettling refugees.

The immigrant-receiving nations must make a fresh effort, and each accept a share of the 800,000 to one million persons who have refused to be repatriated and who cannot find permanent homes in their present countries of refuge, which are principally Germany, Austria and Italy.

Who are the immigrant-receiving nations? The total figures are misleading, since so many countries show an unfortunate though understandable readiness to take only the young, the able bodied and the skilled, and to leave their dependants behind. This is revealed as soon as the figures are even slightly broken down:—

REFUGEES DEPARTED FOR RESETTLEMENT UNDER PCIRO AUSPICES.			
Country of Destination		Country of Destination	
Belgium		Canada	
Individual	30	Individual	35
Minors	3,012	Lumbermen	766
Individual	58	Close Relatives	136
United Kingdom		Domestic Servants	152
Westward Ho Scheme	3,026	Unspecified	98
France	2,045	Venezuela	718
USA	1,707	Netherlands	439
Italy	158	Argentina	173
Palestine	130	Switzerland	114

There are often good, if temporary reasons, for this predilection. The United Kingdom and Holland, for instance, at present prefer the single worker to the family man on account of their housing crisis. France, always conscious of the problem of its birthrate, is ready to make every effort to take couples of

an age to breed children. For instance, the French offer a free home to the miner and his family, and a free gift of coal ranging from three to six tons per annum according to the size of that family. Australia, also, offers attractive endowments to child-bearers. Some areas in South America provide opportunities for a pioneering existence which suit only the young and able-bodied. It follows that if national selection missions continue to skim off the young, the physically fit and, in particular, the single men, there will remain, for long years, as a charge on the present member governments, a hard core of stateless people composed entirely of those who are not thought to be a good economic risk. The proportion of such risks is in fact small. The old and infirm for whom permanent international care would have to be arranged are relatively few. For, on the whole, the aged have not survived the hardships of recent years. The inmates enjoy some of the best health care in the world, thanks to the provision of one doctor to every 700 patients. The tuberculosis rate among them is only slightly above that shown for the Royal Navy in the last decade. An excess of births over deaths is being registered at a rate of 20,000 per annum. Physically, their state is good; only the psychological climate disturbs it.

There is only one way to avoid a permanent rump of vigorous but unwanted refugees and that is a share-out, by agreement between the receiving states, of all the elements in the total number of people to be resettled. Any such agreement must of course be subject to a standard process of sifting whereby the small percentage of thoroughly undesirable people can be eliminated. It is plain that unless governments will take the rough with the smooth—the dependants with the workers—they will be left with about half the present inmates of the camps on their joint hands as international guardians of these people. If they agree now to take a share of all the elements in the total number of people to be resettled, less than 100,000 refugees will remain—and that largely composed of people who would qualify for care under existing charitable foundations.

Here, then, is a two-fold programme for the forthcoming meeting—the fixing of a date line, plus the acceptance by states members and by others in need of immigrants of a rule whereby the picked men and women do not arrive alone. This suggestion is bound to meet with some opposition. It is likely to be encouraged by the principal payers for the present arrangement—the Americans, the British, the Canadians. (Of the \$38 million so far paid into PCIRO's coffers, 77.4 per cent was subscribed by the United States, 7.5 per cent by the United Kingdom and 12 per cent by other members.) It is likely to be opposed by some countries who have a strong feeling of humanitarianism but lack the will or the means to pay for unlimited refugees, by others whose tradition in the field of social work causes them to wish for a long period of re-education before they will accept immigrants, and by still others who see in the present dollar financing of resettlement a small but useful source of hard currency. No doubt the critics will contend that those at present paying can well afford to go on doing so, or that the organisation could perhaps be run more cheaply. In fact, it spends on administration at the rate of only \$16,500,000 per annum out of its budget of \$122 million—a sum which is small in view of the number of offices it is obliged to maintain all over the world. There is no doubt that if it were richer or knew more about its future it could do better. No staff can maintain its calibre in an atmosphere of uncertainty, and many good men have left. By setting a determined course for the future, the governments concerned could help everybody—from high administrator to old-timer refugee—to play a better role in the organisation while it continues. This last participant in the scene is mentioned with a purpose, for he is the man who, perhaps, merits the greatest consideration of all. Unless the stream of newcomers applying for the present funds is cut short, the older inhabitants are doomed to a life of hoping for a settlement that is permanently deferred.

would be invited to enter into treaties similar to the Treaty of Dunkirk between Britain and France was only part of the short-term policy; and the promise to relax the ban on travel had an odd prominence in a speech of this stature.

Mr Bevin said he thought western Europe was "ripe for consolidation." To appreciate the gap between the principle and its execution, it is salutary to recall what has been done in eastern Europe. In that region, where the Molotov Plan has got well ahead of the Marshall Plan, consolidation has advanced rapidly in two years, with the intervention of a dominant Great Power and under the direction of a single political party, ubiquitous and ruthless. Economic and social reforms have had behind them—with a few exceptions—the sanctions of the police state; military and economic arrangements between the seven states follow a uniform pattern. All preparations are being made for turning what was to have been a sphere of influence into a bloc which, should Russian policy require it, could become in a few years a self-sufficient political and economic federation. Already it can show an example of co-ordinated national production plans—between Poland and Czechoslovakia; already it has on the stocks a customs union—between Bulgaria and Yugoslavia; already it has great national industries in Hungary and Rumania, working to the requirements of the master Power.

Obviously, Mr Bevin has no closely formulated pattern in mind, much less a precise counterpart of the eastern bloc. This has to be said, not to disparage the new hopes and prospects that Mr Bevin has offered, but to emphasise the differences that must distinguish a western union from the eastern bloc, and to moderate some of the expectations that have been aroused in the United States. Senator Vandenberg has called the Foreign Secretary's speech "terrific"; it was indeed terrific, but precisely because of the prospect which it presented of long and intricate negotiations, painstaking study and unsensational discussion in committee. To achieve anything like western union in reasonable form and time will demand from the British and other governments creative energy and planning skill of the kind which defeated Germany. The effort will have to be made against a background of international tension, active Communist opposition and low standards of living.

For the immediate future, the task of the British Government is, clearly, to formulate and declare the priorities which this new stage of foreign policy will demand. They are not difficult to list: preparation for executing the European Recovery Plan when Congress has approved it; the closest political and economic collaboration with France, on a basis that will assist moderate government there; practical proposals for the association of western Germany with the European Recovery Programme; full consultation with the Dominions on the implications of this new direction in British policy; exhaustive study with them, and with the western governments, of the possibilities of eventual customs union, and of its effects on Commonwealth ideas of preference and economic collaboration.

With so much depending on Anglo-French co-operation, it was unfortunate that the French decision to create a free market for the franc had to be taken on the very morrow of Mr Bevin's speech and only three weeks after the French had been seriously irritated by the latest Anglo-American proposals for the administration of western Germany. The difference of view on the franc (which is discussed fully on page 191) will, it is hoped, prove only a temporary source of difficulty, and stability in the European exchanges should be attainable once Marshall aid begins to flow. But the incident underlines the need to place such practical matters as currency reform at the head of Mr Bevin's programme, and to press on with the work delegated to the committees of the Paris Conference, among them the committee on currency stabilisation.

The other issue which divides Paris and London—the future of Germany—is political and more fundamental. It is seldom

realised how far the French have moved from their earlier, short-sighted policy of security at all costs towards an acknowledgment of the part that western Germany must play in European recovery. Political conditions in France have compelled M. Bidault to move very slowly, under cover of Mr Molotov's bombardments, towards a less narrow view. But there has been no corresponding move by the British and Americans towards a policy for future control of the Ruhr. Without guarantees in this matter, no democratic French Government can possibly co-operate in the political and industrial development of western Germany, and survive. Talks on Germany are to be held in a few weeks' time; but unless the preparations for them provide adequately for French views and fears, Mr Bevin must not expect that M. Bidault will take up the cry of western union with any conviction.

Next on the list of priorities comes the study of customs union possibilities and consultation with the Dominions. The two tasks are inseparable, because ways have to be found of reconciling a free trade area in western Europe with Britain's system of imperial preferences. Mr Bevin has, rightly, refused—and this should be noted in the United States—to accept the "either-or" of western union or Commonwealth association. He believes that the systems could be made to interlock; but how to do so is far from clear. This is not the only question raised by the proposal for customs union—as the Benelux governments have discovered in five years of negotiation. Some way has to be found of reconciling the nineteenth-century technique of customs union with such innovations as government planning of full employment, bulk buying, and intervention to defend standards of living—policies which are far from uniform in the countries likely to be interested in western union. If these problems are not tackled, as they have been by France and Italy, the whole project of a customs union is likely to be still-born.

It is still difficult to foresee exactly what openings for close co-operation and integration the execution of the Marshall programme may offer. But there is everything to be said for setting up now in western Europe an executive agency, capable of seizing and developing opportunities as they occur. Since the postponement of any further meeting of the Sixteen, there has been a tendency to push aside the question whether they should eventually discuss the establishment of a joint secretarial or administrative body. Yet it is impossible to see how the bases of western union could be laid when aid begins to flow, unless there were some multinational agency in action, providing the atmosphere and studying the problems which alone can train officials and experts in habits of co-operation. Such an agency would provide the test of Mr Bevin's doctrine, and leadership; it would reveal whether governments are ready for sacrifices of sovereignty and for adjustments of conflicting economic interest.

Mr Bevin has a great gift for expressing—in homespun and sometimes stumbling phrases—the mood and hope of ordinary men and women in Europe. After six years of war and two years of "phony peace," their desire for stability and friendliness is very strong—strong enough, indeed, to resist the bitterness and guile of the Communist "cold war" if an objective can be offered them worth working for. For this reason, and because the announcement that the basis of British postwar policy had collapsed could not be made in cold blood—Mr Bevin was right to speak in warm and visionary terms. But it is still too soon for any hosannas. The policy he has offered calls for mind as well as heart, for hard work and will-power as well as good-will and eloquence. The practical problems involved in achieving union stretch far into the years ahead. But there are jobs to be done now in which the foundations of union can be laid. Mr Bevin should lose no time in stating what they are, and how Britain will contribute towards them. Until he does so, only a faint echo of his call for unity will be heard from western Europe—and the Bevin offer will not become the Bevin Plan.

Industrial Democracy

INDUSTRIAL democracy is a subject which will figure in the Party's election programme." These words introduce the first of a series of pamphlets intended for discussion within the Labour Party. They suggest that "industrial democracy" should be taken seriously as one of the issues which the electorate may have to judge by 1950. Rather coyly, the Party does not accept responsibility for the views expressed in the pamphlet, and it is difficult, therefore, to judge how far its arguments, which are expressed with clarity and persuasiveness, will obtain official party support. But there is no doubt that a new ferment of ideas on workers' participation in industry is abroad. Something of the old notion of "democracy in the workshop" still survives. And the consciousness of political power—and perhaps full employment too—make the average worker's submission to the necessary discipline of the factory more oppressive.

Or so, apparently, it appears to the writer of the pamphlet, for he starts from the premiss that the workers are told when to start work and when to stop; what to make and how much; when to rest, when to eat, and when to smoke. The orders are seldom framed in consultation with labour. Industrial power becomes ever more concentrated, and work ever more dehumanised. To the Unions, therefore, "participation in the making of industrial policy is a vital means of maintaining and improving wages, hours, and conditions of work." These ideas have historical roots in the labour movement which it would be stupid to ignore. And they have been much watered down, compared with the early pretensions of the syndicalists and guild socialists. The emphasis has shifted from "workers' control" to "workers' participation in control"—from being the boss to talking on equal terms with the boss about what the boss does.

Those with long memories in the labour movement have always criticised the ending of the Joint Industrial Councils which were set up during the first World War. They have recently been asking whether the elaborate arrangements for joint consultation which worked so well during the late war are themselves in peril. The instruments for "workers' participation in control" already exist. National Councils and Regional Boards, Trade Union participation in the control of nationalised industries and on Development Councils when they are set up—all these (and the trade union representation on the many Working Parties which the President of the Board of Trade has set up) cover a wide segment of British economic life in which labour views and power can be expressed. True, these high-sounding bodies rarely provide an arena for finely tempered debate; they more commonly follow the pattern of committee government—worthy, inclined to compromise, and dull.

The advocates of industrial democracy, however, seem to be satisfied with the opportunities for discussion and consultation at these comparatively exalted levels. But they are much less satisfied with the opportunities for consultation "in the workshop." They claim that participation in control will not become a reality to the millions of workers in pits, yards, and factories until it becomes part of their own everyday lives. It is a large claim, and it should be stripped of all pretension. It assumes that every employee, in nationalised and privately owned industries, has a contribution to make, not merely in doing his own work well, but in the organisation of the whole complex of productive processes of which it forms part. But it is very doubtful whether this claim is generally justified. The great majority lack either the interest or the knowledge to project their thoughts beyond the immediate task. Most people, to be blunt, like being told what to do; they may grumble, but they are spared the need for thought. The proportion of workers which can maintain a lively interest in factory problems, and make an effective contribution towards their solution, is small.

★

The argument that "joint consultation, at its fullest, means that in each factory workers should have the same rights to a voice in policy as their representatives have in the policy for the industry and the nation" is based on a doubtful analogy. For although the elected representatives in Parliament or Trade Union can be called to account, they are not submitted to day to day interference and pressure in carrying out their duties. The argument for a regular flow of explanation and information to those working at the benches is well understood by all sensible managements. Opportunities for discussion at joint production and shop committees are of value in promoting understanding, and smoothing the way for changes in production methods or conditions of work.

All this would be accepted as commonplace by all good employers. But the claim for joint consultation goes farther. "The workers at the bench" it is said, "should have full details presented in an understandable fashion, about output and production policy, about the financial state of the factory, the profits being made, and their distribution. The right of the worker to this knowledge is far greater than that of the shareholder; he has his whole working life bound up with his factory, whereas the shareholder, as such, does little but collect dividends." Arguments of this kind grossly overstate the importance of the shareholder, and his power of control. There is not a single board of management of any large industrial concern in Britain which

£1,000 if you live for twenty-five years.

★ On earlier death, in addition to this £1,000, up to £5,000 payable to your dependants by instalments of £200 per annum (not subject to tax) for the remainder of the twenty-five years.

All this may be secured under the **FAMILY PROVISION SCHEME** for a monthly premium, at age thirty-five, of £5.1.1 reducing after seventeen years to £3.4.0.

walks in dread of its shareholders. Such concerns take on each year more of the attributes of public institutions, mindful primarily of the welfare of their staffs, the security of the undertaking, as distinct from the income of the shareholders who, in theory, own it, the satisfaction of their customers and—if there is anything left, the payment of a reasonable return on the shareholders' capital. Not all companies behave in this way, but the largest do, and their example is being increasingly followed.

Again, what does it mean, in practical terms, to inform workers about production policy and the financial state of the factory? There is admittedly plenty of scope for more information about what the factory does and what it earns. To take two examples, which happen to be large concerns belonging to the same industry, Dorman Long and United Steel Companies have lately tried, by pamphlet and poster, to explain to roughly 30,000 employees something of their activities, their output, costs and dividends. There is every reason why these examples—there are many others too—should be followed by all industrial concerns which value the support of a body of understanding employees. But information of this kind is a different thing from a works committee in regular session. Production is only one

part of the industrial process. A works committee can assist in arranging the details in a suitable way, but it can hardly think out the principles of industrial policy. For that, wider views, a broader knowledge of technique, and careful estimate of consumers' requirements are involved.

It would be regrettable if the leaven of good sense in the idea of workers' participation should be killed by excessive claims about the contribution which workers can be expected to make in the ordering of a modern industrial economy. Such claims are based on the assumption that ideas should be allowed to rise from the lowest ranks and put into practice. But unfortunately the flow of ideas from the bottom is bound to be small—it could not be otherwise, for innovators do not stay for long at the bottom. Every means of promoting confidence and understanding at every stage in the structure of industry must be exploited to the full. Only by such means can British industry make its maximum contribution to the nation's well-being. The task is to match the separate skills of production, management and sheer toil into a single effective process. And the condition for success is that each participant should know what the other is doing, and understand his reasons for doing it.

What Does Iraq Want?

THE new Anglo-Iraqi treaty of alliance has—after a brief but premature bout of publicity—been repudiated by the Iraqi public, which danced in celebration of its downfall and has dismissed the premier who signed it just two weeks ago. For the time being, therefore, one link is faulty in the chain of mutually satisfactory alliances which bind Britain to a line of countries from the Aegean to the Indian ocean and which are due for inspection and overhaul. The Premier of Transjordan is in London this week discussing adjustments to the treaty terms agreed in March, 1946. The visit of the Emir Feisal, Foreign Minister of Saudi Arabia, also to discuss treaty relations, is expected in mid-February.

Salih Jabr, the Iraqi premier, who signed the treaty on January 15th, had come to London armed with a big vote of confidence—with 96 supporters out of a House of 138 members. The suddenness with which discomfiture overwhelmed him and the apparent approval given by the pro-British Regent to an abrupt disavowal of what he had done, at first sight baffled many onlookers. It seems that the Foreign Office, as in 1941, has underrated the strength of anti-British feeling in the country. More than once it seems to have listened to what it liked hearing and not to informants in touch with all sorts of Iraqi opinion.

Those Iraqis who are politically awake—they are less than ten per cent. of the total population—fall into two classes, one whose members have usually been abroad and seen other countries, and the other consisting largely of stay-at-homes. Those who know Europe in general and the United Kingdom in particular tend to realise first, that while Britain, as the mandatory responsible for their upbringing, has worked partly from self-interest, it has also done much disinterested work to raise the country and people of Iraq from the oppression, neglect and the denial of independence which had been their lot for six hundred years. The prototype of this school of thought is Nuri-Pasha-es-Said. The Regent and Salih Jabr, the Prime Minister, who signed the repudiated treaty, belong to it also.

Iraqis who know only their own country hold an opposite view. According to them, the British intend to retain Iraq as a vassal and have proffered it only the trappings of independence. The independence treaty of 1930 was, they say, a mere lengthening of the leading-string. They greatly resented a clause which bound them to employ no foreigner unless British manpower had first been combed to make certain that no suitable Briton was available. Before the war, their views flourished chiefly in

the army. These were the men who, in 1941, under the leadership of Raschid Ali and his Golden Square, invited in the Germans and rebelled in their support. They spent the war in a concentration camp on the Shatt-el-Arab. Now they are back in jobs, chiefly in the civil service.

The wartime experiences of the former rebels, needless to say, have not changed their outlook. As proof of their view, they point to the "fresh occupation" of 1941, the origin of which they prefer to forget; and they remind their audience that the last detachments of the British army did not leave Iraq until last October. Some of their arguments are understandable, and others fantastic. For instance, they are ready to ascribe any and every trumped-up local incident to malevolent planning by the British Embassy. Nevertheless, their opinions count with a crowd that, nowadays, imbibes a good deal of heady nationalist stuff from Egypt, through magazines and school text books as well as through imported technicians and teachers.

Up till now, the Independence party has been disappointed of political power. The Salih Jabr government, which had been in office since the elections in the spring, took over with the impetus of a promise from the Regent that the country would return to "normal political life." Parties were allowed to resume activity at the end of 1946, and elections took place in March last year. They were free from violence, but hardly free in every sense of the word. They were boycotted by the groups (they consist of personal followers rather than parties) that are christened Liberals, National Unionists and the People's Party. The Istighel, a pronouncedly anti-foreign Independence party, participated in the elections but failed to attract support. Iraq is a country in which the average elector is illiterate, and so poor that his vote can without difficulty be swayed. So the House and Senate that emerged from the ballot boxes suggested that Palace circles had been busy.

Salih Jabr at once secured applause by announcing that one of his goals was to revise the treaty with Britain. Nine months later he came to London to do so. Meantime, however, nationalist stock had been rising at home, chiefly on account of the situation in Palestine. The Iraqi police are to be congratulated on the way they have preserved the security of the large Jewish populations of Baghdad, Basra and Mosul. But they were unable to protect the American Public Information Office in Baghdad's main street, which was pillaged in December, and the premises of the *Iraq Times*, which, having

used somewhat exaggerated language in reporting the American incident, came in for mob attack when the terms of the treaty were announced on January 14th. The demonstrations against the treaty resulted in numerous deaths and casualties. The Regent, gauging the strength of the opposition, waived his personal views about the treaty, which he had expressed only the day before in telegrams exchanged with His Majesty the King and Mr Attlee. He held an all-party meeting which, in five hours, repudiated Salih Jabr's work in London. Then, last Sunday, Salih Jabr flew home to justify himself. Having failed to do so, he has resigned. But his resignation settles nothing. What have his opponents to suggest in order to bring their country security and quiet?

Iraq needs both these blessings if it is to provide the resources and the man-power that are required to exploit its great natural advantages of oil and water supplies. Potentially it is a rich country. Its wealth of oil is beginning to produce greatly increased revenues that ought to be spent on improving Iraqi agriculture. The great Iraq Petroleum Company—the Anglo-French-American-Dutch concessionaire that extracts its oil and pumps it to the Mediterranean coast—is now doubling its present ten-inch pipes. The present small-diameter pipeline carries four million tons a year and yields £2,000,000 in royalties. The new one, which should be carrying 12 million tons in two years' time, will treble the royalty, and the company's eventual target is to extract 25 million tons a year. Schemes for increasing the country's crop area are also under way. On the Euphrates the new Habbaniya catchment scheme for preventing flood and storing flood water will cost about £3,000,000 and come into operation in three years' time. Companion schemes on the Tigris are still at the investigating stage but something effective could be achieved in five years. Iraq's problem is not, like Egypt's, one of too little irrigated land for too many people. The Iraqis enjoy more land than they can water, more water than they can control, and too small a population for the lands already irrigable.

Their future outlook would be rosy were it not for some major drawbacks. One is their political instability: the average life of an Iraqi Cabinet over the last twenty years has been under nine months. The other is their inability to get any two Ministers or Departments moving simultaneously. For the mere spread of irrigation alone does not bring prosperity. It must be accompanied, first, by health services, or malaria and

The Middle Class—II

Two Million Without a Party

(By a Correspondent)

THE cold-shouldering of the middle-class presents, politically, a very odd paradox. In the special sense in which the term has been used in this article, it is a numerically small class; but it certainly makes up at least the two million votes which gave Labour victory in 1945. This is, in fact, the Floating Vote. The first rule of party tactics ought to be a simple one: Don't bother about your devoted supporters, who will vote for you anyway; coddle your undevoted supporters, who may otherwise vote for the other fellow. Political parties elsewhere know this rule well—as witness how little is ever done for the Solid South by American Democrats. Followed in Britain, it would lead both parties to compete for the middle-class vote. As it is, they take turns in rejecting it—Conservatism taking good care of business and neglecting the professional, Labour taking good care of the trade unionist and (as it has often appeared, particularly in the matter of basic petrol) deliberately victimising the

hookworm will spread, as they have already done in newly irrigated areas. Secondly, the Iraq authorities have failed to take a firm stand against extension to the new farm-lands of the pernicious system of land tenure which now prevails. At present, the rich man steps in first and the peasant remains a share cropper, with no incentive to improve his holding, and always on the move in the belief that some other landlord must be better. Together with extended irrigation must go improved education; without it a conservative peasantry cannot be converted from growing grain (which entails little work on Iraq's fertile soil and provides him with a subsistence crop) to growing cash crops—in particular cotton—which entail more work than he has a taste for, and yield nothing edible.

All Iraqi Ministers pay lip service to such developments. But none will accept the fact that, to bring them about, Ministers and civil servants must do more work. The remedy for their shortcomings offered by employment of foreign advisers is offset by Iraqi unwillingness to offer terms that will attract the best men. Even the most extreme nationalists recognise that the foreign technician has much to offer. But they want to pick his brains without giving him any authority to do his practical work in the way he knows to be best. They like to hear what he has to say and, simultaneously, to clip his wings.

Salih Jabr thought that he was bringing his country the security and quiet it needs by signing the treaty with Britain. Now that he has been freed from office it remains to be seen what his successors want. Three choices seem to offer themselves, and a working model of each is available among their friends and neighbours. Do they want Iraq to become, like Egypt, a country which can settle nothing because, having swallowed democracy before it has educated its people to the meaning and purpose of using their votes, every government is slave to a crowd which the opposition can bribe into shouting: "Down with the policy"? Or do they want to become, like Persia, a prey to so many preoccupations over rival Great Power advances that they have no time for internal policy? Or do they want to become like Turkey, a state which plumps for alliance with one friend and then sedately turns to its internal affairs? Britain does not want to hurry them while they consider these different prospects. Nor does it want an alliance forced through by bribery, which would be possible now, as in the past. It is for Iraq itself to decide.

professional. By treating the professional class as sub-citizens, Labour has laid up for itself a store of trouble.

But it remains a paradox that the middle class, with its enormous influence on the climate of opinion and with its strategic electoral position, can still bring its weight to bear only negatively, by turning out one party it does not like and putting in another it likes no better. It means that what should be the strongest, the most skilful and the most soundly progressive element in British political life functions only in a negative and penal sense. Something will be badly wrong with British politics so long as this remains true.

There is, of course, plenty that is wrong with the British class structure. It is, from many points of view, silly, stultifying and pernicious. It raises barriers unnecessary between man and man. It wastefully and cruelly holds down the able—or a large proportion of them—if they have chosen to be born to the wrong

parents; it puts power and responsibility in the hands of incompetent heirs or wearers of the proper tie. It does these things far less ruthlessly and universally than it used to, but it still does them.

Hardly anyone nowadays believes that this is right; democracy is a genuinely held ideal. But there are two radically different approaches to the problem of the class frontier. One stands for mobility, the fair chance, the career open to talent and closed to lack of talent, with each man's standing and reward dependent on his own abilities and exertions; the result will be inequality, but providing that inequality has downward limits leaving no one below a basic minimum standard, and providing that it does not crystallise by inheritance into a new caste system, that does not matter. On the contrary, it provides a social dynamic, as inequalities of terrain provide hydro-electric power. The other point of view, to which most Socialists subscribe, objects with passion to inequality as such. It is iniquitous that this, that or the other should "depend on the depth of a man's purse"—in other words, that to more important services there should correspond any real increase in reward. Mobility and the open door are irrelevant; gifts and responsibilities should indeed be matched, but space and leisure and amenities generally, are, in the name of social justice, to be divided as equally as the baby of Solomon's judgment.

That, at least, is the theory. In fact, Soviet Russia, the one thorough-going Socialist state, has evolved a structure of earned incomes more unequal than even that of the United States, let alone Great Britain. Even large accumulations of interest-bearing wealth are possible to the Soviet citizen—as witness the million-reuble subscriptions of individuals to the Soviet war loans. British Socialism is more egalitarian; but the salaries offered by the Labour Government to the executives of its new public corporations are—quite properly by non-Socialist standards—ten to twenty times a miner's wage, and the Government's own members—again quite properly—show no precipitate desire to reject the bourgeois way of life. To offer and to accept such incomes and at the same time to point the finger of lofty Pharisaical scorn at car owners, foreign travel addicts, and people who prefer real cheese to mousetrap, is merely dishonest.

Egalitarian consistency, however, would be worse. There is no point in being mealy-mouthed about this; there would be no gain, but severe loss, if the middle classes were assimilated to the proletariat. The noble working man is as mythical as the noble savage. He is no more intelligent, moral, altruistic, conscientious, or endowed with political insight than the man with a profession and a bank account. Why should he be? There is no reason, either, to suppose him naturally less so; but just as his experience encourages endurance, humour, and solidarity, so it discourages farsightedness, objectivity, and the aspiration to intellectual completeness which is the hallmark of the civilised. Other ingredients than the proletariat are needed in the good society. It is good that there should be some houses more spacious than council houses; that there should be some people able to buy, and not merely to borrow, books, to hang pictures instead of lithographs on their walls, to support concert halls and theatres instead of cinemas and fun fairs. It is good that somewhere in society should be concentrated enough leisure for voluntary social and public service, for disinterested research, and for the maintenance of contact with other countries, even if this entails the injustice of a doctor's wife having a cook whilst an equally deserving fitter's wife has not.

The middle class has no reason to be ashamed of its record. It has no reason, indeed, for exclusive pride; contemplating the early days of the Labour movement, the grim perseverance, the heroic comradeship under oppression, the self-sacrificing achievements of scanty leisure and scantier resources, no observer could claim voluntary service and public spirit as a middle-class monopoly. But if the middle class had done no

more and sets its sights no higher, Britain would be a poor and dreary place. To admire the Adult School movement is not to put it on a level with the University. For those elements in British life which conform to University rather than Adult School standards, credit is due less to any superior intellectual gifts that the professional class may have (though the better brains are, by a natural sifting process, concentrated within its ranks), or to any moral superiority, than to the combination of these things, such as they are, with the margin of money and time which that class has left over when primary needs have been met and the day's work done. The professional class, in short, has made its especial contribution precisely because it has obtained the market price of exceptional abilities; and if that contribution is to be maintained the levelling-down of earnings (after tax) will have to stop. It is not wholly or even mainly a question of incentives, though incentive is useful; but of preserving the environment in which alone the contribution can be made.

But the middle class, and its professional core in particular, has more justification than this for survival. It has a civic as well as a social and cultural *raison d'être*. Leave out the salaried or fee-earning professional man, and the political scene becomes a mere tug-of-war between the parties of special interest, the We and They parties, each concerned to do Them down for Our benefit; the party of Business, wedded to the profit margin, the party of Trade Unionism, wedded to the higher wage and the shorter day. For each (whatever may be said on platforms) group interests outweigh national interests. Each holds fast to the great principle of giving Less and Less and getting More and More. The Tory Party has always been a party of interests, the party of the landed interest, the party of the protected industrialist, the party of privilege. It has its dissidents; among the serried representatives of Comfort in Inertia there does arise an occasional ginger group. But the chance of the Bright Young Men swinging the ponderous and suety mass of the party over to a genuinely national policy is remote.

On the opposite side stands Labour, unmistakably inferior in the average personal talents of its executive team, and as hopelessly enslaved to the TUC as the Tories to the FBI; enslaved, therefore, not only to a special interest but to a group of men who cannot learn because learning would cost them their job. The Trade Union Leader is not a leader, but a follower, a mouthpiece, a walking Lowest Common Denominator; he has to be. That is what he is elected for, and it is not a quality (as Burke pointed out to the Bristol electors) compatible with the proper exercise of governmental powers, whether directly or at half a remove. Nor do weakness of personnel and subservience to special interests exhaust Labour's disabilities. The party's whole mentality is soaked and pickled in ideological nonsense, proof against the impact not merely of conflicting ideas but of any ideas at all. In a Socialist leader the capacity for independent thought is called getting out of touch with the rank and file. The extreme or limiting case is to be found in the Communist party and studied, in the full splendour of its pathological efflorescence, in the speeches of Mr Zhdanov and Mr Molotov; but one may fall short of this extremity and still be a national misfortune.

Neither major party, then, is likely, if left to itself, to evolve a sound economic policy. For this reason, if for no other, there would be need for a viable middle class, affiliated to no special interest and comprising trained minds accustomed to looking beyond the immediate to the remote result and through the contemporary catchword to the reality behind it; an element of stability, of objectivity. If anyone wants to see what can happen when the middle class is economically exterminated, let him consider the German inflation of the 1920s and what followed after.

(To be continued)

NOTES OF THE WEEK

Franc Disagreements

The irresponsibility of the French Government's devaluation proposals (described in an article on page 191) could not have been more pointedly underlined than by the domestic political crisis they have caused. It should have been reasonable to assume that before adopting so intransigent an exchange policy, defying the International Monetary Fund, antagonising their neighbours and undermining the work of economic integration of Western Europe, the French Government would have ensured that it was speaking for the coalition of parties it represents. But subsequent events have shown any such assumption to be mistaken. The "tough" policy, the bold front, were found to have no cohesion behind them. At the moment it seems that the French Government's proposals will be, in part at least, negated not by the opposition of the Monetary Fund or of France's neighbours, but by that of the French Socialist Party.

Political opposition to the devaluation plan in France is directed, like the external opposition, to the proposals to establish a free market in gold and certain convertible currencies. The Socialists have based their rejection of this part of the plan on three main arguments: that it is undesirable to undermine the philosophy of the Bretton Woods agreements and cause annoyance and inconvenience to Britain and other friendly States; that the toleration of a free gold and exchange market is a symbol of the retreat from centralised planning of the economy, and makes such planning impossible; and that even with the proposed 25 per cent tax on the proceeds of hoarded gold and currencies sold on the free market, the facilities given to hoarders are an iniquitous and shameful condonation and remuneration of their illegal activities. It is still uncertain, at the moment of going to press, how far opposition will be carried, whether the Government will fall, or whether a reasonable compromise can be worked out.

Assuming that the French plan goes through, with its essential feature—the toleration of a free market in convertible currencies—unchanged, the main task that will confront Britain and France's other neighbours will be to contain and isolate the area of instability and, while doing the least damage to trade with the franc area, to minimise the reactions of the French free market on their own exchange situation. It would be well to stress that this defensive and protective task, especially where Britain is concerned, demands positive as well as negative action. The purely defensive aspects of the task are the tightening up of control on French use of sterling. This is the experts' responsibility, and the work is well under way in Paris, where an Anglo-French working party has begun its labours. But far more important is the positive lead that Britain could give to other Western European nations in the task of economic co-operation, and more particularly in the re-establishment of inter-European monetary convertibility and compensation. A little more boldness from Britain is the only satisfactory way of containing and neutralising the effects of France's reckless irresponsibility.

"Playing with Fire"

The Balkan neighbours of Greece have had their warning. Mr Bevin said right at the beginning of his speech on foreign policy that "there is a very real danger that they and their Soviet mentors may make a grave blunder over this business." He warned them to show great care and to remember that "it is dangerous in international affairs to play with fire." Later in the debate two other things were made clear: that the Corfu incident has not been forgotten and that a sharp eye is being kept on the military strengths of the ex-enemy countries, Roumania, Hungary and Bulgaria. Mr McNeil said that the Hungarian and Roumanian figures were approximately within the limits laid down in the peace treaties; but the Bulgarian figures are open to question, particularly since Mr Dimitrov's boast that he intends to strengthen and modernise the forces under his control.

Whatever may be the reason, the threat to Greece has seemed less acute in the last fortnight. There has been no move towards the recognition of General Markos's exiguous regime, and the aid that is undoubtedly continuing has been given the cover of respectable-looking committees in Belgrade and Sofia. The frank statements and details sent to New York by the United Nations commission on the spot have proved intervention up to the hilt. And it may be that there is some uneasiness in the

minds of Marshal Tito and Mr Dimitrov. The former has been under steady diplomatic fire from Washington and London, and the latter has just received what looks like a heavy snub from Moscow for premature advocacy of an east European federation.

Both must be well aware that, once armed intervention has been proved, there is nothing to stop Greece exercising its rights under Article 51 of the Charter save American and British advice and the limitations of its own strength. "The inherent right of individual or collective self-defence" cannot be lost sight of completely, so long as general or regional plans for security make no progress under Uno auspices. If the threat persists the alternative may be, as was suggested in the Commons debate, to place a small international force on Greece's northern frontier.

A Chance for Agreement?

The debate on the Parliament Bill in the Lords was rather unexpectedly suspended on Tuesday in circumstances which seem to hold out some faint hopes of agreement. In moving the rejection Lord Salisbury appealed to the Government to postpone the Bill and to enable discussions to take place between the leaders of the three parties, with a view to elaborating a scheme of reform covering both the composition of the Upper House and its powers. Lord Addison, as was only to be expected, insisted that the Government regarded the passing of the Bill as an essential condition to the discussion of reform. But when confronted by Lord Samuel's suggestion that the Bill should be amended in committee so that the period of the one year's delaying power should date from the time that a Bill leaves the House of Commons instead of from its second reading, he left the door open to the consideration by the Government of this amendment. The debate was thereupon adjourned in order to give both Government and Opposition an opportunity to reconsider the position.

The compromise for which the way has thus been prepared, though hardly an ideal solution, seems to offer what, in the circumstances, is probably the last way out of the constitutional impasse. It never lay in the power of the Lords to delay the passing of the Bill beyond November, 1949, and the Bill as it stands, without any wider measure of reform, could only weaken the power of the second chamber, while leaving the constitutional issue, if not an open sore, at any rate a standing temptation to both parties. For once the Labour Party has started tinkering, it is too much to expect that an electoral victory would not encourage the Conservatives at least to reverse the process—and perhaps even to go farther in the opposite direction. And though in these difficult days the reform of the House of Lords might perhaps be regarded as in itself an irrelevant complication, the fact that the Government has raised the issue to appease its left wing is in itself a ground for considering reform now desirable. For it is clear enough that an unreformed chamber with its powers curtailed in accordance with the Bill would bring the country unpleasantly close to a system of single chamber government, which nobody wants except a small doctrinaire minority.

There is thus every reason to hope that it may be possible to reach an agreement on reform which will bring the composition of the Upper House into line with modern requirements, in which case the delaying power might reasonably be amended in accordance with Lord Samuel's suggestion. That should not, from the Conservative point of view, be too high a price to pay, since the influence of the reformed second chamber will not be measured arithmetically by the number of days of its delaying power, but rather by the weight which public opinion attaches to the quality of its membership. In return, the Government would be wise to give up the retrospective provisions of the Bill, which have made it appear to all unbiased opinion as a disingenuous piece of sharp practice.

Liberals and Tories

The much-discussed electoral alliance between the Liberal and Tory parties was sharply rejected by Mr Fothergill, chairman of the Liberal Party organisation, at Birmingham last Saturday on the ground that alliance or understanding with the Conservative Party would bring the Liberal Party and the organised

Malaya and the Chinese

This week-end the new constitution for the Malayan Federation comes into force, with a fairly general welcome from the Malays and strong opposition from the Chinese. The stride taken towards self-government, though shorter than many Malays would like, is something on which Mr Malcolm MacDonald may congratulate himself. The original British scheme has been modified with good temper and skill, and the introduction of safeguards demanded by the Malays—notably the separation of predominantly Chinese Singapore—has reconciled them to the ideas of a central government and common citizenship for all Malaysians to which they had objected. Preliminary figures from the census taken last year, the first since 1931, show that Malayan fears of being swamped by the Chinese were justified. In the Malayan Union proper the Malays still outnumbered the Chinese, but if Singapore were included the position would be reversed.

Since 1931 the population of the Union has risen from 3½ to over 4½ millions. Of this total roughly 44 per cent are Malays and 39 per cent Chinese. Most significant is the fact that the Chinese have increased by 46 per cent and the Malays by only 35 per cent. The number of "other Malaysians" (Javanese, Boyanese, etc.) has dropped from 298,000 to 264,000.

Migration as well as natural increase is, of course, represented in these figures. Provisional estimates show that between 1931 and 1941 the net immigration of Chinese was about 240,000 and the net loss of Malaysians about 30,000. On the basis of these figures it is clear that the rate of natural increase of the Chinese is some six per cent greater than that of the Malays. Chinese are shown already to outnumber Malays in the municipality of Penang and in the more advanced west coast states of Johore, Negri Sembilan, Selangor and Perak. Johore, one of the most progressive states and the nearest to Singapore, shows the biggest increase in Chinese population with a figure of over 45 per cent. But the remoter and predominantly Malay states of Perlis, Kedah and Kelantan are, surprisingly enough, not far behind. In Singapore, now detached from the Union, the population has risen since 1931 from 557,745 to 938,079, of which over 700,000 are Chinese 71,000 Malays, 71,000 Indians, and only 8,000 Europeans.

The Health Service Fight

A year ago it was the Presidents of the three Royal Colleges who took the initiative in an attempt to loosen the deadlock between Mr Bevan and the medical profession. This time it is *The Lancet*, which has taken up its pen and addressed to the Minister of Health a series of questions on the main points at issue, and has now published them, together with his answers. It is not likely, however, that this approach will have much success. Mr Bevan has at least promised that, in view of the conflict of legal opinion over the position of medical partnerships when the health service comes into force, he will immediately appoint a committee of legal experts to give their opinion, and will act on their report. This concession—if it be one—gives the British Medical Association the opportunity to make the possibly justifiable, but not very tactful, retort that Mr Bevan might

have had the courtesy to announce it to the negotiating committee of the medical profession instead of to a medical weekly journal.

On the other points, Mr Bevan's answers do not carry the position much further. In one or two cases they are even confusing. For instance, he says that one of the justifications of the basic salary is that it will discourage doctors from building up excessively long lists of patients—an admirable objective in itself. Yet, previously, in justification of the proposed remuneration of general practitioners, he had put first the example of a doctor with 4,000 public patients, who would be able to earn £3,300 a year from them in addition to private fees and payments for other work. Such a list is too long in itself, quite apart from the question of additional work.

Thus, there seems no prospect of a truce being called in the fight—at least before the plebiscite of doctors which is being held in the next fortnight. At present all the signs are of a big majority against Mr Bevan, though whether the professional solidarity demonstrated at meetings of doctors will stand the test of financial insecurity remains to be seen. It is now being matched by Ministerial solidarity. Mr Alexander gave public support to Mr Bevan in a speech last week-end, unfortunately using tactless phrases in doing so. And the Order in Council confirming July 5th as the appointed day for the National Health Service and other social security schemes has been made. The stage is set for a big fight. Even if it does not materialise—if, as Mr Bevan hopes, the doctors fail to carry their opposition into practice—the prospects for the success of the health service are not good.

Fitter Children

No more glowing tribute could be paid to those who devised the special food schemes for children than that contained in the report of the Chief Medical Officer of the Ministry of Education for the years 1939-45 (HMSO, 2s.). At a time when the enemy was attempting to reduce this country by bombardment and blockade, and shipping space was urgently required for the purpose of war, it seems almost a miracle that the nutrition of the elementary school child should have been maintained, and almost certainly improved, and that in the majority of areas boys and girls gained in height and weight compared to prewar years.

The report describes the Government's food policy as "brilliantly successful" and this it certainly was. Not only was the nutrition of school children accepted wholeheartedly as a national responsibility, but, after a period of hesitation in 1940 and 1941, very great concessions were made to fulfil it. The school milk and meals schemes provided large numbers of children with an invaluable addition to the family rations, while at home their priority supplies of milk and the improvements in the dietary

SUMMARY OF ROUTINE INSPECTIONS OF ELEMENTARY SCHOOL CHILDREN (5-14)

Year	Percentages			
	A (excellent nutrition)	B (normal nutrition)	C (slightly sub-normal nutrition)	D (bad nutrition)
1935	14.6	74.1	10.6	0.7
1938	14.5	74.2	10.8	0.5
1941	14.8	74.2	10.6	0.4
1945	16.3	74.5	8.9	0.3

value of "national" flour and margarine gave them additional protection—the latter being shared by the nation as a whole. During the war the number of children receiving school meals rose tenfold, from 150,000 to 1,700,000, and number receiving milk rose from 2,500,000 to 3,300,000, and the proportion from 55 to 71 per cent. Since the decision to provide all school milk free of charge the figure has increased sharply. The additional provision of orange juice, cod-liver oil and milk for the under-fives and for expectant mothers contributed to the satisfactory results shown in the table above, for it meant that these young children reached the first stage in their school life very much fitter and better nourished than they would otherwise have been.

It would not be fair, however, to attribute all these improvements to food policy alone. The report very properly emphasises the wartime improvement in wages, which raised the general standard of living and also the remarkable absence of any serious epidemics. All these factors played their part. In a gloomy world this report makes cheerful reading.

Employment of Poles

It is ironic and deplorable that one of the country's most serious industrial troubles since the war should be threatened about the employment of Poles in engineering. The underlying issues are both political and economic—political, because there is a strong Communist element in the Amalgamated Engineering Union, which will not have Poles at any price, and economic, because the rank and file fear that in spite of the Government's assurances about full employment, the postwar boom will be succeeded by a slump, as after the first World war, and that the Poles will be preferred to British workers. These fears, however, are quite unnecessary. It has been stated unequivocally that Poles will only be employed where there is a local bottleneck caused by labour shortage and where no British worker is available. Nor is there any question of cheap labour undermining British standards, for the Poles will be paid at full union rates and will be the first to go if unemployment develops.

These principles were laid down by the TUC, as general conditions for the employment of Poles, although it has been left to individual unions to negotiate their own arrangements. Some industries, notably mining, have agreed on these terms, although the consent of the local union has to be obtained before any Poles are taken on. Unlike the miners, however, where the executive has accepted Poles and the difficulties have been with the rank and file, the AEU executive itself has taken the initiative in rejecting Poles. It remains to be seen whether this attitude will lead to a show-down with the Government and whether Mr Isaacs, who so far has stood firm, will give way in the face of union opposition.

The AEU's fears of unemployment are understandable, but the proportion of Poles is in any case so small that the union is obviously making a mountain out of a molehill. Engineers would be the first to complain if they found themselves directed from one end of the country to another and obliged to live in lodgings or hostels away from their families; yet this is stated to be the alternative to the use of Polish labour. The AEU, for like every other trade union, has declared its full co-operation for the Government's production drive. It would be a graceful gesture, to say the least, if the union now withdrew its senseless embargo on the Poles.

Housing in December

There have been so many bitter disappointments in the housing programme that it is necessary to be doubly cautious about any good omen: they have so often proved false. Nevertheless, for what one month is worth the results for December are good. Some 17,728 permanent houses were completed, compared with 15,345 in October, the previous highest total. If this rate can be maintained or improved upon the programme may begin to trudge less sluggishly towards its completion.

A number of forces may be operating behind this improvement. The scheme of payment by results may be bringing some early results, and the concentration of labour on partly-finished houses is no doubt increasing the number of completions. Unfortunately the Government's decision to proceed with 90,000 houses under contract, but as yet unstarted, will check the tendency to reduce the number of houses under construction for some time to come.

Danger on Rail?

Railway accidents never come singly, and Sir Alan Mount's report on last year's crop will have an unhappy story to tell of increased liability to accident on the British railways systems. It was their pride that they were the safest in the world. But it is obvious from the tenor of recent reports on accidents at Doncaster, Polesworth and South Croydon that critical shortages of materials and manpower—which Sir Alan singled out for special attention in his report for 1946—have resulted in a further deterioration of the safety factor. At Polesworth a derailment occurred because the condition of the track on a curve was unfit for heavy traffic at high speed; wear on the rails "had been approaching the danger point for some time."

But another factor is appearing with distressing frequency in the reports of the Ministry of Transport inspectors—the standard of care exercised by technical and operating staffs. At Polesworth the district engineer was "out of touch" with the weaknesses of the track, partly because he was not properly supported by his subordinate. At Doncaster, a gross error by a signalman could have been avoided by retaining a relatively simple electrical control in the signalling arrangements where the accident took place, with a loss of 18 lives. And at South Croydon, where 32 people were killed by a collision in thick fog last October, a relatively inexperienced porter-signalman was responsible for a series of errors and improper manipulation of the signalling apparatus.

Shortage of permanent way materials and labour, and of trained signalmen are perhaps unavoidable in these difficult times. But if they have to be accepted, it is preferable that the standards of railway service should be lowered, regrettable though that would be, rather than the standard of safety. Two of the accidents would not have occurred with modern signalling equipment, and, but for the war, that would now be in operation. Last year's toll of accidents and death on rail should be taken as a serious warning of the physical condition of the railways after many years of strain.

Fall of a Barrier

Mr Bevin, who once dreamed of buying a ticket at Victoria and going "where the hell he liked," was certainly the right person to announce the partial raising of the ban on foreign travel. Contact with Europe is no longer to be limited to diplomats, business men and their "secretaries" and persons whose lives would, on the authority of two independent medical men, be jeopardised by the English winter. Just where the line will be drawn between hard and soft currency areas remains to be seen; but at least there is to be an end to the ridiculous ruling that because dollars cannot be spared for A and B to take a holiday in New York, therefore C and D must not have francs for a fortnight in Paris.

It would not do to exaggerate the benefits to international understanding likely to accrue from the charabanc tour, Strength-through-Joy type of travel wherein solidly agglutinated masses, innocent of foreign languages, hurtle to lovely Lucerne (or, more probably, the Riviera) and back under the paternal care of a professional guide; and it is probably this sort of travel which is likely to be encouraged in the near future. It is merely good fun for the participants—which may be justification enough. But at least the door is open for those who, having had a glimpse through the charabanc window, feel impelled to go back and see more for themselves; for students, for those with friends, relations, colleagues beyond the Channel, for the good Europeans who could form the spiritual nucleus of Western unity. And one may hope that the line between available and non-available currencies will not be too rigidly drawn. It is a commonplace of commercial negotiation that Britain must be prepared to accept a certain volume of non-essential imports, even from countries with comparatively hard currencies, as a condition of inducing these to accept its own luxury or semi-luxury export goods. One could certainly argue that for the sake of European recovery it would be a great deal better to stop producing these things at all, and switch the resources concerned, in all countries, to the production of essentials. But switching of resources is not always easy or even possible. In any case, so long as this principle applies to goods, there is no conceivable reason for not applying it to travel. If stay-at-homes may drink port, surely the more venturesome may visit Lisbon.

Polish-Soviet Trade Agreement

Political motives are so plainly behind the trade agreement signed in Moscow on January 26th between the Soviet Union and

Poland that caution is needed in assessing the precise value of the vaguely worded communiqué. The fact that the Polish Premier, Mr Cyrankiewicz, and Mr Stalin conducted important political talks at the same time is not concealed. Poland's original anxiety to join in the Marshall Plan, shared even by the Polish Communists, was one of the main reasons which led to the tightening up of Moscow's control through the Cominform. The Polish Government must now be offered some tangible substitute for Marshall aid. Otherwise it may continue to look to America. It has a long-standing application for \$600 million before the International Bank, and is at this moment receiving locomotives under an Export-Import Bank credit, granted to enable Poland to shift more coal to the west and south of Europe. The country urgently needs mining equipment in order to fulfil its plan to produce 67½ million tons in 1948; in other branches of industry needs are scarcely less.

The agreement with Moscow falls into three parts. The first consists of a five-year trade pact, which provides for the normal exchange of Polish coal, coke, textiles, sugar, steel goods, rolling stock, etc., for Russian raw materials. The only new items from Russia will be cars and tractors, presumably in the later years. Whether the total of one billion dollars for turnover during the five years is really a great increase on the present trade is hard to say. Changing exchange rates make comparisons uncertain. The tendency latterly has been for the proportion which trade with Russia occupied in Poland's total trade to decrease, as the Poles have extended their trade with other countries; but it is still greater than any of the rest. In the first half of 1947 Russia took 38.4 per cent of Poland's exports, and supplied 25 per cent of its imports.

The second section represents a landmark in the recovery of Soviet heavy industry. For the first time since the war (with the minor exception of oil-boring equipment for Rumania) Russia will export capital equipment. However, there is no suggestion that the immediate deliveries will be substantial; on the contrary, the term covers the next eight years, during which Russia will "gradually" supply capital goods. Another landmark is the size of the credit granted to Poland for this purpose—\$450 million over what is described as a "medium term." Russia has previously granted small credits to its eastern trading partners, including one of \$28 million to Poland, as Russian raw materials can be more

quickly delivered than the industrial equipment which has hitherto always been demanded in return; but nothing of this extent has been heard of before. The third section of the treaty solves Poland's food problem for the current year. Russia will deliver another 200,000 tons of grain on credit, making the total up to 500,000 tons. After the next harvest, Poland expects to be self-sufficing in grain.

Very inconspicuously, the communiqué mentions that the question of delivery of Poland's share of German reparations in 1948 was discussed. It is not known precisely how much Poland has received of her share of the German plant which has been allocated to Russia in the west, and taken by Russia in the Soviet Zone (and in the German territory handed over to Poland). The Poles do not appear to have been at all well treated hitherto by their ally. Competition with the Marshall Plan may have helped them to secure some concessions in this respect also.

* * *

Publicity for the Church

The Church militant is a familiar conception. If militancy was in keeping with the spirit of its day, there is no reason why the Church should not equally use the modern armoury of self-assertion—propaganda—a word, be it noted, of ecclesiastical origin—with all its up-to-date weapons of press, advertisement, film and exhibition. Such is in fact the trend of a report of the Publicity Commission of the Church Assembly published this week.

At first blush it appears that the authors of the report have wholeheartedly embraced the methods now fashionable in more temporal spheres. A Public Relations Officer with a salary of £2,000 and expenses, a press officer, a publications officer, a visual aids officer and an annual budget of £14,000 smack strongly of the arrangements in any large government department. But closer reading of the report reveals so many doubts and hesitations and so cautious a view of the possibilities that the initial impetus appears to dwindle away. No doubt the Commission felt that the task of making the clergy publicity-conscious was as difficult as that of making the public church-conscious. Nevertheless, in an age of mass propaganda, if the Church wishes to appeal to the masses it may at least try methods to which the public have grown accustomed in their daily life.

Letters to the Editor

Industrial Democracy

SIR,—It is at first sight surprising that in all the 8,000 words of the Labour Party's recently published pamphlet "Industrial Democracy," to which you refer in your Notes of January 24th, there is not so much as a mention of co-partnership, nor even a passing reference to one of the least important of its manifestations, profit-sharing.

"Profit," it says, "is the bone which sticks in many throats." Why should workers co-operate with the boss in an attempt to raise production, if at the same time they raise the profits of the shareholders? The incentive held out to the puzzled worker is that profits are not what they used to be. Controlled prices keep them down and a beneficent Chancellor takes large slices of the small cake which remains. This is undoubtedly and sadly true, though it is hardly the kind of stuff to infuse the British working man with new zest for his work. Socialist chickens have been coming home to roost, and decades of "go-slow" propaganda have not been without their effect in lowering output.

Is Industrial Democracy to mean no more than improved technical training and workers' participation in control through an extension downwards of joint consultation? Important as these are, they will achieve little unless they spring from a recognition on both sides that industry is a partnership between master and man, between management and the managed; unless, as the authors of the pamphlet say, "the human relationships are harmonious."

It is exactly because co-partnership, as its name implies, is the most obvious way of bringing about a unity of purpose in industry that the omission of all reference to it in the pamphlet is so regrettable. Co-partnership seeks to raise the status of workers in an enterprise to that of partners by enabling them to share in its ownership and prosperity, to be informed about the operations of the business and to have a voice in its internal management. This is of the essence of industrial democracy.

An immense interest is being taken in co-partnership at the present time. Directors of firms which are run as co-partnerships, as well as organisations like the Industrial Co-partnership Association, are being inundated by inquiries, and many new schemes are being launched. To many of us who have immersed ourselves in the practice of co-partnership it seems to be both a wholesome corrective to a disproportionate distribution of profits, on the one hand, and a practical alternative to the monopoly of State Socialism, on the other. Perhaps that is why it finds no place in the Transport House idea of Industrial Democracy.—Yours faithfully, C. N. THORNTON-KEMSLEY

House of Commons, London, S.W.1.

Food from Denmark

SIR,—Denmark's capacity to supply us with butter and bacon turns on her need of dollars. Inadequate supplies of coal from Britain compel her to buy less coal for more money in the United States of America. The dollars so spent would pay for pig and cattlefeed if we supplied Denmark with her essential coal.

Denmark's need of coal raises a big question which it is difficult to answer. Should we not export "Coal in its own right" as opposed to the export of a small available surplus? We discriminate in our imports. Why not in our exports? Should we not give, up to a limit of say ten million tons, first priority to an export which contains no percentage at all of re-exportable import? And could not those few million tons be saved by withholding coal used in the production of exports with a high import-content in their price structure?

Let it be remembered that these latter exports will be the first to disappear in a buyers' market.—Yours faithfully, H. A. REINCKE
Foreland Cottage, Kingsdown, nr. Deal

A Capital Levy?

SIR,—I do not agree that a capital levy can justly be made on capital increment in the way that Mr Simon suggests in his letter published in *The Economist* last week. Surely some notice should be taken as to how the increment in capital arises. Take, for example, a Mr Brown. He had £3,000 capital invested in securities in 1939. In 1944 his father died leaving him half his estate

proved for £50,000. The securities transferred to Mr Brown as his moiety have actually fallen in value, but his estate is now £21,000. Should his inheritance that has already paid death duties be taxed again? Then professional men find that most of their savings for old age are made in the last fifteen years or so of their professional life, when their children are off hand and when their life policies fall due. Are they to be taxed on these savings as if they were increments? Mr Simon is confusing unearned income with unearned increment, whereas much capital increment is earned.

The best way to tax wealth is not to try to tax capital nor to continue the profits tax, which falls so unevenly on different forms of wealth, but boldly and straightforwardly to increase the standard rate of income tax once again to 10s. and to increase the earned income allowance to one-quarter or even one-third.—Yours faithfully, H. H. BARKER

"Saxby," Glendale Road, Southbourne, Bournemouth

Boom in Life Assurance

SIR,—Your Note of January 10th, together with the reference to this type of saving made by Lord Linlithgow in the annual statement of the Midland Bank, both draw attention to life assurance and annuities as a form of savings. At the present time this form has two particular merits. It can be made attractive to members of the wage-earning groups who claim that in the face of present prices they are unable to make any regular contribution to National Savings. It is the saving of these wage-earners, who are spending all of their pay each week, which would be very useful in relieving inflationary pressure.

Further, the system of collection by agents ensures regular contributions and helps to reinforce the popular belief that if contributions are not maintained all is lost. With National Savings too much rests on the self-discipline of the saver. As a student living on a Government grant I can testify to this, as only the

WUTHERING HEIGHTS: a Novel. By ELLIS BELL. T.C. Newby, Mortimer Street, Cavendish Square.

A most strange and mysterious story, calculated to excite any other feelings than those of pleasure; interesting, it certainly is, but the interest is not a pleasing one. It possesses considerable affinity to "Jane Eyre" by Currer Bell, noticed in one of our late numbers, but wants its vivacity and its pathos. The principal character, Heathcliff, resembles in no slight degree the Rochester of "Jane Eyre": he has all Rochester's failings, but none of his virtues; he is passionate, and bears malice; all who offend him are ruined both in purse and mind, though years elapse before his plans are matured and carried out. His nature is all darkness; and he stoops to anything to gain his purpose. Originally, he is brought into the family of the proprietor of Wuthering Heights from the streets; he is there ill used by the son, petted and loved by the daughter, and strongly loving her in return; but, when the daughter is about to marry a neighbour's son, stung by a sense of her unkindness, and the general ill treatment he has received, he runs away. The daughter marries, and after some years Heathcliff returns: several scenes ensue between his former companion and himself—she dies broken hearted—he marries her sister-in-law, and succeeds in his attempts to gain possession of the whole of the property of his former benefactor: he ill treats his wife; she flies from him, and dies when her son is about twelve years old. Heathcliff obtains possession of his son, and, by a succession of cold-blooded stratagems and lies, succeeds in marrying him to the daughter of his former love. The son dies soon after the marriage, and the young widow ultimately marries the grandson of the first proprietor of Wuthering Heights, who had been allowed to run wild about the house in his youth, and made to work as a common labourer on the property. The story closes with the death of Heathcliff, who, after making restitution, dies a hardened infidel. Such is a very brief outline of the "Wuthering Heights." The story is connectedly told, and the characters are well and vividly portrayed; but we cannot say that the sketches of the strong, hardened in wickedness, and of the weak, led away into sin, are subjects of pleasing interest.

Future

A quality publication indispensable to all those with a part to play in the reconstruction of business and cultural life throughout the world. Influential and authoritative, critical but constructive, FUTURE presents a balanced picture of the British way of life.

Published every other month in 1948 (with two special additional issues).

In the United Kingdom by subscription only.

weekly sales-talk keeps up my contribution. It would certainly never be used to buy Savings Certificates.

Wages are high at present, so high that many workers feel they are too good to last, and whatever "imperfect comprehension of the economic issues involved" there may be, there is plenty of evidence that the habit of life assurance is deep-rooted in working-class behaviour. Perhaps the success of the life assurance companies will do something to offset the failure of National Savings. —Yours faithfully,

The Cost of Coal

SIR,—I have read in your issue of January 17th your comment on the National Coal Board report for 1947, also your conclusions which show the necessity to allocate extra quantities to exports, and this you consider would be "an act of economic wisdom." As an old importer of British coals, for many years interested in the production and export of anthracite from South Wales, I fully agree with your opinion because of the soundness of your reasoning, both as regards "restitution for the humiliating necessities of 1947" and your country's "handsome assistance to European recovery and British trade."

May I mention as of paramount importance that the qualities offered to foreign buyers must be those they actually require, and that prices should not necessarily be based on those of American coals, which are, in fact, too high for the French industry. It

may be argued that French-mined coals are produced at possibly higher figures than imported coals; but, while this should be temporary—at any rate, as a Frenchman, I sincerely hope things will right themselves in this direction—may I remind you of the fact that foreign imported coals were in the past generally sold at lower figures than home-produced.

For the time being, and since any favourable purchases abroad would help to bring down the general cost of coal consumed in France, it would materially help our country to restore its position. It would also be a check to the propensity of a great many industrialists to give up coal for its rivals. Finally, your country should at all cost avoid the fatal mistake of the 1920's, when British coal prices soared up. Collieries' costs increased to such an extent that, when the law of supply and demand fatally reaffirmed itself, the British coalfields had to suffer a long and painful strike, and although foreign markets were depleted, they were compelled to bring down export prices to ruinous figures, in spite of which they never recovered their prewar attainments. Other coal-producing countries will also be eager, and probably able, to compete both in quantities and prices.

May I conclude by the remark that, so far as France is concerned, she wants help at the moment, otherwise the risk of her disappearing as an important factor in the counsels of Western Europe will be increased, and your country would then have to fight on its own a battle, which its tenacity alone is not, I fear, sufficient to make it win.—Yours faithfully,

Rouen

A FRENCH IMPORTER OF BRITISH COALS

Books and Publications

Motives Unmasked

"Diplomatic Prelude, 1938-1939." By L. B. Namier. Macmillan. 503 pages. 18s.

PROFESSOR L. B. NAMIER is not the first historian to turn his hand to the contemporary scene but few historians have come to their task so well equipped. The present volume is the outcome of an ambitious undertaking—to present the detailed narrative of the diplomatic relations between the major European powers in the year between "Munich" and the outbreak of war. It was begun as a study of the "coloured books" which the various governments published to justify their course of action in that period, and portions of it—or rather preliminary sketches for portions of it—have already appeared in various publications. Nevertheless, this is substantially a new book, for the inadequate evidence provided by the originally published documents has been supplemented by the proceedings at Nuremberg and the documents produced there, and by a growing flood of personal memoirs. In addition, Professor Namier has had the advantage of being able to question personally a number of the actual participants in the events which he describes.

The author is probably right in thinking that until the publication of the archives—and this will not be for some years—there will not be much one can add to the general lines of the history of the last uneasy months of peace. In default of documentation one has to rely (as Professor Namier does for most of his account of the abortive negotiations with Soviet Russia) upon contemporary press reports. Meanwhile one can only commend the skill which has enabled Professor Namier to weave the hetero-

geneous material at his disposal into a single direct and dramatic narrative, and regret that it is not always as easy as it should be to discover whether he is quoting accessible sources or a piece of private information, and that he does not always give full references to the former (e.g. to the Nuremberg Documents).

But it must be realised that we are not dealing with an impersonal work of reference. Professor Namier is not merely piecing together a phase of diplomatic history; he is drawing up an indictment. It is not at first clear to what an extent this is so, since there seems so little sympathy for any of the states or individuals involved. The Germans are condemned for their immorality and brutality, the Poles for their megalomania and insouciance, the British and French for their blindness and weakness. It is only by elimination that one can arrive at the fact that what Professor Namier is trying to do is to absolve Soviet Russia from the major share in the responsibility for the catastrophes of 1939-1941, and to shift that responsibility on to the shoulders of the British and French statesmen who could have had an agreement with the Soviet Union and refused it.

This view makes it necessary to prove that the Soviet-German pact was only entered into when all chances of an agreement between the Soviet Union and the Western Powers had been dissipated. Professor Namier nevertheless admits that it was in any case in the Soviet Union's interest to delay such a pact until almost the close of the possible campaigning season in Poland, for fear of another "Munich" if Germany were given time for a war of nerves. It is true that no unmistakable evidence of political contact between Russia and Germany before mid-August has come to light. But it is surely rather cavalier to dismiss as simply a German "concoction" the statement to Ciano on August 12th about the telegraphed Soviet agreement to receive a political representative. Why should the Germans have concocted it?

But the issue goes deeper than this. The author discounts as simple flattery on Ribbentrop's part the statement made by him to Stalin on August 23rd that it was Stalin's speech of March 10th which had given the Germans the hint that a *rapprochement* might be possible. Professor Namier assumes that Ribbentrop had in mind only the banal sections of the speech. But there was more to it than that, for it contained Stalin's general analysis of the world scene which made it clear that the Litvinov differentiation between the peace-loving and the aggressive nations had served its turn.

More than one hypothesis as to Soviet policy at the time of "Munich" is possible, and more than one view can be taken of the military deterrent to Germany which a Soviet alliance would have provided. Russian arms were not notoriously successful in 1941, when its military organisation had had some time to recover from the "purge." Nevertheless, even assuming that the Western Powers could have had their agreement with the Soviet Union in

1939, by accepting Soviet terms, is it quite as clear as Professor Namier thinks that those terms should have been accepted? It is obvious from events since then that the Soviet terms involved the incorporation within the Soviet Union of at least the areas which it gained by its pact with Hitler. Russia, argues Professor Namier, had ethnic claims to most of Poland east of the Curzon line, and historic claims to the Baltic littoral. But Germany had ethnic claims to Austria and the Sudetenland, historic and ethnic claims to Danzig and some historic claims to Poznan and Pomorze. If it was Britain's duty to recognise that Russia had become a Great Power again, and was entitled to the full heritage of the Romanovs—why was not Hitler entitled by the same token to the full heritage of the Hohenzollerns and Habsburgs?

The course of British foreign policy in the interwar period was not a glorious one and its exponents were not great men. But they seem to have had two instincts common to most of their fellow-countrymen—that war is an evil to be avoided at almost all costs and that in the last resort, the only possible justification for resorting to it, was an unmistakable challenge to the way of life the British people were struggling to create or maintain by a profoundly alien and hostile ideology. On this point it is hard to see that even Neville Chamberlain differed fundamentally from Professor Namier's hero, Winston Churchill.

Professor Namier is the most illustrious representative of the school of historians whose tacit assumption it is that politics is only a matter of interest and of power, and that ideals are merely the self-delusions by which statesmen obscure the unpleasant face of reality. The history of international relations is thus the history of a self-perpetuating and meaningless anarchy, and the only escape from a historian's subjective reactions is the yardstick of success and failure. Within the limits of this sterile and dangerous philosophy, *Diplomatic Prelude* is a masterpiece.

Enemy of Jargon

"Arthur Quiller-Couch." By F. Brittain. Cambridge. 174 pages. 15s. net.

THE use of the English language and the enjoyment of English literature are no man's professional preserve, but there are few professors of English who make this assumption the very inspiration of their Chair. "Q" did, and while the economist and the business man, no less than the student of literature, have his "Art of Writing" and "Art of Reading" on their shelves, the famous initial will command affection and respect.

From the point of view of his own students at Cambridge "Q" performed a great service in insisting that the study of literature was part of the art of living and not an adjunct to a linguistic grind. But his rejection of compulsory Anglo-Saxon most certainly did not mean lack of care for the English language. Quite the reverse. If there were teachers at Cambridge in his later years who excited the young more by their critical penetration, they did not all illustrate in practice, as "Q" did, the virtues of an English that was elegant but not ostentatious, and familiar but not coarse.

"Q's" wider service to English was no less important. He gave the first of his lecture courses before there was an English Tripos, and every one came. Throughout his life he was concerned with the English that every one used and that every one read, not merely with his students' essays and his colleagues' books. One small illustration of this that Mr. Brittain does not mention is that he remained till his death examiner in English to the Chartered Institute of Secretaries.

BURGH ISLAND HOTEL

OPEN EASTER TO OCTOBER

Telephone: Bigbury-on-Sea 272

Such a man's humanities must have sprung from a deep joy in life. Mr Brittain, in a delightful book, has told us what manner of man "Q" was: a faithful son of Oxford who enjoyed Cambridge, a university man who toiled for years to make a living from writing in London, a Cornishman the crown of whose career was to be Mayor of Fowey. In politics "Q" was a Liberal, and he was a Liberal because he believed in the English tradition. His Liberalism did not prevent his expressing a strong sympathy with Labour, and equally did not prevent his being a lover of good wine and a stickler for correct (Edwardian) dress. Nor did being a professor at Cambridge prevent his doing the hard routine work necessary to give Cornwall a good system of secondary schools or interfere unnecessarily with his duties as harbour-master at Fowey.

It is the practice at Cambridge for undergraduates reading Natural Sciences to come up for a Long Vacation term. Last summer they came up as usual, but they asked the English Faculty to give them a series of lecture courses in English Literature. The request was honoured, and the scientists came in their hundreds. "Q," one feels sure, would have been pleased. Were his spirit informing English teaching everywhere, we should have less need to fear the bane of over-specialisation.

Political Economics

"Palestine's Industrial Future." By Dr E. Schmorak. 275 pages. 20s.

As an economic apologia for the immigration of a million Jews into a united Jewish Palestine, Dr Schmorak's book is already a little out of date. Whatever the future of Palestine may be now that partition is to be carried out, it is certain that some of Dr Schmorak's assumptions will not be valid. Industrialisation, he argues, is the necessary economic basis for the absorption of large numbers of immigrants; but the products of such industrialisation require markets, which in the case of Palestine would necessarily involve the Arabs within Palestine and the neighbouring Arab states. Thus it is unfortunate that the problem of the political relationship between Arab and Jew is ignored.

As head of the Department on Industry and Trade of the Jewish Agency Dr Schmorak is necessarily somewhat partisan, and of the many and interesting statistics given, those relating to the Jewish sector predominate. For this reason forecasts of the rate of future development of Palestine are unduly optimistic. But the book gives much interesting information; the prewar history of Palestine's economic development, the effects of the war, and the current economic situation are outlined. Dr Schmorak gives a detailed description of the existing and potential branches of industry, which are surprisingly numerous and varied; he also reviews the contribution that could be made by non-industrial occupations in maintaining a growing population at a rising standard of living. Perhaps the analysis of the means of providing sufficient raw materials, manpower, capital and markets necessary to rapid industrialisation is the most interesting section. Markets and raw materials would cause the major problems, although Dr Schmorak thinks they could be solved.

The book is thus a very thorough presentation of the Jewish aspirations to industrialisation based on the past achievements of the Jews and their potentialities. It is unfortunate that the part to be played by the Arabs is sketched only in brief outline, thus detracting from the value of what otherwise is an interesting study of the problems of industrialisation as applied to particular conditions.

AMERICAN SURVEY

Arbiters of Foreign Policy

(From Our US Editorial Staff)

THE Foreign Relations Committee of the Senate in the 80th Congress is, fortunately for Europe, the United States and the non-Communist world, more knowledgeable and experienced than any of its predecessors. Others have been more amenable rubber-stamps for Administration policy, but none have been so painstaking in their search for truth. By the time the European Recovery Programme reaches the floor of the Senate in the form of a Bill they will have spent two months on hearings and drafting, without counting the months of study in Washington and Europe after the Secretary of State's Harvard speech had foreshadowed the work they would have to do. There are thirteen members—seven Republicans and six Democrats—of whom two, Senator White (Republican, Maine) and Senator Wagner (Democrat, New York) are ill and cannot take part in the Marshall Plan hearings. The remaining eleven sit at a long table—the Chairman in the middle—facing the witnesses and, behind the witnesses, the press and public. Each face, taken by itself, would be at home in England—more so, perhaps, in Scotland—but the eleven taken together are unmistakably American. All have the hallmark of the American climate—their mouths turn at the corners and run down in deep shadows to their chins.

Senator Vandenberg, the chairman, is one of the strangest phenomena of American politics today. Elected to the Senate in 1928 as an isolationist, he remained one until after his sixtieth birthday. His conversion was abrupt and has proved unwavering. If ERP is passed in a form in which it can do its job, it will follow from his conviction, patience and unparalleled manipulative skill. His handling of the Interim Aid Bill was masterly and he has kept the hearings on ERP on a high level of statesmanship. He is determined to see the Bill through and has eliminated himself from the Presidential race in order that no political pressure can affect him. Those European countries which specialise in that form of tribute might well start to consider the christening of a Rue Vandenberg or a Vandenbergplatz. In England, at least an equestrian statue is called for.

Mr Vandenberg looks the part of a Senator—at times he even looks like Groucho Marx playing the part of a Senator. There is the same perpetual cigar and, in the eyes, the same eager watching for the moment to counter-attack. At a press conference, just as Groucho would, he replies to the difficult question with an unanswerable one. In committee he asks questions and makes comments, not for information, but to get important points on the record.

To Senator Vandenberg's right sit the Republicans, to his left the Democrats, but this pattern has no ideological significance. On his immediate right is Senator Capper, who seems to have shrivelled progressively through his 82 years so that his shrinking store of vitality has always been enough to carry the ever-lessening burden of his body. He asks few questions but appears now genuinely to approve measures which, a few

years ago, his thin Kansan spirit would have rejected as internationalist nonsense. To the left of Vandenberg sits Senator Connally (Texas), Chairman of the Committee while the Democrats controlled the Senate. He plays the Senatorial part with the gusto and humour with which a Bensonian Falstaff would have endowed it. Long a defender of causes which are less lost than non-existent, he is presently occupied in trying to get more control for the State Department than even Mr Marshall has requested. His white hair may be too carefully overgrown but only a life lived to the limit of his ambitions could have given him finally the florid benignity of a Chaucerian friar.

The next in seniority—Senator Wiley of Wisconsin—is still another Republican bred in the isolationist Middle West but he has not yet developed as has his Chairman. He may have been too handsome when young and, had his features not coarsened and his face set in an ungenerous cast, his white hair would have made him a striking figure in late middle age. He is obsessed with the idea that the United States should get bases in exchange for ERP and is one of the two members of the Committee who, one feels, would be happier voting against it—if he were not frightened of the consequences. The other, Senator George of Georgia, sits on Connally's left. He has the thin features and pursed lips of a general practitioner in a middle class suburb. But his own limited field of vision is offset by his predilection for taking the advice, within limits, of Mr. Baruch.

Beyond Senator Wiley there is the deceptive figure of Senator Alexander Smith of New Jersey, bald and wrinkled, who might be taken for a mildly successful businessman until his smile exposes his tolerance and generosity. A lawyer, his questions are precise and chosen to illumine the forgotten corners, never to throw a spotlight on the obvious—or on himself. Though no Socialist he praised the efforts of the Ministry of Fuel and Power when he had satisfied himself that they would be successful. His remarks, on this and other subjects, are cool and honest.

The next ranking Democrat is Mr Elbert Thomas of Utah, whose Mormon upbringing gives him the advantage of a firm and unquestioned set of principles to which he can refer all problems with certainty. Had Alfred Drayton never been involved in the moral tangles which Aldwych farces require he would have been the double of Senator Thomas. Strategic raw materials are his hobby and he was delighted when Mr Baruch recommended buying all raw materials, whether scarce or not.

Senator Hickenlooper of Iowa is new to Congress, having been elected after a successful Governorship of his State. His face is unlined, compared to those of the other members of the Committee in which experience has dug its trenches, and he finds international problems harder to understand than local ones. But he has integrity, which cannot be learned, and his handling of Atomic Energy in the last Session gave promise that he will develop into one of the Senate's most valuable members. Senator Barkley (Kentucky) is a junior member of this Committee but was the Senate Democratic leader chosen by President Roosevelt.

The last of the Republicans, Senator Lodge (Massachusetts), who would have greater seniority if he had not resigned to join the Army and had to be re-elected after the war, is the grandson of the earlier Lodge, who, as Chairman of this very Committee, fought Woodrow Wilson and the League of

Nations. The present Senator, the youngest member of the Committee, has the appearance of a bulldog which suggests that he has his grandfather's obstinacy; but he also has his ability and both are directed into better channels. He preaches the United States of Europe in and out of Congress and, for him, ERP is only a small step in the right direction. He may well be a future President—when the Republican Party has learned that the nineteenth century is not to be recaptured. On the left wing of the Committee sits Carl Hatch of New Mexico, one of the President's closest friends. With Senator Smith he is trying to make the Marshall Plan an issue above party.

These are the men who have been listening to evidence on the European Recovery Programme. For two weeks they heard the Administration document its case. Each has developed, during the weeks of evidence, his own special interest and can be counted on to question every witness, on his favourite aspect of the problem. Only two Senators—Vandenberg and Barkley—have the wider experience which makes their questions responsive to the individuality of the witness. Their questions have showed no alarm at the size of the programme. But they have showed anxiety over the proposed method of administering it, over the reluctance of the European countries to integrate their economies and over the difficulty of ensuring that all of the huge sum should be used to the best advantage. After two weeks they began to hear the evidence of private citizens. At once disturbing new ideas presented themselves. Mr Bernard Baruch, even at the age of 77, is always certain to have something original to say. The members of the Committee seem to have found him on this occasion more rococo than Baruch. The Marshall Plan was no more than a jumping-off point from which his imagination took him all over the field of world politics and the domestic economy. His recommendations were too much for the Committee—particularly in an election year. They listened in uncomfortable silence and their subsequent questions returned to the pedestrian level.

Two days later Herbert Hoover, four years younger in years but a century older in spirit, sent a message from Florida pathetic in its inadequacy. His present plan is but a recollection of problems with which he grappled after the first World War. He does not so much recommend a relief programme instead of a recovery one as display a total ignorance that the Marshall Plan is supposed to be more than relief. The faded precision of the old man of 73 was tragic after the abounding vigour of the young one of 77.

Between these two witnesses the Committee heard Mr John Foster Dulles, who, still of an age to have years of public service before him, gave them advice from an extensive experience and hope from his own store of faith. He might be Secretary of State in a Republican Administration, in which case he would be intimately involved in the programme. What he had to say was, therefore, carefully considered and, in terms of the Marshall Plan as it is, the most valuable support which the Committee has yet found. There are many more witnesses to be heard but it is already certain that the Bill which goes to the floor of the Senate will not be a disappointment to the Administration.

American Notes

The Republican Nomination

At a moment when the public opinion polls suggest that he could sweep the country, General Eisenhower has at last firmly announced that he would not accept the nomination for President even if it was offered to him. The "I Like Ike" clubs are regrouping their shattered forces behind Mr Stassen. General Eisenhower did not go quite so far as General Sherman in his famous renunciation and declare that if elected he would refuse to serve; and the hopeful still profess to see a loophole in the event of a spontaneous demand for the General at the Republican Convention. All past experience shows, however, that this kind of political miracle has to be most carefully organised behind the scenes. Mr Willkie's storming of the convention in 1940 was no exception; and the Old Guard is determined not to have the presidential nomination snatched from it by an outsider this time.

General Eisenhower's decision to remove himself from the political scene may have been prompted by loyalty to Mr Marshall; it may have been stimulated by a lively dismay at the prospect of working with men of the temper of Senator Wherry, Senator Taft

and Mr Halleck. But for a man with any presidential ambitions it represented a real sacrifice. The nation-wide Gallup poll reported that, pitted against President Truman, General Eisenhower would receive 47 per cent of the vote against the President's 40 per cent. Governor Dewey would win only 41 per cent to the President's 46 per cent; while Senator Taft would bring up the rear with 31 per cent to the President's 51 per cent. It would be wrong to assume that even with General Eisenhower out of the running these figures constitute a prediction of Democratic victory. Nor only can the shape of things change radically in the nine months ahead, but it must be remembered that American Presidents are chosen, not by popular vote, but by each state voting as a unit. Democratic defeats in states like New York would go far to offset the President's certainty of the Solid South.

The Republicans are left with a slate of party regulars. Despite the crushing unanimity with which public opinion polls report the unpopularity of Senator Taft, the report has gone out from the recent meeting of the National Committee that although Governor Dewey is still ahead, Ohio's favourite son is gaining. The Republican elephant is still snug in its ivory stable, comfortably oblivious of the enthusiasm of the Republican rank and file for a bigger and less rancorous figure than either of these perennial candidates.

* * *

Mr Hoover's ERP

Mr Hoover's letter of testimony on European recovery has sketched a very much more modest proposal than that of Mr Marshall. Because it is likely to become the intellectual arsenal of isolation, to which frequent recourse will be had in the debate, its main points are worth recording. Mr Hoover's ERP possesses a split personality, consisting of charity and business, with the concept of recovery wholly missing. Even the moral commitment to a four-year plan is opposed; the United States should be free to withdraw at any time without recriminations. In the first fifteen months Mr Hoover would confine the grants of the American Government to "surplus consumption goods"—food, fuel, fertiliser, cotton—amounting to about \$3 billion. Loans of \$1 billion for capital projects would bring the overall appropriation to \$4 billion, suspiciously close to the opposition figure.

Mr Hoover would also spread the plan thinner by including China, Latin America and the occupied countries among the recipients. The conditions of aid he laid down include, on German policy, a trizonal economic union, the cessation of plant destruction, and the raising or abolition of the level of industry to lighten calls on the United States. This is plainly a heaven-sent, if not prearranged, outline of the opposition programme.

Mr Hoover's objections to the Administration's plan for control of the recovery programme appear to have been met in large part by the recommendation of the Brookings Institution, sought by Senator Vandenberg. The proposal is that the aid programme be administered by an officer of Cabinet rank appointed by the President and confirmed by the Senate. This would give the administrator a position equal to that of the Secretary of State and other Cabinet members involved in the programme; and the President alone could veto decisions challenged by the Secretary of State on grounds of foreign policy. In outline this is close to Senator Taft's proposal, and is certain to secure the approval of a number of Senators critical of Mr Marshall's demand for a veto over the recovery programme. Whether, if this formula is accepted, the Administrator proves as independent as Senator Taft would like—anarchic might be a better description—lies with the man the President proposes and the Senate confirms.

Mr Eccles and FRB Policy

Few of the sturdy controversialists of the Roosevelt regime now retain positions in which they can sway Federal policies. This week's victim of the Truman axe was Mr Marriner Eccles, chairman of the Federal Reserve Board of Governors, who will retain a position as vice-chairman of the board, but who will be replaced as chairman by Mr Thomas Bayard McCabe, an industrialist and former chairman of the Reserve Bank of Philadelphia.

Although reports from Washington have suggested that Mr Eccles would be re-appointed for another term as chairman, the decision is not altogether surprising. From early postwar days Mr Eccles has been a vigorous and outspoken critic of monetary and fiscal policy, and his more recent remarks have pounded impartially at Congressmen and Cabinet for their successive failures to grapple with the inflationary boom. The climax was no doubt reached during the special session, when his plea for new control powers over credit policy met with the stubborn resist-

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

ance of Mr John Snyder, Secretary of the Treasury, and a close personal friend of the President.

Because the new FRB chairman is "Republican by politics and considered conservative by bankers," it should not be too easily assumed that Treasury policy will undergo an immediate and radical change. The Treasury has constantly upheld the policy of maintaining the long-term rate, and in that view was supported by Mr Eccles and the whole of the Reserve Board. Official emphasis now places great reliance upon the voluntary co-operation of member banks in their present campaign to curb "speculative and non-productive" loans, and with a heavy Treasury cash surplus through February, inflationary pressure may lessen. If by the close of March the inflationary trend is still well in evidence, industry must be prepared for a more general retreat from the cheap money pattern of recent years.

* * *

National Product in 1947

With figures given by the Department of Commerce, and by the Council of Economic Advisers, it is now possible to complete the business record for 1947. A year ago, the US economy was all but fully extended, with industrial production at a peacetime peak, and with unemployment down to very low levels:—

	(billions of dollars)				
	1946	1947			
	Dec.	Mar.	June	Sept.	Dec.
Labour force	58.4	58.4	62.6	60.8	59.6
Non-farm	49.1	48.8	49.7	50.1	50.9
Farm	7.2	7.2	10.4	8.7	6.9
Unemployment	2.1	2.3	2.5	1.9	1.6
Industrial production (1935-39)	182	190	184	186	193

Over the earlier part of the year, in fact, it looked for some time as though the immediate phase of postwar re-equipment was nearing completion, and as though the consumer buying spree of late 1946 would be very difficult indeed to repeat. For a time the trend of commodity prices were uncertain, there was a justifiable caution on the part of industry, and a fairly widespread belief that a deflationary reversal might not be so very far away.

Those who forecast a decisive setback from those pointers, however, proved to be very wide of the mark. Activity was still relatively high, wage advances were still being won, the commodity outlook changed suddenly with later crop news (more particularly for farm products) and the Marshall Aid proposals finally gave a fresh fillip in mid-summer. By late autumn the anti-inflationary proposals of the Federal Government were themselves feeding a rising price-trend. Industry did not fear serious deflationary moves; but it did believe in securing whatever material was available before the reimposition of limited controls. In the new situation, supplies were far from sufficient to equate demand at existing price levels:—

	(billions of dollars; annual rates)				
	1946	1947			
	Dec.	Mar.	June	Sept.	Dec.
Personal consumption	154.9	158.0	162.0	166.0	172.0
Gross private investment	30.4	29.4	29.1	30.4	33.0
Net foreign investment	5.2	8.3	10.5	7.7	8.5
Govt. purchases	28.2	27.4	27.5	28.2	29.0
Gross national product	218.6	223.1	229.1	232.3	242.5
Personal income	187.5	190.9	192.3	200.4	205.3
Personal saving	13.1	11.7	8.9	12.7	11.0
Savings %*	7.8	6.9	5.2	7.1	6.0

* Of net income, after taxes.

Net consumer income reached new peaks, but purchasing power in terms of current prices declined by nearly 8 per cent. Purchasing power was bolstered by the lower rate of savings and by the use of consumer credit (or instalment finance), while bank loans reached new peaks, as business expenditures on plant and inventories outpaced the accumulation of liquid resources:—

THE ECONOMIST BY AIR

Express Service to U.S.A. and Canada

(billions of dollars)

	1946		1947		
	Dec.	Mar.	June	Sept.	Dec.
Expenditures on new plant, etc.	...	12.6	15.7	16.5	17.7
Business inventories	35.4	37.9	38.9	40.2	...
Construction (private)	2.2	1.9	2.2	2.8	3.0
Consumer credit	9.9	10.2	11.0	11.7	13.3
Bank loans	31.1	...	33.7	...	37.7

* Annual rate.

The bank loan figure is for November, and a further rise will certainly mark the close of 1947. In dollar volume bank loans are now far above 1929 peaks.

* * *

Financing Expansion

The Federal budget gave a modest contribution to the anti-inflationary forces:—

	INVESTMENT AND SAVINGS (billions of dollars)			
	1939	1946	1947*	
			(1)	(2)
Domestic gross investment:—				
Construction	4.0	8.5	10.0	11.2
Plant, equipment, etc.	4.6	12.4	17.3	18.0
Inventories	0.4	3.7	2.1	2.5
Foreign investment	0.9	4.8	9.4	8.2
Total	9.9	29.4	38.7	39.9
Financed by:—				
Personal saving	2.7	14.7	10.3	11.8
Retained profits, reserves	8.6	13.3	17.4	17.8
Other receipts	0.5	...	5.4	4.3
Govt. surplus or def.	—1.9	1.4	5.5	6.0
Total	9.9	29.4	38.7	39.9

The Government's cash surplus (which includes the excess of revenues on Federal, State and local accounts) was, however, far from sufficient to curb the inflationary trend. With de-control, and full output, prices and business profits soared (thus bringing the necessary transfer of resources from consumption to investment) as the value of the consumer dollar declined:—

	PRICES, PROFITS AND PURCHASING POWER				
	1946	1947			
	Dec.	Mar.	June	Sept.	Dec.
Wholesale prices (1926) ..	140.9	149.5	147.6	157.4	162.7
Farm products (1926) ..	168.1	182.6	177.9	186.4	196.0
Consumer prices (1935-39) ..	153.3	156.3	157.1	163.8	164.9
(Billion dollars; annual rates; quarterly figures)					
Business profits:—					
1946	15.2	19.4	22.9	27.1	
1947	29.0	27.4	27.4	28.2	
Disposable income per capita:—					
1946	\$ 1,285	\$ 1,284	\$ 1,225	\$ 1,211	
1947	1,194	1,183	1,196	1,188	

The rise in consumer expenditures exceeded by \$3 billion the advance in net personal income, while consumer credits rose by an almost similar amount. The last CEA report suggested that consumers are now using past credits "substantially for general living expenses and medical care," and drew an appropriate moral concerning the future. The proportion of income saved in 1947 was still higher than in the 1935-39 period (4.5 per cent only), but was much below earlier rates.

The pace of business expansion, again, is far higher than that suggested by most postwar estimates, even when full allowance is made for present high rates of profit. American industry closed the war period with a considerable extension of capacity, and most observers assumed that capital investment would be far more cautiously undertaken. Unquestionably many industries (utilities are one example) were developing a deficiency of capacity through the thirties in relation to population trends. A considerable "backlog," too, developed in the war years. It seems reasonable also to assume that, apart from foreign relief programmes which have suggested continuing "floors" for national output, there has been a general disposition to modernise factory processes purely in order to meet rising labour costs.

THE WORLD OVERSEAS

Australia—A New Industrial Power—I

Full Employment and Defence

(From a Canberra Correspondent)

AUSTRALIA is no longer a nation willing to depend entirely on primary production for its national income. The most important effect of the war, which isolated Australia from European protection and made the population rely upon its own resources more than ever before, has been the growth of secondary industries. There is now a waiting list of 30,000 jobs for skilled workers, and textile factories are appealing for women to take part-time work.

The present Government looks largely to secondary industries to provide the jobs to fulfil its "full employment policy." Indeed, the Labour Party's policy for several decades has supported Australian secondary industries. The new emphasis today is upon three factors: first, the shortages overseas of most of the manufactured goods which were previously imported, but which in many cases can be made equally well locally; second, the desirability of maintaining, as shadow defence factories, many of the enterprises established during the war, among them aircraft factories which are building prefabricated houses, household fittings and utensils; third, the urgency, in the Government's view, of "decentralising United Kingdom industry" by dispersing of British industries and population to Australia and other Dominions.

Behind this emphasis is the Government's conviction that industrialisation means secure employment, greater military security and against the uncertain future policy of Asiatic nations and an internal market for primary products in the event of overseas prices falling. This conviction is shared by the principal Opposition party; only the minority Country Party persists with the idea that Australia should remain a rural community.

However, there is no intention to attempt an artificial self-sufficiency, apart from measures to treat the "short-term" difficulties of the current dollar exchange position. The aim is to co-ordinate the industrialisation of Australia as part of the modern industrial world in a way that will promote the flow of goods between countries. Arguments that rural production would fall as secondary industry developed have been destroyed by recent experience. Also, more factories are being opened in larger country centres, counteracting to some extent the congestion of population in the main industrial cities of Melbourne, Sydney and Adelaide. As far as possible immigrant factory workers are sent to factories in the rural areas for the same reason.

Flourishing Industries

Official statistics paint the Australian industrial picture in glowing colours. Between December, 1945, and September, 1947, there was an increase each successive month in the number of persons in factory employment. September figures represented an increase of 30 per cent in private employment since July, 1939, when 1,325,200 were so employed. The greatest rise in employment during September occurred in the metals group, which rose by about 1,200. Other types of production showing an increase were: treatment of mine and quarry products, chemicals, oils, paints, saw-milling and furniture. In the clothing and footwear industry, for instance, the latest complete figures show an output in 1944-45—when demobilisation was still proceeding—of nearly £60,000,000. Since 1934-35 in this industry the average wage per employee has risen from £109 to £196 per annum. The value of production per person has risen from £167 to £320 in the last ten years. Demand for Australian textiles is increasing in New Zealand, India, Canada and in the United States. In fact, the Government has been severely criticised for allowing any exports of such consumer goods while any shortages continue at home.

The Minister for Commerce (Mr R. T. Pollard) has replied that the intention is to develop overseas markets for Australia's secondary products. A network of Trade Commissioners has

been established abroad for this purpose; and, "while local demand is still pressing hard on production, token shipments only will be allowed; but these are essential to retain and build markets abroad."

American wartime help in equipment and technical staff stimulated Australian secondary industry. The results surprised the most sanguine, in quantity and quality. The record includes munitions, explosives and all kinds of guns; special steels for guns; special ferro-alloys for the steels; tanks, ships, aircraft, drugs, optical glass, machine tools and extensive textile production. Among capital undertakings were the Captain Cook Graving Dock in Sydney; the graving dock in Brisbane; and the construction of aerodromes and roads. All this was accomplished while a maximum effort was being sustained in the fighting services.

Future for Iron and Steel

Between the two wars, iron and steel production began to establish the Australian claim to be recognised as more than a huge sheep station. Between 1930 and 1939, when the threat of war became imminent, the production of pig iron—its export to Japan has quite unfairly haunted political meetings addressed by the former Prime Minister, Mr R. G. Menzies, ever since—steel ingots and steel rails increased by between three and four times. Iron and steel look forward to a good future because of high-grade ore, excellent equipment and efficiency. Overseas demand for Australian metals, which have been kept at remarkably low prices, would quickly strip Australia of local requirements. It is the outstanding Australian secondary industry, which is able to compete with that of any other country in the world. It has encouraged the growth of local engineering industries, ship-building—which the present Federal Government is undertaking on a large scale for quicker inter-state trading and defence—and the complete manufacture of tractors and motor cars.

Chemical industries have expanded in spectacular fashion. Plastics, rayon fibre, pharmaceutical products and fertilisers are now Australian-made. The growth of heavy industry has also promoted greater textile production and the establishment of large-scale cotton spinning and weaving, mainly concerned with the coarser kinds of cotton but capable of being turned to lighter varieties.

In its annual report for 1947, tabled in the Federal Parliament towards the end of last year, the Tariff Board, which devotes its whole time to examining individual industries seeking protection and reviewing Australian industrial efficiency, declared that

"in general the competitive position of Australian industry is much stronger than before the war. . . . The small number of cases in which requests for increased protection have been referred to the Board is a good indication of the general position. . . . During the year production cost levels in Australia, the United Kingdom, the United States of America and Canada have continued to rise. . . . If anything, however, the changes have increased rather than diminished Australia's competitive advantage."

This expert opinion guided the Government in the negotiations for the setting up of the International Trade Organisation. The Minister for Postwar Reconstruction (Mr J. J. Dedman) told Parliament

"the Government has every confidence in the ability of Australian industry to withstand the concessions proposed. Price levels in Australia have risen much less than in most overseas countries. This has resulted in Australian industries enjoying greater competitive advantage; and an ability to compete within the shelter of a lower tariff wall. . . . any increase in imports of goods in competition with Australian production is likely to be absorbed by greater demand and consequently not to affect Australian industry. . . . The lower duties on goods which are imported will tend to reduce prices, and this, together with any increased supplies of goods, will be a useful offset to inflationary tendencies in the economy"

(To be continued)

This Marxist doctrine is pure theory in Poland at the moment, however, and it is hard to find more than piety in the hope that it will be put into practice in the neighbourly future.

There is much less disagreement between the two parties on private enterprise, since, in small scale operations, it has proved invaluable in the period of reconstruction. Also, while the Socialists contemplate a large, permanent private sector based on the peasantry, the Communists are equally careful to avoid any suspicion of collective aspirations—at least during this generation—because of the probable virulent reaction.

A more immediate and concrete division has arisen over the Bureau of State Control, a flexible accounting agency whose financial responsibilities give it power to investigate and intervene in any branch of the government and even in co-operative and private business. As it was before the war, it is still responsible only to the President, which, under the two-party agreement, is a Communist post. The Socialists, therefore, want the President to be responsible to Parliament. The Communists vigorously uphold the *status quo*.

Reform of the SEJM

Reflecting their general views on civil freedoms and the advantages of a loyal opposition, the Socialists are also pressing in numerous little ways for fuller and more intelligible debates in the *Sejm* (Parliament). There is a marked tendency at present to restrict public discussion to compliments and withhold criticism to more private reunions. The Socialists favour the development of the British custom of question-time with the corollary tradition of truthful and fairly prompt and complete replies. The Communists consider this excessively dangerous and subversive during the lengthy revolutionary period.

Oscar Lange, who returned from Lake Success to take a very prominent rôle in the Socialist Party—perhaps that of a Polish Professor Laski—is now negotiating this question of the rôle of the *Sejm* with the Communists. There is rather more hope of making headway on this point than on the other controversies, particularly since the flight of Mikolajczyk has left Poland without a single party in open opposition to the government coalition.

On the other hand, Socialists will probably wind up with another face-saving "compromise" in the dispute over Poland's

political youth movement. They flatly rejected intense Communist pressure for the parties to pool their youth organisations and, with the addition of the peasants, to form a single national group which would obviously be dominated by the Communists. A fairly recent Communist proposal will be much more difficult to overcome. It is to establish labour battalions composed of young men conscripted for military service but not needed in the army. The Socialist Party, which has already agreed to a united youth front similar to the united front in the government, will undoubtedly have to accept this plan, but it will try to provide the conscripts with a choice in their political education.

Effect of International Tension

There are, of course, differences of opinion among the top Socialists about just how far collaboration with the Communists should go, but at present it can truly be said that there is unanimity against both extremes of fusion and open break.

An undeniably sincere wish to work in close harmony with the Communist Party exists among the men who lead the Socialist Party, but it would be silly to ignore the fact that this desire is much abetted by iron circumstance. There is no doubt that neither party nor government can long function in Poland today without accepting Soviet Russia as a friend at least, if not as a blood relation. On the other hand, the Socialists have both a tradition and an important mass following to support their arguments. Moreover, the great bulk of the Polish people are firmly anti-Communist and only a little less anti-Russian. The balance between the practical power of the Communists and the greater political popularity of the Socialists hangs on the international situation. The more tightly the lines are drawn between East and West, the more aggressive become the Communists in defence of home territory and the more difficult becomes the position of Socialists, no matter how Left they fly.

Thus, the Polish Socialist policy is to push ahead with social reform while playing for time politically in the hope that international tension will eventually decrease. If it continues to mount, they would not be surprised to discover in a couple of years that they have either been swallowed whole or ripped to pieces.

THE BUSINESS WORLD

The Franc Devalued

LAST Sunday the French Minister of Finance announced the long-expected devaluation of the franc. As had been feared, it was not a straightforward devaluation within the framework of the Bretton Woods agreements but involved the adoption of multiple currency practices specifically forbidden to members of the International Monetary Fund unless applied with its consent. Under the new devaluation the official par value of the French franc has been reduced by 44.444 per cent. As a result, the new official dollar parity is 214.392 francs compared with the previous figure of 119.107 francs, and the corresponding official sterling rate has been raised from 480 to 864 francs. There was, in principle, no criticism of this aspect of the plan. What aroused such keen opposition, both internally and externally, was the simultaneous decision to introduce, as an integral part of the whole scheme, a free market for gold and certain convertible currencies—to be restricted at first to US dollars and Portuguese escudos. French exporters will be permitted to sell in this market one half of the dollar or escudo proceeds of their sales, the other half being sold to the French monetary authorities at the official rate. Only importers of non-essential commodities will be authorised to buy convertible currencies in the free market and their dealings will have to be conducted through an authorised French bank and will have to be covered by the necessary import licences. Imports of essential commodities will, for the most part, still be handled by the French Government and will be transacted at the official rate of exchange. Indeed, for certain bulk imports the Government will continue to use the parities which existed before devaluation, but this decision has a mere accounting significance. The free market will also handle exchange arising from certain "invisible" exports, including sales of dollars and other permitted convertible currencies by tourists. Finally, the free market will be open to receive without question any sales of gold and specified hard currencies which French hoarders may unload.

This two-decker devaluation of the franc, with its establishment of a free market in which specified currencies will be allowed to find their own level, and which will therefore produce foreign currency equivalents that may bear no relation to the parities notified to and agreed by the International Monetary Fund, has been strongly opposed by Britain and rejected by the International Monetary Fund. The French Government, however, was unmoved by this opposition and was prepared to pursue its objective even if that involved withdrawal from membership of the Fund. In fact, France will continue to be a member, although it has undertaken not to exercise its rights to draw on its Fund quota for the time being.

The reasons that prompted this determination on the part of the French Government must presumably have had a strength appropriate to what was at stake in endangering Western European economic collaboration and risking expulsion from the IMF. The reasons so far disclosed, however, do not quite suggest such weight and urgency. The French Government's reasoning was clearly indicated in Sir Stafford Cripps's statement last Monday:

The French Government have as their chief objective the stabilisation of the French economy. The fiscal and budgetary

measures were the first step in this programme. Their next step was to adjust the rate of exchange in order to take into account the rise of prices in France. They regarded it as impracticable at this stage in the evolution of their economic programme to determine a new and fixed equilibrium rate which would be appropriate. Therefore, in their judgment it was necessary that, for a transitory period, part of the convertible currencies coming to France should find its level through the operation of a free market. . . . The French repeatedly made it clear that the proposals are designed as a transitory measure to meet the urgent needs of the moment, and their objective is a stabilisation of the franc on a fixed uniform rate.

Reports from Paris have emphasised the desperate nature of the French gold and dollar reserve position and make it appear that one of the main immediate objectives in establishing a free market for dollars and gold is to remedy this situation by encouraging sales from French hoards, which have been estimated at up to £800 million.

When they were fully acquainted with this case for a free market, the British Government and the International Monetary Fund felt bound to oppose it, although they sympathised with the devaluation of the official rate to a new parity. M Gutt, in a statement issued by the International Monetary Fund in Washington last Sunday, agreed with the French Government that a change in the par value of the franc was necessary, and indicated that the Fund was "prepared to concur in the devaluation of the franc to a realistic rate which would be applicable to transactions in currencies of all members of the Fund." In London the desire to see the franc devalued to a realistic rate—and even to a somewhat undervalued rate, if that were thought to help French interests—has been no less strongly held and expressed. But to accept a free market would condone an undermining of the whole Bretton Woods philosophy, which is based on the doctrine that members shall work to create monetary stability and shall abstain from multiple currency practices.

The British attitude on this issue is based on considerations both of general and of particular interest. It fears, in the first place, the danger of contagion from the French move, causing an extension of multiple practices and of an added impetus towards competitive exchange depreciation. This is the most serious ground for concern, in general European terms, about the effects of France's devaluation. As Sir Stafford Cripps explained, the British Government feared the possible effect upon Western European economic and political co-operation and stability that might be brought about by the French proposals. It was this fear which induced him and his imposing retinue of experts to fly to Paris on Friday last week to try to persuade the French Government at the eleventh hour to think again.

But apart from these questions of general stability there are some specific British interests at stake. It is evident that the creation of a free market in Paris will lead to "cross rates" in which sterling will find itself quoted at a discount on its official parity against the convertible currencies quoted in the free market. The original French intention was to allow quotations for all foreign currencies in the free market, but in deference to the wishes of other countries and particularly to

those of Britain, the free market quotation has been restricted for the time being to dollars and escudos. Even so, the free market provides the basis for calculating cross rates between sterling and other currencies, and they might be far less flattering to sterling than an open quotation for sterling on the free market. The psychological effects of the discounts at which sterling will be quoted may be serious. It is one thing to have sterling quoted at a discount in a market for bank notes which rests on a "double-smuggle," or in a market for blocked sterling available only for reinvestment in sterling securities. But it is quite another thing for this discount to arise from commercial rates which result from the transaction of a substantial volume of trade. Inevitably, other countries will look at the sterling cross rate and take it as a reflection of the true value of sterling against the dollar, and by doing so they will tend to undermine confidence in the official rate for sterling. It remains to be seen whether views thus formulated about the future of sterling will be outweighed, in the minds of people abroad, by protestations such as those of the Chancellor of the Exchequer this week. He asserted in the House of Commons that Britain does not contemplate taking any action to alter the rate of sterling in relation to other currencies, as we do not believe that this will be rendered necessary or advisable."

There is every reason to accept this statement as an unequivocal declaration of intentions. Whatever the ultimate fate of sterling may be, all the arguments at present are against any change, and the direct consequences of France's action do not alter the position. But when that is said, the psychological influence of an important free market in Paris may acquire direct practical significance if it causes non-sterling countries, with which Britain has to negotiate payments and monetary agreements, to be less willing than they otherwise would be to hold sterling balances. The French initiative, therefore, might in due course create serious handicaps to the increasing use of sterling in financing multilateral trade in Europe.

Apart from this psychological factor, the existence of differential rates in Paris is bound to cause far greater temptations for contravention of French and other exchange control regulations. Indeed, some of the disadvantages to Britain may proceed from perfectly legal transactions. Under the new ordinance there will, for example, be a constant temptation for French merchants and manufacturers to over-import materials for which they pay in sterling at the official rate in order to re-export the surplus to hard currency countries whose convertible currencies they will, in part, be able to sell at inflated prices in the free market. To Britain, any development of a French entrepôt trade of this kind would mean the direct loss of hard currency income, since re-exports by France would tend to replace direct exports from the sterling area to the hard currency countries concerned. Admittedly, this risk can be safeguarded by a further tightening up of export licences and

by restricting the flow of trade from sterling currency areas to France's essential home requirements. But this adds another important item to the tally of regret about the French decision.

Finally, although sterling will not be quoted in the free market in France, can it be doubted that the toleration of that free market will encourage the development of black markets in all the non-specified currencies, including sterling? It should, of course, be possible to prevent leakages by the effective control over sterling held in French accounts. But it must not be forgotten that the area of control is extremely wide, for it includes the whole of the French monetary area and the whole of the sterling area. It is at the peripheries of these areas that leakages may tend to occur, both in financial and commercial transactions; it follows, therefore, that the necessary task of tightening up the machinery of control will be formidable.

The test of the French case rests on the future—and it is likely to be the very near future. It remains to be seen how far the free market will attract dis-hoarded gold and dollars, or, conversely, how far the rates which will be quoted in that market will further undermine confidence in the franc and redouble the tenacity with which French hoarders have clung to their dollars and gold. Again, how far will the French economy succeed in sheltering itself from the repercussions of both the official and the "upper deck" devaluation and in preventing prices, wages and costs from overtaking the advantages of currency depreciation? If these objectives can be satisfactorily reached, France's monetary policy may prove justified. But there is ample ground for doubt on both scores.

No discussion of this tense episode in the monetary relations of France with her neighbours and with the International Monetary Fund can ignore the friendly spirit in which the negotiations were conducted and in which the agreement to differ was reached. France remains a member of the Fund and is pledged to use the chosen devices only as a short-term makeshift. The ultimate objective is still to return to a single official rate. Nor do these events mean that France has drawn aside from the Western European nations.

Although the points of view of the two governments on the method to be adopted in this matter did not coincide, the conversations which took place, both in London and in Paris, have made clear the frank and intimate character of the relations existing between the two countries. . . . Whatever the differences between the French and British points of view the two governments wish to continue their close co-operation in order to ensure that any measure which may be considered necessary in these new circumstances will have only a minimum repercussion on the commercial relations between the sterling and franc areas.

On this score the joint communique issued by the British and French Governments after the devaluation of the franc says all that need be said.

Nationalisation of Gas

THE Gas Bill, which was published at the end of last week, is the only nationalisation measure of the present session. It completes what Mr Shinwell once described, in an unguarded moment, as the "trilogy" for fuel. Coal has been publicly owned for a year, and it will not be long before electricity is taken over under the Act passed last year. With these precedents on the Statute Book, it is hard to generate much excitement over the principles of the Gas Bill. It has fewer political overtones than the Coal Industry Act, and technically it is less complex than the Electricity Act. Moreover, gas is the only industry on the Government's programme for nationalisation which has lately been examined by an independent body.

The Bill is in line of descent from the Heyworth Report, though there are some differences of consequence. It proposes, for instance, to set up twelve area boards, and not ten, though it does not depart from the principle laid down in the Heyworth Report that each area should have as its nucleus at least one large urban and industrial district. The Greater London area, which the Heyworth Committee proposed, has been reduced to a North Thames area—probably wisely, for the area originally proposed would have included more than one-fifth of the total population of the country.

Apart from the interlinking of gas mains in the important centres of population and of coke production, gas is largely a localised industry. Well over 1,000 statutory and non-statutory undertakings will be taken over under the Bill. The Heyworth Report showed that they vary in size from those supplying single villages to the Gas Light and Coke Company, which itself accounted for 12 per cent of the industry's total sales. The structure of the industry, as the Heyworth Committee found it in 1944, is illustrated in the table in the adjacent column.

The non-statutory companies—one-third of the total undertakings in the industry—supplied a mere 2 per cent of the industry's total sales. There are 269 local authority undertakings which supply rather over one-third of the total sales. And of all the undertakings in 1944, as many as 264 were under holding company control.

These figures show that, apart from the giants, the gas

industry consists of a large number of modest local undertakings. With such a diverse structure, a considerable degree of regional autonomy is essential as a basis for public ownership. Gas is not, in the same sense as coal, a national problem; nor is it characteristically divided, as electricity is, between the wholesale production of power and its retail distribution. The Bill recognises this technical fact by a greater measure of decentralisation

STRUCTURE OF THE GAS INDUSTRY

Form of Ownership	Number of Undertakings	Percentage of Total Sales of Gas in 1944
<i>Companies:—</i>		
(1) <i>Independent</i>		
(a) Statutory	245	50.4
(b) Non-statutory	264	1.6
(2) <i>Under Holding Company Control:—</i>		
(a) Statutory	161	10.6
(b) Non-statutory	103	0.6
<i>Local Authorities</i>	269	35.7
<i>Joint Boards</i>	5	1.1

and regional independence than has yet been seen in other nationalisation measures. The Area Boards are given prominence; each of the twelve will have the statutory duty to develop and maintain an "efficient coordinated and economical system of gas supply" and to secure "the efficient and economical production of coke," in conjunction with the National Coal Board. Each Area Board will consist of seven to nine members, including the chairman of the Gas Consultative Council for the area; the Bill does not state whether any of these members may hold part-time appointments, and all are to be appointed directly by the Minister.

Each of the twelve Area Boards will have sole responsibility for fixing tariffs, subject to its general duty to earn a profit "taking one year with another." Thus, in their trading policy, the Area Boards will have complete independence; and there will not necessarily be any uniformity of charges—or even of charging principles—among them. The main safeguard for the consumer will reside in the Gas Consultative Councils, which

for Germany manage to be co-operative only after long and arduous effort; and then disagreement seems to spring up naturally and luxuriantly on any point which has not been the subject of detailed examination.

The latest instance concerns the vexed question of reparations. In the last year, slowly—very slowly—but steadily, the Potsdam policy of dismantlement has continued, with 25 per cent of the machinery earmarked for Russia and the rest allotted to the countries covered by the agreement setting up the Inter-Allied Reparation Agency (IARA). This body, broadly speaking, represents the interests of the Western Powers, but—rather inconveniently from their point of view—includes Yugoslavia and Albania. In the spring of 1946 the Americans, for a time, refused to make any new allocations to Russia from their zone until the Russians fulfilled their obligations under the Potsdam agreement. The British did not follow suit. Deliveries to Russia continued and pressure was put upon the Soviet Government to ensure that they in return fulfilled their part of the reparations bargain, according to which food and raw materials to the value of 15 per cent of the deliveries from the West should be dispatched from the Eastern Zone. Such was the position at the time of the London Conference.

Immediately after its breakdown Mr Marshall threw out the hint that America would again consider stopping all reparations to Russia. But almost simultaneously the Russians announced that they were ready to begin their deliveries of the promised raw materials. This conjunction places the British Government in a very awkward predicament. The interests of the Marshall Plan and the desirability of keeping in step with America suggest that the British should follow the American lead. The interest of the IARA countries in receiving their share of the reparations now to come from the Russian area pushes them towards the continuance of reparations deliveries to Russia. It is an unwelcome predicament, but at least it should explode once and for all the idea of a concerted Anglo-American strategy in Germany.

Mr Isaacs Spreads his Net

Details of the Registration for Employment Order—more popularly known as the “Spivs and Drones” Order—issued by the Ministry of Labour this week, suggest that Mr Isaacs is spreading his net far and wide without any very clear idea whether he will catch a minnow or a whale. The Ministry cannot give any estimate of the numbers who will register under any of the three categories—the street traders, employers in betting and gambling undertakings, night clubs and amusement arcades, and the “not gainfully employed or occupied.” The potential number of registrations under at any rate the third of these headings is enormous, but the numbers likely to become available for useful productive employment are surely very small. In any case, a number of convenient loopholes are provided which the inveterate spivs and work-dodgers will be quick to use.

A barrow boy must register if he has a regular site in a street market, but if he moves up and down the street knocking at door to door he will be exempt. A poet or a free-lance journalist who can prove that he is “spending 30 hours a week in writing with the intention of selling” need not register, but an actor who is “resting” must apparently conform. People who are doing voluntary work must register, but if they are doing useful work for 30 hours a week they will not be called upon to take up other work. Those who can think of a good reason why they should not work at all, and can persuade the Ministry of Labour officials—or, in the case of women, the special Women’s Panels—will be left alone.

An enormous and altogether unfair responsibility is being placed on the Ministry’s local officials, both in the interpretation of the Order and in any action following registration. How can an employment exchange manager determine who is, or is not, a genuine writer, and why should a 30-hour week be the criterion? And even if a man cannot, or does not wish to, sell his work, why should he be disturbed? The impression is left that a vast administrative façade is being set up, for what is mainly the window-dressing purpose of satisfying the TUC that there will be genuine “equality of sacrifice” and that the “idle rich” as well as the manual workers are being subjected to labour control. An unattractive aspect of the whole business is the encouragement which may be given to unofficial snoopers and informers. The Ministry of Labour itself has no direct means of checking up on registrations: it does not intend to invoke the aid of the police, but however much it may disclaim the desire to encourage informers, it cannot very well ignore representations it may receive from any quarter.

Newsprint and Newspaper Prices

The price of British newsprint is to be increased by another £9 a ton next week. The reasons given are the general rise in all costs, but particularly of British coal and Scandinavian wood pulp. The particular interest in this increase lies in its effect on the press. Will it tip the balance against the continuance of the penny press at a penny? This last increase, following a rise of £7 last July, brings the total price per ton to over £48 compared with £11 10s. in 1939. To have kept the selling price of most of the papers at the pre-war figure in the face of such an increase in costs is quite an achievement; and if it is continued it will eat into profits very severely.

Fortunately for the public three forces are operating against an increase in the price of the national dailies. The first is the need for unanimity: no one paper is going to be so suicidal as to take unilateral action in raising its price. The *Daily Express* and the *Daily Mirror*, the competitive pace-makers of the last decade, are well enough content with the present price, and the rest must follow suit. But some of the others would like to go to 1½d.; some (of which the *Daily Herald* is said to be one) because they have difficulty in making ends meet, others (for example the *Daily Mail*) because of their responsibilities to their numerous public shareholders.

The second factor making for stability is the very smallness of the coins for which a British newspaper sells. An increase of a halfpenny is the smallest that is practicable (there are not enough farthings in the country to make a price of 1½d. possible). But an increase of a halfpenny would be an increase of 50 per cent and it would provide far more revenue than is needed at the moment. It would therefore certainly bring an enormous number of complicated readjustments in its train—in particular, further demands for still higher wages—which would inflate the level of costs to a degree that cannot be permanently sustained. And thirdly, so long as the papers are restricted to four pages, the burden of dearer newsprint is at a minimum, while the competition for such advertising space as is offered is so keen that advertisers will pay high rates. For the present the national dailies will probably stay at a penny. But the issue will arise again in an acute form as soon as there is sufficient newsprint to permit the popular dailies to expand to six or eight pages. Dearer newspapers will then be inevitable if newsprint is then selling at anything like today’s prices. Meanwhile almost every day brings news of increases among the more expensive dailies, the weeklies and periodicals. Some of the Sunday papers rose to threepence in the summer and the *Financial Times* succumbed on January 1st. Others are following suit. *The Economist* has no intention of increasing its price—at present.

BEA’s First Year

In the first eight months of their Continental operations and the first two of their internal flying, British European Airways have lost £2,157,937. Giving these figures last week, the first annual report showed with depressing clarity the perverse and difficult conditions that caused them. In the Corporation’s formative period a heavy initial outlay with but little return was expected. But it has proved heavier than anticipated. About three-quarters of the staff had had no previous experience of work in civil airlines: technical training of aircrews cost nearly £600,000. Accommodation was difficult to find and inconveniently sited: the supplies depot had to be extended over a widely dispersed area some 20 miles from the main engineering base. This has meant a dissipation of effort, increased rentals and communication costs, and waste of working time—all of which have added to operating costs.

Nor has the Corporation been fortunate in technical matters. Sometimes nearly a quarter of the Dakotas, which formed the backbone of its Continental fleet for most of the period under review, were grounded through lack of spare parts. A reasonable supply was finally assured by the establishment of a buying office in America; but this increased their cost by 50 per cent. The eagerly awaited Vikings had to be grounded only three months after their introduction. They stayed on the ground beyond the period under review. Navigational aids were generally inadequate to meet the Corporation’s standards of safety, and three out of every ten Continental flights scheduled for February and March were cancelled as too dangerous. On those completed, extra fuel was carried to provide an ample safety margin—but at the expense of the payload and, consequently, of revenue. Seats reserved for VIPs, which were not cancelled early enough to permit their resale, cost £26,000, irrecoverable duties on fuel £14,900—they are expected to be £100,000 in a full year—landing fees £36,398—

they are so high in the UK that short routes are made “quite uneconomic.”

The list seems endless. Yet such disadvantages had been foreseen. To meet them the Civil Aviation Act provides for a loss of not more than £10,000,000 for each of the first two years of the Air Corporations’ existence. It had been obvious for some time that their first year’s deficit would not be less than this sum. Admittedly the present economy drive underlines its size, just as the dispute about the Tudor focuses attention on the whole organisation of British civil aviation. But to show undue concern at a deficit different only in degree from that expected and to hint of revolutionary changes in organisation appears unnecessary. The amalgamation of the three Corporations into one would, of itself, be of no advantage. The special requirements of each would have to be duplicated in separate divisions of the larger body. And it is extremely doubtful whether the financial benefits would be large enough to offset the loss of individuality and the spirit of emulation encouraged by the existence of separate Corporations. Yet this is not the main issue. So long as the Corporations—or, for that matter, a single Corporation—are the chosen monopoly instrument of the British Government, commercial considerations are liable to yield to political. The introduction of modern machines should reduce costs. But the situation will always be potentially uneconomic.

Ex-King Michael

The abdication of King Michael has made Rumania a “People’s Republic,” bringing it formally into the same category as Yugoslavia, Albania, Bulgaria and Mongolia, the “most progressive states in the world after the USSR.”

The wartime Allies owe a great debt to King Michael for one of the decisive actions of the war. On August 23, 1944, he made his country break with the Axis. Thereby he opened the German south-eastern front to the Russians and shortened the war by many months. But he also ensured that the whole of Central Europe would be “liberated” by Soviet, and not Anglo-American troops. Marshal Stalin showed both a deep historical understanding and a pretty sense of humour when he awarded the king the highest Soviet decoration, the Victory Order. For King Michael’s brave blow at the Germans who were exploiting his country set in motion the Sovietisation of Eastern Europe which has now driven him from his throne.

The abdication is only a formality. The *Gleichschaltung* of Rumania was completed two months ago, when Mr Maniu was sentenced to life imprisonment, and when the non-Communist parties in the Government (Socialists and Liberals) lost the last remnants of independence. For two years King Michael has had no power. His formal opposition to the Groza Government had to be abandoned when the Western Powers recognised it early in 1946. Even his personal household had long been filled with men considered “safe” by the Communist Party. So his position has been equally embarrassing to himself and to the Communists.

The decision to abdicate was announced suddenly, without any of the anti-monarchy propaganda which was used before the proclamation of a republic in Yugoslavia and Bulgaria. It may be hoped that the regime will now have the decency to leave him free to go where he will and marry whom he wishes.

Though not affecting the real balance of power in the country, the abdication will greatly depress the average Rumanian, who still saw in the King the symbol of a national independence which he could not admit to himself had utterly disappeared. The leading figures of the regime are now the Foreign Minister, Anna Pauker, and the War Minister Emil Bodnarash. Mrs Pauker is a Polish Jewess who, while in exile in the Soviet Union in the thirties, denounced her husband as a Trotskyist and has never looked back since. Bodnarash is a former Rumanian regular army officer of Ukrainian extraction, who fled to Russia when his work as a Communist agent in the army was discovered, and who has directed for the last two years the Special Security Service, Rumania’s second and most secret political police. He will doubtless use his position to speed up the recruitment of Rumanian volunteers for the Greek rebel forces, for which propaganda has been conducted in Bucharest for some months.

Question for the Commonwealth

In their decision to appeal to Uno against Pakistan over the Kashmir conflict, the Indian Government are fully within their rights as a Dominion. It is nevertheless surprising that the dispute should be brought before Uno without any serious attempt

to find a solution within the limits of the Commonwealth. The situation in the world being what it is, the Indian appeal to Uno, whatever its result, is only too likely to involve Indian affairs in the whirlpool of current Great Power rivalries and to afford certain nations a golden opportunity for fishing in troubled waters. It is indeed deplorable that there exists in the Commonwealth no machinery for dealing with disputes between its members, which could be used as a means of settlement within the family before appeal to Uno is made as a last resort.

It may be granted that any kind of compulsory British jurisdiction, like that formerly exercised by the Judicial Committee of the Privy Council, is unsuitable for countries as new to Dominion status and as jealous of their independence as are India and Pakistan. But some attempt might have been made to set up a system of arbitration in Commonwealth affairs, with panels drawn from all the Dominions. A body with an Irish chairman, for example, might inspire in members of the Congress Party a confidence which they cannot yet feel able to extend to the departed British Raj. A Commonwealth arbitration system need not in any way reduce the independence of the Dominions, but it would greatly diminish the risk of loosening Commonwealth ties, which must result from public displays of mutual abuse and manoeuvre in the larger international arena. Kashmir is not the first, and is not likely to be the last, issue that to confound the Commonwealth in the eyes of the world, if no attempt is made to remedy the present state of affairs.

Local Government in Committee

Mr Bevan has so far defended his Local Government Bill with considerable skill during its progress through standing committee. The chief bone of contention, up to the time that Parliament adjourned, has been whether the new equalisation grants of £33 million to local authorities will be enough and will be fairly distributed. The Opposition has urged a rather indiscriminate generosity on the Minister. The Bill provides that the total sum payable shall not fall; but one suggestion, rightly rejected, would have given the Minister power to raise it by any amount at his own discretion. An attempt to increase substantially the transitional grants, which are payable for five years only to the richer local authorities to ease the Bill’s impact on them, was stiller still. Now, when state expenditure needs curtailing, is emphatically not the time to pump extra money into the pockets of local councils. The Bill already meets their immediate needs by confirming a total net relief to the rates of about £38 million.

However, it is true that this relief is only temporary, and that as the cost of education, fire and other local services rises, fresh Exchequer aid is likely to be unavoidable, and probably the best way to give it will be in the form of higher equalisation grants, which amount to a much smaller percentage of local authority income than did the discarded block grant. But it is difficult to legislate now for this future contingency. It is wiser on the whole to wait and see how fairly the new system of grants operates and what happens to the general structure of local government, which even Mr Bevan now admits to be in for drastic changes.

The fairness of the equalisation grants will depend almost exclusively upon the degree of rating uniformity throughout the country which the coming revaluation attains. Factors other than that of rateable value will in future be of very minor importance in settling the distribution of Exchequer aid. For the next few years, until the new valuation lists are ready, there will be much unfairness in the distribution of the new grants because of grave local distortions in existing rateable values. How completely the distortions will then be eliminated remains to be seen.

Mr Bevan Speaks too Soon

It was unfortunate for Mr Bevan that in his Christmas Eve message to the National Federation of Building Operatives he should have committed himself to the statement that “The rate at which permanent houses are being completed is increasing...” when a week later the Housing Returns for November [Cmd. 7288, 7289] showed a slight decrease—from 15,445 houses in October to 15,203 in November. The decrease is itself small, but it is disappointing when so much effort is supposed to be going into accelerating the rate of completions, and so many houses are on the eve of readiness.

In another place—in the House of Commons debate on December 18th on the cuts in the investment programme—Mr Bevan

steel office of the bizonal economic administration, which in turn will get the bulk of it from commercial dealers.

Negotiations with the bizonal iron and steel office, designed to secure eventually a million tons of commercial scrap, were begun early last year. They are going on in Frankfurt still, and have borne only disappointing fruit so far. A contract for the delivery of 100,000 tons of commercial scrap in the first quarter of 1948 was signed at Frankfurt in December. Doubts have arisen, however, about the fulfilment of even this instalment. German objections have shifted from the price to the needs of German industry for scrap, and thence to the difficulty of getting the German commercial scrap dealer to deliver supplies.

Absurd though this is (for the quantity of scrap steel awaiting removal in the Ruhr towns and factories is fantastic), it is an objection not easy to meet in the present state of the German economy. It should be demonstrable to the German administration that the sale of scrap to Britain—since, under the Anglo-American agreement of December, Britain must pay either in dollars or in commodities—is in the German interest. To persuade the German scrap dealer that it is in his interest is not so easy. The sterling price now offered is handsome, but he does not get the sterling price; he is paid in overvalued marks. He gets a sterling bonus of 10 per cent, half to be expended for the benefit of his firm and half for the benefit of his workpeople; but the remainder goes into the bizonal foreign exchange account. The bonus has not yet shown itself to be a powerful inducement. German scrap dealers, like other German traders, do not seem to want to sell for export.

When this difficulty is surmounted there will be others. Shortage of food creates a shortage of effective labour. Cutting equipment is scarce in the Ruhr; so are railway trucks. If it is added that the new price of £6 10s. a ton at the German port will mean £9 to £9 10s. a ton delivered to the British steelworks, it will be seen that there is the strongest case for maintaining the collection of British scrap at the highest possible level.

Cotton Wages and Output

The increase of 7s. 6d. a week for adult weavers in the cotton industry, though less than the 10s. rise sought by the union, was expected. Spinning operatives had recently secured an increased minimum wage, and the shortage of manpower in the industry provided the unions with a strong case for making the industry more attractive to recruits. The increase is to be regarded as an interim measure, pending the conclusions of the Moelwyn Hughes committee on the revision of the wages structure. There is other evidence that the level of wages in the cotton industry has by no means become stable. In the spinning section the Aronson agreement, which came into force only on January 5th, cannot yet be said to be working satisfactorily. In many mills there were some workers who were already getting pay equal to or beyond the new rates. They are naturally among the more experienced workers. While the lower-paid workers have been given increases, these have not; and the resulting discontent has caused some stoppages of work. The card-room workers' union complains that the employers' association has sent out a circular urging employers not to pay more than the new list rates, and that in consequence "many workers" have had no benefit from the Aronson agreement. The employers, whose main concern is to prevent the dispute spreading into a new general wages claim, maintain that only a few workers are concerned. Negotiations on this subject were resumed in Manchester on Thursday.

What effect will these wage movements have on the industry's costs and on its ability to export? The industry has put in applications to the Board of Trade for increased price margins to offset the wage increases, and the Board has now granted an increase of 5 per cent in spinning and doubling margins. Whether the markets for cotton goods will stand higher prices in general may perhaps be doubted. Mr. Wilson and Mr. Isaacs, who met representatives of the two sections of the industry in London this week, impressed upon employers and employed the need to increase output, raise efficiency and reduce costs. Wage increases will only make difficulties for the industry unless they are followed by improvements in efficiency. It does not seem, however, that any concrete plans to raise output emerged from the meeting, although both sides pledged their co-operation in any measures the Government might take to this end. The most urgent need is to increase and stabilise the labour force, for although recruitment has improved since the Control of Engagement Order, it is still insufficient to offset wastage. Plans for increasing manpower include the introduction of more European voluntary workers.

It was also agreed to continue overtime working, but the industry shows no inclination to adopt this universally; only about one-third of the mills are now working overtime. There are hopes that by the spring, when the physical difficulties are less, an extension of overtime will be possible.

Italian Debt Service

The undertaking given by Italy in the Anglo-Italian financial agreement last April to resume interest payments on prewar Italian debts due to Britain is at last to be implemented. Full arrears are to be paid in sterling on bonds and coupons up to September 15, 1948, of the £1,119,340 outstanding Maremmana Railway 5 per cent bonds, 1862, £562,600 outstanding 7 per cent Credit Consortium for Public Works, 1927-47 issue, Adriatic Electric Company 4½ per cent 1933-83 bonds, and the "A" and "B" series of the Royal Sardinian Railway Company 3 per cent issues, of which a total of £562,960 is outstanding. Notice will be given of the dates when coupons will be payable.

The agreement is welcome, though after the generous treatment afforded to Italy under the agreement a much more expeditious settlement might have been expected and some explanation offered for the nine months' delay. It has certainly not been on account of any lack of sterling balances, which are at present in the region of £35 million.

It is clear, however, that Italy's sterling creditors have had to take second place in the queue, which has been headed by dollar bondholders. In a reference to the provision of interest after September 15th, the president of the Italian Trade Delegation has informed the Council of Foreign Bondholders that it will be "a matter for negotiation directly with the bondholders' representatives, with the reservation that sterling bonds cannot receive better terms than those recently offered to holders of Italian dollar bonds." This proviso emanates directly from a clause in the settlement with the dollar bondholders which precluded the granting of any better treatment to other Italian creditors than the terms of the new 30-year dollar bonds—which bear interest of 1 per cent for the first three years, 2 per cent for the fourth and fifth years and 3 per cent thereafter, with a 1 per cent sinking fund operating from 1952 onwards. Even granted that American interim aid to Italy is the main pillar of its economy and that Italy has difficulty in meeting the service on its dollar debt, the submission by the British authorities to this limitation on subsequent interest payments in respect of the sterling debt seems questionable.

"Unvalued Securities"

This week the Transport Arbitration Tribunal has met for the first time to consider the submissions of the Transport Commission about the value for compensation purposes of four canal stocks in the "unvalued list." This list includes some 80 railway and canal securities whose value for compensation could not be determined directly by stock exchange prices; those in the "valued list" were taken over on January 1st, and have been compensated by the appropriate amounts of Transport Stock.

The "unvalued stocks" have occupied a particularly invidious position since the beginning of the year. They represent rights to an amount of British Transport Stock which cannot be determined until the Arbitration Tribunal has examined the submissions of the Transport Commission and after holders of the securities have had an opportunity of being heard. The Tribunal was set up in August last year, under the chairmanship of Mr C. Montgomery White, KC, with Mr B. G. Catterns and Sir Russell Kettle. But since the Tribunal could not move until the Commission had made its submission in each case, the responsibility for any delay in the settlement of outstanding claims for "unvalued stocks" plainly cannot rest with the Tribunal, which has made a prompt start with the first cases, though it will not, apparently, be called upon to sit again for some weeks.

The chairman of the Tribunal, in a letter to *The Times*, has made a point of some importance regarding the price at which Transport Stock will be reckoned for the purpose of compensating these delayed claims on the "unvalued list." This is not, admittedly, a matter in which the Tribunal is directly concerned, but the chairman has expressed the view that there seems to be no ground for the apprehension (or hope) that the Treasury may effect the exchange of the "unvalued stocks" into Transport Stock at the market price of the latter at the date of issue. The date of the transfer—that is, January 1, 1948—is to be treated as the date of issue of the Transport Stock which is exchanged. In other words, holders of "unvalued stocks" will eventually

BAY HALL TRUST LIMITED.

Summary of Directors' Report for the year ended 31st December, 1947, and of the accompanying Statement by the Chairman, Sir Charles Hambro, K.B.E., M.C.

DIRECTORS' REPORT

The gross revenue amounted to £145,379, compared with £155,679 in 1946. After charging Debenture Interest, Income Tax and Profits Tax, Directors' Fees, Management and General Expenses amounting to £81,807 the net profit is £64,372. Adding £159,075 brought forward, the total available for appropriation is £223,447 and a dividend of 6 per cent, free of tax, is recommended, which will absorb £69,828 and leave £162,519 to be carried forward.

At market prices on December 31st, 1947 (for where no market price existed at valuations by the Directors at that date amounting to £281,315), the Share and Debenture Holdings and British Government Securities had an aggregate value of £3,341,375, as compared with their book value of £2,050,386.

CHAIRMAN'S STATEMENT

The net profit of £64,372 compares with £71,436 for 1946, a decrease of £7,064. Full provision has been made in the Profit and Loss Account for Income Tax and Profits Tax in respect of all income to 31st December, 1947. Double taxation relief allowable to the Company, amounting to 2s. 11d. in the £, has been taken into account in arriving at this provision. At the end of 1947, the value of the investments showed an indicated appreciation of £1,319,989 over book cost. Over 93 per cent. of the investments, including British Government Securities, taken at the valuations at December 31st last, are situated in the United Kingdom, South Africa and other parts of the British Commonwealth. Similarly measured, but excluding British Government Securities, about 90 per cent. of the investments are in Ordinary stocks and shares and the balance in fixed-interest bearing securities.

ABRIDGED PROSPECTUS

Consent of His Majesty's Treasury has been obtained to this issue in compliance with the Order made under Section 1 of the Borrowing (Control and Guarantees) Act, 1946

ISSUE OF £12,870,500 GOVERNMENT OF THE COMMONWEALTH OF AUSTRALIA 3 PER CENT. REGISTERED STOCK, 1963-1965, at the Rate of £98 10s. per cent.

Interest payable 1st May and 1st November. Six months' Interest will be paid on 1st November, 1948.

The Government of the Commonwealth of Australia will comply with the requirements of the Colonial Stock Act, 1900, in order that Trustees may invest in the Stock, subject to the provisions set forth in the Trustee Act, 1925.

OFFER OF CONVERSION TO HOLDERS OF £17,870,500 NEW SOUTH WALES 5½ PER CENT. INSCRIBED STOCK & DEBENTURES, 1947-1957, for which notice of repayment on 1st May, 1948, has been given.

COMMONWEALTH BANK OF AUSTRALIA is authorised by the Government of the Commonwealth of Australia to offer to holders of New South Wales 5½ per cent. Incribed Stock and Debentures, 1947-1957, conversion of their holdings, in whole or in part, into an equal nominal amount of Government of the Commonwealth of Australia 3 per cent. Registered Stock, 1963-1965, on the terms set forth in this Prospectus.

The amount of the above-mentioned Stock and Debentures outstanding is £17,870,500. This offer of conversion is limited to a total amount of £12,870,500, and the List will be closed when applications totalling that amount of Stock have been accepted. In any case, the List will be closed not later than 9th February, 1948.

Holders of New South Wales 5½ per cent. Incribed Stock and Debentures, 1947-1957, who convert, will receive on 1st May, 1948, a cash payment of £1 10s. per cent., representing the difference between the issue price of the new Stock and the redemption price of the old Loan. They will also receive on the same date an interest payment of £1 15s. 0d. per cent. (less tax) representing four months' interest at the rate of 5½ per cent. per annum from 1st January, 1948, to 1st May, 1948.

Six months' interest on the new Stock will be paid on 1st November, 1948. Applications for conversion of Incribed Stock must be lodged on the appropriate forms at WESTMINSTER BANK LIMITED, Stock Transfer Office, 41, Lothbury, London, E.C.2. These forms have been posted to the Stockholders, or, in the case of joint accounts, to the Stockholder first named in such accounts.

Applications for conversion of Debentures (interest on which is paid by coupons) must be lodged at WESTMINSTER BANK LIMITED, as above, on forms obtainable from that Bank.

Any New South Wales 5½ per cent. Incribed Stock and Debentures, 1947-1957, not converted, will be paid off at par on 1st May, 1948, together with four months' interest from 1st January, 1948, to that date.

The revenues of the Commonwealth of Australia alone are liable in respect of this Stock and the interest thereon, and the Consolidated Fund of the United Kingdom and the Commissioners of His Majesty's Treasury are not directly or indirectly liable or responsible for the payment of the Stock or of the interest thereon, or for any matter relating thereto. 40 and 41 Vict., cap. 59, sec. 19.

A commission of 5s. per £100 Stock will be paid to Bankers and Stockbrokers on allotments made in respect of conversion acceptances and cash applications bearing their stamp.

Full Prospectuses, with Statistical Statement relating to the Commonwealth of Australia, may be obtained from Commonwealth Bank of Australia, 8, Old Jewry, London, E.C.2; Westminster Bank Limited, Stock Transfer Office, 41, Lothbury, London, E.C.2; from Messrs. R. Nivison & Co., 6, Threadneedle Street, London, E.C.2; at the Offices of the Government of the Commonwealth of Australia, Australia House, Strand, London, W.C.2; and from the Agent-General for New South Wales, 50-57, Strand, London, W.C.2.

COMMONWEALTH BANK OF AUSTRALIA,
8, OLD JEWRY, LONDON, E.C.2.
26th January, 1948.

The List for Cash Applications closed on 28th January, 1948.
The List for Conversion Applications will be closed not later than 3 p.m. on Monday, 9th February, 1948.

receive a right to a nominal amount of Transport Stock on the terms at which it was issued on January 1st—that is, par; what has happened to the market value of Transport Stock in the meantime is not a question for the Tribunal, though it may well be a matter of lively interest to holders of "unvalued stocks."

Higher Rate for Commercial Bills

For fully fifteen years now there has been the paradox in Lombard Street that the discount market, which over a century did a thriving business in bill-broking and bill-dealing, has supported its bill operations only by means of the profits won from its latter-day activities in the short bond market. The market's bill turnover, preponderantly in Treasury bills, is now vastly greater than it ever was before the war, yet the bill side of its operations has for years been consistently run at a loss. The explanation of this odd situation is partly historical and partly technical, but it mainly resides in the peculiarities of the clearing banks' short loan market practices during the depression of the early thirties, when a system of virtually fixed bill rates (as a means of avoiding utterly uneconomic rates) replaced the traditional system of freely fluctuating quotations in a normal competitive market. Since then the Treasury bills—which are of course "risk-free" paper by contrast with trade paper—have been tendered for by the discount houses week by week at a rate of discount offering the merest fraction of "profit" above the uniform rate charged by the clearing banks for the short loans by means of which the market finances its purchases. At one time it was generally assumed that the gross margin thus obtained generally sufficed, on a large turnover, to cover the market's office expenses, but now it probably covers less than half. So long as bond business offers scope for profits (and it has handsomely done so in recent years) the market is content, and certainly nobody is likely to suggest any change.

But one consequence of this system is that correspondingly fine rates of discount have regularly been applied to first-class commercial bills. Since the clearing banks' rate for short loans secured by bills dropped in 1945 to ½ per cent, the discount rate for three months bank bills has been ¾ per cent—which gave the discounter a mere ¼ per cent for his trouble and his risk. This was the margin customary as remuneration for a "running" broker, who assumed no liability on the bills and was merely the channel through which they passed from seller to buyer. The discount houses, however, act as full principals, and endorse the bills they buy before re-selling them to the banks or the Bank of England, and thus remain liable upon them until they are duly met at maturity. Yet the accepting house, whose name and liability on the bills gives them the standing of first-class bank paper, is commonly remunerated at the rate of between 1 and 2 per cent per annum—charging an acceptance commission of ¼ to ½ per cent on each three months' bill.

Now that supplies of commercial paper are expanding, the discount houses have decided that the time is ripe for some improvement in this anomalous situation, and last week the standard rate for fine paper was raised from ½ per cent to ¾ per cent for three months' bills and from ¾ per cent to 1 per cent for longer usances. It is a modest advance, for, even now, the rate of return after meeting the cost of financing the bills will be no more than 3½d. per £100 for each three months discount. In other words,

on every £1,000,000 of bills turned over the discounter will earn £625 per annum. Needless to say, this is purely a technical change, and it is not in any sense a counterpart of the tendency towards a rise in short money rates which has lately been evident in other centres. It is not a precursor of any general movement in other rates in the London market.

Design for Carpets

The report of the Board of Trade Working Party on the carpet industry is an attractively produced document, well printed on good paper and with handsome illustrations. This may account for the time taken to publish it and thus for the fact that the more topical sections of the report were out of date before it appeared. Estimates of future demand prepared in the summer of 1946 can hardly be expected to make full allowance for the severities introduced by the fuel crisis and dollar shortage of 1947. Most of the assumptions on which the calculations of future demand are based would be hard to substantiate now. The report assumes that between three and four million new houses will be completed in the decade 1946-55. It assumes a rising standard of living, i.e., increased average carpeting per house, a combination of people buying more carpets and more people (new classes of people) buying carpets.

In 1937, 18 per cent of total British carpet production was exported; the report assumes a post-war export level of 20 per cent, although a footnote added in June, 1947, raises this to 40 per cent. Its conclusion—that even when the prewar rate of production has been regained, output will be sufficient to meet only about two-thirds of the requirements of the home market—may still be true, or may not. The factors on which it is based certainly need to be re-assessed.

The working party finds that the capital structure of the industry is sound and the profits reasonable, and that there are adequate reserves for reconstruction. It concludes, therefore, that the industry is strong enough to take care of its capital development by normal means. It shows concern, however, to accelerate the rate at which carpet manufacturers re-equip their factories. To this end it makes two fiscal proposals. It wants the period allowed for depreciation of plant under the Income Tax Act of 1945 to be shortened from between fifteen and twenty years to between seven and ten. It also recommends a revision of Section 21 of the Finance Act, 1922 (which limits the proportion of profits of private companies which may be ploughed back before surtax is charged), in order to remove deterrents on the re-equipment and rebuilding. This is a consideration which applies to other industries besides the carpet industry. It raises the question of how far the country can afford to encourage the competitive re-equipment of the light industries in the next seven years.

That many people would like new carpets can hardly be questioned. A Central Office of Information survey conducted in the summer of 1946 is described in the report. It found that 89 per cent of working-class housewives thought that they were in need of a new carpet and fifty per cent of working-class homes had no carpet at all. The generally cheerful tone of the report can be attributed, perhaps, to the fact that home demand for carpets increased by 88 per cent between 1931 and 1937. It is a mistake, however, to assume too readily that effective demand will go on increasing at that rate.

This world-famed Sherry (formerly called Findlater's Fino) could not be registered under that name and thereby protected from imitators. For the safeguarding therefore of our world-wide clientele we have renamed it—Findlater's Dry Fly Sherry.

FINDLATER MACKIE TODD & CO. LTD.
Wine & Spirit Merchants to H.M. the King

Commercial History and Review of 1947

Next week's issue of the *Records and Statistics Supplement* to *The Economist* will include the first part of the Commercial History and Review for 1947.—The 85th of the series which began in 1863.

Part I will include a general review of British economic developments last year, and special articles on finance, investment and overseas trade. Part II, to be published on March 6th, will contain articles on all important British industries, and Part III, consisting of overseas economic reports, will appear on April 3rd.

The *Records and Statistics* supplement is obtainable by subscription only, at 30s. per annum; a combined subscription to *The Economist* and *Records and Statistics* costs £4 per annum.

Rising Profits

The withdrawal of EPT at the end of 1946 is now being reflected in a more rapid rise in industrial profits. The figures for 450 companies whose reports appeared in the third quarter of last year show that profits before tax and after deduction of EPT and Profits Tax amounted to £107,813,000, compared with £83,592,000 for their preceding financial years. The latest figures (which are published in detail in this week's issue of the *Records and Statistics Supplement*) show an increase of nearly 30 per cent compared with the preceding year's results; compared with the profits of the same group of companies three years ago (which can be notionally attributed to 1943-44), the latest results show an increase of nearly 50 per cent.

In view of the interest which has lately been expressed to increased ordinary dividends, it is significant that while the gross value of such distributions has increased from £41,293,000 to £59,032,000 in the latest year, the proportion which equity dividends have absorbed from total profits has been reduced from 49.4 per cent to 46.4 per cent, and the lion's share of the expansion in earnings has been taken by free reserves and other savings which have been increased by no less than £15½ million. As for the distribution of profits and the percentage rates paid upon various types of capital in the third quarter of 1947, the average rate of earnings on ordinary capital was 26.8 per cent compared with 20.1 per cent in the corresponding quarter of 1946. The average rate of ordinary dividend, however, has risen by only 1 per cent from 14.2 per cent for companies whose reports appeared in the third quarter of 1946 to 15.2 per cent for the latest batch of companies.

Thus, although the tide of industrial profits is now rising fairly fast, the extent to which profits are being distributed in dividends is still being kept under fairly close restraint. Certainly, the widespread notion that ordinary dividends are soaring is not borne out by the figures.

Catering Wages

The Ministry of Labour's latest order regulating the wages, hours and conditions of work in licensed hotels and restaurants is part of the general scheme for protecting badly organised and exploitable groups of workers which Mr Bevin initiated when he was Minister of Labour. After March 1st the minimum weekly wage for a waiter in a licensed establishment will be £5, for a barman or porter £4 10s., for a barmaid £3 17s., with lower rates where board and lodging are provided. It also provides for overtime rates and holidays with pay—an important consideration in this trade of long and irregular hours.

The case for respectable basic standards in the industry is obvious. The average member of the public who uses hotels and restaurants would have liked, however, to see the question of tipping tackled at the same time. That has not been done.

The order treats hotel and restaurant workers who come into contact with the public (and who are therefore tipped) on an equality with those who do not (who are not tipped and are at the mercy of the *trone*). A pantryman will get the same wage as a waiter. No suggestion is made, however—and none has come from the hotel trade itself—that tipping is to be discouraged or that the waiter is to expect any less in tips. The new rates are not high enough to make that at all likely. No initiative is likely to come from the consumer, who (the hotel-keepers say) often over-tips nowadays in the hope of getting a better meal. The result seems likely to be that those hotel workers who come into contact with the customer will get their new wages and their tips as well. The extra money will come out of the consumer's pocket; managements will either charge more or cut down their services, or both. An extra fillip will have been given to inflationary trends, and the opportunity of putting the relations between hotel and restaurant workers and the consumer on a less opportunist and more self-respecting basis will have been missed.

Shorter Notes

Saleable output of deep-mined coal fell last week by 77,000 tons to 3,935,100, while opencast production recovered by 40,000 to 161,700 tons. Despite the milder weather total inland consumption so far this winter (11 weeks) has passed last year's total for the corresponding period. Coke ovens, general industry, collieries and gas undertakings have increased their consumption most, and domestic consumption of all kinds has been slightly greater than last winter. On the other hand, electricity, railways, iron and steel and engineering have taken less, partly because of the changeover to fuel oil. Stocks now stand at 15,459,000 tons compared with 6,990,000 tons a year ago.

Holders of 3 per cent Defence Bonds purchased between May 1, 1941, and August 30, 1941, will shortly be invited to continue their bonds until the next interest date, November 1, 1948, when they will be paid a full six months interest at 3 per cent and the maturity premium of 1 per cent. At that date their bonds will be exchanged into the equivalent amount of 2½ per cent Defence Bonds (Conversion Issue), repayable at £101 for each £100 nominal value of ten years after November 1, 1948; there will be no break in encashment rights.

In the article entitled "Sugar or Dollars?" in last week's issue, the table showing world production and consumption of sugar was based on estimates supplied by Messrs C. Czarnikow, Ltd. We regret that proper acknowledgment was inadvertently omitted.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports appear in the Supplement: British American Tobacco; Jute Industries; R. E. Jones;

Prices, Year 1948 (Jan. 1 to Jan. 28)		Name of Security	Price, Jan. 21, 1948	Price, Jan. 28, 1948	Net Yield, Jan. 28, 1948 (n)	Gross Yield, Jan. 28, 1948 (s. d.) Redemption yields on stocks optionally or fully redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'r'), and those paying 3 per cent or less will be repaid at the latest date (marked 'l'). (n) Net yields are calculated after allowing for tax at 9% in the £. (r) Flat yield. * Assumed average life 17 years 6 months. † Notice given for repayment on March 1, 1948. (c) Buying Price.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2½ per cent free of income tax. Yield worked on 15 per cent basis. (g) Fifteen months to March 31, 1947 (yield basis 7.6 per cent.) (h) To latest redemption date. † Free of tax.

WESTMINSTER BANK LIMITED

A YEAR OF DISAPPOINTMENT

NEED FOR UNRELAXED EFFORTS

THE HON. RUPERT E. BECKETT'S VIEWS

The annual ordinary general meeting of the Westminster Bank Limited will be held, on the 4th proximo, at the head office, 41, Lothbury, London, E.C.2.

The following is an extract from the statement of the chairman, the Hon. Rupert E. Beckett, circulated with the report and accounts for the year ended December 31, 1947:—

Our annual statement of accounts shows that the deposits of the bank have increased by some £25 million as at December 31st last, and for the first time in our history the total money lodged exceeds £800 million.

The increase of £18 million in our advances to customers in so far as it represents accommodation called for by greater business turnover is, of course, a satisfactory feature, but the main demand is due to the ever-rising prices of materials which when held as stock obviously need greater financial support. The profit for the year amounts to £1,391,076, and is an increase of £24,454 on the previous year's profits.

The year 1947 can only be described as one of great disappointment to us all, in spite of some slight improvement in certain directions towards its close. The exhaustion of inadequate stocks of coal in a winter of exceptional severity led to the shutting-down of industry, with a loss of production which cost us £200 million in exports alone.

Externally, under the terms of the American credit negotiated in December, 1945, sterling arising from current transactions became freely convertible without discrimination as from July 15 last, but the rapid dwindling of our dollar resources forced suspension of this convertibility little more than one month later.

THE FUNDAMENTAL PROBLEM

In our visible trade we were on the wrong side in 1946 by £333 million, and instead of the gap being closed last year it widened to £600 million. Concealed within the figures for our total trade is the even more serious hard-currency deficit. So far we can see no way of making good an estimated deficit of £300 million with the hard-currency countries except by drawing on our reserves of gold and dollars. In all, these amount to £250 million. Apart from this sum there remained at the end of the year reserves in gold and dollar exchange amounting to £500 million. These are the hard-currency reserves not only of this country, but of the whole of the sterling area. If the deficit for 1948 is to be restricted to the estimated figure of £300 million, there must be a considerable reduction in the drain on these reserves which at the end of 1947 was running at the rate of \$45 million a week—an annual rate of £600 million.

EXTERNAL INDEBTEDNESS

Apart from our more immediate liabilities, we cannot afford to lose sight of the heavy burden of our external indebtedness, which by December last had reached the enormous amount of £5,300 million.

What are the Government's plans to deal with the problem of our overall balance of payments? The position was summarised by the Chancellor of the Exchequer in the House of Commons on December 18th last. For 1948, he said, we should require £1,600

million of imports, and Government expenditure overseas would be £100 million. Our total exports, if we fulfilled our export programme, should yield £1,550 million, and invisible earnings another £130 million. Our total receipts and payments should thus be brought into balance. This is the plan. The measures to be adopted consist, on the negative side, of cuts in our imports of food amounting to at least £12 million a month, a regrettable necessity entailing further hardship and austerity. But we must face it. Our food supplies will be reduced, and we cannot look for much relief to the new programme for our domestic agriculture during the coming year. On the positive side there is to be an increase in exports by no less a figure than £31 million a month.

NEED FOR INCREASED PRODUCTION

Obviously this increase in our exports can be brought about only if we can achieve a very considerable expansion of the volume of production. Increased production is the solution to this as to most of our other perplexities. It must be achieved in spite of certain most severe handicaps. Our resources are limited; all the more need, therefore, to employ them to the best advantage. As regards manpower, the labour force is probably approaching its maximum.

Our aim must be to ensure that labour in particular is not wasted and is used in the right places. The most important of the basic industries, textiles, coal, agriculture, and certain branches of the iron and steel industries are still undermanned. This must be rectified. Our resources of machinery, equipment and transport are also limited, and much of them suffer from arrears of maintenance, due to the war, which in present conditions we have little hope of overtaking. In implementing the measures officially announced for cutting capital expenditure by £200 million in 1948, however necessary these may be, we cannot afford to ignore the grave risks we run if we allow our productive equipment to deteriorate any further.

INFLATION DANGER

We are constantly hampered by another difficulty which, though less obvious, is none the less dangerous. I refer to inflation. There is a surplus of spending power which draws resources away from the vital industries and trades. Despite all controls, labour and materials are frittered away in unnecessary or useless pursuits.

A greater danger still is a wages and cost-of-living spiral. Inflation breeds upon itself. In its acute form such a development could bring all our efforts to naught. It is most important that this problem should be resolutely tackled before it gets out of hand, for the prospect before us is of still fewer goods in the shops for some time to come. Neither in the April budget nor in the autumn supplementary budget was this issue faced. Almost every country is grappling with this problem. Only one, Russia, claims to have solved it. She has adopted an expedient under which the pursuer of goods is deprived of the ammunition by means of which he may bring down his quarry—in other words a wholesale confiscation of the monetary resources of the people. I am certain that such a course, if proposed here, would be regarded as far

SALE OF GOODS ABROAD

Apart from the problem of production, we have also that of selling our goods abroad. Buyers are becoming much more discriminating. Other countries have been faced like ourselves with the obstinate problem of the balance of trade, and have been forced to curtail all but essential imports. Moreover, as time goes on, competition returns to the world's markets. In these circumstances quality and price take on again their former significance.

The need for efficiency and economy in production is clear. Wages, which play so important a part in determining production costs, must not be allowed to increase without reference to output. Further increases in wages unaccompanied by a commensurate increase in output merely add to the dangers of inflation.

SOME IMPROVEMENTS

The outlook for the year 1948, sombre though it is, would have been grim indeed had it not been for the few indications of improvement which appeared towards the end of 1947, and which, small though they be, give grounds for some encouragement. The performance of the coal industry in all but reaching the target figure for output of 200 million ton in 1947 was greeted with rather more enthusiasm than was justified by the achievement of this "indispensable minimum," but it was none the less welcome as an indication that the industry is now in better heart. The resumption of coal exports on however limited a scale is a notable step forward.

The 1947 production target for steel was reached, and with the improved output during the closing months of the year there are good hopes of reaching the target figure of 14 million ton for 1948. But shortages of scrap, pig-iron and coke, as well as of transport, are difficulties which will have to be overcome. In the textile industries also, production in some sections has reached its highest level since the war. In spite of some increase in the numbers employed, however, the shortage of labour is still acute.

THE WORKER AND HIS TASK

The level of production is still far below what it could and indeed must be, if the demands of our present circumstances are to be satisfied. We must secure the maximum possible output from our limited resources, and since, as I see it, shortage of manpower is one of our greatest handicaps, it is upon labour that the greatest responsibility lies.

If in the national interest the miners are prepared to work longer hours at their hard and hazardous task, it is surely not unreasonable to expect others to do likewise. Even at this stage it seems that few appreciate that rations and work are directly linked, that every article produced and sold abroad helps to reduce the austerity of our conditions. When even our present meagre food supplies are in jeopardy, it is time for everyone to realise how near we are living to the poverty line. We are faced with the inescapable fact that our whole future depends solely on our own individual effort.

It seems likely that for the second time a helping hand will be extended to us and to Europe from across the Atlantic. President Truman's proposals if carried into effect will constitute an unparalleled act of national magnanimity. If in attempting to work out our own salvation we appear to make our plans without regard to this proffered assistance, it is not through a lack of appreciation either of its generosity or of its profound significance; it is certainly up to us to make such an attempt.

There is, as I see it, a danger in the Marshall Plan that its prospect may lead some to relax their efforts at self-help. We must avoid this at all costs.

R. A. LISTER AND COMPANY, LIMITED

STRONG FINANCIAL POSITION

SIR PERCY LISTER'S REVIEW

The ordinary general meeting of R. A. Lister & Company, Limited, was held at Dursley on the 26th instant.

Sir Percy Lister (the chairman) said:

Your Directors' report and audited accounts are submitted herewith. In accordance with our previous practice we have included a consolidated balance sheet, together with a consolidated profit and loss statement, both of which continue to reflect the strong financial position of your undertakings.

BALANCE SHEET ITEMS

From the consolidated accounts you will observe that the capital reserve has been increased by £70,879, being Excess Profits Tax Post-War Refund and a further payment on this account is anticipated.

The Revenue reserves have been increased by £107,697 from the current year's undistributed nett earnings. In addition an amount of £150,000 has been carried to a dividend equalisation reserve from the contingency reserve, being no longer required for the purpose for which it was set aside.

The deferred repairs reserves item of £18,513 has been spent on essential repairs. The fixed assets have increased by £260,000, due to the completion of the purchase of a modern factory at St. Peters, Sydney, N.S.W., and the extensions to our factories and the installation of the latest equipment ordered since 1945 and now beginning to be delivered, in accordance with the carefully prepared conversion plans, which are now taking effect despite the exceptionally difficult circumstances prevailing for this class of operation.

Current assets.—Stocks have increased by over half a million pounds, an increase largely due to the increased cost of raw materials and bought-out components together with the not unnatural tendency under current supply and control conditions for stocks to become unbalanced.

Bank balances are lower as a direct result of the increase in stock and the expenditure on the fixed assets. Your directors are convinced that your financial position is enhanced as a result. Further considerable expenditure on fixed assets will continue in accordance with existing plans and commitments.

The production facilities of your factories at Dursley, Stamford, Wroughton, Cinderford and Sydney, N.S.W., have all been increased during the year under review and will be expanded during 1948.

SUBSIDIARY COMPANIES

Your subsidiary companies in the U.S.A., Argentina, Australia, France and Belgium have all made their tangible contribution during the period under review, and your associated companies, Messrs. Harrison Lister Engineering Limited—with their growing ramifications in the Far East—as well as your Canadian associated company, have made steady progress despite delivery and like handicaps.

TODD INSECTICIDAL FOG APPLICATOR

As anticipated in my statement last year, during the current year we have secured the sole manufacturing licence for all those countries outside the Western hemisphere, the Republic of China and the U.S.S.R., for the Todd Insecticidal Fog Applicator. With

our American friends, the Todd Shipyards Corporation, we have jointly formed the Lister-Todd Engineering Corporation, Limited, who are now actively concerned with the marketing of these machines. Already machines have been shipped to meet a variety of problems, amongst them the combating of grasshopper plagues in Australia, the frog-hopper in the sugar cane plantations in the British West Indies, cholera in Egypt and malaria under the supervision of the Rockefeller Foundation in Sardinia.

PROFIT AND LOSS ACCOUNT

Turning to the profit and loss account, it will be observed that the consolidated profit was £370,864, after providing a more substantial amount for depreciation than last year. The provision for taxation for the year, amounting to £171,267, was a slightly lower figure than last year, due to the benefit of the new initial allowances on capital expenditure.

This leaves £199,597 of Profit to which must be added certain exceptional receipts totalling £19,116, resulting in an aggregate nett profit for the year of £218,713 as against £204,354 last year.

Your directors recommend the same distribution as last year, namely a 10 per cent. dividend and 8 per cent. bonus on the ordinary shares. After providing for ordinary and preference dividends there remains to be carried forward to next year £239,094, in addition to the undistributed profits of the subsidiary companies of £99,744.

The results now before you, despite the severe handicaps with which industry has been confronted during the year under review, such as the coal crisis a year ago, the exasperating bottlenecks in supplies of labour and material, the often underestimated restrictions affecting imports into some of the world's largest markets are worthy of the high standards achieved by all in your employ, at home and abroad, during the 80th year of your company's existence.

LABOUR PROBLEMS

Our inability to secure permission to continue our pre-war practice of providing attractive and reasonably priced homes for our workpeople has had serious repercussions on our labour supply, but by taking the initiative, and with the help of the Ministry of Labour, and the wholehearted co-operation of our employees, we have been able to make an important contribution to the problem of absorbing those men whose war record on our behalf was so great and whose country is now behind the Iron Curtain, into British industry and off the backs of the British taxpayer, and we must pay tribute to the excellent work of those Poles now in our employ.

You will, of course, appreciate that these gratifying results have only been achieved by the loyal and patient co-operation of our distributors, both at home and overseas, as well as the long-established goodwill and support of our suppliers.

TRIBUTE TO STAFF

In conclusion it is my pleasure and privilege to extend, on your behalf, to the executive officers, staff and employees in all parts of the world, our sincere thanks for their loyal support and co-operation during the period under review.

The report and accounts were unanimously adopted.

BARCLAYS BANK LIMITED

ANNUAL MEETING

The fifty-third ordinary general meeting of Barclays Bank Limited was held, on the 23rd instant, at the head office of the bank, 54, Lombard Street, London, E.C.3.

Sir William Goodenough, Bart. (the chairman), presided.

Mr H. G. Tickle (the secretary) read the formal notice convening the meeting and the report of the auditors.

With the concurrence of the stockholders present, the report and accounts and also the statement by the chairman, which had been previously circulated, were taken as read.

The Chairman moved: "That the report of the directors produced, together with the annexed statement of the company's accounts as at December 31, 1947, duly audited, be received, approved and adopted, and that a final dividend of 5 per cent., making 10 per cent. for the year, on the "A" stock, and a final dividend of 7 per cent., making 14 per cent. for the year, on the "B" and "C" stock respectively, less income tax in each case, be declared, payable on the 9th proximo to the stockholders registered in the books of the company on December 31st last."

Mr W. O. Stevenson (a deputy chairman) seconded the motion, which was carried.

The resolution, of which previous notice had been given, governing the rates of remuneration of the directors, was passed.

The retiring directors were re-elected, and the auditors, Messrs Kemp Chatteris and Company, and Messrs Price Waterhouse and Company, were reappointed for the ensuing year.

A vote of thanks to the staff and a vote of thanks to the chairman for presiding at the meeting were unanimously accorded and the proceedings terminated.

BIGNELLS, LIMITED

INCREASED TRADING PROFIT

The annual general meeting of Bignells, Limited, will be held, on the 6th proximo, at Imperial House, Rushden, Northants.

The following is an extract from the statement by Mr Arthur J. Bignell (the chairman), which has been circulated with the report and accounts:—

There has been a further increase in the trading profit, and I think you will agree that this is particularly gratifying, taking into consideration the coal crisis in the early part of last year, which seriously curtailed our production for some weeks, and the ordinary difficulties experienced with regard to labour, machinery and general administration.

Our stock has risen from £100,069 to £215,004, which, in view of the difficulties generally experienced in obtaining supplies, reflects a very satisfactory position.

The company's export business has been expanding with great rapidity, and our figures in respect of the year are more than double those of the previous year and represent more than 25 per cent. of our total output. Every effort is being made to develop this important aspect of the company's trading.

The Kettering factory commenced manufacturing boots and shoes in the late summer of 1947, and at the present time we have plant and machinery there for making approximately 2,000 pairs per week. The Export Corporation in London is negotiating through the Board of Trade for more machinery, and we hope that in due course we shall have installed at this factory plant capable of making approximately 12,000 pairs of boots and shoes a week.

Your board has decided to recommend the payment of a final dividend of 17½ per cent., making a total of 22½ per cent. for the year, as compared with 17½ per cent. for the previous year.

WILLIAMS DEACON'S BANK LIMITED

EXTREMELY SATISFACTORY RESULTS

MR G. POWYS DEWHURST'S STATEMENT

The annual general meeting of Williams Deacon's Bank Limited was held on Thursday, the 29th instant, at Manchester.

In place of his usual annual address, the following statement had been circulated by Mr G. Powys Dewhurst, the chairman, in advance of the meeting.

From the report in your hands you will have seen that we have suffered a serious loss from the board by the death of Lt.-Col. Sir Henry K. Stephenson, Bart., D.S.O., D.L.

Sir Henry had been a director of the Sheffield and Rotherham District Advisory Board for 40 years and a director of the Bank for 16 years. He was also chairman for many years of the Sheffield and District Gas Company and a director of many colliery companies and closely identified with the Sheffield steel trade. He played a prominent part in the foundation of the Sheffield University and the formation of the Sheffield Diocese. It is not too much to say that in all his activities he was a conspicuous success, but apart from his business ability his colleagues will best remember him for his sterling character, untailing good humour and, last but not least, his genius for friendship.

The board has also lost, through resignation, the highly valued services of Sir William Bird.

Sir William had been a member of the board for the past 40 years. He had, as you know, extensive interests in and experience of coal, iron and steel. His good judgment and sound commonsense were invaluable on the board, and I should like, in your name, to assure him that we have highly appreciated the knowledge and experience which he made so readily available to the Bank.

To fill one vacancy thus created, the directors have appointed Mr Mark Richard Norman, O.B.E., and I should like, in your name, to offer Mr Norman a very hearty welcome to the board.

Before proceeding to refer to the accounts, I would like to offer our heartiest congratulations to our colleague, Sir Douglas T. Garrett, on the honour of Knighthood which was recently conferred on him in the Birthday Honours' List.

BALANCE SHEET ITEMS

Turning now to the figures of the balance sheet, our deposits at £106,673,000 show an increase of £2,030,000 over last year's record figure. Acceptances and credits opened have increased by £707,000 and endorsements and other obligations have gone up by £86,000.

On the assets side of the sheet our cash, balances with other banks, money at call, and discounts, show an increase of £2,253,000. But our holding of treasury deposit receipts has decreased by £5,000,000, the decrease being occasioned, of course, by the Government's policy of switching from treasury deposit receipts into treasury bills. The total of these items—£57,269,000—constitutes practically 54 per cent. of our deposits, and I may perhaps again remind you that the average earnings on that group of assets have, during the year, been at the rate of less than one half of one per cent. per annum.

There has been a modest increase of £987,000 in investments, taking the total to £32,852,000.

These figures, I submit, clearly demonstrate the exceedingly liquid position of the bank and the satisfactory progress of its business.

Advances, at £19,128,000, show a most welcome increase of £4,203,000. That increase may be taken as an indication of the increased demands of productive industry. We see clear signs of further demands for our services as the export and production drive proceeds. Of course, as you will be aware, under present conditions the banks

can only make advances for purposes such as the export trade, essential services, or in the ordinary course of business. They are precluded from making advances for speculative purposes which would be entirely contrary to the policy of His Majesty's Treasury.

PROFIT AND LOSS ACCOUNT

Turning now to the figures of profit and loss, our net profit after making the usual provisions (which include, as you know, contributions to staff pension and widows' and orphans' funds and appropriation to contingencies account) appears at £247,125; that is to say, an increase of £8,578 on the year.

This profit, with a balance of £125,130 brought forward from last year, gives us a total of £372,256 now to be dealt with. After transferring £100,000 to the reserve fund we are in a position to pay dividends at the rate of 12½ per cent. on both the "A" shares and the "B" shares, and to carry forward to next year's account £143,349, as against £125,130 brought in.

You will notice from the report, that in addition to the above-mentioned appropriation of £100,000 to the reserve fund we have decided to transfer £300,000 from inner reserves, thus increasing the reserve fund to £1,500,000.

These results, I submit, are extremely satisfactory, particularly if account be taken of ever rising costs in all directions.

THE PAST YEAR

Nineteen forty-seven has been a momentous year. In its earlier part even the elements seemed to combine to hinder economic recovery. Frost, flood and drought, the return to convertibility, the retreat from it and also the retreat from unduly cheap money, and the realisation by early summer that the American Loan was running out at an alarming rate, were all factors which at last caused during the year an almost general appreciation of the gravity of our position, and that slowly growing appreciation was sharpened by the inevitable further fall in our standard of life which our economic position imposed.

Moreover, during 1947 it came to be generally realised and accepted that there was to be no easy return to the normal; indeed that the word "normal" itself called for definition in a shifting world. This clearer and more general appreciation of our problems is, of course, a healthy sign, and in view of the foregoing catalogue of the events of the year it is all the more pleasant to record that it ended on a more confident note—due to discussion of the Marshall Plan, the rise in coal output and the great achievements of the iron and steel industry.

In referring in a little greater detail to the events of the year I turn first to the return to convertibility for current transactions in July. This was a gallant, if mistaken, gesture. It kept the letter of our bond. If it could have been maintained it would have been a decisive stride towards making sterling a world currency again. Largely, however, owing to the indirect demands of foreign holders of sterling it was found impossible to withstand the consequent pressure and the retreat from convertibility was sounded in August. In passing, I might perhaps mention that even so the system of transferable accounts makes sterling available over a wide area.

"GAP" IN BALANCE OF PAYMENTS

During the year anxiety about the "gap" in our balance of payments inevitably deepened as the American Loan ran down. Moreover, the terms of trade, that is the price relation between imports and exports, moved further to our disadvantage. It also

became apparent that unexpected delays in the process of speeding up production both here and in Europe had been encountered.

His Majesty's Government, faced thus by a situation in which, after the Loan had run out, we should be balancing our payments by drafts on reserves, were compelled to reduce imports and cut down capital expenditure, to prohibit travel (except in the scheduled territories—that is the old sterling area) and private motoring. On the positive side they launched an export drive setting energetically before the nation the vital necessity of increasing productivity.

As regards exports and imports, these measures were, of course, what was to be expected. They are, in fact, almost the traditional remedy for this state of affairs. They can only be commended and any criticism can only be on matters of detail.

But other dollar-starved countries are applying the same type of remedy in an effort to extricate themselves from the same type of predicament. The danger is, of course, the old familiar one that the refusal to take imports because of the fear of not being able to pay for them will bring, as it has done in the past, a forcible contraction in the volume of world trade.

THE MARSHALL PLAN

It was against this background in the summer that Mr Marshall's pronouncements electrified the world and showed clearly that that danger was appreciated with the utmost precision in Washington. Details of the Plan have been widely reported and, in any case, they and the Plan itself have yet to receive the sanction of Congress. Sufficient to say that the conception ranks with Lease-Lend itself, so aptly described as one of the least sordid acts in history.

It would not be proper for me to speculate as to what action Congress will ultimately take, but I feel that even at this early stage it should be clearly realised, not only here but in all the possible beneficiary countries, that the purpose of any operation under the Marshall Plan would be, in simple terms, an effort to inject into a system of world trade, starved in so many directions of the means of exchange, sufficient power of exchange to get the wheels turning.

The possibility of success in this direction should not obscure in our minds the great long-term changes in the position of Europe which have been brought to a head by the economic and industrial distortion and dislocation of the war years. At the present moment so much of mankind's industrial power, and also agricultural power, is concentrated in the New World that Europe, with a festering and dismembered Germany in its heart, will need all its ingenuity and all its energy to maintain its traditional economic position, particularly in view of the competition from a politically resurgent Asia, which cannot be long delayed in the historical sense.

NEED FOR STEPPING UP PRODUCTION

It may be that I sound too sombre a note, but the challenge of the times lies before our people and I have no doubt that with proper leadership they will respond. We must export on a greater scale than ever before to maintain anything like our present reduced standard of life. In other words, our production must be stepped up by every means in our power, and it seems to me that one of the Government's main problems is how to provide our severely tried and tested people with a proper incentive.

The schemes of colonial development, particularly in Africa, may well prove to be of inestimable value in the future. Indeed, the value of the Colonial Empire in Africa as a source of supply of certain indispensable raw materials can hardly be over-estimated, and in this connection the recent contacts between French and British colonial experts in that area are much to be welcomed.

ANNUAL INCOME EXCEEDS £16,300,000
ASSETS EXCEED £97,000,000
CLAIMS PAID EXCEED £181,000,000
(1946 Accounts)

UNIVERSITY OF LONDON

The Senate invite applications for the Readership in Economics (Banking and Currency) tenable at the London School of Economics and Political Science (salary £800-£1,000-£1,200). Applications must be received not later than April 20, 1948, by the Academic Registrar, University of London, Senate House, W.C.1, from whom further particulars should be obtained.

UNIVERSITY OF GLASGOW

Applications are invited for the following posts, tenable from 1st October, 1948.

Political Economy: One Lectureship, Assistantship.
Economic History (Modern): One Lectureship.
Political and Social Institutions: One Lectureship.
International Relations: One Lectureship.
Sociology: One Lectureship.
Social Psychology: One Lectureship.
Appointments will be made according to the University Grading Scheme. The initial salary for the Lectureships will be between £450 and £600, and for Assistantships between £350 and £450, and will be fixed in each case according to experience and qualifications. Applications (three copies) should be lodged, not later than 1st March, 1948, with the undersigned, from whom further particulars may be obtained.
ROBT. T. HUTCHESON,
Secretary of University Court.

UNIVERSITY COLLEGE, LEICESTER

Applications are invited for a Lectureship in STATISTICS in the Department of Economics and Commerce. Salary according to qualifications and experience, within the scale £500-£750, with membership of F.S.S.C. and family allowances scheme. Duties to commence 1st October, 1948. Further particulars may be obtained from the Registrar.

UNIVERSITY OF SYDNEY**LECTURESHIP IN ECONOMIC STATISTICS**

Applications are invited for appointment to the position of Lecturer in Economic Statistics in the Faculty of Economics. Salary range is £500 (Australian) per annum, rising by annual increments of £50 to £750 (Australian) per annum. Salary is subject to deductions under the State Superannuation Act. The commencing salary will be fixed according to qualifications and experience. Travelling expenses will be paid as arranged at time of appointment; generally speaking, they will cover first-class steamer fare in the case of a successful applicant coming from abroad. Applicants should have training in Economics and Mathematical qualifications. Duties include teaching of statistical theory and methods to both Pass and Honours students under the supervision of the Senior Lecturer in the subject. There will be opportunities for research. Duties commence as soon as practicable in 1948. Further information may be obtained from the Secretary, Universities Bureau of the British Empire, 8 Park Street, London, W.1. Applications supported by testimonials and giving the names of three referees close with the undersigned on 31st March, 1948.
G. DALE, Registrar, University, Sydney.

THE WEST OF SCOTLAND AGRICULTURAL COLLEGE

Applications are invited for a post on the SENIOR AGRICULTURAL ECONOMIST grade and will be considered from either: (a) Graduates in agriculture, having a sound practical background, especially in dairying, to specialise in farm management economics or (b) Graduates in agriculture, economics or commerce, having experience of economic surveys and the preparation of reports thereon. In either case some knowledge of accounting is essential and certain lecture duties may be required.
Salary scale £730 x £25-£875, plus consolidated bonus of £90 at minimum. The post is superannuable.
Forms of application, to be lodged not later than February 14th, are obtainable from the undersigned.
N. B. BAIN, Secretary.

GOVERNMENT OF SOUTHERN RHODESIA

DEPARTMENT OF AGRICULTURE AND LANDS.

VACANCY: PROFESSIONAL OFFICER.

Applications are invited for the post of Agricultural Economist on the staff of the Chief Agricultural Economist in the Department of Agriculture and Lands, Southern Rhodesia.

Applicants must possess a degree in Economics or Agriculture. Experience of investigations into costs of production of agricultural products will be of value.

The minimum salary for a person possessing a specialised degree normally involving a four year course at a University (Professional Officers) is £495 per annum, rising by annual increments of £27 10s. to £660 per annum, and thereafter, following an efficiency barrier £737 x £33 to £935 per annum. Advancement to the scale £935 x £33 to £1,100 will be made as vacancies occur.

The minimum commencing salary for a person possessing a degree normally involving a three year course at a University (Junior Professional Officers) is £330 per annum, rising by annual increments of £55 to £495, and thereafter by annual increments of £27 10s. to £660 per annum. Thereafter, subject to the approval of the Public Services Board and to the responsibility and nature of the duties performed, the applicant will be eligible for promotion to the scale of £737 x £33 to £935 per annum.

A Junior Professional Officer may, after appointment to the Service, be promoted to Professional Officer and be eligible for the same scale of pay as a Professional Officer if he:—

(a) obtains a higher professional qualification in Agriculture equivalent to a specialised degree normally involving a four year course at a recognised University;

(b) writes a thesis on a professional subject selected by the head of the department which is proved to the satisfaction of the Public Services Board, to be an original thesis, and is approved as being of a sufficiently high standard either by the Board or by any person to whom it is submitted for examination by the Board.

The commencing salary may be higher than the minimum according to qualifications and practical experience, but not exceeding four steps in the grade. Service in His Majesty's Forces during the war will also be a consideration for further advancement.

The successful candidate will be required to furnish a satisfactory medical certificate by a Government medical officer.

The applicants shall be subject to Civil Service Rules and Regulations. Cost of living allowance (the present rate is 10 per cent of salary, but not to exceed an allowance of £100 per annum), Marriage Allowance of £50 per annum and children's allowance of £24 per annum for the first child plus £18 per annum for each additional child in the custody of the applicant and resident in Southern Rhodesia, will also be paid where applicable.

Application forms may be obtained from the Secretary, Office of the High Commissioner for Southern Rhodesia, Rhodesia House, 429, Strand, London, W.C.2, and completed forms should be returned to his office not later than February 27, 1948.

Canvassing will disqualify applicants.
MANAGING Director's Assistant required by progressive North London manufacturers of nationally advertised products distributed through the grocery, hardware and domestic store trades. excellent prospects; commencing salary £1,000 p.a. Write particulars of career to date, education and age to Managing Director, Box 633.

On the Rocks

BRITAIN faces bankruptcy. That is the real significance of the Government's latest White Paper. At last, the British people now know where they stand. In the past two years, they have as a community overspent their income to the extent of £1,000 million and the rate of overspending was almost twice as large in 1947 as in the preceding year. At the present rate of expenditure (which has fallen since its peak last August but now shows signs of settling down at a monthly figure of some £40 million), the remaining reserves of about £600 million in gold, dollars and unexhausted credits may last Britain and the sterling area until midsummer. After that, it will just be impossible to buy either the food or the raw materials which are necessary for Britain to eat and work. The spectre of starvation and mass unemployment is now alarmingly close.

To translate the tables and figures of the White Paper into more homely terms, Britain has been living like an improvident family which, failing to make both ends meet, first spends the accumulated capital of the past, then borrows from friends—from American friends, from Canadian friends, from South African friends—and when their loans are exhausted, begins to pawn the furniture. How else can one describe the latest deal with Argentina in which the whole capital asset represented by the British-owned railways is bartered away for eighteen months' supply of meat? It is of course true that there is nothing discreditable in the events which led the British community to this desperate plight. Alone of the belligerents (except the German aggressors) Britain fought in two world wars from the first day to the last. The income from overseas investments which nearly bridged the gap between imports and exports in 1938 disappeared in the struggle. Exceptional conditions of world demand created by war devastation added £300 million to the cost of British imports in 1947. But in fact the reasons which have brought the British to beggary are less likely to be remembered than the fact that they are beggars. The old soldier showing his campaign medals at the street corner is an object of pity, not of respect.

When a family faces bankruptcy, either it goes under to a life of perpetual makeshift and pauperism, or it restores its solvency by vigorous action—by buying less, by cutting down every kind of expense and by straining every nerve to sell more of its goods and services. A nation is in no different case and the choice open to the British people is in reality precisely the same difficult choice between pauperism and grueling recovery. The only question worth asking today when the crisis is, in Sir Stafford Cripps's words, not a matter of years, but of months and weeks, is what further steps the British people can take to consume less and produce more, to reduce their standard of living and at the same time do harder work. The subject is being debated in the Commons as *The Economist* goes to press, but clearly the Government's plea—it is not much more—that neither wages nor profits shall rise at this juncture is one small part of the much bigger effort that is needed to restore solvency to the British people.

Both wages and profits have to contribute their share. Bankruptcy

is a family responsibility and no section of the community can avoid its hardships. The real need for workers and managers alike is longer hours and more output for the same income. In this way, more goods could be produced for export without new financial pressure being created to divert those goods to consumption at home. So drastic a departure from current industrial practice is too much to hope for, but at least the principle of no further wage increases save for cases where workers are genuinely below an adequate level of subsistence must be endorsed. Further, there is certainly a case for increasing the contribution to national solvency by those who, despite their reduced standards, can still afford it best. Heavier taxation or limitation of dividends and the control of expense accounts (upon which so much of the "conspicuous waste" in the big cities is based) will help politically, and to some extent economically. Even if such steps must wait upon the budget, their announcement would go far to relate the question of wages to the wider action needed to counter bankruptcy abroad and inflation at home.

But, although it will be necessary to temper the cuts by considerations of social justice, the brute fact remains that standards of consumption in Britain do not reflect the insolvency which may lie only a few months ahead. Can it be said that the rationing of domestic fuel has been drastic enough in view of the vital importance of coal as an export? Can Britain afford £200 million for Government expenditure overseas, or to feed a million mouths in the Forces in return for no productive work? It is easy to make a case for keeping two million Government servants, but if 500,000 were returned to industry, would the gain in output not ease the burden of the controls? By what yardstick can the overseas expenditure of £50 million on "tourism" in 1947 be justified? It is no longer a question of choosing whether or not to maintain certain amenities. The stark fact is that the means to provide them no longer exist.

In spite of the recent cuts in capital expenditure, it is clear that more has to be done. No one will criticise the Government for wishing to build better schools, new hospitals and more and better equipped houses. But this programme has added to Britain's insolvency by diverting materials and manpower from the export industries; in that sense it is Americans, Canadians and South Africans who have been paying for part of the British programme of development at home. No one denies the desirability of these things, but it is not usual to add a bathroom to the house just as the receivers walk in.

The last items to be cut back should obviously be productive assets, the renewal and modernisation of plant. The reductions already announced in these items are severe—probably too severe—but in another field the figures suggest that outlay has been too heavy. The sum of £180 million for new assets overseas, a large part of which must be represented by various schemes of Colonial development, seems unduly high in relation to the time which must elapse before they begin to yield their fruits.

These are a few instances picked from a possible list of further cuts and reductions, but simply to set them down shows how painful their execution would be and what appalling stresses it would introduce into the national life. But bankruptcy is necessarily an ugly, painful and distressing business. It tests the temper of the most united family. It requires not only fortitude and patience but considerable humility to weather it with dignity and success. Yet bankruptcy is nevertheless the crisis through which this nation may be about to pass. What are its chances of surviving this latest test—a test with none of the glory and solidarity of a nation at war but perhaps more gruelling as a result?

It cannot be said that the outlook is encouraging. In the first place, the country so far has remained in ignorance of the facts. The Government's powers of explanation have never been high, but its inability to convey to the public the significance of the gathering economic crisis is beyond all previous failures. And this is not simply a question of poor public relations. The failure goes deeper. It is not only that the Government has not talked as though the crisis were serious. Until quite recently, it has not behaved as though it were. In 1946, before the catastrophic rise in American prices and the fierce winter, there was some excuse for believing that Britain could recapture its export trade, police Europe, rebuild its industries, create new social services, rehouse the people and provide cheap food all at the same time. But the writing on the wall was there for all to see after January or February, 1947. The fatal flux of gold and dollars had begun. The gap between imports and exports was growing. Home production continued to lag, but the Government went on its Micawberish way, waiting for something to turn up. Mr Dalton was happy with his "balanced" budget, Mr Morrison declared that no further sacrifices could be demanded of the people. Today, with the gap wide open and no prospect of filling it from British resources, even Sir Stafford Cripps's realism may be too late.

If the British had been made to realise in 1945 that in many ways the problems of reconstruction facing them were no less urgent than that which faced, say, Poland, they might have set to and worked as the Poles have done ; but cradled in illusions, they have advanced in their crisis like somnambulists. It is the illusion either of infinite prosperity or of infinitely squeezable profits that makes it still possible for the trade unions to press for more wages for fewer hours. It is the illusion of wealth withheld by a spiteful Government that has turned large sections of the more well to do against the controls and restrictions which they recognised as necessary during the war. Yet the reality is of a nation in greater economic straits than at any time since the Napoleonic wars. If the present attitude of the different classes in society cannot be mobilised into something more than the collective and disgruntled selfishness they show today, then the British will be obliged to face their supreme economic crisis without the only assets upon which they could still draw—their political balance, their deep natural unity, their phenomenal staying power.

This statement will no doubt be contested. Why speak of "Britain's only assets" when there is every chance that by midsummer the Marshall Plan will have been passed by Congress and assistance will be assured for the next eighteen months at the least? Even Sir Stafford Cripps has said that the only hope lies in American assistance, to give Britain the necessary time to bring about the restoration of normal conditions. But herein lies precisely the danger. Continual borrowing can have the same effect as continual drinking. The borrower's—like the drunkard's—sense of reality tends to fade. Britain has already had the American loan and the Canadian loan and will get the South African loan. All have been necessary but all have helped to mask from Government and people alike the country's true economic straits. A standard of living has been maintained, reserves have been eaten up, expenditures undertaken on a scale which is quite out of accord with Britain's real economic position. And what guarantee is there that the Marshall Plan may not be used in the same way? The only proper, the only long sighted, the only courageous course would be for Britain to pursue now the policy it would pursue if the Marshall Plan were reduced to a half or a third and to use the surplus thus created to build up reserves, modernise industry, develop economic integration in Western Europe and undertake now the programme of hard living and hard working in which in the long run salvation alone will lie.

For the Peace of Jerusalem

THE Trusteeship Council of the United Nations meets next Thursday to handle its share of the Palestine problem—the future of Jerusalem. Uno's arrangements for taking over in the rest of Palestine are in other hands. Its five Palestine Commissioners are simultaneously at work on these, and are responsible to the Security Council. The Trusteeship Council's task, as set by the Assembly, is to arrange for administration of the Jerusalem enclave as a "*corpus separatum* under a special international regime." It has, at next week's meeting, to approve a detailed Statute for the city, and to appoint a governor of it "on the basis of special qualifications and without regard to nationality." The success of its work hangs on many factors that are beyond its control, but there is one act that it must at once perform if its work is not to be futile from the outset. It must seek to establish that Jerusalem is genuinely a separate body—that is, that it does not house any of the organs of partition, the Commissioner's headquarters, or the Economic Board. If these are situated in the city, it becomes, inevitably, the hub of the Jew-Arab quarrel and a scene of conflict. It is also necessary to establish that acceptance of the international regime for the city does not automatically involve acquiescence in the partition plan for Palestine as a whole.

But, however efficient the spadework done by the Trusteeship Council there are outside factors which can make or mar it. And of these the most important is the state of security in Jerusalem at the moment when the international regime begins. At the moment it is not good. Attacks and reprisals have been proceeding since December 3rd when an Arab mob, incensed at Zionist rejoicings over partition, burst from the Old City and burnt Jewish shops in Julian's Way and the streets beyond. Unfortunately these initial acts, which were perpetrated by hooligans and could (according to more than one neutral eyewitness) have been stopped "at that stage by a swish of canes" were not met with the resolution which is now being shown by the British authorities. Nevertheless, the situation is not hopeless. The city is anything but out of hand. The worst prospect ahead is not the state of tempers, but the arrangement proposed by Uno for taking over. The Assembly resolution on this subject includes the impolitic provision that "the special international regime for the City of Jerusalem . . . shall come into existence two months after the evacuation of the armed forces of the Mandatory Power has been completed." Unless this two months' hiatus can be avoided, the fat will be in the fire. And there is only one body that possesses the experience to foresee this, and the apparatus to ward against it. That body is the outgoing Mandatory Power—Britain.

Ever since its final proposals to the Jews and Arabs fell on

acceptance without comment of a plan involving two months' hiatus in security measures for Jerusalem is another piece of mistaken silence. But here it is still not too late to mend.

There is still time for the British Government to speak up. For the City of Jerusalem is in a class apart from the rest of Palestine. Its name means "City of Peace," and its Arabic name—el Quds—"The Sanctuary." The world is eager to recognise this. So are a great many Palestinians, both Jew and Arab. The Zionists have already arranged to seat their government elsewhere. Anyone who has seen the city's splendid silhouette must for ever think of it as different in nature from all other cities, because it is holy to three great religions. It is full of people to whom its political significance is completely secondary. Its religious significance is what matters

£1,000 if you live for twenty-five years.

★ On earlier death, in addition to this £1,000, up to £5,000 payable to your dependants by instalments of £200 per annum (not subject to tax) for the remainder of the twenty-five years.

All this may be secured under the **FAMILY PROVISION SCHEME** for a monthly premium, at age thirty-five, of £5.1.1 reducing after seventeen years to £3.4.0.

For further particulars, please write to :-

EQUITY & LAW
ESTABLISHED 1844
LIFE ASSURANCE SOCIETY
20, LINCOLN'S INN FIELDS, LONDON, W.C.2

to priests and nuns and seminarists, as well as to rabbi and alema. Here are people who lead dedicated lives and merit the world's consideration. Secondly, large numbers of its inhabitants want it to be international because they crave for the quiet life which they hope an international status will bring. This assertion holds good not merely for the religious communities, but also for many Jews and Arabs who, on account of their business, or simply of their home life, want an end of insecurity. Residents in the proposed zone congratulate themselves on their good fortune; landlords are putting up their rents. Both Jews and Arabs outside the zone talk freely of the possibility of moving into it. Great numbers would be vastly disappointed if international protection in the end were extended only to the Old City. Last, but far from least, the original British undertaking to "care for" the Holy Places cannot be abandoned, as the rest of the mandate has been abandoned, on the ground that it has become "unworkable." On this score conscience must prick now, and not after tragedy has occurred because the Holy Places have been abandoned at the centre of a political hubbub.

These facts are set forth in order to show that countless numbers both outside and inside Palestine—and not only Gentile, but Jewish and Arab also—would respect and be thankful to Great Britain if it had the moral courage to declare the city sacrosanct but endangered, and to state its intention to leave a British force to police it up till the day and hour at which the new Governor and his neutral police force are installed. Unless this is done, or the hiatus is otherwise eliminated, the Uno Statute, however good, and the Uno Governor, however bold, will find that the situation is already beyond control.

The danger ahead is that the British Government will join its fellows on the Trusteeship Council without admitting this salient fact. It will set about the task earnestly enough, and in the atmosphere of purpose that can so easily be created by a mass of papers; but it will, in fact, work *in vacuo*. The papers are all ready. They do not name a governor, because none of the men whose names have so far been put forward has been ready to stand. But they include a complete draft of the statute of the

city. This has been prepared by a Trusteeship Council working party of six—Australia, China, France, Mexico, the United States and Britain—and is a good attempt to battle with the main conundrums.

But these questions will be academic unless more is done than is at present being done to keep the city at peace. Some praiseworthy efforts are being made by Britons on the spot. These are trying to secure from the leaders of all Jerusalem's many religious communities a joint declaration that their people must keep the Old City sacrosanct. There has also been a move by the courageous Briton who is Mayor of Jerusalem to recruit and run a municipal police force of 300 Jews and 300 Arabs. But these small efforts need mighty support if they are going to prevent extremists with Tommy guns from indiscriminate use of convents and synagogues, churches and mosques as fire points.

In Britain, only the Archbishop of York, Sir Ronald Storrs and a leader-writer in the *News Chronicle* have so far said that plans for Jerusalem demand a special effort. That is a poor showing for a Christian people. To initiate such an effort would earn the British Government respect, including self-respect. Is there no echo today of the sentiments which fired earlier generations? The Crusaders felt differently. When the first British pilgrim to keep a diary reached the city, "the mariners sang the Litany." But when Robert Curzon sighted it in 1838, some inhibitions had set in:—

The more natural children of the East wept for joy, and as in the army of the crusaders, the word Jerusalem! Jerusalem! was repeated from mouth to mouth; but we, who consider ourselves civilised and superior beings, repressed our emotions; we were above showing that we participated in the feelings of our barbarous companions. As for myself, I would have got off my horse and walked barefoot towards the gate, as some did, if I had dared; but I was in fear of being laughed at for my absurdity, and, therefore, sat fast in my saddle.

The portrait is tragically true of the leaders of British thought in this final year of British responsibility for the peace of the city.

The Appointed Day

IT was hardly to be expected that a man of Mr Bevan's temperament would take the opportunity offered by the debate on the health service to pour oil on the troubled waters between himself and the British Medical Association. The leaders of the BMA have not minced their words when attacking him. Why, Mr Bevan evidently thought, should he show any greater restraint? One only wonders, after reading his accusations of a "squalid political conspiracy," what he said to the negotiating committee of the medical profession in private if he could thus refer to them in public.

There is, however, one overriding reason why Mr Bevan should have restrained himself. The health service is due to start in four and a-half months' time. It is quite unrealistic of the BMA to think that the Government will postpone the appointed day because of opposition from the medical profession. On July 5th, the National Insurance Act, the Industrial Injuries Act, the National Assistance Bill and, presumably, the Children Bill, will all come into force. The national health service is an essential part of the framework of social security created by all these measures. How could the Government—how could any government—agree to defer it even if the deferment would not be regarded as a political victory for the BMA? After the personal attacks made on the Minister responsible for the health service, such a retreat is quite unlikely.

Nevertheless, Mr Bevan is clearly going to find it very difficult to introduce the health service successfully, even if by July 5th a large part of the present opposition from the profession has disappeared. It is one thing to announce that the health

service comes into force on that date; it will be quite another to make sure that people will then be able to obtain all the benefits to which they are entitled. A Minister who has taken on the gigantic task of providing

a comprehensive health service designed to secure improvement in the physical and mental health of the people... and the prevention, diagnosis and treatment of illness ought to do his best to bring every member of the profession willingly and gladly into his service instead of forcing doctors into it by using the whip of financial insecurity.

In Monday's debate, Mr Bevan jeered at the Opposition for wanting to play the part of honest broker and to bring about a reconciliation between himself and the medical profession. Does he then want the present antagonism to continue after July 5th? Why, he asked, should he be the one to make more concessions, when all the concessions that have so far been made have come from him and not one from the doctors? This is not true, for at one time the BMA was taking up a firm stand on the "100 per cent issue"—whether the health service should be available to all members of the community or restricted to the present insured population and its dependants—and on the taking over of the voluntary hospitals. Both these positions were long ago abandoned.

But it is not concessions that are now wanted so much as a complete change of attitude on both sides. In the debate, the four main points at issue between them were again given an airing: the abolition of the sale and purchase of practices in the public service; the basic salary; the right of a doctor dis-

missed from the general practitioner service on the grounds of inefficiency to appeal to the courts; and "negative direction"—the prohibition, in rare cases, on doctors to take up public practice in areas which are considered by the Medical Practices Committee to have too many doctors. Nothing new was added to the arguments by either side. Mr Bevan showed, more effectively than previously, perhaps, the doubtful value in practice of a right of appeal to the courts, with all its inevitable publicity. On the other hand, when defending the abolition of the sale of practices, he and other Labour members ignored the fact that patients who are thus "bought and sold like cattle" have a perfect right to change their doctor if they do not like him. The case against the sale of practices is undoubtedly strong; it would almost inevitably come about in the course of time. But it is worth pointing out that the right to change one's doctor would be more endangered by the introduction of the full-time salaried medical service beloved of the Labour Party than has ever been the case under the sale and purchase of practices. If two doctors are earning the same salary, with no incentive to work harder and more efficiently, why should one agree to take on more patients than the other?

Mr Bevan once again affirmed that it is not the Government's intention to extend the basic salary so as to introduce a full-time salaried general practitioner service. But he gave no convincing explanation, other than the familiar one of administrative difficulties, why he insists that the basic salary must form part of every general practitioner's remuneration instead of reserving it for exceptional cases. Neither his assurance on this point, nor his reiteration that there will be no censorship therefore, nor his publication of articles by doctors, will dispel the suspicion in doctors' minds that they will somehow be fettered by the dead hand of Whitehall and victimised if they dare to criticise authority. Modern medicine ought to rely, as Socialist doctors love to point out, on teamwork, on co-operation between different branches. But more, perhaps, than any other profession, medicine has also needed its rebels, and it is the rebel, the individualist, the unorthodox, so heartily disliked by the Labour movement, who sees his position threatened today.

The three main issues, together with "negative direction," which seems to be making an unobtrusive exit from the BMA's propaganda, concern general practitioners only. Why, therefore, has there been such a hardening of opinion among specialists and consultants, to whom Mr Bevan has indeed made great concessions in the matter of private wards in the hospitals, if there were not this indefinable fear that the Labour movement, as a whole, has scant respect for the standards and traditions of the liberal professions? The Opposition speakers were, therefore, right to concentrate on this deep-seated hostility of the medical profession to Mr Bevan rather than to argue at length the rights and wrongs of the four main issues—on which, indeed, if they had been in power, their attitude, except in the case of the basic salary, would probably have been much the same as Mr Bevan's.

In thus playing the part of honest broker, the Opposition was also more realist than he. Mr Butler, its chief spokesman, referred to the Education Act for which he was responsible. In practice, that Act is still far from achieving its great promise. State education, taken as a whole, still tends to have a utility label attached to it. Yet Mr Butler and his successors have the inestimable advantage that they secured the goodwill and co-operation of the teaching profession before the Act came into force, so that there remains hope that state education will one day hold its own with that provided by the independent schools. Whatever happens as a result of the doctors' plebiscite, unless there is a radical change of attitude on the part of Mr Bevan and the profession, there will be no goodwill to help the health service over its inevitable first obstacles.

From July 5th, the public will expect—or at least be entitled to—free hospital and consultant treatment when they need

it. There is still a shortage of 40,000 nurses to staff the hospital beds, even today when patients have to pay for part of their maintenance. Over the country as a whole, there is a great shortage of consultants and specialists, and those that are available still do not know what their remuneration will be in the new service—even if no other considerations were holding them back. The dentists are up in arms against Mr Bevan, and even if there were enough dentists and opticians to staff the service, there is likely to be a big shortage of dentures and spectacles, as well as of other medical and surgical appliances, once people are entitled to them free of charge. How far they will be from realising their expectations of the domiciliary and environmental health services to be provided by the local health authorities is apparent from the London County Council's scheme which lists the shortages of staff under each head.

Some ninety-five per cent of the population, it is officially estimated, will also expect free treatment from the general practitioners of their choice, of a standard as high as if they paid for it privately. If 17,000 to 18,000 doctors elect to serve them—that would give an average of about 2,500 patients a doctor—the doctors would still have their work cut out to provide treatment up to the best standards of private practice. In present panel practice, five to six items of service are provided each year for each panel patient, and the number is increasing.

Mr Bevan will introduce his service on the appointed day, whether 18,000 general practitioners elect to join it or, as the BMA is hoping, less than 8,000; those doctors who do not join will forfeit their claim to compensation for the loss of goodwill in their practices. But the Minister must realise that the less co-operation he evokes, the greater will be the gulf between the service actually provided and the ideal contemplated in the Act and the more private practice will flourish. There was once an occasion, soon after he became Minister of Health, when—it seems hardly credible now—he won applause from the British Medical Association for his attitude towards the proposed health service. Can he not recapture that atmosphere and once again exhibit the sweet reasonableness he showed during the passage of the National Health Service Act through Parliament? He would be right to retort that the leaders of the BMA should also show some concessions to common sense and goodwill. Their intransigence is no less marked than his own. But it is on his shoulders that most of the blame will fall if, after the appointed day, the national health service founders in unwillingness, inefficiency and distrust.

The Economist by Airmail

The introduction of a new airmail service for second class mail to the countries specified below, enables us to quote the following rates for airmail subscriptions:—

	The Economist and Records & Statistics	
	Per annum	
Argentina, Brazil, Chile, Uruguay, Paraguay, Falkland Islands ...	7 0 0	9 17 6
Bahamas, Bermuda, Bolivia, Cayman Islands, Colombia, Cuba, Jamaica, Peru, Trinidad and Tobago, Turks and Caicos Islands, Venezuela ...	8 0 0	11 7 6
Azores ...	6 0 0	8 5 0

Subscribers in these countries wishing to take advantage of this new service are asked to notify the Publisher, *The Economist*, 22 Ryder Street, S.W.1, who will invoice them for the additional amount due on their current subscription. Subscribers now receiving their copy by airmail will, in the absence of instructions to the contrary, have their subscriptions extended by the appropriate amount.

The Middle Class—III

Experts Without Power

(By a Correspondent)

THERE are two reasons why the professional middle class ought to play the dominant role in shaping the policies of the parties, instead of being, as it is in Britain today, the disregarded element of the democratic process. The first reason is that the activities of the state are becoming increasingly technical and complex. Politics may still be a game for amateurs; but policy is now a matter for the skilled professional. Unassisted common sense can set limits, lay down general directions and judge results. But it cannot superintend the details; indeed, it often cannot understand them. The technician, the expert, the professional has become indispensable. He will, of course, be willing, in large numbers, to serve one of the existing political parties; the loyalty and discretion of the Civil Service (itself becoming increasingly professional and expert) are still beyond dispute. But a relation between political chief and expert adviser in which the minds are constantly working on different levels, in which policies conceived by the expert are rejected by political timidity, and in which the "mandate of the people" is sought and won for programmes that have little relevance to the realities of the country's needs—such a relation is not likely to be very fruitful. For the parliamentary system to work in the complicated conditions of the twentieth century, it is necessary for mutual confidence and respect to exist—as they used to—between the parliamentary politician and the departmental administrator. This can only be done if the professional man and woman—the economist, the sociologist, the political scientist—come to occupy a more trusted position than he does today either in the party of the trade unionist or in that of the business man.

The second reason for wishing that the middle class had more than its numerical weight in British politics—instead of less, as at present—is that there is very little hope otherwise for the emergence of that policy of social and economic regeneration for which everybody in this country is groping, but which neither major party is finding. The justification of this otherwise rather sweeping statement can be found in the nature of the economic and social problem that policy in Britain has to solve. It is a commonplace nowadays to say that any effective policy must have in it elements both of freedom and of order, of untrammelled enterprise and of collective planning. Very few people nowadays would hold that *laissez faire* could solve the economic problems of the British community, let alone resolve its social conflicts. And the glimpse that recent years have revealed of the all-planned state has been enough to give all but a tiny minority the creeps. There would be an overwhelming majority of agreement for the Middle Way.

But it matters enormously how freedom and order are combined. Far too many people seem to accept the view that to have one party committed to one principle and another committed to the other, and to let them take turn and turn about in office, will produce a satisfactory compromise. Labour should first go as far as it dares in nationalisation, and then the Conservatives should go as far as they dare in decontrol. And the more moderate each party is—that is, the more tepidly it agrees with its own principles—the better for everybody. This formula may have worked well enough in past centuries, when the conflicts were on the political plane and technically simple. But, if it is further pursued in this era of social and economic engineering, the results are likely to be disastrous. If freedom and order are to be successfully combined, they must not simply be watered down together. The planning, if it is to be success-

ful, must be bold and forehanded, applied to realities not to empty symbols. And free enterprise, if it is to play its part, must have its cutting edge resharpened. Anyone who wishes to see the results of letting the two principles singly offset each other, instead of thinking out how they can be meshed together, has only to look at the frustrations of the present day. No society or economy will work without motive power, and at present the alternative motive powers—the incentive of individual profit and the incentive of collective welfare—use up more of their strength in putting the brake on each other than in moving the community along its road.

The task is, then, to take off the brakes and to seek means by which the different motive powers can each be applied to its own axle. And for this something much more positive is needed than the alternating pressure of blind interests, something requiring much more professional technique and objectivity. It requires above all two qualities, those which M. Paul Reynaud once described as *la lucidité et l'audace*—clear thinking and moral courage. The clear thinking must obviously be expert thinking; it cannot be derived from a Gallup Poll. To say this is not to turn the back on democratic principles—not, at least, as they are practised in Britain. The British principle is that the people should pronounce upon the results, and that should be as true in the future as in the past; there is no more room in a democracy for the dictatorship of the expert than for the dictatorship of anybody else. But it is essential that at least one of the alternatives that is laid before the public should be the fruit of consistent thought, of careful investigation and of scientific impartiality in experiment. The moral courage that is required is the courage to follow the logic wherever it leads, no matter what interests are affronted in the process. A party that tried to base its policies upon these principles could not expect to be in power all the time. But it could make real progress when it was.

It is becoming painfully clear that neither of the two existing major parties is likely to provide the clear thinking and the moral courage that is necessary for such an approach to policy. Until quite recently, many people clung to the belief—though even then it was rather against the evidence—that the Labour Party might have these qualities. It has always had in its ranks a fair proportion of very articulate "intellectuals," and it has shown great tenacity of attachment to an abstract idea. But it is really not possible to entertain this hope any longer. The intellectuals have their way in the Labour Party only so long as there is no interest of the trade unions to the contrary. The average quality of the personnel of the Labour Government, judged either by its capacity for clear thought or by its moral courage, is not high. There is no particular reason to rank Mr Attlee's Government below others of recent years; but there is no reason at all to rank it higher. The Tories have recently been talking much more reasonably; but the disappointment of the high hopes that were put in the Labour Party ought to be sufficient warning to judge parties not by how they talk when in opposition but by how they act when in power. The names of Baldwin and Chamberlain were hardly synonymous with clear thinking and courage in facing unpleasant facts. If the Conservatives are to be judged by the last time they were in power in time of peace, the verdict must be that they were as solicitous for the protection of business profits as ever the Labour Party has been for the standard wage.

Nor is this double failure an accident; it lies in the nature

of the two parties. For however much they may protest against the verdict, they are both from their composition bound to be parties of vested interests. The Labour Party cannot escape from the trade unions. And though one section of the Conservative party is trying to assert its independence of Big Business, it is from business that Lord Woolton's Fighting Fund is being solicited and it is in the directorships of business that Conservative politicians find their incomes while they are in opposition.

Both parties, in fact, are hopelessly handicapped. A policy combining responsibility, purpose and freedom requires, far more than either the old *laissez-faire* dispensation or the steam-

NOTES OF THE WEEK

Big Thoughts and Little Treaties

It is not at all surprising that the Benelux governments have looked sceptically at the Anglo-French proposals for extending to them the Dunkirk Treaty of last March. When that rather hurriedly prepared document was signed, there were still hopes that some stuffing might be put into the Anglo-Soviet treaty of alliance, and that the Foreign Ministers would agree about Germany. The Truman Doctrine had not been born and the Marshall Plan was not even conceived. Events have moved so fast in eleven months that the Dunkirk Treaty is now inadequate, whether as a guarantee of security or as an instrument of economic co-operation. To suggest its extension to the Low Countries as one of the first steps in a new British policy shows lack of imagination; it also shows distressing readiness to abandon Mr Bevin's fresh and bold approach for what looks like a chat between neighbours about sharing a dog to keep off a burglar who is still in gaol.

For what does the Dunkirk Treaty really amount to? To an undertaking that the British and French will consult and act together against any aggression, or threat of aggressive action, by Germany, and that they will be in "constant consultation" about their economic relations. Compared with the nineteen wider and more solid pacts that bind the neighbours of eastern Europe, this looks rather lean. For instance, the Czech treaty with the Russians, signed during the war—December, 1943—provides mutual assistance not only against German aggression but for hostilities with "any other state uniting with Germany, directly or in any other form." Similar terms appear in the more recent Czech-Polish treaty of March, 1947; and in the Rumanian-Bulgarian treaty of last month the governments declared themselves joined together against "war mongers."

It is certainly no part of Mr Bevin's intention to take models for western union from Eastern Europe, where kindred souls are knit together on a very tight thread. But there is much to be said now—which could not be said a year ago—for breaking away from such brief, old-fashioned arrangements as the Dunkirk Treaty, towards more ample regional arrangements of the kind permitted by the United Nations Charter. This is one reason why the Benelux governments have indicated that they are more interested in the model provided by the Inter-American Treaty of Reciprocal Assistance than in the Dunkirk pact.

Alternative to Dunkirk

The Inter-American Treaty, signed last September, embraces an area which includes the whole of North and South America from Antarctica to Alaska and Greenland, with large slices of the Pacific and Atlantic Oceans. It gives a statement of common ideas and objectives; it provides for peaceful settlement of disputes between its signatories before reference is made to Uno; it defines an attack against any American state as an "attack against all American states"; it allows for consultation and self-defence during the time when the Security Council is taking measures to maintain peace; and it recognises the right of Uno to be informed about all action taken for self-defence under Articles 51 and 54 of the Charter.

Associations of this kind for mutual assistance—one hardly dares breathe the words collective security—can be broader and deeper than old-fashioned alliances. Drawn up as regional agreements within the limits of the Uno Charter, they need be in no way offensive to non-participants in other regions. They would command the loyalty of many who would think twice about accepting military service to honour the obligations of simple

roller totalitarianism of Right or Left, the most delicate skill in management, both in the planning itself and in the administration of the frontier between the controlled and the uncontrolled. Both Labour and Conservatives can hire skilled managers—and can be counted on to paralyse them with political directives which frustrate purpose or nullify freedom. So long as the managers, the professional class, are merely instrumental in putting badly conceived plans into practice, their specific qualities will be wasted. And waste will continue until they are given a role in the framing, as well as in the application, of policy.

(To be concluded)

alliances. And, in the long run, they provide the only kind of security organisation within which Britain can reconcile the claims of neighbours in Europe and kinsmen in the Commonwealth.

Moreover, any future association of Western Europe will not work economically unless Germans play their part; and to make its first political instrument a series of treaties specifically directed against future German aggression is to provoke bitter misunderstanding from the outset. Neither in name nor in content is the Dunkirk pact a good enough political basis for Mr Bevin to build on.

Progress at Brussels

Last week in Brussels the Study Group on Customs Union, established last year at the Paris Conference, came together in an atmosphere of far greater activity and optimism than was apparent at the previous reunion in November. Since then customs unions have come in for a sudden wave of publicity and popularity. At that time only the three countries of the Benelux Union were doggedly advancing towards a common tariff (introduced on January 1st), but in the intervening months a mixed commission set up by the French and Italian Governments has examined the possibility of a Customs Union, and has reported that no major obstacles appear to stand in its way provided the stages of economic union are attained progressively. The Scandinavian countries are also making tentative steps in the same direction. They have (with the exception of Iceland) appointed delegates to a mixed commission to inquire into the possibilities of a Scandinavian Union.

The Study Group itself could not do much more than tackle the immense technical difficulties which stand in the way of a general customs union embracing all Western Europe. The first step is to ensure that the negotiating nations use the same terms when comparing their different tariff structures. Another difficulty is to determine whether specific or *ad valorem* duties shall be used as the basis for comparing tariffs, and how the one should be expressed in terms of the other. Further difficulties have to be cleared up in establishing average tariffs and deciding the best methods of doing so. It was decided at Brussels that an office representing tariff experts from the different countries should be set up—in Brussels—to work out these and other technical difficulties.

The Brussels Conference was not content to leave the question at a technical level. The delegates realised that the economic consequences of union for the countries concerned are likely to cause far more controversy and difficulty than mere technical problems. They therefore set up an economic committee to go into the question of the proposed union's wider repercussions. This body will meet in Rome on February 25th, and will report to a third conference of the Customs Union's Study Group to be held in March.

This new economic committee is likely to find itself faced, from the beginning of its deliberations, with the fundamental problem of western association, economic or political, the problem of sovereignty. The Benelux Union has already reached the point at which further advance is impossible without much more far-reaching integration of the two economies. It will not be long before an examination of a wider West European Customs Union reaches the same point. But are the nations of Western Europe prepared for this difficulty? They ask: "What is behind Mr Bevin's speech?" A more salutary question might be: "What concrete diminutions of sovereignty would we, as separate national communities, be prepared to accept?"

Stimulating the Phagocytes

Neither Transport House nor King Street can be feeling wholly elated with the first fruits of Mr Morgan Phillips's campaign to oust the Communists from their positions in the trade unions, though both sides are claiming successes. On balance, the Communists, it seems, have slightly lost ground, though there has been no sign of any clean sweep on the scale hoped for by the Labour Party. In the biggest unions, where Communist influence was strongest, such as the miners and the transport workers, they have suffered a slight setback. The Communists now have 8 seats out of 38 on the Council of the Transport and General Workers, instead of the 9 out of 34 they held previously. Only in the London area have the Communists maintained any substantial hold, but the fact that only 25 per cent of the London membership voted at all in the recent elections suggests that there is considerable apathy among the rank and file. The Communists are strongly represented on the National Union of Mineworkers through Mr Arthur Horner, and though they lost a seat on the Executive with the defeat of Mr James Hammond in Lancashire, they still hold leading positions in Wales and Scotland.

The strength of Communist influence, however, is still greatest in the engineers' union and in the electrical trade union, which recently elected a Communist as secretary. The party has made no headway in agriculture, nor in any of the multifarious textile trade unions, while in the clothing workers' union, where there is a fairly strong Communist element, the recent election for general secretary produced an overwhelming majority for the anti-Communist candidate. The test case may come in the civil service unions. An unofficial anti-Communist "conference campaign committee," largely inspired by Mr George Gibson's anti-Communist crusade in the *Sunday Times*, is busily "boring from without" to rid the Executive of the Civil Service Clerical Association of its Communist domination, and its success or failure will be apparent at the Association's conference before Whitsun. The Communists both within and without the trade union movement can be expected to make the most of the growing opposition to the Government's wages policy, and thereby to retrieve some of the popularity they have recently forfeited. They are particularly strong among the shop stewards. Their influence operated in a positive direction after Hitler's attack on Russia, when maximum production was the party line. Now, however, this machinery will no doubt go into reverse, and widespread industrial trouble may be fomented in the workshops if the White Paper principles are strictly applied. There is thus a stronger need than ever for stimulating the phagocytes. The only way of resisting Communist invasion is to get rid of the apathy among the rank and file of union members, to which, incidentally, Cardinal Griffin drew attention in his Pastoral Letter for Lent.

Can the WFTU be Saved?

The life of the World Federation of Trade Unions now seems to be drawing, not altogether peacefully, to its close. The end has been brought nearer by M. Saillant's somewhat curt rejection of the TUC's ultimatum that, unless a date for a meeting to discuss American aid were fixed by mid-February, the British would consider themselves at liberty to initiate or participate in a conference of the trade union movements which are prepared to co-operate in the Marshall Plan. Leaders of the American Congress of Industrial Organisations, now in London, have made an eleventh hour appeal to Mr Kuznetsov, Soviet trade union leader, to meet them in an attempt to save the Federation, but it seems most unlikely that there will be any reply. Although the initiative for raising the question of the Marshall Plan on the WFTU agenda originally came from the CIO, it is improbable that they would act as sponsors of a special Marshall conference, for the simple reason that any move for self-help should come from the European nations themselves. The same argument applies to the American Federation of Labor, which, however, would certainly participate in the conference.

No further developments from the British end can be expected until the next meeting of the General Council of the TUC, but as this has now been brought forward a week to enable a speedy discussion on the wages White Paper, an early decision on the international situation may be expected. To judge from the tone of Mr Arthur Deakin's statement last weekend, and from an article by Mr Tewson in the current issue of *Labour*, the TUC is obviously prepared to be tough. Mr Tewson repeats the confirmed opinion of the General Council that American aid should be discussed by the WFTU and denies the allegations

that by pressing for this, the British have been sabotaging international trade union unity.

The Council have been patient—perhaps too patient—in rounding on the mischief makers. But it is as well to warn those concerned that if the silence of the British trade union movement under the vilification they have tolerated for many months past is regarded as a sign of weakness, a great mistake is being made.

A final and formal breakdown may be postponed until the full September congress, but unless there is some miraculous change of heart among the Russians, the inevitable consequence would seem to be the establishment of two rival organisations, as at the end of the last war, repeating on an international scale the position in France. There may be a split in the ranks of the CIO, with the Communist minority breaking away, but there are as yet no signs of a permanent *rapprochement* between the CIO and the AFL, although these two bodies would obviously work more closely together on the international side.

* * *

Public Accountability

An interesting three-cornered argument took place in the House of Commons last week between Mr Morrison, Mr Churchill and the Speaker on the now thorny subject of the embargo on questions to Ministers about nationalised industries. The issue is a difficult one. There is no clear line of division between those questions which Ministers should or should not answer. On the one hand there are innumerable detailed matters which it would be entirely wrong for the Minister to answer or to interfere with; on the other there are major questions of principle and policy for which Ministers must be directly answerable. The trouble is the breadth of the no man's land between. How is Parliament to find out about the important things without opening the door to the stultifying effects which the threat of Parliamentary questions exerts over government departments?

So far Ministers have been getting it all their own way. The principle of non-interference having been accepted, a large number of questions is being rejected by the Speaker on the ground that they do not involve "Ministerial responsibility." The most surprising feature of the Speaker's statement was the admission that when he is in doubt about the question of responsibility he rings up the Ministry concerned to ask them. Thus it is possible for the Ministers of Transport and Fuel and Power to avoid a question ever appearing on the Order paper at all merely by disowning responsibility. Under the existing procedure the difficulty of the Speaker is obvious. He cannot know about the detailed lines of demarcation between Ministry and public board. But neither ought the Minister to decide: it makes evasion too easy. It is quite another matter if the question is actually put at Question Time and the Minister openly refuses to answer: the public opinion of the House will prevent any serious abuse.

The issue, however, goes deeper than the details of parliamentary procedure. Having very properly established the precedent against daily parliamentary interference, the Government have not revealed how they propose to avoid the opposite dilemma of making the nationalised boards into citadels of monopoly as secret as any of the castles of capitalism. There is to be a two-day debate each year when the Coal Board presents its annual report and accounts—apparently to be of the greatest detail—but a two-day debate can only cover matters of general interest. What about the details? The Government refused to incorporate investigations by the Public Accounts Committee into the Act, but it is understood that such procedure is in fact being considered. The precedents set for the Coal Board are applicable to all the new boards, and it is vital that the Government should decide quickly what is to be done, if possible with the concurrence of the Opposition. And if such investigations are to get anywhere members of the boards should appear in person and not be represented by officials of their parent ministry. But the Public Accounts Committee can only shut the stable door after the horse has escaped. It is essential that some method be devised of sifting questions, to ensure that those relevant to matters of public policy are put and answered.

* * *

Neighbours in Africa

Before the war the Powers that share the continent of Africa were about as neighbourly as the occupants of a large block of flats. Shortage of food and the alarums of the time have dispersed much of this aloofness. Within the last nine months British, French, Belgians and Portuguese have discussed a

number of common problems: nutrition, forestry, soil conservation, action against the tsetse fly and more general administrative problems have been the subject of conferences in Paris, London, Brussels and in Africa itself. Less formal contacts between officials in the adjoining territories have also been encouraged.

It is still a long step from these consultations to the kind of economic co-operation in the colonies which was visualised in the Paris discussions on Marshall aid, or towards the broader vistas presented in Mr Bevin's "Western union" speech. It is doubtful, for example, whether either Government can yet provide a full survey of the raw materials and food which long-term schemes of development might draw from Africa, and it is already evident that any quick benefits from such schemes are out of the question.

The basic problem, for the French as for the British, is their limited ability to perform, out of their present capital and productive resources, the pioneer role which circumstances are thrusting on them. Capital equipment for Africa cannot be provided at short notice without American help; communications need extensive improvement; the native labour force is unskilled, scattered and uncertain in quality; and the effects on native policy of big schemes have yet to be faced. Already protests from African political groups are reaching London complaining of what they call the "super-exploitation" implied by the Westerners' "Africa fever." They also give voice to the fear that is in the mind of every primary producer—the fear that Europe's desperate effort to find new sources of food and raw materials may create the conditions for a future glut.

* * *

Mr Marquand's Tour

It is to be hoped that the newspaper accounts of Mr Marquand's streamlined tour through East Africa belie the real impressions he has gained from it. Judged by the stories that have appeared, he seems to have fallen into the current popular belief that the development of the African dependencies will solve Great Britain's economic and financial difficulties. Tanganyika's sisal, diamonds, lead, groundnuts—he lists them all as being of great importance to Britain's supplies of food and raw materials or as dollar earners on a large scale.

Obviously all this is true—in the long run and if other things remain equal. But why does Mr Marquand apparently ignore, at least in public, the tremendous difficulties in the way of exploiting African raw materials? What is the use of Britain's sending out capital equipment, that can ill be spared, to develop the lead mines at Mpanda, if there is no labour to work them and no transport to move the lead once it has been obtained? The development of the African colonies, and of Britain's other colonies, is a slow, long-term process. Its main object, and its main justification in view of this country's present economic plight, is that the British people are pledged to raise colonial standards of living. Responsibility for it belongs to the Secretary of State for the Colonies, and tours like that of the Paymaster-General, which foster the far too prevalent belief that Africa can provide a short cut out of Britain's balance of payment difficulties, do more harm than good.

Friction in the Arab League

The muddle and short sight that have lately ruled in the Lebanon's financial affairs have been increased by this week's decision to cut long standing economic and financial links with Syria. The two countries should, for maximum prosperity, be Siamese twins. The immediate cause of their rupture is the difference in the views they take of their financial relations with France. Their currency is backed in Paris; their bank of issue, the *Banque de Syrie et du Liban*, is French. The Lebanese are prepared to go on leaning on this body; the Syrians are not. The Syrians are, in the long run, in the stronger position of the two countries because they possess what is, potentially, a more self-sufficient economic structure. Further, they now feel for the French a hatred which many Lebanese do not share. It is still impolitic—it was in 1946 impossible—to talk French in the streets of Damascus, whereas in Beirut even the urchin selling Spearmin answers to it.

Up to this month, the two states, though politically separate, have maintained old *intérêts communs* in the shape of currency (their notes are interchangeable), customs and a railway. They shared in agreed percentages their revenue from customs and excise, and their hard currency allocation. But the joint arrange-

ment has been uneasy. It has been undermined on the one hand by the Syrian impulse to protect nascent industries, and on the other by the instinct of sons-of-Phoenicians in the Lebanon to live on quick turnovers and free trade. As against these conflicting impulses, there exists the indisputable fact that the Lebanon lives on Syrian wheat and on the traffic through to the hinterland; while Syria, in the present state of its price structure, finds in the Lebanon a market for products it could sell nowhere else at present quotations.

* * *

Rake's Progress in the Lebanon

But is the Lebanon, in particular, in any position to cut the painter? Typical of the financial confusion that can arise there was the extraordinary scene on February 3rd when, following an announcement (by radio only) that that very day from 8 a.m. to 4 p.m. was the only moment at which to change Syrian pounds in local hands for Lebanese pounds, the government created a madhouse round all branches of the *Banque de Syrie*. Its 1947 budget was balanced on paper at £Leb.58 million, but expenditure had by the autumn topped the 100 million mark, chiefly on account of outlay on the army and on diplomatic representation. Its 1948 budget is also balanced, on paper, at £Leb.63 million. But how can the balance be struck? The local disparity between imports and exports is ever increasing. A fatally short-sighted expenditure of vast wartime profits has filled the shops with frigidaires, vacuum cleaners and enough tooth brushes to supply all tooth cleaners in the whole Middle East for a decade. Meanwhile sales are falling because—to give but one example—Lebanese lemons this year cost 60 per cent more than Sicilian lemons.

Nor does the government, despite its majority, seem capable of taking the situation in hand. Not one of its members thinks beyond quick returns on merchandise. They live from hand to mouth. They allocate hard currencies and import licences to their friends. They pay out so much to these and so little to their departments that many civil servants have to find another job in the afternoons. Here is the country which, if well run, and on good economic terms with Syria, could be a second Switzerland. But it is galloping in the opposite direction. All thinking Lebanese are deeply disturbed, but seem capable of nothing but denunciations. So are all thinking Arabs, for if the Syro-Lebanese quarrel develops, what prospect is there of consolidating the Arab League?

* * *

Police Inquiry Postponed

The Government have shown themselves singularly insensitive to the urgency of public needs in their handling of Lord Trenchard's demand for an inquiry into conditions in the police force. It is true that they have agreed to set up a committee of inquiry, but that is not to be constituted until the beginning of next year. And yet the case for immediate action is overwhelming. The Metropolitan police force is still about 25 per cent under strength, and the number of postwar recruits who have left the service, tempted no doubt by brighter prospects in period of over full employment, is more than disquieting. As the Lord Chancellor himself admitted, the facts are pretty grim, particularly in view of the dangerous increase in crime. Why, then, this wholly unaccountable delay? The inquiry, to which the Government have committed themselves somewhat half-heartedly, is bound to take considerable time once the Committee has been set up, which means that action of any kind must be delayed for something like two years.

It is extremely doubtful if the Lord Chancellor's suggestion that men are leaving the police force in large numbers because of the absence of suitable accommodation is of any weight. Housing in London is short whatever career a man chooses to enter. There are two far more significant reasons for the small numbers recruited and the large numbers who have been leaving after their first year of service. The first is the relatively low rate of pay at entry compared to other openings. The police was once an attractive career financially: it is so no longer. The second reason is the poor prospects of promotion for the able young man. The Hendon Police College may have had its faults, but at least it attracted good men, and the violent prejudices it at first aroused were lying down. The new system goes to the other extreme. Men are not to be picked for special training until they are well on in their thirties or even older. No ambitious young man is going to kick his heels for ten years at a low rate of pay for so late a chance of promotion.

This is no time to acquiesce in Gilbert's refrain that "a policeman's lot is not a happy one." The first duty of a Government is to ensure the maintenance of law and order. However urgent the manpower shortage, the adequate maintenance of the police forces of the country is the top priority—a priority far higher than the nationalisation of industries. It is therefore greatly to be hoped that the Government will reconsider their decision to postpone this very necessary inquiry.

Civil Service Salaries

The appointment last week by the Chancellor of the Exchequer of a committee to advise him on the remuneration of the higher grades of the Civil Service will generally be welcomed, both on account of its composition—the members are Lord Chorley (chairman), Lord Layton, Sir Frederick Bain, Sir Hector Hetherington and Mr George Gibson—and also because the subject needs careful independent investigation. Since the war, the different elements in the higher ranks of the service, administrative, professional, scientific and technical, have largely increased in complexity, and the business of arriving at fair scales of remuneration for each category both relatively to the others and to related classes in the outside world is a matter of some urgency. Now, though it is easy enough to cry out against the monstrous and growing hoards of overpaid bureaucrats, there are probably very few people acquainted with the facts who would regard the remuneration of the top ranks in the Civil Service as excessive. Indeed, it might come almost as a shock to those accustomed to thinking in terms of the remuneration of big business executives to realise that the head of the Civil Service, the Secretary of the Treasury, is paid no more than £3,750 a year, and that he does not enjoy in addition a large tax free expenses allowance. Not only are the salaries small compared with those normally paid to the higher business executives in private industry, but they compare distinctly unfavourably with those provisionally fixed for the executives of nationalised industries.

In late Victorian times and even at the beginning of the present century it was usual to justify the comparatively small salaries paid to the higher civil servants on the grounds of their absolute security of tenure and the pension rights that they enjoyed. But since then the responsibilities of Government administration have been enormously increased, while at the same time, with the growth of big business, the degree of security enjoyed by business executives has become much greater and the pension arrangements of the more progressive firms much more generous—to say nothing of the standards in these matters which are now being evolved in the nationalised industries. It is essential, therefore, that in the years to come the Civil Service should be put in a position to compete on reasonable terms for brains and enterprise with the professions and the industrial and business world. That does not mean that it should offer glittering prizes in profusion, but it may well mean some advance in the remuneration offered today. There is nothing inconsistent in this admission with the general recognition of the need for limiting personal incomes as a means of combating inflation, for the total number of persons involved is very small. In these circumstances the Chancellor has done well to seek the advice of an impartial body, the balance of whose judgment is not likely to be disturbed by the immediate urgencies of the present crisis.

The Theatre in Conference

When, for four days last week, representatives of a great variety of interests in the British theatre met to consider their calling, the conference did not prove to be as representative as its conveners had first hoped. The National Theatre Committee, representing the Theatre Managers' Association for the provinces and the West End Managers' Association for London, refused to take part. They believed that the voting system had been weighted against the big commercial interests and in favour of small and to them suspect groups such as Unity Theatre. In a word, they believed the whole thing to be a "Left Wing ramp" designed to discredit them and to get Government support for the nationalisation of the theatre.

They need have had no fears. The tone of the conference was solid, serious, responsible and on the whole non-political. It was soon apparent that the chief desire of the delegates was to clear up difficulties and anomalies in their profession and to exchange ideas on the best methods of doing so. The resolutions passed were practical and, with one or two minor exceptions, very reasonable. The conference asked for a lifting of the present burden of

the entertainment tax which falls on new ventures and old favourites alike and has become a major problem in spreading the capital costs of new plays. They made suggestions on the improvement of working conditions in theatres. They made a plea—and how many would echo it!—for an improvement in the standards of British variety. They asked that drama should receive more attention at the universities and in education generally. And, far from proposing drastic schemes of nationalisation, they suggested simply that the Arts Council should be strengthened and that a Working Party for the theatre should be set up.

If after this demonstration of moderation some timorous managers still maintained their reservations, Sir Stafford Cripps spoke at the final session as though to dispel their last doubts. He pointed to the dangers of state intervention in matters of culture and affirmed his belief that, in the Arts Council, the British people had evolved an instrument not of deadening control but of wise and far-sighted patronage. He pledged further financial support to the Arts Council and gave a most welcome hint that the building of a National Theatre in London was something he looked forward to with the coming of better times. A useful and sensible conference could not have had a more fitting epilogue.

* * *

De Valera's New Hand

With five results still to be announced, it is obvious that Eire's general election has created more problems than it has solved. Mr de Valera's party *Fianna Fail* has probably 68 seats. *Fine Gael*, the main opposition party, which was expected to lose the bulk of its support to *Fianna Fail*, has in fact held its own. The dark horse, *Clann na Poblachta*, which under Mr MacBride was thought likely to gather unto itself all the forces of social unrest in the country, won only ten of the 93 seats which it contested. Thus the party balance among the Dail's 147 members will be an extremely delicate one. Mr de Valera, with the support on most issues of four dissident labour deputies and two or three independents, can command between 71 and 76 votes, giving him at the higher figure a fractional superiority over all other parties. There will be an exciting tussle when the Dail meets on February 18th to elect a *Taoiseach* or leader and it is possible that Mr de Valera might be just defeated by some special combination. Even if he is not the Dail will be at the mercy of the small group of national labour and independent deputies.

However, Mr de Valera holds a stronger hand of cards than is apparent from the electoral returns. He is a wily politician who knows that he can, as most issues lie, divide his opponents. He has twice (in 1938 and 1944) extricated his party from a similar position by speedily going to the polls again, and *Fianna Fail* is probably the only party which could afford financially to fight another election in the near future. Equally, a government based on a coalition of the "anti-Dev" parties would be an unstable affair. As Mr de Valera has been quick to point out, *Fine Gael*, which attacks the high cost of government, would not get far in framing a budget if harnessed to Mr MacBride, who demands a speedy expansion of the social services. The "anti-Dev" vote is not large enough to give a coalition of the smaller parties sufficient power of manoeuvre in face of a united *Fianna Fail*. In the interests of peace and quiet certain sections of Irish opinion are demanding a *rapprochement* between the two parties of the Right, *Fianna Fail* and *Fine Gael*, but their quarrel is of long standing and both have so far rejected the idea.

Whatever happens Eire is unfortunately going to suffer a period of shifting and unstable government. The country has shown itself to be restless under the settled system of the past sixteen years, but it has yet to express with sufficient energy a preference for any alternative policy.

Axioms of the Cominform

"Without desiring to prove it in detail, I accept as an axiom that American imperialism has today become the heir of Hitler's German imperialism." So runs one of the main themes in a speech two hours long made recently in Budapest by Jozsef Revai, an able and prominent member of the political committee of the Hungarian Communist Party. The speech reads as if it came straight from the Cominform's mouth, and it was heard by what is known as a distinguished audience. Once the axiom is accepted there flows from it, with impeccable logic, a stream of conclusions which could be ignored by historians and philosophers if they did not show clearly which way Communist policy for the future is heading. The objective for the spring, in France, in Hungary itself, and, above all, in Czechoslovakia—the key

country of eastern Europe—is to split the left-wing from the right-wing Socialists and get them working with the Communists for the next elections. The tactic has worked in Italy, so it is to be tried elsewhere; and doubtless Mr Revai has hopes that it may work in Britain too.

What is happening now, according to him, is that Socialists who are "anti-Soviet" are swinging back to the Weimar policy of the German Socialists twenty years ago. They are co-operating with clerical reaction, destroying working-class unity, backing American imperialism and threatening war against the Soviet Union. The "Third Road" has been unmasked, "or at least the mask is in process of falling off." And, although "the formation of left-wing Socialist parties is forcibly hampered by the governments of the West," they are steadily gaining strength through the split between them and the right wing. Today through the split between them and Nenni (in Italy) speak a totally different language and live in a world totally different from that of, say, Léon Blum. Therefore—and here comes the line for the future—"men like Fierlinger, Nenni and Szakasits should once and for all discard the illusion that a break with Blum and Bevin would entail a break with the western working class."

In other words, Mr Revai, and those who think like him, want a straight political fight in Europe between extreme left and everything to the right of it. To achieve this they are prepared to thrust moderate Socialists straight into the arms of the centre and right-wing parties, regardless of the consequences. The immediate object of this desperate policy is obviously to eliminate the Social Democrat Party in Hungary; to bring Mr Fierlinger and his left-wing followers over to the Communists before the election in Czechoslovakia next month. The longer-range object is to provoke such tension between governments and Communists as to all over western Europe that their economic recovery will be crippled by strikes, party crises and, if necessary, by civil war. For this kind of aggression the appropriate term has yet to be found; perhaps sickle-waving would do.

* * *

No Easter Basic

Any hopes that may have been raised in the minds of the public by the prospect of a revision of the basic petrol position

before the end of March held out so temptingly last week by Mr Gaitskell must have been rudely dashed to the ground by Mr Robens's announcement in the House of Commons on Tuesday, to say nothing of Sir Stafford Cripps's comments on the White Paper on the balance of payments. Easy as it is to sympathise with the manifest inconveniences caused by the abolition of the basic ration, it can hardly be maintained any longer that these are unnecessary hardships. When the nation is in the desperate position of living on its last reserves, it should be obvious that petrol cannot be preferred to food and raw materials, and the sooner that this is recognised by everybody the better. Nor is it fair to criticise the Government for making this unpleasant decision.

That does not mean that the Government is not open to criticism for the manifest ineptitude with which it has handled the whole question, and Mr Gaitskell's latest performance is a good case in point. It is difficult to understand how a Minister of the Crown could have been so ignorant, as late as last week, of the essential facts about the country's economic position as to permit himself to hold out hopes of any kind to the public, or how such a statement could have been made without previous consultation with the Chancellor of the Exchequer. Or was the prospect of a review of the position, which strictly speaking, of course, committed him to no action, merely a cynical attempt to appease the indignant motorist, very justly resenting the sight of long distance motor coach trips carrying football fans to cup tie matches? It is high time that the Government was a little more consistent in the application of its convenient dogma of the equality of misery.

Miner's Moat

Last week the dilemma of the "Fitter's Freehold" was discussed. This week information about a miners' strike at Mardy colliery in South Wales reveals similar difficulties in the coal-mining industry. The problem of what to do with coal miners displaced by the closing of inefficient pits is likely to grow more acute as time goes on, and since the efficiency of the industry largely depends on cutting losses in old pits and expanding production in up-to-date ones it is essential that the threat of disputes should not hold up the process.

THE UNFORGETTABLE GIFT

How fortunate that you can bestow, at such low cost, a present of such high intrinsic and lasting value as a Smiths Clock. This happy fact is solving the "gift problem" everywhere today. Obtainable from your local Smiths Stockists.

Wages Impolicy

SIR,—The valuable article in your issue of January 3rd describes the TUC and its constituent unions as "the most securely entrenched of the vested interests." But are the power of these unions and the authority which the TUC claims (and which the Labour Government recognises) justified by the number of workers they represent? Recent statistics show that they do not represent even half of the wage and salary earners of this country.

The total working population of Great Britain is given in the Ministry of Labour *Gazette*; it is roughly 20½ million. This figure, however, includes all employers, directors, etc., and persons working on their own account. On the other hand, it excludes all indoor domestics, all males 65 and over, and females 60 and

over. Rough estimates of the deductions and additions to be made to the above figure yield a figure of about 19 million as the number of persons "working for employers."

The total membership in Great Britain of all trade unions is given in the Ministry of Labour *Gazette* (November, 1947) as 8,416,000 in 1946—the highest total ever recorded; the members of trade unions affiliated to the TUC was given at the 1947 Southport Congress as 7,540,000, and this figure includes members outside Great Britain. It thus appears that the TUC represents about 40 per cent of employed persons. No doubt some of these (e.g., domestic servants) are not "organisable"; nevertheless, the TUC cannot claim to speak for much less than half of the wage and salary earners. It would be of interest to know the industries and occupations of these 10 million non-unionists. We are told that important industries like mining, transport, etc., are 100 per cent unionised. Disputes are continually breaking out, or threatening to break out, over the employment of non-union labour in a large variety of industries. Yet we find that the number of workers who are not members of trade unions is much greater than the number who are? Cannot one of the numerous research bodies analyse the figures and how us where these 10 million are? How long is the TUC going to maintain its claim that it speaks for "workers by hand and by brain"?—Yours faithfully,

STATISTICIAN

Overseas League, 5 Park Place, London, S.W. 1

Books and Publications

The Birth Rate Problem

"The Population of Britain." By Eva M. Hubback. Pelican Books. 284 pages. 2s.

AUTHOR and publisher alike are to be congratulated on this well-timed, clear-headed and eminently human book, designed, in the words of the Preface, to "help to arouse an interest in this vitally important subject and serve as a preparation for the Report of the Royal Commission on Population." Probably no social topic needs, for its effective discussion, so wide a range of qualities; but if the Royal Commission, with all the majesty and resources of the state behind it, does any better than this one devoted volunteer, it will have done very well indeed.

Mrs Hubback rightly casts her net widely. She gives the bare demographical facts of population growth, birth rates, net reproduction rates, already familiar to students of the subject but disastously little understood by the general public; estimates the economic and social forces underlying decline—and very shrewdly she does it; discusses the psychology of the present-day preference for a small family, the position of women, the practical obstructions to child-bearing, and the proportion of "unwanted conceptions"—still, apparently, an astonishingly high proportion of the whole. Thence she passes on to a depressing survey of the consequences of decline, social, political and economic, and concludes this part with a practical and realistic discussion of possible policies for the future.

Plenty of writers on social problems are ready to diagnose without prescribing; Mrs Hubback has the courage, and the responsibility, of her convictions. The change-over from small to medium family patterns should be achieved within the next generation, before decline has got out of hand. Education is essential, both in the narrower sense of training in child care,

hygiene and so forth and in the wider sense of the imparting of the sense of social responsibility and of other than ephemeral values. Financial aid and social services for mothers and children should be increased—Mrs Hubback specifies in what ways—and housing and town-planning should serve the needs of the child, not forgetting accommodation for the larger family.

The Pelican imprint can rarely have represented better value for 2s.

From The Economist of 1848

February 12, 1848

THE half-yearly report of the Inspector of Factories . . . has been published. Mr. Horner almost begins his report . . . by stating that "I have already seen indications of a disposition in some quarters to resort to plans for evading the Act of last session. . . ." There is (he says) a great difficulty in obtaining evidence; the workpeople themselves naturally dread the danger of losing their employment by coming forward as witnesses, or even by giving information." Thus at the very opening of the report we have evidence of dislike and mistrust of the law, in the two classes most interested in its enactments.

. . . As the magistrates set aside the inspectors' interpretation of the law, the latter ask whether, in the event of the magistrates pretending to know the law better than they, any course is open to them by which they may appeal to a higher authority. We should be rather disposed to ask, as magistrates, employers, and employed are all against the Act, whether that can be a good law which so many classes conspire to defeat? A law for the protection of life and property, which all men willingly execute, . . . is a law suitable to the customs of a people; but a law which the classes interested in it try to evade or defeat, must be an unsuitable law. . . .

. . . What may be the effect of the law when the ten hours clause comes into operation, and there is a strong temptation both on the part of masters and men, from trade being brisk, to make up for losses, the people having "pledged everything but the mere clothes on their backs to eke out a scanty living," even the inspectors do not venture to foretell. . . . When the temptation to infringe [the law] is greater, more inspectors will be required, and, like all laws which fail, from being foreign to the habits of a people, to execute themselves, this must be enforced by a large increase of persons paid out of the public taxes. So laws, unthinkingly enacted, unsuitable to the circumstances of the people, beget evasion, and all the immorality consequent on deceit; then the sphere of the Government is extended, more laws and more taxes follow, industry is restrained, production impeded, and dreadful poverty inflicted on the people. Half the evils of society which we now require laws to remedy are really the offspring of bad legislation.

Egypt's Social Structure

"Egypt: An Economic and Social Analysis." By Charles Issawi. Oxford University Press for the Royal Institute of International Affairs. 15s.

IN this book Mr Charles Issawi sets out to describe the economic and social structure of modern Egypt up to the outbreak of the second world war. Looking at the country from within, he has an advantage denied to foreigners. Yet in addition he has been able to bring to bear on his task a scholarly impartiality gained both at Oxford and the American University of Beirut. As a result of this favourable background Mr Issawi has produced not only what will surely prove to be a text book on his subject, but a readable and well presented volume in which a mass of detailed statistics has been so cleverly absorbed that it always remains inoffensive and digestible. The statistics are none the less always at hand for the author to use in proving his point.

Among Mr Issawi's most interesting chapters are those on population and education. Speaking of the *fellah*, he shows the appalling poverty by quoting the estimate that the annual cost of living for a family of five in Lower Egypt is only about £26: in Middle and Upper Egypt it is slightly less. Quoting the way in which the *fellah's* vitality is sapped by endemic diseases caused by pollution of the water, Mr Issawi vividly likens the Nile Valley to a gigantic hospital. On the subject of education he explains why Egypt is still faced by low standards and unsatisfactory results, in spite of the effort to gear the national desire for independence to a huge elementary educational programme. Two of the most important reasons for this are the poor quality of teachers and the lack of family life, owing to the overcrowding. At the same time, secondary and university education is apt to lead, as in all Arab countries, to unemployment for degree holders, since there is little opening for them except in government service.

The chapters on agriculture, commerce and industry provide a wealth of material which is not available elsewhere in one place. There is also an extensive bibliography and elaborate index. Mr Issawi, in fact, has compiled an exceedingly readable reference book which will be of use to all who want to understand not only Egypt but many of the problems which are common to the whole Middle East.

Industrial Morale

"Psychology in Industry." By Norman R. F. Maier. Harrap. xvi, 463 pages. 12s. 6d. net.

DR MAIER lays down in his introduction that "Psychology, as the science of man's behaviour, must have much more than common sense to offer if it is to make its contribution to Industry." This is both true and important. The human problems in industry are at least as complex as the physical problems, but whereas the latter are referred to engineers, chemists and other research or technical specialists, the former are dealt with mainly on a basis of good will and rule of thumb. In the early days of psychology of good will and rule of thumb. In the early days of psychology this was unavoidable, but by now the industrial psychologist is equipped to tackle the human problems of industry on a scientific level.

It follows from this that to give a general account of industrial psychology for the layman is not easy. The writer has to steer a course between over-simplification and incomprehensibility, and this Mr Maier has succeeded in doing. He has given an account of contemporary industrial psychology which covers the whole field and yet includes just sufficient in the way of example, diagram and illustration to keep the details in sharp focus.

Perhaps the most important section of the book is contained in the first five chapters, which are devoted to the factors underlying industrial morale. We no longer believe that high wages, well lit work rooms, frequent rest periods and short working hours are in themselves sufficient to produce high morale, and the older kind of industrial psychology, with its concentration upon particular problems such as fatigue or incentives, has now been enlarged to take into account the whole man in his social and industrial setting. But although he rightly places the question of industrial morale in the forefront, Dr Maier does not exclude the more special problems, and there are chapters on selection, training, incentives, fatigue, accident prevention and on the physical conditions which are important for efficient work.

Dr Maier has not written for the professional psychologist nor for the layman, but primarily for the man who, in the course of his work, has to cope with the human problems of industry. But

any intelligent reader who wishes to acquaint himself with the growing and important province of industrial psychology will find in Dr Maier's book an admirably clear and up-to-date guide.

Britain's Industrial Survival

"Britain's Industrial Survival." By Ian Bowen. Faber and Faber. 201 pages. 12s. 6d.

THIS interesting and suggestive book suffers from trying to pack too much into two hundred pages. To analyse what is wrong with British industry needs a volume in itself, and to discuss possible reforms another. To try to do both in a work as short as this means inevitably that one or the other goes to the wall, and Professor Bowen's chapters read as a result a little like one of those essays on public ownership, of which he must have had some experience in his own tutorial days at Oxford, which rollick through the honours of the Coal Miner Act of 1930 and the apocalyptic revelation of the Reid Report, and conclude, as the book closes with a satisfied sigh, that "this, therefore, is the case for nationalisation." In fact, of course, it is the case for nothing at all, for it is one thing to prove that our industrial system is imperfect, and very much another to prove that an alternative is generally better.

It is certainly refreshing to find at least one left-wing economist whose principles have stood the test of two years of socialism. But Professor Bowen's own personal blend of glorified trade associations, disjointed consultation, and idealistic planning—with the ideals slightly overcast as a result of practical afterthought in chapter 10—though starting out on the right path is not fully enough thought out to carry conviction. And somehow he never quite seems to answer the question about what are the factors which account for the higher productivity of American industry.

But let these things not be taken as arguments against reading his book. On his own ground of statistical analysis of factors such as efficiency, advertising, investment, population, or lower supply Professor Bowen has plenty to say which is both new and interesting. Perhaps some of his Census of Production data smell more of the lamp than of earthly fact, and he has had to open his mouth a little wide to swallow the whole of the Steindl mythology of the small man. But that still leaves plenty worth consideration in a study which stimulates even where it fails to convince.

Shorter Notices

"History of England." By Professor E. L. Woodward. Methuen, Home Study Books, 4s. 6d.

DIFFICULTIES too obvious to be mentioned must face the writer of a history of England, from Roman times to the end of the First World War, if he confines himself to 270 small pages. Professor Woodward has overcome them all. What could so easily have been dogmatic is stimulating and thoughtful; what could so easily have been over-generalised is accurate and precise. Most developments of importance, not only political but also social and economic, receive some treatment and the history of England is placed in its world setting. This gives the book comprehensiveness despite its size. It is well written and a pleasure to read, which accords with the author's statement that he found it a pleasure to write. The standard of judgment is high, as we should expect, in spite of the difficulties imposed by limited space. Specialists may want to differ with the author on occasional controversial issues in their field; but they could not claim that he is misleading the reader. In short, Professor Woodward was aware of his problem and has been successful in meeting it.

The volume is well produced and has a workmanlike index.

"The Motor Industry of Great Britain, 1947." Society of Motor Manufacturers and Traders, Limited. 452 pages. Non-members, 40s.; Members, 30s.

THIS first post-war edition of the statistical review of the motor industry is a much more comprehensive and attractively presented publication than the last one, which appeared in 1939. The detailed information in it is for the year 1946, covering the United Kingdom production and exports of motor vehicles, the numbers of new registrations and full particulars of the vehicle census for Great Britain. Some useful comparative figures are given for 1938. For instance, the changes in the motor vehicle population at September 1946 compared with pre-war are given for each country separately; whilst the total number of vehicles owned in Great Britain in 1946 was almost the same as in 1938, the numbers in the London County Council area had decreased by 22 per cent. The statistics also include a certain amount of information about overseas producers, including figures for world production and a world census of motor vehicles. It is unfortunate that the difficulties in collecting and compiling uniform statistics have inevitably delayed the publication of this book, and that any figures later than 1946 are confined to a very short appendix.

AMERICAN SURVEY

The Battle for Minorities

(From Our US Editorial Staff)

IN the Washington buses there is displayed, at the moment, one of those pieces of self-congratulation on the "American Way of Life," in which advertisers occasionally indulge "as a public service." A typical poster mechanic—with broad shoulders, greying hair, strong jaw, kindly eyes and a pipe—is saying "Who says my vote doesn't count? My vote counts as much as the President's vote. My vote has the power to help hire or fire a Senator, a Governor or a Mayor. Look around the world and see how many common men can do that!" The mechanic is identified as Fred M. Lambert of Brooklyn, New York. It is somewhat of a mystery why any advertiser should choose gratuitously to taunt the unfortunate inhabitants of the District of Columbia who have no vote—whether they are common or uncommon. There seems to be no realisation that Mr Lambert would certainly be feeling much less smug if he lived in Washington—or in one of the seven Southern States where payment of a poll-tax is a prerequisite of voting.

On February 2nd Mr Truman sent a message to Congress asking for a ten-point programme for increasing civil rights and one of them was the grant of home rule and suffrage in Presidential elections to the inhabitants of the District of Columbia. (At present the District is governed, with conspicuous inefficiency, by Committees of Congress through an appointed Commissioner.) The President also asked for legislation making lynching a Federal offence, abolishing the poll-tax, protecting from intimidation individuals who are trying to exercise their right to vote, prohibiting racial segregation on inter-State transport facilities and establishing a Fair Employment Practices Commission to prevent racial discrimination in employment.

This programme is the result of the report (published last October) of a Committee appointed by the President in December, 1946, in which recommendations for legislation to protect the civil rights of the people of the United States were made. There would seem to be little in these recommendations which the President of the country which prides itself on the most democratic constitution in the world could not think of without the help of nine months' deliberations by fifteen of its leading citizens. But the reaction to the President's message shows that there is much inflammatory material in the programme. This is an election year and Mr Truman has stepped on some very gouty Southern toes.

The President's message—or at least its timing—was made necessary by the challenge of Henry Wallace's third party. Though Wallace has no chance of getting many votes he can make the difference in three key States. In one of them—California—his strength is in the lunatic fringe. But in the other two—New York and Illinois—he is counting on the support of racial minorities. If he can persuade the negroes of Harlem that the Democrats are now the "creatures of Wall Street monopolists," New York State is lost to Mr Truman. If, on the other hand, Mr Truman can establish himself as the friend of the down-trodden, whether any of his programme becomes law during this session (which is unlikely)

or not, he may save two of the three States with the largest electoral votes.

The American system of electing a President makes it necessary for a candidate to find a programme containing suitable carrots for all minority groups instead of an overall programme appealing to the whole of the nation. He must concentrate on winning individual States, since his majority will come from a majority of votes in the Electoral College where each State votes as a block. Out of the 449 votes in the Electoral College, 47 come from New York, 35 from Pennsylvania, 28 from Illinois and 25 each from California and Ohio. These blocks of votes go to the candidate with a majority in the State, however small that majority. (In 1884 Cleveland won New York by only 1,149 votes.) Therefore every candidate must base his programme on appeasing the doubtful groups in these five States—and particularly in New York.

Roosevelt won New York, in both 1940 and 1944, thanks to the support of the American Labour Party. On both occasions the Democratic vote was smaller than the Republican. The American Labour Party is now officially supporting Wallace, though much of its strength has refused to follow the party leadership. Mr Truman must persuade as many as possible of those outside the regular Democratic ranks to vote for him as they did for Mr Roosevelt. His is not an easy task as he will not be, as Roosevelt was, the candidate of the American Labour Party. The civil rights programme is his bid for their vote. More specifically it is his bid for the 200,000 negro votes in Harlem. So even are the two parties in New York State (in 1944 Mr Roosevelt won by a little over 300,000 out of a total vote of more than 6,000,000) that the negro vote could be decisive.

The situation in Illinois is similar. The Democrats need a majority of about 300,000 in Cook County, which includes Chicago, to overcome the solid Republicanism of the rest of the State. In 1944 they got it with 40,000 to spare, carrying the State by 140,000 votes. But last November, in the local elections, a new party, the Progressive Citizens of Illinois, won 116,000 votes in Cook County. This is the organisation which will support Mr Wallace, and even if his name brings no new votes from the negroes on Chicago's South Side the 116,000 votes may be enough to lose the State for the Democrats.

There is nothing very new in the President's programme. Four Bills to abolish the poll-tax have been passed by the House of Representatives in the last few years. Three of them were killed in the Senate (the fourth has not been debated there) by the filibustering of the Southern Democrats. At present the Republicans, who would always be happy to win back the negro vote by passing such legislation, are sitting quietly and watching the Southerners try to destroy Mr Truman's attempt to save New York and Illinois. There is always an anguished cry when a Democratic President suggests a measure which would interfere with the rights of the Southern States to discriminate against negroes. This week the cry has had a sharper note than usual.

In 1944 there was an attempt, strongest in Texas, to teach Mr Roosevelt a lesson by electing delegates pledged to support another candidate. It came to nothing then, but another attempt is going to be made this time. The Conference of Southern Governors, meeting this week at Tallahassee, Florida, has decided to discuss the advisability of "bolting the Party" (though where they will bolt to is their hardest problem).

The Governor of Mississippi has announced that his State will take the leadership in the South and will mobilise for an all-out fight. "I am confident," he stated dramatically, "that this militant leadership on the part of Mississippi, the most Democratic State in America, will spread like wildfire across the entire South and sweep before it all those who stand as enemies to our institutions and our way of life."

Meanwhile, Republicans in the House of Representatives are widening the split by taking the President at his word and preparing an anti-lynching Bill which will be ready for debate in two or three weeks. It will, no doubt, pass the House, where the filibuster is not allowed, and founder, as usual, on the rocks of Southern long-distance oratory in the Senate—in full view of those whom the civil rights message was intended to win for Mr Truman. The problem of holding together a party, which is an alliance, based on little more than a name in common, of reactionaries in the South and Liberals in the big cities, taxed all Mr Roosevelt's superb political skill. It may prove too much for his less adroit successors. Fortunately for them, however, the Republicans, with fewer natural obstacles, have a talent for misunderstanding the voter and offering him candidates for whom he cannot vote. If they do so again, and the Southern Democrats' fury turns out to be all sound, as is probable, Mr Truman's effort to protect the rights of minorities may have some of its intended effect.

American Notes

Commodities, Trade—

It is never very easy—or very safe—for any commentator to determine the point at which price changes mark a full turn in the business tide. Postwar experience of the American scene, moreover, has brought more than one unexpected rebuff for the prophets, and on this occasion there is a confusion of counsel in high quarters which makes the task of determination perhaps more than ever difficult. Mr Roosevelt, for example, was not a trained economist, but he usually had the good fortune to be pointing to charts at a time when the trend was still in the direction which he indicated. On Friday last, Mr Truman was less fortunate. His repetition of earlier pleas for price control, and his renewed expression of alarm over the upward price spiral coincided with the worst liquidation met by the stock and securities markets for many months past.

So sharp and sudden was the downturn, in fact, that on the same day, Mr Clinton Anderson, Secretary for Agriculture, is reported to have given the farm community an implicit assurance that his Department will move very slowly in proposing any revision of "parity prices" which at present determine Federal support levels for farm produce.

On the commodity front, falls now outpace the severity of those earlier bouts of liquidation in 1946 and 1947. Over a week, March wheat has fallen from \$2.95 a bushel to \$2.43, and maize from \$2.48 to \$2.05, with September wheat quoted at \$2.17 (\$2.53). Grains took the first shock, with quotations falling over several sessions to the full limits allowed by commodity exchange regulations, and it is significant that some wheat futures are now well below the Federal price "peg" (at which support loans become available to farmers). That level is now about \$2.25 a bushel, but since it is based on the relationship of farm prices to those of industrial products, it may move against growers now. The fall might be a pointer to later trouble here. Elsewhere, cotton (down from \$34.80 to \$32.63), hides and rubber joined a wide retreat in industrial commodities. The Moody index of staple commodities is down from a 1948 high of 459 to 404. This pace of decline is fully reminiscent of the worst bouts of depression in commodities, although underlying forces are certainly different today.

Speculative activity has been given a great deal of publicity in recent weeks, but a contraction of these operations is not alone sufficient to account for this new break. In grains, especially, it follows encouraging reports on crop conditions, and the revision of 1948 crop estimates along lines which might well daunt the sturdiest of short operators. Improving weather conditions have brought forward predictions of a 1948 crop well beyond 1 billion bushels, against the gloomy autumn estimates of disaster (or its equivalent crop level of perhaps not more than 750 million bushels). Mr Anderson himself has declared that "given good weather," US exports of 300 million bushels over the next crop year could be met with comfort. In the meantime the 1947 crop year export target has been cut, and the high price of wheat has

proved to be an effective deterrent to abnormal livestock feeding. In short, the grain position has justified a fall in prices. That still does not explain why the markets waited until last week to reflect the more sober views prevailing, though the latest suggestion from Washington is that another "leak" inspired the initial sales.

—And Wall Street

The less spectacular, but none the less severe, break on Wall Street is less difficult to explain. For months past that market has refused solemnly to discount the trend of steadily rising company profits, bigger dividend payments, and higher yields. A normal end-year rally was brought to an abrupt conclusion by the Presidential plea for higher tax rates in the Budget Message, and not even the disappearance of Mr Mariner Eccles, or new rumours of lower margin requirements for securities trading could induce any substantial recovery.

Here the commodity slump served merely to push stocks from a level (the 180 plateau maintained by the Dow average within a fairly narrow range for some time past) which they had shown no disposition to hold for very long in 1948. Turnover widened in a manner which was no doubt significant to the Dow Chartists, who are, in the main, content to believe that a primary bear market began in 1946 and has not been concluded. The Dow Jones average has fallen to 166, and there is still no sign of a spirited rally.

The evidence for, and against, continuing declines and major reactions on the business tide is by no means easy to weigh. On the one hand, it is worth remembering that the grain markets are now presuming the continuance of good weather through to harvest time, that the balance between world supply and demand is still in favour of the latter, that stocks are still abnormally low, and that North America has for a decade enjoyed a more than average share of good fortune in terms of weather—despite the 1947 corn crop failure. Relatively little damage would be needed to tilt the scales toward scarcity, if not actual privation.

But the remaining question which has not been settled is the influence of stock and commodity price changes upon domestic demand. Will industrial buyers now refuse to provide any longer the stimulus derived from more than two years from re-stocking? Will the buyer in the residential construction market now hold aloof? Will industry, faced with this fresh uncertainty, become more grudging on wage claims which will almost certainly go forward now? Will the feverish pace of business re-equipment die down after the first quarter, or will first quarter predictions of high demand be, in fact, fulfilled? By how much will Congress cut the Marshall aid figures?

At this stage, any answer to these queries can scarcely be conclusive. What we can say is that all the familiar indicators of a

US Business Bulletin

THE ECONOMIST receives every week, from its own correspondents and from other sources, a great deal more information on business conditions and economic developments in the United States than can possibly be used for "American Survey."

It is therefore proposed to issue for private circulation a fortnightly "US Business Bulletin" which will contain a more extensive digest and analysis of this information than can appear in the paper. It will be designed to be of value both to exporters and also to those more generally interested in economic affairs in America.

Detailed information on this bulletin will be available shortly and will be sent to any reader who would like to receive it. Please address your request to:

Manager, The Economist Intelligence Unit, 22 Ryder Street, St. James's, London, S.W.1

Express Service to U.S.A. and Canada

Readers of The Economist in the United States and Canada can receive their copies within a day or two of publication for an annual subscription of \$24. They should apply to The Publisher, The Economist, 22, Ryder Street, St. James's, London, S.W.1.

Business turn have in recent months become more than ever apparent, right down to the despised, but none the less inevitable, hardening of money rates and the new curbs on bank credit. Until last week some indicators were, perhaps, no more than faintly discernible. But this week has given some support to the theory that they may herald a widespread process of deflation which could last for some time and could be very sharp indeed.

* * *

Writing the "Vandenberg Bill"

The Foreign Relations Committee, having concluded its hearings on the European Recovery programme, is now engaged in writing the Bill which Senator Vandenberg hopes will be presented to the Senate by February 20th and passed by April 1st, the date when interim aid funds officially run out. In fact they are already perilously low. The public forum afforded by the hearings has shown, despite criticism of details, a general, though hardly enthusiastic, recognition of the necessity of substantial contributions to European recovery. Proceedings in the House have lagged behind, both in time and interest, and it seems that Mr Eaton relies upon the Senate Bill both to galvanise and to steady debate in the Lower House.

The Bill written by the Senate Committee will be a compromise measure, designed to conciliate the "revisionist" opposition and exemplify the traditional right of the Senate to give advice as well as consent, on matters of foreign policy. But Senator Taft's public friendliness to ERP before leaving Washington suggests that the chief outlines of a settlement have already been reached; and that they involve no grave sacrifices of substance. The administrative quarrel is already out of the way—as far as the Senate is concerned—in the decision, approved by the State Department, to appoint a single executive with Cabinet rank independent of the Department. He would be assisted by an advisory board of 12, and a roving ambassador, and supervised by a 14-man investigating committee chosen from the members of both Houses.

The Administration has made a number of helpful concessions. The \$570 million programme for aid to China, designed as a holding operation while European recovery holds first place, makes good Mr Marshall's promise not to neglect the "other front" against Communism. The sum is only a drop in China's vast

and dusty economic desert, but it will help to placate the professional Sinophiles and those who fear that the Marshall Plan locked the front door while leaving the back door wide open. The Administration, through Mr Snyder, has also announced that it will, by the threat of confiscation, make available to the Marshall country governments, chiefly France, the dollar hoards blocked during the war. The much larger "free" assets of Britain, Eire and Turkey would not be affected. The scheme may make available a useful \$750 million which countries like France have been trying to recover for over two years, and will also do something to satisfy Americans like Senator Lodge who feel it outrageous that wealthy Frenchmen should evade any contribution to the recovery of their own country.

Finally, the Administration has clarified the meaning of the gap between the requested ERP authorisation of \$6.8 billion for fifteen months, and the \$4.5 billion, which is all that is included in the budget to the end of fiscal 1949. Approximately \$1.5 billion of this difference is for goods to be delivered and shipped, but not paid for during fiscal 1949; the remaining \$800 million is for forward contracting. The suggestion is that a billion-dollar cut, replaced perhaps by contracting authority, might, without making substantial real changes in the programme, conciliate those who have been shocked to find that the overall foreign aid bill of the United States totals \$9.3 billion, including occupation costs, aid to China, and the Philippines, and Greece and Turkey. Some doubts are expressed as to whether it is sound strategy to make this concession before the Bill meets its severest challenge in the House, but it may be inevitable in view of the failure to stir public opinion to more than a resigned consent.

* * *

Military Guarantees?

The proposals of Mr Dulles and Mr Baruch for American military guarantees of political union in Western Europe are still lively subjects of speculation despite the chilling lack of interest shown by the Senate and the veto exercised by Mr Lippmann, the "third force" in American foreign policy. Mr Lippmann's opposition was based both on economic and security grounds. He argues that a defence union would frighten off countries like

Switzerland and Sweden; and that the rest of the countries of Western Europe would refuse to accept new commitments to collective security without fabulously expensive military aid from the United States. If American strength cannot contain the Kremlin, he insists that the signatures of a dozen weak countries would not materially change the odds.

Mr James Reston reports in *The Times*, however, that there is considerable concern in Washington as to whether a political and military ERP is not essential if the economic programme is to succeed. Each country's fear for its own security, it is argued, will stand in the way of the best use of the resources of the continent. It is interesting that a recent Gallup poll shows a slight majority, 51 per cent of those questioned, 59 per cent if those with no views are excluded, favouring a military alliance with Britain and France. An alliance with either country alone is much less attractive.

Those who favour some overt assurance that the United States has a political and military, as well as an economic, stake in Europe argue that the resulting increase in political stability would mean a much greater effectiveness for American dollars invested in European recovery. Without it, perhaps no sum would be sufficient. In effect, this would be the application of the Truman Doctrine to Western Europe. That it is discussed at all is a symbol of how rapidly concepts of foreign policy are widening. But it is a highly academic debate. The converted isolationist may now believe European recovery is worth \$4 billion next year; but to run the risk that military commitments might lead to another war would be quite unacceptable, not only to the isolationists but to the majority of Americans.

* * *

Budget Revision

Budget controversies in Congress have so far given a pattern almost precisely in line with that of 1947. Last year the President stood firmly against tax cuts. This year he is seeking modest relief for the low income groups, and a corresponding gain from company profits. On both occasions Congress has ignored the Presidential Message, and gone its own way.

Last year the House moved vigorously, under the lead of Mr Harold Knutson, chairman of the Ways and Means Committee, to bring about a heavy reduction in the expenditure total. Quite recently the Committee again found items totalling \$6 billion to be excessive, and on the floor of the House these impressive Budget economies were approved by 297 votes to 99.

On this basis the House could quite easily override the Presidential veto which would certainly follow passage of the new Budget Bill. Once again, however, the Senate is displaying a mood of restraint and responsibility, and it is now quite certain that no attempt will be made by the Upper House to enforce a show-down on the lines adopted by Mr Knutson.

The Senate itself, of course, will insist upon tax reduction this year. But Senator Taft, who ranks as one of the most vigorous advocates of economy, has always insisted that the \$6 billion goal was only a mirage. A joint Budget Committee has now adopted proposals which would reduce expenditures by \$2.5 billion only from the \$39.7 billion level outlined by Mr Truman.

One basic dispute between President and Congress concerns the probable revenue total for 1948-49. Mr Truman assumed a level of \$44.5 billion, with income and employment maintained near current levels. Congress, with the realisation that the Treasury has underestimated tax receipts in recent years, has hoisted the tax yield estimate by \$2.8 billion. With expenditures cut by \$2.5 billion, the Budget surplus—before tax reliefs—is thus put as high as \$10 billion. The Budget Committee has given no details of expenditure, and no final estimate of probable tax cuts. Already, however, the White House is reported to be moving for higher foreign expenditures, certainly for China, and possibly for Latin America. And the Defence estimates are held by many Congressmen to be too low. The revenue estimates accepted by Congress, moreover, may quite easily look very shaky six months from now. It may be that Congress would be willing, in the event of a business setback, to permit a substantial Budget deficit. But the Republican leaders have shown no sign of falling from orthodox standards, and it is difficult to discern where the economies suggested by Congress are to be found, at least beyond the foreign relief and recovery items which, Mr Marshall insists, form no more than a minimum list.

THE WORLD OVERSEAS

Soviet Budget Survey

(By a Special Correspondent)

THE budget session of the Supreme Soviet of the USSR is over. Its time was entirely taken up by the motions of a quasi-parliamentary debate on the figures presented by the Minister of Finance, Mr Zverev. The peculiar interest in this year's budget estimates has arisen out of the currency reform and the abolition of rationing, which took place in December last. How—it was asked—would the drastic revaluation of the rouble, at the rate of one new rouble in cash to ten old ones, affect the Government's revenue and expenditure for 1948? The answer has now been provided, and it makes possible a more precise opinion about the impact of the currency reform on the Soviet economy.

But, apart from the things that have been said at the Supreme Soviet, the things that have been left unsaid are, as usual in Russia, no less significant. The Supreme Soviet has not officially endorsed the campaign for speeding up the present Five Year Plan and for its fulfilment in four years—a campaign which has for many weeks filled the columns of the Russian Press. In between the lines of his budget speech, Mr Zverev suggested that he was opposed to speeding up the tempo. He openly repudiated the demands of several deputies for a bigger volume of capital investment in industry than that allowed for in his estimates. He argued that the revenue side of the budget was stretched to its limits and could not support any additional expenditure. It seems that the issue had been, or was still, the subject of a tug-of-war between various Government departments, some of which undoubtedly pressed for a quicker fulfilment of the Five Year Plan.

One the face of things, "sound finance," embodied in the somewhat professorial figure of Mr Zverev, carried the day. But it is merely "sound finance" that has militated against the Five Year Plan in four years? Mr Zverev's estimates have provided

for a surprisingly big budget surplus: revenue in 1948 is to exceed expenditure by 41 billion roubles. The surpluses for the two previous years, too, add up to 42 billion roubles. The accumulation of such large reserves in the Soviet Treasury does not suggest that purely budgetary considerations prevent bigger money outlays. The relative shortage of materials and productive capacity apparently does not allow industrial output beyond the targets originally planned. Mr Zverev gave many instances of the scramble for scarce materials between the various state-owned trusts and combines, as well as of the freezing of capital in uncompleted construction. Under such conditions, higher appropriations for capital investment would have merely intensified the scramble and produced inflationary effects. This consideration seems to have outweighed—perhaps only temporarily—the political motives for turning the Five Year Plan into a Four Year Plan. This year's appropriations have been so allocated as to speed up the completion of plant under construction.

The overall figures of the estimates for 1948 are much higher than those of the preceding years, in spite of the recent drastic monetary deflation. This puts the inflation of the rouble and the currency reform of December in the right perspective. The depreciation of the rouble proceeded along two different lines. In the free market, in the "commercial" shops and at the bazaars, the purchasing power of the rouble was officially between one tenth and one fifteenth of what it was before the war—in actual fact, it was even less. This was the "galloping" inflation similar to that experienced by most continental countries. In the planned sector of the national economy, however, the rouble suffered a much more moderate loss of purchasing power, a loss comparable to that suffered by the pound or the dollar. Jews in Cyprus

[FROM A CORRESPONDENT]

WITH the arrival of the *Pan Crescent* and the *Pan York* on January 1st, the number of Jews in the camps at Caraiolos, Xylotymbou and Dekhelia was raised to 31,344. The disembarkation of the 15,450 from the two ships was carried out smoothly and speedily by the Sixth Airborne Division, but their absorption into the camps has proved a more difficult matter. Only 8,000 Jews are accommodated in Nissen huts, and the remainder were under old and often damaged canvas. In the only camp where exact figures were available there were 2,435 Jews in tents designed for 2,210. Many families separated on the ships have not yet been united. There are 6,000 children in the camps, and the birth-rate is more than 150 each month.

Tension in the camps was perhaps higher than at any time since the hunger strike in April, 1947. Two immigrants, attempting to visit relatives, were shot a few weeks ago, and the military have ordered guards to open fire on any immigrants crawling through the wire. The Haganah have threatened to retaliate if this order is carried out. Much of the tension is due to the situation in Palestine and the feeling among the immigrants that they are held in Cyprus at a moment when they are most needed for the defence of "their country." But it is clear that the present state of overcrowding cannot long continue with safety.

Meanwhile, the Cypriot views with disfavour the raising of the Jewish population to a trifle more than that of Nicosia, the island's largest town, while it is no secret that even the Cyprus Administration have protested vigorously since the opening of the camps. The Secretariat repeatedly deny that the camps are a drain on the island's resources, as arrangements have been made to make available only such supplies as are surplus to local requirements, but it is that surplus which is the one guarantee that prices will remain low. During the past year the cost of fruit and vegetables has risen by more than 100 per cent.

Although the Cyprus Government has recently reiterated that Cyprus will be cleared of Jews before May 15th, so far nothing has been said regarding arrangements for their transfer, nor is there any indication of an increase in the Palestine quota. As a result of the blowing up of the *Ocean Vigour* by terrorists in April last year, the British Authorities have refused to provide transport for released internees. These have been carried in small vessels chartered by the Jewish Agency and capable of conveying about two hundred refugees each trip. Such vessels would be useless for a wholesale evacuation, but the *Pan Crescent* and the *Pan York*, with their original crews, are still in Famagusta Bay, making it theoretically possible to transfer the whole 31,000 to Palestine in three weeks. It is clear, however, that if complete chaos is to be avoided, the operation will have to be spread over several months. What is most probable is that a special quota will be granted for children, and the adults will follow in three monthly shipments on the *Pan Crescent* and *Pan York*.

High Cost of the Camps

It is unlikely that the total cost of the camps will be known for some time. The American Joint Distribution Committee, providing additional food and comforts at the rate of 30s. per head per month with only 3 per cent administrative expenses, estimated that they had spent £312,500 by the end of 1947, and that in 1948 they would need £45,000 per month. Putting the Army figure at £6 per head per month, the estimate would be £1,250,000 for food alone. The total cost was estimated by Sir Godfrey Collins (Commissioner for Jewish Camps) at £4,500,000. Last February the Chancellor of the Exchequer stated that the whole cost of combating illegal immigration would be a charge against the Palestine Government, but so far there has been no indication that the Palestine Government will accept that charge. There is a growing feeling that in the end it will be the British taxpayer who will pay.

The future of the camps themselves is again only open to conjecture. The hutted camp at Xylotymbou, officially stated to have cost half a million to build, is the only one likely to have any value as permanent quarters for British troops. As they stand, the three camps could probably house 20,000 men temporarily, under reasonable conditions, but officers in charge have stated that after the evacuation of the "illegals" the camps would need six weeks' preparation to make them inhabitable. Local reports state that of the 30,000 troops coming from Palestine to Cyprus, 12,000 would remain as a permanent garrison, and that the two tented camps at Dekhelia and Caraiolos were to be eventually demolished.

Hesitation Over Finland

In Denmark there is a distinction between unofficial and official comment. There, too, the responsibilities of office and the inheritance of a traditionally neutral policy make the Government cautious. Yet in some respects it interpreted popular reactions more faithfully than the Swedish Government appeared to do. The newspapers commented late and rather reluctantly on Mr Bevin's speech. Lately, however, more favourable reception has been accorded to Mr Bevin's ideas. Two former Ministers of Defence have made speeches strongly in favour of a northern customs union, and of a clear choice by Denmark of its position "in the fight between democracy and dictatorship, between freedom and oppression." Opinion is veering towards a more positive stand. The traditional friendship for Britain is now growing after its decline a year or so ago, and this undoubtedly increases support for the Western European Union. Yet it would be rash to believe that Denmark would join any partnership which could eventually be turned against Russia.

Limited co-operation in such a union is nevertheless likely from all three countries. A limiting factor, to which too little weight is often given, is their common determination not to increase Finland's difficulties. In recent weeks there have been many signs that the Russians were putting themselves in a more favourable position for assuming fuller control of Finland, if this should be deemed necessary. Externally, the one thing that would certainly impel the Russians to act would be their conviction that the other Scandinavian states had committed themselves to the West. This reinforces old arguments for neutrality.

The vagueness of Mr Bevin's proposals also sets a limit to any precise and purposeful reactions. They raise fundamental questions. What is the exact distinction between economic co-operation under the Marshall Plan, which is accepted, and the political co-operation proposed by Mr Bevin, which, until more clearly defined, is ruled out by a policy of neutrality? The distinguishing features were blurred by Mr Bevin's speech, but they can easily be brought into sharp focus again. The Scandinavian countries will then be able to see how the result squares with their desire to maintain policies of neutrality.

**CAN
SARDINES
BUILD
STRONG
LIMBS?**

It may sound surprising, but both tinned sardines and tinned salmon can have quite a marked effect on bone formation. Both are singularly good sources of vitamin D, which is essential for building up strong straight bones and good teeth. Vitamin D is the 'sunshine' vitamin, which prevents rickets. We particularly also have need of 'protective' vitamin A during winter to ward off ailments. But the best and handiest way of ensuring that you get ample A and D is to put yourself on Crookes Halibut Oil throughout the winter. **FREE: Why not get to know the vitamin-value of the foods you eat every day. Our free illustrated booklet tells you this in an easy interesting way. Write to The Crookes Laboratories Limited, Dept. F193, Park Royal, London, N.W.10.**

THE BUSINESS WORLD

Britain's Balance of Payments

THE publication on Tuesday of this week—only two days before the crucial debate on the new wages policy—of the White Paper on the balance of payments in 1947 (Cmd. 7324) may not have been specifically designed to strengthen the Government's hand for that occasion. But, from that point of view at least, the release could not have been better timed. The balance of payments is both the resultant and the measure of all the pressures—economic, financial, political and social—which have forced Britain in the past two years to the very brink of the greatest peacetime disaster of modern times. And though this document speaks only in the cold language of statistics, it starkly portrays the rake's progress during these past twelve months. The Government and the officials concerned are to be congratulated upon presenting a more detailed analysis of Britain's overseas payments, on capital as well as on the current account, than has ever before been attempted; the estimates seem to be as complete and as objective as the available information and official zeal can make them, and though many items are necessarily tentative and liable to a wide margin of error, it is a praiseworthy effort.

There, however, the scope for congratulation abruptly ends. The "Economic Survey" issued twelve months ago was then described as one of the gravest warnings ever uttered by a British Government. But the lesson of this statistical White Paper is infinitely more grave. The "Survey" based its programmes on the assumption—which certainly was not over-cautious—that it would be "unsafe" for Britain to borrow in 1947 more than £350 million. In fact, the net depletion of the central reserves of gold and dollars (including of course the drafts on the North American credits) was almost three times as large as this maximum "safety" limit, and the net deficit on current account for the United Kingdom alone was almost twice as large. Thus it has happened that the reserves and credits which two years ago were intended to last the sterling area until 1950—the year in which equilibrium was then expected to be reached—will run out in a few months' time, while a huge and apparently unbridgeable gap remains.

By what means was more than £1,000 million of the central reserves expended in a single year? Britain's own net requirements in the dollar area absorbed £677 million; the remainder was absorbed by the direct dollar needs of the rest of the sterling area (£273 million gross, less £84 million financed by sales of newly mined gold) and by the net hard currency expenditure in other countries by the sterling area as a whole (£157 million). In this third category, which relates to net payments to non-dollar countries which convert only part of their sterling receipts into gold or dollars, it has been found impracticable to apportion the drain between Britain and the rest of the sterling area. It was in this category that the direct effects of the experiment in convertibility, and of the resultant disastrous run on sterling, was experienced.

As Table II shows, the total depletion of reserves was more than four times as great as in 1946—a net deterioration of nearly £800 million. The increase in Britain's own direct dollar deficit on current account, from £340 million to £626 million, accounted for £286 million of this, and the rest of the sterling area accounted for £228 million. In addition, there was a deterioration of no less than £237 million in the balance of

hard currency payments between the whole sterling area and non-dollar countries, while an additional £48 million of dollars had to be provided for subscriptions to the International Bank and Fund.

The United Kingdom, in addition to its current account deficit of £626 million with the dollar area (defined as the United States, Canada and other "American account countries"), had a deficit of £54 million with the rest of the Western Hemisphere (principally Argentina), and one of £75 million with the other non-sterling countries, making a total of £755 million, compared with £350 million in 1946; but a UK deficit of £30 million in 1946 with the sterling area was last year converted into a surplus of £80 million. The global current deficit for the United Kingdom was therefore £675 million, compared with a revised estimate of £380 million for 1946 and the "Economic Survey" programme of £350 million for 1947.

It is instructive to analyse the sources of this deterioration. The debits and credits are set out in detail in Table I, which shows that imports at fob values rose by 44 per cent, from £1,092 million to £1,574 million. But the actual volume of imports rose by only 14 per cent. In other words, only £153 million of the expansion was due to the increased bulk of imports; the remaining £329 million of the addition to the bill resulted from an average rise of 26½ per cent in prices—an increase which accounted for over £30 million more than the whole deterioration of £295 million in the final deficit. Although the import figure was increased by no less than £44 million by the cost of ships purchased last year, it demonstrates strikingly enough the devastating effects of the worsening of the terms of trade. Government expenditure abroad has, of course, fallen sharply, thanks to a reduction by almost two-thirds in military expenditure, and an even steeper decline in payments for relief and rehabilitation; these reductions have more than offset the effects of a doubling of the net cost of the British zone in Germany. Other invisible items, taken as a whole, are most disappointing; instead of yielding a considerable net revenue, they actually show a net deficit of £15 million. In 1938 there was a net invisible surplus of £248 million. Though it does nothing to explain this depressing performance in 1947, it should be noted that the apparent deterioration, by no less than £129 million compared with 1946, is partly illusory; imports in 1946 included substantial shipments from British-owned stocks abroad: in consequence, a corresponding credit for the value of these goods was included in miscellaneous invisible receipts, which were not similarly inflated last year.

Even more illuminating is a comparison of the actual results for 1947 with the original estimates for that year—a comparison which is free from such fortuitous distortions. The error in the forecasts was much greater than the worsening of £325 million in the deficit, compared with the "Economic Survey" estimate, implies. The rise in prices, as already noted, added £329 million to the bill for imports, while exports, despite the rise in prices, yielded £75 million less than the £1,200 million for which the "Economic Survey" budgeted. Government expenditure exceeded the estimate by £36 million, and other invisibles (net) cost £15 million instead of yielding £75 million. The gross deterioration, by comparison with the estimates, was

opened firm, and rose to 1½ premium. But the nature of the recovery in gilt-edged stocks suggests that technical factors have played an important part. It would be surprising if the further development of counter-inflation throughout the world is not accompanied by some further rise in interest rates in Britain in due course.

How Far Have Profits Risen?

The Government's statement on personal incomes has been followed by a good deal of unthinking comment based on the assumption that profits of industry represent an unfailing source from which higher wages can be paid. In this controversy, there is a good deal of cant, not confined to one side, and all too few facts. Everyone knows that profits have not stood still while wages have been rising; but that is only to say that during a period of active inflation every factor of production whose reward is not fixed can expect to do well in money terms.

But the notion that ordinary shareholders, as a class, have been doing outrageously well during the past year is not supported by the facts. The usual course of the critics is to go down the columns of the financial press and underline the cases in which striking increases in dividend rates, or in trading profits, have occurred. This unscientific method has the advantage, for their purpose, of leaving entirely out of account the many cases, among large companies particularly, where dividends have been increased little, if at all, during the year.

Since official figures on profits are so late, and so inadequate, no apology is needed for reprinting two tables from the Com-

mercial History of 1947, which appeared with last week's issue of the *Records and Statistics Supplement to The Economist*. No one knows better than those who have the task of preparing these statistics how many pitfalls occur in handling profits figures. The figures are struck after provision for EPT and Profits Tax; therefore in 1947, they show some relief, but not the full relief, from the withdrawal of EPT from January 1st last year. On the other hand they do not reflect the increased cost of Profits Tax as provided, with retrospective incidence, in the November Budget. All the figures are shown before any deduction for standard income tax; those profits figures which are published by companies after deducting standard income tax have accordingly been adjusted upwards. Finally, the figures relate, not to all companies, but to a large and representative sample of public companies (mainly industrial companies); therefore, they do not include profits of private companies or of small businesses and traders, which have recently attracted adverse comment.

Profits, before tax, but after EPT of these nearly 2,000 companies increased by 25 per cent, from £346.4 million to £435 million, in the latest year. The amount of profits paid out in

ordinary dividends, however, increased by a much smaller absolute sum, from £183.8 million to £220 million—an increase of rather under 20 per cent. On the other hand, the total amounts placed to reserves rose from £86.1 million to £137.7 million—an increase of 60 per cent. Expressed in another way, the proportion of profits (after meeting debenture interest) paid in ordinary dividends fell from 56.2 per cent to 52.7 per cent, while the proportion set aside to reserve rose from 26.3 per cent to 33.1 per cent. These figures are surely sufficient evidence that, while profits and dividends have increased—which no competent observer has ever attempted to deny—the measure of the increase is relatively moderate (having regard to the fall in the value of money) and, so far as the major public companies are concerned, it would not go very far in meeting claims for increased wages. After all, increases in wages granted last year were at an annual rate of £90 million; the rise in the dividends of public companies is far smaller than this figure. And the analyses of trading profits and net revenues which many major concerns—Imperial Chemical Industries, Vauxhall Motors, Dorman Long and United Steel Companies among them—now publish, show the small extent of the residue of net profit available for paying dividends, after all expenses of trading, including wages, have been met.

A final point remains on dividend rates. Much is made of the high percentage rates of dividend on certain shares, because the critics do not or will not recognise that the percentage is calculated on the nominal amount of the shares in issue, and not on the effective capital which is employed in the business. The average rate of dividend paid on nominal ordinary capital by these public companies last year rose from 12.4 per cent to no more than 15.5 per cent. Can that be called "chucking the money about"?

Meat for Railways

There could be no more apposite illustration of Britain's balance of payments difficulties and of the shifts and expedients to which they are driving this country than the Anglo-Argentine commercial and payments agreements initialled this week. The full details of the agreement have not been published as *The Economist* goes to press, but sufficiently circumstantial reports have appeared from Buenos Aires to reveal its main outlines. The commercial agreement covers a programme of imports and exports for 1948. Argentine exports to Britain this year are expected to amount to £190 million. This compares with a figure of £118 million for the first eleven months of 1947. The increase is in part due to the higher price which Britain has contracted to pay for meat this year. As against this £190 million of imports from Argentina, Britain is planning to export goods to the value of about £40 million to that market. This compares with a figure of £31 million for the first eleven months of 1947. The difference of £150 million is approximately equal to the amount which Argentina has undertaken to pay for the British-owned railways. This sum is apparently to be made available immediately to Argentina by an advance from the British Government. The railway stockholders will be paid out of this credit, which will then be reimbursed in the course of the year out of the surplus of current Argentine trade with Britain. This leaves untouched Argentina's accumulated sterling balances, which must now amount to about £140 million and out of which it was expected that the railway deal would be financed. The greater part of these balances is protected by a gold guarantee.

The deal with Argentina, therefore, is tantamount to "swapping" the British-owned railways in that country as consideration for one year's current trade deficit. This is living from hand-to-mouth with a vengeance. The meat ration is thus safeguarded for another year by throwing overboard capital assets in which British investors have sunk £250 million over the past 60 years. What happens in 1949, when there will be no more reserves of this kind to throw into the current Anglo-Argentine balance is a problem which, in accordance with the Government's present technique, can be left to look after itself when it arises. There is always the possibility that Marshall aid will have come to the rescue by then.

The actual method chosen to finance the railway deal, namely the use of currently earned sterling instead of accumulated balances, is of no particular consequence. One can, however, extract some satisfaction from the fact that the Argentine is maintaining a substantial part of its external exchange reserves in the form of sterling. It is also probable that if accumulated balances had been used to finance the railway deal, Argentina would have insisted on obtaining a gold guarantee for the £150 million to be accumulated as a result of current trade in 1948. Since the war

Britain has successfully resisted demands for gold guarantees on sterling currently accruing to other countries. The agreement with Argentina at least avoids a break-up of the tradition and the setting-up of a new precedent.

Payment at Last?

While few people in this country will condone the means by which Argentine railway stockholders are finally to receive payment for their stocks from the Argentine Government it will be generally agreed that it is high time the payment was made. Over five months have passed since the purchase scheme was due to be

implemented and a full year since the purchase price was agreed. When Sir Montagu Eddy set out for Argentina last September it was fully expected that the final arrangements for the payment to stockholders would soon be agreed with the Argentine Government. It is clear now that Argentina had other ideas, and meant

fresh fields for endeavour

Because of their great importance in the economic life of the world, the Dominions of Australia and New Zealand afford many opportunities for commercial development and expansion. The British industrialist who contemplates establishing a branch or a business 'down under' will find ready help at The Bank of Australasia, where an extensive fund of up-to-date commercial information and complete banking facilities are at his disposal. Please address enquiries to the Overseas Department.

THE BANK OF AUSTRALASIA

(Incorporated by Royal Charter 1835)

Head Office: 4, THREADNEEDLE STREET, LONDON, E.C.2
(Manager: G. C. Cowan)

to drain the utmost value from the railway purchase scheme as a bargaining counter for a trade agreement.

The original intention of the Argentine Government to draw from its sterling balances the major part of the amount to pay for the railways has now been superseded by an arrangement whereby they will be paid for by a credit to be made available at the Bank of England by the British Ministry of Food in favour of Argentina against commodity shipments in the coming year. The agreement provides for a payment in cash to stockholders without delay on the basis of the payments proposed at the end of May last year and finally agreed by them and sanctioned in the courts last August.

The pessimism which had gained ground in the Argentine rail market during the months of delay since last September abated little until the end of last week, and prices had fallen to substantial discounts compared with the take-over prices. On Monday prices were marked up to within 5 per cent of the payment prices, but they have not moved any higher, since the feeling persists that the Treasury or the Argentine Government might even yet find occasion for delaying the transfer of the purchase money. But it seems unlikely that, after such a long road has been travelled in the negotiations, either party to the general agreement would withdraw at this stage.

Grain Prices and the Rice Crop

The collapse of American grain prices, which began ten days ago, has continued this week, after a feeble rally on Monday. By Wednesday, March wheat was selling at \$2.43 a bushel, or 18 cents above the parity price, compared with \$2.85 a week before and well over \$3 a bushel towards the end of 1947. Three dollar wheat is high, even making full allowance for the world grain shortage; but wheat was bid to this level largely by the pressure of US Government buying (with additional support from speculators) to fulfil the European recovery programme. But this high price served at least one useful function, for it prevented the diversion of a large part of available wheat supplies to feeding livestock. It is estimated that only 200 million bushels of wheat have been used for this purpose during the current season. This is more than the 180 million bushels so used in 1946-47, but far less than

Machines to Europe

In shipping goods from one country to another both Exporters and Importers encounter continually changing problems and varying regulations. Williams Deacon's Bank Limited

the estimate last summer, after the failure of the maize crop, that at least 400 million bushels of wheat would be fed to pigs and cattle.

Since the turn of the year, grain prices have been falling with each report of improved prospects for this season's harvests. The era of three dollar wheat may well be over, but even the sharp fall in Chicago grain prices will do little of itself to ease the world shortage—unless farmers fear a wholesale collapse. Admittedly, farmers may market stocks sooner than they had intended, but there are no large grain surpluses anywhere—and certainly not in the United States. The heavy slaughtering of livestock in America over the past nine months suggests that there may be a prospective shortage of meat and milk. And in the absence of price controls, a lower wheat price may turn wheat into a profitable animal food. Moreover, even the large harvests in Argentina and Australia and the greatly improved prospects of the European summer crops will not cause a glut of supplies on the grain market, assuming that deficit countries are not hampered in obtaining supplies by lack of foreign exchange. In this, Marshall aid will play an important role, for America as well as Europe. The level of wheat consumption is sufficiently low in Europe and stocks are so exhausted that deficit areas will in all probability be able to absorb heavy crops in 1948-49 and in 1949-50 before they return to their prewar standard of consumption. Over this period, however, the general trend of grain prices, in the absence of continued inflation or short crops, should be downwards.

An important factor in the grain market, however, is the prospect of a bumper rice crop in Burma this year. The yield is expected to be the largest for ten years, but acreage has not yet regained its prewar level. Burma is the world's largest exporter of rice and the chief source of supply for India, Ceylon and Malaya. Its prewar annual exports averaged nearly 3,000,000 tons; the export quota for 1948 was provisionally fixed at 1,500,000 tons, but it is now confidently hoped that this figure will be exceeded by a substantial margin. A more ample supply of rice for the East would obviate the need to divert wheat supplies to these areas. It would also be an important factor in promoting economic and political stability in a region which can contribute greatly towards rectifying the world shortage of primary foods and raw materials.

The Export Task

Progress towards the mid-1948 export target of 140 per cent of the 1938 volume has so far been disappointing, and the waning of the sellers' market for many British exports, coupled with increased costs caused by higher wages and dearer raw materials, will make the task of achievement still more difficult. The terms of trade continue to move against Britain, and add yet a further

strain to its balance of payments, and are putting the 1948 import programme of essential food and raw materials in peril.

The expansion in volume of Britain's main exports during 1947 is shown in the accompanying table. It is not a very cheerful picture. Exports of vehicles increased in spectacular fashion throughout the year; in the first three months they were 50 per cent above the 1938 volume and by the last quarter were well over double. Even so, they are still 14 per cent below the mid-1948 target, and vehicle exports are particularly sensitive to price

competition. Machinery exports—the other mainstay of the export drive—showed satisfactory progress up to the last three months of the year when their rate of increase declined quite considerably. They have still to expand by 24 per cent to reach their June target. Exports of other metal goods also tended to decline in the last quarter of 1947.

Textile exports increased slowly over the year, despite a significant rise in the shipment of woollen and worsted goods during the last six months. But only a phenomenal increase in output can ensure the attainment of their mid-1948 target, which requires a 30 per cent increase in the volume of exports. Recruitment into the textile industries has recently been showing a more satisfactory trend, but many more workers are still needed. Britain's balance of payments difficulties would have been much smaller if the volume of textile exports had been more satisfactory in 1947, particularly since export prices of textiles in December

IMPORT AND EXPORT PRICES

Index (1938=100)	Sept.	Oct.	Nov.	Dec.
Imports:—				
Food, drink and tobacco.....	254	238	239	239
Raw materials.....	281	288	295	302
Manufactures.....	259	264	267	269
TOTAL.....	254	256	259	261
UK Exports:—				
Food, drink and tobacco.....	225	224	222	226
Raw materials.....	236	239	246	241
Manufactures.....	257	258	241	243
Metal goods.....	216	217	218	221
Textiles.....	315	317	321	324
Others.....	225	227	232	232
TOTAL.....	236	237	240	243

were 224 per cent above their 1938 level. By contrast, prices for metal goods were only 121 per cent higher. Among the less important export industries, pottery and glass expanded steadily over the year, but exports of cutlery, electrical goods, chemicals and paper all declined in volume during the last quarter of 1947.

Both export and import prices continued to rise in December, being each 1 per cent higher on the month. But over the whole year import prices increased by 19 per cent and export prices by only 16 per cent. The sharp increase (14 per cent) in the export value of raw materials during the last month of 1947 was entirely due to the higher price for British coal which became effective on December 1st. Given the larger volume of coal exports which is in prospect in 1948, the hope of a significant reduction in the trade deficit is reasonable. But the most disquieting feature is the rise in the prices of imported raw materials (28 per cent last year) and of imported manufactures (30 per cent). Since import prices of food, drink and tobacco rose by only 10 per cent, it follows that, other things being equal, proportionately larger cuts would have to be made in the volume of these imports in order to reduce the adverse trade balance.

Dollar Drain

The details of the monthly dollar drain given in this week's White Paper, discussed in an article on page 273, carried the story only to the end of 1947. Up to that date the monthly figures showed a steady decline which, though slower than might have been hoped, at least did not seem to have exhausted the downward impetus. But additional evidence has accumulated this week to suggest that if the series were brought right up to date a distinctly more disquieting impression would be given. In a Note in these columns last week on the latest monthly statement of gross sales of gold, it was assumed that a fair proportion of the loss in January was probably made good by final purchases of gold from South Africa under the 1947 gold purchase contract. The Chancellor revealed this week, however, that the amount of these purchases was very small, which suggests that the net sales of gold last month must actually have been distinctly larger than in December. Whereas in November and December (as the table on page 274 shows) the total net drain on reserves declined by £8,000,000 and £11 million respectively, it seems that in January there may even have been a slight increase—or, at best, only a fractional further decline.

Meanwhile, a further draft of £25 million on the US credit was announced at the end of last week, leaving only a further £25 million available, so that presumably the whole of the credit will run out during next month. The holdings of gold and of

No kind of science can possibly flow, save from some pre-existing knowledge of more obvious things.

WORKING TOGETHER—the District Bank and its customers.

DISTRICT BANK LIMITED

The task is not easy, and it is early to judge its chances of success. Mr Edwards spoke of a systematic attempt to provide nurseries and other welfare facilities to attract married women into the industry, and he even mentioned that other incentives and extra rations were being considered. He obtained the support of the spinning and cardroom workers' unions for working 2½ hours overtime a week "until a date to be agreed." This will not be

enough by itself, but it will help—if the trade union leaders in the industry are able to get better support from their branches than they have been getting in recent months.

Imperial Tobacco

The reduction in the dividend payment of Imperial Tobacco from an equivalent of 35 to 33 per cent gross for the year ending October 31, 1947, gives a favourable impression of the company's performance in the light of the increase in the tobacco duty last April and its loss of output during the fuel crisis. But the fall in earnings on the ordinary capital from 46.5 to 35.6 per cent was much more severe, and it was brought about by the double impact of the fall of 9½ per cent in trading profit (excluding exceptional profits arising from the revaluation of stocks consequent on the increase in the tobacco duty) and of the substantial increase in the provision for taxation—from £8,450,000 to £9,785,000, of which £6,985,000 was provided for income tax. It is clear even from the preliminary statement that profits tax is bearing more heavily on earnings than EPT, the incidence of which appears to have been comparatively light in the case of Imperial Tobacco.

No doubt the company will have something more to say on the vexed question of tobacco stocks in the course of the next month or so, for the preliminary profit figures do not carry the stockholder very far in appraising the present position, except to indicate that sales have evidently declined over the full financial year and must consequently have fallen sharply after the Budget. But two points are made on the financial aspect of the stock position. The exceptional profit made on the revaluation of stocks after the increase in the tobacco duty last April has been placed to contingencies reserve in keeping for a reversal of the Budget wheel, when that comes about. And, in addition, it is proposed to transfer to redemption reserve £1,000,000 set aside in 1945-46 for a special leaf cost reserve, which indicates that it has not been required for its original purpose. This information is useful, but the full accounts will be carefully examined for any indications about changes in physical stocks, or in the total cost of carrying them—they were valued at £80½ million in the balance sheet for 1945-46—and for new light about short-term borrowing, which involved a commitment of £46 million in those accounts. The price of the £1 ordinary stock units has traced an erratic course over the past few weeks as hopes have risen and fallen in expectation of tobacco being sent to this country under Marshall aid; at the present level of 5½d the yield is £5 17s. 4d. per cent. From this it would appear either that the future prospects are not held too high or that the market suspects that the deterioration in the stock position of Imperial Tobacco is worse than is apparent from the data at present available. The full accounts and Sir Robert Sinclair's statement will be of exceptional importance.

Heavy Supplementary Estimates

The presentation this week of supplementary estimates of no less than £135 million for the Civil and Revenue departments for the current financial year may come as rather a shock to those who lately have too readily deducted from the large income surpluses of this bumper revenue season that the momentum of Government expenditure is still downwards. Perhaps the most disquieting feature of these large additional outlays is that they are very widely spread, although there is some reason to hope that savings on other votes may suffice to keep this year's total expenditure by the Civil departments within the provision made in the Budget. That, however, is a poor consolation, for it is upon the prospective requirements of 1948-49 rather than upon the actual net expenditure in the current year that attention is naturally focused, and these new demands are a poor augury for the future.

The largest item is a net £47½ million for the Ministry of Food, whose net requirements for trading services are now estimated for the current year at £364 million in contrast with £313 million at the time of the Budget—an increase which measures the rapidly rising strain of the food subsidies. For the Ministry of Transport £40 million is required for the so-called war services—£12½ million to reimburse the deficit of the net revenue of the railways under the Railway Control Agreement, £9,500,000 for additional outlays on hire and operation of ships (which will require £94.7 million compared with an original estimate of £85.1 million) and an additional £2,000,000 for purchase and building of ships. In addition, £22½ million is needed for "deficiency in appropriations-in-aid"—the resultant of some

large cross-items the most important of which is the £43½ million guaranteed net revenue of the railways, offset to the extent of £18.3 million by receipts by the Transport Commission from sale of works and equipment. The West African Produce Control Board requires nearly £14 million for distribution under the Cocoa Control Scheme to Governments of the producing territories of profits realised in the seasons 1945-46 and 1946-47. In addition, £7,300,000 is required for Civil Aviation, mainly to reimburse the losses of BOAC and BEAC, and £8,700,000 is needed by the Ministry of Health for payments under the Emergency Housing and Emergency Hospital Services, and for interim grants to hospitals "to enable them to maintain proper services pending the establishment of a national health service."

Tin Controversy Continued

The controversy over the price of Malayan tin continues. A meeting between the Ministry of Supply, the Colonial Office and the Malayan Chamber of Mines is due to take place this week-end to discuss the Government's bulk purchase price and the question of a premium for Straits tin. Before the war Straits tin commanded a higher price because of its better quality, but as improvements have since been made in other types of tin, there is room for argument whether a premium for Straits tin is still justified on purely technical grounds. When the Ministry of Supply raised the Malayan price from £423 to £500 a ton last December, it subsequently transpired that this price was the same as the American price for Bolivian tin, and Malayan producers feel that their price should be higher. In any case they maintain that £500 a ton is too low for the Chinese section of the industry.

Since tin is an important earner of dollars, it is obviously in Britain's interest broadly to get as high a price for it as possible, subject to certain conditions. Maximum dollar revenue, however, cannot be the sole criterion of price policy. British consumers of tin will not welcome another increase in raw materials costs, particularly if it affects their export business. Equally important, what will be the American reaction to any rise in Malayan tin? No doubt a formula for a premium payment could be devised which would not necessarily lead to a further increase in Nigerian and Bolivian contract prices. But if, as reports suggest, American consumers strongly opposed the payment of a higher price for Straits tin, could Britain afford to disregard such opposition? The United States exacts strong pressure by virtue of the Marshall Plan alone, and Congress has still to decide the fate of the Texas smelter. The recent report of the Reconstruction Finance Corporation suggested among other things the imposition of the import duty on tin metal to enable the Texas smelter to operate without Government subsidy.

Moreover, it will be interesting to see to what extent the new price of £500 a ton does in fact restrict Chinese tin production in Malaya. Output of Chinese mines in January, 1947, was 493 tons, and it increased steadily to 1,219 tons in September. The price during that period was £423 a ton. Was this expansion carried out in the expectation that the tin price would be raised to £575 a ton? Malayan tin producers might be heard with greater sympathy if they did not plead for uncontrolled prices in a period of high inflation—such as exists nowadays—and demand a restriction scheme as soon as prices turn downwards. Market stability is certainly desirable, but it implies the determination of a "just price" which offers an adequate return to producers and is acceptable at the same time to consumers. No formula has yet been invented to calculate a "just price"—and a round table conference of producers and consumers is least likely to produce one.

A New Deal in Coal Prices?

Mr Herbert Morrison's remarks at Brixton last week-end that the Coal Board "is trying to devise a new and more rational price structure for the coal industry" should not be taken to foreshadow any immediate change. Indeed, Mr Morrison was not revealing anything very new, for he merely repeated what Lord Hyndley had disclosed last December in a review of the Coal Board's work. In fact, mining engineers and colliery management have been concerned for some years with the problem of relating quality and prices more logically. The British Coal Owners' Research Association, in its report on grading and sizing, made an advance in the direction of a remodelled price system by devising the terms on which such a system could be based. The Coal Board has taken up the question where the coalowners left it, and is attacking the problem of applying in commercial

STOPPED—FOR REPAIRS

Water can be a major nuisance to industry for it may cause scale deposits or corrosion which reduce efficiency in heating and cooling systems or block the main supply.

The introduction of minute quantities of 'Calgon' (sodium metaphosphate) into industrial water systems is now a recognised way of preventing scale formation, corrosion, and the troubles which follow in their wake.

ALBRIGHT & WILSON LTD

CHEMICALS

CALGON, MICROMET—

TRADE NAMES FOR SODIUM METAPHOSPHATE

We all had a sharp reminder last winter of the importance of coal. The English Electric Company helps to solve the coal problem in two vital ways—first, by the manufacture of more electrical equipment for the mines, to speed production and improve conditions for the miners; second, by ensuring the efficient utilisation of the coal by designing and manufacturing the best possible generating plant so that Britain's factories can have more electricity to make more goods.

THE ENGLISH ELECTRIC COMPANY

Robert of Chester

brought the science of chemistry to Western Europe, 800 years ago. Of this remarkable man's origin little is known except that he was probably born in Rutland. He was certainly educated at the then flourishing school at Chester, after which, following the custom of the times, he studied at the Moorish universities in Spain. The Moors or Arabs were the world's leading scientists at that period. On February 11th, 1144, Robert completed the translation into Latin of an Arabic treatise on chemistry. This was Europe's first chemical textbook.

No doubt he also brought with him from Spain one of the flowing Arab robes which, as the "gown" of British universities, still serves to remind us that a close bond once linked the scholars of East and West. He could no more have dreamed of the place this garment was to occupy in later years than he could have imagined the future of another Arabic treatise he translated. This was a work by a celebrated mathematician, Khwarizmi, on a branch of mathematics developed by the Arabs and still known to us by its Arabic name, algebra. Besides his extensive works in mathematics, Robert made the first Latin translation of the Koran. Europe owes an immeasurable debt to this Englishman. But for him, the knowledge of the East of chemistry and mathematics might have remained a closed book to the Western world for centuries afterwards.

UNIVERSITY OF OXFORD

The Delegacy for Social Training proposes shortly to appoint a Senior Tutor (Woman), the appointment to begin as soon as possible. The stipend will be £600-£700, according to age and experience, and will be subject to the conditions of the Federated Superannuation System for Universities. Children's allowances are payable under the system in force in the University.

Applications for this post (six copies), with the names of three referees and a short account of the applicant's qualifications, experience, and academic career, should be sent before March 15th, to the Registrar, University Registry, from whom further particulars can be obtained. Testimonials are not required.

The choice of the electors will not be limited to those who apply.

UNIVERSITY OF LONDON

LEON FELLOWSHIP

Applications are invited for the Leon Fellowship for Research (preferably in the fields of Economics or Education) for the Session 1948-49. The fellowship is of the value of not less than £500 a year, and is tenable in the first instance for one year. It is not essential that candidates should be members of a university. Selected candidates will be required to attend for interview. Further particulars should be obtained from the Academic Registrar, University of London, Senate House, London, W.C.1, and applications for the Fellowship must be received not later than April 1, 1948.

UNIVERSITY OF LONDON

The Senate invite applications for the Readership in Economics (Banking and Currency) tenable at the London School of Economics and Political Science (salary £800-£1,000-£1,200). Applications must be received not later than April 20, 1948, by the Academic Registrar, University of London, Senate House, W.C.1, from whom further particulars should be obtained.

UNIVERSITY OF GLASGOW

Applications are invited for the following posts, tenable from October 1, 1948.

Political Economy: One Lectureship, Assistantship.
Economic History (Modern): One Lectureship.
Political and Social Institutions: One Lectureship.
International Relations: One Lectureship.
Sociology: One Lectureship.
Social Psychology: One Lectureship.

Appointments will be made according to the University Grading Scheme. The initial salary for the Lectureships will be between £450 and £600, and for Assistantships between £350 and £450, and will be fixed in each case according to experience and qualifications. Applications (three copies) should be lodged, not later than March 1, 1948, with the undersigned, from whom further particulars may be obtained.

ROBT. T. HUTCHESON,
 Secretary of University Court.

CANADIAN PACIFIC RAILWAY COMPANY—(Incorporated in Canada with limited liability)—DIVIDEND NOTICE—ORDINARY CAPITAL STOCK—A meeting of the Board of Directors held today, a final dividend of Three per cent (seventy-five cents per share) on the Ordinary Capital Stock in respect of and out of earnings for the year 1947 was declared payable in Canadian funds on March 31, 1948, to shareholders of record at 3 p.m. on February 23, 1948. The Directors consider it desirable to point out that this dividend of three per cent, making a total dividend payment of five per cent in respect of operations for the year 1947, is made possible only by income from sources other than railway operations. Continued increases in gross earnings from freight traffic had been largely offset by decreases in passenger traffic and by increases in wages and the cost of materials and supplies. By order of the Board, FREDERICK BRAMLEY, Secretary. Montreal, February 9, 1948.

NORANDA MINES LIMITED

DIVIDEND NOTICE.

Notice is hereby given that an interim dividend of Seventy-five Cents (\$75) per share, payable in Canadian funds, has been declared by the Directors of Noranda Mines Limited, payable March 15, 1948, to shareholders of record at the close of business February 13, 1948.

Toronto,

By Order of the Board,

February 4, 1948. J. R. BRADFIELD, Secretary.

EXPORTS, IMPORTS AND FOREIGN EXCHANGE. Accountant, aged 46, with initiative and tact, fully conversant with existing Currency Regulations and Procedures here and abroad, having 26 years' practical commercial experience, seeks responsible appointment.—Box 666.

WOMAN graduate with varied experience in commerce and public service, including statistics, buying, office organisation, secretarial and personnel work, seeks interesting position requiring energy and initiative. Willing to travel.—Box 665.

ECONOMIST, journalistic experience, interested in research; fluent French, German, some Spanish, familiar publicity work, seeks editorial or managerial post with periodical or business organisation.—Box 660.

CAPABLE woman (free from direction), wide experience, 25 years in Home and Export Trades, requires appointment as Personal or Administrative Assistant. £450 p.a.—Box 668.

ADMINISTRATION.—Applications are invited for senior administrative appointment in Food Processing Company (Home Counties). The position will be advisory to Managing Director and will carry initial salary of not less than £1,750 p.a. Candidate must have University Degree (Economics, Sociology or Psychology) with wide industrial experience, with emphasis on personnel, industrial engineering, and cost control study of modern methods of organisation desirable. This is an important appointment with excellent prospects for a keen, enterprising, young executive who has courage, imagination and capacity for hard work. Apply, in confidence, stating age, education and full details of career with salaries earned, to Box 667.

EXPERIENCED sales and advertising executive seeks permanent post with scope for brains, initiative and modern idea on marketing and management. Public school man of proved ability and adaptability, including war service. (Lt.-Col. M. of S.)—Box 663.

spread to the whole economy and ushered in a short but violent slump. On the other hand, a slight break in prices first in 1946 then in 1947, both interpreted as signals of a recession at the time, proved to be no more than wobbles in a rising line.

The economic prophets in America are proving much more cautious on this occasion, and even while they predict no recession, they are conscious of the strength of the purely subjective factors which have to be taken into account. "Business confidence" is both the most vital and the most unpredictable element in the trade cycle. However, with all these precautions in mind, most American comment suggests that the break in grain prices merely marks the end of excessive price inflation brought on in recent months by the belief that the American harvest would be small and that the whole world would be fighting for it. It is now clear that it may be big and that Europe's harvests, too, will also be more favourable. If this analysis is correct, the recent fall in American grain prices may be of some assistance to the passage of ERP. On the one hand, dollars spent under the programme will buy more food. On the other, the farming *bloc* may begin to display more interest in the maintenance of their markets abroad.

★

Caution is, now as always, a vital instrument in analysing the state of a union as vital, turbulent and complex as the United States. Yet there may be ground for reasonable optimism. It is not only that the economic position seems to be growing a little easier. The political situation is more promising than anyone a year ago had a right to hope. In March and April, 1947, many weeks of grudging, disgruntled debate were necessary to obtain \$400 million for aid to Greece and Turkey and the country at large made little secret of its dislike for the Truman Doctrine. Today, even if the unanimous approval given to ERP by the Senate Committee on Foreign Affairs is the first and not the last step in the Bill's legislative journey, it is, nevertheless, a very significant one. There is much evidence to suggest that the House of Representatives will be strongly influenced by the Senate and it is clear that Senator Vandenberg has established an undisputed position of leadership in the Republican Party. It is above all to his guidance that the safe passage of the Bill through the Committee stage is due. His compromises have saved the day when a number of ugly deadlocks threatened to arise. For instance, while insisting on the moral obligation to continue the Aid Programme through four years, he suggested the withdrawal of the President's proposal of \$17 billion for the full period on the sensible grounds that in the fluid state of the world, it could not be said whether the sum would prove too little or too much. Again, he found a way between the President's demand that the administrator of ERP should be virtually an assistant secretary in the State Department, and the Republican desire for an independent corporation staffed with business men. He proposed instead a single Administrator who would have separate Cabinet rank and whose disputes (if any) with the State Department would be settled by an appeal to the President. Again, in the most difficult issue of all, upon which the "isolationists," Senator Taft and Mr Hoover, had fastened—whether the proposed first instalment of \$6,800 million is not, in fact, too large—Senator Vandenberg saved the principle by limiting the appropriation to the period running from April to January and settling for \$5,300 million, \$3 billion of which will be set aside from the large surplus achieved under the 1947/48 Budget.

Nor have Senator Vandenberg's achievements been merely tactical. He must share with Mr Marshall the most notable achievement of contemporary American politics—that in an election year the greatest issue in foreign policy, aid to Europe, has remained firmly bi-partisan. Both men have been assisted by responsible leaders outside Washington—including Governor

Dewey, Mr Stassen, and Mr John Foster Dulles. But it is in Washington that most of the harm could have been done. Attacks there have been. For instance, it is from opponents of the whole conception of ERP that the driving force has come to get more aid for China, if necessary at the expense of Europe. And there have been constant attempts to get the actual figure reduced. Yet the sniping on the side has not yet modified the remarkable fact of a Democratic President and a Republican Congress pursuing jointly a really revolutionary and anti-isolationist foreign policy in election year. Perhaps this fact of anti-isolationism is the most remarkable of all. Who would have thought that within a year of the hotly contested Truman Doctrine, an isolationist should be one who "thinks that \$4 billion is quite enough for Europe this year"? The revolution in American thinking in the last two years has scarcely a parallel in history, and it has been accomplished, not by the drumming propaganda of some totalitarian tyrant, but by the spontaneous movement of a freely-thinking people.

At this point there may be some people in Europe, particularly in this country, who will be tempted to lean back and argue: "American aid is certain. Our troubles are over. We can now rely on four years of dollar aid. All the expedients and policies we thought might be necessary can now be set aside." No state of mind could be more mistaken or disastrous. If one thing emerges more clearly than any other in the hearing of evidence in the Senate—evidence by the Government, public servants, leaders of public opinion, distinguished private citizens of the quality of Mr Bernard Baruch, evidence even by the lunatic fringe—it is that the Americans regard ERP as a programme designed not so much to help Europe as to make European self-help possible. The critics have already given notice of the line they will pursue—that Europe is simply waiting to get its hands into the American pork barrel and that gestures of self-help will end the moment it does so. Senator Taft has departed to the country with such forebodings in mind. Others—particularly in business circles—are already expressing the same views openly. On the whole, debates, official and otherwise, have been remarkably free of any desire to "put strings on American aid" and most Americans go out of their way to disclaim any intention of intervening in other countries' political and social affairs. But they cling all the more tenaciously to the demand that Europe shall show signs of a vigorous will to recovery and that it shall pursue that recovery not as a queue but as a team.

★

The reason why Mr Bevin's speech adhering to the concept of Western Union aroused such astonishing applause in the United States was that it put an end to a period of doubts whether Britain might not in fact be sabotaging Western association. Disappointment and anger will be all the greater if, after many fine words, not a single concrete consequence is worked out. One thing and one thing only could turn the United States back in its tracks and send it off down the old road of isolationism: the conviction that Europe's protestations of work and unity were simply window-dressing designed "to make Uncle Sam a sucker once again."

Of all issues connected with ERP, this is the most urgent. The need for American aid to Europe not only this year, but for three or four years to come is admitted by all, but perhaps Europeans should be reminded that that aid will be allocated year by year, by separate Congressional appropriations, each accompanied by the closest scrutiny of Europe's achievements that a highly critical body can apply. If the record of Europe is to be that mixture of great phrases and virtual inaction which is all there is to show for the first two months of 1948, then it is a fair prophecy that the second appropriation will be voted with distaste, the third with difficulty and the fourth appropriation not at all.

Exorcising the Symptoms

ON Thursday last week, the Government had an opportunity to explain, in simple and convincing terms, the arguments which had been put forward a week earlier in the White Paper on Personal Incomes. The Government have come, belatedly but rightly, to the conviction that a rampant cost inflation is in progress in Britain. Its exhortation, nominally addressed to all sections of the community, not to demand increased personal incomes has fallen with the greatest effect on the trade unions. This time, it is indeed the "workers' pennies" which are involved.

Sir Stafford Cripps did much in his speech to make the doctrines of the White Paper clear. He underlined the damage which inflation is doing to the British economy, and the threat which it presents to exports and the standard of living. High taxation, price control and subsidies have prevented the inflationary situation from getting out of hand. What then remains? First, to increase production over and above what has to be exported to pay for essential imports of food and raw materials; secondly, to prevent any further rise in money incomes which would force up prices and export costs. This simple exegesis led the Chancellor to his positive proposals—and as so often in the past, the diagnosis proves to be more acceptable than the remedy which the Government have to offer.

It was obvious that the political price which would have to be paid for a "stop" on wages was some *quid pro quo* in the form of increased profits tax or dividend limitation. In fact, the bargain which Sir Stafford outlined, and which has now been rapidly endorsed by the Trades Union Congress is that, in return for a general stabilisation of wages, there must be a reduction of prices and profits. In other words, the price for the stabilisation of money wages is an increase in real wages. In these circumstances, it is necessary to examine, seriously and objectively, the solution which the Chancellor proposed:

It is essential . . . that if wages and salaries are not to be increased generally, there must be a halt to price increases, and wherever possible a reduction in prices, to offset such rises as may be inevitable if there are continued increases in the prices of imported articles. Price reductions will lead to reductions both in overall and in distributed profits, and a decrease in prices is far the most satisfactory way to get that reduction of profits.

Those are the key words of the Government's proposals. They reveal in the clearest form the notion that the other factors in prices apart from wages, in particular profits, are big enough to stand—and in social justice ought to stand—the squeeze. They still suggest that high prices and high profits are a cause of inflation, while high wages merely represent an attempt on

the part of wage-earners to overtake the course of inflation. Causes and symptoms are here so hopelessly intertwined that the gravest doubt must be expressed about the logical foundation of the new policy of freezing prices—quite apart from its administrative complications. It is intended, first, to impose an "immediate ceiling" on manufacturers' prices "of all goods which come within the price control system, and have not already got a sufficiently close price control." Secondly, the Federation of British Industries and other organisations covering wholesale and retail distribution, have been asked by the Chancellor to work out, within the space of a month, "some plan for price and profit decreases."

It is hardly surprising that the FBI should have expressed concern about the magnitude of the task and the strict time limit which the Chancellor has imposed upon it. Indeed, where is its task to begin? What is a reasonable profit? And what, in a period of excessive inflationary demand, can be done to prevent "excessive profits" which, according to Sir Stafford, "upset the whole economic system and create false values"? The profits and prices are not causes; they are results. To attempt to restrict prices and profits without removing the basic forces which are pushing them up does not reduce inflationary pressure; so far as it succeeds at all, it bottles up the inflation at one point and is powerless to prevent it from bursting out at other points. That, surely, has been the lesson of all experience of price control during and since the war. Unless steps are taken through taxation or through the encouragement of an adequate volume of genuine savings to quench the excess of purchasing power that is being created, the control of prices of particular commodities merely diverts demand to commodities and services which are not controlled. And recent experience has shown all too clearly that the pressure of demand is forcing its way through the barriers of price controls and physical controls. An attempt, at this stage of inflation, to pursue a policy of deflation by public appeal can have little hope of success, unless appeals are backed by a determined policy of financial retrenchment.

It is not, indeed, that the new policy is original. It was tried in the ill-fated *expérience Blum* in France. In the United States, President Truman has on more than one occasion appealed for voluntary restraint to combat inflation. These experiments indeed had some partial success to begin with, but they failed in the end simply because they lacked the determined support of Governments to restrict credit and budget for genuine disinflationary surpluses. Nor, indeed, is it possible to put much faith in the machinery of price control, as Sir Stafford

£1,000 if you live for twenty-five years.

On earlier death, in addition to this £1,000, up to £5,000 payable to your dependants by instalments of £200 per annum (not subject to tax) for the remainder of the twenty-five years.

All this may be secured under the **FAMILY PROVISION SCHEME** for a monthly premium, at age thirty-five, of £5.1.1 reducing after seventeen years to £3.4.0.

outlines it. All the experience of wartime—when the problems were less intractable—shows how difficult, if not impossible, it was to control prices and profits. One lesson, indeed, did emerge at an early stage—namely, the inadequacies of the “cost-plus” form of price control. As a sop to the inefficient, and an encouragement to inflation, this method has no rival. Yet it is one which, in principle, is still largely relied on. The Chancellor himself admitted that if the price is so fixed as to allow a reasonable or small profit to the less efficient producers, then the more efficient are “almost bound to make large profits, especially where demand is unlimited.” That is the rub. The source of the excessive profits lies not in greed, but in excessive demand.

There must, moreover, be grave doubts whether the submission of this problem, with all its political overtones and its intimate connection with the Government's monetary policy, to such a body as the FBI is the proper course to take. To say that is not to question the public spirit which the FBI will bring to bear on a task which admittedly it did not seek and would doubtless gladly be spared. It is, however, proper to emphasise, with all seriousness, that if price control is the only democratic “solution” of the problem of inflation, the only body which should be entrusted with responsibility for it should be the Government. The Government, in effect, is trying to reach a dual bargain—on the one side, with the trade unions to limit their wage demands, and on the other side with the FBI to produce its own notions for the control of profits and prices. The result—if indeed there is any practical result—can only be a system of prices more rigid and more artificial than exists at present.

The Chancellor has put forward these proposals as the last chance to extricate the British economy from the toils of inflation. He regards them as a great test of democracy, and asks whether we can take them in a democratic way by free choice or have them imposed by force. This is not the first occasion in recent weeks on which the Chancellor's mind has turned to the dangers of totalitarianism, and his words are beginning to take on an ominous ring. It is no accident that the only country to impose a rigid system of price and wage stops in peacetime was prewar Germany, and even in that totalitarian context the policy was not conspicuously successful. It was difficult to administer, easy to evade by depreciation of quality, and produced a brittle inflexible economy which in the end contributed largely to Germany's downfall. From such a totalitarian solution, the Government would be the first to recoil in horror. But Sir Stafford Cripps does not forbear to put it as the only

alternative to his policy, if it cannot be carried through with the consent and support of both sides.

But already it is clear that the Government's proposals provide no remedy. They contemplate, as the TUC has been quick to perceive, an increase in real wages (and perhaps some increase in money wages) and a reduction in profits—as if, in defiance of all the facts, there were some natural counterpoise between the two. Even if profits are reduced, the resulting deflation of incomes derived from profits will make no very effective contribution towards a reduction of the pressure of excessive aggregate demand. This simple fact of econometrics makes all the present bickering about the size of profits irrelevant. And the consequence of stabilising wages at the present levels, and reducing prices would increase, not diminish, the harmful effects of money demand on the controls of prices and physical resources. Any system of stabilised prices which emerged could not last very long, unless it were enforced with extreme measures.

Is there, then, no way out? Does it come down, in the last resort, to a struggle between the extremists of Left or Right who—Sir Stafford half suggested—would alone decry the possibility of agreement? Is there no middle course by which root causes, and not mere symptoms, can be tackled? Surely the real remedy is not to get an outside organisation to attempt to frame a scheme to lop x per cent off prices and then pretend that inflation has been stopped. It is, quite simply, to use budgetary and financial policy as an effective weapon to counter inflation. Every attempt to check the symptoms without removing the causes is bound, not merely to fail, but to make failure more devastating in the end. The remedy for unsound money is not to fake the price system. Patients suffering from fever are not cured by a bogus temperature chart. Inflation requires a purge, not a pretence. And the purge which the Government should now apply, at this desperate stage, is a reduction of the supply of money in the hands of the whole community—by budgeting for a large, genuine surplus, by restraining credit, and by cutting the tremendous expenditures which it controls. That would, indeed, be a symbol of self-respecting democracy, for it would show that the Government were sufficiently sure of themselves and of their supporters to pursue the simple truth that a community cannot, for very long, enjoy more than it produces, and were prepared, at last, to strip down the illusion of monetary prosperity and to expose the truth and the challenge of hard times.

Marxist Centenary

A HUNDRED years have passed since a short pamphlet was published in Germany, which, almost unnoticed and unread at the time, was destined to mark a turning point in human history. This pamphlet, Marx's Communist Manifesto, must be counted the crucial document in the development of Communism. His weightier work, *Das Kapital*, was written years after to justify and develop the main ideas of the Manifesto, but the ideas themselves already appear in this first pamphlet in the finished form in which they invaded history.

The chief features of Marx's philosophy can be briefly retold. Engels, in his preface to the German edition of the Manifesto published in 1883 declares that

The basic thought underlying the Manifesto is as follows: the methods of production and the organisation of social life inevitably arising therefrom, constitute in every historical epoch the foundation upon which is built the political and intellectual history of that epoch.

This, then, is the starting point—economics is the final cause of everything else. Property and the means of production are the fundamental economic factors in society and Marx sees the

whole of history as a struggle between classes to secure control of these levers of power. Each ruling class, by dialectic necessity, produces its opposite which is first oppressed by it and later destroys it, just as the middle-class destroyed the feudal landowners. But the coming of industrial capitalism has made property not personal but social and at the same time has welded the propertyless majority into a coherent class which must by the iron laws of the competitive system become poorer as their masters grow richer. Moreover, since private property cannot provide scope for the full productivity of the new industrial methods, society must inevitably stagger from slump to slump, plunging the workers in ever growing instability and misery. Meanwhile the same laws of competition reduce the number of masters, depress the small owners into the proletariat and transform the powerful capitalists into monopolists. Finally, a vast majority of class-conscious workers will face the small group controlling the huge mass of “social property” (i.e. capital) gathered together in the cartels and trusts. They will then expropriate the masters (who will use every method from internal violence to external war to counter the threat) and set

up a society in which, since property is held in common, classes will disappear and with classes all need for government.

This, in barest outline, is the vast panorama of history, the total philosophy of life, the stirring call for revolution and the reassuring doctrine of its inevitability that Marx unfolds in the few pages of his Manifesto. It is easy to understand the fascination it has exercised on later generations. In the first place, some of its prophecies have been fulfilled. It is difficult to picture a more apparent fulfilment of the Marxist prophecy than the speed with which two great communities—Germany and Japan—industrialised themselves, created vast cartels and trusts, became involved in industrial depressions, witnessed an increasingly discontented working class and finally created dictatorship at home and plunged into aggressive wars abroad to find some way out of the impasse of class war and economic stagnation.

Again, Marx stated no more than the truth in underlining the fact of class antagonism. For nearly two thousand years Europe has carried a contradiction at its heart—between a philosophy and a religion which teach that all men are brothers and an economic system which organises them as masters and servants. Marx took up one of the oldest instincts of Europe (“When Adam delved and Eve span, who was then the gentleman?”) and applied it to a new emergent class—the industrial workers—who, as they grew in political consciousness, were bound to seek a justification of their place in society.

Marx's explanation had everything likely to appeal to a man of this new generation. In the first place, it was aggressively and stridently scientific. It dismissed contemptuously the idealistic strivings of Utopian socialism. It claimed to be derived from a cold-blooded analysis of the structure of reality, to be verifiable as any other experiment is verifiable—by experience, by the test of fact. In a society increasingly alive to the new achievements and possibilities of the scientific method, and increasingly indifferent to older religious and moral values, Marx soon found a willing audience. Nor was the appeal of Marxism purely scientific. It appeared to dismiss idealism and moral concern, but it was able to canalise them by painting the miseries of industrial workers and by holding out the hope that in a classless society, where the state would have “withered away,” men would be brothers and a Utopia as bright as any painted by the Utopians would dawn.

The Marxist explanation fulfilled another fundamental human urge by laying the blame for everything squarely on a small, easily identifiable group of men—the monopolists. Strictly speaking, there is no room either for scapegoats or for moral indignation in the economic determinism of the Manifesto but every line of it breathes the vitriolic hatred which drove Marx's pen, as it drove his life. And, last of all, the Marxist explanation satisfied what is perhaps the deepest of all instincts in the human mind—the desire to find unity within the manifold, to discover an explanation which explains, not simply a part, but the whole. If ultimately the explanation of all events can be pursued back to the single ultimate reality of economic relationships, the trick is done. Reality is uniform. Everything is explained. To an age which was coming to regard the weighing and measuring of material things as the only source of genuine meaning, the discovery that the apparent realm of the spirit—religion, philosophy, thought itself—springs from measurable physical reality came to put a crown on the materialist view of life.

Yet it is precisely this simplicity of Marxism, these sweeping generalisations, this imposition of a single pattern on all reality that has changed it from a useful instrument to a false religion. Even a first reading of the Manifesto reveals a great deal of obvious error and nonsense. So many of the prophecies have been disproved—that machinery will increase the burden of labour; that it will lead to a progressively less skilled labour force; that the petty bourgeoisie will be swallowed up in the proletariat; that “the worker is becoming a pauper and pauperism is increasing even more rapidly than population and

wealth.” It is surely significant that in Britain and America, which as the most highly developed capitalist nations ought to have shown the symptoms soonest, none of these predictions has in fact been fulfilled.

If it is objected that these are points of detail, there are still many failures of the broad sweep of the Marxist analysis which have to be explained. The Great Powers of the century ought, as the centres of industrialisation, to conform to the Marxist pattern. In Germany and Japan, the sequence has indeed been more or less fulfilled. In Russia, the revolution which should have emerged from capitalism was imposed on a predominantly agricultural community by the chance that, in a moment of military collapse, the Communist minority alone had sufficient self-confidence to provide a Government. And being a minority, they had to impose a dictatorship which, so far, shows no tendency whatsoever to wither away. In America and Britain, the most highly industrialised, the most bourgeois communities—those therefore in which the Marxist prophecy should have been most completely fulfilled—democratic processes have progressively widened the basis of society, shared more of the wealth with the workers, raised trade unions to the rank of Third Estate and developed an ever increasing distaste for any war, imperialist or otherwise.

★

It would be tempting to pursue at some length the question why two capitalist Powers, Germany and Japan, have behaved in a totally different fashion from Britain and America, and why Communism should have come to that community which was least fitted to receive it. But it is sufficient to establish the fact of these profound differences to discredit Marxism as a total explanation of reality. If the common capitalist economic structure of these societies did in fact determine all the rest—social patterns, political theories, diplomatic practice—presumably their behaviour would be as similar as has been that of Germany and Japan. But clearly other factors have to be taken into account, among them the length and strength of their democratic and Christian tradition, their degree of economic *lebensraum*, their freedom from feudal survivals. Marx's claim that economic structure in the last resort conditions all the rest must be reduced to the much more modest and self-evident claim that one factor influencing society is its class and economic structure and that one element in the dynamics of history is the struggle between the classes.

Let no one think that these distinctions are the concern only of academic hair splitters. Unhappily, they are the very stuff of modern politics. What single factor in the last two years has influenced history more than the growing antagonism between Russia and the United States? And what more fundamental cause of this antagonism is to be found than the dogmatism of the ideologues in the Kremlin? Looking out on to a world they know only through the distorting lenses of Marxist theory, they see the United States, a powerful, advanced capitalist nation; they immediately infer, from their Marxist definitions, that it must be an imperialist aggressor only biding its time to attack the Soviet Union. It is against all the canons of sound Marxism that America should be in reality profoundly pacific, profoundly isolationist and only to be provoked from a strict attention to its own affairs by actions as crass as those which Russia's imaginary terrors and suspicions have inspired. There is no more tragic example of the triumph of ideas over reality, of theory over fact, of fear and dogmatism over common sense than the policy which the masters of Russia have pursued since 1945. Out of the present smouldering fears and counter-fears, a new imperialist conflagration may indeed burst. But what consolation will it be, to Marxist and non-Marxist alike, if the false prophecies of Marx become one of the main instruments in making one of his forebodings true—that out of the final struggle may come, not a new society, but a “common ruin of the contending classes”?

Third Party or No Party?

(By a Correspondent)

THE preceding article in this series showed how very little hope there is that either of the existing two large parties will be able to work out the sort of consistent policy of economic regeneration, bold and yet balanced, that the country requires. They might be brought, over the years, to appreciate more highly than they do the strategic political position of the professional middle class, and to pay it court instead of flouting it as now. But it is almost out of the question that either of them should win the enduring respect of the professional man and woman by the policy they pursue. For both of them are tied to particular interests—the Labour Party indissolubly, the Conservative Party by bonds which give no present sign of loosening. The Labour Party is a trade union party; the Conservative Party is a businessman's party. It follows that neither of them can be the party of the professional middle class or can seek with complete impartiality the interest of the whole community.

It cannot perhaps be taken quite for granted that the interests of the professionals and those of the whole community are identical. Indeed, they are sometimes at cross purposes, and it is not unknown for a particular professional group both to organise itself against the community and even to go on strike. But this does not happen very often, and there are three good reasons for believing that the professional class can, on the whole, be better trusted with the national interest than either the trade unions or the business man. The first reason is precisely that they are in the middle and unlikely to run to extremes. The second reason is that they are, or at least ought to be, better at the clear thinking that was set up in the preceding article as one of the two main requirements of a sound policy. This is not by any means always so; the very intellectualism of the educated man makes him prone to prefer logic to common sense, often with bad results. The phenomenon of the *trahison des clercs* is not unknown. But on the whole his record for distinguishing the essential facts from the mass of irrelevant data, and for keeping his emotions under control, is, as it ought to be, better than that of the other classes. And thirdly, the professional man is—or, again, ought to be—in a better position to show the moral courage that is the second main requirement. The particular interests of the professions, though they exist, are far more closely identified with those of the community, or at least far less likely to obstruct them. It is possible for doctors to go on strike over a particular issue. But it is hardly possible for doctors or accountants or even lawyers to flourish except when the whole community flourishes. A particular business firm, and even a particular trade union, can hold the community to ransom; a single profession—and even more so the whole professional class—cannot do anything of the sort. Individually, the professional man has more resources than the wage-earner and can therefore more easily take the long view. But he is rarely encumbered with great possessions and does not therefore suffer from the retentive timidity of so many property owners.

These arguments are unlikely to convince either the trade unionist or the business capitalist. But it is the contention of these articles that the professional class has something special to offer to the political life of the British community and that its efforts to do so are at present frustrated by the shape and structure of the party system. The question to which this concluding article has to address itself is what the professional middle class can do about it. One obvious recourse is that the managers, the professionals, the salariat should rally wholesale

to the Liberal Party, whose tenets are at all events reconcilable with the necessary policy discussed in earlier articles. It is an attractive idea, and has elicited an impressive display of pertinacious hard work and courageous defiance of misfortune on the part of Liberal supporters. But it has become depressingly clear how ineffective such a course is likely to be. Only in very small degree is this the fault of the Liberal Party's own defects—though it has to be said in all candour that its inability to shake off its old Whig wing is a handicap for any party that wishes to face the twentieth century in a spirit of scientific foresight.

The real trouble is to decide in what circumstances any third party can be expected to do more good than harm to the cause it champions. There is only one example in British political history of a small third party gradually displacing one of the major parties—and that one exception was not in the middle and it had the funds and the membership of the trade unions behind it. The traditional way in which new political groupings occur is by splits among the leaders of the existing parties—the Peelites, or the Liberal Unionists. One can indeed imagine a simultaneous split in both Labour and Conservative ranks, a breakaway of liberals without the capital letter, inspired by the old passion for freedom and by a new and equally powerful determination to put efficiency and hard thinking before protection and prejudice; a rally of the Free British, so to speak, to which the Gallant Liberal remnant would gladly adhere. One can imagine it; it is, after all, good clean fun. But short of this most improbable consummation the prospects for a new Centre Party are nil. The difficulty of any new party, under the British voting system, is to persuade voters that it is worth while casting what will almost certainly, for many succeeding elections, be a wasted vote. Apart from the ordinary human reluctance to get laughed at for supporting an organisation of inveterate depositors, there militates against it the quite reasonable desire to apply one's weight where it will count in pushing events, if not in just the direction which one likes, at least away from that which one loathes. Few of the stalwarts who launched the Labour Party lived to see it come to power. If the country is to wait a generation to be saved by a new Centre Party, it may well be past saving.

Nor is this negative consideration the only one weighing against a third party—whether Liberal or other. There is also the very positive disadvantage that liberal opinion, attached to a third party and labelled with its name, actually gets much less consideration when the major parties are framing their policies and choosing their candidates than if it were freely "floating." Why, say the party managers in effect, worry about these people who would not vote for us if we spoke with the tongues of men and of angels? Up for auction in each constituency, the liberal vote is worth cultivating; enrolled under its own party banner, it is plainly marked in their eyes as valueless and negligible. Below a certain proportion of established voting strength, a level beneath which the Liberal Party has unmistakably sunk and which any new party might take a lifetime to attain, autonomy is sterility. This is not to say that the professional and managerial class must toe the party line on pain of political impotence. It has a much more positive and hopeful task. That task falls into three parts: first, the framing of a standard by which policy should be judged—the resolute setting in order of its own ideas; next, the propagation of those standards and the building up of a body of intelligent, coherent and disinterested public opinion; and finally, the

bringing to bear of that opinion, through every organ of political action, on the policy-makers of the parties themselves. The totalitarians, abhorring the party system, formed the Party to end all parties; the professional class, which has such good reason to abhor the influence of vested interests, must form the pressure group to end all pressure groups.

It is not difficult to sketch this three-fold programme. But it would be very difficult to carry it out. The formulation of a policy should not be an impossible task; there is already an impressive body of agreed opinion which only awaits the pen and the voice of a prophet to take on the guise of a rounded body of doctrine. But the creation of a body of voters who would act together, without being a party of their own, is always

NOTES OF THE WEEK

The Doctors' Vote

Whatever views may be held of the proposed National Health Service in general and the points at issue between the British Medical Association and Mr Bevan in particular, one thing is certain: the results of the doctors' plebiscite are a remarkable professional demonstration against Mr Bevan and the Labour Government. The size of the vote is itself telling, and is a complete answer to Mr Bevan's attempt to discredit the plebiscite in advance by his insinuation of intimidation because the ballot papers had to be signed. As many as 82 per cent of the doctors to whom plebiscite forms were sent—and this includes all doctors on the register—voted. The only class from whom a poor return was obtained was the small group of alien doctors who are on the wartime temporary register.

Every doctor was asked to say whether he approved of the National Health Service Act in its present form or not. Disapproval was expressed by 40,814, and approval by 4,735; or, if the vote of Service doctors is excluded because it is not yet complete, 38,534 disapproved and 4,479 approved. Most interesting in this section of the plebiscite is the attitude of the doctors in full-time public service, including Government service and local authority service. Six out of every seven doctors in Government service (634, against 127) expressed disapproval; doctors working full time in local authority hospitals voted against the Act by 1,984 votes to 391; and doctors working full time in the public health service voted against it by 1,928 votes to 316.

Consultants and specialists, general practitioners, and doctors working whole time in voluntary hospitals were also asked to state whether they intend to join the health service in its present form or not. Consultants and specialists declared that they would not join it by 5,069 votes to 971, and general practitioners—principals and assistants—by 17,037 votes to 2,500. Those working whole time in voluntary hospitals, who, like general practitioner assistants, are predominantly young men, either newly qualified or working on ex-Servicemen's training grants, stated that they do not intend to join the service by 3,234 votes to 613. (Full tables are given in this week's *Records and Statistics Supplement*.)

In fact, from whatever angle the vote is regarded, the result is a big majority against the Government. Youth and crabbled age, Serviceman and civilian, salaried and non-salaried, public and private practitioner, specialist and general practitioner—all have decided, by a large majority, to put professional solidarity first. This is a fact which Mr Bevan cannot ignore. He may expect—and he may be right—that when the time comes far more doctors will join his service than at present say they intend to. But he cannot shut his eyes to the fact that his attitude has antagonised virtually a whole profession. There should also be some heart-searching at BMA House. The BMA has secured far more than the large majority it wanted to justify its continued opposition to the service. But its leaders should ask themselves exactly what they hope to gain by it. They have won an overwhelming victory, but that does not mean that they have the support of the public at large. On what has come to be a political issue it is the public which should have the deciding vote.

Electoral Reform Bill

The chief interest in the second reading debate of the Representation of the People Bill in the House of Commons centred on the passage of arms between Mr Churchill and the

a difficult task, and particularly so when it concerns a class of people who, by definition, think for themselves. It has been done before, and successfully, by the Anti-Corn Law League, though the front of attack was then much narrower.

Perhaps a Cobden could do it again. But in waiting for his appearance, there is one thing that the professional middle class can do for itself. It can recognise its own existence, and its own importance, and the unique contribution that it can make to the community—a contribution without which the great twentieth-century experiment of combining individual freedom with an exertion of deliberate control over the economic environment in which the individual lives will certainly fail.

(Concluded.)

Prime Minister. Mr Churchill charged the Government with a breach of faith in not adhering to the agreement reached by the Speaker's conference in 1944, which included neither the abolition of the business vote, nor of the university seats, nor of the constituency of the City of London, against which the City itself in the person of two sheriffs lodged an official petition. Mr Attlee repudiated this charge on the ground that the agreement reached by the conference dealt only with legislation to be introduced in that Parliament and could not, therefore, be held to bind a future government to any particular legislation.

Now even granting the Government the benefit of the doubt—and there would appear to be some doubt as to the exact nature of the bargain, if any, struck between the parties in 1944—the fact remains that in introducing these changes the Government has transgressed what may now rightly be considered an unwritten law of constitutional procedure, a matter of far greater importance than the doctrinaire maintenance of the abstract principle of one man one vote, which is today accepted by all parties as a general rule. And the very fact that Mr Churchill has refused to bind the Conservative Party to the acceptance of the abolition of the City of London and university constituencies is in itself a proof of the unsatisfactory nature of this type of constitutional tinkering. Nor can any urgent public demand be alleged as an excuse to justify the levity of this procedure. It is true that the business vote has become an anachronism, and if the Government had confined itself to the abolition of this, the most conspicuous form of plural voting, it would have been difficult to raise any very strong objection. But the abolition of the university seats disquieted a large and representative body of opinion representing almost all except extreme party views. Even some Labour members like Mr Skeffington-Lodge appear to have their doubts. And though the granting of a special franchise to the holder of a BA degree might be a little difficult to defend on purely theoretical grounds, this fact cannot be made to excuse the wanton destruction of an institution which does in fact contribute an element of independence to our Parliamentary representation, the absence of which will be increasingly missed. But independence, as Mr Dalton pointed out, is just what the Labour Party dislikes. And Mr Woodburn let the cat out of the bag in his monstrous description of the university seats as Conservative pocket boroughs. It is revealing to learn from a Minister's lips the real motives of the Government's action.

Mr Churchill's Valentine

Mr Churchill's political broadcast last Saturday (St. Valentine's Day) should have put an end to the loose rumours which have been floating about in certain quarters of the formation of another coalition in the near future. Though the shriller tones of party polemics were very largely excluded from his discourse, in view of the critical time through which the nation is passing, the leader of the Opposition left no doubt about his eagerness to face a general election. It was, however, difficult to discern any constructive elements of national leadership in his criticism of the Government's policy, which followed rather distressingly conventional lines, and the accusation that they had slushed away the American loan and given or lent £750 million to other countries in the last two years was hardly very convincing. The Government have indeed made mistakes enough

The committee has completed its work; its plan seems sound; and Sir Stafford has told the FBI that he considers it "workman-like" and is prepared to give it a year's trial. All that remains to be seen is how closely the business-world will co-operate.

The plan is not on such a scale as to upset the existing economics of advertising. In the first place, it refers only to advertising of certain classes of goods: rationed consumer goods, fuel, drink, tobacco, and articles subject to purchase tax at the higher rates. Firms which spend less than £2,500 a year in advertising goods of these kinds will be left undisturbed. Advertisers who spend more are being asked to reduce their spending by 15 per cent, though they need not reduce it below £2,500. Exceptions for new advertisers and for those whose expenditure has been limited by special reasons in the recent past are provided in a sensible manner. The general sentiments incorporated in the plan are not the least important part of it. Advertisers are asked to undertake to observe the spirit as well as the letter of the scheme—and the spirit is "to refrain from increasing inflationary pressure of demand for scarce or rationed goods and services, and where possible to encourage the attainment of the country's export and production objectives." Forms of reply to embody these undertakings have been sent to trade associations by the FBI, and will eventually reach the individual advertiser. Controllers of advertising space are being similarly invited to endorse the plan in writing. On this matter the FBI has done an efficient job.

Commonwealth Consultation

On Tuesday the House of Lords, at the instigation of Lord Bruce of Melbourne, had an excellent debate on the question of consultation within the Commonwealth. Drawing upon his own experience as Prime Minister of Australia and Australian High Commissioner in London, Lord Bruce doubted whether co-operation between the Dominions and Great Britain is as thorough as after-dinner speakers like to claim. He pointed out that interchange of information, however perfect, is not the same thing as an exchange of views, developed in time to ensure real integration and mutual understanding of national policies. "I can say from bitter experience," he declared, "how impossible it is to get any official indication of the United Kingdom's policy on any great question during the formative period when that policy is being created." Lord Bruce has hit on a sore point, and may well have made Mr Bevin wince. For consultation with the Dominions has been far from adequate during the gestation of his new policy in Europe.

Lord Bruce advocates a revised version of the Curtin plan of 1943, which called for a Council of the British Nations, with a permanent secretariat to replace the Imperial Conference. The plenary sessions, held where most convenient, would summon together the Prime Ministers of the self-governing nations; its special sessions would deal with specific problems of co-operation, and an ordinary monthly session would meet in London, with the Dominion High Commissioners and the British Prime Minister as permanent members.

Other speakers were obviously unwilling to give more than qualified support to a project which might revive in minds overseas the old spectre of Joe Chamberlain. They argued that there are few subjects, except imminent war or the kind of economic collapse which produced the Ottawa agreement, that interest the Commonwealth as a whole; they favoured therefore regional co-operation, with Britain as an interested participant in each group. Lord Addison was anxious lest the existing structure of co-operation should be damaged by formalising the arrangements, a venerable point of view which has been echoed with remarkable alacrity by General Smuts.

INDEXES TO VOLUME CLIII OF "THE ECONOMIST" AND TO VOLUME II OF "RECORDS AND STATISTICS" (July to December, 1947)

These are now available at the following rates, post free:—

Index to "The Economist".....	s. d.
Index to "Records and Statistics".....	2 6
Both Indexes.....	4 9

There is one solution worth canvassing. If consultation is imperfect at the stage where policy is being thought out, and if the Foreign Office and Treasury will not yield up their secrets for transmission to the Dominion representatives, a strong case could be made for giving the Prime Minister charge of the business of the Commonwealth Relations Office. With competent under-secretaries, it is not an exacting administrative office, and it would give the High Commissioners direct access to the fount of British policy without necessitating new constitutional machinery.

Moreover, the suggested Council of British Nations would now represent only a fragment of a Commonwealth which includes India, Pakistan and Ceylon. The next few years will show whether the idea of Commonwealth, implying a high degree of confidence between nations and the outlawry of force as a weapon of negotiation between them, can be applied only to nations bred in the British tradition, or whether it has a more general validity.

The Real Aggressor in India

In the eyes of the world at large the struggle in Kashmir, which has led to the Indian appeal to the Security Council, is essentially a conflict between India and Pakistan. All who are maliciously inclined towards the British Commonwealth watch with satisfaction the spectacle of the other members of that association vainly trying to compose the quarrel between two Dominions. In reality, however, the situation is somewhat different. Although Pakistan cannot escape the responsibility for allowing armed bands to pass through its territory into Kashmir, and may have given them positive aid and encouragement, nevertheless, these raiders have come from the tribal territories in the North-West Frontier, which are outside Pakistan itself and which are potential sources of danger to Pakistan as well as to India.

The old djinn of Pathan tribal lawlessness has put its head out of the bottle in which the British Raj with great difficulty confined it, and it is in the long run in the interest of all plain-dwellers east of the Indus, Hindu and Moslem alike, to push it back again. It is open to Pakistan at any time to repudiate the Pathan adventure, which it has never officially recognised, and to order all armed tribesmen on its territory back into their own tribal areas; such bold action might involve Pakistan in immediate local trouble, but would be likely on a longer view to improve Pakistan's internal stability and international standing. Moreover, by taking a firm line with the raiders, Pakistan would put itself right with the Commonwealth and create at once Commonwealth solidarity in common defence; for from the moment Pakistan positively opposes the raiders, two Dominions would stand together under external attack, and would have the right to expect full support from other members of the Commonwealth against an invader. What is now needed is not a judgment on Pakistan's past actions or inactions, nor even a scheme for settlement in Kashmir, but action by Pakistan to put a stop to the Pathan campaign in Kashmir.

Mr Jinnah would no doubt object that this would merely leave Moslem Kashmir at the mercy of the Dogras and the Indian troops now in the country, and would destroy Pakistan's hopes of obtaining the accession of Kashmir or any part of it. But no proposals for settlement are likely to be accepted by India while the fighting continues; India feels itself the aggrieved party, and is more and more resentful at what is regarded in Delhi as a denial of justice due to British efforts at conciliation at Lake Success. Pakistan must make a positive contribution to restore the goodwill which is essential for reaching an equitable agreement on Kashmir, and should not doubt that the good offices of all members of the Commonwealth would be used to ensure a fair deal now and later.

Mr Jinnah in Baluchistan

Mr Jinnah is certainly not unaware of the many problems which have fallen to Pakistan as heir to the old North-West Frontier of a united India. He is anxious to preserve as far as he can the structure of law, order and strategic defence handed over to him. In the southern sector of the Frontier the tribal elements are less bellicose than in Waziristan or Swat; but the juridical problem is peculiarly complicated by the Khanate of Kalat—a large state which claims to be completely independent—and by important pieces of territory, including the town of Quetta, which were held by Britain from Kalat on lease. (An account of the little-known country of Kalat and its present

crucial position in relation to Pakistan, Afghanistan and Iran is given on page 307.)

Kalat has now come into the news with a spectacular progress of Mr Jinnah into Baluchistan. His object was to tell the Baluchis that they are under his "special care" and to bid for the accession of Kalat to Pakistan. So far the Khan has avoided giving a definite reply, and has asked for "time to consult his Houses of Parliament," by which is meant the subordinate chiefs of the Khanate.

The poverty of the Khanate, which consists mostly of mountains and deserts, provides strong arguments for accession; on the other hand, what has happened in India is not likely to encourage the idea to a state so addicted to independence as Kalat. There the Indian Government has just taken over by decree the administration of Alwar and Bharatpur, on account of support alleged to have been given in their territories to the organisation alleged to have planned the murder of Gandhi. It remains to be seen whether Mr Jinnah has been able to convince the Khan that accession is a good bargain, or whether the map will now have to show on the northern coast of the Arabian Sea a large and vulnerable area subject to no internationally recognised sovereignty.

The Party Melodic Line

The word has gone forth from Moscow. Shostakovich and Prokofiev are convicted of "journalistic perversions" and "anti-democratic tendencies" and will now presumably follow the humourist Tostchenko and the historian Varga into obscure silence. There may be an alternative open to them. Positive instruction has accompanied condemnation, a demand that music shall sing a democratically comprehensible tune; and the censured composers may work their passage home to respectability by an adequate output of hummable melodies, such as *My Little Grey Home in the Urals*, *After the Purge was Over*, the *War March of the NKVD*, and the *Harmonious Stakhanovite*—finally demonstrating their political soundness with a Marxist version of *Gott Straf England*. One's heart goes out to them. Imagine Mr Dylan Thomas, convicted of unintelligible cacophony, forced to redeem himself by a reversion to the style of Lord Tennyson or—since democratic appeal is to be the supreme test—Miss Wilhelmina Stich. Conceive Mr T. S. Eliot offering as his neck-verse a new *Absent-Minded Beggar*. One would not put it past Picasso to get a lot of quiet fun out of his penitential *Monarch of the Glen*, and Sartre might contrive to slip an existentialist message, under the censor's nose, into a modern *Silver King*. But "Oh, what labour! Oh Prince, what pain!"

This lamentable business, however, may yield good in the long run. It indicates to the Western world a hitherto unnoticed channel of access to Russian public opinion. The crime of Shostakovich and his fellow-sinners was that they were Westernisers, corrupted by the approval and applause of the Fascist beasts who read the *New Statesman* and frequent Carnegie Hall. The praise of the Western critic spells professional death to its object. Well and good. Let the Foreign Office brief the critics, and let them do their stuff. Let them ecstatically analyse the oratorical cadences of Mr Zhdanov, and prostrate themselves before the monolithic magnificence of Mr Molotov's *Eviges Nein*. Let them demand for Mr Gromyko a pedestal in Trafalgar Square, and public celebrations on the birthday (if discoverable) of the news editor of Moscow Radio. The public, once aware of its rôle, will surely back them up, directing a barrage of fan-mail on the selected targets, and offering large sums by advertisement for any available locks of Mr Molotov's hair. Who can doubt the result? One can at least be certain that the Russians will not retaliate by sending a mission, on behalf of their art galleries, to negotiate the purchase of a steady supply of landscapes by Mr Churchill.

University Grants

Oxford University managed to step into quite a patch of limelight last week by the assertion that its development plans will have to be remodelled because of "substantial reductions in the amounts to be received from the University Grants Committee." In actual fact no reductions after approval have been made: all that has happened is that the committee has not approved in the first place the first estimates of expenditure asked for by the university. There will probably be some argument about how far Oxford over-estimated its demands, but there is good reason for thinking that the university was over ambitious, and assumed much too readily that the Government would foot any bill it put forward. No one should, therefore, conclude from this incident that there has been any change in Government policy towards the universities. The total sum

for recurrent grants remains unchanged: it is only the allocations between the universities which are being negotiated.

This incident has coincided with the publication of the amounts of capital grants given to the universities over the past three years. These grants are to cover the cost of schemes of physical expansion: so far all but £9,000,000 worth of expenditure has been approved and £2,000,000 actually spent. Out of the total allocation, London University receives almost £2,000,000, Durham £1,200,000, Birmingham £744,000, Oxford £623,000, Manchester £464,000, Leeds £436,000, and Cambridge £202,000. Since the recurrent grant for Oxford University is £465,000 for 1947/8 Oxford's share is substantial. Before the war all the universities together only received £2,500,000 a year from the Government.

The prospects for the capital programme are not good, although fair progress has been made in getting schemes started. The labour force allocated for all university projects is only 3,000, and even this small allocation may be reconsidered next summer. The universities asked for a capital programme of £40 million over the quinquennium: although the schemes were approved in principle it was reckoned last March that only £20 million of these could be carried out in the time. It now looks as if even this more modest target would not be reached.

Who Will Intervene in Palestine?

The problem of Palestine is now before the Security Council, which will begin discussions next Tuesday. In its second report the Palestine Commission of five has told the Council formally that, unless provided with an armed force, it cannot carry out its task. The moment for facing facts has come, and it is above all America which has to face them. It is now clear that events in Palestine have helped to bring about a big change in Washington since November 29. The reckless partisanship with which President Truman mobilised the Assembly's votes for partition has given way to the sober misgivings of the Departments of State and Defence.

In answer to four questions on Palestine put to him last week by thirty Congressmen, Mr Marshall could only reaffirm America's determination to see the provisions of the United Nations Charter complied with—he did not say "the Palestine resolution." In advance of the Commission's second report he could not say what instructions would be given to the US delegate on the Security Council.

Recently, American columnists, not hitherto unfriendly to Zionism, have given a warning against the dangers of intervention. In addition to the obvious reasons—oil and Middle East security—the *New York Herald-Tribune* suggests the danger of anti-semitism in America if there were a serious proposal to send American troops. Equally "unthinkable," it may be guessed, to the Americans would be the sending of Soviet troops to Palestine.

A decision of the Security Council requires seven affirmative votes and the absence of a negative vote by any of the five permanent members. Of the 11 members, Britain will continue to abstain; Syria will certainly oppose enforcement. China, Colombia and Argentina abstained in the Assembly; only six, the USA, USSR, France, Belgium, Canada, and Ukraine, voted for partition, and of these France and Belgium had previously abstained in committee. Mr Trygve Lie has pleaded that the prestige of the United Nations—taken more seriously in the USA than elsewhere—is involved in enforcement. But even if small powers can be found to risk their prestige in contributions to an international force, and if seven votes can be mustered in the Council, it will still be too little and too late. The Council is not bound by the Assembly's resolution, and it would better serve the United Nations' prestige by shaping its policy to events than by attempting enforcement which must be ineffectual.

America has banned the supply of arms to Jews and Arabs. Britain's treaties with the Arab States, it is now thought, do not require the supply of arms for guerilla war in Palestine. None are in fact being sent, and this will no doubt be notified to the Council. For what it is worth, the Arab League has given a promise not to use the armies of the Arab States in Palestine unless an outside force intervenes there. It has not objected to the foreign consulates in Jerusalem being provided with guards for their own protection. It might, on terms, agree to their policing the city when the British leave. There is therefore still hope that the city under trusteeship may be preserved as an international sanctuary. All the makings of an effective policy of non-intervention are here. The Security Council will do the United Nations more honour by seizing this chance than by futile intervention in support of a policy which cannot be carried out.

for so long been the sacred calf which American industry worshipped that any attempt to bring it into balance with the realities of current international relations had to be undertaken with the utmost persuasiveness and caution. Will prices now fall so far and so fast that repair crews will start at once for the tariff dykes? And if they do, what will happen to the international dealings of which tariff reduction forms an integral part?

Meanwhile, the atmosphere of foreboding which overhung most of 1947, from the price breaks in the early spring until November proved that the long-anticipated crisis would not materialise last year, has now returned. Night clubs in New York are showing long stretches of untouched table cloth; theatre seats can be bought without the need to pay speculators' prices; Florida reports a disconcerting proportion of very moderate spending. Americans who are profiting look gloomy lest they cease to profit, and those who are not look gloomy by reflection. But even this is not so much depression as a rain-coat worn out of superstition to ward off a disaster whose inevitability has become a national fetish. So far, it shows few signs of becoming a national and hence an international fact.

The Public Domain

[FROM A CORRESPONDENT IN COLORADO]

MORE through inadvertence than design, the American people, through their government, have retained joint public title to one-fifth of the land of the continental United States or some 400,000,000 acres. During the war public domain grew, owing to takings for training-camps and other military or related purposes.

These lands are in public ownership for many reasons. The predominant one, however, is that the Government retained its title because these acres were too dry, too high, too poor or too remote to interest settlers. All or almost all were originally open to conversion to private ownership through the Homestead Act and its numerous predecessors and successors. Many millions of acres have since been withdrawn from the "vacant and unappropriated public domain," and converted to specific purposes, such as the national forests, national parks and monuments, and the reserves of oil, coal, and shale. Of such public domain there remains about 200,000,000 acres; that which is at all suitable has been dedicated to a great degree to the summer grazing of cattle and sheep under a special permit-system by which private stockmen may take a specified number of sheep or cattle on to the public lands for a certain period for a small fee. Thus a Western ranch, at least in some 31,000 instances (there are about 21,000 permit-holders on open lands administered as pasture, and about 10,000 on open glades in US forests), includes as a part of its rounded economic worth the privilege of such public grazing, and can support many more animals than if the owner were restricted to the lands which he owns. And therefore the tendency is to count the public lands as actually part of the ranch lands, and to include in the sale-price the value conferred by them.

The Grazing Service (now a part of the Bureau of Land Management), which administers grazing on some 145,000,000 acres, was instituted during the "dust bowl" days in part to save the public lands from going to dust and desert through overgrazing. The Forest Service also found its lands were being overgrazed and in some forests has drastically cut down the number of animals allowed to graze. Stockmen in both cases have advisory councils that work with the federal authorities. Now that lush pasturage is back (at least temporarily) they

feel they should be allowed to graze more animals, not less.

Forest and grazing officials, with an eye to a possible return of drought, and to other valuable uses of high plains and forests (such as generators of water for irrigation and municipal use), dissent. Stockmen are also very critical of the enormous increase in the big game population through conservation measures adopted on the public lands.

All these irritations, major and minor, came to a blazing focus after V-J Day, and the Western stockmen's two large organizations, the American National Livestock Association and the National Woolgrowers' Association, named a joint committee to determine, not the wisdom of turning over the public lands to private exploitation, but the best way to go about it.

Little attention was paid for some time, especially as the committee worked without publicity. There was considerable local sentiment in the stockmen's favour. More than 50 per cent of the area of the 11 Western states is still in public ownership. This is a traditionally sore point with officials of State and local governments who are unable to tax such lands, and who regard lieu payments by the federal government and its upkeep of roads and other public utilities, as insufficient recompense. The stockmen sought to take shrewd advantage of such feelings. But when their recommendations finally became public, a roar of wrath arose.

They proposed, in brief:

That ranchers who now hold grazing rights on public lands (for the present, only the grazing lands, not those included in national forests) should have first priority in buying the lands they use, and must be allowed to buy.

That the price-scale should run from 9 cents an acre to \$2.80 an acre, based on the ability of the land to feed stock. (The land worth less than 9 cents an acre does not interest them—they would leave to the nation the barest peaks and the driest desert.)

That they should pay 10 per cent down and have 30 years to pay the rest at low rates of interest. That only this 10 per cent should go to the federal government, the rest going to the states in which the land is situated.

The stockmen have found public sentiment against them, even in quarters where they expected support. Owners of "dude ranches," ski resorts, and other vacation spots are hostile. Western mining men have gone on record against the proposal, even though the stockmen are willing to leave mineral rights untouched. Conservation societies, hunters' and fishermen's associations (who visualise miles of fishing-streams with "No Fishing" signs; and hundreds of square miles of game territory closed off to hunters) are critical. Federal officials in charge of the lands insist that there is still overgrazing, and that the land would rapidly go to pieces under private grazing. President Truman again and again has emphasised the importance of conservation of national resources.

A large factor in the opposition is that the proposed plan would create a group of permit-holders with a vested right to take over the land without competition or bidding. Since it is owned by all the people of the United States and since there are hundreds of thousands of land-hungry veterans, a policy which would shut out veterans is unpopular. Stockmen have been badly led and advised. Shut off in isolated ranches as they are, hearing little but the general righteousness of their cause as fed to them by their own officials and propagandists, they have been genuinely hurt and surprised by the vigour of the opposition. The stockmen thought they saw their opportunity in the election of a Republican Congress supposedly dedicated to the strengthening of private enterprise. They missed their guess so badly that none of their Bills introduced in the 79th Congress were revived in the first session of the 80th Congress. But the stockmen are persistent and may yet win their objectives by indirect means. A sub-committee of the House Committee on Public Lands held hearings across the West this autumn, which in effect arraigned the Forest Service for its unco-operative attitude toward the sheep and cattle interests; and cuts in appropriations for the Forest Service and the Grazing Services—in the sacred name of economy—may break down the barrier to exploitation almost as effectively and much less conspicuously than a new law.

American Notes

Trial Run for the Plan

The Senate Foreign Relations Committee has formally and unanimously approved its own draft of the European Recovery Bill, and debate on the floor of the Senate will begin on March 1st. The Bill shows every sign of having been constructed by a masterly political architect, who knows how to conciliate without giving way on the substance of the programme. The Administration has been almost embarrassingly enthusiastic. Two feats of political engineering stand out. The first is the decision to authorise the Plan for a year, rather than fifteen months. This automatically reduces the immediate cost from \$6.8 billion to \$5.3 billion, and offers the opportunity of a realistic review of the Plan as soon as the new Congress reassembles in January, 1949. It satisfies those who insist that one Congress cannot bind another, and appeals equally to those who anticipate a Republican, or a Democratic, sweep in November. By that time the Committee feels that Congress will be better able to judge, being able to draw on the experience of the administrator and his staff, as well as the views of the "watch-dog" committee of the House and Senate which is to be established. By suggesting that Mr Herter, the House expert on foreign aid, should head this committee, Senator Vandenberg may have captured the most effective leader of the friendly opposition. By 1949, too, crop conditions will be clearer, and there will be more information on "the extent to which foreign nations are co-operating on a self-help basis."

How to reconcile the Marshall expenditures with Republican plans for tax reduction in the next fiscal year has also been ingeniously solved. A sum of \$3 billion is to be set aside from this year's budget surplus, leaving only \$2.3 billion to come out of the revenues in the fiscal year 1949. This exemplary financial caution, which might be called pay-as-you-learn, will retard debt retirement and the contraction of credit; but the fall in the markets provides a timely and plausible excuse.

A variety of other objections have been recognised, and, in the main, turned away by soft answers. The demand that raw materials should be made available, free, by the European countries is reflected in the change from the provision that foreign countries should "facilitate the sale" to "transfer by sale, barter, or otherwise" of raw materials, but the decision is left to the Administrator. The transfer or sale of 500 ships, opposed with such energy by the maritime unions, has been altered to the chartering of not more than 300 ships, on the condition that they shall be dry cargo ships not in current operation. The countries of Marshall Europe are directed to balance their budgets as soon as possible, and to make every effort to "locate and control" the assets and earnings of their citizens in the United States in the interests of ERP.

The Marshall Plan has survived its launching intact. Mr Marshall has given a warning that there will be no second chance, and even Mr Dewey has hastened to break a bottle of New York State champagne across its bows as it went down the slipway. There still lie ahead the Senate debate—and Mr Taft still insists that the total is too much—passage through the more hostile House, and through the appropriations committees. But the omens are favourable.

* * *

Early Diagnoses

Over the past week, the stock and commodity markets have clearly reflected the degree of disturbance and the mood of caution which have followed from recent waves of liquidation. Intermittent support has appeared, but there has been no sustained rally, and irregular movements have left many quotations lower on balance, although the Moody index of staple commodities at 407 shows modest improvement. Elsewhere March wheat is \$2.39½ (\$2.43 last week), September, \$2.20 (\$2.16½), May maize, \$2.10 (\$2.05½), March rubber, 19.90 cents (\$20.10c) and spot cotton, 33.07c (32.35c).

Knowledge that the Government is committed to price support throughout the rest of 1948, and that the farm bloc is unlikely to miss the challenge presented by current price-levels, are factors which have assisted bolder operators in Chicago. But more than one official spokesman, apparently, now stands committed to the view that \$3 wheat is not likely to reappear, and industrial interests in Congress are reminding the farm bloc that present support levels could be very dangerous under conditions less abnormal than those of recent years.

General diagnoses are justifiably cautious at this stage. The most definite note of optimism has been the declaration by Mr

John Snyder, Secretary of the Treasury, that there "is still a lot of inflation," and that the United States has "all the elements of continued prosperity and production." President Truman, though non-committal on the longer-term significance of the price fall, has repeated his demands for inflationary controls and has requested the Council of Economic Advisers to report on the new situation. And Congressional committees, with typical flexibility, have turned from their studies of price inflation to brand-new allegations that the Government is concerned to "let the bottom fall out of grain prices." The rest of the commentators repeat, in fairly general terms, the widest range of predictions, from Mr Chester Bowles, formerly head of the Office of Price Administration, who believes that Mr Truman and Congress are now reaping the whirlwind, to those sturdy optimists who assert that depression can never occur with "demand high, and unemployment low, as now."

*

It is, so far, too early to discern any marked change in official policies, and the conflicting forces which pull the Federal Government in election years will, no doubt, continue to favour indecision, as they have done in the battle against inflationary forces. One factor which seems altogether likely to emerge quite quickly, however, is the abandonment of further restrictive moves in the monetary field. The Senate vote on ERP, indeed, with its proviso that the Treasury surplus over 1947-48 (to the extent of \$3 billion) shall be earmarked for foreign relief, is presumably a guarantee that these accruing funds will not be used to retire government debt, and exert a continuing pressure, to this extent, on commercial banking reserves. Had such a proposal not been made in Congress, however, it seems likely that the Treasury itself would have moved very cautiously in bringing new pressure against banking reserves.

The extent of the downtrend still cannot be forecast with any degree of precision. But the week's movements still support the view, given here last week, that more than a market flurry is involved, and that more basic indicators of recession will appear later on. A business boom of recent proportions gathers a certain impetus as it nears the climax, and time must be allowed for commodity and stock market declines to exert their full weight on other sectors of the industrial front.

* * *

Southern Democrats and Civil Rights

At last week's conference of the Southern State Governors, all Democrats, Governor Wright of Mississippi duly proposed that an independent Presidential convention should be held, as a protest against President Truman's civil rights programme. His colleagues gave him no support—but may change their minds in 40 days. They are pledged to meet again within that period to consider the report of a special committee which is to recommend joint action to make the South's displeasure felt in Washington. This displeasure appears to focus on the President's request for the abolition of racial segregation on interstate transport facilities, and there were rumours, and White House denials, that this point might be dropped when legislation was presented to Congress.

As always, even those Southern Governors who genuinely support the objects of the President's programme are united in condemnation of Federal interference with States' rights and of the Democratic Party's disregard of its Southern backbone. This year their protests can be supported by more than oratory. While it seems unlikely that the threat to "bolt the Party" will become irretrievable action, it can seriously embarrass the Party managers at the July convention. Meanwhile, the Governor of Arkansas is proposing to withhold the proceeds of his State's annual Jefferson-Jackson Day dinner from the Party treasury until the civil rights issue is decided. His example may be followed, and the Southern States are among the most substantial contributors. Finally, unless the President relents, the Administration may find many of its Southern supporters in Congress even less amenable than usual during the unavoidable controversies of the next few months.

THE ECONOMIST BY AIR

Express Service to U.S.A. and Canada

Readers of *The Economist* in the United States and Canada can receive their copies within a day or two of publication for an annual subscription of \$24. They should apply to The Publisher, *The Economist*, 22, Ryder Street, St. James's, London, S.W.1.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

There is another new factor on this occasion. In the past the Republicans have been well pleased that the inevitable Southern filibuster should defeat all legislation on fair employment practices, poll taxes and so on. Being in the minority, they could take a righteous stand on the very substantial plank on these subjects in their Party platform. But now the time is approaching when they will have to explain why they have not used their opportunity to convert this plank into something more effective than a floor board. In Washington it is believed that the necessary two-thirds majority can be obtained in the Senate to end a filibuster on Bills implementing the President's programme. If this happens and the legislation is passed, Mr Truman will have alienated the Southern section of his Party to a degree unknown in recent years, and the Republicans will gather the electoral fruits of his programme from the Northern negroes, if not from the liberal voters.

* * *

Regional Colleges for the South

It is doubtful whether the President's programme would in practice do much to improve the status of the Southern negro. Well-informed and sympathetic observers believe that the answer to the problem can only be found by the efforts of the Southerners themselves and as the result of gradual social development. They are agreed that one of the most helpful influences would be a higher standard of negro education, and it was to consider a scheme which may be of real use in this connection that the Southern Governors met last week. In spite of the civil rights outcry, they did deal with their main business and signed a compact for the establishment of co-operatively financed colleges for the whole Southern region. This compact must, however, be approved by the legislatures of at least six of the States concerned before it can take effect. It is hoped that there will be about five of these regional institutions, which will provide higher education, especially in professional and technical subjects. No estimates of cost are available, but the scheme will be financed by an unprecedented pooling of State funds. The existing Meharry Negro Medical College at Nashville, Tennessee, may become the first of the regional colleges.

The scheme has been in the air for some years, but the solidity of its present form is due to the series of Supreme Court decisions, culminating in the recent Oklahoma Law School case, which oblige the States to provide equal educational opportunities for both whites and negroes. So long as educational segregation is practised, the financial strain of this obligation is greatest in the professional and technical fields. The regional college scheme is an attempt to maintain segregation while meeting the Supreme Court's attack upon it, without either the increased taxation which is hardly feasible in the South or the lowering of the already low standard of white education.

Nevertheless, it is definitely a scheme for white as well as negro colleges, although not for joint institutions. Indeed, if only negro colleges are set up, the Supreme Court will almost certainly have something more to say. It may in any case, since the Court has laid down that equal facilities for negroes must be provided within the State's own boundaries and not by granting scholarships to enable the negroes to study at colleges in other States. The success of the new scheme turns upon whether these regional colleges develop into educational Harlems, with not only the segregation but the low standards which that implies, or into the first-class training centres which the South needs so badly for both its white and its coloured students.

A Draft for Vandenberg?

General Eisenhower's renunciation created a temporary political vacuum, which has been turned to the immediate advantage of Mr Harold Stassen. The most recent Gallup poll shows him to be, at the moment, the President's most formidable challenger and leading outside the discontented, but still Democratic, South. Mr Stassen's view that running for the presidency is a long-term and full-time job is paying handsome dividends. In the probable event of a deadlock between Senator Taft and Governor Dewey at the Republican convention, his chances of becoming a compromise candidate cannot be dismissed.

But the convention is still four months off; and nominations are not decided by Gallup polls. Mr Stassen's public taunting of both Mr Taft and Mr Dewey does not suggest that he would be very likely to secure the reversion of either of their delegations, given a deadlock convention. He is relatively inexperienced;

young, just over forty; and, from the point of view of the Old Guard, an alarming phenomenon rather than a reliable member of a team. He is unpopular with labour for his espousal of the Taft-Hartley Act.

A new name is already coming up. Senator Vandenberg's name is "new" only because it has been believed he would not run. As in Poe's famous story, "The Purloined Letter," he has been in full view all the time: a trusted party man with an appeal far outranking party. He has immense political experience. Since the war he has proved himself the real leader of the party, a patriotic statesman who towers above the rest. The public response to the possibility that General Eisenhower might run was significant chiefly as showing how dissatisfied the average Republican, and particularly the independent voter, is with the stale choice between Senator Taft and Governor Dewey.

A year ago, Senator Vandenberg renounced all presidential ambitions, an act which has stood the bi-partisan foreign policy, and the European Recovery Programme, in good stead. He is a politician, however; in his case there are no high grounds of principle for abdication, and the presidency would be a fitting crown for so distinguished a public career. In Michigan a "draft Vandenberg" movement is in full swing. It is already rumoured that should he accept he would confine his presidency to a single term. His age and his health would rule out the political strains and electioneering which must be assumed by a man running for a second term during much of his first. Such a decision would also, it is argued, give him a freer hand in the public interest.

Mr Stassen has always indignantly denied the political partnerships arranged by benevolent rivals which cast him as the junior member of the firm. In recent speeches, however, he has gone out of his way to pay tribute to the leadership of Senator Vandenberg. The vice-presidency is usually regarded as a political blind alley! Mr Stassen may reflect that Mr Truman and a number of other vice-presidents, including Theodore Roosevelt, have found it a stepping-stone to the highest office in the land.

Pensions for Miners?

The pension issue, which was dropped by the Ford workers this autumn in favour of more earnings, has been taken under the wing of Mr John L. Lewis, who has demanded that the miners' welfare fund be used to provide pensions of \$100 a month at the age of 60 for miners who have had 20 years in the pits. This fund, which was established in July last year, has on hand about \$30 million, derived from the 10-cent a ton royalty paid by the coal owners. The employers' representative on the board controlling the fund has refused to accede to this demand, urging that pensions on such a scale would require contributions at three or four times the present rate. Mr Lewis has thereupon announced that the "integrity of the contract" had been infringed and that he reserved the right "to take any independent action necessary to the enforcement of the contract."

Is this a strike threat? More specifically, would it satisfy the requirement of the Taft-Hartley Act that notice of 60 days must be given of a strike in an essential industry? Is it more than bringing pressure on the owners through the Government, which would be reluctant to see any coal stoppage just as the Marshall Plan goes into effect, with its schedule of 3,000,000 tons of coal exports every month? The present contract runs until June, 1949; but no one has forgotten Mr Lewis's famous victory in forcing the owners to insert in the contract the provision that the miners would work only so long as they were "willing and able." If Mr Lewis is bent on a strike, will that little phrase enable him to evade the section of the Labour Law which lays down an 80-day strike stand-still and empowers the Attorney-General to seek an injunction against further stoppages?

The steel companies, which last year through their ownership of the "captive mines" brought pressure on the other coal owners to make concessions to Mr Lewis, fear this year that any encouragement to pensions in coal mining might sell the pass to pensions in the steel industry. How much it would cost to pension the nation's miners is unknown; calculations are being frantically made. As at present phrased the demand covers miners who have left the pits for other employment. Neither the coal nor the steel industry can regard any interruption in production without an inward shiver. And whatever happens to the cost of living, present profits, even in the coal industry, invite wage demands as forcibly as a red flag invites a bull. The "third round" of wage increases may prove the last. If Mr Lewis can bring off his pension coup at the top of the boom, he will add a crowning victory to a remarkable career.

THE WORLD OVERSEAS

Neighbours of Afghanistan

(By a Correspondent)

A LITTLE way to the west of the broad stream of the lower Indus a wall of arid mountains rises from the flat plain of Sind and buttresses the desert plateau of Baluchistan. Baluchistan occupies a large area on the map, but it has hitherto figured very little in history because of its unproductiveness, difficult communications and small population. Barren as it is, however, it cannot be altogether ignored in a world where even deserts and polar ice caps can be objects of acquisition because of possible minerals or strategic passes and bases. Baluchistan is believed to contain beneath its stony soil reserves of coal and oil which may some day become economically important; it also affords one of the two main approaches to India from the north-west—that by way of the Bolan pass—and access from the north to a potential port on the seaboard of the Indian Ocean. It remains today an out-of-the-world land of parched wastes and sparse semi-nomadic inhabitants, but it is not without its local politics, and these politics are inevitably entangled with the problems arising out of the termination of the British Raj in India.

The political configuration of Baluchistan is about as complicated as it can be. The whole country, which is between two and three times the size of England, was divided before last August into six parts:

- (1) British Baluchistan, in the strict sense, consisting of territory directly annexed by Britain after the Second Afghan war;
- (2) tribal territories under partial British administration;
- (3) districts held on lease from the Khan of Kalat on an annual quit-rent;
- (4) the Khanate of Kalat;
- (5) Lasbela; and
- (6) Kharan, states under the formal suzerainty of Kalat.

As regards population, British Baluchistan in the wider sense, including (1), (2) and (3) above, had about 500,000 inhabitants, Kalat 250,000, Lasbela 69,000 and Kharan 33,000. The preponderance of population in the British-controlled territory, comprising less than half the total area, was due to the inclusion of the Nasirabad irrigated tract, which belongs geographically to the Sind lowland, and of the garrison town of Quetta, which had a population of nearly 40,000 apart from troops and was the only real urban centre in the country.

This curious political patchwork was the result of a series of military and political expedients over a long period. The main British interest in Baluchistan was to safeguard the Bolan pass and its approaches as one of the gateways of India, and to restrain tribal unrest on the Sind border; there was little or no reason for interfering with the remote Khanate of Kalat or its vassals, and indeed the traditional British view has been that Kalat is an independent State like Nepal, not included in the system of "Indian States" under British paramountcy, though its status has never been very precisely defined. In various ways, however, British policy has reduced the realm of Kalat, even though the process has hitherto been far from painful for the Khan. The areas which the British wanted for the defence of India were leased from the Khan for rents which were extremely welcome to the impecunious monarch of a barren hill country, and he did not have to worry about the regularity of the payments; on the other hand, some of the leases were permanent and in terms which could be interpreted as

cession when the question of their transfer to another nation arose. Moreover, for purposes of administrative convenience, the British authorities took to dealing directly with Kalat's vassal states, Kharan and Lasbela; and though this meant no immediate injury to the Khan of Kalat, who by custom left them to manage their own affairs, it provided precedent for treating them as completely separate political entities in an age forgetful of the niceties of feudal relations.

With the approach of the transfer of power in India the Khan of Kalat, a man of ability and resolution, began to be concerned about his legal rights. He took the view that the leases of territory to Britain were not transferable and would revert to the Khanate on the termination of British sovereignty in India unless re-negotiated with the successor authority; he was also determined to reassert his authority over Lasbela and Kharan and control their foreign relations in future. In order to get a ruling on his position before the British left India, he appealed to Delhi for a declaration of the British view, but his application received no answer; those acquainted with the bureaucratic talent for passing the buck will not be surprised that British officials who were packing up for departure preferred to leave the legal tangles of Kalat as a bequest to Pakistan.

Mr Jinnah has from the beginning regarded Pakistan as the full heir of all British rights in Baluchistan, including the leaseholds, and is determined to obtain the accession of Kalat and its vassals. It has not so far, however, proved so easy for the Karachi Government to deal with the Khan. There are several reasons for this. In the first place, the Khan is not an autocratic monarch, detached from his subjects and liable to be undermined by a popular mass movement worked up from outside. He is not even, strictly speaking, a hereditary ruler, for he is the elective head of a confederacy of tribal chiefs, though by custom the electors may not go outside a clan (of Arab origin) which has held pre-eminence for over a century. The Khan regards himself as head of the Baluchi nation, and though the word "nation" can hardly be used in the modern European sense, it is not altogether inapplicable. The Baluchis speak two different languages—Baluchi,

which is an Iranian tongue, also spoken in part of south-eastern Persia, and Brahui, which is classified as a Dravidian speech, allied to Tamil, Telugu and other languages of South India, but geographically far separated from them. Both languages of Baluchistan are quite distinct from Sindi and Punjabi, and there is a certain common consciousness among both Baluchi and Brahui tribes of their separateness, as a pastoral hill people, from the peasants and townsmen of the Indus lowland. Although the population of Baluchistan is entirely Moslem, except for a few Hindu and Sikh traders and shopkeepers, there is very little inclination to accept administration by Pakistan officials from Sind or the Punjab. The Khan has thus substantial popular support—which can find expression through the tribal councils or *jirgas*—for a policy of resistance to any attempt at centralised control from Karachi. There is fear lest accession to Pakistan might mean a change from King Log to King Stork.

Further, the Khan has become dissatisfied with the terms of the old leases and has wanted to have them revised in his favour. He is aware that his patriarchal court lacks the administrative personnel to take over places such as Quetta, nor would he wish to have sole military responsibility for the frontiers with Afghanistan and Persia, but he insists that his basic sovereignty in the leased areas, and particularly his mineral rights, should be recognised. Pakistan has been very reluctant to accept these claims, but it will be wise to go a long way to meet them, because it is very much in Pakistan's interest to have a strong and friendly Kalat on its flank. If Pakistan intends to hold the Bolan pass, Quetta and the light railway westward to the Persian border, thus keeping up the system of defence along the southern frontier of Afghanistan, it is essential to have no trouble with the tribes

in the interior of Baluchistan, and the authority of the Khan is the best guarantee for order there. Even if Pakistan were to drive out the Khan by force from his capital, direct administration of this vast, mountainous area would be a task imposing a most severe strain on the financial and administrative resources of Pakistan at a time when Mr. Jinnah's regime faces many other formidable problems. It is to be hoped that a compromise will be reached making Kalat a firm ally of Pakistan without undue encroachment on its independence and that no fresh focus of disorder will be added to those already existing in Asia. Should Kalat bid for Afghan support in order to resist Pakistan pressure, a situation with possible serious complications might arise.

Economically the rents hitherto paid to Kalat for the leases and forming a large part of the total revenues of Kalat will in future be a charge on the treasury of Pakistan, as will be also various other payments and subsidies formerly dispensed on the Frontier by the Central Government of India. Pakistan, given a period of tranquillity and orderly economic development, should be able in time to carry the burden of what are really distressed areas from Chitral down to the Makran coast. But Pakistan is not yet in sight of tranquillity, and if it is unable to meet its liabilities towards the hill people, the latter will quickly revert to old-fashioned marauding as an outlet for their energies. The problems of Baluchistan, like those of the Frontier further north, are thus dependent for their satisfactory solution on the solvency of Pakistan. Kalat is not a country which can make any progress or support a civilised administration and social services from its own resources, and its inclination to accede to Pakistan must be conditional on its estimate of Mr. Jinnah's capacity to provide for his dependents.

Report from Havana

(By a Correspondent)

SINCE November 20th the representatives of 59 nations, meeting in Havana, have been discussing the charter of the proposed International Trade Organisation. Their progress has been slow, but it is now reasonably certain that success will ultimately crown their labours. Little news of the meeting, known as the United Nations Conference on Trade and Employment, has appeared in Britain. The proceedings of the preparatory committee, first in London, then in New York and finally in the seemingly endless Geneva session last year, were too diffuse and too concerned with subtle points of drafting to seize the general interest. The Geneva meeting came to life with the signing of the General Agreement on Trade and Tariffs by the 23 "nuclear" countries represented on the preparatory committee; but it was on the practical issues of tariff and preference concessions that interest tended to focus—especially as it was known that the work on the draft charter would have to be started all over again at the Havana conference.

Some of the difficulties which have arisen at Havana could have been foreseen. They were due to the fact that the 36 nations at Havana which had not been among the 23 which laboured in Geneva were naturally inclined to suspect a code of commercial behaviour in the drafting of which they had played no part. The resistance to a *fait accompli* found extremely vocal leadership in the Argentine delegation. This leadership of the "unrepresented" became also leadership of the "under-developed," i.e., of the primary producing countries which wish to diversify their economies and will brook no interference from any international body in the means they choose to foster their industrialisation. The role of rebel leader also admirably suited the political strategy of the Argentine delegation. It enabled Dr. Molinari, its leader, to portray the form of capitalism represented in the Charter as "typified by the dollar sign, the gold at Fort Knox, international cartels and a spider web of Shylocks squeezing the heart of hungry multitudes."

These inflammatory opening speeches were soon over; but the basic differences they revealed have persisted through the long debate. Its "first reading" stage closed about six weeks ago. Since then the committee stage has been proceeding and working parties have been redrafting certain clauses of the charter. Progress has been made in these crucial stages of the conference, and delegates should be dispersing before the end of this month.

Prising the Charter Open

The main differences that still remain emerge from the desire of the under-developed countries to have a free hand in fostering new industries and diversifying their economies. They demand

first the right to use import quotas for protective purposes, and second freedom to create new regional preferential systems, with the consequential right to discriminate. The Geneva version of the charter allows members to impose quotas or other quantitative restrictions on imports when they are in balance of payments difficulties. Moreover, the draft charter makes liberal provisions for discriminatory application of such restrictions. Until 1952 discrimination can be applied, subject only to posterior disapproval by the ITO. After 1952 the machinery tightens up somewhat and prior approval of the ITO will become necessary. The broadening of these provisions was largely the work of the British delegation on the Preparatory Committee. But the wedge inserted by British initiative is being used as a lever by other countries to prise the charter open to much wider toleration of quotas. Britain, as the largest *per capita* exporting country in the world and as a large exporter of relatively inessential manufactures, has reason to fear import quotas, the one obstacle to imports over which price and efficiency cannot prevail. So at Havana the proposed use of quotas for protective purposes has been opposed by Britain with great vehemence.

The Latin-American and Middle Eastern countries resent the fact that the draft charter recognises existing preferential systems while restricting the formation of new groups. Admittedly the charter opens the door to new preferences designed to aid economic development; but any such development would require the sanction of the ITO. Here again, the issue is between "prior approval" and "posterior disapproval." These groups of under-developed countries want freedom of action subject only to the limitations of subsequent recall by the ITO. The British delegation has persistently resisted the principle of "posterior disapproval" because once a country has decided upon a certain policy and implemented it by launching new protected industries or instituting new discriminatory tariff arrangements, it will be doubly difficult to retrace those steps, however artificial they are, and however serious the damage caused to other members of the ITO. The British Government supports the general aim of the under-developed countries, and appreciates that more trade may ultimately result if those countries diversify their economies and raise living standards. But this should be an orderly and balanced process, not a scramble leading to the mushroom growth of uneconomic industries. The prior approval of the ITO for the protection of quotas for infant industries should help to prevent costly mistakes.

But how will the ITO arrive at its decisions in such matters? That question leads to the issue of voting power on which there

Privileged...

Since 1834, we have imported the world's finest cigars. This experience has brought with it many privileges. For privilege it is, indeed, to be able to smoke and recommend to others a cigar so delicate in flavour and so delightfully mild as *La Tropical de Luxe*. Knowing that this cigar has met the demand of critical taste for over 70 years we can, and do, (as sole importers of this brand in the United Kingdom) recommend it unreservedly.

has also been considerable, though one-sided contest at Havana. The British delegation has supported the principle of weighting the voting according to the economic importance of each member. But though that rule was followed at Bretton Woods, the overwhelming majority at Havana is against it and favours equal voting rights for all. The dangers and frustrations of this particular form of international democracy may in part be avoided by reserving a certain number of seats on the executive board for the most important member countries.

Other outstanding points of difference concern the grant of export subsidies (which the United States strongly favours); the problem of relations with non-members, i.e., whether they should be specifically deprived of any extension through the most-favoured-nation clause of the benefits exchanged between members; and finally the very special and difficult problem of a country like Switzerland which, not being in balance of payments difficulties, would be called upon to dismantle most of her economic defences when surrounded by countries to which no holds would be barred for at least four years.

On the very topical problem of customs unions the new version of the Charter is likely to show some interesting changes. In particular, it will introduce the concept of a free trade area, i.e. a group of countries among which trade will be free but which will retain their own separate tariffs in their trade with countries outside the group. No such group could be formed if it held within it substantial variations of import duties. In that case imports for the whole group would tend to be canalised to the lowest tariff country and then be re-exported, without paying further duty, to the other members of the group. But if the new conception can help to avoid some of the technical difficulties of elaborating common tariffs, it should do valuable work in serving the objective of freer trade.

Ideals for the Future

This list of the various points still in dispute at Havana does less than justice to the wide area of agreement revealed at the conference. It is certain now that an International Trade Organisation will be launched. Its membership may show some notable gaps, but they are the gaps to which the world is becoming accustomed—notably the absence of Soviet Russia—though it should be noted that Poland and Czechoslovakia are represented at Havana and have been pulling their full weight. The charter, as it will emerge from Havana, will be concerned with exceptions as much as with positive, basic principles. The price had to be paid for launching an organisation of this kind in trading conditions so abnormal and unbalanced as those which lie immediately ahead. At least the charter will ensure that, whatever shifts and devices of bilateralism and discrimination the nations of the world will be driven to, the ideals of a saner system of multilateral and non-discriminatory trade will be kept before their eyes. That should prevent the habits formed in these abnormal times from becoming incurable.

Prospects for the Pipe Lines

[FROM A SPECIAL CORRESPONDENT]

RECENT events at Haifa, and along the pipeline that comes out there, have given all Middle Eastern oil companies reason to worry about security. If existing pipes and terminals are in jeopardy, are new ones worth laying? Economically, the answer is yes. Pipelaying specialists from America calculate that a 30-inch steel pipe from the Persian Gulf to the Mediterranean will repay the huge cost of its construction within a year. It is a far more profitable proposition than the long haul by tanker round Arabia.

But politically the outlook has become problematical. Security through miles of desert depends upon local, even tribal, good will. What if Arab hostility to the west over Palestine leads to continuous sabotage? So far, stoppages caused by saboteurs have proved easy enough to perpetrate, but equally easy to mend. Machines at the nearest pumping station automatically register the exact locality of the break, and the damaged section is replaced in a few hours. But will such mends be feasible in face of wrecking by bands large enough and purposeful enough to baulk the repair gangs? Oil men in Palestine say no.

The facts which have induced this gloomy conclusion are as follows:—Though several companies are planning to lay pipelines, one only has a pipe in operation. This is the internationally owned Iraq Petroleum Company, pumping from Kirkuk in Iraq to the Mediterranean. Its pipe is a 12-inch affair (stigmatised by post-war American engineers as "macaroni"). After crossing the Euphrates, it forks like a wishbone, and pumps half of its

four-million-ton annual output via Syria to Tripoli in the Lebanon and half via Transjordan to Haifa. The Tripoli consignment is, except for a small amount refined for local use, exported in crude form. The Haifa consignment is refined on the spot by a British concern called Consolidated Refineries, Limited. This is capable of handling over four million tons a year, and is, or was, expanding so as to handle the contents of a new 16-inch pipe from Iraq. Palestine depends entirely on this refinery for its supplies. Recent happenings have focused attention on the complete interdependence of the Haifa installation—the pipe, the oil dock, the refinery, the storage tank farm on the beach. To knock one out is, after a few days, to paralyse the rest. Lately, the refinery was reduced to inaction by an upsurge of political feeling between its Jewish and Arab employees—an outburst provoked by the wanton throwing of a bomb at an Arab queue of workmen at the gate from a passing Jewish taxi. Oil that is due to be locally refined cannot be exported crude in a flash. The world is short of refineries. By an admirable feat of organisation of the storage tanks, pumping was able to continue uninterrupted, and the refinery is now back at work. But longer interruptions threaten daily. Since the Jewish community is far more dependent upon oil than the Arab, the likely perpetrators are Arabs. The outlook when the British troops go is black.

Problem of Haifa

But is it black for more than the Haifa branch of the Iraq Petroleum Company's pipe? Cannot companies that are planning lines to terminals outside Palestine continue to plan? Undoubtedly the prospects for the Haifa fork are the blackest. Haifa is in the projected Jewish state. The Arab states through which the pipe to it passes—Arab Palestine, Transjordan, Iraq—are not going to sit by while oil courses through to feed the Zionists. The IPC took a decision that was sound enough economically when it decided to use its first post-war allocation of steel pipe and dollars to double the Haifa branch of the fork. (By this operation, which is approaching completion, the Haifa refinery was to handle 3,000,000 tons of crude oil from Iraq by late 1949 and 6,500,000 tons by mid-1950.) Politically, it would have done better to double the Tripoli fork while awaiting Palestinian developments.

For though Haifa is virtually bound to be inoperable so long as the Jew-Arab fight continues, there is no comparable Arab reason for damaging the other fork. This, through a small refinery at its terminal, furnishes Syria and the Lebanon with the bulk of their day-to-day requirements. It also pays port dues and an ex gratia payment into the Lebanon's all but empty coffers. It pays Iraq to the tune of 4 shillings gold per ton pumped. It is 120 miles away from the Palestinian frontier. It is in danger chiefly from gangs who dub all oil installations as "American" and therefore pro-Zionist. Provided that no Arab government along the route is in a similar mood, preferring vengeance to royalties, there is no reason why it should be subject to interruptions of more than a matter of hours.

One conclusion that has already been drawn by the other companies planning pipes to the Mediterranean is that Palestinian terminals are out of the question. Other conclusions are now being framed. A first is that, since the ill-will of one state can baulk a whole pipe, prudent companies should choose lines that cross a minimum of frontiers. A second is that the prospects of security outside Palestine depend on more thoughtful American handling of that problem than has hitherto been displayed.

The Foreign Office is to be congratulated on preparing and publishing a report of 57 pages [Cmd. 7320] on the stormy second session of the General Assembly of Uno, which lasted from September 16th to November 29th last year. It records the evidence of an unbridgeable division between the Soviet bloc and the Western Powers, the open breakdown of the hypothesis of unity between the leading Powers on which the whole theory and practice of the United Nations was to have been based. The speech made by Mr McNeil on September 22nd, following the provocative tirade of Mr Vishinsky four days before, marks the turning point in British policy which Mr Bevin defined more clearly in the foreign affairs debate a month ago. The Greek Assembly, the decision to partition Palestine all come within the scope of the paper, but disarmament, control of atomic energy and the creation of Uno forces were not discussed.

THE SPIRIT OF ENQUIRY

A half-empty bottle in 1836...

In the 1830's Charles Askin, formerly a young Birmingham veterinary surgeon, devoted himself to finding a method of extracting pure nickel from the nickel-cobalt ores then available.

His final experiment depended on the addition of a quantity of bleaching powder which it was expected would precipitate the cobalt hydroxide and leave only a nickel compound from which nickel could then be relatively easily obtained.

Askin found he possessed only half the powder he calculated he would require, but he continued with his experiment, and succeeded by chance where an associate, using ample powder, failed. Thus was a lucky stride made towards the Nickel Age.

The spirit of enquiry and research typical of this pioneer still characterizes the Nickel Industry.

THE BUSINESS WORLD

The Argentine Agreement

THE trade and financial agreement with Argentina was formally concluded by an exchange of notes this week. It is a complex arrangement which involves a complete re-casting of the payments machinery between Britain and Argentina; on the commercial side, it conforms to the new pattern of semi-barter agreements, though it inevitably fails by far to reach that bilateral equilibrium which is so desired by our present-day commercial negotiators. In order to get the new agreement in proper focus it may be well to step back a little and look at it from an historical viewpoint. Before the war, Britain bought a good deal more from Argentina than it exported to that country, but the balance was largely made good by various invisible items, the most important being interest on capital invested by Britain in Argentina. During the war the traditional disequilibrium in the merchandise trade between the two countries was considerably accentuated, and as a result Argentina built up substantial accumulations of sterling.

The agreement of September, 1946, was negotiated to deal with these accumulations and to arrange the future mechanism of current trade payments between the two countries. The Argentine balance was struck as at September 17, 1946, and the amount of £130 million was blocked, receiving interest at $\frac{1}{2}$ per cent, and to be released at the rate of £5,000,000 per annum. These balances, which had the protection of a gold guarantee, were also available to finance the purchase by Argentina of British-owned assets. The 1946 agreement provided that currently earned sterling held on Argentine account was to be fully convertible. It also provided for an extension of the meat contract and sketched the main outlines of the purchase of the British-owned railways.

The suspension of convertibility of sterling last August involved a fundamental and unilateral change in this agreement. It affected the convertibility both of Argentina's currently earned sterling and of the prospective releases of £5,000,000 per annum from the accumulated sterling balances. The world-wide events of which the suspension of sterling convertibility was a part also had their inevitable direct effects on Argentina. That country had suffered considerable pressure on its gold and dollar reserve, and for that reason felt increasing reluctance to use its accumulated sterling, which carries a gold guarantee, in order to finance the railway purchase. As matters stood, that sterling had become an essential part of the statutory reserve for the Argentine note circulation. The new agreement which had to be negotiated was, therefore, concerned with the new commercial contracts, with the machinery for financing current payments between the two countries and finally with the completion of the railway deal.

On the commercial side, the agreement which takes effect from the date of signature this week and covers the period until March 31, 1949, provides for the purchase by the United Kingdom from Argentina of essential foods and animal feeding stuffs valued at £110 million. Of this, £100 million is represented by the price of supplies to be bought in the period, while the remaining £10 million is an *ex gratia* retrospective payment by the United Kingdom. In addition to these contracts, which are being handled by the Ministry of Food, a

programme of additional imports from Argentina has been arranged to a total of about £20 million for the period.

There are two interesting points on the food side of the agreement. Under previous contracts, Britain purchased supplies for other European countries; the new contract relates only to the United Kingdom and dependent areas. Secondly, wheat has not been included. After Britain's recent purchase of 80 million bushels of Australian wheat, there is possibly no urgent need to buy additional supplies before the summer. By then more definite information may be available about the Marshall Plan. The main items covered by the new contract are 500,000 tons of meat, over 1,200,000 tons of coarse grain, consisting almost entirely of maize, 100,000 tons of oilcake and some linseed oil, believed to be about 20,000 tons. In addition, quantities of wheat offals, tallow, edible beef and mutton tallow and lard have also been purchased. The new quantities are similar to those purchased in 1947, so that the new agreement is unlikely to affect British rations, although the weekly two-pennyworth of corned beef may be reintroduced. No details have been published of the new contract prices or of the cost of individual items. But the meat purchases will probably account for £45 million, maize for about £42 million and linseed oil for a little over £3,000,000.

If this division is correct, the new contract price for meat shows no increase over the previous one (ignoring the £10 million retrospective payments), while the price of maize has been raised to about £35 a ton, compared with the current Chicago price of around £22 a ton. This is indeed a sharp increase and the inference to be drawn is that the higher prices asked by Argentina have been wholly shifted on to maize, to prevent a general rise in the contract prices of meat from other sources.

Over the period of thirteen months covered by the agreement, therefore, the United Kingdom will have to make payments of approximately £130 million to Argentina in respect of current transactions. On the other hand, a long and detailed programme has been drawn up of exports from the United Kingdom to Argentina. The British Government has agreed to facilitate the supply of certain essential commodities, including 1,000,000 tons of coal and 2,000,000 tons of petroleum products valued at £25 million. The Argentine Government has in turn agreed to grant licences to the value of £10 million for the import of certain non-essential consumer goods from the United Kingdom including rayon goods and motor cars. In addition, exports of capital goods valued at £10-15 million from the United Kingdom are being arranged bringing the prospective total of British exports to between £45 and £50 million. Including remittances from Argentina to the United Kingdom on "invisible" account, it is estimated that Argentina will have to find about £60 million sterling for current payments during the period of the agreement. On balance, therefore, the current account will involve a net payment of about £70 million from the United Kingdom to Argentina—apart from the capital item of £150 million which Argentina has to remit to Britain this month in payment for the British-owned railways.

For the finance of these diverse transactions, Argentina has

in hand at the moment £117 million in the blocked "A" account at the Bank of England, which is protected by a gold guarantee, and a further £35 million representing current accruals of sterling under the 1946 agreement and held in the "B" account at the Bank of England. For reasons already explained, Argentina does not wish to exhaust its accumulated sterling as it would have to do if the balance in the "A" and "B" accounts were used to finance the railway deal. A way around this difficulty has been found by an arrangement under which the Ministry of Food is to make an immediate pre-payment of the £110 million which is due on the whole of the food contracts up to the end of March, 1949. This sum is to be credited immediately to the "B" account, and will raise the balance on that account to £145 million. The remaining £5 million needed to make up the required £150 million for the railway purchase will be provided by a draft on the balance in the "A" account which will thus be reduced to £112 million. The sterling in this "A" account will then be the only resources immediately available to Argentina to meet current payments due to Britain. These payments will amount to £40 million over the period of the agreement—namely, £60 million due for visible and invisible imports, less £20 million exports to Britain for which pre-payment is not being made. To enable Argentina to make these current payments, it has been necessary to unblock the balance in the "A" account. This balance is, in fact, being made available to meet current payments in any part of the sterling area. The net payment of £40 million due to the United Kingdom will reduce the balance in this account to about £72 million by the end of March, 1949; but in fact, the draft on the balances may be greater since Argentina will have the right to finance purchases from other sterling area countries by drawing on these resources.

The sterling remaining in "A" account will continue to enjoy the benefit of the gold guarantee which, it should be emphasised, is not a guarantee to pay in gold but to adjust the sterling balances to allow for any revaluation of sterling in terms of gold. The Argentine negotiators succeeded in extracting a similar guarantee for any sterling which they might accumulate at a later date in the "B" account. This is not an eventuality which is likely to affect either country during the next 13 months, since over this period Argentina will have no net current sterling earnings. Looking beyond the period of the present agreement, however, it is evident that the precedent which has now been set in granting Argentina an exchange guarantee on currently earned sterling may acquire

considerable significance. This is the first occasion on which such a guarantee has been given, for the only other essays in this direction are the strictly bilateral guarantees given to Belgium and Sweden, which operate only if sterling depreciates in terms of the other currency concerned. The guarantee to Argentina operates without qualification if sterling depreciates in terms of gold, irrespective of anything that may happen to the sterling-peso rate of exchange. The agreement also involves the grant to the United Kingdom of an informal preference by the Argentine Government, which has undertaken that its departments will, other things being equal, give preference to British firms when placing contracts abroad.

What emerges from this complex of commercial and financial arrangements? The basic fact remains that Britain is throwing in one of its last remaining assets in Argentina in order to maintain a level of current imports far higher than could be financed out of current income. Contrary to first impressions, the £150 million capital transaction will not be engulfed in one fell swoop by a single year's deficit on current account; the full details of the agreement show that it represents about two years deficit at the 1948 rate. But whether it will do duty for another 12 months beyond the period of the present agreement depends on whether the Argentine authorities are prepared once again to build up their sterling balances to somewhere near the £152 million at which they stand today. That, even with the help of the gold guarantee, is a doubtful prospect.

As regards the financial arrangements, the most important feature of the new agreement is the freeing of the whole of the sterling accumulated by Argentina during the war and now held in "A" account. This gesture is not calculated to help negotiations with other countries whose accumulated balances Britain may wish to immobilise. Nor is the freeing of Argentina's accumulated balances a formal gesture. This sterling, as already noted, will be available to finance Argentine purchases in sterling area countries other than the United Kingdom. If, at the same time, Argentina persists in its present policy of demanding dollar payments for exports of cereals and other essential materials to sterling area countries such as India, the sterling area's use of the remaining dollar reserves will be correspondingly increased. At the same time, if Argentina succeeds in obtaining greater supplies of essential imports from sterling countries—for example, jute from India—these accumulated balances may in fact run away rapidly, in spite of all the arguments which the Argentine authorities have just used about their indispensability as currency reserve.

Economics in Fleet Street

STEEP increases in newsprint prices have recently caused much calculation in Fleet Street about its economic problems—its future profits or losses and the readjustments which may have to be made at the next turn of the screw of rising costs. In most newspaper offices, the balance between profit and loss has now become extremely precarious, for the various economies by which the newspapers have cushioned repeated shocks since 1939 are almost exhausted. And now *pro forma* accounts are being drawn up in an attempt to answer two questions—What will happen when the next increase in newsprint prices occurs? How can the cost of larger papers be shouldered, in the more distant future, if and when the Government agrees to a larger dollar expenditure on newsprint imports? Already the full-size dailies are said to be toying with the idea of half-size or "tabloid" issues, or of raising their price.

Unfortunately for the economist or investor, competition between the various papers is so fierce that their internal finances are shrouded in the utmost secrecy and it is extremely difficult

to arrive at any reliable estimate of changes in revenue and expenditure. The Daily Express, with a gesture of urbane open-handedness, has from time to time published figures ostensibly designed to enlighten its readers about its financial position (one set of such figures was published a few weeks ago); naturally enough, however, the figures stop short of revealing any vital information to competitors, and they have, therefore, only limited value as an illustration of the trends of newspaper finance over the past ten years.

Table I sets out in rough outline the analysis of costs provided by the Daily Express in 1937 and 1947. In 1937, newsprint cost £10 a ton; even so, paper and ink accounted for 27 per cent of the expenditure of the undertaking. As a result of the most recent increase in January, the cost of newsprint is now £43 a ton. Such a huge increase has been absorbed only because of the reduction in the size of the newspapers from about twenty pages to four. When allowance is made for the increases in circulation shown in Table II, most papers must

The price of newsprint to British papers charged by the Newsprint Supply Company Limited is calculated by weighting the average of the prices of imported supplies and home produced newsprint. At the present prices of £32 per ton for Canadian newsprint and over £48 for home supplies, the average cost is £43 a ton. Before the recent increases, the

The present policy of the newspapers on advertising and the alternatives before them will be discussed in greater detail in a second article. Meanwhile the trends revealed in the other main items in the Daily Express statement of expenditure call for examination. The first main head of expenditure is production. Wages of workers engaged on the mechanical processes of newspaper production have risen since 1939 by about 25 per cent for the highest paid workers and by about 37½ per cent for the lowest. These increase in rates of pay have, however, been greatly offset by a reduction in the numbers of workers employed: the reductions have not been proportional to the decrease in the size of newspapers, but they have nevertheless

* London newspapers, each of which has no connection with any other newspaper; "Reynolds News" is the property of the Co-operative Press Ltd. which issues all publications of the Co-operative movement.

The story is very different in the case of the Editorial Departments. Nearly as much news has to be gathered in for a four page paper as for a twenty page one, while the problem of sifting and editing it is much greater. Roughly the same number of correspondents have to be kept all over the world.

Distribution costs—in which railway charges are the major factor—have moved comparably with the curve of costs in the production departments; the reduction in the size (and therefore in the weight) of the newspapers at first brought a sharp fall in railway freight charges. As railway charges rose, these economies diminished, though by the end of the war savings on freight were still very large. But since 1945, railway costs have increased really rapidly, and now the distribution costs for a four-page paper with a normal increase in circulation have increased to about 70 or 80 per cent of their prewar figure, and the earlier savings have been sharply reduced.

Business Notes

The stock market barometer, in these days, is a very poor guide to the economic health of the nation. The Chancellor's speech in the debate on personal incomes last week, though it disappointed almost every thoughtful observer, yet brought a little reassurance to the Stock Exchange, and demonstrated once again that political factors—this time in the shape of fears of a new drive against profits—loom at least as large in the minds of investors as the menace of the economic situation itself. By contrast with the visions of strong measures which had been conjured up, the half-baked proposals for voluntary action looked almost innocuous. So, at least, it seemed on the morrow of the speech, when the equity markets staged a perceptible rally and brought to a halt the movement which had knocked some 8 per cent off industrial values in as many days. It was not to be expected, however, that these gains would be held. Although American grain prices recovered sharply and Wall Street looked steadier—thus calming the more melodramatic of the fears which the earlier collapse had aroused—the week's pause in Throgmorton Street has been a very uneasy one. The heavy selling ceased, and gave scope for a technical recovery in extremely thin markets, but already prices have started to fall away afresh and a resumption of pressure would cause no surprise.

Second thoughts on the prices-profits "plan" have indeed shown that any relief may be short-lived. It ought to have been apparent from the outset, as has been confirmed by the TUC statement this week, that the price of wage stabilisation will not be profit stabilisation, but profit or dividend reduction. If that cannot be achieved by voluntary action—and the Government's hopes of that are quite unrealistic—pressure from the unions will surely enforce a new initiative from the Government. In this context, it should be observed that the market has certainly read too much into Mr Attlee's statement, at the close of the same debate, about dividend restriction. He did not say that there could be no dividend limitation, but simply that a flat limit on dividend percentages was impracticable, which is too trite an observation to have any significance. The significant pointers (which the market seemed to miss) were the implication that the Prime Minister is concerned to achieve a *reduction* in dividends and the plain evidence, in the Chancellor's sequence of argument, that attention is being directed to undistributed as well as distributed profits.

In the circumstances, the market is perhaps justified in putting political factors in the forefront of its fears, yet it is proving a

From this brief account it is clear that the large economies made by the newspaper companies during the war years have gradually been eaten up by the rising spiral of costs since the war ended, and of these the rise in newsprint prices is the most spectacular. The pressure which higher costs exerts on any particular paper varies according to size of its two main safety valves—circulation and advertisement revenue. The size of circulation has a direct bearing both on sales revenue—the penny paid by the public—and on the rates chargeable for advertisements. On both these counts, as Table II shows, the Express, the Mail and the Mirror are relatively well off. And while they can keep the present pace, their competitors must, willy-nilly, run the same course. The present position on sales and advertisement revenue will be the theme of a second article.

poor judge of the way events are moving. The alternatives seem to be either a stop-gap voluntary plan (which might appease the unions and please the Government for a time, but would certainly not be workable) or a much more determined anti-inflationary budget, with dividends and/or profits demonstrably shouldering at least their share of the burden. The only other alternative would be for the Government to resign itself to a continuing and even rising inflationary pressure which it at last seems determined to avoid. Between now and the Budget, the only consolation which is in sight for the markets is the imminence of the Argentine rail payout, which (in the absence of further shocks) might help to check the seepage in values which is the normal consequence of sustained uncertainty.

As a result of the signing of the Andes Agreement, the Argentine railway companies are expecting the full payment for their properties to be made by the end of this month. But the actual disbursement of the cash among the various classes of stockholders will be a lengthy process. It will begin by the payment of arrears of interest on the debenture capital for the three months ending September 30, 1947, after which the books of the companies will be closed as a preparatory step for the repayment of the debenture stocks. It is thought that these repayments will not be completed much before the beginning of May, especially by the largest companies, such as Central Argentine, whose debenture holders number over 22,000. The clerical and legal work involved in this operation will be a formidable task for the London staffs of the companies.

Once having paid off the debentures, it will be necessary for the companies to arrange for compensation for their staffs and then to proceed with liquidation. This can be done only with the approval of shareholders' meetings, for which the statutory three weeks' notice is required, although this period can run concurrently with the debenture repayment. The preference and ordinary stockholders will then receive a payment of the major portion of the money assigned to them under the payments scheme, but not necessarily the amount fixed in that arrangement, for the last word will be with the liquidators, who have to take into account future expenses. But while the interim payment may well be less than the agreed sum, it will be followed by a final payment to both preference and ordinary stockholders who are entitled to share equally in the residual assets.

6, 7 and 8 TOKENHOUSE YARD, LONDON, E.C.2
Agencies in New York, Bradford, Manchester

Trusteeships and Executorships Accepted.

The total payments are not likely to be less than the amounts set down in the scheme, for the gross allocations to the companies are expected to be more than sufficient to meet them, after allowing for staff compensation, the expenses of winding up and the disbursement of funds, and the final costs to be met in the Argentine itself where litigation and miscellaneous claims have to be settled. As it is estimated that the interim disbursements are not likely to be completed much in advance of the end of June, stockholders will probably not receive their final payments for perhaps another six months. Thus the investment of the purchase money is unlikely to make an immediate impact on the Stock Exchange, but should be gradually absorbed over a period of several months.

Mr Strauss and the Motor Industry

Critics of the British motor industry have long held that it needs to concentrate its quantity production on fewer types of car if it is to expand its sales overseas. At first glance Mr Strauss's latest intervention in the affairs of the industry in his speech at Birmingham on Tuesday might seem to be serving this purpose. Mr Strauss indicated that the six big manufacturers, which account for 90 per cent of British car production, could depend on the maintenance of their steel allocations, but he spoke of the possibility of withdrawing supplies from the smaller firms which were not reaching their export quotas. Firms which failed to export 75 per cent "or an agreed proportion" of their output within six months or so would have to turn to other light engineering work.

What would be the consequences for the motor industry if this threat were carried out? It would reduce the number of financial groups producing motor vehicles; but would that by itself solve any problems? The six large groups last year produced 29 out of the 51 types of car being made in Britain; and it is among the 29 rather than among the other 22 that concentration on fewer types would yield results in cheaper production. The small firms represent (measured in quantity of production) only 10 per cent of the industry. Among them are a few which can make no particular claim to technical distinction or originality in design; they would not be greatly missed. But among them, too, are makers of distinctive good-quality cars, whose technical record

is excellent and who have in many ways acted as a stimulus to inventiveness in the past. Their sales are small, but the demand they meet is specific and reasonably permanent; they can hold their own as well in a buyers' as in a sellers' market. They have served the prestige of the British industry better, on the whole, than have the "cheap" quantity producers. Their disappearance from the field would not release large quantities of materials to the mass producers. It would, however, reduce still further a competitive stimulus which in this particular industry has been for many years too low.

Mr Strauss acknowledged that the export difficulties of the smaller firms were not, in general, their fault. Clearly they cannot add elaborate foreign sales and service organisations to their overheads—especially at a few months' notice. Have the possibilities of a joint organisation been fully considered? Had Mr Strauss explored what he could do by initiative and leadership before he engaged in this policy of stimulation by thwacks from behind? The industry could do a good deal by a common effort of self-help to improve its competitive position. But a threat of extinction (or, at any rate, elimination from the motor industry) to those who fail to reach an arbitrary export target within a brief time-limit hardly seems the way to evoke joint effort.

Mining Production and Manpower

Since the five-day week was introduced in the mines, the question of extra work to provide the coal production that is urgently needed has never been satisfactorily settled. The present agreement expires on April 30th, and discussions have begun between the National Union of Mineworkers and the Coal Board to decide what is to happen then. In the past month or two, largely owing to the competing attractions of football, work in the mines on Saturdays has been falling and an attempt to devise a longer working week which the miners are prepared to support has become overdue.

Coal output in the first six weeks of this year averaged 4,104,000 tons a week—47,000 tons more than the weekly average required throughout the year to attain the target of 211 million tons. The weekly average over the corresponding period last

year was 3,792,600 tons. But, even if industrial disputes are avoided, holidays and other causes can be expected to affect output adversely in the summer. The present slender surplus is hardly enough to offset those factors.

Hopes of reaching the Government's 1948 manpower target of 750,000 miners do not look good. To replace an annual wastage of about 70,000, it will be necessary to recruit some 102,000 men—2,000 a week. Figures published by the Ministry of Fuel, and a manpower report by Mr James Bowman, vice-president of the National Union of Mineworkers, show that the chances of recruiting British labour on this scale are slender. It is true that manpower has been increasing, and the net addition of 1,300 in the past fortnight has brought the latest figure to 721,000, which is nearly 25,000 more than this time last year. Wastage is slightly less than a year ago, and as more young men come into the industry the loss from sickness and retirement should diminish. But it is disturbing to note that of 22,090 men recruited in the 13 weeks to the end of January only 2,000 were boys under 18, compared with the 3,850 juvenile recruits in the same period of 1946-47. Older men and foreign workers do not relieve the necessity of recruiting a sufficient number of juveniles. Mr Bowman estimates that at least 25,000 boys under 18 will be needed during the year.

It is also estimated that by the end of the year 30,000 European Volunteer Workers and Poles will have joined the industry, together with 3,000 Irish workers. So far, 4,537 EVWs and 6,414 Poles have been recruited, but only 1,147 EVWs have been placed. It will clearly take time before foreign workers can become fully trained and absorbed as productive workers in the pits. In the meantime, the proportion of face workers to the total labour force is still disagreeably low. As the Production Members of the Coal Board have repeatedly stressed, the industry will never become fully efficient until the balance between productive and non-productive labour has been adjusted.

Germany's Central Bank

The British and American military governors in Germany have signed a charter for a new German central bank. Its immediate task will be to serve the needs of the Anglo-American zone, but its constitution has the required elasticity to make it a possible central bank for a new unified Germany—if such a Germany ever emerges again. The new bank is to be known as the Länder-Union Bank. It is to be patterned closely on the Federal Reserve system in the United States, and will give expression in terms of credit and monetary policy to the principles of federalism on which the future political organisation of Germany is apparently to be built. That federalisation of the German banking system has been under way for some time. The Americans established no less than three Land banks in their zone, one for each Land, and a few months ago the British authorities followed suit and scrapped the highly centralised relics of the Reichsbank organisation which they adapted—with some deference to Bank of England practices—after occupation of their zone. The French have virtually made the banking offices in their zones branches of the Banque de France, and it would need rather more fundamental amendment to bring them within the orbit of the new federal system. The Russians, however, have wiped out the vestiges of the Reichsbank and of the old commercial banks, together with their old deposits, and have set up a single bank for each Land in their zone. Technically, therefore, the banking system in this zone could easily be brought within the framework of the new federal system.

The new Länder-Union Bank will be more akin to the Board of Governors of the Federal Reserve System in Washington than to a central bank as such. The actual central banking operations will be done for each Land by its respective Land bank. The LUB will be given some control over the policies of these Länder banks, and will have direct operational and executive powers in such matters as exchange control, the issue of currency and the determination of reserve regulations, where the principles of regionalism will necessarily have to yield to some measure of homogeneity and centralised control.

The setting of this new coping stone on the federal reorganisation of German banking may be regarded as the first step towards currency reform. This move is an absolute essential to economic rehabilitation. There is still complete artificiality in the structure of German prices, wages and costs. Export trade is still shackled by a schedule of fixed prices that has lost all touch with reality. Such foreign trade as can overcome this obstacle is either the crudest form of barter or transactions which from start to finish are under the control of the official Export and Import Agency. Upon the introduction of the new currency

the real dearth of capital in Germany will make itself fully felt. A famine of working capital will become just as apparent as it did after the inflation of 1919-1923. The new central banking organisation will then have to show its mettle in satisfying the essential and crying needs for additional credit without compromising the stability of the new currency.

Electricity Stock Valuations

Now that the vesting date under the Electricity Act, 1947, has been officially fixed for April 1st, the absence of fixed compensation prices for the majority of electricity stocks becomes more of an anomaly than ever, and contrasts strangely with the simple announcements of the "take-over" prices for the bulk of the transport and gas stocks. True, the Act itself provides two alternative bases for calculating what the compensation price might be. Under Section 20 (2) compensation prices will be equal either to the mean of the quotations for the individual securities on the first, fourth, fifth, sixth, seventh and eighth of November, 1946, or where this mean is less than that of prices on the alternative dates—February 15th, March 15th, April 16th, May 15th, June 16th and July 16th, 1945—the average for those alternative dates will be taken. But subsections 20 (6) and (7) leave a provision for stockholders' repre-

sentatives to negotiate with the Minister of Fuel and Power in the case of questions arising from the Stock Exchange basis for compensation; failing agreement, questions will be resolved by arbitration. These methods, moreover, do not apply in the case of holding companies.

Already several companies have disclosed the results of negotiations with the Minister, and the take-over prices which have been agreed form a nucleus of a composite list. Those announced to date are given in the accompanying table; in no instance do the negotiated prices differ from those calculated from the dates laid down in the Act.

As the vesting date approaches, the movement in the price of 3 per cent British Transport Stock 1978-88 is being watched with increasing interest by electricity stockholders. On present indications, and despite official support for Transport Stock, the new Electricity Stock may have to be issued on terms more favourable to stockholders than those which ruled on January 1st. The Act provides that regard must be paid to the market value of Government securities at the vesting date—April 1st—but much, of course, can happen in the gilt-edged market before then.

Bigger Savings

Amid the encircling gloom, one of the few heartening signs recently has been the better performance of National Savings. In each of the past five weeks gross savings have surpassed £20 million, while, more recently, withdrawals have shown a declining tendency and are now running slightly below their 1947 level. Until early January, weekly net savings had on only four occasions reached the target rate of £7 million per week fixed for the current financial year. But since then this rate has been very comfortably exceeded; last week's figure was a little over £11 million, while the average for the past five weeks is only a shade below that figure. As a Note in *The Economist* of January 24th

The beautiful Temple of Philae rises from the waters of the Aswan reservoir for a few months in the summer and autumn. For the rest of the year it lies submerged below the surface—a sacrifice to the vital need for irrigation in the Nile Valley.

To meet this ever-present demand for water the rulers of Egypt, from the earliest kings, tried to harness and control the seasonal rise of the great river. Their efforts met with varying success until the nineteenth century, when modern engineers began the construction of the great system of dams and barrages which now extends from the Delta to the upper reaches of the Nile.

With the establishment of a reliable irrigation system the cultivation of cotton became the most important industry in Egypt and it is still a leading factor in the economy of the country. Full and up-to-date information from our branches in Egypt covering the cotton industry and other commercial activities is readily obtainable on request.

BARCLAYS BANK
(DOMINION, COLONIAL AND OVERSEAS)

HEAD OFFICE: 54 LOMBARD STREET, LONDON, E.C.3

THE BANK IS INTERESTED

It is interested in its customers, in their affairs and in their business ventures; it is ready, by direct assistance and friendly counsel, to help those affairs forward, for it recognises that the prosperity of the Bank is to be found in the prosperity of its customers. It is, therefore, good business to keep in touch with your Bank. The Manager at any branch of the Westminster Bank will be glad to discuss with you any problem in which the services of the Bank can usefully be employed.

WESTMINSTER BANK
LIMITED

The Devon Cattle Breeders Society Sale of Bulls, Exeter

In spite of the modern trend towards centralisation and uniformity many of us still believe that local traditions count for a great deal in the conduct of business. We like to deal with local men who understand local problems and conditions, rather than with some remote authority, however well intentioned. It is the knowledge of this deep-seated preference for familiar things and people that underlies the development by Barclays Bank of their unique system of Local Head Offices, covering England and Wales. The Local Directors of these Offices are well acquainted with the districts they serve: their experience is at the disposal of all customers of the Bank, whether their accounts are large or small.

BARCLAYS BANK LIMITED

TRADE WITH THE EAST

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA provides a complete banking service, backed by nearly a century's first-hand experience of Asiatic economic conditions, for every financial operation connected with TRADE, INVESTMENT AND TRAVEL IN THE EAST. The Bank's branch system, under British management directed from London, serves

INDIA • PAKISTAN • CEYLON • BURMA
SINGAPORE AND MALAYAN UNION
BRITISH NORTH BORNEO AND SARAWAK
INDONESIA • FRENCH INDO-CHINA • SIAM
THE PHILIPPINE REPUBLIC
HONGKONG • CHINA • JAPAN

Merchants and Manufacturers planning to establish, renew or extend business relations with the East are invited to consult the Managers in London or Manchester.

**THE CHARTERED BANK OF
INDIA, AUSTRALIA AND CHINA**
(Incorporated by Royal Charter 1853)

Is Australia your market?

Do the people of Australia buy your products? Or do you buy theirs? Whichever is the case, the Commonwealth Bank of Australia is able to give you considerable assistance. Guaranteed by the Commonwealth Government, the Bank has 330 branches throughout Australia and New Guinea; it has an unrivalled first-hand knowledge of Australian produce and Australian requirements; it is, therefore, unusually well equipped to facilitate trade between this country and the Commonwealth. The Managers of the London branches welcome enquiries from those whose interests lie in the Australian market.

COMMONWEALTH BANK OF AUSTRALIA

8 Old Jewry, London, E.C.2. Australia House, Strand, London, W.C.2.

FINANCE AND OVERSEAS TRADE

The financial arrangements involved in trading with countries overseas can present many complications. The Three Banks Group have wide experience of this aspect of modern Banking practice, and with many important contacts overseas is particularly well placed to handle such problems and tender advice based on accurate knowledge of local conditions. The need for increased exports is leading to considerable expansion of the Group's activities in this direction.

ROYAL BANK OF SCOTLAND

WILLIAMS DEACON'S BANK LIMITED
Founded 1771 Manchester, London and Branches

pointed out, the jump in gross subscriptions in early January arose mainly from non-recurring factors; the better performance recently looks more solidly based—though it is possible that it is to some extent simply the counterpart of the continuing dis-boarding of currency.

Unfortunately, even a continuance of this trend during the remaining seven weeks of the financial year would still leave the year's total hopelessly wide of the target. The cumulative total of net savings for the year to date is £170 million and, if it goes on rising at the current rate, would reach £247 million by the end of next month, or only two-thirds of the target figure of £366 million. Moreover, it needs to be borne in mind that in this current financial year £88 million of 3 per cent Defence Bonds have been repaid at maturity; these repayments, as distinct from the encashments in advance of maturity, are not allowed for in the official figures. In addition, an appreciable part of the year's large disbursements of war damage claims must have reached small savers, and some of those monies might well have been expected to be reinvested. The national emergency which recent ministerial speeches have been impressing upon an ever-widening audience may be making savings propaganda more effective. But it is very plain that the Movement faces an even bigger task of public education next year. Fortunately, there is little risk that the organisers of the Movement will this time deceive themselves, as they did last year, by the apparently good results achieved in the old year. In 1946-47, net savings reached the year's target—a somewhat lower one than this year's—but this result was wholly due to the artificial stimulation given to subscriptions by the successive Daltonian stunts and "last chance" drives. In this year's savings, the amount achieved by such questionable means has been relatively small. Indeed, this year has felt the back-lash of Mr Dalton's stunts: small savers have secured lower interest rates than in 1946-47, and many of them must be aware of the radical change which has occurred in the gilt-edged market. In such conditions the Savings Movement obviously has an uphill task.

Southern Railway Dividend

Whatever the fate of the resolutions to be submitted next month to the annual meeting of the Southern Railway, the final payment to deferred ordinary stockholders will be the highest since the company was incorporated in 1923. The dividend might be as high as £4 7s. 2d. per cent, but it will not be lower than £4 1s. 3d. per cent depending on whether the shareholders decide—as it is fully expected that they will—to grant £60,000 (representing three years' fees at the annual rates formerly granted) to the company's directors for loss of office. As the old home rail stocks were declared ex dividend on December 10th last year, the dividend will be paid to all stockholders who held stock on that date. The previous highest payment was 3½ per cent paid for the years 1923-5.

This satisfactory final return results from the implementation of the Railway Control Agreement which has meant an income of £13,795,388 from rentals for the 1946-47 "final period," making with other revenue a total of £14,986,000 to be disbursed by the company among its various classes of capital for the two years. There is a presumption from the figures that income from road passenger transport investments was markedly increased during 1947, for the 1947 net revenue (including £227,000 receivable under Section 20 of the Transport Act) amounted to £7,802,500 compared with £7,184,536 in 1946, while net revenue received from "excluded undertakings" (mainly road transport) amounted to £963,648 compared with £237,423 for 1946. After providing for interest on prior charges and dividends on preference capital and allowing for the payment to directors, a balance of £1,312,504 has been left for the deferred ordinary capital compared with £878,556 for the previous year when a dividend of £2 15s. 0d. per cent was paid.

The CWS Thinks Again

The banking department of the Co-operative Wholesale Society, it seems, is experiencing something of a recoil from its recent phase of aggressive expansion. Especially in 1946, it will be recalled, the CWS Bank was making strong efforts to attract the banking business of local authorities—in particular, of course, in cases where there was a Labour majority on the Council. Many local authorities were then induced by the offer of high interest allowances on their deposits to transfer their accounts from the clearing banks. For those banks, the maximum allowance of interest on deposit account has since 1945 been fixed at one-half per cent and no interest at all is allowed on current

account balances. But the CWS Bank offered to local authorities 2½ per cent, later reduced to 2 per cent, on deposit account and 1 per cent on current account. Since last year's protests about the unfairness of this kind of competition, the CWS deposit allowance has, it is understood, been reduced to 1½ per cent, but the current-account rate remains at 1 per cent. More recently, some local authorities which have asked the CWS to indicate the terms upon which they would be prepared to conduct their accounts have been told that they would be subject to a charge of commission on all withdrawals, at rates varying from 3d. to 9d. per cent. In some other cases it is suggested that the CWS has actually been quite unresponsive to feelers put out by local authorities about the possibility of the transfer of their business from joint stock banks.

These developments are certainly not unexpected. It was clear that the conduct of these large accounts would involve a great deal of work for the Co-operative Wholesale Society, and it is perhaps questionable whether those responsible for launching the aggressive competitive drive fully realised the volume of work and trouble—and even office space—which the new business would entail. To enable the CWS to handle such accounts efficiently, it would be necessary for it to develop into a normal deposit bank with a large number of fully equipped branches—which could hardly be sustained by business of its traditional type. In some cases the CWS has indeed opened particular branches for the specific purpose of handling newly acquired county council accounts. But even where such arrangements have been made, the CWS "Bank" has to lean heavily upon the joint stock banks, to which it must look for many indispensable banking facilities—notably, of course, the provision of clearing facilities and transmission of cash. The clearing banks, for their part, have always provided such assistance, even though they themselves suffered some loss of business from the transfer of the municipal accounts. The assistance has not, however, been given gratis, and the CWS is now passing the cost on to its own clients.

Even on the new basis, the terms quoted by the CWS compare favourably with those which the joint stock banks are permitted to offer. In the past, the ability of the CWS to offer rates which would be uneconomic to a normal deposit bank has arisen, first, from its reliance upon those banks and, secondly, from the fact that a very high proportion of its deposits are invested in gilt-edged securities. Probably there is no direct connection between its new policy in the matter of charges and last year's slump in the gilt-edged market. But if this painful demonstration of the risks to a bank of holding long-term securities were to lead to a change in the CWS Bank's investment policy, it might find it hard to maintain the very liberal deposit allowances which it has offered in the past. Meanwhile, despite the instances mentioned above, the drift of local authority business to the CWS has not entirely ceased.

Blocked Balances in Germany

British firms who own industrial undertakings in Germany have long been restive under the controls to which their German subsidiaries are still subject. They have accumulated over many years large balances in the German banks, which they would have liked to re-invest; but the property control laws in Germany prevent them from engaging in capital transactions, so that their funds are frozen except for ordinary day-to-day running. Mr Hector McNeil said in the Commons on Monday that the Government had this question "under active consideration." He added that there was a four-Power undertaking on the subject: "So long as there was a possibility of quadripartite agreement on economic matters, His Majesty's Government were unwilling to desert the undertakings which they had made." This wording suggests clearly that Mr McNeil thinks the time has come for a change.

There is indeed little logic about the present position. The property control laws were drawn up before the war ended to protect foreign property in Germany from possible fraud or seizure during the war or during the confusion of German defeat. Dealings in the property were forbidden, and persons holding it were made responsible for its safe custody. Foreign-owned business enterprises, like others which because of their ownership had to be subjected to special controls, were permitted to engage in transactions "ordinarily incidental to the conduct of their business," but not in other transactions. This arrangement was clearly intended to last until the special hazards of wartime disappeared and communication could be restored with the foreign owner. It has, however, persisted longer than anybody expected, and the system of custodianship under Control Commission supervision

has persisted with it. It was not until last summer that foreign owners were permitted to appoint their own managers. They still cannot dispose freely of their bank balances, and have not even been able (except in a few special cases) to buy new buildings or plant to replace war damage. In this they have been at a disadvantage by comparison with the average German owner, who has been able to use his funds for repair, replacement and re-investment. The confused monetary position in Germany has made re-investment difficult for Germans, but not impossible; real estate and industrial plant have from time to time come on the market, and some foreign firms believe they could have made use of opportunities of this sort. Although the British and Americans are the biggest foreign holders of property in Germany, the western European neighbours of Germany have a lively interest in the matter too. Their assets in Bizonia are considerable, and the Dutch at least are likely to raise the question if they get the opportunity at the conference on German affairs which opens in London on Monday.

If the restrictions are relaxed, it will still be doubtful whether anything can usefully be done in the way of re-investment now that reform of the currency is a matter of common talk in Bizonia. Currency reform will no doubt involve a heavy scaling down of bank balances. But it will also bring down the inflated prices of real estate and industrial plant, perhaps to the point at which the reduced balances can buy more than at present.

Higher Price for Ceylon Tea

Ceylon has now provisionally accepted the Ministry of Food's new contract price for tea, which has been raised by 2d. a lb. over last year's price. The Ceylon Government requested an increase of 4d., which would have brought the price more into line with the level ruling at the Colombo auctions. The new contract will include a sliding scale allowance covering changes in direct labour costs, and Britain will also pay the export duty of 7d. a lb. Britain has certainly won the first round, but it has not yet got the tea—the growers have still to offer their tenders. Last year, out of a total of 150 million lb. of tea asked for by the Ministry of Food, less than 100 million lb. was tendered. Most producers preferred to take the risk of selling at the Colombo auctions, and they were certainly rewarded by higher prices.

It is too early to judge what response the new contract is likely to have. The Ceylon Government will encourage the offer of tenders without using compulsion. In the circumstances it may be a sound policy for producers to offer, say, half their output, selling the rest at the auctions. The recent sharp fall in American food prices may be transitory, but it has certainly awakened a sense of realism among agricultural producers that the high level of commodity prices may not continue indefinitely. Moreover, the improved political situation in Indonesia will be an important factor in the recovery of tea production in those islands, although exports may not show any significant expansion before the end of this year.

Ceylon producers are not impressed by the increase of 2d. a lb. which has been offered, and unless they decide that the risk of open-market selling is too great, the amount of tea which they tender is likely to be less than in 1947. But Ceylon now has Dominion status with full control over its own external expenditure, which to some degree limits the Ministry of Food in its offers of price, as unless Ceylon decides to accumulate the extra

sterling earned, its increased demand for British exports could restrict the dollar-earning capacity of the British export drive. The cost of tea could thus be tantamount to a dollar payment. Although the new contract price may not be handsome, it is at least reasonable and offers the producers some security. Had the contract been for three years rather than one, the Ministry would probably get a better response.

Fewer Women in Industry

After the very considerable increase in the numbers of women taking up work during October and November, the sharp decline during December is a disappointment. In all, 49,000 women left their employment during the month, and while there was an increase of 27,000 men, the total numbers in civil employment fell by 22,000. There was an exceptionally high rate of wastage from industry (especially after Christmas) which the Control of Engagement Order had been largely instrumental in checking in earlier months. It is likely that many women who originally responded to the Government's appeals to work in industry found the financial inducements insufficient to offset the domestic difficulties.

The biggest proportionate loss was in distribution, hotels and other consumer services. This trend need cause little dismay, for these trades had recently been swelling, largely under seasonal influences. But the fall in textile recruitment is disturbing. Cotton spinning and weaving lost 500 women, although this was exactly balanced by male recruitment. In the textile group as a whole, employment increased by 400, but there was a loss of 1,800 women. The Ministry was less successful in steering workers to the undermanned "first preference" industries than in the two preceding months, for the net gain was only 1,000, compared with the 12,200 of November. Some 35,000 workers, or 12 per cent of the total placings, were in first preference industries. Only one man was directed under the new scheme, which shows that the fears that powers would be indiscriminately exercised remain unfounded. It remains to be seen whether the provision in the White Paper on personal incomes exempting undermanned industries from the general wages stop will be effective in re-distributing the balance. If not, will the Minister of Labour be forced to apply his powers of direction more extensively?

To a limited degree the decline in manpower from British sources is being offset by recruitment of foreign workers, whose numbers rose by 11,000 during December. By the beginning of the year there were 98,000 foreign workers in Britain under the various postwar schemes, and the rate of placing European Volunteer Workers is now running at 1,000-1,500 a week. Agriculture is the main industry to benefit, for it has received more than half the total number of EVWs. This is desirable, for as the repatriation of German prisoners gathers speed the labour problem on the farms is becoming extremely acute. The problem of absorbing the Poles, however, is still presenting great difficulties owing to practical trade union objections, even where the principle of accepting Poles has been agreed.

Empire Wool Stocks Falling

The buoyancy of the wool market since the end of the war has been reflected in the progressive reduction of Empire wool stocks held by the Joint Organisation. In 1945 it was estimated

that it would take 13 years to dispose of the existing stock of 10½ million bales, but by the beginning of the 1947-48 season the stock had been reduced to only 4,500,000 bales. A further 600,000 bales had been sold up to last December, leaving an end-year stock of 3,916,000 bales. Holdings of South African wool have been reduced by no less than 86 per cent, Australian wool by 60 per cent and New Zealand wool by 47 per cent. The reduction in stocks, moreover, has been concentrated on the better qualities. The Joint Organisation at the beginning of 1948 held only 300,000 bales of combing merino wool free from fault and vegetable matter—or less than 8 per cent of their total stock. The decline in Joint Organisation stocks since July, 1945, is shown in the accompanying table.

In the first half of the current season 601,000 bales of stock wool were sold, 368,000 bales being of Australian origin, 135,000

EMPIRE WOOL STOCKS (in thousand bales)				
Stock at :	Australian	New Zealand	South Africa	Total
July 31, 1945	6,796	1,777	1,834	10,407
June 30, 1946	3,789	1,425	572	5,786
June 30, 1947	3,076	1,092	347	4,515
December 31, 1947	2,719	948	249	3,916

bales from New Zealand and 98,000 bales from South Africa. The strength of the market in this period was such that only 12,459 bales failed to reach the reserve price and had to be bought-in by the Joint Organisation. The bulk of this quantity consisted of carbonising types in Australia and karakuls in South Africa. Offerings in the second half of the season have been provisionally fixed at 525,000 bales, and if the rate of buying-in does not increase, total stocks at the end of the season will be reduced to just under 3,500,000 million bales or one-third of the total held at the beginning of the scheme in August, 1945.

Raw Material for Rayon

The search for an inexhaustible supply of the basic raw material of rayon has still a long way to go. Dr Herbert Levinstein, the chemist, in a recent lecture to the Engineers' Club in Manchester, made a number of suggestions of which more may be heard. The obvious sources are oil, coal, and plants. Of these, oil has been gaining on coal as the furnisher of hydrocarbons for industry. Coal has become too dear for the purpose in this country. Oil can be so handled as to give cheap ethylene by-products, though not in unlimited quantity; Dr Levinstein mentioned the Catarole process, to be employed in the new Petrocarbon plant at Partington, near Manchester, as a probable source of cheaper ethylene. He mentioned also the possibilities of extracting furfural from groundnut husks, large quantities of which will be obtained from the African groundnut scheme.

He gave a good deal of attention to straw as a source of cellulose—more suitable for paper-making than for rayon, but a source that is greatly neglected now. Of the 3,500,000 tons of straw grown in this country annually, about 300,000 tons a year were used for paper-making in the last three years of the war. A great deal of the balance was wasted, and he believed that more than 1,250,000 tons could be made available—potentially, 600,000 tons of pulp. There is, however, a re-equipment problem here. During the last two wars straw was pulped by the esparto process in the plant designed to handle esparto grass. This was not a suitable method, and Dr Levinstein attributed to it the bad reputation which straw had acquired in the paper trade. He advocated importing straw-pulping plant at a cost of perhaps £4 million. The cellulose yield of straw and esparto were about the same, he said ; but last year this country wasted many thousands of tons of straw and imported 125,000 tons of esparto grass at a price (£12 a ton or more) at least three times the prewar price. He considered the prospects for methane. The high price of coke oven gas in this country ruled out one important source which is exploited in the United States ; he suggested an alternative in sewage. Regarded simply as a means of disposing of a nuisance, the sewage system of this country is admirable. To the industrial chemist it is a shocking waste : "All the potash and all the phosphates applied to the soil are returned in due course to the sewage works"—and thence run away into the sea. The recovery of fertiliser is a separate field of inquiry. Sewage as a source of methane is already exploited in a limited way ; eight sewage works in this country collect methane from the purification of sewage ; the biggest, Mogden, recovers about 9,500 tons of methane a year. No research would be necessary to apply this method much more widely.

MARIE CURIE SMITH?

Among young students of to-day are the research scientists—the Marie Curies, the Rutherfords—of tomorrow. For their instruction and for that of other serious audiences, the Rank Organisation has filmed the world's most significant scientific achievement—the harnessing of atomic energy. The G-B Instructional film, *Atomic Physics*, made with the co-operation of the world's leading scientists, will not quickly recover its cost. Its production is a long-term investment, a gesture towards putting the whole vast conception into perspective for those who will study it. If atomic energy is to prove the great benefactor, and not the dread destroyer, the race for knowledge is as urgent as it was two years ago.

In 1945 the needs of war directed atomic research into destructive channels. But scientists know that other secrets lie locked in the atom, that the unharnessed power now known to exist could raise human standards of living far beyond our present resources. If the new film should prove a stimulus to even one young future Madame Curie, one future Professor Rutherford, it will have been well worth the making.

People's Cars From Germany

A production and export plan for the German motor car and industrial vehicle industry in Bizonia has been drawn up for 1948 by the Automobile Industry Association, representing the manufacturers, and the Frankfurt Economic Council. It has been pared down to limits which the Germans think may be reached, though with great difficulty. Total production is estimated at 40,000 cars and the same number of lorries and omnibuses. This compares with a permitted output under the Level of Industry Plan of 160,000 cars and 61,500 industrial vehicles. The chief bottlenecks are in stocks of zinc, brass, steel and bronze and in power supplies.

Production is divided among the manufacturers as follows: "People's cars" (the famous *Volkswagen*), 22,000; Opel "Olympia," 8,000; Mercedes 150 V, 4,500, and 170 V, 1,500; Opel "Captain," 4,000; and Ford "Taunus," 1,000. The export quotas are estimated at 11,000 *Volkswagen*, all the 4,000 Opel "Captain" cars, some of the Opel "Olympia" models, and all the Fords. In addition, some of the cars, notably about 3,000 *Volkswagen*, will be sold to the occupation authorities and various missions in Germany. The total proceeds from exports in 1948 are expected to be \$30 million.

Particular hopes are placed on the *Volkswagen*, probably still the most modern small car made. It is sold abroad at \$750, or to the occupation authorities for £160. (Since Bizonia is practically a dollar area, the British may no longer buy the car for their personal enjoyment.) Recently the 20,000th car to be manufactured at the Wolfsburg works since the war left the lines, with a ceremony at which the British controller announced that the plant would in future be an entirely German undertaking, not liable to dismantling.

The present capacity of the works would allow an output of 2,500 cars a month if one shift were worked, or double if there were two shifts. The present low output of about 1,000 cars a month is due mainly to lack of materials. There are hopes that a great spur will result from use of the export bonus of 5 per cent of the dollar proceeds which is intended for purchases of raw materials and incentive goods for the workers. However, the British authorities do not share the view that 11,000 *Volkswagen* will be exported in 1948; their estimate is only 4,000. The present internal selling price of 5,000 marks covers the cost of production and allows for reserves; but the manufacturers are prepared to cut the price once competition in the German industry starts again, with currency reform and abolition of the price stop. It is significant that responsible Germans see no need to write off the advance payments for the *Volkswagen* which Ley secured from the population.

Duty on Light Oils

The pre-Budget campaigning season is getting under way. Two committees have entered the field against the duty of 9d. a gallon on light hydrocarbon oils used for industrial purposes, and have put a respectable case to the Treasury. Their purpose is to get the duty repealed on oils used for purposes other than transport. One committee represents the various industrial users of light oils, such as white spirit and turpentine, which are used in the manufacture of rubber, paint, polishes and printing ink and in extracting vegetable oils from seeds and grease from bones. Motor spirit too has many uses beyond transport—on farms, in workshops and in the bench-testing of petrol engines. The committee claims that the duty represents a tax on an essential material of industry. It raises British costs, while most overseas countries have a system of tax rebates to industrial users. The Federation of British Industries has supported the campaign. Another sufferer from the tax, the aircraft industry, has also set up a committee. More than 70 per cent of the civilian consumption of aviation spirit within the country is used by aircraft and aero-engine constructors, mostly for bench testing and trial flights.

Piecemeal legislation has made the system of oil duties anomalous and confusing. The original duty in 1928 was imposed on all oils for the benefit of the Road Fund. Since Chancellors have tended to raid the Fund for other purposes, the duty is now often regarded as an ordinary indirect tax. There was, however, a protective element, since hydrocarbon oils derived from home sources such as coal were exempted. First to be freed from duty, in April, 1945, were hydrocarbons used as raw materials for chemical synthesis, since it was recognised that chemicals in turn formed the basic raw materials of many new industries. In October, 1946, in order to encourage conversion from coal to oil, the heavy oils were exempted from duty when not used on the roads. The users of light oils are asking for the same principle to be extended to them. To help farmers, duty on kerosene, including vaporising oil, was abolished last year. All oils or articles containing oils have been made free of the duty if they are exported. Finally, neither fishing-boats nor refineries pay duty on the spirit they use. Enough exceptions are already in force to make nonsense of the defence of impracticability.

What is the case for the retention of the tax on oil used industrially? It is estimated to provide £5,100,000 a year, but there are probably less harmful ways of raising the money. No home industry needs this particular protection. Certainly there may be doubts about reducing the price of any commodity that costs dollars. But restriction of oil consumption depends in any case on the controls. The whole question of oil taxation might well be reviewed. Anomalies which allow a gas turbine or jet-propelled aircraft to be tested without incurring any tax, while a propeller aircraft has to pay, or which protect tractors using vaporising oil at the expense of petrol-driven tractors, are hard to justify.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports appear in the Supplement: Leyland Motors; International Combustion; Ilford, Limited; Inveresk Paper.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked *), and those paying 3 per cent or less will be repaid at the latest date (marked †). (n) Net yields are calculated after allowing for tax at 9s. in the £. (f) Flat yield. * Assumed average life 17 years 6 months. (g) Buying Price.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2½ per cent free of income tax. Yield worked on 15 per cent basis. (g) Fifteen months to March 31, 1947 (yield basis 7-6 per cent.) (h) To latest redemption date. † Free of tax.

Half the homes of Britain take the RADIO TIMES*

Each weekly issue of the RADIO TIMES brings its message into over six million homes. Each member of each family pores over it, one concentrating on the Third Programme, another being faithful to the Home, and several selecting items from all three programmes. With such a varied and receptive readership, you can launch a national advertising campaign at a very economical cost.

From tenant to owner...

Why not see your landlord about buying the house you are renting? Prices to "sitting tenants" are often very favourable. Our leaflet, "From Tenant to Owner", shows how you may purchase a house for as little as 10/8d. per month for each £100 advanced. A house very often costs little more to buy than to rent...

THIS EASIER WAY

Your bank offers a free service that enables you to invest your money in National Savings Certificates without trouble or effort. Whether you want to make a block purchase or invest a regular sum every month, you have only to sign a Banker's Order Form. The Bank will do the rest free of charge.

You can hold 1,000 of the new 10/- Savings Certificates—and they will become £650 in ten years' time. With Income Tax at 9/- this is equivalent to a taxable investment yielding £4 16s. 8d. per cent. If you are paying more than 9/- in the £ it is even more attractive.

Savings Certificates are a gilt-edged investment: ask your Bank Manager to tell you all about the easy way of buying them.

COMPANY MEETINGS

JUTE INDUSTRIES, LIMITED

INCREASED OUTPUT OF YARN

MR J. ERNEST COX'S REVIEW

The twenty-seventh annual general meeting of Jute Industries, Limited, was held, on the 12th instant, in the board room of the Association of Jute Spinners and Manufacturers, 5, Cowgate, Dundee, Mr J. Ernest Cox, the chairman, presiding.

The secretary, Mr William G. Greenfield, read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement circulated with the report and accounts for the year to September 30, 1947:—

In the concluding paragraph of my statement to you at this time last year, I told you that the profit for the first three months of our financial year had been maintained.

The result for the full year is now before you, from which it will be seen that, not only has the profit been maintained, but that last year's figure has been exceeded by a satisfactory margin.

SCARCITY OF LABOUR

Despite considerable difficulties, not the least of which has been the continued scarcity of labour, it has still been possible to increase our output of yarn by 17 per cent. over the previous year's tonnage. This is largely due to the bringing into commission of our new sliver spinning mill in Caldron works, which was planned to come into production in 1940, but was delayed on account of the war. It is now running on a double day shift so that full advantage is being taken of this, the very latest type of machinery.

A night shift is in operation in one of our mills, although sufficient labour has not as yet been obtained to secure maximum production.

Since the close of our financial year short evening shifts of four hours are being undertaken in three of our works by women who, for domestic reasons, are unable to offer their services for a full day.

In the matter of the recruitment of labour we have been greatly assisted by our personnel department, which, in addition, has conducted meetings of managers, staff, foremen and workers, designed to improve industrial relations and to provide the employees with an overall picture of the company's activities.

In order to supplement the labour force still further, arrangements are in hand to employ European voluntary workers, but the number is likely to be somewhat limited by the housing difficulty.

The problem of day nurseries is also receiving consideration.

EXPORT POSITION

Your directors are keenly alive to the necessity for increasing production, not only in order that the high cost of overhead expenses may be spread over the maximum tonnage, but that the company may play its full part in the export drive.

The export of jute goods is both direct and indirect. In regard to the former, licences are granted for such products, and in such quantities, as the Board of Trade may decide, but the licences granted fall far short of the demand. This is the case especially as regards the United States of America and Canada, and our inability to supply these important prewar markets cannot but act unfavourably on future trade with these and other countries.

Indirect exports include such articles as bags, sacks, and packing material (which are used either as containers, or wrappers, for other exported goods), the backing of woollen

carpets, and of linoleums. For these, and many other uses, the jute trade receives no direct credit in export statistics.

As you are aware, the Companies Act is now on the Statute Book. Most of the provisions, however, do not become operative until July 1st, and your directors, after careful consideration, reached the conclusion that it is preferable to delay making a change in the form in which our accounts are presented until next year, by which time it will be possible to ascertain the form most generally adopted.

In the balance-sheet I think there are only two items to which I need call your attention. On the liabilities side you will notice an item—excess profits tax, postwar refund, £84,517 10s. 2d. This represents a provisional payment, and, as you will remember, can only be used for capital purposes. On the assets side, you will observe that there is a considerable increase in the value of stocks of manufactured goods, raw materials, etc.; this is entirely due to a rise in values, and does not indicate that we are carrying larger quantities.

ABNORMAL CONDITIONS

The trading result for the year is satisfactory, but it must be remembered that conditions are far from normal. The cost for wages and materials is high, there is an acute shortage of labour, the country is passing through a period of inflation, and, most important of all, the partition of India, which has raised new and difficult problems regarding the supply of our raw material. Taking all these facts into consideration, and in addition, bearing in mind the 25 per cent. tax on distributed profits, your directors are firmly convinced that the bulk of the profit should be retained in the business. They have, accordingly, transferred £60,000 to depreciation and obsolescence, £70,000 to provision for reconstruction of buildings and modernisation of plant, £25,000 to staff pensions and £15,000 to contingencies.

Owing to the labour situation, modernisation of plant is more necessary than ever. In this connection it is interesting to note that two workers, employed on the latest type of spinning machinery, can, in the same time, produce a similar tonnage as was previously produced by five workers. If our mills had still been equipped with old spinning machinery, we should either have had to employ 900 more workers than were actually on our pay roll last year—clearly an impossible proposition—or our production would have suffered to the extent of slightly over 9,000 tons, which would have produced quite a different result in the profit and loss account.

STAFF PENSIONS

The provision of staff pensions, by means of separately managed funds, or group schemes, is now fairly general. While it has been our practice to grant pensions to members of our staff who have served us long and faithfully, the amount of such pensions has been at the discretion of the directors and the recipient has, during his years of service, been unaware of the allowance which he might expect to receive on his retirement. Your directors felt that this uncertainty should be removed, and that, looking to the future, it was advisable to place staff pensions on a permanent basis. Accordingly, a contributory staff pension scheme, which became operative as from October 1st last, was arranged with a leading life assurance company.

Owing to the considerable rise in the rates of wages, and in all the various materials which we use, the cost of financing your company is a formidable problem, and your directors feel that the provisions which I have mentioned are not only dictated by prudence, but are necessary.

Your directors feel justified, however, in recommending payment of a dividend on the Preference stock at the rate of 8 per cent. per annum, less income-tax, in place of 7 per cent. paid last year. In conclusion, I would like to convey the appreciation of the Board to all managers, staff and employees, whether at home or abroad, for their wholehearted support.

The report and accounts were adopted; the retiring director, Mr H. Giles Walker, was re-elected and the auditors, Messrs Dewar and Robertson, C.A., were reappointed.

OROVILLE DREDGING COMPANY, LIMITED

PATO'S SUCCESS

The thirty-sixth ordinary general meeting of the Oroville Dredging Company, Limited, was held, on the 13th instant, in London, Mr Frederick W. Baker, the chairman, presiding.

The following is an extract from his statement for the year to September 30, 1947:—

Pato. Consolidated, in which a total of 1,150,000 shares are held, is our most important investment, and I am pleased to say that the company is operating very satisfactorily. Two additional areas adjoining the company's holdings and totalling approximately 4,500 acres were purchased during the year, and on one of these, covering about 2,500 acres, river drilling has developed a considerable yardage of payable gravel. The other area is as yet untested. In spite of working over 17,000,000 yards of gravel during the year, the "workable reserves" as at April 30, 1947, remain more or less the same as the previous year; in fact, the closely-drilled and fully-developed gravel stands at 220,315,000 yards averaging 21.9 cents, compared with 212,560,000 yards averaging 22.1 cents.

OPERATIONS AT BULOLO

Next in order of interest is our holding of 60,680 shares in Bulolo. Two dredges were rehabilitated and put into commission before the end of the Bulolo financial year, May 31st last. Since then two more dredges have commenced operating.

At the recent meeting of shareholders of the Bulolo Company, held in Vancouver, the chairman gave some interesting information about the life of the property. Each dredge was originally designed as to digging depth, etc., to handle the particular area on which it was later installed, and when each of these areas is worked out, that particular dredge will be permanently closed down unless some suitable area is found to which it could be dismantled and transferred.

The chairman also stated that, while it is hoped to resume the payment of regular dividends in the latter part of 1948, future earnings are not likely to justify the prewar distribution of \$3 per share, and until it is known as to what future operating costs will be, no further enlightenment on the subject of dividends can be given.

Currency and investment regulations continue to exercise severe restraint on investment in overseas projects. Until there is an easing of the regulations, opportunities for the employment of funds which we may have available are likely to be scarce.

The report was adopted and the proposed dividend of 1s. per share less tax was approved.

"Who first compounded this Mixture, Brothers,
I do not know, but I bless his memory. He
chose tobaccos from the Old World and the New,
and matching flavours and fragrances as if orchestrating
a chord, he made out of many one marvel—*e pluribus
unum*. Help yourself to a pipeful, Brother.
Such a happy discovery is philosophers' treasure indeed!"

THE LAW DEBENTURE CORPORATION, LIMITED

DIFFICULTIES OVERCOME

The fifty-eighth ordinary general meeting of this company was held, on the 17th instant, in London.

The Right Hon. the Viscount Greenwood, K.C., chairman of the company, who presided, in the course of his speech, said: I think, without any undue complacency, the Board may congratulate you upon the results shown in the accounts.

The total gross receipts for 1947 were £129,802, or £805 less than in 1946, and the separate headings which make up that total vary greatly from the previous year. Interest and dividends at £75,787 were less by £4,540. This reduction has arisen partly because arrears of interest received during the year in excess of one year were £2,230 less than in 1946, and partly because throughout the year we have held a larger amount of cash uninvested. Profit on realisations was £13,709, an increase of £8,347 compared with 1946, nearly all the excess arising from repayment of securities called for redemption, over which we have no control.

Fees as trustees amounted to £35,961; the reduction of £4,589 on the year records the fulfilment of the warning uttered in past years from this chair and again to be repeated. Many of us have been reminded of the fact that debtor companies have taken the opportunity to repay debenture stocks carrying higher rates of interest than those now ruling.

Doubtless there will be a return to the creation of loan capital whenever the issue of share capital ceases to be possible at the high premiums that have been current during the past year or two. Further, it is to be remembered that interest payable on Capital created in the form of debt does not call for payment of the 25 per cent. profits tax now levied on profits distributed as dividends on share capital.

The directors now recommend payment of a final dividend of 8 per cent., actual, making a total of 14 per cent. gross, on the ordinary share capital in respect of the year 1947, and there will remain £6,795 to be carried forward to the current year 1948.

POSITION OF GREAT STRENGTH

The balance sheet discloses a position of great strength and I think I need say very little about it. The book cost of the quoted investments amounted to £1,288,590, and of that figure 57½ per cent. is invested in British Government securities, debentures, and other creditor investments; the comparable proportion in 1946 was slightly less than 61 per cent.

The book cost of our quoted and unquoted investments is £1,317,163, upon which appreciation at December 31st last was £456,604, or 34.65 per cent. above book cost; the corresponding figure in 1946 was 38½ per cent. This reduction at December 31, 1947, of 3.85 per cent., is comparable with a reduction of 5.8 per cent. on the 365 representative securities selected by the Bankers Magazine in its record of fluctuations in market valuation at the end of December, 1946 and 1947.

Reserve account £265,000 includes the £5,000 from the profits of the year and, with £6,795 proposed to be carried forward, represents a reserve of more than 60 per cent. of the £450,000 ordinary stock.

The past year has been one of difficulties which, I submit, have been successfully overcome and I can only add that so far as your company is concerned the board have no anxieties in regard to any of your investments.

The report and accounts were unanimously adopted.

At a subsequent extraordinary general meeting alterations to the Articles of Association were unanimously adopted.

MARCONI'S WIRELESS TELEGRAPH COMPANY, LIMITED

NEW DEVELOPMENTS

The fiftieth ordinary general meeting of Marconi's Wireless Telegraph Company, Limited, was held on the 18th instant in London.

Sir George H. Nelson, F.C.G.I., M.I.Mech.E., M.I.E.E., the chairman, in the course of his speech, said: The profit and loss account shows a net profit after providing for taxation of £162,671. This compares with £168,448 for the year ended December 31, 1946—a decrease of £5,777. Your directors recommend the payment of 7 per cent. dividend on the ordinary shares. Owing to the interruption of production during the year due to the coal shortage, we incurred a loss estimated at £27,843, which has been charged against profits.

During the year we have continued actively to foster and extend our world-wide sales and manufacturing organisation, and have received many important inquiries and orders from all parts of the world. The value of orders received for the year 1947 constitutes a record for the peace-time business of the company.

Marconi's continue to play a leading part in the provision of airborne communication equipment, and in this field the Marconi Company was the first to produce a post-war design. Our postwar designs of marine equipment have been most successful. Our Marine Radar has given excellent results on trial, and fittings will commence in 1948. New developments in virtually all fields of radio technique have actively progressed during the year.

Last year we were able to renew and broaden the base of our long-standing agreement with the Radio Corporation of America. The report was adopted.

THE ENGLISH ELECTRIC COMPANY, LIMITED

LARGE ORDER BOOK

Sir George H. Nelson (the chairman), presiding at the twenty-ninth annual general meeting of The English Electric Company, Limited, held on the 18th instant, said:—

Due to the disastrous stoppage through the coal shortage and the delay in completing the necessary changes from the production of war materials to the requirements of peace, the year had been a difficult one, but the company had finished 1947 with a very large order book spread out over several years. They had completed the extension of their important research laboratories at Stafford, which were not inferior to those of any other similar laboratories in the world.

An important section had been added to the laboratories, viz: one to deal with the problems of atomic and nuclear energy, and the application of the results of such research to the benefit of man. The first main line diesel-electric Loco. to run in this country was put into operation on the LMS line in December. The Loco. had been tried on main line trains, had fitted reliably into schedules and had reached speeds of over 85 m.p.h.

The diesel engine and electrical equipment had been designed by the E.E. Company's experts and built in the company's works, the railway company being responsible for the mechanical parts. Labour turnover during the year had been abnormal and this had arisen from lack of houses, difficulties in transport, etc. The company had endeavoured to combat the shortage by moving a great volume of work to areas in which labour was available, and by a house-building programme.

The report was adopted and a final dividend of 6 per cent. (making 10 per cent. for the period under review) declared on the ordinary stock

GAS LIGHT AND COKE COMPANY

IMPENDING NATIONALISATION

The ordinary general meeting of the Gas Light and Coke Company was held in London on the 19th instant.

Mr M. Milne-Watson (the governor), after expressing regret at the death of Mr Thomas Hardie, the chief engineer, said that sales of gas had increased by 4 per cent. over 1946 as compared with about 16 per cent. in 1946 over 1945. Expenses had continued to increase with the rising costs of labour and materials. For instance, the average price of coal delivered at the retort house was 54s. 4d. per ton as compared with 21s. 11d. in 1938. The balance on revenue accounts showed a reduction of £699,000. They had raised the price by ½d. per therm on December 1st, which had had a negligible bearing on the revenue for 1947.

HIGHER FUEL COSTS

Since the turn of the year there had been a further increase in the cost of coal, and the price of gas had again been raised on February 2nd by another ½d. per therm. After providing for dividends and co-partnership, there was a satisfactory addition to the carry-forward of about £114,000.

When plant extensions had been completed the carbonising capacity would be increased to deal with a further 650,000 tons of coal per annum, representing an output of some 45 million therms. The total programme was one of some £8,000,000 capital cost. They had continued and extended their research work in gas manufacture and in the development and design of appliances. The commercial side of the business had continued to be hampered by shortage of appliances for sale and hire, but there should be a great expansion of business as soon as they could obtain the necessary apparatus. The imposition of 75 per cent. purchase tax on water-heaters was a severe blow.

The company, in conjunction with the Conjoint Conference of Public Utility Associations, had successfully petitioned against that part of the London County Council (General Powers) Bill, which was intended to give the L.C.C. and other Councils power to supply district heating to any property acquired by them under the Housing Act, 1936. As a result the true cost of district heating was made public and the local authority would be subject to controls. He hoped that the precedent so created would prevent the propaganda value of district heating from being exploited at the expense of ratepayers.

NATIONALISATION BILL

A Bill was before Parliament, and after, as seemed likely, it received the Royal Assent the company would cease to exist. It was surely a catastrophe that this great company, which since 1812 had been supplying gas to an ever-increasing number of Londoners, should lose its identity and with it, perhaps, that strong personal pride which had made it a household name. They had survived wars and had flourished on competition. They had boasted that the company never let London down, and had done their best to make that a fact.

The view of the directors remained unchanged, that the nationalisation of the company was inadvisable, being unlikely to benefit its consumers and involving considerable sacrifice to the stockholders. They were doing their utmost to obtain proper compensation for stockholders, including co-partners. They would be handing over a company in first-class order for totally inadequate compensation.

The report was adopted.

GOVERNMENT RETURNS

For the week ended February 14, 1948, total ordinary revenue was £118,234,000 against ordinary expenditure of £42,829,000 and issues to sinking funds £580,000. Thus, including sinking fund allocations of £13,547,000 the surplus accrued since April 1st is £741,479,000 against a deficit of £349,066,000 for the corresponding period a year ago.

UNIVERSITY OF OXFORD

SENIOR LECTURER IN LOCAL GOVERNMENT

The University proposes to appoint a Senior Lecturer in Local Government at a stipend of £550 to £900 per annum. The initial stipend will be fixed with reference to age and qualifications. The Lecturer will be expected to include in his study the historical and comparative aspects of the subject. Applications should be sent to the Secretary of Faculties, University Registry, Oxford, not later than 26 April, 1948. The person appointed will be required to take up office as soon as possible after 1 October, 1948.

UNIVERSITY OF LEEDS

DEPARTMENT OF MATHEMATICS

The Council will shortly make appointments to three posts one in each of (a) Pure Mathematics, (b) Applied Mathematics and (c) Statistics, on the Assistant Lecturer grade (initial salary £100-£150) or on the Lecturer grade (£150-£250) according to applicants' qualifications. The appointments will take effect from October 1, 1948. Further particulars from the Registrar, University, Leeds, 2, to whom applications (3 copies) should be sent not later than April 17, 1948.

MALAYA: UNIVERSITY BURSAR

Applications are invited for the post of Bursar in the university institution which is being established in Malaya on the basis of the existing King Edward VII College of Medicine and Raffles College. The Bursar will be equal in status with the Registrar and directly responsible to the Principal for the financial administration of the institution. Salary up to £1,600 p.a., plus cost of living allowance (at present £151 p.a. for single and £224 p.a. for married persons). Free passages. Superannuation. Children's allowances. Experience of university administration an advantage. Candidates should submit applications (6 copies) giving full particulars of professional qualifications and experience and the names of three persons to whom reference may be made, to the Secretary, Inter-University Council for Higher Education in the Colonies, 8, Park Street, London, W.1, before April 1, 1948.

LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE

UNIVERSITY OF LONDON

Applications are invited for a Lecturer and Assistant Lecturer in Statistics with experience in the application of statistical methods in the social sciences. Salary scales £500 p.a. rising to £850 and £400 p.a. rising to £500 with superannuation benefits and family allowances. In the case of the Lectureship, preference will be given to candidates with experience in applied economics.

Applications, which should be accompanied by the names of three referees, should be forwarded not later than the 31st March, 1948, to the Secretary, London School of Economics, Houghton Street, Aldwych, W.C.2, from whom further information may be obtained.

REGIONAL PSYCHIATRIC SOCIAL SERVICE

Applications are invited from trained or experienced social workers interested in case-work in the mental health field. The work includes case-work and an advisory service dealing with mental health problems in children and adults and involves close contact with clinics, hospitals, local authorities and other social agencies. Salary is from £300-£450 p.a. according to experience. Applications with copies of two recent testimonials should be sent to the General Secretary, National Association for Mental Health, 39, Queen Anne Street, London, W.1. Vacancies in Birmingham.

Applications are invited from experienced Psychiatric Social Workers for work in the Regional Psychiatric Social Service. The work includes case-work and an advisory service dealing with mental health problems in children and adults and involves close contact with clinics, hospitals, local authorities and other social agencies. The Regional Representative has the supervision of the work of the regional team of social workers. Salary is according to the A.P.S.W. scale with special responsibility allowance. Applications, together with copies of two recent testimonials, should be submitted to the General Secretary, National Association for Mental Health, 39, Queen Anne Street, London, W.1. There are no vacancies in the London region.

ASSOCIATION OF CERTIFIED AND CORPORATE ACCOUNTANTS

APPOINTMENTS REGISTER

Employers seeking the services of Certified Accountants are asked to write to the Secretary of the Association, 22, Bedford Square, London, W.C.1. (Telephone: Museum 5168.)

SUDAN GOVERNMENT

SUDAN RAILWAYS require an experienced ACCOUNTANT for general accountancy and costing in the Sudan. Applicants should have had good practical experience on a railway or with a business firm and, preferably, should possess a recognised accountancy qualification. Knowledge of modern costing procedure and of punched-card accounting would be an advantage. Age 25-35. Short Term Contract for five years, subject to satisfactory probation, at a starting rate according to age, experience, and qualification, but not less than £E.375, followed by periodic increments. Cost-of-Living Allowance at 45 per cent of salary, subject to a maximum of £E.225. Outfit Allowance £E.40. Bonus of one month's pay for each year's service subject to a maximum of six month's pay. There is at present no income tax in the Sudan (£E.1-£1 0s. 6d.). Strict medical examination and free passage on appointment.—Application form and further particulars from Sudan Agent in London, Wellington House, Buckingham Gate, London, S.W.1. Please mark envelope "Railway Accountant."

ACCOUNTANTS.—Robson, Morrow and Co. have vacancies on their staff for outstanding Chartered or Incorporated Accountants, not over 37, who have held appointments in industry, and who are interested in being trained in the installation of modern industrial accounting methods. Four-figure commencing salary and good prospects. Special arrangements may be made for ex-members of the Armed Forces.—Send full particulars of age, education, qualifications, experience and present salary to 59, New Cavendish Street, London, W.1, marking envelope "Application."

LARGE plastic material manufacturers in the London area require the services of an assistant export manager. Good knowledge of plastic industry and overseas markets. Age 30-40. Education at least Matriculation standard. University degree preferred. Languages—good French and German.—Write, giving full particulars, to Box 671.

A MATURE BUSINESS MAN, age 40 to 50, with wide management experience, who desires a new interesting and profitable field of activity, can find a unique opportunity with a Professional Organisation of standing. The essential qualifications are: First-class health, abundant energy, a good tactical and social sense, and familiarity with the structure of industry. Early interviews will be arranged with suitable applicants who send, in confidence, full particulars of education, career to date and views for the future as to present and eventual remuneration.—Box 659.

S. AFRICAN (29) engineer, Lon. Univ., experienced in design, production and sales, Army 5½ years (Major), at present London manager for Midland engineering concern, seeks position as P.A. to industrialist with international outlook.—Box 657.

GENTLEMAN, public school, single, desires responsible position with progressive firm in British West Indies. Excellent trade connections Trinidad, Barbados. Sound knowledge import procedure. Returning U.K. April, 1948.—Box 662.

ENFORCED SALE. Exquisite mod. beamed det. residence (Tudor design), 1 acre fruit, 1 min. sea: 4-5 beds (h. & c.), 2-3 rec. cloak room, loggia, large kit., mod. bathroom, det. garage. All main. Refined, exclusive. £7,500 freehold.—Photo Yeomans, Angmering-on-Sea.

B. Sc. (Econ.) Hons., 27, at present in Government department, experience in Statistics, interested international affairs, seeks appointment with scope and prospects.—Box 670.

NORTH WALES.—Visitors received in comfortable country cottage near sea. Good cooking. May-October.—Mrs. Milligan, Pen-y-Waen, Abersoch, Caernarvonshire.

UNIVERSITY DEGREES. QUIETLY, in your own home, by studying our carefully prepared and tested courses, you can secure an external Degree of London University (B.Com., B.A., B.Sc., B.Sc.(Econ.), LL.B.). Expert and inexpensive tuition also given for Accountancy and Secretarial Diplomas, Matriculation, Civil Service posts, etc. Write now, specifying interest for the new 100-page FREE book "YOUR CAREER" to The Principal, The Rapid Results Centre (Est. 1928), F.177, Tuition House, London, S.W.19 (or call at 235, Grand Buildings, Trafalgar Square)

The Cost of Ignorance

THERE are two nations today: those who realise the plight of Britain, and the looming catastrophe which threatens the British economy and perhaps the British way of life; and those who still cherish the illusion of prosperity, the full wage packet, and the easy profit. In recent weeks, thanks largely to the frank realism of Sir Stafford Cripps, the gulf of understanding between the two has narrowed. But it must be reluctantly confessed, even now, that the majority of the people are still unable, or unwilling, to form any conception of the economic—and ultimately the political—peril in which the country stands. Unrelieved gloom, like intense cold, soon ceases to act as a stimulus; it quickly numbs the senses and paralyses the muscles.

That is perhaps the chief danger of the moment. The shocks which the Government administered in the White Paper on Personal Incomes have had a short-lived effect. Indeed, it is disheartening to see how quickly the lessons which the White Paper preaches have been lost in unprofitable bickering about austerity by fair shares, and in indignant denunciation of those companies who are froward enough to increase their dividends. Yet indeed the boot is on the other foot. For, as the price of a stop on wages (itself subject to an impressive list of escape clauses of varying justification) the Trades Union Congress has managed to secure the principle, offered to it by the Chancellor of the Exchequer, that prices and profits must be reduced. In other words, the policy of the wage stop has been re-written by Transport House into a doctrine of higher real wages. The old grey mare of the TUC, as Low draws her, is more subtle than she seems.

Nothing could better illustrate the Government's failure to "put the crisis over." There has admittedly been a great improvement in publicity about economic affairs since the ineffectual "Work or Want" campaign. But it is still couched in terms utterly remote from the average man. Confront a steelworker with the White Paper on the Balance of Payments, and he will just scratch his head, or turn to his football pool coupon. Dockers do not read White Papers on Personal Incomes, and they are not greatly moved by frozen prices for "adornments and accessories for apparel." The forthcoming Economic Survey for 1948, which is expected during the next ten days, will, on the authority of Lord Addison, "not attempt to hide or gloss over the difficulties which confront us." But how many people will read and understand it? Failure to understand is not a matter necessarily for blame, for these are formidable documents, and even the expert often has difficulty in interpreting their content. What is needed is something which is honest, yet inspired by the common touch.

That demands the observance of two conditions. First, it requires the most scrupulous regard for facts, untintured by political hopes or prejudices. Secondly, it must show the average man and woman what the facts mean in terms of the food on their plates and the clothes on their backs. It means that Mr Strachey should cease to make consoling assurances about food supplies this year, and that he should

give the people a week's taste of the kind of rations to which the country will be reduced by the end of the year if Marshall aid does not arrive. It means—to take an example from Lord Pakenham's speech in Tuesday's debate in the House of Lords—that the Government is not doing its simple democratic duty if it declines to take "extreme measures of austerity," merely on the ground that they would only damage the British people and their power of recovery, "so long as there is a reasonable prospect that they will be unnecessary in the event." This line of argument is reminiscent of Mr Morrison last July, just before the storm broke. It blandly assumes that Marshall aid will provide a permanent way of escape, instead of a short breathing space.

The time has long since passed for such illusions. But where is the spur to action to be found ? Is it, as Lord Samuel suggested, to be found in higher money incentives, by reducing the burden of taxation ? There is little doubt that a change in the method of levying PAYE (on the lines which have frequently been advocated in these columns in the past) would remove much of the resistance to increased output and overtime working which it now sets up. But it is necessary to go carefully in any change which would increase the net spendable income of any section of the community without the firmest assurance that the relief would be fully compensated in increased production. It is becoming fashionable to argue that high direct and indirect taxation are themselves causes of increased inflation, because they put prices up and at the same time increase the demand for more wages to pay higher prices. The argument confuses cause and effect, but at any rate it concedes that high taxes succeed in their first purpose of preventing people from consuming so much.

That is where the emphasis properly belongs—on the need still further to reduce standards of consumption which are already grievously low. No money incentives can do much to alter this situation; the experience of the entire postwar period shows that money without goods to back it breeds inflation and disillusionment. It cannot be repeated too often that even with the powerful support of the American loan, inflation, though concealed within respectable limits, has been rampant. Now it is reflected in a dollar drain, from Britain's last reserves, which in January reached the alarming level of £57½ million, com-

The Fall of Prague

ONCE again long and careful preparation, ruthless single-mindedness and clever use of the whole party box of tricks have brought the Communists a bloodless victory. Against the prestige and national veneration enjoyed by President Benes, against the instincts and traditions of a people which during four centuries has defied tyrants and conquerors, against a majority of the electorate and against a strong and not completely unprincipled Social Democrat Party, the Czech Communists have taken all but the last steps towards the establishment of a "People's" Republic in Czechoslovakia. The new cabinet, in which every post that matters is in Communist hands, can now spend the next weeks or months in "rigging" the spring elections. The broadest bridge between east and west has been blown. A further proof has been given that Communists will not work loyally with other parties in any system that remotely resembles free, just and parliamentary government.

Those who wish to sugar the bitter pill which is now being swallowed by millions of Czechs and Slovaks ask us to believe that a choice had to be made in Czechoslovakia between what is called strict state planning and a compromise between democratic and socialist ideas. That is far less than half the story. Others may declare that the security of Russia demanded Com-

pared with £48 million in December. It may be true that the January drain was inflated by special drawings by India and Pakistan, and by seasonal payments for cotton, but it is a formidable and frightening figure none the less.

Must the conclusion, then, be sheer despair? Are the British people incapable of hoisting themselves by their own exertions? Will they defeat themselves in an orgy of self-pity? There is a section of American opinion, and of British too, which holds that Britain is down and out. But the British people are capable, even now, of a courageous effort of self-help. The weak spots are still obvious. Coal production is showing disquieting signs of lagging well below the output which is needed to hit this year's target, and to fulfill the promised level of exports. Even so, stocks still exceed 14½ million tons, and one of the greatest contributions to European recovery would be a speedier rate of export. The cotton industry remains undermanned, but it is still jealous of its shorter week, and resistant to the appeal for overtime working. These examples could be multiplied throughout British industry. Despite the improvements in production which have occurred—in which some industries (notably steel) can take particular pride—it is true to say of British industry today that it is working at too low pressure and for too few hours a week.

Who will have the courage to lead the movement for a longer working week? Sir Stafford Cripps has a double burden of duties which must tax even his powers, and it implies no disrespect of his qualities to point out that their greatest appeal is not to the mass. There was a time when Mr Morrison made effective speeches in the country which combined economic good sense with the right popular touch, but except for skidding too hastily round Recovery Corner, he has been strangely silent in recent months. Are the preoccupations of party management so vital and absorbing that he cannot spare the time for explaining, in homely terms and without party rancour, the situation of the country today? Or does he, like the ex-Chancellor, still refuse to recognise them? Some spokesman for the Government must evoke a new expansionist spirit in production and effort, not indeed for the purpose of consuming more, as the TUC would wish, but of building more and exporting more. The alternative is growing frustration soon followed by collapse. Let there be an end to demagoguery, and instead a new technique of democratic explanation and encouragement.

munist predominance in Prague. That is no part of the story and entirely untrue. The loyalty of the former coalition government to Russia in all essential matters could be depended on absolutely. The incredible story of the plot prepared against it by non-Communist parties and "agents of the West" has been given an even more perfunctory and bogus form than usual. The issue is crystal clear, as our Prague Correspondent points out in an article on page 346: the Communist Party, which won 37 per cent of the votes at the elections in 1946, wished to impose its will on the elected representatives of the majority of the Czech and Slovak nations. It wished to do so now because it feared a reverse in the elections two months hence. It has now manœuvred itself into a position where the result of those elections is a foregone conclusion. The latest from Prague is that a purge has begun.

The conflict between the Communists and the other parties has been growing for some months. The adhesion of the Czechoslovak Communists to the Cominform was hardly consistent with the maintenance of a "Popular Front" policy. Ever since the autumn signs have multiplied that the Communists wished to replace the five-party coalition—which included National Socialists (approximating in their ideas to the French Radicals), Populists (Catholic democrats from the Czech pro-

vinces) and Slovak Democrats (a heterogeneous collection of centre and right elements)—by a two-party government, in which the Social Democrats would play a not very brilliant second to the Communist lead. But the Socialists refused to be wooed and the other parties stood firm.

After nearly two years of debate the Constituent Assembly had failed to produce a constitution, and new elections could not be postponed beyond May. The Communists knew they were losing ground in the factories to the Socialists, and in the villages to the other parties. They could not hope to repeat the success of May, 1946. As the elections approached the parties began to compete in demagogic offers to the public. The non-Communists took up the cause of the grossly underpaid civil servants ; and the Communist-controlled trade unions, which opposed an increase in civil service pay, demanded further measures of nationalisation. The crisis came to a head on February 13th. The non-Communist members of the Cabinet carried a majority resolution instructing the Communist Minister of the Interior to stop his campaign—pursued with varying intensity ever since 1945 against increasing protests from democrats in and outside Parliament—of turning the police force into a department of the Communist Party. The resolution was then simply ignored by the Minister and by the Communist Premier, Gottwald. Twelve ministers—from the National Socialist, Populist and Slovak Democrat parties but not from the Social Democrats—resigned on February 20th.

In the following week the Communists quickly and efficiently seized the controls of the state, and demanded that a new government be formed, under Gottwald's premiership, but without any of the ministers who had resigned. The police were issued with arms, and seem everywhere to have obeyed the Communist orders. Local authorities were instructed to take orders from "action committees" of local Communists appointed by the party headquarters, and they, too, appear meekly to have submitted. In Slovakia Dr Husak, Communist "premier" of the "Board of Commissioners" (regional government) simply kicked out the majority of his Democrat colleagues. Communist armed gangs occupied the headquarters in Prague of the National Socialist and Social Democrat parties. The Minister of the Interior announced that he had discovered a subversive plot, and the "independent" War Minister, the fellow-travelling General Svoboda, ordered the army to stand aside from politics and be on its guard against "foreign agents who are enemies of the Soviet Union." Several newspapers were suppressed and others were intimidated. It was announced that Parliament was adjourned. Mass demonstrations of workers were organised in Prague.

Two uncertain factors remained: the Social Democrat Party and the President. The Socialists had supported the cabinet resolution on the police which opened the crisis, but their representatives in the cabinet did not resign. Dr Benes openly stated his belief in Parliamentary methods and in the

necessity of government by all parties. What kind of pressure was used upon them is not yet known, but in the end both succumbed. The President wrote a tragic letter to Gottwald accepting his terms—a government of Communists and left wing Socialists, in which the other parties are nominally included in the persons of several individuals who are quite unrepresentative of their policies.

It does not look as if Czechoslovakia will now pass straight to the Yugoslav type of totalitarian regime. Probably the technique used in Hungary will be followed: the non-Communist parties are deprived of their real leaders, subjected to a series of artificially provoked "splits," and forced to take part in elections under a bogus "coalition programme." At the elections there are few flagrant scandals, but the general belief that the vote will not be secret (even if it is in fact) causes many opponents of the government to vote for it, and the Communist vote is increased by falsification of polling cards. The parties keep their newspapers, but their freedom is whittled away. All this is now so familiar that neither President Benes nor the average democratic Czech citizen can have any illusion about the future.

Perhaps the most striking feature of the whole crisis is the amateurishness of the non-Communists. The issue on which the three parties resigned was a good one, but their action seems to have been utterly unprepared. If they expected that the Communists would not take unconstitutional action, then they should at least have made their position constitutionally impregnable by enlisting the support of the Socialists, without whom they had not even a majority in Parliament. The Socialists themselves were divided, and the fellow-travelling minority within their ranks, led by the rejected party leader Fierlinger, succeeded (by what means is not yet known) in imposing its views. Perhaps the leaders feared to expose their workers to victimisation by Communist management in the factories. Perhaps they were swayed by an appeal to "Marxist loyalty." But it seems a curious blindness in the resigning Ministers to have expected the Communists to behave constitutionally. Even if the Socialists had joined them, they could not have stood up to Communist force except with force. But, far from being subversive plotters, they do not seem to have made any plans. The army's General Staff has long been "penetrated" by Communists, but this was certainly not true of the bulk of officers or men. Even the police contained many non-Communists. Yet the party leaders cannot have thought out anything beforehand.

Western criticism of Czech democrats for not "standing up to" the Communists now is, of course, as unfair as British or French criticisms of Benes for not fighting alone in 1938. But even if western aid had been available it is doubtful whether the Czech democrats would have wished for it. Civil war and western aid would have led either to international war

£1,000 if you live for twenty-five years.

On earlier death, in addition to this £1,000, up to £5,000 payable to your dependants by instalments of £200 per annum (not subject to tax) for the remainder of the twenty-five years.

All this may be secured under the **FAMILY PROVISION SCHEME** for a monthly premium, at age thirty-five, of £5.1.1 reducing after seventeen years to £3.4.0.

Arithmetic of the Subsidies

IN several respects, Mr Strachey's defence, at the end of Monday's debate on the Supplementary Estimate of £142 million for the Ministry of Food, was uninformative. Mr Strachey claimed that the Argentine agreement was something for which the country should be "extremely thankful"—because it was based on inconvertible sterling. The time for such claims will be twelve months ahead, when Britain has no capital assets for sale. On prices, the Minister of Food was as secretive as ever; the argument that disclosure would be against the public interest because it would embarrass "those very eminent business men who conduct these negotiations for us" was always thin, and it is now intellectually threadbare. On subsidies, the Minister forecast that, at the end of the year—which means at the end of the financial year to March 31st next—the cost of the subsidies will "come out very near to the predicted figure of £392 million."

To discover exactly where the truth lies about subsidies involves much complicated arithmetic. Changes in rations and in prices paid to producers and charged to consumers affect the total rate of subsidies, and they enable the Government to keep the total cost within the limit of any preconceived figure, so long as the prices paid for imports are not rising out of hand. It should be recalled that the Government is bound by Mr Dalton's twice-repeated undertaking to limit the cost of the food subsidies to £392 million for the current year. But since these declarations were made, the cost of imported foods has risen sharply; already the cost of subsidies on imported foods exceeds that on home-produced foods.

This increase, however, is only a pallid reflection of the increase in prices which the Ministry of Food has within recent weeks undertaken to pay under new contracts. A little ferreting through the ludicrous barrier of silence which the Ministry attempts to erect round its price policy shows that Empire sugar has gone up by £3 a ton, Empire butter by £30 a ton, Danish butter by £79 10s. a ton, Empire cheese by £15 10s., Danish bacon by £65, Canadian wheat by £4 a ton, and Danish eggs by 8s. 6d. a long hundred. Mr Strachey asserted on Monday that the cost of maize under the Argentine agreement was "very appreciably less" than £30 a ton—calculations in *The Economist* last week suggested that the price might be as high as £35—but perhaps the full text of the agreement will show whether this is a true or a notional price. Moreover, the cost of home-produced food during the coming year will also rise, perhaps to the extent of £25 million.

In the light of these increases in prices, it follows that if the existing level of subsidies is to be maintained—or reduced—the policy of stabilising the cost of living at an artificially low level must be modified, and that prices to the consumer must be allowed to rise. The time has passed for small adjustments in the supplies and prices of particular commodities to keep the total of subsidies within a fixed limit. Some increases in retail prices have indeed already been made. Sugar was raised from 3d. to 5d. a pound in November, and more recently bacon has been raised from 1s. 6d. to 2s. 0½d. a pound, and eggs from 1s. 9d. to 3s. a dozen.

Obviously, the Government will have to consider this problem between now and the Budget. Indeed, Sir Stafford Cripps stated last week, in connection with the Argentine agreement, that an increase in the price of meat, or a reduction in the amount consumed, "would depend on the adjustment of subsidies," which would be decided soon. Mr Strachey's claim that the subsidies will not exceed the budgeted figure of £392 million may have some validity for the year which is just closing—though indeed it is difficult to see how the total

cost can be kept within the limit—but it will have none for the coming year, if rations and retail prices are unchanged.

Two tables which accompany this article give the basic arithmetic of the food subsidies. The first compares the cost of the subsidies during and since the war with the movement of imported and home-produced food prices, the cost of living and the ever-rising trend of wage rates. This table gives the familiar story of the growing burden of the subsidies (which current Labour Party propaganda suggests is borne "by the Government" whereas, of course, it is met by taxpayers of every class) and their failure to arrest the rising course of wage rates. The second table is concerned more specifically with the apparent increase in the cost of food subsidies during the current year. This second table demands a little explanation. To some extent, admittedly, apparent changes in the cost of various items may reflect changes in methods of estimating. Yet sufficient data have been published to obtain what ought to be a reasonably reliable estimate of the current cost of the subsidies. Table II shows the original estimate of cost, made at the beginning of the present financial year, and a revised estimate given to Parliament last November. Only three items show a reduction in the revised estimate—cheese and butter (of which the rations were reduced) and potatoes (of which there was a light crop). On the assumption that "other items" remained unchanged at £89 million, the revised cost of sub-

sidies as estimated last November was running at an annual rate of rather over £430 million. But since some of the unspecified items—including animal feeding stuffs and the milk schemes—must be costing more to subsidise than they did last April, the actual cost of the total subsidy bill might even be approaching £450 million.

There is a sharp contrast between these figures and Mr Strachey's claim that the budget figure of £392 million will not be exceeded. Moreover, they can be cross-checked by actual consumption of foodstuffs in 1947—the assumption implied in this check, that consumption in the first quarter of 1948 is similar to that of the first quarter of 1947 is near enough for this purpose. Consumption figures are given in the *Digest of Statistics* for the main classes of foods (column 5); from these it is possible to calculate the total cost of subsidies (column 3) by applying the known rates of subsidy for each item, just as it is possible to compute from the estimated cost of subsidies last November (column 2) the physical quantities of foods to which they presumably relate. Columns 2 and 5 are fact; columns 4 and 3 are the converse of the same facts.

The estimates of cost in column 3 suggest that the burden of subsidies, based on the consumption of 1947, might be well in excess of £460 million. How far is this figure reliable? It will be noticed that the items in column 3 agree quite closely with those in column 2, with the principal exceptions of shell eggs, sugar, margarine and cooking fat. The difference in shell eggs may be partly due to consumption of (unsubsidised) eggs by domestic poultry keepers, and in the other items to the inclusion of deliveries to domestic manufacturers, which carry a smaller or no subsidy. It is difficult to guess by how much the total of column 3 ought to be reduced to take account of these factors. Some idea may perhaps be derived from the original Supplementary Estimate for

the Ministry of Food, submitted at the beginning of the month. This showed an increase of £51 million in the Ministry's trading deficit for 1947-48 to £364 million. The estimate suggests (by a method of reasoning suggested on May 3rd last year in these pages) that the cost of subsidies is of the order of £450 million—or perhaps £445 million if the saving on eggs and bacon (through higher prices) was not allowed for in the supplementary estimate; but against this, £10 million should be included for retrospective payments to Argentina, primarily for meat already supplied.

These calculations take little account of recent price increases, from which it could be inferred that, other things remaining equal, the total cost of subsidies for 1948-49 would reach the fantastic total of £525 million. Other things, of course, will not remain equal. But whatever the Government may do about subsidy policy, there is no relief from increased costs of imports, for which Britain has largely contracted a year ahead. The need, by every canon of sound and sober policy, is to allow at least some food prices to rise to their import cost. If milk, meat, bread and fat were kept at stable prices, and the subsidies on sugar, butter, eggs, tea and bacon were withdrawn, some £100 million or more of the prospective expenditure of £525 million could be saved—in other words, the cost of subsidies could be kept at something near its present level. That indeed would be no resounding achievement. The extra cost in retail prices per head would be of the order of 9d.-1s. per week—which could hardly be described as a savage cut in subsidies, which have been officially estimated as being worth 3s.1½d. a head. And if the estimates in this article are to be relied upon, it would leave the total burden on the taxpayer broadly unchanged. "We cannot freeze prices here, particularly the price of imports, regardless of what is happening to prices outside this island." Can Sir Stafford Cripps afford to be less of a realist than was Mr. Dalton last November?

NOTES OF THE WEEK

Warning from Prague

The easy victory of the Communists in Czechoslovakia has had an electric effect in Paris. Men of the right and left have been startled and shocked into a realisation of what they have in common, dismayed too at the quick collapse of a Czech Social-Democrat Party which only three months ago seemed strong enough to slough off its extremists and fellow-travellers. The Gaullists and the Socialists have been talking of national unity in a way unknown since the first days of Liberation. But the question whether anti-Communist forces should be concentrated in the Government, or behind and outside it, is for the moment theoretical.

It is not yet certain how and when the next wave of Communist attack in France will come; it has been freely predicted for next month, but it seems probable that the next great effort will be in Italy, where elections are due in April. Signor Togliatti is a more supple and guileful revolutionary than Mr Gottwald in Prague, and some observers declare that he is confident of winning all the votes he needs with the present combination of Communists and left-wing Nenni Socialists.

M. Bidault made a brave speech on Wednesday about the warning from Prague. He spoke warmly of the Anglo-French effort to gather round them "what is left of Europe"; and he put into clear and forthright language what President Benes no longer dares say publicly:

There can be no democracy where you shoot or hang your opponent, or where people speak of their truth, their freedom, their justice and not simply of truth, freedom and justice.

* * *

One Stage More in Hungary

The Sovietisation of Eastern Europe is smoothly following its predetermined plan, whose phases, faithfully repeated in one country after another, have often been pointed out in *The Economist*. In the same week in which Czechoslovakia was brought to the "Hungarian phase" of 1947, Hungary herself took a big step towards the "Rumanian phase." After a year of

Communist-staged "splits," purges, suppressions and arrests in the non-Communist ranks—the process on which Czechoslovakia is now embarking—the only political force left in Hungary that preserved any significant degree of independence was the Social Democratic Party. Now it has received its decisive and final purge. While the party leader Szakasitz—a "near-fellow-traveller," but a man with some personal sense of loyalty—was safely away on an official mission in Moscow, his deputy-general-secretary, Marosan—a "crypto" unencumbered by such bourgeois scruples—announced the resignation from the party, and from their public offices, of a long list of prominent Socialists.

The most important of the expelled is Antal Bán, until recently Minister of Industry. Bán is in no sense a "right winger." On the contrary, his ideas are in many respects more radical than those proclaimed by the Communists, and as Minister he has carried through with considerable success the government's policy of nationalisation and national control in industry. But he has stood firmly for his party's independence, refusing to see its 50-year-old trade union and political machine taken over by the Communist power-clique in the name of "workers' unity." Another victim is the deputy speaker of the Parliament, Miss Anna Kéthly, a veteran of the Hungarian labour movement, herself of middle-class origin but immensely popular among the workers in the factories. Her crime is that, though by no means always in agreement with the policy of Western Socialists, she valued her friendships in the West, and did not wish her party to be cut off from the world labour movement.

* * *

Another Meeting of the Sixteen

Two events have brought to the fore the question of the next meeting of the Sixteen. The passage of the European Recovery Bill intact through the Senate Committee on Foreign Relations has encouraged the State Department sufficiently for it to announce that no harm would now be done by a further meeting of the Sixteen Nations and that there need be no further anxiety lest a premature conference should give a sensitive American

about Palestine. His statement, a masterly piece of drafting, was as carefully—and precariously—balanced as a card house. Two lines of action were proposed: first, enquiry into a possible threat to peace in Palestine; secondly, an attempt to get agreement “on the basis of the Assembly resolution,” by a committee of the five permanent members (USA, USSR, Britain, France, China) in consultation with the Palestine Commission, the Mandatory, and “representatives of the principal communities.”

The Council, said Mr Austin, had no power to enforce a political settlement (e.g., partition) but only to intervene against a breach of the peace. The Commission's report implied that such a breach would occur if the effort to carry out partition continued. But Mr Austin pointed out that the Council was not bound to accept the Assembly's recommendations, although attempts to frustrate them by force would be contrary to the Charter. He was on firmer ground when he pointed out that according to the Charter, a finding by the Council that a danger to peace existed placed all members of the United Nations, regardless of their views, under the obligation to assist the Council.

This provoked from Mr Creech Jones a prompt restatement of Britain's refusal to “shoulder any further commitments.” He added: “Logically, our course is to abstain from voting.” He did not say what he would do if he were asked to vote on a decision which would automatically involve British intervention with other Powers. If he abstained he would be committing Britain; if he voted against it, he would be using the veto.

Jerusalem Outrage

Meanwhile the events of last Sunday in Jerusalem have made it almost impossible for Britain now to offer any forces to help in preserving the city as an international sanctuary. It is a tragedy that this should be so. Using a technique made familiar by the Irgun Zvai Leumi, persons unknown in British uniforms parked an armoured convoy of stolen vehicles in the middle of the Hagana “security zone” and blew up a large section of Jerusalem's business shopping street, killing some 50 people. In subsequent rioting, nine British soldiers and police were murdered by the Jews, who were told by their leaders that the outrage was the work of the British security forces. This accusation has been categorically repudiated by Mr Rees Williams on behalf of the British Government, but much more clarification is necessary.

A leaflet signed Abdulgadie Husseini (the Arab commander for the Jerusalem area), claiming that the deed was an Arab reprisal for a similar Jewish outrage at Ramleh, was read out in the House of Commons, but this has in its turn been repudiated by the Arab Higher Committee in Cairo. The circumstantial allegations made by the Jewish Agency must be investigated one by one and a full account published. It has been known for months that the Arabs were using foreign military advisers, mostly European exiles, to train their guerilla forces. Since December there have been Arab reports of British volunteers enlisting to fight with the Arabs. In the emotional climate induced by two years of Jewish terror there will, unfortunately, be many to whom such an adventure would appeal. If any of these non-Arabs should turn out to have been responsible for Sunday's outrage, the facts should be published as soon as known.

* * *

A Left Labour Government?

Mr. Harry Pollitt's notion of a Labour Government of the Left, acclaimed with enthusiasm at the Communist Party's annual conference last weekend, is not without its attractions. Imagination boggles at the great strides forward to Socialist peace and prosperity which would be made under a Government, with himself as a possible Premier, Mr Zilliacus as Foreign Secretary, Mr Piratin or Mr Platts-Mills as Home Secretary, Mr Horner as the obvious choice for Minister of Fuel, and Mr J. R. Campbell or Mr Palme Dutt, the Communists' main theoreticians, no doubt replacing Sir Stafford Cripps as Chancellor of the Exchequer. Mr John Gollan, a member of the Executive, however, refused to enter into the game of Happy Families, and contented himself with saying that as and when a mass fighting movement against the Labour right-wing leaders develops, so would the new left-wing leadership emerge.

There is no doubt that some discontent and disappointment exists among the rank and file of the workers, after two and a-half years of Labour Government, and this feeling will no doubt be intensified if the mounting pressure for higher wages is resisted. But it is pure fantasy to talk in terms of an alternative Government,

or to suggest that any feeling of frustration in the Labour movement has reached a pitch of fury against the present leaders. Paisley provided an effective answer. Wigan will no doubt provide another.

What is more dangerous than this day-dreaming is the threat to industrial stability presented by the Communists' campaign against the Incomes White Paper. Trade unions who go ahead with their claims are promised full support, and workers are urged not to “accept passively” adverse awards of Government-inspired arbitration tribunals. While the Communists deny any intention to “sabotage” production, the threat to encourage strikes is surely implicit in this advice. It is true that the Communist Party is negligible in size; although a recruitment of 8,000 members since October is claimed, total membership is still only 43,500. But Communist influence is strong among shop stewards, especially in the key engineering and shipbuilding industries, and, in spite of Mr Morgan Phillips's circular, Communists have not been removed from offices in trade union executives and trades councils. Hitherto, Communist propaganda has been directed mainly against Mr Bevin and Sir Stafford Cripps. It is significant that the TUC General Council, which endorsed the White Paper, is now included in the directive.

* * *

Local Government Bill

The Local Government Bill, which had its third reading this week, emerges from the Commons substantially unchanged although amended on numerous points of detail. The egalitarian principle, under which the Exchequer in effect pays rates to all those local authorities which possess less than the national average of rateable value is undoubtedly fairer than the old “block grant” method. Its chief danger is that it will intensify central control and interference, for since the Government will have to pay whatever rate is settled locally, it has reserved the right to check the whole of the local authority's expenditure and to discuss any item which is regarded as “excessive and unreasonable.” This danger is admittedly reduced by an amendment made in committee, under which the Minister cannot withhold the grant from any local authority without presenting a report and seeking the approval of Parliament.

It has transpired that the total of the Exchequer Equalisation Grant for the coming year, 1948-49, will be over £51 million, which is higher than was expected. The average net saving to the rates confirmed by the Bill, taken in conjunction with the transfer of hospitals and public assistance and the upward revision of education grants, is now put at 3s. 4d. Many, but by no means all, of the local authorities are planning to reduce their rates for the coming year—although not to the average extent of 3s. 4d., partly through financial caution and partly because costs are likely to rise in other fields. It is, however, impossible to generalise because the impending changes will affect local authorities so very variously. Mr Bevan could say, however, that all but seven of the counties and county boroughs are eventually expected to receive some Equalisation Grant.

The centralisation of valuation at the Inland Revenue, which the Bill introduces, is generally accepted as being desirable in itself and necessary for the fair allocation of Exchequer grants. However Mr Bevan has now agreed that the rating authority should be given a third party's right of appeal against the Inland Revenue's valuations. The payment to councillors of expenses and of some compensation for loss of earnings is a good feature of the Bill; the central pooling of payments which are to be made in lieu of rates by the nationalised transport and electricity undertakings seems logical and fair, but again weakens local independence. The most unsatisfactory part of the Bill is still the new system for the valuation of dwelling-houses. It has become quite clear that under this system houses built before 1918 will come off badly compared with those built after that date; and the use of several very different bases of valuation remains capricious in principle and unpredictable in outcome. Without doubt, a new system is badly needed here; but Mr Bevan has not shown that his is the right one.

* * *

Dancing on the Rates?

The Commons' debates on the concluding stages of the Bill have been enlivened by controversy over a new clause which empowers county boroughs and county districts to provide “entertainment of any nature or of facilities for dancing.” The powers are so wide as apparently to include every cultural and frivolous activity, and a catholic council may dispense to its citizens dances, films, and peepshows side by side with symphony concerts, art

exhibitions, and dramatic productions. It can build its own theatre, concert hall, or dance hall, and it can provide any entertainment in a corner of its park. In principle, this is a good provision. What is actually done under it will vary very much with the energy, taste, and inhibitions of the council in question, and too much should not be expected—certainly not in rural areas, or in any area at the present time. It is a pity, as Mr Mitchison pointed out, that the parish council is given no opportunity to provide simple and inexpensive entertainment, since often its knowledge and zeal must be greater than that of the rural district.

The local authorities concerned are permitted to subsidise these activities up to the product of a 6d. rate. This is a questionable arrangement, and Mr Bevan was unpleasantly brusque in his refusal to reconsider it. With such wide powers, the average council ought easily to be able to recoup on the swings of frivolity what it loses on the roundabouts of culture. To show a loss on entertainment taken as a whole is a dreary and unhealthy prospect. It may be objected that some councils will wish to promote only cultural activities, which involve a loss; but the way to meet this point is to limit the ratepayer's liability exclusively to activities of this sort. As things stand, he can be made to pay for free dancing and the like, which is absurd. Surely it is time for the public to be made to realise the truth of Lord Pakenham's warning that the country can only come through the present crisis by abstaining “from certain forms of enjoyment which we have come to think of as our rightful share.”

* * *

More Negotiations on Austria

Few negotiations have lasted as long or tried tempers so sorely as the Four-Power talks on a peace treaty for Austria. For months, the representatives of the Powers sat in unchanging and irritable deadlock in Vienna. No formula could be found to reconcile the Russians' determination to keep control of 250 factories which they claimed to be German assets, transferable to them as reparations under the terms of Potsdam, and the equal determination of the other Powers to prevent what they felt would be the placing of the key part of Austrian industry under the extra-territorial control of a foreign Power.

The French delegate finally suggested a compromise whereby reparations from current production or money payments should take the place of a direct cession of assets and on the last day of the Four-Power Conference in London, Mr Molotov put forward suggestions on Austria which implied that he was ready to budge from Russia's previously immovable demands for possession of all the German assets. This loophole for further discussion was eagerly exploited by Mr Bevin, with the Americans giving a more guarded consent and it was agreed that the Russians should prepare proposals on the basis of the French compromise. At the end of January, the Russians produced their new plan and the Four-Power discussions began again in London shortly afterwards.

The Russian proposals are in one sense a genuine compromise. They represent the reduction of their original claim by some \$400 million and their demands for ownership of plant and extra-territorial rights have been considerably reduced. The following summary gives the essence of their proposals:

1. Austria should grant Russia two-thirds of its oil extraction rights in the country as well as two-thirds of its oil exploration rights.
2. Both these concessions should be for fifty years.
3. Russia should receive oil refineries capable of producing 450,000 tons of crude oil a year.
4. Russia would choose the oil undertakings to be transferred to her from units now under Soviet operation.
5. Austria should hand over to Russia the assets of the Danube Shipping Company, including its ships, in Hungary, Bulgaria and Rumania as well as 25 per cent of the assets of the company located in Austria itself.

LIMITS OF CONCESSION

6. The Big Four Powers should surrender their rights to all former German assets in Austria except the oil and shipping concessions demanded by Russia, and Austria should pay the Soviet Union \$200 million in freely convertible currency.
7. Austria should grant Russia certain extra-territorial rights in connection with the former German assets taken over by the Soviet Union. These include the unqualified rights to take out profits and other income in the form of output or freely convertible currency as well as immunity from any earlier obligations of the undertakings.
8. Any disputes arising out of the German assets problem should be settled bilaterally between Austria and Russia.

What should be said of these proposals? The Austrians at least are certain that they should be accepted. For Austria, the one desire is very naturally to get rid of the four armies of occupation. Ideally, no doubt, they would like the Russians to treat them as generously as the British and the Americans who have renounced all claim to reparations and have on the contrary supported the Austrian economy through two years of complete dislocation. But the Austrians know that the Russians can only be persuaded to withdraw at a price and some were even ready to pay the price entailed in Russia's original claims. There is thus all the more eagerness to seize the new concession and make it the basis of a settlement.

The Austrians are prepared to ignore the strategic argument—that the presence in Austria of Russian concerns with extra-territorial status would offer a permanent threat to Austrian security. The events in Prague have not changed their view. They claim that the Austrian Communist Party is too minute to stage a coup and that in any case, a Russian move would be the signal for the return of Anglo-American forces. But the Western Allies cannot accept the risk so lightly. Russia's right to reparations is admitted and Austria's industrial capacity has been so expanded during the war that it can certainly afford to make transfers to Russia, even over and above all the plant the Russians have already removed. These reparations could take the form of deliveries from current production and guaranteed deliveries of oil might well be part of the total. There is also no new danger in a transfer to Russia of part of the Danube Shipping Company since virtually the whole of the Danube is already under Russian control.

What is obviously inadmissible—doubly so after the tightening of the screws in Prague and Budapest—is that Russia should enjoy extra-territorial rights. For one thing, the whole conception belongs to an outdated period of “imperialist, capitalist exploitation.” For another the concerns under direct Russian sovereignty would be a permanent centre of disturbance in Austrian national life. On this point the Western Allies must, in spite of Russian pressure and Austrian regrets, stand firm. Reparations for Russia are admissible, indeed justified; extra-territorial concessions are not.

* * *

Japan's New Premier

The Japanese general election of last April—the first to be held under the new Constitution—returned the Social Democrats as the strongest single party, but without a majority of seats in the Diet. The two other strong parties were the Liberals and the Democrats, both of them parties of the Right, but the former rather more so than the latter. The Democrats, led by Mr Ashida, were prepared to enter a coalition with the Social Democrats, under the Social Democrat leader, Mr Katayama, as Prime Minister; this coalition commanded a Diet majority and the Liberals went into opposition. But the two Government parties, with programmes based on antagonistic social principles, found it difficult to agree on the measures to be taken to cope with Japan's urgent economic problems; each made concessions to the other which caused trouble in its own ranks.

A section of the Democrats, led by the aged Mr Shidehara, was unable to endure the spectacle of the nationalisation of the coal mines, and broke away from the coalition. On the other side the left wing of the Social Democrats demanded that a full Socialist programme should be carried out. They warned the leaders of the loss of popular support to be expected if the party continued to bear responsibility for the hard living conditions of the urban masses without having the power to put into effect its own remedies. The pressure of the left wing finally forced Mr Katayama to resign.

Thereupon the Liberals, as the second largest party, claimed the Premiership for their leader, Mr Yoshida; they professed willingness to take the Democrats into a Liberal-led Cabinet, but refused to have anything to do with the Social Democrats. A Liberal-Democrat coalition would have ranged Right and Left in Japanese politics in sharp division, but Mr Ashida prefers a middle-of-the-road policy which avoids this situation, and the Social Democrats appear to wish to continue their association with him, for they gave him the votes necessary to secure his election on February 21st as the new Prime Minister. Violent criticism of the choice has been heard from both wings of the Japanese press, and such phrases as “political black marketeering” have provoked General MacArthur's headquarters into some very testy comments on the bad manners and instability of Japanese politics.

There has thus been a certain shift towards the Right without a dissolution of the former political alliance. It should now be

force. This could only be done by the introduction of the transferable vote. But the transferable vote could only be introduced with the help of one of the two big parties.

As a means to this end, the Liberal Party itself might be used as pressure group—by offering to conclude an electoral truce with the Conservatives, on condition that they pledge themselves to the introduction of the transferable vote. The truce itself would take the form of dividing all constituencies between the two parties in proportion to the number of votes cast for each at the General Election—a proportion of 4.45 to 1. (Thus the Conservatives would contest 445 seats to 100 contested by the Liberals.) Such an arrangement would preserve the complete independence of both parties.

If this gave the Liberals a "casting vote" in the Commons, they would of course have to form a coalition with one of the other parties—presumably the Tories. If such a coalition broke up because the Tories failed to live up to their present Liberal pretensions, some of the more enlightened Tories might then very well come over to the Liberals. So, perhaps, might some of the more moderate Labour members.—Yours faithfully,

Trinity College, Cambridge

NIGEL SEYMER

SIR,—Your contributor dealing with the subject of the middle class had a close look at the only possible solution of his problem, turned his back on it, and resigned himself to political impotence.

The outcome of elections is unpredictable and it is not beyond the bounds of possibility that the next election may follow a partial or complete collapse of the country's economy, in which case many thousands whom even semi-starvation would not induce to vote Conservative might turn towards the Liberals.

Apart, however, from such an unpleasant eventuality, it seems likely that the two main parties would have fairly equal representation in the House, and if only 50 Liberals are returned the majority party could not afford to ignore their opinion. A hundred Liberal members could almost certainly influence the course of events decisively and the future of the Liberal Party would then depend largely on their actions.—Yours faithfully,

V. MOLYNEUX

46 Grasmere Gardens, Harrow Weald, Middlesex

SIR,—The brilliant diagnosis of your four articles on "The Middle Class" is not carried far enough, with the result that the

cure suggested in the final paragraphs is half-hearted and impracticable. How can a body of voters be created who would act together "without being a party of their own"? How can the professional middle class "recognise its own existence and its own importance" unless it is organised into some political form?

Within the next twenty-five years the people of this country have got to perform two main tasks. The first is to solve the immediate economic problems, which is another way of saying that the war remains to be paid for and the wealth wasted or destroyed thereby replaced. The second is to retain and strengthen the democratic form of the state so that it may be proof against the advances of the totalitarians from either side. At one time in our recent history our freedom was threatened by the totalitarians of the Right. Now the danger appears to be Communism into which we may imperceptibly glide via Socialism or, more probably, be high-jacked by the next swing of the pendulum after a future Conservative administration.

I think your correspondent is in error when he suggests that those who vote Liberal are exclusively of the middle or professional classes. As the issues become clearer it is probable that many who voted Labour last time to keep the Conservatives out, but who are not Socialists, may vote Liberal again.

Another point I should like to make is that at a by-election, with Parliament constituted as it is at present only the "sea-green incorruptibles" are likely to vote Liberal. At a General Election the electorate would be influenced by different considerations. The Liberal Party is at the moment politically ineffective. If it were more effective, many more people would vote Liberal. Might not the present be the time for the middle and professional classes to take an active part in politics and to ensure not only their own survival but that of all free thought, free expression and free institutions in this country, and perhaps throughout the civilised world?

Hitler admitted that the Liberals, not the Communists, were his real enemies, and proceeded to destroy them. Let the true Liberals of this country be forewarned and take action in time. Liberalism is not a middle way. It merely seeks to prevent too much power being concentrated in the hands of too few people. It matters little to an individual who has been deprived of his freedom whether those in power should belong to the Left, the Right or the Centre.—Yours faithfully,

OLIVER SMEDLEY

16-27 Bunhill Row, London, E.C. 1

AMERICAN SURVEY

Bronx Cheer

(From Our US Editorial Staff)

IN American slang, a Bronx cheer is a derisive sound that induces no cheer in its recipient. No cheer whatever was given by Henry Wallace, and the forces behind him, to the Democratic Party on February 17th, when a special election for Congress was held in the Bronx. Mr Leo Isacson, American Labour Party candidate, for whom Mr Wallace and his group had been actively working, ran away with what is normally a safe Democratic seat. The publication of the result coincided with a radio address by Senator McGrath, the Democratic National Chairman, in which he urged that the third party effort should be abandoned and trusted that Mr Wallace

will realise that unscrupulous forces who look to Moscow for guidance see in his candidacy a chance to disrupt the normal activities of our two-party system.

The White House had no comment; Mr Edward J. Flynn, Democratic boss of the Bronx, towards whom eyes rolled with eyebrows lifted, took refuge in the fact that the vote was light. Certainly the Democratic vote was light. It was 60,486 in that district in the presidential year 1944; in the off year 1946 it was 39,316; and in this special election it was 12,578. The Republican vote was proportionately even lighter: in the same three elections it was 18,481; 16,931; and 1,482. The Labour Party figures, by contrast, showed hardly any change: 24,943; 24,249; and 22,697.

Other alibis are available: the district is predominantly Jewish—Mr Isacson himself is a vigorous Zionist—and therefore susceptible to the appeal to minority groups on which Mr Wallace's campaign is based. So Mr Wallace doubtless indulged in overstatement when he said that this election presaged a third party victory in November. But he might have been on tenable ground if he had said it presaged a Democratic defeat. The unexpected margin of his candidate indicates that even in less specially favourable districts he may be able to divert enough votes to let the Republicans in rather comfortably. It shows that the split in the ALP over the third party issue has not crippled its effectiveness. And, New York State politics aside, it gives to his followers elsewhere in the country an extra fillip for the last weeks of rolling up signatures on the petitions required in most States for a new party to get on the ballot. In California and Illinois there is cause for left-wing rejoicing. There is even more cause for Republican rejoicing everywhere. (Super-cynics are even wondering if voters, normally Republican, may have given the Labour Party a little help on this occasion.)

Clearly, if Democratic hopes are to be more than illusory, new energy must quickly be found. Outside the Party proper, the two most likely sources are the Congress of Industrial Organisations' Political Action Committee, now a veteran of several campaigns, and the new organisation for which the American Federation of Labour made arrangements at its recent executive meeting, Labour's Political Education League. The purposes of the League, in which all the AFL unions except the carpenters are taking part with greater or less enthusiasm,

will be to get members and friends to register and to vote, to explain the issues involving their interest that are at stake in the campaign, and to compile and circulate the voting records of the candidates. In theory at least, the League will follow the traditional practice of rewarding the friends of Labour and penalising its enemies, whatever their party. Greatest activity is anticipated at the time of the primaries; where all the candidates likely to offer themselves seem to be bad ones, the League will attempt to induce others to run.

On what is a very similar programme, the CIO is somewhat further along. Highly practical four-page leaflets are being distributed outlining the dull indispensable details of political action, card-indexing the ward, precinct and affiliation of every union member, checking names against official registration lists, securing block workers to visit the families whose names are known and to ring the door bells of the rest.

The political arms of both the AFL and the CIO are financed by voluntary contributions. The funds are collected through the unions—"Give a buck to PAC"—but the donors receive receipts and the funds are handled separately from dues money. This separation of political from economic funds followed the legislation on which—especially if the present halt in the upward price spiral proves permanent—most of Labour's campaign effort is likely to be concentrated. Candidates who voted for the Taft-Hartley Act are going to have to do some fast explaining if they are not to meet solid Labour opposition to their re-election.

*

That Act made substantial changes in labour law, but its importance as a symbol is even greater. Labour claims that it was passed because, at the last Congressional election, only a minority of the people went to the polls. Believing that a bigger vote would have meant a Democratic victory, Labour aspires, through a larger turnout this time, to bring in candidates who will secure its modification. A new Gallup poll, however, finds that sentiment for revision has declined compared with last August and September.

The law is an omnibus measure; its various clauses are likely to be passengers with various destinations. In the day-to-day economics of shop activity it is being widely used. Cases filed before the National Labour Relations Board in January, cases, that is, that had exhausted the regional boards' procedures, numbered 3,008, an all-time high in the Board's twelve-year history.

While these cases were being disposed of, others were rolling in at a rate that can create a log-jam if it is continued. At the end of January, 7,237 cases were pending; about a fourth of them were hang-overs from the days of the Wagner Act, but 5,339 had come in under the new regulations. But as the Board has been grinding out routine cases, a series of tests has been in preparation, some of them within the limits of the Board's procedure, and some of them in the Courts.

One of the features of the Taft-Hartley Act most bitterly opposed by Labour is the vesting in the Board of the power to seek injunctions. (Past use of the injunction in labour disputes in the United States—particularly in the 1920s—has no British parallel.) Not many injunctions have been sought. But two, one against a union and one against a company, are attracting wide attention. The Board is seeking an injunction against the International Typographical Union (AFL) for refusing to bargain collectively. The union, an old-established group of highly skilled workers, has always operated on a closed shop

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

basis. The closed shop is outlawed by the Taft-Hartley Act. Where its contracts expired, the union sought to avoid collective bargaining by simply posting conditions of work. Some time after the occurrence of the dispute the Board sought an injunction, and hearings start March 1st and briefs have been filed by the AFL, the CIO and the United Mine Workers as friends-of-court as well as by the immediate parties. The other injunction by the Board, on which hearings started on February 10th, concerns the proposed revised insurance plan of General Motors. The United Automobile Workers (CIO) contend that the company agreed to bargain collectively on this plan.

Two cases before or on their way to the courts concern civil as contrasted with economic rights. One is the suit of the National Maritime Union against the Board, brought on the constitutional ground that the affidavit required of officers of unions making use of Board procedures violates the right to freedom of belief. The contested wording runs:

that he does not believe in, and is not a member of or supports any organisation that believes in, or teaches, the overthrow of the United States government by force or by any illegal or unconstitutional means.

This case is now pending in the District of Columbia Federal District Court.

The other main case is the recent indictment by a Federal Grand Jury of Mr Philip Murray and the CIO on a charge of violating the political expenditures section of the Taft-Hartley Act. Seven months ago, immediately after the Act became law, Mr Murray invited the indictment by authorising the publication, in the *CIO News*, of an endorsement of Judge Ed Garmatz, then running in a special Congressional election in Baltimore, Maryland. When indicted, Mr Murray said he had acted

in the hope that such an authorisation would enable the courts of the United States to rule again that no Act of Congress can abridge our basic constitutional rights of freedom of press and freedom of expression.

These aspects of the Taft-Hartley Act are likely to receive attention as Labour seeks to bring its members to the polls, and selects candidates for political endorsement. And the intensity of their feeling on this and related subjects may determine whether the Democratic Party, minus the minorities, has enough strength to hold its own in the key States where the election will be decided.

American Notes

Waving the Ragged Shirt

For two decades after the Civil War the Republicans, by "waving the bloody shirt" of the rebellion, perpetuated themselves in power and distracted attention from their own rifts and the political corruption which was the hall-mark of the period. At the Jefferson-Jackson Day Dinner held in Washington (the prototype of many other fund-raising banquets throughout the country), Mr Truman waved the ragged shirt of the depression at the Republicans. Even in a party so riddled with dissension as the Democrats, the "forces of selfish wealth and privilege" are as safe to attack as the man-eating shark, though there was little more than polite applause of these passages from Democrats able to afford \$100 a plate.

Mr Truman compared his ten-year programme of welfare and economic expansion to that vision of the westward march toward a new frontier which inspired Jefferson and Jackson; and accused the Republicans of clinging to a policy of selfishness and timidity which would once again bring down the whole economy in ruins. Even businessmen, he considered, might want more of the government "hostility" which has transformed the deficits of 1933 into the record profits of 1947.

Prosperity is an invaluable party asset, though perhaps not so reliable a one as patriotism, as the Republicans discovered to their cost in 1929. It did not suffice to conceal the cracks in the Democratic façade. At a dinner to promote party harmony, thought for the Southern Democrats prompted Mr Truman to silence on civil rights, and Mr James A. Farley, the practical architect of two Roosevelt victories, was enthusiastically welcomed back into the fold. But his presence was more than offset by the empty table reserved for South Carolina on the President's left hand and the spectre of Mr Wallace. Mr Wallace was on every one's mind, but his name was religiously avoided by

speakers who still cherish the hope, surely now quite forlorn, since his heady victory in the Bronx, that Mr Wallace may yet repent. The excuse for the absence of the South Carolinians was that there was no guarantee they would not be seated next to negroes, but in Little Rock, Arkansas, half the diners solemnly left a Democratic dinner as the loud-speakers began to carry the President's speech; and there was a tied vote on the question of whether the funds collected should be sent to the Democratic campaign fund or kept in Arkansas to finance party secession.

* * *

Inflationary Steel

The serenity of the President's voyage in the Caribbean was this week shattered by the news from Washington that steel producers had announced price advances for semi-finished products by a general rate of \$5 a ton. Peremptory instructions were cabled to the Council of Economic Advisers, and to the Department of Justice, to investigate the cause of the increases, and to determine whether or not the industry's policy marks a violation of the anti-trust laws.

In Washington the Department of Justice gave formal notice of attack on lines which were more than vaguely reminiscent of totalitarian methods. The Attorney-General, Mr Tom Clark, reported that "simultaneous questioning of executives of leading steel companies began [this morning] and is continuing." The grilling will no doubt be mild by the standards of Prague or Warsaw, but the atmosphere is distinctly unfriendly, and the steel companies, which have long been suspect in respect of "basing point price standards," are facing a new burst of opposition from Congressmen who have already called for the submission of evidence, and who are recalling Mr Truman's earlier appeal for the revival of EPT.

The steel manufacturers, it must be noted, have scarcely strengthened their case by the sleight-of-hand procedure adopted. The new prices announced are generally for such products as forging booms, billets and slabs, at \$54 a net ton (2,000 lb.), an actual reduction on the earlier schedule of \$55, which was, however, for the standard UK ton. There has been a widespread assumption that the new prices represent a deal with the steel workers, in anticipation of a "third round" of wage increases to be agreed this spring. The manufacturers, however, present a more belligerent view, and assert that, despite present prosperity, "break-even" points are now so high that fresh adjustments are necessary. The president of Republic Steel says, for example, that new prices are inevitable because of high costs inflated "by phoney economists and former New Dealers."

Non-integrated steel companies are the first to suffer from the new move, which certainly puts a new impetus behind the gathering wage claims, and which is scarcely in accord with the advice given recently by the Council of Economic Advisers. In the absence of those ruthless physical controls, or draconian monetary restraints which will scarcely emerge from the Department of Justice or from Congress (at least to judge by 1947) there is, however, perhaps a little to be said for the classic pattern of price movements at this phase of the postwar boom. Last year the rise in wages in the steel industry, and the subsequent price adjustments, were heralds of the general inflationary tide which followed the mild business setback in the spring. But such basic indicators may also be warnings that the industrial position is becoming more than ever unstable. Neither the manufacturers nor the steel workers possess an automatic guarantee that demand will continue to bless their full claims through the whole of 1948.

The Future of Farm Prices

During the war years legislation, originally designed to alleviate agricultural depression, was used to stimulate the American farmer to make the necessary changes and increases in his output. The amendments by which this was achieved expire at the end of this year, and the recent drop in agricultural prices was a reminder of what might happen then. It has been urged that the opportunity should be taken to review the nation's whole farm policy; on the other hand, it can be argued that the moment for returning to a normal basis has not yet come, since the European Recovery Programme will require agricultural planning on something approaching wartime lines. In addition, Congress seems unlikely to find either time or inclination in an election year to undertake action which will necessarily be complicated and controversial and which cuts across all party lines. The present indications are that the emergency legislation, possibly with some changes, will be continued for at least another year.

Nevertheless, the Agriculture Committees of Congress have for some time been conducting hearings both in Washington and across the country, and the trend of thought on the question of future agricultural policy is becoming clear. Mr Taft covered the two points on which expert opinion seems agreed when he spoke at Omaha, in the middle of the farm belt. He took for granted, as does practically everyone else, the Government's basic responsibility for the farmer, but, he went on, with courage and with what a Washington columnist called "bleak honesty," to declare that price supports should be substantially lowered from their present level of 90 per cent of parity. The original programme of price supports affected only six basic commodities and varied between 52 and 75 per cent of parity and occasional surpluses have already shown what a heavy financial commitment the new level would involve in a real agricultural depression. The remedy proposed is that advocated by Mr Taft although it is usually put more tactfully: price guarantees are to be made more flexible and the list of commodities to be supported is to be revised and reduced.

Mr Taft also favoured a revision of the parity price formula, and thus warmed his audience a little, since it is this formula which decides the actual level of support prices. At present it is designed to assure the farmer purchasing power equal to that he would have had in a base period, usually 1909-14. The main criticism of this formula is that it perpetuates an out-of-date agricultural pattern and a change in the base period is one suggestion. Another is that the farmer should be guaranteed an overall parity income rather than parity prices on individual crops.

Tight-Rope Walking over Palestine

Mr Warren Austin's dissertation on American policy toward Palestine shows that when one dare not move back, and cannot move forward, it is still possible to move sideways. The Administration, having failed to persuade the Republicans to pay any part of the price incurred by a Zionist adventure which has profited the Administration in the past, is attempting to buy time and to widen international responsibility for the next step. On Palestine, as on the domestic civil rights issue, cannon are thundering to the left and to the right of Mr Truman. But on Palestine they thunder in unison. In the Bronx, Mr Henry Wallace has made the charge that the President "talks Jewish but acts Aryan" and that he is stalling until after the election. On the far right Mr Taft's mobile guns have growled out that a moderate force under the United Nations should be sent to enforce partition and that the shipment of arms to Palestine, now embargoed, should be "controlled and regulated in accordance with the policy" developed by the Palestine Commission of the United Nations. Senator Taft went on to say that the situation called for more than formal expression of adherence to the United Nations' decisions, and that if the Great Powers failed to back up those decisions, the United Nations would sink into insignificance as did the League of Nations.

Mr Taft may merely be extending to Palestine the tactics the Republicans are following in the civil rights dispute: holding the Administration embarrassingly to the letter and the implication of its promises. But the issue of the authority of the United Nations is taken to heart by many who are not Zionists and who fear that Palestine may prove the Ethiopia of the United Nations. The election of the American Labour candidate in the

Bronx is a pointed reminder that Palestine may lose the Administration one of the mickles that goes to make the muckle of Democratic victory. In such a Jewish district the Wallace candidate was at his strongest, but it is clear that the Jews in New York, like the negroes, may swing the city that can swing the state that can determine the election. The defeated Democratic candidate did not fail to support partition; and the Administration by now must be aware that it can continually be outbid by one or the other side of the opposition. The political liabilities of enforcing partition with American troops—quite apart from the considerations of oil supply both to Marshall Europe and to the United States in the event of another war—are very much more formidable. Even if Congress took the unlikely step of approving the dispatch of American troops, the effect of sending American boys to enforce Jewish ambitions in Palestine might well set up a running sore of racial hatred which would sap Democratic strength over a much wider area than the Bronx.

Planning for Security

In his final report as Chief of Staff of the United States Army, General Eisenhower outlined some of the practical difficulties which would make the establishment of a basis for enduring peace a long and arduous process, and then went on to discuss the "short-term security programme" of the United States. This is intended as an insurance against quick or overwhelming military defeat, although not against "unlimited atomic devastation," and includes industrial as well as military preparedness. The General repeated his previous recommendation for universal military training as "an essential measure under present circumstances." In spite of this expert advice, Senator Taft is not convinced that an adequate case has yet been made for a measure so entirely "contrary to the whole concept of American liberty."

On this question the Senator finds himself opposing Governor Dewey and Mr Stassen and, of course, President Truman, but, rather more unexpectedly, supporting Mr Henry Wallace. Although there are indications that labour objections to universal military training are weakening, a number of other groups are still campaigning strongly against it, on the grounds that it is both harmful to the youth of the country and useless under modern conditions of warfare. These groups include many well known and respected figures in the religious and educational worlds, whose influence on the independent voter is appreciable. This, coupled with a recent Gallup survey which showed that the percentage of those approving universal military training had fallen from 75 to 65 in six months, has certainly something to do with the reluctance of the House Rules Committee, in spite of pressure from both Republicans and Democrats, to bring up for debate the Bill which was reported favourably by the Military Committee last July and on which action was expected during the present session.

General Eisenhower declared that, unless this vital issue were settled in the near future, it would be necessary to "embark upon a total reorganisation of the Army's civilian components"—the National Guard and the Organised Reserves. This whole question is at present being studied by the Gray Committee, set up by the Secretary of Defence. Members of the Army and Air Force Reserves are said to be very dissatisfied with the way in which they are organised and with the low standard of the training they receive, but the National Guard seems to be emerging from its postwar difficulties and to be growing in strength.

BURGH ISLAND HOTEL

OPEN EASTER TO OCTOBER

Come and relax from the strain of City life on this delightful Private Island, under the warm cliffs of South Devon, with easy access to the mainland.

You will find luxurious surroundings, first-class cuisine, and the finest cellar in the West Country.

THE WORLD OVERSEAS

Before the Surrender

(From Our Prague Correspondent)

February 22nd

THE cloud which went before the storm that has broken over parliamentary democracy in Czechoslovakia has long been plainly visible on the horizon. It began to grow menacing when a majority of the Cabinet rejected a Bill presented by the Czech TUC (URO) and substituted one of its own prepared by Mr Majer, the Social Democrat who was Minister of Food. Within a day, the Communists had organised two mass meetings, one of factory works council delegates and the other of hand-picked farmers from all over the country; they threatened that "economic upheaval" would result if the Cabinet did not climb down. The other parties in the Cabinet, greatly daring, replied by passing a resolution, the Communists again dissenting, in which they instructed Mr Nosek, the Communist Minister of the Interior, to stop victimising non-Communists in the police.

Mr Nosek took no notice. Pleading illness, he refused to appear before the Cabinet to explain why he had not carried out its order. The non-Communists accordingly refused to discuss anything else. Thereupon the Communist Party immediately issued a call to action stations, to defend democracy and National Government. The non-Communist Ministers still persisted in their demand and absented themselves from the Cabinet to enforce it. By this time it was clear that it was action stations for all, and not merely for the Communists. The following day the non-Communist Ministers, with the exception of the Social Democrats, offered their resignations to the Prime Minister. He at once asked President Benes to accept them, which the President refused to do. The battle for the soul of Czechoslovakia had begun in real earnest.

The main issue could scarcely be clearer but the Communists, as is their invariable way, have dragged in a great many other matters. They include all the Bills on which it has so far been impossible to reach agreement, as well as an entirely new demand for the immediate nationalisation of all private concerns employing more than 50 workers—a demand which goes back on all their previous pledges. Curiously enough they did not raise the question of the Constitution, which is still not agreed after nearly two years of discussion. The main question is therefore simply this: whether the chosen representatives of the majority of the electorate, which votes on a system of proportional representation, shall or shall not give way to the representatives of what is unquestionably a minority, even though it claims to represent "the people." The answer President Benes gave to a deputation of workers was: "Parliamentary Democracy must go on for ever." This reply was broadcast to the nation by the Communist-controlled radio, together with his statement: "I trust the workers" and the deputation's assurance that "the working people trust their President."

Burden on President Benes

Writing while the dispute is still at its height and the result uncertain, it is impossible to do more than enumerate the factors which will affect its solution. The principal factor is a new version of the old problem of a force which, if applied, would be irresistible and a mass which though not immovable is at least unshakable. As a physical force the Communists are irresistible, but the intellectual yearning for freedom is as strong in the hearts of very many Czechs as it is in that of the President. The Communists control the trade unions, the factories, the police and, to all intents and purposes, the army. At the last election they polled about 42 per cent of the votes in the Czech "Lands" and about 37 per cent in the whole country. Their present conduct, with another election due in three months, suggests that they do not expect to improve materially on this percentage. They remain, however, far stronger numerically than in any of the east European countries in which they already dominate the situation, and they represent perhaps 40 per cent of the electorate. In other words, at least three out of every five voters are against them.

But this Communist minority is organised and disciplined, whereas the majority is neither organised nor even united. The

minority is led by a set of men, many of them idealists, who know their own minds. The leaders of the majority, by resigning, have cast the chief burden and heat of the day on the President. They are ordinary parliamentarians, accustomed to the give and take of parliamentary life, shrewd at tactics and compromises, but unproved as yet in matters of principle. This is especially true of the Social Democrats, who hold the balance between the Communists and the others, who have their following mainly among the workers, and who are therefore bound to consider how far their flock would go if faced with victimisation in the factories. Benes, of course, is both a rock and a host, and his prestige is immense. But if the opposition of the non-Communists in the Cabinet were to falter, his own declaration that Parliamentary Democracy must go on would oblige him to accede to the wishes of his Cabinet. The Communists have been wooing the Social Democrats with the most fraternal ardour and have induced a number of them to join them on the platform. The final result of their blandishments is already apparent.

Choice Before Communists

In any case, however, it is clear that if parliamentary democracy does "go on for ever," it will be because the Communists have spared it at this critical moment in its development. They could overthrow it as and when they pleased, without any help from anyone. But not all of them want to overthrow it. The more level-headed among them realise they would face the prospect of a boycott of the legislative organs by the other parties, and that camouflage like that in Hungary and Poland is well-nigh impossible. They would also face the unconcealed hostility of three-fifths of the Czechs and more than two-thirds of the Slovaks. They would have to find a new President and Foreign Minister. As to the latter, a Social Democratic paper recently declared that Masaryk, when asked what would happen if the Communists got 51 per cent of the votes at the next election, replied: "Then you see before you the Chairman of the League of Future Political Prisoners." The story may be apocryphal but it carries a moral. The only way to muzzle not only Benes and Masaryk, but a good many others would be to put them in gaol or hang them. That is quite an undertaking, even for Communists.

Czech Communists have so far been law-abiding enough, except when their enthusiasm runs away with them, or when their leaders get themselves into a position from which it is difficult to withdraw without loss of face. So far as votes in the next election are concerned, they have probably lost more than they have gained in the past week. Indeed, last Saturday, several members of the Party were seen in the Wenceslas Square openly tearing up their membership cards to show their distaste for the methods that are being used. Allegations that men like Dr Zenkl, leader of the Czech Socialists, is plotting an armed rising in conjunction not only with the West, but also with "the German Military General Staff," sound ridiculous to Czechs who know Dr Zenkl's record during the war, when he spent a long while in a concentration camp. Indeed, when such a charge is made by an official radio commentator on the basis of an official communiqué, it merely arouses suspicion of the motives of those who bring it.

The question of the police is really a major issue by itself. Under Mr Nosek, the various police forces in the country have been unified. They now form a trade union which is part of the nation-wide network of the revolutionary trade union movement, ROH. When the other parties attacked Mr Nosek for communising the police they hit a keystone of the arch of Communist power in the country. "They want control of the police," said Gottwald, the Communist Prime Minister, at a mass rally of his supporters, "but we are not going to give it them." If there were a real spirit of co-operation between the parties of the National Front, it would not matter who controlled the police, and the dismissals would probably not have occurred. But the parties do not trust one another. They never have.

The unwritten rules of parliamentary democracy direct that, when there is an acute difference of opinion on a matter of

principle, there should be an appeal to the electorate. So far the only appeal has been to the organised workers, and not even to all of those. That there will be an election soon, however, is one of the few prophecies which seem safe in the present situation. It is, in any case, due in May. If parliamentary democracy has by then already gone under, the election will, of course, be a farce.

Eire Without De Valera

[FROM OUR DUBLIN CORRESPONDENT]

THE new Irish "Inter-Party" Government, includes representatives of the most divergent interests. The fact that they could combine at all registers the depth of their desire to change the administration. There is no doubt that the country generally was tired of Mr de Valera's Government and that the change was popular. It was widely felt that his party had enjoyed a monopoly of power and patronage long enough. The assembling of the new Executive Council was a masterpiece of diplomacy and compromise: every party agreed temporarily to shelve some of its most cherished policies in the interests of unity.

One of the most difficult problems was the selection of a leader to act as *Taoiseach* or Prime Minister. In the end the choice fell on Mr John Costello, who very unwillingly agreed to allow his name to be proposed in the Dail. In consenting to act, Mr Costello has made great professional and financial sacrifices. At the height of his career he has abandoned a lucrative practice at the bar for an office which will certainly prove extremely troublesome and may not prove to be very durable. Other Ministers have made similar sacrifices, and many members of the new ministry are animated by a sense of duty rather than by personal ambition. They feel they have a mission to improve the government of the country and to demonstrate that party differences can be subordinated to the public good.

The new Executive Council contains a great deal of ability and experience. The *Taoiseach* was Attorney-General in Mr Cosgrave's administration, which came to an end in 1932, and he has been, since then, an active opposition member in the Dail. He possesses the highest legal and political attainments and to have been selected as leader of such a mixed group is itself a great compliment to his integrity. He enjoys the advantage of not possessing a "national record," which means that he took no active part in the physical force movements that preceded and followed the Treaty. His appointment, therefore, registers a break with the militant tradition in Irish politics which is very welcome and long overdue.

The new Minister of Finance, Mr Patrick McGilligan, who also served for many years in the Cosgrave Government, is a man of first class ability and considerable experience, a member of the senior bar and Professor of Law in University College, Dublin. He can be relied upon to conduct his department with distinction. The Department of Education has been entrusted to General Mulcahy, the leader of the *Fine Gael* Party, who has, with characteristic public spirit and self-effacement, consented to take office under one of his own junior followers. He, also, possesses long experience of administration in Mr Cosgrave's Government. Two other members of *Fine Gael* have seats in the Executive Council. The other ministries are divided among the co-operating parties in rough proportion to their numbers; two to the Labour Party, two to the new Republican Party, and one each to the National-Labour Party, the Farmers' Party and the Independents.

Right and Left in Harness

The Independent who obtains office is Mr James Dillon, who becomes Minister for Agriculture. This is an excellent appointment. The increase of agricultural output, the reduction of costs of production and the expansion of exports are the most vital needs in the economic life of the country. To this serious and, it must be admitted, exceedingly difficult task, Mr Dillon brings a strong mixture of native ability, business experience and economic commonsense. He stands in the tradition of Mr Patrick Hogan, Mr Cosgrave's brilliant Minister for Agriculture, and is completely immune from protectionist fallacies. Politically, Mr Dillon is at the extreme right of the new combination of parties. He advocates closer association with the British Commonwealth and active co-operation with the Western democracies against the menace of Communism.

Right at the opposite end of the political spectrum is Mr Sean McBride, the leader of the new Republican Party, who advocates, as his ultimate aim, an Irish Republic completely detached from

all ties with Great Britain. Mr McBride has consented to act as Minister for External Affairs, and has courageously stated that he will not press his full policy for the present, as he does not consider that the electorate has given him a mandate to do so. The inclusion in the same cabinet of Mr Dillon and Mr McBride is striking proof of the desire for unity among Mr de Valera's opponents and of their almost passionate longing for a change of Government.

The cohesive capacity of the new combination will be tested when the programme of legislation comes to be arranged. No doubt new legislation will be reduced to the barest minimum and controversial measures avoided as far as possible. But there are certain steps that must be taken if the Government of the country is to be carried on. The estimates must be approved and the budget passed. It is hard to see how estimates and budget can be prepared without strong differences of opinion arising between the different groups, particularly between the Labour parties and their more Conservative colleagues. The published programme of the Government contains proposals for economy and retrenchment which may prove hardly consistent with other proposals for social services and welfare. In spite of these obvious difficulties, it is generally believed by judicious observers of the political scene that the combination will survive the strain and that there will not be another change of government in the near future.

The common desire to exclude the late administration from returning to power, the vested interests created by the possession of office and the dislike of another election are all factors that may prove steadying influences in an apparently unstable situation. If the experiment succeeds it will demonstrate that proportional representation can be extended from the electoral to the executive sphere.

Chilean Crosscurrents

[FROM A SPECIAL CORRESPONDENT]

EVER since the end of the war Chile has gone through political experiences which would be enough in themselves to unsettle a nation less stoical or basically sound. In February, 1946, there was a general strike led by the Communist elements in the labour movement. Although the strike was finally broken by the Socialists, they, too, lost prestige. The president, Juan Antonio Rios, was at the time mortally ill, and all knew that a presidential election would be held. Therefore, the Socialist-dominated Government could carry out few of the things which it promised. On the other hand, the Congress was controlled by the Right—the Liberal and Conservative parties—who were unwilling to carry out social reforms of any importance.

Out of that situation, the Communists were the gainers. By the time the presidential election was held in September, 1946, the Communists were supported by most of the forces of the Left in Chilean politics, and were able to put forward as candidate for President a member of the Radical party who had for years been particularly intimate with them, Gabriel Gonzalez Videla. This is the Señor Videla who has gained some notoriety in recent news from the Antarctic.

In the elections Videla came out as the leading candidate, but failed to gain a clear majority. In the negotiations that followed to determine whom parliament would select—if no candidate receives 51 per cent of the popular vote the President is elected by the Legislature—the key position was held by the Liberals. They first backed Fernando Alessandri, a Senator, twice president of the Republic, and the real "grey eminence" of Chilean politics, but they finally agreed to vote for Videla, and in return they would provide three members of the new Cabinet.

So for six months Videla governed with a Cabinet composed of members of his own Radical party, the Communist party and the Liberal party. These ministers were usually at cross purposes. Two groups—the Liberals and the Communists—were avowedly meant to checkmate one another. The Communists used their position in the administration for two purposes—to infiltrate into the government machinery as much as possible, and to win control of the Labour movement. The opposition did not move because they feared that the Government would step in and replace the anti-Communist leaders of various unions and put in their stead Communists or their friends. On the other hand, the Government gave complete support to the Communist faction of the Labour movement, subsidising it on every occasion. Thus the Communists had in early 1947 a good half of the unions under their control and from two-thirds to three-fourths on their side.

Communist Errors

But they made a serious error. They acted as if they already had a dictatorship. They tried to gain control of the rationing system of the country. In some areas they succeeded and used it as a weapon to force people into their party and its organisations. They launched a terrorist campaign against their rivals in the Labour movement—the Socialists and Anarchists—to see how far they could go in this direction. But these moves rebounded, tending merely to unite all factions against the Communists. This united pressure became irresistible after the municipal elections of April 6, 1947, which showed that the allies of the Communists in the Government had lost heavily, even though the Communists themselves had gained. The Liberals found that the conservative-minded voters went over to the Conservatives, resenting the association of Liberals with Communists.

The Liberals thereupon left the Government, and President Videla was faced with a dilemma. Though only a few weeks before he had said that nothing in heaven or on earth could separate him from the Communists, he was forced to decide whether or not he should dismiss them from his Government, which now had a minority in parliament. Although it would have been possible for Videla to govern in this situation, it would have been difficult. If the dictatorial tendencies of the Communists had become more pronounced, it would have been virtually impossible to get the support of the anti-Communist army.

So the Communists left the Government. For a little while they did not attack their old hero. They urged him to be sure to carry out the programme upon which he was elected President. They attacked his "reactionary advisers," but not the President himself. They steadily increased their pressure on the Government through a series of strikes, particularly in the basic mining industries. The President became increasingly perturbed by these and finally, in August, 1947, broke with the Communists.

Soon afterwards the Communist-led coal miners' unions went out on strike. This was hitting at the heart of the whole Chilean economy. It was in the coal mining regions that Communist control was probably closest. Faced with this threat, Videla offered the coal miners a justified 40 per cent increase in their wages and a number of other economic benefits. The Communist leaders prevailed on their followers not to accept this offer. An ultimatum was therefore issued; and, when it expired, troops and sailors marched into the mining districts. Most of the chief Communists in the area were arrested. At the same time the President announced that he was immediately putting into effect his offer to the miners. Anti-Communist miners were meanwhile brought in from all parts of Chile. The local miners, who had been kept out mainly by threats that they would be killed in the mines if they returned, then went back.

A Broken Partnership

The Communists tried to stage a general strike throughout Chile in protest against this handling of the coal strike. It failed miserably, and in such places as the copper mines, and nitrate "officinas" in the north, Communist union leaders were arrested. The result of all this has been to turn Videla against the Communists, at least for the time being. He asked for special powers from Congress to deal with the strike situation when it arose, and used them to deport a fair proportion of the Communist labour leaders to the extreme southern part of Chile. He broke off relations with Russia, Yugoslavia and Czechoslovakia on the claim that they were giving orders to and subsidising the Chilean Communists. It is more likely that the Chilean Communists received their directions from certain leaders of the Argentine Communist party who are in direct contact with Europe.

But Chilean politics are volatile, if nothing else. It is not inconceivable that the situation will change again on short notice. It remains true that the President's own Radical party is thoroughly honeycombed with friends and perhaps agents of the Communist party. There is a strong faction which is opposed to Videla's present anti-Communist stand, and tends to emphasise its agreement with the President's *mot* of less than a year ago that "anyone who is anti-Communist is a Fascist." Furthermore, it is as yet uncertain to what extent the faith of the considerable masses of the working-class, who followed the Communist party, has been shaken. To a certain degree the reaction of the workers will depend upon the ability of the Socialists and, to a lesser degree, the Radicals to fill the gap among the workers left by the Communists. It is impossible to be very sanguine about this—Antarctic expeditions and high-flown oratory are no substitute. Finally, the possibility of some new political current arising from the workers' disillusion with the hopes which the Communists aroused a year ago is not to be ruled out. After all, Perón is just across the Andes, and he has a powerful "labour movement" of his own. He has hitherto been thwarted in his

endeavour to co-ordinate the Chilean economic and political system with his own by the negotiation of a treaty. In the present uncertainty he may see a chance to achieve his ends by other methods.

Interregnum in Trieste

Few tasks could be more fraught with administrative and political problems than that of governing the Free Territory of Trieste. When, on September 15, 1947, Major-General T. S. Airey took up the position of Commander of the British/United States zone, he expected to do no more than form a temporary caretaker administration for the few days or weeks which would precede the appointment of a civilian Governor. Instead, several months have passed and the appointment of a Governor is as remote as ever. General Airey's administration has had to carry out economic and political measures without authority for long-term planning; indeed, he is expressly forbidden by the Italian Peace Treaty to do anything which would lay down a precedent or limit the action of the future Governor. In his report for the period up to December 31, 1947, and issued by the Foreign Office this week, the burden of governing under such intolerable conditions is referred to again and again.

From the first, the Free Territory of Trieste has been under continual ideological fire from Yugoslavia. The truculent behaviour of General Lekic, the rabble-rousing tactics of the Communists, and the traditional brigand-like atmosphere of south-eastern Europe make administration extremely difficult. It is hardly surprising to find General Airey's sympathies are predominantly pro-Italian. Italian law is enforced and local government is based on the Italian model; the economic policy of the Italian Government has been adopted, and Trieste has been included in the Italian economic system. Nevertheless, General Airey has strictly upheld the democratic principles of free speech, free press and free association. In an interesting table he gives the number of applications granted and refused for holding public meetings:

	Granted.	Refused.
From Slav and Communist organisations ...	180	12
From "Independent" parties	16	1
From pro-Italian organisations	130	5

Free movement of Trieste between the two zones is allowed, and a monthly average of 70,656 crossings through the control posts have been recorded. To maintain order General Airey has a police force commanded by 23 British and American officers with 5,753 policemen drawn from local sources and trained on London models. There is no censorship of the press, but newspapers and periodicals are licensed by the Allied Military Government according to the technical facilities available. All six daily papers, regardless of their political outlook, are printed in the same plant and housed in the same building. The Communist and pro-Yugoslav papers have a circulation of about 23,000, while the pro-Italian papers average about 80,000 copies. Only one paper champions the Free Territory as a political entity; its circulation is about 7,000.

Trade and Unemployment

Even more difficult than dealing with the political situation has been the task of reorganising the economy of Trieste. The British/United States zone has an estimated population of 300,000. Formerly it relied on such mercantile activity as shipping, insurance, brokerage and banking for its prosperity; but now there is a marked reluctance by businessmen to invest their capital in an area with a temporary government and an uncertain future. The result has been heavy unemployment—estimated at 25,000—particularly among "white collar" workers, who, without special training, are unsuitable for manual labour. Due to the ban on long-term planning, General Airey has aimed at little more than preventing disease and unrest. Food and essential commodities have been provided out of American relief and from Italy; unemployment has been kept down by embarking on essential public works. Trade has been carried on principally with Italy, but its one-sided nature is represented by a debt of 1,500 million lire owing to the Italian banks from the Trieste banks. The total trade with Yugoslavia amounts to little over 500 million lire, with a balance in favour of Yugoslavia of 17½ million.

The most important fact brought out in General Airey's report, however, is the virtual absence of any large group of Triestines who are prepared to accept Trieste as an entity in itself. The population is sharply divided between the pro-Italians and the pro-Yugoslavs—almost none are pro-Trieste. The implication is that Trieste is doomed to political instability and poverty, until such time as the Italian and Yugoslav national and racial ideologies can be resolved.

THE BUSINESS WORLD

The Budget Prospect

TWELVE months ago there were some who hoped that in this coming financial year, 1948-49, when most of the terminal expenditures left over from the war should have been running off, the total of Government expenditure would be substantially reduced, and might even fall towards £2,500 million. The estimates of the year's requirements of the Defence and Civil Departments, published last week, have finally extinguished these always rather sanguine hopes. It is clear that the level of the Budget which is now taking shape will be around £3,000 million, excluding all items of expenditure conventionally accounted "below-the-line." Not until the actual Budget statement will it be known how much terminal expenditure has still to be provided for, but the reduction from last year's provision of £440 million should have been substantial. It appears, therefore, that the benefits of the ending of abnormal expenditures arising from the war—and, moreover, of the acceleration of the reduction in the armed forces—have been swallowed up by the rising tide of outlays on the social services. The implication is that, in the absence of any far-reaching changes in policy, the future level of the Budget is not likely to drop significantly below this immediately prospective figure of £3,000 million—and even that figure, presumably, makes little or no allowance for any further rise in prices.

A little reflection on these figures should suffice to check any premature rejoicing at the size of the revenue surplus which recently has been piling up "above-the-line." It is, however, an impressive surplus, for most of the recent accumulation does not arise from any such internal financial juggling as enabled Mr Dalton twelve months ago to budget for a bookkeeping surplus of £270 million—an estimate adjusted to £308 million after the changes made in the interim budget last November. In the first 10½ months of the current financial year, ordinary revenue exceeded ordinary expenditure by roughly £750 million. Almost every one of the revenue items has been buoyant and, with the possible exception of Excise receipts, all seem likely to reach or comfortably exceed the estimates. Income tax, for example, might conceivably yield a round £100 million more than Mr Dalton expected, and EPT and profits tax, which were expected to drop by more than £150 million, have fallen by less than half that sum. Customs revenue, despite the import cuts, will largely surpass the revised estimates. Even among the abnormal items, sales of surplus stores and profits from Government trading were expected to fall by £50 million, but have already risen by £100 million. Altogether, ordinary revenue seems likely to reach £3,850-£3,950 million.

Estimation of the year's expenditure is liable to a wider margin of error, in consequence of the heavy and unpredictable items which are commonly brought to account in the closing weeks. On the basis of last year's experience, the total would be little more than £3,100 million, or rather less than the original estimate. But the heavy supplementary civil estimates recently presented make it likely that this figure will be considerably surpassed. It is believed, however, that in consequence of savings on other votes, the total of civil expenditure will probably not exceed the original provision by much more than the amount (£95 million) involved in the recently revised "supplementary" for the Ministry of Food. Hence the year's global total may fall some £100 million short of the revised estimate

of £3,421 million. It will be noted, however, that even on that figure the year's surplus might be around £500 million; it could conceivably be £100 million more than that. Least figures such as these should encourage dangerous illusions, two major reservations should at once be made. First, at least £200 million of the surplus will reflect merely Mr Dalton's "clawing back" process. Secondly, this year's outlays below-the-line, though somewhat smaller than at first expected, have been very large. Excluding such special items as the subscriptions to the Bretton Woods institutions, they already approach £700 million.

What, now, of the prospect for the coming year? Defence expenditure is estimated at £206 million less than the 1947-48 estimate, while Civil expenditure will ostensibly be only £10 million higher, at £1,708 million, despite the heavy additional expenditure arising from social insurance and the new National

Health Service. But this comparison is distorted by the abnormality of the arrangements made under the recent Anglo-Argentine Agreement. The whole of the Ministry of Food's advance payment of roughly £100 million is being charged against the current year's expenditure, thus correspondingly relieving the estimate for the ensuing year. On a true reckoning, therefore, civil expenditure would show a large expansion—yet the estimate for the current year included no less than £320 million for terminal payments, a sum which surely should have provided a large measure of slack for 1948-49. The remaining items of expenditure, both "above" and "below" the line, will not be known definitely until Budget day, but the global total above-the-line may be put at around £3,000 million.

After the wide errors in the official forecasts of revenue for the current year, any attempt to estimate its course next year involves more than usually hazardous guesswork. But it is plain, first, that some hundreds of millions of this year's non-recurring or nominal credits will be lopped away. In the current year, sales of surplus stores and receipts from trading will have provided about £300 million. Mr Dalton implied twelve months ago that these sources would now be drying up; after their recent performance, his successor may perhaps be more optimistic. But he will presumably be unable, even if he wished, to produce any more rabbits from the hat, to match Mr Dalton's

"clawing back." The deficiency on these three items may be guessed at around £400 million, and might be much larger.

Secondly, there will be large cross-movements from the operation, for the first full year, of the tax changes made in the two Budgets of 1947-48. The increases in profits tax, in customs and excise and in stamp and estate duties should bring in an additional revenue of £259 million *minus* a loss of £62 million on income tax. The great imponderable is Excess Profits Tax. The terminal date for this tax year was fixed at December 31, 1946; but the effects of this termination upon the revenue operate only after a considerable time lag. Mr Dalton expected that at least half the effect (measured in terms of the 1946-47 yield) would be felt in the year now ending and that receipts in and after 1948-49 would be "not much more than a trickle." But his forecast for the current year has proved to be so pessimistic, and the tide of receipts is still flowing so strongly that it seems permissible to assume a fair revenue from this source in the coming year. Conceivably, the loss of revenue on this account might not be more than £125 million to £150 million. There remains to consider the great uncertainty about the effects of changing levels of prices, incomes and volume of imports, and of the new austerity. These factors cannot be surveyed in detail here; but they involve adjustments in both directions and on both sides of the account. On balance, their effect may be small—unless prices rise more steeply.

On such assumptions as these—they are made only for the purpose of indicating the broad shape of the budget problem—the decline in total ordinary revenue in 1948-49, on the existing basis of taxation, might not be more than £300 million to £400 million. On that basis the year's prospective revenue would be, say, between £3,500 million and £3,600 million—including rather more than a further £100 million from surplus stores and trading receipts and £100 million to £125 million from EPT. There would thus be a prospective surplus, above-the-line, of £500 million to £600 million—or, if the doubtful terminal items must be regarded as exhausted, about £250 million less.

Before any judgment can be made upon the appropriate budgetary policy to be followed, it is, of course, necessary to relate the budget out-turn to the National Balance Sheet as a whole. Many commentators consider that the "budget" deficit ought now to be computed by taking account of the "below-line" items. But, in fact, there is little logic in this method; it is no more than an approach towards the new technique of revenue and capital budgeting which is of value only if all factors can be brought into account. These other factors, so far as economic forecasting permits, will, presumably, be presented in the 1948 Economic Survey in a few days' time.

It is with the estimates of "investment" and of the external deficit that some of the most important of the Governmental "below-line" expenditures need to be integrated. Exchequer

outlays such as those for Housing and Coal, which in 1947-48 will absorb some £340 million, are better considered in that context than as an expenditure of any surplus above-the-line. On the other hand, there are below-line outgoings, such as repayment of Postwar Credits, which would be better treated above-the-line as a direct addition to expenditure; and this is even more true of net repayment of Tax Reserve Certificates, for such repayment shows that some of the revenue credited above-the-line was never, in fact, received in cash. If this sort of distinction is applied when estimating the below-line prospect for the coming year, it appears that there may be only a slight decline in the Governmental "investment" outlays (Housing and Coal, for example, might require as much as £225 million) but the other expenditures are likely to fall steeply. Assuming that repayment of Postwar Credits is next year confined only to people newly reaching the age qualification, the amount required would presumably be only a fraction of the £50 million to £60 million expended this year. Similarly, the bulk of the War Damage payments have now been made, but there may remain, perhaps, £70 million to £80 million still to be disbursed, compared with aggregate payments of about £240 million to £250 million in the past year. Allowing for net repayments of Tax Reserve Certificates, for Civil Contingencies, and for a moderate residue of EPT Refunds (which this year have also fallen well short of the estimate) it appears that aggregate below-line outlays in the current year, apart from those on Housing and Coal, may be around £200 million, compared with roughly twice that sum for the current year.

These guesses—for obviously they can be little more at this stage—open the door wide to conjecture about the shape of Sir Stafford's first Budget. But there is one lesson from the present year which is likely to apply with equal force to the coming year—a very large element in the buoyancy of the revenue derives simply from the impact of inflation upon incomes and profits. It is the ex-Chancellor, not the careful and normally very successful forecasters of the Inland Revenue and Customs and Excise Departments, who is to be blamed for the wide errors in their estimates this time. Sir Stafford Cripps, it is to be hoped, will be forewarned of the monetary delusion which this surplus is apt to create. On paper, Mr Dalton has done precisely what his critics urged last year, and what he, himself, said he would not do—he has sucked into the Exchequer a huge draught of public spending power. But this draught has not produced any net curtailment of the pressure of funds outside. It is simply the Exchequer's share of a greatly increased total; and the Exchequer itself has yet to feel the full impact of this increasing pressure on its own expenditure. In conditions such as these, any very large and uncovenanted surplus is better regarded as the measure, not of scope for budgetary relief, but of the need for more effective anti-inflationary restraints.

Newspaper Revenue and Earnings

AN article last week examined some of the economic problems of newspaper production—in particular the forces which have been thrusting up the costs of paper, staff and distribution during the past ten years. It is now proposed to consider the changes which have taken place on the revenue side of the profit and loss account—in particular, the movement of income from sales and advertisements—and the trend of profits. The two sides of the equation—costs and revenue—have moved violently out of line from their prewar position; the proportion of revenue derived from sales and advertisements has also been shifted considerably; and profits, which hitherto have managed to escape the sharp blade of rising costs, are now threatened with a more or less severe cut.

Unfortunately, detailed statistics about newspaper revenues are nearly as difficult to obtain as figures about expenditure. It is true that newspapers quote standard rates for advertising, but the actual rates paid for space by particular advertisers differ markedly from these standard rates. In the days of ample advertising space before the war, it was a common practice to grant rebates for "series advertisements" and other space; as a result, the rates actually paid for advertising space might be as much as 25 per cent below the standard rate. Now the boot is on the other foot. Space is so scarce and advertisers so clamorous that newspapers no longer have "ordinary positions" to sell; almost all positions are "special," and they can be got only at a premium. Today, advertisers may in fact

be paying on an average 25 per cent more than the standard rates. Discounts and premiums of this kind make it difficult to draw any certain conclusions about advertising revenue merely from a study of advertising space and the newspapers' standard charge.

The growth of newspaper circulations is fortunately more measurable. Between May 1939 and May 1946 the total circulation of all the dailies (National and Provincial) had risen from 19 million to 25 million—the increase being proportionately greater in the case of the provincial papers than of the London papers—while the circulation of the Sunday papers rose from 16 million to 25 million. Since 1946 the rise has continued. The further increase for the London morning and evening papers and Sunday papers for the last six months of 1947 is shown below:—

TABLE I—NEWSPAPER CIRCULATIONS ('000)

	Prewar	May, 1946	Average Last Six Months of 1947
London Mornings	10,400	13,400	16,040
London Evenings	1,850	2,570	3,500
Provincial Mornings	1,740	2,830	27,040
National Sunday Papers	16,000 approx.	25,000 approx.	

This growth in circulation has substantially increased the sales revenue of all newspapers. As the margin for distributors, much to their grief, has remained unchanged, and total advertisement revenue has fallen, income from larger circulations has now become a factor of major importance in newspaper trading accounts. But for the limitation of paper supplies, circulations might in fact be even larger than they are now. When the embargo on circulation was lifted in September 1946, sales increased sharply, but after the return of the dollar crisis in July 1947, maximum circulations were limited to the June 1947 level. In normal times, sales of newspapers increase during the summer and decline during the winter months. This normal pattern occurred in the winter of 1946-47, but there has been a marked change this winter. The seasonal drop has been much smaller, and sales are already picking up rapidly, and some newspapers must now be almost up against their circulation ceilings again.

This striking increase in the demand for newspapers reflects the existence both of larger pay packets and an increased interest in public affairs. Any serious fall in the standard of living of the bulk of the population would be quickly followed by a fall in sales, though it is likely that a fair proportion of the increased demand would in fact prove permanent. Newspapers may therefore expect some part of their increase in sales revenue to be lasting. In a Report on the British Press issued by PEP before the war it was reckoned that the newspapers themselves received about two-thirds of the penny paid by the public to the newsagent, the rest being deducted as newsagents' commission. As the distributors' margins have not altered, the position is probably much the same now. Indeed, the figures published by the Daily Express early this month showed that of £7 million paid by the public £2½ million went to the newsagents.

TABLE IV—NEWSPAPER PROFITS AND SHARES

Daily Mirror 5/- Ord.....	Feb. 28, 1947	350,897(c)	476,843(c)	20.0	52.8	15	30(d)	21/3	7 1 3
London Express Newspapers 5/- 'A' Ord.	June 30, 1947	243,947(f)	612,592(f)	15.1	22.6	15	15(g)	15/6	4 17 0
Odham Press 4/- Ord.....	Dec. 31, 1946	1,160,135(f)	1,211,312(f)	19.5	29.9	10	17(h)	10/-	7 0 0

(a) After taxation. (b) Before taxation, after depreciation. (c) After depreciation and taxation. (d) Interim for 1947-8 increased from 10 to 12½ per cent. (e) On 1946-7 dividend. (f) Before taxation and depreciation. (g) Interim for 1947-8, 5 per cent against nil. (h) Including 2½ per cent bonus.

The movement of revenue from sales can, therefore, be readily calculated from the increases in the numbers of copies sold.

Warning has already been given about the dangers of generalising about advertising revenue from a mere comparison of standard advertisement rates. The figures set out in Table II below certainly understate the average rise in rates which has taken place; even so, they still reflect the fierceness

TABLE II—ADVERTISING RATES AND SPACE

of demand for the restricted advertising space which is available. Fleet Street is now debating whether advertisers can be squeezed yet further, in order to ease the pressure of rising costs on the newspapers themselves.

Although advertisement rates have increased sharply, advertisement revenue has fallen as a result of the reduction, principally, in the size of papers, but also in the proportion of space devoted to advertising. Before the war as much as

TABLE III—ANALYSIS OF NET REVENUE

	Net Revenue of Newspapers (£ Million)						Net Advertising Revenue as a Percentage of Total Net Revenue	
	Sales		Advertising		Total Revenue			
	1935	1943	1935	1943	1935	1943	1935	1943
National and London Dailies ...	8.2	10.2	11.8	4.6	20.0	14.8	59.0	31.1
Provincial Dailies	6.0	7.4	7.9	6.0	13.9	13.4	56.8	44.8
National and Provincial Sundays	3.6	4.7	3.5	1.7	7.1	6.4	49.3	28.6
Suburban & Provincial Weeklies	1.7	2.4	5.0	4.8	6.7	7.2	74.6	66.7
All Newspapers	19.5	24.7	28.2	17.1	47.7	41.8	59.1	40.9

44 per cent of the twenty or twenty-four pages of the national dailies carried advertising; today only 19 or 20 per cent of the present four-page papers are so used. Only The Times, with its small circulation and larger number of sheets has maintained roughly its prewar proportions. These reductions in advertisement space have fallen with greater severity on the national and London dailies than upon the provincial dailies. In 1946, the whole London press received only 23½ per cent of their prewar newsprint consumption, while the English provincial press received 35.3 per cent and the Scottish papers 38.4 per cent.

One result of the less austere treatment of the provincial papers is shown in Table III, which compares the movement

of the constituent items of net revenue for various sections of the press between 1935 and 1943.

Advertising revenue for the national and London papers fell from £11.8 million in 1935 to £4.6 million in 1943, and the proportion of advertising revenue to total net revenue from 59 per cent to 31 per cent. The provincial dailies, showed much smaller falls, from £7.9 million to £6.0 million and from 56 per cent to 48 per cent respectively. Since 1943, the net revenue position has altered considerably, owing to increases in circulation and in advertising rates. But it is still probably true that whereas before the war London newspapers were receiving 56 per cent of their revenue from advertisements and 44 per cent from sales, the position now is just about reversed. The most recent figures for the Daily Express, indeed, show that for the year June, 1946-7 circulation revenue had become preponderant: net sales revenue was £4.4 million, and net advertising revenue £1.5 million.

The change—if not the reversal—of the roles which circu-

lation revenue and advertisement revenue play in newspaper economics has perhaps not yet shown its full effect on newspaper profits. The final table in this article compares the profits of the latest financial years of several important groups with their earnings and dividends before the war.

Yields of 6 per cent or more are common in the newspaper share group. This suggests that investors are taking a cautious line about the prevailing prospects for newspaper profits, and are disinclined to place much confidence in the rising trend of profits and dividends of the last year or two. Such caution would not be at variance with the analysis of revenues and costs of these two articles. Fleet Street has exhausted virtually all scope for major economies; costs are still rising; there is no immediate prospect of more newsprint and more advertising space; and there are strong pressures against a general increase in the price of the national dailies. In these circumstances, a 6 per cent return can hardly be called an excessively pessimistic assessment of newspaper prospects.

Business Notes

Programme for Coal Exports

Mr Gaitskell, when he discussed coal export prospects yesterday, was confident that British obligations under the European Recovery Programme could be carried out this year, and that enough would be left over to export two or three million tons under further bilateral trade agreements. Instead of 13 million tons going to exports and bunkers this year, Mr Gaitskell has told the Coal Board that it may accept commitments for 15 to 16 million tons. Of this figure bunkers (including bunker depots abroad) take 7,000,000; 6,000,000 were promised to Marshall Plan countries at Paris last autumn; the remaining two or three million includes a million tons to Argentina under the Andes Agreement, some to Canada, and other bilateral commitments which are expected. The quantities left for any future trade bargaining are therefore severely limited.

That export supplies are as good as they are Mr Gaitskell attributed to lower home consumption than had been expected: there have been no pleasant surprises in production. Home stocks are much better than last year; when the winter ends they will still, if all goes well, be about 12 million tons—6,000,000 better than last year. This means that only 4,000,000 tons will need to be accumulated during the summer and autumn to reach the desired stock figure of 16 million tons on November 1st. In framing the summer coal allocations to industry the Government will cease to ignore stocks already held. As a reward to thrift it will allow firms with more than two weeks' coal stocks to keep one week's extra stocks "as a bonus." Firms with one or two weeks' stocks will thus finish the summer with the standard four weeks; firms with three, four, five or more will be left with five.

Mr Gaitskell showed that coal production for the first seven weeks of this year was 268,000 tons a week better than in the same period of last year, though it was lower than in the weeks before Christmas. It still needs to be improved. Last week's coal output of 4,123,200 tons was less than that of the previous week, and more than twice as much coal was lost through disputes, rail difficulties and other causes. Moreover, the level of production necessary in good weeks to reach the 1948 target of 211 million tons has not been achieved once this year.

In the light of the current production figures, the decision of the miners' Executive to recommend an extension of the overtime agreement, due to expire on April 30th, for another year becomes all the more urgent. The final decision will not be taken until the miners' special delegate conference early in April, but there seems no reason to assume that the Executive's recommendation will not be accepted. It is likely that the methods of arranging overtime will be left to individual districts to determine, as they were when the agreement was reached in November; but it is likely too that the miners' leaders, who had at first maintained that Saturday working would be the more productive, will recommend switching over to the extra half-hour a day instead. In this way the stand taken by the Government when the question was originally broached last September and which led to some six weeks' delay in bringing the agreement into operation, may be vindicated. In some districts there has been excessive absenteeism on the Saturday shifts.

India and Pakistan Sterling Agreements

The financial negotiations with India and Pakistan, in which the British delegation was led by Sir Jeremy Raisman, were concluded last week and a brief outline of the agreements has been published. The previous agreement, dated August 14, 1947, covered both Dominions and made arrangements up to the end of 1947. It provided for the blocking of the accumulated sterling in No. 2 accounts but made available for expenditure up to the end of the year a sum of £35 million plus £30 million for working balances, all of which was to be in freely convertible sterling, since the agreement was signed six days before convertibility was suspended. The new agreements cover the first half of 1948. The balance in the free No. 1 account, which includes the working balance of £30 million, is being carried forward in the name of the Dominion of India, though a sum of £4,000,000 has been transferred from it and put at the disposal of Pakistan's No. 1 account. The Dominion of India, in addition to the £30 million or so carried forward from the previous agreement, will have an additional £18 million of accumulated sterling liberated and transferred from No. 2 account to No. 1 account. India will therefore have free sterling in excess of £18 million to spend during the first half of this year from accumulated balances, in addition to the working balance of £30 million. As part of the agreement the Government of India have agreed to restrict their net drawings on the central gold and dollar reserve to a total of £10 million in the current half year. This will be in addition to India's own earnings of hard currencies and to any dollars India may draw from the International Monetary Fund.

The first agreement with Pakistan follows the now traditional pattern. The new Dominion will have at its disposal in free sterling credited to a No. 1 account the £4,000,000 transfer from the joint account hitherto operated with India, a further £6,000,000 transferred from Pakistan's No. 2 account and finally a sum of £10 million by way of working balance, making a total of £20 million. This must serve for the first half of this year, though it is of course understood that the £10 million working balance will be maintained at around this figure. The Government of Pakistan has agreed to restrict its drawings on the sterling area's gold and dollar pool to £3,300,000 in the current half-year. In addition to this Pakistan will have at its disposal its own earnings of hard currencies. The effect of the two agreements is to set a ceiling of £28 million to the amount by which India and Pakistan can draw upon their accumulated sterling balances up to June 30th next, though the actual amount may be somewhat greater if their working balances are reduced over this period. At the same time, the agreements put £13,300,000 of gold and hard currencies at the disposal of the two Dominions. These are less generous figures than those provided by the former joint agreement but they still look handsome enough in the light of British export capacity and of the dwindling reserves from which they will have to be satisfied.

Palestine Balances Blocked

A unilateral decision by the UK Treasury at one stroke blocked Palestine sterling balances amounting to about £100 million as from midnight last Saturday and declared Palestine to be no longer a member of the sterling area. Because Palestine and Transjordan have a common currency, the latter country has had to be placed temporarily outside the sterling area, but the Transjordan Government has already announced its intention to make such currency and exchange control arrangements as will enable Transjordan to return to the sterling area. In the light of current political developments in Palestine and of the prevailing uncertainty about the future of the country, the decisions taken by the British Treasury were well-nigh inescapable. Palestine balances had been heavily drawn upon in the last few months, and they promise to be even more seriously depleted in the impending period of political and economic confusion.

Preventive measures had therefore to be taken to protect other sterling area countries from excessively rapid demands upon the central reserves. In order to alleviate the consequent disruption to current trade and payments with Palestine, it has been decided to release immediately £7,000,000 out of the blocked balances. Of this figure, £4,000,000 will be provided as working balances for Palestine banks and £3,000,000 will be used together with current accruals of sterling in order to meet the current commercial needs of the country up to the middle of May. The necessary technical arrangements follow the familiar pattern of No. 1 and No. 2 accounts. Banks in Britain have been required by the Bank of England to establish the total sterling assets held on behalf of each bank in Palestine at the close of business on February 21, 1948, and to transfer them to a No. 2 account in the name of the bank in question. These assets include deposits, short loans, Treasury and commercial bills and sterling securities. The No. 1 account will be credited with current accruals of sterling and the authorised releases from the blocked assets.

The future of Palestine's relations with the sterling area is a matter which will have to be discussed with the United Nations Commission for Palestine and, later, with whatever Government may administer the new state or states in that country. Whether a Jewish state in Palestine should be a member of the sterling area or should seek closer integration with the dollar group is a matter that has been the subject of considerable debate in Zionist circles. There are many compelling arguments in favour of the former course, particularly the fact that the bulk of Palestine's external reserve is invested in sterling; that most of Palestine's exports go to sterling countries, and that much of the capital that has built up Palestine is sterling capital. The protagonists of the dollar cause base their case on the future rather than the past, and urge that a new Jewish state will for some time to come be compelled to receive the assistance of external loans which can come in appropriate quantities only from the United States. The channels for this receipt of external capital would, they argue, be cleared if Palestine were no longer in the sterling area. There are, however, questions of greater urgency to be decided before this issue is reached.

Crisis in Steel Scrap?

Mr Strauss gave a written answer in the Commons on Monday which, though strictly correct, contributed nothing to the public's grasp of the steel scrap situation. He denied that any blast furnaces had been closed down because of a shortage of steel scrap; the only one closed had been closed for relining. Quite so; blast furnaces make pig-iron and do not depend on supplies of steel scrap. Open-hearth steel furnaces, however, have been closed down for lack of scrap, and it would have been helpful to have said so. So far they have only been in places where supply is especially difficult. Scotland has to import more than half of its scrap supplies; the flow of imports has lately been irregular, and Colvilles have had to close three steel furnaces.

The position in England and Wales is not yet as bad as in Scotland. Supplies continue to come in at a better rate than last year, but then they need to do so if the present higher rate of production is to be maintained. Stocks are no better than last year, and with a more rapid consumption it is naturally difficult to maintain an even flow. This keeps steelmakers uneasy and engenders rumour. It is not likely to be put right until there is a new Government attack on the problem of supply.

Any such new attack will have to take a more realistic view of the German prospects than the Ministry of Supply has taken so far. The Ministry may deserve sympathy for its failure to understand the politics and economics of Bizonia, which are

indeed hardly its subject. But the failure is clear: otherwise, why should a year have been wasted in negotiations with the German economic authorities at Frankfurt—negotiations which are no nearer any useful conclusion? In the absence of any currency which the German trusts, it is useless to go to the German commercial scrap dealer on a business basis. The Ministry's representatives have therefore been thrown back on dealings with the Frankfurt officials whose goodwill is in doubt, who are aware that British authority in economic matters is having to take second place to American; and who have in any case little or no authority over their own people. The political tangle at Frankfurt has grown worse rather than better since the latest Anglo-American reorganisation of Bizonia was announced, and there is no reason to suppose that it will suddenly improve. In the circumstances the British can continue to expect supplies of "booty" scrap collected under their own authority, but it is folly to rely on any big additional supply through the processes of trade. The Ministry of Supply may have to make its calculations afresh on that basis.

Time and Space in the Film Industry

When is a film in production? The film industry's processes lay traps for any attempt to assess the degree of productive activity at a given moment. So it is possible for critics to show that the studios are idle and empty, and for admirers to report that they are throbbing with life and work, within a few days of one another. Visible productive activity in the film business means work "on the floor." A production can leave the floor and go to the cutting-rooms on one day, and transform the apparent situation at a studio, without changing the real position in any important way. Its successor can be put "on the floor" and bring the studio to apparent life—but if it has not been properly prepared, it may cumber the floor space wastefully for six months and add a new liability to the film business and nothing to its stock-in-trade.

If the momentary situation is difficult to assess, the general trend can still be measured, and the trend in the British film industry is bad. A number of straws show its direction. The Association of Cine Technicians is always an articulate critic of the industry, but it is not addicted to complaints of unemployment; it complained last week that between 300 and 400 of its members—more than a quarter, that is, of the highly paid craftsmen of the industry—were out of work, and that unemployment among them was increasing. Among the productions which defenders of the industry quote as evidences of life there are singularly few new enterprises to be seen, and far too many that have been "on the floor" already for long periods. Campaigners at the weekend mentioned "Hamlet" at Denham (but "Hamlet" has just gone to the cutting-room after, it is reported, more than six months on the floor) "Bonnie Prince Charlie" at Shepperton (but "Bonnie Prince Charlie" last week was in its 28th week on the floor), "Esther Waters" (17 weeks), and "Lost Illusion" (18 weeks). One does not hear the shipbuilders congratulating themselves on the number of ships they have not been able to finish. If the industry is to hope to bring down its costs to a level which its market can stand, some way will have to be found of reducing the time spent in production. It might learn something here from Hollywood, which is also having to cut its costs. Preparation in Hollywood tends to become more and more elaborate so that time and space taken up in the studios can be more and more tightly rationed. Since costs of preparation represent about 1 per cent of the total cost of making a film, it seems reasonable to spend six months in meticulous preparation so that production on the floor can be limited to 28 days. These times were taken by Orson Welles in preparing and making "Macbeth." Another American example, "Crossfire," was about four weeks on the floor.

Producers and Exhibitors

It is a mistake to let considerations of prestige cloud the hard facts of the British film situation. The first hard fact is that the studios, whether fully employed or not, are not being efficiently employed. They are producing too few films at too high a cost; several of the recent British prestige efforts have cost £600,000 or more, and it is utterly impossible as things are for the industry to recover costs of that order. Ten years ago, according to evidence given to the Moyne Committee, the British studios had 796,000 square feet of floor space, and with that space produced 215 feature films. Many of those, it is true, were poor

films made for the quota, and, if comparable films are included, the nearest corresponding figure for last year is 103.

What will the industry's production record be this year? It had last year 623,000 square feet of floor space, and should by the end of 1948 have 700,000. Sir Henry French, the director-general of the British Film Producers' Association, estimated in January that the association's members could make 37 first-feature films in 1948. If a few possibilities of outside production are added, and some allowance is made for improvement on the estimate, it is still clear that the number of British first-feature films made this year will be well below 50. The reasons which prompted the President of the Board of Trade to put the target at 75 have never been explained.

Instead of concentrating on improving its cheaper films, the industry has gone in for fewer and more ambitious productions for which the British market cannot, and foreign markets will not, pay. It is now being overtaken in addition by the curious consequences of the stiff import tax on foreign films. For the tax and the retaliatory embargo imposed by the American producers have hit first of all the British film exhibiting business, and the exhibiting business is the chief single source of finance for British film production. Filmgoers are bored already with re-issues; receipts are falling; the available new films will hardly last, at the present rate of issue of one a week, for another two months. Naturally, the exhibitors are not in a bold mood to put up money. But there is another factor; whether they finance production or not, the two big exhibiting groups have to be consulted before any big film production is undertaken, for no film can pay its way unless they agree to book it for their circuits. Are the exhibitors taking an expansionist or a contractionist view of British film prospects at the moment?

Synthetic Rubber and the Shafer Bill

The United States is at last defining its long-term policy on synthetic rubber production. The Shafer Bill, which has been recently approved by the US Armed Services Committee, is Republican sponsored and enjoys the written support of the Administration. With such a strong backing, it seems inevitable that it will become law without much difficulty. Its main provisions cover the maintenance of "rubber-producing facilities having a rated production capacity of not less than 600,000 long tons per annum of general purpose chemical rubber and not less than 75,000 long tons per annum of special purpose chemical rubber." Of the latter quantity "at least 45,000 long tons shall be of a type suitable for use in pneumatic inner tubes," and there is to be at least one plant for making butadiene from alcohol. Actual production is to be maintained at not less than one-third of the specified rated capacities, and it can be increased above this level only in the interests of national security. US consumption of synthetic rubber will be regulated as hitherto on a percentage basis, general purpose synthetic (GRS) being related to the combined total annual consumption of natural and GRS rubber and special purpose synthetic to the combined total of natural, GRS and special purpose synthetic rubber consumption. The synthetic plants may be either Government or privately owned.

The Bill contains two danger points for natural rubber. First, it is permanent, and if it becomes law it can be changed only by altering the law—not a very easy task in the United States. Secondly, it is couched entirely in terms of national security. As such, it is not contrary to the letter of the International Trade Organisation Charter, although it may be contrary to its spirit. As Sir John Hay has recently pointed out, if the United States were primarily concerned with national security, why were they willing to bargain with it at Geneva? The level of GRS consumption, fixed at 200,000 tons a year, will allow for an increase in American demand for natural rubber, judging from last year's figures. According to the Rubber Study Group Secretariat, American consumption of all synthetic rubber in 1947 was 560,000 tons and of natural rubber 563,000 tons. The Bill would thus ostensibly allow for an increase of 300,000 tons in the US consumption of natural rubber if last year's demand were in fact maintained, although it will take some time to re-orientate production arrangements to allow for the change. But American tyre manufacturers are worried about future prospects, and some factories are even reducing output. If total US rubber consumption declines, the advantage which natural rubber may gain would be reduced. Again, if the President of the United States decides to increase the minimum consumption of GRS to, say, 300,000 tons annually, who can gainsay him? It would surely be difficult to prove that the level of 300,000 tons is not in the interests of national security, particularly as only the President would be in possession of the necessary information.

Rubber is a very important dollar-earner for the British sterling area. Exports to the United States in 1947, which came largely from Malaya, totalled \$266 million, and its seems strange, to say the least, that America is on the one hand preventing Britain from earning dollars and on the other intending to hand out dollars in the form of Marshall aid. And the paradox is widened by the US championship of free enterprise externally and the restriction of free choice of rubber manufacturers and consumers in its own territory. America has a right to ensure its national security, but it is open to question whether the means proposed in the Shafer Bill are the most effective, or even the most reasonable, way of doing so.

The Raw Cotton Commission

Events in the cotton trade provide a first warning to the Government of the difficulties it has shouldered in aspiring to hold down the general level of prices. The new price control orders for yarns, controlled cloth and specified cloth represent considerable labours in themselves, for price control in the cotton trade, though incomplete, is immensely rigid and detailed. They contain nothing unexpected, but are the inevitable reflection of recent wage increases on the price-fixing system; and the wage increases were accepted as necessary to the recruitment of an undermanned industry. But they mean dearer cotton goods, and the foreigner's appetite for dearer cotton goods has yet to be demonstrated.

But the new orders do not end the story. On Monday the Raw Cotton Commission raised the prices of Egyptian-type cottons. Here again the increase can be justified and its causes are simple; pressure of foreign demand for the longer-stapled cottons has pushed up world prices since the last set of British prices was fixed in July. But the increases, ranging from 4½d. to 8½d. a lb. and falling most heavily on long-stapled Egyptian and Sea Island cottons, are heavy and abrupt. It is early to calculate their effect on the cost of finished products; but increases tend to "snowball" from one process of the trade to the next, and vigilance will need to be exercised to see that they do not have unreasonable and damaging effects on the marketing of finished goods.

To the trade, they have come as a sharp reminder that the system of bulk purchasing and price-fixing, which has replaced the discarded machinery of the Liverpool Cotton Exchange, has its drawbacks. No one supposes that the Raw Cotton Commission could prevent prices from rising; there are suggestions that the scale of its buying, and the mere fact that it buys officially, have pushed prices higher than they need have gone, but this is hard either to prove or to disprove. But it is clear beyond question that the abruptness of the increases can be blamed on the Raw Cotton Commission, which for some time has been holding down the prices of Egyptian-type cottons and carrying the cost itself. The uncertainty in the industry caused by fluctuations in raw cotton prices has been not removed but aggravated by closing the Liverpool market. The functions of that market were to reflect accurately the world movements in raw cotton prices, and to enable the trader to buy the exact qualities he wanted. As to the first, it appears that the claim that a central buying commission would smooth out the movement of prices is not being supported by practical experience. The Commission may have great difficulty in doing what the old market, as a collection of private individuals with no superior claims to wisdom, did automatically and with ease. As to the second, complaints from spinners that it has become difficult to get the right cotton for their individual needs are too many to be ignored. Producers of special lines in particular, who knew their requirements precisely and were well served by their broker, are in a genuine difficulty. Buying and selling procedures may be standardised, but bales of cotton are not.

Problems in the Cotton Trade

Reports of approaching difficulties in cotton supplies from India and Pakistan, of which the new Pakistan export duties are merely the outward sign, suggest that the factors making for higher prices in the cotton trade have by no means exhausted themselves. Those Lancashire producers for export who have been making a serious effort to bring their costs down are confronted with a hard task. To others, who have been taking an easier way to deal with (or evade) the problem of costs, Sir Raymond Streat addressed a warning on his return from the United States. He was concerned at the tendency to switch production away from the "bread-and-butter" cloths to special

lines which could hope to find only a limited demand in the hard-currency markets for which they were apparently intended. Manufacturers, in planning their production, have been under some temptation to turn out the lines which offer the easiest passage through the mesh of price control rather than those which are most wanted. Plain cotton cloths are controlled in great detail at all stages. Fancy weaves are not. It is a commonplace that Lancashire manufacturers have been finding it difficult to keep their labour happy with work on plain cloths in the face of competition from more profitable special productions, and that some of them have taken refuge in mixed production programmes which would be hard to justify economically. Too rigid price control, maintained for too long, may defeat its own purpose and can end by distorting the pattern of an industry. This seems to be happening to a limited extent in Lancashire. If the controls make fancy goods, more attractive to manufacturers, the production of plain goods will suffer; appeals may slow down the resultant distortion of trade policies, but they will not prevent it in the long run. And any attempt to extend the full controls to all types of product would inflate the industry's bureaucratic overheads beyond all reason. It may be that the best answer to Sir Raymond Streat's warning would be a more flexible price control system which, applied in less minute detail, might achieve its purpose and yet allow the manufacturer to keep his eye on the market.

The Cripps Plan for spinning re-equipment progresses, though slowly. The Cotton Spinning (Re-equipment Subsidy) Bill, introduced this week, aims at securing not only the re-equipment of the mills but the concentration of spinning into larger financial groups; one condition of subsidy is that the applicant group should comprise not less than three mills and should have not less than 500,000 spindles ("or such smaller number of spindles as the Board may in any case allow"). Grants are also subject to a strict time-table: contracts for re-equipment must be made by April, 1949, applications by April, 1950; the work must be done between August, 1945, and April, 1952. (Here again the Board of Trade has power to make exceptions.) It may still be some years before the Bill can bear fruit in any substantial increase of spinning efficiency. Whether the subsidy will reach its estimated total cost of £12 million depends on the response of the trade. Eleven groups, controlling 16 million spindles, have so far been registered; to the rest financial uncertainties, commitments, and difficulties of company organisation are proving serious obstacles.

South Africa and Sterling

Considerable misconception appears to have arisen in this country and in South Africa about certain restrictions imposed in recent months on imports from the Union of South Africa to the rest of the sterling area and in particular to certain African colonial territories with which South Africa normally transacts an appreciable trade. The suggestion has been made that these restrictions derive from the "non-discrimination" article 9 of the Anglo-American financial agreement. This article, which required that the British Government in its import policy should not discriminate against United States goods, may in the past have been used as a convenient excuse for refusing the offer of inessential, high-priced consumer goods manufactured in the Dominions. But it has now been interpreted so loosely by the US Administration as to constitute no impediment on the freedom of action of the British Government in determining import policy for this country or the other areas which it controls.

The explanation of such restrictions as may have been applied to imports from South Africa is that the financial agreement between the British and South African Governments of October, 1947, has virtually made South Africa a hard currency country. The Union no longer sells the bulk of its newly-mined gold to the British Treasury and, conversely, it no longer has access to the sterling area dollar pool in financing its direct deficit with hard currency countries. From the beginning of 1948 the amount of newly-mined gold which South Africa will make available to the British Government (apart of course from the outright £80 million loan, which has now been received) will be adjusted to the balance of payments between South Africa and the rest of the sterling area. South Africa will not accumulate sterling, thus maintaining a policy consistently followed since 1939. South Africa has even announced that sterling obtained as a result of capital movements from other sterling area countries will be used for commercial purposes, i.e., will be drawn upon to pay for imports from these sterling area countries.

These are the hard facts of the financial relations between South

Africa and the rest of the sterling area; it follows that every additional export from sterling countries to South Africa and every reduced import from South Africa to these other sterling countries is tantamount to a receipt of gold. The facts may not be altogether to the liking of South Africa but they arise solely from the consistent unwillingness of the Dominion to hold any appreciable part of its external reserves in sterling. If the South African Reserve Bank were prepared to accumulate sterling, the rest of the sterling area might find it possible to afford a number of South African imports which at present are being discouraged. They are being discouraged because, in effect, they cost gold. Since South Africa is unwilling to accumulate sterling, there is no option but to treat the Union like any other hard currency country.

The Direction of British Trade

It is still too soon to discern any long-term changes in the direction of Britain's postwar trade. The dollar shortage has demanded profound changes in export markets and sources of imports changes which began, to some extent, to take shape in 1947. But the accompanying table shows how limited the readjustment in the traditional pattern of British trade has so far been. Last year over 8 per cent of British exports went to North

TABLE I—DIRECTION OF BRITISH TRADE

Area	IMPORTS (percentage of total value)			EXPORTS (percentage of total value)		
	1938	1946	1947	1938	1946	1947
France & Northern Europe	28.52	13.91	16.11	29.75	30.53	26.27

America, compared with 7½ per cent in 1946. But in 1938 the proportion was over 9 per cent, when the need to sell in the western hemisphere was less urgent. A similar trend is shown for South America. Imports from North America comprised 30 per cent of the total; this was a welcome reduction from the 1946 proportion of 33 per cent, but it is still well above the 22 per cent for 1938. The proportionate share of imports coming from Central and

TABLE II—BRITAIN'S TRADE PATTERN, 1947

Class	Hard Currency Areas	Other Areas	
		Sterling	Non-Sterling
	£ Million	£ Million	£ Million
Imports:—			
Food, drink, tobacco	830.3	569.4	367.8
Raw materials	418.8	268.0	118.6
Manufactures	216.0	210.1	133.7
	190.2	77.4	131.8
Exports:—			
Food, drink, tobacco	236.5	571.9	328.7
Raw materials	13.5	32.7	18.5
Manufactures:—	14.7	4.8	14.7
Metal goods	103.5	271.1	175.5
Textiles	54.5	128.7	41.6
Others	45.3	115.5	63.2
Re-exports	18.2	8.2	32.8
⁰ Visible Trade Balance	-575.6	+ 10.7	- 26.3

South America, however, was higher in 1947 than in the previous year and in 1938. The western hemisphere last year thus supplied Britain with 47½ per cent of its imports, compared with 49 per cent in 1946 and only 33 per cent in 1938, whereas this area took only 17 per cent of British exports, against 15 per cent in 1946 and 19 per cent before the war.

In 1947 Europe also supplied a larger proportion of imports

than in 1946 and took proportionately less exports. This again is a move in the right direction. Imports from and exports to Africa, India and Western Asia, although relatively smaller than in 1946, were substantially above their 1938 proportions. Trade with Oceania (chiefly Australia and New Zealand) has followed a different trend. The proportionate share of imports from this area has declined to 10.6 per cent compared with 13.1 per cent in 1938, and while exports have recovered to 10.2 per cent, this is still considerably below the prewar figure.

The analysis of Britain's trade with the hard currency, sterling and non-sterling area classified into the main commodity groups is shown in Table II. Britain's visible deficit for 1947 was £591 million, of which £576 million was due to the hard currency areas alone and a further £26 million consisted of the deficit with non-sterling areas. The only area with which Britain had a surplus (£11 million) was the sterling area. Well over a half Britain's imports of food, drink and tobacco came from hard currency countries, nearly 40 per cent of the raw material imports and nearly half the manufactured goods. The chief market for British exports was the sterling area, but hard currency countries took 43 per cent of British exports of raw materials, nearly a quarter of the textiles and nearly 20 per cent of the metal goods exported.

* * *

January Exports

The value of British exports in January was £119.5 million, a higher figure than in any month of 1947 and, in fact, a record since July, 1920. There were, however, two factors which tended to inflate the January total. First, the month contained the maximum number of working days—27 compared with 25 in December—and secondly, the total includes the late recording of some Christmas parcels. On the basis of a notional month of 26 working days, the rate of export in January continued the general upward movement which has been in evidence since September, but it was only very slightly above the rate for December.

RATE OF EXPORT ON BASIS OF 26 WORKING DAYS A MONTH
(£ Million)

May	89½	August	97½	November	106½
June	101	September	99	December	114½
July	106	October	104	January, 1948	115

The volume of exports in January has been provisionally estimated at 123 per cent of the 1938 volume, compared with 120 per cent in December, and 117 per cent for the fourth quarter of 1947. If allowance is made for both the length of the month and Christmas parcels, the volume of exports would show little change over December, and both months fall short of the original end-of-war target of 140 per cent of 1938 by about 14 per cent.

Exports of food and tobacco amounted to £8.2 million and were 19 per cent higher than in December, while raw material exports at £3.5 million were the highest since January, 1947—thanks, at last, to the resumption of overseas shipments of coal. The export of manufactured goods rose by 10 per cent and was probably entirely due to the longer working month. Only cotton goods and non-ferrous metals showed any marked increase, while the export of vehicles declined; the record number of motor cars (14,593) and cycles (146,000) sent overseas was counterbalanced by smaller exports of ships and aircraft. Machinery, however, established new records for value (£19.4 million) and quantity (69,601 tons) and its exports were 80 per cent heavier than in 1938. Shipments of textile and agricultural machinery showed the largest increase over the monthly average for the fourth quarter of 1947.

Imports into the United Kingdom reached a surprisingly high level, and totalled £161.8 million. This figure was only surpassed last July and August. The increase of £8.4 million over December was mainly due to higher values for food imports. Much larger quantities of tea and coffee were received while the import of animal feeding stuffs was the highest quantity since June, 1940. The monthly visible trade deficit, however, was reduced to £36.8 million, compared with £39.2 million in December.

Arranging the Argentine Payout

The coincidence next week of the disbursement of the Argentine rail moneys with the redemption of the "called" 3 per cent Conversion Loan is presenting the authorities with a more tricky technical problem in the art of credit management

than they have faced for many a day. The normal preparations for the Conversion Loan operation have, of course, been going on for some months, with the result that probably two thirds of the £302 million which is nominally due for repayment on March 1st has now been acquired by the "departments" and for all practical purposes has been redeemed already. The £100 million or so remaining in public hands is probably quite widely dispersed and, with the Argentine moneys, will involve a total disbursement of about £250 million. On most occasions in recent years when any similar situation has arisen, the technical problem of credit smoothing has been facilitated by the existence of a natural safety valve in the shape of a currently running "tap" for Government bonds. This time, not only is there no such ready channel into which a part of the surplus funds might be drawn, but the surplus itself will be further swollen by the maturing of £100 million of Treasury deposit receipts held by the banks.

The problem raised by the coincidence of the Conversion Loan and TDR maturities—in a week, moreover, which lies beyond the seasonal phase of large revenue surpluses—has been foreseeable for some time, and the plans which the authorities have been laying to meet it have long been visible to the money market. The "special buyer" of bills from the discount houses (and, at times, from the banks), whose services have been much in request lately to enable the market, by selling bills, to meet the pressure caused by revenue transfers, has shown a particular appetite for bills maturing next week. Thanks to these arrangements, the money market's share of the new issue of Treasury bills is likely to exceed by far the maturities held outside official quarters, and the resultant intake of funds by the authorities should offset a large part of the effective sum due to be paid out on the Conversion Loan. These are the normal devices of credit control; but something more is required to mop up the very large surplus which will remain. Ordinarily, an attempt might be made to achieve this by making an unusually big call upon the banks for money against new TDR's, and thereby to offset both the TDR maturities and a large part of the Argentine moneys. But that would not work for these particular disbursements, owing to their odd distribution. It is believed that a large proportion of these moneys will come to only three banks (bankers to the recipient railway companies), and one of these, although one of the smaller institutions, is due to receive almost half the total.

*

The authorities, however, seem to have risen to the occasion. They are often criticised—in these columns and elsewhere—for allowing tradition to prevent desirable improvements in technique, such as the introduction of the long-advocated 91-day Treasury Bill. But this time, it is believed, they have devised a novel formula for what must surely be a novel situation. It appears that the "special buyer" is not only assuming his occasional guise of "special seller" but is in effect arranging "forward" deals for next week on a very large scale. The net result should be that the banks will receive most of the Argentine moneys, not in cash, but in short bills, which will remain with the recipient banks as a flexible counterpart of the railway companies' deposits until the funds are paid out to stockholders. Only then, when the moneys become more evenly distributed through the whole banking system, will the normal TDR counterpart become again appropriate. At that stage, therefore, TDR's will presumably be issued to replace the bills. One other point deserves to be noted. Owing to the accident that the Supplementary Civil Estimates, permitting the advance payment to Argentina, had not been approved when the payment was made last week, it had to be shown "below-the-line" as a charge against the Civil Contingencies Fund, which rose by £120 million; there was, of course, a corresponding rise in departmental ways and means and tap bills. In effect, it will apparently be this Fund which will be the source of the bills to be released to the banks.

* * *

Last Railway Dividends

All the main line railway companies and the London Passenger Transport Board have now announced their dividends for 1947. Disbursements on the junior rail stocks flatter the poor dividend record of most of them over the past twenty-five years. In the final batch of payments, Great Western has lived up to the tradition of its former liberal distribution policy by proposing a payment of £7 5s. 8d. per cent on the ordinary stock; this compares with the record dividend of £7 10s. per cent paid for 1929. No allowance has been made in calculating the Great Western dividend for any compensation to be paid to directors for loss of office, and no proposal will be put from the floor at

the last general meeting at Paddington, although resolutions will be submitted to the meetings of the other three main line companies to pay £75,000 compensation to the seventeen directors of LMS, £63,000 to the twenty-one directors of LNER and £60,000 to the sixteen directors of the Southern Railway.

The dividends to be paid on the junior stocks of the other railway companies are shown in the accompanying table. The preferred ordinary of LNER is to receive 16s. 2½d. per cent for 1947, the first payment since 5s. per cent was made in 1930; the only other year between 1925 and 1947 in which more than 7s. 6d. per cent has been paid on this stock was in 1929, when the dividend was 3 per cent. The dividend for 1947 is therefore handsomely measured against this dismal record. Nor can the holders of LMS ordinary stock be dissatisfied with their final payment of just over 4½ per cent, for no dividend had been paid on the

RAILWAY REVENUE AND DISBURSEMENTS, 1947

Company and Marginal Stocks	Total Revenue for "Final Period" 1946 and 1947	Balance of Revenue Available for 1947	Service of Prior Charges 1947	Available After Meeting Prior Charges	1947 Dividend on Marginal Stocks (Per Cent)
	£000's	£000's	£000's	£000's	£ s. d.
