You will expect me to say something about the future. As far as your Company is concerned, it has practically completed a comprehensive programme of expansion and rehabilitation in the last ten years and a pause must now be made to consolidate the position it has attained. The outlook for cloth continues to be good and the yarn market is showing signs of improvement. We are now up-to-date with our bonus provision and the current year's accounts will not have to bear any additional burden in this regard as was the case in 1954 and 1955. Further your selling agents have agreed to a substantial reduction in their commissions. Against this, the year has got off to a bad start due to the disturbances in the city in the latter part of January, when several working days were lost and the Bombay Cost of Living Index figure has not come down as much as was hoped. I must leave you to draw your own conclusions.

Mr. Mikoyan in Delhi and Karachi

MR. MIKOYAN has come and gone. Wide significance has been attached both in Karachi and Delhi to this first visit of the Vice-airman of the Council of Ministers of the U.S.S.R. As far as can be determined, it was as successful in Karachi as it was in Delhi. In Karachi one might, perhaps, have compared Mr. Mikoyan's position with that of Mr. Dulles in Delhi earlier this month. Both were out in slightly unfriendly territory, trying to reduce the hostility which their policies had aroused. The fact that Mr. Mikoyan was successful while Mr. Dulles ordered relatively little on official circles in Delhi is not without its own significance. That significance reflects not their talents but the difference in their assignments. The main ingredient of difference arises from the fact that Pakistan's key in the international arena is less stable than it looks at first sight. It does not exclude a sudden demarche embarrassing to her Free World friends. So far as India is concerned, possibly because of her more stable international position, which is itself the reflection of the Prime Minister's resolute mind in these matters, it is more difficult to obtain a policy shift. Mr. Mikoyan

could thus set up a new wave motion; Mr. Dulles was not operating in so adaptable a medium.

This, and not the economic story which has been highlighted in the newspapers, is the most interesting result of Mr. Mikoyan's visit following so soon on that of Mr. Dulles. It has underlined not so much the more flexible methods of the Soviet Union as against the United States as the backgrounds against which the two countries operate in India and Pakistan. It is true that there was also a personal equation; Mr. Mikoyan was rather more resilient in Karachi than Mr. Dulles in Delhi. For example, whereas Mr. Dulles adhered firmly to his previous position on Kashmir and Goa while he was in Delhi, Mr. Mikoyan had different policy statements on Kashmir for Delhi and for Karachi. At Karachi he could say that the statements of Messrs Bulganin and Khrushchev when they were in Kashmir had by no means prejudged the Kashmir issue in India's favour; the USSR still adhered to the view that it was for the people of Kashmir to decide their future. In Delhi, Mr. Mikoyan made it quite clear that he interpreted Mr. Khrushchev's statements as indicating that the USSR was not prepared to set up a new wave motion; Mr. Dulles was not operating in so adaptable a medium.

shchev's statement in Kashmir to the effect that the people of Kashmir had already decided in India's favour. The Free World does not seem to enjoy the advantage which Soviet diplomats have of trimming their sails so readily to the prevailing wind. In that sense, Mr. Mikoyan had one degree of freedom which Mr. Dulles has not. It would be a mistake, however, to see his current operation in terms only of this larger degree of verbal freedom. It is largely to be found in the area of opposition which the USSR has to meet in Pakistan against that which the Free World needs to overcome in India.

Quite simply it might be stated that the USSR enjoys a remarkable advantage in the fact that the situation in Pakistan will always remain more fluid than the situation in India. This is partly because there is no towering personality in Pakistan equal to that of the Indian Prime Minister, who is the sole architect of India's foreign policy. But it is mainly because Pakistan's foreign policy is based on expediency and not on conviction. Pakistan does not have a major interest in SEATO, the Baghdad Pact and other Free World alliances so passionate as to prevent a sudden switch in her policy to suit her short-period situation. The short-period situation admits of quite considerable wooing by the USSR. Mr. Mikoyan was a successful wooer because Pakistan was in a mood to be wooed; no one who knows the atmosphere in Delhi at the present time will deny that the task of a suitor is much more difficult in the Indian Union.

Mr. Mikoyan's visit has demonstrated, so far as the Indian sub-continent is concerned, that both sides are being wooed by both sides of the Cold War. This two-way wooing is new; but the difference is not in the wooers so much as in the partners wooed. Sooner or later, the Free World will need to recognise that the obstacles it will encounter in India on its present military policy are far greater than those which will face the USSR if it turns its abundant flexibility on to the Islamic Republic of Pakistan. There was enough evidence in Mr. Mikoyan's visit, both in Karachi and in Delhi, to show that the USSR is prepared to play an equally generous and captivating role as suitor, in both countries. In a sense India has lost her favoured position with the USSR since the same advances are now being made to Pakistan. But this may not be for Indian opinion the setback which rational opinion would deem it to be. Already a great deal of Indian opinion has reacted favourably to the USSR's approach to Pakistan. It is one more strand of evidence that, in dispensing its economic aid the USSR is prepared to open an account with no strings attached. The conclusion has been quickly drawn that the fact that since Pakistan has accepted this position so readily the Free World's convictions cannot be held with great depth in Pakistan. The tables are thus being turned on the Free World.

For the rest, once the unpleasant memory of the fact that the USSR's wooing Pakistan is enough for her not to be a passionate friend of India in Indo-Pakistan disputes has worn off, Mr. Mikoyan's visit to Delhi will be deemed nothing but successful. There is no doubt that much more precision has been given to the content of Indo-Soviet trade. Mr. Mikoyan has, it is known, agreed that the structure of that trade should be arranged to suit India's special needs, and that the USSR should adjust her imports of Indian products so as neither to dislodge trade with the other countries nor to hinder in any way the exe-

cution of the Plan. The fact that it has been agreed in principle that the steel and pig-iron that the USSR is supplying should be covered by Indian 'surplus' exports is a result so satisfactory from an economic point of view that few people have taken in the full turn in Soviet policy towards Pakistan.

One particular observation can be made now with some assurance; there is unquestionably a real difference between the approach of the USSR and that of the Free World to India's economic needs. It is by no means true that the volume of goodwill in the Free World is less than that in the USSR and satellite countries. It is, however, true that democratic methods work in the Indian scene with even greater hesitation than when they operate at home. Take the steel plants as a case in point. The prolonged negotiations with the British steel consortium ended in an agreement; but comparisons are constantly made in New Delhi between the period it took to reach this agreement as against the quickness of the Russian acceptance. Again, on the terms for deferred payment there is no doubt that the Russians are operating with a resilience which the Free World seems unable to match. To some extent this is understandable since the Russians do not have to deal with anything like the Congress of the United States and there are far fewer people to be consulted even in the Executive Government. But even when allowance is made for differences in procedure because of the need of Parliamentary sanction, one must recognise that dilatoriness is written into our negotiations with most Free World countries by reason of the fact that they try to mould Indian requirements into their surplus areas, while the Russians seem prepared to cut their own cloth in order to meet our needs. Partly because of this readiness to adapt their programmes to our needs, Russian negotiators have created a far more favourable impression in New Delhi than their Free World counterparts. The trouble here is not so much with getting legislative sanction as making executives in Free World countries make up their mind. Every important Russian visit has underlined the point that the Free World's methods of doing business in India have undergone a very large eclipse so far as promptitude of decision is concerned. An administrative overhaul of these methods should be in the Free World's interests as much as it is in our own.

In the result, one might say that while the economic situation has become clearer and Indo-Soviet economic ties have undoubtedly increased, the political situation has become a little more uncertain because of the turn in Soviet policy. There was no hint in Delhi given to Mr. Mikoyan that India was a little concerned about the hesitation with which he endorsed the Bulganin-Khrushchev statement on Kashmir and the obvious reluctance he showed to cramp his style on Pakistan. Indian opinion should take note of the fact that, if it considers that the USSR will back India in every dispute against Pakistan, Mr. Mikoyan's statements in Karachi or Delhi give no colour for that belief. On the other hand, the visit has been fruitful in the only field in which expectations were substantial. These expectations have been broadly fulfilled and one might, perhaps, be content with this achievement; sufficient for the day is the evil thereof. But do nations live in the short or long period? One cannot say of nations, as Keynes said cryptically of individuals, that in the long period they are all dead.

The Sugar Target

AMONG the more notable features of the Indian economy in the last two or three years has been the absence of crises in sugar, which at one time recurred almost every year. Even though production has remained below the higher levels of consumption attained in recent years, it has been possible to make up the gap by substantial import of six to seven lakh tons a year to prevent shortage. The latest position is still happier, because the production in the current year is expected to be about 17 lakh tons, which is still slightly below the demand. It is in the context of this increasing consumption on the one hand, and the infrequency of production rising equal to it that plans have been made for expansion of sugar units, to reach an installed capacity of 25 lakh tons by 1960-61. If the first Five-Year Plan period is any guide, the rise in consumption expected in the next five years, with a larger development outlay and deficit financing, cannot be regarded as unduly optimistic. The consumption propensities of the persons who receive new incomes as a result of development expenditure may be regarded as reasonably predictable, and sugar is one of the items for which this country has got both the natural facility as well as an established private sector to undertake expansion.

It is, therefore, somewhat puzzling that with an almost ready market and with promise of assistance for expansion, the industry should feel somewhat querulous about the rate of expansion proposed in the Plan. Both at the annual meeting of the Indian Sugar Mills' Association held last week, and in the proceedings of the Development Council for the Sugar Industry a fortnight ago, the possibility of over-production of sugar appears to have assumed undue importance. While the Development Council seems to have been only concerned with being prepared for exports in the event of the emergence of a surplus, the members of the Indian Sugar Mills' Association have seemed more apprehensive. The Association's resolution on the licensing of new units, while accepting the proposed increase in the installed capacity of 25 lakh tons, has suggested that "indiscriminate and unplanned" expansion should be avoided. The basis for the fears underlying the statement seems to be the feeling that not enough consideration has been given to the existing scope for stretching the capacity of the units already working. It was in essence, therefore, a plea for reassessment of the existing capacity in the matter of licensing.

There is some substance in this suggestion because the recent steps taken towards increasing the productivity of cane are proving satisfactory and according to Dr. Punjabrao Deshmukh, they hold out the promise of a substantial increase in cane productivity. It is well known that a major reason for the low production of sugar mills particularly in Northern India has been the non-availability of sugarcane in adequate quantities so that many mills have to work less than 100 days in a season. If productivity can increase in these areas by the new method of top-dressing of the soil with ammonium sulphate or mixed fertilizers, there are possibilities of increasing sugar yields and total production so as to reduce the uneconomic working of existing factories.

But this is not by any means a final argument for any drastic revision of the target of 25 lakh tons assumed in the second Five-Year Plan. Mr.

Ajit Prasad Jain, the Food and Agriculture Minister, has ruled out the possibility of any large surplus arising as a result of the licensing of new units or expansion of the capacity of existing units. He has also, appropriately enough, referred to the question of exports, subsidised by the general consumer, as somewhat academic at this stage. These are all matters in which premature fears should not be created in the context of the development plans, for that would involve a certain compartmental view of the trends in our economy. It has been the private sector's case, for example, that in the next five years the rate of increase of the demand for cloth would be such as to raise the per capita consumption to 20 yards and above and surely it cannot be that the case of sugar stands on a much different footing. It is well known that even in the matter of cloth the existing capacity can turn out much more than what it now does because of the limitations placed by ceilings on output; this has not been accepted as a reason for the proposed refusal of new spinning units to bolster up the Ambar Charkha or for the very modest increase in the cloth ceiling by only 500 million yards. Sugar production is one line which is firmly to be held in the private sector, and any hesitation or doubt in undertaking expansion on anything less than the most ambitious lines can hardly be consistent with the ambitions entertained by the private sector for a larger share in development than what has been allotted.

It is hardly appropriate to create the impression that the industry would be content with a more limited expansion and would be prepared to watch proposed investments in sugar being diverted elsewhere. This is precisely the danger to which Government's policies may in due course lead. The advocates of curbs on consumption can find in this an opportunity to urge that the community should impose sacrifices on itself in these consumer goods by restrictions on capacity and output and that any price-rises created by the shortage can be intercepted by Government by higher excise duties to form capital in the public sector. This is a theoretically tempting idea; though in practice it may be difficult of implementation in a climate of discontent which shortages may create. If, as a result, there is pressure on Government for imports of sugar—just as there may be pressure to prevent exports of cloth—the resulting loss of valuable foreign exchange cannot be in the national interest. There are uncertainties already in the fact that out of 50 new factories for which licences have been issued 25 are intended to be established on a co-operative basis; of 5.5 lakh tons of sugar expected from these new units some shortfall may be a possibility. Licences have also been issued for expansion of 46 existing units for an additional output of 3 lakh tons. All this production would be needed if the new demands have to be met without a return to the rigidities of control or rationing which may become inevitable when prices rise and foreign exchange becomes relatively more precious than it has been in the first Five-Year Plan. The only object at the present time should be to let the economy expand on all fronts and in all areas, and the country is vast enough to absorb what is likely to be produced. The fears of over-production created four years ago have been now proved to have been unfounded and the same may be eventually true of the apprehensions now felt.

Taxation of Registered Partnerships

A STUDY of the incidence and the probable effects of the proposed tax on registered partnership firms makes one wonder whether the Government is fully aware of the iniquitous nature of this impost. Such a study provides a remarkable example of the extent to which the Finance Minister is apparently willing to flout the elementary canons of fiscal equity in his search for additional tax revenue.

The principle that a partnership should be treated as an aggregation of individuals for tax purposes, has been recognised by the Taxation Enquiry Commission. The income of a registered partnership firm has, till now, been apportioned among the partners and the tax liability placed on the partners at the rate applicable on their total incomes. There appears to be no sound reason for departing from this eminently sensible method and imposing a special tax, as is now proposed, on partnerships as entities, while retaining the existing super-tax on incomes of individual partners.

The purpose of the new tax is presumably to check evasion of tax liability by introducing bogus partners, with a view to fractioning income and reducing the total tax liability. The number of cases, where such abuses have occurred, must be a negligible percentage of the total number of genuine partnership firms, the great majority of whom are engaged in highly specialised professional occupations, where creation of benami partners would be difficult, if not impossible.

There can be little doubt that the partnership as a form of business organisation has great advantages in those fields of activity where professional qualifications, specialised skill and personal integrity are important. In some of these cases, the partnership form of organisation is a legal necessity; in others, it is dictated by long-established professional tradition. Apart from the objection on principle to taxation of such firms, the proposed partnership tax is objectionable on the ground that it is a flagrant case of double taxation. This is because the rebate on the tax paid by the partnership will be admissible in the case of income-tax liability of individual partners, but not in the case of super-tax. As a result, a partner will be required to pay super-tax, at the rate applicable to the highest slab of his income, in respect of a part of the firm's profit, which the firm has already paid as income-tax and which has at no time been a part of his income.

An example of how the tax will work in practice will perhaps make the matter clearer. Let us suppose that a partnership firm consists of five partners who share in the profits at the following rates: A—30 per cent, B—25 per cent, C—20 per cent, D—15 per cent, E—10 per cent. If in a particular year, the firm earns a profit of Rs. 5,00,000 the shares of the various partners will be: A—Rs. 1,50,000, B—Rs. 1,25,000, C—Rs. 1,00,000, D—Rs. 75,000, and E—Rs. 50,000. The firm's tax liability will be Rs. 41,014, made up of a levy at the rate of 9 pies in the rupee on the first Rs. 75,000 of the profits, amounting to Rs. 3,515, a rate of one anna in the rupee on the next Rs. 75,000, amounting to Rs. 4,687 and a rate of one anna six pies in the rupee on the balance of Rs. 3,50,000, which amounts to Rs. 32,812. The shares received

by the partners are, therefore, reduced by Rs. 41,014 as follows:

	(1) Gross Income	(2) Firm's Tax	(3) Net Income
A.	Rs. 1,50,000	Rs. 12,304	Rs. 1,37,696
B.	„ 1,25,000	„ 10,254	„ 1,14,746
C.	„ 1,00,000	„ 8,203	„ 91,797
D.	„ 75,000	„ 6,152	„ 68,848
E.	„ 50,000	„ 4,101	„ 45,899
	Rs. 5,00,000	Rs. 41,014	Rs. 4,58,986

The anomaly and the injustice lies in the fact that though the whole of the firm's tax of Rs. 41,014 is paid by the firm and only the balance of income is distributed among the partners, each partner has to pay super-tax on the gross income shown in column 1, which includes the firm's tax paid in column 2, which of course was never received by him at all, because it was paid over as tax by the firm. It is difficult to see how such a levy can be justified on any principle of fiscal equity.

The incidence of the tax, as distinct from the principle involved in its imposition, is so heavy as to be crushing. A partner already suffers from certain disabilities as compared with a salaried employee. He cannot make provision, through his firm, for a Provident or Superannuation Fund. He gets no tax-free perquisites such as (in the case of a foreigner) home leave passages. At current tax rates, a retiring partner finds it difficult if not impossible to realise the value of his original partnership share through sale to a new partner. In addition to all this, the tax now proposed is likely to put some members of partnership firms to a degree of hardship that may affect their ability to continue to participate in such concerns.

How heavily the tax will fall on some partners can be illustrated by comparing the position of partners A and C in the above example with those of a business or professional man operating on his own and of a salaried employee in company employment, in both cases with the same gross income and in the case of the employee, as a married man, after taking into account provident fund contributions to the extent of Rs. 6,000. With a gross income of Rs. 1,50,000 in all the cases, at 1955-56 tax rates, partner A would be left with net receipts of Rs. 52,973, the sole trader also with Rs. 52,973 and the salaried employee with Rs. 54,810. At the new rates proposed for 1956-57, partner A's net receipts would fall to Rs. 42,089, the sole trader's to Rs. 51,333 and the salaried employee's to Rs. 53,070. The relative worsening of the position of the partner is striking. In a similar calculation for partner C whose gross income is Rs. 1,00,000 as compared to the other two types of persons also with a gross income of Rs. 1,00,000, the net receipts of the partner decline from Rs. 45,630 at 1955-56 rates to Rs. 38,754, the sole trader's from Rs. 45,630 to Rs. 44,973 and those of the salaried employee from Rs. 47,525 to Rs. 46,869. Here again the partner fares very much worse than the others.

The conclusion seems inescapable, that the partnership tax is inequitable, discriminatory and likely to produce undesirable effects among a highly useful and respectable section of society.

Fly to Tokyo

a flight every Thursday, every Sunday

BUSINESS in Japan? Fly there and settle it on the spot. Our twice-weekly service enables you to get there and back — all in seven days!

It's Constellation luxury, now with Slumberette...courteous hostesses to look after you. Stop over in Bangkok and Hong Kong if you wish — at no extra cost.

new light on your overheads

Actually its good lighting.
Fluorescent lighting—Philips.
Cutting overhead costs, and giving
you over 3 times the light on the job.
All workers, office employees and
factory labour, who have had experience
of this new light correctly handled,
will agree that they can work
a lot better over a length of time
under fluorescent lamps.
Less eye-strain, fewer mistakes,
quicker work, and an improved general
atmosphere, these are the results of better
lighting. And working tests have proved
that Philips Fluorescent Lamps,
used with quality control gear, have a
burning life of 7500 hours, which is just
about 4 years. These are a few reasons why
Philips Fluorescent Lamps & Fittings
are being installed in homes, offices
and factories throughout the world.

THE WEEK'S NOTES

THE 'AMBAR' CHARKHA

WITH THE economies of the 'Ambar' charkha still undecided, the Production Ministry has proposed to put into production in the next twelve months two lakhs of 'Ambar' charkhas, without prejudice to the larger proposal for 25 lakh 'Ambar' charkhas during the second Plan period to meet the entire additional yarn requirements. In so far as the present scheme is intended to replace part of the yarn now supplied by the traditional type of charkha, it is all to the good, for the price of khadi is expected to go down by half as a result. Maybe this is an exaggerated estimate of the likely benefit. The Production Minister's reported estimate that a subsidy of four annas per yard of 'Ambar' khadi will bring its price to the level of comparable mill varieties appears too good to be true. There has been a suggestion that the annual cost of this subsidy, placed at Rs. 16 crores, can be met from an additional excise on mill cloth, which is by no means lightly taxed as it is. Mr. K. C. Reddy has also calculated that the larger programme will provide employment for five million persons, the capital expenditure involved being Rs. 144 crores and the working capital needed Rs. 60 crores.

But all these calculations have now been upset by the reported result of an experiment which discloses that output is well below what had hitherto been assumed and that the cost of the proposal will consequently be more than Rs. 500 crores. This probably means that not 25 lakh 'Ambar' charkhas but 50 lakhs will be required if all the additional yarn needs are to be met from this source. Not only the capital cost involved, which will surely be a waste when the inevitable changeover to mechanised production takes place by the grim logic of economics, but also the capacity of the country to produce and put into operation so many 'Ambar' charkhas has to be considered. Supporters of the 'Ambar' charkha may argue that the reported result of the experiment only means that possibly ten million persons can be employed in this programme. A rosy prospect, no doubt, but can mill cloth bear the burden of all that the purposeful functioning of 50 lakh 'Ambar' charkhas employing ten million persons will involve? At probably a fourth of the cost in capital investment mills can supply the additional yarn required at less cost with no additional burden on buyers of cloth. All the money that will be left over, after providing for investment in mills, out of the cost of the 'Ambar' charkha programme, can be usefully spent in engaging unemployed people to add to the permanent assets of the nation in the form of roads, canals and irrigation wells, which may not be immediately economically worth while but are bound to turn out to be so in the process of industrial growth.

SECOND THOUGHTS ON MERGER

THE PROPOSAL for the Bengal-Bihar merger seems destined to end not with a bang, but with a semi-whimper. This, in short, seems to be the conclusion that can be drawn from the trend of the recent talks in the capital concerning this move. The idea of parity for the two regions in the Upper House might not have been unacceptable, but the whole scheme, though imaginatively conceived and boldly placed before the public, smacked too much of a stratagem to get round an awkward situation created by rival border claims. Dr. Roy's demand that the Bihar areas recommended for inclusion in West Bengal by the S.R.C., and later modified by the Cabinet Sub-Committee, should be transferred to West Bengal in the event of the merger not

taking place, is unexceptionable and is unlikely to be refused by the Central Government. It is necessary to ensure that this decision should not once again set off a spate of demonstrations in Bihar and Bengal over little bits of territory.

The sudden cooling off of the ardour for merger exhibited in the earlier stages need not spell the end to the proposal for larger bilingual States, which will contribute to greater national solidarity and the death of linguistic fanaticism. But if bilingual States are to be workable propositions they must have their origins from below. This does not mean that only the people should make such proposals, for the people as such have no initiative in such matters. Courageous leadership guided by instinctive wisdom should sense the people's needs correctly and act accordingly. A few disgruntled politicians with an infinite capacity for organising mischief can give the appearance of a popular movement to a sectional narrow-minded agitation. The task of leaders in the South where a Dakshina Pradesh may provide the answer to many problems, and in other areas where bigger States are desirable for various reasons, is to uncover this and lead the people along the right path without appearing to impose anything on an unwilling people.

EXODUS FROM EAST BENGAL

THE MIGRATION of minorities from East Pakistan is assuming alarming proportions. The Rehabilitation Ministry report for 1955 placed the number of persons who migrated to India during the year at 240,000, a monthly average of 20,000. This is double the rate of the previous year and compares with a monthly figure of 6,000 during 1953. This steadily rising trend has been topped by a total exodus of 70,000 persons in January and February last. It may be recalled that Pakistan's draft Constitution was published in the beginning of January, and there is thus reasonable ground for the presumption that a great deal of the increase must have been due to its avowed Islamic bias.

But this has by no means been the only factor. Mr. Biswas, the Minorities Affairs Minister, disclosed in the Lok Sabha the other day that the most important cause of migration was the increasing incidence of crimes against the person and property of minorities, particularly crimes against Hindu women. The steadily shrinking scope of employment for Hindus in the private and public sectors—the Government is reported to have only issued instructions that private firms should employ only Muslims hereafter—and the Government's calculated policy of deliberate discrimination against Hindus in such matters as the requisitioning of houses and buildings, have all convinced even the land-bound minority community that Pakistan is not a safe home for them. Communal riots have not been infrequent and the police are stated to have displayed indifference towards complaints.

Mr. Biswas confessed that this gravest of Indo-Pakistan problems seemed impossible of solution—that is, expect through wholesale migration, which will involve an onerous burden on India. The Government of India have done all they could do to induce the Government of Pakistan to make conditions in that country safe for minorities, but to no effect. Ironically enough, Pakistan has been complaining that it is the inducements offered by India to refugees which are responsible for the exodus, though what attractions the life of a refugee can hold for a land-owning and

cultivating people it is difficult to fathom. The East Bengal refugee population in India at the end of 1955 was estimated at 36.7 lakhs, and any increase in that number at the present rate of migration will seriously upset India's economy and the second Plan. It is possible that Pakistan will not be unhappy to achieve such a result, but goodwill cannot be established so long as this situation lasts and it cuts the ground beneath Pakistan's contention that a solution of the Kashmir question is the only obstacle to such goodwill.

PROSPECTS OF DISARMAMENT

THE NEW plan for disarmament put forward jointly by Britain and France has had an unexpectedly warm reception at Soviet hands and looks like showing the way to an agreement on the procedure for the reduction of arms. The Anglo-French plan envisages a three-phase programme starting with the renunciation of the use of nuclear weapons except against an aggressor and freezing of the armaments, manpower and military spending of the Big Five at existing levels. A compromise between the aerial survey proposed by President Eisenhower and the Russian proposal for inspection teams at strategic points has been included as a pilot project and world disarmament conference will fix the limits of the forces of countries other than the Big Five. The success of all these schemes will, of course, depend on the working of the executive committee composed of the Big Five and ten others, which is to be in charge of supervision and implementation of the various phases and details. The absolute prohibition of the use of nuclear weapons for any purpose will ostensibly be the final step in the third phase leading to a state of comparative disarmament.

The United States is reported to have refused to back this plan fully on the ground that it is too sweeping, but the whole scheme depends on the efficiency and extent of supervision possible. Moreover, every stage of the programme is subject to unanimous international approval and stringent control. Be that as it may, the significance of the Soviet welcome should not be exaggerated since at every step their approval for the next move has to be obtained. Anyway, the most important single reason why disarmament talks have not hitherto made headway is that there has been no agreement on the method of supervision and the extent of supervision which will be required if disarmament is to be universal and simultaneous. The Soviet Union has been consistently refusing to allow that amount of control which the Western Powers consider as the necessary safety minimum, alleging that it will constitute interference in its internal affairs. But, while supervision will be easy in the open systems of the Western Powers, where every step in arms reduction will be publicly debated, in Russia such an automatic check as is provided by democracy and a free Press will be lacking. The size of the territory also makes difficult the task of ensuring that progress towards disarmament has in fact kept pace with the steps being taken by the other Powers. True, there has of late been a relaxation of tension, but whether this can justify the optimism of 'Izvestia' and Moscow Radio appears doubtful. However, the Russians have nothing to lose, and everything to gain by way of propaganda by seeming to welcome a disarmament plan which may create obstacles when it comes to implementation.

THE JANUS FACE OF FRANCE

PRIME MINISTER GUY MOLLET'S Republican Front Government has followed up the grant of freedom to Morocco with a similar praiseworthy move in Tunisia. In the elections which were held immediately after, supporters of the moderate nationalist leader, Mr. Habib Bourguiba, who negotiated Tunisian independence with

France, have won all the 93 seats in the Assembly, with 90 per cent of the electorate of 700,000 voting. This was in spite of the fact that the nationalist extremists who were dissatisfied with the agreement had called for a boycott of the elections on the ground that the electoral system favoured the National Front. The terms of the agreement are similar to those incorporated in the Franco-Moroccan agreement. Mr. Salah Ben Youssef, the former Neo-Destour leader, now in exile in Libya, has expressed doubts about the genuineness of the independence agreement and there have been demonstrations in Tunis and elsewhere by his supporters against Bourguiba. But, with 93 per cent of those who voted voting in his favour, Mr. Bourguiba is unlikely to be deterred in his task of implementing the agreement.

With Morocco and Tunisia off the list of France's North African liabilities, Algeria alone remains to torment her, and here the wheels of progress have been reversed with the grant of special powers to the Resident Minister and the sending of reinforcements of French troops. But the Algerian problem is complicated as much by the adamant behaviour of the French settlers who want to dominate and control the colony's affairs as by the absence of any recognised nationalist leader who can assure the French settlers of fair treatment and gain their confidence. Without proper leadership, the agitation has taken a turn towards terrorism, and it has become a matter of prestige for France to put this down before she can concede the demands of the nationalists. But the Tunisian example should show the Algerian nationalists that France means business when she says she wants to quit North Africa, though their faith has been rudely shaken by M. Mollet's retreat a few weeks ago. It is to be hoped that the Socialist Prime Minister of France will put the 'colons' in their place when he next visits Algiers instead of being bullied by them.

NEW MINISTRY FOR INDONESIA

INDONESIA'S FIRST elected Government has come into being with Dr. Ali Sastroamidjojo, the Nationalist leader, as the Prime Minister. The coalition headed by him is composed of the three biggest parties and five smaller ones and commands 189 seats in the new House of 260. Of the four main parties which emerged from the September elections, the first in Indonesian history, only the Communists with a strength of 39 will now form the Opposition. The inclusion of the pro-West Masjumi Party should not only give the Government the much-needed stability, but should also help to counterbalance the strong Left-wing influence of the neutralist Nationalist Party. The outgoing caretaker Cabinet of Dr. Harahap of the Masjumi Party has had to resign as a natural corollary to the inauguration of the new Parliament. Dr. Harahap's Ministry took a firm decision on elections and later took the initiative for terminating the Netherlands-Indonesian Union. These have offset the many other shortcomings of his Government.

Several problems, however, remain to be tackled. The future of West Irian is sure to dominate the political scene until Indonesian aspirations are met. So long as this problem continues to embitter Indonesia's relations with the Dutch, with the covert support of the West, the Communists will try to take advantage of it to give a pro-Soviet orientation to Indonesia's foreign policy. The growth of Communist strength in the last few years in the country has caused widespread concern abroad, and though they have been kept out of the Government up to now, Dr. Sastroamidjojo's earlier Cabinet had to depend on that party for functioning effectively. As it is, the present coalition Government may have to face many dangers to its life since there is no basic identity as regards foreign or domestic policy.

A Window on the World

THE APPROACHING WORLD CRISIS

By

ODYSSEUS

A NEW WORLD CRISIS? Is it towards that that we are hastening? Blithely, blandly, because we recoil from drawing the logical conclusions from the realities of the North African and Middle Eastern situations? I will merely set out the facts. They speak louder than any comments I could offer.

India's foreign policy is based on the assumption that, at least for the next few years, a reasonably stable balance of power will continue between the USSR and the USA and their respective camp followers. It is assumed that doubtless there will always be some pushing and shoving on the perimeter; tensions which it is India's objective to help to keep local, as with Korea and Indo-China. But it is not assumed that the over-all balance of power will be upset by any large-scale swing of camp followers from one side to the other.

We should, however, be prepared to witness in the near future a major swing of the balance away from the free world in favour of the Communists.

Of the USA's camp followers, the two most important are Britain and France, with West Germany coming up as her rearmament comes into being. All three belong to the North Atlantic Treaty Organisation, the existence of which first slowed down, and then held, the USSR's post-war drive to expand westwards the number of her satellites.

But, barring the unforeseen, France will within weeks face in Algeria the sort of major catastrophe that drove her from Indo-China. Her concession of independence to Morocco has set fire to Algeria. If it were merely a question of conceding independence, France might have withdrawn with a good grace, but her difficulties arise because Algeria has been since 1881 an integral part of France, and of the population of 8,676,000 no less than 1,200,000 are European French. It is, as M. Pincau said in Delhi, as though India's post-war independence had been complicated by the presence of a domiciled European population of 47,000,000. The Algerian French have no homes in France to which they could return. Although outnumbered by the indigenous Algerians by 7 to 1, the French Algerians have sufficient organisation and resources to be able to launch a civil war on a scale which would find the indigenous at an initial disadvantage. Whoever won such a war would be heir to devastation, ruin, and bitterness.

EUROPE UNDER SOVIET CONTROL

If France is expelled by an Algerian uprising, abetted by the Arabs of Africa and the Middle East, the consequences for Europe, and for the world, must be revolutionary. Could the present French republic, a weak enough regime in all conscience, survive it? A collapse could be followed by a dictatorship of the Right or, more probably, since there are 5,500,000 Communist voters, by a Popular Front ending in a Communist dictatorship which would turn the Quai d'Orsay into a branch office of the Kremlin.

With France a Communist satellite in control of the English Channel ports, would West Germany remain loyal to NATO? Power attracts followers. Would Germany not find it politic to climb on to the USSR's band-waggon before she was forcibly jerked into it? All Europe would follow and be added to the USSR's agglomeration of world power.

Britain's troubles are in the Middle East. Her interests there are (1) to ensure that the world's largest oil deposits remain accessible not only to the Commonwealth but to the whole free world, and (2) to prevent war between Israel and the Arabs in which the USSR would rejoice to intervene. Why should Britain be allowed to keep bases by treaty in Jordan or elsewhere? Why should she not buy oil from the Arabs just as she buys jute from India? Because, at a pinch, the Commonwealth could do without jute and because there is no hostile power on India's borders ready to pounce on her jute industry if it were left unguarded. But without Middle Eastern oil, Britain's 50,000,000 inhabitants would starve within weeks, because her capacity to manufacture and to export would be stricken. And it is too often forgotten that the economies of the Commonwealth, including India, and of the rest of the free world, would also be damaged in varying degree. The sterling area would cease to function. World trade would be reduced to barter. For India, the 1951 Iranian oil crisis is no precedent because we then had alternative sources of supply in the Middle East. But if, as seems certain, Britain is driven from the Middle East, can we rely on the USSR not to slip into the chair thus left vacant?

Consider: on the one hand, the USSR's oil resources are insufficient for her needs and, on the other, by controlling all Middle East supplies she could hold the whole free world to ransom. Not only are all Western Europe, Africa, and India, dependent on Middle Eastern oil, but the USA is a net importer of oil. Could the USSR resist such a chance to secure world domination?

Our sympathies are aroused by the renaissance of Arab nationalism. Britain's withdrawal from the Suez Canal and Glubb's dismissal are preludes to a glorious dawn. But we must face the possibility that the dawn may be blood-red and the certainty that the mid-day sun will blaze down on a world changed out of all recognition.

REPERCUSSIONS ON INDIA

With all Europe and the Middle East in the Sino-Soviet, Communist camp, we shall need to review our own position. Virtually all India's export and import trade is done with the Americas, Western Europe, and the Commonwealth, and our oil comes from the Middle East. Our economy and our Five-Year Plan could, therefore, continue to expand along their present lines with, but not without, Russia's blessing. If the Soviets wanted some or all of the oil or other commodities which we import, we could not prevent them from helping themselves. Ditto with our exports. We

could continue to sell to our present customers with, not without, Russia's blessing. Under British rule, our economy was subordinated to her conception of our interests and of her own. Since independence, our foreign trade has continued to flow for the most part in the old channels—but with this all-important difference: our economy is geared to the sterling and free world area to suit no man's convenience but our own. With the USSR controlling Europe and the Middle East, putting a strangle-hold on oil and other internationally traded commodities, she could dictate terms to the Commonwealth. Our economy would be adjusted once more to policies laid down by an alien authority.

The 'Manchester Guardian' said recently that Pandit Nehru would argue that if Britain and the USA would disinterest themselves militarily from the Middle East, the tensions would die and the Arabs would supply all the oil needed. But, asked the 'Guardian', can the West take the gamble that the Arabs could maintain their independence of the USSR once all Western material aid was withdrawn? Their present governments want to, but could they succeed?

The 'Guardian' said that Britain's recognition that she must avoid a head-on clash with Asian nationalism had saved her. But whereas Britain was able to hand the Indian sub-continent over to two stable successor states, the Middle East is a medley of mutually hostile statelets, over which Egypt and Iraq are contending with each other to impose the unity that Prussia imposed on the nineteenth century medley of German statelets. Should the West support Egypt or Iraq? No, said the 'Guardian'. The West cannot back Arab nationalism unreservedly, because one of its aims is to annihilate Israel. The West's obligation to protect Israel is the USSR's opportunity and the danger arises that the Arab intelligentsia will, from resentment at the West over Israel and other matters, precipitate their governments into the Soviet camp. But, concluded the 'Guardian', Arab nationalism, however violent, is not necessarily suicidal, and some of the present Arab governments would prefer the co-operation of the West rather than surrender to Soviet control. With these governments the West should co-operate. The USSR can always overbid the West in sympathy for Arab

hostility to Israel and it would be absurd to jeopardise the safety of Israel by appeasement of the Arabs "of a kind which can bring no genuine reconciliation between Jews and Arabs". I do not understand this last sentence. The hope that aid to those Arab states ready to co-operate to preserve their independence could be distinguished from aid that would help them to subdue Israel seems unreal, as unreal as the West's current view that its aid to Pakistan is no danger to India. Such aid would be provocative of local antagonisms, just as it is here.

The last word on these problems may lie with Mr. Eisenhower. Recognising that a French collapse in Algeria could lead to the end of free Europe, will the USA seek to intervene diplomatically in such a way as to enable France to withdraw from Algeria in honourable fashion? The Paris Government might agree, but would the 1,200,000 French Algerians? Does the solution lie in their subsidised emigration to France, the Americas, and the Commonwealth? To us, who coped with a two-way mass migration involving 15,000,000, this would not seem difficult to organise. But the French Algerians might not wish to be organised out of their homes. They might prefer to die in them. Human nature often prefers emotions to logic.

In the Middle East, with the free world's oil at stake, US intervention is certain. All depends on its manner. If Mr. Eisenhower can keep Mr. Dulles under lock and key, he might steer the West through some summit negotiations with the USSR without toppling over the Dulles brink into World War III. But it will be a close shave: the stakes on each side are too high for it to be otherwise. But if the gamble comes off, I hope that Mr. Eisenhower will discipline his oil barons and veto any compromise that would rob India, the Commonwealth, and the free world, of their present sterling access to oil. We need all our dollars for other things.

These are the re-appraisals that one presumes are agonising the External Affairs Ministry. They should also be debated in the open so that public opinion may not be bewildered when the headlines begin to get bigger and blacker. That is why I set the ball of discussion rolling today.

NORTHERN RAILWAY NOTICE REGARDING CHANGES IN TIME TABLE

The important features of the changes in Time Table that will take effect from 1-4-1956 are notified below:

- (i) **Existing trains to be cancelled.**
(a) Nos. 63 Up/64 Down between New Delhi and Delhi.
(b) Nos. 1 FC/2FC between Faizabad and Kanpur Central.
(c) Nos. 71 Up/72 Down between Moghalsarai and Kanpur Central.
(d) Nos. 1 BF/2BF between Bhatinda and Ferozepore Cantt.
(e) Nos. 5BH/6BH between Bhatinda and Hindumalkote.
- (ii) **New Trains to be introduced.**
(a) Nos. 11 HH/12 HH between Hathras and Hathras Killah.
(b) Nos. 9 JN/10 JN between Jullundur City and Nakodar.
(c) Nos. 9 AP/12 AP between Amritsar and Patti.
(d) Nos. 2 URJ between Rajpura and Ambala Cantt.
(e) Nos. 2 LC/3 LC between Kanpur Central and Lucknow.
(f) Nos. 2 FL/1FL between Lucknow and Faizabad.
(g) Nos. 6 FH/5FH between Ferozepore Cantt. and Hindumalkote.
- (iii) **Trains extended**
Extended Run
No. 1 KFK (Old No. 1 FTC) /2KFK (Old No. 2FTC) between Khaga and Fatehpur.
No. 3 SS/4 SS between Sitapur Cantt. and Sitapur City.
No. 4 CCM (Old No. 2CC)/3 CCM (Old No. 1CC) between Chunar and Mirzapur.
- (iv) **Existing train halts cancelled.**
No. 7 JMP from Ghiala Musahibpur and Kala Bakra.
Nos. 75 Up/76 Dn. from Raiwala.
No. 72 Down from Achalda, Jhinhak and Rura.
No. 354 Dn. from Maripat, Ajaibpur, Wair and Sikandarpur.
No. 48 Down from Bhadan and Sarsaul.
No. 71 Up from Pora, Madrak, Daudkhan, Mehrawal and Danwar.
No. 1 UR from Fatehgarh Sahib.
No. 353 Up from Sikandarpur.

(v) Important changes in Mail and Express Train Timings.

Train No.	Station from	Time of Dep.	Station to	Time of Arr.
304 Up/Dn.	Delhi	21.0	Lucknow	7.20
31 Up	Delhi	21.20	Amritsar	8.17
319 Up	Ambala Cantt.	4.30	Nangal Dam	8.45
320 Down.	Nangal Dam.	21.15	Ambala Cantt.	1.35
303 Up	Lucknow	20.50	Delhi	7.30
401 Up	Delhi	21.30	Bikaner	9.30

(vi) Through and Sectional Services to be cancelled.

Departure from	Time	Arrival at	Time	Train to which attached	Class of accommodation.	Remarks.
Delhi	8.45	Khurja	11.35	2 ATD	III	This has been cancelled though shown in the Time Table.
Delhi	10.20	Lucknow	4.43	4MD/4KM/354	III	
Hardwar	17.56	Kalka	5.50	349/308	II, III	This has been cancelled though shown in the Time Table.
Kalka	22.0	Hardwar	9.15	307/350	II, III	
Kalka	22.0	Pathankot	8.5	307/305	I	
Khurja	15.23	Delhi	18.5	1 ATD	III	
Lucknow	22.14	Delhi	16.5	353/3KM/3MD	III	This has been cancelled though shown in the Time Table.
Panthankot	18.35	Kalka	5.50	306/303	I	
(vii) New through and Sectional Services to be introduced.						
Lucknow	14.55	Kalka	6.45	73/61	I	On Wed. and Sat. only.
Kalka	23.40	Lucknow	4.52	62/352	1	On Thursday and Sunday only.

CHIEF OPERATING SUPERINTENDENT,
NEW DELHI.

Economic Report from the U.S.

U.S. ECONOMIC SCENE

(BY GUY SIMS FITCH)

WASHINGTON March 27.—Stability and confidence dominate the American economic scene as the first quarter of 1956 comes to a close. Business activity has been holding at the record levels set in the final quarter of 1955 and is expected to remain high throughout the year. There was a cut in automobile production and a slight dip in housing starts, but these have been offset by strength in other sectors of the economy, notably by the high rate of business investment in plant and equipment.

A report this week by the members of the National Association of Purchasing Agents underscores the sustained economic vitality. Some 33 per cent of these business executives say their companies stepped up their production schedules in March, while 57 per cent say production was the same as in February. A strikingly similar pattern emerges from new orders booked for future months. Reports of declines in either output or orders are few and far between. In fact, recent expressions of widespread confidence point rather to an acceleration in economic activity. Within the past month, both business men and consumers have projected the most optimistic spending plans ever drawn for any single year.

The U.S. Commerce Department and the U.S. Securities and Exchange Commission, in a joint nation-wide survey, have found that business men plan to spend an unprecedented \$35,000 million for new plant and equipment this year—a jump of 22 per cent over last year's record total. All major industrial groups are represented in the increased investment plans. What is more, outlays are expected to rise throughout the year. These expansion and modernization expenditures are projected at a seasonably adjusted annual rate of \$34,500 million in the first half of 1956, and at \$35,500 million in the second half. Actual outlays already have reached an estimated annual rate of \$35,200.89, in the first quarter, compared with a rate of \$31,600 million predicted by the two Government agencies last December. Commerce Secretary, Sinclair Weeks, has characterized these record capital investments as "the best economic news so far this year." Most economists believe that business activity in 1956 will depend to a large extent on the size of these business outlays, in contrast to 1955 when the upsurge was based primarily on consumer spending.

It is not that the American consumer, plans to sit idle this year. To the contrary, he has been spending so far at a rate comparable with the high 1955 pace, and from all indications, he will continue to do so.

The US Federal Reserve Board and the Survey Research Centre of the University of Michigan report that their annual study shows the American people are planning to buy at least as many homes, automobiles, and other goods as they did last year. This representative sampling finds consumer more optimistic than ever about the general business outlook and their own financial positions. Reinforcing these surveys, which have proved remarkably accurate in recent years, is a report by the US Department of Labour. It finds that

business men throughout the United States expect a "brisk" pick-up in employment this spring, as they will need additional workers to meet rising production schedules. Job gains are expected to stem mainly from the usual seasonal revival in construction, lumbering, farming and other outdoor work. But manufacturing industries, including the automobiles industry, also have scheduled significant increases in their hiring rates.

It is too early to tell whether all this will add up to another record-breaking year for the American economy. There are those who cautiously hold up warning flags, noting that actual performance has yet to match the unparalleled expressions of confidence. But even they concede that the sources of economic health are strong and plentiful. And more than a few economists are beginning to think that 1956 may repeat the 1955 pattern—actual achievements exceeding forecasts as the year advances.

AGRICULTURE

Sugarcane Cultivation in India: Sugarcane yield in blocks brought under intensive development is 23.8 tons per acre as compared to an average of 13.9 tons per acre in the entire area of 39.32 lakh acres under the cane in the country. The increase in per acre yield relates to 6.25 lakh acres taken up under intensive cultivation. Bombay registered the highest acre yield of 42.1 tons in 1953-54 in intensive cultivation blocks. U.P. and Bihar which together constitute the major sugar producing areas in the country had the per acre yields at 18.9 tons and 18.4 tons respectively in 1954-55 in the intensive cultivation blocks. The Government of India had now directed the State Governments to bring the maximum of the remaining area of 33 lakh acres under intensive cultivation scheme.

Control of Cane Insect Pests: About Rs. 20 lakhs worth of schemes for the control of sugarcane insect pests at regional centres in the various cane-producing States were sanctioned by the Indian Central Sugarcane Committee which met here recently under the presidency of Shri T. C. Puri, Joint Secretary, Union Ministry of Food and Agriculture. The Committee approved of cane development schemes in Madhya Pradesh, Assam and Mysore under the second Five-Year Plan and proposals for soil survey in Bombay, Mysore and Hyderabad. The Committee also sanctioned an all-India scheme for "studies of physical and chemical criteria of 'gur' leading to the formulation of a basis of gur grades" for two years at the Indian Institute of Sugarcane Research, Lucknow, schemes for research in the manufacture and storage of gur in Madhya Bharat, Assam, Mysore, Hyderabad and Andhra.

INDUSTRY

Standard for Electrical Steel Sheets: The Indian Standards Institution has published an Indian standard specification for electrical steel sheets. This standard covers the requirements for electrical steel sheets of four grades intended for use in the manufacture of fans, motors, dynamos, transformers and similar other electrical equipment. The Standard specifies maximum specific core losses of electrical steel sheets and prescribes standard sizes for different grades of such sheets. It also includes the inspection and testing facilities required to be afforded by the manufacturer to the purchaser. Methods of tests for determining the requirements of steel sheets used for electrical purposes in respect of specific core loss, permeability, space factor, surface quality or lamination, brittleness, and ageing have been laid down in a separate Indian standard.

Cotton Reinforcing Tape for Aircraft: An Indian standard specification for cotton reinforcing tape for aircraft has been published by the Indian Standards Institution. This standard prescribes the quality of yarn intended for use in the manufacture of tape, weave, and other details of manufacture. It also prescribes the specific requirements such as ends in full width and picks per inch, width, length, weight per linear yard, breaking strength, scouring loss, and chemical neutrality. In the seven appendices to this standard are included methods of test for the determination of the following characteristics of the tape: ends in full width and picks per inch, width of tape, length of roll, weight per linear yard, breaking

strength, scouring loss, and chemical neutrality. Details of the length of tape in a roll and the method of marking rolls have also been given in the standard.

U.K.'s Steel Production: United Kingdom steel production in February was the highest achieved in any month. Reaching a weekly rate of 417,000 tons, the February output surpassed by 9,200 tons the previous highest figure, achieved last November. The year's production estimates have been revised as a result of the achievements in February. Announcing this in London, the Iron and Steel Board states that it should be possible to produce about 1,500,000 tons more crude steel this year than in 1955. This forecast raises the current year's production estimate to about 21,300,000 tons. The annual rate has gone up from 19,860,000 tons in December 1955 to 21,069,000 tons in January 1956 with a further leap of 655,000 tons to reach the February estimate of 21,724,000 tons. Pig-iron production in February was also at the highest rate for any month.

Penicillin Factory's Production: The State-owned Penicillin factory at Pimpri, near Poona, which has been gradually stepping up its output, has now exceeded the target rate of production. The factory produced 889,000 mega units of penicillin last month giving an average of 10.7 million mega units per year, well above the target of 9.0 million mega units per year envisaged when the factory was planned. The factory, which is the first of its kind in India, began trial production in March last year with an output of nearly 67,000 mega units for the first month. Regular production began in August 1955 when the production stood at nearly 480,000 mega units. Till the end of February 1956, the factory's total production was nearly 5.6 million mega units of penicillin. This is well above the target of 4.8 million mega units fixed under the first Five-Year Plan.

Drilling Rig for Oil Prospecting: An agreement for the purchase of a drilling rig and the training of technicians to operate it at a cost of Rs. 45½ lakhs, has been signed between the Governments of India and Rumania. The agreement also includes the import from Rumania of tools, accessories, and spares for one years working of the rig which has 10,000 feet capacity. The Rumanian Government, according to the agreement, will erect the drill at the operation site free of cost but will charge for the services of 22 technicians that will operate the drill and for the training of Indian personnel for a period of six months. Satisfactory performance of the drilling rig tools and accessories for a period of 12 months have also been guaranteed under the agreement. The drill will be used in Jwalamukhi area in the Punjab.

TRADE

Validity of Import Licences Extended: The Government of India, according to a Public Notice published in the Gazette of India, have decided that all import licences, the validity of which expired during the recent dock strike in Australia, will be automatically extended to cover shipments up to April 15, 1956. This concession will be applicable to import licences which, after taking into account the 15 days' grace period, expired on February 15, 1956, or thereafter. A dock strike was recently reported in Australia from January 22 to February 15. As a result, there have been cases of delays of shipment. No formal revalidation of the licences will be necessary. The customs authorities will allow clearance of goods against

the import licences provided the importers produce a certificate from their foreign suppliers/shippers to the effect that the goods in question would have been shipped during the period of original validity of the licence, but for the strike. No further extension of the validity will be allowed.

Indo-Yugoslav Trade Doubled: According to Yugoslav economic review 'Ekonomika Politika' trade between Yugoslavia and India in the first two months of 1956 was double the value of the whole of last year's exchange of goods. Business contracts for the export of Yugoslav iron and steel products concluded for January and February of this year amounted to \$1 million, while the value of last year's total trade turnover was only \$520,000. This, 'Ekonomika Politika' said, was an encouraging element for the economic talks between Yugoslavia and India which are to open in New Delhi shortly. The question of revision and renewal of the trade agreement of July, 1953, will be examined, and the possibilities of establishing technical co-operation and conditions for the conclusion of commercial arrangements will be discussed. Shipping and transport questions are also to be dealt with.

India's Trade Arrangement with Finland: Letters were exchanged in New Delhi recently between the representatives of the Government of India and the Government of Finland extending the validity of the Trade Arrangement between the two countries up to December 31, 1956. An opportunity was also taken to review the development of trade between the two countries. Imports into India from Finland amounted to Rs. 1.88 crores, Rs. 2.14 crores and Rs. 1.8 crores during the year 1953-54, 1954-55 and 1955-56 (April-December 1955) respectively. India's exports to Finland during the same period totalled Rs. 13 lakhs, Rs. 18 lakhs and Rs. 38 lakhs, respectively. The important items in the list of exports from India to Finland are tobacco, hides and skins, cashewnuts, spices, jute goods, tea, coffee, shellac, coir yarn and manufactures, fibres for brushes and brooms, myrobolans and extracts, handicrafts and cottage industry products, cotton textiles, coal and iron ore. Among the chief items available for export from Finland to India are tea chests, mechanical and chemical wood pulp, newsprint, various kinds of papers and paper products, boards, stationery, household and sanitary porcelain, steel files, machinery for farming, woodworking, plywood, road making etc. and electrical and tele-communication cables. The Trade Arrangement was signed on January 12, 1951, and was extended from time to time. It was extended in April 1954 and was valid up to December 31, 1955.

FINANCE

Aid for Road Development: Sums totalling Rs. 12,02,500 have been sanctioned by Government of India for road development works in Bihar, Kutch, Tripura and Uttar Pradesh. Of this a sum of Rs. 14,64,100 is for laying tar-carpet on the first 18 miles of the Agartala-Assam road and Rs. 3,000 for survey operations relating to the Melaghar-Kakraban portion of the Melaghar-Udaipur road. A sum of Rs. 1,63,400 has been provided for the construction of minor bridges between 18 miles on the Talwana-Pragpur road in Kutch. Of the expenditure of Rs. 1,26,100 approved for the construction of five minor bridges between miles 18 and 33 of the Pithoragarh-Askot road in the Almora district of Uttar Pradesh, Government of India's share will be Rs. 1,18,600. The rest is to be met from the State's allocations from the Central Road Fund. Technical approval has been given for improvements to Buxar railway station—Ramrekha-ghat road in Bihar (reconstruction of the canal bridge) at an estimated cost of Rs. 45,200. Government of India's share of this expenditure will be to the extent of Rs. 45,400.

Loans by Rehabilitation Finance Administration: Up to the end of January 1956, the Rehabilitation Finance Administration had disbursed about Rs. 997.17 lakhs by way of loans to displaced persons. Of this amount Rs. 704.14 lakhs were given to displaced persons from West Pakistan and Rs. 293.03 lakhs to those from East Pakistan. The total amount of loans sanctioned by the Administration up to February 29, 1956, was Rs. 1262.67 lakhs. An amount of Rs. 64.54 lakhs was granted on 4,787 fresh applications from East Pakistan displaced persons.

Aid for Village Oil Industry: Further development aid, consisting of grants and loans, has been sanctioned to the village oil industry by the Government of India. Madras has been given a grant of Rs. 1,37,400 and a loan of Rs. 30,000. A loan of Rs. 40,000 and a grant of Rs. 78,000 have been sanctioned to Delhi. Madhya Pradesh has been given a grant of Rs. 24,290. For the development of the gur and khandsari industry, the Centre has sanctioned a further loan of Rs. 22,500 and grants totalling Rs. 62,400. The loan has been given to Bombay for introducing improved appliances required for manufacturing gur and khandsari. Out of the grants, Uttar Pradesh gets Rs. 30,000 and Punjab Rs. 12,000. Smaller grants have been sanctioned to Bihar, Hyderabad, Andhra, Madras, West Bengal, Orissa, Madhya Pradesh, Assam and Mysore. Besides this the All-India Khadi and Village Industries Board has been sanctioned an additional expenditure of Rs. 13,300 on contingencies for the implementation of the palm gur scheme.

GENERAL

Centre for Research in Basic Education: The Government of India have set up recently a National Centre for Research in Basic Education. The Centre will deal, among other things, with research from an all India point of view in the field of Basic Education, curriculum construction, correlation and other problems of teaching methods, research in crafts, improvement of crafts equipment and materials, production of literature for children and teachers including guide books for teachers, crafts for Basic Schools in urban areas, optimum time which may be allotted in the curriculum to various crafts and factories involved in reconstituting schools in the Basic pattern. It will also undertake the training of basic education workers at the higher level, i.e., inspectors, administrators and supervisors, and to associate itself in various ways with the work of the existing Basic Training Institutions.

Special Scheme for Educated Unemployed: The Study Group on Educated Unemployed has recommended special schemes which are likely to provide employment to 2.4 lakhs of educated persons. The corresponding investment required would be of the order of Rs. 130 crores. The Planning Commission had asked the Study Group to work out details of pilot projects for which financial provision has been made. If pilot projects are successful, the question of adequate allocations for special schemes will be considered.

Tubewell Programme in Second Plan Period: During the second Plan period it was proposed to construct 3,755 irrigation tubewells at an estimated cost of about Rs. 24 crores in the State of Punjab, Pepsu, Uttar Pradesh, Bombay, Bihar (Aurangabad-Bhabua), Madras, Andhra, West Bengal, Orissa, Madhya Pradesh, Saurashtra, Rajasthan, Assam and Madhya Bharat. The construction of tubewells in areas other than Punjab, Pepsu, Uttar Pradesh and Bombay (North Gujarat) would, however, depend upon the results of the Exploratory Tubewells Programme of the Government of India for these areas.

NEWS IN BRIEF

INDIAN

India and United States signed recently an agreement for the sale of 21 tons of heavy water to India as part of a broader programme of co-operation in peaceful uses of atomic energy in which the two nations are engaged.

The Government of India have decided to extend for a further period, up to the 30th September, 1956, the existing arrangements for payment to displaced central and provincial government pensioners of advances of pensions pending the transfer of their pensions from Pakistan.

It is reported a sum of Rs. 1,223.42 lakhs had been spent on the first Five-Year Plan in Kashmir.

A proposal to create a Directorate-General of Tourism is under the consideration of the Government of India, according to a review of the activities of the Ministry of Transport for 1955-56.

It is reported Rs. 5 crores had been provided for loans to State Governments for subscribing to the share capital of the co-operative sugar factories. The Industrial Finance Corporation of India was also given a loan at the rate of Rs. 35 to Rs. 45 lakhs per factory on the joint guarantee of the State and Union Governments.

With a view to stimulating agricultural research in the country, the Indian Council of Agricultural Research has decided to award fellowships in agronomy, horticulture, agricultural economics, agricultural botany, agricultural entomology, mycology and plant pathology, social science, agricultural chemistry, dairying, animal husbandry and agricultural statistics.

Indian shipping companies placed orders abroad for the construction of 17 ships of a total of about 110,000 G.R.T., during the first Five-Year Plan period. Of these five ships of a total of 33,500 G.R.T. have already been delivered.

The Government of India have, up to January, 1956, sanctioned about Rs. 21.28 crores as loans to various States under the Low-Income-Group Housing Scheme.

During 1955, 58,236 persons were trained by the National Volunteer Force at 127 training camps, each of 30 days' duration.

It is reported about 20 million general lighting service lamps are manufactured in India every year.

Schemes costing Rs. 360.80 lakhs for Cochin Harbour and Rs. 7 lakhs for Alleppey Port have been drawn up for inclusion in the second Five-Year Plan.

The Employees' State Insurance Scheme is now in force in about 30 industrial areas and covers nearly one million workers.

Wheat imports into India declined from 3,617 lakh tons in 1951-52 to about 326 lakh tons in 1955-56.

It is reported about 14.5 million razor blades are produced in India every month.

It is proposed to train 5,000 Gram Sevikas during the second Five-Year Plan period.

FOREIGN

A trade and payments agreement between Ceylon and the Rumanian Peoples Republic was signed recently in Colombo.

The non-Communist world produced 2,614,000 thousand long tons of primary copper last year compared with an estimate of 355,000 tons by Russia and her allies.

An International Convention—the first of its kind—is being held in conjunction with the Mechanical Handling Exhibition—at Earls Court, London, 9-19 May, 1956. Speakers from all over the world will be there to discuss the latest labour-aiding equipment, and its application to their own industries.

Thirty-eight million three hundred thousand children and mothers are expected to benefit from UNICEF-aided activities in 1956—a rise of more than 18 per cent over 1955.

An all-time high in the flying of freight between the United States and Europe was achieved by Pan American World Airways in 1956, when it carried almost 7,000,000 pounds over the Atlantic.

More than 6,000 airplane seats on 100 flights a week will be available to trans-Atlantic holiday-seekers this summer on Trans World Airlines Constellation flights between European and United States terminals.

It is reported an Anglo-German economic Committee, has been set up to discuss economic matters, of mutual interest to the two countries.

Taxation relief equivalent to Rs. 5.7 million (£430,000) was provided in the Pakistan Budget. Total revenue was put at Rs. 1,310.2 million (£98.3 million) and expenditure at Rs. 1,304.4 million. The import duty on British drugs was cut by 7½ per cent. Income-tax relief was also provided.

France, like Britain, is to revise its cost of living index. The present one, drawn up in 1949, and comprising 213 articles, is considered out of date.

A West German trade delegation and the Government of Uruguay have agreed to settle the payments between the two countries on a multilateral basis. Other European countries, especially, the members of the multilateral payments system with Brazil, are expected to conclude similar agreements with Uruguay.

Gross operating revenues of the British Columbia Power Corporation rose 7.1 per cent to \$63.4 million in 1955, while operating expenses were 3.3 per cent higher at \$48.8 million leaving operating income of \$14.65 million against \$12.03 million.

A new road from the border of France along the Italian Riviera to Genoa is being completed over the old route carved by the Romans between the Maritime Alps and the Mediterranean, according to Pan American World Airways.

The world's first long-range propeller-jet air service will be started in July when B.O.A.C. introduces the giant Bristol Britannia on the route between London and Johannesburg.

CANADIAN KNOW-HOW — serving a vital Indian industry

INDIA'S fast-growing aluminium industry owes much to the know-how and experience of Canadian experts.

Indian Aluminium Company's Canadian consultants are helping to erect a new smelter at Hirakud in Orissa which will more than double the country's total production and embody techniques and advances resulting from continuous world-wide research.

A lot of money, too, will be required to construct this smelter, and part of the funds will be raised by a proposed issue of new capital by the Company.

NON-FERROUS SHEET ROLLING INDUSTRY

THE Indian non-ferrous sheet rolling industry which is in the grip of a crisis for the last few years had to face acute conditions in 1955. The root of its troubles goes much deeper than what appears on a superficial analysis of its problems and it would be obvious that stability can be secured only by long-term remedies. The pre-war demand for copper and brass sheets ranged in the neighbourhood of 30,000 tons of which indigenous production accounted for about one-third. The war-time spurt in demand led to an estimation of the post-war requirements to be of the order of 40,000 tons. This expectation of the Panel on Non-ferrous Metals Industries was not realised.

If it would be wrong to judge the assumptions made by the Panel in the light of subsequent experience, it is difficult to overlook the optimism engendered by it. The industry also needs to share part of the responsibility for some impatience shown in planning for expansion. Production capacity was raised from the pre-war figure of 10,000 tons to 45,000 tons in 1950 and to 54,000 tons in 1954 which represents the current level. As against this increase, output of large mills rose from 9,000 tons in the pre-war to 14,250 tons in 1955 and it is some relief that no imports are now made of commercial brass and copper sheets. But the grave effects of miscalculation in planning are quite apparent. About 75 per cent of the installed capacity remains idle and in the meantime depreciation and overheads are running at a high rate. The fair production cost estimated by the Tariff Board at Rs. 35 per ton for both types of sheets ten years ago has become out of date and needs to be revised.

The industry's present hard condition was recounted at the recent annual session of the Western India Sheet Rollers' Association by its President, Dr. C. A. Mehta. Basically the industry has been deprived of a balanced cost structure by the excessive disparity between production and installed capacity. The financial troubles in the recent past, however, have been aggravated by factors chief among which are that there is a critical shortage of raw materials, a steep rise in the price of copper and a fall in the demand for brass and copper sheets. The price of copper surpassed the previous peak of £307 per ton in 1954 and reached a new high of £404 per ton last year. The manufacturing margin, representing the gap between the cost of the metal and the price of sheets, which stood at Rs. 30 per cwt. in 1954 was halved on an average for the last year and touched even lower points. Raw material prices and the nature of the domestic demand explain the predicament of the Indian industry. The Association's President has stated that manufacturers in most of the Western countries enjoy the benefit of home supplies of copper at attractive prices generally £40 to £50 per ton below world prices, while Indian producers are offered imported as well as domestic supplies by ICC at prices related to the quotations on the London Metal Exchange, which are subject to frequent fluctuations,

sometimes of large magnitudes. The element of higher cost is difficult to be shifted to the consumer by reason of the elasticity of demand in this country.

The current difficulties of the industry present a tough problem, but in the light of the assured long-term prospect for its expansion imaginative action is needed by producers as well as by the Government. There can be no doubt about a rapid and continuous increase in the demand for cold rolled sheets for industrial use in the coming years. Indigenous manufacturers are aware of the need to divert the direction of output to industrial sheets on an increasing scale and have shown readiness to install additional equipment. It is only proper that no licences for new units to manufacture sheets and strips ought to be issued so long as existing units are prepared to cater to the rising demand. But fundamentally, the pressing problem of this industry is to obtain stable supplies of materials on a stable basis at reasonable prices. The Association has urged that the projected All-India Metals Board should now be set up without long delay. The main relief which it should be the Board's first objective to secure for the industry must be steady supplies by means of long-period contracts at reasonable prices. This would involve regulation of the direction of imports.

One grievance ventilated on behalf of the industry pertains to the levy of an import duty of 25 per cent on aluminium scrap. This is in reality a measure of protection to the home aluminium industry. The gravamen of the charge levelled against this policy on behalf of the non-ferrous sheet rolling industry is that while the duty has raised the price, between September 1955 and March 1956, of aluminium sheet scrap by As. 4 per lb., the price of indigenous aluminium ingots has gone up by As. 2 per lb. and even then home producers are not in a position to supply aluminium ingots to this industry in adequate quantities. The issue viewed in its entirety is complicated. On the one hand, Government is understandably anxious to meet the claim of the aluminium industry for assistance. On the other, the non-ferrous sheet rolling industry wants relief against hardship resulting from the levy. It is pointed out by the latter that its idle capacity can be absorbed in the production of aluminium sheet rolling by making suitable modifications necessary for the conversion. One inducement essential for this measure of rationalisation should be cheap supply of aluminium scrap. It is stated that indigenous ingots can be used for other purposes. In the context of this situation, a practical way out seems to be to investigate the feasibility of a revision of the rate of duty since total withdrawal represents one side of the picture. It is claimed for the industry that removal of the ban on export of copper sheets would enable it to explore the foreign market and reduce under-utilisation of capacity. Here, issue of ad hoc export licences may prove helpful in assessing the prospect for an export market without detriment to adequate supplies at home.

SUGAR INDUSTRY IN THE DECCAN

By

CROESUS

SUGAR interests in Bombay, representing the Deccan sugar factories, have greeted the proceedings of the twenty-third annual meeting of the Indian Sugar Mills' Association, held in Delhi last Saturday, with mixed

feelings. They are both concerned and gratified. Their concern is primarily because of the ominous reference that Mr. A. P. Jain, the Food and Agriculture Minister made—whilst inaugurating the meeting—to the Gov-

ernment still having under examination the question of a ceiling on sugarcane farms run by factories. For practically every factory in the Deccan has its own cane farm. A few of the factories like Belapur and Walchandnagar have to their credit a record of achievement in scientific sugarcane breeding and cultivation that some State-run farms cannot yet boast of. This is because the managements of the Deccan factories believe and always stress the fact—and rightly so—that “sugar is made on the farm”. Now, all this improvement has been possible because of the scope for experiments and research work that exists in the large farms of these factories. It is worth emphasising here that the results of these experiments and researches are freely extended by these factories to sugar cane cultivators near and around their factories, even if uncharitable critics may choose to attribute motives for this and say that this is done purely out of selfish considerations, inasmuch as the factories also buy sugarcane from these cultivators for use in their factories. Even so, the fact cannot be challenged that the cane cultivator benefits by reason of the relatively higher price that his cane yields, thanks to the improvement in its quality rendered possible by the good work of the factory farms. If the Government is under the impression—as it seems to be—that, by putting a ceiling on the cane farms of sugar factories, it can let cultivators have additional acres of their own under cane, thereby forcing the factories to purchase more outside cane at prices dictated by outside cultivators invariably at the instance of political agitators who have no stake of their own to lose either in the factories or in the land of the cultivators, it is bound to be disillusioned. Not only that, it will also lay itself open to the risk of two dangers: first, of a deterioration in the quality of the cane and, secondly, of a possible decline in the output of cane (unlike the factory farms, for, the cultivator will raise cane only when it suits him and the cane prices, vis-a-vis those of other crops, are high enough). In either case, there is the danger of the target for sugar under the second Five-Year Plan not being achieved.

The Deccan sugar interests have also some reason to be gratified because of the adoption, by the meeting, of the resolution on licensing of new units. As reported in the daily Press, the resolution, which was, appropriately enough, moved by Mr. K. K. Birla and seconded by Mr. R. P. Nevatia, (in that these cannot be accused of having brought forward a resolution out of any selfish interests inasmuch as they are not interested in any sugar factories in the Deccan) referred to the licensing of new units and, while recognising the need for sanctioning new units, recommended that due care should be exercised so that no indiscriminate and unplanned expansion was effected. That this apprehended eventuality has already begun to manifest itself will be evident from the experience of more than one Deccan sugar factory. Interested parties with the help of highly placed politicians are believed to have taken advantage of the encouragement and facilities and to have persuaded their henchmen to start sugar co-operatives and that in the dangerous vicinity of existing sugar factories. This move has led to several anomalies, such as, for instance, the diversion of cane supplies from the existing factories to the newly licensed co-operatives making it incumbent on these factories to go sometimes beyond a radius of even 5-10 miles to be assured of cane supplies. Where is the sense in, or justification for, planting a sugar co-operative so near an existing sugar factory as to deprive the latter of its present and near-at-hand source of cane supply to favour the former? Would it not have been saner, and also more economical from a national point of view, to insist on the newly licensed sugar co-operative locating itself somewhere beyond a given radius from an already existing sugar factory area. By the discriminate licensing of a sugar co-operative and the locating

of it in the wrong place, the licensing authorities can only achieve one thing, namely, to make the sugar of the adversely affected factory more costly to its consumers because of the increased cane transportation costs imposed on it wittingly or unwittingly. It is alleged that, in one instance, an earlier sensible decision, recommended by a committee specially appointed for the purpose, was reversed to please a political high-up!

Be that as it may, in moving the resolution, Mr. K. K. Birla pointed out that, by the end of the second Five-Year Plan, the target of sugar production would be exceeded by about five lakh tons merely “by carrying out the expansion plans” of the existing factories. Although Mr. Jain did not seem to think the licensing of new units would lead to no more than an increase in sugar production from 17 lakh tons this year to 25 lakh tons by the end of the second Plan period, he might have been sporting enough to accept the reasonable suggestion of the I.S.M.A. to “reassess the present overall capacity of the sugar industry along with future possibilities of its expansion”, before licensing new units—in particular co-operatives—in haste now and repenting for it in leisure later on. Repentance is all right in so far as it goes, but one must not forget that no amount of repentance can adequately compensate the taxpayer for the loss that a wrong decision entails.

BUSINESS NOTES

PRIVATE SECTOR—AN OBJECTIVE ATTITUDE

THE SIMPLE philosophy behind the role of the private sector in the economy is unfolded in a new persuasive but convincing manner in the following extracts from the speech of Mr. J. F. Sinclair, incoming President, Bombay Chamber of Commerce at the Chamber's last annual meeting:

We are continually being told, and indeed it is obvious, that the fulfilment of this second Plan is going to strain the country's resources to the utmost, its resources of human skill as well as its financial resources. Would it not then be sensible to use to the greatest practicable extent those who have spent their whole lives doing exactly what we are told, and ourselves know, must be done at the highest possible pressure, if the race to economic and social prosperity is to be won. For, after all, what is it that the business man has spent his life learning to do better, he hopes, than the next man? It is, I suggest, simply to plan a project, whether it be a factory, a distribution system or a sale, with the utmost care, precision, speed and economy and, having planned it, to push it through with all the energy, tenacity and accumulated special skills he can organise for the purpose.

It all sounds simple enough, but I believe it is worth emphasising that these qualities and painfully learnt skills are not to be picked from a mango tree; they are very, very valuable commodities, in short supply, and I would say with all the earnestness I can command that to neglect them or suppress them at this critical hour is as criminal as to rob a bank.

We do not lay claim to high political administrative skill, we do not say that the Supreme Court or the High Courts would be more efficient instruments of justice if their benches were manned with business men, we would refuse an invitation to perform an intricate surgical operation on a friend, or even on an enemy. We are simple men, we respect and admire the special skills of others. All we ask is that our own special skills should be equally respected, and, if not admired, at least cherished and sympathetically directed to the attainment of our common objectives. Do we deserve the respect we claim? I would say firmly that we do. We have our weak sisters, our backsliding heifers, but so do all sections in all nations. What I would like to suggest, and I am not deterred by the piercing eye of our leading castigator of public and private morals, Mr. Gorwala, is that just as we are certainly in an era of staggering economic expansion, so also we may be at the beginning of an age of deepening social and civic consciousness which we can hope will permeate us all, politicians, bureaucrats, professional men, and naturally, business men.

The second Plan, somewhat nervously I thought, anticipates a possible private foreign investment, in the period, of Rs. 100 crores. Here, I think, the planners' imagination flagged for I am myself convinced that given a proper place for free enterprise, a minimum of encouragement, and a blunting of the sharper disincentives, our friends and associates overseas would consider it a privilege to be allowed to assist, to a far more substantial extent, on terms honourable and rewarding to both sides, in the vast and stimulating task that lies before us all.

THE BANK RATE

AN IMPORTANT issue which has raised some controversy in the Indian banking world has been discussed at adequate length by Mr. G. D. Birla in his presidential speech at the last annual general meeting of the United Commercial Bank. Mr. Birla has expressed himself in

emphatic terms that no change is called for in the Bank Rate in India at the present time. Those who plead for an increase in the rate point out to two indicators as urging such a change. They are the rise in the rates for deposits in this country and the steep increase in the rate of the Bank of England. The Chairman has no hesitation in considering as unconvincing the suggestion for the increase in the Indian bank rate on account of the trends in deposit rates. He has stressed that the interest rates quoted in the money market have not been integrated with the official rate and further the prevailing money rates in the bazar have not much real relation to the official rate.

Economic conditions in India at the present time are quite different from those in the United Kingdom, and no analogy need be drawn between the bank rates in the two countries. In India planning for increased production, a higher rate of national income and a larger measure of employment are the characteristics of the economic scene and the progress of the first Five-Year Plan has amply demonstrated that increased money supply has on the whole been matched by increased production. The impact of the increase in the Bank of England rate will be that Indian resources will have to take greater care of the finances required for the country's foreign trade. But the tempo of the resources to expand is a pointer that no serious fears need be entertained about their inadequacy for this task. The Bill Market scheme now offers a sufficient safety-valve for the seasonal expansion of credit and the recent rise of 4 per cent in the rate on advances under the scheme is in no sense to be interpreted as a policy for dearer money. It is actuated by different reasons. In the sphere of imports, however, the pressure for resources will be transferred in a full measure on the Indian money market, but expanding economic activity should be expected to provide a cushion for it. An increase in the Indian Bank Rate will be dictated only by the pressure of inflation or by a general scramble for deposits culminating in acute competition in rates of a runaway nature. Mr. Birla has confidence that appropriate action will be taken when such an emergency arises, but not before.

FORWARD TRADING IN PEPPER

ALTHOUGH BOMBAY pepper interests may feel disappointed at the selection of Cochin as the location for a futures market in pepper, there is no gainsaying the fact that from an overall point of view, it is a happy choice. For the production of pepper in India is practically concentrated in Kerala and the adjoining South Kanara district. Dealers and exporters of pepper of the southern region participate in futures trading as one of the regular mechanisms of trade, and such trading has been actively conducted in the past, though not with unqualified success. However, Cochin has four special advantages. First, pepper is essentially an export commodity and 72 per cent of the total shipments to foreign countries is made from Cochin; secondly, almost all the important non-Cochin pepper exporters (those of Alleppey and Bombay) have their offices at Cochin; thirdly, the offices of the Deputy Chief Controller of Exports and the Export Promotion Council for Pepper and Cashewnuts are located there and, finally, Cochin is a major port and affords facilities for quicker transport of the commodity all the year round.

India has been recognised as the original home of pepper. She had a flourishing export trade in pepper till the beginning of the nineteenth century, when large-scale production of this commodity was undertaken by Indonesia, Sarawak and Indo-China. Slowly and steadily, these countries captured the export trade from India and between 1800 and 1941, accounted for 80 per

cent of the world production and 98 per cent of the world trade. With the overrunning and occupation of these countries by Japan, India again became the sole supplier of pepper to the world until 1952, when, following the defeat of Japan, Indonesia and Sarawak re-entered the market. Production in these countries has been on the increase ever since, and India is now contributing only about 40 per cent to world output.

During the pre-war years, pepper did not figure as a major item in India's export trade. During and since the war, however, there has been a steady increase in pepper exports with an all-time peak of 16,600 tons in 1947-48. The Korean stockpiling helped sustain the trend in 1950, 1951 and 1952, after which there was a slight fall. In spite of severe competition from Indonesia and Sarawak, India succeeded in maintaining her exports at 13,700 tons in 1954-55. More than 60 per cent of our pepper shipments go to the USA, the other important buyers being the USSR, Canada and the UK. The value of pepper exports advanced from Rs. 3 lakhs in 1938-39 to Rs. 23 crores in 1951-52, nearly two-thirds of which was earned in dollars. Due to the fall in price, the value of exports declined subsequently to Rs. 16 crores in 1952-53 and to Rs. 6.9 crores in 1954-55.

It may be remembered that the Spices Enquiry Committee had recommended official regulation of trading in pepper, it being a commodity which lends itself easily to a good deal of speculation. The exporters have also urged the establishment of a well-organised futures market. In the absence of such a market, shippers do not find it possible to cover their export risks and have perforce to limit their forward deals. The resumption of a futures market will also help the wholesalers, who act as intermediaries between the growers and the exporters. A regulated market will, above all, discourage illegal trading, which is reported to be rampant under the guise of non-transferable specific delivery contracts.

THE CENTRAL BANK OF INDIA

THE CENTRAL BANK'S working results during 1955 show a substantial improvement in earnings which is in keeping with the general tenor. To mention some of the outstanding features, advances registered an increase of Rs. 12 crores and reached the figure of Rs. 72.20 crores at the year-end. Earnings by way of interest and discount went up appreciably, but of much greater importance was the more concrete improvement in commission, exchange and brokerage. This was due to the expanded exchange business and an appreciable part came from the devaluation of the Pakistani rupee. On the deposit side, the increase recorded was of the extent of Rs. 4.60 crores to Rs. 128.66 crores. It could have been higher but for the fact that the Board of Directors adhered to a bold policy of refusing to join the scramble for deposits at a high cost. In spite of higher earnings, and here again the general trend is confirmed, the net profit of the Bank did not rise correspondingly. It was maintained at the previous year's level. This was due to a steep increase of Rs. 23 lakhs in establishment charges which shot up to Rs. 2.60 crores. The ratio of establishment charges to total expenses last year jumped to 32 per cent. There is welcome assurance from the Board that every possible measure will be adopted to secure improvement through efficiency.

Sir Homi Mody's presidential address before the Bank's last annual meeting draws attention to an aspect of the second Five-Year Plan which is apt to be overlooked in the enthusiasm for the achievement of the socialist pattern of society. Sir Homi has pointed out that while the shares of the public sector and the private sector in investment in the first Plan were equally distributed, the second Plan makes a lop-sided allocation of 62 per cent and 38 per cent respectively. He regrets, and with perfectly sound reason, that the

rich and tried experience of the private sector in business management is not being utilised in the national endeavour to the full extent of its potentialities. On the other hand, it is to be seriously doubted whether the enormous burden on administrative and managerial abilities of the public sector has not been severely under-estimated.

FREEZING OF MILL CLOTH PRODUCTION

THOSE WHO are entitled to speak with clear objectivity and authority on the subject have uttered a word of grave caution against the contemplated policy of the second Five-Year Plan to freeze mill cloth production at the present level of 5,000 million yards. Actually the output in 1955 was a little higher by 94 million yards above this figure. Mr. R. E. Castell, Chairman of the Buckingham and Carnatic Co., Ltd., has lent his weight to this small band of experts. He challenges the adequacy of the assumed per capita consumption of cloth at 16 yards and emphasises that higher money incomes cannot fail to make their impact upon a basic item of consumption like cloth.

Apart from this under-estimate, he points out that the allocation of 3,200 million yards to handloom-cum-powerloom production in a total of 8,200 million yards can be regarded as practicable only with an extreme degree of credulity. This target represents a hundred per cent increase in the handloom-cum-powerloom sector. Even when given the incentives and encouragement to the extent that the Government can, the organisational and distributive problems will be certainly unmanageable for the present structure of this sector. Consequent shortage of cloth and an inflationary rise in prices threaten to be real risks in this planning. Mr. Castell points out from the war-time experience that an eleventh-hour effort to increase production by resort to the third shift in the mills will not be feasible as it appears on a superficial consideration. Machinery, labour and quality all suffer in the third shift working. A realistic policy must take cognizance of probable cloth shortage and it must also realize that expansion can hardly be planned and achieved promptly at short notice.

POLYCHEM, LIMITED

POLYCHEM, LIMITED, who were incorporated as a company on the 24th October, 1955, are approaching the capital market for subscriptions to their issue of share capital. As the name indicates sufficiently, the principal object of the company is to carry on the business of manufacturers and dealers in chemical products of any description and also to carry on the business in the same capacities in styrene, polystyrene and other goods. The authorised capital of the company is Rs. 1.50 crores divided as follows: (1) 80,000 Redeemable 7½ per cent (taxable) Cumulative First Preference Shares of Rs. 50 each. (2) 80,000 Ordinary Shares of Rs. 50 each and (3) 1,40,000 unclassified Shares of Rs. 50 each. The issued capital will be Rs. 80 lakhs divided into: 80,000 Redeemable 7½ per cent (taxable) Cumulative First Preference Shares of Rs. 50 each of the total value of Rs. 40 lakhs and 80,000 Ordinary Shares of Rs. 50 each of the total value of Rs. 40 lakhs. Out of this issue, the promoters, Messrs. Kilachand Devchand & Company, Limited, the Directors of the Company and their friends including Dow Chemical Company of Midland in the State of Michigan, USA, have agreed to subscribe for ordinary shares of the nominal value of Rs. 20 lakhs which will be allotted to them. The balance of the issued capital consisting of preference shares of the value of Rs. 40 lakhs and ordinary shares of the value of Rs. 20 lakhs are offered to the public for subscription at par. The subscription list will remain open from 31st March, 1956 to 12th April, 1956 both days inclusive. It may be closed earlier but not before 6th April, 1956, at the discretion of the Directors.

Company Meeting

THE UNITED COMMERCIAL BANK LIMITED

Statement of Shri G. D. Birla, Chairman of The United Commercial Bank Ltd., circulated to the Shareholders at the Thirteenth Ordinary General Meeting of the Bank held on 28th March, 1956.

Gentlemen,

Before I proceed with the ordinary business of this Thirteenth Annual General Meeting of the bank, I should like to refer with great sorrow to the loss sustained by the bank in the premature death, in August 1955, of Mr. Navinchandra Mafatlal, who was a Director since its inception and had contributed greatly to its growth. He was a staunch friend of the bank and was held in the highest personal esteem by us all who miss his genial presence and wise guidance. The sorrow is tempered by the fact that his son has joined our Board and the connection of the bank with the House of Mafatlal will continue unbroken.

I have also to report to you the resignation from the Board, on his appointment as a Director of the State Bank of India, of Mr. R. G. Saraiya, who as a Vice-Chairman guided the affairs of the bank, particularly in Bombay, since its inception.

In the vacancies which had arisen in the Board the Directors have appointed Mr. Yogindra N. Mafatlal, Mr. G. D. Kothari and Mr. T. S. Rajam. I am glad to welcome them on your behalf and I am confident that the bank will benefit greatly by their wide experience in their respective spheres of industry and trade.

Reference has been made in the Directors' Report to the changes which took place last year in the general management of the bank. Mr. B. T. Thakur who was the General Manager of the bank since its inception resigned on grounds of health, from the chief executive charge of the bank in April 1955, and has gone on leave preparatory to retirement. I take advantage of this occasion to pay a tribute, on your behalf, to the ability and zeal with which he had served the bank during his period of office and built it up to its present position as one of the leading banks of the country, and to place on record our high appreciation of his valuable services.

Mr. S. T. Sadasivan has been appointed to succeed Mr. B. T. Thakur, as General Manager and I extend to him our good wishes for success during his period of office. Mr. Sadasivan was the Dy. General Manager of the bank since 1945 and has also acted as General Manager. I have every confidence that the progress of the bank will continue with great vigour under his zealous care and able guidance.

I also take this opportunity to thank the members of the staff in India and abroad for their devoted service to the bank and for their valuable contribution to the satisfactory results achieved during the past year.

I now turn to the ordinary business of the meeting. The Balance Sheet and the Profit and Loss Account have been in your hands for some time and they bear testimony to the continued improvement of the bank's business in the past year.

Bank's Business

DEPOSITS

You will notice that the total of the current, savings and fixed deposits and other accounts at the end of 1955 stood at Rs. 47.69 crores as compared with Rs. 40.42 crores at the end of 1954. The increase in deposits of Rs. 7.27 crores represents a rise of 17.9 per cent which is a much higher rate of increase than 7.1 per cent recorded in 1954 and is higher than the rise of 9.7 per cent in the deposits of scheduled banks as a whole. The rise in deposits, which is common to all banks, should be attributed to higher production and an expanding economy which are the results of successful implementation of the first Five-Year Plan.

CASH

Cash on hand, balances with banks and money at call and short notice accounted for Rs. 6.21 crores and represented 13.02 per cent of our total deposit liabilities.

INVESTMENTS

The investments of the bank in Government and other approved securities stood at Rs. 22.17 crores showing a rise of Rs. 5 crores as compared with the figure at the end of 1954. The bulk of the increase in deposits has thus gone into Government Securities. During the year, as a result of the nationalisation of the Imperial Bank of India, we received compensation for our holding of shares in the Imperial Bank of India in the form of Government Securities. We have, however, made a fresh investment of Rs. 23,93,200 in the shares of the Industrial Credit and Investment Corporation of India Ltd., which was incorporated in the beginning of last year with the assistance of the Government of India by way of interest free advance, for the purpose of carrying on the business of assisting industrial enterprises in the private sector of industry in India by providing finance in the form of long and medium term loans or equity participation and for sponsoring and underwriting new issues of shares and securities. The ratio of our investments to our deposits, after deducting the amounts borrowed thereagainst is 37.60 per cent as compared with 33.6 per cent at the end of 1954. Cash resources and unencumbered investments together amount in the aggregate to Rs. 24.14 crores, giving a liquidity ratio of 50.62 per cent to total deposits. The bank's investments are shown in the balance sheet, in accordance with our usual practice, at below the prevailing market rates.

BILLS

The amount of bills discounted and purchased has increased during the year from Rs. 8.57 crores to Rs. 9.74 crores. You will be gratified to note that this self-liquidating asset forms 20.42 per cent of the deposits of the bank.

LIQUIDITY RATIO

The total of our most liquid assets—cash on hand and with banks, money at call and short notice, unencumbered investments and bills—represents 71.04 per cent of our deposit liabilities. This is a very high liquidity ratio and enables us comfortably to expand credit during the busy season.

FOREIGN EXCHANGE BUSINESS

Our foreign exchange business continues to improve. It forms an important part of our banking operations and the turnover in this department has increased during the past year as a result of the rise in the value of the foreign trade of India and the neighbouring countries. We are constantly expanding the network of our foreign correspondents and overseas connections in order always to be ready to handle any business that might be offered to us.

ADVANCES

Our advances showed a moderate increase from Rs. 16.07 crores to Rs. 17.85 crores. This gives a ratio of 37.43 per cent to our deposits against 50.58 per cent for the banking system as a whole.

BANK'S PROPERTY ACCOUNT

The additions to the bank's property account during the year were Rs. 10.03 lakhs. This is due to the purchase of the premises of the Banque de L'Indochine at Pondicherry in connection with the acquisition of their business and to the construction of our own premises at Parliament Street, New Delhi. We hope shortly to commence the construction of the Head Office building at Calcutta at the site which we have acquired for this purpose at the corner of Brabourne Road and Royal Exchange Place Extension.

PROFIT AND LOSS ACCOUNT

Turning to the Profit and Loss Account you will notice with satisfaction that the profit for the year 1955 is Rs. 36.69 lakhs as compared with Rs. 31.06 lakhs for the year 1954. This satisfactory result has been achieved in spite of heavy increase in expenses and in interest paid on deposits. As stated in the Directors' Report the total profit including the sum of Rs. 1,08,724-8-9 brought forward from 1954 accounts is Rs. 37,77,761-2-0. Out of this amount the Directors have already transferred Rs. 8.50 lakhs to the Reserve Fund which now stands at Rs. 95 lakhs and have made a provision of Rs. 14 lakhs for taxation and Rs. 4 lakhs for bonus to staff, leaving a balance of Rs. 11,27,761-2-0. In view of the improved working results the Directors feel justified in recommending a slight increase in the dividend from 5 per cent paid last year to 5½ per cent per annum, free of income-tax.

THE BANK AWARD

Since we met last, the Bank Award Commission which was appointed by the Government of India to go further into the dispute between banks and their employees in the matter of salaries, dearness allowance etc., gave its decision which the Government of India accepted in toto. By its decision, the Commission restored with slight alterations the Award of the Labour Appellate Tribunal which the Government had previously modified. It also decided that no employee

should be asked to refund any excess paid to him under the then existing scheme over what he would be entitled to under its Award. In order to lighten the burden on banks imposed by the higher salaries and allowances recommended, the Award permitted banks to pay the employees any arrears that may be due to them in three instalments. Favourable to the employees as such recommendations were, the banks went further and waived their right to pay the arrears in three instalments and paid the entire amount due to each employee in one lump sum. The banks also waived their right to recover the excess dearness allowance paid during the period July to November 1955. Notwithstanding such generous concessions the employees were not satisfied, instead they carried on an agitation culminating in the refusal to work overtime for the purpose of the annual closing of accounts which was consequently delayed and also finally resorted to a two days' strike in January this year. It is extremely regrettable that they should adopt such an attitude and go on a strike which was clearly illegal. It is to be hoped that the employees will take the provisions of the Industrial Disputes (Banking Companies) Decision Act as final and devote themselves to strenuous and harmonious work in close co-operation with the management. Needless to say, such co-operation will naturally produce better working results for the bank which, in turn, will enable the management further to improve the conditions of service of the employees.

BANK RATE

The Bank Rate in India remained unchanged at 3½ per cent throughout the year 1955 though the Bank of England rate was raised from 3 to 3½ per cent on the 27th January, 1955 and again to 4½ per cent on the 24th February, 1955. Notwithstanding the fact that the year 1955 saw an upward revision of bank rates in varying degrees in different parts of the world, it is a matter of gratification that the bank rate in India remained unchanged and adequate finance could be secured by commerce and industry on the basis of 3½ per cent official bank rate. The increase in the Bank of England rate on the 16th February, 1956 from 4½ per cent to 5½ per cent has raised the question whether it will be necessary or desirable to effect any change in the Indian Bank rate.

On a superficial assessment of the situation it would appear that the Indian Bank rate is unrealistic in the light of the competition for deposits which has carried the deposit rate almost to the level of the official bank rate, but there has never been any integration with the official rate of the various interest rates quoted in the market and the money rates prevailing in the bazar have never had any relation to the official bank rate. The impact of the rise in the Bank of England rate has so far been confined to a rise in the deposit rate and a sporadic increase in the rate of interest charged by some banks on certain classes of advances but has had no significant influence otherwise.

The problems facing India are wholly different from those of the United Kingdom and the prevalence of unemployment and the existence of a steady level of prices which have characterised Indian economy are in sharp variance with overemployment and inflation which are the features of British economy. We are now engaged in bringing into fruition a planned economy which has for its objects increased production, increased national income, the provision of employment on a large scale and the maintenance of stable economic conditions. In the financial sphere the operation of the first Five-Year Plan has resulted in increased bank deposits, a larger note circulation and enhanced bank advances without any appreciable increase in commodity prices of the

cost of living. This was because increased money supply has been matched by increased production.

One result, however, of the rise in the Bank of England rate is that more and more of the foreign trade of India will have to be financed out of Indian resources. But these resources are expanding and the stage has not yet been reached when they may be said to be inadequate. The bill market scheme inaugurated by the Reserve Bank of India in 1952 is a sufficient guarantee that seasonal expansion of credit could be effected without a change in the bank rate, and the recent announcement of the Reserve Bank of India that advances under the scheme will be made at 3½ per cent interest instead of at 3 per cent as hitherto is not to be interpreted as a measure of dearer money. Moreover, the export trade is financed on the basis of the higher money rates prevailing in London through an adjustment of the exchange rates applicable to usance bills and in an emergency the bills could be rediscounted in the London market. It is only in the case of imports that the pressure for finance will be squarely transferred to the Indian money market but the expansion of resources resulting from the operation of the second Five-Year Plan appear to be adequate to take care of such increased responsibility as might devolve on the Indian money market.

It is necessary for the success of the borrowing programmes associated with the second Five-Year Plan that stable and healthy conditions should be maintained in the money and gilt-edged markets and the continuance of the Indian bank rate unchanged at its present level is a necessary condition for the fulfilment of our development plans. From this point of view it is regrettable that the authorities have allowed the price of 3 per cent Conversion Loan to go below Rs. 80. A little support to this loan will inspire confidence in the stability of the gilt-edged market.

The question of an upward revision of the bank rate will arise in the event of the spectre of inflation raising its head or the scramble for deposits developing to the extent of a run-away rise in deposit rate to a level higher than the bank rate. The authorities will, no doubt, keep a close watch on the situation and act without hesitation when the contingency arises.

Before proceeding to review the economic conditions in India, I shall briefly comment on the conditions prevailing in the countries where we have branches.

BURMA

At the beginning of the year, Burma was faced with the problem of rapidly dwindling balance in Foreign Exchange. As a corrective measure the Government imposed a 50 per cent moratorium on all outstanding import licences in March 1955, and this action was followed by the complete suspension of the Open General Licence. This had the inevitable repercussions on business and commerce. The prices of imported consumer goods such as textiles, toilet requisites, tinned provisions, etc., shot up to a very great extent. As a result of these corrective measures, the position improved somewhat in the latter part of the year and since then the Government has been issuing a few licences for import, mostly from countries like China, Hungary, Yugoslavia, and U.S.S.R. with whom agreements for payment on barter basis have been concluded. As a result of these and of severe restriction on private remittances, the shrinkage of foreign holdings of the Union Bank has been arrested and a moderate improvement has set in. The Government's policy in recent months has shown a tendency towards the scaling down

of capital expenditure which is not considered as wholly essential or immediately productive.

During the year the Government of India granted a loan of Rs. 20 crores to Burma to assist her in financing her development plans. The loan is repayable in half-yearly instalments of Rs. 2.5 crores beginning from March 1959. The rate of interest on the loan is 4 per cent.

The prospects of Burma's most important export crop — rice — seem to be bright this year. It is reported that out of an exportable surplus of about 1.5 million tons, agreements have been practically concluded for disposal of very nearly the entire quantity.

MALAYA

The total value of Malayan trade last year was ST\$7,977.1 million — a rise of 27.61 per cent over 1954. With imports at ST\$3,819.4 million and exports at ST\$4,157.7 million, the adverse balance of trade of 1954 was turned into a favourable balance of ST\$338.3 million. This improvement was largely due to better prices of tin and rubber. The exports of these commodities registered a rise of 8 per cent and 1 per cent respectively. Rubber production was highest since 1950 at 637,463 tons and the average price during the year was \$1.14 per lb. as against the average of 67 cents during the previous year. Tin production at 61,244 tons was in fact a post-war record and the average price during the year was ST\$365.50 per picul compared to the average of \$353.59 in the previous year. As a result of improved trade with Indonesia, the conditions in the textile market showed signs of improvement. On the whole the year 1955 can be considered as the second best year, the best so far being 1952.

The Colony of Singapore and the Federated States of Malaya had their first measure of self-Government when the General Elections were held. The general conditions in Malaya were still disturbed and the "Amnesty" proposals made by the Government were unsuccessful. There were also signs of industrial unrest resulting in a number of strikes in industrial organisations, rubber mills, transport etc.

The prospects for 1956 would be bright if the prices of Rubber and Tin are sustained even at their present levels.

HONG KONG

The industrial production of the Colony continued to rise and the number of registered factories as well as the number of workers employed showed an appreciable improvement over the previous year. This has enabled Hong Kong to stabilise her economic position and to a certain extent has made up for the loss of her trade with China after the Embargo. The Colony was able to compete with certain amount of success with the industrialised countries in finding markets for its industrial products in South-East Asia, U.K. and other British Colonies. The export of industrial products registered an increase of HK\$48 million—an increase of nearly 7 per cent over the last year's exports.

A significant feature of last year was the continued influx of a very large amount of Chinese capital into the Colony from countries in South-East Asia. As a result of this boom conditions were prevalent on the Stock Exchange and in Real Estate markets.

PAKISTAN

Our next door neighbour, Pakistan, continued during the year to show resilience and progress. The important development on the economic side was the

devaluation of Pakistan Rupee. The Pakistan Rupee which had a higher value than its Indian counterpart since September 1949 was brought on a par in July 1955. The need for obtaining capital goods from abroad and the peculiarly monopolistic nature of the country's export goods combined to stave off devaluation. These two factors, however, could no longer continue to support the artificially inflated Rupee.

The economic progress as a whole was maintained. The trade position also showed an improvement. Exports rose from 190.5 million Rupees to 371.1 million Rupees, during the three months August-October 1955 and instead of trade deficit on private account of 53.5 million Rupees there was a surplus of 131.5 million Rupees. During the year an Agreement was also signed between the United States of America and Pakistan providing the use of 20 million dollars of U.S. Assistance Fund for the improvement of Pakistan ports, highways, air-bases etc. Industrial output also continues to rise and it is hoped that she could look forward with confidence to a year of good development.

On the political side a Constitution for the country has just been drawn up and Pakistan has been proclaimed as an Islamic Republic within the Commonwealth.

Economic Conditions in India

THE CAPITAL MARKET

During the year under review the Government of India floated a 3½ per cent 10 Year Loan at an issue price of Rs. 98.8 and secured Rs. 103.7 crores. Collections from Small Savings, to which more attention is now being devoted, yielded Rs. 65 crores. The previous year's experiment of floating a combined loan for the requirements both of the Central Government and the State Governments was scrapped and the States came out with their own loan issues—all 4 per cent loans maturing in 1967 but at different issue prices—and gathered in all Rs. 47.50 crores. The expansion of treasury bills—the measure of deficit financing—is expected to be Rs. 240 crores.

The Industrial Credit and Investment Corporation of India Ltd. issued its share capital of Rs. 5 crores of which Rs. 3½ crores were privately placed and Rs. 1½ crores were successfully offered for public subscription. Two big debenture issues and quite a number of preference and ordinary shares flotations met with satisfactory response. Altogether the capital market had an active and successful year.

During the year State Financial Corporations were floated in Madhya Bharat, Andhra, Uttar Pradesh and Rajasthan.

FOREIGN TRADE AND BALANCE OF PAYMENTS

The foreign trade of India during 1955 registered a significant growth both in exports and imports and the visible trade deficit has been reduced. The relative figures are as follows:

Foreign Trade—January-November

	1953	1954	1955
Exports	477.84	499.90	539.85
Imports	530.13	559.29	577.47
Balance	-52.29	-59.39	-37.62

Import policy is now designed to allow an increase in import of industrial raw materials and capital goods while extending further the principle of protection to Indian industry. The large internal demand for steel has necessitated its import from wherever it is available but the loss of foreign exchange has been offset by the cessation of imports of food grains and sugar and the saving of exchange arising from the import of crude mineral oil in place of refined petroleum products. Imports of chemicals, drugs, electrical goods, newsprint and rayon have remained steady, while imports of iron and steel, non-ferrous metals, vehicles and wagons have begun to show a rising trend. The growth of Indian industry is making itself felt in the pattern of our import trade.

In exports most of the major commodities with the significant exception of tea, have been doing well. Exports of jute manufactures showed expansion.

The Jute Industry's success last year is attributed partly to the Government's prompt abolition of the export duty on jute goods in the wake of the devaluation of the Pakistan Rupee. The prices of Indian jute goods, thus lowered, enabled the industry to compete on better terms with Pakistan and other jute manufacturing countries. Exports of cotton textiles in 1955 were slightly lower than in 1954 and may again decline in 1956 due to the growth in domestic demand. The decline in export earnings on this account has been more than made good by the large increase in exports of raw cotton so that the total value of raw cotton and textiles amounted in the eight months April-November 1955 to Rs. 67 crores as compared with Rs. 55 crores in the corresponding period of 1954.

The continued weakness of the tea market is an adverse factor likely to offset the increased export earnings in 1956 from other commodities.

With reference to our export trade the emphasis has shifted in recent years from sending raw materials to sending manufactured goods abroad. The rapid pace of industrialisation has enabled some of our industries to produce manufactured goods which can find an outlet into the world market on a competitive basis both as regards quality and price. On the export side all restrictions which were necessary in earlier years have been removed as a result of the improvement in the internal supply position. In fact, except for a few isolated commodities, exports of most major items are being allowed without any control. About 80 to 85 per cent of the country's export is today free from control.

In order to secure adequate foreign exchange resources for the second Five-Year Plan efforts have to be made to stimulate exports and the recent announcement of the Commerce Ministry on this subject gives hopes of considerable development in this field in the near future. The Ministry is thus anxious to canalise all measures of rationalisation so that foreign trade can be regulated properly. Similarly the Government of India is taking all possible steps through Export Promotion Councils to promote exports of cotton textiles, silk piecegoods, engineering goods, plastic manufactures, cashew and pepper. With adequate financial assistance these bodies would be able not only to help the normal flow of export trade but will also conduct research, propaganda and publicity in foreign markets. Export Credit Guarantee Scheme is sure to give added confidence.

During the first nine months of 1955 trade with the Dollar area resulted in a surplus of Rs. 31 crores against a deficit of Rs. 3 crores in the corresponding period of 1954. By reason of this satisfactory position, the outstanding loan from the International Monetary Fund

was repaid to the extent of Rs. 19.3 crores, leaving only a small balance of Rs. 6 crores still due to the Fund at the end of 1955. The country's net balance of payments on current account for the same period showed a surplus of Rs. 25 crores and the year as a whole is expected to show a surplus of about Rs. 35 crores as compared with a deficit of Rs. 4 crores in the previous year.

AGRICULTURAL PRODUCTION

Progress in the field of agricultural production was satisfactory. The output of foodgrains during the year amounted to 65.8 million tons, which, though a little lower than the previous year, was yet in excess of the Plan target by just over four million tons as a result of implementation of irrigation and power projects in the first Five-Year Plan, now drawing to a close. By the end of 1954-55, fresh irrigation facilities and increased water supplies were provided to over four million acres of virgin and irrigated soil. The easy supply position of foodgrains enabled the Government to remove the last remnant of control on foodgrains.

The production of commercial crops showed further improvement during the current year. Oilseeds output at 5.9 million tons and raw cotton at 4.3 million bales have exceeded their targets under the first Five-Year Plan by four lakh tons and about one lakh bales respectively. The production of sugar touched the record level of 15.9 lakh tons as compared to 10.01 lakh tons in 1953-54, while that of jute which remained depressed during the last two years has shown a significant increase of about 12 lakh bales during the 1955-56 season as compared to the last.

The general crop prospects for 1955-56 are considered to be satisfactory. They would have been better still but for the calamitous floods in the North and the devastating cyclones in the South that occurred during the year.

INDUSTRIAL PRODUCTION

Industrial production has made commendable progress during the year under review. The upward trend in industrial production persisted through 1955. A revised index of industrial production is now available. According to this series the index of industrial production (Base: 1951=100) for the first ten months of 1955 works out at 125.7 as against 112.9 for the whole of 1954. This represents an increase of over 11 per cent over the preceding year. This increase in production was shared by almost all the major industries. The output of finished steel at 1.26 million tons was higher than the record achieved in 1954. The production of mill made cloth at 5,087 million yards in 1955 was 89 million yards higher than the production of 1954 and exceeded the target fixed under the first Five-Year Plan by 387 million yards. Cement production during the year reached 4.5 million tons. In jute, chemicals and paper too the performances were very high. Considerable strides have also been made by the engineering industry. Licences for manufacturing jute mill machinery have been given. Progress in the modernization of jute mills has already been made.

Further in terms of expenditure, the position in respect of the centrally financed multi-purpose projects—The Damodar Valley Corporation, Bhakra Nangal, Hirakud and Harike—is that, against a provision of Rs. 224 crores, about Rs. 238 crores will be spent by the end of the Plan period. In regard to State projects, the outlay will be Rs. 352 crores against the Plan figure of Rs. 378 crores. Against a provision of Rs. 30 crores, a total of Rs. 20.8 crores has so far been spent on the new

projects undertaken during the last two years of the Plan—Kosi, Koyna, Chumbal, Rihand, and Nagarjuna-sagar.

Second Five-Year Plan

It is some time now since the draft outline of the second Five-Year Plan has been published; the total amount of expenditure envisaged, the departmental allocations, the State-wise distributions, the various targets aimed at, etc., have now been so widely publicised that it is hardly necessary to repeat them here. But the lapse of time has also enabled us to get over our first emotional enthusiasm and to take an objective and dispassionate view of the Plan.

The Plan has been variously criticised as either too optimistic or too ambitious. There is nothing wrong about being too ambitious. In the present condition of India to aspire a progress at as quick a pace as possible cannot but be a laudable object. But to be too optimistic is certainly a danger if in that mood, we ignore realities and base our hopes on mistaken calculations and emotional approaches. Failure to reach the goal would mean disaster of the severest kind and, therefore, to shut our eyes to the realities and create difficulties by our own actions would be, to put it at the mildest, a first-rate blunder.

In the first place I wish to emphasise that higher employment, though a very desirable objective, cannot be as important as creation of greater wealth. It may sound a little unorthodox, but I wish it to be realised that increased employment cannot in all cases result in greater prosperity. Only such employment as is highly productive can create prosperity. On the other hand prosperity can definitely be a precursor to greater employment. A highly productive employment alone can create prosperity, and once we have the effective means, we can create all kinds of employment. The main problem, therefore, is not so much to create any kind of employment as to create such employment as would yield higher production and greater wealth. With wealth a large number of tertiary employment would grow automatically. Higher production is thus the objective which really matters.

Judging from this angle, Ambar Charkha is not the answer to the problem. It has a place, no doubt, provided it is proved that the most efficient methods of production within our resources are already fully utilised and the only resources, potential or otherwise, left for us is the utilisation of Ambar Charkha in which case it functions in a supplementary capacity. Since this is not the position, Ambar Charkha is likely to obstruct rather than pave the path to progress, if by progress we mean higher standard of living. This stark reality, if fully realised, should stop us from toying with ideas likely to take us on a backward march. If Ambar Charkha could have solved our problems, it would have done so centuries before.

Again, the relative treatment accorded to cottage industries 'vis-a-vis' the factories seems to be based on fallacious grounds. There would be no conflict between the two if they could be supplementary to each other. Cottage industries can only follow the large scale industries and not 'vice-versa'. If one plans that the large-scale industry shall follow the cottage industry, then one might as well plan that Railways shall progress only through the bullock cart. The fact of the matter is that more bullock carts will be in the streets to feed Railways if the latter expand. Paradoxical as it may sound, Railways alone can support more bullock carts. In more economically advanced countries cottage industries play a much bigger role than in India

because there is such a great task for them for feeding the large-scale units.

REAL DIFFICULTIES

The real difficulties that must be faced and solved if the Plan is to be successfully implemented are:

1. Inadequacy of internal resources;
2. Inadequacy of foreign exchange;
3. Inadequacy of technical personnel;
4. Inability of transport systems to keep pace with the development in other fields; and,
5. Rigidity of Government machinery.

AVAILABILITY OF INTERNAL RESOURCES

How is the money to be invested in the public sector to be raised? The means suggested are: additional taxation, loans, small savings and deficit financing. I wonder whether it is fully realised that additional taxation, savings and loans come into play only after production and wealth have increased and cannot precede them. We have to begin with deficit finance. The criterion of its success would be that by raising the purchasing power of the people we create greater demand for goods which stimulates higher production. If higher production of goods is suppressed, then what follows is inflation and failure. In other words, we should rely on much larger production of essential goods to absorb the newly created purchasing power that would come into being through deficit financing. This is one aspect of the question. The other aspect is that if we begin with additional taxation and compulsory savings, then we fail to create the new purchasing power which is expected to create increased demand for goods. The resultant decrease in consumption would lead to lower production and to decrease of employment and of wealth. These two aspects must be kept in mind.

From the way in which the Budget is planned, it looks as if it is believed that taxes and savings could precede increased wealth and that savings could take place before earnings materialise. If a house is taxed before it is built, the result would be that no house would be built to pay the tax. To appreciate this sequence is very important. In a car the brake is as useful as the accelerator. But one does not start the car with a brake. The brake is useful only after the car is started. If you tax a person and compel him to save before increasing his earnings you, in reality, restrict his consumption and give a set-back to production, which is obviously not the goal in view.

AVAILABILITY OF FOREIGN EXCHANGE

Whatever may be the method of estimating our requirements of foreign exchange, I personally feel we shall need anything like Rs. 1,600 to Rs. 2,000 crores.

Even accepting the figure of Rs. 1,600 crores as correct, it might be difficult to get all this amount. Sterling balances Rs. 350 crores, trade surplus Rs. 300 crores on the basis of Rs. 60 crores per year (this assumption is justified by cessation of food imports) and invisible exports Rs. 150 crores make up Rs. 800 crores leaving Rs. 800 crores still to be found.

Of this amount, Government expects to raise Rs. 400 crores by way of foreign aid; but total American aid to India from July 1955 to June 1956 is \$50 million, i.e., Rs. 25 crores. On this scale foreign aid will amount only to Rs. 125 crores in five years.

I fear the seriousness of the paucity of foreign exchange is not fully realised. With proper efforts foreign exchange should be available. And we have to work for it. But the Planning Commission seems to have under-estimated its importance and has abruptly ended the chapter after pointing out that there is a gap of Rs. 800 crores. I fear the gap would be much more, but even if we accept the figure of Rs. 800 crores, its direct effect would be on the productive industries and transport leading again to less wealth and less employment.

AVAILABILITY OF TECHNICAL PERSONNEL

The dearth of technical personnel is admitted on all hands. It is one of the main reasons for the country's inability to make spectacular headway. State-owned steel plants alone require 5000 engineers and 10,000 skilled personnel. This shortage of technical personnel will be a serious handicap in the working of the Plan.

The private sector today can command a large number of technically qualified experts. In its search for technical talent, it has gone far and wide and has, with great difficulty, built up at least a nucleus of expert administrators. The public sector has nothing like this and has to start the training of its staff right from A.B.C. But if we talk in terms of austerity for the technicians, then neither the public nor the private sector will have enough technical knowledge at its disposal. We should not restrict the incentives that go to stimulate technical education and knowledge.

AVAILABILITY OF TRANSPORT

Under transport, specially with reference to rail ways, the allotment in the second Five-Year Plan has been cut down very substantially. If the railways do not bear the strain that is proposed to be put on them, the whole edifice of the Plan will collapse.

RIGIDITY IN GOVERNMENT MACHINERY

Experience has shown us again and again that Government machinery is dilatory, hide-bound by rules and unaccustomed to take quick decisions. While this machinery is eminently qualified to deal with long-range questions of policy, it can hardly meet the needs of day to day industrial expansion when rapid decisions are necessary. A thorough overhaul is needed.

I have mentioned all these difficulties not that they cannot be solved—but that they must be solved. I fail to see any sign of awareness on the part of the authorities of these hurdles and, therefore, I give expression to my misgivings. What I have said is not by way of criticism. We need to make the Plan a success. But we cannot do so by minimising or under-estimating the difficulties and by starting in a complacent mood. Forewarned is fore-armed and what I have suggested is a constructive note of caution in order that we may meet difficulties squarely in the face and solve them and not create more difficulties by our own actions. We have enough troubles on our hand to engage our thoughts and energies, and it would be unwise to create avoidable problems.

Company Meeting

THE BUCKINGHAM & CARNATIC CO. LTD.

Presiding at the Thirty-fifth Annual General Meeting of the Shareholders held at the Company's Office, 7 Armenian Street, Madras, on Friday, 23rd March 1956, Mr. R. E. Castell said:

Gentlemen,

The Report of the Directors and the Accounts for the year ended 31st December, 1955 having been in your hands for some time I propose with your permission to take them as read, but I will be glad to answer questions later.

Your Company has closed another successful trading year and I am glad to report that a useful increase in the production of yarn and cloth has contributed towards this result. This increase in production arises from the further progress made with the Company's rehabilitation programme and the continuing efforts to improve efficiency in all processes.

The position remains unchanged to the extent that your Company cannot expand its manufacturing installation because of the regulations affecting the cotton textile industry. I feel it is my duty to add my voice to the warnings so often uttered lately by other representatives of the industry about the danger of continuing to limit mill cloth production to the present level which is about 5,000 million yards, it was in fact 5,094 million yards in 1955. Government estimates that by the end of the second Five-Year Plan in 1960, 7,200 million yards of cloth will be needed to provide for 400 million people at the rate of 18 yards per capita, in addition to which it is hoped to produce 1,000 million yards annually for export. Of the total target production of 8,200 million yards, 3,200 million is planned for the handloom-cum-powerloom sector: this is almost double the present output from handlooms and powerlooms and it is open to serious doubt whether anything like such an increase can be achieved.

I might add that the estimated consumption of 18 yards per capita may well prove to be inadequate in view of the plans which are in train for India's further agricultural and industrial development, and the reasonable expectation that the per capita income will materially improve.

I earnestly hope, and I am sure that you will join me in this, that Government will soon revise its present policy of limiting the production of the mill industry and so guard against a shortage of cloth and its consequent inflationary results and probable counter-measures in the form of controls which, as past experience has shown, are costly and generally vexatious.

Whatever may be the true potentialities of the handloom industry and the powerlooms, including partial substitution of the latter for handlooms, I do think that Government would be well advised to examine the possibilities of considerably increasing the present production of mill cloth. In my view the increase which is desirable cannot be achieved substantially by the introduction of a third shift. Our own experience

during the last war definitely showed that in all processes but particularly weaving, the third shift is severe on machinery, discomforting to labour and harmful to quality. The need for a change of policy is urgent not only because signs of a cloth shortage are already apparent, but also because as time goes on, the difficulty of planning and executing any expansion promptly is bound to increase.

For the information of those of you who do not already know, I would mention that your Company operates an India-wide system of distribution of its cloth and its policy of controlling the selling prices of the mills' dealers continues. We often receive complaints from various parts of India that our cloth is not readily available, but that I can assure you is not the Company's fault. Apart from the statutory limitation of our capacity which we suffer along with the rest of the industry, we continue to fill two responsibilities which to us are traditional, the first being to supply large quantities of cloth to the Defence Services, and the second being to make our contribution towards India's export trade and her foreign exchange resources: we also supply increasingly large quantities of cloth for the needs of other Indian industries, particularly the coated abrasives industry. These responsibilities, although it is important in the national interest that we should continue to discharge them, handicap us in our effort to meet the needs of the general public. As I believe there are other mills in a somewhat similar position, here is an additional reason why Government, in the interest of the ordinary consumer, should encourage without delay an expansion of present mill cloth production by permitting the installation of more machinery.

In 1955 your Company exported nearly one-fourth of its total production of cloth. As you may know, there was a considerable shrinkage in the world trade in cotton textiles last year: India was not affected quite so much by this decline as the U.K. and Japan, but nevertheless her exports of Mill cloth fell from 898 million yards in 1954 to 816 million yards in 1955: exports of handloom cloth from India were also lower in 1955, being 55 million yards against 61 million yards in 1954. I do not feel hopeful about this shrinkage in the world trade in cotton goods being reversed since cotton-growing countries will undoubtedly continue to develop their own textile industries and competition from those countries foremost in the export field is likely to become keener than ever. In the past India's exports of cotton textiles have at times been restricted by controls and as a result some part of overseas demand has been permanently lost to her. I hope that no restrictions of any kind will ever be imposed again on exports of cotton textiles, but on the other hand, I hope that Government will do everything it reasonably can to encourage such exports. Here again is a strong reason for allowing the expansion of mills' productive capacity, as when cloth is not enough for domestic

needs, mills and traders will be less inclined to export, particularly when increasing competition overseas makes export less attractive. Even now your own Company and their representatives overseas have to exercise constant energy and vigilance, and prices have to be kept strictly competitive in order to maintain the mills' exports.

You will know that by the 1956 Finance Bill, the excise duties on all kinds of mill made cotton cloth (except coarse and medium dhoties) were increased by 6 pies per square yard. In spite of the current generally good demand for cloth I doubt if consumers' present purchasing power can absorb this increase in cost on all varieties, and to some extent it may have to be borne partly by the industry, at least for the time being.

Your Company's installation is so designed that in ordinary circumstances almost all its spinning production would be woven in its own looms, but in order to fulfil its obligations to Government and to assist the handloom industry, your mills have for some years by adjustment of their manufacturing programme contrived to supply fairly substantial quantities of yarn to the handlooms: in 1955 over 8,400 bales were supplied, this being more than one and a half times the previous year's supply.

I now propose to comment on the published accounts and draw your attention to the very considerable transfer from Capital Works in Progress to Machinery account due to the completion of the New Weaving Shed, the Power House and the progress made in the Machinery Replacement Programme.

You will notice that our current assets have been reduced when compared with the previous year by approximately Rs. 38,00,000 and this is mainly accounted for by the reductions in Stores and Stock in Trade of approximately Rs. 11,00,000 and Rs. 48,00,000 respectively, offset to the extent of Rs. 22,00,000 by an increase under the heading 'Book Debts'.

On the Liabilities side there is a reduction of Rs. 3,50,000 on our Debenture Debt, Rs. 27,00,000 in the overdraft from Bankers and Rs. 5,00,000 on Taxation account. There is also a reduction of approximately Rs. 24,00,000 in our Liability for Acceptances as, owing to the recent increase in the Bank rate in the United Kingdom, we have temporarily discontinued our practice of paying for the purchases made in that country by means of Exchange Bills. This last reduction, however, is offset to the extent of approximately Rs. 11,00,000 appearing under a new heading 'Loans Unsecured' and this has been lent to us by Binny & Co., Ltd., London, on favourable terms.

The Directors' Report has drawn your attention to the increase in sale proceeds of cloth, yarn and waste and I think the only other item calling for comment in the Profit and Loss Account is the increase in the depreciation charge resulting from new buildings and machinery brought into use during the year.

Section 23A applies to this Company for the financial years 1954 and 1955, but the dividends already respectively declared or proposed comply with the provisions of that Section in that they exceed 60 per cent of the assessable income less the tax thereon.

For the greater part of the year the difficult administrative problems referred to in my last speech on account of inter-State sales tax continued, but although some relief resulted from the Supreme Court's decision in September 1955 that the levy of this sales tax was ultra vires, additional problems arose from the many demands which were received from our customers for refund of the inter-State sales tax collected from them. We, in our turn, demanded refunds from the various State Governments and it was not until the Ordinance was issued in January 1956, legalising the levy and collection of inter-State sales tax from 1st April, 1951 to 6th September, 1955 that the position was clarified to some extent. There are, however, several important points still to be decided and I fear that it will be many months before the unhappy history of this unfortunate taxation measure, which has caused the business community so much harassment and expense, will be concluded.

The Mill Labour Advisory Organisation has continued to function in a most satisfactory manner, but this year I regret I cannot say that there has been no loss of production from stoppages of work by labour. In common with many other workers throughout India, our employees joined in the Hartal called in memory of those who lost their lives in the Goa incidents. They also participated in an unwarranted strike on the 24th November, 1955. The issues which were the pretext for this second stoppage will shortly be the subject of arbitration by the Hon. Mr. Justice Ramaswamy Gownder.

In November 1955 the Employees State Insurance Scheme was implemented in Madras City and its immediate effect in these Mills was a considerable increase in absenteeism. The position has lately improved somewhat but it is clear that absenteeism on account of sickness is likely to prevail in future to a greater extent than before the Act came into force.

Shareholders will be interested to know that at the request of the workers, Sunday 29th January, 1956 was treated as a normal working day and the wages earned by the workers for that day and the profit earned by the Company will be given to the Madras Cyclone Relief Fund. An advance payment of Rs. 50,000 has already been made.

It will also be of interest to you to learn that the liabilities of the Workpeoples' and Employees' Provident Funds, the accounts of which are now maintained by the Trustees, amounted at the 31st December 1955 to Rs. 1,31,87,122 and Rs. 14,48,932 respectively, and corresponding amounts have been invested in Trustee securities.

The lot of those concerned with the management and operation of industry in these days is by no means enviable. In addition to the complexities of recent legislation covering all aspects of their work, their is the burden of severe personal taxation and uncertainty about the future.

I hope you will gladly join with me in expressing appreciation of the cheerful and determined manner in which the executive and supervisory staff of the Management and the Mills have carried out their duties. I think we should be particularly grateful to the Manager and other Officers of the Mills who have worked so hard and intelligently in implementing the Company's aim to attain the maximum improvement in efficiency.

Company Meeting

THE CENTRAL BANK OF INDIA LIMITED

Speech delivered by Sir Homi Mody, Chairman, at the Forty-fifth Ordinary General Meeting of the Bank on Thursday the 29th March, 1956.

Ladies and Gentlemen,

In presenting the Directors' Report and Statement of Accounts for 1955, I would like to say a few words on some of the important developments in the country during the year. The volume of trade, both internal and external, and industrial and agricultural production, continued to rise, and if it had not been for some of the measures undertaken by Government to expand their sphere of operations and tighten their control over the Private Sector, economic activity might have shown a still greater buoyancy.

The growth of banking business during the year was very pronounced. In consequence of the impetus to production provided by increased public expenditure on development, the demand for bank credit showed a sharp rise and Advances made and Bills discounted by banks went up from Rs. 554 crores to Rs. 642 crores at the end of 1955. In relation to Deposits, the proportion of Advances and Bills which was already high increased to 62 per cent at the close of the year. Simultaneously, the ratio of cash in hand and balances with the Reserve Bank declined from 11 per cent to 9.5 per cent. All this activity is reflected in the amount of currency in circulation which went up by about Rs. 160 crores.

The expansion of economic activity which should result from the sharp increase in the tempo of investment under the second Five-Year Plan must create an enormous demand for bank credit, and if a profitable margin can be maintained between the rates of Deposits and of Advances and if establishment charges do not get out of hand, the future growth of banking would seem well assured.

The tremendous role which the second Five-Year Plan must play in the economy of the country cannot be exaggerated. The Commission has published its proposals in the form of a Draft Outline. According to it, the total investment during the period would be of the order of Rs. 6,100 crores, which is Rs. 500 crores higher than what was envisaged in the Plan Frame. The view that the size of the Plan should be curtailed in order to make it more realistic has not found favour with the Planning Commission. The pattern of investment has, however, undergone a slight change and larger amounts have been allocated to transport. Since the size of the Plan has been enlarged, the question of securing the resources needed for its fulfilment has naturally become more difficult. Even after estimating on a liberal scale the resources that could be obtained through taxation, borrowing, deficit financing and external assistance, the Planners have left a gap of Rs. 400 crores, which presumably will also have to be met from internal resources.

Though the investment in the second Five-Year Plan is to be much larger (Rs. 6,100 crores) than that in the first Plan (Rs. 3,500 crores), the share of the Private Sector has been greatly reduced. As against a

more or less even division under the first Plan, 62 per cent of the investment in the second Plan is to be in the Public Sector and 38 per cent in the Private Sector. The shift in emphasis on the development in the Public Sector becomes more significant when it is realised that the increase in investment from Rs. 1,700 crores in the first Plan to Rs. 3,800 crores in the second represents an increase of the order of 124 per cent in the Public Sector, as compared to an increase of only about 28 per cent in the Private Sector. In the interest of the Plan itself, a much larger scope should have been given to the Private Sector. The wide and varied experience which it possesses and the managerial personnel it commands should have been utilised to the fullest possible extent. With a much larger number of complicated schemes involving enormous amounts of capital investment, the administrative problems in the Public Sector are bound to present considerable difficulties and if they had been shared with the Private Sector to a greater extent, the successful implementation of the Plan would certainly have been more assured.

As things are, the Plan must involve enormous burden being placed upon the community; even so, through the over-emphasis it places on household goods industries, acute shortages of essential articles of consumption might come about, involving a risk of serious inflation which it would be difficult to control.

The Budget proposals for the year have to be viewed in the light of the needs of the Plan for additional resources by way of taxation. Between the Centre and the States, the figure laid down is Rs. 450 crores, and as it that was not sufficiently drastic, the Finance Minister has hinted at the possibility of raising another Rs. 200 crores to finance the heavy defence programme which the situation on our borders is deemed to have rendered necessary. In the face of all this, detailed criticism of particular aspects of the Budget proposals, however valid and relevant, is not likely to receive much attention, but it is necessary to state all the same that the process of disincentives has been carried several steps further, and the future can only be viewed with serious misgivings. There is, however, a ray of hope, and that is to be found in the assurance that has been given that our Planners contemplate periodic reviews of the situation with a view to making such adjustments as are found necessary, and if that happens, we should see a more realistic approach to the problems of our under-developed economy.

I shall now pass on to matters of more direct interest to the Shareholders and refer to some of the important features of the Statement of Accounts which has been presented to you.

The working results of the year showed substantially higher earnings, but the net profit has been about the same as that of the previous year. This is accounted for almost entirely by an increase of as much as Rs. 23 lakhs in our establishment charges which now stand at the huge figure of Rs. 2.60 crores. The effect

of this will become clearer if I point out that the ratio of Establishment charges to total expenses has gone up to over 82 per cent. Your Board is giving very close attention to this situation and is doing everything possible to retrieve it by effecting greater efficiency in working and by closing down unremunerative Branches, wherever that can be done without detriment to the Bank's business.

The improvement in earnings to which I have just referred was brought about largely through a more active pursuit of business possibilities. Our figure of Advances recorded an increase of over Rs. 12 crores and stood at Rs. 72.20 crores at the end of the year. The average during the year, it must be pointed out, was not as high—the bulk of the increase occurring during the last quarter of the year—but showed a definite improvement over the figures of the previous year. To enable us to cater to the growing needs of business, we had to resort to borrowing against our Securities and under the Bill Market scheme. In that connection, it is somewhat unfortunate that the Reserve Bank should have found it necessary to raise the rate of interest on Advances under the scheme from 3 per cent to 3½ per cent and, further, to discontinue the practice of sharing the cost of stamps.

On the income side, there has been an increase under the item of "Interest and Discount". There has also been a substantial improvement under the item of "Commission, Exchange and Brokerage"; apart from an expansion of our Exchange business, this result has been due to no small extent to the devaluation of the Pakistan currency.

Deposits of scheduled banks showed a marked increase during the year on account of the monetary conditions that prevailed. We have shared in the increase to the tune of Rs. 4.69 crores. Our deposit figure of Rs. 128.66 crores might easily have been larger had we participated in the growing scramble for deposits at steadily rising rates of interest. With the bank rate being somewhat out of alignment with the prevailing interest rates in the country, the margin between the rate at which working funds are obtained and that at which they are lent out tends to be not sufficiently remunerative and I hope you will agree that the policy we have been pursuing is right in the circumstances of the case. It has been responsible for the comparatively small rise of Rs. 4.24 lakhs in the item of interest paid on deposits, borrowings, etc.

Our investment portfolio shows a reduction of Rs. 62 lakhs and stands at Rs. 56.71 crores. During the year, the Bank had to take up sizable blocks of the Central and the State Governments loans and, in addition, a large allocation of 3½ per cent National Plan Bonds, 1965, was received in lieu of Shares of the Imperial Bank of India held in the portfolio. While the total figure shows only a small reduction, profits have been secured wherever possible and there has also been a shift towards better yielding securities. It may be mentioned here that while the reduction in the portfolio may appear small, the ratio of Investments to Deposits has come down from 50 per cent in 1953 to 44 per cent in the year under review. A special Committee of the Board has been looking after our investments, and you may be sure every effort will be made to effect reductions in the portfolio.

At the end of the year, the difference between the book value and the market value of our investments was substantially narrowed. It now stands at Rs. 1.62 crores. When we recall that, at the end of 1953, the gap was of the order of Rs. 3 crores and 13 lakhs, we can appreciate the improvement in the position that has taken place.

During the year, the Report of Mr. Justice Gajendragadkar's Commission was published. All the recommendations made by it were accepted by Government and embodied in a Bill which was passed on the 22nd of October. This enactment is to continue in force for a period of five years. The Act provides a suitable machinery for dealing with matters arising from the interpretation of the recommendations made by the Commission. It is very unfortunate that this liberal measure of amelioration of working conditions should not have been adequately appreciated by those in whose interest it was conceived. The adjustments made in accordance with the terms of the Award occasioned disturbances and dislocation of work in a number of banks and it would appear as if a section of the employees had made it its business to perpetuate the unhappy relations subsisting for so many years and which the Commission's recommendations had done their utmost to remove. I am glad that the majority of the members of our staff have given no countenance to such activities which are calculated to react very adversely on the fortunes of themselves as well as of the bank they serve. I am sure no one who has any understanding of the conditions under which banking business has to be carried on will fail to appreciate the great advance that has been made in the working conditions of employees, and realise the close identity of interest between Managements and Staffs. I reiterate the hope I expressed last year that a new era of closer and happier relations will be ushered in and that all of us who are engaged in the service of banks, from the highest to the lowest, will do all in their power to promote the growth of the industry and enable it to make its full contribution to national development.

The Directors' Report has referred to the great loss suffered by the Bank by the passing of Mr. H. C. Captain within a very few days of his retirement from service. Mr. Captain, in spite of ill health during the closing stages of his life, had continued to devote himself unstintingly to the interests of the Bank and it was a matter of great regret to the Board that his long connection of 34 years had come to such a tragic and abrupt end. The Board and the members of the staff have severally placed on record their appreciation of all Mr. Captain had done for the Bank and I am sure the shareholders share their sense of loss and wish to convey to the members of his family their heart-felt condolences.

On the retirement of Mr. Captain, the Board appointed Mr. N. K. Karanjia as General Manager of the Bank. It was a fitting recognition of his long and meritorious service, and during the few months in which he has been working as Chief Executive of the Bank, the Board has every reason to be satisfied with the wisdom of their choice.

To strengthen the organisation of the Bank and to exercise greater control over the day-to-day working, the Board appointed Mr. C. H. Bhabha, Vice-Chairman, and delegated certain powers to him under Article 107 of the Company's Articles of Association. Mr. Bhabha has since been devoting a great deal of his time and energies to the affairs of the Bank and I cannot speak too highly of the work he has been doing.

To Mr. N. K. Karanjia, General Manager, and Mr. F. C. Cooper, Deputy Manager, our acknowledgments are due for the zeal and efficiency with which they have been discharging their responsibilities. I would also like to thank other members of the Staff at the Head Office and the Branches and the members of the Local Committees at various centres for the services they are rendering.

I now move the adoption of the Report and the Audited Statement of Accounts for the year ended 31st December, 1955.

(This is not a Prospectus but only an Announcement of Prospectus. The Prospectus dated 17th March, 1956 has been filed with the Registrar of Companies, Bombay, and a copy thereof can be inspected at the Registered Office of the Company on any working day during business hours. Copies of the Prospectus may be obtained from the Head Office and branch offices of the Bank of Baroda Limited mentioned below).

(Consent of the Central Government has been obtained to this issue by an order of which a complete copy is open to public inspection at the Head Office of the Company. It must be distinctly understood that in giving this consent the Government of India do not take any responsibility for the financial soundness of any schemes or for the correctness of any of the statements made or opinions expressed with regard to them.)

An application will be made to the Native Share and Stock Brokers' Association, Bombay, in due course for a quotation of the shares.

The subscription list will open on Saturday the 31st day of March 1956 and will close on Thursday the 12th day of April 1956, both days inclusive, or earlier as may be decided by the Directors, but not before the 6th day of April 1956.

POLYCHEM LIMITED

(Incorporated under the Indian Companies Act, 1913).

SHARE CAPITAL

AUTHORISED CAPITAL :

80,000 Redeemable 7½% (taxable) Cumulative First Preference Shares of Rs. 50/- each.	
80,000 Ordinary Shares of Rs. 50/- each.	
1,40,000 Unclassified shares of Rs. 50/- each	Rs. 1,50,00,000

ISSUED CAPITAL :

80,000 Redeemable 7½% (taxable) Cumulative First Preference Shares of Rs. 50/- each	Rs. 40,00,000
80,000 Ordinary Shares of Rs. 50/- each	Rs. 40,00,000
	Rs. 80,00,000

There are no Founders' or Deferred shares nor any Debentures or Mortgages.

Out of the above issue the promoters Kilachand Devchand & Co., Ltd., the Directors of the Company and their friends including Dow Chemical Company of Midland in the State of Michigan, U.S.A., have agreed to subscribe for:

Ordinary Shares of the nominal value of Rs. 20,00,000-0-0 which will be allotted to them.

ISSUED TO THE PUBLIC :

Preference Shares of the nominal value of	Rs. 40,00,000-0-0
and	
Ordinary Shares of the nominal value of	Rs. 20,00,000-0-0

The whole of the issue to the public has been underwritten.

TERMS OF ISSUE

PREFERENCE SHARES

The Redeemable 7½ per cent (taxable) Cumulative First Preference Shares (hereinafter called the "Preference Shares") shall entitle the holders thereof to a fixed cumulative preferential dividend at the rate of 7½ per cent per annum (taxable) on the capital for the time being paid up thereon, and the right in the winding up to the payment of capital and arrears of dividend (if any), whether declared or not, up to the

commencement of the winding up in priority to all other shares in the capital of the Company, but shall not confer any further right to participate in the profits or assets of the Company, nor confer any right to the offer or allotment of further shares whether issued by the Company or by the Directors.

The Company shall have the right after 15 years from the date of issue of the Preference Shares to redeem at par all the said Preference Shares or such of them, by drawing lots, as the Directors may from time to time decide, after giving six months' previous notice in writing in that behalf addressed to the holders of the Preference Shares so to be redeemed. All outstanding Preference Shares will be redeemed within 20 years from the date of issue.

The Preference Shares shall confer no right of voting at any General Meeting of the Company except,

(i) When resolutions are placed before the Company which directly affect the rights attached to preference shares (and for this purpose any resolution for winding up the Company, or for the reduction of its share capital shall be deemed directly to affect the rights attached to preference shares); or

(ii) When the dividend due on such capital or any part of such dividend has remained unpaid in respect of an aggregate period of not less than two years preceding the date of the commencement of the meeting and for the purpose of this clause dividends shall be deemed to be due on preference shares on the last date specified for the payment of such dividend in the Articles or other instrument executed by the Company even though no dividend has been declared by the Company on such capital.

ORDINARY SHARES

Every holder of an ordinary share shall be entitled to be present and to speak and vote at any General Meeting and when present in person shall have one vote on a show of hands and on a poll when present in person or by proxy shall have one vote in respect of every ordinary share held by him.

Under the Articles of Association of the Company, no member shall be entitled to be present or to vote at any General Meeting either personally or by proxy or as proxy for any other member or be reckoned in a quorum whilst any call or other sum shall be due and payable to the Company in respect of any of the shares of such member.

No person as the bearer of a Share Warrant in respect of the shares mentioned therein shall be entitled to attend or vote at any General Meeting of the Company.

BOARD OF DIRECTORS

BUSINESS OF THE COMPANY

The Company has not yet obtained Certificate to commence business.

The Company has been formed for carrying on all or any of the objects mentioned in its Memorandum of Association. One such object is to carry on the business of manufacturers of and dealers in styrene, polystyrene, vinyl chloride, polyvinyl chloride, polyethylene, cellulosic plastics and other thermosetting and thermoplastic materials (synthetic and natural origin), oxygen, nitrogen, hydrogen, hydrocarbon gases including ethylene, and acetylene, reagents, agricultural chemicals, insecticides, fumigants, weedicides, pesticides, colouring materials, pigments and lakes, paints, varnishes, lacquers, finishes, dyes, toners, perfume and flavouring chemicals, rubber chemicals, plastic and resinous materials, elastomers, gums, glues and adhesive composites, plasticizers, surface active agents, tanning agents, coating resins, drugs and pharmaceutical chemicals, solvents, marine chemicals, synthetic fibres, fertilisers and all types of industrial chemicals, acids, alkalies, hormones, trace elements.

The promoters of the Company have entered into an agreement with Dow Chemical Co. of U.S.A., one of the foremost chemical concerns in the world and a leader in the world production of polystyrene for the exclusive grant to the Company of the formulae for the manufacture in India of polystyrene moulding powders by the continuous technique of polymerisation and for other technical assistance.

The principal raw material required is styrene monomer, the supply of which has been provided for over

a period of five years by an Agreement entered into with Dow Chemical International Ltd. of U.S.A. and the Promoters.

This is the only unit sanctioned by the Government of India for the manufacture of polystyrene in India.

Polystyrene is at present used in India by the plastic moulding industry for the manufacture of numerous articles of industrial and domestic consumption. Polystyrene has many other uses which have hardly been touched upon in India.

Polystyrene has been consumed in India so far for manufacturing articles of domestic use such as toys, combs and toilet articles and articles of personal use. The importance of polystyrene in the industrial field is now being recognised. The consumption of polystyrene in India has grown from below 2,000,000 lbs. in 1948 to about 5,000,000 lbs. in 1954, almost all in the consumer items alone, some of which are finding export markets at present. Its future potentialities can be judged from the fact that the Indian Plastic Manufacturers' Association has estimated a consumption of 10,000,000 lbs. annually during the period of the second Five-Year Plan and has requested the Planning Commission to plan accordingly.

The Company's plant has been designed to a rated capacity of 6,000,000 lbs. of moulding powder per year with a margin for expansion which will meet the requirements of the moulding industry. Further provision will be made for the manufacture of 12,00,000 lbs. of modified polymer. The unit will be expanded with appropriate additions to take care of increased consumption by the plastic moulding industry. There is also

a very wide scope for development of many other products of considerable commercial value such as Styrofoam (insulating material), Styroflex (Electrical insulating film and sheet), Synthetic resins (Co-polymers, synthetic rubbers), Paints (Styrenated alkyd resins), Films and Sheets based on Styrene as well as other important chemicals and plastics.

Negotiations are in progress for obtaining suitable site for the Company factory at Goregaon in the Bombay Suburban District.

CAPITAL OUTLAY

Import licence for the greater part of the plant has already been obtained, the designing of machinery has also made much progress and orders will be placed for equipment without delay. The capital outlay for the plant will be about Rs. 39,30,000 made up as under:

Land and buildings	Rs. 7,00,000-0-0
Machinery and Equipment	26,00,000-0-0
Utilities and other expenses	3,00,000-0-0
Issue of stock to Dow Chemical Co. for exclusive grant of formulae	6,00,000-0-0
Brokerage and underwriting	1,80,000-0-0
Preliminary expenses	1,50,000-0-0
	Rs. 39,30,000-0-0

Working capital required per year is expected to be approximately as follows:

Technical fee to Dow Chemical Co. \$25,000 for each of 5 instalments	Rs. 1,20,000-0-0
Raw materials (about 3 months' stock)	22,00,000-0-0
Finished goods (about 3 months' stock)	25,00,000-0-0
	Rs. 48,20,000-0-0

The capital outlay and the working capital will be provided for the greater part from the present issue of capital totalling to Rs. 80,00,000. Any balance will be provided by borrowings.

On the basis of existing prices and after allowing for all costs, overheads, depreciation and a margin for contingencies, the Directors are confident that the Company will be able to pay an attractive dividend on the Ordinary Shares after meeting interest on loans and Preference Shares.

UNDERWRITING AND BROKERAGE

The issue of 40,000 Ordinary Shares and the 80,000 Preference Shares has been fully underwritten by the Industrial Credit and Investment Corporation of India Ltd. and the Bank of Baroda Ltd. In the opinion of the Directors the resources of the said Underwriters are sufficient to discharge the underwriting obligations.

The Company will pay brokerage at the rate of 1 per cent to recognised brokers or banks on allotments made in respect of applications bearing the stamp of such brokers or banks.

DOCUMENTS OPEN FOR INSPECTION

The copy of the Prospectus, Memorandum and Articles of Association of the Company, Consent of the Government of India for issue of capital, permission to allot shares to Dow Chemical Company, agreements

between the Promoters and the Dow Chemical Company and Dow Chemical International Limited, Promoters' agreement and the underwriting agreements contained in correspondence are available for inspection during office hours at the Registered Office of the Company until the subscription list is closed.

GENERAL

Copies of the Prospectus and Application Forms may be obtained from the Company or from the Head Office of the Bank of Baroda Ltd. at Baroda and its branches at Baroda, Ahmedabad, Bangalore, Bhavnagar, Bombay, Calcutta, Coimbatore, Delhi, Dhulia, Hyderabad, Jalgaon, Jamnagar, Kanpur, Madras, Mehsana, New Delhi, Patan, Poona or Rajkot.

Application forms should be delivered before the closing of the subscription list to the Head Office or any of the above offices of the Bank of Baroda Ltd. accompanied by payment of the application money. Where no allotment is made, the deposit will be returned in full less the money order charges (if any) and where a partial allotment is made, the unutilised balance will be applied towards the further amount due. The Directors reserve the right to refuse any application wholly or in part without assigning any reason.

Applications from the Public for the shares described in this announcement will be received only on the footing of the full prospectus and in the printed forms of application accompanying such prospectus. This announcement is not to be regarded, for the purposes of the Companies Act, as an invitation to the Public to subscribe.

RECORDS & STATISTICS (QUARTERLY BULLETIN)

Editor: R. V. MURTHY, M.A.

"The Eastern Economist" Bulletin of Records and Statistics surveys economic trends in each quarter in India and abroad with the aid of graphs and all available statistics. One of its special features is the Investment Supplement.

COMMODITY NEWS AND NOTES

EXPORT OF MANGANESE ORE

There is a considerable decline in exports of manganese ore to the principal consuming countries. Total exports of ore from India during 1955 declined approximately by about 2.54 lakh tons to 8.37 lakh tons from 10.91 lakh tons in the previous year. In terms of value the decline is of the order of Rs. 5.43 crores. India's principal customer is the U.S.A. accounting for an offtake of 3.46 lakh tons in the previous year. The offtake by the U.K. has also declined. The total offtake being 86,078 tons against 1.5 lakh tons in the previous year. This is because the U.S.A. has been increasingly relying on the Brazilian ore in view of her substantial investment interest in that country. The decline in Indian exports is also attributed to increased competition from Cuba, the Union of South Africa, Gold Coast and Belgium Congo. Transport bottlenecks and the restriction on the manganese ore exports have also contributed to the short fall.

SECOND ESTIMATE OF WORLD RICE OUTPUT

According to the U.S. Agriculture Department world rice production in 1955-56 (August-July) would be 27,500,280,000 lbs of rough rice compared with the estimated 262,382,400,000 lbs produced in the 1954-55 crop year. This crop is close to the record of 276,259,900,000 lbs in 1953-54 and is 22 per cent above the average production in the immediate post-war period, the Department said in its weekly publication, "foreign crops and market." World acreage seeded to rice in 1955-56, was placed at 201,901,000 acres compared with 195,041,000 acres sown in the previous year and with 202,514,000 in 1953-54. Gains are largely in India, Thailand and Japan, though a continued upward trend is noticeable in other Asian countries. It was the second forecast of world production made by the Agriculture Department. In its first, published in November, world output of rough rice in 1955-56 was then forecast at 270,210,900,000 lbs.

EXPERT COMMITTEE'S QUESTIONNAIRE ON TOBACCO

A questionnaire has been issued by the Expert Committee appointed by the Government of India to review the developmental procedure now in force for giving effect to the tariff based on capability of unmanufactured tobacco other than flue-cured for use in biris, with special reference to the concessions authorised by the Government of India in July, 1951 to examine whether the concessions have been satisfactorily operated or not, and to make recommendations for modification in the existing concessions and procedures. The main points in the questionnaire elicit information on the two botanical types of tobacco grown in one's area, local names of each variety and the districts or sub-divisions or talukas in which each is grown; method of harvesting, the consumption of varieties in the area and the existing maximum and minimum whole-sale prices per standard maund for each variety produced in the area.

Part II of the questionnaire refers to varieties grown outside one's area and asks for an alternative scheme of concessions, if not satisfied with the general scheme of concessions under the M.F. (R.D.) Notification No. 23 dated 14-7-51 and C.B.R. letter No. 9016-CX(I) dated 12-7-51. In part III, opinion is sought on the scheme of denaturation of marginal types of tobacco; while in part IV the effect of tariff changes in

1951 on the price structure of different varieties of tobacco are enquired into: Part V and VI pertain to questions like the methods adopted for estimating the yield of tobacco for purposes of accounting and assessment and other rates and taxes levied on unmanufactured tobacco. In all there are 51 questions in the questionnaire.

FINAL ESTIMATE OF CASTORSEED

According to the Directorate of Economics and Statistics, Union Ministry of Food and Agriculture, the all-India final estimate of castorseed for 1955-56 puts the current year's acreage and production at 1,462,000 acres and 126,000 tons, as against the partially revised estimate of 1,394,000 acres and 124,000 tons respectively for 1954-55. This shows an increase of 68,000 acres or 4.9 per cent in area and 2,000 tons or 1.6 per cent in production over last year. The increase in both area and production of castorseed during the current year has occurred mainly in Saurashtra and has been attributed to the satisfactory rains during the current year. This increase in area and production has, however, been reduced to some extent by the decrease reported by Hyderabad.

GRAPE PRODUCTION IN INDIA

The annual production of grapes in India is 200,000 maunds which is valued roughly at Rs. 120 lakhs. It covers an area of 1,420 acres under recent estimates. An acre of the crop yields 10,000 to 15,000 lbs of table, raisin or current and juicy grapes, or anything between, 7,500 to 10,000 bunches—each vine bearing 35 to 50 bunches. In South India, as high a yield as 50,000 lbs. has been obtained, which comes very near the world record of 55,000 lbs an acre.

It is reported, besides grapes, viticulture provides some valuable bye-products like Argol or cream of tartar which can be obtained from the stem of the vines and forms a component part of ingredients in baking confectionery, and dyes. A kind of jelly can be made from the skin of grapes and oil and oil cakes are obtained from the seeds. The oil is mixed with linseed oil and used in paints.

SECOND ESTIMATE OF SMALL MILLETS

According to the Directorate of Economics and Statistics, Union Ministry of Food and Agriculture, the all-India second estimate of small millets for 1955-56 puts the current year's area and production at 11,446,000 acres and 1,693,000 tons as against 12,215,000 acres and 2,002,000 tons in the corresponding adjusted estimate for 1954-55. During 1954-55, the second estimate both in respect of area and production of small millets reached record figures. As compared to these record figures, the current year's estimates show a decrease of 769,000 acres or 6.3 per cent in area and 309,000 tons or 15.4 per cent in production. The decrease in area has been shared mainly by Uttar Pradesh, Bombay, Andhra, Hyderabad and Madhya Bharat due to unfavourable weather conditions at the time of sowing. This decrease in area has, however, been offset to some extent by increases reported by Vindhya Pradesh, Madras and West Bengal.

COMPANY AFFAIRS

THE STANDARD MILLS CO., LTD.

The Directors' Report and the audited accounts of the Company for the year ended December 31, 1955, show the Company's profit for the year of Rs. 38,87,581, after deducting the Managing Agents' Commission amounting to Rs. 4,28,326, remuneration of Rs. 30,000 and depreciation of Rs. 17,21,971. Including the carry-forward from the previous year's accounts of Rs. 17,128, the total sum available for distribution is Rs. 39,04,709. The Directors have recommended transfer of Rs. 10,87,376 to special depreciation reserve. Provision for income-tax and corporation tax absorbs Rs. 10,00,000. Dividends of Rs. 4, free of income-tax, per share on 6000-4 per cent cumulative redeemable 1st preference and 2nd preference shares each, take Rs. 48,000. The dividend on 87,800 ordinary shares at Rs. 20 per share, free of income-tax absorbs Rs. 17,56,000, leaving a balance of Rs. 12,833 to be carried forward.

These accounts include the accounts of the New China Mills Ltd., for the same period, which was amalgamated with the Standard Mills during the period under review. A total of 31,800 newly created ordinary shares of the Company were allotted to the shareholders of the New China Mills, Ltd.

Modernisation of the mills was continued and Rs. 4,00,346 were spent on the construction of new buildings and another Rs. 26,15,895 were spent on the purchase of new machinery. A sum of Rs. 9,64,020 has been transferred from rehabilitation and development reserve to the development rebate reserve in accordance with the provisions of the Income-Tax Act.

THE BRITISH INDIA CORPORATION, LTD.

The working results of the Corporation for 1955 are disappointing. Including income from investments and after making all the usual allowances, including Rs. 15 lakhs for depreciation, the loss for the year is Rs. 30,17,727. The carry forward from the previous year's accounts, of Rs. 2,81,142, reduces the deficit to Rs. 27,36,585 which is to be carried forward.

The impact of excise duties on leather, footwear and cotton cloth, and the heavy cost of employing, or discharging, redundant labour, have been responsible, according to the Directors, for the unfavourable results. The 3-month strike in the textile branches at Kanpur and the floods in the Punjab, causing dislocation of despatches of manufactured goods from the New Egerton Woollen Mills Branch, have been additional adverse factors.

In addition to the adverse effect on the sales of woollens, profit margins were controlled by competitive conditions. There was a considerable drop in the prices of raw material towards the close of the year under review, and to make provision against such a drop in the value of raw and manufactured stocks, a further penalty was suffered by the Corporation. The Directors feel that the quality and quantity of suitable raw hides for leather and footwear branches are not satisfactory and prices are high. However, prospects for the export of leather are now brighter than before.

Suitable action continues to be taken by the Directors to restore trading to a profitable basis. The capital expenditure programme is under execution and rehabilitation plans for all branches are being pursued.

THE SHIVRAJPUR SYNDICATE, LTD.

The profits of the Syndicate for the year ended November 30, 1955, amount to Rs. 35,49,059, after deducting depreciation of Rs. 3,60,493. To this has been added Rs. 13,381 brought forward from the previous year's accounts and Rs. 269, being profit on sale of assets. After providing Rs. 12,25,000 for income-tax and super-tax, writing off Rs. 558, setting aside Rs. 27,867 to workmen's compensation reserve, Rs. 6,10,511 to staff welfare reserve, Rs. 3,50,000 to mine development and prospecting reserve, Rs. 5,00,000 to general reserve, Rs. 1,50,000 to equalisation of dividends reserve, and Rs. 1,17,112 to retiring gratuities reserve, the available balance for distribution is Rs. 5,81,661.

The Directors have recommended a dividend of Rs. 5 per share, free of income-tax, which absorbs Rs. 3,50,000. Bonus to shareholders at Rs. 3 per share, free of income-tax, takes away Rs. 2,10,000 and the balance of Rs. 21,661 is to be carried forward.

The mining operations were satisfactory, producing 91,427 tons. The slight drop from the previous year's production of 96,405 tons has been attributed to the gradual approach of the end of the useful life of the opencast working in Bamankua. There was an increase in the shipments of manganese ore, mainly to the USA, totalling 81,775 tons against 74,477 tons during the previous year. The abolition of export duty in August, 1954, has been responsible for this increase. The policy of forward selling of ore helped the Syndicate to escape the effect of slump in the Indian manganese ore trade during 1954. Forward sales during 1955 also have been concluded extending into the financial year 1956-57.

Stopping operations continued at Shivrajpur and the tonnage yield was 26,335 compared to 17,958 in 1953-54. Development plans are proceeding in other areas also. An additional power plant of 300 H.P. has been erected at Shivrajpur, and the installation of a new power plant at Pani is nearing completion.

STATE BANK OF INDIA

The Directors report that after making usual and necessary provisions, the net profit of the Bank for the half-year ended December 31, 1955, amounted to Rs. 68,59,396. Together with Rs. 33,56,439 transferred from the Imperial Bank of India, it makes a total of Rs. 1,02,15,835. A sum of Rs. 45,00,000 has been paid out in payment of a dividend at Rs. 8 a share. Transfer to the pensions fund amounts Rs. 2,78,500. Bonus to be paid to staff absorbs to Rs. 20,00,000 and the balance of Rs. 34,37,335 is carried forward.

AGRA ELECTRICITY SUPPLY CO., LTD.

The accounts of the Company for the half-year ended September 30, 1955, show that, after providing for all charges and setting aside Rs. 16,030 to the general reserve, there remains a balance of Rs. 1,46,064, including Rs. 46,887 brought forward from the previous half-year's accounts, available for distribution. The Directors have recommended payment of a 10 per cent dividend per annum, free of income-tax for the half-year under review, which absorbs Rs. 99,980. The balance of Rs. 46,084 is proposed to be carried forward.

During the last six half-years, there has been rise and fall, alternately, in the number of units sold, but the revenue shows a steady upward trend.

The Communist Party of India

THE Communist Party of India was in closed session for six full days in New Delhi within the last fortnight. On one subject alone—the Twentieth Congress of the Soviet Communist Party—there has emerged a 2,000-word resolution which reflects not a little of the anxious thought and conflicting emotions which are now part of the mind and heart of India's Communist Party. It is known that when "the cult of personality" was developed in Moscow for the purpose of the denigration of Marshal Stalin, many leading members of the Communist Party in India rebelled against the idea. So, indeed, both logically and emotionally they well might have done, for the Communist Party of India has never been tired of extolling the tremendous capacity of benevolence and warm humanitarianism of the former Russian dictator. It has waited for Mr. Mikoyan's visit and some conversations in New Delhi for a complete change of countenance in the Communist Party of India. Today the Communist Party in India, unlike a month ago, has adopted with as much grace as is possible, the Moscow line. There was, of course no doubt that the Indian Communist Party would eventually adopt the Moscow line. That is the only fixed line in its current policy. What Moscow says today, the Communist Party of India will say tomorrow.

Thus, if ever there was any doubt as to the character of the relationship between the Communist Party of India and the Communist Party of the USSR, the 2,000-word resolution now issued should dispel it. It shows that the Indian Communist Party has no individuality of its own. The Communist Party of India cannot have any major purpose in the denigration of Marshal Stalin although, presumably the Communist Party of the USSR has. Whether it is that the tensions inside the Soviet Union associated with Stalin's ruthless dictatorship have proved overwhelming, or that the satellites of the Soviet Union needed an assurance that a new and somewhat more rational element was at work in the Kremlin, one might conceivably argue that the USSR had some purpose in taking its beloved hero until a year ago off his great pedestal. But that the Communist Party of India which has no major interest in the tensions which Stalin created in Europe should sign meekly on Moscow's dotted line, and find new reasons for eating its own words repeated in season and out of season over the whole of the Stalin period, shows that local policy is dominated far more by the Moscow line than by Asian needs.

To those who have drawn attention to the Communist Party of India as something different

from the Communist Party of the USSR this slavish imitation of Moscow should be a salutary lesson. It may suit the Communist Party of the USSR to treat a non-Communist Government—to art, the present Congress Government in India—as being an expression of its own voicing so long as the Indian Union appears to take what, in Moscow's eyes, is an anti-West line. But if there is anyone in the Indian External Affairs Ministry who considers that there is a real breach between the Communist Party of the USSR and the Communist Party in India, he is employing very wishful thinking. It is perfectly true that from time to time the Kremlin does change its line and does embarrass its followers abroad. Its recent turn on Stalin has certainly been embarrassing to National Communist Parties everywhere; what, however, is important is that, in the last analysis the National Communist Parties always wheel round to the Moscow line. In other words, in the end the alliance between the Communist Party of the USSR and the Communist Party in India cannot be broken. This is essentially because the Communist Party of India, like other National Communist Parties, has its spiritual home in Moscow. Any differences that appear between a National Communist Party and the Kremlin will sooner or later be brought into line by the acceptance of the Kremlin's views. The Indian Communist Party is no exception to this rule; if the Congress thinks it can drive a wedge between Moscow and the Communist Party of India, it is making a very foolish mistake.

What lessons are to be learnt from the events of the last two months? By every standard, they have been earth-shaking events. The public exhibition of the greatest hero of the Soviet Union as a murderer, a war-monger and something little short of a madman has introduced an element of deep inferiority into all Communist leaders. Few of them can escape the point that, if Stalin was all that he is now made out to be, their slavish acceptance of his administration and his mistaken theories on the nature of capitalism and socialism must have indicated nothing more powerfully than the fact that the famous "dictatorship of the proletariat" can be one of the most perilous instruments ever invented for the maintenance of the rights of men. More has been done to promote democracy and democratic ways of thought in the last two months by the admission of the terrible character of the Russian dictatorship than could have been done by many volumes of Free World criticism of the character of the Communist State. This should be a heartening lesson to those in India who have frequently thought of dictatorship—whether of the proletariat or of any other kind—as a solution of the problems of an underdeveloped economy. Stalin certainly developed Russia's economy; there is no evidence now that this development was worth the terrible price that was paid.

In particular there is no evidence that the remarkable progress of the Soviet Union under Marshal Stalin has found any comparable translation in living standards of the Russian working classes. The record shows that the dictatorship of the proletariat has not succeeded—even when economic progress was extremely high—in protecting the average worker from exploitation. The rise in real wages in the USSR is one of the lowest in the world even while the rise in industrial output is one of the highest. In other words, the benefits of the socialist industrial miracle in the USSR have not been transmitted

to the Soviet worker in the same degree as has economic progress in democratic countries.

The reasons for transmission of wealth in democratic States are twofold. In the first place, an active Trade Union movement has always been able to secure for the worker directly for more than would be apportioned to him by a "dictator of the proletariat", who as a producer in the State sector is always anxious to keep his labour costs at a minimum. The dictatorship of the proletariat, precisely because it is both manager and worker, is far less effective in improving the lot of the worker than a powerful Trade Union movement which has no conflicting loyalties. Thus it is that there is no country with a strong Trade Union movement which has not recorded for its workers far larger successes than workers have received in the USSR. Only the Stakanovites—still a minority of Soviet workers—have benefited by extremely generous bonus production rates.

The second argument in favour of the democracies arises from the character of social democracy, that is to say, from the willingness of free communities to associate all levels and all interests in political decisions in which, in the last analysis, the vote of the majority is supreme. The effect of every expansion of the franchise in democratic countries has been to assist the underdog. Every increase in production in recent years has tended to be biased in favour of labour, not management. This is no more than to say that, in every increment of production, the share which accrues to lower income groups must be considerably greater than that which accrues elsewhere.

In the Indian Union the beneficial effects of social democracy are already at work. There is no doubt that there has been a great expansion of Trade Union influence which has tended to make Indian real wages in the last five years rise much more steeply than corresponding real wages in the Soviet Union. Similarly, as recent researches of the Indian Institute of Public Opinion have shown, irrespective of taxation in the income-tax paying class, there was less inequality in 1954-55 in the distribution of gross incomes than there was in 1948-49. When the operation of the Indian tax system is added to the equalising process of new production, it transpires that the inequality of incomes in the Indian Union is being reduced much more considerably than in the Soviet Union, even, in terms of the rate of the reduction of inequality, greater than in the United Kingdom.

At the present time, India is beginning to have a rate of correction of social injustice which is as high as that in any country in the world. It is these facts which in the last analysis will defeat the Communist Party of India. The Prime Minister was right to say the Communist Party is "reactionary" in the sense that it is unable to see developments outside its text-books which make the original doctrine of Marx largely inapplicable to the current situation. But there are some of these lessons which are not only to be learnt by Communist "reactionaries". There are not a few people in India—most of them are in the Congress—who consider that State control, in theory democratic but in practice monolithic, is the only solvent for India's social problems. There is nearly as much danger in this monolithic State philosophy as there is in the pattern of Communist dictatorship, which has received in the last two months so much denigration and derision even from its innermost sanctuary.

Socialists at the Signposts

WHAT is Socialism? If a modern Jesting Pilate were to ask the question today, he may wait indefinitely for an answer and perhaps the lack of response may itself provide in eloquent terms an answer. Mr. Gulzarilal Nanda, Minister for Planning has said this week that India's socialist pattern meant Sarvodaya, though that explanation may not greatly add to one's enlightenment. Mr. Nanda, however, seemed to be clear that starting industries in the public sector or nationalising insurance was not socialism. This was a somewhat negative approach but defining concepts through negatives had been the technique of many great thinkers in the past. It is deeply imbedded in the Indian philosophical tradition: 'not this, not this' (*neti, neti*) is an outstanding classical example of the approach to the definition of the Ultimate by ruling out what it is not. The most curious thing about Socialism today is that even outside India its advocates should keep asking at every stage 'Is this Socialism?' and sometimes rather ruefully admitting the truth contained in the inevitably negative answer.

The most encouraging feature of this Socratic mood is its basic honesty of purpose, revealing an attitude of mind which refuses to be totally conditioned by dogma; perhaps this is only the obverse of the other doubt, how free can "free enterprise" be? The socialist challenge provoked this latter question at the other end; but free enterprise has not presented a counter-challenge except in terms of the demonstrated economic achievements of countries like the USA, Germany and Japan. The contradictions to which the theory and practice of socialism have led have been far more effective at the present time than other factors, in prompting new questions about the direction. These contradictions will not be accepted as indicators of the impracticability of socialism as it has been hitherto understood by its advocates but only as pointers to the need for pursuing new paths to the old goal of establishing the most practicable form of equality in society, consistently with the promotion of freedom and growth. So long as any system tends to be tested by the conditions for growth it provides and the preservation of the freedom of the individual, there is hope for the avoidance of dogma.

The British Labour Party's latest search for fresh political objectives cannot be described as born entirely of frustration. Hitherto, it could take considerable credit for creating the climate for the acceptance of the idea of the Welfare State but its consequence has been to rob the Labour Party of special function. The Welfare State plus nationalisation provided at one time a complete socialist programme; and the maintenance of full employment along with the two represented a long step towards the creation of equality of opportunity, if not of wealth and income. The evolution of modern social policy has enabled a Tory Government to keep the Welfare State as well as ensure over-full employment. On the only issue on which the Conservatives have been definitely opposed to the Socialists, namely nationalisation, Socialists have themselves been half-hearted and apologetic; they have not concealed their discovery that nationalisation is not an essential instrument for the effective regulation of the health of the economy.

As Mr. Gaitskell has pointed out in a recent paper, nationalisation was conceived at first as a means of giving the wage-earner a just reward, by preventing the owners of industry reaping undue profits; but workers in nationalised enterprises have not felt less exploited under a Labour Government than in private employment. Nor has it been found that nationalisation is essential to control the economy in order to regulate production in the national interest or to prevent the evils of private control of productive resources. And in the matter of production for a competitive international market, planning has not, indeed, been an infallible method; the widely accepted view that in 1954, the British Government did not simply have the indicators which could have warned it of the dangers ahead of brimful employment have revealed the limits to planning and extension of the nationalised sector at least in a country which has to live on its export trade.

This has been the starting-point of the search for new content to the socialist doctrine. The new content may not be easily available; and even if positive basis can be found in due course to suit the changing social context, it will not disprove the fact of the departure from the established modes of thinking. The existence of this quality may be a guarantee against any doctrine being carried to the point where it causes social disadvantage but it would prove the fluidity of socialism all the same, under a democratic system of discussion and persuasion, making it sound more as a slogan than as a manifesto.

What is still more interesting is the apparent revision of current socialist assumptions even under non-democratic systems, where revolution on a certain pattern was regarded as a *sine qua non* of the transition to socialism. At the Twentieth Congress of the Communist Party at Moscow, there has been a surprising degree of unanimity about the need for a revision of these assumptions and almost every speech indicated that the change to socialism can take place peacefully, employing existing parliamentary institutions. For the present, the Communist leaders have found a basis in Lenin's obiter dicta for a revision of their thesis on revolution and also for acknowledging that the forms taken by socialism may vary from country to country. In practice, the Soviet leaders have been quick to recognise the deviations from the Soviet pattern in Yugoslavia and in China.

At the same time, there is a significant aspect of this change which has gone unnoticed in the current debate over the "personality cult". A passage in Mr. Mikoyan's speech draws a distinction between "reformism and revisionism", on the one hand, and Marxism, on the other, the former being regarded as undesirable because it would not abolish private ownership of the means of production. Reformists are those, he says, who believe that small and miserly gains over the course of many years can bring them some day to socialism; Mr. Mikoyan characterised them as "not revolutionaries, but evolutionaries who reject revolution and the seizure of power by the working people." In this view, the Labour leaders in UK would appear as apologists of capitalism and therefore unworthy of being reorganised as fellow Socialists choosing different means to the same end. The contrast between the second thoughts of Socialists under a democracy and under Communism is thus striking.

Krishi Pandits and Productivity

SOME of India's present and potential Krishi Pandits met in convention in Delhi for some days this week and listened to why and how they should increase their output and, more important, productivity. It was a sign of the changing times that the farmers should have met in a convention at all, and be honoured at the Rashtrapati Bhavan. Though the important part occupied by agriculture in the national economy has never been denied, our farmers have been in the shadows since cultivation is still largely of the subsistence variety. The first Five-Year Plan saw no large-scale change in that position since the emphasis had been on increasing food production to solve the recurring scarcity and no major changes in the rural set-up which might have brought the farmers to the market were contemplated. In the second Plan, however, while agricultural output as a whole is expected to go up by 18 per cent, food production will rise by only 15 per cent, while increases programmed for commercial crops vary from 25 to 30 per cent. Which all mean that of the additional output envisaged a larger part is intended, by its very nature, for the market.

Of the additional production planned, a large part is to come through higher productivity, this being a comparative shift from the first Plan in which larger output was the primary goal. This is not to deny that farm productivity has gone up. The average yield per acre of almost all the important crops has gone up, but yields are still far below what have been achieved in more advanced countries. Part of this gap is to be made up in the next five years. This can be seen from the fact that the additional ten million tons of foodgrains envisaged by 1960-61 is expected to be realised from the following sources: Major irrigation: (2.4 million), Minor irrigation: (1.8 million), manures and fertilizers: (2.5 million), Improved seeds: (1.8 million), Land reclamation and development: (0.8 million), Improved techniques: (1.5 million). This is to say, only 0.8 million tons, or just 8 per cent, is expected to be realised from more extensive cultivation. The other 92 per cent is to be obtained through increasing productivity on the existing acreage, indicating a 14 per cent increase in overall productivity. The programmes to realise a higher output of other agricultural commodities, it can be stated, are no different in their emphasis on higher productivity.

There is no logical reason why this extent of improvement in productivity should not be realised in the next five years. It is certainly not beyond the bounds of possibility. There is a large amount of truth in what the President said at the Farmers' Forum—that there is no basis for the belief that Indian farmers are conservative by nature and that, therefore, it is difficult to popularise new ideas and practices among them. The fact that cultivators have readily taken to the Japanese method of paddy cultivation and even experimented these methods with other crops, as they have done in Bombay, is evidence of this. What is needed to make them aware of better practices and better methods is proper publicity for the results achieved by the agricultural research institutes at the village level. But, though this will ensure knowledge among the farmers of better techniques, it will not secure the automatic adoption of the new methods, because of the resources needed by

farmers depending on increased provisions for extending credit facilities through co-operatives. The targets for short-term, medium-term and long-term credit have been fixed at Rs. 150 crores, Rs. 50 crores and Rs. 25 crores respectively, compared to Rs. 30 crores, Rs. 10 crores, and Rs. 3 crores in the first Plan. This programme is to be supplemented by a country-wide scheme for co-operative marketing and warehousing, which will enable agriculturists to obtain easy, cheap and timely credit on the basis of warehouse receipts.

A further spur will be the crop competition schemes organised by the Central and State Governments. Unlike at present when the schemes are confined to only some of the better-off individuals who can afford to concentrate on one or two plots of land without being deterred by the expense involved—though the outturn may not be incommensurate with the input—the development plans included in the second Plan should, by making facilities for betterment available more generally, enable a genuine and fairer competition in the setting up of productivity records. But these records should cease to be records as they tend to remain at present and come to represent the ordinary performance of every efficient cultivator.

It is possible that the better-informed sections of rural society will wonder whether higher output and higher productivity—the latter involving a somewhat higher average outlay in some instances—will not all go to waste should agricultural prices fall seriously as they threatened to last year or if the rains should fail, involving the cultivators in heavy loss. The fear of a crash in prices can be ruled out in view of the higher per capita income contemplated, which will also go up by 18 per cent, in the same proportion as general agricultural output. In any event, it is clearly not possible to extend the area under crops to keep pace with the increase in population, which is rising in our country at the rate of one per cent per annum, the population doubling in 70 years. But on the side of intensive cultivation the scope for raising productivity seems almost limitless.

Increasing productivity depends not only on the adoption of better techniques but also on the wider use of fertilizers and better seeds. The country will have to depend on its own fertilizer output since availability overseas is likely to fall with widespread interest in all countries in increasing agricultural output. The second Plan has provided for this, however, and fertilizer production is to be more than quadrupled in the next five years. The farmer can make up for the non-availability of more fertilizers by greater conservation and use of organic and green manure. Developments in the past few years, particularly since decontrol, suggest that a great deal can be left to the initiative of the farmer himself, for the Indian rural scene is witnessing the emergence of the business farmer producing for the market. This trend will undoubtedly receive a fillip from the second Plan. The formation of the Farmers' Forum and the holding of the National Convention are the first signs of a growing awareness among our farmers of the wider possibilities open to them to improve their condition and of their wider responsibilities to society in cajoling land to yield more than it is now doing.

THE WEEK'S NOTES

NEW SET-UP FOR THE PUNJAB

THE CENTRAL GOVERNMENT'S scheme on the new administrative set-up for the reorganised Punjab has been published and has been well received in all quarters, as far as can be judged at present. Like any other State, the Punjab will have a single Legislature, one Governor and one Cabinet responsible to the State Assembly for the whole field of State administration. Representations have been made that there should be only one High Court and one Public Service Commission, and the Home Minister, Mr. Pant, has stated that he has no objection to it. There is no point in having two High Courts with jurisdiction over the two regions of the State, which can sometimes give rise to anomalous decisions, arising from conflicting interpretations of the law.

The proposed Regional Committees will consist of all M.L.As. from the region, including Ministers but excluding the Chief Minister, and will examine legislation on 14 specified subjects, dealing mostly with local matters, before it is passed by the Assembly. The Committees can also make proposals for legislation and submit recommendations on general policy not involving any additional financial commitments except of a routine nature. The suggestions of the Committees in the sphere allotted to them will be normally accepted by the Government, but, where there is a difference of opinion, the Governor's decision will be final and binding. Since the members of the Regional Committees will be bound by party discipline, occasions for conflicts will be few, unless the ruling party happens to be in a hopeless minority in one of the Regional Committees.

The Punjabi and Hindi-speaking zones are to be demarcated soon in consultation with the State Government and other interests concerned. The official language in each region, at the district level and below, will be the regional language, while in the State as a whole both Punjabi in Gurmukhi script and Hindi in Devanagari will be official languages. The Central Government has taken upon itself the task of encouraging the growth of the Punjabi language. These provisions are certainly calculated to assuage even the worst fears of either community, and there would be, one hopes, no further controversy over the choice of the capital, just as other points at issue are nearing solution.

INDIA AND YUGOSLAVIA

THE SIGNING of a trade agreement between India and Yugoslavia last week should further strengthen the ties already existing between the two countries. Apart from an increase in trade, the agreement envisages closer co-operation in the technical and scientific fields through the provision of technicians and training facilities and supply of equipment and machinery. The leader of the Yugoslav delegation, Mr. Martini Cetinic, has offered his country's assistance in the improvement and expansion of shipbuilding and in the construction of ports. The agreement now signed provides for payments settlements in either Indian rupees or pound sterling according to convenience. The character of the exchange of goods contemplated as disclosed in the schedules to the agreement point to a readiness on Yugoslavia's part to assist in India's industrialisation since our main imports will be industrial and electrical machinery and transport equipment. Yugoslavia can also lend the services of experts in the manufacture of electrical plants and machine-tools and would like to have the advice of Indian irrigation engineers.

Apart from the direct and indirect assistance in industrialisation, Yugoslavia has also promised to help

India in building up a fleet of merchant ships. Mr. Cetinic has asserted that the cost and quality of ships built in his country compare well with world market prices. The necessity for India to have a merchant navy of her own for both strategic and economic reasons is being increasingly realised, and two of the factors standing in the way of the acquisition of a larger tonnage have been the huge initial investment in foreign exchange needed and the delay in the fulfilment of orders for ships. The Yugoslav Government has promised to use its influence with the shipyards to give priority to Indian orders and to ensure that deliveries are made in time. It should not also be impossible to arrange for some system of deferred payment which will relieve India of the burden of having to find a big foreign exchange surplus in one lump sum.

HIGHER EDUCATION FOR RURAL AREAS

THE PROBLEM of what type of higher education we should provide for the rural people is one which has yet to be solved by the Government in India. It has become obvious that the training our universities now impart, which is usually theoretical, is not exactly suited to the requirements of people who have to go back to the villages, for which a more practical turn of mind has to be cultivated. The first step in providing a truly rural higher education for rural pupils has been taken by the Government of India with the inauguration of the National Council for Rural Higher Education by Dr. K. L. Shrimali, the Union Deputy Minister for Education, to advise the Government on the development of higher education in rural areas. Ten institutions have also been selected for being developed into rural institutes.

A distinctive and highly commendable feature of these institutes is that they will provide part-time employment to their students on farms or in some other kind of productive work to enable them to meet at least part of their expenses during the course. Without this facility to earn while learning, the rural institutes might at best have deteriorated into institutions where most of the students belong to the upper rural classes and have come just for the sake of undergoing an education and not with any higher motive of making their training help in rural development; at worst, they would have failed altogether in attracting a sufficient number of students.

In fact, it is the craze for university education which has spread even to our villages which will create an initial prejudice against the rural institutes. This desire for degrees cannot be explained except in terms of the higher social status they are supposed to confer. But, if the universities respond to the Government's request to treat the diplomas conferred by these institutes as equivalent to the B.A. degree, the institutes will improve their standing with those sections of the rural population who send up their children for higher education. At the same time pupils can also be recruited from other sections since the question of the cost of education will not be important, so long as the families affected can go without the meagre earnings which another earning dependent can bring in.

ECONOMISTS AND POLICY-MAKING

EVER SINCE the years of the Great Depression economic analysis has come to play an increasing role in the shaping of administrative policies and decisions, conferring on the professional economist a great deal of influence in policy-making. India has been no exception to this. In particular, the Indian economists' sphere has been expanding since the country launched

on a programme of planned economic development. The tendering of advice on economic affairs, if not the advice itself, has been systematised not only by the setting up of 'ad hoc' bodies but also by more permanent arrangements such as the constitution of the Panel of Economists to the Planning Commission.

It is true, as Mr. D. L. Mazumdar pointed out the other day, that while the contacts between economists and administrators have been of mutual benefit, they have not always felt reasonably satisfied with the results of such contacts or exchange of ideas. The difficulties, as he rightly diagnosed, arise from the basic hurdles in the way of the application of economic analysis to practical administrative problems, or, in other words, from the limitations of economics and the handicaps under which economists have to function. The economist cannot get over his handicaps by technical qualifications of a high level of competence, for there are imponderable factors, like human behaviour, in economic affairs, which can be sensed only by an amalgam of logic and intuition and wide knowledge of economic facts (on which Lord Keynes laid emphasis, himself representing the best combination of all these attributes).

Part of the difficulties of economics, of course, arises from the defective educational system which emphasises the acquisition of knowledge of the higher tools of economic analysis to the detriment of providing the students with a surer grounding in basic principles, which alone can help economists to see some pattern in the confusing play of events portrayed by figures and curves. The comparative ease with which economics can be learnt even outside universities has put the professional economist at a disadvantage, and in trying to prove his "expertness" he tends to rely on mathematical formulas even in situations as in India where they are inapplicable. If the economist in India is to be more effective than he is today, it is essential he should realise that he cannot shun the market-place.

NEW BRITISH INDEX OF RETAIL PRICES

BRITAIN HAS gone over to a new index of retail prices based on January 1956 prices and on the pattern of spending in 1953 as revealed in the report on the household budget enquiry of the Cost of Living Advisory Committee. The index until now in use largely measured changes only in the prices of the things bought by working class households, and the consumption pattern assumed was what prevailed before the war, though there was a modification in 1952 on the basis of an estimated pattern of working class consumption in 1950. The new index, though broader based, excludes households whose head has a gross weekly income of £20 or over and households depending entirely on national insurance pensions or assistance. On the whole, however, it covers 90 per cent of the households.

The change in the base year has had certain important consequences. Food and fuel receive smaller "weights" than before, the former falling from 40.0 per cent to 35.0 per cent, while clothing, household goods and transport claim more. About 80 new items are brought within the purview of the index, making the total 350. The costs of television sets, washing-machines, second-hand cars and telephones are now included, as also better quality foods formerly not consumed by working class families. Within the food group itself, meat has improved its position at the expense of others.

It has been contended that the overweightage given to food in the old index exaggerated the real rise in prices in recent years, since it is the price variations in food and fuel and lighting since 1952 which have pushed up the index. But, with all the changes made in the new index, the British Ministry of Labour has

come to the conclusion that, if the new set of weights had been used, the result would have shown a difference of only one point. However, the usefulness and reliability of the new index is bound to be greater in the future. The new index has also shown that there is no truth in the claims of trade unions that changes in the old index bore no relation to shifts in the cost of living.

THE GOLD WEAPON IN THE SOVIET ARMOURY

OF LATE Soviet economists have been paying attention to the problem of multilateral convertibility and the role of gold in international payments. Professor Smirnov has pointed out that gold is a world currency with the function of a general medium of payment. It is, therefore, being used by the Soviet Union as a foreign exchange reserve and, if necessary, certain amounts of gold are sold abroad in order to restore equilibrium in the balance of payments or to finance additional purchases. Professor Smirnov recognises the important role gold can play in correcting maladjustments arising from the execution of Soviet economic plans and in extending economic aid to other countries. The huge gold reserves which the Soviet Union is now reported to possess have been entirely accumulated from internal production, unlike those of the United States which have benefited from foreign payments. Since Russia's own gold production is considerable, the prospect of the Soviet Union attempting to alter the pattern of world trade at some future date by unloading her stocks cannot be ruled out. This possibility, it must be emphasised, has received insufficient attention mainly because the US as well as the sterling area is a big producer of gold.

The problem of convertibility is also defying a solution because gold has to provide the basis for it and it is unequally distributed among the several countries. Writing in the official journal of the Soviet Ministry of Foreign Trade, Mr. F. Ivanov has expressed the view that any restoration of multilateral convertibility will be of limited duration as it will lack a firm material basis. Parities in relation to gold will continue to be artificial, instead of being determined by an effective rate of exchange. Mr. Ivanov comes to the conclusion that free convertibility cannot work since, with the exception of the US and Switzerland, no country has adequate gold reserves to withstand temporary or seasonal fluctuations in the balance of payments. He correctly points out that currency convertibility will not be stable so long as there are disequilibria in the payments balances of various countries, with fluctuation in the purchasing power of currencies with every fluctuation in commodity prices.

FUTURE OF SINGAPORE

WITH MALAYA firmly set on the road to freedom, the future of Singapore is to be settled at a conference in London to be held in the next few weeks. In preparation for it, Mr. David Marshall, the Chief Minister, has formulated certain proposals and secured the agreement of most of the parties in the island at a conference summoned by him. Mr. Marshall rightly wants the relationship between Singapore and Britain to be settled for the foreseeable future. His insistence that internal security cannot be left in the hands of Britain is understandable, though he is willing to give Britain the right of intervention in emergencies. That this provision has received all-round support among Singapore's political parties shows that the difficulties which the city will have to face have not gone unrealised. External political relations, other than in trade, will be the concurrent but paramount responsibility of Britain, and external defence her exclusive responsibility. It cannot be gainsaid that these proposals provide a real basis for agreement. There are other problems like citizenship to be solved, but these can be tackled once the basis of transfer of power is settled.

*it's a **BIG** job...*
prospecting for oil

Crude oil is not found everywhere in the world. Here and there it may occur in rocks that were once at the bottom of ancient seas and lagoons. But finding an old sea-bed is no guarantee that oil will be discovered there; that can be decided only by drilling a test well.

In some areas, likely clues to buried rock conditions may be found on the surface of the earth, but where surface features are absent, as in the Assam Valley, the search for oil possibilities is aided by geophysical surveys.

Three different methods of geophysical surveying for oil are being employed by the Assam Oil Company to "feel" for suitable

rock conditions under the Brahmaputra's thick blanket of Alluvium.

By aeromagnetic, gravity and seismic surveys, scientists can form a picture of the type, depth and attitude of buried rock layers.

But none of these can point to oil—even if it is there. The scientists, after studying the results, can only say—there *may* be oil there. The only absolute way of finding out is to drill a test well. Frequently the answer then is—no oil. The prospector must try again elsewhere... and so the search goes on, in the hope that India's petroleum requirements may be supplied to an ever increasing extent from her own resources.

By
ODYSSEUS

WHO ARE THE PEOPLE in India who look forward to a rosy future, confidently, with buoyant spirits? Who awake to each day's dawn eager to launch themselves on a constructive, rewarding day's work, the objective of which seems to them within reasonable reach of attainment? How many are they?

Who are the people who rise indifferently to confront the day's toil as something to be got through with just enough conscientiousness to avoid trouble? To whom it brings no real satisfaction, to whom the objective, if any, seems to lie in so dim a future as to have no meaning or reality and to offer no incentive to joyous effort? How many are they?

To secure accurate answers to these questions is of the first importance for India's future, for ultimately that nation survives, thrives, and moves on to greater glories, spiritual and material, which contains the greatest number of individuals whose confidence in their own personal future stimulates them to improve the individual contributions out of which are made up the sum total of the nation's wealth, spiritual and material. And that nation languishes, slips backward into a brutish subsistence economy, disappears from history, like the empires of Vijayanagar or Rome, or is forced to lie prostrate under foreign rule, which contains a majority of individuals who view the future listlessly and accept with bowed heads and backs what seem to them the blows of inscrutable and inescapable fate.

So important is it that the answers to these questions should be scientifically ascertained that I urge some philanthropist, a Tata or a Birla or some institution like the Ford Foundation, to finance a suitable survey. Without this, one can only speculate. I propose therefore to speculate here in an effort to show the importance of such an investigation and in hopes of provoking any who may disagree with my speculations to support my plea for a scientific enquiry.

JOYOUS PLANNERS: DEPRESSED PRODUCERS

Who are the confident people, making their best individual contribution to India's forward march? Should they not, I wonder, be identified with those who are in a position to mould India's economic and social policies? How many are they? I doubt whether their numbers achieve a four-figure total. A handful of statesmen and politicians from Pandit Nehru downwards, key members of the Congress Party, a few score senior civil servants, secretaries to ministries, officially employed economists, administrators of state industrial projects and enterprises, an even smaller number of officially employed engineers in charge of the Five-Year Plan's technical development. On further reflection, would you not be inclined to guess that their total is in three rather than in four figures, nearer, say, 500 than 1,000?

Who, on the other hand, are those who see no rosy future for themselves and their families, who think of their work in terms of unrewarding routine, rather than of splendid adventure? Would they not include

all those from the topmost to the lowest levels in the industrial, commercial, trading, business, and professional classes (doctors, educationists, architects, barristers, etc)?

I guess that the politicians and the planners, and the officially employed, are happy and confident because they can congratulate themselves on having, so far any way, achieved something; they have made a real contribution towards India's renaissance since independence. Their interest and enthusiasm have therefore naturally been aroused. They have, in the economist's language, been offered incentives. But please note that the short list of those included among the confidently expectant is, with the exception of a handful of technicians, devoid of any actual producers: they are planners for others or administrators of others.

Where do we list the industrialists, the business and professional men who are the actual producers of wealth? Among the browned off, the frustrated, the dissatisfied, the cynical or the stoic. Why? Because their share of the carrots, of incentives, has been steadily whittled down since independence by taxation and by the general attitude towards them, mostly of suspicion, at worst of hostility, at best of somewhat grudging tolerance. Yet these are the people who are responsible for the production of the greater part of the goods and services that make up the non-agricultural sections of India's wealth. Our balance of payments depends not on the planners but on the entrepreneurs, the men who work for our great export industries, tea, jute, cotton, oils, hides, skins, spices, tobacco, ores, etc., etc. What percentage of earnings do our State controlled industries contribute to our balance of payments?

"Here you go again", says the tired Socialist in the back row, "re-hashing the same old sterile and futile argument of free enterprise versus socialism. Can't you see that that's all settled all water over the dam? What's the good of bringing it up?" I am not. My basic submission is that under either the free enterprise or the socialist system, you must have incentives to produce and to save.

This elementary proposition is elaborated in masterly fashion in an anonymous article entitled "The Dynamic Society", published in the "Times" (of London) Literary Supplement, dated February 24. I am able to reveal that this article, which has attracted widespread attention in the UK, was written by the economist, Graham Hutton.

USSR AND USA: WORLD'S MOST DYNAMIC ECONOMIES

Mr. Hutton points out that the two most dynamic, go ahead economies in the world today are those of the USA and the USSR, followed by those of Holland, West Germany, and Italy, and that the two least dynamic, least progressive economies are those of the UK and of France. The American and Soviet economies are lively because in both these countries the labourer is deemed worthy of his hire and is given,

and is allowed to keep, bigger rewards for bigger results. The Americans and the Soviets seek to raise their total national wealth so that everyone who contributes to it can have a bigger individual share.

Britain and France, on the other hand, whatever the professed views of their leaders, show themselves in their policies and deeds to be ruled by the ideal of a more or less static national income merely to be re-distributed. They shudder at the egalitarian concept of a rapidly growing national income to be distributed in whatever way is best to make it keep on changing and growing.

Mr. Hutton classifies China and India among the dynamic countries whose leaders consciously seek this rapidly growing national income by offering prizes to those who help to make it keep on growing. I know nothing of China, but is he right about India?

It is, of course, true that India's national income and productivity has risen in spectacular fashion since independence, but I throw out the thought for debate, and refutation if need be, that this has been due partly to the initial enthusiasm generated by the consciousness of independence among individuals in a position to influence policies and partly by the setting free of the economy from the various restrictions which prevented its full and uninhibited exploitation prior to August 15, 1947. But the effect of these two factors must diminish with each year that passes. Far from plumping for the American and Soviet technique of big individual rewards for big individual efforts, we have heightened and tightened income-tax, virtually eliminated all special rewards in the shape of allowances, medical facilities, free cars, houses, etc., have reduced civil service and ministerial salaries and amenities, and are talking of setting a top limit on all incomes. In these circumstances, the initial enthusiasm and impetus derived from the inauguration of independence must wear off and the advance slow down—especially if the danger of inflation from the Five-Year Plan materialises, for if everyone is on a fixed income, all the leaders, civil servants, business and professional men alike, on whom our economic advance depends, would, by inflation, have their share of goods and services progressively decreased.

We can have sufficient confidence in the intelligence of our rulers to believe that they will (sooner rather than later) recognise that incentives are essential to ensure a growing (as opposed to a static) economy. But there is a further prospect then to be faced. If the incentives are reserved, as in the USSR, for the members of one party, for civil servants, officials, and administrators, and if the antipathy to non-officials, industrialists, business and professional men, that exists today, persists, then democracy, the free society in which the individual has rights, must disappear from India and totalitarianism slip in by the back door. For it seems reasonable to suppose that if today's handful of people in positions able to influence policy were to find that their lives were slowly but surely becoming economically more and more difficult owing to inflation and the much mooted ceiling on incomes, they would be but human if they used their privileged positions to stage a totalitarian revolution, which would probably be imposed in almost imperceptible degrees by one unobtrusive gazette notification after another, until we woke up one morning to find that the bureaucracy and the "public sector" had become all powerful.

Our discussion this week has but served to scratch the surface of the basic questions: What makes an economy static or dynamic? What makes it decay or grow? How can it ensure the accumulation of those fresh savings without which no expansion, no innova-

tions, can take place? Under the general heading "Inquest on Incentives", I propose to try during the next few weeks to throw further light on this, the most important problem of the contemporary world for every society, capitalist or socialist.

BOOK REVIEWS

THE ONE-WORLD OUTLOOK

World Commerce and Governments—Trends and Outlook: By W. S. Woytinsky and E. S. Woytinsky:
The Twentieth Century Fund: New York 1955:
888 pages: Price \$10.00

American philanthropic foundations have now launched on a bold programme of financing research projects dealing not only with individual problems of particular countries but also with the overall surveys of world trends and prospects in which there is an increasing interest due to a growing "one-world" consciousness. The Twentieth Century Fund issued in 1953 the first massive volume, taking the whole world for its theme under the title "World Population and Production"; and that book has become a 'vade mecum' for every thinker on world economic problems. The book under review is a companion volume which completes the other aspects like the organisation of trade, tariffs and payments, transportation of all types and systems of government.

The authors, Mr. W. S. Woytinsky and his wife, have shown themselves eminently qualified to plan and execute a work of this tremendous range because of their first-hand knowledge of American and European countries and their extensive travel elsewhere. It is remarkable that this volume of 888 pages, strewn plentifully with statistical tables, graphs and charts, has been prepared without the help of research contributors or collaborators. The Rockefeller Foundation and the Twentieth Century Fund which have financed the project and administered it jointly with the Johns Hopkins University have made a wise choice of both of the theme and its authors. A notable feature of the illustrations is the adoption of the new technique of emphasis by "distortion". For example, the comparative facts of population or income or of other factors are highlighted by drawing maps of countries according to their largeness or smallness in these particular matters, 'distorting' the existing scale but with dramatic effect. The system makes for forceful comparisons though it produces a number of very odd-looking maps.

The book is not a mere survey or tabulation of facts. It surveys trends and compares the position of various countries at various points of time so as to bring out in full force the changes that have taken place as a result of two wars and sustained economic development in certain countries. Many significant points emerge. It is shown that one out of ten gainful workers in the world as a whole is engaged in trade as compared with the United States' ratio of one for every six. Foodstuffs represent 20 per cent of the total value of the world's trade, the rest being equally divided between industrial materials and manufactured goods. A chapter on international investments shows the decline of Great Britain from her position as the greatest creditor nation in the world before World War I to a second place below the United States which had stood fourth in 1914.

The most fascinating sections of this survey are those relating to transportation which show the number of miles of railways, roads, cars, ships and airlines. India emerges as the third largest railway system in respect of total route mileage after the USA and the USSR. India is also the third in carrying the heavies, passenger traffic in the world after the USSR and Japan, even the USA closely following India as the fourth. Such interesting comparisons could be multiplied, but they can be better grasped by a direct study of the book which has been written without making the various data look commonplace or dull.

The third section of the book classifies the various types of Governments, their systems of election, the colonial empires, the financial position of Governments and the institutions for international co-operation. It is the use of the historical approach that is the distinguishing characteristic of this book which can be used very widely with profit.

THE LIBERAL ECONOMIST

Economics and Liberalism: Collected Papers of O. H. Taylor: Harvard Economic Studies: Vol. XCVI.
Price \$5.00

A collection of occasional writings over a long career would often suffer from the lack of a theme which confers character on a book and in this respect Mr. Taylor's book has not proved an exception. The author himself concedes it in a long introduction which gives the background to the articles published at various times and his own present attitude to some of them. But the book has considerable value as a case history of the evolution of a liberal rather than that of an economist. "Various internal tendencies and external influences", he says, "seem to have combined long ago to make me a belated specimen of a now nearly extinct intellectual 'species'—an old-fashioned, philosophical political economist, with interests extending far beyond the limits of 'economics' as now commonly conceived...." Here is sarcasm in the most euphemistic terms; the intellectual background of classical liberalism and social thought fits less and less the econometric age of measurement, which has gone far in the United States.

A Liberal, who finds himself removed not only from the main stream of what passes for economic thought but also from the American business men's conceptions of "free enterprise", may not have much scope left. The book is a commentary on this Liberal economist's declaration: "I simply cannot do as others now do—jump directly into special problems of economic policy, with only an economist's equipment and my basic personal predilections left in the state of being merely unexamined prejudices." The result is a continuous reevaluation of assumptions and revision of conclusions, revealing a high degree of intellectual honesty which often fails to record by the side of those who can easily identify themselves with the certitudes of the prevailing philosophy.

Running through this collection of writings is the thread of doubt created by the consciousness of the imperfections of the old doctrine and the inadequacy of the new in correcting them. "Strict laissez-faire" the author observes, "does not follow from my argument and is not, I think, a tenable ideal for the present and future.... A limited number of limited policies of State intervention to help in solving special problems are necessary.... But it needs careful conservative handling and safeguarding both from political pressures and from the visionary enthusiasms of some of the relatively socialistic or politically ambivalent Keynesian economists". And Mr. Taylor utters a profound truth when he says that irrational management of economic affairs creates conditions that create new demands for new interventions till the process leads to an over-expansion of the powers of the State. This has been the Liberal's nightmare; of late, however, there is a clearer perception of this danger even among the doctrinaire interventionists of the West; though in India they are having their heyday unperturbed.

Economic Report from the U.S.

AMERICA AND WORLD TRADE

(BY GUY SIMS FITCH)

NEW YORK, April 3.—The outlook for world trade this year is deemed highly encouraging by the men who direct foreign sales for American manufacturers. The consensus among the 900 business men who last week attended the annual convention of the Export Managers Club of New York was that economic progress around the world is likely to continue. Consequently, they expect new and larger markets to open up to world trade in the United States and other countries. Almost without exception, every delegate polled reported that his company's export volume so far this year has been running ahead of last year's rate. In 1955, commercial exports from the United States—shipments exclusive of goods sent abroad under the US Government's Mutual Security Programme—jumped by \$1,400 million to a total of better than \$14,200 million.

American purchases of goods from other countries figure large in the export managers' optimistic appraisal. Last year, US imports expanded by more than \$1,200 million to set a record of nearly \$11,500 million. These purchases helped other countries earn the dollars with which to finance their purchases from the United States. To these import earnings must be added the income other countries received from American private investment, tourist spending, and government grants. These and other balance-of-payment factors enabled other countries to add \$1,500 million to their net holdings of gold and dollars. As a result, total currency reserves abroad are stronger than ever, and most countries are in a position to step up their purchases from the United States. Available statistics so far this year bear out the views of the export managers. In the first two months of 1956, commercial exports from the United States came to \$2,450 million, about 10 per cent more than in the corresponding months of 1955. US imports, meanwhile, have been expanding even faster than exports. In January, the latest month for which data are available, US imports reached \$1,045 million, an increase of more than 20 per cent over the January 1955 level. And customs receipts for February indicate an import total nearly as high as in January.

Unless some unforeseen setbacks are encountered, therefore, both import and export totals this year are likely to surpass the 1955 records. Most of the American exporters anticipate a rise of from 5 to 10 per cent this year in US trade with the rest of the world. In assessing the 1956 outlook, American export managers are favourably impressed by prospects in every part of the world. They see shipments to Western Europe at least maintaining the high 1955 level of \$4,000 million, with signs indicating a continuance of Europe's current prosperity. They anticipate another increase in American exports to Canada, which last year bought \$3,200 million worth of American goods in the wake of a significant rise in consumer purchasing power.

The exporters also point to the growing requirements of Asia, Latin America, Africa and the Middle

East areas where large-scale economic development projects are under way. These areas need especially machinery and other capital equipment to speed industrialization projects. These are goods in which the United States has a highly developed industry. In 1955, US export volume of these capital goods was about three times as large as, for example, 30 years ago. They now represent nearly 27 per cent of total US exports, compared with little more than 16 per cent in the 1926-30 period. The biggest advance has been made in industrial machinery, including such items as construction and mining equipment, machine tools, engines, pumps and turbines. This export trend is likely to continue this year and the years ahead. As economic progress accelerates in newly developing areas, demand for capital equipment is likely to grow rather than diminish.

NEW CENTRAL JUTE MILLS COMPANY, LTD.

NOTICE is hereby given that the Annual General Meeting of the shareholders of the Company will be held on Monday, the 14th May, 1956 at 4-30 P.M. at the Company's Registered office, 11 Clive Row, Calcutta to receive and adopt the Directors' Report and the Audited Statement of Accounts for the year ended December, 1955, to declare final dividends, to elect a Director in place of the retiring one and to appoint Auditors for the current year and fix their remuneration.

The Share Transfer Books of the Company will be closed from 5th May, 1956 to 14th May, 1956, both days inclusive.

By order of the Board.

SAHU JAIN LTD.,

Managing Agents.

CALCUTTA,

29th March, 1956.

N.B. A member entitled to attend and vote at the General Meeting is entitled to appoint another person as his proxy to attend and vote instead of himself and the proxy need not be a member.

WORLDGRAM

AGRICULTURE

Bombay Tenancy and Agricultural Lands Bill: The President gave his assent to the Bombay Tenancy and Agricultural Lands (Amendment) Bill 1955, on March 16. The policy of the Government of Bombay in the matter of land reforms has been to remove gradually all intermediaries, so as to make the tiller the occupant of the land. The present Bill for the amendment of the Bombay Tenancy and Agricultural Lands Act, 1948, is a further step in this direction. The Bill defines an "economic holding" as a holding between 4 and 16 acres, depending on the class of soil. The "ceiling area" has been fixed at three times the economic holding.

Redgram Crop in Madras State: The area sown with redgram in Madras State up to December, 1955, is estimated at 163,000 acres. Compared with the area of 161,500 acres estimated for the corresponding period of last year, this is an increase of 0.9 per cent. The present estimate is more than the average area of 158,700 acres for the five years ending 1954-55 by 2.7 per cent. The crop has been harvested in most of the districts. The yield per acre is expected to be below normal in all districts of the State. The seasonal factor for the State as a whole works out to 93 per cent of the normal as against 97 per cent in the corresponding period last year. On this basis the total yield works out to 22,800 tons of cleaned grain. Compared with the yield of 23,400 tons of cleaned grain estimated for the previous year present estimate shows a decrease of 2.6 per cent compared with the yield of 19,900 tons of cleaned grain calculated for the five years ending 1954-55, this is an increase of 14.6 per cent.

World Dairy Congress: The Government of India will participate in the fourteenth International Dairy Congress which is scheduled to meet in Rome in the last week of September, 1956. The Congress will provide an opportunity to dairy workers and organisations in different countries of the world to meet and discuss problems of common interest. The topics selected for discussion at the sectional meetings and at the main conference relate to problems of milk production, manufacture of milk production and consumption of dairy products in various parts of the world and programmes for increasing milk consumption in underdeveloped areas.

INDUSTRY

Rubber from Gas: The making of synthetic rubber from natural gas is one of the projects for which the State-owned Ente Nazionale Indrocarburi has been authorised to float a loan for 60,000,000,000 lire by the Italian Government. Fertilisers are to be produced from the same basic material. The plant at which this work will be carried out will be in Ravenna. The loan, to be issued in equal amounts in each of three years, will also be used to push ahead with more oil hunting in central and southern Italy.

Standards for Toluole and Toluene: The Indian standard specifications, one for toluole, industrial, solvent grade, and the other for toluene, pure, nitration grade, have just been published by the Indian Standards Institution. These standards prescribe the requirements and methods of test for the materials. A distinction of nomenclature is introduced with the publication of these two standards; the commercial name "Toluole" is retained for the industrial solvent grade of the material, while the more correct scientific name "Toluene" has been introduced for the pure grade.

Plans for Electricity Development: The per capita generation of electricity in India registered an increase of more than hundred per cent between 1938 and 1953, according to the hand book "Planning for Power Development in India". The average monthly generation of 283 million kilowatt hours (kWh) of power in 1938 rose to 536 million kWh in January, 1953. During the same period, the per capita generation in the United States and the United Kingdom increased by 150 per cent. The booklet indicates that according to recent surveys completed by the Central Water and Power Commission, India has an approximately hydro-electric power potential of 10.5 million kWh. at 60 per cent load factor.

Water, Gas and Sewage Pipes Draft Standard: A draft Indian standard specification for water gas and sewage pipes (vertically and centrifugally cast) and specials for use with them has been prepared by the Indian Standards Institution and issued for eliciting comments. The draft covers the requirements for cast iron pipes with spigot and socket, for water, gas and sewage, manufactured by one of the following processes: centrifugally cast in metal moulds, centrifugally cast in sand moulds and vertically cast in sand moulds.

Packing Charges for Cement: On March 27, 1954, the Government of India announced that Packing charges for cement would be fixed every quarter on the basis of the overage of the maximum and minimum market prices for packing materials during each week of the immediately preceding nine months plus Rs. 1-4 per ton to cover incidental charges. On this basis, packing charges for the current quarter were fixed at Rs. 13-7 per ton. The packing charges for next quarter commencing from April 1, 1956, work out to Rs. 13-4 per ton. The Government of India have informed all the State Governments of the revised packing charges. The above packing charges are applicable to cement packed in new bags only. Packing charges for cement asked in old bags will be a matter for settlement between the buyer and the seller subject to the maximum indicated above.

TRADE

Indo-Italian Trade: India's import and export trade with Italy in 1955, totalled Rs. 16.89 crores and Rs. 5.59 crores, respectively, as compared with Rs. 17.71 crores and Rs. 3.75 crores respectively in 1954. During the period January-March 1955, it amounted to Rs. 2.51 and Rs. 1.77 crores respectively, as against Rs. 4.22 crores and Rs. 1.39 crores respectively in the same period of 1954. Export of raw wool from India is increasing, while Italy's total imports of this product during the past few years have actually decreased. There are some items the imports of which from India into Italy have remained more or less same as tea, drugs, spices and yarns of vegetable fibres (cotton excluded).

Foreign Sea and Air-Borne Trade of India in February, 1956: The provisional figures of foreign sea and air-borne trade of India on private and Government accounts during February 1956, according to data so far available in the Department of Commercial Intelligence and Statistics, Calcutta, are as follows: Merchandise, excluding transit trade of Pakistan but including that of other land frontier countries: Exports Rs. 50.12 crores, re-exports Rs. 74 lakhs (transit trade—nil), Imports Rs. 64.64 crores (transit trade Rs. 2 lakhs): Total trade Rs. 115.5 crores. Treasury: Exports of currency notes Rs. 14 lakhs, Others—negligible. Imports of currency notes Rs. 1.61 crores, others—negligible. Balance of Trade: The merchandise import figures are

exclusive of the value of certain consignments of Government stores awaiting adjustment. Subject to this deficiency in import figures and to the exclusion of figures for transit trade, the total value of exports (including re-exports) or merchandise gold and silver fell short of imports by Rs. 13.76 crores.

Trade Between India and Japan: It is reported, Japan's trade with India has recorded a steady expansion during the past few years; recently, India's implementation of the Five-Year Plan has resulted in a spectacular advance for Japan's heavy chemical and industrial products on the Indian market. Principal exports are steel products and rolling stock as well as soda ash and caustic soda. As far as Japan's imports from India are concerned, cotton and raw materials, and metal ores, constitute the main imports. An increase in exports of Japan's capital goods is expected along with the realization of India's industrialization. At present 15 or 20 economic technical co-operation projects are underway between Japan and India.

Import of Indian Sewing Machines: Forty-two countries including Aden, Australia, Afghanistan, Burma, Ceylon, Egypt, Gold Coast, New Zealand and Guatemala imported Indian sewing machines. This was stated by Shri T. T. Krishnamachari, Minister for Commerce and Industry in a written reply to a question by Shri D. N. Tiwary in the Lok Sabha. The Minister said that the Tariff Commission had estimated in 1954 that the production of sewing machines had exceeded the demand.

FINANCE

Loans for Mechanisation of Sailing Vessels: The question of advancing loans to owners of sailing vessels to enable them to effect mechanisation and hereby secure increased efficiency is being considered by the Union Ministry of Transport. During the past four years, the quantity of cargo carried by sailing vessels has been registering a steady upward trend. From 8,69,272 tons in 1951-52, the cargo lifted by sailing vessels has risen to 1,499,276 tons in 1954-55. The respective figures for 1952-53 and 1953-54 are: 8,11,529 tons and 9,25,515 tons. Taking an average rate of Rs. 15 as the freight per ton, the total freight earned by the industry during 1954-55 is estimated at Rs. 2.24 crores. With the appointment of three Regional Officers (Sails) at Bombay, Tuticorin and Masulipatam, the problems of this industry, which plays an important role in the transport system of the country, are being attended to more effectively.

Hyderabad Sica Currency: The Government of India, in consultation with the State Government have, further decided to extend the existing conversion facilities for a further period of six months from April 1, 1956 to September 30, 1956. According to the Hyderabad Coinage and Paper Currency (Miscellaneous Provisions) Act, 1953, the Hyderabad Currency ceased to be legal tender as from April 1, 1955. In order, however, to enable the public to exchange their holdings of Hyderabad Currency for Indian currency, the Government of India, had provided necessary facilities at all offices of the Hyderabad State Bank and Treasuries and Sub-Treasuries of the Hyderabad Government, for a period of one year from April 1, 1955, to March 31, 1956.

Madras Cotton Cloth Sales Tax Bill: The President gave his assent to the Madras Medium Cotton Mill Cloth (Sales Tax) Bill, 1954, on March 22. The Government of Madras have decided to levy additional sales tax on the first sale in the State of medium cotton mill-cloth at the rate of one anna three pies for every rupee. In the case of such cloth imported in the State either from

outside the territory of India or from any other State in India, the State Government proposes to levy the additional tax on the first sale effected in the State by a seller after the import of the said cloth into the State.

Grants and Loans for Development of Village Pottery: The Government of India have sanctioned further loans and grants for the development of the village pottery industry. West Bengal gets a loan of Rs. 34,000. Madhya Pradesh has been given a grant of over Rs. 20,000 and a loan of Rs. 3,500. Mysore gets a loan of about Rs. 6,000 and a grant of over Rs. 4,700 for the manufacture of roofing tiles. The All-India Khadi and Village Industries Board has been given a grant of over Rs. 2,250 for meeting the establishment charges of the model production centres at Khanapur and T. Kallupatti.

GENERAL

Expansion of Employees State Insurance Scheme: Nearly 85,000 employees will benefit under the Employees' State Insurance Scheme, which is being extended to 22 more areas in India shortly. These include 7 centres in Rajasthan, 4 in Madhya Pradesh, 6 in Saurashtra and 5 in Travancore-Cochin State. The scheme, which came into force in February 1952, at present covers 10.5 lakhs employees in 31 centres in the country. It is applicable to employees in perennial power using factories employing 20 or more persons. Employees drawing a salary up to Rs. 400 are covered under the Scheme.

Hyderabad Coal Mines Provident Fund Scheme: As a part of their expanded social security programme, the Government of India have framed a scheme called the Hyderabad Coal Mines Provident Fund Scheme for granting provident fund benefits to about 17,000 coal miners of Hyderabad State. The Scheme, which follows the pattern of the existing Coal Mines Provident Fund Scheme functioning in the coalfields of West Bengal, Bihar, Madhya Pradesh, Orissa, etc., has been made applicable to all the four coal mines of Hyderabad with retrospective effect from October 1, 1955, and collection of contributions would commence from April 1, 1956. Under the Scheme every employee whose basic wages do not exceed Rs. 300 per month and who earns a bonus under the Hyderabad Coal Mines Bonus Scheme is required to become a member of the Fund. The employees who have already been contributing to the employer's Provident Funds would, however, join the Fund straightaway from April 1, 1956. The Fund established under the Scheme would merge in that already functioning in respect of West Bengal, Bihar, etc. coalfields and would be administered by the Board of Trustees constituted for the existing statutory Fund.

Project Agreements between US and Government of India: The first twelve project Agreements against the technical assistance allocation of \$10 million for the fiscal year 1956 (July 1, 1955 to June 30, 1956) have been signed between the Government of India and the United States. The allocation provided in the 12 Agreements aggregates to more than \$2.5 million. The Agreements cover mainly provision of technical know-how needed for the implementation of the development projects. The 12 projects for which assistance is being provided include the establishment of a steel foundry at Chittaranjan, Centre for the study of the effect of thermal environment conditions, a project for the development of co-operative techniques in the production, processing and marketing of citrus fruits in India and a nation-wide campaign for the control of filaria. Other projects relate to social welfare work, improvement of agricultural methods, agricultural and home science extension and training, development of an inter-disciplinary curriculum in the field of educational administration, etc.

NEWS IN BRIEF

INDIAN

Over 10,000 villages and about 500 small towns are expected to be electrified during the second Five-Year Plan period under the programme of expansion of power facilities for increasing employment opportunities. The schemes of various States are estimated to cost about Rs. 90 crores.

The US has agreed to supply in 1956 steel to the value of \$22 million for requirements of the Indian railways.

The fifth session of the International Rice Commission of the Food and Agriculture Organisation would be held in Calcutta from November 12 to 17, 1956.

The President has given his assent to the Hyderabad Tenancy and Agriculture Lands (Amendment) Bill, 1955. The Bill seeks to amend the Hyderabad Tenancy and Agricultural Lands Act, 1950, in order to give greater security to Tenants.

The Indian Standards Institution has published an Indian standard specification for wrought aluminium and aluminium alloys, sheet and strip for general engineering purposes.

It is reported that all the missing links of the National Highway system in Orissa State will be constructed during the second Five-Year Plan period.

The Railways in India at present carry roughly one per cent of the country's total population every day.

An Export Promotion Council for tanned hides and skins, leather goods and tannery by-products is expected to be set up by the end of May or the beginning of June this year. The Council will have its headquarters at Madras.

The Expert Committee on Export Credit Guarantee Scheme, appointed by the Government of India, has extended the time by which replies to the Committee's questionnaire or memoranda may be submitted up to April 7, 1956.

The Government of India have sanctioned a further sum of about Rs. 59 lakhs (Rs. 43 lakhs in grants and 16 lakhs as loans) to the All-Indian Khadi and Village Industries Board for the development of the Khadi industry.

The Coal Mines Labour Welfare Fund has so far started 44 adult education centres for providing educational and recreational facilities to adult miners.

The Government of India have made a provision of Rs. 55.9 crores for payment of compensation to displaced claimants from West Pakistan during 1956-57.

The Geological Survey of India has discovered the occurrence of good quality limestone deposits of about 254 million tons in the Dehra Dun-Mussorie area in Uttar Pradesh.

The Sindri fertilizer factory exceeded its production target for the financial year 1955-56. During the year, the factory produced 3,26,062 tons of fertilizer which was 6,062 in excess of the target.

A sum of about Rs. 2 crores is proposed to be spent for the development of salt industry during the second Five-Year Plan period.

FOREIGN

It is reported world's labour force is 1,000 million people. Pakistan's labour force according to the same report is 22,600,000 made up of 21,300,000 men and 1,300,000 women whereas India's labour force is 139,300,000 consisting of 98,700,000 men and 40,600,000 women.

According to two Burmese journalists who were on a visit to East Pakistan on invitation from the Government, Burma has contracted to purchase gunny bags worth Rs. 2 crores from East Pakistan during the current year.

The Governments economic survey setting out Britain's economic prospects and policy for 1956 and a survey of the situation last year has been published as a white paper.

The Upper House Budget Committee approved recently the Japanese Government's Budget for the current year, involving an expenditure of 1,030,000 million yen.

Krupps has decided to go ahead with its Brazilian undertaking. An initial investment of DM. 30 million (£2.6 million) will go for the building of assembly plants for diesel locomotives and lorries of five tons and upwards.

Publicly reported cash dividend payments of US Corporations totalled \$800 million (almost £209 million) in January, 1956, about 12 per cent larger than the \$721 million, disbursed in January 1955.

Foodstuffs worth approximately £2.2 million have been presented to Spain by the United States Government.

Cotton yarn production last year in three countries for which figures are available was about 1½ per cent greater than in 1954 according to the Cotton Board's quarterly statistical review.

According to the Reserve Committee of the Canadian Petroleum Association, Canadian crude oil reserves rose more than 300 million barrels in 1955 to reach a record of 2,509 million barrels. Biggest increase was reported in Alberta and British Columbia.

Pan-Malayan production of rubber in February fell 14 per cent to 51,822 tons. The estates total of 27,577 tons fell 18 per cent and that of small holders declined 9 per cent to 24,245 tons.

Brussels Universal and International Exhibition which will involve the Belgian Government in an expenditure of £80 million will be held from April 3 to November 3, 1958, and will be the first major international exhibition to be held since the war and the largest ever to be held in Europe.

According to the British Bureau of non-Ferrous Metals Statistics, world's smelter production of copper rose by 9 per cent to 2,696,000 long tons, as compared with 2,720,000 tons in the previous year.

A use for rice hulls, ordinarily discarded as waste, has been discovered by scientists at Louisiana State University in Southern United States. From the ashes of the burnt hulls, they have developed a light-weight, low-cost brick that is especially valued for farm buildings.

How banking serves the SPICES INDUSTRY

There is tremendous demand throughout the world for pepper and cardamoms and South India produces the bulk of these spices. One-third of the entire world demand for pepper is grown between Karwar and Cape Comorin; and in 1951-52, India's exports earned more than Rs. 27 crores.

Within the last ten years there has been a remarkable increase in cardamom growing, particularly in the South Indian states of Mysore and Coorg, and the districts of Madura, Tinnevely, Malabar and Coimbatore.

The Indian spices industry has a happy future, and banking will naturally help to expand and improve it. The facilities and guidance of a good bank, such as the availability of ready funds when needed and the collection of dues from any part of the country, have become part of efficient organisation in every industry.

We at Palai are proud that many spice growers of South India employ the complete banking service we offer:

Current Accounts—Demand Drafts—
Telegraphic Transfers—Investments—
Letters of Credit—Bill Collection—
Deposits—Loans & Overdrafts—
Confidential Credit Reports, etc.

If you have business interests in the South, it will pay you to open an account with us. Our 24 branches are strategically located, 22 in important South Indian business centres and two in Delhi and New Delhi; and we have correspondents in all important Indian cities. We offer a fully comprehensive banking service at each office.

Our clients can make deposits at any of our correspondent banks, situated in all important Indian towns and have the amounts credited to their accounts at any of our branches.

PALAI CENTRAL BANK LTD.

(Incorporated in Travancore-Cochin with Limited Liability)

Head Office: PALAI, TRAVANCORE,
Branches at: Madras, Cochin, Quilon,
Trivandrum, Alleppey, Mangalore, Bangalore, etc. Also at: Delhi & New Delhi.

A LEADING BANK IN SOUTH INDIA

Special Articles:

TEXTILE TARGETS IN THE SECOND PLAN

(By G. D. SOMANI, M.P.)

AN unnecessary controversy has been precipitated on the question of fixing production targets for consumer goods industries in the second Five-Year Plan. Both the Kanungo and Karve Committees have recommended that cloth output by mills should be restricted to the present level of 5,000 million yards per annum so that all the additional clothing requirements of the community during the second Plan period may be supplied by the labour-intensive handloom sector. These proposals would certainly have been unexceptionable if, in relation to present output, the required increase in cloth production by 1960-61 had been modest. The two Committees have formulated their proposals in the belief that even after five years, the 'per capita' consumption of cloth will increase only by two yards from the present 16 yards to 18 yards. A people so woefully under-clothed as ours, will most certainly give precedence to cloth next only to food when they achieve a greater purchasing power. If, as our planners anticipate, there is a 25 per cent increase in the 'per capita' income by the end of the second Plan period, it is quite possible that cloth consumption in the country will rise to 22 yards per head. This is the estimate of the textile trade and industry, but even if we accept a lesser rate of consumption, namely, 20 yards 'per capita' as anticipated by the Union Minister for Commerce and Industry and by the two dissenting members of the Karve Committee, the total volume of production that will have to be attained by the end of the second Plan will be considerable in order to clothe an estimated population of 400 million, besides providing for an export of 1,200 million yards.

In other words, cotton cloth production in the country by 1960-61 should reach 9,200 million yards, representing 2,550 million yards more than the current output of 6,650 million yards, consisting of 5,000 million yards of mill cloth, 1,450 million yards of handloom fabrics and 200 million yards of registered powerloom cloth. By freezing mill and powerloom production at present levels, will it be possible for the handlooms to give an output of 4,000 million yards?

The immensity of the task that is proposed to be assigned to the handloom sector can be better understood by studying its performance in recent years. In spite of the most generous help which it has been receiving, its production has not shown any appreciable increase. Thus, the output of handloom cloth was 1,200 million yards in 1953, 1,318 million yards in 1954 and 1,450 million yards in 1955. It is significant that handloom production, which should have reached 1,700 million yards in the last year of the first Plan, has lagged behind by some 250 million yards.

In these circumstances, to expect the handloom sector to raise its present production of 1,450 million yards per annum to 4,000 million yards per annum within a short period of five years by ignoring its serious limitations is to place an unduly heavy strain on one's credibility. Even on the basis of a 'per capita' consumption of 18 yards, it is extremely doubtful whether the production of handloom cloth can be doubled by the end of the second Plan by stabilizing mill and licensed powerloom output at the present level.

In this connection, the observations of an eminent British economist on the shortcomings of the small-scale handicraft industry are worthy of serious con-

deration. The economist, who has made a critical but sympathetic study of the Plan-frame papers of the second Five-Year Plan, says:

"The danger that possibilities in this respect have been over-estimated is rather considerable as a glance at the projected development of the national product clearly shows. It is seen that the increase of the output of small enterprise in the last five years was hardly 10 per cent as against the expected 40 per cent in the next programme."

In the case of the handloom industry, with its admittedly outmoded instruments of production, the Kanungo and Karve Committees have fixed a production target that is one hundred per cent more than the present volume of output. This percentage will be considerably higher if domestic cloth consumption will be more than 18 yards 'per capita'. In the circumstances, competent observers do not expect that handloom production can be increased by more than 1,000 million yards over the present level of output.

Similarly, attempts are being made to prevent any expansion of the spinning capacity in mills. Here again, there can be no valid objection to the development of the non-factory sector if its capacity to deliver the goods is proved beyond doubt. The potentialities of the Ambar Charkha, on behalf of which the installation of additional spindles in mills is sought to be banned, have not yet been fully explored. From the published data, it has been established that mill yarn is much cheaper than the yarn produced on the Ambar Charkha. In this connection, the figures worked out by a distinguished industrialist and referred to in his recent speech provide an illuminating study in contrast:

I. No. of Man-hours required to produce 100 lbs. of 20s yarn.

	On Ambar Charkha	By mills.
2,000 Man-hours	35.84 Man-hours.	

II. Ratio of Man-hours required for a given output:
1 : 55.56

III. Cost of Production per pound of 20s yarn:

	Mill Pies	Ambar Charkha Pies
1. Raw Material	224	224
2. Wage Cost	30	480
3. Stores, Power and Light, Depreciation and Overheads	35	17.5
Cost per pound	289	721.5

In fact, in an article, published in the December issue of "Khadi-Gramodyog", a writer has pointed out that the price differential between Ambar cloth and mill cloth of 20 counts is 5 to 6 annas per yard in urban areas and 3 to 4 annas in rural centres. In order to neutralise the great price advantage enjoyed by mill manufactures, he has rather blithely suggested the imposition of a staggering levy on mill cloth so that

the products of the two sectors may be sold at the same or identical prices.

The author of the article goes on to say:

"To market the bulk of the Ambar Charkha cloth in the rural areas at prices competitive with those of the handloom cloth with mill yarn and mill cloth, the price differentials may have to be eliminated by the provision of appropriate levels of subsidies. Taking the price differentials at an average of 4 annas a yard, the total subsidy requirements over the five-year period amount to Rs. 82.50 crores, rising from about Rs. 1.88 crores in the first year to Rs. 37.5 crores, in the last year of the Plan. To mobilise resources required for this purpose, (excluding the difference that this levy may cause in the prices of mill cloth) an excise duty at the average rate of 6.4 pies per yard on the output of mill cloth may be necessary during each of the Five-Year Plan periods."

In addition, he wants a sum of Rs. 17.68 crores to be spent in order to establish the Ambar Charkha in the country as a spinning unit capable of mass production. The total cost of sustaining this new instrument will thus be Rs. 82.50+Rs. 17.68=100.18 crores, or over Rs. 20 crores per annum.

It is pertinent to ask whether such an enormous expenditure of the national resources would be justified in order to perpetuate a manifestly uneconomic means of production. Moreover, in this scheme of things, the predilections of the consumer do not appear to have been taken into consideration at all. Although there has been more than a three-fold increase in the 'per capita' income, cloth consumption in the country has just begun to reach the pre-war level of 16 yards per head. This is due to the high prices resulting from cost inflation. If cloth becomes even more expensive by the creation of an artificial price parity between mill and handloom products, all plans for increased consumption are likely to go awry. In that event, neither the mill sector nor the handloom sector will be able to expand. Stagnation or fall in production is bound to react adversely on the employment position in these sectors.

Secondly, considerable organisational effort will be necessary in order to establish the Ambar Charkha in the vast countryside and to ensure its efficient working. Can this gigantic task be accomplished within a couple of years, even assuming that the yarn spun on this Charkha will be acceptable to the weaver? The Prime Minister, who is himself in favour of extensive use of the Ambar Charkha, has said:

"In regard to Ambar Charkha, the main difficulty is not the working of the Ambar Charkha. It may be good. But the main difficulty is in spreading it out over thousands of villages. The main difficulty is with regard to its organisation. It is relatively easy to organise a huge iron and steel factory, but it is difficult to organise something which is spread over more than fifty thousand villages. The servicing of it, if something little goes wrong, is another problem. The giving of raw materials and the collection of yarn is a tremendous job. If this machinery does not work satisfactorily, as one might expect, then there might be a lack of production. Therefore, one should rather err on the side of over-production rather than under-production. It is from that point of view, therefore, that one has to think of what spindles might be required in the mills or elsewhere."

The Prime Minister's views on the importance of avoiding cloth shortage are equally valuable. He observes:

"If the demand is much greater, then there is a lag. Then, prices go up and difficulties occur and inflation occurs. We want to avoid that. We do not want to take a risk in that matter and allow demand to out-strip supply of both sides and thereby create other conditions which affect not only our cloth position but our whole economy."

In the concluding part of his speech, quoted above, the Prime Minister draws attention to the fact that already there has been a great strain on the national finances "in spite of our growth because of our big development schemes" and that "there is a big gap between our estimated resources and what we intend to spend". In these circumstances, would it be worth while to spend such a huge sum as Rs. 100 crores on the Ambar Charkha and thus arrest progress in the other sectors of the economy? For these reasons, there is a sound case against the imposition of any arbitrary limit on mill production.

It is readily recognised that the problem of unemployment must be solved, but the claims that are being made on behalf of small-scale industries as a panacea to this ill have no basis in fact. For instance, the Khadi Board hopes that the introduction of 25 lakh Ambar Charkhas "will provide part and full-time employment to 50 lakh persons in the country in the spinning of yarn, 8.46 lakh weavers and 4.25 laks assistants in weaving, besides providing full employment for 72,000 carpenters and their assistants and about 20,000 persons in administration and organisational jobs". This is a breath-taking recital of the capabilities of the Ambar Charkha, but from the practical point of view it is rather incredible.

The snow-ball effect on employment in enterprises directly and indirectly connected with the cotton textile mill industry will be considerable, consequent upon the expansion of the industry on such a scale. The cotton-growers, the machinery manufacturers, the producers and suppliers of mill stores and a host of others, who contribute goods and services to meet the manifold requirements of the mills, derive their livelihood and prosperity from this, the nation's premier organised industry. In short, the industry touches the economic life of the country at so many points, enriching and diversifying it, that it is almost impossible to assess its importance in precise terms. As against this, the contribution which the handloom sector can make either to the enrichment of the economy or to the State exchequer is infinitesimal. Even assuming that the Karve Committee's estimate of additional employment in this sector is correct, the wages payable to the extra one million persons will amount to only Rs. 31.5 crores in one year of 280 working days at Rs. 1-2-0 per weaver per day. On the other hand, the wages and salaries payable by the mill industry, to the additional workers required for producing the extra 2,000 million yards of cloth will be as much as Rs. 45 crores per annum. The prosperity of the nation will be even more impressive if the industry is given a higher production target on the basis of a 'per capita' consumption of 22 yards of cloth, as estimated by the textile trade and industry.

To conclude, the producers do not ask for a higher production target for mills out of any selfish or sordid motives. In fact, they stand to gain if mill output is pegged at the present level, as the pressure of demand for mill cloth will bring them better returns. But it is in the wider national interest that there should be an abundant supply of cloth at economic prices, parti-

cularly at a time when consumer demand is likely to increase. The object of providing full employment and higher wages in the handloom sector will be best served by assigning to it a production target of 2,000 million yards which is both feasible and equitable. It is ear-

nestly to be hoped that both the Planning Commission and the recently appointed Committee on Ambar Charkha will give full consideration to the various points discussed in this article before determining the production targets for the cotton textile industry.

THE CITIZEN AND THE STATE

BY

SARDAR K. M. PANIKKAR

IN a dependent society, the individual is a subject. He has neither the rights nor the obligations of a citizen. He obeys the law because he is forced to do so; he performs such services and duties as he is compelled to, not because he has any obligation. In an independent state where the people govern themselves, the situation is fundamentally different. The basic assumption in a free community is that each individual shares in the responsibility of government and has, therefore, duties and rights towards the society and the state. The obligations of a free citizen in a self-governing community are, therefore, different from those imposed on him in a dependent society.

In discussing the position of the individual in regard to the state in India, this is a major consideration which we must constantly keep in mind. During the period of India's struggle for independence we developed attitudes and ways of thinking appropriate to our position as a dependent people fighting to secure our freedom. We were for over 27 years in revolt against the state, denying its moral validity and claiming the right to disobey its laws and to force it into courses of action by methods of non-co-operation. While no one can deny that an unfree society has the right to resort to such action—in fact the right to rebel—it is obvious that such action—in a self-governing society is against the fundamental postulates of freedom. Leaving alone the group of thinkers who believe in philosophical anarchism, there has been practical unanimity from the time of Bhishma that a free society involved duties and obligations without which man would fall back to the law of the jungle. A widely accepted doctrine of social obedience is, therefore, of the essence of free society. The Constitution of India lays down in general the duties and rights of the citizens, and the democratic nature of that Constitution and its processes at all levels places on each individual the responsibility of sharing in the government. It postulates the widest measure of freedom for the individual and entrusts each one with the duty of participating in the determination of such duties and obligations as are placed on him. The principle of obedience is voluntary and proceeds ultimately from the individual himself.

It is necessary to emphasise this obvious point, for one of the major problems in India is the survival of the doctrine of disobedience, which we had, in the unfree society of the past, adopted with every justification as a weapon of revolt. It is not an uncommon feature of life in India for individuals to go on 'fasts unto death' for political purposes, for students to go on strike, for large groups to reject the decisions which the government takes after due democratic processes. We had some notable instances of such action during the last few years. It is, therefore, necessary to examine how far in the present state of our society such actions can be morally justified. How far is it within the rights of the citizen to disobey the law? How far is it justifiable for individuals to organise the public to resist an unpopular decision taken in full view of the public and after the ascertainment of national opinion. As the name of Mahatma Gandhi is often appealed to by the

advocates of such resistance, it is necessary to consider this question carefully and in all its implications.

The right of mass disobedience is the right to revolt against a state. Such a right undoubtedly exists in the case of a dependent people, as the reduction of a people to such dependence is based generally on conquest. Though a people may have accepted subjection voluntarily, their continuance cannot be assumed to be voluntary. Freedom is the right of every society, and the deprivation of it involves the right of a people to revolt. The right of disobedience is only a passive form of the right to revolt. But does such a right exist in a free society? Normally the answer is no. If a society ceases to be free, or pursues a course of deliberate injustice to an integrated group of people, such a right may be said to arise. Assuming that in a multiple society, one section is dominated by another against which it used all the powers of the state to maintain it in subjection, then clearly the group so held down or oppressed has the right to disobey or to revolt. Mahatma Gandhi in his life emphasised both these truths. The Civil Disobedience Movement in South Africa was the assertion of the right of a section held in subjection and differentiated against by law to gain its rights by passive resistance against the state. The Non-co-operation Movement in India was the revolt of a people against the state with the object of gaining freedom. But the problem is different when the citizens of a free society claim such a right against the state. Here again a distinction has to be made. It is the right of each individual, where his conscience is concerned, to decide whether he could submit to the authority of the state. In such a case the authority of the state is not denied, but the individual, obeying what is to him a higher law, voluntarily submits himself to punishment rather than obey an unjust law. This undoubted right in a free society should not be confused with the right to organise disobedience, for this latter involves a denial of the validity of the state's action and is a repudiation of the allegiance to the state. Such a right does not exist in a free society.

The failure to recognise this essential difference has been at the bottom of much confused thinking in India. We have, as a result of thirty years' struggle, based on civil disobedience, come to value its irresistible potency, and we take pride in the fact that it is through this process that we won our freedom from alien rule. But many people in India seem also to think that it is an instrument which can be used against our own state. The numerous abortive satyagrahas, during the past ten years, should help us to realise that the obligations of the citizen in a free, self-governing, democratic state are inconsistent with the doctrine of passive resistance and the survival of this doctrine among a section of our people is an anachronism, which may have dangerous consequences.

Another unfortunate survival from the period of our national struggle is the attitude of the students to authority and the support that public men extend to student action. In no free society has one heard of

students' strikes. In England, America, France, or any of the other countries, do the students claim the right to walk out of educational institutions? In India, in Egypt, and in the past in Kuomintang China, widespread student activity in politics and withdrawal from colleges for alleged grievances were common features. Again it is a survival of the doctrines of our political struggle. When a nation is engaged in the fight for freedom it is entitled to call upon its young men to join the national struggle. In the same way compulsory military service was extended to university students in European countries during the great wars and colleges were denuded of their members; the nation in India had the undoubted right of calling on the youth of the country to participate in the fight for freedom. But again the persistence of the idea that the students had the right to strike and to carry on agitation is a projection of our past methods into a free society. The right to strike is based on the idea of conflicting interests. In a competitive society, unorganised workers are generally recognised as having a right to strike to secure justice to themselves. But it is necessary to emphasise that in non-capitalist societies this right is not recognized and even in capitalist societies there are strict limitations to its exercise. Clearly the relationship of the students to the university is not that of the employed and the employer. No conflict of interests can be presumed to exist between them as the university exists solely for the students. The right to strike against the university would, therefore, seem to be meaningless and the support that such action on the part of the students receives from political leaders can only be considered as an unfortunate survival of our past attitudes.

In a modern society the rights of the citizen in relation to the state is the most complicated of all problems. Every state in the world today is totalitarian, in the sense that it claims the totality of powers. It was said in the beginning of the century that the modern state was Jenghiz Khan with the telegraph line. Today it is much more than that. It is Jenghiz Khan with distance control exercised by a hundred methods. The new Jenghiz speaks with a million voices on the radio. He overhears our conversations on the telephone. He pries into our secret thoughts by censoring our letters. He controls the water we drink, the food we eat, the lights we use, our modes of transportation, and in fact practically everything in our lives. He gives with one hand and takes away with the other. In fact his picture is that of some demon of Hindu mythology multiplied manifold, a Ravana with a thousand faces and a million hands, each hand wielding a different instrument of power. What chance has the individual against such an institution—impersonal, all-pervasive, unmoved by sentiment, armed both by the power of the law and by every possible instrument of authority. The individual in the modern state, whether it be capitalist or communist, is reduced to a position of nullity.

And yet, all this concentration of power is said to be in the interests of the individual himself. And to a large extent that is true. The laissez-faire tradition of liberalism on which the doctrine of individual liberty is based and to which we hark back did not lead to an arcadian system of happiness. It meant inevitably the right of the capitalist to exploit the worker, of the powerful to oppress the weak, of the rich to grow richer, and the poor to grow poorer, all in the sacred name of liberty of the individual. It was the doctrine of the devil taking the hindmost. Life was conceived as a race for success, with the state, heavily over-weighted in favour of privilege, being the umpire. It is the omnipotent state that has set right some of these injustices of a competitive society by emphasising the ideals of economic equality, social security, nationalised health services, organisation of labour to prevent ex-

ploitation, control of production and distribution in order to secure for everyone the minimum necessities of good living. It is only an omnipotent state which claims the right to act in every sphere that can be a welfare state. When all this is said, the problem still remains of safeguarding the position of the individual in the modern state. This is the fundamental contradiction in free societies today. In India we are facing this at every turn. The tradition of British administration in India was necessarily one of laissez-faire. It tried, except where its own security was concerned, to avoid interference with Indian life and was content to leave us to ourselves—a doctrine which led Mahatma Gandhi to exclaim that of all governments he had the least objection to the British government as it governed the least. But with independence the situation has undergone a revolutionary change. Our objective is the creation of a welfare state based on economic and social planning. By its very nature, it has to interfere with all aspects of our life; even with such intimate things as family relationships, marriage and inheritance, not to speak of the complete control it has claimed on our economic activities. Such a development was necessary and unavoidable. The problem is how to reconcile these claims with the rights of the individual.

THE BELSUND SUGAR COMPANY, LIMITED

NOTICE

The Annual Ordinary General Meeting of Shareholders will be held at the Registered Office of the Company 14, Netaji Subhas Road, Calcutta-1, on Monday, the 30th April, 1956 at 3 p.m. for the purpose of receiving the Directors' and Auditors' Report for the year ended 30th September, 1955, passing the Accounts, declaring Dividend, electing Directors and Auditors in place of those retiring and transacting any other business that may be brought forward.

Notice is hereby given that the Share Transfer Books of the Company will be closed from 16th April to 30th April, 1956 both days inclusive.

The Dividend Warrants will be sent to Registered Shareholders.

By order of the Board,

BANGUR BROTHERS LTD.,

Managing Agents.

14, Netaji Subhas Road,

CALCUTTA.

Dated 28th March, 1956.

N.B. A member entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself and a proxy need not be a member.

The Business World

PRIVATE ENTERPRISE—CORRECT ATTITUDE

By

CROESUS

BETWEEN them, the outgoing President (Mr. K. G. Milne) and the incoming President (Mr. J. F. Sinclair), of the Bombay Chamber of Commerce (Bombay Chamber of Commerce and Industry hereafter) managed to convey both to the Chief Minister of Bombay, who was present at the Chamber's annual general meeting on 22nd March last and to the outside public who were not, not only their apprehensions and difficulties but also their claims in a most telling manner. I particularly liked Mr. Sinclair's dignified, yet firm, categorical assertion: "Do we deserve the respect we claim? I would say firmly that we do". And, all the while, the new President seemed only too conscious of the presence of "our leading castigator of public and private morals, Mr. Gorwala", but I noticed too that that did not either embarrass or make him feel awkward as it might well have done a less experienced and shrewd person. His gleaming eye was more than a match to "the piercing eye" of Mr. Gorwala, so that, not deterred by the latter, he could still assert: "...just as we are certainly in an era of staggering economic expansion, so also we may be at the beginning of an age of deepening social and civic consciousness which we can hope, will permeate us all—politicians, bureaucrats, professional men and, naturally, business men". In other words, he stressed the obvious, though not generally appreciated, fact that the changed times will not leave unaffected only the business men. Notwithstanding all their ability and acumen, business men have certainly not been able to develop a charm that leaves them unscathed by the impact of the revolution that has been taking place today in our social and civic consciousness.

One other striking feature of both the speeches is the great importance that they attach to our second Five-Year Plan and their transparent anxiety to see it succeed, coupled with their assurance to do their utmost—even as the private sector has done in respect of the first Plan. In this connection, I cannot resist the temptation to quote what Mr. Sinclair said, inasmuch as his observation admirably sums up the significance of India's economic progress at the present juncture, a significance which (may I venture to add?) is still not realised and appreciated by many people—particularly some foreigners and quite a few Indians as well. "Economically and industrially, India, it seems to me," said Mr. Sinclair, "is on the verge of an expansion, the speed and extent of which the world may never before have witnessed, and all this by democratic methods" (emphasis is by me). Of a piece with this observation is the following remark of Mr. Milne: "It is natural and commendable...that the new India should be aflame with a desire to catch up with the greatest possible speed on arrears of industrialisation. Nor should it escape the understanding of private business that this titanic exercise is being undertaken at a time when new social values and new conceptions of labour relations have set their mark throughout the world".

Although a spokesman of the private sector, Mr. Milne deprecated the bad habit of talking of sectors, because the word, he said, "tends to create misapprehension". He would not even speak of the two as "complementary" as this too, he said, "is misleading".

To him, "the two are inextricably connected", so that, the wise business man he is, he did not bother about the share assigned to the private sector—though he did say earlier that, while the share of the public sector in the second Plan had been greatly increased, that of the private sector had been drastically curtailed—but felt convinced "of the wealth of opportunity for private business expansion that will be offered in progressively wider measure and over expansive fields". But, for the utilisation of this opportunity, he insisted that Government must recognise "without reservation, that private enterprise is thoroughly well equipped to develop these opportunities." "Private enterprise", he went on, "asks only to be allowed the chance to respond, hand in hand, never in conflict, with Government and its complementary public sector". What response there would be for this request, "the next five years will test and show". Meanwhile, there must be created and brought into being a climate favourable to rapid economic progress. True, almost everyone is anxious to bring this about, but fond hopes and pious platitudes alone do not carry us anywhere. An effective beginning must be made and that by some important person. Presumably, this was at the back of Mr. Sinclair's mind when he said: "We know that, if he (Mr. Morarji Desai) thinks we are talking sense, he will ensure that our views are properly represented to those responsible for making policy in Delhi". Perhaps no less urgent is the need to cry halt to the rather ill-conceived and senseless campaign of abuse of private enterprise in and out of season by persons in privileged circumstances as, for instance, in Parliamentary debates. As Mr. Milne pointed out, vituperation of private enterprise leads us nowhere. On the contrary, it will create the very feeling of frustration which he voiced. "It seems to me to be hopeless to expect the private sector to play its proper part in the progress of the country, if it is to be decied on almost every possible public occasion".

I do not think it is really necessary for me, in these columns, to refer to the criticisms of Government policies and actions by the spokesmen of the Bombay Chamber, if only because they are but the familiar ones already voiced by spokesmen of various other chambers. But the plea of Mr. Milne for an extension of the concessions to foreign technicians, to administrators or executives who were working previously or come hereafter to make a long stay in India, and that of Mr. Sinclair for "a proper place for free enterprise, a minimum of encouragement, and a blunting of the sharper disincentives" to enable "our friends and associates overseas to be allowed to assist to a far more substantial extent (than that indicated by the meagre Rs. 100 crores when our planners were perhaps in one of their less imaginative moods) on terms honourable and rewarding to both sides, in the vast and stimulating task that lies before us all" are worth all the consideration at the hands of the Government. Several prominent Indian business men also would want an extension of the facilities to technicians, though in another form, namely, by way of enlarging the scope of the term "technicians". It is their view that an administrator or a manager, or a cost accountant, or a specialist in scientific management like, say, Lt.-Col. L. Urwick who was recently in India, whose services Indian industries might require for a time, must also be brought within the scope of the term "technicians".

A Letter to the Editor

THE METRIC SYSTEM

Sir,

There are a number of misleading statements in the article which appears under the above heading on page 492 of your issue of 23rd March. First, (a real howler) at the foot of the first column on that page, we are told that "one cubic metre is one litre". Any French schoolboy will tell us that the relation is not so simple as all that!

Next, your contributor's vocabulary is rather muddled over the use of the word "quantity". At the foot of column one on page 492 he talks of "weight, quantity and cubic measure", implying that quantity means "length", but at the top of column one on page 493, he talks of "weight, length and quantity". Here he is clearly using quantity for "volume".

It is certainly wrong to say, as he does at the foot of column one on page 493, that "under the foot-pound system, the maximum fineness possible is 1/1000th of an

inch." Surely it is possible to measure to "half a thou." or even finer, under our present system? Any good tool-room gauge will measure accurately to one-tenth of a "thou".

How right your contributor is, though, when he says that "only frequent use over a period of time can make it (the Metric System) universally accepted". His own inexperience is a good pointer to the muddle the masses will find themselves in when the system is first introduced.

All this is not to say that I am against the Metric System, but we must be prepared for a difficult period while we are getting used to it.

Yours faithfully,

(J. H. Adam)

[We regret the 'howler': there are one thousand litres in one cubic metre.—Ed.]

THE RAMAYANA OF TULSIDAS IN ENGLISH VERSE

LATEST "HINDUSTAN TIMES" PUBLICATION

The famous Hindi epic regarded by many as "the greatest book in all devotional literature" is for the first time now available in English verse.

The translator, the Rev. A. G. Atkins, completed the book after ten years of devoted work. He has tried "to keep and express in English in the fine rhythm and music of the original in simple lucid language, and with as much of the vivacity, wittiness and picturesqueness that Tulsidas has put into his work." He has also followed in some measure Tulsidas's metrical variations such as *chhand*, *chaupal*, *doha* and *soratha*.

In a foreword Mr C. Rajagopalachari says: "Mr Atkins' monumental work and his Introduction are a revelation of hope for those who desire to see all the great religions of mankind come together. His service is not only to English-speaking people but also to that very large number of Hindus in India who do not speak the Hindi language and to whom English has become a very familiar medium."

The book is of special value to libraries, scholars and devotees of Tulsidas.

It has been issued in the following four editions:

- I. Original text of Tulsidas with translation in English verse; three volumes; 1468 pages; price Rs. 50 net.
- II. Translation in English verse; without Hindi text, two volume; 898 pages; price Rs. 40 net.
- III. Special tissue paper edition of I, one volume, price Rs. 100 net.
- IV. Special tissue paper edition of II, one volume, price Rs. 100 net.

THE HINDUSTAN TIMES,
NEW DELHI.

BUSINESS NOTES

AHMEDABAD ELECTRICITY COMPANY

THE AHMEDABAD ELECTRICITY COMPANY's forward planning for expansion has been amply justified by the ease with which it could meet last year's peak demand of 100,000 kw. It is an additional merit of this policy that its power generating potential has been kept ahead of the probable increase in demand. This prudent policy comes in sharp contrast with the experience of some of this country's important industrial centres which have to suffer from intermittent shortages of power. Against this background, it is paradoxical to find that the company should be disabled from passing a legitimate part of its higher productivity to the investor. Mr. K. G. Milne, presiding over the company's annual meeting, has explained how the intermeddling of external agencies imposed a difficult situation upon the management and left it no choice except to reduce the dividend for the accounting year ended 30th September, 1955, by 1½ per cent to 5 per cent. The high cost of capital expansion argued a reasonable case for an increase in the company's rates for electricity by at least 15 per cent., but the Rating Company appointed by the State Government took a rigid and dogmatic attitude and eventually an increase of 8½ per cent only was allowed to the company just in the current year. This is obviously a case where the quantum of the proposed dividend has been adversely affected by external intervention. The investor's confidence in the management's policies, however, will remain unshaken and there can be no doubt that the Chairman's optimism about the future will be taken at face value.

The prospect which has been opened up for electricity undertakings by the Electricity (Supply) Amendment Bill is depressing in certain important directions. It is unfortunate that this should be the case at a time when the expansion of this industry as envisaged in the second Plan will make it necessary for the undertakings to approach the capital market for developmental finance. Mr. Milne's clear and forceful analysis of the implications of some of the amendments merits emphasis. The standard rate has now been linked with the Bank Rate, but it is to be pitched at a point only 2 per cent above the Bank Rate. This differential is certainly quite inadequate on any reasonable test and it ought to be raised at least to 2½ per cent. The disallowance of interest amount for debentures and loans as a charge before determining the permissible profit will deprive electricity undertakings of the benefit which they are at present enjoying to secure a rate of return sufficient to attract fresh investment. The increase in the standard rate will not be enough to offset this loss. The provision in regard to the obligatory appropriation to the Development Reserve at a rate equal to 25 per cent of the capital expenditure during the year concerned and not on the basis of the volume of surplus revenue creates a very difficult situation. It is, therefore, problematic how many undertakings, however efficiently managed, will be able to achieve the full reasonable return. Another unwholesome aspect of the Reserve is that it will bring no benefit to the shareholder since it is to be deducted from the Capital Base and transferred to the purchaser.

While the Bill is still pending consideration before the Joint Select Committee, there is ample time to give mature second thoughts to its ill-digested provisions.

ORGANISATION FOR TRADE CO-OPERATION

THE CORRECT American business attitude to the Organisation for Trade Co-operation is best exemplified in the accredited views of organised bodies like the

National Council of American Importers. Mr. Morris S. Rosenthal, President of the Council, in his statement before the House Committee on Ways and Means last month, announced in unequivocal terms the Council's approval of and support to the projected Organisation for Trade Co-operation. To those who harbour certain mental reservations Mr. Rosenthal pointed out that they need not apprehend any injury to the legitimate interests of American trade and business from the OTC. The powers vested in the President under the Trade Agreements Act constitute a sufficient safeguard in this behalf. But he reminds his country that real content and authority will be imparted to the OTC in a substantial measure only by America's participation.

From its very inception the GATT lacked to some extent the essential sanction and stature as an international instrument of tariff co-ordination because of the fact that it was an interim organisation and was always presumed to be an arrangement for transition to a permanent organisation. The main arguments in support of the formation of OTC are fairly well-known, nevertheless, to dispel any hesitations and to eliminate any wavering attitudes, Mr. Rosenthal has thought it necessary to re-emphasise them. Healthy and mutually beneficial world trade relations can never be achieved on the basis of the bilateral pattern and all efforts must be directed towards the achievement of multilateral trade relations. OTC will serve as a suitable instrument for this purpose. Any likely controversies and disagreements, which must inevitably arise from time to time, can be settled in a spirit of amicable understanding and this fact has been proved in some degree by GATT. Difficulties of under-developed countries and of countries suffering from the malady of imbalance in payments will certainly continue to receive special consideration. OTC with a well-organised permanent secretariat and backed by a consistent body of regulations can work for the elimination of trade obstacles like rigid and harmful customs regulations by aiming steadfastly at a policy of reform.

FOCUS ON COTTON TANGLE

THE CHAIRMAN of the Dawn Mills Co., Ltd., addressing the shareholders on Thursday, 29th March, dwelt at great length on the problems of the cotton trade. Referring to the intervention of the Government in banning futures trading on December 23 last, Mr. Ruia observed that "if it is argued that high prices of cotton could not fit the general economy of the country and that Government intervention was necessary to bring down the prices, I am afraid, subsequent events have not borne out this view". In fact, during the last three months all the commodity markets have maintained an upward tendency and there have been substantial rises in other forward markets too. In the circumstances, Mr. Ruia asked why cotton alone should be singled out "as deserving of Government intervention".

In the absence of any hedge facilities thus, the cotton trade in general and manufacturers, merchants and growers in particular, are verily in an unenviable position. Apart from the inflationary pressure on prices, the cotton crop this season has been considerably damaged on account of untimely rains and floods and the quality and the quantity have been adversely affected to the extent of about 20 per cent. Under these conditions prices could hardly be expected to be kept at "reasonable" levels. Mr. Ruia is, therefore, convinced that "the forward market is not likely to reopen unless the Government revises its policy in consonance with the market trends."

Now, what are the prospects of Government taking any measures to have the resumption of futures trading in cotton? The pattern of trading in the spot market, almost throughout the month of March, has not been in any way conducive to any reopening of forward trading in cotton. For in many cases the prices have been pushed very near to the ceilings fixed by the Government while prices have occasionally hit the ceilings. Government, by causing the resumption of futures trading, would only be accelerating the rising tempo in the spot market. In order not to give a handle to the bulls Government is left with the alternative of either reintroducing the quota system for allocating the available supply of Indian cotton among the mills on an equitable basis or revision of import policy, permitting purchase of US cotton stapling 2" and above. In fact, a directive issued by the Textile Commissioner in the middle of last month clearly indicated how the Government was going to act. The said directive asked mills to furnish 'within seven days' a statement of ready and delivery cotton purchased by them as on February 29, 1956. Evidently, this information was called for to ascertain the stock position of Indian cotton with individual mills with a view to exploring the possibility of importing lower qualities of American cotton. Some trade quarters suggests that both the alternative measures may be given effect to simultaneously. One good thing (from the point of view of resumption of futures trading) that has come out as a result of the repeated rumours of Government intervention in the spot market was the psychological bearish bent that the market assumed gradually. Unless the price trend in the spot market assumes what Government considers to be a reasonable level, it is unlikely that any effort would be taken to effect resumption of futures trading in cotton.

BANKERS' PROBLEMS

THE DIFFICULTIES under which banking business is conducted in India were emphasised by Mr. C. H. Bhabha at the ninth annual general meeting of the Association in Bombay. According to him, while it is heartening to note the increasing gross earnings of Indian non-scheduled banks, the picture presented by the net results of their working is not very encouraging. This is mainly due to the rise in establishment expenses. It was only in 1954 that gross earnings increased substantially more than establishment expenses. The percentage of establishment expenses to working funds of Indian scheduled banks was 16.08 in 1954 and 16.50 in 1953 against only 10.13 in 1948. This trend, we are told, has adversely affected the net profits of Indian scheduled banks, which are left without sufficient reserves to meet contingencies. In the result, the total net profits declined from Rs. 3.7 crores in 1948 to Rs. 7 crores in 1954. Working funds also were lower at Rs. 876.56 crores at the end of 1954 as against Rs. 937.89 crores in 1948.

That banking in India is still in its infancy and needs constant nursing is borne out by the fact that the total assets of Indian banks, including those of the Banking Department of the Reserve Bank, are only Rs. 1,500 crores, compared to Rs. 12,000 crores of the British banks and Rs. 80,000 crores of the American banks. Is it a surprise then that all the assets of the Indian banks are no more than those of a single big American or British bank?

Employer-employee relations have been none too cordial, and even the passing of the Industrial Disputes (Banking Companies) Decision Act 1955, has not had the desired result. Labour indiscipline in the banking industry has been the subject of a good deal of comment in recent times. In this connection, it has been significantly suggested that, as in the USA, only those

unions which have a membership of 50 per cent of the employees should be recognised by the Government. The obvious implication is that even the educated bank employees have allowed themselves to be led by outsiders with no stake in these vital institutions.

EMERGENCE OF SOLAR ENERGY

THERE WAS no need whatsoever for Mr. J. R. D. Tata to be so apologetic as he seemed to be about the lengthy reference he made recently, in his presidential address to the Nineteenth Annual Meeting of the Court of the Indian Institute of Science, to the subjects of atomic and nuclear energy. For, as he himself observed, these "hold out a promise of revolutionary developments of immense potential benefit to our country to which, if we go about in the right way, we can make a valuable contribution". "The coming years", to quote (or rather requote from Mr. Tata) what Dr. Bhabha said in his admirable presidential address to the Geneva conference on the peaceful uses of Atomic Energy, "will see many new applications and achievements which we can only visualise at present. The historical period we are just entering may well be regarded one day as the primitive period of the atomic age." It was Dr. Bhabha, again, who also drew attention, in a paper he read at the same conference, to the enormous amount of solar energy available in a sun-lit country such as ours. There is no country in the world, "which, by the nature of its geographic, climatic and economic circumstances, is better suited than India to the use of solar energy as a source of power and heat or which can derive greater benefit from it". If, therefore, it is the opinion—even if it is based on tentative estimates—of so eminent a scientist as Dr. Bhabha that the pattern of energy consumption in this country indicates that, while atomic energy might be economically competitive in certain areas, there is enormous scope for the use of the solar energy in several parts of the country, it is only proper that institutions such as the Tata Institute in Bangalore should play their rightful role in what Mr. Tata aptly described as "this exciting adventure".

Obviously, the outside world has taken long strides in both atomic and solar energy since we in India began to think of solar stoves or cookers (thanks to the late Dr. S. S. Bhatnagar) and atomic reactors. Since then much water has flowed under the bridge. Thus, the deliberations at the International Conference and the World Symposium on Applied Solar Energy recently held in America have reached the heartening conclusion that the prospects of practical uses of solar energy are none too distant. Already considerable progress has been made, it is said, towards the solution of many complex, scientific and technological problems. Mr. Tata alluded to some interesting achievements made by other countries which are worth noting. Thus, France is reported to be building a 1000 kw. solar furnace for high temperature industrial applications, while Italy has developed a solar irrigation pump, and the US Air Force has been supporting a project for converting solar energy into chemical energy through the production of hydrogen from water and its subsequent conversion into electrical energy in a hydrogen-oxygen fuel cell. All these applications of solar energy could indeed be profitably employed in our country also and all efforts, made by any agency, to place them at the disposal of the Indian people must be welcomed. But it is always prudent and statesmanlike to avoid duplication of effort or avoidable clashes in these matters even at the start. Mr. Tata did well, therefore, to acknowledge the work on solar energy already done by the National Physical Laboratory, even while pleading for the concentration, in the Indian Institute itself, of all fundamental and applied research in this field.

COMPANY AFFAIRS

THE TATA MILLS LTD.

The profits of the Tata Mills Ltd. have more than doubled during the year to December, 1955, compared to the previous year. During the year under review, the profits, after providing Rs. 10 lakhs for bonus, Rs. 20 lakhs for depreciation and Rs. 55,800 for taxation, amount to Rs. 7,69,550 against Rs. 3,39,552 in the previous accounting period. Adding thereto Rs. 11,417 brought forward, the total available for distribution is Rs. 7,80,967, from which the Directors have appropriated Rs. 6,52,482 to Dividend Reserve Account and Rs. 35,000 to Gratuities Account, leaving a balance of Rs. 43,485 to be carried forward. The proposed dividend on ordinary shares is Rs. 4 (Rs. 2-8-0) without deduction of income-tax (to be paid out of the Dividend Reserve Account).

Trading conditions were favourable during the year. No further controls were imposed on the industry and there was a sustained demand for cloth at remunerative prices. For the first time since partition, the Indian cotton supply position became easy, the quota system was abolished and mills were able to secure their requirements at satisfactory rates.

In pursuance of the Company's plan for the reorganisation and renovation of the mills, machinery of the value of Rs. 16,70,000 was installed in 1955. At the end of the year, machinery of the value of Rs. 1,90,000 which was received had still to be installed. The authorised capital of the Company has been increased from Rs. 66,12,500 to Rs. 1,00,00,000 by the creation of 1,35,500 new ordinary shares of Rs. 25 each.

SVADESHI MILLS CO., LTD.

Like those of its sister concern, the Tata Mills, Ltd., the working results of the Svadeshi Mills Company have also shown substantial improvement during the year ended December 31, 1955. The profits for the year, after providing Rs. 19,00,000 for depreciation, amount to Rs. 15,77,509 against Rs. 8,30,903 in the preceding year. Adding Rs. 43,799 brought forward, the total amount available for distribution is Rs. 15,91,308, from which Rs. 14,88,697 have been appropriated to Dividend Equalisation Fund and Rs. 35,000 to Gratuities Account, leaving Rs. 67,611 to be carried forward. The Directors have recommended payment of a dividend of Rs. 5 (Rs. 5) on preference shares free of income-tax and Rs. 12 (Rs. 8) on ordinary shares without deduction of income-tax.

In accordance with the Bombay bonus agreement, the Company will have to pay the minimum of 4.8 per cent of the basic wages, which will amount to about Rs. 2,00,000 each for 1953 and 1954. Further progress was made in the reorganisation and renovation of mills. Machinery of the value of about Rs. 37,11,000 was installed in 1955. At the end of the year further machinery of the value of about Rs. 3,62,000 was received.

THE BANGALORE MILLS CO., LTD.

The working results of the Bangalore Woollen, Cotton and Silk Mills Co., Ltd., for the year ended December 31, 1955, show that, after allowing Rs. 18,17,314 for depreciation but before providing for taxation and bonus to employees, there is a profit of Rs. 56,34,938. Adding the unappropriated profit brought forward of Rs. 2,44,711, the total sum available for disposal amounts to Rs. 58,79,649. Out of this, the Directors have recommended payment of a dividend of Rs. 3 per share, for the half-year ended June 30, 1955, free of income-tax, on the 6 per cent cumulative preference shares, which absorbs Rs. 18,000. An equal

dividend for the half-year ended December 31, 1955, absorbs another Rs. 18,000. The interim dividend of Rs. 10 per ordinary share, for the half-year ended June 30, 1955, free of income-tax, takes away Rs. 4,05,000. Another Rs. 3,10,000 are to be paid as final dividend at Rs. 20 per ordinary share for the year ended December 31, 1955, free of income-tax. After making provision for taxation amounting to Rs. 20,25,000, bonus to employees for 1955 Rs. 10,90,000, general reserve Rs. 9,00,000, workpeople's housing fund Rs. 3,00,000 and officers' retiring fund Rs. 75,000, there remains a balance of Rs. 2,38,649 which is proposed to be carried forward.

During the year, production and sales showed a further increase, but it was not found possible to raise selling prices to cover the cess and excise duties imposed early in the year on Woollen and Union fabrics. In fine cotton section also, there was need to meet increased competition. This has resulted in comparatively reduced profit margins and, therefore, the unusually high level of profits attained in 1954 could not be reached.

The Government has given consent to the Company's proposal to capitalise Rs. 81 lakhs of the general reserve by the issue of two ordinary shares for each such share held. The Directors, however, now feel that the present position is uncertain and that it is in the interests of the Company to defer action for the present.

MADURA MILLS CO., LTD.

The accounts of the Company for the year ended December 31, 1955, show a net profit of Rs. 44,20,509, after allowing for taxation amounting to Rs. 33,66,000, depreciation Rs. 18,72,633, and managers' commission (Rs. 10,01,154 less Rs. 28,150 charged to capital) amounting to Rs. 9,73,004. After taking into account the credit carried forward from the previous trading period, there is a balance of Rs. 53,87,309 at the credit of Profit and Loss Account. The Directors have recommended payment of a dividend of 20 per cent, free of tax, and the balance of Rs. 18,86,813 is carried forward.

The bonus to workers and staff for the year under review is hoped to be decided shortly. Any such bonus to be payable will be treated, as usual, as a charge against the trading results of the current year.

THE ORISSA MINERALS DEVELOPMENT CO., LTD.

The Profit and Loss Account of the Company for the half-year ended June 30, 1955, shows a credit balance of Rs. 3,05,053. This is after providing Rs. 89,344 for depreciation, Rs. 1,50,000 for taxation, and taking Rs. 15,217 to provision for staff and workmen's accident and compensation, Rs. 50,760 to tax contingency reserve and Rs. 1,40,000 to mechanisation reserve and including Rs. 11,217 development rebate reserve written back, Rs. 1,50,000 taxation provision no longer required and Rs. 91,384 brought forward from the previous half-year. The Directors have proposed to pay a dividend of 20 per cent per annum on 200,000 ordinary shares, without any deduction for income-tax paid by the company, which absorbs Rs. 2,00,000. The balance of Rs. 1,05,053 is carried forward.

Both raisings and despatches of iron ore at 220,283 tons and 224,788 tons, show a fall compared to the previous half-year's 303,531 tons and 310,459 tons respectively. Shipments to Japan at 48,811 tons are, however, over 2½ times that of the 19,002 tons in the previous half-year. Raisings of manganese dioxide also show a decrease of 580 tons, though sales have increased by 473 tons compared to the previous period. Manganese ore raisings have increased but sales have recorded a sharp drop from 27,388 tons during the previous half-year to 16,959 tons in the period under review.

COMMODITY NEWS AND NOTES

NEW INTERNATIONAL TEA AGREEMENT

The new standard export quotas suggested for the participating countries under the new International Tea agreement, expected to be signed soon, totalled 1,122.5 million lb. This quantity is considerably higher than the old standard export quota, which amounted to 808.4 million lb. The quota assigned under the new agreement is 500 million lb. for India, 47.5 million lb. for Pakistan, 400 million lb. for Ceylon and 175 million lb. for Indonesia. The corresponding figures under the old agreement were 348.24 million lb., 35 million lb., 251.59 million lb. and 173.6 million lb. It is further understood that for the time being the restrictive clauses on replanting, extensions and exports have been suspended.

EXPORT OF HUSKED RICE

The Government of India have decided to resume licensing of export of husked rice "to certain extent", against pre-ban commitments, according to a press note issued by the Joint Chief Controller of Exports. Shipments against the pre-ban commitment would be allowed up to April 22 only and no extension beyond that date would be granted. Export of husked rice outside India was banned in view of rising prices on January 19, 1956. Later exports were permitted against pre-ban firm commitments until early in March, when they were again stopped.

WORLD WOOL CONSUMPTION

Estimates compiled by the Commonwealth Economic Committee indicate that world consumption of virgin wool during 1955 reached a total of 2,580 million lbs. (clean), an increase of 3 per cent over the figure of 2,502 million lb. recorded for 1954. The estimate for 1955 is the third largest since the war, having been exceeded only in 1950 and 1953, when the respective aggregates were 2,681 million lbs. and 2,631 million lbs. (clean), respectively. In the eleven countries, which together use about two-thirds of the world's wool, consumption last year increased by 4 per cent over 1954, the outstanding advances being in the USA (9 per cent), West Germany (9 per cent) Japan (13 per cent) and Canada (22 per cent). In the United Kingdom, still the largest user of wool in the world, the increase over the year was 3 per cent, but there was a sharp increase of 14 per cent in the final quarter of the year. Wool consumption in France, however, was 4 per cent less than in 1954, and in Italy the fall was 6 per cent, but France—like the U.K.—registered a sharp increase in consumption in the final quarter. Outside the eleven large manufacturing countries, wool consumption in the rest of the world during 1955 is estimated at 2 per cent more than that in 1954. Approximately half the rest of the world total is accounted for Russia, Eastern Europe and China, consumption estimates for which are 3 per cent higher than in 1954.

PAKISTAN'S RAW JUTE EXPORTS

Sales of raw jute for export declined sharply to 169,451 bales during the fortnight ended March 15, 1956, from 223,157 bales in the corresponding period of the previous month, according to figures released by the State of Pakistan. The UK topped the list

of buyers with a purchase of 23,896 bales, closely followed by Poland with 23,095 bales. Of the total sales, during the fortnight under review, the Sterling area accounted for 48,506 bales, the Dollar area for 15,475 bales. Continental area for 95,686 bales and other areas for 9,784 bales.

WORLD TIN PRODUCTION IN JANUARY, 1956

The world's mines produced only 13,900 tons of tin-in-concentrates during January, 1956, a drop of 1,100 tons from the December total. Yet Malaya's output was the highest ever at 5,531 tons. In the previous month it was 5,090 tons. Tin metal in Malaya was a post-war record at 6,995 tons, an improvement of nearly 2,000 tons on December. Indonesia was one of the areas which proved disappointing in the concentrates field, her January, 1956 total being 1,999 tons compared with 2,239 tons in December, 1955.

FALL IN US RUBBER CONSUMPTION

US consumption of natural and synthetic rubber in February, 1956, a short working month, fell to 125,292 against 133,013 tons in January, 1956. Natural consumption in February was 49,915 tons, against 53,599 tons in the previous month and 50,997 tons in February of 1955. Consumption of synthetic was 75,377 tons, compared with 79,414 tons in January and 67,614 tons a year ago. The ratio of natural used fell during the month by 0.45 to 39.84. U.S. stocks of natural at the end of February 1956 amounted to 110,293 tons and those of synthetic to 147,087 tons.

EXPORT OF FISH MEAL AND MANURE

The export of horn and hoof meal, sterilized animal meal, and blood meal will continue to be licensed freely up to the end of June 1956, against no objection certificates from the Governments of States, from which these manures are obtained for export. A quota of 500 tons has been fixed for the export of fish guano from the Port of Bombay during the current half year, January-June, 1956. The export of fish meal and fish manures from the port of Bombay will be allowed within the portwise ceilings of 800 tons during the rest of the current half-year on a "first come first served basis."

RUBBER PROSPECTS FOR 1956

According to a leading American rubber consultant, 1956, would be a good year for natural rubber throughout the world. With booming demand everywhere, any excess of production over consumption at the end of the year would be in synthetic and not natural rubber. The anticipated fall in US car production this year would not materially affect the prospects of natural rubber. The cut would have no drastic effect as world consumption was expanding rapidly. In 1956, output and consumption of natural rubber would exceed 1.9 million tons each. Of this America would use nearly 600,000 tons. Natural rubber producers should establish a technical liaison service as only through such a body could natural rubber be sold on a bigger scale and its range of uses expanded.

Company Meeting

THE AHMEDABAD ELECTRICITY CO., LTD.

Speech delivered by the Chairman, Mr. K. G. Milne

Gentlemen,

The year under review has been one of continued growth and consolidation, culminating in the peak demand on your Power plant reaching 100,000 KW. Your Directors have always adopted a progressive policy coupled with a spirit of initiative and as a result the expansion of your Company's power facilities is ahead of the demand, which affords the City of Ahmedabad an enviable position when compared to many other places in India.

Unfortunately the fortunes of few industries today are conditioned solely by their own foresight, however astute. External factors intervene to nullify the most careful planning, and the Electricity Supply Industry has come in for more than its share of such intervention. It is solely on account of this that your Directors have thought fit to propose to you a cut in the year's dividend from 6½ per cent to 5 per cent, and as you may well be very disappointed at this, as your Directors are also, I will discuss at some length the factors which have influenced your Directors to come to this decision and about which I gave you warning at this time last year.

In 1946-47 your Company's plant capacity was of the order of 37.5 MW. This rose to 97.5 MW. in 1950-51, and in 1954-55 the plant capacity had reached 142.5 MW., when the combined subscribed Share Capital and Debentures stood at Rs. 10,75,00,000. A further 15 MW. Turbo-Alternator Set has recently been placed on order to meet the ever-increasing demand, a demand which in your Company's area of supply is increasing by an average of more than twice the accepted world average of 7 per cent. It is this very magnitude and pace of expansion in recent years, which, paradoxical though it may seem, has reacted to penalise the investor.

During these years of rapid investment and expansion with high-cost plant and attendant high annual capital charges, and with rising expense levels generally, even the very modest return permitted under the Electricity (Supply) Act has not been achieved for several years past. For the year under review we are short of it by the calamitous figure of Rs. 27 lakhs. We have been caught by the continued necessity to expand even within the by no means adequate level of return prescribed under the Electricity (Supply) Act what time our charges for Electricity have been conditioned by politics and by the contradictions inherent in diverse provisions of the Electricity (Supply) Act versus the Indian Income Tax Act, as repeatedly stressed from this Chair at former Annual General Meetings. Hence it has only been possible to keep up our moderate dividend level at all by drawing subsistence from the tax relief resulting out of accelerated Depreciation Allowance given under the provisions of the Income Tax Act, but which properly should have been made additionally available for us to place in Reserve to meet

the corresponding future tax liability which must arise when the Allowances decelerate in their turn.

The proposal of the Company in April 1954 to put its house in order by a 15 per cent increase of its rates, was overtaken by the imposition by Government of a Rating Committee whose Report is common knowledge to you all. This was followed by the freezing of the Company's old rates where they stood, and until circumstances changed. In the meantime the Company referred for arbitration by the Central Electricity Authority the long-standing dispute with the State Government over the admissibility of interest on Loan and Debenture Capital as an item of operating expenditure for purpose of determining the Clear Profit. The Award of the Central Electricity Authority in the Company's favour was not announced until April 1955, but when it came it proved a fundamental change in the circumstances as viewed by the Rating Committee, and there followed at once a resumption of negotiations with the State Authorities for an upward revision of rates. Unfortunately even then these negotiations were prolonged; and it was only at the beginning of the current year that an 8½ per cent surcharge on supplies to Industrial and Commercial H.T. Consumers could be effected. No benefit to the Company's finances could, therefore, accrue during the year ended September 30, 1955. The delays and curtailments inherent in these developments, which have been entirely beyond the Company's control, have culminated in the diminution in the Company's disposable surplus to the point we have reached in the proposal for a lower dividend.

It might be asked whether we could not have availed of the Dividends Equalisation Reserve to a greater extent than Rs. 6 lakhs to maintain the Dividend level, in the hope that earnings hereafter would equal the return permitted under the Electricity (Supply) Act. I may say that your Directors have given most careful consideration to this point, but a number of factors have influenced them to come down on the side of austerity. Our liability for payment of Tax at present deferred is gathering momentum. The final verdict on the liability of the Company for Additional Income Tax in respect of past years, and to which I will refer later, is still unresolved. The margin of profit allowed by the law makes it likely that, even in the best years, subsequent replenishment of free Reserves will be possible only in meagre amount, if at all. In the circumstances it has been thought best to conserve our resources, already drawn down to a level incommensurate with the size and position of the Company, so that we may be better able to meet contingencies which might arise. I feel confidence that in the light of the circumstances you will be in agreement with this policy.

The Electricity (Supply) Amendment Bill introduced in the Lok Sabha in September 1955 still awaits reference to a Joint Select Committee of both the Houses of Parliament. If this materialises during the current Budget Session of Parliament, the Bill will find its

place in the Statute Book before the close of the Company's current financial year. From the financial point of view the principal changes sought to be made to the Electricity (Supply) Act are three. First, the proposal to link the Standard Rate to the Bank Rate with a differential of 2 per cent (instead of the present fixed overall level of 5 per cent). Second, to provide for the Electricity Supply Industry to "avail of the benefits of the Development Rebate permitted under the Finance Act, 1955". Third, to disallow Debenture and Loan Interest as an expense in the computation of permissible Clear Profit, on the ground that Debentures and Loans find their places in the Capital Base upon which the Standard Rate of return is already allowed.

Much has already been said about the need for greater incentive to sustain and promote investment in the Electricity Supply Industry, and it is most unfortunate therefore, that the proposal regarding the Standard Rate as outlined in the Bill will not positively ease the Industry's difficulty in raising finance for expansion. The situation calls for a differential over the Bank Rate of 2½ per cent at least. Even with that, there will be no scope for providing that measure of internal finance which the extensive Capital development programmed for the Industry in the Country's second Five-Year Plan could absorb. With the disappointment prevalent regarding "Electrics" amongst the investing public, approaches to other agencies, e.g. Banks and Investment Corporations, for the necessary finance will become imperative more often than not. What the fate of such approaches will be, and on what terms of interest and security such agencies might lend, if at all, gives much food for thought; especially when viewed in contrast with the very low rate for statutory return delimited for equity capital itself in this Industry. In this connection I should like to say how grateful we are as a Company to the Bank of India Limited for the confidence they have always shown in us, and for the great volume of assistance they have rendered to us on most fair terms over the last few years.

While the proposed revision of the Standard Rate does not enthuse the Industry, the provision in the Bill with regard to a Development Reserve is extremely unwelcome as it stands. Any compulsory appropriation to Development Reserve ranking as a prior charge in the calculation of the Clear Profit would create a perilous position indeed, for who could be sure of being able to earn enough Clear Profit in every year both to meet this prior charge and the full Reasonable Return! An appropriation based, not on revenue surpluses of any year, but on 25 per cent of capital expenditure during that year, must give rise to fluctuations with which the tariff structures of a tightly regulated and capital intensive Industry, such as ours, could never adequately cope. Moreover, the creation as proposed of the Development Reserve visualises no benefit to shareholders, since the Reserve would have to be deducted from the Capital Base and ultimately passed on to any purchasing Authority. The authorities have been specially apprised of the dangers, and the suggestion has been made that at least appropriations to any statutory Development Reserve should be made optional within a limit, so that the virulent threat of such a Reserve encroaching upon the Reasonable Return would be removed.

The proposal to negative the allowance of Debenture and Loan Interest as a charge before arriving at permissible profit, will remove an advantage which played its part in helping us to maintain a level of return sufficient to attract new Capital during all the years of heavy capital expenditure since 1948—the year the controlling Act was passed. During these years we raised and invested in Electric service Rs. 5½ crores of equity capital and Rs. 1½ crores of debentures. Now in fact your

Company stands to lose more from disallowance of interest figures than it stands to gain from the proposed upward revision of the Standard Rate of return. Thus when we asked for bread in the shape of greater incentives to attract more Capital, we are in fact likely to be offered a stone, as the proposals before Parliament are framed at present.

The draft outline of the second Five-Year Plan refers to the need for a re-statement of the Industrial Policy Resolution formulated by Government in April, 1948, so as to indicate "fresh fields to be reserved for public enterprise, the fields in which public enterprise is to take on larger responsibility and the fields in which private enterprise is to function subject to overall regulation and control". Until this re-statement has taken place it is difficult to foresee what the future of the Electricity Supply Industry will be, but considering that the Industry is subject to rigorous financial control by the Electricity (Supply) Act there is no reason why the place at present occupied by the private enterprise of the Industry in the country's power development should not be maintained. There have recently been discordant notes about the respective roles of the Public and Private Sectors, but the Planning Commission has stated that the "two sectors have to function in unison and are to be viewed as part of a single mechanism. The Plan as a whole can go through only on the basis of a simultaneous and balanced development in both sectors". I am entirely in agreement with this view.

To those who repeatedly advocate nationalisation of Electricity Undertakings, the unfortunate position of consumers in Madras State should stand as a warning. For several years, this State has been repeatedly hit by droughts which seriously curtailed Hydro-Electric Supplies, and yet after all these years, the State Authorities, which control 98 per cent of the Generation, have not been able to put their house in order by firming up the Hydro-Electric Plant by suitable additions to the Thermal capacity of their inter-connected system. Once again, this year, consumers are being subjected to drastic rationing in their electric supplies.

The first Budget of the second Five-Year Plan, if nothing much else can be said in its favour, promises to diminish some of the difficulties arising out of the contradictions between the Electricity (Supply) Act and the Income Tax Act in respect of depreciation. The withdrawal of the Initial Depreciation Allowance will assuage the problem of Deferred Taxation to a certain extent; but only to a certain extent, and that in respect of the future. The abolition of Additional Income Tax in its past form relative to Dividend will mean that in future this vexed question will no more plague the Electricity Supply Industry. The Sword of Damocles, however, in the shape of the contingent liability for this Additional Income Tax in respect of the past years still hangs over us, as you will see from one of the footnotes to the Balance Sheet. High hopes were entertained recently that this note would no longer be required, with the Company's freedom from the Tax definitely established when the High Court pronounced its decision in favour of a Company whose position was similar to ours. Since then, however, the Income Tax Department have gone in appeal to the Supreme Court, with the inevitable delay and uncertainty which this entails. Linked closely with the ultimate ruling by the Supreme Court will be the right or otherwise to "gross up" your dividend from your holdings in this Company; so you will still have to wait some time yet to have the long overdue answer to this question. I have told you previously that the Agency Company itself is also involved in this complicated matter and will contest its case at the opportune time.

In November, 1955, the Government of Bombay in the Public Works Department issued a directive to

Licensees in the State that "the consent of the State Government is necessary to declare dividends in excess of 3 per cent until all arrears of depreciation are cleared off". The Central Electricity Authority has since ruled that so long as the depreciation for the year and any instalments in respect of arrears are appropriated there can be no bar to payment of dividends above 3 per cent. This Company never admitted to having any arrears in any case, but the general result is satisfactory and solacing to investors, who had been much worried. This ruling settles one more controversy between the State Governments and the Undertakings in favour of the industry. Another matter recently settled in the industry's favour is her right of an Undertaking to increase its rates to reach the Reasonable Return under the Electricity (Supply) Act although the rates will thereby be brought into excess of the maxima laid down in the Company's Licence.

We have through constant and successful effort so increased the efficiency of the Company's operations as to have been able to counteract a number of those increases in cost which are beyond our control. With coal in particular, a substantial saving, counted in lakhs of rupees, has been affected during the year under review by reason of an average coal consumption of 1.5 lbs./kwh being attained, and this despite deterioration in quality of the coal received. There is a limit, however, to our ability to absorb rising costs, and now-a-days much of the increased cost arises from burdensome levies of the State or of Government monopolies, the latest being the Surcharge to be imposed by the Railway Ministry from the first of next month.

No one can cavil at Government's policy of intervening to shield its citizens at large, whether industrialist, business man or householder against obviously undue burdens being placed on them by monopolists or others. It is, however, exasperating in the extreme for us to see so much time and effort being given by Rating Committees to the examination of the affairs of Electricity Supply Undertakings whose books show they need to increase their rates, and where the necessary actions by and large will have a very small effect on a manufacturer's production cost or on a householder's budget, while State monopolies literally by a stroke of the pen impose much more far-reaching economic burdens on us all, without the public knowing anything about any investigation into their affairs. At least one feels entitled to ask that Rating Committees should not reject the swift and accurate results which may be had from a study of the audited accounts, that normally satisfy everyone else, in favour of bringing in much more delayed findings derived only after pondering a labyrinth of complex calculations in which all but the specialist will certainly be misled.

To the Resident General Manager and his Staff I must express my high appreciation of their service and the standard of efficiency maintained during the year. A competent staff is one of a Company's biggest assets, and we are very fortunate in that. The Company's facilities at Sabarmati Power Station, at Shahpur Road, and at the Office at Lal Darwaja, continue to keep pace with the needs of the situation. As the great need of the day is more and more emphasis on education at all levels, I would like to make special reference to the opening in June, 1955, of a Kindergarden School at Sabarmati, which will supplement the other educational arrangements already assisted by the Company in the locality.

Having commented earlier on the circumstances leading up to the recommendation of a lower dividend for the year under review, and on other aspects of the situation affecting or likely to affect your Company,

there is I think nothing of particular interest for me to add in respect of the Accounts which are before you, and which, together with the notes appended to them, are sufficiently informative.

To conclude—in spite of the set back reflected in the proposal for a lower dividend for the year under review, I feel that the future can be viewed with a modest degree of confidence, and certainly so far as those difficulties are concerned which are within our control. The recent additions to the plant have given the Company an instrument of high technical efficiency which should enable it to earn the statutory Standard Rate prescribed under the Electricity (Supply) Act, given no undue reapplication of external pressures. The question of dividend which should thereby result will of course also be dependent upon the terms of the controlling legislation from time to time, and possibly, therefore, upon the Bank Rate. Given no change in the latter, however, and other things being equal, I would hope to be able to aim for about 6 per cent for future years.

The creation of Maha Gujarat, with possibly Ahmedabad as the capital, should upon up to this Company still further opportunities of growth and service; and I can only hope that before long the law will be so amended as to afford the future investor in our Industry sufficient incentive to remove the least doubt about its ability to fulfil its great task throughout the country. But we must be afforded incentive, and not increasing restrictions, if we are to maintain that balance between the consumer and the investor and the worker which would be ideal. Above all we must be given the freedom to adjust our rates to the economic level necessary to produce a steady commercial yield commensurate with the cost of the development capital we need for ourselves and, through us, for the service of so many others.

BHARAT NIDHI LIMITED

NOTICE is hereby given that the Annual General Meeting of the shareholders of Bharat Nidhi Limited will be held at the Constitution Club, Curzon Road, New Delhi on Thursday, the 26th April, 1956, at 11 A.M. to receive and adopt the Directors' Report and the Audited Statements of Accounts for the year 1955, to declare dividends @ Rs. 6/- per share on Preference Shares, As. -10/- i.e., 6½ per cent on fully paid Ordinary Shares, and As. -2/6 i.e. 6½ per cent on partly paid Ordinary Shares, to elect Directors in place of the retiring ones and to appoint auditors for the current year and fix their remuneration.

Share Transfer Books of the Company shall be closed from the 11th April, 1956 to 26th April, 1956 both days inclusive.

By Order of the Board,

J. B. JAINI

Manager.

New Delhi,
29th March, 1956.

N.B. A member entitled to attend and vote at the meeting of the Company is entitled to appoint another person as his proxy to attend and vote instead of himself and the proxy need not be a member.

RESERVE BANK OF INDIA

Applications are invited for the following posts in the various departments of the Reserve Bank of India:

(A) POSTS AND SCALES OF PAY:

1. Research Officers, Department of Research & Statistics Rs. 375-55-815 E.B. 55-925-60-1045.

The appointments to the above posts will be made on a temporary basis in the first instance but are likely to be made permanent.

Note: Candidates possessing exceptionally good qualifications and experience may be given a higher starting salary in the prescribed scale.

2. Probationary Assistants Rs. 250-25-450 E.B. 25-650

Note: Promising Probationary Assistants will be eligible for promotion as officers in the scale of Rs. 375-55-815 E.B. 55-925-60-1045.

(B) ADDITIONS TO PAY

1. Local pay: 10% of pay with a minimum of Rs. 10/- per mensem rounded up to next higher complete rupee to the staff working at Bombay, Calcutta, Madras, Delhi, Kanpur and Ahmedabad.

2. House rent allowance

Research Officers: 15% of pay with a minimum of Rs. 60/- and a maximum of Rs. 300/- per mensem.

Probationary Assistants: 10% of pay with a maximum of Rs. 50/- per mensem.

3. Dearness Allowance: At prescribed rates.

Research Officers: The present rate is 16-2/3% of pay with a maximum of Rs. 125/- per mensem.

Probationary Assistants: Rs. 65/- per mensem for pay (including local pay) up to Rs. 300/- per mensem.

(The rate of Dearness Allowance is subject to revision from time to time).

(C) AGE LIMIT AS ON 1st MAY 1956:

Research Officers: Candidates should not ordinarily be over 30 years of age. The age limit may be extended up to 35 years in the case of candidates with exceptional qualifications and/or research experience of value to the Bank.

Probationary Assistant: Candidates should not ordinarily be over 24 years of age.

Age limit may be extended but not beyond 30 years in the case of candidates possessing special qualifications and experience of value to the Bank and also in the case of

- (i) candidates with approved war service,
- (ii) ex-employees of Banking Institutions whose services have had to be terminated for reasons of economy or as consequence of the closure of unremunerative branches or as a result of the Banks going into liquidation.
- (iii) personnel retrenched from Government offices after atleast one year's service, applying through the Employment Exchange, and

(iv) candidates belonging to the Scheduled Castes or Scheduled Tribes.

(D) QUALIFICATIONS

1. Research Officers, Department of Research & Statistics

First or high second class Master's degree in Economics, or Commerce or Statistics/Mathematics of an Indian or foreign University or a Doctorate degree in Economics or Statistics of an Indian or foreign University and a period of research work in one or more of the subjects, viz., (a) monetary economics, (b) banking theory and practice, (c) international finance, and (d) sampling theory and econometrics etc.; a period of practical banking training will be an additional qualification in respect of applicants with specialisation in (a) and (b).

(2) Probationary Assistants:

Applicants should have had a brilliant academic record and must possess a first or very high second class Master's degree or a first class Bachelor's degree of a recognised Indian or foreign University in Economics, Commerce, Banking, Accountancy, or Law as a special subject of study.

THE BOARD WILL INSIST ON A VERY HIGH STANDARD OF SUITABILITY IN MAKING SELECTIONS FOR THE ABOVE POSTS AND ONLY CANDIDATES WHO POSSESS GOOD ACADEMIC QUALIFICATIONS AND ADEQUATE EXPERIENCE OF THE TYPE SPECIFIED ARE ADVISED TO APPLY.

Candidates who wish to apply for more than one category of posts must submit separate applications accompanied by separate application fees.

The selected candidates for the posts of Research Officers will ordinarily be on probation for a period of 3 years which may be reduced or extended at the Bank's discretion. Candidates selected for the Probationary Assistants' posts will also be on probation for a period of 3 years during which they will be liable to be discharged at one month's notice or pay in lieu thereof. Candidates selected for the Research Officers' posts will ordinarily be stationed in Bombay but those selected for the Probationary Assistants' posts must be prepared to serve in any office of the Bank in India.

Applications should be in a special form to be obtained from any office of the Reserve Bank. All the applications should be accompanied by copies of two testimonials (originals should not be sent; the Bank does NOT accept responsibility for returning the originals if sent through oversight) and forwarded to the Secretary, Central Recruitment Board, Reserve Bank of India, Central Office, Post Box No. 406, Bombay No. 1 so as to reach him on or before 1st May, 1956. Candidates already in service must submit their applications through their employers. Candidates belonging to Scheduled Castes or Scheduled Tribes should mention this fact prominently on their applications.

Applicants for the above posts must remit application fees of Rs. 7-8-0 per application by Postal Order, Cheque or Bank Draft on a SCHEDULED BANK PAYABLE AT BOMBAY along with the application. The application fee is in no case refundable. Bonafide refugee candidates who are NOT IN EMPLOYMENT applying through any of the Government Employment Exchanges are exempted from payment of application fees while in the case of Scheduled Castes/Scheduled Tribes candidates the fee will be reduced to 1/4th.

The Elections in Ceylon

YESTERDAY, April the 12th, saw a historic change in the political life of the island of Ceylon; it may be the change will have great repercussions on world policy in so far as it relates to South-East Asia. Mr. S.W.R.D. Bandaranaike, the leader of the victorious Mahajana Eksath Peramuna (People's United Front) Party, is at the moment an unknown quantity. He comes to office with a great majority, implying that parliamentary considerations alone will not restrict his operations. His party, which there is every reason to believe is united behind his leadership, has won 51 seats out of the 90 seats which had been declared by yesterday afternoon. Of the remaining 11 seats in Ceylon's House of Representatives, it is likely that Mr. Bandaranaike's party

will obtain at least half. There is thus an absolute majority which stands behind Ceylon's new Prime Minister. He is also likely to receive some support from other parties, and even Sir John Kotelawala, in a dignified parting message, has offered "support for every measure designed for the good of the country and its people".

To say that this sweeping victory of the Socialist Mahajana Eksath Peramuna Party was totally unexpected is a mild understatement. The appeal to the polls would never have been undertaken by Sir John had not his advisers been totally misguided about the strength of the party and his platform. The platform, in the main, one which must now look trivial

irrelevant, namely, whether Sinhalese should become the sole State language. Only a party which was absurdly cocksure of the entire Sinhalese vote, could have afforded to alienate Tamils with this spearhead for an election. But it is quite clear this is by no means the only reason for Sir John's discomfiture. The Federalist Party, which should have been more favoured by the Tamils than any other and was expected to benefit from the language choice of the Government party, has obtained 10 seats. Language was the main issue in the election, but paradoxically, it does not seem to have been an important issue in the result.

Nor, indeed, was international policy a large issue in the election, or a determinant in any large measure of the result. Nevertheless, the international repercussions are very great by any standards. Mr. Bandaranaike's victory has already resounded all over the world. We in India have a special interest in his victory because there is no doubt that he shares in broad outline India's neutralist outlook so far as the Cold War is concerned. In particular he has declared himself against military alliances, and has even proposed the withdrawal of the bases at Trincomalee for the British Navy and at Negombo for the British Air Force. It is one of the paradoxes of democratic systems that, quite often, the largest consequences of political changes result from issues incidental to those on which the great battles of politics are fought. The international shift has been, so to speak, only a by-product of this election; on this there is no clear verdict. This is not to state that Ceylon's opinion is not neutralist. All that can be said is that, by and large, its neutralism has not been proved. That makes no difference to the final result, which is that Ceylon has now a neutralist Government.

There can be no reasonable doubt that the main reason for Mr. Bandaranaike's success has been a growth in the passion for Socialism in Ceylon alongside, it may be, its growth in India. There can be no doubt that the roots of this passion are not based in poverty alone. Ceylon enjoys a standard of living which, in current per capita national income terms, is reckoned as double that of India. There is still, it is true, some pressure of poverty. But by South-East Asian standards radicalism in Ceylon cannot be attributed to poverty. It is almost entirely the result of a lack of opportunity which is believed, rightly or wrongly, to arise from the strong position which foreign interests occupy in the main plantation industries in the island. There is a widespread belief that Sir John's Government was very apt to come to easy terms with foreign plantation interests. In point of fact, Sir John has often incurred the displeasure of the same planting interests for his regulation of plantations and his frank warning that his government would need to tax its plantations more severely than in the past in order to obtain finance for development. He is justified in claiming credit in his parting statement for the addition to the revenues for which this policy has been responsible. He said: "We are leaving to the new Government Rs. 197 million in cash as against Rs. 36 million when I took office. We have also reduced our short-term liabilities from Rs. 184 million to Rs. 60 million with regard to Treasury Bills." It would be interesting to determine what percentage of this has been contributed by plantations in foreign ownership. Almost certainly the proportion is large.

If, however, it is a fact that the policy of the United National Party was so obviously in the interest of Ceylon nationals, very little was heard in the election of the extent to which this was so. The propaganda front of the United National Party on this point was extremely weak from the beginning. Against the Socialist case that, somehow or other, nationalisation would put things right, there was no argument of a concrete kind to show that, without nationalisation, remarkable stability had been built into Ceylon's economic system after her payments crisis a few years ago. Considering the emotions which must be expected to preside at first elections, the omission to demonstrate that non-socialist measures had done much for Ceylon's economy was a serious error the full consequences of which cannot now be predicted.

This highlights the major question which has now to be answered. Assuming Mr. Bandaranaike proceeds on his domestic policy of nationalisation of plantations with fair compensation, there is certain to arise a serious payments crisis because of the repatriation of much sterling, which would necessarily be involved. At the same time there would almost certainly be a decline in production because a large number of the British plantation managers will be averse to staying on as employees of the Government of Ceylon. In effect at the very time when her earnings of foreign exchange will need to be enhanced, Ceylon may experience a great slump in earnings. It is one thing to win an election on a programme of nationalisation. It is quite another to find the resources wherewith to nationalise. It is safe to say that Mr. Bandaranaike in this respect has set himself an impossible problem.

In his difficult task Mr. Bandaranaike, as a matter of course, will enjoy the goodwill of the Indian people and the Indian Government. He should enjoy also the warm goodwill of democrats everywhere, for there has been seen in operation in Ceylon the working of a true democratic system in a form of which there have been no equally vital displays in South-East Asia. Ceylon seems to be the only country in South-East Asia where a two-party system is in operation. The example of East Bengal in Pakistan was heartening, but there is a difference between a Central and a State election. It is difficult to believe that an Opposition Party in any of the Central Assemblies has at this moment a real chance of becoming a Government. Ceylon leads South-East Asia, in that she has shown that she had an opposition which could readily become a government.

The people of India will on this occasion send their warm greetings to the people of Ceylon. Whatever the result, we will always respect the choice that the people of Ceylon make for themselves. But there can be no reasonable doubt that the fact that this election promises better relations between India and Ceylon makes the result more acceptable at this time. It is earnestly to be hoped that a meeting of the Prime Ministers of India and Ceylon will soon be arranged in order to give concrete form and shape to the goodwill which Mr. Bandaranaike's success has just brought forth. In that concrete form and shape, let us hope, there will be opportunities in which India and Ceylon together may advance the cause of freedom and security in our portion of the world.

A Credit Squeeze?

HAS the time now come to initiate an anti-inflationary policy? This question has been asked in the last few days with a sense of urgency which has been sharpened by the circular issued by the Reserve Bank of India to the Scheduled Banks asking them to report fortnightly instead of monthly on the nature of the advances granted by them. There have been other disquieting signs. The index of wholesale prices has steadily risen till it is today 12 per cent more than its level at this time last year. Total money supply at the end of March had increased by Rs. 150 crores over the figure for March 1955 indicating, along with the increase in the total outstandings of Treasury Bills of Rs. 100 crores, that the tempo of deficit financing has been quite substantial in the final year of the Plan, though well below the original target in the Budget of over Rs. 300 crores. There has been extreme tightness in the money market, particularly after the British rate was put up, and some speculative activity. In the agricultural sector in particular, where there was a demand for price supports because of a feeling of uncertainty over prices until the middle of the last year, there is now satisfaction; and it is conceded the relationship between farm prices and manufactured goods today is not unsatisfactory. Considering that it was the lower level of agricultural prices which provided encouragement in undertaking a bold policy of deficit financing, this new turn cannot but be regarded as a warning to slow down.

There may therefore be little room for complacency at this juncture even if it is held that it would be unwise to create a scare. The total volume of deficit financing under the first Plan has been modest and is unlikely to exceed Rs. 400 crores. At least one half of that until the fourth year of the Plan seemed harmless and even necessary for the good of the economy. Neutralising this inflationary element there have been the steadily rising trend in industrial production and a high and stable level of agricultural production; and the outlook in both respects is hopeful.

Perhaps the proximate cause of alarm has been the tendency to draw parallels between situations abroad and Indian conditions. The British credit "squeeze" and the increase in the Bank Rate have had a powerful psychological effect on the Indian markets, but it has largely ignored the major differences between the two situations.

It is irrelevant at this stage in India to contemplate curbs on investment of the kind proposed in the UK which enjoys 'brimful' employment; our task is one of substantially stepping up the rate of investment under the second Five-Year Plan. India is not faced with a payments problem caused by trade deficits as in the UK which can be avoided by checking spending on consumption or investment. The problem before us is to do our utmost to import more of steel, machinery and even consumer goods like food. Nor is there a situation comparable to the UK in which wage costs have been responsible for pricing exports out of the world markets. The situation is thus totally different; and the effectiveness of the Indian Bank Rate as an automatic regulator of credit is questionable.

At the same time, it must be the firm basis of our policy that there would be no free rein to inflation, particularly at the start of an ambitious

Plan which contains a substantial inflationary element of deficit financing. Credit control may be one and the first of the steps to be taken now, particularly because of the evidence that speculative activity has been on the increase. But it is not so much increase in the rate as selective credit control that would be appropriate; the increasing resort to the purchase of usance bills provides scope for closer screening of transactions. It is, however, necessary that the limits of such control should be clearly recognised because of the danger of placing excessive curbs on market operations. The experiment made in 1951 clearly erred on the side of excess and led to the recession of March 1952; and the recurrence of a similar development would be more unfavourable to the Plan than the incipient inflation. The Finance Minister has been fully aware of this danger and is unlikely to repeat the error. It must also be remembered that the earlier strict credit policy led to permanent results only because it synchronised with the liberal policy of imports of food and cotton and was reinforced by a steadily rising agricultural and industrial production since 1952. Recent trends in food prices have emphasised the absolute necessity for building and maintaining buffer stocks of two million tons as stated by the Food Minister. There should be no hesitation about making imports on this scale; this is the best specific for the malady of the speculative building up of stocks, whether on farms or by traders. An indication has been given that even cotton might be imported if necessary. The improvement in internal production of sugar this year would help in releasing some foreign exchange for the purpose. In any case exchange should not be held to be a limiting factor, even though it is required for more essential imports of steel and machinery.

There are real reasons for anxiety only about cloth. The ceiling imposed on mill production is already showing its effects; if cloth exports are affected as an immediate result of a shortage a setback to our foreign trade would occur. The question is not whether the Ambar Charkha would or would not prove a feasible proposition eventually; if it does help to augment internal production, it can have the double advantage of providing the goods and satisfying its powerful champions. The problem now is to control present price trends and save the Plan, until the Charkha becomes a feasible proposition. The question is connected less with the grant of licences to spindles and more with the fuller utilisation of existing capacity to meet the demands of economy. The existing control on the textile industry does not ensure expansion of output because it is a restrictive control. Whether it should be used constructively or negatively as before to enforce rationing and choke the channels of distribution, is the issue to be now decided.

The conclusion is that the prescription in this situation is more or less the same as before—larger imports to act as props to a firm credit policy, along with the removal of hindrances to a larger production of consumer goods which had a beneficial effect after 1952. The area in which a return to direct controls of various kinds may be appropriate—as in cement—is also a well-defined one; it is only necessary to avoid the danger of extending it indiscriminately to those sectors in which a return to physical controls would revive the rigidities which hinder development.

Mineral Policy

THE debate on mineral policy in the Lok Sabha this week has not been a fruitful one. There have been far more important issues relating to mineral development under the second Five-Year Plan than the taking over of the working of the Panna diamond mines or of copper mining which Mr. K. D. Malaviya triumphantly announced at the end of the debate. An opportunity for making a declaration of Government's policy on the larger questions, in more precise terms than has hitherto been possible, has been avoided. The Ministry of Natural Resources has now been left free to practise its own devices of muddling through in a field in which considerable emphasis has been laid in the second Plan on development along sound lines. The Panna diamond mine with an output worth only about Rs. 6 lakhs at present, and copper mining of 7,000 tons a year are not indeed among the first order of priorities, whatever their potential future value may be. The programme of oil exploration, the Central Government's policy on gold mining in the private sector and mining of coal, lignite and ores have all raised more vital policy issues on which the public and the particular interests concerned have sought answers; the occasion for a Demand for Grant has failed to serve its object of clarifying Government policy.

Mr. K. D. Malaviya has refused on this occasion to commit his Ministry to the specific point that the Government would insist on securing majority participation in the new rupee company to be started in collaboration with the Assam Oil Company. There have presumably been some second thoughts on this question, after the somewhat categorical assertion of Maulana Azad on March 19 last that the Government would not accept anything less than 51 per cent of the shareholding in the new company. Under the existing agreement, Government participation is restricted to only one-third and the choice before the company now is really whether it is in its best interests to maintain the status quo for the prospecting covered by the existing agreement, or to expand its activities further but at the risk of losing its control in the process. It is unlikely that any private company would deliberately prefer a loss of its controlling interest after providing as much as 49 per cent of the shareholding. In such a case, the risks of investment will be nearly as great to the company as to the Government without a voice in management to safeguard the investment. The proper alternative in such circumstances would be to allow private participation only to the very limited extent needed to secure agreement from the company for its working as agents of the Government; this would involve responsibility for the provision of capital only to the extent of one-fourth or one-fifth of the capital by the company.

These implications should be clearly realised in formulating Government's policy. If the Government is prepared in the last resort to make the investment wholly in the public sector, securing only private technical assistance on a contractual basis, it may be well within its rights to speak in the categorical terms in which Maulana Azad had declared Government's policy earlier. The question which then follows is whether the Government would then be able to find funds for undertaking an ambitious programme of oil ex-

ploration in other areas also, besides expenditure on such a large enterprise. Moreover, this is not an issue on which a short-term view can be taken on mere grounds of prestige or ideas about the inevitability of the dominance of the public sector. If the present exploration programme is to be fruitful, it must be followed by the establishment of mining companies in all the areas in which oil is found hereafter. If the present policy is to be the precedent, then the Government will have to find the bulk of the investment in all these areas in future also, while collaborating with private enterprise to secure technical assistance.

Almost similar considerations apply to the policy on gold mining. Mr. Malaviya was explicit on the point that the Government did not attach as much importance to this as to coal, ores or oil and was, therefore, prepared to let anyone mine gold wherever possible and to co-operate with the private sector. This statement is of some importance at this stage in view of the Mysore Government's declared policy of nationalisation of the gold companies, which is likely to come up for discussion shortly. The question here is whether the Central Government's insistence on the primacy of the public sector, particularly in the field of mineral development, is going to disarm it so completely as to yield to the pressure of the State Governments for nationalisation, without sufficient proof of national interests being directly advanced thereby. Legally, State Governments may be within their rights in dealing with mineral wealth except where the Centre has directly shown its special interest. It has, however, been clear that the Mysore Government would be unable to rely on its own resources to do so and would have to rely on Central assistance to pay compensation and work the mines. This is an entirely gratuitous addition to the claims on the Centre under the second Five-Year Plan, which will not add to the rate of development because resources will only be utilised to substitute the ownership, besides possibly adding the strain of repatriation of capital to the extent it is owned abroad. This question has been before the public for a sufficiently long time to have enabled the Government to come to a definite conclusion. If gold mining is a field in which the private sector will be allowed to work, as the Minister has now stated, there is obviously no sense in helping nationalisation based on local pique than on large policy considerations.

The Natural Resources Ministry has not indeed been functioning with clear-cut ideas. The powers taken under the existing law to limit or modify existing concessions have not yet been defined and the rules now proposed to be issued will still exclude coal and petroleum. Meanwhile, there is a proposal for the substitution of the Mines and Minerals Development Act of 1948 by two separate Acts—respectively for Mines and Minerals and Oilfields and Mineral Oil Resources—which may create further uncertainty for existing lease holders. The essential point to bear in mind is that in the field of mineral development investment cannot be promoted except on the basis of stability of contractual agreements regarding concessions. Constant changes which destroy the value of the guarantees implied in the grant of rights of exploitation over a period should only tend to retard the pace of advance.

THE WEEK'S NOTES

FOOD POLICY

MR. AJIT PRASAD JAIN'S announcement in the Lok Sabha this week that the Government of India proposed to build up buffer stocks of food grains totalling two million tons is to be welcomed as a measure which will help immediately in curbing the tendency for food grain prices to rise. As an anti-inflationary measure, however, this policy may fail unless it is implemented early. Provision has been made in the Plan for the import of 4 million tons in the next five years. It is to be supposed that the rate of accumulation of the buffer stock over the next five years would vary with the state of production though Mr. Jain failed to throw any light on this point. The amount of deficit financing envisaged in the current year, together with the failure of earlier predictions of bumper food crops followed by decline in prices, underlines the need for the Government to have sufficient reserve stocks on hand to counter any uptrend in the second half of this year. Subsequent years of the second Five-Year Plan may not prove to be so difficult as some more major and minor irrigation schemes are likely to start yielding benefits.

In saying that the Government planned to build up stocks through purchases from abroad, Mr. Jain was clearly emphasising the obvious. There are limits to procurement from within the country for this purpose and situations requiring large-scale price supports are unlikely to occur in the normal course. But in making purchases in foreign countries the Government is faced with certain difficulties which cannot be minimised. The tendency of exporting countries, particularly those exporting wheat, to control the market even after a minimum and a maximum price are agreed to, works undue hardship on importers, though their bargaining power has now increased. But since exporting countries cannot go on extending price support to their domestic farmers endlessly if importing nations decide to withhold or curtail their purchases to the bare minimum, it is to be hoped—though Mr. Jain is rather pessimistic—that some reasonable International Wheat Agreement will emerge, which will solve India's problem as regards import of wheat. The proposed talks with Burma for purchasing rice may be held as part of the procedure for repayment of the loan; even here Burma's deal with the Communist countries has strengthened her position and it is doubtful whether the landed cost would be below the internal rice prices here.

MYSORE'S LEAD

FROM MYSORE has come a lead on the formation of bigger bilingual States, which should cause much re-searching of hearts among her neighbours and other States and may well once again set in motion the idea of larger units first propounded by the Chief Ministers of West Bengal and Bihar. When the proposal was originally mooted, the reaction in Mysore was lukewarm, particularly as there was a feeling that any bilingual State in which Mysore may join will mean merger with less prosperous and less economically endowed areas. But these short-sighted selfish considerations have now given place to the larger national interests, and the Mysore Assembly and Council have adopted a courageous resolution sponsored by the Chief Minister of that State favouring the idea. It was heartening to note that the resolution received almost unanimous support in the two Houses.

The Mysore Legislature's lead will, however, be wasted if it is not followed up by equally courageous leadership from her neighbouring States. The Madras Chief Minister's refusal to give a lead on the subject,

in spite of the eloquent pleas of two former Chief Ministers and many other leaders of thought in the Upper House of that State, does not encourage one to expect the emergence of any bilingual State in the South with the Tamil areas in it. However, the formation of a West Coast State with Kannada and Malayalam-speaking areas need not be ruled out. The bringing into being of such a State will at least temporarily solve the problem of an unstable Government in Kerala to which, as Mr. Rajagopalachari pointed out, that State seems to be condemned for the foreseeable future. It is true that for that very reason the idea will be opposed tooth and nail by those who hope to fish in troubled waters. Their opposition is understandable, but that should provide the most urgent and powerful argument for a bigger State. In cold-shouldering the bilingual idea, Southern Congressmen, that is, those of them who are either openly or implicitly opposed to it, are in fact unintentionally helping the disruptionist elements who want to secure a permanent stranglehold either in the seats of power or in political confusion.

AUTHORS' RIGHTS

THE COPYRIGHT BILL, which has been referred to a Joint Select Committee of Parliament, contemplates certain important changes in the existing Copyright Act of 1914. A Copyright Office, to be set up under the control of a Registrar, will maintain a register of copyrights. Registration is optional, but the Bill lays down that no proceedings under the new law regarding infringement can be instituted unless the copyright is registered in the Copyright Office. In this, the present Bill follows the example of Australia, avoiding the extremes of having no formalities as in Britain or having rigid formalities as in the United States. Authors and other artists and inventors will receive greater protection from the wiles of unscrupulous publishers since a Copyright Board is to be established entrusted with the tasks of determining the reasonableness of the rates of fees, charges and royalties, considering applications for general licences for performance of works and assessing compensation payable under the Bill in certain circumstances.

Another important change made in the Bill is with regard to the period of duration of the copyright. Until now this extended to the life of the author and for 50 years thereafter, which has now been reduced to 25 years after the death of the author. This is a compromise between the rights of the author or his dependents to the fruits of his labour and the right of society to free and easy access to new ideas and new works without having, for an unduly long time, to pay a monopolist's price for them. Moreover, often copyrights are purchased by publishers who paradoxically continue to enjoy them long after the authors are dead and gone. The Bill, however, provides for repurchase by the author of a copyright seven years after the original sale but within ten years.

The Bill seeks to protect society's interests in other ways too, by providing for compulsory licensing in work withheld from the public, for republication, performance in public or communication through radio diffusion, for issuing licences to public libraries for producing a copy of a book in which copyright subsists, but which is not available for sale. The sole right to translation is made co-extensive with other rights arising from copyright, an improvement from the author's viewpoint over the present law, under which this right lapses after ten years of the publication of the original work, unless a translation is produced in the meanwhile.

THE NORTH-EAST FRONTIER

THE ASSAM Government's decision to seek the help of the Army in dealing with the Naga problem in the Naga Hills district of that State has highlighted once again a problem on the country's vital north-east frontier which calls for delicate and at the same time firm handling. The Naga tribesmen are concentrated mostly in the Tuensang Division of the North-East Frontier Agency, which is Centrally administered, and in the Naga Hills district of Assam. In the Agency areas the problem has been tackled more or less successfully by a more liberal approach to the people and greater readiness to meet local demands; the Political Officer in Tuensang is a Naga who is helped by a large number of Naga people in running the administration. Discontented Naga elements led by Phizo have had consequently to abandon the NEFA area as unfertile ground for their dissident activities, but they were able to exploit the grievances of the Nagas under the Assam Government's jurisdiction, whose policy towards the tribals was not quite as sympathetic and understanding as one might have wished it to be.

It is likely that, with the establishment of military headquarters in Kohima, the activities of the hostile armed Naga bands will soon be brought to an end. Commonsense also demands that law and order should be speedily restored. But that will not bring about a permanent solution to the problem. Urgent improvement of the economic conditions of the Nagas is a prime need as also some measures to satisfy their political demands by the provision of better social services, which will also help the Nagas in realising the meaningfulness of their demand for a separate State. These can perhaps be best undertaken by unifying all tribal areas under one Central administration which will ensure not only greater co-ordination in the drive against armed Nagas, but also that the same enlightened policy of giving them greater voice in the administration is followed. The safety and security of India's vital frontier requires that something more far-reaching than and something different from a mere soldier's campaign is undertaken.

SPAIN'S GESTURE TO MOROCCO

WITH THE signing of a joint Spanish-Moroccan declaration ending Spain's protectorate over Spanish Morocco in North Africa, a unified independent Moroccan State has been born. When the Socialist Government of France signed an agreement a few weeks ago with Sultan Sidi Ben Youssef, recognising in effect the sovereignty of the French zone of Morocco, it was obvious that the Moroccan people's aspirations would not be fully realised until Spain also agreed to the liberation of her zone. Prospects for this development appeared bright since General Franco had already declared himself in favour of Moroccan independence, though that was before France's graceful acquiescence in the face of historical necessity. The dictator of Spain was also anxious to have his say in the final set-up in regard to Morocco's external relations and to ensure for Spain the same status in Morocco which France would enjoy. He has taken the easiest way to securing these objectives by agreeing to hand over the Spanish zone for unification with the French zone, since in any case the economic advantages which Spain derived from her North African protectorate were very negligible; nor did she have the problem of settlers which besets France in Algeria.

It is as yet too early to say how the French will like this move, particularly as it is an obvious attempt to get for Spanish nationals the same rights as will be accorded to French nationals and to the Spanish Government equal rights with the French in helping Morocco in the conduct of her foreign relations and in the building up of her army. In any event, Franco's gesture is to be welcomed and other colonial powers

with similar untenable footholds, it is to be hoped, will not be chary of imitating his move. With this the unification of all Moroccan areas has been completed with the exception of the international Zone of Tangier, whose transfer to the sultanate is bound to come about in course of time.

BRITAIN'S BALANCE OF PAYMENTS

BRITAIN'S PAYMENTS position seems to have taken a turn for the worse. The Balance of Payments White Paper published recently shows that Britain had a deficit on current account of £103 million last year compared to a surplus of £205 million in 1954. The 1955 deficit was made up of a deficit of £313 million with non-sterling countries and a surplus of £215 million with the overseas sterling area, which itself secured a surplus of £137 million against £164 million in 1954. The UK's gold and dollar reserves fell by £229 million during the year, but the sterling balances decreased by £165 million, so that there was a net drawing on assets of £63 million. American aid receipts fell from £139 million in 1954 to £125 million in 1955. Offshore orders from the U.S., however, rose by £15 million to £120 million.

The White Paper discloses that the total turnover in Britain's foreign trade was something like £10,000 million. Considered in relation to the total turnover, last year's deficit is not alarming, particularly as some part at least of the change in the position was due to a fortuitous combination of a number of factors. The present worsening has been considered as not really representing a permanent weakening of the U.K.'s position, but as a sudden expansion of payments which expanding receipts can be expected to overtake in course of time. One element was lower net oil receipts due to a sharp rise in oil companies' expenditure overseas following the resumption of operations in Iran. Payment of interest, profits and dividends were also higher, partly because of increased interest payments on sterling balances. There was also some increase in travel expenditure and in transfers to emigrants following the relaxation of restrictions. Between 1954 and 1955 the balance of visible trade worsened by £160 million and invisible earnings by £148 million. Net earnings from shipping were £30 million less.

The White Paper shows that the U.K.'s annual net investment abroad since 1952 has averaged £160 million a year, most of it in the sterling area; it was £125 million in 1955. Military expenditure abroad has averaged £150 million a year and reached £160 million in 1955.

MOBILE "KNOW-HOW"

THE Union Ministry of Commerce and Industry has followed up the setting up of four Regional Small Industries Service Institutes at Delhi, Calcutta, Madras and Bombay, with four branch units at Agra, Patna, Hyderabad and Trivandrum, by starting an extension service for small industrial units and artisans in towns and villages in the form of mobile demonstration vans attached to the Institutes. At present two workshops, one for carpentry and another for blacksmithy, are attached to each Institute, and 16 more for the whole country are planned. The workshops demonstrate to artisans and workers in their villages and towns the use of modern machines as well as improved methods of production. The advantages of working with these machines and the Government's scheme to supply them on easy hire-purchase terms are explained in the course of discussions. It is reported that the response to the mobile workshops has been very encouraging, and it is not surprising that it should be so. What is important is that the demonstrations and discussions should be followed by more continued interest on the part of the officers attached to the Institutes in securing for artisans the implements they want and in seeing that they learn to operate them properly. There should also be demonstration vans for many more small industries which have a big future in the country.

PLANNED LIGHTING BY PHILIPS

Philips are fully prepared to provide you, without any obligation on your part, advice for a planned lighting system. Call them in and discuss it.

Philips Electrical Co. (India)
Private Ltd.

PHILIPS

make light work for you

Calcutta-Bombay-Delhi-Madras-Patna-Kanpur-Lucknow-Bangalore

An attempt to combine economy with efficiency is often like chasing shadows. Planned Lighting, however, is a sure road to success. Planned Lighting means greater output, fewer accidents, less absenteeism. It's Fluorescent Lighting—by Philips—which will help you reduce overheads by giving you three times as much light for the same amount of electricity consumed.

Philips Fluorescent Lighting ensures diffused, glare-free light, without hard shadows. It is the illumination for ideal working conditions, less fatigue, less eye-strain, hence higher efficiency and increased production. Why not try it out yourself? Ask Philips Lighting Service Bureau to examine your existing installations and submit recommendations for any improvements required.

STANDING PAT AND STAYING PUT

WHY ARE THE USSR AND THE USA DYNAMIC, forward-looking, economically progressive societies? Are Britain and France static? What promotes change and growth? What makes for decay? Does India belong to the dynamic or to the static economies? If to the dynamic, what is necessary to keep her forging ahead? What could occur to arrest her growth and let her slide into the ranks of the static or the decaying? These are the cosmic questions on which we launched ourselves last week under the heading "Inquest on Incentives".

Most of us take the map of the world that we studied at school to be a more or less fixed arrangement of nations, subject to relatively minor alterations here and there, but if we look at the panorama of history across the centuries, we see at once that the map is never fixed and that change is ceaselessly at work. Contemporary with Akbar's sprawling Moghul empire was a small, obscure, thinly populated island off the Atlantic coast of Europe, of which scarce half a dozen people in India could have heard in those days. Yet with every year that passed after Akbar's death in 1605, India and the world were to hear more and more of the English. By 1905, England was the world's wealthiest nation. Why? Why should not the successors of Akbar have made Delhi the world's banking centre, the rupee the currency of international trade, and Bombay and Calcutta its most important bases?

The answer is not necessarily that England became wealthy because her economy was that of a free enterprise, capitalist state, because the contemporary example of the USSR makes it clear that a nation can substantially add to its material power and wealth by professing socialism and by leaving its economy to be organised by a ruthless and tyrannical oligarchy.

In endeavouring to answer these questions, I am happy to acknowledge my debt to a remarkable article entitled "The Dynamic Society" published in "The Times" (of London) Literary Supplement dated February 24. Although unsigned, it is an ill-guarded secret that this article, which has attracted widespread attention in influential British circles, both Labour and Tory, was written by (my old friend and sometime colleague) Graham Hutton, the economist.

In classifying the USSR, China, India, Brazil, Japan, Western Germany, and Belgium, among the dynamic societies, Mr. Hutton argues that their forward economic march does not depend on their political and administrative systems, which show the widest differences. In contrast with these dynamic societies, he classifies Britain and France as static. France, he says, still releases most of the new ideas in the arts and the intellect that influence all countries on whatever side of the Iron Curtain. Britain, he thinks, is "down" in the political initiative and ideas that she put forth some decades ago, still leads in original research in most of the practical arts and sciences, but fails to apply these results and lags behind those who exploit her discoveries. And when you consider what the USA has done with British radar and the British split atom, to cite but two examples out of many, it is difficult to refute Mr. Hutton's case.

There will be many in India to agree that the British and French attitudes towards material progress are not necessarily to be condemned when measured in the scale of absolute values, for the British and French masses may be right in not wanting, or in not willing, the means of rapid material development. Their attitudes may be illustrative, as the French economist, Andre Sigfried, has often argued, of some moral superiority. They may prefer longer hours and more human work to the social and political consequences of the new Machine Age. Or they may just be more tired or lazier. Whatever their motives, it remains a fact that they show, in contrast with the dynamic states, an obsession with their own past at the moment when the greatest number of the world ever to be so obsessed, those of Asia, are struggling to free themselves of it. It is not the policies of Socialist Russia that are conditioned by the goal of social Equality but of bourgeois Britain and France. In their deeds, Britain and France reveal their belief in the virtue of a more or less static national income to be merely re-distributed. In their deeds, they reveal their disbelief in the virtue of a rapidly growing national income to be distributed in whatever is found to be the best way to make it keep on growing. Their peoples seem to be intent on conserving past gains and the vested interests of Labour and Capital alike.

Elsewhere, the Americas, Asia, Africa, Holland, Belgium, West Germany, and Italy are throbbing, struggling, surging in a big ferment. Alone in Europe, Britain, France, Spain and the Scandinavian countries stand pat and stay put.

Of the two factors which (I hope to demonstrate) caused the England of Elizabeth I to become the world's wealthiest nation by 1905 and the India of Akbar to remain among the poorest, one is possession of the will, the know-how, and the means to accumulate capital. By not consuming in the present all that they produced, the Elizabethans enabled their children to consume more for the same or less effort, and so on to greater wealth as the virtuous circle of saving and of creating greater subsequent consumption broadened from generation to generation—until British savings circled the globe with British ships, cables, banks, and other wealth-creating embodiments of conserved skill and effort, unconsumed yesterday for greater yields today. It was the lack of the combination of know-how with the will and the means to abstain from current consumption in order to command greater consumption and leisure later on that kept the successors of Akbar poor.

When you compare the capital needed to launch a primitive instrument like a 20-ton dhow, costing a few hundred rupees, with a modern instrument like a 20,000-ton cargo vessel, costing perhaps a crore and a half of rupees, or the capital needed to build a primitive bucket-irrigation well, with that needed to build a modern Damodar Valley dam, and when you compare the astronomical difference in the yields obtained by the primitive and the modern, you realise how it

is that never before in all history has the potential yield of savings invested in modern techniques been so high, and that never before has the need for accumulating savings been so important—to any nation that wishes to be counted among the dynamic.

TAXATION: THE REWARD OF HARD WORK

If the "dynamic", as Mr. Hutton terms the know-how, will and ability to save and create capital, of the masses is insufficient to be acceptable to those in command of any nation, then they have to be directed. Hence the Five-Year Plans of the authoritarian systems of the contemporary world. If the masses do have the "dynamic", then the economy can be left to run itself and the government's role largely confined to ensuring fair economic play, as in the USA or West Germany. But if the masses' "dynamic" is for any reason impeded, and if its leaders are unclear about their ultimate aims, as in Britain and France, then you get the mixed economy, which is neither fish, flesh, nor good herring.

Between the authoritarian dynamic USSR and the free dynamic USA stand the mixed French and British systems. Now, the leading characteristic of these mixed economies is their preoccupation with Equality as a social goal (long ago denounced by Stalin as a bourgeois deviation) that re-distributes the national income in such a way that fruitful individual effort or responsibility or skill (handsomely rewarded in the USSR and USA) is less and less rewarded. In Britain, Mr. Hutton calculates, moderate responsibilities and skills are fiscally punished by the loss of one year's earnings in seven, while outstandingly productive talents are punished by the loss of one year's earnings out of

four. In lower income brackets, union practices impose penalties against individual skill and productivity. Consequently the rapid rise in the purchasing power of the masses—who put forth less effort than before the war yet refuse to let labour-saving tools do more work—coupled with subsidies to them out of the earnings of others, produce chronic inflation.

This inflation reduces personal savings. Private accumulation of capital does not languish: it ceases, because in order to avoid inflation what could be saved is spent. On the other hand, accumulation of capital by the state is mostly made up of consumer's durable goods because the mixed Welfare state retains representative government and keeps the voters quiet by massive "investment" in new, subsidised houses, schools, apparatus, and buildings (particularly government or municipal offices) required for the re-distribution of welfare. Such a mixed economy Welfare state becomes (says Mr. Hutton in a phrase which has echoed round all England today) like a dog in a barnyard: it cannot lay eggs and will not let the hens do so.

We have exhausted our allotted space. But before closing down, I leave you this thought: Mr. Hutton classifies India among the dynamic states and, as I said last week, there is no doubt that the achievement of independence did let loose substantial economic impetus. But one cannot help wondering to what extent the weaknesses of the British mixed Welfare state outlined above may now increasingly manifest themselves here. Whether the answer is the big stick and forced savings of the USSR type of dynamic economy, or whether we can find a way of combining dynamism with the retention of our individual liberties, I reserve for future discussions.

A DELHI DIARY

THE LAW OF MATHEMATICAL ABSENCE

A GENEROUS friend of mine has been good enough to write to say that he has missed me recently in this diary quite frequently; he has asked, a little tearfully, whether I am returning or whether this is a prelude to retirement. I hasten to inform my all-too-generous friend that my absences in recent weeks are happily not a prelude to retirement. As far as I remember the causes of these absences are varied, but singly and together, they are not likely to be repeated, at least in the near future. Firstly, there was the Budget Number of 'The Eastern Economist' where, by an iron rule, no columnist is allowed to appear lest he should dissipate by his attempts at frivolity the deep passion for grim information which these special numbers are designed to inculcate. Secondly, there was a spell of leave for a period of ten days which (alas!) cannot recur more than a certain number of times in the year, the new Press law for working journalists notwithstanding. Finally, I might refer to what is called an accident of timing by which a diary designed accurately for 6 o'clock one evening—as sometimes happens in the best planned circles—missed the target. I am told by a distinguished mathematical friend that the chance of three such contingencies occurring in a single row is one in a million. May I, therefore, reassure my generous friend, and take comfort in the law of mathematical chance which, by a process of logical deduction, now prevents me from absenting myself for three consecutive weeks by about a million to one. I take no responsibility for odds laid on this version of the law of mathematical probability; in recent years I am told this has been undergoing some change. Even Planck's constant is not what it once was!

LEONTYNE PRICE

Since a time-lag has appeared in these diaries, it would not be inappropriate for me to go back a week to describe an event which certainly should have found a place last week, had natural law (and human weakness) not intervened to displace it. This was the recital that Miss Leontyne Price, the great American Negro singer, gave Saturday before last at the new Fine Arts theatre, which is rapidly becoming the centre of cultural activity in New Delhi. Miss Leontyne Price is a world-famous singer. One of her greatest virtues is that she is completely oblivious of this momentous fact. She has not merely one of the most wonderful voices in the world with a range (I had almost said a spectrum because of its different colours) which is truly amazing. She has French, German, English and, of course, the Negro spiritual, all combined with equal ease in her repertoire. I might add—a thing which cannot fail to attract and encourage us in India—she has risen by her own efforts in a truly free society, although she was a Negro in the midst of the "Solid South". Miss Price tells her story quite simply. But I like to think that she is at this time exhibiting in her person the strongest argument that has ever existed for freedom and equality of opportunity in a free society.

RIGHT HONOURABLES BOTH

I shall pass gently from music to another of the arts; at the time of writing there are two Right Honourables in Delhi; both full of interest for us. The amity with which the Rt. Hon'ble Herbert Morrison is travelling with a Conservative Member of Parliament, the Rt. Hon'ble Geoffrey Lloyd, former Minister for Fuel

and Power is, to my mind, a symbol of the coming alliance between Conservative-Radicals and Radical-Conservatives—one of the most fruitful alliances in the political life of the United Kingdom. My hope of an alliance between India's Left-Centre and India's Right-Centre—which seems to me the natural faith of the Congress Party—has been much encouraged by a study of the similarity between progressive Conservatives and moderate Socialists in the United Kingdom. This is taking me rather far from the two personalities but it is too interesting a subject for me not to say a word about one of the most interesting developments in British politics. As Conservative Minister of Fuel and Power, Mr. Geoffrey Lloyd did almost nothing to change the character of "Labour" legislation in the "power" field.

CENTRE FORWARD

It is not merely the traditional British genius for compromise which explains the coming together of Centre elements in British politics. I venture to think that the facts of economic life are now beginning to show that a Centre view in the old debate between the private and the public sectors is the only one which can endure. The experience of nationalisation has shown that many of its so-called advantages have been exaggerated. On the other hand, the very size of administration now requires much more Central direction. Surely, the truth is that we are now in a stage when events are setting limits to our ideologies. I look upon the visit of Mr. Herbert Morrison and Mr. Geoffrey Lloyd in terms of this new discovery of the extent to which facts in the field are proving that both ideologies are good—within limits. In the process of this testing, I prophesy that, in India as well as in Britain, the path of moderation will also be the path to power!

Unhappily, Mr. Morrison was not talking much either at his address in the Indian Council of World Affairs or at his Press Conference on Thursday about Britain's "socialistic" pattern of society. Most of the questions at the Press Conference were about military pacts which were highlighted by Mr. Morrison's defence of the Free World's action in meeting what he called the "un-co-operative" attitude of the Soviet Union. I think most people have been taken aback by the somewhat firm anti-Communist line that Mr. Morrison has taken while in India. I think he is to be respected greatly for not trimming any sails to the prevailing wind!

TROTSKY: DEAD OR ALIVE?

I thought Mr. Morrison was particularly effective when referring to the misfortunes of Trotsky, whom he described as "a genuine Red" and a "genuine revolutionary" for whom he had a "sneaking regard". He described how when he was in the Soviet Union in 1930 it was always denied that Trotsky had anything to do with the Russian revolution. However, one sees that just as Stalin is being eclipsed, Trotsky is having a rebirth in an Asian country. I see that in the results of the Ceylon elections announced in the papers of April 12 there is a party called the Trotskyite Nava Lanka Sama Samaj whose leader, Dr. N. M. Perera, defeated his "ruling party" rival by a margin of over 6,000 votes. Will some good student of Communist "cult of personality" tell me exactly what this means?

ANGUS.

THE RAMAYANA

OF TULSIDAS IN ENGLISH VERSE

LATEST "HINDUSTAN TIMES" PUBLICATION

The famous Hindi epic regarded by many as "the greatest book in all devotional literature" is for the first time now available in English verse.

The translator, the Rev. A. G. Atkins, completed the book after ten years of devoted work. He has tried "to keep and express in English in the fine rhythm and music of the original in simple lucid language, and with as much of the vivacity, wittiness and picturesqueness that Tulsidas has put into his work." He has also followed in some measure Tulsidas's metrical variations such as *chhand*, *chaupai*, *doha* and *soratha*.

In a foreword Mr C. Rajagopalachari says: "Mr Atkins' monumental work and his Introduction are a revelation of hope for those who desire to see all the great religions of mankind come together. . . . His service is not only to English-speaking people but also to that very large number of Hindus in India who do not speak the Hindi language and to whom English has become a very familiar medium."

The book is of special value to libraries, scholars and devotees of Tulsidas.

It has been issued in the following four editions:

- I. Original text of Tulsidas with translation in English verse; three volumes; 1468 pages; price Rs. 50 net.
- II. Translation in English verse; without Hindi text. two volume; 898 pages; price Rs. 40 net.
- III. Special tissue paper edition of I. one volume, price Rs. 100 net.
- IV. Special tissue paper edition of II. one volume, price Rs. 100 net.

Economic Report from the U.S.

HOUSING BOOM IN AMERICA

(BY GUY SIMS FITCH)

WASHINGTON, April 10.—For a supposed invalid, the American Housing Industry appears to be in extraordinary healthy condition; so healthy, in fact, that with the construction season barely beginning, more than a few experts are hastily revising their earlier forecasts for 1956.

Since housing is a key industry in the American economy, the recent signs of an upswing have now influenced the economic outlook at large, just as earlier in the year signs of a continuing cutback were taken as an invitation to caution. When the year began, most economists were predicting only a modest upturn in construction—something like 3 per cent. The general feeling then was that an expected decline in residential construction would virtually offset a moderate rise in commercial building. Construction contract awards so far this year, however, tell a different story. These awards are particularly significant since they reflect mixed building plans for the months ahead. At this point, building contracts for commercial and manufacturing establishments are up about 19 per cent over the same period of 1955; for utilities, they are some 57 per cent above last year's rate. While larger than anticipated, these building plans are fully in line with the economic requirements of the country. Business is expanding and modernizing to meet the needs of a population that is growing in numbers and gaining in purchasing power. States and local communities are building new schools, hospitals, libraries and other facilities to maintain adequate public service. But what has been a major—and rather pleasant—surprise has been the strength shown in residential construction, the field in which some observers had feared the point of over-building was near.

Since 1949, they noted, more than one million homes have been built in the United States—a total of 8.3 million in seven years. For 1955, the total came to a robust 1.3 million. However, a relatively sharp decline in housing starts that began last September seemed to support those who predicted an early end to the "housing boom."

Yet today, housing starts are on the rise once again, this was partly to be expected; building activity usually increases with the advent of warmer weather. But more significant is the fact that contracts awarded for home construction so far in 1956 actually outrun those of the corresponding 1955 period by a startling 11 per cent. This points to a residential building season far livelier than had been expected a few months ago. More and more economists now are coming around to the view that the so-called housing boom may well be here to stay for some time—that one million new dwelling units a year now can be considered a normal rather than an exceptional performance. How high the "normal" rate eventually may go as the population grows is a matter of conjecture. But the climb of American incomes is not conjecture. More and more families are moving into the middle and upper income brackets; they can afford new and better homes. Today nearly 60 per cent of American families own their homes, and the proportion is constantly increasing.

Hand in hand with this has come a rise in what has been called "standards of demand." Experts estimate that more than 480,000 old and obsolescent homes "disappeared" from the market—in other words are scrapped—every year. The gap must be filled by new building. At the same time, families are getting bigger, and people are moving from older, smaller homes

to newer, larger ones. Advances in medical science and health have lengthened the average American's life span. As people live longer they keep their homes longer, and there are fewer vacant houses available. Not to be overlooked is the ease with which homes can be bought and financed these days. Not only are down payments low, but mortgages are spread over 20 years or more, and monthly payments consequently are low. As a result, home ownership today is within the reach of many more millions than it was some years back. And it is coming within the reach of additional millions year by year.

WORLDGRAM

AGRICULTURE

Jaunsar-Bawar Zamindari Abolition Bill: The President has given his assent to the Jaunsar-Bawar Zamindari Abolition and Reforms Bill, 1956. The Uttar Pradesh Zamindari Abolition and Reforms Act, 1950, enables the State Government to apply the provision of the Act to Pargana Jaunsar-Bawar, with necessary exceptions or modifications, provided that such exception or modification is not in respect of an essential matter. The conditions obtaining in this Pargana are peculiar, and the Act cannot be applied to it without substantial changes. The State Government have, therefore, considered it necessary to promote separate legislation for this Pargana, and have accordingly drawn up the present Bill. The salient features of the Bill are: (i) apportionment of the land revenue on each khat or khag among the zamindars in proportion to the land held by each; (ii) acquisition, on payment of compensation, of the zamindars' rights on lands held by tenants, except in certain cases; and (iii) introduction of land tenures similar to those introduced in the rest of the State.

Nine Standards for Food Grain Storage: The Indian Standards Institution has published a series of nine Indian standards in the field of food grain storage. The first three standards in the series lay down codes of practice for construction for Bukhari, Kothar and Morai. Types of rural food grain storage structures respectively giving all details with illustrations, wherever necessary. The next three standards lay down codes of good practice for construction of food grain storage structures suitable for trade and government purposes, respectively for the eastern, southern and coastal regions of the country. The areas falling in each of these regions have been indicated in the standards. The seventh standard lays down the code of practice for improvement and maintenance of existing structure used or intended to be used for food grain storage. The eighth standard prescribes the code of practice, for storage of food grain and its protection during storage. The last of the series is a code of practice for handling of food grain in transit.

Jute Cultivation in Formosa: Jute cultivation in Formosa to supply the local bag factories dates long back, according to Jute Bulletin of the Indian Central Jute Committee. Production is controlled and encouraged by the Government-sponsored Industrial and Mining Corporation. The system obtaining in recent years is that of fixing a price for jute in advance by the Corporation, which also actually buys the bulk of production from growers for delivery to the mills. The rated capacity of the Formosan industry in 1954 was in the vicinity of 11 million gunny bags, but there has been a slight expansion since and two new factories went into production early in 1955. Demand from the new units led to quick exhaustion of the supply of rotted jute in June last year, when the entire factory production was suspended. The 1955 crop in Formosa gave a fibre yield of nearly 87,000 bales against a target of 100,000 bales set for the year. The season 1955-56 had started with little or no carry-over.

INDUSTRY

Production of Synthetic Rubber in UK: The first full-scale plants in Britain for the manufacture of synthetic rubber are to be erected at Fawley. It is estimated that a saving of about \$30,000,000 a year will be achieved by the production of 50,000 tons of rubber annually—approximately equivalent to the present total volume of Britain's GR-S rubber imports from

the USA (GR-S is the abbreviation for Government Rubber Styrene). The announcement, made by Esso Petroleum Company, says that plans are well advanced for the construction at the Esso refinery at Fawley of a new plant to produce butadiene, a petroleum gas, which will be fed into a new £5,000,000 factory shortly to be built on adjacent site by the International Synthetic Rubber Company, formed by the Dunlop organisation. The plants are due for completion in 1958.

German Industrial Output: West German industrial output increased by 16 per cent last year, the Federal office of Statistics has announced. The 1955 index figure was 204 (1936=100) against 176 in 1954. Output of capital goods, as compared with 1954, rose by 24 per cent, consumer goods by 12 per cent and basic industry by 16 per cent. In the last five years, industrial production has risen by 80.5 per cent. It has been doubled since 1936.

Equipment for Bhilai Steel Project: A contract for the supply of equipment for the Bhilai Steelworks has been concluded. The equipment which will cost approximately Rs. 55 crores will be supplied on credit repayable in twelve equal annual instalments. Credit will be raised on each consignment in accordance with a general average price agreed upon and interest will be payable at 2½ per cent per annum from the date from which credit is raised. The first consignment is expected to arrive towards the end of June 1956 and the entire supply completed by the middle of 1959. The Steel Works are expected to achieve full production by December 1959, but two coke oven batteries, two blast furnaces, two open hearth furnaces and the blooming mill will be commissioned about a year earlier.

New India Fisheries: It is reported that an Indo-Japanese concern under the name of New India Fisheries Limited, had been registered in Bombay to exploit potentialities in Indian Waters with modern equipment. The Company's fishing activities would, however, be restricted to operations beyond seven miles from the coast line of India, and further the Company would not fish in the Gulfs of Kutch, Cambay and Mannar, Palk Bay, Pamban Channel and such other areas as may be specified by the Government of India. The authorised capital of the Company, was Rs. 1 crore and paid-up capital Rs. 15 lakhs. The capital of Indian interests was 51 per cent i.e., Rs. 7,65,000.

Standard for Cellulose Lacquer: An Indian standard specification for lacquer, cellulose, clear has just been published by the Indian Standards Institution. This standard prescribed requirements and the methods of test for the material commercially known as cellulose lacquer, clear. The standard has been prepared by ISI's Paints and Allied Products Sectional Committee.

Steel Wire for Springs: The Indian Standards Institution has published a tentative specification for hard drawn steel wire for springs. This standard covers the requirements for four grades of hard drawn steel wire made from medium and high carbon steels, suitable for use in the manufacture of spring for general engineering purposes. Grade I is a general purpose wire intended for the manufacture of clips and similar lightly stressed articles while Grade II is a hard-drawn patented wire not suitable for high duty where prolonged service under dynamic loads is required. Wires of Grade III and IV are high duty wires suitable for valve springs and other applications where it is essential to have the highest possible resistance to fatigue failure.

TRADE

Trade Agreement between India and Poland: As a result of the recent trade talks between the representatives of the Government of India and the Polish Trade Delegation, a Trade Agreement between the two countries has been signed. The Trade Agreement provides, among other things for settlement of accounts between the two countries in rupees. It also provides for closed scientific and technical co-operation between Indian and Polish industrial organisations by way of sharing technical skill, mutual exchange of technical missions, provision of technicians and training facilities and supply of equipment and machinery. The agreement has come into force from April 1, 1956, and will be valid up to December 31, 1959, subject to the Schedules attached to it being revised for each calendar year.

Export of Jute Products: Exports of Indian jute manufactures during the nine months April to December 1955, totalled 6,95,400 tons as against 6,52,700 tons during the corresponding period of 1954. There was, however, a decline in exports in January and February 1956 which were generally regarded as the slack season for export of jute goods. In twenty countries including the United States, Canada, China, Australia, Egypt, Indonesia, Netherlands, the Philippines and Thailand imported larger quantities of Indian jute goods during April to December 1955, as compared with the corresponding period of 1954. During the same period 22 countries including the United Kingdom, Argentine, Burma, the Netherlands and Kenya imported reduced quantities of Indian jute goods.

Higher Export Quota of Hamburg Shipyards: In 1955 Hamburg Shipyards delivered 80 ships of 272 728 GRT compared with 55 ships of 223 242 GRT in 1954. Hamburg shipyards contributed 30.8 per cent of the total West German deliveries of 884 798 GRT. In 1955, 29 ships on foreign account totalling 156 636 GRT were delivered to non-German customers (in 1954, 16 ships of 90 078 GRT). Sales abroad by Hamburg shipyards amounted 274.4 million marks (£23.4 million) compared with 187.8 million marks (£16 million) in 1954. Roughly 50 per cent of last year's total turnover was on foreign account. As sales abroad of the total German shipbuilding industry in 1955 amounted to 8.15 million marks (£69.4 million), the share of Hamburg shipyards in this achievement was 33.7 per cent.

Trade Agreement Between India and Yugoslavia: As a result of the recent trade talks between the representatives of the Government of India and the Yugoslav Economic Delegation, a Trade Agreement between the two countries was signed recently. The agreement will remain into force up to December 31, 1959. During the talks it was found that possibilities existed immediately for export, amongst other things, of substantial quantities of rolled steel products and cement from Yugoslavia and of iron ore from India. It was agreed by a separate exchange of letters that the two Governments would assist the respective trading organisations on both sides to realise these possibilities.

FINANCE

Indo-British Agreement on Avoidance of Double Estate Duty: An agreement between the Government of India and the United Kingdom for the Avoidance of Double Taxation on Estate Duty has been signed. Since such an Agreement can, under the Estate Duty Act, 1953, be entered into only with the Governments of reciprocating countries, the United Kingdom has been declared

as such by a notification issued on April 2, 1956. The Agreement will be laid before the Parliaments of India and the United Kingdom in the next few days and will come into force on a date to be notified later.

Outlay for Shipping in Second Plan: Expected to increase the Indian shipping tonnage to about 900,000 GRT by 1960-61, present proposals of the Union Transport Ministry envisage a net addition of 301,000 gross tons at a total cost of about Rs. 56 crores during the second Plan period. Government of India's contribution by way of loans to Indian shipping companies, investment in shipping corporations and similar measures for the acquisition of additional tonnage is expected to be about Rs. 46 crores, including a carry-over of Rs. 8 crores from the first Plan period. A sum of Rs. 10 crores is expected to come from the private sector.

Financial Aid for Nigeria: The British Government has made available to the Government of Eastern Region of Nigeria a grant of £1,312,500 from Colonial Development and Welfare (CD & W) funds towards a £1,750,000 programme for the development of water supplies in the rural areas of the Region. Another grant of £971,400 from CD and W funds, towards a £1,295,200 programme for the development of roads and bridges in the Region, has also been made.

Further Aid for Road Development: Government of India have sanctioned sums totalling Rs. 21 lakhs for road development work in Himachal Pradesh, Tripura and Uttar Pradesh. Of this allocation, Rs. 18,08,600 are for the construction of the first 32 miles of the Dharasu-Barkot road in the Tehri-Garhwal district (Rs. 14,61,100) and for the construction of a bridge path from Badrinath to Mana Pass in Garhwal district excluding bridges (Rs. 3,47,500). Tripura gets Rs. 2,77,585 for the purchase of tools and equipment such as diesel rollers, tar boilers, tar sprayers and mixing plants. A sum of Rs. 14,300 has been sanctioned for trial borings for the construction of a bridge over the Yamuna river near Paonta in Himachal Pradesh. Technical approval has been given for widening 6-foot track to 12-foot motorable road from 84th to 89th mile (from Mandi side) of the Simla-Mandi road via Tatapani at an estimated cost of Rs. 1,63,000.

GENERAL

Tentative Standards for Book Production: For the first time in the history of standardisation in the world, the Indian Standards Institution has laid down specifications for production of books. The standard specifications relate to preliminary pages of a book such as the half title leaf, the title leaf, table of contents, etc. This field has not been covered so far by any other standards making body in the world. The Documentation Committee of the International Organisation for Standardization has decided that these Indian standards should be used as working documents to provide the basis for formulating draft international standards for acceptance by all member countries to the Organisation, such as Britain, the United States of America, the USSR, France, Germany, Italy, the Netherlands, Canada, Australia, etc.

Shipping (Continuance) Bill, 1956: The Control of Shipping (Continuance) Bill, 1956, has received the assent of the President. The Bill extends the life of Control of Shipping Act, 1947, for a further period of two years. The Act provides for the control of coastal shipping through a system of licensing and certain other ancillary matters. The provisions of this Act are to be included in the Consolidated Indian Merchant Shipping Bill which is expected to be introduced in Parliament shortly.

NEWS IN BRIEF

INDIAN

It is reported British firms are to build a giant iron and steel plant at Durgapur in West Bengal at a cost of 80 million sterling.

The Coffee Board of India has released a further quantity of 450 tons of Coffee for export from India. The Board has invited necessary tenders for the purpose.

A team of British industrialists and technical experts is arriving in New Delhi shortly to study India's requirements of services and goods, particularly machinery and engineering goods for the second Five-Year Plan and see how far the United Kingdom can supply them.

India may be soon producing synthetic rice. After three years of persistent effort, the Central Food Technological Research Institute has perfected a product which is claimed to be cheaper and more nutritious than the natural grain.

The Central Social Welfare Board has appointed a Sub-Committee to consider the question of grants to hostels for working women of lower income groups.

The Central Government has initiated action with a view to opening a direct steamer service between the mainland and the Lacadive Islands.

The per capital generation of electricity in India increased by more than a hundred per cent between 1938 and 1953.

Indian railways at present carry about 3,600,000 passengers daily as against about 1,450,000 passengers in 1938-39.

Schemes costing Rs. 3.4 crores for the development of inland water transport are proposed to be included in the second Five-Year Plan.

A scheme for the development of fruit production costing about Rs. 8 to 9 crores has been included in the second Five-Year Plan.

The Government of India have decided to appoint the English Electric Company Limited, a UK firm, as a subsidiary consultant for the manufacture of hydraulic turbines and associated equipment as part of the Heavy Electrical Equipment Project.

It is reported that Rs. 125 crores have been set apart for refugee rehabilitation in the second Five-Year Plan, the bulk of it to be spent on displaced persons from East Pakistan.

So far 161 welfare organizations comprising of about 600 authorised workers have been appointed to promote the Women's Savings Campaign and the Small Savings Movement. The total sales under the campaign have amounted to over Rs. 2½ crores.

Government of India have sanctioned Rs. 51.85 lakhs for a 2,050-foot long high-level bridge over the river Mahanada at Dingrghat (Bihar) on National Highway No. 31, Connecting Assam with the rest of India.

FOREIGN

The Netherlands State Coal mines will establish a big polythene factory with a present capacity of 5,000 tons per annum requiring an investment of several million lbs.

The Department of Agriculture has predicted that the US would export 1.9 million bales of cotton during the marketing year ending July 31, compared with 3.4 million bales last year.

South Africa is to allow a duty free quota of 12 million bales of tobacco from the Rhodesian Federation in 1956. Nine million pounds will be flue cured while the balance may be air cured.

Australia's wool exports in the eight months to February decreased in value by £A29.6 (£23.6 million sterling) compared with the similar period of the last year.

A group of West German business men has founded the Society for Protection of Foreign Investments. The society aims to encourage investment abroad and protect it against appropriation and other hazards.

It is reported UK has agreed to extend the period of repayment of the outstanding balance of £16.58 million of loans made to Yugoslavia in 1949-51 from 1962 to 1967 and to reduce the rate of interest—which averaged 4½ per cent per annum—to 3 per cent per annum.

Reports from Fredericton, New Brunswick, indicate that a syndicate of British and United States interests will make a start this May on the construction of \$56 million (£18 million) pulp and paper mill at Lapreau in Montreal.

Shipping has been selected by the British Chancellor of Exchequer for preferential treatment in connection with the measures announced by him recently to arrest inflation.

From next year, Norway will adopt the "Pay as you Earn" tax system. Norwegians have paid tax on the preceding years earnings.

Plans to include practical training in different crafts in the curriculum of refugee school children in Jordan were revealed last month at UNRWA Headquarters in Beirut.

Agreement has been reached in principle between the Yugoslav and Austrian Railways on the electrification of the Rosenbeach-Jesenice section which links the two countries.

The sterling area's gold and dollar reserves, a barometer of Britain's economic health rose by 67 million dollars in March. This is the third successive month the reserves have shown an increase rising by 29 million dollars in January and 61 million in February. The total reserve on March 31, stood at 2,277 million dollars.

Special Articles:

THE CITIZEN AND THE STATE—II

By SARDAR K. M. PANIKKAR

[The first instalment of this article appeared last week.—Ed.]

THE Indian Constitution in a measure realised the significance of this problem and incorporated in the Fundamental Law a chapter affirming and guaranteeing the basic rights of the citizen. This declaration of Fundamental Rights is a self-denying act by the State itself in favour of the individual. Freedom of expression, conscience, assembly, etc., to which the Liberal State attached importance are secured to us by the Constitution and so far the State has worked within that rigid framework. And yet nowhere has legal protection been sufficient to safeguard human rights. It is only by constant vigilance by the public itself that the inevitable tendency of the State to encroach on the rights of the individual can be checked. It is here that India has been slack. Instances can be quoted both at the Centre and in the States where such invasions on the rights of the individual have been accepted without protest.

One case deserves special mention. A distinguished writer of Indian origin, Mr. Aubrey Menon, published in England a satirical work entitled 'Rama Retold' in which he dealt in an unorthodox manner with the characters of Rama and Sita. The book did not attract wide attention in India, but the Home Ministry of the Government of India, considering it objectionable, prohibited its entry into India and had all copies forfeited. The reason alleged was that the book was likely to wound the susceptibilities of the Hindus who looked upon Rama as an 'Avatar' of God. It is not necessary for the purpose of our discussion to discuss the validity of this argument, though it may be noted the 'en passant' that much more virulent criticism of Rama is common enough in the books produced in Southern India, and that at the very time that 'Rama Retold' was being proscribed a more offensive parody of the Rama story was being widely circulated in Madras. Also it is worthy of note that it is a part of the general tradition of Hinduism to criticise the worldly activities of 'Avtars', a notable instance being the attitude of the early Arya Samaj writers to the Krishna legend. It may be that the Home Ministry was justified in the action it took on the grounds of public security, the maintenance of law and order. But the point here is that the action of the Government passed practically unnoticed and was not subjected to any criticism in India itself. The lack of public interest in the maintenance of public rights is a danger signal in democracy, for we should never forget Jefferson's wise dictum that the only safe depositories of the rights of the people are the people themselves.

Another important duty of an intelligent citizen is to resist the influence of mass opinion on his mind. This is particularly important in a democracy where the mass-mind is quickly aroused and is often unscrupulously led. In monarchies, dynastic interests and in oligarchies the vested interests of groups stand in the way of such exploitation of mass-opinion. The history of modern States proves clearly that in communities where leadership is based on public opinion the tendency to exploit mass-emotions is almost irresistible. What divides democracy from tyranny is but a thin line; and this line is the toleration of unpopular opinions. All democracies have a tendency to equate unpopular opinion with anti-State and unpatriotic

activity. It shows itself in a hundred, apparently inoffensive, ways in normal times; but in times of crises it develops into a national hysteria, and those who hold unpopular opinions are branded as enemies of the people. Even in England where toleration of unpopular opinion is a part of the national tradition, during the First Great War the difficulties that Lord Landsdowne, a former Foreign Secretary, encountered for expressing the view that a negotiated peace may perhaps be desirable, the persecution to which Bertrand Russell was subjected for holding unpopular views in regard to war, and the way Ramsay MacDonald was treated, should make us realise that in times of national hysteria democracies are especially subjected to this danger. In our new democracies where the tradition of tolerance in political matters is not strong, it is, therefore, particularly important that we should not merely emphasise the right to free speech, but uphold as a matter of national importance the right to the free expression of popular opinion. This in fact what freedom of speech means. The danger is an insidious one for generally it is not through Government action that unpopular opinion gets suppressed, but through the action of the public itself. It is, therefore, a primary duty of the individual citizen to see that democracy does not get debased into tyranny by insistence on conformity, by denying expression to views against the current of popular opinion. The famous declaration of Voltaire that he will fight to death a certain opinion, but that he will equally fight to death for the right to maintain such an opinion, represents the true democratic spirit. This is a point of view that cannot be too strongly emphasised in a modern society which shows unusual readiness to accept mass-judgment on vital matters, especially when the propagation of mass-judgment is aided by the most modern techniques, the radio, the cinema and the tabloid press.

We have so far dealt with the problem of safeguarding the individual's rights in a modern democratic State. Equally basic to the conception of democracy is the individual's duty of participation in the working of the State. Sovereignty being vested in the people, the ultimate responsibility of all action rests with them. This is emphasised to some extent by the system of elections based on adult franchise to governing bodies, parliaments, assemblies, district boards, municipalities etc. But the citizen's duty does not cease with his voting at elections and then leaving the work of governance to the leaders thus chosen, or to those who make a profession of politics. For the people to wake up at election time and then again go to sleep is to allow the forms of democracy to be utilised by interested groups. More than that, it is not an efficient or satisfactory way of government. Democracy can function satisfactorily only if there is constant and unceasing co-operation between the public and the Government. It is only by the co-operative thinking of thousands of people working through voluntary organisations that ideas and policies are formulated in a democratic State. It is the widespread existence of such organisations, academic, voluntary, functional, at political, social and economic levels, that provides the necessary background of ideas for a democratic Government. Whether organised by

parties, or by independent groups, such co-operative thinking on essential issues is what provides both the framework of criticism and the machinery for independent thought in a modern State. Thus trade unions, chambers of commerce, research institutions, academic conferences, not to speak of specialised bodies devoting themselves to the examination of social and political questions, are equally the organs of the democratic State as are the more formal institutions like parliaments and other legislative bodies. Unless the citizens of a State take continuous interest in the development of ideas and their popularisation, democracy cannot function as a dynamic political system.

A special duty rests on the citizens to ensure that the declared purposes of the State are not ignored and overlooked by political leaders. The modern State exists to fulfil certain defined social and economic purposes, for the steady pursuit of certain ideals. We in India have defined them in our Constitution where emphasis is laid on social justice as the objective of the State. We have further elaborated it as the achievement of a welfare State based on a socialist pattern. Now, it is obvious that in every society, however progressive, there will be powerful elements, which under different pretexts will be trying to weaken these purposes if not actively to oppose them—forces of social reaction, basing themselves on a veneration of the past, forces representing communal or economic privilege, speaking the language of stability and security. It is the duty of the citizen to be vigilant with regard to these forces and to show awareness of the dangers inherent in such developments.

A more insidious danger lurks in the possibility of the leadership in the country becoming complacent and losing the sense of dynamism. The great urges and motivations which carried us forward during the period of national struggle may be weakened by time. This is a common enough phenomenon in politics and the history of new nations provides many instances of a gradual weakening of national purposes. The most conspicuous examples in modern times are those of the Kuomintang in China and of the Wafd in Egypt. This inherent danger can only be counteracted by the active interest of the vast mass of citizens in the policies of the State, their constant vigilance against backsliding and continuous and unrelenting pressure against any weakening of the national will. It is only where there are widespread and intelligent groups of citizens, who by criticism and constant watchfulness keep the leadership up to the mark, that a democracy functions as a progressive social structure.

INDO-RUSSIAN SHIPPING AGREEMENT

THE agreement for the regulation of a cargo shipping service between India and Russia, which was signed by the governments of the two countries on April 6 last, came as a corollary to the recent bilateral trade agreement between them. Ordinarily, a separate shipping service agreement is not considered necessary and a broad principle is usually incorporated in bilateral trade agreements expressing the willingness of the countries to promote the interests of their shipping services in the course of the trade. The Indo-Russian agreement has become necessary primarily because regular and frequent shipping services do not operate between the two countries and also because it was thought desirable that the ancillary benefit of larger shipping services should accrue to the two parties.

The principle of parity in distribution of the cargo and the fact of the execution of a special shipping agreement are likely to create certain hopes which

There is only one other tendency to which I shall allude here. In oriental countries, especially, there is a tendency to elevate the leader to a position of unique importance and invest him almost with superhuman virtues. This may be described as "the father conception", a phenomenon which becomes specially noticeable if the leadership remains continuously in the same hands over a long period. This may be seen in practically every country in Asia. One result of this development is that the leader remains above criticism, his actions, attitudes and prejudices being taken as something which are sacrosanct. We have recently seen how this 'father principle' operated even in the Soviet Union and how the Soviet leaders had to wait for some time to elapse before the myth of the great Stalin, 'the inspired leader and the teacher of humanity', could first be quietly given up and then publicly attacked. The danger of the development of the conception of the unique leader is no less great in Asia's new democracies. It is our good fortune that so far as India is concerned Mahatma Gandhi, though revered and almost worshipped by the masses, was so firm in his faith in democratic processes as to submit himself to public criticism and often to withdraw from leadership. This is even more true of Pandit Nehru. In spite of the unexampled adulation of the people, and the unique authority he has established in the country, he has himself fought against the growth of the 'leadership' principle and helped actively to develop in India collective responsibility and free criticism. But the trends are there among the people and it is the duty of every citizen to be constantly on guard against them.

Democracy is a system which in normal times requires dispersed leadership for its success. Only in exceptional circumstances does it require unique leadership which concentrates power in its own hands. In times of crises, it not only tolerates but welcomes the leadership of the exceptional individual—a Churchill, a Roosevelt, or a de Gaulle; but in normal circumstances, it frowns upon such people—Aristides the Just is rewarded in democracy by exile, and a Churchill, who led the nation with heroic greatness during a life-and-death struggle, is defeated in election at the end of the crisis. In India, the circumstances of our new freedom required an exceptional leader in whom the powers of the State could be concentrated. It was our good fortune that the leader was one whose burning faith in democracy ensured us against the development of a system of veiled dictatorship, one using the form of democracy for the maintenance of an authoritarian regime. But the future is something which depends on the people themselves and it is the duty of every citizen to be vigilant about it.

are not in reality warranted by the situation. The reason for the agreement is now easy to appreciate. As for parity, it needs to be remembered that it may be possible just because the volume of the cargo trade is extremely limited. It is yet another proof of the desire not to allow imbalance in payments; if, as is probable, the balance of trade in merchandise is in favour of the Soviet Union, it would only be accentuated by larger Soviet shipping services. It is, therefore, better that more Indian bottoms should carry the trade. A good deal of manipulation, however, would be necessary to achieve this objective and such manipulation will not be ordinarily practicable in large-scale trade between countries with gross disparities in their national tonnages.

An important angle from which the value of this agreement is to be judged is its impact upon the shipping services of India and other maritime countries

participating in the foreign trade of this country. The real question to ask is to what extent this agreement will alter the present pattern of the shipping services serving India's trade. Table A in this article gives a comparative picture during the post-independence period of the number and tonnage of steam ships which have entered or cleared with cargo or in ballast. The important statistics in this table are those which relate to the tonnage of the ships. A glance at the percentage shares of the tonnage of different nationalities in the inward as well as outward bound trade brings out the importance of the role which different countries play in the shipping services. The UK holds the largest percentage share in the tonnage involved in the services, although it is quite obvious that the quantum of her share is progressively decreasing. The United States claims the second rank in this regard and it may be stated that her share is more or less steady except for minor fluctuations. Among the remaining countries which ought to be regarded as major contributors to the shipping services which India requires are the Netherlands, Norway and Japan. Western Germany is emerging into greater importance in the carrying trade with this country, although her share is not separately mentioned here. It is a fact which needs to be noted with particular attention that Japan whose merchant navy

had practically disappeared at the end of the war is fast capturing an increasing share in this trade.

Russia's place in the total picture is easily seen from the percentage in tonnage which has declined by half between 1948-49 and 1952-53. Even taking her maximum share for comparison, its small size, as low as 0.4 per cent, explains the relative place of Russia. Any possible increase resulting from the recent shipping agreement in Russia's share will necessarily be related to this basic factor. The pattern of shipping services plying the Indian ports is unlikely to be affected in any mentionable degree by a possible increase in the frequency of the visits of Russian ships to India.

The shipping agreement between India and Russia has been designed primarily to serve the existing and the expected larger trade between them. There is a provision in the agreement which stipulates that the number of ports and the number of ships on each side may be increased by mutual consent above the present limits of 2 and 6. This enlargement of the services will depend upon the increase in the trade between the two countries, in the first instance, and in the trade between India on the one hand and the other European Communist and adjacent countries, in the

TABLE A

	1950-51	10	0.4	29	115,750	1.0
	1952-53	225	6.4	255	357,195	6.6
Norwegian	1948-49	157	5.7	146	535,151	5.7
	1950-51	168	6.5	209	818,590	7.3
	1952-53	149	5.2	140	570,871	4.4
Russian	1948-49	10	0.4	13	45,286	0.4
	1950-51	10	0.2	11	18,815	0.2
	1952-53	6	0.2	6	18,789	0.2
Other	1948-49	2,736	13.4	2,653	1,339,238	14.2
	1950-51	2,964	17.6	3,060	1,742,747	15.5
	1952-53	3,292	13.5	3,625	2,382,966	18.3
TOTAL	1948-49	2,903	100	2,812	9,466,616	100
	1950-51	3,142	100	3,280	11,228,615	100
	1952-53	3,447	100	3,771	13,053,944	100

next instance. Here again the basic indicator of the probable future trends in the expansion of shipping services is the trade of individual countries with India. Table B below sets out the present position in this respect.

TABLE B

Percentage Shares of Selected Countries in India's Foreign Trade in Terms of Value During 1954-55

UK	28.20	Sweden	0.63
US	14.32	Irish Republic	0.60
W. Germany	4.49	USSR	0.32
Italy	2.61	Denmark	0.29
Canada	2.30	Norway	0.27
Netherlands	2.23	Czechoslovakia	0.24
France	1.61	Poland	0.12
Belgium	1.32	Hungary	0.03
Switzerland	1.00	Yugoslavia	0.02
		E. Germany	0.02

The figures in the above table re-emphasize the plain fact, that the quantum of the trade of Communist countries with India is fractional. Given the necessary incentives and encouragement as contemplated by India's

bilateral trade agreement with them, it is expected to increase, but not in any appreciable degree. The trends in the tonnages of different nationalities are not likely to be changed to any material extent as a consequence of the agreement.

Still another effect of this agreement in which this country is interested is the probable increase in the Indian tonnage operating the distant sea trade. In this context the relevant factors are the tonnage owned by India whose share is fixed in the agreement and the target of expansion in the Indian tonnage in the second Plan intended for the distant trade. The agreement indicates that a tonnage of 55,000 on each side will be adequate to carry the trade between India and Russia. It should be remembered here that the frequency of the visits of the ships will largely influence the tonnage that will actually operate the trade. The scope for its increase is limited. The second Plan contemplates an increase from 283,500 tons to 405,500 tons in Indian shipping to carry the distant overseas trade. This increase will very likely accommodate the larger trade with Russia. It will be optimistic to expect that the agreement will make an appreciable impression on the Indian tonnage.

BOOK REVIEW

TAXATION AND INCENTIVE

An Expenditure Tax: By Nicholas Kaldor: George Allen & Unwin Ltd.: Price 18s.

Mr. Nicholas Kaldor's book on 'An Expenditure Tax', has attracted a great deal of attention since it was published recently; and in India it has perhaps been more widely discussed than in Britain because of the mention of the expenditure tax as one of the possible sources of revenue for the second Five-Year Plan. This publicity would be entirely to the good if it leads everyone interested in the idea to make a close study of the book itself, instead of making them repeat the idea of an expenditure tax as if it were a socialist slogan. The mistaken impression has gained ground that the expenditure tax is a new addition to the Finance Minister's armoury and the fact that Mr. Kaldor is identified with the Left in Britain has led to the belief that the expenditure tax is an egalitarian measure.

But it is not so much for an assessment of the merits and demerits of an expenditure tax that the book should be read, though Mr. Kaldor has argued a case for an expenditure tax with vigour and conviction. He has not, however, allowed his championship to ignore or minimise the serious difficulties in devising a practicable mode of levy of this type of tax. Indeed, as the book develops and proceeds to its conclusion, the case for an expenditure tax seems well-nigh lost and Mr. Kaldor shows a great candour in almost conceding to that effect. To tax income-earners without at the same time taxing their savings is a problem that has engaged the attention of a respectable line of economists from John Stuart Mill downwards. But the position today is no better than before; in some respects it is even worse because of the established position of the income-tax in spite of all its inequitable aspects. Mr. Kaldor has been quite fair in his conclusions. He agrees that "a personal expenditure tax would undoubtedly be a more complicated tax to administer than the present type of income-tax; it would make greater demands on the taxpayer in the preparation of the return, as well as

on the Revenue officials in checking it; that in consequence, it may never assume the role of the present income-tax as a tax embracing two-thirds, if not three-quarters, of the whole working population of the country." Mr. Kaldor further adds that "it would be impossible to think of replacing the present system with an expenditure tax system at one stroke, so to speak. There is well over a hundred years' accumulated experience in administering the income-tax. There is no such experience concerning the expenditure tax; and until some practical experience is gained in its administration, it is not really possible to foretell with any confidence how difficult its administration would prove in practice."

The question then arises as to why Mr. Kaldor had to write a book. The answer is that Mr. Kaldor has found in the expenditure tax an irresistible peg on which to hang his thoughts on taxation in relation to a system of incentives to help saving and investment. Here in this book one finds ample proof that the complaints against the present systems and rates of income-taxation are not mere protests of the affected interests; and a socialist economist has valuable lessons to teach to the average socialist politician.

In the climate in which taxation is being discussed in this country, the temptation to quote freely from Mr. Kaldor's book is very great in order to counter some of the glib assumptions of politicians and planners. One passage, however, is significant which relates to the principle of taxation as an instrument of attack on the concentration of economic power. After conceding that such concentration is inevitably associated with all large-scale organisation and not always with large personal fortunes and can occur as well in a socialist community, Mr. Kaldor is of opinion that it is not a problem which can or should be dealt with through an instrument of taxation because the taxation which destroys the power would also put obstacles to growth. Mr. Kaldor would advocate instead a system of inheritance and gift taxes and taxation on capital gains, while allowing the maximum incentive for earning and saving.

The Business World

TOWARDS HEALTHY INVESTMENT CLIMATE

By
CROESUS

VIEWED from any angle, the Industrial Credit and Investment Corporation of India Ltd. (ICICI) must be said to have fared very well for so infant an institution. It will be remembered that it was only on January 5, 1955, that the Corporation came into being. But, within the brief span of 18 months (or only 9 months from the date on which the Corporation commenced business), it has been able to present an annual report with a net profit of a little over Rs. 25 lakhs. The Corporation's financial position is quite sound, in that it has got liquid investments amounting to nearly Rs. 5 crores and cash and bank balances aggregating about Rs. 7 crores. The way in which appropriations have been made out of the profits of the Corporation is a visible proof of the prudence which is characteristic of any well-managed privately owned business. It is unnecessary to stress here the point that this Corporation was intended to be, and has been, a wholly privately owned business, notwithstanding the passing into Government control and ownership of 18 per cent of the share capital of the Corporation. This is one of the effects of the nationalisation of life insurance companies, to which the ICICI Chairman, Sir Ramaswamy Mudaliar, did well to call attention at the first annual general meeting of the Corporation, held early last week. Government, however, has promised to take no advantage of this position.

In his Chairman's speech at the annual meeting, Sir Ramaswamy also dwelt on the practicable effects of the concentration of control over life insurance companies in the hands of the proposed Nationalised Insurance Corporation. In this connection, he welcomed the Finance Minister's remarks that it was intended to continue on the same scale to support the private industry which previously had been given to it by the various life insurance companies. For, without such an assurance, it would have been difficult for the Corporation to build up its underwriting organisation. At a time when conditions in the stock markets are so unfavourable and unsettled, it would be difficult for any underwriter, whatever his resources, to undertake to subscribe such part of the public issue as is not subscribed by the investing public. The underwriting work of the Corporation has, therefore, a special significance, and it is no secret that the present popularity of the Corporation stems considerably from the fact that it ventured to underwrite public issues of shares right from the start.

Sir Ramaswamy referred also to another aspect of the nationalisation of life insurance arising from the concentration of control of life insurance funds. He rightly stressed the importance of market operations by insurance companies for the prosperity of the stock markets. "No stock market, nor indeed any other market, can prosper and be enabled to fulfil its function of providing a place where buyers and sellers come together, unless a substantial volume of transactions takes place. It is a fact that, in the past, insurance companies (here I am speaking particularly of the larger and well-run units) have undertaken a great deal of conscious and informed management of their industrial portfolios for which purpose they have built up the requisite skilled organisations. The transactions, both purchases and sales, which have resulted from this activity have provided a considerable volume of business for the Indian Stock Exchanges thereby enabling them to function more efficiently to the bene-

fit both of industries seeking capital and of the investing public." Sir Ramaswamy's purpose in saying all these was just to make the point that it will not be sufficient for those who are soon to be charged with the responsibility of managing industrial portfolio of nationalised insurance to consider themselves as mere holders of a large block of investments representing a cross-section of Indian industry. As he opined, "they will need not only to seek out well-sponsored new industrial enterprises which merit the support of the funds at their disposal but also to continue the policy of conscious management of their investments primarily to the interest of the policyholders but also in order that stock markets may continue to fulfil their important role."

The Corporation being an investment institution as the name itself suggests, it is not surprising that the ICICI Chairman chose, as the main theme of his Presidential address, the causes contributing to the present conditions in the stock market in the country. "It will be evident to everyone" declared Sir Ramaswamy, "that, if the establishment of new industries and the expansion and modernisation of old ones in the private sector are to be as successful as we all hope during the second Five-Year Plan, it is necessary that all interested in the economic and social progress of the country should avoid a continuing series of shocks to the investing public. Since this Corporation came into being, there has been, I think it is fair to say, a series of measures which have produced a feeling of some uncertainty. But even more serious than the measures which Government has adopted are the constant suggestions, proposals and recommendations made by persons holding leading positions but not directly responsible for the enactment of fiscal measures regarding how the private sector should be altered, modified or even abolished."

Lest someone should argue that the private sector can have no place in the new Socialist structure of society, the ICICI Chairman reiterated the remarks he made at the Corporation's Statutory Meeting regarding the relationship between the private and the public sectors. "With a full realisation and, indeed, a complete acceptance of the pattern of society that has been decided upon", he stressed, "in our country today, where we are concerned with conditions as they are at present, I feel that the plans for a large-scale expansion of the public sector of industry will fructify best not independently of, but in conjunction with, the private sector. The two are inextricably bound up and, unless the private sector is enabled to fulfil its role, the public sector will be prevented from carrying through to a successful conclusion the very substantial plans which have been laid for it."

If this thesis is accepted, as it must be, it follows that the authorities should take note of what Sir Ramaswamy said in regard to the effect of what he aptly termed "the anticipatory shocks" given from time to time on the investing public. As he said, it does not seem that some persons at least in leading positions who facetiously forecast the nature of possible fiscal measures, though not at all connected with actual decisions of such matters, fully appreciate the uncertain effect on the mind of the investing public of what they predict. A climate calculated to restore investors' confidence must be created by conscious effort.

ELECTRICITY LEGISLATION

By
CROESUS

THERE have been several criticisms of the targets of production indicated in the Draft Outline of the second Five-Year Plan. An almost universal criticism has been that the target for transport is hopelessly inadequate. But few would appear to have given adequate thought to the reasonably high targets in the second Plan, from the point of view of whether these targets could at all be attained in the prevailing conditions. It appears to me that the electricity industry has the unenviable distinction of falling under the latter category. For, although the target for this industry in the second Plan represents an increase of 100 per cent over the existing capacity, that is from 3.4 million kwts. to 6.8 million kwts, it is doubtful whether the industry, at any rate the private sector thereof, will be able to fulfil the task assigned to it, 'as things stand today.' The present plight of the electricity is fully reflected in the index number of shares of electricity undertakings today as compared to what it was, say, a year ago. Unlike other shares, and contrary to the usual trend in the past, whereas the index numbers of other industrials have improved, that of electricity shares has fallen. Even so sound and well-managed an electric company as the Ahmedabad Electric Company Ltd. has had to reduce its dividend in respect of its last year's working (1954-55) from 6½ per cent to 5 per cent, that is half a per cent below even the Standard Rate of 5½ per cent proposed under the Electricity Supply (Amendment) Bill. It was because of this that Mr. K. G. Milne, Chairman of the A.E.C., expressed the hope that, ere long, the law would be so amended as to afford the future investors in the electricity industry sufficient incentive.

Anyone must admit that this is an extremely reasonable plea, a plea which fully conforms to what the President of the World Bank said on the subject of financing of power developments in underdeveloped countries at the Eighth Annual Meeting of the Bank in September 1953. For purposes of record, I feel it is worth while reproducing here the relevant extract from that speech:

"It is, I think, regrettable that, at some times in some countries, the rates charged to the consumer for power are fixed by the authorities more with reference to the political factors of the times than with proper regard to the economic necessities of particular situations. When this happens, every sound financial and business consideration runs the risk of being sacrificed in what is believed to be the cause of cheap power. But, if power can be made cheap only by charging rates that do not provide an economic return, the power undertakings are denied the ability to raise not only funds to finance needed expansions, but even the funds to maintain their existing plants in good order. In such circumstances, the community in the long must be a heavy loser".

It should not be difficult to evolve an electricity law that will satisfy the requirements laid down by the President of the World Bank as above, provided our legislators apply their minds properly to the Electricity Supply (Amendment) Bill, which is likely to be taken up at the current session of the Lok Sabha for reference to a Joint Select Committee of the two Houses of Parliament.

Be that as it may, from the point of view of an investor, there are three principal changes that are proposed under the Bill in question which need particular attention. These are: (1) the proposed linking of the Standard Rate to the Bank rate with a differential of 2 per cent instead of the present fixed overall level of 5 per cent, (2) the proposal to provide for electricity supply industry all the benefits of the Development

Rebate permitted under the Finance Act 1955, and (3) the proposal to disallow debenture and loan interest as an expense in the computation of permissible clear profits, on the ground that debentures and loans find their places in the capital base upon which the standard rate of return is already allowed.

By reason of the importance of these proposals, the A.E.C. Chief naturally dwelt on them at some length. In regard to the first proposal, it is obvious that the Standard Rate proposed in the Bill, namely, 5½ per cent, will hardly meet the situation as it has developed since the Bill was framed. Unless the Bank rate is raised, a contingency that cannot be ruled out altogether in the prevailing context of the money market, it is necessary, as Mr. Milne stressed, that the differential of 2 per cent over the Bank rate indicated in the Bill should be raised to at least 2½ per cent. Considering that the industry in the private sector would need as much as about Rs. 50 crores for financing its expansion programme under the second Plan, it is a moot point whether even a Standard Rate of 6 per cent will enable electricity undertakings to ensure the full measure of internal finance required.

As regards the second provision regarding development reserve, the proposal as it stands lacks both grace and sanity. In the first place, the element of compulsion which makes the appropriation of this reserve rank as a prior charge in calculation of clear profits creates a perilous position, as Mr. Milne pointed out. For, he would be a prophet indeed who could be certain of being able to earn enough clear profit every year to meet both this prior charge and the full reasonable return. Again, the suggestion that the appropriations should be based on 25 per cent of the capital expenditure during a year and not on the revenue surplus of that year will only give rise to avoidable fluctuations, such as the tariff structure of no industry so tightly regulated as the electricity industry, which is also capital intensive can never hope to cope with. Finally, so far as the investor is concerned, this development reserve is of no consequence, inasmuch as the reserve is not available to the company for being added to the capital base and has to be made over to the purchasing authority eventually.

By making such tight jacket provisions in the Bill, the framers have only laid themselves open to the charge of entertaining an ulterior motive to deprive shareholders of even the permissible return with a view further to depressing the value of electricity shares on the stock markets and thereby facilitate taking over of the industry by the Government at a later stage by paying an unduly deflated value.

The third proposal is apparently intended to indicate the recent decision of the Central Electricity Authority which admitted the interest on loan and debenture capital as items of expenditure for purpose of determining clear profit, following a reference by the A.E.C. to the Authority of the Bombay Government's contention over the admissibility of interest on loan and debentures capital for the purpose. So long as this was not questioned electric companies were able to raise and invest any amount of equity capital and debentures. In the case of the A.E.C., as Mr. Milne disclosed, an anomalous position has been created by the new proposal, in that the Company stands to lose more from its allowance of interest figures than it stands to gain from the proposed upward revision of the Standard Rate of return! This is clearly in contradiction to the Government's own policy (applied to labour) of not penalising anyone when a change is effected by making one get less than what one actually used to get before the change.

ORIENT GENERAL INDUSTRIES LTD. 6, Ghore Bibi Lane, Calcutta-11

Sole Distributors:—M/s. REPUBLIC ELECTRICAL CO., 16/25, Katra Baryan, Fatehpuri, Delhi. Telephone: 23831-(PP)

MMC**revolving flat cards**

are now being extensively used

in Textile Mills in India.

Their efficiency is undisputed,

their reliability guaranteed.

Outstanding features

- 1 Five distinct setting points, used singly or in combination to control setting to .001 inch.
- 2 Johnson bronze bearings for cylinders and doffers. Roller bearings to cylinder; ball bearings to doffer and ball bearing comb box also provided as optional equipment.
- 3 Ball bearings to lick-in pedestals.
- 4 Self-lubricating 'Olice' bearings at several locations.
- 5 William's patent stripping motion for flats.
- 6 Drop lever with new disengaging handle.
- 7 Fluted lap roller with positive gear drive from feed roll helps uniform feed of lap at the back with minimum possible stretching.
- 8 Cards can be geared for any production in a mill organization.

MACHINERY MANUFACTURERS CORPORATION LTD.

Factory: Sonal Works, Kidderpore, Calcutta 23.

Managing Agents:

MAHINDRA & MAHINDRA LIMITEDHead Office: Gateway Building, Apollo Bunder, Bombay.
Calcutta Office: Hall & Anderson Building, Park Street.

(Incorporated in India)

Through a network of branches in India, Burma, Ceylon, Malaya, Thailand & Hong Kong and our correspondents at all important commercial centres of the world, we are in a position to offer the most complete Banking Service to Businessmen and Manufacturers engaged in the export and import trades.

Service is our motto

General Manager: Mr. C. P. Doraisannu

**RECORDS & STATISTICS
(QUARTERLY BULLETIN)**

Editor: R. V. MURTHY, M.A.

"The Eastern Economist" Bulletin of Records and Statistics surveys economic trends in each quarter in India and abroad with the aid of graphs and all available statistics. One of its special features is the Investment Supplement.

BUSINESS NOTES**AMERICAN COTTON EXPORT PLAN**

A GOOD deal of heat has been generated by the recent announcement of the US Department of Agriculture regarding the extension of the American cotton export plan, which, it may be remembered, was initiated in January last. The text of the US export policy for the 1955-56 season, it may be recalled, contained the following provisions:

(i) Stocks with the Commodity Credit Corporation are to be offered for sale for export on a competitive bid basis;

(ii) After January 1, 1956, when the major part of the 1955 crop has been marketed, not more than one million bales of CCC stocks of lower qualities are to be offered for sale on an open competitive bid basis, and

(iii) All programmes and operations are to be handled on a gradual basis—"there will be no 'dumping' of US cotton on world markets."

In the context of this policy enunciation, it is surprising that the U.S.D.A. should now have come out with an announcement regarding the extension of surplus sales and that so soon after the successful completion of the sale of one million bales of upland cotton. Evidently, in arriving at this decision America must have thought that she could ill afford to let go the present opportunity of capitalising the successful sales of the first one million bales and, in the process, conveniently forgot her earlier assurances to the outside world that 'not more than one million bales of CCC stocks would be offered for sale'. Her appetite having been whetted, she has now ventured to target for the disposal of as much as five million bales of her surplus cotton.

Meanwhile, Mr. Benson, the US Secretary of Agriculture, goes on assuring his critics "that sales will be made in an orderly manner to avoid disrupting world market prices and impairing the traditional competitive position of friendly countries", but overseas cotton interests are not easily taken in by this, and protests have already started. Thus, strongly complaining against the US plan to sell surplus cotton at competitive prices, the Peruvian Government hit the nail on the head when it remarked recently that, "inasmuch as the American cotton is to be sold for export at prices well below the domestic market levels, they fall squarely within the scope of what is generally called 'dumping'."

When all is said and done, selling cotton in the world market at a price lower than that in the domestic market would lay open any country indulging in it to the charge of "dumping", and it is more so if it involves selling Government stocks at a loss or with an outright subsidy. In order to avoid the serious repercussions of such moves on world cotton markets, it is high time that a new world cotton programme was evolved either for holding stocks indefinitely or for reducing them only gradually; otherwise, there will be chaos in cotton not only in the US, but all over the world. One would like to know what precisely the International Cotton Advisory Committee is going to do about this.

STEEL FROM POLAND

THE GOVERNMENT OF INDIA'S active search for larger supplies of steel from the overseas market is understandable in the context of the global tight position of this strategic material. In particular India requires sizable quantities of steel from abroad in the first half of the second Plan period since the increase in domestic production promises to ease the position thereafter. As part of the overseas procure-

ment programme, the Government entered into an agreement with Poland this week for the purchase of 300,000 tons of steel to be delivered according to a phased programme till the end of 1958.

As at present agreed, there is a firm promise that India would get a quantity of 50,000 tons of steel to be delivered between April and December in the current calendar year. Efforts would be made to procure another 50,000 tons during the same period, but there is no commitment in this regard. During the next two calendar years, the annual target for deliveries fixed is 100,000 tons. In return, as part payment, India has undertaken to supply to Poland 100,000 tons of iron ore to be delivered annually during the three years 1956 to 1958 at prices which have been fixed in advance. It has now become clear that in our trade with the Communist countries the urgency has been felt to balance the two-way traffic as far as practicable. At this stage it is not possible to assess the benefit from the steel supply agreement since even the price of quantities to be supplied in the current year has not been settled. The terms attaching to the supplies during the next two years have been left for decision at appropriate stages. All that can be expected is that they will compare equally, if not favourably, with conditions prevailing in other producing countries.

The State Trading Corporation which is to come into being in the immediate future has been nominated as the agency on the Indian side to handle the trade involved in this agreement. Until then the Ministry of Commerce and Industry will carry out the functions involved. The fact that the State Trading Corporation has been selected for this work does not necessarily establish its indispensability for trade even with Communist countries. Even in deals of bulk trade like the present agreement, the choice of the Corporation as the agency for execution will have to be vindicated by efficient and economical handling.

PAINT MANUFACTURERS' GRIEVANCES

THE PRESIDENTIAL address at last Monday's annual general meeting of the Indian Paint Manufacturers' Association makes a direct and trenchant attack on Government's policy vis-a-vis this industry in several respects. It would appear that the severity of the handicaps under which the units in this industry are labouring has impelled the president, Mr. Faizullahbhai, to use strong language in ventilating the Association's grievances. The Association and the Paints Federation (whose annual session was held earlier) are bitter about the lack of response from the Government in considering their repeated representations. It is unfortunate that this should be the case. But it is to be expected that a real sense of urgency will be shown in dealing with the industry's problems, since both the organisations have expressed their misgivings about the industry being enabled to fulfil its assignment in the second Plan, if the present unhelpful official attitude persists.

The gravest problem of this industry at the present time is the attitude of the Government Test House, Alipore, Calcutta, in dealing with paint samples. Quantities which, it is claimed, would be easily acceptable to the consumers, are rejected "thoughtlessly and arbitrarily" with the result that stocks are accumulating to create a host of physical and financial problems for the factories. Lack of technical experience and of appreciation of the basic problems of the industry on the part of officials who administer the Paint Section in the Test House is blamed for this state of affairs. The Association's plea for early discussion of the technical grounds of rejection needs to be heeded without

further delay by those at higher levels, it is urged, to revive confidence in the Test House. Another important grievance relates to the administration of the excise duty now levied on an ad hoc basis. The Association takes a practical view that the excise has come to stay and all that it pleads for in the interest of its smoother enforcement is revision of the relevant rules and regulations in consultation with itself. It has also asked for movement of oils in bond to avoid the element of double taxation.

The fact that Government is the biggest single purchaser of paints is a compelling factor which prevents the industry from disregarding government orders. But here the difficulty raised by the Test Houses is a deterrent. The Chairman finds fault with the official policy of accepting the lowest bid in the tenders which results in purchase of what is described as sub-standard material. However he has not suggested any alternative policy for dealing with tenders. Absence of a policy to correlate exports of linseed oil to the requirements of the paints and also other consuming industries has created genuine difficulties of high prices. This difficulty needs to be resolved since home produced industrial raw or processed materials ought to take care of the home demand before seeking outlets in foreign markets.

INDIAN SHIPPING ENTERS TANKER TRADE

INDIAN SHIPPING made its debut in the oil tanker trade last week. The country's maiden tanker, 'Jag Jyoti', owned by the Great Eastern Shipping Company, has been chartered by the Standard Vacuum Oil Company and it has been agreed that it should be employed for the transport of the refinery's oil and oil products from Bombay to Kandla, Cochin, Madras and Calcutta. In the total trade of this variety carried along the coast, the share of 'Jag Jyoti' represents a small part. Its significance, however, lies not in the quantitative aspect of the trade but in the fact that a new phase has started in the history of Indian shipping, namely, that of carriage of wet cargo tonnage. It is now elementary knowledge that no maritime country can rest satisfied with carrying dry cargo trade. A commercial tanker fleet is an integral and very vital part of any country's merchant marine. The post-war emphasis on the construction of tanker ships only underlines its importance.

The long agitation carried on by Indian shipping companies and the pressure they brought on the Government of India to take active part in building a nucleus of a national tanker fleet has begun to bear fruit. Doubts were entertained whether a term in the Government's agreements with the oil refinery companies to the effect that only government-owned tankers will be permitted to participate in the transport of their oil trade will impede the development of the Indian tanker fleet by confining its operation exclusively to the public sector. These doubts have been finally set at rest, although responsible quarters always believed that a spirit of sympathetic understanding will be displayed by the refineries and no technical impediments will be raised. The so-called difficulty has been circumvented by the simple technique of the refinery chartering this private tanker on a commercial basis. This gesture and goodwill shown by the Standard Vacuum offers clear proof of the generosity of spirit with which economic co-operation can be practised by foreign private interests to mutual benefit of both parties. Mr. Bhiwandiwala, Chairman of the Great Eastern Shipping Company, has acknowledged Government's assistance in enabling the company to acquire the tanker. In the near future two tankers are going to be purchased by the Government, but unhappily this project of building the first phase of our tanker fleet has been proceeding at a tardy pace. The urgency to make bold and imaginative investments in more tankers cannot be overrated.

TEXTILE INDUSTRY IN MADHYA PRADESH

THE PROSPECT before the cotton textile industry in Madhya Pradesh poses the challenge of reorganisation. The main task before the units in this industry in the State is to consolidate and hold the ground rather than to think in terms of expansion. Presiding over the recent annual general meeting of the Madhya Pradesh Millowners' Association, Mr. F. P. Mehta, the Chairman, took an attitude of self-criticism in analysing the problems of the regional industry. He minced no words and asked his compeers to recognise the fact that the cotton mills in Madhya Pradesh were considerably behind not only the mills in progressive countries like Japan but also behind mills in Bombay, etc.

In a seller's market shoddy fabrics were bound to lose custom and apart from this fact there had emerged another factor which has compelled attention to better quality, texture, finish and flawless production. This factor is the restriction placed on the industry in the matter of the manufacture of dhoties and specified varieties of cloth reserved for handloom production. Many of the units in the industry in this State stand in urgent need of renovating and modernising their equipment. The present is not the time for them to think in terms of expansion of capacity. The pressing need is that of renovation and possibly of modernisation. They need to prepare carefully planned programmes of re-equipment. It is no secret that some of them suffer from the handicap of inadequate resources to carry out these programmes. But Mr. Mehta has urged them to plan their requirements on a realistic and progressive basis, in which case, he hopes, their need of help will be met.

SUBSIDIES FOR FLYING CLUBS

IN THE post-war era there has been a distinct emphasis on expanding the facilities for the training of civilian air pilots in all free countries. This emphasis has been dictated by the expediency of building a broad-based second line of defence in the air. India has been rather slow in aligning herself with this important trend and her flying clubs had a record of modest progress. It was only since 1954 when the recommendations of the Master Committee were taken up for implementation that the flying clubs were enabled to expand their training facilities for pilots. The major change brought about as a result of the Committee's report is to rationalize the basis of payment of subsidies to the flying clubs. The principle accepted since then is to relate the rate of subsidies to the hours of flying done by each club. During the last two years or so encouraging results have been registered as a consequence of this rational scheme. In place of the fixed amount of subsidy of the order of Rs. 30,000 per year per club based on a flat rate, the assistance now given ranges between Rs. 40,000 and Rs. 1 lakh, depending upon the magnitude of actual training offered.

Simultaneously with the increase in their revenue from government subsidies, an obligation has been laid upon these clubs to reduce the fee charged by them for the trainees by nearly 50 per cent of what it was before the introduction of the present scheme. There is now a proposal to ask the clubs to increase the strength of their staff on an adequate scale and also to standardize the scales of pay to the members of the staff. It is significant that between 75 and 90 per cent of the total expenditure of the clubs is met by the exchequer. The fourfold classification which is now applied to the existing twelve subsidized clubs indicates their importance in the order of flying hours done and flying facilities given. The extent to which the new policy of liberal subsidies has stimulated air-mindedness in the country can be gathered from the fact that the expenditure on subsidies during 1955-56 rose by 75 per cent above the expenditure in the preceding year to Rs. 17.5 lakhs.

COMPANY AFFAIRS

THE TITAGHUR PAPER MILLS CO., LTD.

The accounts of the Company for the half-year ended September 30, 1955, show that after providing Rs. 17,19,230 for taxation, Rs. 7,83,510 for depreciation and setting aside Rs. 2,75,000 to reserve for development rebate, Rs. 1,00,000 each to general reserve, taxation contingencies reserve and dividend equalisation reserve, and making a provision of Rs. 10,00,000 for the New Mill Project, there remains a sum of Rs. 12,28,619. Adding the balance brought forward from the previous half-year of Rs. 39,160, the total sum available for distribution amounts to Rs. 13,17,779. The Directors have proposed the following dividends: On 1st preference shares at 8 per cent per annum, free of income-tax, absorbing Rs. 46,000; on 2nd preference shares at 4½ per cent per annum, free of income-tax, absorbing Rs. 33,750; on preferred ordinary shares at 10 per cent per annum free of income-tax absorbing Rs. 21,875, and on 'A' and 'B' ordinary shares at 12 annas per share, also free of income-tax, absorbing Rs. 8,40,353. A bonus of 4 annas per share of 'A' and 'B' ordinary shares, free of income-tax, takes away another Rs. 2,80,117, leaving a balance of Rs. 95,684 to be carried forward. The credit balances of the subsidiary companies—the Commercial Products Ltd., and the Paper Agencies Ltd.,—have been carried forward.

Production during the half-year was less than that of the previous period which has been ascribed to the lighter average substances of orders made. Renovation and development programmes are progressing satisfactorily. The Tomlinson Soda Recovery Unit which had earlier been commissioned, has shown improvement in operation. Work is expected to be started, in connection with the projected new mill in Orissa, as soon as land is handed over to the Company by the State Government.

THE BENGAL PAPER MILL CO., LTD.

The profit of the Company, for the half-year ended December 31, 1955, amounts to Rs. 6,59,703, after providing for debenture interest, depreciation and taxation. With the sum of Rs. 1,73,122, brought forward, the amount totals Rs. 8,32,825. The Directors have transferred to general reserve Rs. 1,00,000, leaving a balance available for distribution of Rs. 7,32,825. A 7 per cent per annum dividend, free of income-tax, on cumulative preference shares takes away Rs. 7,000 and a similar dividend on 'A' cumulative preference shares absorbs Rs. 14,000. Dividend on 'B' cumulative redeemable preference shares, at 6 per cent per annum, subject to deduction of Indian income-tax, absorbs Rs. 60,000. On ordinary shares, the dividend of 20 per cent per annum, free of tax, amounts to Rs. 4,50,000, which leaves a balance Rs. 2,01,825 to be carried forward.

This reflects satisfactory results which can be attributed to higher production during the half-year under report, and to better chemical recovery, which is expected further to improve. The production during the half-year was 6,944 tons which shows a substantial increase over 6,613 tons of the previous half-year.

The Company has drafted plans for nearly doubling its production capacity which it hopes to implement in the future. The extension of the production capacity is expected to be financed mainly from the Company's own resources.

MARTIN BURN LTD.

The working results for the year ended September 30, 1955, after making provision of Rs. 3,48,584 for a new female hospital block at Burnpur Works of the Indian Iron and Steel Co., show a profit of Rs. 71,18,708. A sum of Rs. 2,52,479 has been brought forward making

available a total sum of Rs. 73,71,187. Taxation, capital redemption reserve fund and general reserve take away Rs. 37,75,000, Rs. 2,00,000 and Rs. 5,50,000 respectively leaving Rs. 23,46,187 available for disposal. Interim dividends for the half-years ended March 31, and September 30, 1955, amount to Rs. 1,50,000. A dividend of Rs. 1-8 per ordinary share absorbs Rs. 20,62,960 and a cash bonus of 5 annas per share absorbs further Rs. 4,29,781, both being free of income-tax. The balance of Rs. 2,03,456 is carried forward.

During the year ended September 30, 1954, holders of Rs. 13,14,500 Convertible Notes converted their holdings into ordinary shares which resulted in an increase of 65,725 ordinary shares and a reduction of Rs. 13,14,500 in the Convertible Notes outstanding.

HOWRAH MILLS CO., LTD.

The working results of the Company for the half-year ended September 30, 1955, are depressing. Before providing for depreciation, the loss amounts to Rs. 96,741. The balance brought forward, amounting to Rs. 92,110, reduces this to Rs. 4,631. The Directors have transferred Rs. 2 lakhs each from the dividend equalisation reserve and jute stock reserve, and another Rs. 4 lakhs from general reserve making available a sum of Rs. 7,95,369. Out of this, Rs. 4,25,000 have been deducted for depreciation and Rs. 1,02,968 for sales tax contingencies, leaving a balance of Rs. 2,67,401. A dividend for the half-year of Rs. 3-8 per share on preference and 'A' preference shares each absorbs Rs. 30,625 and Rs. 61,250 respectively. Another sum of Rs. 1,64,062 is to be paid as dividend at 4 annas per ordinary share and the balance of Rs. 11,463 is carried forward to the next account.

Heavy floods caused considerable shortage of suitable raw material during July to September, and the trading conditions in general were difficult. During the same period, values of finished goods also fell low and all these conditions combined to produce the disappointing results. The devaluation of the Pakistani rupee in July, 1955, did not result in any reduction in the price in terms of Indian rupees of Pakistan jute as they decided to maintain their minimum export prices at the same sterling level as previously. Also they increased the export duty on raw jute, with a few exceptions, by Re. 1 per maund.

In compliance with the Working Time Agreement of the Indian Jute Mills Association, the Mills worked 48 hours per week with 12½ per cent looms sealed. It was later decided further to unseal a total of 7½ per cent looms because of reduction in stocks of hessian and sacking. Also demand throughout the consuming markets was expected to increase.

THE STANDARD JUTE CO., LTD.

In line with some other jute companies, the Standard also suffered a loss of Rs. 2,95,112, after providing Rs. 2,43,207 for depreciation, during the half-year ended September 30, 1955. The loss is reduced by Rs. 46,767 (Rs. 19,821 brought forward from the previous half-year and Rs. 26,946 transferred from general reserve) to Rs. 2,48,345. Taking into account the amount transferred to provision for contingencies (Rs. 26,946) the total loss stands at Rs. 2,75,291, which has been proposed to be carried forward.

With the removal of all export duties by the Government of India from August last year, Indian jute mills were put in a stronger position to meet competition from other countries. The devaluation of the Pakistani rupee was not of much benefit as said above.

As in the case of other companies, the percentage of looms sealed has been reduced from 12½ per cent previously to 5 per cent now.

COMMODITY NEWS AND NOTES

WOOL AUCTIONS IN INDIA

The Development Council for the Woollen Industry decided recently at its meeting in Bombay that auctions of Indian wools should be held in India. The Council believed that any difficulties caused to foreign buyers who normally rely upon the Liverpool (UK) auctions for their supplies would be overcome. The Council believed that it could itself undertake the export promotion of wool manufactures, of which carpets is the main item. But it made no decisions as to whether exporters should have the facilities of Export Credits Guarantee Scheme as an insurance against export risks. Similarly it thought that a more detailed study should be made before deciding whether or not to recommend that manufactures be permitted to operate over the London Wool Tops Futures Market. A sub-Committee has been formed to make necessary recommendations.

FUTURES TRADING IN JUTE

The Forward Markets Commission is understood to have approved a proposal for the setting up of a futures market in jute and an official announcement is expected to be made by the end of May. The market modelled on the pattern of the East India Cotton Association will be located in Calcutta. The proposal for the organisation of the market has been under study of the Commission since September last when the Indian Jute Mills' Association Sub-Committee handed over to the Commission a draft of the articles of the Association and bye-laws of the proposed market. The Commission is said to have recommended certain amendments to the Constitution of the market, particularly those relating to the appointment of directors, and providing for safeguards against undue speculation. First proposals for constitution of a futures market for jute are more than a year old. Early last year the Jute Inquiry Commission recommended constitution of such a market.

RAW WOOL EXPORT

It is reported that quotas of export of raw wool this season will be lower ranging between 15 million lb. and 20 million lb. as the indigenous industry consumes more of white wool which is predominantly produced during the country. However, the Government of India's decision to allow exports of raw wool during the April-September period is welcomed by the shippers. The foreign demand is stated to be moderate, and out of the quota allowed for export in the previous season hardly 50 per cent would have been shipped because of price disparity. Business with the USA is reported at 87 cents per lb., for Bewar White and at 92 cents for Bikaner White. Transactions with the continent are reported at around 66d. per lb. for average yellow quality. It is felt that exports might improve if domestic prices move down by at least two annas per lb. Meanwhile, the movement of raw wool into the terminal markets is reported to be in full swing and mills are evincing keen interest in white wool.

MORE EXPORT OF PEPPER

Judged by the trend of exports of pepper and ginger during the first five months of the 1955-56 season, it appears that India will be able to hold her own in the export market. The output of pepper will be at a new peak of 25,000 tons and shipments during the season are likely to exceed 14,000 tons. The estimates for the ginger crop are yet to be made, but exports during the past four months are 90 per cent higher than those in the corresponding period of last year.

NO CHANGE IN TEA EXPORT DUTY

The Government of India have issued a notification fixing the price of tea, for the purpose of determining the export duty at Rs. 2-13-4 per lb. as against Rs. 2-11-4 per lb. in force from March 1, 1956. There is no change in the existing rate of duty of six annas per lb.

FREE WORLD COTTON EXPORTS

The International Cotton Advisory Committee has predicted an almost certain reduction in aggregate "free" world cotton exports this season following the proclamation of a new United States cotton export policy. The American Agriculture Department has announced it would offer for sale at competitive bidding, beginning on August 1, a minimum of five bales of surplus cotton. Sale prices for this cotton were expected to be lower than previous fixed selling prices of the Department. The Committee consists of representatives of 33 cotton producing and consuming countries.

EXPORT OF ONIONS AND CHILLIES

The Government of India have decided to extend up to the end of April 1956, the validity period of shipment of onions and chillies quotas issued to exporters in terms of previous notification, says a recent notification issued by the Joint Chief Controller of Exports, Bombay.

ARGENTINA MAIZE ESTIMATE

In Argentina, according to preliminary Commercial estimates the area under maize for the 1955-56 crop season is placed at 3.00 million hectares and the production may possibly total 4.7 million metric tons. This compares with 3.00 million hectares planted in the 1954-55 season, when 2.4 million hectares were harvested, yielding 2.55 million tons. In the 1953-54 season the total were 3.31 million hectares, 2.47 million hectares and 4.45 million tons respectively. Home requirements total around 2.50 million tons, so that there should be at least 2.00 million tons available for export, if the present estimate is realized.

COTTON FUTURES

It is reported that the terms of the forward cotton contract in Bombay will soon undergo a fresh change in view of the possibility of new markets being opened at Akola and Indore next season and in the light of the experience and technical difficulties which the Forward Markets Commission had to face in the current season. The proposed changes, it is stated, might enable the Commission to be more vigilant about speculative business in the market. The contemplated changes relate to sworn surveyors, delivery months, election of directors and maintenance accounts by traders.

BAISAKHI LAC CROP ESTIMATE

According to preliminary reports issued by the Indian Lac Cess Committee, the Baisakhi Lac Crop in India for 1956 is expected to be 7,51,000 maunds, as against the previous year's final estimate of 8,13,000 maunds. The normal yield for this crop based on the average of 10 years proceeding 1955 is 7,10,000 maunds.

The final estimate of the Aghari Kusmi Lac crop for 1955 is put at 61,000 maunds, as was estimated at the time of the issue of the preliminary Aghani (Kusmi) report.

THE SOORAH JUTE MILLS CO., LIMITED

NOTICE is hereby given that the 119th Ordinary General Meeting of the Shareholders of the Company will be held at 8, Royal Exchange Place, Calcutta at 2-30 P.M. on Wednesday the 9th May, 1956 for the following purposes:

- (1) To receive and consider the report of the Directors and to pass the audited accounts for the year ended 31st December, 1955.
- (2) To declare dividends on Ordinary and Preference Shares.
- (3) To elect Directors in place of those retiring by rotation. Sri G. P. Birla, an associate of the Managing Agents, retires by rotation but being eligible offers himself for re-election. As he has been acting as a Director of the Company since 1945, it is desirable to avail of his valuable advice by retaining him as a Director of the Company. Hence special notice is hereby given to pass with or without modification the following special resolution:

"RESOLVED that Sri G. P. Birla, an associate of the Managing Agents under the Companies Act 1956 be appointed as a Director of the Company who is liable to retire by rotation under the provisions of the Articles of Association of the Company."

- (4) To appoint Auditors and fix their remuneration. Messrs. Lovelock & Lewes have intimated their intention not to be reappointed as Auditors of the Company in view of the fact that the Account books of the Company are now being maintained in Hindi. A shareholder of the Company has given notice of his intention to propose the name of Messrs. Singhi & Co., Chartered Accountants of 1-B, Old Post Office Street, Calcutta, for appointment as Auditors of the Company. A copy of such notice has been sent to the retiring Auditors. A special notice is hereby given to this effect.

- (5) As special business to pass with or without modification the following resolution which will be proposed as special resolution:

"THAT Article 112 of the Articles of Association of the Company be deleted and the following be substituted therefor: '112—The Directors will not be required to hold any qualification shares.'"

- (6) To transact any other business which may be brought before the meeting with the permission of the Chairman.

The Share Transfer Books of the Company will remain closed from 30th April, 1956 to 9th May, 1956 (both days inclusive).

By Order of the Board,

HINDUSTAN INVESTMENT CORPORATION LTD.,

Managing Agents.

CALCUTTA,

Dated 29th March, 1956.

In particular to Mr. Kamalmani A. Dikshit, Pandit Kedarnani A. Dikshit & Mrs. Bidya Devi A. Dikshit, Mr. Kasam Ahmad Vaiz, Mr. Narendra Shumshere J. B. Rana and Mr. Prakashmani A. Dikshit.

Note: (1) The Directors have recommended dividends on Preference shares @ 7 per cent (free of income-tax) and on Ordinary Shares @ Rs. 1-8- per share (free of income-tax).

If dividends on shares as recommended by the Directors are declared at the meeting, The DIVIDENDS WILL BE PAYABLE ONLY TO THE REGISTERED SHAREHOLDERS, whose names are on the Company's Register on 9th May, 1956. No application need be sent for dividends, as relative Dividend Warrants will be posted to such shareholders within 3 months from the date of declaration.

The Shareholders are advised to notify any change of address.

- (2) A member entitled to attend and vote at the above meeting is entitled to appoint a proxy to attend and vote instead of himself and a proxy need not be a member.

- (3) Explanatory statement in regard to special business to be transacted at the meeting.

It is desired to amend the Articles of Association of the Company by deleting the existing Article 112 requiring the Directors (other than ex-officio Directors) to hold 100 Ordinary Shares in the Company as qualification shares; and by substituting a new Article providing that the Directors will not be required to hold any qualification shares. The Articles of Association of the Company may be inspected at the Company's office at 8, Royal Exchange Place, Calcutta during business hours.

RESERVE BANK OF INDIA

APPLICATIONS are invited for the following posts in the various departments of the Reserve Bank of India:

(A) POSTS AND SCALES OF PAY:

1. Research Officers, Department of Research & Statistics Rs. 375-55-815 E.B. 55-925-60-1045.

The appointments to the above posts will be made on a temporary basis in the first instance but are likely to be made permanent.

Note: Candidates possessing exceptionally good qualifications and experience may be given a higher starting salary in the prescribed scale.

2. Probationary Assistants Rs. 250-25-450 E.B. 25-650

Note: Promising Probationary Assistants will be eligible for promotion as officers in the scale of Rs. 375-55-815 E.B. 55-925-60-1045.

(B) ADDITIONS TO PAY

1. Local pay: 10% of pay with a minimum of Rs. 10/- per mensem rounded upto next higher complete rupee to the staff working at Bombay, Calcutta, Madras, Delhi, Kanpur and Ahmedabad.

2. House rent allowance

Research Officers: 15% of pay with a minimum of Rs. 60/- and a maximum of Rs. 300/- per mensem.

Probationary Assistants: 10% of pay with a maximum of Rs. 50/- per mensem.

3. Dearness Allowance: At prescribed rates.

Research Officers: The present rate is 16-2/3% of pay with a maximum of Rs. 125/- per mensem.

Probationary Assistants: Rs. 65/- per mensem for pay (including local pay) upto Rs. 300/- per mensem.

(The rate of Dearness Allowance is subject to revision from time to time).

(C) AGE LIMIT AS ON 1st May, 1956:

Research Officers: Candidates should not ordinarily be over 30 years of age. The age limit may be extended upto 35 years in the case of candidates with exceptional qualifications and/or research experience of value to the Bank.

Probationary Assistant: Candidates should not ordinarily be over 24 years of age.

Age limit may be extended but not beyond 30 years in the case of candidates possessing special qualifications and experience of value to the Bank and also in the case of

- (i) candidates with approved war service.
- (ii) ex-employees of Banking Institutions whose services have had to be terminated for reasons of economy or as consequence of the closure of unremunerative branches or as a result of the Banks going into liquidation.
- (iii) personnel retrenched from Government offices after at least one year's service, applying through the Employment Exchange, and
- (iv) candidates belonging to the Scheduled Castes or Scheduled Tribes.

(D) QUALIFICATIONS:

1. Research Officers, Department of Research & Statistics

First or high second class Master's degree in Economics, or Commerce or Statistics/Mathematics of an Indian or foreign University or a Doctorate degree in Economics or Statistics of an Indian or foreign University and a period of research work in one or more of the subjects, viz., (a) monetary economics, (b) banking theory and practice, (c) international finance, and (d) sampling theory and econometrics etc.; a period of practical banking training will be an additional qualification in respect of applicants with specialisation in (a) and (b).

(2) Probationary Assistants:

Applicants should have had a brilliant academic record and must possess a first or very high second class Master's degree or a first class Bachelor's degree of a recognised Indian or foreign University in Economics, Commerce, Banking, Accountancy, or Law as a special subject of study.

THE BOARD WILL INSIST ON A VERY HIGH STANDARD OF SUITABILITY IN MAKING SELECTIONS FOR THE ABOVE POSTS AND ONLY CANDIDATES WHO POSSESS GOOD ACADEMIC QUALIFICATIONS AND ADEQUATE EXPERIENCE OF THE TYPE SPECIFIED ARE ADVISED TO APPLY.

Candidates who wish to apply for more than one category of posts must submit separate applications accompanied by separate application fees.

The selected candidates for the posts of Research Officers will ordinarily be on probation for a period of 3 years which may be reduced or extended at the Bank's discretion. Candidates selected for the Probationary Assistants' posts will also be on probation for a period of 3 years during which they will be liable to be discharged at one month's notice or pay in lieu thereof. Candidates selected for the Research Officers' posts will ordinarily be stationed in Bombay but those selected for the Probationary Assistants' posts must be prepared to serve in any office of the Bank in India.

Applications should be in a special form to be obtained from any office of the Reserve Bank. All the applications should be accompanied by copies of two testimonials (originals should not be sent; the Bank does NOT accept responsibility for returning the originals if sent through oversight) and forwarded to the Secretary, Central Recruitment Board, Reserve Bank of India, Central Office, Post Box No. 406, Bombay No. 1 so as to reach him on or before 1st May, 1956. Candidates already in service must submit their applications through their employers. Candidates belonging to Scheduled Castes or Scheduled Tribes should mention this fact prominently on their applications.

Applicants for the above posts must remit application fees of Rs. 7-8-0 per application by Postal Order, Cheque or Bank Draft on a SCHEDULED BANK PAYABLE AT BOMBAY along with the application. The application fee is in no case refundable. Bonafide refugee candidates who are NOT IN EMPLOYMENT applying through any of the Government Employment Exchanges are exempted from payment of application fees while in the case of Scheduled Castes/Scheduled Tribes candidates the fee will be reduced to 1/4th.

Appointments will be subject to candidates being found medically fit for service in the Bank. If any candidate desires to have his application acknowledged he should enclose a stamped self-addressed envelope or a post-card. Apart from those who may be specially called, interviews will not be granted to candidates nor will the Bank enter into any correspondence with them.

Canvassing in any form will be regarded a disqualification.

Revision of Industrial Policy

LAST week, the Planning Commission was engaged in a discussion of the Government's Industrial Policy during the period of the second Five-Year Plan. The revision of the Government's Industrial Policy Resolution of 1948 has lately been under consideration and though the final shape of the revised policy will not be known for some time there is no mystery about the general character of the draft that is likely to emerge from these discussions. This is clear from the circumstances in which the revision has been undertaken now. In the normal course, a revision was not due at least until 1958 when the ten-year period of immunity against nationalisation of certain industries would expire. As recently as the end of 1954, the Policy Resolution of 1948 was subjected to close scrutiny by

Government and Parliament and the upshot of it was that there was no case for substantial modification of that policy. The idea of revision is an afterthought which has occurred during the preparation of the second Five-Year Plan and the refusal to wait for two years more for undertaking revision in the normal course is some indication of the importance attached to declarations of various kinds as part of planning.

This is, perhaps, no more than an example of the tendency to regard statements and definitions on paper to be almost equivalent to the great achievements to be recorded under the Plan. If the Policy Resolution were a material instrument for the implementation of planning, the need for

revision cannot be doubted. But there has never been any complaint that the terms of the Policy Resolution were acting as hindrances to policy decisions that the Government chooses to make. The broad and elastic terms of the 1948 Resolution have been fully vindicated by the experience of the last eight years during which our industrial production has progressed at a satisfactory rate. All or any of the steps taken from time to time for expansion of the industrial sector have been easy to execute even though they differed sometimes from the declared terms of policy. This is nothing more than an affirmation of the ultimate supremacy of Parliament, and of a Government responsible to it, to take such action as it deems necessary in the national interest. It would hardly be true to say that the Government has conformed strictly to the letter of the old Resolution; by the same token, it is hardly likely that it would adhere to every word of the new one. The undue preoccupation with verbal forms of a declaration of industrial policy seems, therefore, to betray a tendency to regard pompous drafting as a substitute for planning. The Draft Plan that is due to come forth shortly may provide more evidence of this trait among our planners.

Quite certainly the new draft Resolution is not going to be the means of delivering the goods. At best it may reflect in different tones the current debate over the virtues of the two sectors, in which prominent spokesmen have taken part in Parliament in the last few days. It is disappointing to find them engaged in controversies over trivialities at this stage. Mr. G. D. Somani moved a resolution before the Lok Sabha which was pointlessly provocative and was liable to be disposed of easily. There may be a tendency to calumniate the private sector by exaggeration but a retort in similar terms can hardly do much good. Assuming that the public sector's deficiencies are fully exposed by an enquiry on the lines demanded, it could not have established that the private sector can, and the public sector cannot, establish new units in steel or heavy machinery or fertilizers. Whichever sector undertook these tasks would have been faced with a problem of management and of technical personnel. Nor, on the other hand, was it necessary to descend, as the Finance Minister did, to the low polemical level of a defence lawyer abusing the plaintiff's attorney. The private sector's deficiencies have not been unknown, and some of them it shares in common with the public sector. But no amount of criticism can burke the fact that the rise in industrial production under the first Five-Year Plan, which in the last resort made a success of planning by providing the cushion against inflationary financing, was essentially not an achievement of the public sector.

It is idle to indulge in this controversy at this stage when the motto for the next five years should be 'all hands to the pump'. The discussions in the last few days have helped to clarify the magnitude of the task that faces the country. With a Plan involving an outlay of over Rs. 5,000 crores in the public sector alone and the resources definitely in sight being less than half, the absolute necessity of deficit financing at a minimum of Rs. 1,200 crores to implement the Plan has been clear. Considering that deficit financing to the extent of a third of that level under the first Plan has only been barely matched by an increase in

production of nearly 25 per cent, the job of production that has now to be undertaken should make any responsible person pause with humility rather than rush to reckless and extravagant polemics. However, all that we now see is a debate on purely ideological lines as though a clinching of issues on this plane would solve our foremost problem.

The proposed revision of the Industrial Policy Resolution is not dissimilar to this larger debate: it is a naive preoccupation with a change from tweedledum to tweedledee. The terms of the new declaration may deliberately be made bold and forthright, but in the last resort the courses of action which can give the results that are required may not be found there. The economy has to advance on all fronts and it can do no good to any section of it if, for example, the production of coal falls short because of categorical declarations. The main lesson of the last few years is that there is nothing to hinder the Government from taking any type of action required to advance national policies, whether in the direction of liberalisation or of tightening up the restrictions of a preconceived policy. But the emphasis that has been placed on making a change at this juncture, a change which to all appearances is in the direction of severity, can only impair confidence here and abroad without being offset by significant advantages.

Our objectives cannot be advanced by deliberately creating the impression of being severely ideological, when in fact serious doubts have occurred in the minds of our chief policy-makers about the implications of the doctrines that are being preached. The Prime Minister's reference to the Ambar Charkha this week has shown an extremely realistic view of its scope. If the Ambar Charkha is to be regarded as a revolution in the manufacture of Khadi, and no more, the other implications are easy to understand. The Ambar Charkha cannot obviously become a handy instrument for providing cloth on the scale that will be needed to counter inflationary trends in the next five years and the question that every Charkha enthusiast must ask himself is whether he would prefer to save the Charkha or the Plan. Similarly, if much of the categorising of industries into one or other of the various groups in the Industrial Policy Resolution has no relevance to the problem of finding the investment, the managers or the transport capacity required for production, the task would be in vain.

The problem is not now to erect a framework for action; it has been there all along, and has been gradually evolving. It is action itself that is needed and a Government "sicklied over with the pale cast of thought", can no longer advance its objectives by this interminable process of discussion. The available apparatus of Government and all the other instruments of implementation outside it have now to be set in motion. The challenge of the Plan, it is now perfectly clear, lies in the creation of a climate which would make deficit financing an effective means of achievement. Mr. T. T. Krishnamachari's speech in the Lok Sabha on Monday reflected to some extent the grave nature of the problem of saving the Plan and if that attitude spreads more widely among other policy-makers the distractions of ideology can still be minimised and a sober approach made possible.

Steel in 1966

IS the target of 18 million tons of ingot steel in 1966 pitched excessively high to raise serious doubts about the feasibility of its achievement? During the debate on the Iron and Steel Ministry's demands for grants there was genuine appreciation of the confidence and determination with which the new Ministry is handling its onerous tasks. It is because of the manner in which it is facing up to its obligations in a novel field that a feeling of strong scepticism, which would otherwise have been created about the impracticability of stepping up the target of production at a rapid rate, was not in evidence. From a target of 7 million tons of ingots in 1961 which is now an accepted fact to possibly 18 million tons in the third Plan is a bold stride but not too far a cry. The greater the stride to be made, the sooner it is necessary to raise a cry.

Even before steel expansion in the second Plan could get into real stride, Mr. T. T. Krishnamachari has found it expedient to underline the restrictive effects of short-term planning for this strategic material. His anxiety to rivet attention on the target for the third Plan arose out of no other consideration. There was some sharp criticism of the initial tendency to rest content with a capacity of half a million tons for the Rourkela plant, but this is obviously wisdom gained after the event. When the agreement with Krupp-Demag was signed in 1953 there was ample satisfaction that a provision was made to raise production capacity from half a million tons to one million tons. In that climate when it was difficult to procure foreign collaboration in setting up a steel plant this reaction was perhaps inescapable. But the crucial period of planning in steel which followed immediately between 1953 and 1955 transformed the whole outlook. It was a coincidence, of course, that the Government found itself in a position in which it could negotiate with three different countries for three steel plants. This was an advantage available to this country by virtue of its policy to refrain from leaning heavily on any foreign source for economic co-operation.

The bargaining strength which India could use in these negotiations could not fail to bring its own benefits. If it is difficult to say at this stage that the maximum of the bargaining advantage has been derived by this country, there is hardly any room to dispute that, considered from a broad angle, the three deals are expected to prove sound transactions. The procurement of the services of the International Construction Company as engineering consultants to the Ministry of Iron and Steel has removed the handicap of the absence of expert technical judgment and has given substantial proof that the terms as regards cost and production processes could be subjected to the necessary searching scrutiny. Any apprehensions about extravagance in commitments would surely be unwarranted. Even in this first planned phase of steel expansion, India has secured a benefit of diversity in the modes of technical and executive operations. Rourkela promises to bring economies in capital and operating costs as well as a higher rate of production by reason of the adoption of the Linz-Donawitz oxygen-blowing process. The Bhilai and Durgapur plants will be run by the conventional open-hearth process. In the first agreement with the

German firm, the freedom to invite global tenders for plant and equipment appeared to ensure the advantage of low terms. But the initial experience of the tender for blast furnaces has now confirmed the shortcomings of this method with its potentiality to delay and hold up progress of erection work. Experience has now confirmed that package deals entered into with the USSR Government and the British consortium for the plants at Bhilai and Durgapur would prove to be the acceptable pattern.

In retrospect, the initiative taken in planning in a bold and imaginative way for the development of the steel industry and fixing the target of six million tons for the second Plan has proved to be prudent. Any hesitation and procrastination then would ultimately have proved to be highly detrimental not only to the expansion of the steel industry but also to the plans for the development of the engineering industries as well as of a wide range of projects dependent upon a continuous supply of steel. As it now transpires, manufacturers of steel plants and equipment have their order books full to an extent which would have made it difficult for this country to obtain deliveries in time, unless the necessary dollar exchange could have been found to place orders with American firms. It is difficult to foresee when this situation in respect of the supply of steel plants would ease and precisely this should weigh as a vital consideration in planning on a long-term basis. The basic need to plan well in advance for this strategic industry has now brought about a shift in the approach to its future. The emphasis on planning for ten years, if not more, ought to be appreciated against this background. At the end of the second Five-Year Plan the capacity of the two major plants in the private sector will be raised to 3 million tons of ingots to which will be added 3 million tons from the three plants from the public sector. The decision to expand the capacity of Rourkela by 250,000 tons and of Bhilai and Durgapur by 300,000 tons each is now a settled fact. The cumulative effect will be to raise total capacity to about 7 million tons.

The difficulties in bringing the three plants to fruition have never been minimised and there is full awareness that the problem posed by the absolute need to train an adequate number of technical personnel cannot fail to call for strenuous efforts. For the three plants in the public sector alone, the requirements have been estimated at 1,200 engineers of high calibre and skilled technicians whose number may go up to 10,000. Recruitment of such large numbers is to be carried out while there exist the parallel demands of the steel plants in the private sector as well as of diverse large-scale development projects. Training in the construction of plants must necessarily be obtained abroad for which the agreements for the plants make appropriate provisions. Other categories of technical personnel will have to be absorbed for training for the major part at home. The expansion envisaged in the third Plan will exert similar pressures, but certainly on a diminishing scale. Training facilities in the steel works and technical institutions which would be broad-based can be relied upon to ease the situation.

The larger capacity needed in the light of the ten-year target is not to be sought exclusively from additional plants. The three plants in the

public sector have been designed to allow a maximum expansion of 2.5 million tons of ingots in each case. The entire layout and the provision of water, electricity supply and every other essential ancillary service have been planned on the basis of expansion of capacity to the maximum limit. During the third Plan additional capacity to be derived from new plants will not exceed 7.5

million tons. A rate of expansion of this order involving the installation of three plants with an outlay of over Rs. 300 crores, need not be considered high. It indicates the upper limit of planning and any shortfall would mean production of finished steel a little below 15 million tons in which case the total requirements of steel will have to look to larger supplies from overseas.

Advances and Speculative Activity

ONE fact which should be quite clear from the Reserve Bank's approach to the question of regulation of bank advances, if it should be necessary, is that the Reserve Bank has not been stampeded into any course of hasty action. For the past some weeks grave concern has been expressed about the inflationary impact of the policies that are known to be followed in the second Five-Year Plan. But certainly no scare has been created at all about inflation rearing its head right now. It is recognised on all hands that deficit financing is an appropriate technique, used with proper vigilance, to finance development in an underdeveloped country. There is, therefore, a reasonable awareness that the economy should be prepared to take a dose of inflation properly phased over the period of the current Plan and the armoury of corrective measures should be planned so far as is possible.

The Reserve Bank's action in calling upon the scheduled banks to submit more frequent returns of their advances on a fortnightly basis, cannot be interpreted as a step towards a squeeze. There have been some disquieting signs of some degree of inflation. The main indicators pointing to this trend are a rise of 12 per cent in prices in March last as compared to a year ago and the rise in money supply of the order of Rs. 150 crores, together with an expansion of outstanding treasury bills by Rs. 100 crores. The impressive increase in money supply contains an important ingredient of a rise in the volume of bank deposits. Deposits in turn have induced a positive increase in the level of bank advances. Between the end of last year and last month the ratio of bank advances to bank deposits has jumped from 61.0 per cent to 71.4 per cent—an increase in this ratio of more than 10 per cent. In the busy season an upward trend in the volume of advances is inescapable and normally it is a healthy indicator of the rising course of economic activity, though it cannot be regarded as normal. The obvious inference which follows is that it may contain an element of speculative pressures. A scrutiny of the various types of bank advances by individual categories perhaps may provide the precise basis required to locate the sources of speculative activity.

Assuming that there is an unusual situation in which there has been an expansion of bank credit, it cannot follow that there is unhealthy speculation of the kind that can be wholly liquidated. Speculation may take different forms, and invariably the rule is that it cannot occur except in a situation in which there is an expectation of price increases in particular commodities. In view of the high level of production in agriculture and industry there may be no absolute shortage, but the development expenditure under the first Plan has obviously created a relative scarcity because of increasing demand. It is pos-

sible that trade is either inclined to hold on to existing stocks or to get hold of more in the expectation of a further rise in prices; and the rise in prices would itself encourage the building up of stocks even outside the trade by primary producers or consumers, thereby accentuating the shortage. The restriction of bank credit cannot be the effective instrument of control to prevent such build-up; the consumer only acts on a legitimate impulse to lay by stocks for his future requirements. Nor can it be said that preventing dealers from keeping stocks of commodities in accordance with their business expectations would be a desirable or a suitable type of intervention. There is an inherent difficulty in these cases in drawing the line between legitimate business activity and the so-called speculative aspect of the same activity. A step which affects one inevitably reacts on the other and it is doubtful whether the submission of returns by banks would pinpoint those sectors in which effective intervention through credit control is possible.

The remedy in such situations is obviously not to set in motion a double-edged policy of restriction but to use the only means of augmenting the supplies of commodities which give rise to speculative activity. That, and no other, can be the genuine solution at this stage. In earlier years, the knowledge that aggregate supply is either equal to or in excess of the demand was a deterring factor, but now the stability of the level of agricultural production and low levels of imports together with the circumstance that the prospect for an increase in consumer goods output in industry is limited by a confusing ideological debate, have all acted to provide a direct fillip for keeping larger stocks. It is necessary that the error should be clearly located in the quarter where it persists. Those who would seek in a stricter credit policy a solution to this difficulty are barking up the wrong tree.

In a period of rising production alongside of deficit financing it is inevitable that there should be short-period cycles which indicate either a temporarily recessionary trend or a short-lived inflationary phase—until production catches up. The greatest amount of vigilance is necessary in dealing with either of these phases with a view to seeing that they are not accentuated to a degree which would affect the working of the Plan. But vigilance should not be interpreted as an excuse for Government to oscillate between deflationary and inflationary policies by exaggerating their importance. Recently Government spokesmen played up the decline in agricultural prices and the need for a policy of price supports; and now, a contrary policy is being advocated in accents which indicate undue apprehension. The real picture of the Indian economy which can get stabilised through steps to increase production and supplies, is being lost sight of in this process of exaggeration.

The Indian Tube Company's works at Jamshedpur bid fair to supply India's growing requirements of steel tubes to the full.

Dunlop anti-corrosion linings have been applied to essential equipment: pipe work lined at Dunlop Sahaganj and Sulphuric acid storage and pickling tanks lined by Dunlop personnel on the site of this modern plant, the largest of its kind in India.

THE WEEK'S NOTES

REORGANISING THE SERVICES

THE HOME MINISTER'S announcement in the Lok Sabha the other day that the Government of India proposed to set up a committee to go into the question of reorganising the administrative and other services in the country has not come a moment too late. There had been growing indications that the large number of difficulties which were coming to light in implementing Plan schemes might cause an administrative breakdown or at least bring developmental activities to a confused stop. There were also signs that the administrative difficulties inherent in the Plan would be taken advantage of to throw the blame for shortcomings in implementation on the administrative set-up. The present decision to appoint a committee to suggest some basis of reorganisation should put authors of the Plan on the spot, provided the committee completes its work expeditiously and its proposals are implemented without delay. It is to be hoped that there will be no undue delay in the setting up of the committee and in the completion of its work, as the success of the second Plan may well hinge on its suggestions. For it is largely true that the type of officers now required is different from that of pre-1947 years, and though most of the incumbents have adjusted themselves to the changed conditions in a remarkable manner, administrators of the quality and in the number required are not forthcoming. The committee to be set up will also have to consider the institution of a separate Industrial Management Service, in which the qualities required will be vastly different from what are needed in the civil service.

The Home Minister's reply to the debate on his Ministry's demands also contained many other announcements. Nobody will grudge the increase of Rs. 5 in basic pay which he has granted to third division clerks, but there is bound to be questioning of the decision to grant P.T.Os. (privilege tickets) to Government employees. It is to be considered whether the additional financial burden, which may be anything between Rs. 50 lakhs and Rs. 1 crore, can be undertaken at this juncture, when the country is being asked to make the maximum sacrifices for financing the Plan; the grant of P.T.Os. may also place additional strain on the railway system in the form of greater overcrowding in trains.

THE RESOURCES GAP AND RAILWAYS

THE FINANCE MINISTER'S frank approach to the many gaps in the Draft Outline of the second Plan in his address to the University Planning Forums, should lead to a more realistic appraisal of planning possibilities and needs of the next five years. He has openly admitted what had hitherto been fairly well known—that the size of the Plan will have to go up by another Rs. 400 crores to meet probable additional defence expenditure, subsidy for the Ambar Charkha and additional allotment for coal and oil, apart from atomic energy development which has still to be provided for. But this has added to the gap on the resources side, since even as it is there is an unprovided-for deficit of Rs. 400 crores in financing the present proposed outlay. If foreign aid can be estimated at only Rs. 400 crores, as he suggested, the gap even now stands at Rs. 800 crores, so that any addition to the size of the Plan will further widen the gap. As a likely solution to this problem, the Finance Minister hinted at the possibility of the Plan being made into a six-year one. But the implications of any such move on the pace of development, which people hitherto have been led to expect,

will be serious, and it is worth while examining whether a smaller plan confined to five years is not preferable to an over-ambitious plan, which may in fact turn out to be far below present expectations if spread over a longer period.

The Finance Minister referred to views that the allocation for railways is somewhat excessive. But the Railway Board's own view is that it is inadequate. While something may be said of the desire of each Ministry to have as much as possible for its own programme, there is a fallacy in conclusions drawn from a study of comparative investments in transport and industry made in other countries while they were in the process of development. Totalitarian planning could ignore the needs of passenger traffic and could adopt many measures to prevent cross-movement and to discourage travel; the free-for-all capitalism of the early days could also eliminate the needs of the poorest sections of society through the market mechanism. But the India of today has to provide for passenger movement too and not just for the movement of raw materials and goods. The gap in resources will have to be bridged by other means than by applying the axe to the allotment for railways. It is possible that additional taxation of Rs. 50 crores every year, which the Finance Minister hinted at, may prove unnecessary, at least in the later years, when booming production and incomes may push up the yields from existing taxes. Also, greater efforts at eliminating evasion should go some way in filling the gap.

THE PUBLIC SECTOR

THE DEBATE in the Lok Sabha on Mr. G. D. Somani's resolution for the appointment of a committee to examine the running of State undertakings was unfortunately turned into an issue of the public sector vs. the private sector, which it need not have been. The mover later made it clear that it was not his intention to oppose the principle of expansion of the public sector and that he only wanted that it should work properly. Even without this clarification, it was obvious that the wording of the resolution cast no aspersions on the public sector as it is now functioning, nor did it attempt to reopen the issue of whether the sphere of the public sector should expand. All this, however, does not mean that everything is perfectly satisfactory in State enterprises. It is no reply to this to argue, as the Finance Minister seemed to, that everything is not well with the private sector either. Undertakings in the private sector are governed by the Company Law, only recently re-enacted after a great deal of public enquiry and discussion. In any event the public sector, which is in the nature of a monopoly, is bigger than any significant section of the private sector with which it can be compared, both in its range and in its size. Public interest will also suffer to a much greater extent through mismanagement in the public sector than in the private sector.

All these facts make it obvious that the criteria for judging the two sectors cannot be the same. A committee such as the one suggested might have laid down certain basic principles on which public enterprise should be run and by which it should be judged; the general principles, it is true, are well known, but they could have borne more detailed enunciation. The Estimates and Public Accounts Committee no doubt look into the working of public projects, but their examination tends to be confined to particular aspects and is rather superficial. In the whole course of his speech, it should be noted, the Finance Minister failed to advance a single reason why a committee of enquiry

should not be set up. The private sector can certainly have no objection to face any enquiry, as indeed it has only recently, but it insists that the enquiry should cover State enterprises too. Only then can any comparison of the achievements of the two yield some meaningful conclusions.

A "THRIFT BUDGET" FOR BRITAIN

MR. HAROLD MACMILLAN has followed up the "credit squeeze" he set in motion a few weeks ago with a "thrift budget" calculated to keep down spending, particularly consumer spending, to the minimum. The tax on tobacco has been still further raised, making the price of a packet of 20 cigarettes go up by two pence to 3sh. 10d.; the tax part of this is 2sh. 11½. Bread subsidies, which have kept down prices, have been abolished, and the price of a standard loaf of bread will consequently rise by 1½d. to 10d. This and the decision to levy a tax on cider and perry (a beverage from pears) may push up the cost of living, giving rise to a spate of claims for wage increases, which may prove difficult to resist. Already there have been the usual murmurings that the cost of living is going up, and the budget measures may help to swell the chorus. But the success of the anti-inflation drive will depend on whether the Government is able to hold incomes and wages, and thereby consumer spending, at least at present levels, at a time when they are trying to rise.

Some changes in direct taxation have also been made, though their effect on the cost of living and the inflationary trends in the economy will not be directly felt. The rates of tax on undistributed and distributed profits have been increased by 1½ and 2½ per cent respectively, making the total rates 3 and 30 per cent. Allowances for children have been increased to 10sh. for the third and subsequent children compared to a uniform rate of 8sh. for all but the first child given at present. But the most important feature of the budget is the offer of cash prizes for investors purchasing £1 savings certificates in a bid to take advantage of the gambling instinct of Britons who wager millions of pounds every year on dog and horse races. The details of the scheme will be worth studying in India's Finance Ministry in the context of the need to raise as much resources as possible for financing the second Plan. In a bid to keep under stricter control investment expenditure by the nationalised railways, civil aviation and gas and electricity industries, the Chancellor has decided that for a temporary period of two years these needs will be met from the national exchequer. But whether this will in fact imply any reduction in investment expenditure appears doubtful, because the expansion of these industries to meet increasing demands cannot be held up.

THE MIDDLE EASTERN CAULDRON

THE U.N. Secretary-General's mission to the Middle East has met with some measure of success, and both Egypt and Israel have agreed to honour the armistice agreement and the cease-fire line. But, even while he was having discussions with Premier Nasser in Cairo, there were clashes on the Israeli-Egyptian border, followed by skirmishes on the Jordan frontier. How far the oral consent to respect the truce agreement will be seen in practice the next few days should demonstrate. If peace is kept it will be a triumph for the U.N. Secretary-General, but a triumph whose extent will be limited by the fact that the temporary cessation of hostilities, if it is to have any great significance, must soon be succeeded by a more permanent arrangement agreeable to all the parties. The main difficulty will

be in evolving this arrangement, a task which is all the more complicated by lack of co-operation between Britain and the U.S.

Up to now no one has ventured to put forward a permanent solution which the Big Powers will be willing to impose. That the Western Powers have proclaimed their determination to enforce the 1950 Tripartite Declaration in the present circumstances is itself a step forward, because none of them is directly in a position to intervene effectively and immediately should full-scale war break out. Mr. Hammarskjöld's trip was itself a recognition of this fact. But it is not certain that the U.N. is the proper forum where a solution can be hammered out. Communist intervention in this area in the form of arms supply to Egypt is certainly not calculated to assuage tempers, and it is unlikely that the Soviet Union will agree to any solution which does not recognise her interests in the region, both as a great Power and as a neighbour of many of the Middle Eastern States. But any solution to the Arab-Israeli problem which allows Russian entry into the Middle East is bound to be unpalatable to the West. A solution must, therefore, be sought outside the United Nations chambers if Western moves are not to come up against the Soviet veto at every turn. Mr. Dulles may be justified in wishing to put Russian intentions to the test in the U.N., but that will not help in the restoration of peace to the Middle East.

THE FALL OF LYSENKO

THE FALL of Stalin from the high pedestal which he had been occupying for nearly three decades has involved the reversion to their original levels of some of his cronies who rose to high positions by pandering to the whims and fancies of the great dictator. One such is Lysenko, whose recent removal from the post of President of the All-Union Academy of Agricultural Sciences of the USSR has been accomplished rather unobtrusively. Lysenko rose to power on the basis of a theory that characteristics acquired in the lifetime of an organism could, under certain circumstances, be made hereditary. This line of thinking pleased Stalin who held that even plants could be made to conform to Marxist thought. But experiments in putting into practice this theory have not met with any success, and the passing of Stalin has removed the one obstacle to recognising Stalin's agricultural policy, based on Lysenko's teachings, for what it was—a thorough failure. With the agricultural policy followed up to now openly discredited, Lysenko had but to make his exit. It is reported that he will, hereafter, have more time to devote to instructing farmers on the implications of his theory, and it is to be hoped that they will benefit from it and prove Lysenko right.

Lysenko's exit will cause not a little embarrassment among the "orthodox faithful" in the scientific community of the free world most of whom, with the notable exception of Prof. J. B. S. Haldane, had not found much scientific and moral scruples in accepting Lysenko's teachings in spite of proved evidence to the contrary. In Russia itself Lysenko could triumph over his academic adversaries only through the intervention of the political authorities. The reverse process now set in motion demonstrates, if any demonstration were needed, the dangers of political and governmental interference in scientific matters, and where, as in Russia, such interference meets with no criticism or opposition when it takes place, the possibility of correction is postponed until the death of the dictator and a new set of rulers take courage to rectify past errors. But the chances of the new rulers committing similar mistakes in other fields are not on that account lessened.

STATE BANK OF INDIA

Successors to the Imperial Bank

Bank with the State Bank

OUR country is planning for prosperity. This cannot be achieved unless the interests of the small depositor, the small trader and the small producer alike in towns and in the countryside receive the same consideration that is bestowed on the more affluent constituents and the larger industrial units.

You are not perhaps aware that the clientele served by the State Bank of India consist predominantly of persons of modest means and modest requirements. It is on the broad and secure foundation of their patronage that the Bank's structure has been built and will continue to rest.

The State Bank's services are many-sided and it would interest you to know that your varied plans and activities—no matter how small they be—can be made to run more smoothly with the help the Bank can offer.

Why not talk things over with your nearest bank agent, or write for information?

The State Bank's branch at Delhi, one of more than four hundred offices waiting to serve you throughout India

Every day Clippers must pass the world's toughest fitness test

Before and after each flight, a rigorous inspection is made of all operating parts. Even in flight, the state of a Clipper's* health is under constant scrutiny—through the electronic eyes of Pan Am's Engine Analyzer.

Every 11 weeks engines are taken down with critical interest. Instruments probe vital parts. From nose to tail each square inch is thoroughly inspected, every part replaced at the slightest drop from peak efficiency.

Exacting care like this is why experienced travellers will tell you, "Pan American knows how to run an airline!"

A Window on the World

THE ECONOMIC VALUE OF LIVING IN HOPES

By

ODYSSEUS

THE BASIC LESSON to date of the British welfare state's case history is that the rapid rise in the purchasing power of the masses, who put forth less effort or skill than before the war and yet refuse to follow the American worker's example and let tools do more of the work, coupled with subsidies to them out of middle class earnings, combine to produce chronic inflation.

The inflation, in turn, encourages expenditure up to the hilt by people anxious to avoid losses that would be caused by holding savings in a depreciating currency.

"Why worry?" asks the Socialist. "We no longer look to the individual to save for his personal profit. We expect the state to save for the benefit of all." I submit for your reflection that if the state is responsible for accumulating the capital without which change and growth is impossible, then a system of forced savings by individuals seems inescapable—for after all it is always the individual who is the source of work and the wealth of the state—the "state" is an abstraction that couldn't, and doesn't, work or save an anna. And forced savings mean the end of individual liberties, the end of the humane liberal democracy that distinguishes India from China and the USSR. This is because fear of the voter in a liberal welfare state, as the British case history shows, impels politicians to bribe their way into office by massive "investments" in new, subsidised houses, apparatus, buildings for consumer services and for the distribution and re-distribution of welfare. An economist would describe this as "saving for consumers' durable goods". It is not saving for the expansion of the economy.

Note that forced saving can take the organised form of rationing of commodities, low wages, and widespread indirect taxation. Harsh and austere, this may be "socially just". But since austerity in democracies is unpopular with electors, governments are apt to take the line of least resistance and allow inflation—the only other way of enforcing saving—to become endemic. This is cruel as well as unjust, and is disruptive of moral standards.

In Graham Hutton's now famous phrase (to be found in his unsigned article, "The Dynamic Society", in 'The Times' Literary Supplement of February 24), in the mixed economy welfare state in "like a dog in a barnyard. It cannot lay eggs and it will not let the hens do so," and he goes on to point out the grave consequences: as the standards of law, order, the value of money, and the citizens' sense of social obligation (particularly of the middle classes, the natural nursery of initiative and leadership) all decline, the hope that individuals entertain for their own personal futures in such a state also declines. The consumption of personal income up to the hilt becomes the "eat-drink-and-be-merry-for-tomorrow-we-die" habit.

ECONOMIC SIGNIFICANCE OF THE PYRAMIDS

All this is as old as the pyramids. Egypt is one of the earliest examples of a static state in which the taxes were spent not on productive tools but on unproductive, subsidised, durable consumers' goods—the pyramids. Mediaeval Europe, in which the greater part of savings were invested in castles and cathedrals, and

mediaeval India, in which they were invested in castles, temples, mosques, and Mughal tombs, were other examples of changeless, unexpanding economies. Britain, on the other hand, began to leave the Middle Ages behind when she ceased to sink savings in masonry dedicated either to feudal protection or to the propitiation of the unseen world, and diverted them into an ever-growing, broadening stream of productive investment—bigger and better methods, implements, or buildings for communications, factories, and agriculture.

Mr. Hutton sums this up by saying that history suggests that dynamic societies spring from spurts in the upbuilding of productive capital, and that stasis, paralysis, or decay, sets in with the consumption or erosion of productive capital. Put thus, his proposition seems a platitude. Alas, it is, I suggest, among those platitudes that it is dangerous to despise or ignore. For Mr. Hutton is but asserting in other words that when individuals feel free to build for their own futures, they dream, plan, live in hopes, and create the means to give reality to their dreams. Think of what the dreaming, planning, and hoping of that handful of adventurous spirits in Elizabeth I's obscure western island had achieved by 1905. In contrast, think of the fate that had overtaken India by 1905 because of the lack among the subjects of Elizabeth's contemporary, Akbar, of individuals with the freedom and means to hope and work for themselves. Elizabeth's island and Akbar's great empire started admittedly on unequal terms—heavily in India's favour as to size, manpower, and potential resources—but, as events were to show, heavily loaded in England's favour by the rewards held out there to individual enterprise.

When men are not allowed to strive for their dreams and enjoy the fruits of their strivings, either they consume all from day to day, as everyone did in India for centuries, or else they must be forced to abstain, to save, and to make and build tools for the future, as they have been forced to do in the USSR since the 1917 revolution. The Americans increase wealth by offering carrots to the donkey, the Soviets by beating it. These are two dynamic states. Static, however, are the British and the French welfare states which offer neither stick nor carrots.

Here is an ironic thought: the extraordinarily high standard of living enjoyed in Britain between 1880 and 1914 (the after-effects of which persisted in the inter-war period and linger on today) was built on the sufferings of 1820 to 1880—a period which the economic history text books hold up to execration as typical of the worst capitalist exploitation, and for which, indeed, capitalists derive (via Marx, and to be just, also via nineteenth century British Government Blue books) their evil reputation. But it is the Soviet communists who vituperate the wickedness of the capitalists, to whose liquidation and punishment they are dedicated, who have put forth the quickest, biggest economic effort, complete with the most ruthless exploitation of the masses, known to history. Mr. Hutton points out that at the combined rates of productive capital formation and population increases, the Russians should have, within the next fifteen to twenty years, as much energy and productive power as the British because the British rate of improvement is so slow. The Russians will, however, fail to catch up with the Americans

if the USA maintains its present rate of increase. "The Russians," says Mr. Hutton, "have been more Calvinistic in their Marxian predestinationism far more Victorian, more forcibly austere and Puritanically thrifty, than any British or American capitalist. They have also been more inhumane towards human sufferings."

COMPULSORY ICE CREAM

One of Mr. Hutton's most striking observations is that, on the one hand, individual personal freedom and personal liberty, on the scale known today, has prevailed for less than 3 per cent of recorded history: only within the last two centuries and only in the West. On the other hand, it is within that narrow time and area that all the great technical advances, all personal liberties have been established, and the foundations of all humanity's hopes, on both sides of the Iron Curtain, have been laid. The great inventors, initiators, applicers of material techniques, still arise in societies in which personal freedoms—including the freedom to get more than another man and to engage in profitable trade—are at their maximum: mainly in North America. The opposite forms of society in which individual choices are kept to the minimum are only the biggest copiers.

One is bound to admit that that does not in itself disprove the tacit assumption of the Soviets and of extremists of both Left and Right in the West, in Asia, and elsewhere, that the masses respond best under a tyranny. (You remember the story of the communist orator who cried: "Come the Revolution, comrades, and it will not be the rich who will eat mango ice cream—it will be all of you." To which a voice in the

crowd called out: "But I don't like mango ice cream!" Thundered the orator: "Come the Revolution, comrade, you'll dam well like mango ice cream!"). And if it is true that increased wealth can be achieved either by carrots or a stick, Mr. Hutton makes the vitally relevant reply that no human society—not even the USSR—is as dynamic in economic growth as the North American and the West German, in which individual freedoms are at their greatest, and the rate of increase in the ratio of productive capital to the workers is at its height. He notes, too, that curiously enough, contrary to generally accepted ideas, population is rising faster in North America than in Russia, India, or Japan.

Does anyone assert that all this may be all right for Europe, but in India individual savings no longer matter: the state can accumulate all the savings required for the Five-Year Plan? If so, I quote the following: "Our country's economy is expanding rapidly and with the second Five-Year Plan in sight it will gather further momentum. The need for a strong efficient banking system has never been greater than today as the nation's savings require to be pooled..." This suggestion does not come from some greedy privately owned bank anxious to make selfish profits. It is taken from an advertisement published by the State Bank of India. The advertisement goes on to announce that the State Bank is to open 400 branches throughout the country. These 400 branches will have plenty to do if the purchasing power of the rupee is kept steady and if the individual citizen is left free to plan for his own future, free to live in hopes of bettering it, free to strive to realise his hopes, free to keep the fruits of his strivings. And India will find prosperity in his prosperity.

A DELHI DIARY

DELHI has been oppressive this week and not in temperature only though temperature (alas!) has also been trying. On Thursday it rose to 106, five degrees above normal, and the weather prophets have promised no relief for some days. Almost the only consolation that has been provided in this respect is that our departure from normal at five degrees is just half the departure from normal in Allahabad which registered 111° or Hissar in the Punjab which registered 109°. In both cases the rise is ten degrees above normal. Generally, these departures from normal behaviour are attributed to areas of low pressure and high pressure and conjure up visions of isobars, strange snake-like lines, with which most of us were familiar when we were introduced to Geography (with a capital G) many years ago. On this occasion, I am told, that the heat wave is due not to any active factor but to the absence of western disturbances. In this manner neutralism can become dynamic, even in determining the prevailing temperature!

THE POT AND THE KETTLE

Temperatures in Parliament have responded to the general atmosphere. Following upon Mr. G. D. Soman's resolution for an enquiry into the public sector there were many gentlemen last week who allowed themselves an excessive display of heat. Mr. Feroz Gandhi—the 'enfant terrible' of the public sector—caused an irrelevant diversion by describing as "rubbish" a statement on the price of Sindri fertilizers. Instead of a calm debate on the inadvisability of all enquiries when the problem is to do, the old question as to which pot should call which kettle black dominated the debate. Unhappily, the Finance Minister also caught the infection and made, to my mind, an unexpectedly unfair attack on potential irregularities in the private sector. It seems a great pity that many members of the Government who should be concentrating on the implementation of the Plan should allow themselves to be distracted from their great tasks by the attractions of this political thrust and parry. Almost the only speech to sound what might be called the practical note was the reply of Mr. T. T. Krishnamachari to the Lok Sabha debate on his Ministry's demands for grants. Rarely has Parliament been given so frank a statement of weaknesses in the public sector: the comment was quickly made that the Commerce Minister's awareness of these defects showed that at least one Minister in the Cabinet was not making an election speech. Indeed, Mr. Krishnamachari said that this was the last time that he was participating in budget discussions "before this House" and this was interpreted to mean that he was not standing for re-election. It is largely because it is known that there was no political purpose behind this speech that Congress back-benchers, who would normally have resented the open criticism by a Minister of the operation of the public sector, took kindly to the Minister's observations. Mr. Krishnamachari said: "I will not commit this country, if I have any say in it, to a type of planning which, while it might seem to meet our immediate aspirations, would, in actual fact, be impossible of achievement. It does no good to flatter ourselves that we can do something more than what is actually possible."

Amongst several illustrations which were then given of unwisdom which has been shown in planning he quoted the absence of transport to receive steel imports which, in a short period from now, may be arriving at the rate of 2,000 tons per day at the port of Bombay, whereas transport there has been planned to handle only 800 tons. It is quite surprising the extent

to which there remains this absence of liaison between different sections of the public sector. Instead of meeting real problems like this which are fundamental to the implementation of the Plan, the great majority of Congressmen are quite ready to go off into a heated debate as to how large the public sector is to be and how much more it can take over from the private sector.

In part the delay in the issue of new Industrial Policy Statement which has been in the process of incubation for the last three months is responsible for the prolongation of this foolish debate as to the appropriate agency in different sections of the Plan. Had the Industrial Policy Statement issued, this might have been a closed question. Unhappily, it has not yet been settled in the Cabinet and rumour has it that the statement is in the process of redrafting after two (unfinished) Cabinet sessions. It is sincerely to be hoped that the statement will issue next week. I sometimes think that the process of applying the guillotine in legislative matters should have a counterpart in executive discussions. It is very necessary that My Lady Guillotine should be applied to the Industrial Policy Statement; and it does not matter whether it is the public or private sector which loses its head. We should soon find out where the brains are, when the head is either put to work or removed!

The difficulty in reaching decisions in the public sector does not seem to be abating, either under pressure of the spacious targets of the Plan or the Prime Minister's tremendous personal pressure to avoid delays. There are few observers in New Delhi who have not had in recent weeks one occasion or another to observe that while there is promptitude in certain respects and a greatly improved system of payments at the Delhi Treasury, there is almost everywhere an offsetting factor so that on balance it is difficult to say that things are any better. In the Ministry of Finance itself where great efforts have been made to place nationalisation of insurance on a sound administrative footing, the new pressure has been so great that practically every senior official in the Ministry has felt an overwhelming impact, such as when a big boat gets into narrow waters and throws waves which hit every craft in the area. It is difficult to say whether it is 106° in the shade or 200 per cent in the incoming trays which has slowed down the Delhi machine this week.

Administrative weaknesses are twofold. In the first place, the topmost decisions are still taken by the same pitifully small group of people, a few senior Ministers and a few senior Secretaries. Now that their work has increased appreciably, their paucity stands out more markedly than their competence, which is undoubted. At the other end in the field it is being increasingly seen that while there is some "slack" to be taken up, it is almost entirely round a few individuals whose leadership permits of wider responsibilities. I was present at a debate last week when industrialisation in India was liberally and volubly discussed; praise and blame were widely distributed to "systems", to "capital", to "housing", to "imagination" and so on and so forth. Almost nobody seemed to think that the real trouble was the absence of managers in quantity as well as in quality. May I in departing rapidly, say dogmatically that new industrialisation is almost entirely connected with the men who will do the job, meaning, in most cases getting it done. I think this is what T. T. K. had in mind in his impressive speech on not matching our aspirations with the instruments of action.

WORLDGRAM

AGRICULTURE

Sericulture Research Station in Assam: The Regional Sericulture Research Station established under a Rs. 146,000 scheme at Titabar (Upper Assam) is the second of its kind in India, the other being at Berhampur (West Bengal). The Research Station covers an area of about 100 bighas out of which 20 bighas have so far been brought under systematic plantation. Experts from the Central Silk Board and also from Japan have visited the Research Station in recent months.

India's Fruit Production: India's turnover of fruit and vegetable products was only 20,000 tons as compared to the production of 6 million tons in the USA, over 4 million in Britain, over 3 million in Canada and 158,000 tons in Australia. It is reported the Government proposes to increase the area under horticultural crops by about 300,000 acres during the second Plan. The horticultural development of many regions is taking on a newer pattern due to the various projects of irrigation likely to increase the scope of horticulture. At present the fruit preservation industry is only utilizing 12 per cent of the estimated total of fruit and vegetables.

West Bengal Premises Tenancy Bill: The President gave his assent to the West Bengal Premises Tenancy Bill, 1956, on March 29. The Bill provides mainly for the fixation of fair rents, and the circumstances under which the rents fixed may be revised; the protection of tenants from eviction, and the conditions under which such protection may be claimed; the grounds on which a landlord will be entitled to recover possession of premises; restrictions on subletting and obligation on the part of landlords to keep the premises in a proper state of repair, and to provide essential services.

Second Plan's Agricultural Programme: It is reported agricultural development under the second Five-Year Plan will be much more broad based than under the first Plan, under which the emphasis was on increased output of cereals. Under the second Plan there would be a shift in emphasis from extensive to intensive cultivation. The aim would be to increase not merely the production of cereals but of all protective foods. Agricultural branches like horticulture, animal husbandry, dairying and fisheries, would be developed. Further, unlike the first Plan, which laid stress primarily on production, the second Plan will lay considerable emphasis on marketing, co-operation and rural credit.

INDUSTRY

TISCO Production: The Tata Iron and Steel Company Ltd. reports that the total approximate production of iron and steel at the steel works at Jamshedpur during March was 103,300 tons of pig-iron and 96,200 tons of steel ingots. Saleable steel production totalled 69,900 tons, of which semis were 17,600 tons and finished steel 52,300 tons.

Aluminium Factory in Hirakud: Permission has been granted for setting up an aluminium factory at the Hirakud Dam Project with an annual capacity of 10,000 tons. It will be a joint Indian and Canadian enterprise. The minimum power load required for the plant is estimated at 25,000 k.w. and the power would be drawn from the Hirakud Project. The plant is expected to go into production by the middle of 1957.

Use of Peat in Sugar Refining: Northern Ireland is opening a new factory at the end of this month to

convert peat by a new British method into activated carbon. This is widely used in the food industry—especially in refining sugar, vegetable oils and fats, and pharmaceutical products—where it is employed as a purifying agent for the extraction of unwanted odour and flavour. The establishment of this new industry in the United Kingdom results from a peat survey carried out during the last three years. Output from the new factory will represent the first UK source of peat-based activated carbon for which a ready market is assured in the UK and the Commonwealth, whose demands for this type of activated carbon have hitherto been met by imports.

Ring Rabbeth Bobbins: A draft Indian standard specification for six-inch lift varnished and enamelled ring rabbeth bobbins for cotton mills has been prepared and circulated by the Indian Standards Institution for eliciting comments. The draft prescribes requirements for such bobbins and contains the recommended code of practice for the manufacture of ring rabbeth bobbins and a list of approved species of timber with their short descriptions. A comparative statement of test values of the various characteristics of timber, which may be used in making bobbins is also contained in the draft.

Development of Hand-Pounding of Rice Industry: According to the Minister for Production, financial assistance was sanctioned to give a subsidy for introducing improved pounding implements on the basis of 50 per cent of the cost and for a production subsidy to co-operative societies and recognised institutions at the rate of six annas per maund of paddy processed by hand-pounding methods. Stipends were given for the training of workers and loans were sanctioned for stocking paddy and for manufacturing implements. Money was also sanctioned for research and experiments. The production of hand-pounded rice in 1954-55 was 18.24 million tons as against 20.75 million tons in 1953-54.

Salt-Glazed Stoneware Pipes: The Indian Standards Institution has published an Indian standard specification for salt-glazed stoneware pipes and fittings. The specification covers straight pipes and fittings such as tapers, bends, channels, junctions and traps. The requirements specified are in respect of quality of stoneware, glazing and tests for hydraulic strength, water absorption, resistance to acids and alkali salts and dimensions of pipes and fittings. The second part deals with dimensional specifications of pipes and the different types of fittings.

TRADE

US Foreign Trade in 1955: United States foreign trade, aid and investment in other countries rose to a record total of \$21,327 million in 1955. The Commerce Department notes that expansion in both receipts and payments reflected the continued business improvement in the United States and other countries. US imports set a new high of \$11,500 million. Other countries continued for the sixth consecutive year to gain gold and dollar assets in international exchanges with the United States—the increase last year amounting to \$1,500 million.

Jute Goods Exports to Dollar Area: Increased offtake by dollar area countries was mainly responsible for the improvement in jute goods exports last year. Exports in 1955 amounted to 895,700 tons valued at Rs. 126.48 crores against 842,800 tons worth Rs. 121.36 crores in the previous year. Out of the total increase

of 52,900 tons worth Rs. 5.12 crores dollar area countries accounted for 39,000 tons valued at Rs. 4.92 crores. The total offtake by dollar area countries last year amounted to 310,900 tons worth Rs. 47.14 crores. Exports to other countries increased by 13,900 tons to 548,800 tons, but exchange earnings improved by only Rs. 20 lakhs to Rs. 79.34 crores.

Import Policy for Cycle Tyres and Tubes: The Government of India have reviewed the import policy for cycle tyres and tubes during the licensing period January-June 1956 and have decided to liberalise further this policy. Applications for import of cycle tyres and tubes from approved manufacturers/assemblers of bicycles, on the register of the Development Wing, will be considered ad hoc by the Chief Controller of Imports and Exports, New Delhi. Such actual user applications should be submitted not later than May 31, 1956. Under a Public Notice issued on January 21, 1956, it was prescribed that any additional licences granted to established importers of motor tyres, etc. would be subject to the condition that not more than 40 per cent of the face value of the licences could be utilised for the import of cycle tyres. It has now been decided that this condition regarding 40 per cent of the face value for import of cycle tyres be withdrawn. Cycle tyres can now be imported up to the full value of additional licences which inter alia will be valid for import of cycle rickshaw tyres also.

Trade Between India and New Guinea: New Guinea imported from India goods worth Rs. 7,83,081 in 1954-55 as compared to Rs. 5,47,746 in 1953-54. During the year ended June 1954, the main imports from India were spices, £A1078; misc. foodstuffs £A45; coffee and chicory, £A37; tea £A7,122; cotton piece-goods including bedding, £A32,262; coir mats and matings, £A356; jute bags and sacks, £A109,434; canvas, £A64; paints and varnishes, £A56, lamps and lampware £A1097, wooden boxes £A18, and fancy goods, £A11. Other imports were household and cooking utensils £A9, cotton wool and surgical dressings £A8 and miscellaneous chemicals £A8. There were no exports from New Guinea to India.

FINANCE

Japan's Foreign Exchange Budget: The Government set the foreign exchange budget for the first half of fiscal 1956 on March 31 at \$1,886 million, an increase of \$512 million over the like period last year. The salient features of the Budget are (1) backed by favourable foreign currency position greater imports are contemplated to check price rise and also to expand production; (2) a step was taken toward freer imports in that some of the iron-ore and lumber imports were shifted to "automatic approval" imports. Of the total of \$1,886 million, \$1,543 million is meant for goods (including reserves of \$50 million) and \$343 million for invisibles including freight charges.

UK Scientific Education Fund: The industrial fund for the advancement of scientific education in British schools is within £600,000 of its financial target of £3,500,000. The fund, inaugurated last November, was formed to assist the teaching of science in Britain's independent and direct-grant schools by the provision of capital grants towards the building, expansion, modernizing, and equipping of science laboratories. The 17 founder-member companies undertook to provide £1,900,000, and since then 73 additional companies have agreed to support the fund. The total now subscribed is £2,900,000.

Correlation of R.F.A. Loans to Rehabilitation of D.P.s.: A provision of Rs. 1.5 crores for the grant of business loans to displaced persons has been made during the ensuing financial year by the Rehabilitation Finance Administration, it is learnt. Much of this amount will be utilised for the benefit of D.P.s. from East Pakistan now resettled in West Bengal, Assam, Tripura, Manipur, Bihar and Orissa. A new policy decision is believed to have been taken to integrate the sanction of these loans with the expanding of D.P. townships and colonies in the eastern region. It has been decided that in future loans might be given to such persons as have business experience or have received training in vocations or crafts. Cases of other applicants, who do not fulfil these conditions, should also be examined on individual merits; but other things being equal, preference should be given to persons having such experience in the past.

Subsidy to Flying Clubs: The Government of India will be paying an estimated amount of Rs. 17.5 lakhs as subsidies to Flying Clubs during 1955-56 as against roughly Rs. 10 lakhs during 1954-55. For purposes of subsidies, Flying Clubs have been categorised into four classes on the basis of the number of hours of flying that they are expected to do in a year. Under the old rates, the fixed amount was Rs. 30,000 per year for each Club. Now, it is Rs. one lakh for Class I Clubs (doing about 3,500 hours of flying in a year), Rs. 75,000 for Class II Clubs (doing about 2,500 hours in a year), Rs. 60,000 for Class III Clubs (doing about 1,500 hours in a year) and Rs. 40,000 for Class IV Clubs (doing about 1,000 hours in a year). The rates of flying subvention have also been rationalised.

GENERAL

Provident Fund for Plantation Workers: The Government of India is keen on extending the Employees Provident Fund Act to tea, rubber, cardamom, coffee and pepper plantations employing more than 50 persons, as the result of a survey of such plantations conducted by the Central Provident Fund Commissioner. The Union Labour Ministry has circulated copies of the Assam Tea Plantations Provident Fund scheme among the concerned interests with a view to eliciting opinion. According to the survey there are 1,121 tea estates in India, 71 rubber plantations, 9 cardamom estates, 247 coffee estates (situated in Coorg, Madras and Mysore States) and one pepper plantation (in Travancore-Cochin) employing more than 50 persons.

Freight Earnings in Overseas Trade: Freight and passage earnings of Indian shipping companies engaged in the overseas trades showed an upward trend in 1954-55 with Rs. 10.47 crores as against Rs. 8.59 crores in 1953-54. There were 33 Indian-owned ships of about 225,000 gross tons employed in the various overseas trades by the end of 1955. Five ships, totalling 25,000 gross tons, were added by the Indian shipping companies in 1955-56 to the India-UK-Continental cargo service. The India-UK-Continental Conference has accepted the claims of Indian shipping companies for full membership with unrestricted rights; and two Indian lines, the Scindias and the India Steamships, propose to employ 18 ships each in the trade in the course of the next five years.

Aid to India: The amount of aid to India authorised under the United Nations Technical Assistance Programme for the year ending December 31, 1955, was \$1,809,094. It was given in the form of: 1) services of 21 experts; 2) equipment ancillary to the services of these experts; and 3) training facilities for 83 persons.

NEWS IN BRIEF

FOREIGN

A new one-year trade pact has been signed between Japan and Pakistan. Japanese exports under the pact will include textiles, iron and steel, other metals, capital goods and machinery, chemicals and dyes.

During the first two months of 1956 more wool was consumed, more tops produced, and more worsted yarns delivered in England than in the same period of 1955.

Plans for all-round increased production and for expansion of overseas markets have been outlined by the New Zealand Government.

The bilateral clearing account between Japan and Brazil will be abolished at the end of June, according to the Japanese Ministry of Trade. A three months notice has been served by Brazil for closing the account, which Japan has acknowledged.

World consumption of tin metal during January was estimated at 12,900 tons, against 12,400 in December, 1955, and 118,00 a year previously. The UK used some 1,881 tons compared with 1,689 tons in December, whereas US consumption was unchanged at 5,000 tons.

A Bill to regulate the operations of investment trusts—of which there are three in Germany at present—is being drafted by German officials of the Ministries of Finance, Justice and Economy.

Australia had a deficit of £A45,124,000 in trade with the UK during the six months ended last December compared with a deficit of £A35,184,000, in the first half of the 1954-55 financial year.

In view of Malaya's importance to the Commonwealth and because Britain is her best customer for natural rubber, British manufacturers have sent a delegation by air to Malaya to explain UK policy on synthetic rubber.

As a result of a recent Franco-Soviet trade agreement Russia will export anthracite, pitch chrome and manganese ore, oil products, platinum, timber and furs, and in exchange France will export equipment mainly for Soviet mines, steel and food industries.

A population of 27 million by 1980 for Canada and a 565,000 million gross national product by 1980 have been forecast by economists of the country.

The sale of 50,000 tons of white maize for £875,000 to Egypt over the next three months has been announced by the South African Government. In exchange, Egypt will sell 25,000 tons of rice of the same monetary value to the Union.

Traffic revenues of the Suez Canal Company totalled £E3,021,500 in March compared with £E2,786,800 in February and £E2,821,500 in March 1955. For the first quarter of this year the value of revenues reached £E8,726,000.

It is reported that Burma has concluded negotiations with a Japanese firm for the erection of two new spinning factories in Burma, one at Thamaing and the other at Myingyam.

North Viet-Nam has signed trade contracts with Britain, France, Egypt, Switzerland and West Germany.

INDIAN

Total borrowings by the Central and State Governments during 1956-57 were expected to be Rs. 100 crores and Rs. 50 crores respectively.

The World Bank has signed its willingness to consider granting a loan to the Koyna hydro-electric project. A consolidated project report on Koyna is being sent to the Bank who would now proceed further in the matter.

The Bihar Government would set-up an Institute at a cost of Rs. 3.86 lakhs for imparting training in pisciculture to fishermen.

The Rajasthan Government has decided to give a subsidy up to one anna per unit on electricity consumed by small-scale industries (excluding food industries) using power up to 20 H.P.

The Indian Standards Institution has issued a draft code of building bye-laws. It envisages a rational practice in regard to administration of bye-laws, covers essential requirements with regard to structural safety and fire safety, and lays down the basic requirements for health and sanitation.

It is reported Government of India had sanctioned a loan of Rs. 109.31 lakhs to the Government of Jammu and Kashmir during 1955 for rendering help to the displaced persons.

The Government of India proposes to develop and work the iron-ore deposits at Rajhara hills (Madhya Pradesh) for the Bhilai steel plant.

Indian goods were exhibited at 63 international fairs and exhibitions during the first Five-Year Plan period.

Salt production is to be increased from 85 million maunds to 100 million maunds under the second Five-Year Plan.

The Railway repair workshop at Izzatnagar (Uttar Pradesh) is to be remodelled at a cost of about Rs. 1.86 crores.

Eighteen specialists have so far been made available to Indian business organisations under the Industrial Technical Services Project of the Indo-American Technical Co-operation Programme.

About 3,756 tube wells are expected to be sunk in 14 States at a cost of about Rs. 24 crores during the second Five-Year Plan period.

It is reported that batches of Indian technicians are to be sent abroad for training in oil drilling and other techniques.

The Government of India have accepted the proposal by the Asia Pacific Forestry Commission of F.A.O. for a regional survey of timber trends and prospect for the next ten to fifteen years and have agreed to carry out the required survey for India.

The profits of all the Annapurna Cafeterias of the All India Women's Central Food Council and its branches for the year 1955-56 amounted to about Rs. 62,000 and loss to about Rs. 51,000. The profit during the period from 1950-51 to 1954-55 amounted roughly to Rs. 2.18 lakhs.

It's a
BIG job

looking
for oil

Have you ever considered what a long, elaborate and costly business it is looking for oil? Although oil lies thousands of feet underground, the oil prospector may have to take to the air—to photograph the lie of the land and make aeromagnetic surveys. Or he may create artificial earthquakes, in what is called a seismic survey. Then the findings have to be interpreted, in geophysical laboratories, before a test well is bored perhaps to a depth of as much as three miles.

The Assam Oil Company, for many years the pioneer of oil search in India, discovered a fresh source of oil recently at Nahorkatiya in Upper Assam. Crores of rupees have been spent in the search and many more will have to be spent on the development of this discovery.

And all the time, remember, the search for more oil is going on—for further sources of this most elusive mineral are vital for India's industrial development. All the very latest scientific methods and technical equipment, including aeromagnometers and even helicopters, are being employed. No effort in fact is being spared to reduce India's dependence on oil purchases from abroad.

Special Article:

THE DEMAND FOR HOUSING

WHAT is the relation between the demand for housing and rising real income? It is often assumed it is a straight line which, like the Plan Frame's rules of thumb on the 'Ratio', can be applied mechanically to determine housing demand in the next few years. This is an error. In this article there are presented some figures in Table I to show that the character ordinarily assumed of the relation between income and rent paid is by no means justified. They establish the negative conclusion that a simple linear relation between income and rent does not exist for the Indian Union as a whole and that, even for a particular place, the linear character of the relation holds over a very limited field.

This negative conclusion is one of considerable importance when one is attempting to measure the character of housing demand as money incomes increase, as they will during the second Five-Year Plan and beyond. Since no even approximate relation emerges from the figures of rent and income, one might be tempted to say that any estimate of the volume of demand based on a per capita rise in money income, or even of real income, is likely to have a very large error. If we take extreme cases, for example, in the graph below of four cities in which middle-class housing figures are available, one might say that the error could be over 100 per cent between certain ranges in Ahmedabad and Darjeeling. Figures which have such a large margin of error are obviously not suitable for precise planning.

The conclusion, therefore, to be drawn in regard to this matter can only be rough and ready with a kind of arbitrariness which incidentally belongs to all groups of "overall" economic co-ordinates computed over a long period. Just as there was an error of

something like 60 per cent in the assumption of India's capacity in the first Five-Year Plan in national income terms, and an error of some 200 to 300 per cent in computing our foreign exchange gap, one must be prepared in the next five years for equal surprises in the behaviour of the demand for housing.

The capacity to predict the behaviour of housing in the next few years in general terms is extremely limited. One might hold the view that, while the capacity to predict "overall" housing trends is very limited, a substantial volume of prediction can be done over small areas recognising the special place of supply factors and the behaviour of the population over the last few years. In the city of Delhi, for example, where one of the highest rates of building anywhere in the world obtains, it is possible to say that the tempo will stay at a level of about 18 per cent a year which seems to have been reached in the last four years. This is not, of course, because the population of Delhi is substantially different in texture from that elsewhere where the rate of urban housing growth might conceivably be between 1 and 2 per cent. It is merely that money for housing is relatively unlimited in Delhi while it is in short supply elsewhere. One can draw the conclusion from the wide disparity from the Delhi rate of housing and that of almost every other urban area that it is supply and not demand factors which are likely to be the critical determinants of the volume of new housing which is to be set up in the next few years. Where the supply factors are given, it is possible to be much more effective in prediction because it is supply, not demand, that is largely calling the tune.

Assuming that this view, namely, that the supply of housing is more important at the present time

than demand which arises from the structure of personal consumer expenditure, it appears that the volume of housing can be kept by governmental action at a level which might be very different from that which free market forces would determine. There will be no free market in the next few years both because of demand and supply factors—demand factors because of the continuance of the rent control and the absence of mobility, and supply factors largely because priorities in the choice of building areas and in the allocation of raw materials are bound to be overwhelming. It is, therefore, suggested that we should concentrate surveys of housing in particular areas based primarily on supply and not on rent-income relations. Much the greater part of increasing demand following the flow of money incomes will be held back. This implies that, even if building increases as envisaged in the Plan, there will be an acute shortage in particular areas. This may well be in the national interest.

What is the national interest in regard to the volume of new housing that is to be provided? Almost certainly at this period when there is great pressure on all sources of capital much of which is urgently re-

quired for productive purposes, the national interest requires that housing should be maintained at a minimum. All construction cannot be held back because it is an element in production. But all non-essential construction should be given a low priority because of the fact that the capital-output ratio in construction is the highest of all economic activities in almost all countries of the world. There is evidence to show that the overall capital-output ratio in India has been of the order of 1.5 to 1 in the last few years. In the case of industry it has tended to be between 1.5 and 2, but in housing it is very nearly in the ratio of 6:1 against an average of 7:1 to 10:1, elsewhere in the world.

It is now possible to draw together the conclusions of this article. In the first place, it has been argued that the evidence that exists does not justify the assumption that there is any linear relation between rent paid and income received which has any widespread application in the Indian Union. It is argued, therefore, that it would be dangerous to assume that the demand for housing moves linearly with a rise in income. All the evidence indicates that the rate of

TABLE—II

SHORT-PERIOD BUILDING PROGRAMMES

City	1949-50	1950-51	1951-52	1952-53	1953-54	Total Number of Houses Built in 1949-50 to 1953-54	At Present	Average Annual Rate of Increase
Madras	1,809	1,057	976	1,439	927	6,008	115,912	1.1%
Ahmedabad	880	602	525	439	525	2,971	33,000	1.9%
Kanpur	759	886	862	1,007	850	4,354	35,249	2.8%
New Delhi	—	—	—	—	—	16,000	33,000	18.8%

rise varies enormously both between different areas and between different income-groups in the same area in such a manner as to make the demand for housing in the next few years completely indeterminate. Secondly, it has been argued that while the demand factors are largely indeterminate, the supply factors have for the most part set the pace of new housing in the last few years. Thus in the city of Delhi a rate of 18.8 per cent seems to have been maintained against an average annual increase in Madras of 1.1 per cent, in Ahmedabad of 1.9 per cent and in Kanpur of 2.8 per cent. In the result there has been the widest disparity imposed upon housing merely by the capacity to supply houses, almost entirely now determined by government policy. In other words, it is not the market, but the Government of India and State Governments which will determine essentially the volume and the rate at which new housing can be supplied. Thirdly, it is argued that the discretion of the Government should be exercised in the direction of restricting, and not advancing, that element of housing which is not related to productive activities. This is merely because, at a time when shortage of capital is critical in the economy as a whole, a high priority to housing would imply a non-optimum distribution of the nation's scarce capital resources.

The conclusion to be derived from this article is thus not likely to be encouraging; it can, however, be given a constructive turn. There is an absence of adequate data at the present time to make decisions on the volume of new housing required and where and when. Since these decisions will need to be made, a new set of surveys will have to be undertaken to determine firstly the priority of housing in each place in

terms of productive and non-productive elements; there must then be determined the nature of the policy of restriction which should be imposed by the Central Government or the Planning Commission. The second Five-Year Plan is already too ambitious on housing. It will need to be cut back; it is more necessary that principles should be prepared and facts arranged so that the cut will involve the minimum dislocation in the attainment of the real income imperatives of the Plan.

COLLABORATION WITH SMALL INDUSTRIES

BY
CROESUS

ABOUT more or less the same time that Dr. B. C. Roy, the Chief Minister of West Bengal, was stressing the need for a properly co-ordinated and complementary relationship between large and small industries, in India, at the last annual general meeting of the Bharat Chamber of Commerce, Calcutta, Pressmen in Bombay were being taken round a factory, or rather the only factory in India which has been manufacturing all types of air conditioning units, including the latest to come on the market, namely, the new 'Crystal' Room Air Conditioner. After reading what Dr. Roy had to say on this important subject, I said to myself, in retrospect, that it was a fortuitous coincidence that I was also asking the manufacturers of 'Crystal' sets—Volta—questions intended to elicit information on precisely the same subject. Indeed, whenever I visit any industrial undertaking, this is invariably one of my stock questions. I have asked the question of industries in both the public and the private sectors, and, without intending any reflection on industries in the public sector, I maintain that there is a greater readiness and willingness on the part of industries in the private sector than on those of industries in the State sector to give contracts to small industries to turn out a number of secondary items. In view of this personal experience, I am bound to tell Dr. Roy that the jute mills of Calcutta are not the only "villains of the piece" in this behalf and that there are sufficient justifications for these mills to adopt the course they have chosen. Perhaps the bureaucratic red tape that has wound round the public sector enterprises makes it impracticable for these enterprises to take the help of smaller industries situated near and around their factories. Another reason may be that, invariably, enterprises in the public sector are not at all starved for machinery for any purpose, so that the need to go in for any outside assistance hardly arises. Nor are these State enterprises handicapped for space to instal any plant they may need to turn out a new product, unlike many units in the private sector.

In the case of Voltas themselves, for instance—why, for that matter, in the case of almost all industries located in Bombay—this handicap seems to have necessitated placing orders outside for some parts that could well be manufactured by them with little or no addition to their plant. This should not be interpreted to mean that either Voltas or other private sector units place orders outside only in the last resort and not as a deliberate policy to assist small units. According to the Voltas chief, sub-contracts are given to quite a few small units to produce parts from raw materials supplied. Right from the start, the Kirloskar-Petter enterprise in Poona has made it a policy to encourage small industries near and around its factory to produce some parts. Some of these big industries are known to have advanced money, supplied raw materials and even technical advice to small units. It is moonshine to expect State enterprise enthusiasts to discern altruistic motive in all these gestures. So, it is necessary to examine why any enterprise should feel called upon to go so much out of the way to place orders with small industries and take all the trouble to see that these industries deliver the goods. Herein lies an obvious explanation to Dr. Roy's complaint that some big industries (jute mills, for example) engage themselves in manufacturing even small items such as nuts and bolts, instead of letting some small industries do this for them. Left to themselves, unfortunately, many small industries in this country will not pay the same attention to quality as the bigger industries, which have to use the parts manufactured by the small industries, are required to exercise in the interest of uniform quality. In other countries, such as Japan and Switzerland, if smaller industries flourish side by side with larger ones, it is because the former are relatively more efficient and conscientious than their confreres in our country. But this need not occasion despair. If an intensive educative campaign is launched, our small industries also will rise to the occasion. And this is imperative if the targets in the second Five-Year Plan are to be reached.

AUTHORS' RIGHTS

By
CROESUS

AUTHORS and authors' organisations in Bombay at least are not disposed to agree with the line taken by 'The Eastern Economist' (vide p. 593 of issue dated April 13, 1956) in regard to the Copyright Bill which was recently introduced in the Rajya Sabha and has since been referred to a Joint Select Committee. It is not, however, the Bombay view, or rather the view of organisations of writers, artists and thinkers like the P.E.N., I.I.E.C.C. and the I.C.C.F., that the Bill in question, as a whole, is uncalled for. There is unqualified approval, for instance, to the comprehensiveness of the proposed legislation, as also to several of the useful provisions that it embodies. At the same time, there is strong feeling in these circles that the Bill also includes a few unwholesome features from their point of view. Meetings have accordingly been held to highlight these undesirable features and focus public attention thereon, so that the Select Committee and, failing that body, Parliament at least might press for suitable modifi-

cations of these proposals and thereby prevent avoidable harm to creative artists.

While none will deny that this is a perfectly reasonable stand to take, there is perhaps an even more fundamental point which our legislators have to bear in mind. Thus, it is of paramount necessity to ensure that, in the final form in which the present Bill emerges, it will not contain any provision that runs counter to the Universal Copyright Convention and thus renders India's membership of the International Copyright Union untenable. As the I.C.C.F. has rightly observed in a note on the Bill which it has prepared and submitted to the Government of India, it would be most unfortunate if, because of any provision in the Bill, India should be required to cut herself adrift from the comity of civilised nations.

Now for a few words about the provisions in the Bill which have been described as either undesirable

or retrograde. No less a person than Mr. Warkar (Mama Warkar), the veteran Marathi writer and a Member of Parliament himself, who participated in last Monday's public meeting convened for the special purpose of discussing this Bill under the joint auspices of the three organisations named earlier, felt compelled to observe that although amendment of the existing Copyright Act (which is hopelessly inadequate) was necessary, the proposed amendments were not all to the good. Stressing the point that amendments to the existing Act must be in the interests of those covered by the Act, he observed that the clause requiring artists to register themselves was retrograde and condemned it as "a flagrant violation of the right of the artists". Mr. M. A. Venkta Rao, another scholarly participant in the discussions, further stressed this point and remarked that to insist upon the registration of copyright before a suit could be instituted for its breach was equally retrograde. He maintained that the publication of the work should itself give the author the right to claim copyright and to sue for it, without having to go through further formalities.

A second feature of the Bill which has caused considerable consternation among writers and authors in Bombay is the clause that seeks to reduce the term of the copyright from 50 to 25 years. Mr. M. R. Masani vigorously opposed this clause at Monday's public meeting. Strongly deprecating the proposal, he urged that, as under the International Convention, all writers, musicians and other creative artists who would be covered by the Bill in question were entitled to the benefits of their works throughout their life. There is both point and force in this plea. For it is well known that, as a class, generally, Indian authors, composers and other creative artists are not only poor but also very poorly paid. Many of them are forced to live in abject conditions of poverty, and to deny a class of people such as these to enjoy the benefits of their only worldly possession and what perhaps may be their sole legacy to their heirs is to forget the fundamental objective of the legislation itself, namely to protect the interests of genuine artists and authors. It is a sad commentary on the understanding of those who framed this Bill that they should have overlooked such an important aspect. The result, ironically enough, is that we have, on the one hand, a class of people who, because of their being anything but worldly-wise, notwithstanding all their genius and talents, need the fullest protection of law and, on the other, a Bill which is ostensibly out to extend precisely such protection, but, in fact, miserably fails to do so.

Yet another undesirable feature of the Copyright Bill is that it is not only proposed to reduce the term of enjoyment of a copyright from 50 years after the death of a writer or artist to 25 years but, in the case of joint authors, this 25-year period is to be calculated from the death of either of the partners and not from the death of both. Naturally enough, Mrs. Amy Rustumji, the well-known educationist of Bombay, ridiculed the thoughtlessness of such a provision and instanced cases where this would work as a severe hardship. She said how, in several cases, young writers, who are not well known and do not have the means, allow themselves to be bracketed with obliging and established cronies who are one foot in the grave and how the poor young unknown writers or artists who have really slogged stand—as the Bill stands—to be deprived of the chance to enjoy the copyright of their creative work even for their own life time, by reason of the decision of their older sleeping partner to go off into eternal sleep.

Fears also were expressed that the proposal to set up a Copyright Office and the powers proposed to be invested in the Registrar of Copyrights would import

all the bureaucratic unimaginativeness into a sphere where imagination and sympathy were the most imperative needs. It was even voiced by a few that legislation such as this was harmful in the extreme, in that it would mean a slow but sure, albeit imperceptible, infringement on the fundamental rights of the people.

BUSINESS NOTES

IMPLICATIONS OF TEXTILE POLICY

IN THE context of the discussions that have been going on about the place that the 'Ambar Charkha' and the handloom weaver are to occupy under the second Plan, it is only to be expected that Chairmen of cotton mill companies would devote their addresses at their shareholders' meetings to a discussion of the implications of the Government of India's textile policy. It should be obvious to anyone who has followed articles of millowners in the Press and representations by mill-owners' associations to Government that there is a genuine fear in the minds of cotton mill interests that the proposed reliance on the handloom industry for all the additional requirements of cloth needed during the second Plan period will only land this country in trouble. Simply because such a view is expressed by spokesmen of the cotton mill industry, it should not be disregarded either by the protagonists of 'Ambar Charkha' and handloom weavers or the Government of India.

Addressing the shareholders of the Svadeshi Mills Co. Ltd., a few days ago, Mr. A. D. Shroff questioned the wisdom of the Government in putting a ceiling on the production of cloth for textile mills at 5000 million yards in pursuit of certain ideologies. He said: "Whilst Government agree with us that the demand for cloth in the country has shown a marked tendency to increase, and, by the end of the second Five-Year Plan, may well exceed 18 yards per capita, in their wisdom, they have decided that the additional requirements of cloth should be found from the handloom weavers. It is certainly incomprehensible that, at a time when the country's most imperative need is decreased production all round, Government should liberately decide not to utilise the capacity of the industry to make its effective contribution towards meeting the increased demand for cloth in the country".

In saying this, Mr. Shroff did not want to be misunderstood that he was opposed to the encouragement to handloom weavers that the Government is intent on to giving. As a matter of fact, he said, he entirely associated himself with the Government's intention to find increasing employment for a large number of people who are unemployed in the country and even welcomed the provision of self-employment to them in cottage and small-scale industries. But, at the same time, he made it clear that Government should not pursue the policy "which is bound to result, much sooner than we may dare to imagine, in an acute shortage of cloth."

Speaking to the shareholders of the Tata Mills Ltd., the Chairman, Mr. Naval H. Tata, expressed himself in even stronger terms on this subject. He felt that it was tragic to find that a noose is being slowly put round the neck of the promoters of textile industry who have struggled hard to develop this premier industry of the country representing a national investment of over Rs. 113 crores. He warned that it would be suicidal if the industry was allowed to stagnate on the plea of creating more employment by subsidising the cottage and village sector. Any further curbs placed on the expansion of the Indian textile industry, he warned, would make the way easy for our competitors to capture the coveted position in the textile world.

This latter point is particularly important. In order that the implications of the Government's textile policy might be fully understood, there is need to reproduce Mr. Tata's reference to this subject.

"It would be suicidal," Mr. Tata said, "to hold back the energised gears of this dynamic and progressive national effort with the intention of revitalising the cottage and village sectors on the plea of creating more

employment. There is no doubt that those foreign countries which are now scared of the tremendous progress of the Indian textile industry would breathe a sigh of relief, as more curbs placed on the expansion of the Indian textile industry would adversely affect its competitive position in the export market which, in turn, would make the way easy for other countries who are forging ahead boldly to capture the coveted position in the textile world." Few warnings have been more outspoken than this, but will it be heard?

NOT SO CLEAR AND PRECISE

IN THE course of the last sixteen years of its progressive existence, the All-India Manufacturers Organisation has built up for itself a position of authority and prestige as the accredited spokesman of medium-scale industries which invests its policies and official views with a good deal of weight in the discussion of industrial problems. Its annual and some of its important quarterly sessions have usually made valuable contributions to such discussions. However, certain observations in the presidential address of Mr. M. J. Vaidya at last Saturday's annual session of the AIMO held here tend to indicate that some of the views voiced on behalf of it could have been subjected to a deeper process of crystallisation and precision.

What the Chairman said about the transformation of the private sector which is currently under way and the evolution of a new pattern for this sector discloses that thinking on this issue remains to be carried to its logical conclusion. It must be stated clearly that Mr. Vaidya has been quite positive on the indispensability of the preservation of the private sector. But he is not as clear as one would wish him to be in the amplification of his thesis of the current evolution in the pattern of the private sector. He spoke with emphasis of the millions of small enterprises dispersed all over the country under the direction of millions of small men responsible for raising the requisite capital on a small scale. This phase, he argued, marked the emergence of a new middle class of small entrepreneurs. His grouse was that the Government's mind was too much preoccupied with "the few tall poppies that appear on our economic field" and it is they who influenced its policy on forcing the pace of the expansion of the public sector. His main grievance related to the inadequate attention paid by the Government to medium-scale industries. The Prime Minister who inaugurated the session made a pertinent observation that this may at best be considered as correct just in a partial sense.

Leaving aside this understandable solicitude of the AIMO Chairman for a greater share of Government's attention to medium industries, the preliminary question to consider is whether the issue of a correct attitude towards the private sector can be considered to have been viewed in its real perspective by concentrating attention on the new entrepreneurs to whose emergence reference is made. What precisely is the truth about the essential character of the private sector? The Chairman's most pointed emphasis on the spectacular increase in the interim index of industrial production in the last year only argues the massive contribution made by large-scale industries in the private sector, since it is their output that accounts for a predominant part of the index. To concede the necessity of the control and regulation of the private sector is a different and unrelated issue. But there is need for clarity and precision in assessing the genuine nature of the private sector of industry. In an age in which mechanised production is becoming more and more complex and big strides are being made in technological advances, survival in international competition is possible

primarily by placing an ungrudging emphasis on large-scale enterprises in the structure of industry. This is indeed a basic condition of a progressive economy anywhere. These enterprises need not hamper the growth of medium industries which have their proper place as ancillary components.

EXPANSION OF ELECTRICITY UNDERTAKINGS

DEALING WITH investment, the Draft Outline of the second Five-Year Plan alleges that "information available in regard to electricity undertakings does not permit anything more than a guess". But, as is only to be expected, this is not the view of the electricity industry itself, which says that, through its accredited organisation—the Federation of Electricity Undertakings in India—it has furnished the Planning Commission ample data relating to expansion visualised in the private sector of the industry during the years 1956-1961. Neither the spokesmen of the industry nor the Federation have claimed, however, that the data so furnished are exhaustive or complete. It seems, in fact, to have been specifically pointed out by the Federation that the data do not include information about normal expansion to be undertaken by a number of undertakings. The mistake that the Federation did was that it did not inform the Planning Commission that an estimate of such normal expansion could be had from a Government of India publication itself—General Review of Public Electric Supply: All India Statistics 1954. These statistics show that, between the years 1952 and 1953, there was an increase in capital expenditure of electricity undertakings in the private sector of Rs. 632 lakhs.

Anyway, so that the final version of the second Five-Year Plan also may not repeat the allegation, the Federation has been periodically writing to the Planning Commission to supplement the information already furnished by it in regard to all major expansions in the electricity industry in the private sector. The latest of such major expansions about which it has apprised the Planning Commission is that visualised by the Tata Hydro-Electric System involving a capital expenditure of some Rs. 8 crores. Together with this addition, according to the Federation, the major expansion in the private sector during the second Plan period would amount to 287,000 kw involving a total capital outlay of Rs. 41.48 crores.

Now for a few words about this latest expansion scheme of the Tatas at Bhira. The main features of the proposed extension to the Bhira Hydro-Electric scheme (the Hydro-electric group of Tatas) are:

(i) The construction of a new tunnel 14,800 ft. long and 154 sq. ft. cross section, lined throughout with a surge shaft, a new sluice house at lake, and a valve house at penstock end. This is expected to cost Rs. 150 lakhs and take about 27 to 28 months to be completed.

(ii) Strengthening and raising of the existing Mulshi dam so as to take the new spillway 10 ft. above the present one. This work is estimated to cost another Rs. 50 lakhs and take about two years. (iii) Erection of a 60 MW 11 kv vertical turbo-generator, along with associated penstock, transformer, switch gear, governor, voltage regulator, etc., all of which is expected to cost Rs. 21 crores and take about 24 months for completion.

(iv) Replacing of the present transmission lines of Bombay by 0.2 sq. in. in copper A.C.S.R. conductor lines, on double circuit, galvanised steel towers. This would cost about Rs. 50 lakhs and be ready by 1958.

COAL FOR AHMEDABAD MILLS

STATISTICS OF peak wagon loadings of coal and special movements to pockets of shortages which are highlighted occasionally on behalf of the railways do give a measure of the effort which the railway administrations strive to make to assist the consuming industrial units. But equally important is the failure to rush supplies when they are needed in critical situations. This factor need not be interpreted as a reflection of any sort on the bona fides of the railway administrations, but emphasis on it seems essential in the interest of continuous vigilance and timely action.

The Ahmedabad cotton textile mills have suffered a good deal from a steady decline in the arrivals of coal since the middle of 1955. At the last annual meeting of the Ahmedabad Millowners' Association, Mr. Madanmohan Mangaldas, the Chairman, described in his address the critical situation of coal shortage in a few telling words. A number of cotton mills in this city are operating just on marginal stocks. A situation of near-crisis has become their normal fate in spite of the arrangement made under the guidance of the Association for pooling of the stocks of member mills and the ad hoc allotments made in favour of the Association. The Chairman has grudged no words to express the Association's gratitude to the Western Railway for the assistance it rendered. Making allowance for the full effect of these palliatives, the stark fact remains that the gravity of the shortage situation could not be mitigated over the period as a whole. All that these palliatives could do was to avert total closure of some units. This is a specific case of an important industrial centre for which some normal readjustment of wagon allotments needs to be made.

HEAVY INDUSTRY IN MADRAS STATE

THE CLAIM of regions with a low level of industrial development for special consideration in the choice of the location of State enterprises in the second Plan has certainly some justification if only to correct the regional imbalance in industrialization. As the Draft Outline of the second Plan is due to come up for final discussion before Parliament, it is not unexpected to find claims of individual States being advanced for the allocation of a share in the programme of heavy industries. At last week's annual general meeting of the Southern India Chamber of Commerce, the President, Mr. M. A. Chidambaram, directed part of his comment on the Draft Outline to this problem. He made no secret of a sense of keen disappointment at the omission in the Plan to pay attention to the requirements of Madras State for a place in the rapid expansion of industries. The backwardness of the State in this sphere, coupled with the growing size of unemployment among the educated classes, worsened by the pressure of population increase, he urged, ought to have directed the attention of the Planning Commission to the needs of Madras State.

The usual argument about sufficiency of the requisite resources to operate an industry can hardly be pressed in the matter of regions like Madras which are lacking in them for the plain reason that location of some enterprises at least is to be determined to rectify disparities in regional industrial growth. The President has sought to stress the fact that lack of industrial resources has not prevented Japan or the UK from achieving a high level of development. Madras possesses a good potential of talent and technical skill. He mentions some industries as suitable for location in Madras. This demand has been inspired by the expectation of provision of employment at different levels. The significance of this consideration is obvious even if the nature of the employment potential of heavy industrial units is recognised.

COMMODITY NEWS AND NOTES

RESUMPTION OF RICE AUCTIONS

It has been decided by the Government of India that rice auctions be resumed in Bombay. Burma raw rice and indigenous qualities fall under this category of auctions. It is also understood that about 9,000 tons will be offered to the trade. The stocks are held in Bombay and other godowns in the district. Meanwhile, the price trend shows a quiet tendency following the auction news. Prices of Burma rice as well as of indigenous qualities have dropped by about Rs. 5 to Rs. 7 per candy, with the buyers aloof from the market. The setback in the market is also attributed to the improvement in arrivals. Results of the auctions are being awaited as it would have a significant effect on the future trend of prices.

WOOL PRODUCTION IN UNITED STATES

Wool production in 1956 in the United States is not likely to be greatly different from last year, according to USDA experts, as little change in the number of stock sheep is suggested by slaughter figures. Mills will probably use about the same quantities of both apparel and carpet wool that they used in 1955. Prospects are for a slightly larger world supply during the 1955-56 season. Production is expected to be a little larger and stocks are up slightly from a year ago. Prices received by US farmers for wool in 1955-56 averaged substantially below the 53.9 cents a pound received during the 1954 season. Individual producers will receive incentive payments based on the percentage needed to bring the US average price per pound up to the incentive level of 62 cents per pound. For the 1956 marketing year the incentive level is continued at the 1955 figure and payments will be made as under the 1955 programme. It appears probable that the average of prices received in the open market in 1956 will not be greatly different from the 1955 average and will again be substantially below the incentive level.

FINAL ESTIMATE OF DRY GINGER

According to the Directorate of Economics and Statistics, Union Ministry of Food and Agriculture, the all-India final estimate of dry ginger for 1955-56 puts the current year's area and production at 36,900 acres and 14,000 tons, as against the partially revised estimates of 35,400 acres and 14,000 tons for 1954-55. Thus, the current year's estimate shows an increase of 1,500 acres or 4.2 per cent in area and 900 tons or 6.4 per cent in production over last year. The increase in area and production during the current year has occurred in all the States, except Orissa and Vindhya Pradesh, which have reported slight decreases in area. The increase in area and production has been attributed to favourable weather conditions during the current year as compared to last year.

IRON ORE DEPOSITS IN HYDERABAD

Large deposits of "high grade iron ores" with an iron content of more than 60 per cent have been found over extensive areas in the districts of Khammameth and Warrangal. Several deposits of low grade iron ores are also known to occur in different districts of the State—Adilabad, Karimnagar, Warrangal, Khammam, and Raichur. On examination by the Mines and Geology Department it has been found that these areas contain a total of about 40 million tons of iron ore with an average iron content of little less than 40 per cent. Experiments are being conducted to study whether these ores with the help of locally available non-coking coals could be used for the production of iron and steel.

SHELLAC SHIPMENTS

Overseas demand for shellac is moderate as supplies, together with the carry-over from the previous

season, are considered adequate to meet the demand. Total shipments of lac in March were lower at 26,171 packages compared with 27,628 packages in February. Out of the total shipments last month, shellac accounted for 16,782 packages, seedlac for 6,196 packages, buttonlac for 299 packages and others 2,494 packages. The corresponding figures for February were 19,151, 5,634, 494 and 2,249 packages. The shellac market has presented a firm front recently. The price of pure T. N. which declined from Rs. 134 to Rs. 115 per maund last month has improved to Rs. 121. The discount for forward delivery over ready quotations had narrowed down to about Rs. 2 from between Rs. 4 and Rs. 5.

RUBBER PRODUCTION IN CEYLON

It is reported that Ceylon rubber production would rise by 50 per cent as a result of a four-year replanting programme. During eight years of independence, the tea industry has increased by 62 million lbs. A total 50,000 acres of worn out rubber had already been replanted and a further 100,000 acres would be replanted during the next four years. A similar programme was also planned for the coconut industry.

ZINC AND ZINC ALLOY FOR DIE CASTING

The Indian Standards Institution has published a specification for high purity zinc and zinc base alloy ingots for die casting. This standard covers the requirements of high purity zinc and two grades of zinc base alloy ingots for die casting designated as alloy one and alloy two. Alloys one and two have similar composition except for the copper content. Whereas alloy one is virtually copper free, alloy two contains 1 per cent copper.

EXPORT DUTY ON LINSEED OIL

On a review of the trend in the prices of oils and oilseeds, the Government has decided to impose with immediate effect an export duty of Rs. 250 per ton on linseed oil according to a press note of the Ministry of Commerce and Industry. The Government has also decided to levy an export duty of Rs. 200 per ton on nigerseed oil and kardiseed oil, and to raise the export duty on castor oil from Rs. 125 per ton to Rs. 175 per ton.

COMPANY AFFAIRS

THE DUNLOP RUBBER CO. (INDIA) LTD.

The accounts of the Company for 1955 show that, after providing for depreciation (Rs. 27,51,477) and interest (Rs. 6,50,000), but before taxation, the profit, amounting to Rs. 96,72,154, is slightly higher than Rs. 96,37,915 for the preceding year, though the ratio of profit to turnover, before providing for taxation, is lower at 6.4 per cent compared to 7.0 for 1954. This has been attributed to further reductions in selling prices. The ratio has, in fact, shown a downward tendency for a few years and was 7.7 for 1952 and 7.4 for 1953. The cost of goods sold (excluding depreciation) is Rs. 12,39,20,099 compared to Rs. 11,13,39,847 for 1954. Sales amount to Rs. 15,09,18,972 as against Rs. 13,70,34,228 for the preceding year.

After deducting the provision for taxation (Rs. 42,32,360 which includes Rs. 2,30,000 in respect of the new super-tax on the ordinary dividend in excess of 6 per cent), and gratuity provision of Rs. 5 lakhs, the net profit available for distribution amounts to Rs. 61,28,686 compared with a slightly higher figure of Rs. 69,45,891 for 1954. The Directors have recommended payment of a Guaranteed Preference dividend for the year under review, at 6 per cent, free of tax, which absorbs Rs. 1,80,000. The Second Preference dividend at the same rate but less income-tax absorbs Rs. 1,77,000. The Directors recommend maintaining the rate of the Ordinary dividend at 15 per cent, free of tax, which takes away Rs. 24,00,000. A sum of Rs. 22,00,000 has been transferred to General Reserve in order to provide resources necessary for the expansion of the business. This leaves a balance of Rs. 11,71,686 to be carried forward.

During the year, additions were made to the extent of Rs. 33,69,602. In accordance with Schedule VI of the Companies Act 1956, an amount of Rs. 1,13,86,174 has been transferred to a Special Depreciation Reserve, which was the Depreciation on Buildings and Plant provided in the post-war years at higher than normal rates. Inventories, conservatively valued, are lower by Rs. 4,17,891, due to difficulties in procuring certain raw materials, and there is a reduction of Rs. 6,89,846 in cash and current balances. Against that, there is an increase of Rs. 16,74,490 in Debtors, which reflects the higher level of turnover.

THE FINLAY GROUP OF MILLS

The working results of the Finlay Mills, the Gold Mohur Mills and the Swan Mills (Agents: M's. James Finlay and Co., Ltd.) for the year 1955 are satisfactory. The figures are tabulated below:

	(In rupees)		
	Finlay	Gold Mohur	Swan
Trading profit for the year	21,81,538	16,77,978	28,76,266
From which there have been deducted:			
Provision for Income-tax, Corporation Tax and Dividend Tax	5,60,000	2,66,000	8,00,000
Retiring Gratuity Fund	10,000	30,000	30,000
Development Reserve	5,70,000	3,37,000	1,25,000
Reserve Fund	—	—	1,00,000
Depreciation	2,65,000	4,63,000	11,30,000

Adding the amounts carried forward from the previous year, of Rs. 3,90,661, Rs. 2,04,390 and Rs. 3,59,764 the sums becoming available for disposal, respectively for the three companies, stand at Rs. 11,67,199,

Rs. 7,86,368 and Rs. 10,51,030. For the Finlay Mills, Ltd., a dividend of Rs. 20 per share on 50,000 shares, free of income-tax, has been proposed which absorbs Rs. 10,00,000, leaving a balance of Rs. 1,67,199 to be carried forward. In the case of the Gold Mohur Mills, Ltd., Rs. 7,50,000 are to be paid as dividend on 50,000 shares at Rs. 15 per share, free of income-tax, and the balance of Rs. 36,368 has been proposed to be carried forward. A dividend of Rs. 25 per share, free of income-tax, on the 36,000 shares of the Swan Mills, Ltd., absorbs Rs. 9,00,000 which leaves a balance of Rs. 1,51,030 to be carried forward.

The Alexander and Finlay Thread Co., in which the Finlay Mills has a 50 per cent interest, showed a loss, during the year, of Rs. 1,34,780 of which the Finlay's share amounts to Rs. 67,390. According to the Directors, the loss occurred mainly due to certain technical difficulties in regard to some articles of production and the need to establish markets. They are, however, hopeful about its improved working in the future.

THE MODERN MILLS, LTD.

The result of the Company's operations during the year ended October 31, 1955, shows a profit of Rs. 12,53,899, after providing a sum of Rs. 4,66,006 for bonus payable to the staff and workers for the three years: 1953, 1954 and 1955. The bonus is to be paid in accordance with an agreement arrived at between the Rashtriya Mill Mazdoor Sangh and the "Millowners' Association, Bombay. Adding to the profit the amount of Rs. 16,412 brought forward from the previous year's account, a total sum of Rs. 12,70,311 becomes available for distribution. The Directors have allocated to the depreciation on buildings a sum of Rs. 62,711. Another sum of Rs. 4,55,820 has been allocated to the depreciation on machinery. The reserve for taxation gets Rs. 35,962, the machinery rehabilitation reserve fund gets Rs. 3,00,000 and the reserve fund Rs. 30,000, leaving a balance of Rs. 3,85,758.

The Directors have proposed a dividend of Rs. 5 and a bonus of Rs. 3 per share, making a total of Rs. 8 per share on 44,261 ordinary shares of Rs. 50 each, for the year under report, which absorbs Rs. 3,54,088. This leaves a balance of Rs. 31,670, which is to be carried forward.

In the cloth trade, conditions were satisfactory during the year. For yarn, however, the demand and prices realised during the latter half of the year were poor and improved only after the turn of the year.

BRAITHWAITE & CO. (INDIA) LTD.

The Company's working for the year 1955 has resulted in a profit of Rs. 15,52,716, which shows an increase of about 50 per cent over the profit for the preceding year which stood at Rs. 10,94,082. This figure is exclusive of the provision of Rs. 13,00,000 for taxation and Rs. 2,00,663 for depreciation. The profit, together with Rs. 2,09,750 brought forward from the previous year's accounts, makes a sum of Rs. 17,62,466.

To meet the obligations of the amended Section 23-A of the Indian Income-Tax Act, the Directors have recommended an additional dividend of 6 annas per share for the year 1954. For the year under report a provisional dividend of Rs. 1-12 per share has been recommended, pending decision on an application submitted by the Company for being exempted from the provisions of Section 23-A. Dividends as recommended absorb Rs. 12,02,705, leaving a balance of Rs. 5,59,761 to be carried forward.

THE RAMAYANA OF TULSIDAS IN ENGLISH VERSE

LATEST "HINDUSTAN TIMES" PUBLICATION

The famous Hindi epic regarded by many as "the greatest book in all devotional literature" is for the first time now available in English verse.

The translator, the Rev. A. G. Atkins, completed the book after ten years of devoted work. He has tried "to keep and express in English in the fine rhythm and music of the original in simple lucid language, and with as much of the vivacity, wittiness and picturesqueness that Tulsidas has put into his work." He has also followed in some measure Tulsidas's metrical variations such as *chhand*, *chaupai*, *doha* and *soratha*.

In a foreword Mr C. Rajagopalachari says: "Mr Atkins' monumental work and his Introduction are a revelation of hope for those who desire to see all the great religions of mankind come together. . . . His service is not only to English-speaking people but also to that very large number of Hindus in India who do not speak the Hindi language and to whom English has become a very familiar medium."

The book is of special value to libraries, scholars and devotees of Tulsidas.

It has been issued in the following four editions:

- Original text of Tulsidas with translation in English verse; three volumes; 1468 pages; price Rs. 50 net.
- Translation in English verse; without Hindi text. two volume; 898 pages; price Rs. 40 net.
- Special tissue paper edition of I, one volume, price Rs. 100 net.
- Special tissue paper edition of II, one volume, price Rs. 100 net.

The Apple of Discord

BOMBAY has become India's apple of discord. Throughout the States Reorganisation Commission Bill debate in the Lok Sabha this week it returned, again and again the only deep dis-

turbing element in what was, on the whole, an amicable battle of wits. Credit is due to Maharashtra Members of Parliament for the relative moderation with which they stated their case, a

moderation so different from the violence of language and the passion in thought and deed, which has previously done so much to prejudice their reputation in the minds of large sections of the Indian people. Because of the calm which is now descending on both sides in the Bombay dispute, the time is opportune for a settlement of this vexatious issue which, it might be said, is fraught with consequences graver than any that face the immediate internal political life of the country. Because of these considerations the meeting of Congress Members of Parliament from Maharashtra with the Prime Minister on Friday evening was believed to have been an event justifying the delay in the publication by a few hours of the current issue of *The Eastern Economist*. It was hoped that there would be good news to report and greater goodwill to anticipate.

These high hopes have been, to some extent, belied; for the Prime Minister refrained from committing himself to any definite statement although he seems to have said he shared the "agony" of Maharashtrian leaders and was anxious to find an amicable solution. So to state the political problem of Bombay is greatly to underestimate the consequences of indecision in the political life of the country. It is foolish not to recognise that the whole of Maharashtra will stake everything on a claim to Bombay. If that claim is not admitted—and on the face of it, it is difficult in principle to reject it—the reverse to the Congress Party in Maharashtra in the general elections next year will be tremendous. A vast political problem will then be imposed on the administration of Maharashtra, quite apart from the merits of the Bombay dispute. It is earnestly to be asked of the Prime Minister and the Home Minister, who hold the key to the situation, whether they have appreciated not merely the agony of the Maharashtrians, but the danger to India as a whole from a display of political discontent which has had no parallel in the country since Independence.

The issue of prestige is not easily overcome even though the Prime Minister stated on Friday that "prestige" would not stand in the way. Indian Governments, particularly based on a law and order conception of administration, have been very prone to treat prestige as a deciding factor in many administrative decisions. In historical perspective this was justified. So long as one had an irremovable executive, prestige was a measure of the determination with which that executive was proposing to govern. In other words, prestige was in those days a sound political principle, being in fact nothing more or less than a condition of ultimate survival.

It is not often recognised that this principle of survival has no application in a democratic government. Democratic governments do not, indeed, have a right to survival. Certainly, they do not have a right to survival on the merits of a particular case, however rational and convincing that case may be to the intelligentsia or to objective observers in any country or time. A democratic government accepts the verdict of its people as the supreme argument. Since the verdict of the people can run counter at any time both to rationality and good administration, the implication must be that any democratic government admits the superior right of the people to determine policy. Once the condition is accepted, the executive has no right to claim that

prestige requires that it should not surrender to a people's case. Since the theory of democratic government is government by consent of the people, any order contrary to the wishes of the people should be politically inappropriate and administratively unwise.

This argument applies with full force to the Bombay case. There is no doubt that if the present decision of the Government of India is implemented as it stands, there will be a major vote of displeasure against the Congress Party. In other words, in Maharashtra the people will vote solidly against the Congress and may vote partly for the Communist Party of India. If the decision were reversed to the point of giving Bombay to Maharashtra after a set period, and allowing the Maharashtrian Government to function from Bombay, there is no indication that there would be equal displeasure in Gujarat. On balance—and all democratic balloting is on balance—the people's voice certainly stands against the present formula. This being so, the adherence to the present formula would be an egregious political error.

To admit that both political principle and political expediency require that the current formula should be changed is not to deplore all the errors that have been made in arriving at the present tortuous decision. The Maharashtrian leaders cannot absolve themselves of responsibility. The speeches of men like Mr. N. V. Gadgil at a time when passions were being roused were of a kind which has convinced most honest observers of the scene that he is a leader unfit for high responsibility, and his removal from high office at the Centre was a sound political judgment, however unjust it looked at the time. Again, though this belongs to a quite different category, India's Finance Minister, Sir Chintaman Deshmukh has greatly reduced his stature in the minds of his many admirers by the trivial manner in which his resignation from his high office has been frequently tendered in recent years. On each of these issues, if, indeed, these were issues for a resignation, the Finance Minister should have underlined his determination to leave office by departing, not by staying at home. Too often in the last two years he has made it appear that his central place in the Finance Ministry has been used merely as a bargaining counter to impose his views on the Central Government. The great office of the Finance Minister of India has thus been brought into disrepute.

It is good that these sorry episodes are coming to an end. It is sincerely to be hoped that the Government of India will in the next week announce a decision, after consultation with Gujarat interests, which will either restore the bilingual State—the case for which was splendidly stated by Mr. Tulsidas Kilachand in his speech on the Bill this week—or arrange to give the Maharashtrian leaders the assurances on Bombay necessary to allay their agony and the deep distrust of the Prime Minister and his advisers which has been sown on a grand scale in a strategic portion of the Indian Union. This is the time when Indian patriots must stand behind any decision, however injurious it might be to prestige and the personal position of our leaders, in order to draw the country together with a single heart and a great will to accomplish the tasks which face the nation as a whole.

The World Bank Mission

DURING its long and fruitful period of relationship as a lender with India, the World Bank has sent many fact-finding missions to survey individual projects on which its assistance has been utilised in the past. The Bank's representatives have thus had opportunities of inspecting not only the manner in which the Bank's assistance has been made use of but also the development that has been made possible otherwise than through such assistance. But there is special significance in the arrival of a special Mission of the I.B.R.D. at this time to study the growth of the Indian economy with a view to formulating plans of assistance under India's second Five-Year Plan. On the one hand, the Indian economy today is in better shape for making such assessment; on the other, the I.B.R.D. has now acquired considerable experience as a result of surveys conducted in many other underdeveloped countries and can show greater insight in understanding the various forces now at work in this country. The I.M.F. undertook a similar Mission some time ago and came out with a penetrating analysis of the problems of "development with stability", but that Report was largely governed by considerations of sound monetary policy to which the Fund has of necessity to give priority. A wider view can now be taken by the Bank Mission and its conclusions, based on a tour of this country in the next two months, will be awaited with interest.

The Deputy Leader of the Mission, Mr. J. C. De Wilde has emphasised that the fundamental thing to be observed is the rate of growth of India's economy and its future economic prospects. On both these aspects, there have not been serious differences of opinion. The rate of growth under the first Plan has exceeded original expectations and the official estimate of an increase of national income over the last five years of about 18 per cent errs considerably on the side of caution. Exact computations of the actual difference may not be possible by statisticians but indications have not been wanting to show that in the uncharted sectors of the economy the tempo of activity has been on the increase. There has been a rise in consumption, particularly of food grains and cloth, which, as a symptom of a widening market, is some proof of the development that has been achieved.

These hopeful features continue to operate today when India is on the threshold of a second Five-Year Plan which is much more ambitious than the first one. The real problem today is whether the process of planning would help to maintain and increase the momentum that has already been given to the economy by enabling large-scale investment in industrialisation and in transport—the two vital sectors in which development has now to concentrate. By their nature, development projects in these fields require external assistance in terms of materials and of technical knowledge. Attempts to help India's second Five-Year Plan must largely concentrate on providing these two ingredients of development. The problem of supplying materials may for the major part involve only a problem of providing the finance and here the World Bank can be of great assistance; but to the extent to which India competes for supply of scarce materials like steel, the Bank's role may be only secondary.

The World Bank has all along approached these problems of assistance to underdeveloped countries with a definite philosophy of aid, though, from time to time, changes have been effected according to the prevailing circumstances in particular countries. In this context, the current controversy in this country over the relative importance of the two sectors is unlikely to escape the Bank Mission's attention. On earlier occasions, the Bank has shown a positive inclination to favour the promotion of private enterprise in fields in which the State's obligation to provide social overheads like transport was not involved. It has been known for example that the World Bank was not quite friendly to aiding the Rourekela steel plant in which public sector is the major participant. Though no aid may be necessary for this or the other two steel units, it has become a cardinal feature of industrial policy—and this is likely to be re-emphasised in a short time by the revised policy now on the anvil—that the public sector must have a controlling interest in many other fields too, like heavy machinery, coal and fertilisers.

These may not accord with the principles of the Bank, but in the last resort these are decisions that have come to be accepted under the established democratic process in the country; and the aversion to the ideology behind the decisions should not deter the Bank from taking most constructive view of its policy of aid even under such conditions. The World Bank independently through its participation in the Industrial Credit and Investment Corporation is in a position to fulfil its other role of promoting free enterprise. The expansion of the public sector as now proposed may in many cases even be an essential pre-requisite to the growth of the private sector. While the projects themselves are being undertaken by Government, their indirect effect is to widen the scope for orders to the private sector for construction and supplies; also the increase in incomes creates a market for products of private manufacture which acts as an incentive for larger production.

The Bank may not fail to point out that it is still possible to promote dispersal of decisions subject to overall programming under a Plan, particularly when it is asked to undertake overall financing for development, as in Australia. Its influence can perhaps be best exercised in practice; mere refusal to countenance the undue growth of the public sector may not be the best way.

No observer can fail to be disturbed by the existing gap between ambitions and resources in planning. Even the views of official spokesmen in the last few weeks have revealed some degree of anxiety. The answer to these doubts is not to limit ambitions. It is easy to prescribe a counsel of caution but that can hardly help; the experience of the last few years alone must be proof that caution will prevail when it is dictated by necessity. Meanwhile, the World Bank has an opportunity to make India a kind of case-study of a flexible type assistance. So far, the Bank has been the second most important agency of external assistance in India's development; and it can still maintain its position in spite of India's looking more and more to other agencies and areas for collaboration and aid.

Advertising and the Plan

IN the second Five-Year Plan publicity on an organised basis has been assigned a distinct place. For this purpose the draft outline has proposed an allocation of Rs. 7 crores. The programme of publicity has been conceived after an integrated pattern in which diverse media will be selected to suit particular regions or sections of populations to inform and educate public opinion on the objectives of specific schemes of development. The experience of the first Plan has brought home, though still inadequately, the imperative necessity of sustaining a rational campaign of publicity as an effective instrument to enlist the co-operation of the people.

This changed outlook on the technique of publicity comes in happy contrast with the traditional attitude which looked upon advertising as a component of wasteful patronage only. Publicity for State and public enterprises has normally received its full share, and even an excess of it on occasions; but the fact that it was carried out without being placed on a systematic basis, had concealed the extent to which the public sector had leaned upon it for popular appeal. Outside the domain of the public sector, there has lately been ample evidence of the importance of publicity as a valuable aid in pushing up the claims of handicrafts and cottage industry products. The direct outlay that is incurred in advertising these products at home and particularly in the markets abroad has been vindicated on the ground that this vulnerable segment of industry requires special attention in view of its employment potential in the rural and semi-urban areas. It is in fact not at all necessary to take a defensive attitude to explain the special measures taken to stimulate these industries. If they vindicate anything, it is the simple fact that advertising is an integral part of modern business and an essential aid to the promotion of industry.

It is paradoxical that there should be a good deal of hesitation in conceding the application of this dictum to large-scale industries. Perhaps this attitude is due in some measure to the mode of advertising adopted until recent times. Advertising in the past had tended to err on the side of overstatement which had been due to the fact that sound and rationalised techniques were usually not resorted to. Business men in this country have so far been slow in appreciating the value of scientific advertising as an aid to sales promotion. Misconception about the function of advertising has been responsible for this lack of appreciation, which also created a wrong belief that quality products need no publicity to make themselves readily acceptable to the consumer. This attitude often resulted in the allocation of inadequate or scanty funds for advertising an essential accompaniment of marketing. In an era of acute competition there is every need to educate and induce consumer preference even for products whose quality and price may leave no room for doubt.

The special attention which is being devoted to publicity in the public sector must serve to underline equal urgency for placing a new emphasis on advertising in the private sector. This urgency arises from certain special considerations which have an intimate bearing on the success of the implementation of the second Plan. The higher standards of living which must emerge in the wake of the new and expanding incomes will

mean a diversification of wants and a demand for goods which were hitherto not in popular demand. The traditional pattern of family budgets indicates that as big a slice as two-thirds of the total expenditure in the rural sector is taken away by food items while the proportion has been a little lower in the urban sector. The improvement in the standard of living which is expected in the periods of successive plans will shift the emphasis of demand and a wide range of consumer goods will find an expanding market. In the second Plan consumer goods will come in for heavier pressure also by virtue of their disinflationary effects.

The second Plan aims at changing the complexion of the economy by a deliberate switch-over to industrialisation. This process, necessarily to be extended over successive plan periods, will inevitably call for a corresponding change in consumption habits. Industrialisation in this country can be developed primarily on the basis of mass markets at home since even our exports may have to fall back on home demand in times of recession. A sustained mass market at home can be built only by cultivating consumer preferences in the right direction. It would be oversimplification of the situation to believe that production of goods possessing all the desired merits will command prompt patronage. In the complex economy of the present time, the manufacturer has also to explain how his products can satisfactorily answer the consumer's demand. This is precisely the function of advertising which it can succeed in discharging provided it is conducted on scientific and rationalised principles. It implies intensive market research and publicity in a manner that will carry genuine conviction with the consumer.

While different media of advertising open up a variety of choices, it can hardly be disputed that the most potential and the most far-reaching medium will be the press. This role of the press highlights an important obligation whose social significance is as important as its financial significance. Any official policy, therefore, which is likely to affect the capacity of newspapers to serve as expanding agencies of advertising cannot fail to cause concern to advertising interests. It is for this reason that Mr. Dharamsey M. Khatau, addressing this Wednesday's annual session of the Indian Society of Advertisers, made an earnest plea to the Government to refrain from any intervention calculated to curtail the ability of the press to provide adequate coverage for advertisements. The price-page schedule, recommended by the Press Commission, may seem to confer benefit on medium and small papers. But in the final analysis, newspaper circulation will have to be established on a basis of inherent appeal. Restriction on the size of newspapers cannot fail to produce adverse repercussions on their circulation. It is plain logic that contracting circulation must in course of time detract from the value of the newspaper as a potential advertising medium. Still another direction in which State intervention threatens to rear its head has been disclosed recently. It is to be trusted that the official directive which has influenced tyre companies to reduce their outlay on advertisements will prove a solitary instance. The eventual limit to be placed on expenditure by way of publicity had best be left to the discretion of the producer who can never ignore the revenue criterion.

THE WEEK'S NOTES

CURTAIN DOWN ON THE COMINFORM

THE TIMING of the dissolution of the Cominform announced by Mr. Mikoyan on April 17, is as significant as the act itself. When the Russian leaders were in Delhi, they were not ready to agree to the liquidation of this body, which had its origin in the Cold War, though they had by then accepted the Pancha Shila. There was, *prima facie*, an inconsistency between the adoption of the Five Principles and the maintenance of an agency actively interfering in other countries, including two in the Western World, France and Italy. Mr. Nehru had also indicated the incompatibility between the Pancha Shila and the continuance of the Cominform. The fact that no changes were made till now seems proof of the fact that the latest move is not a concession to the Indian point of view on the Pancha Shila though it might have added to Russian doubts about the value of the Cominform. On the other hand, the announcement of dissolution has been made on the eve of the visit of the two Russian leaders to London where the climate has not been propitious for an enthusiastic reception despite the successful preliminary goodwill tour of Mr. Malenkov. Mr. Malenkov could not have failed to impress on the Russian leaders the state of hostility and suspicion against Russia among the British people; or, perhaps, the 20th Congress of the Communist Party had already decided to liquidate the Cominform and to let Mr. Bulganin and Mr. Khrushchev use the decision to the best advantage at the appropriate time.

As one more step to better relations between the Communist and non-Communist worlds, the end of the Cominform can be hailed with satisfaction. It does not, however, mean that the tendency of Communist parties functioning in the countries of the Free World to adopt the Moscow line at any given moment—whether it is the exaltation or the denigration of a hero or a doctrine—would disappear. The extra-territorial loyalty of the Communist doctrine will continue to remain a powerful substitute for the Cominform. Or again, nothing would prevent its revival at a suitable opportunity, just as the Comintern which was dissolved in 1943 was resurrected with another name in 1947 when the Cold War began. It is not wise, however, to minimise the importance of this dissolution. Marshal Tito was one of its first victims and his virtual return to the Communist fold might also have necessitated the abolition of an agency which in the name of an Information Bureau practically dominated the satellite countries. The East European Communist States may, probably, have more freedom now than before in determining their local policies.

SOVIET LEADERS IN BRITAIN

MR. BULGANIN and Mr. Khrushchev will conclude their British tour this week and at the present moment it is difficult to say that the results achieved have been very significant. Their experience with the British public has not been encouraging and stands in contrast to the exhilarating welcome they had received in India, Burma and Afghanistan. Much of the coldness in the reception was only to be expected in view of the preceding controversy over the visit. The Malenkov mission was a great success in itself but it has not contributed to an easing of the prejudice against Mr. Khrushchev and Mr. Bulganin, who were mainly responsible for the anti-British statements during their Indian tour. At the Lord Mayor's luncheon of Guildhall, Mr. Khrushchev was in his best mood of persuasion on the subject of co-existence and the opportunity for exchanging opinions with Sir Winston Churchill appears to have been well utilised. An unexpected de-

velopment was the clash with British Labour leaders at the House of Commons dinner. Mr. Khrushchev's allegation that Britain had instigated Hitler to attack Russia could not have been a mere indiscretion, nor a reaction to the Labour leaders' demand for release of Social Democrats imprisoned in Communist countries.

It is possible to interpret it only as a refusal by Mr. Khrushchev to go to any length to woo the British, if the latter were determined to remain cold and unresponsive to their gestures. The Anglo-Soviet talks have not apparently been successful enough, and the London Disarmament Conference has not made progress. Mr. Khrushchev has not omitted any occasion to emphasise that the Soviet Union is talking from strength, while the British have refused to create the impression that they have been flattered by Russian attentions. It has been largely a transition from the cold war to a cold peace, if at all. The British Government can now succeed in convincing American opinion that it has not been swept off its feet by Russian overtures and has not allowed the Anglo-American alliance to be impaired. The honours in this rivalry seem even.

THE RIDDLE OF STATES' REORGANISATION

THE DEBATE in the Lok Sabha this week on the States Reorganisation Bill has again provided a forceful reminder of the tentative character of the Government's decision on Bombay City's future. Time has not helped to abate Maharashtra's resentment over the exclusion of Bombay City from the proposed Maharashtra State, whether as a Centrally administered area or as a separate State. The difference now is that while formerly there was inclination among some sections of Maharashtra opinion to favour a large composite State including Gujarat—the MPCC has also passed a resolution to this effect—there seems to be no disposition now to think on similar lines. In this respect, the position is worse today than in January last and is the result of the unacceptable solution imposed by the Government of India, without bestowing sufficient thought on the feasibility of a composite State, especially when in the Punjab it seemed an eminently suitable method of cutting the Gordian knot of regional politics.

It is idle to deny that opinion in the rest of India, barring Gujarat, has veered round in favour of the Maharashtra claim for Bombay City and there was a reflection of it in the speeches in the Lok Sabha this week. The Government is bound to be in a difficulty in retracing its steps and Mr. Deshmukh's offer of resignation on this issue may further add to its embarrassment. Such resignation may help to focus attention on a vital issue but in view of Mr. Deshmukh's role as an architect of the second Five-Year Plan, the position becomes particularly delicate. Unless the question is satisfactorily solved preventing Mr. Deshmukh from pressing his resignation, the nation will be losing the services of one on whom it has to rely strongly for finding the resources through taxation and deficit financing on the scale now accepted by him as member of the Planning Commission and Government.

THE FINANCE BILL

THE FINANCE BILL as now passed by the Lok Sabha contains only moderate alterations of the original proposals. The halving of the duty of half an anna originally proposed to be levied on cotton seed oil was not a substantial concession to the general demand for a low duty on all edible oils. On the new tax on the earnings of registered firms with an income of more

than Rs. 30,000, the Finance Minister announced exemption of the first Rs. 40,000 from tax and also exemption from super-tax for a partner on his share of income from the firm other than business income on amounts equal to the tax attributable to such incomes paid by the registered firm. This was intended to give reliefs to partners of professional firms like those of accountants and lawyers.

The tax on bonus shares has come to stay and the Finance Minister justified it again on the argument that the share-holder himself will not be taxed on the value of the bonus shares as if it were a dividend, but that only the company issuing it has to pay it as corporation tax. A second argument was that the levy of a corporation tax linked to paid-up capital cannot ignore any widening of the base through bonus shares. The main disappointment has been the refusal to modify the tax on dividends in excess of six per cent. The Finance Minister's calculation that an extra tax of half an anna on the total distributable profits is not an excessive burden in cases where the whole of the profit of a company is distributed may seem good on paper but will not convince business men that it is a minor burden to be borne without complaint.

ICS SALARIES—A PETTY-MINDED APPROACH

A CIRCULAR to ICS officers exhorting them to accept a voluntary cut in their salaries is reported to be under Government's consideration. This is perhaps the first step in taking measures in pursuance of the idea of fixing ceilings on income; presumably the Government hopes it will be fortified by a voluntary gesture made by ICS officers in enforcing on the officers of the private sector similar restrictions. The protection granted to these officers under the Constitution now stands in the way of firmer action, which would certainly have been adopted otherwise, thus proving that the officers were not exaggerating their fears when they sought constitutional safeguards. In any case, these salaries have remained static over decades and inflation at one end and taxation at the other have been steadily eating into their real value. At the same time the remnants of the ICS corps have taken an increasing share of the burdens of administration of a Welfare State and it would be less than honest to say that these salaries are unconscionably high compared to the levels prevailing in the private sector or to the real emoluments of politicians in office, if their perquisites are also included. It is wrong to create the impression that these devoted public servants form a highly privileged class, or that any saving by a cut will be substantial. In any case, they are already limited in numbers and time will reduce their ranks further.

A more practical aspect of the question should be taken into consideration. Even if the cuts are not considerable, it is wrong to create the impression that strong pressure would be exerted in this matter, and it is idle to deny that all this constitutes pressure. If the result is to encourage the officers to opt for the benefits of premature retirement to which they are eligible and to seek other occupations which offer attractive monetary or other rewards, the public services will lose heavily. As the Minister for Commerce and Industry remarked last week, it is indeed a strange kind of socialism that reduces the attractions of public service on the one side, and expands the activities of the public sector, on the other. It is time to call a halt to the tendency to find whipping boys among the non-vocal sections of the community.

EDUCATION MINISTRY AND ITS CRITICS

THE LOK SABHA debate on the Education Ministry's demands for grants revealed a wide awareness on the part of the members of the great gap which still remains between the Directive in the Constitution, which envisages the provision of free, compulsory education

up to the age of 14 within ten years of the inauguration of the Constitution, and practicable targets. On other points also progress has been below expectations and needs. Teachers' salaries continue at the same old levels except for some tinkering here and there, though the Central Government has now offered to help State Governments in revising them, and secondary, university and technical education continue to founder on the scarce financial rocks. But, while one has to agree with the Deputy Minister on this point, it should be pointed out that the Ministry could have done something more to persuade the Governments, at the Centre and in the States, to take the Constitutional objective a little more seriously.

The speeches once more revealed that Hindi enthusiasts still refuse to leave their old ways of thinking and even the Language Commission's hearings in various parts of the country and the Chairman's plea for tolerance have apparently fallen on deaf ears. The Deputy Minister squarely met the charge that the Ministry was not doing all it could to accelerate the pace of Hindi by, first, pointing to what had been done and, secondly, to the need for going slow in such a matter which may well affect the unity of the country. But it is not clear why he should have been somewhat apologetic over the adoption of international numerals for Hindi typewriters when the provision in the Constitution is clear on the point. It almost seems as if simultaneously with its other programmes, the Education Ministry should launch a programme to educate dogmatic and over-zealous Hindi protagonists on the advantages of gradualness in making Hindi acceptable in areas where it is not.

A Window on the World

THE ECONOMIC VALUE OF UNEQUAL REWARDS

By

ODYSSEUS

THE USSR, THE USA, AND BRITAIN reveal in the history of their economic development one grim major factor in common: Britain and the USA have passed, and the USSR is passing, through a period of postponed consumption, mass thrift, and pioneering hardship and suffering, before the capital thus created began (or, in the case of the USSR, will begin) to pay back the astonishingly high dividends which give the USA, and which once gave Britain, the world's highest standards of living. Mr. Graham Hutton, the British economist, in an unsigned article entitled "The Dynamic Society," published in the 'Times' (of London) Literary Supplement of February 24, put the question: Is it a necessity of economic growth that such periods of hardship must be endured by any country (e.g. India) that wishes to emulate the same high levels of consumption? Is the hard-headed Victorian philosophy, that made Britain and the USA rich and strong, the unavoidable precursor of the contemporary Soviet tyranny over the Russian masses? Before giving a final answer, Mr. Hutton points out the important preliminary truth that these hard-faced methods are the social cost of accumulating capital quickly.

Rightly does Mr. Hutton insist that there is no escape from toil and ill-fare without the modern equivalent of the ancient slaves—tools, machines, productive capital. How often do our planners and welfarists, our Socialists and anti-capitalists, forget that tools and productive capital are not created by vote-catching speeches or rousing slogans: they must be produced by innumerable individuals abstaining from immediate consumption. In the past, as over most of the world today, the requisite rate of capital formation far exceeded what the ordinary man would acquiesce in (except in by-gone Britain, and today in the USA, West Germany, Holland, and Switzerland). That is why personal freedom, representative government, freedom of consumer's choice—those points which Western democrats often unthinkingly assume to be universals of the Good Life—are regarded by societies such as the USSR and China only as impediments to the rate of economic growth that they consider to be desirable.

Mr. Hutton, scoring a palpable hit, describes the converse proposition—that rapidity of material development automatically guarantees the Good Life—as the Russo-American fallacy. The question is (he says): "Do you let your society's material growth take precedence of all other considerations, at the cost of ending up with a society utterly unlike your ideal; or do you, indeed can you, forgo some of the rate of that development, in order to make a more humane transition to the more easily realisable social ideal of a more humanistic society?" At first glance, it would seem that India has answered this question by plumping for a slower rate of development and a more humane transition, but are we sure that this aim is being kept as steadily, and as consciously, in view as it should be if it is to be realised?

BRITISH FOXES AND U.S. GRAPES

Mr. Hutton says flatly that the British comfort themselves for the increasing lag in their material

standards since 1890, compared with the USA, by proclaiming that material growth does not matter if moral stature (undefined) grows, and that anyway the social and personal cost of the US standard is too high. "For British foxes, American grapes are sour", he comments. "Yet the British foxes go on demanding more grapes than they are prepared to grow themselves. And both British political parties, and their leaders, go on encouraging the foxes to believe that grapes, sweeter than those grown the American way, can somehow be provided ad lib., without either the American or the Russian cost in rewards, thrift, and organisation."

A parallel, as instructive as it is extraordinary, may be drawn between the plight of post-World War II Britain and France and the period of the Roman Empire's decline. We can equate the struggle between the Romans and the swarming hordes outside their frontiers with the struggles between the contemporary civilised Western world and the raw upthrusting USSR. The assaults of the barbarians from without on the Roman empire placed on the Roman peoples an ever-increasing burden of military expenditure and bureaucratic government, accompanied by crushing taxation of both income and capital, remorseless inflation, failure to save, declining population, failure in the supply of slaves (mobile capital or machines), constant shortages of economic and military manpower (See the British and French press every day on this problem!) ever wider expansion of the machinery of administration, impingement by officials of all kinds on the lives of the individual citizens, loss of individual responsibility, loss of belief in and hope of a future worth striving for (See "The Economic Value of Living in Hopes", published here on April 20), the failure of an old religion to command popular allegiance (Question the young men and women in our universities on their religious views), and a steadily increasing breakdown in respect for law, order, and discipline. Again and again, Roman leaders arose who strove desperately to arrest the downhill slide. But if sometimes they succeeded in securing a temporary halt, the screws of authority, of the state, of government officials, of the police, and of the collectors, were driven tighter and deeper and deeper into the lives of the individual citizen. In vain.

It is sobering to note that there is hardly a social or economic panacea being used in the West today (and often imitated in India)—from subsidised corn, meat, and housing, to capital levies, controlled prices, and frozen wages—which was not tried out in the second to fifth centuries throughout Roman Western Europe, North Africa, and the Middle East. In vain.

THE WARNING OF ANCIENT ROME

Tenney Frank's "Economic Survey of Ancient Rome" contains these words which ring ominously in the 1956 world of the Cold War and the static Welfare state:

"The ruler whose economic innovations proved ultimately most disastrous to the Empire was Septimius Severus.... The important fact is that the rights of the citizens to independence and to property had been questioned, and habits of autocracy had been incul-

cated.... The havoc wrought was not due to a communist revolution let loose against an ancient culture; it was due to the failure of efficient government at the centre of the State.... No recovery was possible except through the absolutism of Diocletian.... Typical of his regime was the imposition of a maximum limit both on the price of all wares for sale and on the amount of all wages in order to keep wages as low as possible and to check the returns from industry. The declared purpose was to curb speculation when the state inflated the currency, but Diocletian attacked the inevitable result, not the cause of inflation.... The state which he saved lived under such conditions that it is questionable whether it was worth saving. At least, when the barbarians came on, the inhabitants of the Empire were in some doubt on this point, and many of them were glad to surrender in the conviction that any new regime could hardly be worse than the one that they had endured."

"Economic growth may be particularly important to societies where political aspirations are currently in excess of resources.... in some countries, such as Great Britain, the working classes or their spokesmen are demanding ever larger wage-packets, and ever-increasing expenditure on housing, education, health and other amenities. If in such societies income per head is stable, the desires of one group can only be met at the expense of other groups.... Most countries of the world are passing through a phase where bitter strife is inevitable unless there is a rapid increase in production per head...."

So that, whether under a Socialist or under a Tory government, if the British are to get what they want, they must allow their embodied labour of the past, their productive capital, to lighten and speed their task, and they must create more productive capital. This is straight talk from a Socialist thinker on the restrictive practices so dear to the British Trades Unionist heart: the under-utilisation of existing machines, and the fear of capital.

Finally, does this Socialist Professor deplore inequality of income? Yes, but note with what qualifications:

"....Economic growth may be deplored in so far as it is dependent on inequality of income. That this dependence exists cannot be denied, since growth would be small or negative if differential awards were not available for hard work, for conscientious work, for skill, responsibility and for initiative. It is arguable in any given situation whether the existing differentials are too great or too small, in the restricted sense of being greater or less than is required to achieve the desired rate of economic growth. But it is not arguable, as the rulers of the USSR soon discovered, that significant economic growth could be achieved if there were no differentials at all."

Turning from this terrible picture of a world in twilight, we may find consolation in the unexpected fact that Professor W. Arthur Lewis, one of Britain's leading Socialist economists, rejects Marxian determinism and would not draw from the foregoing the conclusion that Britain has no choice but to slide down the Roman slope to destruction. On the contrary, he agrees with the Toynbeian view, often expressed in this column, that response can be made to challenges. Professor Lewis is at pains to refute much current British Socialist nonsense that material growth is no longer desirable—the fox's judgment on the grapes—and he insists that it is just as possible for a society to be insufficiently materialistic as it is to be too materialistic (a point which the faithful will recall, I have frequently made here because this facile vulpine fallacy finds too many supporters in India). Professor Lewis' words carry the greater weight as coming from a Leftist and one who has worked hard for the under-dogs of this world. He says in "The Theory of Economic Growth" (Allen & Unwin, 30s.):

SPAIN AND FRANCE IN NORTH AFRICA

FROM OUR SPECIAL WESTERN EUROPEAN CORRESPONDENT

[The Eastern Economist is happy to be able to announce that, from the current issue, there will appear a regular exclusive despatch from a Special Correspondent in Paris who will interpret, on the basis of special studies in various Western European countries, matters of political, economic and social interest to India. While the identity of this correspondent has not been revealed, Indian readers may be assured that he has had very recent knowledge of India where he has spent many years.—Ed.]

PARIS, April 20, 1956.

INTERNATIONAL borders fall infrequently nowadays and countries once divided have the greatest difficulty in achieving unity again. Germany, Korea and Indo-China seem to be as far from unity as ever. This alone makes the re-unification of Morocco an unusual development in our modern world. But that re-unification should be modern simultaneously with liberation from imperialist tutelage makes Morocco's good fortune altogether unique. India is familiar with the fact that independence has sometimes to be paid for by dismemberment, but the Moroccans have succeeded in repairing both their major political ills in negotiating with two European powers who were extremely jealous of each other's influence in North Africa. The speed and smoothness with which they have done this surprised everybody including themselves. It is only a few months since the Sultan of Morocco was languishing in exile, and it is only a matter of weeks since General Franco was declaring that never would he agree to restitution of Moroccan unity. Today Morocco has entered into her first Ramzan of independence while her rulers attend to the considerable political problems of national freedom. These are baffling problems but at least they attend to them as free men.

The major element in this happy transition has undoubtedly been French goodwill. The second factor has been Moroccan readiness to trust the French fully once they began to demonstrate that goodwill. One could if one wished extract from this an interesting lesson on the power of moral forces in international affairs; but let us simply look at the facts. Moroccan nationalists say today that French foolishness in 1953 advanced the nationalist cause by ten years; the exile of the Sultan was so obviously a brutal mistake that it had to be repaired some time and once the French set out to make good their error, then they were set on the course of goodwill and could not stop short of complete independence. It is to the credit of the French that they realised this fairly quickly and, once they resumed negotiation with the Moroccans, were willing to go to the end of the line. And this despite the obvious fact that concessions in Morocco made the French position in Algeria (where they are not ready to go to the end of the line) much more difficult. Indeed one could argue that French concessions in Tunis and Morocco have made it impossible for them to maintain for very much longer their old position in Algeria; but that is a story for another day.

Spain, which has exercised the "protectorate" over the northern part of Morocco, watched this surrender of French positions in southern Morocco with considerable dismay. Madrid described this turn in French policy as the outcome of democratic weakness, the product of liberal illusions ("liberal" is a term of abuse in Spain) which General Franco would never imitate. Morocco was not fit for democracy and if Spain had her way never would be, because democracy is a species of disorder that the Caudillo has devoted his life to combatting. Yet while he was thus denouncing French weakness, General Franco continued the policy he had

followed for years past, of supplying arms, shelter and encouragement to Moroccan rebels and terrorists from the French sector of the country. This contradiction may seem extraordinary and to understand it one has to grasp the fantastic ambitions Spain has nourished since the war in regard to the Arab world. By lending support to rebels against French imperialism in North Africa, Spain hoped to pose as the Arab's best friend in Europe, to buy friends in North Africa if and when the French withdrew, and meantime to curry favour in Cairo, towards which city most of Madrid's blandishments are directed. And yet at the same time, Madrid aspired to maintain absolutely untouched its own hold over northern Morocco. If this dual aim seems childishly simple, the fact is that it was cherished in Madrid. And of course today it has collapsed, leaving Spain the worst loser in North Africa—but it has not cured Franco of his ambitions in the Arab world, of which we shall hear much more in the near future.

French withdrawal from their section of Morocco made it plain that Spain would have to surrender her share of the kingdom. Franco was quick enough to accept this painful fact but what then disturbed him most was the reference to "interdependence" in the independence agreement signed in Paris between the Moroccans and the French. The French had in those agreements surrendered their position in Morocco, but the Moroccans had promised to come back later and work out a new agreement defining the special connections between themselves and the French as two equal independent powers. There is nothing sinister in this arrangement, which is really parallel to Britain granting Indian independence while India agrees to remain within the Commonwealth. But Franco saw in it, rightly I suspect, that it means that the whole of united Morocco, including the formerly Spanish part, would, although independent, be subject to some measure of French influence. For example, the two parts of Morocco now use two different currencies, the French franc and the Spanish peseta, but as economic unity is achieved, the French franc will oust Spanish commercial interests from the north. Again, the country has had two armies, run by France and Spain respectively; but a united Morocco "interdependent" with France would fall militarily wholly under French influence. And so on. It is clear that the degree of French influence in free Morocco will be far less than it was under the protectorate, but what worried Spain was that that influence, although diminished, would henceforth cover the whole country, to the detriment of the special position Spain hoped to maintain in the north.

This explains the constitutional quibbling that went on in Madrid this month when the Sultan went to negotiate liberation of the northern section of his country from Spain. The Spaniards wanted to debate the precise meanings of such necessarily vague terms as "interdependence" and "free co-operation". The Moroccans fully justified the trust the French had in turn placed in them when it was agreed in Paris that independence would be granted first and "interdependence" discussed later: they refused to go into these questions with Franco and made it clear that their free allegiance would go to Paris and not to

Madrid when their country was united. Faced with this determination, Franco had no option but to surrender.

Not that he has surrendered everything, however. He has maintained two little "Goas" in free Morocco, the towns of Cueta and Millila where many Spaniards live. How long he will be able to hang on to them is doubtful; recent trouble in the enclave of Ifni on the Atlantic coast of Morocco, which also remains a Spanish colony, suggests that, just as in India, a chain reaction of freedom has been set going which will not stop just where European statesmen want it to. More interesting perhaps is the fact that Spain's retention of these footholds in free Morocco seriously jeopardises her case against Britain about Gibraltar. Spanish declarations about the necessity of complete control of the national territory will henceforth sound rather hollow, just as India's case in Goa would look strange if Delhi

were hanging on to Aden, which once used to be part of the Presidency of Bombay.

The costliness of Madrid's surrender in Morocco should not be underestimated. Spain is not a free country and her dictator is worse placed to make concessions to democracy than are, say, the statesmen of Britain and France. The same could be said of Portugal, but Franco is in a much more serious position than Salazar, because his military strength is historically based on Morocco. His rebellion against the Spanish republic began in Morocco, the troops which carried him to victory came from Morocco and his personal military retinue is to this day composed of soldiers from that country. Franco may now be strong enough to kick away from under him the ladder by which he mounted, but dictators can never be sure of such questions. The outbreak of unrest in Spain this month comes as a curious coincidence immediately after the Caudillo has severed this link with his past.

A Letter to the Editor

"AMBAR CHARKHA"

Sir,

With reference to the comments contained in the issue of 'The Eastern Economist' dated 30th March, 1956 on the "Ambar Charkha" I should have been grateful if you had mentioned the sources on which you had relied for the fresh data on the performance of the Ambar Charkha.

During the period November 1955 to January 1956, The All-India Khadi and Village Industries Board had opened 100 Parishramalayas all over the country. Each of these Parishramalayas works with 30 to 50 Ambar Charkha sets, and provides training to men and women in the age group of 15 to 40. The majority of these trainee-spinners are new to handspinning. Even during the period of their training, their performance has been, by and large, satisfactory. Parishramalayas operating in Uttar Pradesh and Travancore-Cochin show records of performance, which exceed by a substantial margin the Board's assumptions of productivity of the Ambar Charkha at an average of 8 hanks of yarn per spinner per day (from opening of cotton to spinning of yarn). Wherever local varieties of cotton have been continuously supplied, and wherever the spinner has been allowed to work during the hours of his or her own choice i.e., during the early morning and late afternoon hours, and where, consequently, for experimental purposes different varieties of cotton had not to be used on the same machine during the course of the same day, the performance of the trainee-spinners, men and women, has averaged 6 hanks of yarn a day. There are, however, cases where productivity has been 10, 12, 14 hanks of yarn for composite spinning and 33 hanks of yarn for only spinning. The performance of Parishramalaya in each of the States thus supports the Board's claim and there has been no need for revising its earlier assumptions on which the Ambar Charkha programme is based.

The Board's Ambar Charkha programme involves a total cost of Rs. 144 crores, of which about Rs. 63 crores are loans for working capital, Rs. 12.5 crores loans for the purchase of equipment. In other words, of the total estimated cost of the programme Rs. 75 crores are recoverable over a period of five to ten years. The net expenditure thus is around Rs. 70 crores. This indeed is a far cry from both your figures of Rs. 200 or Rs. 500 crores.

The estimates of employment presented by the Board are not based on mere arithmetical calculations, but are founded on verified experience. Of particular importance is the fact that the Ambar Charkha set in

most areas where it is now functioning is utilized on an average for a period of ten to twelve hours by the trainee-spinner and the members of his or her family. The Board does not, however, claim to provide employment for any more than 2 persons per Ambar Charkha set. You may appreciate that it matters very little whether a person devotes a day exclusively to spinning or exclusively to opening and preparing of slivers of cotton so long as the combined productivity of the two per given period does not fall short of the assumptions of the Board's Ambar Charkha programme. The data available about the trainee-spinners, and not expert spinners, during the first fortnight of their training confirm rather than question the productivity assumptions. The Board has no knowledge of the tests which are supposed to have definitely proved a lower rate of productivity.

Yours sincerely,
C. K. NARAYANSWAMI

AGRICULTURE

New Variety of Barley: British crop scientists have produced a new hybrid variety of barley which, in trials over a period of years, has consistently given yields about 25 per cent higher than either of its parents and, at the same time, grows well on light soils and withstands drought conditions. It is attracting the interest of farmers in countries like India, Pakistan and Australia. The new variety of barley is called "Proctor", and is a cross between the British "Plumage Archer" and the Danish "Kenya" types. Produced largely through the efforts of Dr. G. D. H. Bell, of the Cambridge Plant Breeding Station, the "Proctor" has inherited the stiff, short straw characteristic of the Danish "Kenya" and the malting qualities of the British "Plumage Archer". It is completely different from any other barley grown on a commercial scale.

Census of Land Holdings: Census of land holdings has so far been completed in 19 States. They are Andhra, Bihar, Bombay, Madhya Pradesh, Madras, Punjab, Hyderabad, Madhya Bharat, Mysore, Pepsu, Rajasthan, Saurashtra, Ajmer, Bhopal, Coorg, Delhi, Himachal Pradesh, Kutch and Vindhya Pradesh. No census was proposed to be undertaken in Assam, West Bengal, Jammu and Kashmir, Manipur and Tripura. Results are awaited from Orissa, U.P. and Travancore-Cochin. These States have been requested to complete the work as speedily as possible.

Cotton Production in British Oversea Territories: Production of cotton in British overseas territories in 1955 and the previous year averaged 1,250,000 bales compared with an average of 1,000,000 bales in the three years before that. Since the latter war years and those immediately after, when average production was around 600,000 bales, output has steadily increased. Now it more than doubles that figure for both the Sakel and American types. Over the period under review, production of Sakel types has risen from about 300,000 to 450,000 bales. These types have been mainly grown in the Sudan, but in the last two years Aden has produced 22,000 and 23,500 bales, respectively, and Aden's production is expected to increase still further. Among the territories growing American types, the crop in Uganda in 1955 was nearly 100,000 bales less than in the previous year. But there were increases of 44,000 bales in Nigeria and 18,000 in Tanganyika. The Nigerian crop was three times as large as the highest achieved before the war, while Tanganyika's production of 120,000 bales exceeded the pre-war record by 50,000 bales.

INDUSTRY

Output of Coal in India During February 1956: The output of coal in collieries in India increased from 3,206,558 tons in January, 1956, to 3,357,546 tons in February, 1956, according to official statistics released by the Chief Inspector of Mines in India. Despatches of coal amounted to 2,697,020 tons in February, 1956, as against 2,794,074 tons in the preceding month. Coal stocks at pitheads amounted to 3,812,570 tons at the close of the month. Nine coke plants at collieries and elsewhere produced 535,204 tons of hard, soft and other kinds of coke during the month and despatched 170,602 tons.

Production of Fertilisers, Penicillin and Telephone Cables: Production targets under the first Five-Year Plan have been exceeded by the State-owned Fertiliser Factory at Sindri, the Penicillin Factory at Pimpri and

the Telephone Cable Factory at Rupnarayanpur, under the Ministry of Production. The Sindri Fertiliser Factory produced 326,073 tons of ammonium sulphate in 1955-56 against the annual production target of 320,000 tons fixed under the first Five-Year Plan. The Penicillin factory which started trial production in March 1955 and regular production in August last, had a total production of 6.4 million mega units at the end of the Plan period. This was appreciably higher than the target of 4.8 million mega units fixed under the first Plan. The Telephone Cable Factory at Rupnarayanpur in West Bengal produced 525 miles of cables during 1955-56 against the Plan target of 510 miles of cables per year. The production of 1955-56 was considerably higher than the planned capacity of 469 miles of cables per year.

Power Generation in India: Power generation in India in 1954 rose by 2,415 million kwh. over that of 1950, the total output being 7,522 million kwh., according to the booklet "Electricity Supply—All-India Statistics, 1954". The booklet, published by the Central Water and Power Commission, Union Ministry of Irrigation and Power, says that the number of consumers increased to 2,164,782 in 1954 compared to 1,500,737 in 1950. The figure for consumers for irrigation purposes rose to 36,012 in 1954 from 19,316 in 1950. The number of towns, with a population under 5,000, electrified was 3,786 in 1954 as against 2,792 in 1950 and with a population of about 5,000 was 1,765 as against 895. Nationalisation of electricity supply undertakings was continued during the year. Eleven privately-managed undertakings were acquired by the various State Governments.

Development of Steel Re-rolling Industry: It is reported the Government of India would like arrangements to be made from now onwards for developing the Steel Re-rolling Industry in the light of the growing demand for its products and the expected increase in the availability of raw materials (scrap and billets) during the next 5-year period. Government is making a comprehensive study of the raw material position. The indications are that supplies of billets in reasonable quantity are likely to be available towards the latter half of 1959.

Capital Plant for Indian Steelworks: The £7,000,000 contract for a rolling mill and railway wheel and axle plant for the new steelworks follows the announcement of an agreement between the Government of India and the Indian Steelworks Construction Company (ISCON), which is a consortium formed specially by a number of British firms (including Davy-United) to undertake the whole construction of the new plant at Durgapur at a total cost of £80,000,000. The £7,000,000 order represents the biggest single enterprise ever undertaken by Davy-United. It includes a 42-inch blooming mill, a 32-inch intermediate mill, a 24-inch medium section mill, and continuous billet and merchant mills, together with a 6,000-ton wheel forging press, a 2,000-ton dishing press, wheel and type roughing and finishing mills, and a host of auxiliary equipment.

TRADE

Pakistan's Trade Balance: Pakistan's exports on private account, during February 1956 exceeded imports by more than Rs. 110 million according to official figures released recently. Exports of raw jute alone during February, 1956, registered an increase of 50 per cent in value and 45 per cent in quantity over that during the previous month. Other items of exports which showed an increase of exports over those during

January, 1956, were jute manufactures, hides and skins and oilcakes. The slight increase in total imports during 1956 has been due to increased imports of machinery, metals and ores and art silk yarn, and also the imports of wheat.

*

Steel and Cement Imports from Poland: In pursuance of the Trade Agreement concluded between the Polish People's Republic and India recently, the Polish State Enterprise "Cengrozap", Stalinograd, will sell to the Iron and Steel Controller, Government of India, Calcutta or any other authority nominated by the Government of India in this behalf 50,000 tons of iron and steel products between April 1, 1956 and December 31, 1956. Efforts will also be made for the sale and purchase of an additional quantity of 50,000 tons of steel products before December 31, 1956. A quantity of 100,000 tons of iron and steel products has been agreed to be sold in each of the calendar years 1957 and 1958. The terms and conditions of the sale will be settled in due course. The "MIMEX" a Polish State Enterprise, have also agreed to sell cement to the projected State Trading Corporation of India. The "MIMEX" will supply 100,000 tons of cement between August 1, 1956 and March 31, 1957. India will sell through the State Trading Corporation to Poland 100,000 tons of iron ore during September 1, 1956 and March 31, 1957. A quantity of 100,000 tons of iron ore has been agreed to be sold in each of the calendar years 1957 and 1958.

*

Import of Cotton: The Government of India have decided to permit import, with immediate effect, of cottons stapling 7/8" to 1-1/16" up to a ceiling of 40,000 bales from both dollar and non-dollar areas. Licences will be issued in favour of mills and importers on the basis of 'first-come-first-served' and will be valid up to June 30, 1956. The nature of evidence required will be the same as in the past and will be detailed in a trade notice to be issued by the Joint Chief Controller of Imports and Exports.

FINANCE

Customs and Excise Revenue Collected in the Indian Union: According to the returns received in the Department of Commercial Intelligence and Statistics, the total gross Sea and Land Customs revenue collected in the Indian Union during February, 1956, amounted to Rs. 1471 lakhs, as compared with Rs. 1720 lakhs in the corresponding month of the previous year. Of the total Customs Revenue collections, import duties accounted for Rs. 1194 lakhs as against Rs. 1276 lakhs; export duties for Rs. 263 lakhs as against Rs. 423 lakhs, and land customs and miscellaneous for Rs. 14 lakhs as against Rs. 21 lakhs. The total gross collection of Union Excise Duties amounted to Rs. 1413 lakhs, as compared with Rs. 960 lakhs. During the eleven months, April 1955, to February, 1956, the grand total of gross customs and Union excise revenue realised was Rs. 28906 lakhs, as compared with Rs. 25382 lakh during the corresponding period of the preceding year. Of this amount, import duties accounted for Rs. 11643 lakhs as against Rs. 13136 lakhs; export duties for Rs. 3385 lakhs as against 3706 lakhs; land customs and miscellaneous for Rs. 188 lakhs as against Rs. 270 lakhs; and Union excise duties for Rs. 13690 lakhs, as against Rs. 9470 lakhs.

*

Peru's Credit Agreement: At the request of the Government of Peru, the International Monetary Fund has extended for one year a stand-by credit agreement that enables Peru to draw up to \$12,500,000 from the Fund. The arrangement between the Fund and Peru was initiated on February 17, 1954 and was extended for one year from February 17, 1955.

Grants for Project Centres: Grants totalling Rs. 8,96,000 have so far been sanctioned by the Central Social Welfare Board to 250 Project Implementing Committees in 10 States for the construction of buildings for Project centres. These grants are made at the rate of Rs. 2,500 per Project centre on the understanding that the Project Implementing Committee secures the donation of a piece of land from the people of the Centre villages for the building. A larger grant, up to a maximum of Rs. 5,000 in each case, will be sanctioned by the Board in cases where the villagers make an additional contribution towards the building centre in the shape of cash, labour or kind. The number of centres to which grants have been made in the 10 States is as follows: Madras 19, Orissa 44, Bombay 75, Travancore-Cochin 5, Coorg 5, Bhopal 25, Madhya Pradesh 26, Delhi 11, Vindhya Pradesh 20 and Punjab 29.

*

Financial Aid to Small Industries: During the second Five-Year Plan, the Centre hoped to give about Rs. 20 crores to the State Governments for providing financial assistance to small industries, to supplement the resources of the State Governments co-operative banks and other such institutions in their scheme of direct financial assistance to small units. It is reported Government have given equal prominence to technical assistance to small units in the programme of development in the second Plan. Regional Institutes for industrial extension service to small industries have been set up at Bombay, Calcutta, Delhi and Madras. During the second Plan it was proposed to establish one Institute for each State and several Branch Institutes.

*

Subsidised Industrial Housing Grants: The Government of India sanctioned during February, 1956, Rs. 16,43,060 as loans and subsidies for the construction of 460 tenements under the Subsidised Industrial Housing Scheme. The Government of Bombay will get Rs. 67,500 as loan and an equal amount as subsidy for the construction of 50 single-room tenements at Khatodra (Surat). For the putting up of 64 double-room tenements at Shibpur, the Government of West Bengal will be given Rs. 3,79,520 divided equally as loan and subsidy. The Government of Punjab will receive Rs. 11,28,540, half as loan and the rest as subsidy, for the construction of 100 single-room and 246 double-room tenements in the State. One hundred tenements will be put up at Amritsar, 60 at Dhariwal, 60 at Ambala and 126 at Bhiwani.

GENERAL

Employment Situation During February 1956: The total number of unemployed in India registered at the Employment Exchanges during February 1956, was 7,24,448. The figure represented an increase of more than 7,000 over the figure for the previous month. The number of vacancies notified by the private sector during the period was 7,652—largest since May, 1953. Of the vacancies notified by the Public Sector, 18,354 were by the Central and State Government Departments. The placements effected during the period were 15,465 as against 14,753 during January, 1956.

*

Manufacture of X-Ray Equipment: The Government of India have had under active consideration the development of manufacture of X-Ray Equipment in the country and a Panel was recently constituted to advise Government on this question. The Panel has decided that schemes for the manufacture of X-Ray equipment in the country should be invited from firms interested in the manufacture of X-Ray equipment. Proposals from interested firms for the manufacture of X-Ray equipment are, therefore, invited giving full details of the programme of manufacture together with terms of foreign collaboration, if any.

April 27, 1956.

NEWS IN BRIEF

INDIAN

The Lighthouse Department of the Union Government completed work on 25 new light houses at an estimated cost of Rs. 22 lakhs during 1955-56. Improvements to eight more light houses were made at a cost of about Rs. 2 lakhs.

*

Freight and passage earnings of Indian Shipping Companies engaged in overseas trade increased to Rs. 10.47 crores in 1954-55 from Rs. 8.59 crores in 1953-54.

*

India has placed orders abroad for 60 drills required for the coal production projects. These will be purchased from the Soviet Union, Sweden, the United States and the United Kingdom.

*

About 3,756 tube wells are expected to be sunk in 14 States at a cost of about Rs. 24 crores during the second Five-Year Plan period.

*

NEFA has at present six Community Development Blocks covering 206 villages with a total population of 61,432.

*

The Government of India propose to give about Rs. 20 crores to State Governments for providing financial assistance to small industries during the second Plan period.

*

Forty thousand teachers will be trained in the Rural Development Programme during the second Five-Year Plan so as to enable them to relate the education of the children to the changing conditions in the country.

*

The Central Soil Conservation Board has recommended the setting up of a Directorate of Soil Conservation. About Rs. 1,30,300 so far have been sanctioned to the State Governments by way of grants for the schemes of training in Soil Conservation during 1955-56.

*

The Ropes and Cordages Sectional Committee of the Indian Standards Institution which met in Calcutta recently in Joint session with the Ropes and Cordages Sub-Committee, finalised the draft Indian specification for hawser laid Manila rope, Shroudi laid Manila rope and cable laid Manila rope.

*

A sum of Rs. 75 crores is likely to be allotted for rural electrification schemes in the second Five-Year Plan. The schemes when included in the Plan, will be technically scrutinised and the State Governments will be asked to execute them.

*

The Government of India propose to set up 125 Vigyan Mandirs (Rural Scientific Centres) throughout the country during the second Five-Year Plan period.

*

Two hundred and fifty-nine committees set up by the Central Social Welfare Board for implementing projects have so far received Rs. 8,96,000 from the Board for constructing buildings for project centres.

*

A sum of over Rs. 24 crores is proposed to be spent for the development of India's forest wealth under the second Plan.

*

India produced over 14,000 tons of fruit products and preserves valued at about Rs. 1.58 crores during 1953.

FOREIGN

The Third International Congress on Food Distribution will be held in Rome from June 18 to 22, 1956. This Congress has been convened by the International Association for Food Distribution with headquarters in Paris, and organized by the Italian General Federation of Trade and the Technical Centre of Commercial Productivity.

*

Automobile production in Italy has attained a new record in 1955 according to data released by the National Association of Automobile Manufacturers. Altogether 268,756 vehicles were turned out (24 per cent more than in 1954), consisting of 230,833 motor-cars, 12,193 vans, 22,878 trucks and 2,852 buses.

*

A new atomic power station based on sodium graphite is now being designed by the British Atomic Energy Authority at Risley, Lancashire, and is one of several types being considered for future use.

*

The Board of Trade in Britain has confirmed that licenses have been granted by the British Government for the export of a limited number of agricultural tractors to China.

*

The pit-head price of German blast furnace coke of over 80 mm. size has been raised by Dm. 5.60 (9s 4d.) per ton to Dm. 70.60.

*

Savings banks in Australia have increased their interest rate on deposits by one-quarter per cent to the new maximum of 2½ per cent. The new rate will be payable on deposits of up to £1,000 in place of the previous £500.

*

The US Air Force has announced that it would build an atomic reactor in Ohio, to test parts and instruments for an atom-powered aircraft.

*

The world oil industry expects to expand its production by 70 per cent during the next decade to 1,200 million tons annually.

*

A world Congress of port and waterway delegates—to be attended by about 800 representatives of 50 countries—will be held in London in July next year. It will be the 19th Congress of the Permanent International Association of Navigation Congress and the first to be held in Britain since 1923.

*

The Australian Government is to increase its subsidy on the cost of merchant ships built in Australia for coastal trade from the present level of 25 per cent to 33-1/3 per cent.

*

The Suez Canal Company has subscribed £1 million in foreign currencies to the Egyptian Government's £E20 million long-term National Production Loan, which will be used for major development projects.

*

It is reported an institute for nuclear research is now being built in Crackow, Poland.

*

Nineteen fifty-five was a record export year for the British glass industry. Glass and glassware worth £19,800,000 was sent abroad—an increase of £5,900,000 over 1954.

DETERRENTS TO DEVELOPMENT

By
CROESUS

AS was only to be expected, the question of the curb on production by the factory consumer goods industries formed the main theme of the address of Mr G. D. Somani, M.P., the retiring Chairman of the Millowners' Association, Bombay, at the annual meeting last Tuesday (April 24). There was nothing new in what Mr. Somani said on this subject on the occasion. But the persistence with which spokesmen of mill interests like Mr. Somani have been urging a reconsideration of the Planning Commission's decision on this subject, especially in so far as it relates to the cotton mill industry, must convince anybody that it is not merely self-interest that prompts them, but that there is something more than that, namely, the interest of the country at large. In the interest of the country, it is significant that Mr. Somani approves of the high priority to the development of basic industries that has been assigned in the second Plan. He even approvingly quoted in this context what the Soviet planners said about their plans: "We shall continue in every way to develop heavy industry... We must always remember that the heavy industry is the foundation of foundations". But, while endorsing this view which some at least do not feel like endorsing in the peculiar circumstances of this country today—the retiring chief of the BMA reiterated his plea that efforts should also be made to increase consumer goods commensurately with the demand therefor which the additional flow of money in heavy industries generates. He was even convinced of the awareness of the Planners to the need to keep such a balance in the economy and complimented them on their efforts to augment supplies of consumer goods by the maximum utilisation of capacity in existing industries and by the harnessing of capital-light and small-scale industries for the development of additional production. Whoever questions the wisdom of this decision? It is only the feasibility aspect of the question that has been causing all the controversy. It cannot be said that, even in official circles, there is complete unanimity on the point that the additional production needs under the second Plan should wholly, or even mainly, be entrusted to the small-scale industries. Outside Government circles, there is an increasingly large section of public which has begun to look askance at the temerity with which the Planning Commission and some enthusiasts of small-scale industries are, in what they consider to be a service to the small-scale industry, almost leading the country to a dangerous precipice.

The Karve Committee, which was set up by the Planning Commission to prepare a scheme, industry-wise, for the utilisation of resources to be earmarked for purposes of these industries as an integral part of the second Plan, recommended that production by mills and powerlooms should be limited to the level already reached, namely, 5,000 million yards and 200 million yards, respectively, and that of the increased demand during the Plan period, that is, something like 3,200 million yards, should be met by expansion of handloom production. This committee further suggested the employment of the Ambar Charkha to provide the additional requirement of yarn for the purpose. It is not necessary to highlight here, after having said that, even in official circles, there has been no unanimous opinion on this subject, that two members of even the Karve Committee have held the view that it is unlikely

that the handloom sector would be able to produce by 1960-61 more than a total of 2,500 million yards, or 1,000 million yards over and above its present production, meaning thereby that the deficit would have to be made up only by suitable expansion of mill production and production by powerlooms. These dissenting members, it is noteworthy, recommended that maximum facilities should be afforded to powerlooms to increase their production cent per cent and only thereafter allow the balance, that is, about 500 million yards, to be allotted to the mill industry. In other words, they endorsed the Kanungo Committee's recommendation of a target of 5,500 million yards (inclusive of 500 million yards, exclusively meant for export, in addition to the normal exports for the cotton mill industry). Probably because of this controversy, the draft outline of the second Five-Year Plan has conveniently omitted to make a mention of the targets for the various sectors of the industry. Or, presumably, it indicates that the Government has still an open mind on the question. It is just as well, therefore, that Mr. Somani availed himself of the occasion to put forward his views once again on the subject.

The points that the retiring BMA chief made were, (i) that whatever the target of production, it is doubtful whether the handloom industry will be able to produce anything beyond 2,000 million yards per annum, except at enormous cost to the consumer in the shape of taxes and levies on the mill industry to subsidise the handloom and the Ambar Charkha cloth; (ii) that unless the consumer goods industries are galvanised to generate more goods in time, the result would be either inflation or non-fulfilment of the investment planned, as the planners themselves have apprehended in view of the inflationary impact due to deficit financing of the last two years of the first Plan and the still larger dose of deficit financing contemplated in the first year of the second Plan, (iii) that the planners should take a realistic view of the situation and provide for augmentation of the mill industry's productive equipment commensurately and in time, lest our consumption standards which are already low are further diluted, and (iv) that the millowners are not averse to handloom interests but are only anxious that the latter should stabilise themselves on the lines suggested by the Kanungo Committee.

As far as it occurs to any reasonable person, I feel there should be no difficulty in accepting the suggestion of the Kanungo Committee that the handloom interests should endeavour to convert their present handlooms into improved types of handlooms to begin with and then to switch over to powerlooms eventually. But there would appear to be as strong an objection to the encroachment of powerlooms as that of the mill industry in handloom circles. This is at once short-sighted and almost makes nonsense of the enormous efforts that are being made to develop the power potential of the country and to bring electric power within the reach of even the humblest home in the village. It would be a red letter day in the annals of this country when this happens, and it is not difficult to visualise the great day, what with all the multi-purpose river valley projects and the thermal projects that are in progress today, in the not distant future. With this

prospect, one would have thought that the natural reaction would be for people to take the maximum advantage of the available electric energy, which means the employment of more powerlooms, in so far as the cottage and small-scale sector of the cotton textile industry is concerned. Unfortunately, those who speak for the handloom industry suffer from more inhibitions than the handloom weavers themselves and are trying to perpetuate, of course with the best of intentions, an order of things which would be neither helpful to the handloom weaver nor to the country.

One of the important considerations that must have weighed with the Planning Commission and the Government in selecting cottage and small-scale industries to play their role in adding to the production of consumer goods in the Plan period is that these are more labour-intensive and less capital-intensive. As Mr. Somani said, this is the prime consideration which has prompted the Government to buttress the cause of the Ambar Charkha and the handloom weaver. He was therefore quick to retort—and, in doing this, he has only followed the Union Finance Minister—"The contemplated expenditure of Rs. 100 crores on the Ambar Charkha and Rs. 80 crores on the handloom by way of subsidies or otherwise can, by no stretch of imagination, be termed 'capital-light' but, on the other hand, it may ultimately turn out to be a colossal waste, for very powerful reasons." The Government, in their enthusiasm for creating more employment, are only attempting to prop up inefficient and outmoded methods of production. The Ambar Charkha and the handloom will not be able to achieve the targets assigned to them, while the productively efficient mill-sector is prevented by artificial curbs from expanding its production to meet the increased demand during the Plan period. Such a policy will only lead to the opening of Pandora's box and, if the present market trends are any guide, the possibility of emergence of a cloth famine in the country in the near future cannot be ruled out, as the available production will be grossly inadequate to meet the greatly increased demand, on the one hand, and incomes during the Second Plan period increasing appreciably, on the other. It does not require a prophet to predict that the result in such an event would be inflation. It should not be forgotten that 70 per cent of the consumption expenditure of an average Indian is taken up by his food and clothing, and that should indicate the extent of suffering that the planners would be directly responsible in bringing about if they were to persist in sticking to the targets urged by the Karve Committee.

I do not know if the appeal to the business community with which Mr. Somani concluded his address (that, in spite of many handicaps and difficulties with which they are faced, they should continue to offer their constructive cooperation in the herculean task of building a new India) provoked Mr. J. C. Burns, the incoming Chairman of the Association, to make this comment on the Second Plan—(here, I must digress to convey my warm felicitations to Mr. Burns, through this column, on his being elected as the Chairman of the BMA, for he is the first European to be so honoured after independence, and that is saying a great deal not only about the intensely cosmopolitan spirit of Bombay but also about the capabilities and qualities of Mr Burns as a spokesman of the textile industry): "One hears and reads a great deal now-a-days of the private sector being exhorted to play its part in the second Plan. The private sector played its part very fully in the first Plan—if it erred at all it was in overplaying its part and I personally am unaware of any reluctance on the side of the private sector to play its part equally in the second Plan. The need of the moment, in my view, is for the private sector to be told just exactly what part it is expected to play in the second Plan and

exactly what will be the conditions under which it must play that part. Its role must be clearly defined and, having been given the part, it must surely be given freedom to play it".

Be that as it may, I entirely agree with Mr. Burns in having raised this point and further in the plea that he made that, when re-writing the statement of industrial policy of 1943, the Government should be as categorical as possible so that all concerned may know just exactly where they stand. As he said, once stated, the policy should remain undisturbed at least until it is found necessary to state it again, and, in the meanwhile, responsible spokesmen should be discouraged—I would say, forbidden—from drawing their own inferences and giving their own interpretations of it, thereby merely raising doubts as to whether the policy remains unaltered or is about to be changed.

As Mr. Burns rightly said, uncertainty is the greatest possible deterrent to development. The latest instance of how development could be, or has been, impeded by an impending statement of industrial policy is perhaps to be found in the postponement of oil prospecting talks between representatives of the Government of India and the Assam Oil Company for the formation of a company to be in charge of oil prospecting in the Assam valley. Although the explanation given in press reports is that the postponement is to enable both parties to have more time to consider various aspects of earlier proposals, I have my own reasons to believe that the talks have been postponed pending the new Statement on Industrial Policy.

There is another problem to which Mr. Burns made a reference in his speech, and it is sufficiently important because it comes from the President of BMA and a spokesman of the Indian cotton mill industry, an industry which still maintains a high place in regard to earnings of industrial workers in the country. Mr. Burns was alluding to experiments that are being urged to be carried out in select industrial establishments in the matter of constituting Councils of Managements of representatives of workers, technicians, and employers. Although employers have accepted this in principle, it was Mr. Burns' view that they should rather hasten slowly in the introduction of such a step. The reason for his cautioning thus is that, if such an experiment should succeed it would have to be approached in the right spirit. As he remarked, "it should not be overlooked that management is a science; it is just as much a skilled job as that of any skilled worker. The knowledge and the experience needed for good management are not lightly acquired; they are the result of years of labour, and it is not everybody that has the necessary aptitude." The danger inherent in a step such as this is that a measure honestly intended to make for harmony, may have the very reverse effect of it and merely lead to bickerings and misunderstandings through lack of knowledge and inexperience.

This, however, should not be mistaken to be a half-hearted support on the part of Mr. Burns to a highly laudable measure of reform as some believe. For his genuine interest in good industrial relations cannot be questioned by anybody, especially after the prominent part that he played in bringing about an agreement between the Association and the representative union (of mill workers in Bombay) regarding payment of bonus for the five years, 1953-57. This agreement illustrates, as he highly observed, what can be done if both employers and the representative unions approach a problem with the intention of finding a solution, and it is to be hoped that this would be a forerunner of good relations and the adoption generally of other similar means of settlement in the future. In this connection, Mr. Burns also broached the question of

setting up a joint negotiating machinery for settling differences of labour matters, about which a reference had been made by Sir Vithal Chandavarkar at last year's annual meeting of the BMA. Regretting that no progress had been made in implementing this laudable intention, Mr. Burns explained that the delay was not due to any unwillingness or hesitation on the part of millowners but due to the fact that the representative union declined to consider any other question pending a settlement of the bonus question. Now that the bonus agreement has been signed, it may be expected that the agreement on joint negotiating machinery will soon be a 'fait accompli'. Perhaps this and an agreement with the representative union regarding extension of the four-loom-to-the-weaver system to more units in the industry remain to become the achievements of Mr. Burns during his chairmanship.

Finally, there is a topical propriety in the reference that Mr. Burns made to the consumers' retail price index number (the old working class cost of living index number). This is of paramount importance to textile interests in Bombay, because it is this index number which determines the extent of dearness allowance payable to textile workers. Mr. Burns referred to the strange tendency of the Bombay city index relative to the strange tendency of the Bombay city index remaining impervious to change until the end of 1954 when there was a steep decline in most index numbers throughout the country, not excluding Bombay State. Although slow in registering a decline thus in the past its sensitiveness cannot be impeached, it seems, judging from the pronounced tendency to rise that it has shown during the last two or three months. The reason, of

course, is the sharp rise in prices of cereals and rice, and it is the price of rice, as Mr Burns pertinently pointed out, that largely composes the food group in the consumers' weekly index. While he, therefore, demanded that effective steps be taken to prevent the rise in prices getting out of hand, he also urged a re-examination of the weights employed in compiling the consumers' retail price index. Fortunately, his plea comes just at a time when the Government of India and State Governments also are proposing to institute a fresh enquiry with a view to initiating a new series of index numbers with a common base year. Who will not endorse the new BMA Chief's remark that the index number has assumed great importance since the post-war years and, for the same reason, who will not share his view that it is in the interests of both workers and employers that the indices in the country should be uniform, besides being a true reflection of conditions as they are today and not as they used to be?

OPERATION SPECULATION

THE REACTION so far of the authorities to appreciation in prices, be it in commodity markets or shares, could only be likened to that of a bull at the sight of a red rag. At a time when the inflationary psychology is steadily seizing hold of the people, following a sizable increase in the money supply with the public that has already taken place, not to mention the heavier deficit financing that the Union Finance Minister has been hinting off and on, and the more sizable addition to the money supply in consequence, it cannot lie in the mouth of Government to point an accusing finger at the markets and to say that the spiralling up of prices is mainly due to speculation. Nor is the assumption of what amounts to almost dictatorial powers by Government to check speculation an answer to the problem, but this is exactly what has been in increasing evidence of late. And, as is only to be expected, in nearly all cases, such has definitely proved to be to the detriment of the concerned trade, without, at the same time, any success to Government's efforts.

A striking illustration of Government's inefficient handling in this respect is provided by the Bombay cotton futures market. Attributing the rise in prices to gambling, the Forward Markets Commission banned futures trading in cotton as far back as on December 24, 1955. Although the Commission lifted the ban on January 7, there has been no resumption of forward trading worth the name till todate. All things considered, the blame for creating such a vacuum in cotton trading must be placed squarely on the shoulders of Government. But, then, the Forward Markets Commission, which won a legal victory, when dragged to a court of law by the trade in connection with the case to decide whether the emergency resolution declared by the East India Cotton Association was taken under coercion or not, was apparently emboldened by its success to assume more and more powers. It is a pity that the Commission failed to realise that what the Court did was only to interpret the law as it stands and not to decide where the moral justice lay. Anyway, in the event, the existence of even so accredited and long-established an organisation like the East India Cotton Association was practically ignored on one pretext or other, and increasing powers of regimentation were assumed by Government. These were being put up with patiently by the trade up to a point, but, when the limit was reached, there was naturally strong resistance which was climaxed by the resignation, the other day (April 20), of Sir Purshotamdas Thakurdas, President of the E.I.C.A. for the past 30 years. This veteran of the cotton trade for over three decades succinctly put the whole problem in a nutshell, when he stated, in his letter of resignation to the E.I.C.A.: "I do not think that, when the trade accepted Government supervision, they expected to have to more or less surrender their initiative and to content themselves merely with carrying out the wishes of the Forward Markets Commission, both in the matter of prices and in the matter of day-to-day operations". Recalling his past struggles against an alien government to secure independence and democratic control in the management of cotton trade, Sir P.T.—as he is affectionately known to the trade—added: "I have worked so long to preserve this independence through difficult times. But I cannot fight our Government, nor do I seem to be able at this juncture to carry them with me". It is a great pity that things should have reached this pass.

Recent events amply demonstrate that the Forward Markets Commission is not content to stop at being just an impartial supervising body, as it ought to be. It insists on and must needs go beyond its orb to assume

wide powers amounting to virtual displacement of associations which have been specially instituted to conduct the affairs of a trade and have been functioning for years as such. Forward trading, with its inherent scope for speculation does, at times, call for Government intervention, but the idea of Government imposing its will on the market at each and every stage is hardly conducive to the healthy development of free enterprise and private trading. It is like the old type Hindu mother-in-law ever conscious of her being a mother-in-law trying to assert her right as a mother-in-law. It should always be borne in mind that, to be effective, the fight against all gambling and unhealthy speculation in markets can only be conducted with the active co-operation of the people concerned in the trade itself. Unfortunately the Forward Markets Commission has failed to realise this. The way it is going about, it is hardly likely to succeed in winning genuine friends in the trade and influencing the markets properly.

PROGRESS OF CIVIL AVIATION

EVEN AFTER the nationalisation and complete integration of the airlines operating in the country, the departmental half-yearly reports issued by the Civil Aviation Directorate continue to follow the old routine pattern. One of the conspicuous omissions in this conventional pattern is the total absence of the results of financial working. The latest report for the half year ended December 1955 has been released three and a half months after the expiry of the period. Now that the multiplicity of the airlines operating the internal services had been ended and the Indian Airlines Corporation has emerged as the single successor to them there should be no difficulty in giving at least provisional financial statistics to show the comparative picture. This is important in view of the fact that the IAC is operating at an appreciable loss. Another flaw in this conventional pattern of reporting is to present comparative figures relating to the previous half-yearly period. This practice ignores the important element of seasonal fluctuations in air traffic which is very much influenced by the duration of the monsoon season. Progress, stability or set-back under certain heads of operation, whatever may be the case, would be fairly judged if the corresponding period of the previous year is selected for the comparison.

In the latest report, for instance, the total number of passengers carried by the IAC on its schedule services is stated to be 193,635 as against 213,353 in the first half of 1955. This is a substantial decrease. If it is read in conjunction with the statistics relating to the total number of miles flown, which show a good increase, it appears on the face of it somewhat puzzling. The simple explanation is that the decrease in passengers carried is explained by this seasonal factor. As is usual, the volume of freight and of mails carried shows an upward trend. This is as it should be because civil aviation has a reasonably good scope for development.

One of the reasons assigned for nationalisation was the necessity for discarding the Dakota aircraft on the ground of obsolescence. The report states that the process of substituting larger aircraft is under way. Three Skymasters were acquired during the period while orders for five four-engined Viscount turbo-prop aeroplanes were placed. Two new feeder services were started by engaging Heron aircraft and the frequency on one feeder route was increased from thrice per week to seven times a week. This gives reassuring proof of expanding the feeder services. Information on the economics of Heron aircraft would be interesting. Likewise, it would be interesting to know the financial benefits of substituting Skymasters for Dakotas on the

tax-payer has a legitimate reason to expect financial information in these half-yearly reports.

ANOTHER RECORD YEAR FOR DUNLOP

DURING THE calendar year 1955 the Dunlop Rubber Company (India) Limited achieved a new record in output. Throughout the year the factory worked to 100 per cent capacity. This level of output brought in its train record level of employment. The consumption of crude rubber in 1955 exceeded the previous year's volume by 10 per cent. An idea of the heights reached can be gathered from the fact that consumption in 1954 which was the earlier all-time high was itself 18 per cent above consumption in 1953. This dynamic trend has now come to stay. Stressing this outlook for the rubber manufacturing industry, Mr. Cecil Stack, Chairman of the Dunlop Rubber Company, assured the shareholders at the last annual meeting that the company was fully armed to fulfil its part in the second Five-Year Plan as the leading manufacturer in the country.

While the situation in regard to the supply of most raw materials did not create any difficulty, there was a vital exception in the case of crude rubber. As against the production of rubber in India of 22,481 tons in the last year, consumption by rubber manufacturers alone was as high as 27,643 tons. The gap of a little more than 5,000 tons had to be bridged by means of imports. Of this quantity more than half was imported by Dunlop, who had to face strains of precarious stock position which are attributed, among other factors, to the great difficulty in obtaining import licences from the Government. In terms of prices imports entailed heavier liability. It will be recalled that the controlled price of domestic rubber was raised from Rs. 138 per 100 lbs. before the first increase early in 1955 to Rs. 155-12 in September. The price of imported rubber ranged as high as Rs. 207 from the minimum of Rs. 144.

In a pithy observation made at the outset of his speech, Mr. Cecil Stack has drawn the Railway Ministry's attention to a disconcerting problem which threatens to assume grave proportion during the period of the second Plan. Distribution was held up and delayed on account of repeated shortages of railway wagons. The Chairman's warning that the anticipated acute shortages call for "the most serious attention" ought to be heeded by the Railway Ministry in good time.

REORGANISING COIR INDUSTRY

THE REPORT of the working of the Coir Board for the half-yearly period ended September, 30, 1955, which was placed before the Lok Sabha last week, indicates that the Board has got off to a good start. In this preliminary period of planning of its work it has taken quick and realistic decisions for the reorganization as well as rationalisation of the coir industry in suitable stages. This small-scale industry has an enduring market at home as well as overseas, but the overseas market needs to be consolidated and developed by the competitive strength of the products. Now that the industry is being organised on a national scale the Coir Board has made a decision to set up a coir research institute near Ernakulam. A branch of the institute associated with a model factory is to be set up at Calcutta. The outlay for these schemes in the second Plan is estimated at Rs. 13 lakhs. The Board considers it quite feasible to fix a target of increasing the production of coir yarn by 5,500 tons in the second Plan. This is expected to absorb an additional 10,000 workers.

It will be recalled that Dr. Franz Wilhem, President of the Union of European Coir Industry, was on a business tour here in India in August last year. He emphasised that coir yarn export for the European manufacturing industry should be linked with continuity of supply and reasonable levels of prices. This is evidence of the fact that additional output can find market in Europe. Nevertheless, the Board has emphasised that, while export of yarn would be welcomed on the lines proposed to strengthen the base of the developing coir industry, there ought to be a switch-over to export of coir products.

The Board has asked for wider statutory powers for the integrated development of the industry. It has pressed that the development scheme for coir in Travancore-Cochin should be placed under its administrative control, subject to the continuance of financial contributions by the Central and State Governments as at present. Similarly, it has asked for transfer of control to itself of the co-operative schemes for coir already started in other States. A vital proposal which the Board has made for marketing and passing on a reasonable share of the income of yarn to the producer is to start licensed ware-houses under its control, for which legislation has been suggested. In the first instance, the system of regulation for passing coir yarn through licensed ware-houses has been recommended in respect of yarn intended for export. All these proposals indicate that rationalised production and marketing need not present insuperable difficulties.

OUTLOOK FOR HEMP

HEMP IS steadily emerging into a position of increasing importance in the market for fibres. At last annual general meeting of the Indian Hemp Association the possible expansion of hemp in the immediate future was the main theme of the presidential address. The Chairman, Mr. B. L. Jalan, expressed optimism that the time was not far away when the supply of hemp would be unable to cope with the domestic demand as well as the demand overseas. In the search for additional fibres, hemp has come in for not a little attention. Inside the country itself there have appeared indications that the domestic rope, cordage and paper manufacturing industries have been increasing their consumption of hemp as a raw material. So far no systematic attempts have been made to increase the supply of hemp either by evolving better seeds and improved methods of cultivation or by bringing a larger acreage under this crop. Mr. Jalan is of the view that the patronage which is being extended to this fibre crop should turn the attention of the Government as well as the trade to developing hemp cultivation on an organised basis.

The relative stability of the prices of hemp in the context of fluctuations in the prices of other fibres attracted a larger demand for hemp. It is not as if speculative selling is insignificant in the hemp trade and Mr. Jalan has issued a warning to traders to keep forward trading within reasonable limits. The paper industry has expressed concern at the export of hemp rope cuttings which are feared to affect its demand adversely. The Association's Chairman is emphatic that this anxiety is not warranted by the facts of the situation. Total collections of hemp rope cuttings were about 8,000 tons per annum and out of this quantity the requirements of the paper industry were expected, on a reasonable estimate, not to exceed 45 to 50 per cent. In view of a large surplus, the Chairman fully endorsed the Government's policy of permitting free exports and urged its continuance.

new light
on your
overheads

Actually its good lighting.

Fluorescent lighting—Philips.

Cutting overhead costs, and giving you over 3 times the light on the job.

All workers, office employees and factory labour, who have had experience of this new light correctly handled, will agree that they can work a lot better over a length of time under fluorescent lamps.

Less eye-strain, fewer mistakes, quicker work, and an improved general atmosphere, these are the results of better lighting. And working tests have proved that Philips Fluorescent Lamps, used with quality control gear, have a burning life of 7500 hours, which is just about 4 years. These are a few reasons why Philips Fluorescent Lamps & Fittings are being installed in homes, offices and factories throughout the world.

PLANNED LIGHTING BY PHILIPS

revolving flat cards

are now being extensively used
in Textile Mills in India.
Their efficiency is undisputed,
their reliability guaranteed.

MACHINERY MANUFACTURERS CORPORATION LTD.

Factory: Sonai Works, Kidderpore, Calcutta 23.

Managing Agents:

MAHINDRA & MAHINDRA LIMITED

Head Office: Gateway Building, Apollo Bunder, Bombay.
Calcutta Office: Hall & Anderson Building, Park Street.

Outstanding features

- 1 Five distinct setting points, used singly or in combination to control setting to .001 inch.
- 2 Johnson bronze bearings for cylinders and doffers. Roller bearings to cylinder; ball bearings to doffer and ball bearing comb box also provided as optional equipment.
- 3 Ball bearings to lick-in pedestals.
- 4 Self-lubricating 'Olite' bearings at several locations.
- 5 William's patent stripping motion for flats.
- 6 Drop lever with new disengaging handle.
- 7 Fluted lap roller with positive gear drive from feed roll helps uniform feed of lap at the back with minimum possible stretching.
- 8 Cards can be geared for any production in a mill organization.

COMPANY AFFAIRS

BHARAT NIDHI LTD.

The Company's working in India during the year 1955 has resulted in a net surplus of Rs. 17,69,920 showing an increase of more than 50 per cent over the figure of the previous year which stood at Rs. 11,63,241. The figures are exclusive of the accounts of the Company's working in Pakistan which had not been received. The net surplus has been transferred to the general reserve as in the previous year.

The Directors have recommended payment of the following dividends, without deduction of income-tax, for the year under review from the General Reserve account: On 53,572 Preference Shares at Rs. 6 per share, absorbing Rs. 3,21,432; on 8,07,182 Fully Paid Ordinary shares at As. 10 (or 6½ per cent) per share absorbing Rs. 5,04,480 and on 26,83,262 Partly Paid ordinary shares at As. 2/6 (or 6¼ per cent) per share which absorbs Rs. 4,19,260.

At the end of the year under review, there was appreciation of the order of Rs. 70 lakhs in the Company's holdings of shares and debentures in joint stock companies, thereby strengthening the Company's position. In fact, during the last few years, the Company's working has shown progressive improvement; while investments have increased, loans have come down.

CAWNPORE SUGAR WORKS LTD.

The trading results of the Company for the year ended October 31, 1955, after providing for all charges including provisions for taxation (Rs. 6½ lakhs) and depreciation (Rs. 3 lakhs) show a surplus of Rs. 8,07,327. From this are deducted the rehabilitation reserve amounting to Rs. 4 lakhs and Rs. 80,000 for contingencies reserve, leaving a balance of Rs. 3,27,327. The carry forward from the previous year of Rs. 59,696, when added to this sum makes available a total of Rs. 3,87,023 for disposal. The Directors have recommended payment of dividends on Preference and Ordinary Shares, both free of income-tax, for the year under report at 8 per cent per annum and As. 12 per share respectively. These dividends absorb Rs. 80,000 and Rs. 2,25,000 respectively, leaving a balance of Rs. 82,023 to be carried forward.

The quantity of cane crushed by the two factories, Gauri and Marhawrah, during the year has shown considerable increase over the previous year. Marhawrah Factory crushed 32,62,453 maunds with a recovery of 10.21 per cent. The 24,14,693 maunds crushed by the Gauri Factory was its highest ever recorded and the recovery was at 10.68 per cent. However, while the efficiency in operations was satisfactory, despatches of sugar, according to the Directors, were adversely affected by inadequate railway transport facilities.

The sugar produced in the country during the year was at the record figure of 16 lakh tons, which is also the figure of consumption on a rough reckoning. With the imported 6 lakh tons of sugar during the period the prices had shown a downward trend, and with the increase in the excise duty by Rs. 1-6 per maund, the trading results of sugar companies have been affected.

As for the Company's distilleries, while the Marhawrah distillery has shown a modest profit, the Cawnpore distillery has incurred a further loss which has been attributed to the higher cost of molasses.

THE INDIA SUGARS AND REFINERIES LTD.

The Directors' report and accounts of the Company as at September 30, 1955, show that after providing Rs. 1,94,295 for bonus to employees, and Rs. 6 lakhs for reserve for taxation and contingencies, the profit for the year amounts to Rs. 5,39,538. Adding the carry forward, of the previous account, of Rs. 4,32,688 the total sum available for appropriation is Rs. 9,72,226. A 7½ per cent dividend, less tax, on the preference shares absorbs Rs. 9,218. A sum of Rs. 4,40,690 is absorbed by paying 14 per cent, income-tax-free dividend on 3,14,778 ordinary shares, which leaves a balance of Rs. 5,22,318 to be carried forward. The percentage of dividend appears reduced, but the quantum of dividend paid for the year registers an increase over the previous year's payment, representing nearly 27.5 per cent, tax-free, on the cash invested in the Company's ordinary capital.

During the year under report 27,609 tons of cane were crushed to yield an output of 13,067 tons of sugar, which is a record for the Company.

ORIENT PAPER MILLS

The report submitted by the Directors of the Company for the half-year ended September 30, 1955 indicates favourable results. After payment of the Managing Agents' remuneration of Rs. 6.86 lakhs, Directors' remuneration of Rs. 80 thousand, and after providing for depreciation a sum of Rs. 6 lakhs and for Taxation Rs. 20 lakhs, allocating Rs. 8.38 lakhs to Dividend Equalisation Fund, Rs. 7 lakhs to Development Fund and taking into account the balance of the previous half-year, there remains a surplus of Rs. 14.11 lakhs. A dividend at the rate of 5½ per cent per annum is to be paid on Preference Shares. Dividend on Ordinary Shares has been decided to be paid at the rate of As. 10 per share of Rs. 10 each. A sum of Rs. 2.3 lakhs has been carried forward.

The Mill worked satisfactorily during the period under review. Since the last report, the Lime Sludge Reburning Plant and the Coating Plant have been commissioned. Erection of a new boiler and Black Liquor Evaporation Plant are near completion. Other erection and modernization work is also progressing satisfactorily.

THE TRAVANCORE OGALÉ GLASS MFG. CO. LTD.

The working results for the year ended December 1955, show that the sale of bottles worth Rs. 7.7 lakhs (against Rs. 6 lakhs last year) was a record figure for the Company. There was, however, a net loss of Rs. 24 thousand (after payment of Rs. 44 thousand as Depreciation) against a net loss of Rs. 1 lakh last year. The Directors recommended setting off the debit balance in the Profit and Loss Account against General Reserve of Rs. 1 lakh and the Dividend Equalization Reserve of Rs. 40 thousand.

Arrangements are being made to increase current production. One of the automatic bottle-making machines has gone into regular production and a second is expected to be commissioned shortly, after which prospects are expected to improve.

COMMODITY NEWS AND NOTES

FINAL ESTIMATE OF BLACK PEPPER

According to the Directorate of Economics and Statistics Union Ministry of Food and Agriculture, the all-India final estimate of black pepper for 1955-56 puts the current year's area and production at 214,200 acres and 27,200 tons, as against the partially revised estimate of 208,300 acres and 25,800 tons for 1954-55. Thus the current year's estimate shows an increase of 5,900 acres or 2.8 per cent in area and 1,400 tons or 5.4 per cent in production over last year. The increase in area during the current year has generally occurred in all the black pepper growing States. The increase in production has occurred in all the States except Travancore-Cochin, where production has declined by 100 tons. The increase in production has been attributed partly to increase in area and partly to favourable weather conditions during the flowering and growing periods of the crop.

FINAL ESTIMATE OF BAJRA

According to the Directorate of Economics and Statistics, Union Ministry of Food and Agriculture, the all-India final estimate of bajra for 1955-56 puts the current year's area and production at 27,025,000 acres and 3,400,000 tons, as against the partially revised estimates of 27,983,000 acres and 3,421,000 tons for 1954-55. This shows a decrease of 958,000 acres or 3.4 per cent in area and 21,000 tons or 0.6 per cent in production over 1954-55. The decrease in acreage has been shared mainly by Bombay, Uttar Pradesh, Rajasthan and Kutch and to a lesser extent by Andhra, Saurashtra, Mysore and Madhya Pradesh. The decrease in acreage is generally attributed to adverse climatic conditions at the time of sowing. The decrease in acreage has been offset to some extent by increases registered in Punjab, Hyderabad, PEPSU, Ajmer and Madhya Bharat.

FINAL ESTIMATE OF MESTA

According to the Directorate of Economics and Statistics, Union Ministry of Food and Agriculture, the all-India final estimate of mesta for 1955-56 puts the current year's area and production at 618,000 acres and 1,201,000 bales (of 400 lbs. each), as against the partially revised estimates of 528,000 acres and 1,018,000 bales respectively for 1954-55. This shows an increase of 90,000 acres or 17.0 per cent in area and 183,000 bales or 18 per cent in production over last year.

FINAL ESTIMATE OF RAGI

According to the Directorate of Economics and Statistics, Union Ministry of Food and Agriculture, the all-India final estimate of ragi for 1955-56 puts the current year's area and production of crop at 5,627,000 acres and 1,844,000 tons, as against the partially revised estimate of 5,711,000 acres and 1,846,000 tons respectively for 1954-55. This shows a decrease of 84,000 acres or 1.5 per cent in area and an increase of 198,000 tons or 12.0 per cent in production as compared to last year. The decrease in acreage under ragi during the current year has been shared mainly by Mysore, Bihar, Andhra and Madras and is due generally to unfavourable weather at the time of sowing. Bombay has recorded a slight increase in area during the current year. Despite a decrease in area the production of the crop has increased substantially during the current year. The increase in production is shared mainly by Mysore and is ascribed to favourable climatic conditions during the growing period.

ALL-INDIA FINAL ESTIMATE OF RICE FOR 1955-56

According to the Directorate of Economic and Statistics, Union Ministry of Food and Agriculture, the

all-India final estimate of rice for 1955-56 puts the current year's area and production of the crop at 76,253,000 acres and 25,474,000 tons, as against the partially revised estimate of 75,949,000 acres and 24,531,000 tons respectively for 1954-55. This shows an increase of 304,000 acres or 0.4 per cent in area and 943,000 tons or 3.8 per cent in production during the current year. The increase in acreage under the crop during the current year has been shared mainly by West Bengal, Bihar and Hyderabad and is due to favourable weather conditions at the time of sowing. This increase in area has, however, been offset to a considerable extent by the decreases reported by Uttar Pradesh, Orissa, Saurashtra and Andhra due generally to the prevalence of unfavourable weather at the time of sowing. The increase in production has been shared mainly by Madhya Pradesh, West Bengal, Uttar Pradesh, Bihar, Mysore and Vindhya Pradesh and is mostly due to the comparatively better climatic conditions during the growing period in the current year.

FOURTH ESTIMATE OF COTTON

According to the Directorate of Economics and Statistics Union Ministry of Food and Agriculture, the all-India fourth estimate of cotton for 1955-56 puts the current year's acreage and production at 19,525,000 acres and 3,705,000 bales (of 392 lbs. of cotton lint), as against the adjusted fourth estimate of 17,505,000 acres and 4,072,000 bales respectively for 1954-55. Both the area and production of cotton at the fourth estimate stage registered record figures during 1954-55. As against the adjusted fourth estimate of 17,505,000 acres and 4,072,000 bales respectively for 1954-55. Both the area and production of cotton at the fourth estimate stage registered record figures during 1954-55. As against these, the current year's figures show further increase of 2,019,000 acres or 11.5 per cent in area but a decrease of 367,000 bales or 9.0 per cent in production. The production of cottonseed is estimated at 1,297,000 tons during 1955-56, as against the corresponding adjusted estimate of 1,425,000 tons, thereby showing a decline of 128,000 tons or 9.0 per cent.

FALL IN NORTHERN INDIA TEA EXPORTS

Exports of Northern India tea declined further to 323,270,000 lb. during the year ended March 1955 from 369,690,000 lb. in the previous year and 388,720,000 lb. during 1953-54. The decline in exports was due to poor demand and restrictions on direct tea shipments for London auction, as production in the year under review was about 20,000,000 lb. higher at 533,200,000 lb. The fall in exports was general and with the exception of a few countries shipments to all destinations recorded a decline. Out of a total fall of 46,420,000 lb., the UK alone accounted for 32,710,000 lb., with shipments declining from 261,780,000 lb. in 1954-55 to 299,070,000 lb. during the year under review. Shipments to Australia declined sharply from 7,060,000 lb. to 2,200,000 lb. and those to the Irish Republic from 22,790,000 lb. to 19,080,000 lb. during the year under review. Exports to Red Sea ports, Iran and the Persian Gulf were lower at 3,950,000 lb. 1,690,000 lb. and 1,170,000 lb. respectively. In the dollar area, USA, offtake fell from 22,500,000 lb. to 18,260,000 lb. during the year under review, while the Canadian offtake dropped from 14,050,000 lb. to 10,930,000 lb. Exports to Egypt and Turkey, however, improved to 11,480,000 lb. and 5,320,000 lb. during the year under review from 8,440,000 lb. and 2,000,000 lb. respectively. Shipments to Hamburg and Bremen at 4,550,000 lb. and to New Zealand at 1,010,000 lb. were also a shade better.

Company Meeting

THE DUNLOP RUBBER CO. (INDIA) LTD.

Mr. Cecil Stack's Review

The 30th Annual General Meeting of The Dunlop Rubber Co. (India) Ltd. was held on the 25th April, 1956, in Calcutta. Mr. Cecil Stack, Managing Director, said:

Gentlemen,

The Directors' Report and Accounts for the year 1955 have been in your hands for some time and with your permission I will take them as read.

THE YEAR'S TRADING

From the point of view of volume of sales the year under review may be considered very satisfactory. Progress was achieved in all products and the factory worked to full capacity throughout the year, thus maintaining the highest possible level of employment. In my speech last year I advised you that our consumption of crude rubber in 1954 was the highest recorded, being 18 per cent above 1953. Another record was created in 1955, rubber usings being nearly 10 per cent higher than in the previous year. Nevertheless we had difficulty in meeting the demand for our products which is indicative of the continued expansion of India's economy and the growing importance of our own particular industry. As I suggested on this occasion last year, the level of output and employment will require to be expanded considerably if the demand for rubber products under India's second Five-Year Plan is to be met, and we as a company hope to play our full part.

Distribution of the Company's products was again adversely affected by unsatisfactory transport conditions and shortage of railway wagons. The indications are that this problem will become more acute in years to come and in my opinion it calls for the most serious attention by the Government of India.

Total sales in value were 10 per cent higher than in 1954 but as the result of selling price reductions the net profit at Rs. 96,72,154 was approximately the same as for the previous year and the ratio to turnover declined from 7 per cent to 6.4 per cent before taxation. The price reductions on this occasion arose out of Government's implementation of the Tariff Commission's recommendations regarding tyre prices. I do not propose to comment on the Commission's report other than to say we do not necessarily agree with some of the findings but this has not in any way affected our relations with the Government which I am pleased to say remain satisfactory.

PRODUCTS

In the Rubber Industry in recent years the most intensified research has been undertaken in relation to new varieties of raw materials and new methods of manufacture. Development work continues on a vast scale and no manufacturer can afford to stand still. In this respect we are fortunate in having available the benefits of Dunlop research activities not only in Great

Britain but in many other countries, notably Canada, United States of America, Germany, France and Malaya. Our technical staff are in constant liaison with the world-wide Dunlop Group research organisation, which ensures that the most modern production methods, equipment and materials are available to us.

The Dunlop Trakmaster Giant tyre, which is specially designed for rough roads and cross country routes, has proved most popular and it is hoped that this year supplies will be sufficient to meet all demands. Another important development has been the introduction this year of the new Dunlop Roadster Giant tyre which I have no doubt will be equally successful. This tyre has been thoroughly tested in many countries of the world on some of their worst roads and results everywhere have been outstanding. The tubeless car tyre which your Company were first to introduce in 1954 has given excellent results and is now being fitted as original equipment by most car manufacturers.

Further progress was made in our sales of tractor, off-the-road and aero tyres and new records were again created in our production and sales of cycle tyres and rims. The use of the bicycle has grown so rapidly that we have not so far been able to keep our cycle tyre capacity abreast of the demand although it is hoped to remedy this before long. Stock shortages unfortunately existed throughout the year and to ease the situation Government have now adopted our suggestion of permitting tyres to be imported.

Substantial increases were also achieved in sales of other products, for which increased manufacturing capacity is also required if the needs of our customers are to be met. Great strides were made in Dunlopillo Latex Foam Cushioning, which is now firmly established as the most economical and hygienic material for cinemas, hospitals, hotels and transport services. It is also being used increasingly for domestic purposes and by car manufacturers.

Our rubber-ply transmission belting sold well throughout the year and we have had difficulty in maintaining dealers' stocks at an adequate level. Many important contracts for Conveyor belts which are supplied only against firm orders have been fulfilled from our Sahaganj factory. It is gratifying to know that our industrial vee belts and fan belts are proving so popular as is borne out by an increase in sales of over 60 per cent compared with the previous year. The excellent quality of our braided hoses has justified our decision to increase our range of sizes so that we can meet consumer needs more fully.

During 1955 we further expanded our activities to cover the highly specialised field of anti-corrosive and

abrasive linings. This service is available to a wide range of industries and not only do we undertake the application of linings to vessels and pipes at our factory, but at customers' premises as well.

RAW MATERIALS

The raw material supply position was satisfactory throughout the year except in the case of crude rubber. Against the total consumption of rubber by manufacturers in 1955 of 27,543 tons, India produced only 22,481 tons which means that there was a deficit of over 5,000 tons. In such circumstances it is the larger manufacturers who are forced to import a portion of their requirements, especially when the world market price is higher than the controlled Indian price. We in fact imported 2,368 tons of rubber in 1955, but we experienced considerable difficulty in obtaining import licences from Government and our stocks at times fell dangerously low.

The controlled price for local rubber was increased from Rs. 138 to Rs. 150 per 100 lbs. in February 1955 and again to Rs. 155-12 in September. The prices paid by us for imported rubber ranged from Rs. 144 to Rs. 207. There were no significant price changes in other raw materials.

PROFIT AND LOSS ACCOUNT

The net profit for the year was Rs. 96,72,154 and after deducting the provisions for taxation and retirement gratuities the balance of profit available for disposal is Rs. 61,28,686 compared with Rs. 69,45,891 for 1954. The Directors propose the same rate of ordinary dividend as for 1954, that is 15 per cent, which will absorb Rs. 24 lakhs. The Directors also recommend the transfer of Rs. 22 lakhs to General Reserve as against Rs. 30 lakhs last year. This will increase General Reserve to Rs. 1 crore 90 lakhs as shown in the Balance Sheet. The total amount transferred to Reserves during the last 11 years was Rs. 2 crores 67½ lakhs, representing earnings retained and fully employed in the business.

BALANCE SHEET

The additions to Fixed Assets during the year amounted to Rs. 33,70,000 consisting mostly of plant for expansion and modernisation. The amount of depreciation written off in 1955 was Rs. 27,51,000 as against Rs. 30,20,000 in 1954. Schedule VI of the

Indian Companies Act, 1956 lays down that any future amount written off for depreciation in excess of the amount reasonably necessary shall be treated as a reserve and not as a provision. In view of this the Directors have considered it desirable to transfer to Special Depreciation Reserve an amount of Rs. 1,13,86,000 representing depreciation on Buildings and Plant provided in the post-war years at higher than normal rates.

Stock inventories at Rs. 3,91,63,000 are Rs. 4,18,000 lower than at the close of the previous year in spite of expansion in the volume of production and sales. This was due mainly to abnormally low stocks of raw rubber and some categories of finished goods. Bank and Current Balances are also lower by Rs. 6,90,000 but Sundry Debtors are up by Rs. 16,74,000 as a result of the higher sales turnover, giving an increase of Rs. 7,16,000 in total Current Assets. Net Working Capital is, however, approximately Rs. 6 lakhs lower than at the end of 1954 and the closing bank overdraft is reduced by Rs. 17,49,000.

EMPLOYEE RELATIONS

During the past year no effort has been spared in maintaining our high reputation for working conditions and general labour relations, which, I am happy to say, remain consistently good. Further extensions and improvements have been made to our housing and social amenities for the benefit of our factory staff and operatives. The construction of new quarters for 30 of our Watch and Ward personnel was completed and these are now fully occupied. Work on the additional married operatives' quarters which I mentioned last year was unavoidably delayed but we shall shortly commence the building of 65 further houses. During the year electric lighting was installed in 800 single quarters. The addition of a Tennis and Social Club, consisting of a club-house and 3 floodlit tennis courts, has proved extremely popular and successful. A retirement gratuity scheme, which is additional to the provident funds which have been in force for many years, was introduced at the beginning of 1955 and will benefit all long-service staff and operatives.

Once again all our employees, at head office, factory and in the field, have shown initiative and devotion to duty and played their part in the achievement of the year's results. I know you will wish to join with the Directors in sending them a message of thanks and appreciation of their continued efforts.

MONEY SUPPLY IN INDIA

Industrial Policy and the Plan

THE Industrial Policy Resolution read out by the Prime Minister in the Lok Sabha on Monday this week has been in the process of gestation for a matter of nearly six months. In this process alarms and excursions were naturally abundant in Delhi, and even more prominently, in Bombay and Calcutta. These alarms and excursions have done little to promote constructive thought, for there is nothing in the resolution introduced last Monday to suggest that a determined effort is now being made to overcome the obstacles which hinder Indian industrialisation. Bombay and Calcutta, it is true, have heaved a large sigh of

relief, because, as has now become usual, the business community tends to raise its own jitters apart from those which emerge suo moto from the Central Secretariat. There is nothing in the present Industrial Policy Resolution which can cause either alarm or enthusiasm; it is a predominantly neutral document. It is merely a category of industries in three classes. If categorisation could hasten the process of industrialisation, the first Industrial Policy Statement of April 1943 should have helped considerably towards that end. The first Industrial Policy Statement cleared some doubts, but jumped no

hurdles; for there is no magic in schedules or categories. The second Industrial Policy Resolution can do no better; it chose the same ineffective talisman.

It is in terms of deeds, and not of a nice balance between the Right and the Left, that the Industrial Policy Resolution of the 30th April must be scrutinised. To do it justice, it is a splendid piece of ideological tight-rope walking. The fact that the Prime Minister has himself drafted many paragraphs of this resolution also gives it the high virtue of reflecting the ultimate source of political power in the Indian Union. That source of political power, contrary to general belief, is not socialistic in any extremist sense. If this represents the socialistic pattern of Jawaharlal Nehru, one can at least congratulate India on her powerfully realistic conception of what Socialism can be made to be in Indian conditions. There is nothing which should terrify private enterprise in this Socialism. On the other hand, there is nothing in this mixture which enables the public sector to do any job for which it was not otherwise qualified.

This, and no other, is the weakness of the new Industrial Policy Statement. It seems to believe clarification is a good substitute for incentive and action. In Schedule A—a formidable list of 17 industries reserved for the public sector—it places the responsibility fairly and squarely on the Government of India. If the placing of responsibility on an agency were equivalent to the discharge of that responsibility in a specified time all would be well. But at the present time the Government of India has taken on its shoulders a responsibility which everyone knows it cannot discharge. It has barred in these industries all new private enterprise except when it suits the Government of India to draw it in. But a moment's inspection will show that it is extremely difficult, if not impossible, for the Government of India to find new initiative or resources merely by extending the list and area of its Schedule A industries.

It is a source of some irony that, at the very moment that the Government of India was planning to expand its activities in this grandiose manner, Mr. K. C. Neogy's note on the excessively ambitious character of the second Five-Year Plan, and of the large obligations which the public sector is unable to discharge in it—should have been placed before the National Development Council. The National Development Council has dutifully endorsed the size of the Plan indicating that, whatever its sympathies with Mr. Neogy's presentation, this is not a politic moment to suggest that the public sector has overreached itself. But anyone who can read between the lines of the Prime Minister's speech—and the adoption of a higher target for food grains in order to combat the inflationary pressures to which Mr. Neogy refers—must admit in fact that Mr. Neogy has won his case. It has been agreed that the investment of the order of Rs. 4,800 crores in the public sector cannot be attained without inflation unless the Plan is substantially modified on the agricultural output side.

The conclusion to be drawn from this week's happenings is confused; but at least it is becoming more evident now that facts, not aspirations, will win. Thus, it is being recognised the position on transport will be critical until at least 5,000 locomotives and 50,000 wagons are added to existing Railway targets. Two articles in this issue,

one a Leading Article and another a Special Article, forcefully argue this case which has been drawn into prominence this week by a misguided note by Prof. J. K. Galbraith, whose great reputation in the economic world has unfortunately suffered an eclipse because of his unwillingness to look closely enough into the facts of the Indian transport situation. The issue at the moment, however, is not transport but industrialisation.

The argument is constantly advanced in India that since the private sector has not the resources—a fact which cannot be denied—the public sector must go into industrialisation in a much bigger way. From this perfectly legitimate conclusion the jump is easy to the perfectly absurd proposition that any extension of the public sector is legitimate, presumably on the assumption that the public sector can always find the resources. If Mr. Neogy is substantially right—and who can deny it?—there are financial limits on the public sector almost as rigid as those on the private sector. The public sector's financial capacity may be, let us say, eight times that of the private sector. But it is not unlimited, and all its resources are already committed; where can new resources be found for the additional industries which the public sector has taken under its exclusive wing and for which no adequate provision has been made in the second Plan? Does the Industrial Policy Resolution mean that while the private sector is excluded in Schedule A industries, the public sector will be able to produce only at the levels of investment already approved in the Plan? If so, Schedule A adds not an iota to new public sector industrialisation.

This is the central point of those who argue that the mere inclusion of additional industries in the public sector will not hasten the pace of industrialisation. There was a time when the private sector had many of the sources which the public sector now claims as its own. Successful industrialisation did not proceed automatically in the wake of these sources of finance. This was because there were many other problems in addition to finance to solve before a successful industrial venture can be established and expanded. Today the public sector monopolises the main sources of finance. But it is in no happier position than was the private sector fifteen years ago. The same obstacles to industrialisation remain and, indeed, in some respects they are more obstinate, for the character of modern taxation and the highly competitive demands of accelerated development make both incentive and supply of management far more difficult than it was fifteen years ago.

Because the problems of industrialisation are not primarily financial problems and because they cannot be settled by a philosophical or ideological categorisation of agencies, this Industrial Policy Resolution cannot furnish any new incentive to hasten the process of Indian industrialisation. To the extent that it removes the uncertainties in the private sector it is welcome. But it is important to remember that it is not the private sector which is the main agency for new development; it is the public sector by its own dogma and by its own deed. It is one thing to arrogate responsibilities; it is quite another to discharge them. Will the public sector be equal to its dogmas is the pressing question which arises out of the Industrial Policy Resolution. The country will await the reply; it will not be impatient. Let Time give its answer.

The Anglo-Soviet Communique

THE long Anglo-Soviet Communique issued in London last week at the end of the Russian leaders' visit to Britain gives some proof of the general opinion that Mr. Bulganin and Mr. Khrushchev have not succeeded in scoring a resounding success this time. The verdict on the visit has been distinctly different from that of their Asian tour, particularly in the USA, where there has been much satisfaction. It would be wrong to say that the Russian leaders expected much more than what they secured; the preliminary Malenkov mission was intended mainly to smooth over some of the difficulties expected during their visit. The announcement of the dissolution of the Cominform, on the eve of their arrival in London, seemed a further special gesture to dis-trustful British opinion. It is possible that the Soviet leaders expected difficulties in dealing with a Right Wing Government; but they have actually found the Conservative leaders more congenial for purposes of negotiation than Labour leaders.

For many reasons, the Soviet leaders and particularly Mr. Khrushchev have had a chastening experience in Britain. The final Communique is significant as much for the matters it mentions as for those it does not. There has been no reference to the question of China's recognition in the United Nations or to other major Asian questions. The Five Principles, which the Soviet Union has accepted and reiterated in relation to a number of other countries have not been invoked in the Communique; there is only a mention of the principles of United Nations Charter to govern relations of the two signatories with each other and with other countries. These are perhaps in the nature of commonplaces, having no special significance. The reference to establishment of peace in Europe is in fact an admission of the lack of any basis for negotiation on the problem of German unification.

The two specific problems on which the Soviet leaders' visit may be said to have marked an advance are those of the Middle East and of the prospects of Anglo-Soviet trade. The Communique may be read as implying a recognition of the Soviet Union as a Middle East Power whom the Western countries can no longer keep out of that area. The Baghdad Pact has split the Arab countries into two groups and Russia has been successful in drawing one to her own side by allowing shipments of arms. The Soviet Union might have sought in London a deal with the West on the basis of stoppage of the Communist arms shipment to Egypt in return for the abandonment of Baghdad military alliance. At this stage, however, no such open abandonment of the military alliance would be possible in order to satisfy the Soviet Union. The understanding reached with Britain implies, however, Russia's support to all moves taken in the United Nations for the restoration of peace in the Middle East and for the reduction of tension in the area of the demarcation line between Israel and Arab States. The importance of Russian agreement on the problems of this area has thereby been emphasised. It is not known whether there has been a tacit understanding on the question of supply

of arms but if professions of peace are sincere, it must in due course lead to a limit of supplies to the Arab States in accordance with some formula which would preserve a balance. A reference in the Communique to the independence of the peoples of the Middle East and to their national aspirations is probably a veiled admission of their right to purchase arms from the Communist countries when they wanted; and so long as that right is recognised Russian interest in the Middle East cannot be prejudiced.

The other major question that has received greater prominence both in Britain and abroad is the possibility of expansion of Anglo-Soviet trade. In drawing up an optimistic picture of the scope for trade expansion, Mr. Khrushchev touched on the most susceptible spot of British policy in order to make it appear that difficulties arose mainly because of the strategic controls on trade with Communist countries.

Nevertheless, it has been a spectacular offer of trade on a large scale, to the extent of over £800 million in five years, which no British Government can afford to ignore, in spite of important snags. Mere expressions of the desire to expand trade on this scale cannot make headway without the offer of practical evidence to show that the Soviet Union would be able to make the large readjustments in the trading pattern within the Communist bloc, as well as in the principles of bilateralism and balanced trade adopted in relation to countries outside the Communist fold. These possibilities have been left over for detailed study by officials on both sides. The Soviet Union will have to show that she can earn adequate foreign exchange in terms of sterling for the purchase of goods from Britain which are outside the list of strategic goods now banned. It is possible that the Russians will be driven more and more to adopt multilateral transactions in order to get supplies of the materials they need from Western Europe and sales of Russian machinery and manufactured goods in some of the underdeveloped countries may provide the sterling resources with which to buy British machinery or raw materials from the sterling area. In any case, the Russian offer on trade has been conceived boldly to gain a diplomatic initiative in dealing with the suspicious British whom it has impressed considerably, despite the failure of the more modest Kabanov offer three years ago to materialise in larger trade.

The Russian leaders' visit to Britain has thus proved worth while to both sides. It has made the Soviet Union realise that it is not possible to drive a wedge in the Western alliance; and Mr. Khrushchev took special pains to disclaim any such intention. As a potential bridge to an understanding with the United States, later if not sooner, some progress, perhaps, has been made in the London talks though it would be unwise to exaggerate it at this stage. It is possible that something more tangible may be attempted when Sir Anthony Eden visits Moscow in return.

The Railways in the Plan

BITS of two confidential documents have this week escaped unauthorisedly into the light of day. The central point in both happens, fortunately, to be a central point in the second Plan, namely, the allocation for railway transport. Some of the difficulties of the current transport situation in India are complex and so complex that so eminent an economist as Prof. John Kenneth Galbraith has failed utterly to appreciate the politico-socio-economic factors which surround railway planning in this country. To talk, for example, about making travelling inconvenient for passengers is to ignore nearly fifty years of political agitation on the terms of travel of India's third class passengers who alone can alter significantly the transport pressure in the second Plan period. One might talk equally easily of multiplying salt taxes. If Mr. Galbraith had recognised how impossible it is to restrain additional amenities for third class passengers, he might have spared himself what is politically a serious misdemeanour by the suggestion that the pitiful passenger travel that exists at the moment should be further cut back.

It is a condition of Indian democracy that the Indian people should know their country. The Discovery of India has been preached not merely by the Prime Minister in the spacious prose of a famous book; it is very much the content of the pattern of the political democracy introduced by the Constitution of the 26th January, 1950. Everyone in India who values India's plans values them for things such as these—the opportunities it will give for low income groups to see the Himalayas, to see great places of historical interest all over the country, to have a sense of personal participation in the adventure of India. If this is shut off for no better purpose than that a few train journeys could be saved and some additional capacity made available for goods traffic, enthusiasm for production will certainly be reduced. This is in effect a kind of forced saving, which is contrary to any liberal form of planning. It is right that it should be firmly resisted.

Against Mr. Galbraith's suggestions of cuts here and there, there is to be set the positive statement of Mr. K. C. Neogy that existing allocations for transport are not adequate to deal with other targets in the Plan; it is not a preference for transport as such. It is merely a plea for consistency in targets. In a Special Article in this issue there will be found some details of the volume of transport which is believed to be an inescapable necessity. The highlights of these needs are 5,000 additional locomotives and about 50,000 wagons beyond the Plan's targets. The most important point about this demand is that it should be made available not at some time but that it should be treated as immediate. Since deliveries are in most cases of 18 months' durations, actual imports are not likely to take place before the end of 1957.

There cannot be an iota of doubt that investment on railway development in the second Five-Year Plan has been conceived on a parsimonious scale. The fact that the National Development Council has endorsed the size of the railway plan as adumbrated in the Draft Outline does not alter in the least the basic fact that the conservative allocation of resources for the railways threatens to jeopardise most of the plans of industrial production, particularly in the private sector. For it

should be crystal clear that where a question of rationing of scarce rail transport capacity between diverse competing claims arises, state projects will be allotted priority in transport allocations and the private sector will be left, by and large, to fend for itself. Even within the orbit of the public sector it would be an error to suppose that the requirements of basic production programmes will be met in a full measure. The latest case in point is that of cement where the imperative need to raise the accepted target of production by another six million tons needs a substantial addition to transport capacity. Transport threatens to stultify this high priority programme of further expansion. Instances of this kind have cropped up in the course of discussions for revisions of development programmes in several other sectors.

Mr. K. C. Neogy has had the courage of conviction to speak out in a forthright manner the serious implications of the danger that lurks behind the attitude which shrieks coming to grips with the problem of fundamental priority for resources for transport development. His outspoken note circulated to the National Development Council raises the crucial issue of the failure to maintain a reasonable co-relation between expansion of transport capacity and expansion of other production programmes. It is idle to attempt to think aloud in planning on a bold and imaginative scale without recognizing the elementary fact that adequate transport capacity must first be provided for before large outlays in development projects can be risked. Mr. Neogy has uttered a grave warning in good time in regard to the consequences which must follow any failure to underestimate the magnitude of the requirements of transport capacity.

The tendency amongst experts has been to emphasise the possibilities of getting a better utilization of existing capacity through improved methods of haulage. It is true that there are possibilities of paying attention to such better utilisation. It does not, however, mean that proposals for doubling of track or for electrification or for new lines are redundant at this stage and that all the investment contemplated in these directions can be arbitrarily transferred to other sectors like heavy industries. The second Five-Year Plan is still in a preliminary stage of development in which the value of investment and social overheads cannot be exaggerated. Dieselisation cannot be the complete answer or a substitute for electrification in view of the better position of this country in regard to thermal and hydel power. The opening up of the underdeveloped areas in order to provide balanced economic development cannot be achieved by mere improvement of operational efficiency on the existing track. Nor can it be said that penal rates on short haulage would somehow automatically create the alternative means to carry short distance traffic. The danger of hampering movement of raw materials and finished goods by recourse to such policies is great. The American Technical Mission, which is expected to investigate the problem thoroughly, may be in a position to indicate the improvements that can be made with moderate outlays. That would not, however, be a substitute for a plan for railway development which ought to take adequate account of an expanding economy. The tendency to secure the approval of experts for short-sighted economy must cease if the plan has to be saved.

THE WEEK'S NOTES

THE DRAFT PLAN

WITH THE completion of discussions by the National Development Council this week, the stage is set for the presentation of the Draft Plan to Parliament before it concludes the Budget Session. The interval between the publication of the Draft Outline last February and the Draft Plan will not, therefore, be long but it has to be remembered that changes will not be substantial; most of them had been effected in the long interval of discussions between the Plan-Frame, presented exactly a year ago, and the Draft Memorandum last December. It is unlikely that the main features of resources and targets of the Plan would undergo revision, even though some misgivings have been expressed recently at high levels about the availability of monetary and material resources on the scale envisaged. It is inevitable that the Plan should depend for its fulfilment on external assistance of about Rs. 800 crores and deficit financing of the order of Rs. 1200 crores; and the question is how the Government's policies will be shaped to make these feasible. The increase in production needed to offset the effects of inflationary financing can be achieved only by allowing the maximum scope for the private sector and recent trends in policy, which have sought to emphasise the dominance of the public sector, may tend to divert attention from this all-important problem to the spectacular nature of the particular projects undertaken in the public sector to expand the industrial base of the economy.

The World Bank Mission now touring the country may take a more helpful view of aid than before and that in turn can lead to a better appraisal of Indian needs abroad. It is not possible to overlook that the mobilisation of internal resources through taxation, savings and loans will also involve some degree of strain and special effort. There is finally the question of managerial and technical personnel and the provision of transport; the problem of railway transport has loomed large because of the substantial investment required on railways.

All these matters would require many adjustments of detail of targets and of investment and the now familiar explanation is that they may be effected by a system of annual planning. It is possible to doubt whether, in view of the need to place orders abroad and to make other arrangements within for the new projects, it is possible to make the annual adjustments anything more than a task of phasing out the outlay in a convenient manner. In any case, this deliberate provision of scope for adjustments may detract somewhat from the Plan as a complete and final picture of development, even if it is conceded that the virtues of elasticity will far outweigh the impression of the somewhat tentative nature of planning.

VERDICT IN BURMA

THE RESULTS so far announced of the general elections in Burma have shown a clear lead for the AFPFL, which is likely to be maintained in the final picture. There have been about 36 unopposed returns for the 250-member Burmese chambers, which give indications of the AFPFL's popularity; the victory of all the nine candidates of the party in Rangoon district, where the Government's contacts are the closest, is another evidence of popular support, the significance of which should not be under-estimated. In the rest of Burma, rebel activity has been stepped up during the elections and voters in many areas have been intimidated and prevented from exercising their franchise.

To what extent this will affect the polling or the results remains to be seen; the threats to law and order only show the extremely difficult conditions in which the Government has chosen to test the opinion of the electorate. Prime Minister U Nu's popularity thus seems unshaken despite the hard conditions in which his Government has been carried on.

The glaring contrast with the fate of the former Government party in Ceylon in the recent general elections suggests itself and further reinforces the general belief that the trend of public opinion in Asia is to support the Governments which adopt an independent and neutral foreign policy and reinforce nationalistic pride by avoiding commitments to Western policies of military alliances. In other words, the Burmese elections now present the obverse of the verdict in Ceylon and point the moral that free and independent Governments like those of Burma promise better conditions for the successful working of democratic Governments than those merely propped up by external aid, but lacking inner strength based on the enthusiastic support of the people. The statesmanship of Prime Minister U Nu has contributed much to prove this point and his complete victory would place it beyond question.

THE REPORTER'S CHARTER

A PRIVATE MEMBER'S Bill has at last the chance of providing an important right to the press in India. The Select Committee's report on Mr. Feroze Gandhi's Bill seeking to protect the publication of reports of proceedings of Parliament and State Legislatures generally supports the right that was sought to be written into our statute book by the sponsor. In principle, all the members of the Committee are agreed that the proceedings of legislatures when reported in the press should be protected for purposes of action for defamation or libel. Hitherto, there was no positive safeguard to the publishers. While members of the legislatures were free to express their views on all matters of public interest, subject only to the regulation of the proceedings by the Chair, the reporter was often in a dilemma, during the brief time at his disposal before rushing to the press, in deciding whether any objectionable portions of a speech in Parliament should be published or not. In all such cases newspapers have worked only on the motto "Publish and be damned"; but this has been a procedure full of risks to the profession and consequently inadequate and over-cautious reporting failed to give a correct picture. Obviously what is of sufficient public interest inside Parliament is of interest to the world outside except where the legislature discusses 'in camera' on special matters. The consequence of the present anomalous situation has been that any daring publisher who was ready to face action got away with credit for true reporting.

There has been very little of opposition to the present move; even the dissenting minutes have been appended only for arguing the case for extending the benefit of the protection to the reports of the proceedings of State Legislatures also. The majority view is that Parliament should only regulate the publication of its own proceedings. There seems to be no reason to take such a restricted view of the matter because the authority of Parliament cannot be disputed and it is obviously undesirable to have two sets of principles on this matter. There is still room for making the change in the final stages of the Bill; the majority of the State Governments have approved the principle underlying the Bill.

SELECT COMMITTEE ON INSURANCE BILL

THE SELECT COMMITTEE'S REPORT on the Life Insurance Corporation Bill seems to underline the criticism that insurance nationalisation was a hasty step which did not take into account many aspects of insurance business. Eight minutes of dissent have been appended by members of different shades of thought. The Committee has inserted a new clause in the Bill to enable a company registered in India to carry on life insurance business in respect of persons residing outside India. This is one method by which the existing foreign business of the life insurance companies taken over can be managed by the same companies or by one of them specially constituted for the purpose. The original clause in the Bill was vague and perfunctory and the Committee's redraft must be regarded as an improvement to the extent to which it enables continuity of foreign business.

The formation of an investment Committee to advise the Life Insurance Corporation in the investment of its funds must also be regarded as an improvement though the functioning of such a body must necessarily depend on the instructions and rules issued by Government. The special provision for provident funds is on more doubtful ground; if the Corporation takes over all the existing obligations, there may be no reason why it should not take over all the assets too. The absorption of chief agents would afford protection to this class of employees which was threatened by the Finance Minister's reference to abolish 'sinecures'.

The Select Committee has, however, allowed its prejudices to get the better of its sense of expediency and fairness by enlarging the period, transactions during which were liable to be reopened after taking over. The original Bill provided that only transactions of the last two years before nationalisation could be reopened but by extending it to five years, a good deal of uncertainty would be created in respect of concluded transactions, and the fact that some of them were malafide would not justify the unsettlement of the rights of existing title-holders.

The dissenting minutes have drawn attention to the anomaly of excluding the audit of the Life Insurance Corporation from the purview of the Auditor-General of India. It is reported that the latter had to assert his claim to jurisdiction over audit through a special note circulated to the Committee, which has been supported by the dissenting members. The fact that no provision for such audit was made in the State Bank of India Act cannot be regarded as a precedent in this matter. On the other hand, it is more relevant to note that in the case of the Industrial Finance Corporation a special provision had to be inserted later to provide for the Auditor-General's audit. The proposed Corporation is not in fact an independent body because it would work on the instructions of Government and only the special Constitutional position of the Auditor-General should provide a guarantee against abuse of executive authority.

KING MAHENDRA

THE CORONATION of King Mahendra of Nepal this week has provided occasion for scenes of enthusiasm amongst the people of that country which, one must hope, would provide in abundant measure loyalty and

good will towards the young king. During the five years since the abolition of Rana rule there has been no political stability in Nepal on the basis of the working of a popular ministry. Royalty has thus become both a focus of allegiance and an instrument of stability in the midst of the factions and quarrels of politicians. These difficulties have enhanced the role of King Mahendra, who by his own personality has fully earned the confidence of his people. His coronation is also of special significance as the first for over a century in which the king to be crowned will not be a puppet in the hands of a hereditary Prime Ministership. Though his late father, King Tribhuvan, was mainly instrumental in overthrowing the Rana oligarchy and in preparing the ground for the introduction of a democratic government in Nepal, the responsibility for the actual fulfilment of democracy rests on the shoulders of young King Mahendra.

Even during the little time at his disposal since his father's death, King Mahendra has done much to tone up the administration. The latest achievement of Nepal in the international field is her admission to the United Nations as a full-fledged member. If with tact and perseverance the king could manage to keep the warring elements in peace and make a bid for the support of the people he can look forward to a long and fruitful reign.

SURPLUS LABOUR IN DEFENCE INDUSTRIES

DR. KATJU'S statement in the Lok Sabha on the volume of surplus labour in ordnance factories presents the problem in a much worse light than it has been seen hitherto. There has been some improvement in the volume of civil work executed by the ordnance factories. The value of this output is reported to have increased from Rs. 54 lakhs in 1954 to Rs. 3.5 crores in 1955 but this is regarded as almost the limit of the capacity of the ordnance factories in diverting production to meet civilian requirements. About 8,000 workers have been absorbed in this civil work, showing a fairly high degree of labour intensity. But the gross value of the output per person employed would be only one-half of that in the engineering industry, proving that this absorption has not occurred entirely on the basis of efficiency and that if costs are further cut, the scope for the outturn of civilian requirements may still improve. Even more disquieting is the statement that the average number of idle workers in ordnance factories even after this absorption has been about 6000 in the last few months and that there are 2500 other surplus men in other defence installations.

The Defence Minister has conceded that it is no longer in the interests of the tax-payer or the State to retain in service this surplus personnel. The problem has not grown overnight and till now it has been possible to minimise it because of the special character of defence expenditure which prevents close scrutiny. No retrenchment was effected in spite of a large and growing surplus merely on the ground that there were possibilities of expanding civilian work; but the limits to such expansion could not have been unknown all along. More vigorous efforts to find employment for the men in the public sector projects could have been made even if the Government did not wish to retrench the surplus workers. Only recently a Liaison Officer has been appointed but this should not be treated as an end in itself. In any case, here is some evidence of how in a sheltered atmosphere the public sector tends to operate and maintain wasteful ways.

How banking helps the FISHING INDUSTRY

THE seas around India's 2,900 miles of coastline are rich in fish. In the South of India, particularly, fishing is an important industry. It supplies food and many valuable by-products, some of which are exported.

In South India alone, the fishing industry employs over 1½ lakhs of people, and its catches are worth about Rs. 3½ crores every year.

Banking has greatly helped the growth of the fishing industry. The facilities and guidance of a good bank, such as the availability of ready funds when needed, and the collection of dues in any part of the country, are an essential part of good organisation in the fishing industry.

We at Palai are proud that so many leading fishing firms, and indeed important firms in every field of business and industry in South India, employ the complete banking service we offer:

Current Accounts — Demand Drafts — Telegraphic Transfers — Investments — Letters of Credit — Bill Collection — Deposits — Loans and Overdrafts — Confidential Credit Reports, etc.

If you have business interests in the South, it will pay you to open an account with us. Our 25 branches are strategically located, 23 in important South Indian business centres and two in Delhi and New Delhi; and we have correspondents in all important Indian cities. We offer a fully comprehensive banking service at each office.

Our clients can make deposits at any of our correspondent banks, situated in all important Indian towns, and have the amounts credited to their accounts at any of our branches.

PALAI CENTRAL BANK LTD.

Head Office: Palai, Travancore-Cochin
Branches at: Madras, Madurai, Cochin,
Quilon, Trivandrum, Mangalore, Bangalore
etc. Also at: Delhi and New Delhi.

WHERE THE U.S.S.R. AND THE U.S.A. AGREE

By

ODYSSEUS

AMONG THE MOST IMPORTANT of recently published books on economics is "The Theory of Economic Growth" by Professor W. Arthur Lewis (Allen & Unwin, 30sh.), which every student of economics in this country should read, not least the distinguished members of the Planning Commission on whose onerous tasks Professor Lewis will shed much light. I urge the Finance Ministry to buy a score of copies for distribution to everyone in key administrative positions. I have quoted extracts from this book last week and they are so relevant to so much of what we see around us that I do not hesitate to repeat their essence this week. They are important because they are not the obiter dicta of some orthodox economist or reactionary Tory, but the reflections of a prominent Socialist who has played a personal part in helping the under dog, and because we live in a society of a Socialist Pattern, it behooves us to keep abreast of what the more percipient exponents of Socialism are thinking.

Professor Lewis says that economic change and growth is particularly important in societies in which political aspirations are running ahead of current economic resources. In countries such as Britain, for example, where the workers demand ever larger wages and greater expenditure on welfare housing, education, and health, income per head must be made to keep rising. Productivity must be made to keep growing. And this, says our Socialist Professor, means unequal incomes, because there will be no growth if differential incomes are not available for hard work, skill, responsibility, and initiative. If the good Professor sounds almost as reactionary and old-fashioned as this column, I hasten to add that he has the most orthodox Socialist support on this point, for the discovery that no significant economic growth was forthcoming if everyone received equal pay was the outstanding contribution to applied Socialist economics made by the USSR in its earliest and most orthodox days.

The British liberal economist, Graham Hutton has pointed out the ironic fact that it is because those ideologically battling giants, the USA and the USSR, agree on the necessity of unequal incomes that their economies are forging ahead. Whereas the workers of the USA and the USSR regard the existence of individuals much richer than themselves as spurs to ambition, the workers of Britain and France remain filled with a grudging envy of anyone better off than themselves. To be rich in the USA and the USSR is the socially acceptable reward of hard work. In Britain and France, the remaining possessors of wealth are lumped together with crooks and shareholders as anti-social beings. (While numerous government posters urge the British to save, the citizen who manages to save a few pounds and invest them in shares is penalised by being taxed at a special rate on the "unearned" income that he receives from his saving!).

WELFARE ECONOMICS IN OXFORD

The workers of Britain and France are wedded to restrictive practices which prevent productivity from rising. They want higher wages but will not work longer hours. They want shorter hours but will not

let tools and machines do the job for them. Consider the latest example, one of a multitude: There is a shortage of bus conductors in the ancient city of Oxford. The Oxford bus company wanted to send out buses without conductors and with a collection box into which travellers would be on their honour to put their fares. The company promised that for every new conductor recruited, a collection box would be removed so that no one would be done out of a job. This, please note, was not an attempt to raise productivity but merely to maintain it by keeping the existing number of buses on the streets. But the bus conductors threatened to strike if a single conductorless bus left the garage.

British workers will not, moreover, abstain from current consumption in order, by greater use of new plant and modern machinery, to raise their standard of living over the years. In other words, they insist on re-distributing existing wealth. They resist growth. This, of course, means that the more wages and welfare one section of the community extracts, the less well off is another. In practice, the better off the workers, the less well off the middle classes, who are not organised in unions which can bring key industries to a halt and hold the nation up to ransom. And it is, it cannot be repeated too often, the middle classes in all countries, from India to the Arctic and back, who are responsible for making the whole economic machine function at all.

Where the incomes of all tend to greater and greater equalisation, as in the UK, productivity lags, inflation flourishes, and all get poorer even though their money incomes rise. This is one of the factors contributing to the current British inflation, for if the workers insist on more and more spending power without increasing their productivity, more and more money chases the same number of goods.

What too many Socialist Pattern societies suffer from today is the effort to work in post-World War II conditions with pre-World War I philosophies. We continue to be hypnotised by theories from which we have extracted outworn slogans which have no meaning in today's context. It is not perhaps surprising that it is among the dynamic Soviets that attempts are being made to formulate a new philosophy. While the Soviets set up a new Ministry of Automation and redouble their peoples' forced savings to create productive capital, Soviet engineers and planners are, Graham Hutton tells us, debating the nature of capital, discussing the criteria by which new investment and its productivity can be measured, considering the shifts and stratagems to which Marxist logic is reduced in the effort to square Marx's dogma of capital as "embodied labour" with the patent facts of Soviet daily life: the abstinence forced on Soviet workers, the presence of such disconcerting bourgeois phenomena as discount, depreciation, and an effective (although not a quoted) rate of interest. "The biggest economic dilemma in Russia," says Mr. Hutton in a memorable phrase, "remains the improvement of welfare while overcoming the shortage of capital. The greatest organised unhappiness of the greatest number provides the capital. It is the biggest confusion of ends and means in history."

In the USA, the machine is used as a means. Both Soviets and Americans, however, agree that the future well-being of the masses depends on the growth of capital. Both make the strenuous social effort (differing according to their different social conditions) necessary to secure it. The Soviets use the big stick on the donkey, the Americans put carrots in front of its nose. Both are dynamic societies.

HARRIED, HARASSED, HAG-RIDDEN BRITISH

Turning to Britain, we find that while the biggest social revolution since the Reform Bill of 1832 has been put through—the socialisation within ten years of one-quarter of the national output—production in the socialised industries except electricity generation and aviation lags. The socialised industries have the worst industrial relations, the least sense of public service, and the worst exhibitions of unimaginative, red-taped, bureaucratic administration. These, Mr. Hutton points out, are precisely the complaints now being investigated in the USSR. Yet Britain's socialised industries have been given priority in capital development. Private enterprise which produces the money to pay the taxes which meet the losses of the nationalised industries, and private enterprise which produces all the exports on which Britain depends for survival, comes at the bottom of the list for new capital.

No new ideas for tackling these problems have emerged so far from the leaders of either the Conservative or Socialist parties. On the continent of Europe, welfare France lags painfully behind, devoid of new political or economic ideas, repeating the old slogans, and re-distributing existing wealth, while the Belgians and the West Germans who plumped after World War II for the American way of carrots, rewards and incentives for the donkey, progress by leaps and bounds. Germany's decision to discard Socialism in favour of free markets was greatly influenced by that great economist, the late Walter Eucken, and I take a modest pride in recalling that I was the first in India to draw attention to his little classic "This Unsuccessful Age" (Hodge & Co., London. 1951. 10sh.). The older hands will remember the series under that title published here between January and April, 1952, in which I predicted that Germany's courage in freeing her economy from the bureaucratic strait-jacket would result in prosperity. The mistake I made was not to have foreseen how soon that prosperity would come and how great it would be.

Let me conclude by noting the encouraging fact that there is now beginning to be at least awareness of these problems of productivity and incentive in the UK. Outside the Socialist ranks, Graham Hutton has sounded the tocsin in his "Times" Literary Supplement article of February 24 which has aroused a nation-wide interest. Within the Socialist party, Professor Lewis' realistic views are taken seriously, and Mr. Hugh Gaitskell recently wrote at length in 'Socialist Commentary' on the USSR's success in building a wealthy, if unfree, state, to which he asserted that the democratic answer for Britain must be to consume less and save more. Dare one hope that he will publicly urge the Trades Unions to put forward no more claims for higher wages unaccompanied by proposals for simultaneous higher productivity?

(This is the final article in a series of five, the first of which appeared here on April 6.—Ed).

WRAPPED IN
TRAYOPHANE
MOISTURE-PROOF FILM

Moisture-proof Trayophane has been developed for wrapping all goods which must not be affected by moisture—biscuits, tea, coffee powder, cigarettes, sweets. It is available in rolls and sheets, and can be printed with brilliant designs.

Trayophane is more transparent than glass, shows off your product better.

Trayophane can be heat-sealed—just run a hot iron along the seam.

And Trayophane is cheaper than any other packaging material. Ask for free samples catalogue!

FRANCE'S LEGACY IN MOROCCO

FROM OUR SPECIAL WESTERN EUROPEAN CORRESPONDENT

PARIS.

INDIA'S population problems dominate economic thinking in that country so much that one is surprised to find a country with a population of only 8 millions face with almost identical economic dilemmas. Yet this is the case in Morocco. The answer is of course that it does not matter if the population is 8 million or 380 million; once population gets out of all relation with economic development then similar economic difficulties arise. Morocco has a birth rate of over 40 per 1000, and a death rate of about 20 per 1000—and can thus expect to double her population every 25 or 30 years. Meantime she has a primitive agriculture, practised on tired soil, a negligible rate of capital formation and considerable unemployment. Her main difficulty—the dislocation between population and economic development—is not the fault of France's stewardship, but its credit: the birth rate has remained steady but the death rate has been spectacularly lowered by the modern medical science brought by the metropolitan power. France's achievement in this field has been even more notable than Britain's in India, for in Morocco epidemics have almost disappeared: there is little typhus, typhoid, smallpox, cholera or plague. The endemic diseases, syphilis, trachoma and tuberculosis, have regressed sharply, and modern hygiene practice, especially in obstetrics, is widespread. The result is that cereals has made famine rare. The result is that Morocco's population has doubled, from 4 to 8 million, since the early 1930's. In the demographic field the one reproach that can be made to France is that she has done absolutely nothing to encourage birth control. This is because birth control is illegal in France itself; in theory at least, even Frenchmen can be prosecuted for so much as advocating birth control. Such policy, practised by most Catholic countries, is probably indefensible in France, but in her North African possessions it was grotesquely inappropriate.

Before we look at the other economic problems that the newly independent State of Morocco has to face, it is as well to contrast the situation between the French and Spanish parts of the kingdom. The contrast is brutal. Spain did nothing for Morocco. There are more barracks than schools in the Spanish sector, which was run as a reservoir of troop supplies and a field of military manoeuvres; the very administration was less like a civil service than an army general staff, and was of course headed by a general. Living standards are lower and living costs higher than in the French sector. There is no industry and more unemployment. The first result of the breaking down of the division between the two parts of the country is that overcrowding in the urban agglomerations of the French part is being exacerbated by an influx from the north.

Of the 8 million Moroccans, 1 million are engaged in industry, 1 million in crafts, professions and clerical work, and the remaining 6 million in agriculture. Industry has expanded considerably since the war, principally under French auspices. The purchasing power of the Moroccan industrial worker has doubled since the 1930's and it is this section of the population that generates most of the current demand for cloth, sugar, tea, bicycles and radios. But of this favoured million, almost half are Europeans: of the 420,000 white people in Morocco, only 60,000 live from agriculture.

The vast majority of Muslims work on the land and constitute, economically speaking, an inert, stagnant mass. They provide almost no purchasing power to support local industry, whose progress has, therefore, now slowed down. The standard of living of the Muslim agriculturalists rose noticeably between 1912 and 1935, but since then the increase in their numbers has wiped out these gains and led to a gradual decline. They are grouped in 1,300,000 separate farms most of which have an area of under 4 hectares. (One hectare equals 2.47 acres). It is reckoned in Morocco that a farm of 10 hectares is needed to support a family of five people and its ploughing cattle, so obviously most peasant enterprises are uneconomic. Worse, most of these small holdings are not in one piece; successive inheritances have divided them and scattered them about in patches each of a few hundred square yards. There is no virgin soil, and most of it has been exhausted by continuous cultivation without proper fertilisation, or ravaged by erosion. When land is totally exhausted, instead of being left to recover its resources, it is turned over to the flocks which trample the topsoil to a fine dust which wind and water then wash away.

Ploughing consists in merely scratching the surface with a wooden plough drawn by under-nourished cattle. In the shallow furrows are cast inadequate quantities of degenerate seed, which is then left to the mercy of a capricious climate. Late rains mean disaster. If the crop is successful, the Moroccan *fellah*, like the Indian *ryot*, converts his savings into gold which adorns his wife's arms as coarse bracelets. I could continue this account into greater detail but there is no need to do so for an Indian audience which will already have recognised an all too familiar picture.

It is very easy enough for the agronomical scientists to say what is required in this situation, but of course the main obstacles are psychological. Economic failure has produced a sort of spiritual degradation. Apathy and distrust greet any effort to improve agriculture, and indeed there is such a narrow margin between the peasant and starvation that he regards any sacrifice for supposed future benefits as lunacy. Yet nothing can be done without him or in spite of him, and he will not agree to any experiment that does not produce immediate and tangible benefits. India, which gave Morocco moral support in its demand for independence, will henceforth have the opportunity to share with Moroccans the knowledge she has acquired in dealing with this situation through the Community Development Projects. Here is a field of substantial co-operation between India and North Africa.

As one would expect, this agricultural insufficiency has driven many *feelahs* into the cities. There are parts of the countryside where a peasant family earns only Rs. 390 in a year, a sum that can be earned by an industrial worker in Casablanca in two months. The result is that one-fifth of the total population is now urban, living in the towns of Casablanca, Marrakesh, Fez, Rabat and Meknes. I borrow the following pathetic description of the condition of many of these people from an official publication: "They seek refuge in the cities, full of hope but innocent of qualifications and without money to live on while they wait. They swell the ranks of the unemployed and half-employed whom the factories hire for one or two days a week. Relying on the solidarity of fellow Muslims, they move

into the already overcrowded shanties of vague 'cousins' and tribal relatives, live at their expense and thereby depress the standards of those who have work. They pass their days in idleness or look for insecure jobs, offering their services at below the minimum wage and thus jeopardising the position of more experienced men who have a job. They form a troubled element in the population, open to exploitation by extremist nationalists who invite them to smash a society that rejects them. They wait impatiently for the harvest which, if it is a good one, requires workers and pays good wages. But once that brief period is passed, the country-

side goes to sleep again and pushes them out. They go back to town to an unstable and degrading life, the life of the uprooted to whom the tribe, the family and religion no longer bring balance and moral health."

There is not a line in all the foregoing description of an economy that will be news to an Indian. The only news is that it applies to a country at the other end of the earth, a country that has just become free. There is a solidarity of free men, and a solidarity of misfortune. Poverty is indivisible. "Every man's death diminisheth thee. Never send to know for whom the bell tolls—it tolls for thee".

A Letter to the Editor

DIESEL SETS FOR NURSERY SCHEMES

Sir,

In your "Notes on Oil Products", forming part of the Oil Industry Supplement in your issue dated 27th April, 1956, reference has been made to the role of diesel engines generating power in rural areas which because of their remoteness are not able to be served by power coming from bulk generating stations. In fact, greater emphasis is laid on portable units for building up load until "grid distribution" moves in.

In practice, there is very little generation in the country by "portable units" except in dam sites where electric service has to be provided and which sites are inaccessible to existing systems of supply.

The "Nursery Schemes" are mostly permanent in nature; at least so for a long time to come until they receive supplies from Grid Schemes.

One other aspect which has to be mentioned in this context and to which your "Notes" make no reference is the incidence of fuel oil price on the economy of small-size diesel generating stations. For the present, as many as 208 diesel undertakings operate with plant capacities below 250KW in the country, mostly in small townships. A major portion of these are owned and operated by licensees of small means.

These small undertakings perform a useful service in opening up the countryside and but for them the communities concerned would not be enjoying the benefits of electricity. To such undertakings, the present level of fuel oil price is of great concern in that if economic rates for power in respect of domestic lights and fans and motive power are to be enforced, they would be of the order of at least Re. 1 per unit and As. 6 per unit, respectively. These are rates which are quite impracticable to be applied, and if enforced, will only result in the Law of Diminishing Return setting in.

As an indication of the price trend, it may be stated that the cost of fuel oil, say in February, 1946, was Rs. 87-2 per ton ex ports, and the price for the oil is now of the order of Rs. 247-6 per ton ex ports, including the new impost of Excise duty of 2 annas a gallon.

The latest addition to the fuel oil price has come into being because of the excise duty of Rs. 30 per ton imposed by the Finance Act, 1956. Representations to the Central Government for this duty to be reconsidered have proved to be of no avail. Earlier representations to the Government of India to give special regard to the problem have equally been unsuccessful in that

Government have taken a facile view that it is their constant endeavour "to see that prices of petroleum products are fixed on an equitable basis and that the consumer is not made to pay more than is absolutely necessary." The oil suppliers have taken an equally unresponsive attitude by pleading helplessness on the ground that the oil prices are linked to "Gulf" prices and are regulated by the Government of India.

The object in underlining the price aspect is to bring home to the authorities, no less to the oil suppliers, the crushing effect of the current fuel oil prices on a sector of the Industry rendering pioneer service and to point out the limitations to further progress in electricity generation by diesel engines.

Yours faithfully,
R. P. AIYER,
Secretary,
The Federation of Electricity
Undertakings of India.

BOMBAY,
1st May, 1956.

RECORDS & STATISTICS (QUARTERLY BULLETIN)

WORLDGRAM

AGRICULTURE

International Rice Commission: Recent developments in respect of nutritional problems related to rice and use of rice fields for fish culture will come up for discussion at the fifth session of the International Rice Commission to be held in Calcutta from November 12 to 17, 1956. According to the provisional agenda, the Commission will consider the reports of its Working Groups on rice-breeding, better fertilising practices, soil, water and plant relationships in rice production, mechanisation of rice cultivation and reduction of losses through improved operational methods. It will also have before it the progress report of the Executive Secretary on the Commission since its last session held in Tokyo in October 1954. The Commission is at present composed of 26 member countries, viz., Australia, Burma, Cambodia, Ceylon, Cuba, Dominican Republic, Ecuador, Egypt, France, India, Indonesia, Iran, Italy, Japan, Korea, Laos, Mexico, the Netherlands, Pakistan, Paraguay, the Philippines, Portugal, Thailand, the U.K., the U.S.A. and Viet-Nam.

Developing India's Forest Wealth: It is reported the total expenditure planned for the development of the country's forest wealth under the second Five-Year Plan would be over Rs. 24 crores. The Centre would directly incur an expenditure of nearly Rs. 2½ crores on the forest research, education and demonstration centres for upgrading secondary timbers, besides financing the Forestry Commission. The Centre would subsidise the States to the extent of Rs. 2½ crores in order to enable them to implement schemes not immediately remunerative. The Centre would assist the States with loans to the extent of Rs. 10 crores to implement other forest projects. In addition, the States would themselves find over Rs. 9 crores to complete financial provision for such schemes, as also for schemes which they would undertake entirely on their own.

Rice Production in Manipur: The acreage and production of rice in Manipur is 2.74 lakhs and 39.45 lakh maunds respectively. There is no reliable consumption figure for rice in Manipur and as such no estimate for surplus rice in that State during the year 1954-55 and 1955-56 can be given. However, the surplus is estimated to be of the order of 4 lakh maunds of rice.

INDUSTRY

Water Displacing Composition: A water displacing composition has been developed at the Technical Development Establishment Laboratories, Kanpur. The composition possesses the unique property of simultaneously drying and affording temporary protection against corrosion to metal parts. Its mode of application is simple dipping, spraying or flow-coating and requires no heating or power services. Small quantities of such water displacing composition are at present imported and used in ordnance factories and for other defence requirements.

Mechanisation of the Panna Diamond Mines: Soviet Russia has deputed to India three of its top-ranking mining and engineering experts to help large-scale mechanization and expansion of the diamond mining industry in the country. The Russian Government have also offered to supply all modern equipments needed for the mechanization of the mines and technical know-how. These equipments are expected to cost over Rs. 60 lakhs. The plant, which is expected to go

into full operation by 1956, will handle about 7,000 to 8,000 tons of ore. The Soviet Government have offered to send technicians at their own cost to erect the plant and train Indian personnel to operate them. According to the original estimates of the Geological Survey of India, the Panna area possesses 11 million carats of diamond deposits worth Rs. 165 crores. The potentialities of these mines have been proved and the existence of a regular kimberlite pipe has been established by the working of a pilot plant and extensive geological and other tests. The Russian experts will also survey the Golkonda area in Hyderabad and Andhra States with a view to ensuring fullest exploitation of the diamond deposits of that area.

Plan for Developing UK Coal Industry: The Indian National Coal Board (NCB) proposes to spend nearly £1,000 million during the next 10 years on the reconstruction of the coal industry in the United Kingdom. Required investment will represent something of the order of 4 per cent, or 10d out of every £ invested within the British economy. The revised plan provides for an output of 240,000,000 tons a year in 1965, of which 228,000,000 tons will come from Coal Board mines, 10,000,000 from open-cast workings, and 2,000,000 from private mines. Output last year totalled 221,600,000 tons.

Common Salt for Chemical Industries: The Indian Standards Institution has issued an Indian Standard specification for common salt for chemical industries. The Indian Standards covering edible common salt, common salt for fish curing, and common salt for hide curing, have already been published. This is the fourth standard in the series and prescribes the requirements and the methods of test for common salt for use in chemical industries. It specifies the minimum sodium chloride content of the material and lays down upper limits for moisture, sulphates, calcium and magnesium salts, carbonates, etc.

Standard for Pure Benzene: An Indian standard specification for benzene, pure, nitration grade, has just been published by the Indian Standards Institution. The standard prescribes the requirements and methods of test for the material. The standard which lays down requirements in respect of neutrality, acid wash test, carbon disulphide and thiophen, colour, specific gravity, etc., also provides for the methods of determination of carbon disulphide, thiophen and crystallizing point.

Increased Production of Iron Ore: The total output of iron ore in India increased to 373,998 tons in February, 1956, from 364,288 tons in January, 1956, according to official statistics released by the Chief Inspector of Mines in India. Returns received from 89 mines for the month of February, 1956, show despatches totalling 260,698 tons to the iron and steel plants and 51,405 tons to the export market. The reported stocks as at the end of the month amounted to 1,262,843 tons.

TRADE

UK's Export Achievement: Final figures issued by the Board of Trade show that the UK's export achievement in March was even better than was indicated by the provisional figures published some time back. UK exports in March reached a total of £271,300,000—an increase of £1,700,000 on the provisional figures—and thus exceeded by over £3,500,000 the previous highest

monthly figure recorded in October 1955. Imports in March amounted to £330,200,000. The rise of £21,000,000 between February and March was a good deal less than between the same month of previous years. Re-exports, at £13,300,000, were a little lower than in the two preceding months. In the first quarter (January-March) as a whole, however, re-exports were over one-quarter more than in the same period of 1955. The value of U.K. exports in the first quarter of this year was 4½ per cent higher than in the corresponding period of 1955. Export prices rose by about 5 per cent.

*

Trade and Payments Agreement Between India and Bulgaria: As a result of the recent trade talks between the representatives of the Government of India and the Bulgarian Trade Delegation, a Trade Agreement between the two countries has been signed. The Trade Agreement provides that the trade between the two countries will be governed by the laws and regulations in force in either country. It also provides, among other things, for settlement of accounts between the two countries in rupees. The important items in the list of exports from India to Bulgaria are iron ore, manganese ore, lac including shellac, tea, coffee, tobacco, spices, hides and skins, oil and oil seeds, raw cotton, cotton waste, cotton manufactures, raw wool, wool waste, jute manufactures, sports goods, handicrafts and cottage industry products. Among the chief items available for export from Bulgaria to India are various kinds of machines such as wood working, metal working, forging, pressing, agricultural etc; certain kinds of chemicals, drugs and medicines, electrical instruments, machinery equipment, paints and diesel engines.

*

Textile Export Markets: It is reported that Indian and Japanese cloth exports are flooding overseas markets once dominated by Britain, France and other European nations. Textile output was off more than 10 per cent last year in England. Finance has sharply curtailed her production. Ireland no longer makes rayon cotton damask cloths because Japanese are selling competing items at 20 per cent of the Irish price. World textile exports this year will be below 5 billion square yards, or less than 15 per cent of total production.

FINANCE

Salt Cess: The Government of India announced on June 28, 1955 that small-scale manufacturers, whose individual holdings did not exceed ten acres, and who were organised as members of co-operative societies, even if the total area under salt production with each of such societies exceeded ten acres, would be exempted from the liability to pay the cess leviable under Section 3 of the Salt Cess Act, 1953. It is further announced that small-scale manufacturers, whose individual holdings exceed ten acres but not 100 acres and who are organised as members of co-operative societies, will henceforth, pay cess at the reduced rate of one anna per maund instead of two annas per maund.

*

PEPSU Adopts Central Estate Duty Act: PEPSU has adopted the Central Estate Duty Act of 1953 by passing the necessary resolution and the Act now becomes operative in the State in respect of agricultural lands of persons dying on or after April 10, 1956—the date on which the resolution was passed. Under Article 263(1) of the Constitution, each State has to pass a resolution authorising the Centre to regulate the levy of Estate Duty on agricultural lands in that State. The names of those States which have already passed such

resolutions are included in the First Schedule to the Estate Duty Act.

*

Japan's Foreign Exchange Accounts in Fiscal 1955: According to the Ministry of Finance, foreign exchange accounts for fiscal 1955 ending March, 1956 showed receipts of \$2,839 million and payments of \$2,304 million, or a surplus balance of \$535 million, which marks a sharp increase of \$191 million over the previous fiscal year. This improvement in balance of payments position is explained by the fact that exports, particularly of consumer goods, considerably increased to \$2,095 million propped by good business in the United States and Western Europe, and also that receipts from the procurements unexpectedly rose to \$569 million. With imports staying at \$1,956 million, fiscal 1955 witnessed for the first time since the end of war a favourable balance, if only small in visible trade. Accordingly, the Government's foreign exchange holdings at end of March reached \$1,508 million. Excluding from this frozen credits and deferred payments for imports through usance bills, actual foreign currency holdings come to some \$900 million, which is regarded still inadequate by the Finance authorities.

*

International Finance Corporation: India is the twentieth country to complete the action required for membership of the International Finance Corporation, the proposed new affiliate of the World Bank. This marks the two-thirds stage towards the minimum membership of 30 countries which is required for the new Corporation to begin operations. The prospective capital subscriptions of the first twenty adherents amount to \$61,751,000 of the minimum starting capital of \$75,000,000. The ten other countries which have adhered to the new Corporation since the last announcement was made on January 10 are Bolivia, Ceylon, Dominican Republic, Ethiopia, Guatemala, Haiti, Honduras, Nicaragua, Panama and Peru. Previously announced were: Australia, Canada, Costa Rica, Ecuador, Egypt, Iceland, Mexico, the United Kingdom and the United States.

GENERAL

Wagons for Despatch of Coal: It is reported the estimated number of wagons required for the movement of coal by the end of the second Plan period would be of the order of 6,755 per day as against a daily average supply of 4,045 wagons during 1955. The Government has been discussing with the Ministry of Railways, the ways and means to cope with the increased demand. The stocks of coal that could not be moved due to wagon shortage were 3,019,795 tons in 1952; 3,411,194 tons in 1953; 3,501,388 tons in 1954 and 3,605,870 tons in 1955.

*

Working of the Cochin Port: The working of the Cochin Port in 1954-55 resulted in a surplus of Rs. 10.92 lakhs as against a surplus of Rs. 6.62 lakhs during the previous year. The net increase of Rs. 4.30 lakhs in the surplus over the previous year was made possible by an increase in revenue of Rs. 5.85 lakhs, set off by a small increase in expenditure of Rs. 1.55 lakhs. Gross revenue receipts of the Port Fund amounted to the record figure of Rs. 77.07 lakhs for 1954-55, as compared with Rs. 71.22 lakhs in 1953-54. As in the previous year, a special contribution of Rs. 5 lakhs was made to the Capital Account from the year's revenue, after making the usual contribution of Rs. 2 lakhs to the Revenue Reserve Fund and Rs. 3.97 lakhs to the "Accident" and "Renewals and Replacement" Funds.

NEWS IN BRIEF

FOREIGN

Steel production is expected to be more in 1956 in England than in any of the last eight years. The Iron and Steel Board has estimated the rise at 1½ million tons to 21.3 million tons compared with last year's increase of 1.27 million tons.

*

Crude oil production in Saudi Arabia during March amounted to 31,278,000 barrels, or a daily average of 1,009,000 barrels.

*

A further fall in the price of copper has occurred in France. The price is now Frs. 375 per kilo against Frs. 385 nearly three weeks back.

*

A one-year bilateral trade agreement providing for the export to Italy of Pakistani raw jute, wool, hides and skins, tea and cotton and for the import of Italian iron and steel, building materials and chemicals and radio and chemical equipment has been approved by both Governments.

*

French exports during March were valued at Frs. 145,688 million (£148 million) against Frs. 123,115 million (£125 million) in February and Frs. 136,544 million (£139 million) in March 1955. For the first quarter, exports totalled Frs. 408,282 million (£388 million), against Frs. 408,282 million (£415 million) in the corresponding period of 1955.

*

The Egyptian Government has announced that a customs duty of one per cent on all imported goods will be imposed.

*

It is reported asbestos cement building materials will be made in East Africa for the first time.

*

France is to begin producing heavy modern equipment required for oil exploration. Equipment envisaged includes winches and drills weighing from 10 to 30 tons.

*

United Nations Korea Reconstruction Agency is to import mechanical equipment to the value of 300,000 dollars to help a spinning firm in Korea to repair its mill which was damaged during hostilities. The mill will have a potential output of 342,000 lbs. of high quality spun silk per annum.

*

Nearly one thousand midwives have benefited from the vocational training programme undertaken in the Philippines with the help of the World Health Organisation and the United Nations International Children's Fund.

*

Forty iron lungs, bought out of its emergency funds by the Pan-American Sanitary Bureau at Washington have been transported by plane to Buenos Aires where an epidemic of poliomyelitis has just broken out.

*

More than 1,000 tons of heavy machinery and construction materials have been landed in Korea for the country's largest cement plant, now being built at Mungyong by the United Nations Korean Reconstruction Agency.

*

It is reported two specialists have been assigned to Iraq by the UN World Health Organisation, one in the field of maternal children health services, the other in the field of water purification.

INDIAN

It is reported a scheme for the establishment of one foreign silk worm race seed station at Chakrata in Dehra Dun district of Uttar Pradesh has been sanctioned recently. The station would rear 7,000 layings of univoltine seed per annum. A sum of Rs. 15,045 which represents half of the estimated cost has been sanctioned for the purpose.

*

A preliminary plan costing nearly Rs. 112 lakhs for the manufacture of streptomycin at the Hindustan Antibiotics Ltd., Pimpri, has reached the concluding stage. The scheme is expected to be taken in hand towards the end of 1956 or early in 1957.

*

Soap production of foreign-managed concerns for the years 1953, 1954 and 1955 was respectively 50,561 tons, 50,381 tons and 57,810 tons. Production in the organised sector during 1953, 1954 and 1955 was respectively 32,786 tons, 38,100 tons and 42,530 tons. The production of unorganised units was estimated at 1,20,000 tons in 1955.

*

An agreement has been signed between the Government of India, the Government of Norway and the United Nations for the provision of certain additional facilities under the Fisheries Community Development Project in Travancore-Cochin.

*

The Union Ministry of Production has constituted a Coal Prices Revision Committee comprising the Coal Controller, a representative of the Ministry of Production and the Chief Cost Accounts Officer of the Ministry of Finance.

*

The Union Planning Ministry has under consideration a proposal which aims at diverting incomes of Hindu religious shrines and endowments to financing the Five-Year Plan.

*

The Government of India have asked for training facilities for 14 persons in Soviet Russia under the United Nations Technical Assistance Administration Programme. Six of these persons are at present employed in the Geological Survey of India and the remaining 8 in the Oil and Natural Gas Directorate under the Ministry of Natural Resources and Scientific Research.

*

India produced 15,20,316 tons of manganese ore during 1955, whereas in 1954 the total output of manganese ore was 14,13,068 tons.

*

The Central Food Technological Research Institute, Mysore, has planned to start investigations on fish technology including canning trials on various Indian fishes.

*

A sum of Rs. 30 crores is expected to be allotted for oil exploration by the Oil and Natural Gas Directorate under the Ministry of Natural Resources and Scientific Research during the second Five-Year Plan period.

*

The Government of India have sanctioned a scheme for housing resident workers in plantations governed by the Plantations Labour Act 1951. The scheme, which has been put into operation in April will remain in force during the second Five-Year Plan period.

STOP THE TRANSPORT MUDDLE

(CONTRIBUTED)

THE self-assurance of the planners who have chopped off Rs. 355 crores from the original Railway Plan of Rs. 1,480 crores must have received a jolt during recent days, when a senior Minister of the Central Cabinet has had occasion repeatedly to complain that transport inadequacy was standing in the way of his fully realising some of his own plans. The complainant is no less a person than Shri T. T. Krishnamachari, the Minister whose responsibility it is to work some of the key portions of the Plan in the public sector, and also whose worry it is to get the private sector to play its full role in the next five years. The Commerce and Industry Minister has said, for instance, that the cement production cannot be increased beyond what is provided in the draft second Five-Year Plan, mainly because of the fear that the necessary rail transport may not be available to match the increased production. The misgivings to which Shri Krishnamachari has given open expression must be in the minds of many others who are faced with the prospect of producing large additional quantities of goods and commodities for which rail transport may not be available. Those concerned with the launching of large new projects, both in the public and private sectors, are even now pausing to ask themselves whether the schemes on which they are lavishing both money and other resources would be stalled because the railways may find that they cannot carry their goods.

What tends to make one uneasy in the extreme about the transport situation is the fact that much of the limited extra rail capacity which the planners have decided to provide for will be monopolised by the State. Pertinent to this is the disclosure now made that out of the sanctioned additional capacity of 42 million tons per annum by the end of the second Plan period, as much as 83 per cent will be reserved for steel, coal and cement traffic, leaving the rest of the country to share the balance of 13 per cent. If things were only as bad as that, it would be some mercy. Actually, the situation is much worse. According to the Planning Commission's own targets of production, additional traffic to the extent of 60.8 million tons per annum would be generated by the end of the second Plan. As against this, due to the limitation of funds, provision has been made only to the extent of 42 million tons, leaving about 19 million tons uncovered. The Planning Commission appears to have asked the Railways to guarantee transport to the extent of 35 million tons (out of the 42 million tons) for the three basic industries. Existing and new steel plants and raw products for them, including coal, would monopolise 25 million tons, additional coal for general and the Railway's own use would account for another six million tons, and additional cement four million tons. Out of the six million tons of coal, Railways themselves would require three to four million tons, leaving only two to three million tons for the rest of the country. The balance of seven million tons left out of the total of 42 million tons is to be shared by foodgrains, fertilizers, textiles, light and heavy engineering industry and a hundred and one other articles which the country needs and for which the Plan itself makes provision.

Where does the cut of 19 million tons, left unprovided for by the Planning Commission, fall? Seven million tons of the additional coal produced for general use, one million tons of additional cement production, and 11 million tons of general goods traffic will make up this cut of 19 million tons. As if this were not

enough, demands are now being made that the target of foodgrain production should be substantially raised. Here is the crowning piece. After the Planning Commission had slashed the original Railway Plan of Rs. 1,480 crores to Rs. 1,125 crores, further detailed examination has revealed that the original estimate of 60.8 million tons as the additional traffic might, after all, prove to be a gross under-estimate. A more correct estimate would appear to be somewhere between 70 and 75 million tons. That this is nearer the mark than the original estimate of 60.8 million tons is borne out by several factors. Original estimates made no provision for the vital export drive, a precious foreign exchange earner.

It has been assumed, also, that the lead of traffic would not increase—an assumption the folly of which would be apparent to those who study the trend of traffic leads in countries like USA and USSR. It is a matter of record that under the impact of planned development, the leads of the traffic in these countries went up by as much as 50 per cent. To expect that experience in India will be different is knowingly to invite disillusionment. Then, the original Railway Plan had assumed that manufactured goods or even commodities would move by rail only once, from the producer direct to the consumer. Common experience shows that goods often move first from the field and the factory to the wholesaler, and then from the wholesaler to the retailer, each stage involving movement by rail. No account has been taken of such duplicate movements. Under a free, unregimented economy like India's prevention of cross movements by rail, however desirable, presents its own serious administrative and other problems. The spectacle that faces the country and the Government, therefore, is that as against an estimated additional traffic of between 70 and 75 million tons, the Plan provides for no more than 42 million tons—a yawning gap of 28 to 33 million tons. That this unprovided for transport capacity will affect largely the share of the private sector of the industry is already clear. Let not the public sector, however, feel so unconcerned. For it is obvious that the Rs. 1,125 crores Plan, after taking care of the new steel traffic fully, and that of the additional coal and cement traffic partially, will have little capacity to spare for the rest of the public sector. In fact, if things are allowed to drift in the present manner, both the private sector and a considerable portion of the public sector will find themselves in the unhappy position of chasing rail transport which just will not be there.

What, then, is the way out from a situation which, candidly, looks ominous? Here, the Planning Commission finds itself on the horns of a dilemma. It faces a conundrum, the solution of which it is not easy to find. Yet they must find one, if transport chaos is to be avoided. The solution lies in marginally cutting the allocations made to some of the other Ministries which are not of direct importance to the main objective of the second Five-Year Plan, that is, rapid industrialisation, and to pass on the savings thus made to the Railways. Will the Planning Commission dare to recommend this solution? Here, alas, politics get mixed up with planning. The result is the pathetic admission made by the Planning Commission in its draft of the second Five-Year Plan that the transport position will be kept constantly under review and the allocation made to the Railways will be increased if resources permit. What the Planning Commission fails to realise,

is that funds placed at the disposal of the Railways in the third or fourth years of the Plan can be utilised only in the third Five-Year Plan. If the present wide gap in transport capacity, which is likely to assume serious proportions in the fourth and fifth years of the second Plan, is to be closed, it is imperative that the Railways be authorised now to enter into commitments for supplies which will be paid for only in the third and fourth years of the Plan. Even next year it may be too late, because it takes two to three years to build up new manufacturing capacity in the country, or to develop additional line capacity, or even to import rolling stock from abroad.

It is estimated that development of additional capacity of 33 million tons, the extent of the uncovered gap, would require a further investment of Rs. 150 to Rs. 160 crores. This would comprise Rs. 60 crores for additional 50,000 wagons, another Rs. 60 crores for additional 1,000 locomotives and Rs. 30 to Rs. 40 crores for developing additional line capacity. Roughly, it takes Rs. 4 to Rs. 5 crores in capital investment to carry an additional one million tons of traffic. That this additional investment will have to be found partly, or even largely, in foreign exchange may prove to be a more difficult problem to solve than finding the money itself. But the important thing is to give up vacillation and decide whether the country would deliberately go

in for a transport chaos, or whether it would make sacrifices in less important sectors in order to eliminate this risk.

Common sense boggles at the thought that the Planning Commission has failed to realise the gravity of the situation. The anxiety on its part to obtain "neutral" opinion on the Railway Plan from a succession of foreign experts and economists bespeaks of its desire to find a way out. But more expert advice is only helping to produce more confusion. In this confusion, which clouds vision and warps judgment, one cardinal factor is being overlooked. How much of the expert advice, even where found acceptable, can be taken advantage of during the second Plan period? This is the question of questions which the Planning Commission and its experts must answer. Whatever is in the nature of a long-term solution for curing the ills of our railway system or improving its efficiency, must be eschewed from immediate calculations. Where measures for improving railway efficiency are found to be capable of immediate and large-scale application, by all means let us have them—and quickly. But let not the planners get bogged down in theory which may have worked admirably in foreign climates but which has no application in present Indian conditions. The stake is great—the very success of the second Plan, on which the nation has fondly pinned its hopes.

THE BASIS OF COMPENSATION

THE discussion last week in the Lok Sabha on the nationalisation of banks was fruitful in at least one important negative manner. No nationalisation of banks beyond those already announced is to take place. This, however, is not a closed question and at least one aspect of the matter deserves special consideration in view of the fact that several members seemed to be of the opinion that the rate of compensation in the case of the State Bank of India had been excessive. This article is concerned with estimating the difference between the market value of shares and their share capital plus reserve funds.

The table below contains a study in respect of 11 Indian Banks. The last column in this table shows the market value of share capital worked as a mean of the highest and the lowest prices for the years 1954 and 1955. The third column shows the reserve funds at the end of these calendar years and the next column shows the share capital also at the end of each year.

The unexpected conclusion emerges that, over all the banks taken together the market value both in 1954 and 1955 was significantly lower than the sum of reserve funds and share capital. There are only two

banks, namely, the Bank of India and the Bank of Mysore in which this has not been the case, and here the differences are marginal. The Bank of Mysore is due for nationalisation so that the only private bank in which it might be said that the market value does no injustice to shareholder—assuming his rights are determined in terms of the sum of the reserve fund and share capital—is the Bank of India.

So to state the problem of compensation is again to do a shareholder an injustice. Companies earning profits after taxation shown in the first column must obviously be presumed to have substantial goodwill. Some of these banks have been in operation for over 25 years, and it is obviously unreasonable to assume that established companies of this kind carry no substantial goodwill outside their capital and reserves. If any conclusion is possible from these figures it surely is that, in the case of these banks, compensation on the basis of market value of shares is grossly unjust to shareholders. The State Bank of India's case should, therefore, never be a precedent in such cases, not because the compensation was high or low in that case, but because the principle is one which is unjust for Indian banks as a whole.

Serial No.	Profits after Taxation		Reserve Fund		Share Capital		Market Value of Shares	
	1954	1955	1954	1955	1954	1955	1954	1955

The Business World

FROM A MIXED ECONOMY TO A MEDDLING ANOMALY

By
CROESUS

THE Prime Minister of India sprang no surprise on the business community when, on Monday last, he re-enunciated the Government of India's industrial policy. For, for over a month now, inspired reports about the new statement on industrial policy, which is believed to have been drafted by a committee of Economic Secretaries, have been current, and it is seen that, except in regard to details, there is no appreciable difference between the new policy statement and the broad outlines thereof indicated earlier.

After reading the full text of the statement made by the Prime Minister, many felt like reiterating the observation made by Mr. M. A. Master when he recently addressed a public meeting on "Will Shipping be Nationalised?" He then said: "There will perhaps be no need to announce that the shipping industry will be nationalised. We shall, however, be soon witnessing the spectacle that steamers of the State alone will be running on some of the old routes which private enterprise has served and on all the routes which India is anxious to serve". Without being cynical, a veteran business man suggested that there is no longer the need to ask the question whether any industry is going to be nationalised, not that the absence of any indication to this effect would matter much after our experience of the 1943 statement on industrial policy. More than one industry not specifically scheduled therein for a take-over by the State was nationalised without any qualm. Yet the new resolution, I must say, represents a fundamental shift and a crucial change in the industrial policy of the country. There is no gainsaying the fact that the new policy promises to take the country even beyond perhaps than what the sponsors of the Avadi and the Amritsar Congress resolutions desired. It would be sheer hypocrisy to contend, as has been done, that the changes that have taken place since the enunciation of the industrial policy statement of 1948 warrant the reorientation of the policy on the lines on which it has been done. The truth is that doctrinaire principles have come to prevail. Surely, in order to realise the objectives indicated by Mr. Nehru or, for that matter, to accelerate the rate of economic growth and speed up industrialisation and develop machine making and heavy industries, it was not necessary to expand the public sector and hold a threat of extending it even further to the extent that has been envisaged. It is a moot point, again, if the new industrial policy will go long enough to reduce disparities in income and wealth, although it will certainly prevent the development and expansion of industries—which is not equivalent to the creation of private monopolies and concentration of economic power in all cases. But even granting that such a radical reorientation of industrial policy was called for, is the State today in a position really progressively to assume a predominant and direct responsibility for setting up new industrial undertakings and also for developing transport facilities, not to speak of undertaking State trading on an increasing scale?

In the course of his lecture referred to earlier, Mr. Master had dwelt on the relative achievements of private enterprise and of mixed economy and established that the achievements of private enterprise could stand very good comparison 'vis-a-vis' those of mixed economy. But even Mr. Master, I am sure, will not

ask today for a monopoly to private enterprise. Many would be content if the economic pattern in this country were left as it is, that is as a mixed economy. Not so, it seems, the Government. The mixed economy concept has to be content with only small mercies now. The conspicuous absence of even a reference to the term "mixed economy" in the new industrial policy is significant. As a Calcutta contemporary has aptly remarked, in the type of industrial structure that is now being visualised, "the tentacles of State control and interference threaten to reach down to the source of individual initiative and enterprise upon which private industry is founded". It is noteworthy that, even in the sphere of trading, the private sector is to have an opportunity to develop and expand only as an agency for planned national development in the context of the country's expanding economy.

The new statement no doubt attempts to categorise the industries which will be the exclusive responsibility of the State, the industries which will be progressively State owned and of which the State will generally take the initiative in establishing new undertakings, but in which private enterprise will also be expected to supplement the efforts of the State, and industries in which further development will, in general, be left to the initiative and enterprise of the private sector. At the same time, the statement makes it clear that this classification is by no means watertight. This was only to be expected in the light of the observation in the draft outline of the second Five-Year Plan that, "in effect, it is appropriate to think in terms of interpenetration of public and private sectors rather than to separate the sectors." In the event, it is not so much the interpenetration of the two sectors but the super-penetration of the public into the private sector. Instead of clearly demarcating the spheres of operation of the public and the private sectors, it has rendered the position even more vague than under the earlier statement. The statement also does not adduce convincing reasons for the inclusion of certain industries, such as coal, etc. in schedule A. Similarly, the inclusion of generation and distribution of electricity under schedule A and the statement that this should not come in the way of generation and distribution of electricity purely for local purposes leaves the position highly uncertain. Apart from believing earlier expectations that generation and distribution of electricity would come under schedule B, it seriously limits further large-scale expansion of power generation, notwithstanding the assurance that the inclusion in schedule A does not preclude the expansion of existing privately-owned units or possibility of the State securing co-operation of private enterprise in the established and new units when the national interests so required.

Although the absence of any time limit for the operation of the new policy statement is to be welcomed, the fact that the policy makes it open for the State to take up any industry or trade and that there is no specific guarantee against nationalisation of any industry as such detracts greatly from the value of the statement.

It is all very well for the authorities, in their pursuit of an ideological principle, to propose a further shift towards the left. But they must not forget that

Products Of The BIRLA COTTON SPINNING AND WEAVING MILLS. LTD., DELHI.

BIRLA BROTHERS LTD.

this is beset with a great danger, in that it may lead to fundamental distortions in the aims and methods of our country which we profess to be a democracy. This country has, indeed, done well in eschewing violence in the political sphere, which is tantamount to the use of the stick as an incentive in the economic sphere. The logical corollary of this would be acceptance of the carrot. Whether this is called profit motive or social gain is best left to the people's conscience to decide. In the ultimate analysis, it is just not ideology that works but the initiative, enterprise, and experience of those who know. There is no wisdom in doing everything to discourage the latter and relying wholly or unduly on the former. Anyone in the 20th century would not be so unwise as to advocate a regime of

'laissez-faire'. But experience since the industrial revolution, more especially during the inter-war period and since, has established that it is not regimentation that can bring about a nation's prosperity. After what America, West Germany and Japan have achieved, it would be shutting one's eyes to argue that anyone of the objectives sought to be attained by the new statement on industrial policy can only be achieved by the proposed shift in strategy. There is no doubt much to be said politically for the revolution of expectations that this statement is sure to evoke. But if this is not to end up in a revolution of frustration, there is clearly a case for a rethinking of the new industrial policy statement. As a was tells me, it is a shift from a mixed economy to a meddling anomaly.

SEARCHLIGHT ON INSURANCE BILL

By

CROESUS

ALTHOUGH, in a democracy, it is the majority that counts, no one has had the temerity so far to suggest that the minority is never in the right. As a matter of fact, more often than not, it is the minority that may be expected to put forward the right point of view on problems of public interest, and my study of the joint minute of dissent by Messrs. Tulsidas Kilachand and G. D. Somani to the Select Committee's Report on Life Insurance Corporation Bill, 1956 convinces me that this view is correct. I am surprised that, in a legislation which is ostensibly intended for the good of the policyholders, there should be an endeavour to do away with even the protection that had been assured to them under the old Insurance Act. There are various provisions under the Insurance Act, 1938 which seek to secure the interests of policyholders. But Clause 43 of the Bill, as it has emerged from the Select Committee (Original 34), for instance, provides for the compulsory application of only certain provisions of the Act, with the result that certain important safeguards which the policyholders enjoyed under the 1938 Act have, so to say, been done away with. Thus, no provision is made for the election of policyholders' representatives either as members of the Corporation or as members of the zonal boards; again, there is no provision for keeping the expenses of management within prescribed limits, as though this were not necessary under a State undertaking; if anything, there is greater need to regulate expenses of management of public enterprises; one also misses in the Bill as approved by the majority of the Select Committee, the provision to regulate the investment of controlled funds in the interests of the policyholders. (It must, however, be added here that there is a provision empowering the Government to frame rules for this purpose).

When the interests of the policyholders themselves have not been fully secured, the shareholders may not dare complain that the basis of paying compensation due to them is unfair. It is, in my opinion, necessary to highlight some of these points made by these two distinguished members of Parliament in their joint minute of dissent.

The revised clause 22 of the Bill, it may be noted, provides for the formation of zonal boards and zonal members. But not even on these boards, let alone on the Corporation, is there any representation for the policyholders. Under the 1938 Act, there was provision for election of policyholders' directors on the boards of management of the concerned insurance companies. To deny the policyholders the representation on even

the zonal boards is, therefore, to ignore their interests altogether. It is no argument in support of the majority view to point out that the policyholders' interests can be expected to be well looked after by the members of the Corporation or the zonal boards, even if they do not happen to be representatives of the policyholders. For there is a genuine fear that anyone other than an elected representative of the policyholders may not be able to plead the case of the policyholders effectively. Accordingly there is considerable force in the point made by the two M.Ps. that it would be not only reassuring to the policyholders if their representatives were on the board charged specifically with the responsibility of looking after their interest, but also instilling more confidence in them which would make life insurance more popular and attractive.

In regard to expenses of management, it is the considered view of these two parliamentarians that, inasmuch as the Corporation has been given the monopoly of life business and the policies it issues are guaranteed by the government, and also because the Corporation is likely to get a large amount of business even without canvassing, the Corporation will not need to incur the same expenses as individual insurance companies had to incur with competitive salesmanship. Accordingly, it would have been proper as well as justifiable to provide for the enforcement of similar provisions as those that existed under Section 40b and other relevant sections of the Insurance Act. In other words, Sections 27, 27A, 40B of the Insurance Act 1938 with suitable modifications should be made compulsorily applicable to the Corporation.

As regards investment of insurance companies, the guiding principle everywhere is that the investment should be spread as widely as possible, should give a handsome yield, and should be secure. It was with this object in view no doubt that Section 27 of the Insurance Act, 1938 imposed certain conditions on the investments of insurance companies. Since the known purpose of nationalisation which has been embarked upon is to enable the Government to be in possession of adequate funds, it is feared, there would naturally be a tendency for Government to invest as much portion of the insurance funds as possible in government securities and, correspondingly, to reduce the portion of investments in industrial securities and property, etc., the average yield in respect of the latter of which would be relatively higher. There is also the danger in a corporation such as the one proposed to confine its investments to the equities of only a few companies in order to save the trouble of investigating

and ascertaining the best equities. It is surprising that the Bill in question as approved by the majority has nothing to say on this important issue.

Perhaps the most important aspect of the Life Insurance Corporation Bill, 1956 is the basis of compensation payable to insurers. This is dealt with in the first schedule to the Bill. The basis of compensation takes into account the method of valuation of surplus, the relevant period of valuation, and the percentage of valuation surplus appropriated for the benefit of shareholders, which is as it should be. But in regard to the percentage of valuation surplus appropriated for the benefit of shareholders, the majority would appear to have taken a line that is clearly indefensible. As regards the period of valuation also, the average of the last two valuations of a company is adopted and the figure so arrived at adjusted with the average business in force during the calendar years 1950-55.

As a general rule for purposes of valuation of an ordinary trading business, no exception should be taken if the basis adopted were its profits over a number of years, because, in some years, these are low and in others high, inasmuch as profits tend to fluctuate from year to year in the case of these businesses. In the case of insurance business, on the other hand, in the very nature of things, the volume of business goes on increasing and with it also the valuation surplus. The earning capacity of an insurance company, therefore, is higher as the years pass. One would have expected our legislators to adopt the earning capacity of the insurance companies on the date of the taking over or as near it as possible as the basis for computing the compensation. But, under the arrangement pro-

posed by the majority, the date that would be taken into consideration for determining the earning capacity would be shifted back to the detriment of the interests of shareholders. The apprehension of the two M.Ps. that the underestimate of compensation consequent on this back-dating would be considerable is quite genuine and I would therefore support the arrangement that they have proposed, namely, to adopt the valuation for the year 1955 or, if this is found to be unacceptable, to ensure the basis for ever company on its last valuation surplus adjusted in proportion to the business in force as at the end of the year 1955.

Similarly, there should be no objection to accepting the suggestion of these two M.Ps. in the matter of the percentage of surplus to be taken into account. As they say, there is no reason to vary the percentage allocation by any company within the limits laid down by law. There is a clear risk of injustice happening to insurance companies if the percentages are less than those of their respective valuations. For, it should not be forgotten that it is on this basis that the shareholders would have purchased their holdings in these companies. Moreover, even the limit of 7½ per cent laid down in the 1938 Act is relatively lower than the corresponding limits permitted in other countries. In these circumstances, the upper limit of 5 per cent endorsed by the majority is not only arbitrary but also unfair. The only improvement that the majority has effected in regard to this aspect of the matter is to increase the limit of companies appropriating less than 3 per cent to 3½ per cent. But this is neither here nor there. If, therefore, the percentage is not raised when the Bill comes up before Parliament, the least that our legislators could do is to insist that the basis for any company should be the actual percentage appropriated by that company in respect of its last valuation.

Economic Report from the U.S.

NEW IDEAS IN BUSINESS MANAGEMENT

(By Guy Sims Fitch)

HOLLYWOOD BEACH, Florida, May 1.—Business gatherings are not exactly rarities on the American scene. But last week, at this Florida resort town, a little-noticed meeting was held that deserves more than a passing glance. The 400 men who attended it all are 40 years of age or under, and all are heads of companies doing at least one million dollars worth of business a year. Affiliated with the "Young President Organization", they were attending the Group's sixth annual "school" on management improvement. Its curriculum speaks volumes about the views and interests of American business leaders of the future.

Anyone present at last week's sessions could not help but be struck by the breadth of their subject matter. This year, the school offered 55 different "workshops" on current management problems. At the same time, the school's outlook was notable for its lack of insularity. The major theme was the "world around us". Delegates discussed such wide-ranging topics as higher education, new patterns in business thought, and the role of organized labour in society.

In assessing the attitudes of these young business men, it needs to be recalled that they grew up during the difficult years of the 1930's, but have pursued their careers during the post-war years of prosperity. Now at issue in their minds, and indeed accepted, are the many reforms that grew out of the experiences of the 1930's—reforms that help make the possibility of serious economic decline a remote one. It is no surprise, there-

fore, to find them a generally forward-looking lot, aware of economic pitfalls but unimpeded by fear that could stifle enterprise and initiative. They believe in change. They have demonstrated a willingness to try new ideas in business management—including such devices as profit-sharing, and stock-purchase plans for their employees. They accept government as an economic moderator, and they accept organized labour as a legitimate spokesman for the workers. They put great emphasis on planning. Particularly on their minds is long-range planning to meet the growing needs of a rising population that expects to keep on improving its living standards. And they agree that with business, labour and government working together, the American economy cannot help but grow and prosper.

With few exceptions, they welcome automation for the benefits it can bring to business in the way of more efficient operations and to the worker in the way of higher pay, shorter hours, better working conditions and higher living standards. But they also recognize that as the trend toward automation grows, considerable thought must be given to certain economic and social problems: workers will have to bring new and higher skills to their jobs and a great many people will have to find constructive outlets for their increased leisure time.

They see a need for the executive with a well-rounded education and place greater stress on what they call "creative thinking".

BUSINESS NOTES

GAMBLING AND THE LAW

THE FORWARD MARKETS COMMISSION has become increasingly active these days. One of its recent moves has been to warn speculators in non-transferable specific delivery contracts. With the application of the Forward Contracts (Regulation) Act, 1952, to cotton, cotton cloth and yarn, edible oilseeds and oils, raw jute, spices, sugar, wheat and gram, seedlac and shellac, forward contracts in these commodities are either prohibited or permitted only through recognised associations. Non-transferable specific delivery contracts, however, remain free, except in the case of wheat and gram in the whole of India, and in the case of certain oilseeds in Bombay, though the Central Government has powers, under Section 18(3) of the Act, to bring these contracts also under regulation.

The main conditions of a non-transferable specific delivery contract, as the description of the term itself clearly conveys, are: first, that there should be an intention actually to give and take delivery of specific types or qualities of goods and, secondly, that the rights and liabilities under the contract should not be transferable. It has been reported that, in several cases where forward contracts are prohibited, such contracts (forward contracts) are entered into under the guise of non-transferable specific delivery contracts, even though these do not conform to the requirements of the law.

The necessity of controlling unhealthy speculation through a statutory body is recognised by all. But it is only when the statutory body dubs all trading as speculation and tars all traders with the same brush that it provokes criticism. The sole rationale of forward trading is the provision of hedging, which is an important facility for those who have to carry stocks, in so far as it offers a valuable insurance against wide price fluctuations. By eliminating some of the risks of carrying stocks, forward trading also helps the grower, who generally does not have the means to hold on indefinitely for a better price. Without the participation of traders and large-scale consumers like, say, mills, any forward market would be narrow and less liquid with prices being hardly stable. The essence of forward trading consists in cushioning the risk of price fluctuation. It is, as such, wrong to limit forward trading exclusively to producers and consumers, on the pretext that hedge facilities are abused by persons who have no "direct interest except in making quick money". The object of the Forward Contracts (Regulation) Act, as can be judged from the Statement of Objects to the Bill and the Minister's statement in Parliament when it was under discussion, is to provide hedging facilities for both producers and traders and to have forward markets which would play "a useful part in tempering price fluctuations". According to the Forward Market Commission's press rejoinder to Sir Purshotamdas Thakurdas issued last week, however, it is now claimed that the forces of supply and demand are not the only criteria for the efficient functioning of the market but that other factors, such as national income and requirements of planned development also would have to be taken into account.

Be that as it may, it may be easy to suppress forward trading or stamp out betting on horses with just a simple fiat or firman declaring these illegal, but what about the other forms of gambling that take more injurious forms? Whether we like it or not, this spirit of gambling has today spread even to the remotest villages, making a hollow mockery of even the worst

forms of forward trading and led to rampant speculation in all manner of things that can be bought and sold, gold and silver, grains or seeds. It is not only the moral aspects of such gambling, but its material aspects as well, that present a serious problem and have defied solution hitherto. So long as buying and selling is free or relatively free, and people have to carry large stocks of commodities which cost money and involve risks of price fluctuations, the facility for hedging, which organised markets offer, cannot be lightheartedly dispensed with. Even so, one must accept that, between such forward trading and the Dheria market where one can bet for a pice, or betting on cotton figures, *sutta khel*, the dividing lines are not as sharp as they should be. Herein lies the headache of a body like the Forward Markets Commission.

REVISED POLICY FOR CEMENT

ONE OUTSTANDING fact of immediate importance, affecting the Government's policy on cement, which emerged from last Monday's discussion on the subject in the Lok Sabha, is that a striking change is to be introduced in the matter of distribution and price regulation of this commodity. A deeper probe into the persistent demand which is being pressed for the last few weeks for liberalising the imports of this basic developmental material has conclusively established that the whole problem needs to be reconsidered afresh and attention cannot be restricted only to the present requirements of imports. The consumption of cement is increasing with such rapidity that unless a comprehensive policy on distribution and pricing is adopted, sharp regional shortages and price disparities can hardly be prevented. In the first quarter of 1956 total demand for cement rose steeply to an annual rate slightly below 10 million tons which is double the current rate of home output. This rate of demand is sure to keep on increasing and it would pose a difficult problem for the industry and Government.

Mr. T. T. Krishnamachari has assessed that the problem of short supply will be hard to tide over at least till the end of 1957 when domestic production could be increased possibly to 9 million tons. The supply situation will then ease, but meanwhile the pressure of demand will continue to increase. Imports of 400,000 tons which have been arranged so far will have to be stepped up from time to time. The strategic importance of cement to a majority of development projects dictates the necessity of putting control on import and internal distribution. This task is to be assigned, as the Minister made it clear, to the forthcoming State Trading Corporation on very much the same pattern as the control over distribution and pricing of iron and steel. Total supplies, including indigenous production and imports, will be pooled together and prices will be equalised. It should be noted in this context that the c.i.f. price of imported cement ranges between Rs. 113 and Rs. 118 per ton as against the range of Rs. 71 to Rs. 79 for home-produced cement inclusive of freight charges. Packing and handling charges are, of course, additional to this latter price. Manufacturers in India are said to have asked for a price increase of Rs. 20 per ton for their output. Mr. Krishnamachari's observations on the price factor indicate that an increase of some such order would be necessary if more ambitious schemes of expansion are to be encouraged successfully in the private sector which takes responsibility for almost the whole output except for a fractional share.

The target of cement production of ten million tons (which would necessitate a capacity target of 12 million tons) suggested in the Draft Outline of the second Plan, has obviously become inadequate. On reasonable reconsideration a revised production target of 16 million tons (or over 18 million tons of installed capacity) has become necessary. This question is currently pending investigation at the hands of the Planning Commission. However necessary and desirable it may appear, any revision of cement expansion schemes will have to be fitted in with the transport capacity which the railways can spare. The limitations on the availability of this capacity are quite well known. The railway development programme provides transport for an additional 5 million tons of cement or 9.5 million tons in all. The gap of 6.5 million tons (on the assumption of a target of 16 million tons of output) would require the creation of an extra 130 per cent rail transport capacity. With no prospect of pressure easing from any other points, it is difficult to underrate the magnitude of this limitation.

EXPORT CREDIT GUARANTEE

IN A competitive world market where the buyer's voice is becoming more and more predominant there has arisen the necessity for offering liberal inducements to the overseas importer. Exporters in most countries have found it advisable to provide attractive terms of credit to their foreign customers. This increasing emphasis on export credit is not without its own risks, but these risks have to be undertaken on reasonable assessments. The element of risk exposes individual exporting firms to the danger of substantial financial losses. While on the one hand the object of the export credit guarantee system should be to make suitable provision of insurance in cases where ordinary insurance companies do not accept the risk, on the other hand, an important purpose ought to be promotion of exports which might otherwise make slow headway. It is clear that the balance of advantage would lie in setting up an export credit guarantee system. This is the view urged upon the Export Credit Guarantee Committee by the Federation of Indian Chambers of Commerce and Industry.

The Federation's memorandum does not claim to suggest any novel features for incorporation in the system which should be adopted in this country. On the other hand, it makes a frank observation that schemes for such guarantees which are operating in different countries are substantially the same in their broad pattern. Nevertheless, some of the principal suggestions made by it are worthy of careful attention. The Federation is of the view that the guarantee system in this country should start with a limited coverage. A scheme of this nature would be compact and capable of being worked efficiently. The Federation favours two types of policies under the scheme as in the UK, namely, shipments policy and contracts policy to cover distinct types of risks. The contracts policy should apply to additional risks like non-renewal or cancellation of export licences, imposition of restrictions on exports and similar changes in official policy subsequently introduced, circumstances leading to nonfulfilment of contracts on account of reasons beyond the exporter's control such as non-availability of transport, etc. As for the categories of commodities to be covered, the scope should extend to exports of machinery and durable consumer goods in respect of which India is trying to build new markets and similar goods for which a stable or developing market has not been built. Profit margins in export trade are tending to contract and it is of the utmost importance that the cost of the guarantee system should not

reduce these margins or reduce the competitive strength of exports. Premia under the system must necessarily vary from commodity to commodity but the general average, it is urged, should be about 1 per cent of the export cost. The Federation proposes that exporters should retain at least 20 per cent interest of the gross invoice value in the policies to ensure that they would continue to exercise all necessary prudence in their deals. Its other recommendations point to the desirability of extending the policies for specified commodities throughout the world to minimise premia and risk and establishment of a corporation to work the system in collaboration with the general insurance companies if they choose to participate in it.

WORLD MEET TO LAY SURPLUS GHOST?

WHETHER IT is in India or elsewhere, cotton this season seems to be in a mess all right. If it is the handling of the problem by the Forward Markets Commission that has produced a crisis in the cotton market in this country, the policy adopted in the distribution of her surplus cotton by America has provided a perennial source of headache to all the cotton-producing countries in the world. America's recent decision to embark on a policy of competing in the world markets has given rise to widespread apprehensions in the minds of many as to whether this would not result in damaging world cotton interests as a whole. Even though the details of this plan were adumbrated, for the first time, by the International Cotton Advisory Committee itself at its 1954 June meeting, the implications of the plan, with particular reference to the consequences on the price front of world cotton markets, are expected to be discussed threadbare only at the 15th plenary meeting of this body, which is scheduled to take place in Washington from May 8 to May 17.

The Conference is expected to be represented by the full complement of its members from 33 Governments of cotton exporting and importing countries, accounting for nearly 95 per cent of the world trade in cotton (outside the USSR). India will be ably represented by Mr. Manilal Patel, a leading cottonman of Bombay, who may be assisted by a senior official of the Indian Embassy in the US.

An examination of the statistical facts reveals that the accumulation of stocks in the US is the direct consequence of a high level of production aided and abetted by that country's price support policy, on the one hand, and a growing shrinkage in her as well as of world cotton exports generally. Cotton production in the US, which was 16 million bales in 1949-50, fell sharply to 9.9 million bales in the following season consequent on acreage restrictions. Although these restrictions on production became effective from 1950-51 onwards and were made even more severe since then, the production trend refused to slacken. In fact, from 1951-52 onwards it was one of increasing output, even the peak figure of 16 million bales in 1949 having been outstripped during 1953-54 with that year's outturn of 16.4 million bales. Since then, however, there has been a steady fall to 13.6 million bales in 1954-55. By the 1955-56 cotton season, it is estimated that cotton production would again be higher, being around 14.5 million bales, notwithstanding all the efforts of the authorities to limit production to just ten or eleven million bales. What has been achieved by acreage restriction has been almost wholly undone by the phenomenal rise in the US per-acre yield of cotton. On the disappearance side too, neither the US consumption nor her export has increased sufficiently to make any appreciable impression on the supply position. In the result, the imbalance between supply and demand in respect of American cotton is threatening to become a hardy annual. This

aspect of the matter will, of course, be discussed fully at the Conference.

Is America alone to be blamed or this surplus cotton problem? From the persistent manner in which the accusing finger has been directed towards her, it would seem so. But is it really so? Honestly, no one can say yes without any qualification to this affirmative. For, while America was at great pains to restrict her cotton production, other countries—whatever individual justification they may have had—went on increasing their plantings and merrily feeding the vicious circle. To have an effective control even on her own cotton output, America needs the assistance of other countries. Practical economics demands that America realise this fully and make every effort to keep the other cotton-growing countries in good humour. It is in this context that the forthcoming world Conference gains added significance. Every country participating in the Conference will get an opportunity, one hopes, to speak out its own peculiar problems arising out of America's decision to sell her cotton at competitive prices. In all such matters, especially, it is needless to say, a frank heart-to-heart talk between the concerned parties is a pre-requisite to the solution of any problem.

NEPA MILLS

THE RS. 6½-CRORE NEPA MILL, formally opened by the Prime Minister last week, is the first newsprint factory in India, and perhaps the only one of its kind on the mainland of Asia. It has a capacity of 30,000 tons a year, though output at present is lower at 60 tons a days. As production gets into stride, Nepa should satisfy nearly a third of India's requirements of 100,000 tons of newsprint annually, which are imported at a cost of about Rs. 8 crores. Imports of newsprint recorded an increase of 350 per cent between 1930 and 1955; they were 79,000 tons during 1954-55.

Production at Nepanagar is based on the use of **salai** for groundwood pulp and of **bamboo** for chemical pulp. This is a departure from the use of the conventional raw materials abroad. Conifers are the traditional raw materials used abroad in the manufacture of paper, newsprint, and chemical pulp. Though these are available in our country, their utilisation has been difficult owing to the inaccessibility of the Himalayan region, where they grow. Efforts are being made to open up these areas for exploitation. The utility of bagasse, eucalyptus, wattle and other hardwood species is also being investigated. A team of experts is visiting this country this year to prepare a project report on the subject. As the Nepa Mill is not in a position to meet the entire requirements of newsprint, further production capacity has to be installed. Two more newsprint mills are likely to be put up in the near future, one at Coimbatore in South India and the other in the North. Undoubtedly, both of these will profit enormously from the pioneering work that has been, and is being done at Nepanagar.

India has a long tradition in the paper trade. There are in this country at least 20 odd mills with an annually capacity of 2.12 lakh tons, manufacturing different varieties of paper and boards to the tune of 180,000 tons per annum. The industry is meeting the indigenous demand only to the extent of 80 per cent of printing and writing papers, 50 per cent of specialties, 30 per cent of packing and wrapping and about 95 per cent of paper and pulp boards. Tissue, parchment, grease proof, writing and printing, kraft and electrical grade papers and boards are being imported in various

quantities. The heavy duty imposed on old newspapers and the restrictive end-use of newsprint are intended mainly to enable the production of cheap wrapping and printing papers. The industry at present operates mostly with old and reconditioned plants. The investment in the industry in 1952 was Rs. 25 crores. Modernisation and substantial expansion of the mills and installation of new units licensed so far will require an investment of Rs. 20 crores. In the second Plan an outlay of Rs. 66 crores is envisaged so as to produce six lakh tons of paper and boards. It may be noted, however, that most of the machines and even some of the consumable stores, such as paper makers' felts and wires, have to be imported.

RESOLUTION ON BANK NATIONALISATION

FOR SOME time apprehensions were raised about the possibility of nationalisation of commercial banks in the country. A brief reference by the Prime Minister in a speech to the desirability of treating economic services like insurance and banking in a separate category from other enterprises in respect of nationalisation and the abrupt decision to nationalise life insurance had created an atmosphere of uncertainty about the future of commercial banks for some time. Not that there was an impending threat to banks, but the existence of fears of likely nationalisation at some time in the not distant future was itself highly undesirable. These doubts were set at rest by an unequivocal statement by the Finance Minister in the Lok Sabha to the effect that nationalisation of commercial banks as such was not contemplated by the Government. In the context of this policy statement, Mr. Gurupadaswamy's non-official resolution on nationalisation in the Lok Sabha need not have been pursued. If it was rejected by an overwhelming majority of votes, this fate of the resolution was a foregone conclusion.

The debate on the resolution served to disclose the basic weakness of the argument for nationalisation. It ought to be remembered that among the countries of the underdeveloped regions of the world, India ranks as one of the few which have built a sound and efficient structure of modern banking. Mr. Gurupadaswamy's allegation that the history of private banking in India was full of "disappointment, mismanagement, mishandling, misfeasance and mispursuit" was not only unsubstantiated but too wild and sweeping even to be noticed. Mr. A. C. Guha was constrained to dismiss the facts and figures quoted by the mover as irrelevant to the matter under discussion. His reply, however, was valuable in one sense. He removed some of the misconceptions on the subject. In considering the failures of banks (largely non-scheduled) in the post-war period, one had to remember that the majority of the failures related to West Bengal and here the upsets caused by the partition of the country were primarily responsible for them. Some more bubbles were also pricked by Mr. Guha in his reply. The savings of the community channelled into the commercial banks could hardly be used for development projects in the public sector. The obvious reason is that they represent short-term investments which cannot be locked up in long-term public enterprises. The adoption of the socialist pattern of society did not imply total effacement of the private sector and the necessity of a mixed economy and gradual transformation are recognised. Over 90 per cent of the production in the economy comes from the private sector in the context of which bank nationalisation ceases to have real reasoning. The statutory powers invested in the Reserve Bank of India provide ample safeguards for regulation of commercial banks and since the last five years they are being exercised with increasing effect.

MAHINDRA AND MAHINDRA LIMITED

NOTICE

The 10th Annual General Meeting of the Shareholders of Mahindra & Mahindra Ltd. will be held at the Registered Office of the Company, Gateway Building, Apollo Bunder, Bombay-1 on Monday the 14th May, 1956 at 4-30 p.m. to transact the following business.

1. To receive and adopt the Directors' Report, the audited balance sheet and profit and loss account for the year ended 31st October, 1955.

2. To declare dividend on Preference and Ordinary Shares.

3. To appoint a Director in place of Mr. K. C. Mahindra who retires by rotation under Article 110 of the Articles of Association but is eligible for re-election.

4. To appoint a Director in place of Mr. H. C. Mahindra who retires by rotation under Article 110 of the Articles of Association but is eligible for re-election.

5. To appoint a Director in place of Mr. Jal H. Mehta who ceases to hold office by virtue of Article 116 of the Articles of Association but is eligible for re-election.

6. To appoint a Director in place of Raja Maharaj Singh who ceases to hold office under Article 116 of the Articles of Association of the Company, but is eligible for reappointment.

And to consider and if thought fit to pass the following resolution of which special notice as required by Section 281 of the Companies Act, 1956, has been received by the Company and the relative explanatory statement concerning which as required by Section 173 of the said Act is annexed hereto.

Ordinary Resolution—

"Resolved that the age limit prescribed under Section 280 of the Companies Act, 1956 shall not apply to Raja Maharaj Singh who has attained the age of 77 years and who retires under Article 116 of the Articles of Association of the Company and that he be re-appointed a Director of the Company".

7. To appoint a Director in place of Sir D. N. Mitra who ceases to hold office under Article 116 of the Articles of Association of the Company, but is eligible for reappointment.

And to consider and if thought fit to pass the following resolution of which special notice as required by Section 281 of the Companies Act, 1956, has been received by the Company and the relative explanatory statement concerning which as required by Section 173 of the said Act is annexed hereto.

Ordinary Resolution—

"Resolved that the age limit prescribed under Section 280 of the Companies Act, 1956 shall not apply to Sir D. N. Mitra who has attained the age of 65 years and who retires under Article 116 of the Articles of Association of the Company and that he be re-appointed a Director of the Company".

8. To appoint a Director in place of Rai Bahadur Isher Das Sawhney who ceases to hold office under Article 116 of the Articles of Association of the Company, but is eligible for reappointment.

And to consider and if thought fit to pass the following resolution of which special notice as required by Section 281 of the Companies Act, 1956, has been received by the Company and the relative explanatory statement concerning which as required by Section 173 of the said Act is annexed hereto.

Ordinary Resolution—

"Resolved that the age limit prescribed under Section 280 of the Companies Act, 1956 shall not apply to Rai Bahadur Isher Das Sawhney who has attained the age of 73 years and who retires under Article 116 of the Articles of Association of the Company and that he be re-appointed a Director of the Company".

9. To appoint Auditors for the current year and to fix their remuneration.

10. Section 293, sub-section (1)(d) restricts the total borrowing powers of the Board of Directors to the paid-up capital of the Company and its free reserves which amount to Rs. 80 lacs. The Company's borrowings from the various banks amounted to Rs. 9,26,49,989 on 31-3-1956. It is therefore necessary to approach the shareholders for approval of these borrowings by the Company.

And to consider and if thought fit to pass the following resolution as required by Section 293 (1) of the Companies Act, 1956 and the relative explanatory note as required by Section 173 of the said Act is annexed hereto.

"Resolved that the consent of this Company be and it is hereby accorded to the Board of Directors borrowing monies in excess of the aggregate of the paid-up capital of the Company and its free reserves, that is to say, reserves not set apart for any specific purpose and that such borrowing shall be exclusive of the temporary loans obtained or to be obtained by the Company from the Company's Bankers in the ordinary course of business. Resolved further that the Company doth hereby ratify and confirm, all borrowings by the Directors after 2nd April, 1956 which are in excess of the aggregate of the paid-up capital and free reserves of the Company".

A member entitled to attend and vote at a Meeting is entitled to appoint a proxy to attend and vote instead of himself and the proxy need not be a member.

By Order of the Board,

KESHUB MAHINDRA,
Director.

28th March, 1956.

The transfer books of the Company will close from 30th of April, 1956 to 14th of May 1956 both days inclusive.

The dividend when sanctioned will be made payable to those shareholders whose names stand on the Register of the Company on 14th May 1956 and the dividend warrants will be duly posted to them on or after the 25th May, 1956.

The shareholders are requested to immediately notify any change of address.

EXPLANATORY STATEMENTS AS REQUIRED BY SECTION 173 OF THE COMPANIES ACT, 1956

In respect of Item No. 6 of the above notice of the 10th Annual General Meeting of the Company it is

notified that Raja Maharaj Singh who retires under Article 116 of the Company's Articles of Association but is eligible for re-election is 77 years of age and accordingly the ordinary resolution set out in the said Item is necessary under Sections 280 and 281 of the Companies Act, 1956 to be passed, for his reappointment as a Director and special notice under the Provision of Section 281 has been received by the Company from a member of his intention to move the said resolution at the said Annual General Meeting.

In respect of Item No. 7 of the accompanying notice of the 10th Annual General Meeting of the Company it is notified that Sir D. N. Mitra who retires under Article 116 of the Company's Articles of Association but is eligible for re-election is 65 years of age and accordingly the ordinary resolution set out in the said Item is necessary under Sections 280 and 281 of the Companies Act, 1956, to be passed, for his reappointment as a Director and special notice under the Provision of Section 281 has been received by the Company from a member of his intention to move the said resolution at the said Annual General Meeting.

In respect of Item No. 8 of the accompanying notice of the 10th Annual General Meeting of the Company it is notified that Rai Bahadur Isher Das Sawhney who retires under Article 116 of the Company's Articles of Association but is eligible for re-election is 73 years of age and accordingly the ordinary resolution set out in the said Item is necessary under Sections 280 and 281 of the Companies Act, 1956 to be passed, for his reappointment as a Director and special notice under the Provision of Section 281 has been received by the Company from a member of his intention to move the said resolution at the said Annual General Meeting.

In respect of Item No. 10 of the accompanying notice of the 10th Annual General Meeting of the Com-

pany it is notified that the major portion of the borrowings from the Banks is on account of the financing of import of Steel which the Company has been doing on behalf of the Iron and Steel Controller as well as on its own account as a recognised stockist. In the calendar year 1955 out of the total imports of 520,000 tons of Steel in India by the Iron & Steel Controller the Company imported over 187,000 tons which represents about 36 per cent of the total imports. Each ton of steel costs on the average between Rs. 500 and Rs. 700. Financing of such large imports needs strong banking credits. The Company has been fortunate in securing such assistance from the following Banks: Lloyds Bank Ltd., Bank of India Ltd., Bank of Tokyo Ltd., Mitsui Bank Ltd., National Bank of India Ltd., Bank of China.

The Government of India has entered into several contracts with Governments of Russia, Belgium, Germany and China for the import of Steel and the Iron and Steel Controller has allotted to the various importers of Steel the commercial handling of such business and the Company is receiving its share of such allotments.

With the advance planning to import three million tons of Steel in the next 3 years, the tempo of purchase will continue to increase and consequently the share of your Company in such imports will also increase. This will require provision of additional credit facilities.

The anticipated increased turnover in Jeeps, Spare Parts, and in manufacturing operations will also require additional finance provisions. Trading for the first five months of the current year is well above the average of the past year in all the divisions. In order therefore to maintain and develop its business it is necessary for the Company to have recourse to large credit facilities from Banks and other institutions.

THE RAMAYANA OF TULSIDAS IN ENGLISH VERSE

LATEST "HINDUSTAN TIMES" PUBLICATION

The famous Hindi epic regarded by many as "the greatest book in all devotional literature" is for the first time now available in English verse.

The translator, the Rev. A. G. Atkins, completed the book after ten years of devoted work. He has tried "to keep and express in English in the fine rhythm and music of the original in simple lucid language, and with as much of the vivacity, wittiness and picturesqueness that Tulsidas has put into his work." He has also followed in some measure Tulsidas's metrical variations such as *chhand*, *chaupal*, *doha* and *soratha*.

In a foreword Mr C. Rajagopalachari says: "Mr Atkins' monumental work and his Introduction are a revelation of hope for those who desire to see all the great religions of mankind come together. . . . His service is not only to English-speaking people but also to that very large number of Hindus in India who do not speak the Hindi language and to whom English has become a very familiar medium."

The book is of special value to libraries, scholars and devotees of Tulsidas.

It has been issued in the following four editions:

- I. Original text of Tulsidas with translation in English verse; three volumes; 1468 pages; price Rs. 50 net.
- II. Translation in English verse; without Hindi text. two volume; 898 pages; price Rs. 40 net.
- III. Special tissue paper edition of I, one volume, price Rs. 100 net.
- IV. Special tissue paper edition of II, one volume, price Rs. 100 net.

COMPANY AFFAIRS

THE INDIAN OVERSEAS BANK, LTD.

During the year 1955, the upward trend in bank resources in general continued, the total liabilities of Scheduled Banks rising by Rs. 90 crores from Rs. 942 crores at the close of 1954 to Rs. 1,032 crores at the end of 1955. Their total credit registered an expansion of Rs. 102 crores. There was an increase in total advances, including bills, of Rs. 93 crores, expansion in notes issued of Rs. 148 crores and in money supply of Rs. 206 crores. In brief, monetary tendencies reflected predominantly the implementation of the first Five-Year Plan. The Reserve Bank of India rate has remained unchanged at 3½ per cent from the middle of November 1951, while the Bank of England rate has gone up steadily from 3 per cent to 3½ towards the end of January 1955, to 4½ per cent about a month later and again to 5½ per cent in February 1956.

The working of the Indian Overseas Bank for the year 1955 has been satisfactory, establishing some new records. In 1954, deposits had improved by Rs. 132 lakhs, which now stand at Rs. 1,442 lakhs, registering an increase, during the year under review, of Rs. 313 lakhs or about 27.7 per cent. This compares favourably with an expansion of 9.5 per cent in the total liabilities of Indian Scheduled Banks. Advances, comprising mostly bills purchased and discounted, showed a rise of Rs. 353 lakhs over 1954 and investments increased to Rs. 484 lakhs, an increase of Rs. 75 lakhs. Gross earnings of the Bank went up from Rs. 69 lakhs in the previous year to around Rs. 85 lakhs in the year under report, an increase of over 23 per cent. The net profit was higher at Rs. 16.55 lakhs (subject to income-tax) as against Rs. 13.35 lakhs during 1954. This was in spite of increase in expenditure under all heads, particularly under emoluments to the staff.

Interest and Discount earned for the Bank about Rs. 46 lakhs, while Commission, Exchange and Brokerage earned a little under Rs. 39 lakhs. Interest paid by the Bank on Deposits, Borrowings, etc., amounted to nearly Rs. 21.81 lakhs, salaries, allowances, etc., accounted for Rs. 32.13 lakhs and Depreciation a little over Rs. 2 lakhs. Other major items of expenditure were rent, taxes, etc., accounting for Rs. 4.48 lakhs and Other Expenditure amounting to around Rs. 3.64 lakhs. Provision for taxation amounts to Rs. 7.5 lakhs and Rs. 4 lakhs have been transferred to Reserve Fund. In view of the all-round improved working of the Bank during the year, the Director have raised the percentage of dividend by 1½ from 6 for the past four years to 7½ for the year under review. This absorbs Rs. 3,68,265. After taking into account Rs. 2.16 brought forward from the previous year, and after allowing for all appropriations, there remains a balance of Rs. 2,28,299 which has been carried forward.

THE CENTRAL BANK OF INDIA, LTD.

The working of the Bank for the year 1955 has resulted in a profit of about Rs. 77.76 lakhs (subject to tax) in a gross earning of Rs. 5.70 crores. This year's profit is a little less than Rs. 77.88 crores for 1954 when the gross earning was comparatively low at Rs. 5.41 crores. The profit, together with Rs. 17.89 lakhs brought forward from the previous year's accounts, makes available Rs. 95.65 crores for disposal. An ad-interim dividend of 6 per cent, income-tax free, or Rs. 1-8 per share, on 12,58,170 shares, was paid for the half-year ended June 1955 which absorbed Rs. 18.87

lakhs. An amount of Rs. 15 lakhs has been transferred to the Bank's Investments, Rs. 5.5 lakhs have been provided for taxation and an equal amount has been set aside for staff gratuity fund. The Bonus has been provided at Rs. 13.5 lakhs, leaving a balance of about Rs. 37.27 lakhs. A final dividend also at 6 per cent for the half-year ended December 1955 absorbs the equivalent of the ad-interim dividend, i.e., Rs. 18.87 lakhs and the balance of Rs. 18.40 lakhs is to be carried forward.

Of the major items of income, Interest and Discount has earned over Rs. 4.52 crores against Rs. 4.43 crores during the previous year. Commission, Exchange and Brokerage accounts for Rs. 93.59 lakhs against Rs. 85 lakhs of the previous year. Net profit on sale of Investments has trebled from Rs. 5 lakhs in 1954 to Rs. 15 lakhs during the year under review. The earnings of rent on the Bank's premises also register an increase from Rs. 4.97 lakhs of 1954 to Rs. 5.36 lakhs for 1955. On the Expenditure side, interest paid on Deposits, etc., is a little higher at around Rs. 1.70 crores as compared to Rs. 1.65 crores for 1954. Salaries, allowances and provident fund also have increased from Rs. 2.37 crores in 1954 to Rs. 2.61 crores during the year under report. Rent, taxes, etc., have absorbed Rs. 24.14 lakhs, nearly Rs. 4 lakhs less than during 1954, while stationery, printing, etc., have taken away about Rs. 14 lakhs, which registers a marginal increase over the figure of Rs. 13.72 lakhs for 1954.

THE UNION BANK OF INDIA, LTD.

In a gross income of Rs. 40.53 lakhs as against Rs. 31 lakhs for the previous year, the profit of the Bank for 1955 at Rs. 9.45 lakhs has registered an increase of a little less than 40 per cent over that for 1954 when it was around Rs. 6.76 lakhs, reflecting a satisfactory working of the Bank during the year 1955. Adding to the profit Rs. 1.76 lakhs brought forward from the previous year, the amount totals Rs. 11.21 lakhs out of which Rs. 2 lakhs go to the Reserve Fund account. An amount of Rs. 50 thousand is transferred to Contingency Account while the amount written off premises is Rs. 75 thousand. For taxation has been provided Rs. 1.75 lakhs and for Bonus to Staff Rs. 1.25 lakhs. Of the balance of Rs. 4.96 lakhs, Rs. 3 lakhs are paid as dividend (free of income-tax) on 8 lakh shares at 6 annas per share which is equal to 7½ per cent per annum. The balance of Rs. 1.96 lakhs is to be carried forward to the next account.

As against the figure of Rs. 26.74 lakhs earned as discount and interest during 1954, the Bank's income from these sources for 1955 amounts to Rs. 31.52 lakhs. The income from Commission, Exchange and Brokerage has shot up from Rs. 1.97 lakhs in 1954 to Rs. 5.21 lakhs during 1955. Sale of Investments also has earned a net profit of Rs. 1.33 lakhs which is more than double of Rs. 64 thousand earned during the previous year. Rents on buildings also register a 50 per cent increase over the previous year. Among the major items of Expenditure, where there is all round increase, interest paid on deposits is a little over Rs. 14 lakhs against over Rs. 12 lakhs in 1954. Salaries, allowances, etc., absorb Rs. 10.34 lakhs against only Rs. 7.96 lakhs in the previous year. Rent, taxes, etc. are high at Rs. 2.25 lakhs against Rs. 1.35 lakhs for 1954, and stationery, printing, etc., absorb Rs. 1.74 lakhs against Rs. 1.24 lakhs in the previous year.

COMMODITY NEWS AND NOTES

CONSUMPTION AND PRODUCTION OF RUBBER

According to Mr. Cecil Stack, Chairman of the Association of Rubber Manufacturers in India, rubber consumption in 1955 at 27,543 tons was 8% higher as compared to 1954. Production in South India was 22,481 tons (988 tons more than in the previous year). The deficit was largely made good by imports which totalled 3,839 tons for the whole year. The estimated deficit is likely to be more than 8,000 tons as compared with 4,948 tons last year. The newly constituted Rubber Board have drawn up plans to replant 70,000 acres of rubber in South India, but increased production is not likely to become available until 1963.

As railways alone will be unable to provide sufficient transport to meet the growing requirements under the second Plan there is a case for building up additional capacity for the production of automobile tyres and tubes to 1.44 million each by 1960-61 and a production of 9.7 million and 10.4 million cycle tyres and tubes by 1960 (as against consumption in 1954 of 5.436 million and 5.577 million respectively). Moreover, motor vehicle is expected to increase from the 1955 figure of 23,000 units to 57,000 by 1960—an increase of nearly 150 per cent and production of bicycles from 500,000 in 1955 to 1,000,000 by 1960.

CEMENT IMPORTS

Controversy is rife again whether to have liberal cement imports or not. Trade organisations have been pleading for a review of the Import Policy of the Government of India; their main argument being that as the price of the imported cement is higher by about Rs. 40 per ton, the indigenous industry will not be affected by liberal imports. Besides this, the assessment is that India needs 9 to 10 million tons of cement annually at least to meet its requirements, whereas the present production capacity is only five million tons. In the month of March the Government of India permitted cement imports of about 400,000 tons only and reduced the duty to Rs. 5 per ton which is the same as the excise on the commodity.

SUGAR PRODUCTION

Sugar production in India during March this year was 3,32,226 tons, bringing the total production during the first five months of the current sugar season to 14,05,275 tons, against 12,90,000 tons during the corresponding period last year. It is further reported that during the current season, 142 factories were working as against 132 factories last season. The off-take of sugar from the factories during the month of March was about 89,000 tons against 99,290 tons during the corresponding period last year. The total off-take from factories during the first five months of the current season was about 7,04,000 tons as against 3,74,600 tons of the previous season. The closing stock of indigenous sugar with the factories on March 31, was about 11,27,000 tons, against 9,84,000 tons during the corresponding period last season.

GOLD PRODUCTION IN INDIA

It is reported that India produced 2,39,168 ounces of gold during 1954. Of this quantity, 2,20,522 ounces were produced from the Mysore gold fields alone. The only other working mine—the Hutti Gold Field in Hyderabad—produced only 18,646 ounces during the period. Gold-bearing veins are also known to exist in Dharwar district of Bombay, Mynaad and Anantapur districts of Madras and Loma in the Manbhum district of Bihar. Alluvial gold is found widely distributed in many parts of the country—Assam, Bihar, Orisa, Madhya Pradesh, Punjab, Uttar Pradesh, Kashmir and West Bengal.

TURMERIC FUTURES CENTRE AT SANGLI

A forward contracts centre for turmeric, the only one of its kind in the country, has been opened at Sangli. Merchants from different parts of the country, including those from Bombay, Madras, Kolhapur, and Nipani, attended the inaugural function which was held at the buildings of the Spices and Oilseeds Exchange Ltd., Sangli. The centre is likely to be made permanent after the experience gained from the three years' period granted to it.

PAKISTAN TEA ESTIMATES

Pakistan's final estimate of the area under tea crop for the year 1955-56 is 76,500 acres as against 74,000 acres reported in the first and final estimate of the previous year, and shows an increase of 3.4 per cent according to figures released by the Pakistan Government. The release added, the final estimate of the yield under this crop for the year 1955-56 is 52.5 million lb. as against 54 million lb. reported in the corresponding period of the previous year, and shows a decrease of 2.8 per cent which is attributed to unfavourable weather conditions throughout the plucking season.

SECOND ESTIMATE OF LINSEED

According to the Directorate of Economics and Statistics, Union Ministry of Food and Agriculture, the all-India second estimate of linseed for 1955-56 puts the current year's area at 2,560,000 acres, as against the adjusted second estimate of 2,478,000 acres for 1954-55. This shows an increase of 82,000 acres or 3.3 per cent, in area over last year. The increase in acreage under linseed during the current year has been shared mostly by Madhya Pradesh and Hyderabad and has been attributed to favourable climatic conditions at the sowing time. This increase has, however, been offset to some extent by decreases reported mainly by Bihar. The information given in this estimate relates generally to the period up to the end of February 1956.

SECOND ESTIMATE OF RAPE AND MUSTARD

According to the Directorate of Economics and Statistics, Union Ministry of Food and Agriculture, the all-India second estimate of rape and mustard for 1955-56 puts the current year's area at 2,386,000 acres, as against the adjusted second estimate of 2,228,000 acres for 1954-55. This shows an increase of 160,000 acres or 7.2 per cent in area over last year. The increase in acreage under rape and mustard during the current year has been shared mainly by Punjab, Rajasthan and PEPSU and is due generally to favourable climatic conditions at the sowing time. A slight decrease in area has, however, occurred in U.P. and Assam.

Heads I Win, Tails You Lose

THE Eighth Session of the Indian National Trade Union Congress held at Surat this week was significant for a number of imposing resolutions. Designed, it seems, for the widest political effect. Those related to real wages—the appointment of Wage Boards for major industries and a Pay Commission for the public sector is important in this respect—the removal of large disparities in earnings and, of course, the new exciting subject of workers' participation in management, on each or all of which long essays can be written. So, indeed, one could write a treatise on the morality of for-bidding strikes and lockouts for the duration of the Plan. To the extent that this curtails freedom in a democratic society one can assail it on political as well as on moral grounds. But these are in truth incidentals. If production is the supreme task of the Indian Union in the next five years—and the alternative to production is increasingly seen as inflation—some restraints on all members of Indian society are inevitable. It is quite inappropriate to quarrel about minor restraints of this kind while the large issue of production in the next five years is unresolved.

There should, therefore, be no petty criticisms of the proceedings of the Surat Conference. What is important is that there should emerge from all conferences of sectional interests in this country a broad pattern which is consistent with the second Five-Year Plan and its targets. The errors that Trade Unionists make—and for this purpose Mr. Khandubhai Desai and Mr. Gulzarilal Nanda are nothing but Trade Unionists—is that, when they perform at Trade Union Conferences, labour leaders forget that they have obligations no less than those of employers to take a national, and not a sectional, view of issues like wage policy and employment. It is all very well to talk about the need for higher wages to those in existing employment. But surely Mr. Khandubhai Desai and Mr. Gulzarilal Nanda in particular must recognise that these higher wages can, under present circumstances, whether in the public or private sector, only be bought at the cost of additional unemployment.

If the Government of India had made up its mind that organised unemployment is a secondary matter, and that a higher standard of living

for those in organised employment is the paramount aim of wage policy, no quarrel could arise in regard to the pronouncements of the Ministers of the Central Government. But both the Labour Minister and the Planning Minister are known to be employment addicts, and to favour the Ambar Charkha, the new symbol of the paramount character of India's unemployment problem. If Mr. Nanda, for example, was really in earnest about the raising of organised real wages, he should logically be really in earnest about the raising of productivity; to the extent that he is logically in earnest in raising productivity, he should be logically at least in favour of rationalisation. In point of fact Mr. Gulzarilal Nanda is the most violent opponent in the Central Government of rationalisation and, indeed, he has committed himself in a quite extreme degree to the Ambar Charkha, which is the main enemy of textile rationalisation. Thus he contrives, a little uneasily, to ride both horses at once. To the Trade Unionists in solemn conference he offers higher wages and thereby more restricted employment. To the unemployed he offers a pittance, and a wage policy which prevents the raising of the unemployed in our villages into the privileged ranks of organised industrial workers. The poor are thus kept in their proper stations, as if by an enlightened act of Providence; and Mr. Nanda really looks like the friend and saviour of the employed and unemployed alike. By restrictionism, real organised wages are kept high and it is conveniently forgotten that, by this very act, unorganised wages are kept desperately low.

This differentiation in attitude to the privileged employed and the unhappy unemployed represents a powerful confusion in Congress philosophy which is still to be resolved. So far as the true Gandhian message was concerned, there was no confusion, although latent confusion was resolved only by abandoning economic progress. At the present time, however, the neo-Gandhians—with Mr. Gulzarilal Nanda at their head—wish to have things both ways. They want higher productivity and higher wages for the selected few, but to restrict the instruments of higher productivity in order to perpetuate a larger degree of employment at a pitifully small wage for the many. In their heart of hearts, they recognise the inconsistency of their economics. This does not worry them unduly; for what makes their action consistent is that it is politically advantageous in both cases.

The Rabbit from the Hat

WEEK before the second Plan is to be placed before the Lok Sabha, its contents in one essential respect—the target for agricultural output—are in a state of flux. In part this uncertainty reflects an unknown quantity in the Plan as a whole—the volume of inflationary finance which the system can take. The last-minute proposal to raise the target of additional food output from 15 to 40 per cent is really a trick to persuade ourselves that inflation need be no danger at all. In this sense, though perhaps in no other, Mr. K. C. Neogy was reflecting a general malaise; why otherwise should this sudden jump in agricultural target be presented at the same time as his note? The Deputy Chair-

This, and no other, is the central issue of wage policy in the next five years. Politically the Congress Party has to walk this dangerous tight rope, giving satisfaction to organised labour entrenched in strong Trade Unions liberally supported by the Congress Party, and at the same time giving support to an amorphous mass of unemployed who, by mere force of numbers, enjoy a political strength which it is impossible for the Congress Party to ignore. Thus it suits Mr. Khandubhai Desai and Mr. Gulzarilal Nanda to speak with two voices, because in point of fact both voices lead to more votes, and, therefore, to more power for the Congress Party. In the pursuit of popular support, their policy acquires its unified meaning; its callous economic implications for the unemployed are often forgotten because "free enterprise" has no employment policy.

The question that needs now to be asked is whether this course which is obviously politically wise for the leaders of the Congress Party is in the national interest. It cannot be in the national interest if it holds back production for whatever reason; for production at this moment—as was clearly revealed at the meeting of the National Development Council—is our only bulwark against inflation. It is not enough for the Congress Party to return with an enormous political majority with votes captured dutifully by the Trade Unions from their rank and file and by the Ambar Charkhists from the unhappy rural unemployed. Mere political success will not ensure the implementation of the Plan or the avoidance of inflation. It is this dilemma which prevents the comforting speeches of Central Government Ministers from being effective, for they are forging, at the same time as they talk of production and productivity, the instruments which place a brake on production and productivity. It may be politically wise to ride on the support of the employed and the unemployed at the same time offering each a bribe and an inducement which must rebound against the other. To the extent that this dual policy impedes a rise in production, it will, sooner or later, be realised that it is not in the national interest. The pious resolutions passed at Trade Union Congresses do nothing to alter the fact that higher real wages are being offered not at the expense of employers, private or public, but at the expense of the neglected unemployed capable of being absorbed in organised industries, if wages were more flexible. Central Government Ministers should not embark on this dangerous dual game of restricting organised industrial employment; if they do, their bluff should be called.

man of the Planning Commission seems to have been called in as the magician to cover the retreat. He rose superbly to the occasion. The rabbit out of this particular hat may not live for very long. But at any rate, if a retreat is to be made, it was covered by a remarkable feat of sleight of hand at the National Development Council meeting.

It is obvious that adequate thought has not been bestowed on how this higher target is to be achieved or on whether it will be really necessary at all. It is clear that the decision to raise the food target has been to a great extent influenced by recent trends in food prices and Government's realisation that the stocks at its

disposal are not sufficient to check any serious upward trend. But the proposal has to be judged from two points of view—whether a 40 per cent increase will be physically practicable and whether such an increase can be absorbed by the economy. As regards practicability, the N.D.C. seems to have thought with the Deputy Chairman that the higher target can be achieved without any substantial financial outlay beyond the Rs. 100 crores earmarked by the Reserve Bank for the grant of short-term loans to farmers. But the Union Ministry of Food and Agriculture has now expressed the view that it would be too much to expect an increase of this order merely through rationalisation, better techniques or more intensive cultivation, on which the Deputy Chairman appears to place reliance. In its view the utmost that can be obtained with existing funds through reallocation and better organisation is a marginal increase of another 5 per cent.

This estimate cannot be seriously wrong. The Draft Outline had programmed to secure an additional output of 10 million tons of food grains (15.4 per cent) through the following sources: major irrigation 2.4 million tons, minor irrigation 1.8 million tons, manures and fertilizers 2.5 million tons, improved seeds 1.0 million tons, land reclamation and land development 0.8 million tons, and increased use of improved techniques 1.5 million tons. Clearly no new major irrigation schemes are likely to be included in the Plan hereafter and so no addition to food output from hereafter can be expected beyond what is already envisaged. Some marginal increase in minor irrigation facilities appears possible, but the addition to output is bound to be insignificant. The contribution to food production from the use of fertilizers can increase only if the internal fertilizer production programme is expanded or imports are planned for. As it is the industrial programme in the public sector has been stretched to the limit having regard to the scarcity of financial resources. Import of fertilizers will involve the use of valuable foreign exchange and may also be difficult in view of likely competition from other agricultural countries. Increases that can come about through the use of improved seeds and improved techniques and land development cannot certainly rise much above the present estimates for the outlay proposed.

It now remains to consider whether the Reserve Bank's proposal for the distribution of Rs. 100 crores through short-term loans to farmers can bring the new food target within the range of practicability. Even as it is, agricultural operations are not seriously hampered or held up for want of credit facilities. The Reserve Bank's programme will only cheapen credit and probably avoid certain minor difficulties. Moreover, even after this programme comes into operation more than two-thirds of the credit needs of farmers will continue to be met by merchants and money-lenders. It appears, therefore, doubtful whether the proposed increase in the food target will be capable of realisation within the present outlay proposed. And surely the country cannot afford all the additional money which will be required if the target is to be achieved. The proposal that funds can be diverted from protective foods to cereals cannot help much as these other schemes cannot also be completely neglected and the amounts that can be safely diverted will not amount to much. Co-operative farming as is being practised in China may help to some extent, but whether a programme can be drawn up quickly and enforced in a democracy like India to yield immediate

benefits is open to question.

It is clear that while a higher target than was put down in the Draft Outline may be justified, what is now proposed is too high. In the next five years the country's population is expected to go up by just about 5 per cent. The expected increases in per capita food consumption do not also justify a 40 per cent increase. Per capita consumption of cereals is expected to go up to 18.3 oz. from the present 17.2 oz. and any more increase in this is not required. On the other hand consumption of protective foods will continue to be below the desired levels and on this ground too any diversion of funds to cereal production is to be deplored.

The main object of the proposal to raise the food target is to counter any possible inflationary tendencies which deficit financing to the extent of Rs. 1,200 crores may set in motion. Fears that these tendencies may develop have arisen from the fact that deficit financing in the last year is now having its effect in higher food prices. But the present level of food prices is also partly the result of bad and indifferent weather in various parts of India in the last year. While it is good to take precautions against possible contingencies, there seems to be no reason why there should be a repetition of such weather conditions during the second Five-Year Plan, particularly since many new irrigation schemes started during the first Plan are likely to bring benefits in the next two years. The first Plan itself has witnessed a rise in the floor of Indian agricultural production, and these schemes and the new schemes which will be taken up under the second Plan will further raise this level, which will minimise fluctuations in output. A 40 per cent increase in production, therefore, seems to be unnecessary.

It is even likely that such an increase may present the Government with a very serious problem of saving the rural economy from collapse. Since consumption demand cannot go up by 40 per cent, a good part of the additional output will be surplus to needs and can cause a serious fall in prices, probably much more serious than what took place last year, and the Government may find itself forced to undertake a price support programme. But this time it may be unable to operate at the marginal levels as it did last year since the surplus is likely to be considerable. True, the country can dispose of part of the surplus by export. But the feasibility of this step is severely limited by the present world conditions in which rice-exporting nations in particular are already facing difficulties. This position may well worsen in the next few years. Anyway, even if exports are possible, it is unlikely to exceed one million tons annually, whereas the surplus on hand may be ten times that.

It is obvious from these considerations that the proposal to increase food production by 40 per cent in five years is really in the realm of fantasy. It is unfortunate that while a moderate increase by about 10 per cent over the existing target would have been acceptable and appropriate on technical considerations, confusion has been caused by the introduction of a figure which is clearly outside reach, and which will lead to more futile debate at this late hour. The second Plan has now been the subject of discussion for over a year; why should a proposal of this kind have waited for the thirteenth month of discussion? Perhaps because Chop and Change has become one of the Planning Commission's rules of life.

Manpower for the Public Sector

LAST week the Prime Minister announced the Government of India's new Industrial Policy in Parliament proclaiming a larger place for the public sector in Indian industrialisation. Logically enough, the Ministry of Home Affairs has followed swiftly with the rules governing special recruitment to the Indian Administrative Service. The Ministry of Defence has also been drawn into the limelight by the statement by Mr. Mahavir Tyagi last Tuesday in which he indicated that retired officers in the Indian Army would, by arrangement with the Planning Commission, be available for National Plan work. There is no doubt that until the present time there has been confusion on all three issues, recruitment for the Government of India, direct recruitment to the Indian Administrative Service, and the whole question of premature retirement of Defence officers. It is time that these matters were considered in one piece. The present is obviously a suitable opportunity for this consideration which, unhappily, is still far from the Government of India's mind. There is no indication anywhere that an integrated policy of recruitment and utilisation of manpower has been accepted as a central element in the discharge of the numerous responsibilities which the Government of India chooses to take upon itself.

There have been some complaints about the rules for emergency recruits which the Home Ministry set out last week-end. These complaints should be examined though they do not contain the kernel of the problem, which is shortage in quality of applicants for high posts, however recruited. There is certainly, however, something a little too summary in what the Home Ministry is now doing. It is true that what is described as a "special" examination in two papers, English Essay and General Knowledge, is meant only as a screening device. Screening is essential as the Union Public Service Commission is crushed by a volume of work which may, perhaps, be illustrated adequately by the figures of 1955. During that year the Union Public Service Commission conducted thirty different examinations for which 41,543 candidates applied. Some 5,471 candidates were interviewed and 1,345 appointments were made. This is, by any standards, exacting routine work and nobody should argue against some kind of screening which is essential to reduce the mere mass of paper that impedes highly selective recruitment.

Merely screening the unwanted, however, does not guarantee that those selected will be suitable. In other words, screening is only a negative aspect of the problem, and screening seems at the moment unduly hard. One of the current complaints relates to the limit of salary of Rs. 300, which has been prescribed as a condition of entrance from both sectors. While an arbitrary figure has necessarily to be introduced, it is not clear that the figure of Rs. 300 is the appropriate one. The bulk of Central Government employees are in the time-scale of 160-330 or 160-450 and the corresponding scales of pay in the State Governments are lower still. Practically all these candidates will be deprived of the opportunity of entrance which might well, in particular cases, be in the interests of the public service. Some latitude should clearly be allowed in certain deserving cases where State Governments consider such a course desirable. There

is also a minor objection in regard to dates. While the crucial date in respect of income is April 1, 1956, that for age is December 31, 1956. Some arbitrary line needs to be drawn on age as well as pay, but why should there be two dates instead of one? It would appear that if the date for income was also shifted to December 31, 1956, some hardship might be reduced.

In the last analysis, it is not so much the issue of new recruitment as the utilisation of existing manpower which represents the Government of India's largest failure. At the present time the Defence Services contain the substance of this error in a painful and irritating form, largely due to the unbalanced result of war recruitment of many commissioned officers. At present Majors in the Indian Army may, for the next fifteen years, continue to be Majors, and some have to retire at the age of 45 since existing rules do not permit a Major to continue in service after that age. Similarly for Lieutenant-Colonels the age of retirement is 48. In either case here are men trained in leadership, disciplined in the Army and already with management experience, which new entrants may not enjoy. To allow Defence officers to apply is not an answer to this complaint. They must be accommodated, not just "permitted to apply". That the Government of India should be proposing summarily to reduce officers of this calibre while it recruits indiscriminately elsewhere is merely a measure of the lack of co-ordination which now exists between the Home Ministry and the Defence Ministry of the Government of India. It is a matter of special irony that the present Defence Minister was once the Home Minister, and that the Prime Minister has held direct charge of the Defence portfolio and has permitted premature retirement at a time when as Chairman of the Planning Commission he was deeply concerned about the shortage of manpower for economic development.

This argument leads to only one conclusion, namely that before the volume of new recruitment is decided on, every single suitable officer in the Defence Services due for retirement or willing to move over without objection from the Defence Ministry should be absorbed in the civil administrative line. This may mean some delay in deciding on the actual numbers to be recruited to emergency posts. But this is no more than a condition imposed by justice and equity and the interests of the public services. It is as important to maintain morale in existing posts as it is to provide new opportunities. Unhappily, too often the Government of India thinks its employment policy is far more important than good utilisation of those employed. It should be firmly understood that educated unemployment is not a reason for the creation of posts in the higher services. The country demands that immediate action should be taken for an integrated recruitment policy bearing in mind the utilisation of those already in the public service. How can recruitment even begin without a survey of the nature of coming management demands? Or, is the cart to be placed before the horse here also, meaning that an arbitrary number is to be selected and then thought given as to where and how they are to work? If the present training methods are continued indefinitely, the Home Ministry will go on producing square pegs for round holes.

Here's the *NEW* model

Crystal

It's smarter,

it's smaller

—and costs

much less

and it's got

7 plus features

New, sleek, sophisticated — this 'Crystal' air conditioner occupies no floor space, fits into a window, a skylight or a small space in the wall.

THINK of it! Cool, filtered air to breathe; a quiet atmosphere to work or sleep in; a fresh invigorated feeling — you get them all from the new model 'Crystal', the finest room air conditioner yet made for the Indian climate.

Write to Voltas Limited for details of the new, wonderfully inexpensive 'Crystal'.

For better **HEALTH** and
greater **COMFORT**

A young man with 90 years' experience

**How Standard-Vacuum's technical sales staff
help make industry more efficient and productive**

LUBRICANTS are a vital need for every factory, power plant and machine shop. But it is not enough just to buy the best lubricants. Expert advice on lubrication is also needed.

Trained Standard-Vacuum specialists render complete lubrication service, by studying each problem, no matter how large or small, and finally recommending the correct GARGOYLE Industrial Lubricant. The customer gets the benefit of 90 years' experience, gained in solving lubrication problems throughout the world.

Standard-Vacuum's Lubrication Service helps to keep machinery running at peak efficiency, and eliminates costly breakdowns — thus increasing the productivity of Indian industry.

THE WEEK'S NOTES

THE SUCCESSION BILL

THE LOK SABHA passed this week the Hindu Succession Bill, a further instalment in the programme for the reform of the Hindu Code. The Prime Minister rightly described the measure, which gives the daughter a share in her father's intestate property, as a step which would shake people out of their lethargic ways. He also correctly pointed out that nobody was completely satisfied with the Bill as it was—some wanting a more radical measure in this or that respect, while a few feared that it was going too far in modifying the existing system. Evidence that any Bill like the present cannot be entirely satisfactory to all can be had by studying the progress of the measure since it was first introduced. The Joint Select Committee made many radical changes in the draft Bill framed by the Government on the report of the B. N. Rau Committee. By bringing the Mitakshara co-parcenary system within the scope of the Code, it appeared to put the son in an undivided family at a disadvantage in comparison with the daughter. It also made the daughter's share equal to that of the son, treated, rather unjustly, married and unmarried daughters alike and placed legitimate and illegitimate children on the same footing for intestate inheritance. The Rajya Sabha was equally liberal in making alterations and, among other things, denied the illegitimate child a share in intestate property. While the Select Committee had placed the mother in Class I and the father in Class II of preferential heirs, the Rajya Sabha put both in the latter category. But the Lok Sabha has now reversed the Rajya Sabha's decision on this point. In sum, the Lok Sabha has not liquidated the joint family but has persuaded it to confer fresh legal rights on women.

Property descends according to natural feelings or customary practice. Neither is fixed and uniform in this country. An attempt to introduce some sort of uniformity, particularly where property is left intestate, is unlikely to disarrange family relations, as was contended by some critics, provided family relations are based on something higher than property interest. In practice the rivalry between man and woman is imaginary, and ultimately what a woman gains as a daughter she may lose as the wife of a son. But the present measure will add to her independence and economic security and certainly raise her status. Those who are fighting this trend towards greater social justice are assuredly fighting a losing battle.

STATES BILL PUT OFF

IT NOW appears likely that the Bill relating to the reorganisation of States will not be finally passed in this session of Parliament. For one thing, there is some disinclination in official circles to give the appearance of pushing through such a controversial measure without giving adequate opportunity for all points of view to be expressed. But as it is all possible points of view have been put forward for the consideration of the public and those in authority, and it is unlikely that anything new and worth while will emerge in the next two months. Even so there is something to be said in favour of the Government's reported decision. Also the fact that the Bill regarding Bengal and Bihar will not be ready for some time more makes postponement understandable since all the new States can be inaugurated simultaneously only if this Bill is also passed along with the main Bill.

It is to be hoped that the present postponement is not the result of indecision and made in the expectation that something will turn up to clean up the Bengal-

Bihar affair and to solve the problem of Bombay's future. If anything, the intervening period should be utilised to take firm decisions on all outstanding points and to enforce them. The Prime Minister is correct in saying that no decision is irreversible, but frequent repetition of it makes people think that any decision can be changed at any time provided sufficient stubbornness is exhibited.

The consequence of delay in the inauguration of the new States will be that the elections scheduled to be held early next year may have to be postponed. There is talk of postponement of three or four months, but this will involve the holding of polling in the middle of summer, which may frighten away many conscientious voters and certainly make the indifferent ones stay at home. The weather factor will have to be considered if the elections have to be postponed before the period of postponement is decided on. It is to be pondered whether all the elections—to Parliament and the State Assemblies—need be postponed, though there is point in the argument that unsocial elements will take advantage of any tensions which reorganisation may give rise if elections are held soon after.

INDO-PAKISTAN TALKS

THE DACCA conference on the exodus of minorities from East Bengal has ended with a joint communique which places the responsibility for the safety and security of the minorities in either country with the Governments concerned. That this should require reiteration is rather strange. But the failure of the Pakistan Government to infuse a sense of confidence in the minority community in East Bengal probably necessitated it. But this declaration has been followed by a list of measures already taken and proposed to be taken by the East Pakistan Government to stop the exodus. These measures contain nothing new and are unlikely to have the desired effect unless the method and machinery of implementation undergo some change. That what is wrong in East Pakistan, preventing the minorities from sticking on, is not the professed intentions of those at the top but the attitude of those at the lower levels has been abundantly clear for some time now. The Provincial Government's circular to its officials on the subject also seems to have failed in its purpose.

In these circumstances the agreement of the Indian Government representative to exercise stricter control over the issue of migration certificates cannot but cause alarm among the minorities in East Pakistan. On what basis this control can be exercised it is difficult to understand. Evidently people will not be migrating in such large numbers unless they have sufficient grounds for fearing discrimination and lack of security. The promise to derequisition minority properties which have been requisitioned and other assurances may meet with many difficulties in implementation. Only a few days ago the Prime Minister of India was pointing out that Pakistan had been regularly violating the Nehru-Liaquat Pact, and it seems strange that India should now seek to place difficulties in the way of those seeking safety and security in the name of that now discredited pact. The Dacca conference can be judged only by results—by whether the Pakistan Government succeeds in restoring confidence among the minorities and persuades them to discontinue the exodus.

WORLD BANK LOANS TO BURMA

THE WORLD BANK has granted two loans totalling 19.35 million dollars to Burma for the improvement of

the country's transport system. One loan for 14 million dollars is for the development of Rangoon port and will help finance the reconstruction of cargo berths and storage facilities at the port and the purchase of floating equipment, such as dredges and tugs, for harbour operations. The second loan of 5.35 million dollars is for rail transport development and will pay for freight cars, diesel rail-cars and bridge construction materials. These are the first loans being given by the World Bank to Burma and appropriately enough are to be used for the reconstruction of installations and properties destroyed during World War II.

Improvement of transport is of high priority in the development plans of the Burmese Government, as indeed it must be in the plans of the Government of any underdeveloped country. Rangoon port handles four-fifths of Burma's foreign trade and the \$19.3-million project, partly financed by the Bank, will increase the port's capacity, shorten the turn-round time of vessels and provide better and safer service to ships. The railway rehabilitation programme costing \$35 million will improve the movement of rice, timber and minerals destined for export. The loans bear interest at 4.75 per cent, the first being for a term of 20 years and the second for 15 years. Coming at a time when the Burmese Government's own capacity to invest has been a little adversely affected since rice prices started to turn downward in 1954, these loans will help in urgently needed improvement works. It is reported that some investment programmes have had either to be curtailed or slowed down for lack of adequate internal finance, and it is probable that the present World Bank loans will be followed by more assistance from foreign sources in the country's reconstruction and development.

NEW LOOK FOR WESTERN POLICY

THE DECISION of the Atlantic Council to set up a committee of "three wise men" to advise it on ways and means of improving and extending NATO co-operation in non-military fields and to develop greater unity within the Atlantic community is probably the first considered step the Western Powers have taken to counter the new Soviet policy of winning friends and influencing people through relaxation of internal and external tension and offers of economic aid to backward countries. The other day President Eisenhower indicated awareness of the need of modifying Western policy to meet the Soviet challenge, though the NATO decision does not go far enough. But the NATO has been mainly a military alliance and Soviet foreign policy until recently warranted no change in its set-up. Western thinking has also regrettably fallen into the "military containment" groove. There was awareness that this would not suffice in the long run, but the emphasis on it had tended to exclude other avenues of answering the false attractions of Communism.

It would not be wrong to interpret the present change in Soviet policy as partly stemming from NATO's potency as a military alliance, though the organisation has not met with the desired amount of success in bringing Western forces together and up to the level required. True, the Asian situation also made the change capable of yielding greater successes, but only this change in Soviet policy has impressed on the West the need to modify its own policy. The "three wise men" set up by the Atlantic Council may not achieve much, but if the same rethinking is extended to other frontiers where Communism and Democracy face each other, the results are likely to be far more beneficial. France has opposed the use of the NATO for channeling American aid, and similar objections may be raised to the use of other military alliances for a similar pur-

pose. But, if the change in Western outlook is the precursor of other policy changes to meet the new Soviet offers and wooing of backward and other nations, that will be the greatest achievement. Ironically enough, the Soviets have probably set in motion a policy which may defeat them more surely than the policy the West has been following up to now.

FRANK-SPEAKING BY MR. GAITSKELL

MR. HUGH GAITSKELL'S comments on the "dinner incident" have not come a moment too early. When Mr. Khrushchev complained of the hostility of British Socialists to Soviet Communists, there was some inclination in many circles to agree with what he said and to consider the questions put to the Soviet leaders at the Labour Party reception as ill-timed if not inappropriate. Mr. Gaitskell has now pointed out that the dinner was never meant to be just a social affair as it was the only occasion on which the Labour Party's National Executive was to meet the Soviet leaders. It was, therefore, not surprising that the issue of imprisoned Social Democrats (whose views and policies are akin to those of the British Labour Party) should have been raised, and if Mr. Khrushchev's answer on that occasion was an emphatic "no", it is unlikely that his reply would have been less uncompromising had the subject been raised elsewhere on another occasion. Mr. Gaitskell has grasped this, and Socialists, and humanitarians, everywhere should be ashamed if they avoided mention of the plight of fellow-Socialists and fellow-men on the score of not wanting to be impolite to guests, especially where the guests are highly political guests of the type of Messrs. Bulganin and Khrushchev.

Mr. Gaitskell is probably right in his assessment that the Soviet rulers would perhaps take greater notice of the subject than appeared from their first reaction. It is evident that the British Labour leaders did not expect the Soviets to confess that they had in fact wrongly imprisoned Social Democrats. But, if the present liberal trends in the Soviet Union and other Communist nations are to be credited with any real significance, more steps towards lessening of totalitarian tyranny can be expected. The concern of Socialists in Britain that Social Democrats should not be excluded from the benefits of any move towards liberalisation is understandable. But whether the freeing of these Social Democrats can be safe for the continuance of one-party rule only Mr. Khrushchev can know. His outburst indicates that the loyalties of the people over whom his satellite Communist Parties rule are not entirely undivided. The possibility of Social Democrats, released from prison, attracting the support of the people and setting up a strong counter-force to the Communist Party, should cause Mr. Khrushchev many sleepless nights. Only that can explain his talking of politenesses and niceties of behaviour.

"Where now the city stands,
there was once naught but the city's site." OVID

Calcutta

On August 24 1690, when Job Charnock stood on the banks of the Hooghly, he saw before him a depressing landscape of mud hovels, swamps, and paddy fields. On that very site has risen in the course of the years a pulsating city with heavy industry, modern transport and busy docks—a metropolis which could have made little progress but for STEEL—thousands of tons of it.

A Window on the World

RE-THINKING OUT SOCIALIST FUNDAMENTALS

By

ODYSSEUS

WHY HAS the British Socialist Party lost the support of thoughtful independent voters since 1950? Why have the Conservatives been in office ever since? Among the factors that have antagonised the voters against Labour are four that stand out:

1. The experience of the negative and frustrating war-time controls, prolonged years after the fighting was over; and in particular the impression, fostered by its enemies, that the Labour party regarded the ration card not as a temporary expedient but as a permanent feature of a fair shares economy.

2. The discovery that the Labour government's "Socialism" meant the establishment of a number of vast, bureaucratic public corporations, which failed to fulfil the two proclaimed essential requirements of Socialism, namely, that a state-owned industry should be fully responsible to Parliament and give a share of the management to the workers.

3. The uneasy suspicion that the social revolution of which Socialists have talked was actually leading not to a freer but to a managerial society.

4. The conviction that complete socialisation, as practised by the USSR, has degenerated into a totalitarian state, in which the loss of civil liberties is not counter-balanced by the eradication of inequalities.

What brought people into the British Labour Party before the war was the conviction that it was fighting for popular emancipation at home and abroad. What made them Socialists was the belief that democracy was breaking down and that freedom could only be secured by transforming it into a Socialist society. This was the assumption which converted a whole University generation, who would have been ardent Liberals in 1906, into ardent Socialists during the great depression; and it has been the growth of doubt about the truth of this assumption which has disillusioned them in the 1950's.

At this point some Socialist retorts that all this is just another dose of the usual anti-Socialist propaganda and requires no answer. It is obvious, he says, that we live in an age in which all societies the world over have either adopted the Socialist pattern long ago or are in process of so doing. Why, then, argue as though the clock could be put back?

ANEURIN BEVAN'S GINGER GROUP

True, but it is precisely because we do live in a Socialist pattern society that we owe it to ourselves to keep abreast of the latest patterns of Socialist thought. Not one of the first six paragraphs of this column is mine: they are taken from an admirable pamphlet entitled "Socialism and the New Despotism", newly published at Re. 1 by the Fabian Society (11 Dartmouth Street, London. SW. 1.) and written by R. H. S. Crossman, M.P. for Coventry East since 1945, a man of outstanding intellectual calibre, not the least of whose qualifications entitling him to a respectful hearing in Leftist Indian circles is that he is a conspicuous member of the Aneurin Bevan Labour ginger group of 100 per cent Socialists. Whereas Mr. Gaitskell wants

to slow down on Socialism, Mr. Crossman wants to sprint ahead.

Fairly and honestly, Mr. Crossman sets forth the 1956 Socialist's dilemma when he says that whereas in the 1930's Socialists assumed that Capitalism was not only immoral but unworkable, a system doomed to peter out from its inherent weaknesses, time has demonstrated this assumption to have been false. If so, the question suggests itself, what's the point of being a Socialist any longer?

Mr. Crossman observes that since 1945 the evidence from the USA, Britain, and Western Europe proves that mass unemployment is not, as used to be thought, the fundamental problem of Western society because it can be controlled by any government that understands the economic system and contracts and expands credit in accordance with Keynesian principles.

Why, asks Mr. Crossman, do so many Socialists hesitate to recognise this? Surely democratic Socialists who detest the Communist state's denial of freedom ought to feel relief on discovering that totalitarian control is not essential to abolish mass unemployment? To which Mr. Crossman courageously answers that one reason why Socialists hesitate is that it was difficult enough to persuade people to become Socialists when they could be told that Capitalism was not only immoral but unworkable, so that today Socialists fear that it would be still more difficult to persuade a majority of voters that this workable system must be overthrown simply because it is immoral. Don't most people care more about security than about social justice? If Welfare Capitalism can provide the majority with security, how can voters be persuaded to take steps in the dark towards an unknown quantity—Socialism? (For don't let's fool ourselves: nobody outside the Communist states knows what full Socialism means in practice, and those inside only know totalitarian Socialism, which is perhaps why the good Comrade Khrushchev could not understand why the British Socialists were anxious about the fate of the Social Democrats now languishing in Communist prisons and why he got so mad with Mr. Gaitskell for hoping that these hapless political prisoners had suffered enough and could now be let out).

Mr. Crossman asserts that if British Socialists are honest with themselves they must admit that Britain's experience of the mixed economy established by the Labour government between 1945 and 1950 has demonstrated that it was the least dogmatically Socialist parts of what the Labour government did which were most popular and which worked best. The welfare legislation—free health services, education, etc.—have been popular, whereas nationalisation has not changed the lives of the workers and has disappointed the British trades unions. Mr. Crossman shrewdly points out that although convinced Socialists may look forward to a future in which forty or fifty more national Boards are imposed on other industries besides the existing Coal Board, British Electricity Authority, and Transport Commission, such a programme would neither win votes for Labour nor arouse enthusiasm among the trades unions. If Boards of control for nationalised

Rupee Travellers' Cheques issued in convenient denominations.

It is estimated that the plan will involve expenditure at the rate of £12,000,000 per annum for four years.

TRADE

Trade Agreement Between Finland and Norway: According to the trade agreement recently concluded between the two countries, Norway will import from Finland plywood and furniture to the value of 5 million Kroner, gypsum plates for one million Kroner, machinery, iron and steel for 7 million Kroner and 200 tons of seed. Norway will supply, 5,200 tons of hardened fat, 7,000 tons of lime salt peter, 25,000 tons of sulphur titanium to the value of 3 million Kroner and fatty acids and stearine to the value of 2 million Kroner.

Trade Agreement Between Formosa and Egypt: A trade agreement has been reached between Formosa and Egypt. Under the agreement, Formosa has agreed to buy \$6,300,000 worth of cotton, rice and other Egyptian goods. In exchange, Formosa would supply to Egypt paper, refined sugar, black tea and aluminium.

Trade Between Malaya and India: Malaya's trade with India during November 1955, the latest month for which detailed statistics are available, with imports from India valued at M\$8.5 million and exports to India at M\$7.9 million registered a trade balance of M\$.6 million in favour of India, against a trade balance of M\$.4 million in favour of Malaya during the preceding month, and a trade balance of M\$.6 million in favour of India during the same period of 1954. Cumulative trade during the first eleven months of 1955, with imports from India at M\$79.6 million and exports to India at M\$89.2 million registered in favour of Malaya a trade balance of M\$9.6 million, when compared to a trade balance of M\$39.6 million in favour of Malaya during the corresponding period of 1954.

Foreign Trade of India by Land with Pakistan, Afghanistan, Iran and Burma during March, 1956: According to the land-borne trade returns received in the Department of Commercial Intelligence and Statistics, the provisional figures of the total value of foreign trade of India by land with Pakistan, Afghanistan, Iran and Burma during March, 1956, are as follows: Merchandise: Exports Rs. 39 lakhs, exports to Eastern Pakistan Rs. 16 lakhs; exports to Western Pakistan Rs. 20 lakhs; exports to other countries Rs. 3 lakhs. Merchandise: Re-exports Rs. 1 lakh; Merchandise: Imports Rs. 281 lakhs. Imports from Eastern Pakistan Rs. 225 lakhs; imports from Western Pakistan Rs. 14 lakhs; imports from other countries Rs. 12 lakhs. Total trade Rs. 321 lakhs. Trade in treasure: Negligible. Balance of Trade: The total value of exports, including re-exports, fell short of imports by Rs. 241 lakhs.

FINANCE

Import Duty on Silver Raised: The Government of India have issued a notification raising the duty on the import of silver bullion, silver sheets and plates, which have gone no process of manufacture subsequent to rolling and "silver coin not otherwise specified" from 4-1/5 annas per oz. to 8-2/5 annas per oz. Announcing this, a press note issued by the Union Ministry of Finance says that with a view to facilitating Indo-Tibetan trade, the Government of India have also decided to license freely the import from Tibet of any

silver coin which is current in the Tibet region of China. Applications for such licenses should be made to the Reserve Bank of India or the Political Officer in Sikkim.

Sterling Area's Dollar Reserves: The gold and dollar reserves of the Sterling Area rose by \$51,000,000 during April and stood at \$2,328 million on April 30. Defence aid estimated at \$4,000,000 was received from the U.S.A. during the month, and \$2,000,000 were paid to creditors of the European Payments Union (E.P.U.) in bilateral settlement. On the provisional figures for the month, the U.K. had a surplus of £14,000,000 with the European Payments Union, which will fall to be settled in May as to 75 per cent in gold or dollars and as to 25 per cent by a reduction of the debt to the Union. The improvement in the gold and dollar position has now been continuous for seven months. Reduction of the deficit began in October, and the first surplus was in January. The reserves in the first three months of this year stood at: January \$2,149 million, February \$2,210 million, and March \$2,277 million.

Low-Income Group Housing Grants: The Government of India sanctioned during February an additional loan allocation of Rs. 25 lakhs to the Government of Saurashtra under the Low-Income Group Housing Scheme. During the month, a sum of Rs. 137.64 lakhs was disbursed to five State Governments—Rs. 69 lakhs to Punjab, Rs. 25 lakhs to Bombay, Rs. 20 lakhs each to Mysore and Saurashtra and Rs. 3.64 lakhs to Bihar. The total allocation made under the scheme up to February, 1956, was Rs. 2,153.2 lakhs, of which Rs. 917.63 lakhs had been distributed.

More Central Aid for Development of Handicrafts: The Government of India have sanctioned further loans and grants totalling about Rs. 4,71,000 for the development of handicrafts. Of the amount, Rs. 2,25,300 will be utilised by the All-India Handicrafts Board. A loan of Rs. 80,000 has been granted to the Indian Co-operative Union Ltd. The Indian Institute of Art-in-Industry, Calcutta, has been given a grant-in-aid which will not exceed Rs. 25,000. Rajasthan gets a grant of Rs. 23,250. West Bengal has been given a grant of Rs. 20,000. A sum of Rs. 12,000 as grant has been sanctioned to Bombay State. Andhra gets a loan of Rs. 6,000. Madras gets a grant of about Rs. 4,400. A grant of Rs. 2,000 has been given to Madhya Pradesh, and a further grant of about Rs. 1,300 has been sanctioned to Orissa.

GENERAL

Employment Situation During March 1956: The number of employment seekers registered at the Employment Exchanges all over India declined to 7,04,638 during March, 1956, from 7,24,448 at the end of February, 1956. The number of employed persons, who were in need of further employment assistance, was 6,659 at the end of the month. Fresh registrations at the Exchanges marked a fall of 6,552 during March, 1956. The number registered was 1,21,399 as against 1,27,951 during February, 1956. The decrease in registrations was comparatively large in the State of Uttar Pradesh 5,716; Bihar 1,978; Delhi 955; Rajasthan 942; and Travancore-Cochin 691. On the other hand, increase in registrations was marked in the State of Madras 1,479 West Bengal 861 and Madhya Pradesh 690.

NEWS IN BRIEF

FOREIGN

It is reported federal aid to gold mines under the Emergency Gold Mining Assistance Act is to be extended to the end of 1958 at existing rates in Canada.

The withdrawal of export taxes on coffee and cotton from July 1 in Kenya is contemplated. A proposal to this effect was made by the Finance Minister, Mr. E. A. Vasey in his recent Budget speech to the Legislative Council.

Trade talks between Yugoslavia and West Germany, fixing quotas for the financial year 1956-57, are to be held at Belgrade in the middle of May.

Pakistan will invest a little over Rs. 5 million in the International Finance Corporation. A bill providing for Pakistan's membership of the Corporation passed by the National Assembly has now received the President's assent. The Corporation was set up with a target capital of \$100 million.

World corn production in 1955-56 is estimated at 6,190 million bushels. It would be exceeding the previous record in 1948 by 175 million bushels and the small 1954 production by 650 million bushels.

A M\$1 million housing project has been started in Ipoh, capital of the State of Perak, involving in all a total of 500 houses. Another M\$4½ million housing scheme is being launched in the colony by the Singapore Co-operative Housing Society.

It is reported the Royal show, the biggest agricultural show in the world will be held this year at New Castle-upon-Tyne from July 3 to 6. Sixty different countries are expected at the Royal show.

The sixth session of the Pakistan Tripartite Labour Conference will be held in Karachi from May 17 to 19.

Norway's hydro-electric generating capacity has increased in 1955 by 560,000 kilowatts or 5 per cent more than in 1954, which is the biggest increase ever recorded.

Kuwait Oil Company, jointly owned by British Petroleum and Gulf Oil, reports production of crude oil in Kuwait for March, 1956, of 4,922,844 tons, compared with 4,552,335 tons. Total production for period January 1 to March 31, 1956, is up from 12,907,048 tons to 14,043,452 tons.

Trans World Airlines has renewed its contract with the Government of Ethiopia, to provide management service for Ethiopian Air Lines.

The world spent \$12,000 million last year on advertising. The USA contributed two-thirds of that amount and Britain \$1,000 million.

It is reported an aerial geological and mineral survey of Assian countries would be made under the auspices of the ECAFE shortly.

INDIAN

The Government of India have decided to award passage grants to Scheduled Castes, Scheduled Tribes and other backward classes candidates who have received merit scholarships during 1955-56 for studies abroad without passage costs.

The US International Co-operation Administration has announced new authorization totalling \$17,389,675 for the purchase of a wide variety of equipment for use in India.

The President has given assent to the Hyderabad Abolition of Inams (Amendment) Bill, 1956. The Hyderabad Abolition of Inams Act, 1955, was assented to by the President on July 16, 1955, and came into effect from July 20, 1955.

About 602 factories spread over 19 States are manufacturing fruit products and preserves. Bombay, with 137 has the largest number of such factories.

A sum of Rs. 26.83 crores has been provided for soil conservation work under the second Five-Year Plan as compared with Rs. 3.25 crores under the first Plan.

It is reported a programme for the development of major ports at a cost of Rs. 62.28 crores has been drawn up for inclusion in the second Plan.

Under a scheme of the Indian Council of Agricultural Research, the American Arcot Mission is at present maintaining more than 2410 exotic chicks at Katapadi, Madras.

The last date for filing applications for compensation from landowners whose lands were nationalised in Burma during 1953-54 and 1954-55 has been extended by two months by the Government of Burma.

The Government of India has so far paid Rs. 4,52,89,300 for the execution of development projects in Nepal. The aid given by the Government of India has been two-fold—technical and economic.

Grants have been sanctioned to some of the Universities, colleges and research institutions for conducting economic surveys of important towns in the respective states.

The Government of India and the USSR have concluded an agreement for the export of 500 tons of coffee to Russia at a cost of about Rs. 41.22 lakhs. Two grades of coffee will be exported—the higher quality at Rs. 400 to Rs. 450 per cwt. and the lower quality at Rs. 360 per cwt.

It is reported the Madhya Pradesh Government has decided to stop issuing new manganese mine leases.

The Government of India has decided to establish two more coal washeries—one at Bokaro-Kargali Colliery with a capacity of 550 tons per hour and another at Durgapur with a capacity of 300 tons per hour.

Mr. Nitayanand Kaungo declared recently that three firms were at present engaged in the production of motor cars—in Bombay, Madras and West Bengal, and they claimed a total capacity of 33,000 cars per annum.

THE ECONOMICS OF POWER

(CONTRIBUTED)

THE world is so hungry for all forms of energy that development of energy resources in many fields is complementary. Nuclear fission is emerging as a major source for the future and will give important assistance to the heavy and increasing loads which the mineral fuels are carrying. Nuclear power will not begin to provide a significant contribution to total supplies until the 1970's but should increase its share rapidly thereafter; for example, the United Kingdom, in the forefront of progress in the peaceful application of nuclear energy, estimates that by 1975 this source of power will only be providing 10 per cent of her total energy requirements. But the fact that this contribution will be in the form of centrally-generated electricity lends interest to the economics of electricity supply and use.

The world's consumption of electricity is rising at an annual rate of around 7 per cent and is doubling itself about every ten years, and reached an estimated world total, including the U.S.S.R. and China, of 1,356 million megawatt hours in 1954. Of this total about 40 per cent was consumed in the United States, 25 per cent in the O.E.E.C. countries of Europe, and 11 per cent in the U.S.S.R. India's consumption represented about 0.5 per cent of the total in spite of the fact that she has about 14.5 per cent of the world's population. Electricity still represents, however, only about one-tenth of all energy put to effective use throughout the world—i.e. excluding that lost in production, transmission and use.

In the decades ahead a continuing rapid growth of electricity consumption is foreseen, and though electricity is obviously fundamentally unsuitable for many purposes such as private and commercial road transport, technical advances in general are making it easier for any particular source of energy to be used in wider fields than it has been associated with in the past. It is, therefore, necessary to take greater account of the true economics of the supply of energy before committing extensive blocks of national resources to one particular source of power. The economics of conventional electricity supply indicates that in developed countries, where electricity is already widely used, any big expansion of electricity's functions outside the fields in which it is already used would entail higher costs and more capital expenditure than would be required by the increased use of other energy sources.

Broadly, this position arises from two major factors: First, thermal power—which accounts for about two-thirds of total electricity production, the remainder being hydro power—is a secondary energy source, requiring the costly processing of primary energy sources for its production, with a resultant loss of some three-quarters of the original heat content of the fuels used. Secondly, of electricity production and transmission demands high capital expenditure, far higher even than that required for petroleum. Thus, in a recent study published by the U.S. International Co-operation Administration ("Economic Aspects of Electric Power Production in Selected Countries"), it is shown that the expected cost of 56 proposed new conventional thermal generating installations in 25 different countries ranges from about £55 to as much as £110 per kilowatt capacity.

The capital costs of hydro installations are, of course, higher still. To these capital costs of generation must be added, of course, the capital costs incurred for coal or oil supply and for electricity transmission. At

full capacity operation one kilowatt of generating capacity could produce the calorific equivalent of about 0.7 tons of petroleum products. Thus, the cost of conventional thermal electricity capacity equivalent to integrated petroleum capacity of one ton annually is upwards of £80 for generating plant plus further capital for transmission facilities. By contrast, integrated petroleum capacity, covering all stages from crude oil exploration to the distribution of products to the consumer costs up to £40 or about half this figure per ton.

In practice the contrast between the capital costs of electricity and petroleum supply respectively is even greater than these figures indicate. The wide fluctuation of electricity demand at various times of the day and the year, coupled with the fact that electricity cannot be stored in large quantities, imposes the necessity for a generating capacity greatly in excess of the actual average rate of electricity production. In the U.K. last year, for example, thermal electricity sent out was equivalent to only 43 per cent of thermal generating capacity. The actual throughput of petroleum installations is very much closer to capacity than this, and in the case of refineries, for example, production generally averages over 90 per cent of capacity.

In the field of public transport—one of the few other fields in which both electricity and petroleum are fairly widely used—a comparison shows significant advantages to the consumer of petroleum in the shape of lower capital costs for consuming equipment, although in particular cases a high degree of equipment utilisation coupled with savings in other directions may favour the use of electricity. In the case of electrically-driven trolley buses, for example, while the cost of the vehicles themselves does not differ greatly from that of comparable diesel-engine vehicles an extensive cable-feeding network for electricity supply is also required, costing perhaps £10,000 or more per mile of route. Similarly, in the case of rail transport, electrification entails large additional capital expenditure on fixed installations. Thus, in the British Railways' modernisation plan, the cost of constructing 1,100 main-line electric locomotives is put at about £60 million, and the cost of about 2,500 main-line diesel locomotives at £125 million. But the additional cost of fixed installations to make the use of the electric locomotives possible is put at a further £125 million, this cost having no counterpart in the case of diesel traction.

A survey of the hydro-electric power potential of India reveals the dangers of committing any significant proportion to the propulsion of transport on the railways, a process which cannot be reversed once it has been undertaken in view of the high capital cost. It is a fact that nature has not been generous to India in hydro power and, with very few exceptions, the multi-purpose schemes are not power-intensive, as it is understood in the big hydro power consuming countries. Per capita hydro power potential is very small and will probably serve the country's interests best if devoted to production of goods.

Diesel locomotives have now been amply proved to have such overriding advantages that they are progressively eliminating the steam locomotive, even in countries whose prosperity is founded on coal. The advantages are founded mainly on high efficiency,

high utilisation, high speeds, high torque characteristics, low specific fuel consumption, cleanliness, virtually no consumption of water, and the ability to replace a greater number of steam units. In India it has been proved that the diesel is fully economic on cost and operating considerations and in addition offers the following advantages:

- (a) One ton of diesel fuel can do the equivalent work of up to 9 tons of coal and, therefore, dieselisation releases carrying capacity at a time when it is vitally needed for the second Plan. Railway coal accounts for about 11 per cent of total carrying capacity of the system.
- (b) Diesel fuel is available from ocean installations at the main ports round the periphery of India, thereby reducing cross hauls, and a network of bulk oil storage depots has already been built up covering the main towns on the Indian rail system.
- (c) Reduced railway coal offtake will release coal output which will be readily taken up in the expansion of industrial demand in the Plan.
- (d) Reduction in the water consumption will assist the problems in the drought areas and reduce emergency diversion of tank-wagons carrying water in scarcity areas.
- (e) the areas particularly suitable for diesel conversion are clearly North-West, South-West and Central-West India in that order.

GROWTH OF CO-OPERATIVE FARMING IN POLAND—I

By RICHARD WIELBURSKI

(Vice-Director of the Polish Institute of Agricultural Economics)

AN enormous differentiation in the countryside was the characteristic feature of the situation of Polish peasants before the war. On the one side there were 65 per cent of small-holders (owning less than 5 ha. of land, who altogether had less than 15 per cent of the total of land), and on the other side were 0.9 per cent of landlord families (owning more than 50 ha. of land each, constituting almost 50 per cent of the total area of land in use). The last official statistical data for 1931 gave the following figures for families of the various land-owning groups:

Landless peasants	590,000	families
Very small farms (less than 2 ha.) ..	747,000	"
Small farms (2-5 ha.)	1,136,000	"
Total of rural proletariat and semi-proletariat	2,473,000	"
Landlords (owning more than 50 ha.) ..	14,700	"
Kulaks (15 ha.—50 ha.)	118,200	"
TOTAL	132,900	"

Thus we obtain a picture of enormous land hunger, of the existence of an army of landless peasants, of owners of small farms and small-holders—the sources of cheap labour for the big landowners and kulaks. The peasants in pre-war Poland were also exploited by usurers and, by people who speculated with land. The medium farmer also gradually, but inevitably, sank to a lower level.

It suffices to mention that every hectare of peasant land was indebted (mainly through debts contracted from usurers), debts amounting to the value of 26 quintals of rye. Weighed down by such burdens, the productive forces of the farmer could not develop. Thus,

- (f) A new industry and a new technique in handling modern machines will be built up to India's advantage.

The country is power-hungry and the spread of electric power from the big projects will leave the main mass of townships and villages untouched for many years to come. Furthermore, individual demand in the areas at first is so diffused that steam plants are uneconomic and frequently essential supplies of water are not available. In this context a practical solution for the village lies in the diesel generator and it was an eminently practical view that led Canada, under the Colombo Plan, to allot \$3,000,000 for the purchase of diesel sets for India's villages.

Where higher power is concerned it will also be well to watch closely the development of the industrial gas turbine electric generator, burning oil products. This type of equipment already offers important advantages of high power for small space required, light foundations and buildings, and no water requirements whatsoever. Development has already reached the stage of long service life, and specific fuel consumptions are being steadily improved. Where process heat in an industrial establishment is required as well as electric power the industrial gas turbine is already fully economic. Other even more efficient and promising new developments are in the offing, such as the combination of a free piston gas generator driving gas turbines for electric power generation, water lift, etc.

even the big landowners did not introduce modern techniques in their farms; they did not mechanize production as there was always a surplus of labour which was extremely cheap. Not a single tractor was working on Polish soil.

The main trend in the development of Polish agriculture before the war was the degradation of productive forces and with it the pauperization of the peasants, the constant increase in the number of small farms and deterioration in their situation. The war years and Nazi occupation speeded up this process. The land reform, which was the first great social transformation carried out by the Government of the People's Democracy, was the starting point for a fundamental change in the condition of the peasants, the structure of land ownership and the development of peasant farms.

As a result of the distribution of the landed estates, the peasants received more than 6 million ha. of land; 87.5 per cent of the land in Poland became the property of the farmers. In general 33.4 per cent of all the farmers received all their land or part of it as a result of the land distribution carried out by the People's State. Another important factor in the change was the fact that their debts were written off and they thus became in fact the owners of their property. Land reform was accompanied by an entire system of State aid, which enabled the peasants to husband their land, to develop production and to raise their earnings. The State supplied the peasants with grain, horses, machinery and tools, fertilizers, instructions and so on.

On the other hand the general development of the economy after the nationalisation of heavy industry, the banks and transportation, after the rapid reconstruction of industry ruined by the war and the further

industrialisation of the country, created the necessary basis for the growth of agriculture, accompanied by a simultaneously increasing demand of the urban market for agricultural goods and of the rural market for industrial products.

The main characteristic feature of working peasants in our People's Republic is that they are really the owners of their land and are deeply interested in increasing production. It is important to emphasise this fact, since the development of producer co-operatives can take place only on the basis of voluntary forms of association of working peasants, who are independent owners of their farms. One of the main stimuli promoting the development of co-operatives is the possibility to increase the productivity of their farm, which means that the peasants can increase their income, retaining their position as owners of their soil. It should be emphasised that the setting up of producer co-operatives is the final result of an entire complicated process of peasants joining similar forms of co-operatives—in the field of supply and sale and in the various branches of production. It was also helped by an entire system of stimuli used by the State in granting help to the individual farmer and linking their production with the needs of the developing planned national economy.

While the number of members of agricultural and trade co-operatives among peasants amounted before the war to approximately 300,000, at present more than 3 million peasants are members of the supply and purchase co-operatives of the Peasant Mutual Aid Union. These co-operatives have enormously increased the net-work of their shops in the villages (from 8,000 in 1946 to more than 35,000 in 1952). These co-operatives handle a considerable part of the products sold by peasants and of the industrial goods bought by them. The development of rural supply and purchase co-operatives can be gauged from data on the number of machinery and agricultural implements sold by the entire trade before the war and by the supply and purchase co-operatives at present, because they reveal the enormous progress which has taken place in the agriculture of our country as compared with the pre-war period.

	1936	1950	1955
Ploughs ..	24,600	62,870	84,000
Cultivators ..	3,400	6,500	17,000
Fodder Steamers ..	4,300	15,600	38,000

Considerable progress has taken place in the joint utilization of the vast network of Community Machine Centres by the farmers. Seed drills from such Machine Centres did in 1949 the sowing of 620,000 ha. and in 1952 of almost 1,200,000 ha. Harvesters and sheaf-binders collected in 1949 grain from 250,000 ha. and in 1952 from almost 750,000 ha. The scope and quantity of work done by the tractors of the State Machine Centres for individual farms is also constantly growing. Particularly favourable conditions have been created for the peasants who join into groups and sign contracts for the use of machinery from State Machine Centres. An enormous intensification of mechanization in the work of individual farms is planned. At the end of the Five-Year Plan (1960) 25 per cent of the more important field work in private farms will be mechanized. Constantly on the increase is the number of peasant associations which have been set up in order to facilitate farming and to increase the various branches of production. This concerns particularly associations set up for the improvement of meadows and pastures, for their rational utilization, and for tilling the soil, and also associations of stock-breeders of cattle or pigs; the purpose of the latter associations is to improve the breed, health and productivity of domestic animals. The number of peasant associations for the production

of building material has considerably increased as well as collective action at building.

The substantial development of the simpler forms of co-operation enabled the working peasants to achieve considerable results in their production at relatively low cost which would have been beyond the reach of individual farmers. It is obvious that State aid can be much more effective provided that not individual peasants but entire group benefit from it.

There is still another important aspect in the development of simple forms of co-operation—it frees the working farmer from economic dependence on the kulak, it undermines the possibilities for the still existing (though much less significant than before the war) exploitation of man by man.

The association of peasants and the profits arising from it are still further facilitated by the broad variety of means adopted in the economic policy of our People's State. This policy is in favour of granting far-reaching assistance to the production process, credit as well as expert advice to all the working peasants. Here are a few data concerning this aid:

While the value of the output of agricultural machinery and implements in 1927 amounted to 46 million zloty, in 1950 it had already reached more than 100 million zloty, in 1952 160 million zloty, and it continued to increase at a rapid rate. The number of electrified villages is ten times higher than before the war. The amount of fertilizers used increased, as compared with 1928, by two to three times.

Those peasants have priority in getting State assistance who co-operate in farming. It is worth while to emphasise that this principle is not the result of a political dogma, but of the necessity to create such production conditions in the countryside as would exclude the possibility of exploitation. One of the more important methods of the State exerting influence on increasing production, and simultaneously building a bridge between the individual rural producers scattered all over the countryside and the collective socialist economy in the town, is the system of contract purchase of many agricultural products. The State signs with a considerable, constantly growing, section of farmers contracts for the production of sugar beet, flax, other industrial plants, livestock, pedigree animals, seed grain and many other products. If, for example, in 1947 an area of more than 250,000 ha. was embraced by contract purchase, in 1951 already more than 1,250,000 ha. were covered. In the leading provinces more than 20 ha. out of every 100 ha. of arable land came within the system of contract purchase. The peasants sold their contracted products at profitable prices, receiving at the same time selected grain at specially low prices, as well as fertilizers, concentrated fodder, agronomic advice and other forms of assistance. In order to stimulate production, contracting establishments buy surplus production above the amount contracted for at higher prices constituting a form of bonus.

Per capita income of the working peasants (according to preliminary data concerning the last six years) has increased by 35-40 per cent. Thus, the rural market absorbs more industrial goods. As an example the turnover in the textile goods in the Peasant Mutual Aid Union co-operatives increased from 1,200 million zloty in 1950 to 2,100 million zloty in 1952, in leather goods from 480 million zloty in 1948 to 1,000 million zloty in 1952. Only the development of industry can supply the countryside with the means necessary to increase production, give employment to surplus labour in crowded rural regions of the country, create and constantly help to increase the market for agricultural products in

the towns and for industrial articles in rural areas. We have achieved many successes in the development of our economy, but we still have many difficulties to overcome, which are the result, above all, of the too-slow increase in agricultural production. During the first four years of the last Six-Year Plan the annual increase in agricultural production amounted to 2 per cent, while during the last two years it amounted to 4 per cent an-

nually. Viewed overall we obtained during the course of the Six-Year Plan approximately a 20 per cent increase. This excessive disproportion results from the poor possibilities of increasing production in small, individual scattered farms. It reveals the economic necessity to speed up the rate of association of peasants on a voluntary basis, by setting up large socialist farms—co-operative farms.

Economic Report from the U.S.

COTTON EXPORT PROGRAMME

(BY GUY SIMS FITCH)

WASHINGTON, May 8.—Now underway in Washington is a little international conference that may well turn out to be one of the most important of the year. It is the plenary meeting of the International Cotton Advisory Committee. The Committee has 33 member Governments, representing major cotton producing and consuming countries, including the United States. But so great is the interest in the nine-day session which began today that delegates from more than 20 other nations are attending as observers.

Mostly, the deliberations will be held behind closed doors. It is quite certain, however, that one of the major issues taken up by the group will be the US Cotton Export Programme and its effects on other ICAC members. The programme, which was first announced last February, looks to the sale abroad at competitive prices of the US Government's cotton reserve. The programme will be put in operation on August 1, 1956. The decision to embark on this policy represents a departure from the long-standing US policy of keeping its cotton reserve stocks out of competitive world markets. The decision was made only after the most careful deliberations, and after it became apparent that no other acceptable alternative was available.

However, as the United States has said repeatedly and made especially clear in the February Cotton Programme announcement, sales of cotton abroad will be made in an orderly manner to avoid disrupting the world markets or impairing the position of friendly nations. This is in line with the general policy the United States has followed with regard to other commodities. In fact, this policy of orderly disposal was emphasized in the farm message which President Eisenhower sent to Congress last January. The points the US delegation can be expected to make at the current International Cotton Conference are understood to be these: The United States has made strenuous efforts to cut down its cotton reserve stocks. During the past two years alone, cotton acreage in the United States has been reduced by 35 per cent. In 1956, the harvested area will be the smallest since 1892. But as the United States has cut back its production, other countries have built up theirs—at the rate of one million bales a year. This increase in cotton production outside the United States has been outrunning the increases in consumption. The result has been that export demand for US cotton has fallen to about two million bales, as against five million before World War II.

The United States' share in the world cotton market has now fallen from 40 per cent before World War II to 20 per cent at the present time. During the past three years alone, cotton stocks in the United States have consequently grown from two and a half million to 11 million bales as in August last year, and reserves continue to increase. It is the considered opinion of most experts in and out of the US Government that any further reduction in American cotton acreage would have serious detrimental effects on the economic position of American cotton farmers. This is an eventuality which the US Government obviously cannot accept—particularly as long as other countries

continue increasing their output. The US position on this matter has long been made clear and it has also consistently taken into account the interests of other cotton-producing countries. The possibility that the United States would have to re-examine its cotton policy was raised as early as June, 1954, at the ICAC meeting at Sao Paulo, Brazil. Setting August 1 as the date on which actual competitive exports will begin, allows other nations time to make adjustments in their 1956 production and marketing programmes.

Events so far seem to justify the US view that the American programme, if given a chance to operate, will help reduce the heavy stocks hanging over world markets without causing any serious market dislocations or undue damage to price levels. It is noteworthy that cotton markets generally have remained sound, despite a brief and temporary price flurry shortly after the new policy was announced last February. Not to be overlooked, meanwhile, is the possibility that the US Government, under appropriate circumstances, would be willing to co-operate with other countries in multilateral action to solve the world's cotton problems. Involved in this solution would be a chance for the United States to regain a reasonable share of its historic world trade in cotton.

COMPENSATION FOR LIFE INSURANCE

By
CROESUS

IN the brief reference that I made to the Select Committee Report on the Insurance Bill, with particular reference to the joint-minute of dissent of Messrs Tulsi-das Kilachand and G. D. Somani, I could not deal with the all-important question of compensation to be paid to the shareholders of insurance companies. It was more due to consideration of space rather than to a failure to appreciate the importance of this controversial provision in the Life Insurance Corporation Bill as amended by the Select Committee that prevented me from commenting thereon.

The basis of compensation is indicated in the schedule to the Bill and takes into account the method of valuation surplus, the relevant period of valuation, and the percentage of valuation surplus appropriated for the benefit of the shareholders. While, in their minute of dissent, the two members of Parliament have differed from the majority in regard to the percentage of valuation surplus appropriated for the benefit of shareholders and have also questioned the propriety of adopting the average of the last two valuations as a basis for determining the period of valuation, the Indian Insurance Companies Association (I.I.C.A.), Bombay, has concurred on the compensation formula in the Bill and makes the point that, under this inequitable formula, the shareholders of Indian insurance companies showing surplus stand to receive only 42 per cent of the value of their property, while shareholders of other Indian units would not receive even this, or any compensation for that matter.

The Association does not object to the Government formula or the principle underlying that formula, but it does not accept the way in which the authorities have sought to translate this formula into action. As the Association rightly observes, the most scientific basis to arrive at the earning capacity of any life insurance business for the purpose of compensation would be to make an actuarial valuation as on 31-12-1955. It should take into account 1) the business in force on that day (source of earning power in all life insurance), 2) the surplus earning capacity of the business on that day, and 3) the percentage of the surplus to which shareholders of the company concerned are entitled under the terms of any agreement that they may have with the policyholders. For practical reasons, it may be conceded that the Government has not followed the method of actuarial investigations as on 31-12-1955. While appreciating this, insurance companies would not have objected if any other formula adopted by the Government had assured fair compensation to them after taking all the relevant factors into consideration. However, the I.I.C.A. is not satisfied that the formula followed by the Government secures such fair compensation. Thus, it points to the adjustments made in the current position which curtail the valuation of the interests of shareholders, first, by averaging the last two valuations and, secondly, by artificially reducing the allocations of shareholders from 7-1/2 to 5 per cent.

A further injustice to life insurance companies is the provision for compensation in the amended Bill on the basis of average business in force for the six-year period 1950-55. The result is that companies are compensated not on the current basis, as it ought to be, but on the basis of business in force at the end of 1952 or earlier. In actual terms, this would mean compensation on a business of only Rs. 800 crores, as against Rs. 1,020 crores at the end of 1955. It has been estimated by the Association that the extent of reduction arising from this would amount to as much as 21.8 per cent.

Again, instead of proceeding on the basis of surplus earning capacity on the day of acquisition, the amended Bill seeks to compensate on the average rate of surplus earning capacity over the period of the last two valuations. While, to some extent, it may be that such averaging would eliminate chance variations, as the Government claims, it should be pointed out that it overlooks the basic fact in life insurance, namely the steady trend towards increasing quantum of surplus at each successive valuation. The following instances cited by the Association, in order to illustrate the point, are revealing:

Company	Last Valuation	(In lakhs of rupees)	
		Preceding Valuation	
A	16.34	9.67	
B	0.94	0.10	
C	32.87	16.18	
D	1.15	0.59	
E	5.95	1.41	
F	623.32	357.89	

These figures show that the Government's compensation formula takes into account not more than 80 per cent of the earning capacity, on the basis of last valuation alone. Apart from the fact that the surplus earning capacity on 31-12-55 would be much higher than even at the latest actuarial valuation, the proposal to average has had the effect of reducing the compensation unjustifiably to 62.6 per cent.

Another penalty that life insurance companies are asked to bear arises from the move to reduce the percentage of valuation surplus normally allotted to shareholders from 7½ to 5 per cent. According to the IICA, in respect of 43 companies, this would mean a reduction in compensation by as much as a third, that is to 41.7 per cent. Since public memory is proverbially short, it may be worth while recalling here that the maximum provided for under the 1944 Insurance Act (Amendment) Bill was actually 10 per cent that is, the percentage that the companies had been customarily allocating until that time. This was, however, reduced by the then Select Committee to 7½ per cent. But, when this was accepted by the Parliament, it should be noted, there were strong complaints that the reduction would hurt the shareholders unduly. Yet the Union Finance Minister was found arguing the other day that enlightened insurers allotted 5 per cent or less to shareholders! If some companies had done so, it is pertinent to remember that there were certain special considerations that operated in this case. For instance, in their prospectuses or articles of association, there were specific provisions debarring them from allocating a higher amount than 5 per cent. Moreover, after having allotted a smaller amount once, the companies concerned would naturally be reluctant to change the figure, lest such should be misunderstood by the policyholders.

Nor is the 7½ per cent that insurance companies now claim an unreasonable percentage of the valuation surplus that should be allotted to shareholders, or is it higher than what insurance companies in other countries allot. Almost all over the world, the 10 per cent allocation seems to be the accepted normal. In 1955, the largest British insurance company, namely, the Prudential, declared as much as 8 per cent and it was in an apologetic tone that the Chairman of the Company announced that this represented a slight reduction as compared to the previous year! It is also significant that he emphasised the need for regulating the quantum of profit allotted to shareholders "only when the size of the portfolio became abnormally large." But the

size of the portfolio of how many companies in this country is abnormally large? Even in the case of the largest life insurance company in India, this size is comparatively small and the amount received by its shareholders relatively meagre.

Finally, if it is considered fair for the Government with all the advantages of monopoly as a Corporation that it enjoys, to have 5 per cent of the surplus provided under the Bill, it is rather difficult to understand why the compensation to be given to shareholders of insurance companies taken over by the Government should be on a basis lower than their current expectations of future earnings.

The defect of the formula proposed is not only that it reduces the compensation to 41.7 per cent of what the shareholders should reasonably expect to receive on a proper appraisal of the value of the interest as stated above, but also that it fails to give a uniform lead to all companies by ignoring the rate of growth

of business and efficiency of their organisation. The formula thus fails to provide for equity and fairness in compensation between different units.

The targey of the whole matter is that, whatever the compensation that the Parliament may decide upon, there is no appeal under the Constitution against the decision. Unless, therefore, the Parliament takes a reasonable and judicial view in regard to this question, bearing in mind that the compensation, after all, is not to be given out of public revenues but only out of the existing portfolio of contracts to be transferred to the Corporation, there is the grave danger of the legitimate and reasonable claims of shareholders of life insurance companies, who, by the way, are mainly drawn from the fixed income group, being overlooked. The Parliament would do well to remember the IICA's warning that "in the long run only a society where property rights, individual or collective, are honoured can prosper."

AN ELECTION OUTLOOK

By
CROESUS

THE few recent congress reverses in the elections to Parliament, State legislatures and local bodies have rudely disturbed the erstwhile complacency of at least some top-ranking congress leaders. They are not prone to dismiss these merely as a vote against either the merger proposal as in West Bengal or the S.R.C. Report as in Travancore-Cochin, although they do recognise such to have been the predominant determinant. Obviously, it has not escaped their notice that a degree of sullen hostility towards the Congress has lately been developing because of the feeling that it has been hastening rather too fast, however laudable many of their ideas and intentions may be. This hostility is manifesting itself in a queer, but in no uncertain way, that is in this section of the public, which has always been pro-congress and anti-communist, protesting by staying put and not exercising its right to vote at any elections. The curious thing about it all is that, even now, this section has not ceased to be anti-communist, but, in registering its displeasure against the congress, it is helping the communists, albeit unconsciously, to gain strength. If the process goes on for some time, one may find oneself under a communist regime one fine morning in the not too distant future. Surely this is not the desideratum that even those who do not wholly share the congress view are bargaining for. Here then is a peculiar situation about which our politicians and public men must do some fast and furious thinking.

Meanwhile, it is heartening to find that there are already several persons who seem to have begun to give careful and considerable thought to the situation as it has been developing. According to these, it is fatal to allow the anti-communist elements in the country, wherever they may be, to remain sullen and refrain from exercising their franchise. Whatever their differences with the congress, and whether these are justified or unjustified, it clearly does no good to think of spiting the congress in this manner. It should be borne in mind that the harm that might happen to the country if one altogether refrains from voting is decidedly greater than the help that the congress gets by one's voting for the congress. For, while it may not result in victory to a congress candidate, it will certainly enhance the chances of the communists capturing power.

These thoughts apparently have prompted a few farseeing men to sit down and do some serious thinking. The problem as these people see it seems to be one of devising some means whereby the communists and the other extremist leftists are not allowed to exploit the antipathy of a section of the public towards the congress and its consequent apathy to elections. One idea that would appear to have gained fair currency, at least

in circles known to me, is that something must be devised to canalise the votes of all anti-communist elements in the country. How can this idea be translated into action?

There is a suggestion in this connection that, in order to arrest the slow accession of strength that the extremist leftist elements in the country seem to be gaining, another full-fledged political party must be immediately formed, to be called, say, the All-India Democratic Party or the All-India Republican Party. This party would have no specific leaning towards any ideology, save that of realism. Further, the party, it is expected, would, while resisting all attempts of the communists to defeat or overthrow the present government, not necessarily support any and every move of the party in power. One can list quite a handful of such moves, as, for instance, the unwillingness to impose salt tax or the proposal to enforce total prohibition all at once without regard to its financial repercussions, or the contemplated annual tax on wealth and so on. In other words, this new party would be of the earthy, having its feet firmly planted on terra firma. Viewing every case strictly on its merits, this party, while not hesitating to oppose the congress on certain features of a given measure, would not, at the same time, allow itself to be manoeuvred into any false position like associating itself with the communists, especially where the leftists' game is to rout the congress.

If a political party on these broad lines is started, even the congress could have no objection. For one thing, the new party will never be privy to overthrowing the congress party, even if in the opposition; on the other hand, the congress might see a distinct advantage in the advent of such a party, in that it would mean the diversion of votes to this party instead of to the extremist leftist parties, thereby reducing the chances of these latter parties securing the votes and carrying the day. It would also do a wee bit of good to some of our power-drunk politicians who seem to feel that they can get away with almost anything, by reason of the brute majority they have at the Centre and nearly all State legislatures. While there is urgent need to restrain the often unwarranted enthusiasm and hustling of these, there is no less need to prevent the communists from aligning themselves with other opposition parties, on the one hand, and from their systematic exploitation of the apathy of the electorate to seize power, on the other. I hope the Editor of "The Eastern Economist" will not scoff at this suggestion but examine it with a view, first, to focussing public attention and interest thereon and, secondly, to giving it the benefit of the journal's blessings later on, if it can be done.

BUSINESS NOTES

AMENDING THE RESERVE BANK ACT

THE RESERVE BANK AMENDMENT BILL which was introduced in the Lok Sabha last week is important from several view-points. Undoubtedly the most important and interesting provisions contained in the Bill are those which relate to the creation of money supply and credit control. At the present time a fixed ratio of reserves to the total note issue is stipulated under the Act at 40 per cent in foreign securities and gold. In view of the fact that the planned development of the economy involves expansion of money supply and deficit financing has been accepted as one of the means to implement the plan, it has become necessary to remove rigid restrictions on the Reserve Bank's discretion to expand the money supply. As the foreign exchange reserves will assume a tendency to decline under the impact of the plan projects the need to modify the restriction on the volume of note issue gathers force. The amending Bill seeks to replace the fixed ratio of 40 per cent in terms of foreign securities and gold by prescribed minima, namely, Rs. 400 crores worth of foreign securities and Rs. 115 in gold for reserve against the note issue. Revaluation of gold held as currency of reserve at 2.88 grains of fine gold per rupee in place of the present valuation at the rate of 8.47512 grains will alter the value of gold reserve to slightly above the limit of Rs. 115. How high the actual reserve will be raised in practice from time to time will have to be determined on the merits of the situation then prevailing, but the minima that have been fixed represent the absolute safety limits and it seems unlikely that more of foreign securities can be earmarked for the purpose of the reserve. The rising import bill will exert pressure on the ability of the country to increase its foreign exchange earnings or to procure foreign exchange resources otherwise.

As deficit financing goes under way progressively under the second Plan, expansion of bank deposits and their ability to create an increasing volume of credit must follow as logical concomitants. This possibility makes it necessary that statutory provision should be made whereby restraint dictated by considerations of check on inflation could be imposed by the Reserve Bank on bank credit. Under the Act as it now exists the banks are required to maintain a reserve with the Reserve Bank at a ratio of 5 per cent in the case of their demand deposits and of 2 per cent in the case of their time deposits. These ratios are sought to be raised to 5 to 20 per cent for demand deposits and 2 to 8 per cent for time deposits. A great latitude has thus been given to the Reserve Bank to put curbs on in-bank credit when its expansion indicates threat of inflation which may prove intractable after a time. The Reserve Bank has been empowered to direct that after a specified date banks should maintain additional reserves in respect of the increases in their deposits accruing after the date up to a limit of 100 per cent. But in no event are the aggregate reserves to exceed the upper limits of 20 per cent and 8 per cent for the two types of deposits. The ground has been created to employ the technique of credit control within the limits of its feasibility.

EXPORT LEVIES ON EDIBLE OILS

AMONG THE commodities that enjoyed a rising trend in prices till recently, oilseeds probably held the palm; prices of groundnuts, castor, linseed, as also of niger and kardi seeds, had all touched very nearly the highest levels reached two seasons ago. The authorities promptly attributed the rise to speculative excesses. With a view, therefore, to nipping the alleged speculation in the bud, they announced certain

exports levies in respect of linseed oil, kardiseed oil, nigerseed oil, and castor oil. Thanks to these imposts, the price trend in the market turned bearish and the decline in values in most cases wiped off the earlier gains.

But, then, in the wake of the announcement, the plight of shippers has become unenviable. For such of the shippers as had outstanding orders on hand to be executed had to contend with an export duty for which they had not bargained. It was found that the shippers in general stood to lose heavily, and so a delegation of exporters from Bombay waited on the Union Government and strongly pleaded for an exemption of these levies at least in respect of outstanding business. The Government, however, argued that it was not prepared to change its policy for the sake of a few individuals. It pointed out that the shippers had themselves to thank for having created such a situation; they were told it was their duty, in the first place, to have covered their requirements adequately.

Failing in its mission to persuade the Government thus, the Bombay oilseeds representatives returned from here. Meanwhile, reports had already gained currency in market circles that the British Board of Trade would soon send a mission to New Delhi in order to persuade the Government of India to exempt at least outstanding commitments from the mischief of export duties. It is doubtful if the Board of Trade in Britain would have agreed to do this. Even if it did, it is doubtful if it would achieve any more success than what its Indian counterpart did. Apart from the fact whether the British trade mission would at all be provoked into taking such a step even as a result of persistent pleas from traders in this country to their clients in the UK, the presentation of the case the British way is hardly likely to change the Union Government's attitude to this question. The authorities have apparently made up their mind that on no account must prices of edible oils be allowed to go up. It is not that they do not know that heavy export duties might mean no exports at all, but they are not worried about it. In fact, they might even welcome it, if only because of the tight domestic supply position today.

True, this would upset the foreign exchange budget of the second Plan to some extent, but who could foresee the contingency as has developed now? It is because the Plan rests on several such imponderables and unforeseens that many consider it to be somewhat unrealistic, even when realising it to be quite desirable and necessary in the existing circumstances.

BOMBAY FINANCIAL CORPORATION

THE THIRD year of its working shows that the Bombay State Financial Corporation is getting into the stride to perform the functions with which it is primarily charged. The investment portfolio of the Corporation is considerably reduced and funds have been utilised increasingly for payment of loans to medium and small industries. Total loan commitments have exceeded the issued share capital and the question of enlarging the resources is now under consideration. Rs. 62.71 lakhs have already been disbursed to borrowing industrial concerns and this together with the firm commitments of loans of Rs. 25.44 lakhs takes the total value of loan transactions to Rs. 88.15 lakhs. Repayment, in respect of which no defaults have occurred so far, has brought back Rs. 2.25 lakhs.

There was a carry-over of 66 applications for loans from the previous year. Fresh applications during the year under review ended 31st March, 1956 were lower

at 56. The rate of disposal, assessed with reference to the number of applications, shows quicker speed. In all, 39 applications were sanctioned, 11 were rejected, 49 were otherwise disposed of and 23 were pending investigation. It will thus be seen that about 60 per cent of the applications fell under the category of those otherwise disposed of. This means mainly their reference to the State Department of Industries for assistance under the now liberalised State Aid to Industries Rules. Under this scheme loans are made available up to Rs. 50,000 for a period extending to 10 years. It is likely that part of the applications so referred deserved loans in excess of Rs. 50,000 since their requests ranged up to Rs. 75,000. But the most attractive and compensating factor was the low rate of interest at 3 per cent per annum. This rate is half of the rate of 6 per cent charged by the Corporation on its loan. In his annual speech delivered on May 7 last, the Chairman of the Corporation has explained its inability to lower the rate which is considered by some as too high for the class of borrowers. The guarantee of dividend at 3½ per cent and the prevalence of high market rates are the main causes responsible for the Corporation's rate.

The prudential management of the Corporation is reflected in the final results of financial working. During the year April 1955 to March 1956, it earned a net profit of Rs. 3.55 lakhs. Priority appropriation went to the Statutory Reserve Fund which was allocated Rs. 20,000. A significant feature of the Corporation's developing pattern of finances is the setting up of a Reserve for Bad and Doubtful Debts which was granted an initial allocation of Rs. 20,000. Rs. 4,500 were transferred to the Investment Reserve Fund which are adequate for its changing size in view of the diversion of funds to payments on account of loan instalments. The joint request of the State Financial Corporations to the Government of India for exemption from payment of income-tax and super-tax for at least the first five years has been turned down. In consequence, the Bombay Corporation set aside Rs. 1.50 lakhs for income-tax and had to ask the State Government for a subvention of Rs. 1.89 lakhs to meet the obligation of the dividend at the guaranteed rate of 3½ per cent.

ENGINEERING INDUSTRIES AND GOVERNMENT PURCHASE

IF THE engineering industries take a vital interest in the Government's stores purchase policy, there is no reason whatever to regard this attitude as a sign of their weakness. Its propriety is amply vindicated by the fact that nearly half of the purchases made on Government account at the present time are composed of the products of these industries. A plea has been made by Mr. A. Rajagopalan in his presidential address at this year's general meeting of the Engineering Association of India to grant representation to these industries on the forthcoming Purchase Advisory Council. A choice in this behalf acceptable to a large section of the engineering interests would prove difficult inasmuch as no less than thirty different associations of these industries are functioning at present. It is for them to bring about integration on a federal pattern to seek unified representation and to make their voice heard.

It is one of the demands advanced on behalf of the Association that they should be offered rate contracts for long-term periods which would ensure stability of production and employment of capacity on a continuous basis. In that event, however, new entrants or those who are not approved for award of first contracts stand the risk of being kept out over long periods. The industries have asked for progress payments in long-term contracts. This request seems realistic in view of the problem of raising resources when production is to be channelled in a fixed direction.

Since orders are expected to be scattered over a number of producers, the administrative burden in following up progress of work and in making disbursements will necessarily increase. Relaxation of terms of delivery in case of non-compliance due to reasons for which strict responsibility cannot be fixed on the producer, such as, for instance, delays in transport or in release of controlled materials, would appear to be a reasonable demand. But when the Association makes a request for pooling of Central, State and quasi-Government orders for small supplies to accommodate the units in these industries, it underestimates the feasibility of the proposal on a nation-wide scale particularly from the angle of the small size of the orders and the multiplicity of supplying units.

NEW PEAKS FOR PUNJAB NATIONAL BANK

THE YEAR of Diamond Jubilee—1955—was a year of fresh records in the working of the Punjab National Bank. New peaks were achieved in important spheres. The Bank's profit reached the all-time high of Rs. 69.40 lakhs. This includes an element of the previous year's carry-forward of about Rs. 5 lakhs. It compares with the profit of Rs. 56.86 lakhs in 1954 and Rs. 41.79 lakhs in 1953. The total dividend for the year reached the level of 14 per cent per annum.

Analysing the working of the bank in its 60th year, Mr. S. P. Jain, the Chairman, has invited particular attention to the trends in deposits. It goes without saying that these trends exhibit a marked upward course. Deposits went up during 1955 by Rs. 15 crores to a total of Rs. 90 crores. Taking this indicator of public confidence in the vitality and efficiency of the Bank, the management is entitled to take legitimate credit for the position which it has carved for itself vis-a-vis other scheduled banks. As against an increase of 8.8 per cent in the deposits of other scheduled banks in 1955, the increase in the Punjab National Bank's deposits was more than double at 19.1 per cent. This record surpasses the previous year's difference of 50 per cent. It is hardly to be expected that in any review of banking in the last year an anxious reference to the increasing toll of interest rates on deposits can be ignored. In addition to the impact of the general scramble for deposits among the scheduled banks, Mr. Jain has drawn attention to the effect of the shift in the policy of exchange banks in pursuance of which they are leaning more heavily on the Indian market for funds than on their resources at home. Total deposits of exchange banks showed an increase between 1948 and 1955 of the order of Rs. 45 crores as against the increase of Rs. 35 crores for the Indian scheduled banks. More precisely, in terms of percentages these increases are of the order of 27.1 per cent and 4.4 per cent respectively. The steep rise particularly in the UK Bank Rate is an important factor in this shift in policy.

The total working capital of the Bank increased by Rs. 21 crores to Rs. 112.89 crores in the last year. Loans and advances etc. reached the level of Rs. 42 crores showing an increase of a little less than Rs. 10 crores. There has been an improvement in the foreign exchange business of the bank. The liquidity ratio has been maintained at a satisfactory level. A remarkable feature of last year's progress of the bank was the opening of 13 new offices which takes the total number of the branches to 326. This expansion in branches is to be pursued steadily in the immediate future. The issued capital of the bank is sought to be raised by Rs. 37.5 lakhs in the form of bonus shares to be allotted in the proportion of 3 bonus shares for existing 7 shares. Since this issue is to come out of the premia received from shareholders, official sanction should not prove difficult and besides the issue is expected to be free from income tax.

Partners in Progress

ONE OF the most important developments in Indian industry is the new aluminium smelter going up at Hirakud, Orissa. Designed and constructed by the Canadian consultants of Indian Aluminium Company, this 10,000 ton smelter will embody the latest advances and techniques developed in their

world-wide research activities. Canadian money, too, will share the costs of this project, to finance a part of which Indian Aluminium Company proposes to issue new capital. The Hirakud smelter will be yet another milestone in the history of this Canadian-Indian partnership of progress.

COMMODITY NEWS AND NOTES

WORLD WOOL PRODUCTION IN 1955-56

Total production of raw wool in the free world in the 1955-56 season is now estimated at some 4,037 million lbs. (greasy basis), or 4 per cent more than the revised 1954-55 figure of 3,885 million lbs. The greater part of the increase was due to larger clips in Australia and New Zealand. Estimated world production at 4,840 million lbs. (greasy) was up by 5 per cent on the previous season, since the estimates for the Soviet Union, supplied by the United Nations Economic Commission for Europe also show a marked increase.

On a clean basis, world production in 1955-56 is estimated at some 2,730 million lbs. compared with just over 2,600 million lbs. in the previous season. The main increase is again expected to be in merino production (up by 6½ per cent), with crossbred and other types showing smaller rises.

TEA PROSPECTS

As consumption in India is steadily expanding, while stocks overseas, particularly in the UK, are comparatively low, offsetting the carry-forward of the 1955 North Indian crops, prospects of the tea industry during the current season seem to be brighter than they were a year ago. The world tea production in 1955 at 1,251,200 lbs. showed an increase of 20,000,000 lbs. while consumption advanced by about 3,200,000 lbs.; India, Pakistan and adjoining countries being the principal areas of expansion.

Such an assessment might be considered erroneous in view of a carry-forward of about 55,000,000 lbs. of the 1955 North Indian crop on April 1, 1956. However, it should be noted that overseas buyers, particularly those in the UK, had purchased some 55,000,000 lbs. more than was required and they were faced with heavy financial losses when the market fell in 1955. This, combined with the growing credit squeeze, resulted in U.K. imports of tea in the past 12 months falling by 95,000,000 lbs.

In consequence, while consumption showed little change, stocks in the UK have in recent months steadily declined and are at a fairly low level. Viewed in this context, the carry-forward of 50,000,000 lbs. with producers in India loses much of its significance and should not be considered an unwanted surplus.

TEA OUTPUT IN CEYLON

Tea production in Ceylon showed marked decline in first three months, compared with the corresponding period of last year. Production figures officially released showed March 1956 production to be 32.4 million lbs. compared with 43 million lbs. in March 1955. Production during the first three months this year totalled 84.4 million lbs. compared with 103.5 million lbs. during the corresponding period of last year. The decline in production this year is attributed to the adverse weather conditions, especially drought in mid-country and frost in up-country areas.

FINAL ESTIMATE OF MAIZE

According to the Directorate of Economics and Statistics, Union Ministry of Food and Agriculture, the All-India Final Estimate of Maize for 1955-56 puts the current year's area and production at 8,909,000 acres and 2,519,000 tons as against the partially revised estimates of 9,311,000 acres and 2,939,000 tons for 1954-55. This shows a decrease of 402,000 acres of 4.3 per cent in area and 420,000 tons or 14.3 per cent in production. The overall decrease in acreage during the current year has been shared mainly by Bihar, Uttar Pradesh and Rajasthan and has been attributed to unfavourable climatic conditions at the time of sowing. This decrease in acreage has, however, been offset to some extent by increases registered mainly in Bombay and Punjab, and to a lesser extent in Jammu and Kashmir, Madhya Bharat and Ajmer.

rease in acreage has, however, been offset to some extent by increases registered mainly in Bombay and Punjab, and to a lesser extent in Jammu and Kashmir, Madhya Bharat and Ajmer.

GOVERNMENT OF INDIA'S WOOL POLICY

The All-India Wool Trade Federation has again complained against the raw wool export policy for the April-September 1956 period. Taking objection to the cut of 10 per cent in the allotment of quotas to established shippers from 45 per cent to 35 per cent the Federation has said that this is particularly unjustified inasmuch as even the previous allotment for the half-year ended March 31, 1956, was unsatisfactory. According to the Federation, the disappointment of the trade over this is all the greater because it had anticipated a more liberal policy this time in view of the sufficient scope for the same. In support of the claim for liberal exports, it is said that though 33 million lbs. of wool was allowed for export during the October 1955-March 1956 period, only about 15 million lbs. were actually shipped during the period. Again the fact that the average annual export during the last eight years has not exceeded 27 million lbs., is cited to prove that unlike cotton, oil, oilseeds, etc., wool cannot be exported in unlimited quantities within a short time. In the circumstances it is contended that export of wool must be either allowed free, or the annual ceiling should be fixed at 35 million lbs.

WORLD'S NATURAL RUBBER OUTPUT

A report by the Special Rubber Committee of the office of Defence Mobilization said that world production of natural rubber in the year 1950-54 averaged 1,813,000 long tons a year. There was no upward trend during this period. Production in 1955 was less than in 1954, even though prices were high enough to encourage maximum output. It said that at most only a small overall increase in production seems possible up to 1960, though high prices could push production up. Replanting would continue in Malaya, Ceylon and other areas. Production as high as three million long tons annually in the near future is not beyond the range of possibilities.

COFFEE PRODUCTION

Latest reports are that coffee production in India has reached an all-time record this year. The quantity being about 30,000 tons. It is expected that the final figure at the end of the current season may well exceed 32,000 tons. This figure is very near the target set for the second Five-Year Plan. The export prices in recent auctions have been encouraging enough being roughly twice the internal price at Rs. 420 a cwt. While the high prices in the world market in recent days may be partly attributed to Brazil's action in withholding three million bags, the supply position in the internal market is fairly comfortable.

U.K. COFFEE SITUATION

Britain's consumption of coffee is steadily going up the latest figure 633,823 cwt. for 1955. It was 543,653 cwt. for 1954 and 499,103 cwt. for 1953. The swing to coffee is quite marked in certain special groups according to a survey that was recently made. Tea which is still the principal beverage in UK suffered somewhat from the public resentment developed out of the 1954 high prices as Americans felt about coffee prices in the same year. The April showers are reported to have been good for coffee and the prospects of the next season are likely to influence the Board to take a more optimistic view of exports. A further quantity may be allowed to export during the course of this year, probably up to 8,000 tons if the June estimate for the season justified it.

Company Meeting

THE PUNJAB NATIONAL BANK LTD.

Speech of Shri S. P. Jain, Chairman, at the 109th Ordinary General Meeting held on Thursday, the 26th April, 1956

Gentlemen,

I have great pleasure in welcoming you all to the 109th Ordinary General Meeting.

1955 has been a year of great significance in the history of your Bank. The institution completed 60 years of its useful service to the country and this historic occasion was celebrated on a national scale. Messages of blessings and good wishes were received from the Prime Minister, the Vice-President, Governor, Reserve Bank and heads of large banking institutions in India and abroad, as well as from the innumerable constituents of the Bank. The celebrations were in a manner befitting the prestige and reputation of your Bank and with all these blessings and good wishes I have confidence that the Bank will continue its march forward increasing its service and value to its constituents and the country.

BALANCE SHEET, 1955

The Report of your Directors and Audited Statement of Accounts giving the working results of the Diamond Jubilee year are already in your hands. The Accounts for the year show a record profit of Rs. 69.40 lakhs, including the sum of Rs. 4.99 lakhs brought forward as against a profit of Rs. 56.86 lakhs in 1954

and Rs. 41.79 lakhs in 1953. After the transfers—Rs. 11 lakhs to taxation, Rs. 24 lakhs to Contingency Reserves, Rs. 5 lakhs to General Reserve, Rs. 13.5 lakhs for bonus to staff and Rs. 1,30,000 for gratuity to staff and charity, the Board has proposed a final dividend of Rs. 2 per share in addition to the interim dividend of Rs. 1-8 declared on 1st September, 1955. This raises the rate of dividend to 14 per cent per annum. I am sure you will agree with me that the results of the year under review are satisfactory.

Deposits: The Jubilee year has recorded increase in the total working capital by Rs. 21 crores from Rs. 91.16 crores in 1954 to Rs. 112.89 crores in 1955. During the last five years the total assets have nearly doubled. The Deposits of your Bank increased from Rs. 75 crores to Rs. 90 crores during the year. The rise in our deposits in 1955 was 19.1 per cent against 8.8 per cent in the case of other Scheduled Banks as compared to 15.82 per cent against 10.85 per cent 1954. It is noteworthy that the rate of increase in our deposits which in 1954 was nearly 1½ times of that of other banks became nearly double in 1955. The results of the first quarter of the current year give us the confidence that our progress at a higher rate will be maintained. We have also enlisted a larger number of new depositors as is evident from the following table.

NUMBER OF DEPOSIT ACCOUNTS

Nature of Deposits	All other scheduled banks			Punjab National Bank		
	June '53	June '54	June '55	June '53	June '54	June '55
Demand Deposits	8,93,424	8,93,310	9,08,069	1,05,625	1,05,371	1,03,931
Savings Deposits	17,70,802	18,45,532	19,23,598	2,35,117	2,48,550	2,71,402
Time Deposits	2,88,162	3,07,562	3,40,341	40,796	46,736	57,659
Total	29,52,388	30,46,404	31,72,008	3,81,528	4,00,657	4,32,992
Per cent increase over June 1954			4.12			8.07

One point that is engaging the attention of all banks in the country as is evident from the speeches of the Chairmen of different banks is the rising cost of money. A study of this question reveals that this feature is due to the change in the pattern of deposits arising out of two reasons. From semi-urban and rural areas where new business is developing deposits are secured more in the shape of fixed and savings fund than as current accounts. This tends to raise the portion of higher-interest-bearing time deposits and

increases the average cost of money to banks. The second and more important factor is the unhealthy competition among banks in large cities, especially ports. The banks are offering interest at substantial rates for call money on large amounts. This trend has been encouraged especially due to higher cost of money prevailing outside India. The consequent shift in deposits that is taking place is evident from the following table.

(In crores)

Year	Demand Deposits		Time Deposits		Total Deposits	
	Indian Scheduled Banks	Exchange Banks	Indian Scheduled Banks	Exchange Banks	Indian Scheduled Banks	Exchange Banks
(a) 1948	533	130	262	35	797	166
(b) 1955	483	136	349	75	832	211
(c) Increase or decrease	-50	+ 6	+ 87	+ 40	+ 35	+ 45
(d) Percentage of (c) to (a)	-9.7	+ 4.6	+ 33.2	+ 114.3	+ 4.4	+ 27.1

I request the Reserve Bank of India to carefully consider ways and means to suitably deal with this development.

Liquidity: The liquidity position is very satisfactory. Our liquid assets consisting of cash on hand amounting to Rs. 8,35,89,262, balance with other banks Rs. 81,55,186, money at call and short notice Rs. 10,67,420 and investments in Government and Trustee securities, Rs. 44,41,88,690 total Rs. 53,70,00,558 which forms 59.59 per cent of the total deposits. The Bills purchased and discounted amounted to Rs. 7,64,69,766. When these are added to the other liquid assets, the total comes to Rs. 61,34,70,324 which is 68.07 per cent as compared to 60.53 per cent in the case of other scheduled banks.

Loans: During the year under review, loans and advances including bills increased by Rs. 9.62 crores to Rs. 42.02 crores. The percentage of our loans to deposits is 46.63 as against 63.34 of other scheduled banks. There is thus a good margin for us to develop further to bring ourselves to the level of other scheduled banks.

For the past two years we have been expanding our foreign exchange business. There still remains large scope for improvement and expansion. Bill business expanded considerably. Bills purchased and discounted were Rs. 7,64,69,766 against Rs. 4,71,31,112 of the previous year.

You will recall that I mentioned at the last meeting about opening of new offices in suitable places. This programme was implemented after necessary detailed surveys. Thus, during the year 13 new offices were opened increasing the number of branches from 313 to 326. We have a programme of opening new branches in the current year almost on the same scale. We are taking steps to see that proper personnel with suitable qualifications and experience are available to man these branches.

BONUS SHARES

Your Directors have decided to issue three bonus shares against existing 7 shares of the total aggregate value of Rs. 37.5 lakhs raising the issued capital from Rs. 87.5 lakhs to Rs. 1,25,00,000. This issue is proposed against premium money received from shareholders. Application in this regard has been made to the Controller of Capital Issues. It is gratifying that in the speech of the Finance Minister amending the taxation proposals he has appreciated the difference between bonus shares issued from accumulated profits and those issued against share premia which are but receipts of capital from the shareholders themselves. The acceptance of this distinction ensures that this issue of ours will not be subjected to any tax and encourages us to hope that the requisite permission from the Government will be forthcoming soon. It is also a matter for satisfaction that the Finance Minister has rightly allowed inclusion of share premia in the capital base for purposes of dividend tax. Your reserves including Rs. 5 lakhs now transferred will stand at Rs. 60 lakhs. With the rising earning capacity of the Bank, it will be possible to transfer without disturbing dividends larger amounts to Reserves and to build them up to Rs. 1½ crores equal to the paid-up capital after the issue of bonus shares. This increased capital structure will give the Bank a much wider and stronger base. I am sure that this step will be welcomed both by the shareholders and the depositors.

You will naturally expect me to make some observations on the general economic trends in the country. I shall deal with some aspects relating to banking and national development.

BANKING FOR DEVELOPMENT

We have finished a phase of development and are on another phase of greater activity for building up our economy. We can look back with legitimate pride that the past few years have been full of fruitful activity and our achievements were amply reflected in the stability and generally buoyant trends that came to prevail in the economy. There was phenomenal rise in the deposits of banks from the stagnant figure of Rs. 850 crores in 1953 to Rs. 1022 crores in 1955. Government borrowing expectations were exceeded by 50 per cent. After the serious debacle in 1946, it was probably for the first time that a number of new industrial flotations were launched with great success. In 1955, consent for raising as much as 127.7 crores of rupees was given by the Controller of Capital Issues. The investing public started taking greater interest in the activities of the old and new Companies.

The developments in the early part of the current year, however, caused a set-back. Nationalisation schemes, prospects of heavy taxation and the policy of expanding State sector diverting resources from the people's sector to that of the State and the uncertainty regarding supply of goods consequent on the bias in favour of developing small-scale and cottage industries restricting the development of large-scale industries all cumulatively contributed to dampen the buoyancy and the spirit of confidence. The combined efforts of the different sectors of the economy are required for the tremendous venture of nation building that we are embarking upon. It cannot be gainsaid that the achievement of the desired development, with the rapidity that is essential, would depend on the allotment of the resources in proportion to the ability of the sectors to effectively contribute to such development. It will be a sad mistake if the enthusiasm that has been raised is caused to be deflated by policies that have largely an ideological bias.

DEPOSITS AND CURRENCY CIRCULATION

Banks are effective instruments as structures of credit to support expanding activity. Development of banking is, therefore, an important factor. If we analyse details of notes in circulation and the deposits of banks, we find that during the years 1954 and 1955 the deposits of banks have gone up at a much higher rate than during the earlier years. The notes in circulation have greatly increased since. However, the ratio of deposits to the notes in circulation has declined. During the war years, there was expansion of currency on a much larger scale. Due to the general scarcity of goods and difficulty of securing imports, there were larger savings and the banks increased their deposits. From the year 1943, there was an upward trend in deposits. The percentage of deposits to notes in circulation was as much as 86.6 in 1946. But it declined to 74.5 in 1953 and is only 70.4 at the present time as will be seen from the following table.

		Notes in Circulation	Deposit liab- lity of Scheduled Banks	Col. 2 as % of Col. 1
Last Friday	(1) (Rs. Crores)	(2) (Rs. Crores)		
1946	..	1225	1061	86.6
1953	..	1125	838	74.5
1954	..	1200	932	77.7
1955	..	1362	1022	75.0
6th April, 1956		1507	1061	70.4

The increase in deposits in 1954 was 94 crores against increase in notes circulation by 75 crores thus

registering a ratio of 125 per cent. In 1955, the ratio is only 56 per cent. As against an increase in note circulation of the order of Rs. 162 crores, the increase in deposits was Rs. 90 crores. The trend in the first quarter of 1956 is still lower. Against an increase of Rs. 145 crores in note circulation, the deposits have increased by only Rs. 39 crores. The ratio is thus only 27 per cent. This trend indicates that the rise in deposits in the coming years will be anything like 40 to 50 per cent. It is not likely to be on the scale of the war years when the increase in deposits was very nearly equal to the increase in note circulation. With this low velocity of money the inflationary pressure of deficit financing will be much less. Any pressure that will be felt will only be in respect of cloth and food grains.

DEFICIT FINANCING AND INFLATION

In the context of larger doses of deficit financing, fears are expressed about inflationary trends showing themselves. But the price trends as they are do not lend any strength to such fears. Any increase in prices that has taken place is mostly in food articles and industrial raw materials of agricultural origin. In the former category, there has been a rise in the prices of both cereals and pulses. The rise in prices is to an extent attributable to the increase in taxes especially sales-tax. Further, prices are high in the off-season and the level is brought down with the arrival of new crops. It is also necessary to remember that prices had been hammered down last year on account of the accumulation of stocks of food grains with the Government and the phenomenal increase in agricultural production in the country in 1953-54. Support schemes had to be introduced and prices had to recover to more economic levels. A part of the rise in prices must, therefore, be regarded as corrective. It is thus important that the meaning of the rise in prices should be clearly understood and there should be no efforts at restriction of consumption. On the contrary, the level of consumption should go up in the country as that alone will encourage production and help build up a healthy economy and better life for the people. So far as the agricultural situation is concerned, I do not feel there should be any fear of a repetition of the experience prior to 1952. Large areas have been brought under irrigation in 1954-56 and there is ample evidence to suggest that the efficiency of agriculture has tended to increase. Food production can be expected to rise significantly and it may happen that the records of 1953-54 will be easily surpassed in many cases. If, however, due to fall in agricultural production on account of adverse weather conditions, prices rise, it will not be due to inflationary factors. The situation must be met by adequate imports. If production of cloth is maintained as also such other essential materials as cement, steel, etc., a healthy process of larger consumption and larger and added variety in production will evolve itself and there will be no risk of the increased rate of deficit financing creating inflationary trends in the economy. However, the Government policies, economic and fiscal, must be such as to leave resources and enable their utilisation in productive channels so that inflationary tendencies have no chance to develop.

NEED FOR CORRECT REVENUE ESTIMATES

In this connection, an analysis of the budget estimates and actuals for the last five years reveals that Government have underestimated revenues and efforts have consequently been directed towards drawing larger resources to the Government sector. The following table shows that against an anticipated deficit of Rs. 2.43 crores there was actually a surplus of Rs. 221.34 crores in 1951-56.

Year	Budget Estimates (Crores)	Accounts (Crores)
	Rs.	Rs.
1951-52	.. + 26.10	+ 128.09
1952-53	.. + 3.73	+ 38.93
1953-54	.. + 0.45	+ 8.50
1954-55	.. - 15.36	+ 33.51
1955-56	.. - 17.35	+ 12.31
		(revised)
TOTAL	.. - 2.43	+ 221.34

Considering the actual surplus each year during 1951-56, it will be correct to assess that the total savings from current revenues of the Central and States Governments would be over Rs. 700 crores against the estimate of Rs. 573 crores. In the second Plan, the savings from current revenues are estimated at Rs. 800 crores. Out of this Rs. 350 crores will be derived from the existing taxation and Rs. 450 crores from additional taxation. Obviously, this is an underestimate as the buoyancy of revenues will be very much more in the coming years. Tax revenue has increased from Rs. 405 crores (including State's share of divisible taxes) in 1950-51 to Rs. 483 crores in 1955-56. In 1956-61, the increase in tax revenues will be much more pronounced. By 1960-61, on the basis of the existing taxation, a total of Rs. 610 crores is estimated to be secured while the additional taxes that have been proposed this year for Rs. 36 crores will fetch more than Rs. 50 crores by 1960-61 and take the total of tax revenues to Rs. 660 crores. Taking these into consideration the total savings from current revenues should be expected to be as much as Rs. 950 crores. It needs no emphasis that a correct appraisal of the possible revenue receipts should be made. If more money is gathered towards the Government sector, the effort of the private sector is stultified as it is deprived of resources that could be utilised to greater advantage by it in achieving expanding production to counteract inflationary forces. As I suggested earlier, the allocations should be made according to actual performance and capability. It is also necessary to achieve results quicker in production so that inflationary forces can be kept in check.

EMPLOYMENT

This takes me to the question of employment that is sought to be provided in the second Five-Year Plan period. This is a problem of vital significance to the whole economy and I would, therefore, like to refer to certain details. It is envisaged in the Plan to provide employment to 8 million people by an expenditure of Rs. 7,100 crores, i.e., employment will be provided for 1,10,000 persons per Rs. 100 crores roughly. Towards this end, labour intensive developments are lent powerful support. General estimates have been made of the amount of employment that cottage and small-scale industries and other fields of activity could provide against the investments proposed. The details of employment potential, however, seem to disprove the commonly held view in respect of cottage and small-scale industries.

ESTIMATES OF EMPLOYMENT POTENTIAL UNDER THE SECOND FIVE-YEAR PLAN

(In lakhs)

	Invest-ment (Rs. crores)	Direct employ-ment	Cons-truction	Trade & Commerce & Social Services	Total employ-ment
Irrigation & Power	398	0.51	3.72	2.10	6.33
Railways	900	2.53	(	—	(
Other Transport and Communications	484	1.80	(	1.27	(5.60
Industries & Minerals	1290	8.00	4.03	6.00	18.03
Cottage & small-scale industries	400	4.50	0.45	0.63	5.62
Others (Fisheries, Forestry, Education, Health, etc.)	3128	13.65	11.53	18.26	43.45
TOTAL	7100	30.99	21.00	27.04	79.03

The investment proposed in cottage and small-scale industries is about Rs. 200 crores. It should be expected that a similar amount would almost certainly be invested by the people. Against this total of Rs. 400 crores of investment, the employment possibility visualised is 4.5 lakhs. To this may be added at the most 25 per cent by way of additional employment under

Trade and Commerce etc. totalling to 5.62 lakhs. The investment envisaged in the large-scale industries in both private and public sectors is of the order of Rs. 1,290 crores. The direct employment potential in this field according to estimates in the Plan is 18 lakhs. These figures indicate that cottage industries do not provide any larger level of employment and proper investment on industries with modern techniques and of diversified character will provide equally large employment. This is an analysis significant from the point of view of the pattern of investment that must be pursued in order to achieve the objectives that we have hopefully laid before ourselves. It must be borne in mind that cottage industries do not contribute to the revenues for social services, etc., unlike large-scale industries whose contribution is very large. The subsidy that is required to be provided to prop up cottage industries is an additional drawback. Further, cottage and small-scale industries will provide employment but not employment that will afford an increasing standard of living. Large-scale industries will provide employment and give the means for increasing standard of living.

Banks in India have a growing role to perform in the national economy. Your Directors are devoting all their efforts in this direction to see that your Bank is organised into a perfect mechanism devoting itself to the service of the people. The employer-employee relations in your bank have been comparatively happier. I must express my thanks to all our worthy constituents for their continued co-operation and confidence. I extend my thanks also to the Officers and Staff at all levels who have contributed to the fulfilment of the common task.

India's Second Five-Year Plan

ON Tuesday, May 15, the Prime Minister presented to Parliament India's second Five-Year Plan. This is a document of 640 pages; while it contains no surprises on targets or vital elements on the Plan, it is, nevertheless, an important new contribution to Indian planning literature. It contains both a progress report of the first Plan and literal comment on the philosophy of the second. It would be wrong to evaluate a document of this tremendous importance with a few hasty generalisations. The Eastern Economist proposes, therefore, to defer evaluation to a series of Special Articles to appear in the next three months on various aspects of the Plan. All that can be said at the present time is that the country should treat the final emergence of the Plan

as an event which marks off finally the period of democratic discussion on this Plan from the period of practical implementation. The emphasis is now off talk and discussion; it is firmly on deeds.

Irrespective of differences which have existed in the last thirteen months on the planning papers—which are both numerous and conflicting—one should now treat the major issues of the Plan as closed for a period of five years. It is true that two members of the Planning Commission in the last month have departed unwisely from this counsel of perfection. Mr. K. C. Neogy's consistent questioning of the targets in the public sector and even of the size of the Plan as a whole

have done much to spread uncertainty at a time when assurance was greatly required. Again the Deputy Chairman of the Planning Commission has erred on the other side by attempting to spread overconfidence by a last-minute insertion of a higher agricultural target than previous Planning Commission's discussions had led the country to expect. In both these cases there has been illustrated the unwisdom of continuing even stimulating discussions beyond their appropriate time. In the end both pessimism and optimism represented by these notes encountered a brief and summary end. Arriving late, they were denied entrance to the feast. A last tactful paragraph in the Plan is the epitaph on Mr. Neogy's deep note of dissent.

One must distinguish in a democracy between closed and open questions. The size and targets of the Plan are now closed except to the extent that machinery exists for periodical revision. But some questions of its philosophy are perpetually open because they do not apply to the next five years only. It is wholly legitimate to question fundamentals over the long period, while accepting loyally the decisions of the present. This is what Dr. John Matthai has done this week. His notable address delivered in Bombay this week is published in this issue in full; readers of *The Eastern Economist* are invited to study particularly the observations on the administrative capacity of the public sector which Dr. Matthai has described. He considers that further nationalisation—which incidentally is not necessarily written into this Plan—should be, on the basis of the merits of each case, the exception and not a new rule in the name of a socialistic pattern of society. Secondly, he considers that the administrative difficulties should be faced at once and not complacently assumed away. Here Dr. John Matthai speaks with the highest authority; he has known the Indian administrative system better than any authority now living. He has been Director-General of Commercial Intelligence, Chairman of the Indian Tariff Commission, Minister for Transport and Finance Minister. He is now Chairman of the State Bank of India, a nationalised institution. He is also Vice-Chancellor of Bombay University and has been for many years Vice-Chairman of Tata Industries. The wealth of his administrative experience is unique. His counsel cannot be lightly disregarded.

There can be no reasonable doubt that the statement of Dr. John Matthai on the issue of rationalisation is one which requires the most earnest consideration. This is, indeed, the central theme of his address and one may even regret his having diluted this theme with others which may, perhaps, be more controversial. For example, in regard to the character of the first Five-Year Plan's performance, Dr. Matthai has tended to discount too much of India's achievements by reference to the fact that most of the first Plan's projects were in train before Independence. This is certainly true of the multi-purpose projects. It is, however, to be remembered that most of the multi-purpose projects have not delivered at all in terms of irrigation and only very inadequately in terms of power. The fact that targets have been achieved has concealed the point that income has come from quite unplanned and unexpected sources. It is, therefore, no argument to indicate that the first Plan benefited by these projects. It is much more true that the second Plan will reap greater advantages from these projects than the

first. The instruments of economic progress in India's first Five-Year Plan have not been either the spaciouly planned multi-purpose projects or the strength of the Indian administration. By and large they have been byproducts, in terms of private initiative and private expenditure, of a rising level of individual work and individual expenditure.

While Dr. Matthai has clearly strong ground in voicing his hesitations on the capacity of Indian public administration to shoulder the exacting tasks of the second Plan, one might have been happier if he had dropped from his observations criticism of the Planning Commission at this hour. Views on a document such as the one that has just appeared cannot be uniform. If they were, the soil for democracy in India would not exist. But no one should withhold credit from the Planning Commission for the comprehensive manner in which it has framed both the aspirations of the Indian people and the means to their attainment. One might differ legitimately with the views here and there or even with the interpretation of facts. But a document of this kind must be read as a whole. One can claim that it presents a fair and objective assessment of the difficulties that face the country; it has not yielded to these difficulties, and the spacious picture which it presents in the graph of the growth of the National Income in the next twenty-five years may even look to some somewhat romantic; but this, too, is a measure of the country's faith and courage. This document reflects substantially the spirit of the Indian people. They can well make it their own. That is its source of greatest strength; it is a People's Plan.

To claim that this is a contribution to the task which faces the Indian people and that it presents fairly and honestly the character of that task does not imply it has a solution for every problem. For example, on page 578 there is an outspoken sentence on indiscipline in factories. "It is true," says the Report, "that the existing provisions for penalising illegal strikes or lock-outs have not proved adequate in practice. There have been instances of 'go-slow', 'pen-down' and 'stay-in' strikes which in the larger interest of the economy should not go unnoticed." Yet there is no recommendation as to the means by which this discipline is to be ensured. More than once in cases such as these the Report has stopped short at a frontier which it seems its authors dared not cross. This is a weakness; but it is a weakness which can be overcome by a subsequent act of decision. It is for the Government of India to complete the answer. It is good in the meanwhile that this Report shows that the conscience of the Government of India is alive.

In the last analysis the difficulties in this Plan are not difficulties of exposition or of mental attitudes. They are essentially difficulties of management and organisation. For this reason a well-arranged and well-conceived document is not any solution of the problems which face the Indian people in the next five years. Nevertheless, it is good that India enjoys in the Planning Commission a great clearing-house for information and by and large an honest instrument for the design of economic progress. No Planning Commission can do much more; for deeds one must look elsewhere. The Planning Commission's work is substantially over for five years. Again the ball has been passed to the Indian people. It is for them to carry it to the goal.

Property and Hindu Women

THE Hindu Succession Bill which now goes for the President's assent, to be placed on the statute book without any possible delay, marks the successful culmination of an important phase in the reform of Hindu Law. Despite the growth of a mass of case law containing judicial pronouncements virtually on all points governing the personal law among the Hindus, the imperatives of the changing form of Hindu society demanded much more than mere codification of the existing law. Not a few legal decisions had helped the process of reform by putting bold interpretation on contentious points of law. But the positive problem of modernisation of Hindu law on important issues could not be left to be dealt with except by straight legislation. The Hindu Code Bill introduced in the provisional Parliament and the earlier comprehensive legislation based on the recommendations of the Rau Committee were in part vigorous attempts to incorporate radical principles of reform.

Unquestionably the most controversial of these principles centred round the status and rights of women. The emancipation of women in social and political spheres did not meet with that degree of resistance which it is encountering in the realm of law. The major explanation is to be found in the fact that the right of inheritance to property, particularly to daughters who pass into another family by marriage, came to be looked upon by force of an age-long tradition as an unwarranted encroachment. The disabilities on other categories of female heirs sprang from the status of perpetual dependence on males in the family. Precisely because of this attitude both these pieces of legislation had to be allowed to lapse under pressure of public opinion after initial trial in the legislature. The intense opposition which the Hindu Code Bill invited was due as much to the forward character of its specific provisions as to the ambitious attempt to carry out reform on all current issues in one sweep. The change in strategy which was adopted after the set-back to this venturesome experiment has served to blunt the edge of opposition. The Succession Bill, which came as a link in the projected chain of legislation dealing with individual facets of Hindu law has passed off without much resistance outside Parliament in spite of some of its controversial content.

It is difficult to assume that opposition on the part of the conservative sections of society has died down in a brief span of over five years. Inside both the Houses of Parliament, opponents, irrespective of party affiliations, did not relax in their vigour to resist contentious provisions of the Bill at each stage. But apparently it was nothing like the resistance to the Hindu Code Bill. The difference in the two attitudes is fundamental in character. The orthodox sections of the Hindu community seem to have begun to appreciate the new dynamism in all walks of life which has gathered fresh momentum since independence. They are obviously reconciling themselves with the necessity of a change in the law relating to women much faster than they would desire. During the course of the debate apprehensions were expressed on the consequences of the changes sought to be carried through. The major argument was that the institution of joint family which is basic

to Hindu society would be disintegrated and the rights of inheritance to be conferred on women would lead to litigation and eventual disruption of family property. Litigation is almost inherent in all law relating to property. Similar apprehensions which were expressed, when limited property rights were extended to Hindu widows, failed to be borne out by subsequent experience. On the south-west coast of India, the existence of the matriarchal system and extensive property rights to women have neither broken the fabric of Hindu family nor led to disruption of property. In other religious communities in this country as also in other countries, women's right to property has nowhere disturbed essential harmony. In course of time, the validity and social justification of granting progressive rights of inheritance to Hindu women cannot fail to find whole-hearted acceptance.

It would be an error to suppose that the Succession Bill constitutes a revolutionary measure which would derange Hindu society. In its essentials the Bill strikes a happy compromise between total change at one stroke and stubborn resistance to any reform whatever, particularly in the direction of progressive liberalisation of women's right to property. The Rau Committee Report and Dr. Ambedkar's Hindu Code Bill both provided for the abolition of the Mitakshara system of law. In effect this amounted to an attempt to revolutionise in toto a system which governs the personal law of a vast majority of Hindu society. The Succession Bill retains the core of the Mitakshara system with its dominant feature of the coparcener's interest in property by birth. The daughter by no means becomes a member of the coparcenary. Female heirs take their shares in the interest of the deceased in the coparcenary property only on intestate succession. What the Bill has done is to substitute a revised order of succession for the rule of survivorship. The male coparcener's major right acquired on birth has been left inviolate.

The right of inheritance which was denied in material respects to females has been granted in a liberal degree, which, however, falls considerably short of the recognition of equal share with males. Clause 6 of the Bill is the crux of the whole scheme. The Bill as passed by Parliament modifies the Select Committee's recommendation on the share of female heirs prescribed in this clause. For the purpose of the computation of the share of the deceased coparcener the shares of his male descendants were to be included in terms of the Committee's recommendation. The clause as it has finally emerged makes the basis of computation co-extensive with the individual share of the deceased alone. This modification goes to diminish the size of the share of female heirs. On a superficial observation this final rule of devolution may appear retrograde, but it has valid justification. The prior provision raised a potential threat to encourage the tendency to demand partition in the life-time of the ascendant where such a right prevails. The need to prevent this harmful consequence requires no emphasis and it redounds to the sense of sweet reasonableness on the part of women members of Parliament that the prominent among them readily appreciated the logic of the modification.

less travelling even more popular, and it is ironical that the Prime Minister should think of raising fares when the railways are still to stamp out this evil and when travel is indirectly encouraged by such concessions as return tickets and privilege tickets.

PAK DEBT TO INDIA

THE INDO-PAKISTAN financial conference held in New Delhi last week is stated to have resulted in "substantial agreement in regard to the facts of each particular matter in dispute so as to enable Ministers of the two countries, when they meet, to come to a final decision". This is good as far as it goes since Pakistan is reported to have accepted her liability for Rs. 240 crores—Rs. 120 crores towards assets taken over by her and Rs. 120 crores as her share of the net liabilities. Under the arrangement reached at the time of partition, Pakistan should have started making payments towards her share of the debts of undivided India taken over by the Indian Union in 1952 itself, but so far no payments have been received, though a sum of Rs. 5 crores was provided for this purpose in the 1952 budget of Pakistan. Subsequent budgets did not contain even this provision, and all attempts by India to get Pakistan to honour her obligation had so far proved fruitless.

It now remains to be seen how far the recent discussions will induce Pakistan to start making the long-overdue payments. A change of attitude seems unlikely because Pakistan is now reported to be putting forward a claim to a share in the sterling balances which form the foreign reserves of the Reserve Bank of India. She has already received her share of the gold and foreign securities of the Reserve Bank in proportion to the volume of Indian currency which was circulating in Pakistan at the time of partition. The present claim seems to have no purpose beyond that of postponing still further the long-delayed payments towards a debt settlement. Further, there are certain other items of unfunded debts for which Pakistan has to pay India to the tune of Rs. 60 crores. Though agreement on all these matters may take time to arrive at, there is no reason why payments towards the sums which Pakistan herself has acknowledged should not start right away.

SOVIET ARMS CUT

THE MOSCOW announcement that the Soviet Union will reduce her armed forces by 1.2 million men by May 1 next year, coming in the wake of the deadlock in the London talks on disarmament, has caused widespread speculation on the reasons for this unilateral step. The extent of the cut, as far as can be judged from estimates of Soviet armed strength, will certainly be great since it will amount to more than 25 per cent of the men now under arms. Also 375 ships of the Soviet navy are to be put into reserve. It is, of course, true that there is no means of verifying whether these cuts are in fact being effected, though next year's budget may give some indication. The reduction now proposed is in addition to the demobilisation of 640,000 men last year.

Surprisingly enough there is no sign of any proposal to go slow on the building up of the air force, particularly the long-range bomber fleet. This seems to reflect a change in the military thinking of the Soviet Union—from defensive to offensive warfare, should a war have to be waged. It is evident that the Soviet Union's progress in the manufacture of atomic weapons and her reported successful experiments with the inter-continental ballistic missile have not only rendered this change possible but has also made the maintenance of a huge force equipped with conventional weapons both unnecessary and uneconomical. That these factors must have weighed a great deal with the men in the Kremlin in reaching their present decision is undeniable; and

it is not surprising either if they should seek to reap whatever propaganda benefit they can out of this gesture.

Western analysts have attributed the present demobilisation to the strain on the Soviet economy and called it long overdue in the sense that Russian arms reductions since World War II had not matched that of the West. Be that as it may, to the world at large the present Soviet gesture compares in a favourable light with the efforts of the Western Powers to build up military strength, in particular by rearming West Germany, and their unwillingness to go ahead even with their own proposals for disarmament which, though at first rejected by the USSR, were later accepted by her. The justification for these actions and the probable motives behind the present Soviet move will have to be put out more cogently and persuasively if the West is not to suffer a serious diplomatic defeat. At the same time it is worth considering whether something cannot be done to match the Soviet gesture and to see that the Soviet Union really makes the reductions she has promised to.

INDIA'S TRADE WITH COMMUNIST COUNTRIES

IN RECENT years, there has been a growing diversification in India's foreign trade and development of fresh trade contacts with countries with which there were no contacts previously for historical reasons. The Government of India is thus reported to have finalised a contract worth Rs. 2.5 crores with the Soviet and other Communist countries for supplying coffee and iron ore, and importing cement and steel. The contract, which is due to expire in March, 1957, includes the export of 1,00,000 tons of iron ore to Poland. Out of the total export quota of 4,100 lbs. of coffee from the 1955-56 crop, 500 lbs. have been earmarked for export to the USSR and this will be worth Rs. 41.22 lakhs. All this is good, but it would have been all right, had this trade been through the normal trade channels, especially as, lately, the USSR has expressed its willingness to do trade with the established channels and not necessarily only with the Governments of the countries concerned. Other democratic countries are known to be able to carry on their overseas trade with the Communist countries with a closed economy through normal trade channels. But blissfully being ignorant of this, or, perhaps, deliberately in pursuance of a fashionable fad, the authorities concerned have undertaken that trading in all the commodities listed above is to be handled by the proposed State Trading Corporation.

The shipping agreement concluded recently between India and Soviet Russia, providing for the operation of six Indian ships and six Soviet ships between the Indian and Black Sea ports for carrying the cargoes covered by the Trade Agreement of December last, should prove helpful in the furtherance of trade relations between India and the Eastern European countries. The Indo-Russian Trade Agreement provides, among other things, for the import of one million tons of steel in the course of the next three years and the export of several industrial raw materials. The average volume of trade between the two countries under the Agreement during the first two years is expected to be of the order of 400,000 tons annually, but it is expected that cargoes to other Eastern European countries will also be available to the shipping service. Till now, the value of the total trade between India and the USSR has been of the order of only a few crores of rupees. During 1954-55, India's exports to the USSR aggregated Rs. 2.12 crores and imports from that country Rs. 1.61 crores. The total value of one million tons of steel, which the USSR will be supplying under the agreement, will alone come to Rs. 60 to Rs. 70 crores now. In addition to this the Soviet Union has signed another agreement covering the sale of machinery to the Bhilai Steel Plant.

This Priceless Advantage...

Only Pan American circles the globe with Tourist and First-class services.

Round-the-World experience on every flight... yours only on Pan American!

Whether you fly a few hundred miles or thousands, you'll immediately sense the difference this experience makes.

You'll feel relaxed and confident in the hands of the *only* airline that flies 'round the world... the airline that *specializes* in overocean flying... the airline that does the most to make you comfortable in the air!

Pan American has flown *one billion miles* in overseas service... has carried 13 million passengers to international destinations... has crossed the Atlantic over 50,000 times... and has completed over 2,000 Round-the-World trips.

From unmatched achievements like these comes Experience—Round-the-World Experience—the priceless advantage that only Pan American gives you on every flight.

Let your Travel Agent arrange your trip—his services are free. Or call Pan American in:

A Window on the World

A SOCIALIST CRITIC OF SOCIALISM

By

ODYSSEUS

SOCIALISM (LIKE COMMUNISM or Capitalism) is a philosophy that seeks to explain the economic and political problems that plague mankind and to offer guidance for their solution. Its leaders, therefore, like the exponents of any other philosophy, have no option but constantly to verify their theoretical propositions against current facts and situations, and to re-formulate them in such ways as actual experience suggests. Philosophies exist to explain problems. As long as they do, they are dynamic, forward-looking. But when the facts of contemporary life are dressed up to conform to the fashionable philosophy of the hour (to coin a new definition of that horrible word "ideology"), then the philosophy is obviously lagging behind the times and from being a useful guide for right action it becomes harmful. A "doctrinaire" Socialist is one who suppresses or distorts facts that do not fit in with the theories that he imbibed in his student days. From the time of Karl Marx (1818/83) until the USSR came into existence when Lenin seized power in October, 1917, Socialism was unavoidably "doctrinaire" because its leaders had had no chance of obtaining responsible office and thus being in a position to verify their theories against the realities of government and administration, and of economic booms and depressions.

But what went on, and to a large extent what still goes on, in the USSR is difficult to evaluate because from the first the Soviets forbade independent outside observers to roam freely about studying the country in the way that newspaper men, economists, students, diplomats, and others, can study at their leisure all more, the Communist totalitarian system differs in aims and methods from the democratic. The result has been that when the first Socialist government came into power in post-World War II Britain its leaders were explain the totally different economic and political circumstances that prevailed between the wars and even in many cases before World War I, which were often hopelessly at variance with the developments that had taken place in the intervening quarter of a century. This largely explains the reaction against Socialism that has overtaken that section of the British electors made up of independent-minded people who to cast their votes, not as party men but as intelligent citizens, in the light of the visible effects of political promises made and carried out. These, as distinguished from the solid party men, constitute the marginal or floating votes that put parties in or out of office. That the first taste of Socialism was distasteful to a majority of Britons is suggested by the incontrovertible fact that the Socialists have been unable to win an election since 1950.

Britain's Socialist leaders are, therefore, devoting their enforced leisure to re-thinking out the fundamentals of their philosophy. Between January 20 and February 17 of this year I published articles here outlining and discussing the views of the leader of the Labour party, Mr. Hugh Gaitskell, on the future of Socialism. I began last week to follow this up with an exposition of the views of Mr. R. H. S. Crossman, chief lieutenant of Aneurin Bevan's 100 per cent Socialist Left wing ginger group, as set forth in his stimulating and reflective pamphlet "Socialism and the New

Despotism" (Fabian Society, 11 Darmouth St., London, SW. 1. Re 1-).

I am no Socialist. I do not agree with the views of either of these leaders but I would be failing in my duty as I conceive it if I did not pay tribute to their intellectual honesty and to the fearlessness of their probings into the absurdities into which Socialist theory had worked itself through lack of sufficient verification against contemporary experience. As long as leaders like these can be found who refuse to preach doctrines that are obviously out of date, there is good hope for democracy.

CROSSMAN, TAWNEY, AND POWER

Mr. Crossman starts from Professor R. H. Tawney's premise that parliamentary democracy will only become a fully effective guarantor of individual freedom when combined with social control of economic power, and he goes on to point out that one of the main features of the post-war Western world has been the steady concentration of power in the managerial class whom he regards as irresponsible oligopolists whom it is Socialism's first duty to expose as a threat to democracy and to bring within popular control.

But, asks Mr. Crossman resolutely, is it only the privately owned companies which threaten our freedom? The Labour party, he recalls, has declared that Imperial Chemical Industries is ripe for nationalisation on the grounds that it is a private monopoly. But what about the controlling body of the nationalised coal industry—the Coal Board? It is not fully accountable to Parliament and the degree of workers' participation in management is not markedly higher than in a progressive private company. Actually the technician and the scientist may feel more frustrated under the rule of the accountants, ex-civil servants, ex-generals, and ex-trades union officials who constitute the Board of a nationalised industry than they did under private enterprise. Moreover, these oligopolists—some in charge of nationalised, some of private industries—do not comprise the whole of the managerial society (the people whom the common man in the USSR refers to as "the bosses"), there are also all the million and a quarter of civil servants, national and municipal. And while Mr. Crossman reproves the Tory for instinctively suspecting all government departments of over-staffing and muddle and assuming Imperial Chemical Industries to be a model of efficiency, he chides the Socialist for feeling that loyalty to Socialism requires him to believe that all government-run bodies are well run and that it is sabotage to make any stand against a government department in favour of the rights of the individual.

"Actually," says Mr. Crossman, in a memorable sentence, "the growth of a vast centralised State bureaucracy constitutes a grave potential threat to social democracy. The idea that we are being disloyal to our Socialist principles if we attack its excesses or defend the individual against its incipient despotism is a fallacy." If the Socialist aim is to enlarge freedom by making those who control power fully accountable to the people, that must apply to the managers of nationalised industries and private industries alike. It is the

gigantic size of the modern unit of organisation, whether in industry, in the trades unions, the armed forces, or the welfare services which, in Mr. Crossman's view, compels the choice between accepting the inroads on freedom of an increasingly managerial society or risking the advance towards a fully Socialist society.

The real solution to these problems, Mr. Crossman thinks, is not merely to appeal to the electors to support Socialism to gain economic benefits but to defend their personal freedom and rights in a managerial society. In other words, he agrees that the only solutions are three: (1) to allow the oligopolists to dominate the community, or (2) instead of Socialising the economy to adopt the American system of breaking up monopolies and subjecting them to competition by anti-trust legislation, or (3) to subject the oligopolists to public control.

Mr. Crossman rules out the American system because he says that both British employers and workers are opposed to a freely competitive economy. This is doubtless true but it must undermine the efficiency of either a Capitalist or Socialist economy because competition is essential to both in order to ensure change and growth. It is a confession of bankruptcy in leadership to say that because competition is politically unpopular, no attempt can be made to educate the voters into grasping its importance.

CURING SOCIALISM BY MORE SOCIALISM

Mr. Crossman touches the rock bottom of his analysis when he says:

"In Britain, we are faced with the following dilemma. Since the abuses of oligopoly cannot be checked by free competition, the only way to enlarge freedom and achieve a full democracy is to subject the economy

to public control. Yet the State bureaucracy itself is one of those concentrations of power which threaten our freedom. If we increase its authority still further, shall we not be endangering the liberties that we are trying to defend?"

Today and last week I have tried to extract the guts from Mr. Crossman's 24-page pamphlet and to deal faithfully with his analysis of Britain's present discontents which certainly applies to other countries in process of adopting the Socialist pattern. I go most of the way with Mr. Crossman in his analysis but when he comes to solutions I part company. For what solution to the concentration of power in the hands of managers and civil servants does he offer? Only further nationalisation and yet more nationalisation, controlled by means of Fact Finding Bureaux and committees of parliamentarians. Such a lame conclusion was hardly to be expected after his preceding pages of brilliant analysis of the weaknesses of control by public bodies.

It is admitted on all sides in Britain that the Labour government's planning was faulty, so Mr. Crossman wants to "expand the miserably small body of economists and statisticians at present available" and create a Central Fact Finding Bureau. He truly says that "the modern state with its huge units of organisation is inherently totalitarian; its natural tendency is towards despotism; and that these tendencies can only be held in check if we are determined to build constitutional safeguards of freedom and personal responsibility." Splendid! But to conclude limply thereafter that totalitarianly inclined units—anonymous committees whose natural tendencies must equally be towards despotism is a counsel of despair. In a final article next week, I will outline a solution that seems to hold out greater hopes of a livable future for us all.

"Glad we won. Now I must rush—I've another case in Bombay tomorrow. I'm going by air, of course."

When you have a journey to make, think first of flying. It's the fastest way to travel, and often the only way to get there in time. You escape all the tedium of a long journey—flying is so quick, convenient, and wonderfully comfortable.

THE FIFTH REPUBLIC

FROM OUR SPECIAL WESTERN EUROPEAN CORRESPONDENT

PARIS, May 10, 1956.

OF course there is no Fifth Republic. So far the French are only up to number four. But many people here think the Fifth is coming soon, many are demanding it, and many are planning the form it should take. The Fourth Republic has no defenders, no apologete. That is to say, no one supports it as a reasonable or efficient regime, but there are some who live on its weaknesses and would struggle very hard to prevent its passing. But even their efforts to preserve the worst features of the Fourth Republic take the form of a demand for spurious reforms. This is because in a country where politics is carried on at a very high level of sophistication and where Revolution is a hallowed tradition, political dispute often consists in everyone trying to sound more revolutionary than everyone else—and none more noisily revolutionary than the conservatives.

This is a curious and complicated situation, and it probably has no counterpart outside France. For instance, when I said above that "many people" are demanding an end to the Fourth Republic, I suspect many readers thought this was loose journalistic talk and that by "many people" I meant a few talkative friends in the corner cafe. Not at all. Millions of Frenchmen today want a bloodless political revolution. A complete change of regime, and they are encouraged in this opinion by the most eminent and respected of public figures. The modalities of such a revolution are calmly discussed in all the newspapers, and some of the proposals coolly put forward would make a Delhi politician's hair stand on end. The campaign has now reached such volume that last week the Prime Minister, M. Guy Mollet, hurried into the fray to say that if there was to be a political revolution, the republicans must take the lead and not be outbid by the enemies of democracy.

The prospect of a political revolution, even without violence or coups d'état, would give Indians or Anglo-Saxons nightmares—while there have been phases in recent American history when public discussion of such a possibility might have entailed a prosecution for preaching the overthrow of the republic. Not in France, where the calculation of the chances of a revolution has been normal and respectable ever since 1789. Two examples from the recent past will make my meaning clear. Just after the January elections in France, which produced an obviously unmanageable parliament, Raymond Aron, the philosopher-economist, wrote on the front page of a big Paris daily that one of the measures to meet this situation which he had discussed the night before with a group of eminent industrialists was the restoration of the monarchy! Now what would happen if the "Hindustan Times" announced casually one day that a group of gentlemen in Delhi were discussing the possibility of giving India a king? I imagine the police would be out next day making searches. You might say that Aron was just talking, as Frenchmen notoriously do, and no notice should be taken of him. But one of the men who has this month issued a manifesto hinting at the need for "profound" reforms was precisely the Count of Paris who is the pretender to the French throne. Not that I suggest for a moment that France is going monarchist, but the point is that revolutionary talk in this country is seldom "just talk".

My other example is drawn from the political trial that has been dragging on here for three months. The other day M. Mendes-France was in the witness box being questioned most insolently by a defence

barrister who was a Vichy politician and is again today a rightist deputy with infinite ambitions. His name is Tixier-Vignancourt. Mendes-France said to him, "Your object is not to get the truth but to ruin me as a politician". Tixier replied, all smiles, "Oh certainly, monsieur, to ruin you and your policies completely". Mendes-France added, his temper rising, "And not just me, but the Republic, which you seek to smash". Tixier almost danced with joy as he threw back, "Yes, that too, to smash it totally and completely". The presiding judge—and notice that this was not an ordinary court but a military tribunal—said nothing.

Granted that I have drawn attention to extremists—but serious and influential extremists—what are the revolutionary proposals of more temperate groups? As represented by, for example, "Le Monde", the staidest, stodgiest and most reliable of French newspapers, a desirable innovation would be the presidential system. That is, the Prime Minister would be directly elected by the people at the same time as the assembly would be elected. Being directly elected, his powers would be at least equal to parliament's. He would be much more powerful than India's President, for the authority that is theoretically exercised from Rashtrapati Bhavan in time of emergency would be his at all times. He would in fact have most of the attributions of the American President. Notice that under this scheme, there would still be a separate President of the Republic, as there is today. This might seem a curious idea, like having two Presidents. But as the Americans have realised at least since Mr. Eisenhower's illness, there are advantages in having two Presidents: one to open fetes and the like, and one to govern.

M. Mollet said the other day that he did not favour a system that took power away from the Assembly to give it to one man; what was needed he said was a stronger and more continuous executive. No one but M. Mollet quite knows what this means, except that he is evidently opposed to the presidential system. M. Mollet's wish for a more continuous executive is understandable, for his ministry, like most others in the Fourth Republic, hangs on to life by a thread that can be cut at any moment by a realignment of his enemies in the Assembly. But it is curious for him to ask for more powers under the present system, for no French Prime Minister has possessed more extensive authority than he does. His "full powers" to deal with the Algerian situation, for instance, make his Resident Minister in Algiers no less than a complete dictator.

One of the things that obscures discussion of a presidential system is that there is one very obvious candidate for the first presidency waiting in the wings of the French political stage, and the disputants are apt to be thinking less of the system than of this one man. He is, of course, Charles de Gaulle. Outside France de Gaulle has been written off and almost forgotten; he has even published his memoirs, which is usually a politician's last sacrament. But de Gaulle is not forgotten here, and in fact the collapse of the Gaullist party (the R.P.F.) has succeeded in putting him above the daily battle and making him appear a more effective last resort. Members of the present Government, including M. Mendes-France, call on him periodically for little talks, and when the Algerian Resident Minister visited Paris last week a communique said laconically that he had called on "the President of the Republic and General de Gaulle". This sounded like those communiques issued in Rome that say "So-and-so met President Gronchi and His Holiness the Pope".

General de Gaulle does not wait silently. From time to time, from his estate at Colombé, he issues his terms for a come-back. Briefly, he always says that he is not coming back just to help the present regime out of its difficulties: he will come back to finish it, that is, to institute the Fifth Republic. He would demand "full powers" at once, the dissolution of the Assembly and elections for a new constituent assembly; everything would be done legally but firmly, and the present lot of politicians would have nothing to hope for in the new order. His proclamations are always quite uncompromising: he will do nothing for the Fourth Republic but bury it. Pierre Poujade, the leader of the rowdy petty bourgeois movement, who also roundly proposes the 'coup de grace' for the Fourth Republic, last week went further and spoke favourably of the possibility of General de Gaulle as the first president of the Fifth.

What about the Communists, who are one of the biggest sections of the electorate and have the biggest single party? Ironically, this most revolutionary movement is the least revolutionary in the present situation, and one can easily imagine a state of affairs where they would be the only defenders of the Fourth Republic. Not that they have any respect for it, or for any other democratic system, however efficient or inefficient. But they would oppose the renovation of French democracy and would prefer to cling on to a regime that, by its very uselessness, does their work for them.

A Letter to the Editor

MR. MIKOYAN IN DELHI AND KARACHI

Sir,

In the leading article referred to above in the issue of your journal dated March 10, 1956, there appears the following sentence: "The prolonged negotiations with the British steel consortium ended in an agreement; but comparisons are constantly made in New Delhi between the period it took to reach this agreement as against the quickness of the Russian acceptance."

If, as is presumed, the consortium to which reference is made is the Indian Steelworks Construction Co., Ltd. comprising 13 well-known British companies, we would express our serious concern regarding the inclusion of a passage which, we feel, gives a definitely misleading impression of the character of the negotiations which this company conducted with the Government of India.

Expressing, though it does, no more than an opinion, the sentence undoubtedly supports the theme of the leading article. Its implications, however, could well damage the prestige of the member companies of this consortium, and that of other British interests too, in India and other countries.

The first mission of this company commenced negotiations with the Government of India late in October, 1955, and succeeded in putting forward in less than 10 weeks its preliminary estimates of costs of supplies and services (forming the sterling portion of the total contract) together with estimates of the costs to be incurred in India. The second mission visited India in February, 1956, and the agreement was signed in March.

Our information is to the effect that the USSR commenced its negotiations early in 1955 and that its proposals were accepted some 14 months later, in February, 1956.

Will anything come of this wave of revolutionary ardour in France? I do not know and I am sure no one else in France knows either. There is one error that we who are familiar with the Anglo-Saxon tradition must avoid: namely, to believe that some tame compromise will be the upshot, the mountain will bring forth a mouse. Things do not happen that way in France. Either a movement comes to nothing, absolutely nothing, or it ends in a complete change. Compromise is much more difficult here than genuine political revolution. To judge from quite recent efforts to amend the electoral law, it would be just about as hard to introduce some little reform (what the French contemptuously call a "réformette") as to build the Fifth Republic. The Fifth might be just as bad as the Fourth but if it comes it will be quite different.

The French, after all, have to their credit (or to their debit, according to taste) more revolutions than anybody else—we can scarcely count Latin American pronunciamientos as revolutions. But one thing is clear: the French never got a new republic just by taking thought. It took the French Revolution and the guillotine to get the First Republic. It took Europe in flames and 1848 to get the Second. It took Bismarck, the Franco-Prussian War and the Commune to get the Third. And it took Hitler, Petain and the Liberation to get the Fourth. Are there any forces of equivalent devastating power to act as midwife for the Fifth? Perhaps there are in Algeria.

If the rapidity with which agreement is reached is to be regarded as the criterion of enthusiasm or determination to do business, a basis for judgment to which we cannot wholly subscribe when projects of the complexity and magnitude of complete steelworks are involved, then the British effort which commenced in October, 1955, is surely worthy of favourable comment.

Furthermore, if comparisons are to be drawn, an important feature of the British effort is the acceptance of the entire responsibility for developing the project, from a green field site, up to the point of handing over the plant ready for operation. To the best of our knowledge the USSR has undertaken only to supply plant and equipment and the services of technical personnel to supervise construction while responsibility for work on the site will rest with the Government of India.

Because we realise that your Journal, so highly regarded in both the East and the West, has an appreciable influence on public opinion we have put before you our own view, shared we believe by many officials of the Government of India, that this Company has not hesitated to undertake a large and nationally important project in India and that it has been the very reverse of dilatory in dealing with the technical, commercial and financial problems involved.

We would be grateful if you could see your way to give to our view the same publicity as was given to the text to which it refers.

Yours faithfully,
Indian Steelworks Construction Company Ltd.
CYRIL JONES,
Chairman.

LONDON,
May 10, 1956.

[The difference arises in regard to the date on which negotiations commenced with the USSR. "The Eastern Economist's" information does not indicate that serious negotiations date to "early" 1955.—Ed.]

WORLDGRAM

AGRICULTURE

Scheme for Rinderpest Eradication from India: A large scale programme for the eradication of rinderpest from India will be undertaken under the second Five-Year Plan at a total cost of Rs. 2,82,34,000, including Rs. 1,57,84,000 as the Central Government share. Realising the importance of control of epidemics among cattle, the Planning Commission allocated Rs. 15.7 lakhs under the first Five-Year Plan for the initiation of work on a pilot scale. A Central Rinderpest Control Committee was set up by the Government of India in March 1954 and a pilot project was started in the States of Bombay, Hyderabad, Andhra, Mysore, Madras, Coorg and Travancore-Cochin in October 1954. At a recent meeting of the Rinderpest Control Committee it was decided to extend work in the first year of the second Plan in the States of Orissa, Bihar, West Bengal, U.P., Punjab and the Jammu Province of Kashmir State from October 1, 1956, in addition to continuing work in the States of Andhra, Hyderabad, Bombay, Mysore and Madras, which was started under the first Plan. Work is also in progress in the States of Ajmer, Kutch and Delhi.

Agricultural Workshops: Dr. Panjabrao Deshmukh, Union Minister for Agriculture revealed in the Lok Sabha recently that Agricultural Information Workshops had so far been organised in six States, viz., Himachal Pradesh, Madhya Pradesh, Bihar, Bhopal, Travancore-Cochin, and West Bengal. Workshops in some other States, namely, U.P., Hyderabad, Assam, Orissa, Andhra, Madras, Rajasthan, Saurashtra, Ajmer, Vindhya Pradesh, Punjab and PEPSU were proposed to be held during the current year.

Developing Forests and Pastures: It is reported the Desert Afforestation Research Station at Jodhpur will be expanded under the second Five-Year Plan for developing forests and pastures for the stabilisation of the Rajasthan desert. The arid sandy tract of the Rajasthan desert covers an area of about 80,000 square miles extending over the States of Kutch, Bombay, Saurashtra, Rajasthan, Ajmer, Uttar Pradesh, Punjab and PEPSU. Besides undertaking investigations on the silviculture of indigenous species, the possibilities of introducing exotic arid-zone species and the hydrological conditions, the Research Station has maintained a large store for free distribution of seeds of suitable species and given demonstrations of methods of desert control. It has established shelter belts along selected roads and railway-lines, organised forest plantations on different types of sand and set up a forest nursery for distributing plants.

INDUSTRY

Tata Steel Output: The Tata Iron and Steel Company Limited reports that the total approximate production of iron and steel at the steel works at Jamshedpur during April 1956 was 100,000 tons of pig-iron, 87,200 tons of steel ingots and 64,300 tons of saleable steel, the latter comprising 19,100 tons of semis and 45,200 tons of finished steel.

Draft Standard Specification for Outdoor Type Distribution Transformers: The Indian Standards Institution has issued, for eliciting comments, a draft Indian Standard Specification for Outdoor Type Distribution Transformers up to 100 KVA 11 KV. The draft covers oil-immersed, self-cooled, three-phase, outdoor type distribution transformers with Class 'A' insulation of capacities up to 100 KVA for use on systems with nominal voltages up to 11 KV and a

frequency of 50 cycles per second. The importance of inter-changeability of parts, special needs, such as those of the tube wells; service conditions, especially the high ambient temperatures, etc. have all been taken care of. The draft is intended to bring about uniformity in production, to the extent possible, of different manufacturers. Classification of insulating materials and admissibility of insulation other than Class A, have also been given in an Appendix.

Air Conditioning Corporation Private Limited: It is understood that Messrs. Gillanders Arbuthnot and Company Limited, have relinquished the Managing Agency of The Air Conditioning Corporation Private Limited. From the 1st of April, 1956, the Corporation is a wholly owned subsidiary of The Orient Paper Mills Limited (Managing Agents: M/s. Birla Brothers) and is being run as a director controlled company. It is learnt that in view of the recent re-organisation, and large financial backing, the Corporation proposes to considerably expand its Engineering, Contracting and Manufacturing activities. The manufacturing programme includes, Room air conditioners, Railway air conditioning equipment, Industrial blower fans, and other items of heavier refrigeration and air conditioning equipment. To implement these plans, the Corporation is entering into manufacturing agreement with their Principals' Messrs. The York Corporation, USA; Messrs. Buffalo Forge Company, USA; as also, Messrs. The Safety Car Heating and Lighting Company, USA.

Manufacture of Carbon Black: A small factory has already been set up for producing carbon black, but its output is very small compared with the country's requirements. Carbon black has been included in the programme of the National Industrial Development Corporation and manufacture was envisaged to be based on creosote oil as one of the raw materials. Supplies of creosote oil in the required quantities might be expected only with the commencement of distillation of coal tar from the new iron and steel plants, and therefore, actual manufacture of carbon black on a large scale is likely to take some time.

Draft Standard for Nitrocellulose, Ester Soluble: The Indian Standards Institution has issued, for eliciting comments, a draft Indian Standard Specification for Nitrocellulose, Ester Soluble. The Standard prescribes the requirements and the methods of test for the material commercially known as Nitrocellulose, Ester Soluble, or Soluble Nitrocellulose or Soluble Cotton. The material is used in the manufacture of clear and pigmented nitrocellulose lacquers, dopes and other surface coatings. In recent years, the use of nitrocellulose finish in various industries has increased and the necessity for a standard for nitrocellulose, ester soluble, has become essential.

TRADE

Sterling Area Trade: Sterling trade has not kept pace with the expansion of world trade, and has fallen from 23 per cent of world trade in 1950 to 25 per cent last year. The total value of exports (including Middle East oil) from all countries in the sterling area expanded by 8 per cent in 1955 compared with 1954 and at £6,708 million they were considerably higher than in any year since the post-war peak in 1951 of £6,892 million. Although this recent increase has been in line with the increase in world exports between 1954 and 1955, in the longer term, sterling trade has not kept pace with the expansion of world trade. The total value of imports into all sterling countries increased by 14 per cent in 1955 compared with 1954.

The UK value increase was very similar with heavy purchases of industrial materials and fuel, leading to an increase of over 11 per cent in the volume of goods imported, compared either with 1954 or 1951. For the rest of the sterling area as a whole, imports were running at a very high rate in 1955 and the increase of 1954 (13 per cent) was much higher than that for primary producers as a whole.

Export of Pakistan Textiles to Malaya: About 40,000 yards of cloth from Pakistani mills—the first consignment of substantial quantity ever to be shipped to Malaya, has arrived in the colony, making Pakistan's entry into the competitive textile market in Malaya a reality. According to the Pakistan trade commission in Malaya, the consignment was made up of 27,000 yards of printed cottons and 16,000 yards of unbleached grey cloth.

FINANCE

Highest Income-Tax in the World: Sweden has the highest income-tax in the world. Direct taxation represents 17.9 per cent of Sweden's total national revenue, compared with 13.5 for the United States, 11.9 per cent for Britain and 5.3 per cent for France. France has the heaviest indirect taxes (18 per cent of national revenue), indirect taxes accounted for 8.5 per cent of revenue in the US, 13.9 per cent in Britain and 3.7 per cent in Sweden.

Financial Aid to India: Three new agreements were signed in Delhi recently between India and the US providing for US financial aid of \$736,682 (Rs. 34.99 lakhs) for assisting India's developmental projects. The aid would be used for assistance to Air-India International, for storage of food grains in India and for expansion and rehabilitation of Indian railways.

World Bank Loans: The International Bank of Reconstruction and Development (World Bank) reports that since its inception it had made 141 loans in 41 countries for a total of \$2,483,500,000. In a financial statement covering the nine-month period—from July 1, 1955, through last March 31,—the Bank reported it had a net income of \$21,200,000 compared with \$18,800,000 for the corresponding period of fiscal year 1955. The Bank said that this net income was placed in its supplemental reserve against losses on loans. This reserve now stands at \$142,700,000. During the period of lending operations, important world Bank loans have included loans to Australia for equipment for general economic development, Austria for electric power development, Brazil for electric power development and telephone equipment, Ceylon for electric power development, Colombia for national railway project, France for equipment and materials for reconstruction and development, Guatemala for highway construction and maintenance, India for railway rehabilitation and expansion of iron and steel production, Italy for electric power, irrigation and industrial projects, Japan for electric power development and industrial projects, Mexico for electric power development, Nicaragua for electric power development, Pakistan for railway rehabilitation and construction of natural gas transmission line, South Africa for expansion of transport facilities, Thailand for irrigation project, Turkey for port construction and development also electric power development, irrigation and flood control, and Yugoslavia for expansion and equipment for electric power, coal mining, agriculture and transportation projects.

New Bank at Bahrain: The Bahrain Government has approved the formation of a first Bahrain-owned bank the National Bank of Bahrain. The Bank, planned by the Chamber of Commerce will offer for public sales shares worth ten million Indian rupees. The

shares would be on sale within a month in units of Rs. 100.

National Income Trend in Turkey: In Turkey, Agriculture still ranks first among the sources of the national income. In 1954 it produced 41 per cent of the total. Only 14.2 per cent of the national income was earned by industry. The percentage in relation to the national income of Turkey's agricultural earnings was 12 per cent lower in 1954, the last year for which figures are available, than in 1938, taken as the base year. That of receipts from industry was up by 13 per cent. In addition the percentage income derived from buildings as well as from transportation and communications—that is, from sectors of the nation's economy closely related to industrial activities—had their shares increased by as much as 20 and 30 per cent respectively.

Travancore Sales-Tax Amending Bill: The President has given his assent to the Travancore-Cochin General Sales-Tax (Amendment) Bill, 1956. The Government of Travancore-Cochin considers it advisable to amend their act on the lines of the amendments made in the Madras General Sales-Tax Act so as to specifically authorise the Government to provide for the collection of sales-tax in advance. The present Bill seeks to achieve this. The amendment is to take effect from the date of commencement of the principal Act.

Housing Scheme for Union Government Servants: The Government of India have revised the grant of house building advances to Central Government servants, which it will be recalled, was discontinued in 1937. Under the present scheme advance will be granted for building a house either at the officer's station of duty or in the town where he proposes to settle down after retirement. Loans will also be given for enlarging the living accommodation in a house, provided the cost of the proposed extensions does not exceed Rs. 10,000. Only one advance will be granted during an officers' entire period of service. The loan will not exceed 24 months' pay, subject to a maximum of Rs. 25,000 for new houses and Rs. 10,000 for extensions. A sum not exceeding 20 per cent of the sanctioned advance will be paid for purchasing a plot. Advances for a new house or enlarging an existing house will be paid in instalments: 30 per cent on purchase of land and 40 per cent and 30 per cent on the construction reaching the plinth and roof levels respectively. In all cases the loan will carry simple interest of about 4½ per cent per annum subject to review.

GENERAL

Indo-American Agreements: Twelve operational agreements were signed in April between the Government of India and the United States Technical Co-operation Mission, involving \$6,615,200 in technical aid and developmental assistance. This virtually completes the 1956 Indo-American programme, which totals \$60,000,000 and brings TCM allocations since 1952 to approximately a third of a billion dollars.

Purchase of Development Equipment for India: The International Co-operation Administration has announced authorisations totalling \$361,858 for the purchase of development equipment for India, Iran, and Iraq. The agency reported authorisation for Iranian procurement of \$311,758 in equipment including electrical apparatus for air navigation, spare parts for motor vehicles, tyres and tubes. For India, the ICA announced \$28,100 for electrical apparatus for a ground water irrigation project. Iraq's purchase authorisations include \$22,000 for industrial sewing machines and miscellaneous equipment.

NEWS IN BRIEF

FOREIGN

President Eisenhower, in his latest report to the Congress on US foreign aid programme in Asia, has declared that American assistance to India has totalled 460 million dollars, including a wheat loan of 190 million dollars in 1951.

Australia had a favourable overseas trade balance in April for the first time since last December. It amounted to £A10 million, compared with a deficit of £A15.5 in April last year.

Italy's motor industry produced a record of 82,233 vehicles in the first three months of this year. Exports included 21,527 cars in the first quarter, which was 32.5 per cent more than in the same period last year.

It is reported Malayan rubber exports in April at 72,119 tons, were the lowest since February, 1954. Compared to March the reduction was 12 per cent.

Britain's man-made fibres industry set a new record in March with an output of 45.4 million lbs, compared with 42.6 million lbs. in February, 43.4 million lbs. in January (the previous record) and 42.2 million lbs. in March, 1955.

Factories in Britain exported 19,012 motor cycles in the first quarter of this year. They were worth, with parts, £3,910,103. Figures for the corresponding period of last year were 18,654 and worth £3,498,409.

Britain has the world's highest newspaper readership rate, with 609 copies of daily newspapers sold for every 1,000 of population. The United Kingdom also has the world's largest individual newspaper circulations—two national daily newspapers of over 4,000,000 each, and a Sunday newspaper selling more than 8,000,000 copies.

Production of crude oil in the Middle East totalled just over 43 million metric tons during the first quarter of this year. Although about the same as in the previous three months, it was 13 per cent more than the 38 million tons attained during the first quarter of last year.

According to a report by the Independent Petroleum Association of America, US oil producing capacity will reach more than 10 million barrels a day by next January.

The French Government is to launch a new State loan. It is indicated that the rate of interest would be in the region of 5½ per cent, and would not be tax free. The loan which will be for a period of about 10 years is expected to amount to between Frs. 80,000 million and Frs. 100,000 million.

It is reported the Jordan Government is to execute the Jordan potash and Dead Sea minerals project solely as a domestic scheme and to provide £450,000 in the annual budget for this purpose.

An order in Council relating to the double taxation arrangements with the Federation of Rhodesia and Nyasaland relating to taxes on income was made on April 24 and has now been published as Statutory Instrument 1956 No. 619.

INDIAN

India will purchase 30,000 tons of ammonia sulphate from the German Democratic Republic. An agreement to this effect was signed in London on April 23 last by the Indian High Commissioner on behalf of India and the German Foreign Trade Organisation of the German Democratic Republic.

Imports by sailing vessels of cloves, unmanufactured ivory, gum, mangrove poles, coconut in husks, cheaper and rough variety of shells, cowries, cuttle fish bones, fish and other edible items from East Africa will continue to be allowed clearance at Indian ports without any import license till the end of September.

Sums totalling Rs. 43.2 lakhs have been sanctioned by the Union Transport Ministry for port development works at Bombay, Calcutta and Madras.

A factory for manufacturing precision cutting and turning tools and tool holders will shortly be set up by a private firm at Bangarapet, Kolar district in collaboration with the Ifanger Precision Tool Manufacturers of Switzerland.

The Rajasthan Government has exempted from payment of tax payable under the Rajasthan Motor Vehicles Taxation Act, 1951 every motor vehicle other than a transport vehicle, registered and normally kept in any other state of India and for which tax has already been paid in that other State in respect of the period of its stay in Rajasthan.

The Government of India has decided to set up a Company for the purpose of production and distribution of coal in the public sector, under the Companies Act. The Government visualizes the possibility of forming subsidiary companies to work scattered mines.

It is reported the import duty of 19-17/32 per cent 'ad valorem' on pig-iron has been abolished with immediate effect.

The Government of India have made available a grant of Rs. 150 lakhs for scholarships to Scheduled Castes, Scheduled Tribes, and other backward classes during 1956-57. These scholarships are tenable in recognized institutions imparting post-matriculation education.

A draft between the Governments of India and Canada will soon be negotiated for the creation of Rs. 35.44 crore Kundab power development project in South India.

The Government of India have so far built 645 colonies exclusively for displaced persons from East Pakistan. Sanction has also been given for 90 training schemes and 41 medium, small and cottage industries in these colonies.

It is reported there are at present about 36,000 basic schools and 2,50,000 ordinary primary schools in India.

Each of the special multi-purpose projects to be taken up shortly in the tribal and scheduled areas, under a scheme of the Home Ministry, will be allotted a sum of Rs. 27 lakhs. Of this, Rs. 12 lakhs will be provided from the Community Project Funds and the rest by the Home Ministry. The Government of India have so far approved 1,168 road works under the Village Road Development Co-operative Scheme.

A CHAIN REACTION IN AGRICULTURE?

FOLLOWING fast on the proposals for increasing agricultural production in the Plan up to 40 per cent initiated by the Deputy Chairman of the Planning Commission at the National Development Council Meeting this month, there are other interesting proposals now doing their rounds in New Delhi. One of these relates to an ingenious method by which a chain reaction can be set up in irrigated agricultural blocks using Government finance in the first instance, but becoming self-financing. The scale at which these proposals can be initiated is, of course, variable. Much will depend upon the capacity of managements to secure additional output from new blocks brought under new irrigation. The evidence that has been collected at the present time shows that the managerial bottleneck is severe and therefore, everything points to a very small beginning. The central ideas are not unsound.

Assuming that limited managerial talent is available, there is no reason why there should not be prepared a substantial pilot project designed to develop an area of 500,000 acres in five years, commencing with 100,000 acres divided, say, in 100 blocks of about 1000 acres for managerial purposes. Originally, Government will need to advance Rs. 300 per acre to these units which may well be co-operative societies. If the benefits of new irrigation and intensive agriculture were to raise productivity by one-third of a ton per acre, the additional output on each block of a thousand acres would be 333-1/3 tons. If in the first year a hundred thousand acres were taken up this would mean 33,000 tons, in the second year this could be doubled to 66,000 tons, in the third year to 99,000 tons and so on. In other words, if blocks were augmented at the rate of 100,000 acres per year, it might be possible over five years to obtain 165,000 tons in the last year, and over

the five years an additional production of about 500,000 tons. This is so substantial an addition that a scheme of this kind is obviously worthy of consideration.

The crucial points in this scheme outside the managerial problem relate to the volume of new finance, the marketing of the product and the impounding development finance obtained from the project on the output. In order that finance should be assured, it is obvious that marketing should not be left to chance. It would, therefore, be desirable that the entire output should be bought at a fixed price by the Government for stock or sale at its discretion. It is possible that ploughing back might take the form indicated in the table on the next page; this shows the scheme is a powerful device for capital formation at a rate of about 20 per cent. This high rate of capital formation does not, of course, represent any profit to the Government and excludes interest charged on the loan. If interest is charged, the plough-back will be pro-tanto less.

The initial expenditure being Rs. 3 crores, the second year for the same volume of development would require Rs. 2.74 crores, the third year would require Rs. 2.48 crores additional, the next Rs. 2.22 crores and the final year Rs. 1.96 crores. In other words, the total capital expenditure of the Central Government would be Rs. 12.4 crores. Against this investment of Rs. 12.4 crores the value of the output at Rs. 400 per ton (average of rice and wheat) would be Rs. 20 crores. In other words, the investment would generate in five years an income greater than itself, the ratio of capital to income being only 0.6.

If a scheme of this kind were administratively possible it would solve the Government's problems of

THE CHAIN REACTION

stocks at a very moderate cost, with a development ratio far below that of any other project in the Plan. This sounds so promising that a detailed investigation should not be delayed. Essentially the principle is the

controlled utilisation of the proceeds of investment for purposes of expansion. The agricultural method is only an illustration of the benefits of a controlled development sector worked in this manner.

	Financed by Govt (Rs. Crores)	Amounts ploughed back every year (Rs. Crores)	Additional output of food grains (Tons)	Value of addi- tional output at Rs. 400 per ton (Rs. Crores)
1956-57	3.00	..	33,333	..
1957-58	2.74	0.26	66,666	..
1958-59	2.48	0.52	99,999	..
1959-60	2.22	0.78	133,332	..
1960-61	1.96	1.04	166,665	..
TOTAL	12.40	2.60	499,995	19.99

- Notes:** (1) Cost of irrigation is estimated at Rs. 300 per acre.
 (2) As a result of this investment, it is estimated, the additional output shall be one-third of a ton per acre.
 (3) Capital formation is estimated at 20 per cent of the increment in output at each level.

GROWTH OF CO-OPERATIVE FARMING IN POLAND —II

BY RICHARD WIELBURSKI

(Vice-Director of the Polish Institute of Agricultural Economics)

As already mentioned peasants join co-operative farms retaining the right to own their land. The basic principle observed in setting up co-operative farms is that the peasants join them on an absolutely voluntary basis. In order to encourage the greatest possible number of peasants to join the co-operatives, it has been considered advisable to set up various types of producer co-operatives. They differ as to the degree of socialisation, the share of collective production in the volume of production and the principles of sharing in the production. All the types of co-operatives have, however, a number of common features, namely, the peasants join them on a voluntary basis, all the co-operatives are directed by self-government, and in all the co-operatives the general meeting of its members is the supreme authority. All the types of co-operatives are organised on the basis of uniting the members in order to bring about the development of collective farming while at the same time there exist in all of these types possibilities for combining personal interests with those of the collective, mainly because part of the soil has been distributed among the members as garden plots around their homes and thanks to the principle of all sharing in the division of production.

Though there are considerable differences between the specific types of co-operatives, the fact that peasants are joining producer co-operatives, even of the simplest type, is an enormous step forward towards socialism. The simplest type of a producer co-operative is the Collective Cultivation Co-operative Farm. In this case the working peasants join only for the collective cultivation of arable land. This can be done for collective ploughing only or also for all the field work. The statute of this co-operative reads: "All the fields belonging to the members, those that are collectively tilled and those on which they work individually, as well as the farm buildings, remain the personal property of the members. On the fields on which work is done collectively each owner has the right to mark the borderline of his field in a way which permits the use of tractors and other agricultural machinery". Out of the arable land handed over for collective cultivation, each member is entitled to exclude a small plot which he will cultivate individually. Its size is laid down by a general meeting.

Each member keeps his livestock and tools and lends them, if necessary, for collective work at prices laid down by the general meeting. The co-operative has the right to sign contracts with the State Machine Centres. It is obvious that this type of co-operative should, and in practice does, buy livestock and tools, erect buildings and develop stock-breeding which will be the joint property of the entire collective. This constitutes the guarantee of their economic and social development. The basis for the settlement of accounts in the co-operative is the crop that is collected on the field of a member of the co-operative. In this the share in the work by the member, his livestock and tools used on his neighbour's land and the costs for the work of the State Machine Centre and so on are also taken into consideration.

Another type is the Union of Agricultural Co-operatives where the peasants join their fields permanently. The statute reads that the members of the Union join their fields for joint husbanding, but each member of the Union retains the ownership of his share in land. The member retains for personal use a garden plot of a size from 0.3 ha. to 1 ha. All the statutes guarantee the ownership of land. The members also have the right to part of the income of the co-operative as compensation for the land they have brought in. The livestock remains the individual property of the member; he is, however, obliged to lend it to the co-operative if asked by the management, but he is paid for this. Members of this type of co-operative can, if they wish to, hand over their livestock, machines and buildings to the co-operative for compensation; the conditions for this are laid down by the general meeting. Entitled to a share in the income, on the basis of land brought in, are only those members of the co-operative who participated in the work of the whole co-operative and, together with the members of their families, worked at least 100 work-day units a year. In the division of the income of co-operatives of this type, part of the total production, indispensable for further farming, is set apart. Part of the income is divided up among the members in the form of money and products, which the members take to their farmsteads. The other part serves for the expansion of the joint property of the co-operative

and is used for social requirements, health and cultural needs. This part of the income cannot surpass 20 per cent of the total income; the rest can be distributed among the members of the co-operative. The divisible income is distributed in the following way: four-fifths is divided up among the members according to their share in the work, the use that has been made of their horses, tools and machinery, while one-fifth is divided up according to the arable land they brought into the co-operative.

The next two types of co-operatives are the Agricultural Producer Co-operatives and the Agricultural Co-operative Farms. The main principles in the statutes are the same as those of the type just discussed. However, livestock, horses, carts, tractors, engines, seed-drills, mowers, harvesters, threshing machines and other large machinery, including ploughs and harrows, are handed over by the members to the co-operative as their share in the joint property. On their garden plot each family is entitled to keep two cows and calves, pigs and fowl without limitation. If the member owns more cattle than the above-mentioned number, it is handed over to the co-operative as his share in the livestock and machinery. A member is entitled to hand over his share in livestock and machinery in such a way that it has to be returned in case he leaves the co-operative. Then his horse, cow, etc., are given back to him or he sells it to the co-operative and is paid for it. In the Agricultural Co-operative Farm the income is divided up among the members exclusively on the basis of the quantity and quality of work done.

Foreigners who discussed these matters with me were most keenly interested in the number, size and rate of development of co-operative farms in the Polish countryside. During the years 1944-1947 when the peasants acquired land within the framework of the land reform, they united in so-called allotment-settlement co-operatives. It had turned out to be much easier to till the land, working collectively. The development of co-operative farms on a mass scale began, however, in 1950 when the number of co-operatives surpassed 2,000. At present we have in Poland more than 10,000 producer co-operatives which embrace more than 6 per cent of peasant families and cultivate more than 10 per cent of the total of arable land owned by the peasants.

The following table illustrates the development of producer co-operatives.

Year	Number of members in thousands	Total area in thousands (ha.)	Horses, cattle, pigs & sheep in thousands			
1949	6.1	41.5	3.3	7.6	7.8	1.6
1951	85.6	709.8	54.4	170.0	213.6	75.6
1953	197.8	1,500.0	125.0	366.0	490.0	224.0

The producer co-operatives cultivate a much higher percentage of industrial crops than individual farms. The most important such crop is the sugar beet. Here the average crop yields in co-operatives are 5-10 per cent lower than in individual farms. The crop from 100 ha. of land in use is lower in producer co-operatives than in individual farms, but the milk yields of cows and the animal production per employed person is higher in the producer co-operatives. Below is a table showing the differences in the average production of certain agricultural articles in individual farms and producer co-operatives in 1954.

Crops	In individual farms	In co-operative farms, inclusive of garden plots
Grain (quintals)	30	48
Potatoes	102	127
Sugar beets	53	68
Milk (lbs.)	2,650	3,030
Pigs (Nos.)	2.5	4.8

Producer co-operatives supply our national economy with 15 per cent of the grain bought from the peasants on the basis of contract purchase and 25 per cent of the industrial crops; they sell the State 13,200 litres of milk per 100 ha. of land in use while individual farms sell only 11,300 litres. At the same time they guarantee the peasant families who are members of the co-operatives a higher income than individual farmers can get.

The total income per ha. of land in use increased from 1951 to 1954 by 31 per cent and the same increase can be noted in regard to the earnings per family. The property of the co-operative farms is also on the upgrade. If we take the value of accumulation per ha. of land in use in 1951 as 100, the increase amounted in 1952 to 193, in 1953 to 251, and in 1954 to 306.

It should be stated that this is, on the one hand, the result of the collective effort of the members of the co-operatives and, on the other hand, of the aid granted by the State. The most effective form of such help in the sphere of production is the co-operation between the State Machine Centres and the co-operative farms. In 1951 the SMCs' share in field work amounted to approximately 50 per cent and in 1954 to 60 per cent.

We are not satisfied with the rate at which the peasants are joining producer co-operatives. Collective farming has become very popular in what we call "the new villages", that is to say among those peasants who acquired their land as a result of the Land Reform. But it has not yet embraced the wider ranks of the peasants living in the "old villages". We can also not be satisfied with the fact that there exist a certain number of co-operatives which are not models for socialist farming. Not all the producer co-operatives make sufficiently effective use of the assistance granted by the People's State. A problem the solution of which requires a great amount of economic and organisational energy is to exert such influence on co-operatives that collective farming would become increasingly popular, so that its development would constitute a guarantee of the steady increase in the income of the peasant who is a member of the co-operative, so that the income from the garden plot would yield only an additional, auxiliary income.

Economic Report from the U.S.

THEORY OF ROLLING READJUSTMENT

(BY GUY SIMS FITCH)

DETROIT, May 15.—It appears that the US may have an opportunity in 1956 to put to the test an economic theory that has been gaining considerable prominence in recent years—the theory of the so-called “rolling readjustment.” This means, in essence, that downturns—or adjustments, to put it politely—that may occur in one or more industries from time to time are offset by concurrent upturns in other industries. As a net result, the general level of business as a whole remains high, and may even rise. Some economists have seen in this characteristic of the post-war American economy an end to the orthodox business cycles of past periods.

The validity of such an assumption requires more than a few years' testing, of course. Nevertheless, it is a fact of this spring of 1956 that strength and stability continue to dominate the American economy at the very time when the important automobile industry is cutting production and laying off workers in Detroit and other automotive centres. In a sense, the automobile industry is suffering from overdoses of prosperity—its own booming prosperity last year, and the continuing overall prosperity of the US this year. Last year, the industry turned out the astounding record of nearly 8 million automobiles, and sold an equally unprecedented 7.2 million. But it did this at the expense, apparently, of part of its 1956 market. Some slowdown this year was expected, if only to sell out at least part of the inventory—some 800,000 cars—that had accumulated in 1955. But sales so far in 1956 have not quite kept pace with the reduced output which is now running about 20 per cent below last year's rate. Inventories are now at 900,000 level.

The industry thus faces the strange situation of finding 1955 referred to as a year of setback—even though production and sales are almost bound to reach the 6-million mark and to better those of any other year except 1955 and possibly 1950. Unless viewed in perspective, this setback can easily be exaggerated. It is noteworthy that automobile production and sales in the two years 1955 and 1956 combined will far exceed

those of any other two-year period. Production is likely to add up to 14 million units or more and sales may well reach or surpass 13.5 million. Automobile manufacturers themselves anticipate some improvement in their position as the year progresses. They attribute much of the lag in sales to the unseasonably cold weather that continued through April over large parts of the country, and expect some pick-up in activity now that the weather finally is warming up. Looking further ahead, they are counting on an upsurge in sales with the introduction in October and November of new 1957 models—which, according to present plans, will incorporate extensive changes in styling and several mechanical innovations. All told, the industry is pouring this year more than \$1,000 million into model changes.

This is of small comfort to those workers who have been laid off—about 130,000 in an industry that employs nearly one million. Of more immediate benefit to them are the State unemployment compensation payments they are receiving. And beginning June 1, many of those still out of work at that time will receive supplemental unemployment benefits from the automobile companies, under the terms of the labour-management agreements signed last year. Yet aside from Detroit's special problems, the slump in the automobile market has had little visible effect to date on the overall economic picture. National employment and income remain high, and consumer spending continues at record rates.

Indeed, business has been so good and the demand for materials so insistent that it is questionable whether the automobile industry could have matched last year's production in any case. American industry is in the midst of the greatest plant expansion it has ever undertaken. Construction is booming. Far from feeling the effects of the decline in automobile requirements, the steel industry is hard pressed to meet the demands on its other customers. When its final record is written, 1956 may yet emerge as the best year for the American economy.

Specially Written for India

The Essence of Management

by Mary Cushing Niles

The first management book written expressly for India provides a comprehensive interpretation of the best Western management thinking and practice for evaluation and use in India's industrial expansion. Mrs. Niles weaves together the threads of efficiency, democracy, and human relations, uniting scientific management ideas with new findings from social science research.

Rising managers already in responsible positions are the first audience for this stimulating book. Top managers, teachers of management, students of management and capable persons already at work will benefit from careful study of this book and Mrs. Niles's use of much literature hitherto available only in journals and in reports of management conferences.

The Business World

NATIONALISATION X-RAYED

By

CROESUS

THE literature in favour of, and against, nationalisation is quite considerable. In our own country, ever since the Indian business community started campaigning for the nationalisation of railways, enough has been said for and against nationalisation. Time was when the Government of the day disdained nationalisation, but the Government of today, of the Sovereign Democratic Republic of India, seems to think that nationalisation is the one panacea for all evils. So blatant has been the pleading in certain quarters for nationalising this industry or that trade that one is often constrained to advise these enthusiasts that a more fertile field perhaps for exercising their imagination lies in popularising the myriad cure-all patent medicines. However, it is amazing that, even on so important an issue as this, there has not been a dispassionate examination, taking into account the peculiar conditions of this country against the prevailing background of the world. But this lacuna has at last been removed by Dr. John Matthai, who chose for his address to the Bombay Rotary Club last Tuesday (15th May) this most stimulating theme. When one reads in the morning papers of the day the title of his talk, “The Case for Nationalisation”, one surely did not expect that he would straight-away begin by making the point that “there is no case for a general application of the principle of nationalisation, and that private (or, as I prefer to call it, free) enterprise should be the rule. State enterprise being confined to cases where there is proved necessity for it”. Nevertheless, none could accuse Dr. Matthai as being anti-theoretical; on the contrary, he categorically stated in the same talk: “there are conditions under which State enterprise is required for developing industries in India”.

It is noteworthy that the learned Doctor successfully demolished both the justifications put forward for nationalisation in the recent statement on Government's industrial policy, namely, the acceptance of a socialistic pattern of society and the need for speedy and planned development. “This is not supported, either by socialistic thinking or socialistic practice”, he declared. Since protagonists of socialism swear by Karl Marx (although, in the same breath, some of them say Karl Marx is outdated), I think Dr. Matthai did well to put forward the pertinent thesis that the conditions that prevailed in the days of Karl Marx which prompted him to give the central place in his thinking to the socialisation of the means of production, have radically changed. In the opinion of Dr. Matthai, inasmuch as Karl Marx assumed that the State was identified with the propertied classes, he could not very well be depended upon to judge fairly between capital and labour; nor could Karl Marx anticipate the vast progress of political democracy since his days or foresee that a time would come when Governments would be based on adult franchise, as it is today in our own country. Another interesting point that Dr. Matthai made was that, at the time of the Bolshevik Revolution, there was no democratic government worth the name. Hence his thesis that, “in India, with a parliament based on adult franchise and having sovereign powers, nationalisation as an agency of socialism has little place”.

Dr. Matthai also subjected to a critical analysis the general theory of Lord Keynes advocating Government

participation in industry as a means of relieving economic depression by providing a spur to the revival of economic activity. According to him (Dr. Matthai), Lord Keynes' thinking only amounted to a scientific vindication of President Roosevelt's New Deal and his New Deal experiments, which business men generally regarded even then as an indication of the Government wanting to take a progressively larger share in business and which made capital shy and delayed investment. This, he said, should provide both a lesson and a warning, the lesson being that there are circumstances in which nationalisation will serve a useful purpose and the warning being that it will do so subject to limitations which must not be overlooked. In this connection, this significant extract from Lord Keynes was given by him: “It is not the ownership of the instruments of production which it is important for the State to assume. If the State is able to determine the amount of resources devoted to augmenting the instruments and the basic reward of those who own them, it will have accomplished all that is necessary.”

This, in fact, is also the advice that Dr. Matthai felt constrained to give to the Government of India in connection with the second Five-Year Plan, with particular reference to the Government's latest Statement on Industrial Policy. If it is accepted that this is all the task of the State, it follows that our Government (or is it the Planning Commission?) can be said to have already satisfactorily accomplished its right task, in that it has laid down a general plan and indicated how all economic activities must conform to the Plan. But, it must be added, it has also gone one step further in assigning duties to the private and the public sectors with perceptibly more emphasis on the role of the latter. But Dr. Matthai said he would reverse the order and emphasis and make free enterprise the normal practice. It might be argued that, after having formulated so comprehensive and ambitious a Plan as the second Five-Year Plan to say that the Government has nothing more to do would be rather queer. But, as the Doctor elucidated, “it is not sufficiently realised that the task involved in directing and fixing economic development in the country to the policy requirements of the Plan would be so enormous that the direct participation in the ownership and management industries, in addition to it, will place a large and unnecessary burden on the administrative and financial resources of the Government.” However, unlike a few destructive critics, he was not so pessimistic as to suggest that the Plan would not work at all; for given sufficient concentration of effort and a reasonable measure of luck,—important provision though—he saw no reason why it should not. At the same time, he emphasised what this would mean, namely, that Government's resources in both finance and personnel should be carefully conserved and not dispersed.

Taking up the second ground put forward for nationalisation, namely the need for speedy and planned development, Dr. Matthai asked whether the Government's organisation and administrative resources were capable of meeting the demand for speedy development through nationalisation and he had no hesitation in unequivocally answering this in the negative. His reasons for doing so, which no

objective student of economic history would dispute, were: (1) India, for its population and area, is one of the most under-administered countries in the world, even for the normal purpose of Government.

(2) While we were able to take over from the previous government a first class going concern, the momentum of the old government, although still active, has begun to slacken; if the decline is not still being felt to its fullest extent, it is because this has been offset by the dynamic leadership of the present Government. It will be conceded by all that this leadership will not, and cannot, be permanent. Indeed, the concern of most thinking people in the country today is what will happen to India when the present leadership ceases to be?

(3) The permanent civil service, as in most other countries, "is too slow in taking decisions, too much governed by precedents, too legalistic, too fearful of change and experiment even to provide the elasticity, flexibility, initiative and the willingness to take risks, make mistakes, and lose money, which are called for in any successful enterprise". Dr. Matthai viewed with concern certain other features that have begun to characterise our civil servants, such as the giving up of the old practice of rotating civil servants at the top level between Central and State Governments and the consequent lack of personal contact with problems on the spot, the diminishing, in real terms, of the remuneration paid to the civil servants and, what is perhaps even more serious, the tendency of some civil servants to anticipate the opinion of Ministers and adopting it as their own instead of stressing their own independent judgment, as in the past.

All these and the few disturbing factors that have come to play since launching the present Five-Year Plan which will further add to the difficulties of carrying it out, such as the dislocation caused by the re-organisation of the States, the deterioration of our relations with certain neighbouring countries and the resultant increase in the expenditure on defence, and the fresh inflationary trend which has begun to appear in most countries of the world with its likely effect on this country, make one thing clear which Dr. Matthai stressed, and rightly so. It is that the Government of India have their job in the near future fully cut out for them in seeing that economic development conforms to the general policy laid down in the Plan without going further and undertaking direct participation in specific industries. In this connection, it is noteworthy that Dr. Matthai did not share the view that the Government's responsibilities would not increase very greatly, if the management of the nationalised industries were entrusted to public corporations. But, whatever the degree of autonomy wasted in such corporations, the responsibilities inherent in the management of public funds would oblige Government to keep a close watch on its operations, including the not very helpful intervention of the audit department, and to have the right of issuing directives on matters of general policy affecting the public interest as he observed. Now it is most difficult to draw a line between what is day-to-day working and what is public interest. In a country like ours which has achieved sovereignty for the first time especially, the tendency generally is for the Government to place a very wide interpretation on public interest and to issue directives on matters which affect even day-to-day working, as witness the situations which frequently arise with regard to interpretations in Parliament. According to Dr. Matthai, this leads Ministers to assume a degree of responsibility for the working of public corporations which clearly

constitutes an abuse of the right to issue directives and to answer questions in Parliament. It is most disconcerting to hear such a responsible individual as the Chairman of the State Bank of India, the Vice-Chancellor of the Bombay University and one who has held the highest positions in the Government of India, both before and after independence, that on certain matters "replies by Ministers have been not merely unwarranted but almost invariably factually incorrect!" If this is where whatever attempts at nationalisation that have been taken so far are leading us, there can be no two opinions that "it is in the Government's interest to proceed slowly and with caution in the matter of nationalisation". Enthusiasts of nationalisation will also do well to bear in mind this further warning of Dr. Matthai that, "if the experiments in nationalisation meet with disappointing results, the reaction on the pattern of society that Government are trying to build will be serious". To pursue, therefore, a policy in the name of an ideology that not only not takes us nearer the goals that we have set before us but is also likely to land the country in trouble is neither wise nor realistic. Before proceeding to nationalise, therefore, the authorities should make sure that any proposed measure of nationalisation satisfies the following four-fold criterion laid down by Dr. Matthai: (i) that it is limited in scope, (ii) that it has been applied selectively and not in certain categories of industries but to specific industries, (iii) that the approach to it has been empirical and (iv) that, as far as possible, it will be decentralised.

When the ordinance seeking to nationalise life insurance was promulgated by the Government of India, there were country-wide protests questioning the wisdom of the move. But the official spokesmen ignored them either as being interested or as being ill informed. I wonder what they will now say to this categorical assertion of a former Finance Minister of India: "I have read every statement made by those in authority justifying nationalisation of life insurance and I must confess 'I am as unconvinced as ever'". There may perhaps have been at least a semblance of justification for nationalisation of life insurance, but, as Dr. Matthai has maintained, it is difficult to imagine a case less suitable for nationalisation than the Kolar Gold Fields which are now being sought to be nationalised. Be that as it may, here are two tests that Dr. Matthai set out as being very important in regard to any industry that is sought to be nationalised, namely, (i) that it must be established that, in the national interest, there is a good case for it, and (ii) that the public as well as the interests concerned know definitely the grounds on which the final decision is taken. In effect, this would mean that the policy which the Government should adopt must be one of "discriminating nationalisation". And the test by which the discrimination is exercised, as he very rightly added, should not only be clearly laid down, but the necessary enquiry in this behalf should be made not by the Government, but by an independent body with requisite experience whose judgment would command confidence.

In conclusion, it is necessary to reiterate what Dr. Matthai said, that if large sections of people in the country are worried about the loose talk of nationalisation still going in high places today, it is because "the country needs all the free enterprise now available for its development, and also because there is no justification either practical or ideological, for the decline resulting from Government policy in freedom of enterprise which, in reality, is one of the greatest freedoms in a democratic country". And let us remember that, under our Constitution, India is a sovereign democratic republic.

BUSINESS NOTES

THE MALADY AND ITS CURE

MORE THAN eight months have passed since the commencement of the 1955-56 cotton season, but futures trading was put out of commission as early as December 23, 1955 with the result that hardly any hedging facility was available to cotton interests for the greater part of the season. In the event, jobbers, traders, mills and last, but not the least, the growers have all been equally affected. It is in the interest of all, therefore, that an earnest attempt must be made to diagnose the malady that cotton has been heir to for the past four months and to prescribe a suitable remedy.

In brief, the cotton stalemate has sprung from the prolonged tug-of-war between the Forward Markets Commission, on the one hand, and the East India Cotton Association, on the other. The battle for supremacy between these two bodies took a serious turn when the President and the Vice-President of the Association submitted their resignations. Because it feels it is firmly entrenched in a position of strength, the Forward Markets Commission cannot be expected, in the normal course, to pay much heed to the wishes of the trade in the matter of resumption of forward trading.

In this connection, the bunch of eleven letters from the Commission to the E.I.C.A. President suggesting certain amendments in the Association's constitution and by-laws assumes great significance, because therein lies the solution to the whole cotton problem.

The trade, as represented by the East India Cotton Association, and the Forward Markets Commission are not agreed on a number of issues raised in these letters which are basically linked to the working of the futures market. The most controversial point about which there is strong difference of opinion is the fixation of tendering differentials which, incidentally, was responsible for a serious crisis resulting in the suspension of trading in futures for over two months two seasons ago. While the Commission would seem to be inclined to change the present by-law 55 and adding a new provision for fixing tendering differences on the basis of varietal differentials, that is, on the basis of the intrinsic merit of the contracts, the trade is clearly against this suggestion. According to the trade, this is not just a change, but a radical departure from the present procedure. The strongest argument against such a proposal is that it carries with it seeds of artificial price disparity. This would mean that the trade would have to keep extra constant watch over the price situation all the time and take remedial measures in time.

As regards whether delivery contracts should be transferable or non-transferable, again, the FMC and the EICA have so far failed to reach common ground. The Commission recently brought to light cases where free transfers of contracts are alleged to have taken place when they were actually supposed to be non-transferable. According to the Commission, this contravenes the provisions of the Forward Contracts (Regulation) Act. The delivery contracts entered into with the mills cannot be viewed in the same light, for they are not actually transferred but are definite sales. Again, inasmuch as delivery contracts made as between traders are in the nature of buying and selling daily, the clearing should be on a monthly basis and not on a weekly basis as the Commission is reported to have suggested. It must also be noted here that trading in delivery contracts affords hedge facilities

against purchases and sales of spot cotton. What is more, there have been occasions when prices of delivery contracts have been cheaper than those of cotton sold in the interior, making it advantageous for the dealer to buy delivery contracts for specific deliveries and quantities rather than buy in the interior.

In regard to the question of open survey system also, both the Commission and the Association would seem to be at loggerheads. The prevailing system, according to the trade, needs no change. If at all the Commission insists on some alteration, the trade would vote for the reintroduction of the system that prevailed before the appointment of the sworn surveyors. The trade would also insist on wide representation being given to different sections of the trade before selection of members for the various survey panels.

If some sort of an agreement were arrived at between the Forward Markets Commission and the East India Cotton Association on all these fundamental issues, the resumption of futures trading could be speeded up. With the resignation of Shri Purshotamdas Thakurdas and Shri Chimanlal Parikh, it is felt in certain quarters that the Commission might not encounter very staunch opponents to its view. Even so, it is only if the EICA takes care to see that everything is in the best interests of the trade and is not content merely to sign on the dotted line that cotton futures trading in Bombay may be expected to be resumed.

COASTAL FREIGHT RATES RAISED

A FURTHER increase of five per cent in the coastal freight rates meets the demand of the shipowners, but, again, only partially. It may be recalled that the Government had allowed the Indian Coastal Conference to put up the rates by five per cent earlier, that is, from October 1955 as a measure of 'interim' relief, pending receipt of findings of the Rail-Sea Co-ordination Committee. The Conference has, however, been urging an increase in the freight rate on coal and general cargo to the extent of at least 15 per cent which would mean an additional income of Rs. 150 lakhs.

Except for the two recent changes referred to, coastal freight rates have remained practically unchanged since 1951, although, during this time, the costs of operation have increased steadily. In contrast, the liner rates in the various overseas trades have been subject to several increases owing to the substantial increase, in the initial purchase and operating costs of steamers. The Indian shipping companies also are incurring considerably higher expenditure due to increases in stevedoring charges, cost of repairs and maintenance, wages of floating staff and the cost of bunkers. But this has not been accompanied by a commensurate increase in their freight rates, which, we are told, is the reason for there being no expansion in the coastal tonnage to the desired extent during the last few years. Apart from wages, stores, and victuals and the stevedoring charges that have increased and are likely further to increase substantially, thanks to the introduction of the piece-rate system of payment, there are other factors besides which have also to be taken into consideration. One of these is the high cost of ships. Thus a standard coastal ship, which used to cost only about Rs. 44 lakhs in 1950 would now cost as much as Rs. 80 lakhs. This means that, on every new purchase, our shipping companies would have to earn double the freight they used to earn in 1950 in order to justify the investment.

Another reason why coastal shipping has not been able to make appreciable progress is that coal cargo, which is its mainstay, is not available to it in the required quantities, the bulk of internal transportation being done by rail. This is despite the fact that Indian coastal shipping freights for transportation of several commodities are considerably lower than the corresponding railway rates. The only commodity in respect of which shipping rates are higher than railway rates, is coal. But this is due to the fact that rail freight on coal is far below the actual cost of operation. In other words, in carrying coal, the railways are actually subsidising industries to the extent of the loss incurred by them on the movement of coal. Inasmuch as coal is the mainstay of coastal shipping there is need for a re-examination of the policy of the railways in regard to the rates they charge for movement of coal. Meanwhile, it is gratifying to find that, as a result of representations made by coastal shipping interests, some diversion of transportation of coal cargo from the railways to coastal shipping is under way. The Rail-Sea Co-ordination Committee has been examining, among other things, the existing pattern of trade movements within the country of commodities with a view to determining as to which of them could be more suitably carried by the sea route.

Ships are eminently suited for the carriage of bulk cargoes such as coal, cement, salt, fertilisers and structural steel. If coastal operations are to become really economic and profitable, it is necessary that colliers carrying coal from the East to the West Coast are assured of adequate return cargo in the shape of salt, cement and such other commodities. The volume of return cargo available from the West Coast to the East is estimated at just about half the cargo carried in coastal ships from the East Coast to the West. This means that ships often have to return in ballast or with unutilised space which again lead to enhanced costs of operations. It is imperative, therefore, that, as a corollary to diverting coal from the rail to the sea route, the railways should, as far as possible, make over to ships more and more of such cargoes as salt, cement, raw cotton, textile goods and other manufactured articles, by evolving a properly integrated policy of rail-sea co-ordination.

NOT CONTROVERSY, BUT CONSTRUCTIVE APPROACH

THE OPENING of the India Exchange at Calcutta on May 10 last provided an occasion where a good deal of plain speaking was made on behalf of the two sectors in the economy. Now that the Government's industrial policy has been restated any further controversy on the respective merits of the public and private sectors or on the superiority of the one over the other must cease. In fact it has long ceased to have any useful purpose since it has been quite obvious that the conditions and the tasks imposed on the Indian economy require the co-existence of the two.

Mr. B. M. Birla, Chairman of the India Exchange, was constrained to point out that the old habit of considering the existence of the private sector superfluous in view of the acceptance of the goal of socialism was slow in dying. There was often a talk about concentration of economic power in the hands of a few private individuals or groups of individuals. This assertion was essentially hypothetical. Mr. Birla, however, put a pertinent question whether high concentration of economic power in the hands of the Government of which potential germs were in evidence was not a threat to the sound and balanced development of the economy. Such concentration tended to centralise initiative in the hands of a few at the government level. The prospect of incentive

languishing under such a situation was by no means imaginary. He expressed the hope that adequate caution would be exercised to ensure that the new trend in the Government's assumption of greater powers does not degenerate into authoritarianism. A constructive approach made it imperative to recognise that conditions should be created which would be conducive to arming the two sectors with the resources they need. In this context, Mr. Birla urged the necessity to reconsider the taxation policies which had a marked effect to depress new investment and higher standards of consumption. He also explained that the size of the tasks to be performed by the private sector necessitated Government's positive help and encouragement in certain vital spheres. Speaking at the annual meeting of the Indian Chamber of Commerce, Calcutta, on the next day, Mr. N. L. Kanoria, the Chairman, urged a flexible approach and pointed out the specific case of the impressive coal target of additional production of 23 million tons and explained how the private sector's offer to accept the entire responsibility for itself was turned down by the Government on a dogmatic ground.

Mr. T. T. Krishnamachari who performed the opening ceremony of the buildings was much less correct in some of his assertions than he was outspoken on the attitude of the private sector. It can certainly be questioned seriously whether the private sector has not measured up to the full scale of responsibilities allocated to it so far. His remark to the effect that opposition to the flow of foreign capital in this country emanated mainly from the private sector has hardly a basis of reality. Private enterprise in this country has no doubt emphasised the superfluity of foreign capital in enterprises where indigenous capital was forthcoming and technological skills of a high order did not raise any problems. The numerous flotations of enterprises on a basis of collaboration between Indian and foreign private capital in the post-independence era ought to be taken as indicators of the real attitude of the private sector.

SEAMEN'S SERVICE CONDITIONS

TO THE nascent merchant navy of India, maintenance of peace in the shipping sphere is of vital importance, but this has been conspicuously absent during the past few months. Both the Bharat Line and the Scindia disputes have ended only recently, and that too after the intervention of third parties, and, it seems, the recrudescence of similar troubles in other shipping companies cannot be altogether ruled out. But, if the report of Mr. C. P. Srivastava, accompanying his arbitral award in the dispute between the Bharat Line and the Maritime Union of India, were to be followed as a model in determining employer-employee relations in the shipping industry, such chances would be greatly minimised.

Briefly, the Maritime Union's demands included a revision of pay scales, an increase of privilege leave from 40 days to 45 days, payment of bonus equal to a month's pay, overseas allowance at 10 per cent of the salary, virtual allowance of Rs. 5 per day during the period of leave granted to an officer and an additional leave benefit of 15 days per year as compensation for Sundays and holidays worked at sea. Now, the wage schedules, leave rules and other service conditions laid down by the Arbitrator represent an improvement on those that existed before April 1, when the agreement came into effect. Mr. Srivastava's plea for standardisation of service conditions in the merchant navy is particularly important, as these vary widely at present. Meanwhile, the classification of officer-personnel, processing of grades of pay and adumbration of rules and regulations governing leave,

probationary period, hospitalisation and other working and employment conditions as laid down in the award should provide readymade solutions to a number of pending disputes between shipowners and seamen's unions.

It is a happy augury of the prospect of future peace in the shipping sphere that the end of the 15-day old strike of the 1,500 home-trade seamen of the Scindia and BSN lines, as also the agreement on bonus for Bombay stevedore labour, has come so soon in the wake of the Bharat Line Award. While the terms of the latter agreement are very much in favour of the employees, a point worthy of special note is the provision to refer, in future, all matters at issue, to an umpire jointly selected by both the employers and the employees. With most of their grievances redressed thus, it is up to the workers now to put in their best effort and bring the coastal traffic in passengers and goods to top efficiency.

TERRITORIAL WATERS

THE RECENT Presidential declaration extending the limit of territorial waters over which India will have sovereign rights from three miles to six miles concerns an issue on which there is no precise international law. Earlier in August last, India had declared her sovereignty over the whole of the continental shelf adjoining her coastline and appropriate steps taken to provide in the constitution for vesting in the State all mineral and other wealth embedded in this region in the same way as all the wealth of the territorial waters of any State rests in that State.

There is as yet no internationally accepted general limit as such of territorial waters though an abortive attempt was made as far back as 1925 by the League of Nations to establish an International Convention favouring a three-mile limit, with exceptions in special cases. The United Nations General Assembly has now taken up the issue once again and it is scheduled to come up before the Assembly this year. As several states held divergent and uncompromising views on the subject, the International Law Commission which met in Geneva towards the end of last year could not come to any final agreement. However, the judgment of the International Court of Justice in the Anglo-Norwegian Fisheries case some four years or so ago, seems to imply that islands close off the coast form part of the mainland, while the sea passages between them, even where more than six miles, would constitute internal waters. The judgment thus placed reasonable limitations on the extent of internal waters. Given state sovereignty over the territorial set up to a limit of say 12 miles, it follows that outside this limit a State has limited rights of jurisdiction for particular purposes, economic, protective or others. It will be seen that the limit of three miles evolved in the eighteenth century has now become outdated. The only solution to the problem would appear to be to allow each state to determine its own limit of territorial waters as necessitated by its geographical and economic requirements subject to a maximum limit of 12 miles and such marginal adjustments as may be necessary.

While territorial waters constitute the belt of the sea around the coastline, the continental shelf denotes the extension of the earth into the seas from the coast line, which, in reality, forms part of the soil of the State. The continental shelf around India's coast extends far beyond the country's territorial waters, varying between 20 and 30 miles along the Orissa coast and over 200 miles off the gulf of Cambay. The development of modern techniques for the exploitation of

submarine mineral deposits, such as iron, coal and oil, along the continental shelf has lent economic import to this projection, which was formerly claimed only for purposes of navigation and fishing. It is believed that while the continental shelf adjoining the Travancore coast contains deposits of monazite the Bengal basin contains oil. To the extent that India will be enabled to exploit these resources, the concept will be appreciated by her people.

SYNTHETIC VS. NATURAL RUBBER

PLANS TO step up production of synthetic rubber in the USA, the formation of a new company to manufacture it in the U.K., and the provision for a synthetic rubber industry in schedule B of the latest Industrial Policy Resolution of the Government of India, have all come as a challenge to natural rubber producers. Synthetics have come to stay, and, with the advance of science, one is bound to see a further widening of their range and several improvements in their properties.

Production of synthetic rubber in the Free World in 1955 was estimated at 1,805,000 tons and consumption at 1,055,000 tons, against the output and consumption of natural rubber at 1,895,000 and 1,830,000 long tons, respectively. Last year was the first year in which world output and use of synthetic rubber passed the million-ton mark. The new year actually began, therefore, with a little carry-over from 1955. This apart, under the influence of higher synthetic production in the US and the cut-back in motor car activity on both sides of the Atlantic, prices have generally continued the decline that set in last autumn—though, for some time past, the market has been stable, albeit quiet. Even so, indications, presently at any rate, are that prices generally this year as a whole will move substantially lower than in 1955.

Rather than predict the future of natural rubber it is perhaps easier for one to state that natural rubber producers can, and ought to, try their best to safeguard their future. Fortunately for natural rubber, there have always been a few men with vision prepared to support research and development work. And so we see natural rubber today used more efficiently in conventional ways, besides explaining outlets in some new directions as foamsponge cushions, for example. Truly, the hope for the future of natural rubber lies, therefore, in intensifying research and development.

The present position is that the total demand for rubber in the world far exceeds the capacity of the synthetic factories. If only because of this, there is bound to be a substantial outlet for natural rubber. As in the case of other commodities, in the case of natural rubber also, prices are governed by the usual laws of supply and demand. But, looking further ahead, it seems that the problem would be a question of equation of costs of natural and synthetic rubber. This means that natural rubber interests must adopt relatively more efficient methods of production than now. The most important of these of course is a programme of replanting. Natural rubber producers have got to have faith in their own future and be prepared to replant, even though this means a temporary loss in production, in order that they may take advantage of higher-yielding strains at least for future production.

The very fact that natural rubber prices have remained as steady as they have been recently, despite adverse news, lends substance to the belief that there is still no unmanageable rubber surplus on the market. Whether or no this indicates the prospect of a price recovery in the immediate future is more than one can say. What appears fairly certain on present indications is that the primary trend of natural rubber prices in the face of the increased challenge of synthetic rubber would be downward, so long at any rate as the two are within reach of competing with each other.

THE CASE FOR NATIONALIZATION

[The following is the text of a talk on the above subject delivered by Dr. John Matthai, Chairman, State Bank of India, at the Rotary Club, Bombay, on 15th May 1956.]

THE point I wish to make is that there is no case for general application of the principle of nationalisation and that private or, as I prefer to call it, free enterprise should be the rule, state enterprise being confined to cases where there is proved necessity for it. In such cases, the decision should be based on 'a priori' considerations applicable to industries generally or to categories of industries but to particular industries on the merits of each. The Government's statement of industrial policy relies on both state and free enterprise for industrial development, but it places greater stress on state enterprise. I agree that there are conditions in which state enterprise is required for developing industries in India, but I would reverse the order of emphasis and make free enterprise the normal practice, but if an industry is to be nationalised, the case for it should be established beyond doubt.

The recent statement of Government's industrial policy in its preamble puts forward two grounds for nationalisation, one is the acceptance of a Socialist Pattern of Society and the other the need for speedy and planned development.

The impression that nationalisation is an essential element in socialism is not supported either by socialist thinking or by socialist practice. As regards the latter, the British Socialist Party having experimented with nationalisation while in office for five years is now reacting against it. The feeling is growing that none of the objectives of a socialist society are necessarily served by nationalisation. On the other hand it is felt that regulatory and fiscal legislation by a Parliament, which represents the whole community, can achieve this better.

As regards socialist thinking, if Karl Marx is to be accepted as the father of theoretical socialism, there is no doubt that he gave the central place in his thinking to the socialisation of the means of production. At the time he wrote, partly through increase in population and partly through the substitution of machinery for manual labour, there was an excessive supply of labour and the employer by his ownership of plant and machinery held an unfair advantage in bargaining with labour, which reduced wages to subsistence level. But in most countries in Europe then, government was despotic; such franchise as there was, was based on property rights. Karl Marx assumed therefore that the state was identified with the propertied classes and could not be depended on to judge fairly between capital and labour. Karl Marx could not anticipate the vast progress of political democracy since his days and that a time would come when government would be based on adult franchise. That has now happened in many countries and legislative measures for controlling industries and safeguarding the rights of labour have been adopted by them. The need for socialising the means of production as an instrument of social justice in the sense of a fair distribution of rewards, the removal of gross disparities of income and the provision of satisfactory conditions of work no longer exist in democratically governed countries, since all these projects can more conveniently be secured by appropriate legislation. It is significant that in Russia at the time of the Bolshevik revolution, there was no democratic government worth the name and it was because of this that the thesis propounded by Karl Marx came to be universally put into practice.

In India with a Parliament based on adult franchise and having sovereign powers, nationalisation as a necessary agency of socialism has little place.

Lord Keynes in his book "The General Theory" regarded government participation in industry as a means of relieving economic depression like the one in 1929 by providing a spur to the revival of economic activity. His thinking in effect amounted to a scientific vindication of President Roosevelt's New Deal. It is worth observing that although the policy of New Deal led to a revival of economic activity, the suspicion it caused in the minds of business men generally that it was an indication of government's intention to take a progressively larger share in business made capital shy and delayed investment. The New Deal experiment of government participation in industry provides therefore both a lesson and a warning. The lesson is that there are circumstances in which nationalisation will serve a useful purpose. The warning is that it will do so subject to limitations which must not be overlooked. The general view that Keynes held is stated in his book in the following words—"it is not the ownership of the instruments of production which it is important for the state to assume. If the state is able to determine the aggregate amount of resources devoted to augmenting the instruments and the basic reward to those who own them, it will have accomplished all that is necessary".

The definition of the state's essential part as the determination of the aggregate amount of capital resources to be devoted to development and the basic reward to those who own them means that the primary business of the state is to provide the frame-work within which resources are allocated and rewards are determined. In other words, the state's business is to lay down a general plan and all economic activities whether by state or by free enterprise must conform to the plan.

India has just come to the end of the period covered by the first Five-Year Plan and is about to enter on the second Five-Year Plan. The first Five-Year Plan in my judgment was not a plan but would be more accurately described as a programme of piecemeal development. With the exception perhaps of the Community Projects, every project included in the first Five-Year Plan had been designed and partially erected before the National Government came into power.

Two changes occurred since then. In consequence of the improvement in the food supply and stabilisation of food prices, due to the American Wheat Loan, to successive good monsoons and to the progress of irrigation, it became safer to supplement available resources by deficit finance. Secondly the latter part of the first five-year period was marked in most countries by a revival of economic activity unprecedented since the cessation of war. Partly aided by the Plan, India shared in this revival and was able to fulfil most of the moderate targets laid down in the first Plan.

While it is a matter of gratification that the first Plan has generally proved a success, it is unrealistic to feel complacent on that ground about the prospects of the second Five-Year Plan. The second Five-Year Plan unlike the first is a real plan—a comprehensive overall plan—which seeks to co-ordinate and integrate the different segments of the economy; it is not like

the first a patchwork of isolated projects. Its scope is much wider and the finance it requires is correspondingly larger. It is obvious that the necessary finance cannot be provided wholly by taxation and borrowing and therefore must be supplemented by a large measure of deficit finance. Deficit finance entails serious risks. But, apart from this, there are other difficult problems to face. For a plan so comprehensive and calling for inter-adjustment at so many points, the statistical data available are grossly inadequate and have had to be almost entirely improvised. In the circumstances, it must be expected that maladjustments will come to light at various points in the course of its implementation. Some of the maladjustments which will require to be resolved are those between employment and output of consumer goods, heavy and light industries, large-scale and small-scale industries, state enterprise and free enterprise, production on the one hand and transport and social services on the other and the effect of inflation and high prices on people of fixed and variable incomes.

I draw attention to these aspects of the second Five-Year Plan because it is not sufficiently realised that the task involved in directing and focussing economic development in the country to the policy requirements of the Plan would be so enormous that direct participation in the ownership and management of industries, in addition to it, will place a large and, in my opinion, unnecessary burden on the administrative and financial resources of government. I am not suggesting that the Plan will not work. With sufficient concentration of effort and with a reasonable measure of luck, I expect it will. But it means that government's resources in both finance and personnel should be carefully conserved and not dispersed.

This brings me to the second general consideration in the industrial policy statement which has influenced government's approach to nationalisation, namely the need for speedy development of industries. The question that arises here is whether government's organisational and administrative resources are capable of meeting the demand for speedy development through nationalisation. My view is that they are not and my reasons for this view can be briefly stated.

First, for its population and area, India, I believe, is one of the most under-administered countries in the world, even for the normal purposes of government. Secondly, if the Government of India have done well so far as a government, as they undoubtedly have, as compared for instance with neighbouring Asian countries which have newly achieved independence, it is largely because, unlike them, we were able to take over from the previous government a first-class going concern. The administrative momentum of the old government is still active. Although in recent years this momentum has perceptibly declined at almost every level of administration, the decline has been off-set by the dynamic leadership provided by the present government. But it is unrealistic to think that the natural term of those who form the present leadership can last much longer.

Thirdly, taking the principal instrument of administration, namely, the permanent civil service, making the fullest allowance for the high order of intellectual ability and of personal integrity which by and large prevail in the service, it is common experience in most countries that civil servants "are too slow in their decisions; too much governed by precedent; too legalistic; too fearful of change and experiment ever to provide the elasticity, flexibility, initiative and the willingness to take risks, make mistakes and lose money, which are called for in successful industrial

enterprise". In this context it is worth while to take note of the changes which have occurred in India in recent years in the character and quality of civil servants. The old practice of rotating civil servants working at the top level between the central and state governments has now practically ceased. There is consequently among those who man the services at the centre a serious lack of personal contact with problems on the spot and an increasing tendency to deal with them in a routine, mechanical way. The diminution in real terms of the remuneration paid to civil servants and of the prospects open to them have resulted in a noticeable tendency to look for satisfaction in work not so much to the work itself as to the exercise of bureaucratic authority. With the emergence of political chiefs, civil servants are getting into the habit, while advising Ministers, of anticipating the opinion of Ministers and adopting it as their own rather than stressing their own independent judgment. I agree also with the Prime Minister that the rules of procedure in government departments which answered the requirements of a foreign bureaucratic government are out of keeping with those of a national democratic government.

Lastly, I want to say a word about the Planning Commission. Frankly I have never been happy about the institution of the Planning Commission and the place assigned to it in the structure of government. A Planning Commission logically is or ought to be a body of experts subordinate to the Cabinet. But through adventitious circumstances into which I do not wish to enter, the Planning Commission has become a body of amateurs with whom for all practical purposes final decision rests in matters of economic development. The result is that the Cabinet Ministers concerned with economic affairs have lost much of their initiative and sense of responsibility. This is unfortunate because if it is decided to nationalise industries, it is the initiative and sense of responsibility of the Ministers concerned which must tell.

It must be noted also that at the time of launching the new Plan, some disturbing factors have come into play which will add to the difficulties of carrying it out. First is the dislocation, not merely administrative but psychological, caused by the re-organisation of the States. Next is the deterioration of our relations with certain neighbouring countries which is bound to increase the expenditure on defence. Lastly a fresh inflationary trend has begun to appear in most countries of the world and its reaction upon India may have consequences which it is difficult to forecast.

I have dwelt at this length on the Plan in order to enforce the point that the Government of India have their job in the near future fully cut out for them in seeing that economic development conforms to the general policy laid down in the Plan without going further and undertaking direct participation in specific industries.

It may be objected that these considerations apply only to departmental management of nationalised industries, but that if management is entrusted to public corporations, the responsibility of government would be lessened. In practice it will be found that the responsibilities that fall to government in the case of a public corporation would not be any less. The funds held by public corporations are borrowed from government, or invested or guaranteed by government. Whatever the degree of autonomy vested in a corporation, the responsibilities inherent in the management of public funds would oblige government to keep a close watch on its operations, including the not very helpful intervention of the Audit Department. Besides,

it is the usual practice in public corporations for government to have the right of issuing directives on matters of general policy affecting the public interest. Where the line is to be drawn between day-to-day working and public interest is a moot point in every country which has adopted the device of public corporations. In a country which has achieved sovereignty for the first time, the tendency generally is for government to place too wide an interpretation on public interest and issue directives on matters which strictly speaking affect only day-to-day working. This situation arises also with regard to interpellations in Parliament. A convention has grown up in the British House of Commons that interpellations regarding public corporations, like directives, should apply only to matters of policy. But at the present stage of public corporations in India, an unjustifiable measure of latitude appears to be allowed. The wide interpretation placed on public interest leads Ministers to assume a degree of responsibility for the working of public corporations which constitutes an abuse of the right to issue directives and to answer questions in Parliament. In certain matters with which I happen to be personally acquainted, replies by Ministers have been not merely unwarranted but almost invariably factually incorrect.

I therefore come to the conclusion that it is in the government's interest at the present stage to proceed slowly and with caution in the matter of nationalisation. If the experiments in nationalisation meet disappointing results, the reaction on the pattern of society that government are trying to build will be serious. I suggest therefore—

- (1) that nationalisation should be strictly limited in scope,
- (2) that it should be applied selectively not in regard to categories of industries but to specific industries.
- (3) that the approach to it should be empirical,
- (4) that, as far as possible, it should be decentralised.

There has recently been a tendency on the part of government spokesmen to pronounce in favour of state enterprise generally on the ground that concerns run by free enterprise have been guilty of serious lapses and irregularities. Free enterprise has been at work in India for nearly a century and it is easy in view of the long period and the wide range it covers to find material for allegations as compared with state enterprise. But this is a poor way of judging so important an issue. To one who for some time as Minister of Railways was in charge of the largest public enterprise in India and who at another time as a business man was in charge of the largest free enterprise in India, the Tata Iron and Steel Company, comparisons of this kind carry little conviction.

I do not for a moment deny that in a developing country, there is a case for public ownership and management of certain industries. As an illustration, I would mention transport—railway, road and air. Transport is fundamental to economic development and there is no form of business in which there is greater need for co-ordination. Similarly there are industries, the products of which are required solely for defence purposes and for which a prima facie case for nationalisation exists. On the other hand, as an illustration of a business for which no such case exists, I would mention insurance. I have read every statement made by those in authority justifying the nationalisation of life

insurance and I must confess I am as unconvinced as ever. Another case is the nationalisation of the Kolar Gold mines. The Kolar Gold fields are not a new enterprise; gold is a speculative commodity; the use of currently produced gold as a means of strengthening exchange reserves is diminishing; India's contribution to world production is negligible; the low levels at which gold is now extracted in the mines in question makes it expensive. It is difficult to imagine a case less suitable for nationalisation.

Two things are important where an industry is sought to be nationalised. First, it must be established that in the national interest there is a good case for it. Secondly, the public as well as the interests concerned should know definitely what are the grounds on which the final decision is taken. The policy of government would on this basis be one of discriminating nationalisation. The tests by which the discrimination is exercised should be clearly laid down and the necessary enquiry should be made not by government but by an independent body with requisite knowledge and experience whose judgment would command confidence.

I regard with growing concern the loose talk of nationalisation going on in high places today. I do so not merely because the country needs all the free enterprise now available for its development but because I see no justification, either practical or ideological, for the decline resulting from Government policy in freedom of enterprise, which in reality is one of the greatest freedoms in a democratic community.

RECORDS & STATISTICS (QUARTERLY BULLETIN)

Editor: R. V. MURTHY, M.A.

"The Eastern Economist" Bulletin of Records and Statistics surveys economic trends in each quarter in India and abroad with the aid of graphs and all available statistics. One of its special features is the Investment Supplement.

Annual subscription	Rs. 12
For subscribers to "The Eastern Economist"	10
Single copy	3

Copies can be had from all important Booksellers and Railway bookstalls of Messrs. A.H. Wheeler & Company

COMPANY AFFAIRS

RIISING COSTS AND LOWER PROFITS IN JUTE

From mid-October last year until early March this year, prices of raw jute have risen steadily, with only minor fluctuations, and at no time during this period did any increase in prices of finished jute goods keep pace with the rise in raw material prices. This has resulted in creating difficulties for the jute manufacturers to sell goods at a profit. The steady rise in prices of raw jute has been due, in some measure, to the apprehension that, while supplies may be generally adequate to meet present demands, any recurrence of transport dislocation as a result of flooding during the early part of the coming season might result in there being insufficient raw material from the present crop to meet all the requirements at the increased rate of production till the bulk of the new crop reaches the market. Heavy flooding in Assam and East Pakistan, with consequent breaches in the Assam Link Railway, and later in Orissa, resulted not only in accentuating the difficulties of maintaining jute stocks in mills but also damaging this season's crop to the extent of an estimated 5 to 10 per cent of the total outturn.

Towards the beginning of this year, the Indian Jute Mills' Association decided to increase production by unsealing 2½ per cent of total looms and later in February another 5 per cent, so that only 5 per cent of the total looms now remain sealed. This decision was the result mainly of the heavy reduction in stocks of both hessian and sacking goods, because of an improved offtake during the previous months. A greater demand anticipated in the consuming markets was also partly responsible for the decision to increase production.

KAMARHATTY AND KANKNARRAH COS., LTD.

Both the companies show depressing results for the half-year ended December 31, 1955. Even after taking credit for Rs. 3 lakhs in the case of Kamarhatty and Rs. 2.5 lakhs in that of Kanknarrah, being commission waived by the Managing Agents (M/s. Jardine Henderson, Ltd.) the loss for the half-year before providing for depreciation, amounts to Rs. 2,00,588 and Rs. 3,43,116 respectively for the two companies. Deducting Rs. 24,686 being balance of profit brought forward, Kamarhatty's loss stands reduced at Rs. 1,75,902. The Directors have transferred Rs. 4,07,975 from general reserve account and Rs. 55,000 from provision for taxation which makes available a credit balance of Rs. 2,87,073. Depreciation has been allocated Rs. 50,000 and a sum of Rs. 1,02,449 has been set aside for provision for sales-tax contingencies, which leaves a balance of Rs. 1,34,624. A dividend of Rs. 3 per preference share, free of income-tax, for the half-year under report, absorbs Rs. 48,000 and Rs. 86,624, being the net balance, has been carried forward.

In the case of Kanknarrah, with Rs. 19,297 brought forward, the balance of loss becomes Rs. 3,23,820. The total transfer of Rs. 5,53,425 from general reserve account (Rs. 5,18,425) and provision for taxation (Rs. 35,000), results in a credit balance of Rs. 2,29,605. Out of this, an amount of Rs. 50,000 has been allocated to Depreciation and another Rs. 67,490 to provision for sales-tax contingencies. From the balance, the Directors have recommended payment of a dividend of Rs. 3 for each preference share which absorbs Rs. 30,000, leaving Rs. 82,115 to be carried forward.

Under the terms of the West Bengal Industrial Tribunal's award, the emoluments of a majority of both the companies' employees were increased by about Rs. 3-13 a month. In terms of cost of production, the increase, according to the Directors, represents an additional burden of Rs. 14 a ton.

NEW CENTRAL JUTE MILLS CO., LTD.

The working of the Company for the year ended December, 1955, has resulted in a surplus of Rs. 60,56,404. After deducting the various charges, there remains a balance of Rs. 43,64,163. Deducting further the interim dividends already paid during the year under review, and including the balance brought forward from the previous year, the net sum available for distribution amounts to Rs. 40,56,781. From this sum, the Directors have appropriated Rs. 13,00,000 to provision for taxation; Rs. 11,17,655 have been transferred to general reserve which now stands at Rs. 1 crore. The final dividends to be paid to shareholders are: Rs. 49,000 on 14,000 preference shares at Rs. 3-8 per share; Rs. 77,583 on 19,000 preference shares at Rs. 4-1-4 per share including payment for June, 1955, to preference shareholders of Lothian and Albion Jute Mills Companies both of which have been amalgamated with the New Central and their accounts are included with effect from December 1, 1954; and Rs. 6,41,250 on 8,55,000 ordinary shares at 12 annas per share. This leaves a balance of Rs. 8,71,293 to be carried forward.

The management of the Company changed in 1950. A year later, the working recorded a phenomenal success. But 1952 was comparatively depressing when the net profit available for distribution sharply declined from Rs. 52,54,330 in 1951 to Rs. 11,32,978. The last three working years have witnessed a steady progress. Thus, the dividends paid in 1953, 1954 and 1955 were Rs. 10,71,000, Rs. 11,02,500 and Rs. 15,24,583 respectively. Profit per loom, after depreciation but before taxation, has gone up from Rs. 2037 in 1953 to Rs. 2076 in 1954 and Rs. 2473 in 1955. The Company has undertaken the modernisation and electrification of its various mills, which will cost it approximately Rs. 1 crore and will be financed with its own resources.

KINNISON AND NAIHATI JUTE MILLS

The accounts of the Kinnison Jute Mills Co., Ltd. for the half-year ended September 1955, show, after providing Rs. 1,72,000 for taxation, Rs. 37,000 for reserve for taxation contingencies, Rs. 9,000 for development rebate reserve and Rs. 2,23,000 for depreciation, a profit of Rs. 2,95,566. Adding thereto Rs. 32,590 brought forward from the previous account, Rs. 1,25,000 transferred from provision for taxation and Rs. 1,30,784 transferred from general reserve, the amount totals Rs. 5,83,940. Out of this Rs. 10,000 has been transferred to jute stock reserve, Rs. 1,30,784 to provision for contingencies and Rs. 50,000 to general reserve, leaving a balance of Rs. 3,93,156. The dividends recommended are Rs. 52,500 on preference shares at 7 per cent per annum, and Rs. 2,87,946 on ordinary shares at Rs. 6 per share, both free of income-tax. The balance of Rs. 52,710 is carried forward.

In the case of the Naihati Jute Mills Co., Ltd., the position for the same period is different. It has suffered a loss of Rs. 1,20,910, after providing Rs. 2,61,185 for depreciation and Rs. 1,60,179 for taxation. Adding to the loss Rs. 4,25,342 being loss brought forward from the previous account, and Rs. 33,365 transferred to provision for contingencies, the total loss swells to Rs. 5,79,617. This has been reduced to Rs. 3,19,252 by transferring from reserve for taxation contingencies, jute stock reserve and general reserve Rs. 1,52,000, Rs. 75,000 and Rs. 33,365 respectively. The net loss is carried forward.

Both the companies are managed by M/s. F.W. Heilgers and Co., Ltd.

COMMODITY NEWS AND NOTES

INDIA'S TEA PRODUCTION IN 1955

India emerged as the world's biggest tea producing country in the world in 1955. According to statistics available India produced a crop of 664,550,000 lb. last year compared with Ceylon's 380,010,000 lb. and Indonesia's 95,610,000 lb. In the export field too India topped the list with shipments of 363,090,000 lb. last year against Ceylon's exports of 360,850,000 lb. India's acreage under the crop was 789,471 in 1955 against Ceylon's 574,504 acres. Total tea production in 1955 was 664,554,000 lb. compared with 644,371,000 lb. in the previous year.

NEW WHEAT AGREEMENT

The new International Wheat Agreement recently drawn by the Executive Committee of the U.N. Wheat Conference which is also for a period of three years 1956-59 is in some respects an improvement over the current agreement. Among the striking features of the new agreement is the reduction of five cents in both the maximum and minimum prices. The new agreement provides for a price range of \$1.5 at the minimum and \$2 at the maximum as against \$1.55 and \$2.05 in the current (1953-56) agreement and \$1.50 and \$1.80 in the first (1949-53) agreement. Again, Argentina, which had remained out of the first two agreements is to participate in the pact for the first time. Normally, this should considerably add to the strength of the agreement. But this is threatened to be neutralized to some extent by the U.S. policy to see part of its wheat surplus by way of special bilateral trade deals. Another significant aspect of the new agreement is the reduction in the guaranteed quantities to 303 million bushels from 395 million bushels in the current and 581 million bushels in the first agreement. The share of the leading exporters in this aggregate is USA 132, Canada 1.3, Australia 30, France 16 and Argentina 15.

GOLD PRODUCTION IN RUSSIA

Very little is known about annual gold production in Russia. It is, however, believed that annual output exceeds 10,000,000 ounces. But Russian gold reserves at 200,000,000 ounces are believed to be second largest in the world. Recently Soviet Union has entered the world market as a seller of gold at about 4,000,000 ounces annually. The present estimated Soviet gold reserves are valued at 7,000,000,000 gold dollars and there is some mystery about Russian motives for holding on to this large amount.

SHARP INCREASE IN RUBBER PRODUCTION IN 1953

The production of rubber in India registered a sharp increase in 1953, although the area under it remained more or less at the previous year's level of 1,70,000 acres, according to the 29th issue of 'Rubber in India' brought out by the Directorate of Economics and Statistics, Union Ministry of Food and Agriculture. The production was estimated at 44.7 million lb. during 1953, as against 36.0 million lb. in 1952 and 32.0 million lb. in 1951. Besides an analysis of the rubber position, the publication gives valuable information regarding the number of rubber estimates, persons employed, consumption, prices and trade in India and the world.

STEADY INCREASE IN COFFEE PRODUCTION

There has been a steady increase in the production of coffee (cured) in India during the past few years,

according to the 28th edition of 'India Coffee Statistics', now renamed 'Coffee in India,' brought out by the Directorate of Economics and Statistics, Union Ministry of Food and Agriculture. During the year 1952-53, the output of coffee rose to 59.8 million lbs., as against 54.5 million lbs. in 1951-52 and 54.3 million lbs. in 1950-51. The increase was due to progressive extension of the area under coffee cultivation. In India, Mysore is by far the largest producer of coffee, accounting for about 47 per cent of the total area under coffee in the country. The State of Madras comes next with about 27 per cent of the area, while Coorg contributes nearly 22 per cent. India, however, accounts for only 1.1 per cent of the total world production of this commodity. The quantity of coffee available for home consumption during the year was 45.3 million lbs. About 4.8 million lbs. of coffee were exported, mainly to Western Germany, the United Kingdom, Italy, the Netherlands and France.

SALT PRODUCTION IN INDIA

India has now an exportable surplus of over 100 lakh maunds of salt every year. The production of salt in 1955 was 811 lakh maunds and the area under salt cultivation increased to 80,216 acres as against 77,830 acres in 1954. The production of 837 lakh maunds of salt was envisaged in 1955-56 under the first Five-Year Plan, but the target was surpassed in 1953 itself when India produced 861 lakh maunds of salt. There was, however, a decline in production in 1955, which was mainly accountable to the vagaries of weather. The salt industry in India is largely dependent on solar energy and other natural factors. The consumption of salt in India during 1955 was 728 lakh maunds.

THE INDIAN OVERSEAS BANK LTD.
MADRAS

(Incorporated in India)

Through a network of branches in India, Burma, Ceylon, Malaya, Thailand & Hong Kong and our correspondents at all important commercial centres of the world, we are in a position to offer the most complete Banking Service to Businessmen and Manufacturers engaged in the export and import trades.

Service is our motto

General Manager : Mr. C. P. Doraiannu

Buddha Mahajayanti

MAY 24—once Empire Day—marks this year an event far transcending any mere material Imperial celebration. On this day is being celebrated the 2500th Anniversary of the passing of Siddhartha Gautama, known after his Enlightenment as the Buddha. For Asia as a whole, there is no figure that has left an impress so wide upon

the thought and behaviour of every time. And now after 2,500 years the profound emotion which this 2500th celebration of his passing has evoked bears witness to the extent to which his message retains its original unabating force. Perhaps that force is seen less in India than it is in other Buddhist countries. But it is by any standards

amazingly large in India as demonstrated by the celebrations all over the country on Wednesday and Thursday this week. At Gaya, where he attained enlightenment, the passion shown has outstripped all expectations. The devotees included a majority of Hindus. Here in Delhi also the great flow of feeling has come from Hindus. Thus have the branches of a great tree come together.

If a revitalised Hinduism supplanted Buddhism in the land of its birth, that same Hinduism was transformed radically by the contact, and Buddhist teaching is recognised today as the source of one great strand in Hindu thought. The tolerance of Buddhism entered deep into Hindu psychology and came to rest at the centre of what is called, perhaps inappropriately, the Hindu view of life. If Buddhism thus bent before the Hindu assault, it stooped to conquer. There is today over all this land no conflict of any kind between the teachings of the great Buddha and the teachings of the great Hindu commentators who differed from his conception of the spiritual universe, whether it was in terms of the nature of the God-head or of the value of *Nirvana* as a positive or a negative conception. It is true that Buddhism is not stirring India vitally at this time but which other form of religious thought is more vital? In countries near to us, notably in Burma, where the great Sixth Council is still in session, there is, perhaps, an image of an earlier Indian age when the Captains of the State bore witness to the power and glory of the Buddha's message. There in Rangoon, perhaps, a new Buddhist awakening is in progress under the official benediction as in the glorious Asokan Age.

One can welcome the Rangoon experiment without being querulous about results. For mundane results have never been the purpose of this faith. Buddhism has often failed, as in India and China, to retain a vast and growing following. But even its failures have been glorious, particularly in relation to the absence of persecutions which have marred the practice of so many of the world's great religions. There is no record of a Buddhist incursion of violence to establish an earthly kingdom or a greater area of hierarchical influence. At times, Buddhist teachings were part of both Church and State, and have had the power to exercise overwhelming force; but Buddhism never became the instrument of materialist power in an attempt to force on unwilling minds its powerful message. Thus one can look on the great age of Asoka and wonder why, with all the power that the great emperor had, no force of any kind was exercised to spread his passionate convictions. The edicts of Asoka from Girnar in Junagadh to Molkalmuru in Chitaldrug in Mysore and from Kashmir to Bengal never carry the command of the Emperor to hear and to obey. "The fruit of these measures," as the Girnar edict put it, "is the promotion of one's own religion and the glorification of *Dharma*." Here was a grand personal religion which drew nothing from being an established faith. It is the only religious faith which has never been aided by the adjuncts of power.

The significance of this miracle of tolerance is one which cannot be lost in the Bandung Age. Asia can claim some understanding of the doctrine of Non-Violence. It is as old as the Buddha and as young as Mahatma Gandhi. When we talk of Peace without Arms, we may be romantic; but

over large portions of Asia and for centuries Buddha made unbelievable romance the common truth.

We may take pride in the great victory of Siddhartha Gautama for he was in truth an Indian, although one might argue that he was born in Nepal and spent much of his time crossing into the land of his birth. But his great victory—the Attainment of Enlightenment—was won at Gaya and thus it was from a great Indian city, forever blessed, his message went forth, penetrating with its grand simplicity all the barriers which high philosophy and base struggles for power set against a doctrine of universal tolerance and love unending.

There is great wealth in manuscripts, memorials and monuments to show how wide was the area to which the new faith was carried. The vast territory of Central Asia was once essentially under the spell of Buddhism. Excavations made by Soviet archaeologists in more recent times show its prevalence in the present Republics of Uzbekistan and Kazakhstan. Of equal importance is the new wealth of archaeological finds which indicate the spread of this faith in Kansu in Western China dating back to an early period. Tibet, Ladakh and Sinkiang have long been known to be among the areas of deepest penetration of Buddhist doctrine. In other countries in spite of Asoka's mission of propagation, it struck more slowly. But in many—Burma, Thailand, Cambodia, Laos, Vietnam and Korea—it has taken permanent root. Its greatest monuments are, paradoxically, in the countries where it has not persisted to our day. Borabodur in Java, and Ajanta and Sanchi in India are now merely traces of Buddhist genius drawn across a canvas woven predominantly from other strands.

We can take as much legitimate pride in the tremendous cultural awakening which Buddhism gave to India as in the grandeur of the personality of India's greatest son. But today pride alone will not save us; nor will the virtue of this tremendous spiritual seer. We may take the monuments that came from the Buddhist Age and make them the monuments of the Indian Union claiming Asoka's Capitol as the symbol of the new Indian State. Thus we may pretend we are worthy of his greatness and inheritors of his philosophy and faith. This would be an act of falsehood; for today the message of the Buddha is unacceptable in his own land. We know we value the things he rejected; and we are not even seeking enlightenment. We praise him from afar; but are separated from him not by a gap, but by a chasm.

While we can take pride in the tremendous achievements of an Indian citizen, enlightened by God 2,500 years ago, and in the great contribution which Indians under him made to the spiritual life of Asia and to the artistic life of the world, we should choose this 2500th day of remembrance for thinking humbler thoughts. After 2,500 years we are as far as ever from his message. We cannot even look forward to a day of equal understanding so that in dying, perhaps after many lives, we could say with him "Now I have attained it. This knowledge and insight have arisen within me. Immovable is the emancipation of my heart. This is my last existence. There will be no rebirth for me."

Top Management and the Plan

THE Prime Minister made, on May 18, a speech calculated to put heart into all who were beginning to despair of a realistic approach to the main problem of the Plan. For the Plan depends in the ultimate event on one essential ingredient—the speedy and sustained ability to translate plans into productivity; in a word on Management.

That Management in its highest form is a very rare article may be judged by the relative imperfection of most human concerns and the immense price that the discriminating owner of a large business will pay for the services of the right kind of manager. It is of course a fact that a really competent manager is worth to the company that employs him any salary that he cares to ask, for he represents in person the difference between resounding success and mediocrity or failure.

It had begun to seem as though our Socialist twilight had permanently obscured this great truth, recognised in America, rediscovered in Russia, known, but nullified by tax, in Britain, and that the Plan would founder because it would be impossible to pay the price necessary to put in every case the right man at the top of the right job.

Since May 18 one can hope that if the sun has not risen, dawn is not far off. These were some of the Prime Minister's words:

"If I want a first-class man, a first-class engineer, it is absolutely no use my passing a law about it. People have talked about lawyers and doctors. When you come to the technical field today, it is very difficult to get a high class technical man. I am not even talking about very high salaries. Sometimes, suppose we want a foreign expert, I will have to pay fantastic salaries, and yet these salaries are cheap from the point of view of the work done. We spend on Bhakra Nangal Rs. 8 lakhs a day in salaries and wages. Though this is a big scheme, it is a big sum. But the slightest improvement or speeding of the process means our saving vast sums of money, and the slightest delay ... means a substantial increase in the cost."

And again: "If we take a step which can in theory be justified because it tends to equalise or remove the disparity but it also upsets the machinery of production or lowers that or produces a certain lack of harmony in all this, then we have lost in the main thing."

Here happily is the voice of reality. Here is realization of the value of promptitude—(if a day at Bhakra Nangal costs Rs. 8 lakhs what is the man worth who can speed completion by even six months?)—of the need—if it comes to the pinch—to recruit in the world market and pay—for the right man—world market rates. This is not to suggest that the foreigner *per se* has any special excellence; but if there are gaps—and in a Plan of this size gaps there will be—they must be filled with the best men available no matter what their origin or cost.

This does not apply only to new projects. There must—if productivity is to rise—be a

general raising of managerial standards. The Duke of Wellington said the last word on leadership 150 years ago: "There are no bad regiments—only bad officers".

It is fair to say that in industry and commerce there are no bad staffs—only bad managers; and conversely, since the personality of the manager permeates the utmost limits of his charge, that good management begets good staff and that the better the manager the better the men he trains to succeed him.

In this context the manager is seen both as the fount of productivity and of the Plan's success, and as the nucleus from which will spring the managerial cadres of India's industrial future. Thus on the quality of our management today depends the excellence (or the reverse) of management tomorrow.

Briefly, top management must insist on efficiency at all levels, must refuse to accept excuses—least of all its own—and must be prepared to replace mediocrity with excellence; from within the organization and the country if possible, from without if necessary. If recruitment from outside India is the only solution, the State must find some means whereby the best type of manager who holds the key to productivity, can be attracted.

The means already exists in principle in the provision which exempts foreign experts from tax for a period of three years. This is a bold move, but it fails for three reasons. In the first place the expert who cannot have been recently resident in India under the law may not be as advertised. (Alas, how few of our flowers match the seedsman's illustration!). In the second, the three-year period is too short. The output of managers will be chasing the expansion of industry for the next ten years if not to the end of the chapter. Thirdly unless the expert is imported inside the capsule of a contractor's team, or in splendid isolation as an Industrial Generalissimo or Great Panjandrum, his tax-free spending power (unattainable by residents except by payment of a ridiculous gross figure) will cause a mutiny among his colleagues.

Some means of tax abatement must be found which will give due consideration to proved competence, which can be carried on for as long a period as the development of the country requires, and which does not confer ostentatious spending power in India. Some form of overseas pay might well be the solution. But far better surely, and more permanently effective, would be a complete revision of the tax system which would reward industry and restore incentive to all, Indian or foreigner, who can contribute to productivity.

The United Kingdom and the United States in the past have to their spiritual enrichment offered political asylum to oppressed genius. If India could now offer fiscal asylum to the younger generation of European industrialists frustrated by penal taxation in their own country, she might reap a rich reward in material progress.

The piquancy of the analogy should not obscure its possibilities. If fiscal thinking in this country can follow to its logical conclusion the way that the Prime Minister has pointed, the return in progress and prosperity might well be stupendous.

Pakistan's Plan

IN the Week's Notes of the last issue of *The Eastern Economist*, the Draft Outline of the first Five-Year Plan of the Islamic Republic of Pakistan was dealt with on the basis of the information that was available, through sketchy press reports, until the time of going to the press. Now that the Draft Outline has become available, it is possible to examine it more fully. It is a happy coincidence that the release by the Pakistan Planning Board of Pakistan's first Plan synchronised with the signing of the final version of India's second Plan by the members of the Planning Commission on May 14, 1956. The emergence of a National Plan in Pakistan is an event of great significance, greater perhaps than any other in the recent economic history of that country. The fact that at many points there are close parallels with India should be flattering to us. Pakistan has deliberately chosen India as a model in her new Plan. She is doing the same things, and she is doing them at approximately the same rate. Here again this is not only a conscious choice; it is a reflection of the abiding economic unity in the Indian sub-continent.

A development programme has been proposed for the five-year period from 1955-56 to 1959-60 at an estimated cost of Rs. 1,160 crores, Rs. 800 crores of which will be in the public sector and the remaining 360 crores in the private sector. The investment programme leans heavily on foreign aid which can be seen clearly from the fact that Rs. 380 crores are expected to be provided by foreign aid and loans and Rs. 40 crores are to come from foreign private investment. Resources to be raised domestically would be of the order of Rs. 740 crores. Whether foreign aid to the extent provided for in the Plan would in fact be coming forth is a matter of conjecture; but this may be less problematical than in the Indian case.

The Plan aims at a 20 per cent increase in national income and a 12 per cent increase in per capita income after making allowance for a 7.5 per cent growth in population. First priority is given to village aid and agriculture, since the development of agriculture, on which about 75 per cent of the country's population is dependent, has so far lagged behind industrial production where progress has been rapid in recent years. One-third of the total expenditure of the public sector is devoted to programmes of village aid, irrigation, land reclamation and drainage facilities. Industry and commerce claim about 27 per cent, transport and communications 20 per cent and the remaining 20 per cent is set apart for the provision of social services. Special attention is to be paid to the so far relatively undeveloped wing of East Pakistan and a sum of Rs. 100 crores has been kept in reserve for the schemes that have yet to be prepared for the development of that wing.

Targets laid down include the provision of two million jobs; a 13 per cent increase in food production; irrigation of 3 million acres of additional land, out of which over one million acres will be in large compact blocks of land not now cultivated; installation of 580,000 kilowatts of electric power; 250,000 new houses; 3,000 new post offices; 35,000 new telephones; 9,000 more hospital beds; and an increase in foreign exchange earnings in

order to make available some 50 crores of rupees for the development plan. The production of large-scale industries is expected to increase by about 75 per cent during the Plan period. The productive capacity of cement is to be raised from 670,000 tons per year to 1,280,000 tons annually, of fertilisers from nil to 162,000 tons; of sugar from 115,000 tons to 235,000 tons; and the number of jute looms installed is to increase from 3,300 to 12,000. A Life Insurance Corporation is proposed for mobilising domestic resources and the people have been appealed to give up ostentatious and luxurious living in order to make the Plan a success. The Plan proposes the establishment of an Agricultural Bank in conjunction with the State Bank for the purpose of providing rural credit to help implement the agricultural programme. Small-scale industries are also to be developed and the total output of all industries, large and small, is expected to rise from Rs. 750 crores to Rs. 1,300 crores over the Plan period.

There is one fundamental point of departure from the Indian attitude to planning, which is noteworthy. That is the importance attached to the private sector of the economy. A special Planning and Development Department under the Ministry of Industries and an Industrial Bank, with capital from private and Government sources and from a loan from the International Bank for Reconstruction and Development, are to be set up with the object of providing all possible assistance and advice to private enterprise in the country.

Since the Plan will take some time to take final shape, the investment programmes proposed will not be fully under way until possibly the next financial year. In view of this, it is difficult to see whether all the targets laid down by the Plan can be realised within the stipulated period. Indeed the Planning Board itself realises that there may be a shortfall in expenditure to the tune of 123.6 crores of rupees out of the total of Rs. 923.6 crores proposed in the public sector and has, therefore, accordingly provided for a net public expenditure of Rs. 800 crores. The provision of two million jobs is in present conditions an ambitious target and it is very doubtful if it can be achieved. Even if it can, the backlog of unemployed, of which the Board has not been able to make any estimates, would still remain without jobs as about two million people are expected to enter the employment market in the Plan period.

In conclusion, it may be said that the process of planning in Pakistan is going to be extremely difficult in view of the shortage of managerial skill and lack of organised institutions. And the delay in putting the Plan into effective operation—over a year has already elapsed of the Plan period—is going to add to the difficulties that will inevitably crop up. It is to be remembered, however, that the main object of the Plan is to prepare a base for the further balanced development of the economy. It is necessary, therefore, that the Plan should succeed abundantly in this objective if rapid development is to be possible in future. There is no major reason why it should not, if only political stability could be guaranteed. India wishes Pakistan to have these conditions of political stability with no fear from any source. As partners we should march together to what looks increasingly like a common goal.

THE WEEK'S NOTES

NEW ELECTION LAW

THE LESSONS of the 1952 elections and the experiences gained since then have gone into the making of the Representation of the People (Second Amendment) Bill which the Lok Sabha approved last week. The great number of election petitions, some of which have been decided only recently, four years after the original election, and the complaints about scrutiny and rejection of nominations, definition of election expenses and voting methods, have made some modifications necessary. Among the notable changes, which are also improvements, in the existing law, which will be effected by the new Bill, will be the vesting of power in the Election Commission to remove certain disqualifications incurred on minor grounds, the simplification of what constituted corrupt practices, the composition of tribunals with one judge and the simplification of the procedure for nomination for which no seconder is to be required. The Government could have perhaps gone one step further and made even a proposer unnecessary.

In accordance with the principle that the election law should be above suspicion and acceptable as widely as possible, the Government has accepted at least one important amendment on which the opposition seemed to set much store. But this amendment, as has been made clear since then, will make no alteration in the basic law on elections. The deletion of the explanatory clause excluding expenditure by political parties on their campaign from the returns the candidates have to submit does not improve the chances of independents, since there is no specific provision requiring candidates to show the expenses incurred by their parties in their constituencies. The remedy probably lies in fixing a higher ceiling than Rs. 25,000 for independents who will have to carry on propaganda not only in competition with the opposing candidates but also against the propaganda campaigns of the parties to which the latter belong. This will by no means be unjust to party candidates, for independents have to face many problems which they do not have to. Among the parties themselves not all have equal resources or resources proportionate to the number of candidates they put up, so that candidates of parties with greater financial resources are in a somewhat advantageous position.

A suggestion was made that voting should be made compulsory. The impossibility of enforcing this in a huge country like India with an electorate of 180 million should alone be sufficient reason for rejecting it. Apart from that, it is unlikely that this can remove the anomaly of a party getting a minority of the popular vote getting a majority of the seats, for removing which the suggestion was ostensibly made. The electoral law is no doubt still far from perfect, but the next election will probably help to eliminate most of the defects that still continue.

RICE DEAL WITH BURMA

THE AGREEMENT between India and Burma for the import of two million tons of rice into this country over the coming five years will be welcomed on all sides for more reasons than one. The deal will not only strengthen the already existing economic, and political ties between the two countries, but will also help India to build up the much needed buffer stocks to meet any emergency arising from a shortfall in internal production. For Burma also the agreement will secure an assured market for a considerable quantity of rice and would thereby enable her to dispose of a part of her surplus. The importance of this can be

gauged from the fact that the prosperity of the Burmese economy and the Burmese Government's revenues depend to a great extent on maintaining a sufficient level of rice exports.

Though the price at which Burma will sell rice to India has not been disclosed, it is understood that it will be £34 a ton in 1956, £33 in 1957 and £32 in 1958. The price for the last two years will be negotiated latter. The prices agreed upon represent a compromise between the points of view of Burma and India and are quite reasonable. The emergence of a buyer's market in rice has necessitated a lowering of the price demanded by Burma; at the same time India's anxiety not to take any risk which may give rise to an uptrend in prices arising from a food shortage and her natural desire to help Burma are perhaps the reasons why she has agreed to pay a higher price than she at first offered.

The desire of both countries to strive for balance in trade is also a welcome feature. India is now in a position to supply many manufactured articles Burma needs, and though her exports to the latter now cover a wide range they are not much in value. Indian exporters have now a chance to show their enterprise and they should seize it. The fresh trade agreement which is proposed to be negotiated should also help our exports considerably, as the common object is to raise total trade to as high a level as possible.

INDO-SOVIET AGREEMENT

NEWS THAT India and the Soviet Union have signed an agreement for purchase by the former of two oil-drilling rigs takes a stage further India's plans for oil-prospecting, for which the second Plan provides Rs. 11.5 crores. The cost of the equipment is placed at Rs. 74 lakhs. The Soviet Government will undertake the free erection of the rigs and will provide the services of 22 experts for each rig and for training Indian personnel. Machinexport, the Soviet foreign trade organisation, will also supply seismic equipment and two shot hole drilling rigs to be used for seismic prospecting. All the equipment is expected to be delivered in India before the end of the year so that the work of oil-prospecting can proceed apace.

The Minister of Natural Resources also disclosed in the Lok Sabha the main recommendations of the team of Soviet oil experts who recently toured the country. In accordance with their suggestion, the two drilling rigs are to be set up in the Jwalamukhi and Janauri areas of the Punjab. The seismic equipment and the shot hole are to be used in Jaisalmer as well as the Punjab. These two areas are the ones recommended by the team for more intensive prospecting in the next five years. The Soviet experts have also recommended geological and geophysical investigations as well as deep test drilling in the Ganges valley and West Bengal, geological and geophysical survey and drilling in Cambay area and geological and geophysical investigations on the Madras coast. Operations in these four regions will constitute a reserve for extending the explorations during the following years and to serve as standby in case of failure in Jaisalmer and the Punjab.

The Minister also informed the Lok Sabha that the Government intended to recruit 60 post-graduates for training in geology and 80 for training in geophysics. How far these numbers will suffice when exploration for oil is expanded and the wells also actually begin to operate, it is not possible to say. But it is good that the Government is thinking of problems of training

personnel, and attempts should be made, at least after the second Five-Year Plan period, to avoid having to rely too much on the services of foreign technicians for such work.

GRIM OUTLOOK FOR SINGAPORE

THE FAILURE of the talks on Singapore's future which began with much promise has caused not a little disappointment in the island colony as indeed in the whole of free Asia. The disagreements that have caused the breakdown relate to the nature of the supervisory power which the British should be given over the maintenance of internal security. The British fear of the possibility of Singapore, with its Chinese majority, becoming an outpost of Peking, assumed rather serious proportions after the trouncing the pro-Western party of Sir John Kotelawala received in the recent general elections in Ceylon. In the result the proposals put forward by the UK Colonial Office refused to distinguish between internal and external security. Mr. David Marshall, the Chief Minister of Singapore, rightly refused to agree to the retention by a British High Commissioner of the right to intervene when, in his opinion, internal security is threatened, as this cannot be reconciled with the people's sovereignty. Mr. Marshall was willing to agree that there might be occasions calling for British intervention, but that should be, he argued, at the judgment of the Singapore Cabinet, a very different thing indeed. But this did not satisfy the Colonial Secretary.

The immediate repercussions of the failure of the London conference are difficult to predict, and Mr. Marshall, who at first offered to resign on his return to Singapore, may, it appears, try to find some other basis for reopening negotiations on a Government-to-Government basis. But the chances of such negotiations giving rise to an agreement which will be acceptable to the people at large seem somewhat remote, when an all-party delegation with rather reasonable minimum demands could not succeed in arriving at a settlement. Obviously the military value of Singapore, if it is held against the people's wishes, will be negligible. It is to be hoped that the British Government will see its way to reopening negotiations and reaching a settlement with the more responsible leaders before extremist elements try to force the issue by taking the law into their own hands. Perhaps it will be advisable to devise some link between Singapore and the Malayan Federation as a means of ensuring greater stability.

VIET NAM TO STAY DIVIDED?

THE APPEAL of the two co-chairmen of the 1954 Geneva conference to North and South Viet Nam to take steps for organising nationwide elections is bound to evoke no favourable response from South Viet Nam. Technically the Ngo Dinh Diem Government may be held guilty of violating the Geneva agreement, but commonsense suggests that Diem and his followers cannot agree to an election the result of which is foregone. With North Viet Nam having nearly twice as large a population as the South, the same reasons which impel the Soviet Union to evade all-German and all-Korean elections (because her satellites will be in a minority in a nationwide poll) cause Diem to decline to agree to all-Viet Nam elections until conditions of real freedom are brought about in North Viet Nam.

It is idle to argue whether Diem's Government itself is democratically based, because there is no doubt that he has the support of the people south of the 17th parallel. Otherwise his quick successes against the rebel groups and the trek of a million refugees

to the South (which does not speak too well of conditions in the North) cannot be explained. Nor have all violations of the Geneva agreement taken place from the southern side. The continuance of rebel forces in Laos with Viet Minh support, in spite of the stipulation at Geneva that they should be disbanded, is an instance of violation of the agreement by North Viet Nam. France has also refused to stay the winding up of her High Command and the withdrawal of her forces, but has promised to help in whatever other way she can.

Nor can the Truce Supervisory Commission help in unification in the absence of real freedom in both parts of Viet Nam which can ensure truly fair elections. Such an election may be as unacceptable to the Viet Minh, as elections under present conditions are to Mr. Diem, for the uncertainty which it can introduce into the outcome. But at least the continuance of the Truce Commission will preserve the present precarious peace while its winding-up may give rise to border incidents and gradually restore the old position. But it seems unlikely that the three nations composing the Commission will agree to serve indefinitely on it in the absence of evidence of the possibility of their work coming to an end in the foreseeable future.

THE PROBLEM OF "AUTOMATION"

ONE OF the most intricate technical problems which some British industries are now facing and which many will soon have to face is that posed by what has come to be called "automation". Hailed in some quarters as the second industrial revolution, "automation" bids fair to throw up quite a number of problems reminiscent of those which its predecessor created. Essentially "automation" can be described as the second stage of the industrial revolution presaging an era in which mankind as a whole will have greater leisure to devote to pursuits other than those necessary for eking out an existence. In the beginning the industrial revolution also began in a similar manner, but with its progress men's needs multiplied, making the maintenance of higher standards of living a necessity and thus curtailing the amount of leisure which would have otherwise become available. It is likely the initial advantages of "automation" in the form of more leisure may peter out after some time.

In the process of adoption "automation" threatens to throw out of employment large numbers of men, much as the industrial revolution did. But the growth of trade unions and the progress of ideas have made the infliction of unnecessary suffering on workers impossible to contemplate. An agreed method of introducing "automation" has to be decided upon. However, as the report of the Department of Scientific and Industrial Research in Britain on this matter shows, the problem of technical changes involved are far too many and not enough thought has been bestowed on it even in Britain. More than the social aspects, the political consequences of "automation" have to be considered. A further point is that managers of factories where automation has gone some way have undertaken it without any precise idea of the benefits. Added to this is the problem of giving proper training to workers who may be thrown out and to those who will anyway have to handle new processes. But, so long as the precise effects are unknown and no scheme to avoid unemployment is drawn up to the satisfaction of workers, it is certain "automation" on a large scale cannot go ahead. Fears are, however, being voiced in many influential circles that if Britain lags behind in the adoption of "automation," she may be left behind in the race for export markets and efficiency.

STATE BANK OF INDIA

Successors to the Imperial Bank

Bank with the State Bank

OUR country is planning for prosperity. This cannot be achieved unless the interests of the small depositor, the small trader and the small producer alike in towns and in the countryside receive the same consideration that is bestowed on the more affluent constituents and the larger industrial units.

You are not perhaps aware that the clientele served by the State Bank of India consist predominantly of persons of modest means and modest requirements. It is on the broad and secure foundation of their patronage that the Bank's structure has been built and will continue to rest.

The State Bank's services are many-sided and it would interest you to know that your varied plans and activities—no matter how small they be—can be made to run more smoothly with the help the Bank can offer.

Why not talk things over with your nearest bank agent, or write for information?

ODYSSEUS

MR. R. H. S. CROSSMAN, the British Left-wing Socialist M.P., has in a newly published pamphlet ("Socialism and the New Despotism", the Fabian Society, 11 Dartmouth St., London. SW. 1. Price Re. 1) presented a fearlessly honest analysis of why Socialism has lost favour with the British electors and why the Labour party has had to yield to the Conservatives since 1950.

In brief, Mr. Crossman says that in the past men and women joined the Labour party, or voted for it at election time, because they believed that it was fighting to free the common man from the oppressions of social privilege and economic exploitation. They expected through Socialism to win for the individual social justice and economic freedom. But Socialism in office has so completely disillusioned the progressive, non-party elector (whose floating vote is that which puts parties into or out of office) that he has voted Conservative for two General Elections in succession. Mr. Crossman says that among the main disillusionments was the impression, "fostered by its enemies", that the Labour party regarded the ration card not as a temporary expedient but as a permanent feature of a fair shares economy. Certainly Conservative propaganda has emphasised Labour's love of controls for controls' sake but if this had not corresponded with the fears and dislikes of the ordinary voter, such propaganda could have had little effect. What is more, it is not only in Conservative minds that the Labour party is associated with controls. Socialism in practice has meant the creation of huge irresponsible public corporations and extensions of bureaucracy and form filling—which Mr. Crossman himself brands "a grave potential threat to Social democracy." Nationalisation, he admits, is too often "a perversion of the Socialist ideal" which "has not changed the lives of the workers" and has added to "the steady concentration of power in the hands of the managerial classes." The Trades Unions have become strongholds of restrictive practices, restricting not merely the output but the liberties of individuals and of minorities. Bravely flying in the face of the orthodox Socialist viewpoint, Mr. Crossman asks whether "these sacrifices of individual freedom" are necessary and he sounds the tocsin for a return to "the traditional Radical demand for a free and equal society".

All this is grand and ought to rejoice the hearts of those—not only in Britain but in all Socialist pattern countries—who are now harried by bureaucrats, pursued by forms, and kept poor by restrictions on their capacity and desire to work harder, produce more, and therefore to earn more.

DISMAY

It is, however, when Mr. Crossman reveals his cures for these ills that one stands dismayed and aghast. What Mr. Crossman is really pleading for is a revival of the Liberal individualistic outlook, but his cures for Socialist controls simply amount to still more controls and more bureaucrats.

Throughout his analysis of the Socialist pattern welfare state's weaknesses, Mr. Crossman has argued his case in such classically Radical-Liberal terms that

when he begins to outline his cures, the reader, still flowing, as it were, in the Liberal-Radical traffic stream, does not at first realise that he is beginning to encounter bureaucratic-control traffic running against him. It takes a while for this fact to sink in. But it is not really so difficult to understand why Mr. Crossman, after his resounding Liberal fanfare, sees no contradiction in reverting to a bureaucratic theme. Both the British Socialist and Conservative parties are, in the ultimate analysis, associated with the interests of identifiable groups of producers—the Socialists with groups of workers, and the Conservatives with groups of employers—and, as Mr. Crossman himself admits, both these groups fear a competitive economy.

Competition implies freedom, and to remove or damp it down controls and restrictions are inevitable. The average Conservative prefers trade price agreements that "stabilise" markets, and the average worker, scared stiff of any labour-saving device, prefers restricted output. Thus both parties have a vested interest in keeping things as they are. While there are progressives in each party, these form minorities who make themselves heard with difficulty.

In the series of articles outlining Mr. Gaitskell's philosophy of Socialism, published here between January 20 and February 17, if it emerged that Mr. Gaitskell was apprehensive of further nationalisation, it was also clear that he attaches over-all importance to equality—or, as it is fashionable to call it now—"egalitarianism"—and so does Mr. Crossman. His formula for "enlarging freedom and stimulating an active democracy" is to put the oligopolists (the managerial classes) controlling private firms and the big public corporations and boards of nationalised industries under further control "in the public interest"—to set up a Chinese puzzle of standing Parliamentary committees to keep them in the ever straiter and ever narrower path of officially investigated, controlled, and approved action; to promote workers' participation in the management of private firms and public bodies—thus adding one more complicating, slowing down factor to the process of trying to add to the wealth of the country; to spread public ownership (that is management by appointed boards and committees) still more widely by getting municipalities to take over (1) residential houses that come under the present British rent restriction acts, (2) laundries, (3) taxis, (4) theatres, and (5) cinemas.

REPLACING ONE MONOPOLY BY ANOTHER

Mr. Crossman's reasons for these recommendations are enlightening. "If the tenant of a rent restricted house realises that he cannot obtain a bath room under his private landlord without an exorbitant increase of rent, he may accept the Socialist case for municipalisation." In other words, the distortion of the economy caused by rent restriction must be continued by means of subsidies to the worker from those (already crushingly taxed) individuals or industries whose contributions to the national income are great enough to allow something to be taken from them for someone to get a bath for nothing. The municipal-laundries, taxis, and cinemas, are meant "to break the monopoly of the big

chains". But the way to break a monopoly is not to erect a monolithic and soul-less state monopoly in its place but to split it up by anti-Trust legislation. Not so long ago when I happened to be travelling in a nationalised British bus I chatted with the driver, a man of sixty who had been with the former private company before it was nationalised. "I begin a fortnight's leave on Monday," he told me. "I want to start on Saturday as my daughter is getting married then. In the old days, I would have gone to Bill Edwards, the owner, and explained, and the chances are that he would have let me off if he could possibly have found a driver to take my place. Now, I have to fill in a form and take it to the Personnel Board. They said: 'Sorry. It's against the rules'. So what do I do? Just take the day off without leave. And the bus service gets messed up for that day. But they can't sack me because I'm nationalised, see?"

This anecdote hardly suggests that Mr. Crossman's proposals will be greeted with shouts of joy and relief by workers who feel more frustrated in committee managed machines than ever they did under the most unsympathetic individual boss. "You could always hope to get something you wanted out of the boss," my bus driver told me, "because he was the boss. But you can never hope to get anything out of a Personnel Department because it isn't the boss. Nobody will risk taking the initiative; they're all afraid of getting into trouble by breaking the rules."

Mr. Crossman is dismayed by the frustrations of the workers and wants to help them along the path to freedom but he, like his fellow-Socialists the world over, apparently cannot grasp that the solution to the problems of freedom under nationalisation is not to widen controls but to widen the area of personal choice.

What people in all countries want is, as far as possible to be allowed to choose from as big a selection of things—material and spiritual—as possible. The way to satisfy them, as "The Economist" of London said recently, is not to cut down to a common size everyone else's choice. That is precisely the way to deprive the community of the flexibility, the diversity, and the incentives upon which a policy of plenty—and a dynamic society—must depend. The right way is to create incentives that lead to an increase in the total national product and to level up, not down. Every worker looks forward to a good and rising middle class standard of life. It is the duty of Mr. Crossman's party to see that he gets it, not to wrap the rest of the community up in a cocoon of checks and balances.

This argument, "The Economist" continued, must not be misunderstood. For more than a generation Liberals and Socialists have agreed that an end should be put to poverty and the gross inequalities of wealth; that the state should intervene to end these, both by public provision and re-distributive taxation, and to prevent wasteful and embittering alternations between boom and slump. There is no case now, if there ever was, for mere laissez faire. But, with the stage set by the acceptance of these continuing obligations (among which the fight against inflation in all welfare countries is crucial), the only relevant slogans for Socialists, no less than for Liberals, are beyond mistake: high output, high earnings, bigger shares, wider choices. That is what Mr. Crossman ought to have said to his party and to the Trades Unions. It is Labour's real chance to re-capture the Radical tradition. The way to wealth and to equality is through expansion, and the way to expansion is through more freedom for all, not more controls on (those who are still by courtesy called) the rich.

THE HORRORS OF PEACE

FROM OUR SPECIAL WESTERN EUROPEAN CORRESPONDENT

PARIS, May 18, 1956.

IN foreign politics, successful long-range policies are always framed on the assumption: "supposing the worst happens". Thus, since 1948 the real planners of American policy (not the speech-makers but the brains of the State Department and the Pentagon) have been working on the assumption "supposing 200 Russian divisions begin marching across West Europe now". Similarly, in the Kremlin, policy has been based on the supposition, "what happens if the Americans encircle us with air bases and then launch a multiple atomic attack?" If all parties dispose their forces as if they expected the worst, then the worst very often never happens—as is illustrated in the above two cases. The really dangerous man in international affairs is the optimist, who often succeeds precisely in bringing on the worst by not preparing for it; one sees this by contrasting Churchill with Chamberlain, or Bismarck with Napoleon III. So much is truism. The important point to notice is that the pessimist does not have to believe that the worst will happen, really and truly. He only has to behave as if it were going to happen. So the successful practitioner in this field is anything but a "realist"; the facts are mostly irrelevant to him. For example, anyone who told the Russians in the last few years that the Americans were not really planning war, or who told the Americans that the Russians were peace-loving, would no doubt have been telling the truth but he would have been wasting his breath and misunderstanding the true nature of foreign politics. In diplomacy, "the facts" are only relevant as suggesting what form "the worst" might take in any particular case. They are not needed to show whether the worst will happen; that has to be assumed in every case.

This preamble is necessary before I go on to describe the spectre that is now haunting the chancelleries of Continental Europe, the bad dream that is disturbing the rest of European statesmen. Probably few of them really believe that this dream will come true, but week by week they are reorienting their foreign policies in case it does. Briefly their bad dream, the worst they assume might happen, is this: one day soon the Russians and the Americans will agree between themselves to inaugurate an era of genuine peace; they will each keep a stock of hydrogen bombs and planes to carry them and a radar network to find the planes, but they will wind up most of their own armies and all the armies of their allies and satellites; they will co-operate in maintaining total secrecy about how to build big bombs and they will dole out such information as they think safe to the rest of the world; they will agree to put an end to European colonialism, which neither of them like; they will throw overboard all the Adenauers and all the Ulbrichts and insist that every nation in the world outside the Super-Big Two find itself a Nehru or a Tito, and thereafter shut up. In sum, the world is drifting toward a new Yalta at which there will be only two participants and from which will issue a planet composed of neutralists policed from Washington and Moscow. These, for Europe, are the horrors of peace.

It is necessary to repeat that no one says that this is going to happen, least of all that it is going to happen soon or in the simple, stark way I have described it. But in Paris, Rome, Bonn, Oslo and Ottawa this is the ghost that stands behind Foreign Ministers when they talk about the future. Such ghosts may never take bodily shape and substance, but meantime they

can exert a powerful influence over the framing of policy. This particular spectre was first seen in the Quai d'Orsay a few months ago, and there has been much talk of him during the recent round of international conferences in this city, including the visits of Marshal Tito and President Gronchi.

Because we are dealing with a mere wraith, you must not ask for evidence, for proof of his bodily existence. You will only get hints and scraps of evidence, some of which are nevertheless highly significant. The one that is most talked of here is the personal correspondence between President Eisenhower and Marshal Bulganin. These mysterious letters, which seem to go on regardless of the fluctuations of international climate, give Continental diplomats the horrors. The second thing is the conversation in London between Mr. Stassen and Messrs. B and K during their recent visit; the talk lasted 40 minutes and yet in both Russian and American eyes seemed to dwarf the rest of the London visit. This is closely connected with an impression that French diplomats bring back from the London disarmament talks: the impression that Western solidarity is getting more and more difficult to maintain because the Americans seem to be losing interest in the Anglo-French plan and are more concerned to talk to the only other party at the talks that has plenty of big bombs, the Russians. Another fact that is keenly felt here is American pressure on the French to join Euratom. This is a complex project and the only aspect of it I need to mention here is that it would make it impossible for the French to build their own bombs and would force them to use, not the source of fissionable material they now use, but another over which the USA has virtual control. Next, there is the curious fact of the Baghdad Pact which the French strongly dislike—but what they dislike even more is that the Americans (who invented such military pacts) do not want to join it while the Russians (who should in theory object violently to it) did not ask Sir Anthony Eden to wind it up. Lastly, there is the odd American attitude to Colonel Nasser whom the French especially hate because they think he is behind the revolt in Algeria: whereas Washington used to go purple when Mr. Nehru first invented active neutralism, today the Americans do not seem to care particularly when Nasser fights a Western power with Communist arms.

Now any clever "realist" can see that this does not add up to evidence that Russia and America are planning a new and more exclusive Yalta. But the mere facts do not matter. What does matter in Paris, Bonn and Rome is that Continental diplomacy henceforward has to be geared to some plan for averting the worst dangers that such a situation would produce. For Paris and London (not to mention Lisbon and Brussels) one of the gravest dangers of a genuine Russo-American entente would be that these two traditionally anti-colonialist powers would combine to hasten the end of all forms of European imperialism. Even apart from any such entente, it is clear that once America's allies in Europe become less important to her, she will have no reason to allow herself to be outdone by Russia as the champion of oppressed colonials. But it is not only the European imperialist powers that fear the ghost of a new Yalta—indeed the worst casualty to date has been Dr. Adenauer. The Chancellor fears that peace might be obtained without going through German unification as a preliminary stage, and once it is attained neither of the Super-Big Two will have any special reason to promote unification. The spectre of peace has, in other words,

TO NEW YORK

Fly the finest...

FLY TWA

TRANS WORLD AIRLINES

ASIA · AFRICA · EUROPE · U.S.A.

TWA 6/578

knocked the bottom out of Dr. Adenauer's whole policy, and I have no doubt that Sir Winston Churchill knew this when last week in Aix-la-Chapelle he administered such a damaging blow to Dr. Adenauer by suggesting that maybe peace should come before German unity.

The conclusion that Continental chancelleries draw from the danger of a new Yalta is that they must henceforth insist very strongly on the virtues of the UN as a forum of world problems. The reason for this is that by getting the Russians and the Americans to work through the UN, they can ensure that the second-rate powers of Europe still retain some say in the course of events. Similar reasoning is behind the French plan (strongly backed by Italy and Canada) to convert NATO into a general economic organisation with a special fund for investing in backward economies. At first glance it might seem that the French wanted to scuttle NATO because they thought the military danger of Russian aggression had passed, while the Americans wanted to keep NATO on its feet until there is absolutely no danger of war. But this is a quite mistaken interpretation. The fact is that the French fear that if NATO remains a purely military organisation, then as soon as the danger of war is clearly past, it will be scrapped and the European powers will be left out in the cold while Russia and America talk business. They hope that if NATO is converted now into a general, non-military organ, then it will survive the end of the military cold war

and thus the European powers will have a voice in world governance even when Russia joins NATO.

On any other interpretation the Pineau plan for an investment fund for backward areas would be a mere piece of impertinence. It is obvious that Continental Europe has no money for massive investment: all the money must come from the USA—and later, if Russia joins, from Russia. So the Pineau plan is simply a proposal for spending other people's money, and neither the US Congress nor the Kremlin could be expected to accept it. But the French argument is that if Russia and America invest separately in backward countries they will constantly be trying to outdo each other, and both will find it a very expensive business. On the other hand, if they do it jointly they can avoid costly competition. The price for this will be to allow the second-rate European powers have some voice in how American (and eventually Russian) money is invested. There is some logic—and much calculation—in the plan.

So this is how Continental Europe proposes to react to the horrors of peace. Over the next year or so we can expect to hear a good deal of the argument that a new two-party Yalta would not work because Russia and America will never really be able to co-operate unless Europe is there to help them, as she is in the UN and as she would be in an expanded NATO that included Russia and all the signatories of the Warsaw Pact.

When you have a journey to make, think first of flying. It's the fastest way to travel, and often the only way to get there in time. You escape all the tedium of a long journey—flying is so quick, convenient, and wonderfully comfortable.

Malhotra Building, Queensway, New Delhi Telephone: 40071 (4 lines).

WORLDGRAM

AGRICULTURE

Dairy Schemes During Second Plan: Improvement in the supply of milk to towns and cities through the formation of 36 co-operative milk unions is one of the dairy development projects to be undertaken during the second Five-Year Plan. There will be three categories of co-operative unions—each handling 500,250 and 150 maunds of milk daily. Large dairies will also be established in Calcutta, Bombay, Madras and Delhi, while some existing dairies will be expanded to handle larger quantities of milk. The establishment of milk boards will further accelerate dairy development. The second line of dairy development between 1956-61 aims at increasing facilities for conversion of milk into milk products in areas from where milk cannot be easily transported to the market for sale. It is proposed to establish 12 rural creameries and seven milk products factories in such areas. The capital outlay on these projects is estimated at Rs. 21 crores.

Woollenised Jute Production: Shri J. K. Bhonsle, Deputy Minister for Rehabilitation revealed in the Lok Sabha recently that the Government had given assistance to a new scheme of woollenised jute production for the employment of refugees. A scheme had been sanctioned for training in woollenised spinning and weaving of jute goods, at the Technological Research Laboratory of the Indian Central Jute Committee, Calcutta. After completion of the necessary training, the displaced persons would set up their own production units on cottage industry basis.

Coorg Agricultural Produce Markets Bill: The President has given his assent to the Coorg Agricultural Produce Markets Bill 1955. There is at present no law in force in Coorg for the regulation of markets, and the State Government have, therefore, drawn up the present Bill. The Bill is based on the legislation in force in Bombay, Madras and Hyderabad. One of the recommendations of the Planning Commission is that States should enact legislation for the establishment of regulated markets, so that agriculturists may be freed from money-lenders and middlemen, and obtain the best prices for their produce.

INDUSTRY

Electricity Output: During December 1955, 723 electricity undertakings in India produced 784.3 million kilowatt hours (kwh) of power, of which 648.0 million kwh were sold to ultimate consumers. Power output during the month increased by 58.8 million kwh over that of November. One Diesel generating station at Madhubani in Bihar and one purchasing undertaking in the Harihar-Haveli section in Bombay were the new additions during the month. Power production and sale during December, 1954 stood at 680.8 million kwh and 558.0 million kwh and during December 1953, at 236.2 million kwh and 558.0 million kwh and during December 1939, at 236.2 million kwh and 198.4 million kwh respectively.

Inter-Conversion of Values From One Unit to Another: The Indian Standards Institution has issued, for eliciting comments, a draft Indian Standard guide for inter-conversion of values from one system of units to another. This draft guide is intended to serve as a guide in converting numerical values of physical quantities from one system of units of measurements to another system of units; in particular, it is to assist the designer and the draftsman in converting dimensions and tolerances on engineering drawings from inches to millimetres.

Draft Indian Standard Rules For Making Indexes:

The Indian Standards Institution has issued, for eliciting comments, a draft standard on rules for making indexes. The draft lays down rules for preparing alphabetical and classified indexes of reading material, whether a single or multi-volumed book, an ordinary periodical or an abstracting or bibliographical periodical. This draft forms a part of a series of Indian Standards relating to production of books. Five Indian Standards covering preliminary pages of books have already been published.

Quality Control on Aluminium Utensils:

The Government of India have decided to prohibit with effect from June 15, 1956, export of wrought aluminium utensils which do not bear standard mark prescribed under I.S.I. (Certification Marks) Act, 1952. It has been brought to the notice of Government that scrap of doubtful quality is being used by certain rollers to produce circles of cheap quality and that utensils produced from these circles are finding their way to the export markets and are thereby adversely affecting export trade. Manufacturers of wrought aluminium utensils are advised to apply to the Indian Standards Institution, 19, University Road, Civil Lines, Delhi-8, for licences for marking the goods produced by them with I.S.I. Certification Mark under the I.S.I. (Certification Marks) Act, 1952.

Milk Powder Plants: It is reported two Milk Powder Plants had been donated by the United Nations International Children's Emergency Fund during the last two years; one had been put on operation in Anand (Bombay State) and other was proposed to be set up in Saurashtra.

Annual Output of UK Electrical Industry: The British electrical industry produces more than £900,000,000 worth of equipment a year. For some years now, the industry has maintained the position of second-largest exporting industry in the world, with export approaching 11 times the pre-war figure. The industry's export trade reached a new level of £245,000,000 during 1955. This represents an increase of more than £26,000,000, or nearly 12 per cent, over the 1954 total of £218,000,000, and is the highest increase in any year since the end of the war. The previous record figure was £220,000,000, in 1952.

TRADE

Indo-Swedish Trade Arrangement: Letters were exchanged in New Delhi between the representatives of the Government of India and the Government of Sweden extending for the year 1956 the validity of the schedules attached to the Indo-Swedish Trade Arrangement signed in May, 1955. The Trade Arrangement was signed on May 31, 1955, for a period of two years. The Trade Arrangement provides that the schedules of imports and exports attached to it would be revised every year.

Austro-Bulgarian Trade Agreement: The trade between Bulgaria and Austria will be regulated during the year 1956 by a protocol signed at Vienna. The total value of trade is of the order of \$15 million. Bulgarian exports to Austria which are of interest to India will consist among other items, of tobacco (700 tons), rice (10,000 tons), walnuts (100 tons), tea (\$50,000), spices (\$50,000), castor oil, medicinal herbs (\$30,000), bladder (\$200,000), manganese ore, raw cotton (560 tons), and handknitted carpets (\$50,000). Austrian exports will chiefly consist of vehicles, machinery, and iron and steel goods.

Indo-Burma Trade: Burma's imports from India during October and November 1955, valued at Rs. 1,26,60,080 and Rs. 1,15,81,512 respectively, against Rs. 1,43,75,141 and Rs. 1,69,36,562 respectively, during the corresponding months in 1954. Imports from India during October and November 1955 had gone down very much, as compared to the figures of corresponding period in 1954.

FINANCE

Customs and Excise Revenue Collected in the Indian Union: According to the returns received in the Department of Commercial Intelligence and Statistics, the total gross Sea and Land Customs Revenue collected in the Indian Union during March 1956 amounted to Rs. 1,736 lakhs as compared with Rs. 1,718 lakhs in the corresponding month of the previous year. Of the total Customs Revenue collections, import duties accounted for Rs. 1,421 lakhs as against Rs. 1,306 lakhs; export duties for Rs. 303 lakhs as against Rs. 392 lakhs; and Land Customs and miscellaneous for Rs. 12 lakhs as against Rs. 20 lakhs. The total gross collection of Union Excise duties amounted to Rs. 1,247 lakhs as compared with Rs. 1,327 lakhs. During the twelve months, April 1955 to March 1956 the grand total of gross Customs and Union Excise Revenue realised was Rs. 31,897 lakhs as compared with Rs. 29,713 lakhs during the corresponding period the preceding year. Of this amount, import duties accounted for Rs. 13,065 lakhs as against Rs. 14,442 lakhs; export duties for Rs. 3,748 lakhs as against Rs. 4,141 lakhs; Land Customs and miscellaneous for Rs. 200 lakhs as against Rs. 290 lakhs; and Union Excise duties for Rs. 14,884 lakhs as against Rs. 10,840 lakhs.

Loans by Rehabilitation Finance Administration: Up to the end of February 1956, the Rehabilitation Finance Administration had disbursed about Rs. 1,012.29 lakhs by way of loans to displaced persons. The total amount of loans sanctioned by the Administration up to March 31, 1956, was Rs. 1,256.96 lakhs. Of this Rs. 822.40 lakhs were sanctioned to displaced persons from West Pakistan and Rs. 434.50 lakhs to those from East Pakistan. An amount of Rs. 67.37 lakhs was granted on 5,282 fresh applications from East Pakistan displaced persons.

World Bank Loan to Haiti: The World Bank has made a loan of \$2.6 million to Haiti to help finance a three-year highway improvement programme. Under the programme, a highway maintenance section will be organised, equipped and staffed to rehabilitate and repair 725 miles of primary and secondary roads and to provide continuing maintenance on all public highways and roads in Haiti. Improved roads will expedite the delivery of agricultural goods from farms to markets and will better serve Haiti's growing tourist industry. The Royal Bank of Canada is participating in the loan, without the World Bank's guarantee, to the extent of \$413,000, representing the first three maturities which fall due from July 1, 1959, through July 1, 1960.

Iron and Steel (Control) Order, 1956: Government of India have issued Iron and Steel (Control) Order, 1956, which controls production, distribution and prices of all categories of iron and steel. The present Order is a consolidated order of the previous two Orders—(1) The Iron and Steel (Control of Production and Distribution) Order, 1961 and (2) The Iron and Steel (Scrap Control) Order, 1943—and is intended to enable the Government (i) to distribute the limited supplies available among a large number of users according to the nature and the importance of uses and (ii) to see that the production and import programme are so planned and adjusted as to ensure that the recipients of quotas get their requirements in time and at economic prices. While issuing the consolidated

Order, Government have also re-issued all the current notifications in respect of control over distribution, maximum prices, place extras, size extras, etc., so that the general public may have in one place all relevant data regarding iron and steel control.

Financial Aid for Road Development: The Government of India have sanctioned some totalling Rs. 22,48,335 for road development works in Assam, Madhya Bharat and Kutch. One of the schemes sanctioned is the construction of Porsa-Ater road in Madhya Bharat estimated to cost Rs. 13,49,500. Of this expenditure, a sum of Rs. 12 lakhs is to be met by Government of India. Other road projects sanctioned include: improvements to the North Trunk road from Beki to Sankosh in Assam (Rs. 1,37,400); construction of a temporary bridge for a 12-foot roadway over the Gabru river on the Charduar-Foothills road (Rs. 20,399); a sum of Rs. 8,86,000 for the construction of the Loria-Khavda road in Kutch; and Rs. 4,635 for making a 2-foot wide trace along the proposed alignment from mile 7½ to 10½ of the Gangtok-Pakyong road. Technical approval has been given for road works costing Rs. 7,17,000 in Himachal Pradesh and Vindhya Pradesh. The works concerned are: Construction of 12-foot wide motorable road from Koti to Jammu boundary, via Sundla and Langera, from mile 0.0 to 5.0 (Rs. 2,86,000) construction of a bridge across the Juhilla river at mile 113 of the Umaria-Shaddol road in Vindhya Pradesh (Rs. 3,57,000); and Rs. 73,500 for the construction of a bridge across the Murna river at mile 137.3 on the Shahdol-Umaria road in Vindhya Pradesh.

Vindhya Pradesh Motor Vehicles Taxation Bill: The President has given his assent to the Vindhya Pradesh Motor Vehicles Taxation (Amendment) Bill, 1956. Under the Vindhya Pradesh Motor Vehicles Taxation Ordinance, 1949, the maximum load which may be carried by transport vehicles plying in the State is 14,500 lbs. In Uttar Pradesh on the other hand the maximum weight permissible is 18,500 lbs. To remove the difficulties of the Vindhya Pradesh owners of transport vehicles the present Bill has been promoted raising the maximum permissible load to 18,500 lbs. The Bill also specifies that the rate of tax leviable on vehicles carrying between 14,500 and 18,500 lbs. will be Rs. 850 per annum.

GENERAL

New Oil Refinery for UK: Plans have just been announced in London for the erection of a new £25,000,000 oil refinery in the United Kingdom. It will have an initial capacity of 5,000,000 tons of crude oil a year. The refinery will probably be built near Southampton. Work on this new project is expected to begin towards the end of this year, and the refinery may come into operation some 18 months later. The new refinery will be built by the Trinidad Oil Company and a subsidiary, the Regent Oil Company.

Indo-Polish Shipping Service Agreement: An Indo-Polish shipping service agreement has been signed between the Government of Poland and the Government of India. Under the terms of the Agreement, each side will nominate a shipping organisation which will be responsible for the operation of its ships. To begin with, each side will nominate three ships for operation in the new Service, which is expected to commence before the end of October, 1956. Additional ships will be put in by both sides and when required, the total tonnage participation by each side being always equal. The Service will be operated on the basis of equality of advantages and avoidance of competition between the two Parties and the Agreement envisages the possibility of an arrangement to be made between the two shipping organisations for pooling and sharing of freight earnings.

NEWS IN BRIEF

INDIAN

The latest reports from Shillong aver that Assam's first sugar factory will go into production during the 1957-58 crushing season. The factory will be a co-operative venture sponsored under an agreement between the Assam Co-operative Sugar Mills and Skodas India Ltd.

It is reported that the proposed Rs. 25-crore heavy electrical equipment factory to be located at Bhopal will start initial production in 1960.

A French firm, Voyages Dubreuli of Paris proposes to organise a regular bus service from Paris to Bombay and back. The route passed through Italy, Yugoslavia, Bulgaria, Turkey, Syria, the Lebanon, Jordan, Iraq, Iran and Pakistan.

Export of mustard oil and rapeseed (laha) oil has been banned with immediate effect. It is further reported that no further shipping bills for these commodities will be passed.

Shri A. C. Guha, Minister for Revenue and Defence Expenditure revealed in the Lok Sabha that the branch expansion programme of the State Bank of India would bring banking facilities to rural areas and would provide vastly extended remittance facilities for co-operative institutions.

It is reported the President has given his assent to the Hyderabad Sales of Motor Spirit Taxation (Amendment) Bill, 1956.

The Government of India is stated to have under consideration a proposal to produce on a mass scale 16-spindle charkhas in Government-run ordnance factories in the country.

The Government of India has authorised a further increase of 5 per cent in coastal freight rates over those which prevailed prior to October 15, 1955 on general cargoes. The increase in freight rates has retrospective effect from April 1, 1956.

Motor spirit of the value of about Rs. 12,634,326 (F.O.B.) was exported from India during 1955. The maximum quantity of motor spirit valued at about Rs. 2,339,898 was exported to Australia.

The Governments of India and Pakistan have both enacted the Transfer of Evacuee Deposits Act, 1954, to facilitate the transfer from Pakistan to India and vice versa of movable property belonging to evacuees including cash, jewellery or securities, insurance policies and negotiable instruments in the custody or under the control of any civil court or revenue court or court of wards or manager encumbered estate.

The Bombay Government is shortly setting up a pilot wood distillation plant, at a cost of Rs. 30,000 at the village industries experimental workshop at Poona.

The production of footwear in India in 1955 was of the order of 90 to 95 million pairs. Production by large-scale units was about 5.5 million pairs, the balance being produced by small and cottage units.

The value of India's exports to and imports from Afghanistan by air during 1955-56 was Rs. 33.12 lakhs and Rs. 29.61 lakhs.

FOREIGN

The nine-year basic school system is to be introduced on a general scale in Sweden as from 1962 and it will be adopted throughout the country by 1973. Investments in new school buildings will require Kr. 900,000,000 (£62,069,000) in the period 1956-69.

Egypt has ratified the International Labour Organisation's Convention on Holidays with Pay in Agriculture, and Ceylon has ratified the Convention on Labour Inspection. A total of 12 countries have now ratified the first Convention, ILO says, and 26, more than a third of the ILO membership, have acceded to the second.

It is reported a UNESCO sponsored conference on cultural integration of immigrants was held recently at Havana, bringing together government experts, representatives of non-governmental organisations concerned with migration and social scientists, who have carried out research in this field.

The April issue of the U.N. Monthly Bulletin of Statistics indicates that the world's petroleum industry developed more during 1955 than at any time in its history, producing 11½ per cent more than the 1954 peak. Every region except Africa shared in this development which set a record for the second year in a row.

The U.N. Technical Assistance Administration and Indonesia recently extended for three years the Planning Bureau Agreement originally signed in 1952. Under this agreement, UNTAA made available a team of advisers to assist the Planning Bureau to draw up a comprehensive economic development plan.

An international world rice trade conference will be held in the Far East in October and November. Among the major concerns of the October-November meeting will be the methods of reducing rice trade instability, promoting higher rice consumption and international trade, and improving statistics to give a better picture of the world rice situation and prospects.

The people of Britain spent record amount on consumer goods and services, including food, during the fourth quarter of last year, according to a Monthly Digest of Statistics. Personal expenditure on consumer goods and services reached a record at £3,423 million during the quarter, compared with £3,256 million in the third quarter and £3,107 million in the second.

Japan and Russia signed recently a long-term fishing pact which will come into force when normal relations are established between the two countries—the first treaty to be negotiated by the two countries since World War II.

Israel's exports during the month of March 1956 reached 15.1 million dollars worth as compared with 12.8 in March last year, main rise being in agricultural exports.

The international conference on the development of power as a factor of development of the insufficiently developed countries is scheduled in Belgrade this July. The Conference will be attended by about 1,500 scientists and economists from about forty countries.

We know the drill-----

**for saving
India's
foreign currency**

Oil from abroad costs valuable foreign exchange.
Oil from inside India saves it. And we must
have ever-increasing quantities to cope with the
expansion of industry and agriculture.

Scientists and engineers are keeping Assam's oil
industry working at full pressure to produce as
much oil as possible from our own oilfields. Additional
wells are constantly being drilled, yet even in an
established area they are not always productive; in spite
of modern knowledge and equipment, successful
drilling still remains something of a gamble.

But no effort is spared to find oil and turn it into the
fuel, lubricants and by-products which are so vital
to the progress and prosperity of India.

Special Articles

THE PERILS OF STATISTICAL HASTE

THE publication this week by the Central Statistical Organisation of an estimate for the National Income of the Indian Union for 1954-55 has led to a serious error not merely in statistical debate but, what may well be more important, in terms of political prestige. To suggest—at a time when a World Bank Mission is in this country designed particularly to test the claims of the capacity for growth of the Indian economy—that no progress was made between 1953-54 and 1954-55 is surely an example of outrageous indiscretion, for which there can be few parallels in our recent economic history. Even if the statistical methods employed were sound—which is certainly not the case—the premature publication of these figures, which go counter to the official real indices published, cannot be excused. In point of fact the statistical methods employed make this estimate the most unreliable of any that the Central Statistical Organisation has made since its inception. Why then, it will be asked, was this serious misdemeanour committed, and why after its commission, has the Finance Minister issued no correction?

On the statistical side it is admitted in the foreword to this publication that "for 1954-55 the statistical data used are not adequate and the method of estimation is frequently of a rough character". In the face of this admission, which must cover an error larger than 10 per cent, which belongs to all the National Income estimates, how can one possibly compare the National Income for 1954-55 and 1953-54 and say that in real terms they are approximately equal? Again, in paragraphs 22 and 23, of this very Report, the Central Statistical Organisation states:

"In the absence of detailed figures of quantities and values, the net output of the factory establishment sector in 1954-55 has been obtained by adjusting the 1953-54 figures for production and price changes with the help of overall index numbers.

"For all other sectors as well as for calculation of real product, the procedure of estimation remains more or less the same. Obviously, the real net output in the factory establishment sector has to be obtained by

a rough and ready method in the absence of detailed information on levels of physical production by industries on the basis of SSMI." If ever an estimate was damned by its own authors, surely these paragraphs are its instrument of damnation.

It is not enough to condemn the Central Statistical Organisation for its folly and indiscretion. It is necessary that a fairly competent estimate of real output for 1954-55 should be presented which takes account of the behaviour of real facts in official indices or in non-official indices which run parallel to them. For these purposes a table has been computed following lines suggested in a Special Article in a previous year. In these series it will be seen that there was no fall in real National Income in the Indian Union in the year 1954-55. If one takes the bases of weighting in "The Eastern Economist" Indices the rise in real product is about 3 per cent when the weighting is 2 : 1 : 1 and perhaps 5 per cent if the ratios are 2 : 1 : 1. If one uses the Planning Commission's series for agriculture and the Interim Index for Industrial Production with "The Eastern Economist" Index of Business Activity, the real product figures show a significant rise in every case.

It is clear now that the processes by which constant price figures of National Income are computed in India in terms of 1948-49 prices do violence to real product rises. The reasons for these are statistical and will no doubt obtain in due course searching technical examination. Meanwhile one is justified in rejecting the results of this reduction of money to real income merely on the point that it produces results so opposed from any reasonable real product series. The Central Statistical Organisation owes it to the country to put its statistical house in order but in the meanwhile to exercise a little elementary political discretion. The damage which has been done by the hasty publication of these "rough and inadequate" figures has been very large. The Finance Minister should correct the erroneous impression which has already been created, and bid the Central Statistical Organisation to seek its sanction before hastily entering the lists again.

IMPORTS AND EXPORTS: 1956-1961

THE meetings of the Import and Export Advisory Councils held over the week-end were significant not so much in respect of the agenda presented at both the meetings as in two large unknowns which hang over both import and export policy. The minor issue is the State Trading Corporation which some members argued had introduced the public sector in the international trade zone as effectively as the public sector had entered the industrial production field. It would appear from the statements made both by the Minister of State and Mr. T. T. Krishnamachari that these fears that the State Trading Corporation (which incidentally was registered this week as a limited company) would encroach on the private sector could be speedily discounted. The implications of this assurance are being quickly drawn to mean that in the next five years the total volume of import and export trade handled by the private sector will not decline and may significantly increase. There is probably good ground for this assurance.

It is quite otherwise with the second large factor believed to call for adjustment in India's international trade. This is the basic change in the pattern of development which is reflected in international trade. For the last five years the order, by value, of imports was food grains, petroleum products, raw cotton and so on. In the next five years it is certain that capital goods will move up to the first place and will be followed closely by industrial raw materials such as steel and cement.

A major revolution has already been effected in regard to certain products. For example, the refineries have already led to a saving of foreign exchange of Rs. 30 crores between 1954 and 1955. In fact the entire improvement in India's balance of payments in the calendar year 1955 is to be attributed to this source. It is developments such as these which are likely to be overwhelming. The table below shows the position for 1954 and 1955 in a manner which indicates that vast changes are already under way.

TABLE I.

PRINCIPAL IMPORTS INTO INDIA IN 1954 AND 1955

	(Rs. Crores)	
	1954	1955
Machinery of all kinds	83.39	108.20
Metals	50.07	75.32
Oils—vegetable, mineral and animal	94.46	63.10
Raw cotton	57.53	53.50
Vehicles	33.61	50.73
Grain, pulses and flour	49.38	35.18
Electrical goods and apparatus	11.25	14.02
TOTAL IMPORTS	615.67	643.71

During the first Five-Year Plan one of the paradoxes of the import situation arose from the fact that the money value of capital goods and imported raw

materials—and for the most part the real value—did not change substantially with the marked rise in internal industrial production. That paradox, whatever its explanation, has now been dissolved. As the Minister of State for Commerce noticed last Saturday the increased tempo of industrialization envisaged in the second Plan has already had a marked effect on our imports. During the first three months of the year the balance of trade has been unfavourable to the extent of Rs. 45 crores. The rate of licensing for capital goods has increased so sharply that it is estimated that expenditure on imports of machinery and metals in the next nine months will exceed the figure for the whole of the year 1955 by over Rs. 60 crores.

It is this dramatic change in the structure of our imports that gives purpose and urgency to the export promotion programme. Unhappily the changes in our exports in recent months have not shown the response which would be necessary to keep our payments position in relative stability. The happy position described in the table below between 1954 and 1955 does not look as though it will be any more than maintained while the import position has dramatically altered.

TABLE II.

PRINCIPAL EXPORTS FROM INDIA IN 1954 AND 1955

	(Rs. Crores)	
	1954	1955
Jute goods	121.33	126.10
Tea	131.31	112.81
Cotton piecegoods	66.93	57.79
Raw cotton	8.52	24.22
Groundnut oil	3.85	20.72
Manganese Ore	15.17	10.49
TOTAL EXPORTS	563.00	603.77

A heavy adverse balance of trade is necessary for the Plan, and so long as the adverse balance can be financed it should be as large as possible. It is not, therefore, the adverse balance in itself which should cause us concern, since it is a defence against inflation; it is the capacity of the country to finance it which is in question. It is now being appreciated that the gap cannot be closed by exports, even by the extravagant suggestion that food exports should reach Rs. 200 or Rs. 300 crores in value. The major portion of the gap can only be closed by capital, whether by gift or by loan. It is appropriate that an opportunity is being taken to investigate the possibility of securing such loans and a senior officer of the Finance Ministry is now undertaking a programme of detailed investigation in Western European countries.

BOOK REVIEW

INDIA AFTER INDEPENDENCE

Pilgrim's Progress: Edited by Prabodh Chandra, M.A., M.L.A.; Published by Adarsh Publications, 6 Jang Pura-B, New Delhi: Pp. 308: Price Rs. 25 De Luxe and Rs. 15, Publicity Edition.

Mr. Prabodh Chandra has set himself a patriot's task in setting out with appropriate illustrations and artistic illumination the story of India since Independence. He has called his book "Pilgrim's Progress" which implies that the book has been a pilgrimage for himself. Happily this is now to be published for a wider audience even though the price at Rs. 25 for the de luxe edition and Rs. 15 for the ordinary edition makes its readership inevitably restricted. There is much to be said for the Government of India's buying the rights of the book to enable a popular edition to be made available both in India and abroad. Abroad this fine production may, perhaps, be even more appreciated than at home, though one hopes that the pilgrim in Prabodh Chandra will receive rather more honour in this country than he has received as a politician in his home State.

Much the greater part of the volume deals authoritatively, if a little sentimentally, with the social, economic and cultural reconstruction of India after

freedom. The coverage is comprehensive and there is hardly any facet of the growth of the national life which has not found mention. There is an attractive account of the emergence of our Constitution followed by a wealth of information on the programme of India's unique experiment in democratic planning for the economic development of a vast under-developed country. The social and cultural facets of the national life have also come in for their balanced share of lucid narration. A galaxy of writers, specialists in their own field, has contributed to the weight and authority of this narration. In spite of the diversity of contributions and the complexity of subjects dealt with, the continuity and uninterrupted flow of an integrated narration has not been allowed to suffer. This book should serve as a refresher of knowledge on current topics to the Indian reader. But perhaps more important than that is its value and utility to the reader abroad whose curiosity to follow India's progress since India's Independence is evident everywhere.

In a varied fare, the chapters on economic development compete with much that is less fundamental; it is appropriate that "The Eastern Economist" should ask for special attention to the chapters dealing with the dynamic growth in the economy in the last three years.

THE RAMAYANA OF TULSIDAS IN ENGLISH VERSE

LATEST "HINDUSTAN TIMES" PUBLICATION

The famous Hindi epic regarded by many as "the greatest book in all devotional literature" is for the first time now available in English verse.

The translator, the Rev. A. G. Atkins, completed the book after ten years of devoted work. He has tried "to keep and express in English in the fine rhythm and music of the original in simple lucid language, and with as much of the vivacity, wittiness and picturesqueness that Tulsidas has put into his work." He has also followed in some measure Tulsidas's metrical variations such as chhand, chaupai, doha and soratha.

In a foreword Mr C. Rajagopalachari says: "Mr Atkins' monumental work and his Introduction are a revelation of hope for those who desire to see all the great religions of mankind come together. . . . His service is not only to English-speaking people but also to that very large number of Hindus in India who do not speak the Hindi language and to whom English has become a very familiar medium."

The book is of special value to libraries, scholars and devotees of Tulsidas.

It has been issued in the following four editions:

- I. Original text of Tulsidas with translation in English verse; three volumes; 1468 pages; price Rs. 50 net.
- II. Translation in English verse; without Hindi text, two volume; 898 pages; price Rs. 40 net.
- III. Special tissue paper edition of I, one volume, price Rs. 100 net.
- IV. Special tissue paper edition of II, one volume, price Rs. 100 net.

Economic Report from the U. S.

FOREIGN TRADE TOUCHES RECORD LEVEL

(BY GUY SIMS FITCH)

NEW YORK, May 22.—It was a happy coincidence that the latest report on US imports from the rest of the world should have been issued just now. For, the report, showing that Americans have been buying more goods from abroad than ever before, came out yesterday on the very day that marked the opening of World Trade Week in the US. A yearly event, World Trade Week helps bring home to Americans the importance of close commercial and economic ties with other peoples. The last few years have seen a remarkable strengthening of these ties, with international trade and prosperity at an unparalleled rate, and with shipments to, rather than from, the US rapidly increasing.

The latest report from the US Commerce Department shows that US imports in the first quarter of 1956 reached a value of \$3,221 million, higher than in any previous quarter. On an annual-rate basis, US imports so far this year have been running about 13 per cent ahead of 1954, and 18 per cent ahead of 1955. This expansion of US purchases from the rest of the world has outstripped even the rate of growth of the American economy itself during these past few years. Total output of US goods and services—the gross national product—so far in 1956 has been running at an annual rate of nearly \$399,000 million—about 3 per cent above 1953, 11 per cent above 1954, and 9 per cent above 1955. Imports, however, grew at twice those rates.

American imports are of vital concern, of course, to other countries seeking profitable markets for their goods in the US. Moreover, the dollars they earn enable these countries to purchase the American goods they need or want. It is not surprising, therefore, to find that US exports also have been running at record levels. At their present rate, US shipments to other countries may well surpass the 16,000 million mark this year, after having risen above \$15,000 million for five years in a row.

More and more Americans are coming to appreciate what these rising levels of trade mean to their national well-being. True, exports and imports combined—even at the current expanded rate of trade—equal only 7 per cent of the total value of economic activity in the US. But about 40 per cent of US commodity imports, for instance, are essential to America's industrial economy, while only about 20 per cent of all US imports consist of manufactured items that satisfy consumer demands. On the other hand, close to 10 per cent of the goods manufactured in the US go into export. Thus trade helps provide employment and income for a number of American workers, just as it does—often to a far greater degree—for workers in other countries.

The outlook is for a further trade expansion nourished by rising national incomes around the world and by further agricultural and industrial development in many countries. Both trade and manufacturing have already doubled, compared to pre-World War II times. Yet still higher levels of economic activity hold out the promise of a further acceleration in the growth of international commerce. Another factor bearing on the expansion of international trade is the vigorous efforts of many free nations to widen the channels of commerce. The US for its part—through its reciprocal trade agreements programme and its participation in the 35-Nation General Agreement on Tariffs and Trade (GATT)—has consistently co-operated with other friendly nations to bring about a reduction of tariffs, of quotas, of exchange restrictions and of other barriers to the free international flow of goods and services.

Many problems remain to be solved. A number of trade barriers still must be breached. But experience now indicates that in the past few years the free nations have gone forward in developing a steadily expanding system.

The Business World

THE MORAL OF THE COTTON CRISIS

By
CROESUS

AT least one good thing has resulted from the prolonged controversy regarding the justification or otherwise of Government assuming mandatory powers over the cotton market, and it is that it has brought to light certain interesting facets of the dispute between the East India Cotton Association and the Forward Markets Commission. The circumstances which forced the hands of the authorities to take the series of steps that they did in reference to cotton futures trading have been explained by the Forward Markets Commission, which may be catalogued here for purposes of record.

1. The first difference of opinion between the Commission and Sir Purshotamdas Thakurdas, the chief spokesman of the EICA, has been traced back to August, 1954, when the Commission proposed to the Association the adoption of a system of margins. The EICA acceded to the Commission's proposal, we are told, only when it was found that the alternative was no possibility of trading in the February, 1955 contract.

2. The next rift in the lute seems to have been provided by the strong divergence of views between the EICA and the FMC on the issue of certain amendments to the bye-laws of the Commission. According to the FMC, "on every occasion that the Commission felt called upon to put forward any proposal to the Association, Sir Purshotamdas treated it with open hostility, even though the Commission had always made it clear that its proposals were to be regarded as a basis for discussion".

3. Regarding the vital question of cotton prices, the Commission contends that the decision to set ceilings for cotton was far from an 'overnight' decision. "Apprehensions about a squeeze on the February contract", it states, "were held even by the Association, as early as October, 1955. During a discussion with the Commission, the Vice-President of the Association expressed the view that it was desirable to commence trading in the May, 1956 contract as well at an early stage, in order to avoid a squeeze on the February, 1956 contract, the prices of which had been rising rapidly". The opening of the May contract did not bring down prices to a reasonable level, nor did it bring about an appreciable effect on the price of the February contract.

4. As regards the circumstances leading to the declaration of an emergency, the Commission refers to the announcement made by the Union Commerce and Industry Minister at the Export Advisory Council at Delhi that Government would not release any further export quotas for cotton till cotton prices stabilised themselves at lower levels. This, it is claimed, resulted in the price of the February contract declining from Rs. 709 per candy on 26th November to Rs. 688-8 on 30th November. When the price rose again, the FMC had discussions with Sir Purshotamdas, particularly with reference to the illegal option business and its effect in pushing up the prices of the Contract. Although the Commission's suggestions to examine the books of persons suspected of being engaged in option business with a view to taking disciplinary action against these were accepted, it is alleged, no concrete action was taken by the EICA. Meanwhile, the February contract went up to Rs. 731-8 and, even after

this, finding neither the Board nor Sir Purshotamdas taking any steps, it seems, the Commission addressed a letter to the latter, on 17th December, pointing out that the rapidly rising trend of the price of the Contract was likely to create a serious situation if not arrested in time and enquiring what action he proposed to take so as to prevent the situation from getting out of hand. Although, on December 19, Sir Purshotamdas is stated to have agreed that the only way in which the situation could be brought under control was to declare a state of emergency, he is alleged to have retracted this opinion later on. The Commission says it again wrote to him, on 21st December, pointing out that the price of the Contract had reached a point where prices were not representative of the supply and demand position, indicating thereby that they were apparently influenced by heavy speculative activities. The Chairman of the Commission is believed to have followed this up with a personal call on Sir Purshotamdas and to have suggested that the latter should close the futures market which was within his own powers, pending the working out of the necessary measures. As Sir Purshotamdas did not think it necessary to take, and also did not take, any of the measures suggested, it is argued by the FMC, the price of the Contract went up to Rs. 747 per candy. Inasmuch as the situation could not be allowed to deteriorate any further, we are told, the Commission asked the Association to take appropriate action under its bye-laws to prevent prices from rising above Rs. 700. This directive of the Commission was placed before the Board of the EICA which, however, according to the FMC, was not given any account of the previous discussions or correspondence on the subject that had passed between the Commission and Sir Purshotamdas. "It was, therefore, natural that the Board should have failed to realise the gravity of the situation and passed a resolution declaring that there was no emergency and that it was necessary to take any action". For, when the Board was apprised of the facts of the case, it is pointed out, it readily passed a resolution on January 6 declaring an emergency and fixing a maximum price of Rs. 700. This resolution was, again, reaffirmed by another resolution on February 8.

In the light of the circumstances leading to the cotton crisis thus, according to the FMC, it would appear, the latter has been, if anything, much too lenient with the EICA. But any impartial observer feels that a little more of give-and-take on either side would have enabled the parties, neither of whom could, in all conscience, absolve itself of the responsibility for the crisis, to avoid a state of affairs which was not helpful to either of them or to that imaginary individual, the grower, whose interest is considered vital and is espoused alike by the FMC and the EICA, let alone others. The former, in choosing a course of action which, according to it, would cause the least dislocation to trade, could not have done worse than deciding to close out the Contract at an unrealistic and arbitrary level, thereby throwing the cotton market into utter confusion. The Commission's argument that "the action taken appears to have been justified by the results achieved" suggests that it apparently believes in the principle that the end justifies the means. But what were the results—a further rise in prices unofficially and forcing of quality cotton underground? To say that the later increase in price was

due to factors like scaling down of crop estimates, etc., is too naive to pass muster. The crop did not go down overnight, nor was there a sudden and sharp increase in the export demand. When the FMC took the decision to have the futures market closed for the season, it explained that it was with a view to checking speculative excesses. But the suspension of trading only served to stimulate a further rise in prices, and, without accepting this—because it would tantamount to owning responsibility to the cotton crisis—the Commission conveniently attributes it to "other factors" which expression is beautifully vague. In the event, all that the FMC has succeeded in achieving is to precipitate the resignations of both Sir Purshotamdas Thakurdas and Chimanlal Parekh (President and Vice-

President) which have since been accepted by the Board of the EICA (on Monday 12th May). Most unfortunate as this is—and it cannot but pain any one to see a stalwart such as P.T. who has rendered so much of yeoman service to the economic life of this country to be so unceremoniously ticked off—it has neither helped the cotton trade nor wholly vindicated the FMC. There should at least now be a complete reorientation in the outlook and attitude of the FMC. It should make a concerted effort with the co-operation of the new EICA chief—whoever may be elected—to go into all the issues involved, so that a pattern of organisation and trading which would be in the best interests of both the trade and the country could be evolved.

PROHIBITION HAS COME TO STAY!

By
CROESUS

THE Second Session of the Asian Institute of Scientific Studies for the Prevention of Alcoholism, which was held in Bombay last week, provided an occasion for the protagonists of prohibition to answer certain criticisms against the policy of prohibition and also to correct some misconceptions about the prohibition policy of America. In addition to the 80 trainees who came from all over India, Ceylon, and Burma, there were present at the Session such distinguished persons as Dr. Andrew C. Ivy, Professor at the University of Illinois, and Prof. W. A. Scharffenberg, Chairman of the Institute of Scientific Studies of USA. I was particularly impressed with Dr. Ivy's broadcast talk on the history of American prohibition law, in which he maintained that prohibition did not fail in America, as many people believe. Presumably, he was prompted to touch on this aspect of prohibition after he heard Bombay's Chief Minister, Mr. Morarji Desai, affirm his belief that he did not believe that Prohibition had failed in the US. Dr. Ivy said that Mr. Desai was correct and, in proof thereof, furnished these interesting facts:

"Since the repeal of the prohibition amendment in 1932 and 1933, the consumption of alcohol has increased 16 times, the number of alcoholics has increased 16 times, alcohol related crime has increased 50 times, drunkenness has increased 40 times, accidents due to alcohol have increased 35 times, the money spent on the advertisement of alcohol beverages has gone from zero dollars to 300 million dollars. The expenditure for alcoholic beverages in the US since the repeal of prohibition has increased 40 times and 25 per cent of admissions to mental hospitals are due to the consumption of alcoholic beverages by our people. There were practically no admissions to our mental hospitals due to alcohol during the days of prohibition".

Of the many statistical details that this American Professor gave, I noted with interest his disclosure that it costs more than even the enforcement of prohibition to take care of the cost of all the waste and misery caused by consumption of alcoholic beverages. Thus, for every dollar spent on alcohol, it costs America 10 dollars to take care of the cost of the misery caused by the consumption of liquor. On this basis, as against the 10 million dollars spent on alcohol in America, 40 million dollars are spent on taking care of the costs of waste and misery caused by alcoholic consumption.

Again, according to Dr. Ivy, for every dollar collected in the form of taxes on alcoholic beverages, 20 dollars have to be spent by the Government and the people to take care of all the waste and misery and illness and poverty and loss of wages caused by the consumption of liquor. Rather than raise these inglorious taxes and spend 10 million dollars annually on liquor, it is Dr. Ivy's view—which, he said, he had mentioned to several groups of business men in America none of whom had challenged him—that this money would be better utilised if it were dumped into

the ocean along with the alcohol beverages it purchased. He also answered the query, which is often raised, that "if prohibition did not fail in the US, why was the law repealed?" This was done, he said, because the people were not told the truth and he charged those who wanted to make money by selling alcohol beverages with having spent millions of dollars telling the people untruth. In contrast, the people who seem to be making money out of selling alcoholic beverages, especially of the illicit type, in this country are the most vociferous champions of prohibition and they want the continuation.

Dr. Ivy also disputed the thesis that there is more illicit distillation in a dry area than in a wet area. Both he and Dr. Jivraj Mehta, who also participated in the Session, exploded this myth by quoting facts and figures which show that more money is spent on illicit liquor and bootlegging when there is no prohibition than when there is prohibition. Dr. Ivy maintained that there was more bootleg whisky sold in the US than during prohibition and more laws were being broken today in the US than during prohibition.

Countering the argument that prohibition leads to large-scale illicit distillation which he characterised as fallacious, Dr. Mehta referred to how it has been successfully established that, in Madhya Pradesh, the number of offences under the M.P. Prohibition Act were greater in the wet area of the State than in the dry area. Even in the USA, which has been a wet area since 1933, he said, 40 per cent of the liquor consumed by the public was illicit liquor.

An interesting point that arose during the Session was whether, for the success of a policy of prohibition, educative propaganda should follow or precede. While general opinion in India seems to be that there should be extensive educative propaganda before legislation in regard to prohibition, Dr. Ivy held the view that it is necessary to keep on the propaganda in the wake of the introduction of prohibition. According to him, one of the reasons why prohibition law was repealed in America was because the good people of the US did not continue their educational propaganda and thought that the passage of law would be enough. He, therefore, complimented the political leaders of India on their not only having started an educative propaganda before starting prohibition even from the British days but also on their continuing to tell people constantly that it is wrong to use alcohol by employing an educational programme against alcoholism in the country. The Session seems to have established that the policy of prohibition has succeeded beyond expectations, although this does not mean that there is no one who does not drink in the State of Bombay today. After attending the Session, one came out with the feeling that prohibition has come to stay not only in Bombay but all over the country. The latest publicly to bless it, it is significant, is the Prime Minister, as witness his message to the Session.

MORE POWER TO OUR VILLAGES

The achievements in power and irrigation under the First Five Year Plan are actually the first phase of a long-term expansion. Within 15 years our total irrigated area will be doubled, production of electricity will increase from 2.3 million KW to 15 million KW!

During the Second Plan 21 million acres of fallow land will be irrigated, per capita consumption of electricity will rise from 25 units to 50. Over 80% of all villages of over 5,000 population will be electrified.

In these vast power and irrigation projects paper will play an important part. Wherever plans and estimates have to be made, paper will supply the means of record and communication.

BUSINESS NOTES

MANUFACTURE OF RAILWAY EQUIPMENT

THE COMPOSITION of the Railway Equipment Committee lends weight to its report a summary of which has been released this week. There were two broad terms of reference fixed for the Committee. The first related to the problem of idle capacity. The Committee has given a decisive finding on this term which requires a complete revision of the popular notion. It says that idle capacity does not now exist in engineering industries as a normal situation and its emergence in particular units at different periods is due to acute short supply of basic materials—steel, pig-iron and hard coke. Its suggestions for removal or mitigation of these shortages form part of the recommendations on the second term.

The second term relates to expansion of present production capacity to catch up with the growing demand of railways for equipment and stores. In its view near-self-sufficiency should not prove difficult to achieve. The conditions attached for this goal, however, impose an onerous obligation and require a firm long-term policy to be adopted by the Government. Self-sufficiency is not to be achieved at any cost. But immediate post-war experience of critical shortages of imports has brought home the vital lesson of repeated deadlocks in replacement and expansion schedules resulting in serious worsening of railway transport capacity. A recurrence of similar deadlocks cannot fail to produce grave dislocation in the execution of the Plan programmes.

The Committee wants the Government to frame its equipment purchase policy on the basis of the Railway Ministry's original development plan of Rs. 1,480 crores which would eventually prove inescapable. It urges that licensing of additional capacity should make a liberal allowance for the projects of some newcomers not materialising. Steel shortage is going to be a great worry for at least the first half of the Plan and this aspect makes procurement of steel for railway equipment producers a part of the larger problem of steel for railways in general. The Committee has suggested a special scheme of pricing and distribution whereby controlled materials should be routed from specified centres in the equipment producing States and supplied at a uniform price over the whole country. It has endorsed the Stores Purchase Committee's recommendations of price preference and patronage to small-scale industries, but this is a fractional source of supply for the railways. The Committee has emphasised a policy of long-term orders for continuity in production and supply extending over the entire Plan period and "educational orders" in important lines of manufacture which may be new to some units.

CREDIT CONTROL

THE STEEP rise in the price of rice and paddy in recent months has prompted the Reserve Bank to apply the brake on advances of scheduled banks against stocks of paddy and rice. "It is imperative", the Reserve Bank directive says, "that banks should refrain from excessive lending against commodities and should not assist in the speculative holding of stocks". As evidence that speculation is at the root of the 'abnormal' rise in prices, the Reserve Bank cites the increase in scheduled bank advances against paddy

and rice from Rs. 11.64 crores at the end of March, 1955 to Rs. 24.62 crores at the end of March 1956 indicating a rise of 111.6 per cent. It may be said in support of this contention that prices have gone up in many places which are paddy areas, whereas they have not shown any appreciable rise in deficit areas like Travancore-Cochin and Malabar. But, at the same time, it does not seem to have been fully established that the higher advances are an indication of only this factor, namely, overtrading. The rise in advances may also be due to other causes like: (i) a general uptrend in commodity prices; and (ii) a delayed harvest or a prolongation of the paddy season. It may be mentioned here that the prices of several other commodities such as, for instance, chillies, have also registered considerable rise, as in Madras.

Under the Banking Companies Act of 1949, the Reserve Bank has wide powers to control prices wherever any upward trend can be traced to the activities of the banking system. It is well known that deficit financing will augment the ability of the banks to extend credit to the private sector. There is an obligation on the part of the Reserve Bank to ensure that, as far as possible, such credit extension does not add to the inherent difficulties of inflation. Hence the justification of the Reserve Bank's directive. But, alongside of this, other measures also are necessary, as, for example, provision for a reserve stock of food grains and other commodities, which would serve as the best defence against excessive credit expansion. Fortunately, this has been done under the second Five-Year Plan.

Even more important, perhaps, is the suggestion of quantitative and qualitative controls on credit, including variations, from time to time, in the relationship to be maintained between the liabilities of banks and their cash reserves. This has been provided in the Reserve Bank amendment. But the manipulation of reserves, which banks have to keep with the Reserve Bank, if done carelessly, may even prove injurious to the economy, as was evidenced by the near-crisis of 1952, brought about by a sudden contraction of bank credit. The American experience in this behalf should always be kept in mind.

ENLIGHTENED POLICY FOR SHIPPING

ONE OF the reasons why Indian shipping has not been able to make headway as envisaged by the Shipping Policy Sub-Committee in 1945 and the target of tonnage expansion recommended for 1952 has been deferred to 1961 is Government's failure to adopt an enlightened policy of vigorous encouragement to shipping. The history of the growth of shipping in all maritime countries has exploded the myth of progress in conditions of free competition and has conclusively established that shipping everywhere has thrived and developed by active and deliberate government assistance. This factor is being given slow recognition by the Government of India. It has no doubt come to the help of shipowners in a responsive attitude by liberalising the terms of loans for the purchase of additional tonnage. But this measure does not go far enough.

Mr. C. R. Srinivasan's sober speech at the Bharat Line's annual meeting demonstrates that the Govern-

ment of India's shipping policy on several outstanding issues has been halting. He has illustrated this central drawback with specific instances. The increase in cargo freight rates has come in instalments, but even so the final increase granted with effect from April last adds up to a total of 10 per cent which does not cover the rising costs of operation. The strain on the finances of shipping companies has not been relieved. Freight rates for Railway coal have been raised, but decision on private coal has been postponed until the report of the Co-ordination Committee. In a situation where the profit margin is rapidly diminishing and their budgets are hard to balance, it is difficult to expect shipping companies to come forward with enthusiasm to undertake bolder schemes of expansion. Bharat Line has assumed the risk of entering the Persian Gulf trade on its own, but the promised government assistance is not so far in evidence. An important sphere where Government has hesitated to plant its policy firmly is industrial relations. The way in which industrial disputes in the shipping industry are being settled should leave no doubt that the attitude of drift threatens to produce adverse repercussions on the progress of shipping.

THIN END OF THE WEDGE?

THE FORMAL registration of the State Trading Corporation on the eve of the meetings of the Import and Export Advisory Councils was an event whose significance could not be allowed to pass unnoticed during the discussion on trade policy. For a considerable time past the pros and cons of the Corporation were debated at official and non-official levels. The point generally made by the advocates of the Corporation stresses the fact that its establishment does not introduce any novel or radical principle in our trading policy since the State has been making purchases of stores for government requirements and since the war the area of its operations has been considerably widened by imports of food grains as well as other essential materials on government account. It is argued that our bilateral trade pacts with Communist countries which have a monopolistic pattern for their external trade makes it obligatory on us to set up a counterpart agency in this country.

It would certainly not be uncharitable to treat this view as superficial. The implications of the possible scope of the functions of the Corporation go much deeper. It is not really incumbent on this country to establish a State trading agency to deal with Communist countries and it is well to remind ourselves that other countries of the free world have not found themselves under any such compulsion. At the present time confusion prevails in official quarters over the precise form of the organization and functions of the Corporation. Mr. Karmarkar's reply to the points raised at the Import Advisory Council's meeting has not helped to clarify Government's intentions. It serves little purpose to be told that the organization of the Corporation would take time to evolve and no care need be raised unnecessarily. In the same breath he reminded the meeting that the country had adopted the goal of the socialist society. The Corporation's memorandum and articles of association provide for the omnibus clause to extend the scope of its activities to allied spheres. Subsequent events may prove that it was naive to treat this clause as purely conventional. The threat of encroachment on the established channels which serve as the solid foundation of our trade cannot be dismissed lightly. A clear definition of the limitations of the corporation's functions is necessary to allay genuine fears.

EXPORT CREDIT INSURANCE

THE COMMITTEE of the Indian Merchants' Chamber have, in a memorandum submitted to the Export Credit Guarantee Committee, welcomed the proposal for an Export Credit Guarantee Scheme. They are of the opinion, however, that the scheme should initially be applied to only a few classes of commodities; otherwise, they fear, it would be too unwieldy.

The Memorandum suggests that the articles selected for coverage should be those in which the trade is fairly organised as well as those manufactured goods which would be available for export with the development of the Five-Year Plan. In order to reduce the premium rates and remove unequal competition, it is essential that all exporters of the selected commodities should insure with the Export Credit Guarantee Organisation.

The risks covered are: (i) insolvency of the foreign buyer, (ii) failure to pay for delivered goods within the stipulated period; (iii) exchange restrictions or shortage in the buyers' country; (iv) occurrence of war, rebellion or revolution and (v) any other cause of loss outside the selling country, such as the imposition of fresh import licensing restrictions in the buyers' country or cancellation of the existing valid import licence. The IMC memorandum says that the scheme should not contain, at any rate, in the initial stage, a provision for covering risks faced by foreign buyers, since such a provision is likely to be construed as an admission that the Indian exporters as a class are not reliable.

As regards the organisation for administering the scheme, the memorandum suggests that it should be a quasi-governmental corporation fully representative of banks, insurance companies, trade and commerce. It is the Chamber's view that, though based on commercial principles of insurance, exporters paying premium at different rates according to varying export risks, the scheme as a whole should be worked on a 'no-profit no-loss' basis. Then only, according to the IMC, can premium rates be kept at the minimum level possible. It is also suggested that the period of 12 months within which payment is to be made by the buyer in the case of a 'shipments policy' is too long, and that, therefore, it be reduced to six months.

It would appear that the Export Guarantee Organisation is to be given permission to refuse to guarantee any particular consignment or only to accept part of the risks. While conceding such an enabling provision, in the relevant legislation for the purpose, the IMC points out that it would at the same time be advisable clearly to define and specify the factors and circumstances which will be the criteria for refusing a particular risk. The Chamber also wants that there should be suitable provisions in the scheme by which an exporter would be free to enter into export commitments beyond the limit prescribed by the Corporation at his own risk and cost. This would clearly present a ticklish problem to the Corporation. It is arguable, for instance, that, inasmuch as the Chamber itself wants the scheme to be made obligatory on all traders of given commodities, any such permission would lead to an anomalous situation in which these traders, who are allowed to operate at their own risk beyond a limit up to which they are covered by the scheme, might indulge in excessive commitment and upset the stability of prices.

Company Meeting

THE BHARAT LINE LIMITED

Speech of the Chairman, Mr. C. R. Srinivasan, at the Tenth Ordinary General Meeting of Shareholders, held on May 21, 1956 at Bhavnagar.

Gentlemen,

It gives me great pleasure to welcome you all to the Tenth Ordinary General Meeting of the Company. The Directors' Report and the audited Balance Sheet and Profit & Loss Account have been in your hands for some time now. I trust I have your permission to take them as read.

You will notice in the agenda for the meeting there are several items included which have not hitherto found a place there. The Companies' Act I of 1956 came into force in April last and under the provisions of the New Act, much that was assumed in the past, now requires formal affirmation by shareholders after due notice. The intention obviously is to associate shareholders more intimately in the affairs of the Company; the need to do so arises not merely because there have been instances where their interests have been neglected for lack of sufficient and suitable safeguards; it arises also in the context of our expanding economy which depends in part on joint stock enterprise wisely directed and watchfully supervised for the service of the country's interests. It may be that some of these provisions of watch and ward impose needless and vexatious burdens on the freedom of enterprise, but so long as they are administered with understanding and sympathy, those who are moved and motivated by an identity of interest between the Company and the country should find little difficulty in adjusting themselves to the new conditions and if an informed and instructed body of shareholders emerge in consequence, it is all to the good and none may gainsay its value and importance. Incidentally it may help the private sector to recover its proper place in public economy.

The economy that we recovered from the foreign administration was one of shreds and patches and its reconditioning called for care and caution, especially with the limited mobile resources at our disposal. The first Five-Year Plan was drawn up with emphasis on the agricultural sector and by all accounts a very good job of work has been done in the first Plan period. The second Five-Year Plan commences with the current official year and though its contours are yet to be defined with precision, it is common knowledge that this time the accent is on the industrial sector. The need to create a balanced economy with a view to widening the range of employment and raising the standard of living is now increasingly recognised and means and methods to this end are now vigorously canvassed in all informed circles. Considering the size of the plan frame and the prospect of recourse to deficit financing to service substantial parts of it, it is obvious that the success of this adventure turns largely on the measure of willing and wholehearted co-operation forthcoming from the community; in particular, wisdom lies in enthusiasing the private sector to engage in the task ahead, without doubts or misgivings.

It is not so much the socialistic pattern of society to which our course is set that alarms the business community; they are realists and can appreciate the impact of new forces in a changing world. Everywhere these forces are at work; only in India additional momentum has been imparted because these forces had been dammed for decades past; but our political propagandists, in their anxiety to show that they are in the vanguard of the new movement, have unfortunately laid more stress on the break with the past than the build for the future. The business community is naturally exercised over recent developments and a restatement of Government policy in the context of the socialist pattern was clearly indicated. This has now been clearly enunciated by the Prime Minister in Parliament and should serve to enlighten concerned interests where they stand in the new economy. Industrial programme and progress will be attempted and achieved on a three tier basis. There will be at the base a public sector comprehending industries which, for reasons of security and scale of investments, can best be run on Government ownership and control; in the middle, there will be a composite sector where private enterprise is intended to supplement Government efforts; at the top there will be a private sector where private enterprise will have full play though subject to regulation in public interest. Rightly understood, interpreted and administered, few will be disposed to quarrel with this distribution of responsibilities in a country's economy if the international forces unleashed in the 20th century are properly appraised and assessed. It cannot, however, be denied that what is being attempted, is a controlled economy with facets of freedom.

It is not enough, however, if Government restate their policy in clear terms. They must also create and maintain conditions under which industry, howsoever placed, can thrive and give of its best. The primary requisite in this direction is a period of industrial peace. In my address last year I have dealt at length with the problems posed by labour and by way of illustration cited facts and figures to establish that neither in their own interest nor in the interests of the country could the way they had reacted to the needs of the situation be justified. Government is not unaware of what is happening; but the machinery of Government moves so slowly that oftentimes it serves but to illustrate the juristic maxim that justice delayed is justice denied. I am sorry that so far as our experience goes the position has, if anything, aggravated and the infection has begun to spread to higher ranks also. Not merely is the weapon of strike indulged in on the smallest provocation as the recent dockyard strike in Calcutta illustrates, but the 'go slow' virus seems to have lodged itself deeply in the body politic. The output is steadily falling and the turnover per man hour has declined in every industry. Apart from standard wages, incentive bonuses have been offered by way of additional inducement, but it is early days yet to assess how far this will stop the rot. In marginal industries working under competitive conditions the strain on enterprise

is beginning to sap all enthusiasm for expansion. That this should happen when the country is being called upon to co-operate with a large scale expansion in the industrial sector is a tragedy too deep for tears. I hope those who are framing the plan will turn their attention to this festering sore in the system and see their targets are not defeated by it.

In a rapidly developing economy where progress on many fronts is contemplated there is one danger that farsighted men should guard against well in advance. I raise this note of warning because I am afraid in the frame work of planning sufficient attention has not been paid to the multifaceted problem of transport. As it is, with the limited objectives we have achieved under the first Five-Year Plan, transport has already become difficult, seriously upsetting production and distribution programmes of industrial units. Traffic on the railways has become so congested that it is seriously suggested that propaganda should now be taken on hand for discouragement and not encouragement of traffic. There has also been large scale diversion of coal traffic to coastal shipping; but with rising costs on the one hand and avoidable delays at the ports on the other the rates offered are so uneconomic that shipping companies find little enthusiasm in a situation that should normally stimulate enterprise. The turnover of every shipping company engaged in the coastal trade has registered a fall and the margin of profit is fast coming to vanishing point. More ships should be commissioned to cope with the coastal traffic, but frankly the incentive is not there.

Nearly a year back shipping interests applied for raising the freight rates, but after repeated representations a token 5 per cent increase was allowed in October last year. During the interval the costs of replacement, services and materials, have kept on rising with the result that the original increase, which the Indian shipowners considered a year back as barely sufficient to meet their liabilities, is out of date today, and suitable representations have been made to the Government in the matter. Whereas the Coastal Trade saw the last increase as far back as in 1951, the other Trades with which India is intimately connected have seen increases ranging from 21 per cent to 45 per cent during the same period. Examples are not uncommon where the Conferences concerned have increased their freight rates by 21 per cent within the last twelve months. The Coastal Trade has meanwhile been compelled to suffer heavy losses. The Government of India would appear to be cognisant of this position because at the Meeting of the Consultative Committee of Shipowners held in Bombay in November last the Hon'ble Minister for Transport stated:

"One of the matters which have of late agitated the Indian Shipowners is the question of suitable increase in the coastal freight rates. The Shipowners had proposed to put up the coastal freight by 10 per cent, but Government have found it possible to agree to an increase of 5 per cent only. I know this has not been generally appreciated, but Government are committed to review the matter after the Rail-Sea Co-ordination Committee has submitted its report. If that report is not received by March 1956, Government would take up the matter again on their own with a view to examining whether any further modification in the freight rates could be justifiably made."

The Rail-Sea Co-ordination Committee have not been able to bring out their Report so far. In the meantime, the second interim increase, which was contemplated by the Hon'ble Minister for Transport to be effective soon after 1st March, materialised only some time during the current month. Even this increase is to the extent of 5 per cent only on general cargoes effective April 1 last. The freight rates on Railway Coal will

be revised with retrospective effect from April 1 this year only after the Government receive the recommendations of the Rail-Sea Co-ordination Committee. On the other hand the freight rates on coal moving on private account or for bunkers will continue at the present level till the Government take decision on the recommendations of the Rail-Sea Co-ordination Committee and will have no retrospective effect as on Railway Coal. This piecemeal treatment takes no cognisance of loss in earnings already suffered by the shipowning community, nor does it take into account the changed circumstances of the case which have been duly represented to the Government and which call for higher increases in the freight structure, nor even is the present increase in any way commensurate with the increase effected by foreign shipping on foreign trade routes with some of which the Government themselves are associated.

Unless, therefore, further substantial relief is forthcoming without loss of time, I am afraid, there is little prospect of improvement in coastal traffic. A modest target is fixed under the second Five-Year Plan for the expansion of shipping raising the total tonnage to less than a million tons in 1961 and shipping companies have been asked to frame programmes of expansion during the second Planning period. I wonder, however, if in the conditions that prevail today the response will be adequate. Government is no doubt anxious to help with credit facilities; but unless the prospects of making both ends meet are visibly improved, few will come forward to take advantage of the credit facilities offered. Earlier experience is not calculated to enthrone enterprise either. Shareholders are aware that we were induced to enter the Persian Gulf trade with promise of Government co-operation and assistance. Though two years have passed, a lot of spade work had been done, and quite a sizable trade had been built up, at a considerable sacrifice, we still await concrete proposals as to the manner and measure of help that Government intend to extend to stabilize this new line of traffic. Another matter, which is likely to affect the financial side of the Company's operations, is the recent strike of the Company's floating staff officers, the arbitration award in respect of which imposes considerable additional financial burden on the Company. It seems that the time has come when, as in the case of the ships' crews, the emoluments of the officer staff should also be standardised; and it will be in the interests of the Shipowners that they seek immediate appointment of a Commission to examine the subject from all angles and evolve fair standards of emoluments for the officer staff linked with the country's cost of living index. I am afraid that unless a ministry of shipping is separately organised to study and service the interests concerned, the shipping industry will not develop as much as it should if the expanding needs of the situation are to be adequately met. At the request of Government we have diverted two of our ships to the Russian Service, but it will be possible to assess its potentialities only after an initial proving period. All that I am concerned to stress in this context is that there is no lack of enterprise provided fair conditions and fruitful co-operation are assured.

The Report of the Directors gives a comprehensive picture of the year's work and though earnings have fallen and the margin of profit reduced, we have been able to maintain the dividend at the previous level. I do not propose to make any detailed comments. My thanks are due to my colleagues on the Board and the Management for the cordial co-operation they have extended and I bear testimony also to the good work of the staff both ashore and afloat. With these words I now formally move that the Directors' Report and the audited Balance Sheet and Profit and Loss Account for the year ended December 31, 1955, already duly sent to the Shareholders be and are hereby adopted.

COMPANY AFFAIRS

BIHARAT LINE LTD.

The results of working of the Bharat Line Ltd. for 1955 show the same general downward trend in profits as most other Indian shipping companies, whose accounts have been published in recent months, have disclosed. The freight earnings of the Company declined by about 11 per cent, from Rs. 2.62 crores in 1954 to Rs. 2.34 crores in 1955. This fall is mainly attributable to the fact that no chartered tonnage was permitted on the coast during the year under review as also to the sale of one of the ships at the opening of the year. Both these served to reduce the volume of tonnage handled with a corresponding reduction in freight receipts. Again, there was a considerable fall in the India-Burma trade due to the stoppage of rice imports from that country. Last but not least, the inordinate delays at loading and discharging ports and the high maintenance costs, which had considerably affected the Company's operation in the previous year, continued unabated during the year under report also. The drop in earnings brought with it a fall in the Company's gross profits from Rs. 35.25 lakhs to Rs. 30.68 lakhs. Since the close of the year, the Labour Appellate Tribunal has decided in favour of the piece-rate system of wage payment to deck labour. The Directors hope that, with this welcome change and the trend towards improvement of freight rates, the financial position of the Company would improve in the coming years. The following table gives the earnings and profits of the Company for 1955, as also for the previous two years:

Year	Freight & Charter Hire Rs.	Gross Profit Rs.	Dividends Rs.
1955	2,33,71,418	30,87,642	5,00,000 (5%)
1954	2,61,80,933	35,25,404	5,00,000 (5%)
1953	2,22,27,901	39,61,845	5,00,000 (5%)

The Company has a fleet of 14 ships aggregating 98,598 d.w. tons and 64,516 gross registered tons. The Company has submitted to the Government a project envisaging the acquisition, during the second Plan period, of nine more ships against further loans from Government of about Rs. 6.50 crores, out of which about Rs. 2 crores are to be drawn in 1956-57. The current outstanding balances of loans from Government aggregate Rs. 1.37 crores which, together with unsecured loans, make a total of Rs. 1.46 crores. Now, as the secured and unsecured loans exceed the paid-up capital of the Company, viz. Rs. 1 crore (there being no free reserves), the sanction of the shareholders in general meeting under Section 293 (1)(d) of the Companies Act, 1956, is required to enable the Directors to borrow further money.

INDIAN ALUMINIUM CO., LTD.

After suffering losses for two consecutive years, the Company's working for 1955 has resulted in a profit of Rs. 26,79,662 after providing Rs. 21,55,409 for depreciation and depletion at normal rates. The profits are the highest since the Company's inception in 1938 and have been attributed to improved market conditions, improvement in prices, and the realisation of expected benefits of large-scale production facilities available for operating during the year. As a result of the satisfactory operations during the year under review, the Directors declared an interim dividend of 4 per cent on ordinary shares which absorbed Rs. 6,40,000. A final dividend of 5 per cent has now been recommended, making a total of 9 per cent. On Preference shares also a dividend of 5 per cent, less income-tax, has been recommended for the year 1955.

Sales of the Company's own products registered an increase of nearly 50 per cent over the previous year from Rs. 192 lakhs in 1954 to Rs. 288 lakhs in the period under report. The sales of Agency and Distributor products recorded an even higher increase of 70 per cent totalling Rs. 77 lakhs.

With sufficient power becoming available in March, 1955, the ingot production from the smelter at Alupuram went up from 2,945 tons in 1954 to 4,863 tons in 1955. The rate of production continued to rise. At Kalwa works, the production of aluminium paste, used in the manufacture of paints, reached, for the first time, the rated plant capacity of 260 tons; in 1954 the production was 180 tons. An extension plant of 1000 tons annual capacity, with a die shop, was installed near the Alupuram smelter during the year, and by the end of the year, the plant was producing at about 40 per cent capacity. The Company is also proceeding with the establishment of another smelter near the Hirakud power project with an initial capacity of 10,000 tons which may be doubled later. The Directors feel that considerable success has been achieved in gaining acceptance for aluminium in new applications, principally in railway coaches, and wagons, bus bodies and various kinds of buildings and structures.

THE HIND BANK, LTD.

The business of the Bank during the year 1955 and the results achieved show an all-round progress. After deduction of all working expenses, the accounts show a profit of Rs. 10,86,458, as against about Rs. 6.56 lakhs in 1954, which together with the balance brought forward from the previous account, of Rs. 1,12,820 totals Rs. 11,99,298. Out of this taxation takes away Rs. 4 lakhs, the amount transferred to reserve fund is Rs. 2.5 lakhs and Rs. 83 thousand are allocated for Bonus to staff, leaving Rs. 4,66,278. The Directors have recommended a bonus at Rs. 3 per share, free of income-tax, which absorbs Rs. 3 lakhs, leaving a net balance of Rs. 1,66,278 to be carried forward.

The Bank has been able to have its share of the general improvement during the year under review. Its deposits show an increase of nearly 25 per cent compared to 1954. About 93 per cent of its investments are held in the Central and State Government Bonds of which 87 per cent mature within the next nine years. In the Balance Sheet, the investments have been shown at below market value as at the close of the year.

KLM

In a total turnover of 384,517,000 guilders for its working year ended December 1955, the KLM has announced a net profit of 18,995,000 guilders—over 8 million guilders more than the profit for 1954 in which the total turnover amounted to 367,697,000 guilders. The traffic revenue for the year was 348,087,000 guilders as against 333,291,000 for the previous year. The output in the year under review amounted to 364,900,000 ton kms., registering a 4 per cent increase over 1954, while the sales increased by 8 per cent to 222,800,000 ton kms. The load factor rose from 59.3 per cent to 61.1 per cent. Passenger traffic was 7 per cent higher and freight traffic increased by more than 15 per cent.

After adding 10.5 million guilders to reserves, a dividend of 6 per cent will be paid out of the surplus. Depreciation on the fleet and other assets amounted to 47 million guilders. Substantial orders have been placed for new aircraft expected to be delivered between 1957 and 1960. The Royal Dutch Airlines hopes to be able to finance the greater part of these purchases from its own resources.

COMMODITY NEWS AND NOTES

INCREASED OUTPUT OF COAL IN INDIA

The output of coal in India increased from 3,358,077 tons in February, 1956, to 3,360,456 tons in March, 1956, according to official statistics released by the Inspector of Mines in India. Despatches of coal amounted to 2,835,244 tons in March, 1956, as against 2,696,604 tons in the preceding month. Coal stocks at pitheads amounted to 3,899,650 tons at the close of the month. During the month under review 839 collieries were reported to be working with an average daily employment of 333,269 workers. Output per man-shift was estimated at 1.10 tons for miners and loaders, 0.58 ton for all workers underground and in open-workings and 0.38 ton for all persons employed including surface workers. The percentage of absenteeism was of the order of 14.81. Mine coke plants at collieries and elsewhere produced 358,179 tons of hard, soft and other kinds of coke during the month and despatched 170,911 tons.

FALL IN WORLD TIN OUTPUT

World mine production of tin-in-concentrates fell by 1,500 tons, from 13,900 tons in January to 12,400 in February, according to the International Tin Study Group. During March, Malaya produced 5,261 tons, Indonesia 2,166 tons, and the Belgian Congo 1,349 tons. World tin metal output dropped from 16,900 tons in January to 11,800 tons in February, a decrease occurring in all important producing areas. In March the UK produced 2,452 tons. Stocks of world tin dropped from 71,000 tons at the end of December to 69,300 tons at the end of January this year. By February, UK stocks were 7,300 tons; Malayan stocks 6,100 tons, Indonesian stocks 3,706 tons.

CHILEAN COPPER PRODUCTION

Chilean copper production from January 1 to April 30, totalled 133,033 tons, compared with 139,649 tons in the same period last year. Details were: Chuquibambilla, electrolytic 41,389 tons and blister 34,647; Potruquillos, blister 11,211 tons, El Teniente, fire-refined 38,341 tons and blister 7,445. Kennecott copper has advised the Government that it will continue to sell copper produced at El Teniente and shipped to the United States at 46 cents a pound, following a similar decision by Anaconda.

TEA CONSUMPTION IN INDIA

Tea consumption in India in 1954-55 was largest in the Bombay, West Bengal and Madras regions, according to the provisional statistics. Consumption in Bombay, including Saurashtra and Kutch, was estimated at 39,659,819 lb., West Bengal, including Tripura and Chandernagore, 33,836,124 lb. and Madras, Andhra and Coorg 31,209,354 lb.

Consumption in the Punjab region, including Pepsu and Himachal Pradesh, was 17,163,306 lb., Assam, including Manipur and Sikkim, 11,946,912 lb., Travancore-Cochin 5,129,039 lb., Mysore 3,439,433 lb., Hyderabad 5,286,375 lb., Bihar 7,133,440 lb. Uttar Pradesh 3,161,392 lb. and Madhya Pradesh 4,783,254 lb. In other regions the consumption was comparatively insignificant. In Madhyabharat, Bhopal and Vindhya

Pradesh the consumption was 1,664,814 lb., Rajasthan and Ajmer 1,476,733 lb., Delhi 1,735,864 lb., and Orissa 1,184,589 lb. The total internal consumption in 1954-55 in India was 168,810,448 lb.

WORLD RUBBER CONSUMPTION

World consumption of natural rubber fell in March to 150,000 tons compared with 160,000 tons in February, according to the latest figures issued by the International Rubber Study group. Total consumption was thus down to 475,000 tons in the first quarter of this year compared with 495,000 in the last quarter of 1955. It was still, however, in excess of the figure for the first quarter of 1955 which totalled 460,000 tons. The sharp drop in rubber consumption in March reflects to a large extent a fall in exports to China. These are estimated at only 600 tons compared with 6,250 tons in February. UK consumption was down in March—probably by about 2,000 tons.

UK'S WOOL CONSUMPTION

Less wool was consumed by the UK textile industries during March than a year previously. Fewer wool tops were produced and the deliveries of woven wool fabrics as well as of blankets were also smaller. On the other hand a slightly larger quantity of worsted yarns was delivered. The decline in wool consumption was 11 per cent compared with March, 1955; the largest decreases occurred in the woollen section. Tops of wool and hair were produced at a rate some 3 per cent lower than a year before but while cross bred tops production declined considerably, merino tops output rose slightly. The rate of delivery of blankets was 15 per cent lower than in March last year.

WORLD COTTON SUPPLIES

World cotton supplies are estimated at more than 51 million bales—a post-war record—by the International Cotton Advisory Committee. This is an increase of 2.7 million bales since 1955. It is reported that free world production, at present estimated at 30.6 million bales, would reach an all-time high level, due chiefly to record yields in the United States despite a significant cut in acreage under cultivation. Cotton consumption in the free world should level off at near the record 1954-55 total of 27.6 million. The free world's carry-over on August 1, 1956, should be about 23 million bales.

TEA PRODUCTION IN INDONESIA

Total production of tea in Indonesia was 43,400 tons in 1955 as against 46,000 tons in the previous year. There was also a considerable fall in the export of tea from the country in 1955, compared to 1954. 32,900 tons of tea was exported in 1955 which is 26.9 per cent less than the export figures of 1954. The proceeds from tea exports, however, were only 21.6 per cent less than the export figures of 1954, at Rupiahs 356 million against Rupiahs 454 million in the previous year. The exports of leaf to UK were higher. Governmental controls imposed on exports to Singapore and Hongkong markets reduced the earnings of foreign exchange from these countries.

Planning: Past and Present

DURING this week planning, past and present, has been the central theme. In a powerful debate in the Lok Sabha the Finance Minister met with equal facility and not a little debating grace attacks both from the Right and the Left on the final second Plan. There is no doubt that throughout this debate the Finance Minister showed a capacity for explanation which has gone far to eliminate opposition to the Plan both in Parliament and in the country. It is seen that there are no major alternatives—and indeed objectives being fixed there are no alternatives at all—to a spacious Plan in which some risks are to be taken on resources. It is quite true that the weakest

point in the debate, both in respect of the Prime Minister's and the Finance Minister's speeches was on the large issue of resources. But no one can claim to see more than in fact is humanly possible. There is undoubtedly a serious problem ahead in regard to foreign exchange. If the World Bank does not give India a substantial loan, the whole Plan may need modification. But there is no reason why one should assume at this stage that resources will under no circumstances be available.

The progress report of the first Plan, which, unhappily, issued after the debate instead of

before it, affords chapter and verse to justify the optimism which has been entertained. The progress report incidentally provides a correct setting to the controversial figures on National Income for the year 1954-55 issued by the Central Statistical Organisation last week. The report states: "On the basis of data available so far it appears that National Income in 1954-55 has increased by another 2½ to 3 per cent and that this rising trend has been maintained in 1955-56 also. Broadly speaking, it is reasonable to expect that over the first Plan period National Income (in constant prices) would have increased by about 18 per cent, as against the target of 11 per cent. Per capita income over the same period is expected to show an increase of about 10 per cent.

It is good that an authoritative document, issued after the Central Statistical Organisation unloosed its hasty indiscretion last week, should assert that India's rate of economic progress in 1954-55 was "2½ to 3 per cent". It is this version of the case which is supported by all real production indices as has been argued in a Special Article in *The Eastern Economist* last week. But is the Finance Ministry of the Government of India or the Government of India as a whole deserving of credit for having published two conflicting estimates within one week? Is there no liaison between the Planning Commission and the Central Statistical Organisation? Cannot the Finance Minister of India who is both a member of the Planning Commission and Minister in charge of the Central Statistical Organisation, see that conflicting figures on a matter of this importance do not issue or, if they issue, that the error is immediately corrected?

The debate revealed what was already well known, that the general reactions to the Planning Commission's proposals have largely been favourable. There was overwhelming agreement on the need for a plan of the size proposed though the almost lone voice of Mr. N. C. Chatterjee feared that it was too big and beyond the present resources of the country to implement. But this was a minor discordant note which went unnoticed, largely because it has come to be realised all round that economic development at the pace contemplated is the minimum the country must undertake if the Indian experiment in democracy and in democratic planning is not to suffer in comparison with the totalitarian planning which her sprawling northern neighbour with her many more millions has launched on. This realisation did not, however, imply a blind acceptance of the targets, priorities and outlays proposed in the Plan. There was healthy scepticism of the need for a 40 per cent increase in food output when over a year's deliberations have led to the conclusion that a 15 per cent addition would suffice. It was evident from the way the Finance Minister avoided discussing this issue that a rational explanation for the basis and origin of this new target as well as the reasons for its need are still in the process of germination. Apart from this, the discussion lacked an air of purposefulness and realism since the views expressed in the two Houses are unlikely to lead to any modifications or changes in the content and structure of the Plan.

This consideration, however, did not prevent the leading spokesmen of the various parties from expressing their views on how the Plan should have been drawn up. Spokesmen of the Com-

munist Party in the two Houses wanted to know why the emphasis on heavy industry contained in the Mahalanobis Plan-Frame had been whittled down, refusing to be satisfied by the perfectly logical explanations that were offered. They also demanded to be told why the share of the private sector in industry had been increased while that of the public sector had declined. The reason for this is obvious; the Plan-Frame calculations regarding the capacity of small-scale industries to meet the increasing demand for consumer goods has been found to be over-optimistic, and since consumer goods industries have been left to the private sector, it is but natural that the amount of proposed investment in industry in this sector should register an increase. It is to be noted that only speakers belonging to the Communist Party insisted on a return to the Plan-Frame proportion of allocations, though they were also perturbed over the inadequate attention being paid to social services. Of course, they did not attempt to answer the question how the resources are to be found for all that, beyond a monotonous repetition of the usual cry for soaking the rich, and a warning to the Government of the inflationary consequences of deficit financing.

It was left to Mr. Asoka Mehta to give a healthy practical turn to the debate by boldly suggesting a curb on wage increase, which naturally he coupled with a proposal for a severe tax on profits. A curb on wage increase will help in keeping prices more or less stable, and if this is necessary, a higher rate on corporate profits is not objectionable. Only if private sources of finance dry up as a consequence Government must help to fill the bill. At any rate the more far-seeing among entrepreneurs have realised the need for re-investing in expansion as much of the profits as possible, and it is sufficient if budget policies do not discourage such profit retention for reinvestment. If contrast to Mr. Mehta, the other labour spokesmen, notably Mr. Tripathi of the INTUC and some Communist members wanted a 25 per cent rise in wages; they were properly rebuked by the Finance Minister. Is it too much to hope that more realism will be shown and concrete and helpful suggestions for facilitating the implementation of the Plan will emerge when the discussion is resumed in the next session? Surely Mr. Tripathi must recognise that if labour needs a 25 per cent rise in real income for enthusiasm, a similar plea can be urged by everyone else. In a Blue Supplement "Incentives in Industry" in this issue it is shown that organised labour only among the factors of production has recovered its pre-war position. Is Mr. Tripathi's argument that everyone else must give way to labour's intransigent demands? That way, as Mr. Asoka Mehta firmly pointed out, lies disruption of the entire Plan through inflation.

There was less than adequate attention to the problem of inflation. Curiously, the remedy to inflation and there is only one—its name is Production—was adequately dealt with by the Prime Minister. One of the most heartening things that has happened in recent years is the manner in which the Prime Minister's fine intuition comes into play when the hour of decision approaches. He has given a great lead to the country by refusing absolutely to take a sectarian or "political" view of the production problem. We must produce, or this Plan will perish; the Prime Minister said this more than once. It will bear much repetition.

Finance Minister versus Auditor-General

THE somewhat unseemly controversy—no doubt exacerbated by a strong personal equation between the Finance Minister and the Comptroller and Auditor-General—in regard to the audit of the new Life Insurance Corporation has done much to obscure the real merits of a major issue of policy. The Finance Minister's action has been made to look arbitrary and, indeed, contrary to the spirit of the Constitution which is based on the principle of the sovereignty of Parliament. In point of fact the issue is far more complicated than it looks in plain political terms. There is certainly, as the Auditor-General has contended, the issue of the ultimate responsibility of Parliament. This, however, is not the only responsibility which faces the Government in a field in which private initiative has been deliberately excluded. The Government is responsible in this matter as much to policyholders and to the country at large as it is to the legislative apparatus of the Government. To argue, therefore, that so long as responsibility to Parliament is ensured by placing audit in the hands of the Auditor-General all will be well, is to argue a purely legalistic or constitutional point. One need not emphasise the point that constitutional propriety of itself is no engine of economic progress.

There is much force in the contention which the Finance Minister presented when justifying his proposal that, for the time being at any rate, the status quo should be maintained. He said: "Where important commercial considerations are involved, like the State Bank or the Insurance Corporation, since Government officers lack experience of the work in such enterprises, Government would not like the success of these recently nationalised ventures to be jeopardised by some violent change in the system. Such institutions cannot be run without the exercise of a large measure of discretion by higher executives, and any system which makes it possible for audit to raise objections to the exercise of such discretion is bound to paralyse their working. Undertakings like the Insurance Corporation are basically different from Government's ordinary business and, until we have had some experience of their working, it seems to us to be best to maintain the status quo."

This decision, it is quite true, bypasses the Auditor-General. It is not true that it bypasses Parliament, and the Finance Minister gave an express understanding that he would associate Parliament with the new Corporation by a special Committee or otherwise. The point that seems to be relevant but which has not been raised is the capacity in which Parliament is thus to be represented. Is it as representative of the nation as shareholder, or the nation as manager? The political convention of the sovereignty of Parliament does not imply in either case that Parliament should be represented by an audit agency. And it is conceivable that political responsibility need not have any day-to-day nexus. Why, for example, is there no Parliamentary control of the Joint Water and Sewage Board in Delhi? Because the supremacy of Parliament does not include inspection and management. If the theoretical supremacy of Parliament gives the right to inspection, the Auditor-General should be everywhere.

If it is argued that wherever the nation owns shares—and as a result of the nationalisation of

insurance it holds shares in a very large number of private companies—Parliament must have the right of appointing its own auditors, then there would be a major incursion into the private sector. A logical deduction from the principle that part ownership by the State carries the right of State audit would be perverse in the case of State minority ownership; but the political sovereignty of Parliament is in no way reduced even in that case. It is a confusion to think that wherever there is a public financial interest, there must be State direction, or that this direction is a condition of sovereignty.

Is it the argument then that the Auditor-General must function in every case where a majority holding is with the State? This sounds more reasonable, but in substance again it will involve infringement on the rights of minority shareholders and is by no means a corollary from the supremacy of Parliament. The truth seems to be that the political convention by which the Auditor-General is the supreme financial representative of Parliament—as distinguished from the Government—is one which has no precise economic consequences. The Auditor-General is not a necessary link between the sovereignty of Parliament and the protection of the interests of the State. Indeed there need be no link. It is perfectly competent for Parliament to appoint any agency it chooses for this purpose; or act without a report from any source.

The decision of Parliament in this case is judged to be correct by *The Eastern Economist* on the understanding that the control of Parliament and its sovereignty can be otherwise secured. In other words, the political supremacy of Parliament is not undermined although the supremacy of its financial representative, the Auditor-General, is. This is justified by the accepted fact that Government procedures introduced into commercial ventures of this kind are unsuitable for efficient action. This applies to accounts much more than to audit. It is not a criticism of the Auditor-General in person. It is, however, quite definitely a criticism of Government methods of payment and sanctions which are notoriously slow and dilatory by any commercial standards.

While the decision of the Finance Minister is to be supported in this case, it would be futile to ignore the point that it really has placed the Government of India on the horns of a dilemma. If it is a fact that Government procedure is notoriously unsuitable to commercial transactions, how can the public sector in the new industrial corporations operate with just this kind of procedure, only slightly modified by the latitude given to corporations? The truth is that the Auditor-General is perfectly right to argue that what is sauce for the goose is sauce for the gander. If he is unfit to hold responsibility for auditing the Life Insurance Corporation he should by the same token be bypassed in the case of other public sector corporations. It is wholly illogical to draw an imaginary distinction between the Life Insurance Corporation and other commercial undertakings of the Central Government.

The Auditor-General was certainly within his rights to approach Members of Parliament to acquaint them with his views in this case; he was

certainly wrong to restrict his statement to certain Members of Parliament and to exclude the Finance Minister. On the other hand, the Finance Minister has not dealt adequately with the general application of the principles which he enunciated. It is all very well to dismiss the Auditor-General's criticism on the ground that it has been delivered "from the basement and not from the house tops". But the merits of a prin-

ciple cannot be arbitrarily circumscribed in this manner merely because of an error in presentation. The Prime Minister has thrown his authority behind the Finance Minister in this case; but surely this is a decision which is correct only on the basis that private commercial methods are better than public methods in the business field. Where does this argument lead; is not the Government hoisting itself with its own petard?

The Coal Award

THE award in the colliery disputes, announced last week, recommends a drastic overhaul of the wage structure of this basic industry which cannot fail to produce serious effects on this industry itself and in a considerable measure on the economy as well. The Tribunal has applied itself to the goal of fixing minimum wages at all levels and in addition it has superimposed conditions in vital respects. Thorough standardisation has been introduced in the wages of time-rated workers in the sense that the scheme of scales and categorization has been directed to be put on a uniform basis throughout all the States. Wages of piece-rated and daily-rated workers have been raised virtually to parity with the prevailing scales in the State collieries which have all along borne an uneconomic burden. Market collieries, in effect, have been brought within the wage-structure of State collieries for whom recurrence of losses over a period has been a matter of little consequence. This is by no means the end of the so-called rationalisation of colliery wages. A systematized scheme of grading on the basis of time-scales, it has been ordained by the Tribunal, should be introduced in the third year of the award.

A touch of irony is lent to the psychology with which the Tribunal has approached the solution of the dispute. It has felt constrained to make an apologia for its inability to go the whole way in meeting the demands made by the trade unions. The principal demand was for a minimum wage of Rs. 132 per month for the lowest category workers which comes to an annual rate of Rs. 1,584, far in excess of the annual average rate of real earnings in any organised industry with the exception of iron and steel. The Tribunal seeks to take credit for moderation in fixing minimum wages (comprising the basic wage, dearness allowance and the statutory bonus) on scales which it pronounces to be fair. In the opinion of the majority of the three-man Tribunal, the question of the capacity of the industry to pay wages suggested by it cannot be taken into account at the present stage, although it may enter into the calculations when wages are demanded by labour in excess of what the Tribunal considers minimum. This situation raises a basic issue in wage policy. Should distribution, on principles of social justice, precede production at this juncture in the Indian economy? Should a high wage policy be adopted in utter disregard of its disastrous consequences on production and employment? These posers have become common-places since the recent session of the INTUC. But the answer to them is quite clear. No ideological pursuit must be allowed to stultify the progressive achievement of higher standards of living without inroads in the volume of employment.

The significant effect of the Tribunal's suggestions is to raise the minimum wages for the lowest category of surface worker to Rs.

69-1 per month to which a surcharge of 12½ per cent is to be added when the worker is engaged in underground operations. This change at the lowest level and almost similar changes, with some variations, at the levels which account for the bulk of the colliery labour force, are of crucial importance in judging the impact of the increases on the industry. At the lowest level, the proposed increase will be of the magnitude of 40 per cent above the current wage, while the overall increase will be slightly below this percentage.

The wage-bill accounts for nearly 55 per cent of the total costs in the coal industry. More new burdens are being levied on the industry. The Indian Mines (Temporary) Regulations and the New Mines Rules, both introduced last year, impose a larger financial liability on this industry. The total increase in labour costs, therefore, cannot but be in excess of 40 per cent above the prevailing level. It directly goes to enhance the overall production costs above 22 per cent. The per unit increase will be of the order of Rs. 3 per ton. It ought to be recalled here that the revision of coal prices in 1947 assumed an average profit of Rs. 1.8 per ton. Two years later—in November 1949—coal prices were revised downwards to counter the impact of inflation which explains the depressed levels of profit in the collieries which are sound enough to earn it. The increase proposed by the Tribunal will have the most unsettling effect of wiping out the modest profit margin for the selected few, exposing the rest to the grim prospect of heavy losses.

A committee is examining the basis of the increase which it has become imperative to sanction in the current prices of coal. The whole of the 22 per cent increase in the industry's production costs necessitated in terms of the award will have to be added to the selling price if a substantial number of collieries are to be retained in production. If this is a pre-condition of maintaining coal output at last year's level of 38 million tons, it becomes by implication much more an absolute condition for inducing the private sector to adhere to its development plan whose target of additional output has been raised to 10 million tons by reason of reduction of the public sector's share to 12 million tons. The wage-price structure of collieries is not an exclusive concern of the coal industry alone. It impinges upon the whole mechanised sector of industry since hydal power constitutes a fractional source of power. In view of rail transport shortages, diversion of appreciable stocks of coal to coastal shipping will be inescapable. It means higher freight charges. The total increase to the industrial consumer will range above 30 per cent. How many industries can face up to this liability and yet stick to their expansion programmes? It is certain the only remedy is the raising of the price of coal to the full extent of the rise in labour costs.

THE WEEK'S NOTES

CONTROL OVER EXPENDITURE

NOT MANY will disagree with the conclusion drawn by the Public Accounts Committee in its report for 1955-56 that there is definitely much scope for improvement in budgeting and control over expenditure by Government departments. In the coming five years when the second Five-Year Plan will entail a steadily expanding outlay in the public sector, which will hereafter appropriate to itself a greater share of the national income, closer control over expenditure is necessary to ensure that every rupee of the tax-payer's money brings him the maximum return. The Committee is right in its observation that the propensity to overestimate expenditure persists in many departments. This naturally leads to surrenders, and where the departmental heads do not want monies voted to lapse, there is often uneconomic and wasteful expenditure.

Quite often there is a rush to expend the amounts sanctioned towards the close of the financial year, which can even cause a spurt in general prices. Where expenditure is financed to a great extent through the creation of money, as is going to be the case hereafter, the infusion of a huge amount of created money into the economy within a few weeks towards the close of the financial year can upset the economy seriously. This is only to emphasise the need not only not to overestimate expenditure but also to ensure that amounts granted are drawn upon as steadily as possible so that the deficit financing programme in any particular year need not all be wedged into a small period of time.

The Committee's statement that in its attempts to look into cases of excess expenditure over voted grants, which is one of its important functions, there is frequent inordinate delay in the Ministry or department concerned supplying the relevant information which will facilitate its work, deserves attention. It is necessary to see that the Committee is enabled to complete its work quickly and submit its report, as too delayed submission of the report will detract from its value. It is also necessary to introduce more realism into budgetary procedure and methods, as the Committee has recommended, so that the divergence between actual requirements and the amount asked for can be wiped out. Only then can the available resources be put to the best use to yield maximum advantage.

THE KHARAGPUR INCIDENT

JUST WHEN the Union Labour Minister was telling the INTUC session at Surat on May 7 last that "today the right to strike should not be claimed. We should claim the right to work", nearly 12,000 railway workshop and loco-shed employees at Kharagpur started a lightning, long strike. The strike, which was called off after 22 days, began without prior notice over the issue of classification of certain workers as skilled and unskilled and was later described as in sympathy with the stay-in strike of painters. Evidently, the strikers had no strong grievance but were led astray by interested elements. While any trivial strike in a large and vital undertaking like the railways should be discouraged when the country has embarked on an ambitious development programme, the present is to be condemned for the indiscipline and truculence that have characterised it. The strikers destroyed public property, beat and intimidated loyal workers and their families, and last week-end a mob of them pulled out the engine driver and fireman from a train, sending it crashing into a platform which, luckily being close by, saved what could have been a

major catastrophe. Surely, it is hard to conceive of a "more monstrous and more criminal action" as the Prime Minister has put it.

The Kharagpur strike is only one of a series of such strikes over some parts of the country. Whereas in a democracy, nobody can take away the right of workers to strike as a last measure for the redressal of their grievances, until a better method can be evolved, the grievances should be ventilated only in a lawful, legal and constitutional manner; the trade union movement in the country must develop along healthy lines. At Kharagpur, the strikers have acted in a highly irresponsible manner which can only bring discredit to the unions. The tendency towards violence seems to be growing as other reports of such demonstrations followed by police firing have come in from Kalka. The disquiet is spreading to other major junctions paralysing railway traffic. In the first Five-Year Plan period, industrial relations were smooth which facilitated the execution of the Plan. In the second Plan the emphasis is on industrialisation, and if the targets are to be realized, it becomes all the more imperative to maintain peace. The Government cannot but take a serious view of what is happening. In the larger interests of the country as well as in the interests of the workers, this tendency should be arrested by giving deserving punishment to all those who are to blame.

END THE PREVARICATION

THE PRIME MINISTER'S call to the various political parties in the country to state publicly and openly where they stand in regard to the use of violence has not come a moment too late. The January incidents in Bombay and elsewhere over the S.R.C. report were painful reminders that not all political parties and their so-called leaders had abjured violence as a means of achieving political ends. This recent incident at Kharagpur in which a train was set in motion after the crew were forcibly removed gave proof that violence of some sort—and once violence starts nobody knows where it will lead to—will not be repugnant to some at least of our trade unions and labour leaders belonging to a particular political affiliation. The latter incident brought into clear relief the need to make known to the people the real views of the political parties on the use of violence for securing certain objectives, since the use of violence as a means of enforcing strikes will, apart from upsetting the Plan, involve a certain amount of double-dealing on the part of opportunistic politicians and political parties, which deserves to be exposed.

It is, however, unlikely that the response to the Prime Minister's call will be favourable from the only party whose disavowal of violence is now urgently required; and, if it is favourable, it is unlikely that the assurance to keep the peace will be kept. The recent Palghat Congress of the Communist Party of India no doubt came out with qualified support for the Government's second Five-Year Plan, but one scanned the reports of its proceedings and its resolutions for a denunciation of resort to violence, only to be disappointed. Spokesmen of the party in the Lok Sabha, who spoke on the Kharagpur incident—let it be noted—cleverly evaded the issue squarely placed before them by the Prime Minister and went on to demand an enquiry into the incident. As if condemnation of violence in this particular instance and repudiation of it as a general weapon can be made dependent on such flimsy excuses as they advanced and will have to await the result of an enquiry!

THE FRENCH SETTLEMENTS

THE SIGNING of the agreement on the 'de jure' transfer of the four remaining French settlements in India by India and France marks the graceful end of French rule in India. Nineteen months ago the 'de facto' transfer was effected, after negotiations had almost broken down, because of the good sense of the French and their realisation that the continuance of these outposts in India in the face of hostility all round would serve no useful purpose. Thus did the rights of the people assert themselves. When the present agreement is ratified by the two powers concerned, the transfer would be legally complete.

In announcing the news of the signing of the agreement the Prime Minister paid a well-deserved tribute to the graciousness of French behaviour in this transfer of power. It must be mentioned that in this matter the Government of India too has been generous in the extreme. The citizens of these areas have been granted the right to opt for French or Indian citizenship, and the payment of pensions hitherto met out of the local budget and now taken over by India will not depend on the nationality of the people concerned. The conditions of service of public employees have been guaranteed as well as the continued existence and Government assistance to French-established educational and cultural institutions. French will continue to be the official language until the people decide otherwise.

The place of the former French areas in the reorganised States set-up has naturally aroused some interest. The Prime Minister has given the assurance that for the present there is to be no change. But obviously there will be no resistance if later the people of each settlement wish to merge in the State adjoining it. The example set by Chandernagore is there for future guidance. For the present, however, it is necessary to make some arrangement for the representation of these areas in Parliament. There is no doubt that the Government will soon take steps in this regard.

It is difficult on this occasion not to contrast with France's gesture Portugal's attitude with regard to her settlements. One hopes with the Prime Minister that it will soon be his privilege to announce to Parliament and the people at large that a similar agreement has been reached over Goa, Diu and Daman.

THE ALGERIAN DILEMMA

THE TRAGIC happenings in Algeria have started producing their effect on the French political scene. M. Mendes-France has already resigned from the Cabinet and this may well produce a chain reaction. The Communists, though still supporting the Government in the Assembly, have begun openly to attack its Algerian policy and if the Radical Group also decides to withdraw its support to M. Mollet, as can now be expected, the Prime Minister may be driven to lean more and more on the Right Wing. This in turn will mean more bloodshed in Algeria which is bound to precipitate a political crisis in France. Already, casualties are running high on both sides. The worst sufferers in the fray are the innocent civilians, living in villages which constantly change hands between the French and the 'rebels'. Both sides come down on the unfortunate people with heavy reprisals. In spite of reinforcements the authorities have not succeeded in breaking the nationalist concentrations. The moderate Arab opinion is rapidly disappearing and even if the French succeed in putting down the rebellion, which seems unlikely at the

present time, it would be difficult for them to find any representative Algerians to talk to.

The war in Algeria is damaging the French position in the newly independent North African States of Morocco and Tunisia also. In Tunisia, the extreme nationalists are obviously not satisfied with the settlement that the moderate Mr. Habib Bourguiba succeeded in bringing about. In certain parts fighting has again broken out. From outside his country, Salah ben Youssef, who heads the Tunisian section of the Liberation Committee of the Maghreb—the old Arab name for the outposts of Islam cut off by the Egyptian desert—is reported to have explained the flare-up in Tunisia as designed to divert French troops from Algeria and compel the French Government to call up more troops and thus possibly create a crisis in Paris. Perhaps Morocco also is dreaming of a North African Federation comprising the three parts Morocco, Tunisia and Algeria. There are reports of the Arab countries' desire to refer the Algerian question to the Security Council. In view of this uncomfortable situation the favourable reaction in France to Mr. Nehru's plan for a settlement in Algeria is understandable. The plan contains many points which should prevent any serious dislocations of the non-African sections of the population and should be acceptable to both sides. If further bloodshed is to be averted, and if France desires to retain some goodwill in North Africa, a settlement of the tangled problem should not be delayed any further.

POLITICS IN PAKISTAN

THE POLITICAL confusion in both wings of Pakistan is deepening. For the second time in the last two years, the constitutional and legislative processes have been suspended in East Pakistan. In March, 1954, the United Front, a combination of many political parties, had routed the Muslim League in the elections there, and had formed a government headed by Mr. Fazlul-Huq. Soon after, he fell into disfavour with the League Ministry at Karachi because of some of his allegedly "treasonable utterances". Two months later the Huq Ministry was dismissed and Governor's rule was enforced following strikes in some mills which resulted in widespread riots and killings. The United Front was, however, restored to power in June, 1955, and recently Mr. Huq was appointed Governor. Meanwhile, the province has been going through acute shortage of food which has generated discontent in the masses. The dismissal of the United Front Ministry in the eastern wing cannot fail to have its bearing on the League-United Front coalition at the Centre. In West Pakistan, where the Muslim League is already in the Opposition, Dr. Khan Sahib is now pressing for representation for his Republican party in the coalition at the Centre. It is not unlikely that under such strain from both wings, the coalition may crumble.

It seems the Muslim League leaders had agreed to the selection of Dr. Khan Sahib as the Chief Minister of the one-unit West Pakistan as an expedient for smooth integration. Contrary to their calculations, Dr. Khan Sahib has been consolidating his position and his party has been steadily gaining in strength from the defecting League members. Notwithstanding some of their distasteful attempts at arousing sentiments against Dr. Khan Sahib by challenging his loyalty to the country, the League leaders see only a very remote chance of dislodging the present Republican government. Continuance of this scramble for power and the consequent administrative fumbling is bound seriously to affect the successful implementation of the Five-Year Plan, draft of which was recently published. Weakened as the domestic front will be, the possibility of securing foreign aid, on which the plan depends in a large measure, will be less in the present fluid conditions.

A Window on the World

A HISTORY OF THE USSR SINCE STALIN'S DEATH

By

ODYSSEUS

A COLUMNIST'S broad approach to the problems of the day must soon become recognisable and it is therefore, probable that he is largely read by those who expect to find their pet aversions ridiculed and their fancies upheld, and that he is dismissed, unread, by those of opposite views who prefer not to see their fancies ridiculed and their aversions upheld.

A columnist is no exception to the rule that everyone is equipped with some set of principles, some theory—be it Buddhist or Christian in morals, Keynesian or Socialist in economics, Communist or democratic in politics—which satisfies him as a working explanation of the universe. The columnist, like everyone else, is bound to examine every problem in the light of his own theories. Regular frequenters of this column have long recognised our basic principles: we stand for Free Will and the responsibility of the individual as opposed to Determinism and "Historical Inevitability" (See, e.g., "The Determinist's Monther's Cat", July 29, 1955), for post-Keynesian Free Enterprise as opposed to indiscriminate Socialism (See, e.g., "Free Enterprise vs. Socialism", April 16 to July 9, 1954), for the humane, liberal, democratic approach to political relations as opposed to the despotism of totalitarian systems whether Nazi or Communist (See, e.g., "Is Democracy Possible in India?" January 23 to April 17, 1953 and "Crichel Down and You", October 29, 1954), and in international relations for the strengthening of the Commonwealth (See "The Principles of Foreign Policy", March 11 to June 24, 1955). For those who disagree, these views are naught but bias and prejudice. I suggest, however, that there is one qualification that helps to distinguish between a "view" and a "prejudice". If a writer avoids, suppresses, or distorts facts inconvenient to his theory, he is a "doctrinaire". If he faces them, and if, above all, he makes periodical attempts to re-assess his crystallised judgments against new developments, he can at least hope to be regarded as an earnest seeker after the truth who is ready to follow the argument wherever it leads.

All this is prefatory to revealing that I feel it to be time that we endeavoured to re-assess our views about Communism and our relations with the USSR in the light of any modifications in Soviet domestic and foreign policy that have occurred since the death of Josef Stalin on March 5, 1953. It is only too easy for a weekly commentator, working against time under the usual daily pressures, to reach for his long established and ready tailored judgments concerning a recurrent topic, such as the USSR, without bothering to take into account that the whole caravan has moved on since he last looked at it, and that his comments should now be classified as the exposition of a doctrine rather than an assessment of a problem that can never be static. I refuse to drift into the position of one whose views on the "B. and K. era" are based on judgments formed in the days of Stalin.

PEACEFUL CO-EXISTENCE

First, then, let us glance at the 'New View' of post-Stalinist Russia. It now seems fairly widely accepted that there has been a loosening up of the Soviet regime. With Stalin's departure, the icy blasts of a great fear are said to have yielded to the warm zephyrs of a gentler humanity wafting through the corridors of the Kremlin. A "New Look" is said to have come over

international relations. On the one hand, there has been an abandonment of Stalin's rule only to leave Soviet soil on the rarest of occasions and then only for a closed conference, like Potsdam, which might just as well have been staged in Moscow for all the contacts it gave with foreign peoples, and, on the other, there has been adopted the conference-plus-popular-tour technique that Messrs. B. and K. staged in Yugoslavia, Asia, and Britain, and therefore "peaceful co-existence" has come to stay. Support for this view is seen in Lenin's doctrine that although it is "inevitable" (that good old Historical Determinism again!) that all countries should eventually reach Socialism not all will travel to it by the same road. In other words, there seems to have arisen a general impression that the USSR has set the needle pointing to "Fair" on the international barometer and that the USA attitude of scepticism and suspicion is not merely wholly uncalled for but is the one irritant in what would otherwise be a halcyon age of peace and growing prosperity.

What in the history of the USSR since the death of Stalin justifies all this?

Under the Soviet system of censorship not more than a handful of Soviet citizens at the highest level know what happened in March 1953 when Stalin died. The Soviet man in the street still keeps his speculations to himself but we who live outside the Iron Curtain are, as we always have been, free to mull over the published facts.

The obvious successor to Stalin was Beria, head of the MVD (Ministry of Internal Affairs) and the MGB (Ministry of State Security, or police). A man in that position holds all the strings. He is responsible for law and order and can arrest anyone on any charge he likes.

WHO WAS BERIA?

Beria was a Georgian, like Stalin. A Bolshevik before the 1917 Revolution he did under cover work with Mikoyan (Yes, no other than our late visitor to Delhi). In 1921, Beria joined Lenin's Cheka, the secret police who later became the OGPU, and showed himself a ruthless executioner whenever required. In 1935, when Stalin was wading through slaughter to destroy all opposition, Beria published "The History of the Bolshevik Organisations in Transcaucasia", a lively description of Stalin's Robin Hood feats in the heroic days of the Revolution and a glowing testimonial to the deep comradeship that, Beria said, existed between Lenin and Stalin. According to Trotsky, who is a by no means entirely unreliable witness, Beria's book created "a romantic early revolutionary career for Stalin" which he had never had. What is certain is that this book assured Beria's career. Stalin made it compulsory reading for all party aspirants, and when Stalin finally liquidated his bloodstained henchman Yezhof, head of the secret police, after he had arranged for the shooting without trial of some 2,000,000 Soviet citizens in the nightmare purge years 1936, 1937 and 1938, Stalin appointed Beria to succeed the hated Yezhof. As head of the NKVD (People's Commissar for Internal Affairs), Beria organised the mass transfers of the local populations from the parts of Poland and the Baltic states occupied by the Soviets during the war and then from the vast areas of the USSR threatened by the German advances. Throughout the war, Beria

was in charge of internal security and of security in the armed forces and of all foreign intelligence services (save that of the Red Army) and of armaments and ammunition. As a member of the Defence Committee he organised the vast transfer of industry to safety beyond the Ural mountains. After the war, Beria was put in charge of the USSR's atomic development and was remarkably successful both in building up the USSR's atomic power and in extracting American and British atomic secrets.

At the time of Stalin's death, Malenkov was head of the Communist Party, Bulganin of the Army (he is not a soldier but a Party political supervisory appointee), Molotov of Foreign Policy, and Beria of Internal Affairs and Police services. Of these men, Beria was the most powerful.

One month after Stalin's death, Beria publicly disgraced the head of his secret police section by alleging that "impermissible" methods had been used to extract confessions from the doctors arrested before Stalin's death and charged with plotting the death of members of the Politburo. Beria set the doctors free and reprimanded their accusers. Why? There was nothing new in all this. It was in accordance with established Soviet precedent. It had been Stalin's technique to entrust his liquidations to his police chief and when the lists had been exhausted and he judged that the moment had come to end, for the time being, the blood bath, he sought to divert from himself and on to his police chief the fear and hatred that the terror had aroused. Years before, Beria's predecessor, Yezhov, had been appointed to herald a new era of good will after his predecessor, Yagoda, had been liquidated following a prolonged career of blood letting. In turn, when Yezhov was liquidated, Beria was publicised as Stalin's new, and nicely moderate, broom. So now, Beria doubtless sought to divert some of the

odium of his name by denouncing a subordinate and appearing to inaugurate a new regime.

As the instrument of Stalin's terror for 15 years and as the head of the Ministry of the Interior and of the Police, Beria must have been feared and distrusted by Malenkov and Bulganin. He was obviously too powerful and the precedents of Soviet history all pointed to another dictatorship of terror in due course. Bulganin and Malenkov joined hands with Krushchev to oust Beria. He was arrested in June, 1953. He was too dangerous to live. The usual fantastic charges of being an agent of the British and American Intelligence Services, and of plotting to restore Capitalism, were made against him and he was executed from the death cell in which he had placed so many, which Yezhov had occupied before him and Yagoda before both of them. Beria's liquidators appointed in his place one Kruglov, a modest police officer who, because he has no political talent or position, may be the first Soviet police chief to die in his bed.

The struggle for the succession was not over. Krushchev threw out Malenkov but the men who had trembled through 30 years of Stalin's terror had no wish to repeat the experience, and they had the sense to grasp that the balance of power theory offers prospects of stability not merely in international but also in personal relations, because if everyone agrees that nobody shall be allowed to become too powerful then the arts of persuasion and canvassing come into their own. Assassination ceases to be an essential preliminary to gain office and all concerned may sleep peacefully without fear of the dreaded dawn visit from the secret police.

I concede that the end of the Terror, at any rate at the top level, in the USSR makes for a certain easing of the internal tension. Whether it makes for any substantial modification (a) of the regime and (b) of relations with foreign powers are questions that I reserve for future discussion.

THE RAMAYANA OF TULSIDAS IN ENGLISH VERSE

LATEST "HINDUSTAN TIMES" PUBLICATION

The famous Hindi epic regarded by many as "the greatest book in all devotional literature" is for the first time now available in English verse.

The translator, the Rev. A. G. Atkins, completed the book after ten years of devoted work. He has tried "to keep and express in English in the fine rhythm and music of the original in simple lucid language, and with as much of the vivacity, wittiness and picturesqueness that Tulsidas has put into his work." He has also followed in some measure Tulsidas's metrical variations such as *chhand*, *chaupal*, *doha* and *seratha*.

In a foreword Mr C. Rajagopalachari says: "Mr Atkins' monumental work and his Introduction are a revelation of hope for those who desire to see all the great religions of mankind come together. . . . His service is not only to English-speaking people but also to that very large number of Hindus in India who do not speak the Hindi language and to whom English has become a very familiar medium."

The book is of special value to libraries, scholars and devotees of Tulsidas.

It has been issued in the following four editions:

- I. Original text of Tulsidas with translation in English verse; three volumes; 1468 pages; price Rs. 50 net.
- II. Translation in English verse; without Hindi text, two volume; 898 pages; price Rs. 40 net.
- III. Special tissue paper edition of I, one volume, price Rs. 100 net.
- IV. Special tissue paper edition of II, one volume, price Rs. 100 net.

FRANCO MAKES HIS WILL

FROM OUR SPECIAL WESTERN EUROPEAN CORRESPONDENT

MADRID, May 27.

SEVENTEEN years of dictatorship and nothing to show for it. That, in a phrase, is Franco's Spain. Literally nothing to show for it, not even the grandiose sports arenas that still testify in Berlin and Rome to the megalomania of other dictators. Under Franco, Spain has merely become older, wearier, shabbier, more confused and more divided. Yes, even more divided; the veneer of monolithic unity is the merest tissue, and under it all the old hatreds simmer as they have for a hundred years. This fact is the most striking witness to Franco's incompetence; wherever else dictators fail, they can usually claim with some plausibility to have bludgeoned the nation into an appearance of unity, if only by annihilating non-conformists. But Franco, who justifies his regime precisely as a barrier against dissension and disunity, has not only failed to resolve old differences, but has seen dissension break out in the very props of his state: in the Falange and in the Church. This has become quite obvious this year, just when Franco, at the age of 64, is seriously making arrangements for the succession.

On paper, the terms of the succession are already decided: Spain is a monarchy without a king but she will have a king when the "Regent" (i.e. Franco himself) dies. Until July 1947 Franco was merely Head of the State, Head of the Government, Head of the Legislature, Generalissimo, Commander-in-Chief of the Armed Forces, Head of the Falange, invested with all legislative, executive and judiciary powers and "responsible for his acts only before God and History." This modest situation being judged insufficient, he was made Regent by a farce of a referendum in which 14 out of 15 million voters approved a paper monarchy and appointed Franco uncrowned king. In theory, the pretender Don Carlos will ascend the throne on Franco's death, though how many of the above-listed powers will go with the throne is not yet known.

So the make-believe of a kingless monarchy really settles nothing, and all the political forces in the country are now jockeying for position to determine what form the successor state will take. In this jockeying, deep divisions have been revealed in the ranks of Franco's own supporters, of which by far the most important concern the Catholic Church because the Church has become the strongest political power in the land and yet is also the most divided within itself. But before we look at the issues involved in this dispute it is necessary to make clear that the present dissension does not in any way threaten Franco's own position. Quite the contrary, as long as the disputants disagree about what form of government should succeed Franco, the one point they all agree on is that Franco should remain in complete power. No one can afford to dispense with Franco yet, because no one is quite sure who has the upper hand. Whatever reports of trouble come from Spain, one must guard against accepting the interpretation that Spanish exiles put on them, namely that Franco's position is weakening. It is a safe guess that Franco will die quietly in bed, undisputed master of Spain.

Another point that almost every Spaniard over the age of 35 would agree on is that the succession is not worth fighting about. No one wants a civil war and no one is willing to do anything that might entail the risk of a civil war. Those who remember the years

1936-39 will readily enough understand why Spaniards should feel this way, when the peoples of Spanish stock in Latin America evidently do not. The point is important because, in spite of Franco's immense secret police force, there still exist in Spain several million anarchists and Communists. Though unrepentently hostile to the regime, these people are unlikely to regard rebellion or direct action as possible means to a new polity. Indeed among the Spanish working classes disinterest in politics has reached a stage unfamiliar in her history. Football and bullfights absorb more of the attention of the young men than political considerations. In Valencia the newspaper with the largest circulation is devoted entirely to sport.

The struggle for the post-Franco dispensation is, therefore, carried on at quite a different level, among the priests and politicians who acknowledge allegiance to Franco. When they permit themselves critical remarks about the regime—and such remarks are surprisingly common—they mostly mean that their opponents seem to be enjoying too much favour. Thus when a Cardinal earlier this month announced the curious discovery that the Spanish Church "has always been opposed to the totalitarian system", he did not mean that he was opposed to Franco but simply that among Franco's possible successors he was backing a party whose views were more liberal than their opponents'. And when Senor Gil Robles defended the Madrid students in court a few weeks ago by denouncing the "deification of the State" he did not aim this shaft at Franco but at an extreme right-wing Catholic party which hopes to take over from the Caudillo by introducing an authoritarian theocracy. Franco himself allows, and even half encourages, this political frankness from time to time although he could stop it at will. This is because he knows that he is not being criticised personally and because he is like a man playing chess, tentatively moving forward first this piece and then that to see what the reaction will be. So it is difficult to say in Spain who is using whom: the pretenders to power are using Franco to stave off their opponents until they feel sure enough to step forward, and Franco is using each pretender in turn to judge what dispensation he should finally bless before he quits the stage.

The worst sufferer from dissension is the Falange—which incidentally no longer exists; it changed its name to the Movimiento when its former friends Hitler and Mussolini were eclipsed, but it is the same horse under different colours. Franco's total inability to deal with any of Spain's economic or social problems and the failure of his various foreign policies produced profound disillusion in its ranks. It is now split by a revivalist group of young extremists who hope to restore the crusading fervour the movement had when it was founded by Jose Antonio Primo de Rivera. I say it is the worst sufferer from dissension not because the ideological split is deepest within its ranks but because disagreement has severely limited its political efficacy. Neither the Falange nor any group within it can hope to inherit all of Franco's power and could only aspire to dominance in alliance with a section of the army or a section of the clergy.

The ideological split is deepest within the Church, including in that institution not only the priests but the parallel lay movements like Catholic Action and the Opus Dei. The two extremes here are the parties that favour a constitutional Christian democracy and those that favour an authoritarian state. Roughly one might say that the more liberal group wants to turn

Spain into a state similar to de Gasperi's Christian democracy in Italy or Dr. Adenauer's regime in West Germany, while the authoritarian section favour a more rigid polity modelled in Dr. Salazar's regime in Portugal. A powerful section of the clergy, including several cardinals, the Catholic Action movement and most of the Jesuits belong to the liberal wing. The Order of the Holy Cross and its lay movement Opus Dei favour the authoritarian solution, and this section now controls the universities and the teaching profession; it is ultra-clerical, thoroughly reactionary, operates by means of secret cliques which recall nothing so much as underground Communist cells, and contains at least a small number of men who dream of Spain leading a new

Counter-Reformation in which a new Spanish Inquisition will bring all European liberals and Communists to book.

If none of these groups can take over all of Franco's powers, it is not unlikely that the Army will step in peacefully to run a "transition" regime. This in turn will settle nothing. The Army would simply find itself in the same position as the Caudillo today: holding the fort while behind the scenes the real political forces struggle to decide whether Spain is at last going to join Europe and the Twentieth Century, or whether she is going to go on living in the dream-world of past glories when Spain was rich and heretics were burned.

A Letter to the Editor

HIGH WAGES AND UNEMPLOYMENT

Sir,

In the issue of your esteemed journal dated May 11, 1956, there is a leading article which is an attack on Shri Kandubhai Desai and Shri Gulzarilal Nanda, Ministers in the Central Cabinet. It tries to poke fun at the advocacy of Ambar Charkha and contends that the demand for higher wages in industry and advocacy of Ambar Charkha are self-contradictory; it rather tries to confuse the issue by posing the question in that way and is obviously guided by political motive. The question is answered by the famous conversation of the employer and the worker in a modern rationalised automobile factory in the United States. The employer after taking the worker leader through the rationalised factory said, "Now friend, where will you collect your Union dues from? I have so automatised my factory that there are hardly any workers left". The worker leader replied, "I am not worried as to where I will collect my dues from. But I am worried as to where you will sell your cars because for lack of wages, there will be no purchasing power which might buy your cars".

The problem of India is that the employers have highly rationalized industry and, therefore, they should pay wages at the rate paid in Europe whereas they are paying now wages at the rate prevalent in India. So they have too much profits and people have too little purchasing power. So they cannot sell in India and try to export. As export markets get constricted due to emergence of Independence and national economic policies of different countries, the necessity arises to expand the home market. The home market can be expanded only by raising the wages of workers employed in organized industries to the levels prevalent in Europe. Higher wages, therefore, have to be advocated where too high profits are occurring. Some unenlightened employers do not understand this and feel that higher wages come out of their pockets. Actually they come out of the consumers in the long run, who are in their turn benefitted by the higher economic activity generated. Luckily enlightened employers in India have begun to understand this and, therefore, in the last meeting of the Labour Panel of the Planning Commission, they agreed that workers should be given higher dynamic wage in terms of increasing productivity and studies should be made to give higher wages if the present productivity can bear. The wage index is 102. The productivity index is 113. Obviously, therefore, there is a case for increase in wages even at the present productivity.

With regard to Ambar Charkha, luckily enlightened employers have begun to realise that masses of the new countries coming into independence will have to

seek expansion of internal market rather than look abroad. For that purpose, they are forced to think in terms of expanding purchasing power internally. Ambar Charkha is merely a method to distribute purchasing power for the country-side where at present workers are without employment or only part-time employed. The result of Ambar Charkha will be that the purchasing power of the country-side will expand and this will go to the benefit of the textile industry itself. It will find an expanding home market when its foreign market is contracted. But some misguided interests continue to be misguided. God alone can help them.

Yours faithfully,
K. P. TRIPATHI, M.P.,
General Secretary,
I.N.T.U.C.

DELHI,
May 23, 1956.

[We are happy to publish this letter, but fail to see that Mr. Tripathi has answered the charge contained in the Leading Article in question. Whatever Trade Unionist may say in justification of their stand, the fact remains that, to the extent that they insist on an artificial rigid wage in organised industry, they are adding to unemployment. An unemployment policy in the name of the Ambar Charkha cannot conceal this fact.—Ed.]

Scheme for Free Soil Testing Service: A free soil testing service financed by the Centre is proposed to be started in Uttar Pradesh. Under T.C.M. Project on Soil Fertility and Fertilizer use, the Government of India is setting up a number of Soil Testing Laboratories throughout India, out of which one would be located at Kanpur (U.P.) No charges for testing would be levied from cultivators for the duration of the Scheme. The main feature of the scheme, would be to collect soil samples from farmers' fields to analyse them in these laboratories and then to make practical recommendations regarding requirement of fertilizer for increasing the crop yields. The Scheme is likely to be implemented soon and cover other States also. It is likely to cost about Rs. 28 lakhs, he said.

Development of Improved Wheat Varieties: A new "700 series" of improved wheat varieties, embodying a high degree of tolerance or resistance to wheat diseases, has recently been developed at the Indian Agricultural Research Institute, Pusa, under the Union Ministry of Food and Agriculture. The outstanding features of these varieties, four in number, are their tolerance of rust attack and high resistance to loose smut. The first in these wheat varieties is named "New Pusa 710". It has shown good results in Saurashtra, Madhya Bharat, Uttar Pradesh and West Bengal. Wheat varieties, "New Pusa 718" and "761", are particularly suited to Delhi and Rajasthan, and Bihar and Orissa respectively, where they have attained popularity. Three other varieties in the "700 series"—"797", "798" and "799"—which have shown a good deal of resistance to brown and black rust, are undergoing large-scale field tests.

INDUSTRY

Drilling Rigs for Oil Prospecting: An agreement for the purchase of two oil drilling rigs (complete with spares, tools and accessories for one year's working) at a cost of Rs. 74 lakhs has been signed, between the Governments of India and USSR. The agreement provides for free erection of the drills at the site by the Soviet Government. A team of Soviet experts—22 per each drilling rig—will also arrive in India under the agreement to operate the drills and train Indian personnel for a minimum period of six months at a cost of Rs. 5½ lakhs per drill. In addition, the **Machino-export** will supply a seismic equipment together with two shot hole drilling which will be used for seismic prospecting in the Punjab and Rajasthan. The first oil drilling rig with necessary tools, spares and accessories will arrive in India in November, 1956, and the second rig by the end of the year.

Production of Automobiles: Production of automobiles totalled 2,623 in February 1956 compared with 2,302 in the previous month. Average monthly output during 1955, a record year for the industry was, 1924 vehicles. The increase in production in February this year took place despite a reduction in installed capacity from 4,333 vehicles in 1955 to 3,600 from the beginning of the current year. The improvement is attributed to the rising demand for automobiles in the country. Although production in 1955 was higher at 23,004 vehicles against 14,460 in the previous year, stocks with manufacturers declined from 1,685 at the beginning of last year to 1,288 at the close.

Additional Coal Production in India: The Government of India have decided that out of the additional production of 22 million tons of coal per annum to be achieved by 1960-61, the public sector will raise 12 million tons and the private sector 10 million tons. Of the additional production in the public sector, 2 million tons will come from existing working—0.5 million tons from existing Central Government collieries and 1.5 million tons from Singareni, Collieries in Hyderabad State. Korba coalfields are expected to produce 4 million tons of coal during the period. The areas in Bihar and Central India from which the remaining 6 million tons will be obtained have been decided only broadly and particulars, including specific allocations for each area, are being determined.

New Moisture Proofing Compositions: A new moisture proofing composition has been developed at the Technical Development Establishment (Labs), Kanpur. The compositions are used for preventing ingress of moisture in metal stores. India's present requirements are mostly met by imports. The composition developed at the Kanpur Laboratories has been found to possess all the desirable features of a good moisture proofing composition. It has also been found to be better than the imported material in respect of impermeability to moisture vapour. It can be conveniently applied to cartoons and other packages wrapped in paper, cloth or hessian. The manufacturing process, which is covered by Indian Patent No. 47272, is simple and the equipment required can be easily fabricated.

TRADE

UK Exports to North America: British exports to North America reached a new high level of nearly £34,000,000 in April. The figures show that the United Kingdom's visible trade deficit in April was at £57,300,000. No significant change in the underlying trends of overseas trade can, however, be discerned from the fact that this was rather higher. The increase was due chiefly to the effect of the short working month of 24 days on the value of exports, while imports were slightly lower than in March. In the first four months of 1956, the average monthly deficit of £56,000,000 was £16,000,000 less than the rate for 1955 as a whole, though £6,000,000 higher than in 1954. The value of United Kingdom exports in April was £256,400,000, as shown in the provisional figures—only £15,000,000 less than the record figure for March, which had two more working days, and less than one per cent below the monthly average for the first quarter. April maintained the gain of 4½ per cent over the corresponding period of 1955 which had been shown in the first quarter.

Trade Agreement between USA and France: The American Government has recently ratified an agreement between the organisation of American Cotton producers and the Syndicate General of the French Cotton Industry in order to promote the sale of cotton in the French market. According to this agreement which was concluded for a two-year period, American producer will put at the disposal French industrialists the amount of 85 million Francs. The French Syndicate will have to double this amount in adding an equivalent sum.

Britain's Footwear Exports: Britain last year sent 7,900,000 pairs of boots and shoes to 128 countries and

territories, thus maintaining her position as the world's largest exporter of footwear. According to the annual report of the British Footwear Manufacturers' Federation, these exports were valued at £9,000,000—8 per cent higher than in 1954. An extra 200,000 pairs were sent during 1955 to the USA and Canada, where earnings expanded by \$350,000 to \$6,730,000.

*

Indo-Ceylon Trade: India's foreign trade with Ceylon during December, 1955, amounted to Rs. 28.9 million as compared to Rs. 40 million in October, 1955. The main causes of decrease in India's trade with Ceylon are (1) stoppage of import of red onions into Ceylon and (2) the lower intake of eggs and chillies, beedies, bonemeal, cement and textile goods by Ceylon. On the other hand Ceylon's exports also fell by value in view of reduced intake of Copra and arecanuts by India.

FINANCE

Subsidised Industrial Housing Scheme: Loans and subsidies totalling Rs. 55,10,640 were sanctioned by the Government of India during March, 1956, for the construction of 1,376 tenements under the Subsidised Industrial Housing Scheme. In addition, a sum of Rs. 12,50,000 was advanced to Bihar for financing the State Government's Industrial Housing Scheme. Out of the sum of Rs. 55,10,640, the Government of Punjab will get Rs. 6,98,000 as loan and an equal amount as subsidy. The Government of Saurashtra will receive Rs. 23,28,260. Bhopal State has been sanctioned Rs. 6,98,000, as loan and an equal amount as subsidy. For building 50 double-room tenements at Darrang in Assam, Messrs. Panbari Tea Co., Ltd., Tezpur, Assam, will get Rs. 62,625 as a loan and Rs. 41,750 as subsidy. Messrs. East India Distilleries and Sugar Factory Ltd., Madras, will be given Rs. 32,565 as loan and Rs. 21,710 as subsidy for constructing 26 double-room tenements at Nellikuppam in South Arcot District, Madras State.

*

Low Income Group Housing Loans: The Government of India, during March, 1956, disbursed a sum of Rs. 187.98 lakhs as loans to 12 State Governments under the Low Income Group Housing Scheme. This brings the total payment so far made under the Scheme to Rs. 1105.61 lakhs against a loan allocation of Rs. 2153.2 lakhs. The following are the disbursements made during the month to various State Governments: Madhya Pradesh Rs. 50 lakhs; Bombay Rs. 27 lakhs; Delhi Rs. 25 lakhs; Rajasthan Rs. 20 lakhs; Mysore Rs. 18 lakhs; Punjab Rs. 10 lakhs; Hyderabad Rs. 10 lakhs; Andhra Rs. 10 lakhs; Madras Rs. 10 lakhs; Bihar Rs. 3.66 lakhs; Orissa Rs. 3 lakhs and Assam Rs. 1.32 lakhs.

*

Import of Silver Coins from Tibet: The Government of India recently issued a Press Note announcing their policy to facilitate Indo-Tibetan trade by licensing freely the import from Tibet, of any silver coin which is current in the Tibet region of China. They also incidentally announced in the same Press Note the raising of the import duty on such silver coin from 4-1/5 annas to 8-2/5 annas per ounce. Intending importers are advised to produce such silver coin (other than current coin of the Government of India) and other dutiable articles brought into India from Tibet, at the office of the Assistant Collector of Central Excise, Kalimpong, for payment of customs duty along with (in the case of silver coin) the licences issued by

the Reserve Bank of India or the Political Officer in Sikkim and get the licences endorsed by the Land Custom Officer after payment of the customs duty.

*

Increase in 1954-55 National Income: The national income of India for 1954-55 showed a very slight increase over the 1953-54 figures on the basis of 1948-49 prices at current prices. The corresponding figures, however, showed a decrease in 1954-55 as compared with 1953-54. The national income at 1948-49 prices was Rs. 10,170 crores in 1954-55 as compared with 1953-54. The national income at 1948-49 prices was Rs. 10,170 crores in 1954-55 as compared with Rs. 10,040 crores in 1953-54 and Rs. 9,460 crores in 1952-53. Corresponding figures at current prices are Rs. 9,910 crores. Rs. 10,490 crores and Rs. 9,320 crores respectively. The per capita income at 1948 prices worked out to Rs. 269 in 1954-55 and 1953-54 as against Rs. 256.6 in 1952-53 and Rs. 246.9 in 1948-49, showing a general increase. Expressed at the 1948-49 prices, there is a small rise in the national income between 1953-54 and 1954-55. The rise, however, is so small that the per capita income for both years at these prices were placed at Rs. 269.

*

Saurashtra Sales Tax Amendment Bill: The President has given his assent to the Saurashtra Sales Tax (Amendment) Bill, 1956. Under the existing provisions of the Saurashtra Sales Tax Ordinance, 1950, registered dealers who are manufacturing or processing tax free goods for sale are allowed to purchase a number of taxable raw materials without payment of tax, on the strength of their registrations. This privilege is being misused, to the detriment of other dealers in such taxable raw materials. The present Bill makes a provision to guard against such misuse. A provision has also been included to enable the Commissioner for Sales Tax to assess according to his best judgment the amount of tax due from dealers who have not been maintaining proper accounts. The Bill also clarifies what types of handloom cloth and matches are exempt from tax and rectifies certain errors and omissions in the original Ordinance.

GENERAL

Accumulations in Coal Mines Provident Fund: The Government of India have decided in consultation with the Board of Trustees of the Coal Mines Provident Fund to grant 3½ per cent interest to the subscribers on their accumulations in the Fund during 1956-57. The Coal Mines Provident Fund and Bonus Schemes Act was passed in 1948. The Act empowers the Central and State Governments to frame Provident Fund and Bonus Schemes for employees in coal mines. It applies to all coal mines in the States of Bihar, West Bengal, Madhya Pradesh, Vindhya Pradesh, Assam, Orissa and Hyderabad. More than three lakh employees are members of the Fund. Accumulations in the Fund till December, 1955, amounted to Rs. 5.6 crores.

*

Aid to India: The US International Co-operation Administration has announced new authorizations totalling \$420,000 for the purchase of nitrogenous fertilizer and plant test kits for fertilizer demonstration projects in India. The procurement of the fertilizer and equipment will be carried out through the emergency procurement service of the US general services administration. The authorization of money was made through provisions of US, Indian aid programmes already in effect.

NEWS IN BRIEF

INDIAN

The quasi-medical consumption of opium in India has steadily fallen—from about 160 tons in 1948-49 to approximately 90 tons in 1953-54—under a ten-year plan for its abolition adopted by the Indian Government.

*

According to the Reserve Bank's latest survey of India's Foreign Liabilities and Assets, there were 420 branches of firms and companies operating in India and 565 companies owned by foreigners as on December 31, 1953.

*

The Government of India proposes to appoint a number of valuers for agricultural lands under the Estate Duty Act 1953. They will be known as "Specialists in Agriculture and Farm Valuation."

*

Tentatively, January 1, 1958, has been fixed for the introduction of the metric system of weights and measure in certain sectors.

*

It is reported there is a reserve of 18 million tons of oil in the Assam Oilfields which are being worked out by the Assam Oil Company.

*

A food factory capable of producing 5,000 tons of cheap but concentrated protein food daily will shortly be set up in Mysore.

*

The Government of India have decided to join the new International Wheat Agreement for a period of 3 years commencing from August.

*

The World Bank is expected to complete negotiations before the end of June on its biggest ever loan to an Asian country—about \$70 million to \$75 million for the Tata Iron and Steel Company of India. The firm plans to expand ingot production from 1,300,000 tons to about 2,000,000 tons a year and also increase finished steel production.

*

Seventeen new schools were opened during 1955-56 for training in co-operative methods under the integrated training programme.

*

The Government of India have sanctioned Rs. 60.69 lakhs to the State Governments under the village Road Development Co-operative Scheme. Of this, Rs. 46.53 lakhs have been already disbursed.

*

India exported anti-snake venom serum to nine countries—Burma, Ceylon, Iran, Malaya, Nigeria, Nepal, Saudi Arabia, Thailand and the U.S.A.—during the last year. The value of the exports was about Rs. 60,650.

*

UNICEF has allotted a sum of \$10,559,509 to India as assistance since 1952.

*

Twelve institutions were visited by the delegates to the Ninth Congress of the International Society of Sugarcane Technologists held recently in India. The delegates also visited 10 sugar factories and the sugarcane farms attached to them.

FOREIGN

It is reported the steel industry in West Germany plans to extend capacity by 35 per cent—that is, to 29 million tons per year—by 1960.

*

It is reported between \$3,000 and \$3,300 million were invested in the coal and steel industries of the European Coal and Steel Community in the three years 1953-55.

*

U.S. newsprint consumption for April and the first four months of 1956 was a record. Total estimated consumption for the month was 607,603 tons compared with 568,142 tons for April 1955, and for the first four months 2,247,262 tons.

*

With Government backing, Japanese industrialists are planning an independent, all-Japan policy of trade expansion in South-East Asian markets, supported by technical aid and offers of co-operative "partnership" with South-East Asian interests.

*

A "living catalogue" of what is needed in the field of technical appliances for the propagation, lumbering and protection of the forest was shown at the recent International Forest Exhibition on the premises of the St. Erik's Fair in Stockholm.

*

There would be 100 Constituencies in Nepal for its first general election scheduled for October next year.

*

Overseas visitors to the U.K. numbered 1,037,000 in 1955, a rise of 15 per cent over 1954 and more than twice the number who came in the peak pre-war year, 1937. Estimated receipts from tourists, according to a Board of Trade analysis, were £111 million, or 16 per cent greater than in 1954.

*

The New Zealand Reserve Bank has announced a further increase in the demand liability reserve ratio of the trading banks from 20 per cent to 24 per cent. The ratio of time liabilities remains at 3 per cent.

*

Agreement has been reached on the establishment of a new multilateral trade and payments system between Argentina and Britain, on the lines of that already operating with Brazil.

*

West German output of motor cars was 89,680 in April against 91,800 the previous month. Production in the first four months. Production in the first four months of this year was 357,880 compared with 281,480 in the corresponding period last year. It included 304,863 passenger cars, against 233,432 in the first four months of 1955.

*

It is reported crude oil production of the Peruvian Subsidiary of Lobitos oilfields increased by 6.6 per cent during 1955 to the record level of 522,719 tons.

*

The Soviet Union has ratified International Labour Organisation's 1951 Convention on equal pay for equal work by men and women. The USSR was the eleventh country to accept the convention, which came into force on May 23, 1953. The other ten are: Austria, Belgium, Bulgaria, Cuba, the Dominican Republic, France, Mexico, the Philippines, Poland and Yugoslavia.

Economic Report from the U.S.

REACTION OF TRADE BARRIERS

(BY GUY SIMS FITCH)

WASHINGTON, May 29.—A highly successful round of multilateral tariff negotiations was concluded in Geneva last week under the auspices of the 35-Nation General Agreement on Tariffs and Trade (GATT). The United States and 21 of its GATT partners entered into some 50 inter-governmental contracts for the stabilization or reduction of tariff barriers. Among those joining in the GATT talks were nations from every part of the world—except the Communist orbit. Not a single Communist country was present, or has ever participated effectively in any GATT arrangement. This Communist unwillingness to operate in enlarging world trade comes as a jarring note in the midst of Moscow's current propaganda about its desire to step up Soviet trade with non-Communist lands.

True, the past few years have seen some increase in this so-called "East-West" trade. But the increase has hardly kept pace with the continuing growth of international trade among the free nations. The Soviet bloc's share still amounts to less than 3 per cent of total world trade. Communists like to blame the co-ordinated export controls of the free nations for the low level of East-West trade. But these controls have been in existence for only seven years—and the Soviet Union's share of world trade was declining long before that.

The fact is that the Soviet Union has long aimed at creating within its orbit an authentic trading system. Countries dominated by the Soviet do more than 80 per cent of their business with the USSR, compared with less than 10 per cent before world war. The free nations' export controls cover only a limited number of strategic—potentially war-marking—items and never have been a barrier to the flow of peaceful commerce. The fly in the ointment is that these strategic goods seem to be precisely the items the Soviet Union wants to obtain. Moreover, few business men want to give up commercial relationships of long standing in favour of new trade arrangements with Communist countries whose reliability as trading partners has long been open to question and who conduct all their trading activities under a strict state-controlled monopoly. This hesitancy is underscored by the fact that the Soviet Union adheres to none of the international agreements relating to patent protection.

Aside from strategic-materials needs or propaganda motivations, the Soviet Union's resurgent interest in international trade can be traced to its current economic difficulties. Only recently, for instance, the Moscow newspaper 'Pravda' admitted that "labour productivity is about 2.5 times higher in the USA than in the USSR." This perhaps accounts for the present Soviet interest in the latest products of Western technical skill by a nation that has stressed heavy industry at the expense of consumer goods and farm production. This emphasis on heavy industry, coupled with its failings in agriculture, means that the Soviet Union cannot offer to trade the farm products that have in

the past loomed large in its trade with the rest of the world. Instead, it is actually importing agricultural products and offering in exchange some manufactured and capital goods not in particular demand in the United States and other industrialized countries.

These are some of the things which recommend caution to business men who take a realistic look at trade possibilities with the Soviet bloc. That Western business men want to step up their trade with the Communist countries is shown in the larger number of applications they have been making for licences to export goods to Soviet bloc destinations. And the US Government has revised its licensing procedures to ease trade in peaceful goods with the Soviet Union and its East European satellites. But whether any large-scale increase in the US-Soviet trade becomes a reality will depend largely on the interest Moscow shows in the enlargement of truly peaceful commerce.

A NEW CHAPTER IN CANADIAN-INDIAN CO-OPERATION

THIRTEEN years ago, when Indian Aluminium Company's smelter at Alupuram produced aluminium for the first time in India, this versatile metal was being used mainly in the manufacture of cooking utensils. Today, aluminium has become important in a variety of industrial applications, and to meet the

rapidly increasing demand, the Company is installing a new 10,000 ton smelter at Hirakud, Orissa.

Here, as at Alupuram, the Company's Canadian associates will help not only with their technical know-how and world-wide experience, but they will also share the costs of the project, to finance a part of which the Company proposes to issue fresh capital.

HOW IS WORLD BANK MISSION REACTING?

By
CROESUS

As these lines are written, the World Bank Mission is in Bombay, meeting and having discussions with Government officials, economists, and business men, and it is significant that considerably greater public interest is being evinced in the visit of this mission than in that of the first one which came to India in 1953. This is understandable, because anyone who has cared to study the second Five-Year Plan, which is vastly more ambitious than the first Plan, is bound to be only too conscious of the importance of foreign aid to the success of the Plan. Moreover, hopes of the prominent role that the World Bank in particular is expected to play in this context were roused, even a couple of months ago, that is, when, in presenting the Central Budget to Parliament, the Union Finance Minister said that he expected the World Bank to play a more significant part in financing the foreign capital requirements of the second Plan than it did in respect of its predecessor. Mr. B. Bhagat, the Union Deputy Minister for Finance, reiterated these sentiments, a few days ago, in the Lok Sabha, in reply to a question bearing on the visit of the World Bank Mission. He said that a "significant increase" in the amount of loans to India from the International Bank of Reconstruction and Development was expected during the second Plan period.

According to what the leader of the Mission, Mr. Thomas A. Mckittrick, himself said in Madras, about two weeks ago, the object of the World Bank Mission is "to provide information to the World Bank to assist it to determine the policy and extent of any loan to India to finance the second Five-Year Plan". A notable feature of the present mission is that none of its members, including the leaders, is an official of the World Bank, and some of them are visiting this country perhaps for the first time, so that the team comes to India with an absolutely open mind, free from any inhibitions or preconceived notions. It is of the utmost importance, therefore, that great care and circumspection must precede whatever is told or placed before the members of this Mission. But, what do we find actually? On the official side, there is displayed—as rightly pointed out by 'The Eastern Economist' such heights of indiscretion and tactlessness as the publication (by the Central Statistical Organisation) of the estimated National Income of the Indian Union for 1954-55 (which, according to the CSO's own admission, is based on inadequate data) suggesting that no progress was made by the Indian economy between the years 1953-54 and 1954-55! The non-official side also seems to have contributed its quota of indiscreet and incorrect statements, judging from some of the impressions that the Mission would appear to have formed, albeit tentatively. It is imperative that, before the Mission leaves India, it is enabled by the powers-that-be, when the Mission visits Delhi, to disabuse itself of at least the incorrect aspects of some of its impressions.

Meanwhile, it is gratifying to find (from what the members of the Mission have said in Calcutta, Madras, Trivandrum, and Bangalore) that they are impressed (i) with the success of our first Five-Year Plan, under which 85 per cent of the budgeted Plan expenditure has been spent and there has been an increase of 105 per cent in our economic output, (ii) with India's having set out to build up her economy by democratic methods, (iii) with the rural development work, especially the

community projects and the N.E.S. services, and (iv) with the visit to Calcutta, the Chittaranjan Locomotive Works, the D.V.C., and the Sindri Fertiliser Factory. Mr. Mckittrick is reported to have said, referring to these last: "These major installations are a clear demonstration of India's ability to deal with several problems, including industrial operations". Reading this observation along with another observation of his, namely, that "the World Bank is greatly interested in building up the economy of those countries which have not so far taken a leading part towards industrialisation as more advanced nations have done", one could reasonably assume that the Mission would give a good bit to India.

At the same time, it seems clear that the Mission is not without certain doubts about the second Plan, as also about certain policy approaches of our Government. These are worth noting by the Government of India not only to be able to meet these points if and when these are raised further on by the World Bank, that is after the Mission submits its report, say by mid-June, but also to remedy the position, if need be and wherever possible, in the light of the Mission's findings. The Mission feels, for instance, that it would be a little difficult to attain the targets in the Plan because of lack of technical personnel and also of financial resources. Though some of the advanced countries might be willing to help in the former direction, there are not adequate technical personnel to spare, the Mission has opined. Similarly, in regard to raising more resources within the country itself, the Mission would appear to have gathered the impression, from its talks with various people, that Government's expectations are pitched rather too high. Again, the leader of the Mission is reported to have said, in Bangalore, that there was necessity for production and transport and export and import moving together within the framework of the Plan. In other words, he seemed to have suggested that, in the matter of priorities and of co-ordinating the various phases of the Plan so as to avoid delays, the second Plan did not afford him complete satisfaction. One also gets the feeling that the Mission would have liked a higher provision for transport. The leader of the Mission is further believed to have emphasised the need for both public and private sectors moving forward together in order to achieve the best results. Of course, he did not say, in so many words, that the Plan could well afford to give more responsibility to the Private Sector than at present. Then the rate of increase in gross national output assumed under the second Plan requires to be looked into, according to one member.

Notwithstanding some of these reactions, which, by the way, are by no means unfamiliar, in that more or less similar reactions have ere now been given expression to by critics in our own country, it is encouraging to note that the Mission has been impressed with the second Plan, in particular with the provision for the annual review of the position, and also with the fact that the whole country has been collaborating with the Government in the implementation of the Plan. In the considered opinion of the Mission, although the Plan is ambitious, the approach to it is right and wise. Mr. John C. De Wilde, Deputy Leader of the Mission, for example, thought that, in the matter of planning, more had not been done by any other

country in Asia. And he justified the ambitious nature of the second Plan in these terms, whilst addressing the Press in Trivandrum: "The second Five-Year Plan is a very ambitious one." Obviously, it is, because you want to make rapid progress".

From what has been stated so far, it should be evident that the World Bank Mission has gone about its task of assessment of the Indian economic scene in an able and competent way. Accordingly, its report, based on this assessment, should not cause us any concern. But, in deciding upon the extent of assistance that could be given, all shades of enlightened public opinion in India are agreed that, besides this, the I.B.R.D. authorities should also take one more very important factor into consideration, namely, the economic development plans of another Asian country, of a different political persuasion—China. Naturally enough, all Asian countries would now watch the progress of both democratic India and Communist China, and it is the merest commonsense to expect that the comparative achievements of these two will also constitute to the other Asian countries a convincing commentary on the relatively greater efficiency of either of the two political ideologies. If, for argument's sake, China were to make more rapid and spectacular progress than India, then these other Asian countries would not pause to analyse the means adopted in forming their judgment but precipitately proceed to the conclusion, even if unwarranted, that Communism is to be preferred to Democracy. So it is the duty of all lovers of democracy and democratic planning to ensure that India, with her much-appreciated democratic type of planning, scores a distinct march over China in economic progress. India has proved its capacity to be able to achieve big things, but may lag behind now if adequate finances are not forthcoming in time. All democratic countries must recognise what this will mean and any decision to determine and allot aid to India must be governed solely by this recognition. This is as much in the interests of their own self-preservation as in those of India.

BUSINESS NOTES

SECRET OF JAPAN'S TEXTILE OFFENSIVE

THE PHENOMENAL rise in the export of textiles from Japan, particularly to America, has ere now become a fairly common topic of discussion among American cottonmen, who not only blame Japan for this but for all sorts of internal disequilibrium in the textile industry in the USA. Next to the American surplus cotton disposal plan, the growing—they would prefer to call it 'alarming'—increase in the import of Japanese textiles is perhaps the most hotly debated issue which figures prominently in the agenda of meetings of all associations of textile interests in the States.

The entry of Japan as a full member of the GATT on September 10, 1955 and the generous tariff concessions given to it by America at the Geneva Conference prior to that marked the beginning of the rise in the tempo of textile exports from Japan to America. Thus, the American Government is itself instrumental in a way in helping Japan's increased textile exports, although cotton mill interests in America have been vying with one another in a mud-slinging campaign race against Japan's textile policy. Recently, a leading American cotton manufacturer went to the extent of saying that, "unless we receive relief in the form of import quotas and other measures, we will see, in our life time, the end of the American textile industry. The import of Japanese goods has shaken the American industry more than anything else in the past 100 years". Not to be outdone, as it were, another enthusiastic US campaigner against Japan has gone on record as saying that "such competition during the last four years has thrown the American textile industry into one of its worst depressions, worse, in some respects, than that of 1929".

In striking contrast to the gloomy predictions of these Jeremiahs, the case for allowing Japan to expand her textile exports has been put forward by Richard Hughes. "How defensible, in the global picture today, are these American protests?", he asks. In an article entitled "Japan's 90-million Problems", Mr. Hughes pleads for affording increased opportunities for Japanese exports of textiles. Lifting the veil over the astonishing boom in textile production, Mr. Hughes discloses that it is as a result of the mushrooming of a large number of small cottage workshops, utilising specialised plants (not Ambar Charkhas) that Japan has been able to achieve remarkable progress in the output of the one-dollar Japanese shirts and blouses which, from all accounts, have become the rage in the US. Thanks to the flexible Japanese potential for low-priced—not cheap, be it noted—goods, the export output of these shirts and blouses, which was only 189,000 dozens in the whole of 1954, went up to the phenomenal figure of one million dozen every three months. According to the author, when the demand has outstripped the maximum production capacity, the family-based units, which meet the bulk of the export orders, merely add one or more machines to the tiny domestic plant which they operate and, in Japanese fashion, enlist the services of more members of the family or of neighbouring families.

An even more interesting disclosure made by the author concerns the quality of these home-made goods. He says: "Buyers and sellers are all impressed by the high quality and uniformity of style achieved in these difficult and dispersed, but flexible, low-priced, efficient and characteristically Japanese conditions." It is also significant to note that the Japanese Government has also been extra keen in taking measures to enforce quality standards, so that there could be no more of those pre-war charges of dumping of shoddy goods.

Between the US having a surplus raw cotton on her hands, eager to find buyers, and Japan with an apparent abundance of cotton manufactures, keenly searching for purchasers, there is certainly a close streak of similarity. If America has no qualms to sell her cotton at world (competitive) prices—notwithstanding her assurances against disturbing world markets—it does not surely lie in her mouth to question the ethics of Japanese textile exports. Let her mark these words of Mr. Hughes: "ninety million Japanese responding once more to the ancient, dimmed but re-awakening Japanese instincts of proud patriotism, independence, and self-sacrifice, must eat to live. If they are not allowed to compete, fairly and equitably, in Western markets, their only alternative is starkly clear".

POWERLOOM FACTORY OR COMPOSITE MILLS?

IT WAS after considerable discussion between the authorities and the textile interests concerned that the Central Board of Revenue recently agreed to permit artsilk weaving mills not having their own artsilk spinning units, to pay excise duty on a loomage basis instead of on a square-yard basis. Under the loom basis, power loom factories are required to pay excise duty at Rs. 27 per loom for the first shift and at Rs. 18 per loom for the second shift, the first nine looms being exempt from payment of the duty. The square-yard basis, which involves payment of excise duty at nine pies per square yard—this works out to about four pies per square yard more than under the loom basis—on the other hand, is applicable to composite mills, that is mills having both spinning and weaving units.

One would have thought the intention of the authorities was quite clear and unequivocal. Artsilk weaving units, most of which have no spinning units of their own, accordingly began payment on a loomage basis. Some of these artsilk weaving units in Bombay happen to be located—although separately housed—in the compounds of cotton mills which are composite units, in that these spin their cotton yarn and weave out of the same yarn, that is yarn produced by them. Some ingenious brain in the Central Excise Department has seized this fact to dub the artsilk weaving units so situated as "composite units" and to demand excise duty at a higher rate, that is on a yardage basis. By doing so, the authorities are unwittingly injuring the interests of these mills, inasmuch as they are compelling such units to sell their goods at a price about four pies per yard higher than artsilk weaving units (powerloom factories) not situated in the compound of cotton mills, and this at a time when the industry generally has been passing through rather difficult times and competition has become very keen.

What is even more strange about this anomalous situation is that, when the Millowners' Association, Bombay, had discussions with a member of the Central Board of Revenue on this subject a few weeks ago, he was so fully convinced of the genuineness of the grievance that he said he saw no reason why such units should not be permitted to avail themselves of the option to pay duty on a loomage basis so long as the power looms were separately housed and separately registered under the Factories Act. These conditions seem to be reasonable enough, although it may entail, in some cases, a splitting of the registration certificate by the Factories Inspector concerned into two separate certificates, one relating to cotton textiles and another relating to artsilk textiles. But, normally, this should not present any serious difficulty, although one cannot be too sure what Government departments will do these

United Nations

STATISTICAL YEARBOOK 1955

The latest issue is a comprehensive collection of authoritative statistics on more than 250 countries and territories which contains 183 tables, most of which cover a 20-year period, some brought up to mid-1955. Among the subjects covered are the following:

Population, industrial and agricultural production, mining, manufacturing, construction, consumption, transport, internal and external trade, balance of payments, wages and prices, national income, finance, social matters, education. 644 pages

Clothbound \$7.50

(Payable in local currency)

Paperbound \$6.00

For a year-round international statistical service

MONTHLY BULLETIN OF STATISTICS

Current data on economic and social conditions in over 130 countries covering more than 60 subjects, including a wide range of economic matters of interest to business.

Annual subscription \$10.00

days. It is a pity that, even today, few government officials realise that their unimaginative and unhelpful attitude often retards the tempo of national production which the Prime Minister and our Planners have been ceaselessly striving to raise and raise speedily.

COTTON FUTURES: SEARCH FOR VIA MEDIA

THE NEARLY six-month-long stalemate in the cotton futures market seems to be on its last lap, as serious efforts are being made by the interests vitally concerned to bring about a resumption of trading in futures at an early date. The Hedge Contract Committee of the East India Cotton Association, which has been entrusted with the task of exploring the possibilities of resumption of trading, has got off to a good start with a series of discussions on the issues immediately affecting the cotton trade. However, at its meeting on Monday (May 28), it was found that opinion was sharply divided among the members of the Hedge Contract Committee as to whether trading in the 1956-57 cotton crop should be done with two contracts running simultaneously, or with just one contract. While a majority of the members would seem to favour two contracts, one for medium staple and another for lower staple, the conservatively inclined members would appear to show unmistakable preference for the continuance of the status quo, namely to have only one contract.

Those favouring the introduction of two contracts running side by side point out that this system is by no means novel to the Bombay market, inasmuch as a similar system actually prevailed prior to 1939. They are of the opinion that the parallel operation of two contracts would offer reasonable hedge facilities to all varieties of Indian cotton. Thus, whereas one contract would apply to the better varieties of cotton, the other would take care of medium and lower varieties. It is suggested by some that the contracts should be qualified not only by their staple lengths thus, but by their spinning character as well. In support of their claim for two contracts, those who seek reorientation in this behalf bring in the further argument that there would be less scope for cornering by bulls and also more opportunities for straddle business between Bombay, Ujjain, and Akola.

The opposition to the introduction of two contracts seems to rest on two counts, in the main. In the first place, those who prefer the 'status quo' are highly sceptical whether the two contracts would at all work successfully, when even a single contract has got the cotton market into such a mess. They are certain that it would ultimately result in the present confusion getting worse confounded. Again, they are doubtful whether there is sufficient freedom of operation in the market at present, what with the prevailing floors and ceilings, to warrant a complete reorientation. Yet another drawback, they point out, is the insufficiency of cotton supply which continues to be a gamble, thanks to the vagaries of the monsoon.

The Forward Markets Commission is expected to deal with this issue ere long. Meanwhile, the stage is being set for a heart-to-heart talk between representatives of the trade and the Government, and the forthcoming visit of the Union Minister for Commerce and Industry to Bombay (on June 1) may be availed of by the East India Cotton Association, under the leadership of its new President, Mr. Madanmohan Ruia, to have preliminary discussions on the prevailing cotton situation.

OUTLOOK FOR TEA EXPORTS

THE YEAR nineteen-fifty-five was a crucial one for tea, as witness the fact that export earnings declined sharply to Rs. 1,086.9 million during the year ended

March, 1956 from Rs. 1,472.2 million in the previous year. The quantum of exports declined from 456.7 million lbs. to 401 million lbs., the major part of the decline being in the offtake of our traditional export market, the United Kingdom. The carry-forward from the 1954 crop, the increase in world tea production in 1955 and the decline in absorption of the three main tea-drinking countries, Great Britain, America, and Australia, combined to create a world surplus of nearly one hundred million pounds of tea. For nearly nine months of the 1955 season, there was too a limitation on the amount of tea, which could be exported to London from this country. This coincided with the increased world tea crop, on the one hand, and the credit squeeze in the UK on the other.

However, signs of improved prospects would appear to be visible in the tea market now. There is a fairly good demand and prices are picking up. The UK tea stocks are very low and, though dealers do not want to lock up capital, they are anxious to avoid a situation in which, with plenty of tea in the market, they find themselves short of tea in London! Smaller buyers who were hitherto remaining inactive are expected to buy more in London, while larger buyers also are likely to use this opportunity to replenish their stocks. Proposals to set up a Tea Bureau in the United Kingdom and plans to intensify propaganda in India itself are among other encouraging signs.

Again, drought has done considerable damage to Ceylon's tea crop in recent months. Though the resultant deficit in Ceylon's tea crop may, perhaps, be made up at a later stage, this shortfall would have a healthy reaction on the world buyers presently and may have, if only to a limited extent, the effect of helping the clearance of the surplus on the world markets. The International Tea Agreement is yet to be signed, but a favourable climate for the Agreement is being created. Once it is signed, a closer watch over production and supply would be possible. Producers in the coming season will learn from the lessons of 1955 and adjust their production accordingly.

Meanwhile, there are indications now that small internal buyers are realising that, with the increased amount of tea which has been shipped for direct sale in London, there may only be just enough available to carry them through to August, when the first consignment of the new season's tea can be expected on the market. It, therefore, seems likely that, with the United Kingdom and other outmarkets operating, albeit, in a limited way, and India's internal dealers and blenders continuing to purchase larger quantities, the market will now start rising and higher prices may be realised.

The positive remedy for overproduction is to increase demand. But tea interests are disturbed by this beverage's failure to hold its own, even in traditionally tea-drinking countries such as Britain and Australia. In America, too, despite the success of the Tea Council's 1954 campaign, the present position is not quite encouraging. On the other hand, the consumption of other beverages is increasing steadily. It is not that these countries are suffering from economic depression; it is rather that tea is not sharing in the general prosperity and, what is more, its merits are not being sufficiently appreciated by the younger generation. Future tea campaigns must, therefore, be designed to woo and win this section.

REGULATION OF FUTURES TRADING IN CASTORSEED

WHILE THE consequences of Government intervention in the cotton futures market are still fresh in one's memory, what appears to be the first step in this

direction in respect of the futures market in castor-seeds has been announced by the Government. According to a notification under Section 15 of the Forward Contracts (Regulation) Act, 1952, the Centre has decided to bring under regulation forward contracts in castorseed in the whole country, excepting the State of Hyderabad for the time being.

The notification states that forward contracts, except non-transferable specific delivery contracts, entered into on or before May 23, 1956, shall be deemed as closed, except in the State of Hyderabad, at the rate prevailing at the time the forward markets in the said commodity closed on May 23. Hitherto, section 15 of the Act was applicable to castorseed in Greater Bombay, where futures trading in castorseed was done under the auspices of the Government-recognised Bombay Oilseeds Exchange, while, in other areas, such contracts could be entered into freely.

The oilseeds market in Bombay has been witnessing hectic conditions of business for the past few weeks. Bulls in the market would appear to have a firm grip on the market even now, despite occasional relapses in the price trend. While the statistical position in respect of castor, groundnut, and linseed has been generally tight, at any rate, for the first two weeks of May, there have also been sustained enquiries for oil from overseas. Particularly keen was the demand for castor oil from Japan and the USA. Although the reported business with Japan for about 3000 tons of oil was itself subject to the availability of import licences in that country, the mere possibility that there would be sustained demand from Japan and, to some extent, from Australia, was sufficient to strengthen the hands of the bulls. In the event, prices of castor futures, particularly the May contract (due to mature on May 31) were taken up to the highest level during this season, of Rs. 160-10. This time last year, it is interesting to compare, the same contract did not move beyond Rs. 73! It is true that, towards the third week of the month, the statistical position became easier, following fresh arrivals from Gujerat, Saurashtra, and Karnatak centres. But this did not materially affect the underlying trend of prices which continued to be firm, thereby indicating a distinct speculative bias in the pattern of trading. Many in the trade were, therefore, apprehensive that the Government would come up with some announcement or other to check this rise in prices. So, the decision to regulate forward trading was not altogether a surprise to the market. Since the announcement, a declining trend has set in, which has further deteriorated, following reports that freight rates for all oil shipments to the US are to be raised by \$6½ per ton to \$40 with effect from July 1. The bulk of the business would have been completed well before that date, but even so, the future is certainly bleak, as far as shippers of oil are concerned.

T. C. FIVE-YEAR PLAN AND RESEARCH ON CASH CROPS

THE SECOND Five-Year Plan for Travancore-Cochin aims at providing employment to 1.6 lakhs people. But, in a State where there are 28 lakh unemployed persons, most of them educated and young, this touches only the fringe of the problem. For a population of ten million, Travancore-Cochin has, perhaps, the highest percentage of rural and urban unemployment in India. The latest census report shows that the State Government faces every year the responsibility of providing employment to additional 60,000 people, who attain majority. In other words, Travancore-Cochin should find employment for three lakhs of people during the second Plan period even to keep employment figures at the present level! Organised industries in the State are few and only a small section of the people is engaged in these. The main drawback of the State's second Plan is its failure to provide for the establishment of any major industry in the State.

However, three industrial estates—one each at Trivandrum, Quilon, and Trichur—two major workshops and three small workshops have been sanctioned by the Government of India, following Mr. P. S. Rau's talks with the Union Minister for Commerce and Industry, early last month. The entire cost of these estates and workshops will be met by the Central Government as a long-term loan to the State Government. Loans to individual entrepreneurs for capital expenditure on machinery and equipment and also for working capital will be given on easy terms, according to the scheme initiated by the Government some time ago, i.e., up to 75 per cent of the value of the security offered, including assets and stock-in-trade created out of the loan, and at 3 per cent interest. Loans will also be given at a concessional rate of 2½ per cent to industrial co-operatives. A provision of Rs. 230 lakhs has been made for organising new production units in cottage industries, including the starting of the industrial estates. The establishment of a co-operative spinning mill at Trivandrum and the issue of semi-automatic looms to 3,000 weavers and of loans to 30,000 weavers are the highlights of the programme to develop the handloom industry. There are at present 275 handloom co-operatives in the State.

Another important feature of the second Plan is the provision for research work on the main cash crops, like lemon grass, ginger, cardamom, pepper, arecanut, and sugarcane. Particularly, the scheme to afforest 20,000 acres with cashew will substantially reduce the country's dependence on foreign imports for the supply of raw materials to this vital indigenous industry and a valuable earner of foreign exchange—dollars. The Government of India, it is gratifying to note, is encouraging the extension of the area under cashew, and has already initiated research into its problems. Under the auspices of the Indian Council of Agricultural Research and the State Government, a research station was recently set up in the State to make a comprehensive collection of cashew with a view to isolating and promoting production of superior high-yielding types.

COMPANY AFFAIRS

MAHINDRA AND MAHINDRA, LTD.

The first report since the Company was converted into a public limited Company in mid-1955, covering its working for the year ended October 1955, is now available, showing satisfactory results. The year has been a year of record sales turnover of the Company. Trailer sales were almost double of the previous year and there was substantial increase of nearly 50 per cent in the offtake of jeeps and allied vehicles. The sale of tractors has, however, shown a marginal drop. In regard to steel imports, the Company was responsible for a large share of 36 per cent of the total steel imports in 1955 by the Iron and Steel Controller. The Company is making arrangement for expansion in its various activities.

As for the financial results, the profit for the year under report is Rs. 23,72,443, after providing Rs. 1,51,510 for depreciation. With Rs. 70,080 brought forward from the previous year, the amount available for disposal totals Rs. 24,42,523 out of which Rs. 9.5 lakhs and Rs. 5 lakhs have been appropriated to provision for taxation and bonus to employees respectively, leaving a balance of Rs. 9,92,523. Reserve for additional taxation and contingencies takes another Rs. 6 lakhs. A dividend of 10 per cent per annum on ordinary shares, and of 6 per cent per annum on preference shares, both free of tax, absorb Rs. 2,74,443 and Rs. 31,250 respectively. The balance of Rs. 86,830 is carried forward.

GODFREY PHILLIPS, INDIA, LTD.

After two consecutive years of depressing results, with gross sales falling from Rs. 278 lakhs in 1952 to Rs. 230 lakhs in 1953 and Rs. 185 lakhs in 1954, the results for the year ended December, 1955, show that substantial progress has been made in recovering lost ground. Without any material increases in the prices of the Company's products during the year, the gross sales have gone up to Rs. 250 lakhs, and in spite of increasing costs, the profit figures have also improved. The profit for the year, after providing for taxation, depreciation and other charges stands at Rs. 9,51,201. To this have been added Rs. 13,30,075 brought forward from the previous year and Rs. 46,731, provision for taxation no longer required. An amount of Rs. 1,30,508 is deducted on account of short provision for bonus for 1954 and difference in dearness allowance in respect of previous years, which makes available a sum of Rs. 21,97,499. Out of this Rs. 79,000 have been transferred to reserve for gratuities, leaving a balance of Rs. 21,18,499 available for disposal.

The Directors have recommended a dividend of 5½ per cent per annum, subject to tax, on preference shares, which absorbs Rs. 1,21,688. On ordinary shares, a dividend of 20 per cent per annum has been recommended which absorbs another Rs. 3,00,000 leaving a balance to be carried forward of Rs. 11,96,811.

THE SOORAH JUTE MILLS CO., LTD.

The audited accounts of the Company for the year ended December 1955, show a profit, before providing for depreciation and taxation, of Rs. 10,54,099. Including the balance of Rs. 1,66,758 brought forward from the previous account, the sum totals Rs. 12,20,857. Out

of this amount, Rs. 7,56,701 have been provided for depreciation and Rs. 1,36,000 for taxation for the year, and Rs. 45,000 have been transferred to the Investment Reserve account, leaving a balance of Rs. 2,83,156 available for disposal. The Directors have recommended a dividend of 7 per cent per annum, free of income-tax, on 10,000 cumulative preference shares which absorbs Rs. 70,000. On 1,40,000 ordinary shares, a dividend of Rs. 1-8 per share (or 15 per cent per annum) also free of income-tax, absorbs another Rs. 2,10,000 leaving a balance of Rs. 3,156 to be carried forward.

With 12½ per cent of looms sealed throughout the year under review, the mills worked 351 of the total of 401 looms, 48 hours a week. According to the new working time agreement, only 5 per cent of the total looms now remain out of commission. The Directors have reported that the full benefit of modernisation of the mills up to spinning was felt during the year.

THE MERCANTILE BANK OF INDIA, LTD.

The net profit of the Bank for the year ended December, 1955, is £235,423 which is £41,099 higher than the figure for 1954. Two dividends have been declared totalling 14 per cent, payable on the increased capital, which absorb £118,335 compared to £97,020 for the previous year. After making provision for other usual allocations (£13,000 transferred to Officers' Pension Fund; £35,000 written off Freehold Banking Premises and Property and £50,000 Additional Allocations to Contingencies Account) there remains a balance of £219,372 which is carried forward.

The expansion recorded in the Bank's general business during 1954, continued during the year under review. The Balance Sheet total is £72,065,153 against £68,594,152 at the close of 1954. Deposits are higher by nearly £4 million, while on the Assets side there are increases of over £2 million in loans and advances, nearly £1 million in Bills Receivable whilst the holding of Government Securities is £4½ million higher.

EASTERN INVESTMENTS, LTD.

The profit and loss account of the Company for the year ended December, 1955, shows a credit balance of Rs. 8,13,572 including Rs. 3,13,308 brought forward from the previous account. The profit figure has been arrived at after paying an interim dividend on the cumulative preference shares at 2½ per cent, less tax, amounting to Rs. 46,094 and after providing Rs. 7,36,882 for taxation. A final dividend of 2½ per cent per annum, making the total dividend 5 per cent for the year, on 25,000 issued preference shares, less tax, absorbs another Rs. 46,094. On ordinary shares, a dividend of 9 per cent per annum, free of tax, has been recommended which amounts to Rs. 4,61,340. This leaves a balance of Rs. 3,06,138 to be carried forward.

The company's portfolio is representative of Investments which are quoted on the Calcutta Stock Exchange, with the exception of certain shares costing Rs. 1,29,553 for which no quotations are available. The total market value of the Investments for which quotations are available, together with unquoted investments as valued by the Directors, exceeds the book value at December 31, 1955 by Rs. 75,26,031.

COMMODITY NEWS AND NOTES

SECOND ESTIMATE OF TOBACCO

According to the Directorate of Economics and Statistics, Union Ministry of Food and Agriculture, the all-India second estimate of tobacco, 1955-56, puts the current year's area at 352,000 acres as against the adjusted second estimate of 339,000 acres for 1954-55. This shows an increase of 13,000 acres or 1.5 per cent in area during the current year as compared to last year. The increase in area during the current year has occurred in Andhra, Bihar, Bombay, Madhya Pradesh, Madras and Hyderabad and is generally attributed to favourable weather conditions at the time of sowing. This increase has, however, been offset to some extent by decreases recorded in Madhya Bharat and Rajasthan.

The information given in this estimate generally relates to the period up to the end of February 1956.

ALL-INDIA FINAL ESTIMATE OF DRY CHILLIES

According to the Directorate of Economics and Statistics, Union Ministry of Food and Agriculture, the all-Indian final estimate of dry chillies, 1955-56, puts the current year's area and production at 1,492,000 acres and 340,000 tons as against the partially revised estimate of 1,523,000 acres and 363,000 tons respectively for 1954-55. This shows a decrease of 31,000 acres or 2.0 per cent in area and 23,000 tons or 6.3 per cent in production over last year. The decline in area and production of dry chillies, during the current year has occurred mainly in Rajasthan and Punjab, and to a lesser extent in PEPSU, Andhra, Hyderabad, Madhya Bharat and Delhi and is attributed generally to unfavourable weather conditions especially heavy rains at the sowing time. The decrease in area and production has, however been offset to some extent by the increase reported by Madras and Mysore States.

FINAL ESTIMATE FOR SUGAR PRODUCTION

According to the Directorate of Economics and Statistics, Union Ministry of Food and Agriculture, the production of white sugar on the basis of the Final Estimate for 1955-56 season is estimated at 18.48 lakh tons as compared to 15.90 lakh tons (actual) during 1954-55. This shows an increase of about 2.58 lakh tons or 16 per cent over the previous year's production. The increase in production has been shared by all sugar-producing States, prominent amongst which are Uttar Pradesh, Bihar, Bombay, Hyderabad and Madhya Bharat.

INCREASED OUTPUT OF IRON-ORE IN INDIA

The total output of iron-ore in India increased by 399,651 tons in March, 1956, from 377,591 tons in February, 1956, according to official statistics released by the Chief Inspector of Mines in India. Returns received from 39 mines for the month of March, 1956, show despatches totalling 285,077 tons to the iron and steel plants and 49,972 tons to the export market. The reported stocks as at the end of the month amounted to 1,310,667 tons.

U.S. BURLAP CONSUMPTION

The latest statistics from the USA indicate that burlap consumption there is running at an encouraging rate; it was 7.6 million yards in March, against 68 million yards in March, 1955. US stocks, however, rose last month by 8 million yards to 253 million yards.

ESTIMATE OF COTTON IN MADHYA BHARAT

The area under cultivation and yield of cotton in Madhya Bharat have increased in 1955-56, according to the fourth official estimate of the crop released in a press note issued by the State Government. The estimated area under cultivation is put at 1,773,000 acres

and yield as 355,000 bales, compared with 1,560,000 acres and 3,25,000 bales in 1954-55.

WOOL EXPORTS

The outlook for the disposal of wool clips in overseas markets seems to be healthy. Some of the major importing countries are said to be "under-bought" in relation to their probable needs. This is perhaps reflected in the fact that in the U.K., which is the world's largest wool importer the recent attractive prices have brought out a substantial volume of new business in wool tops and yarns in the Bradford market. It is considered that the weight of business still to deliver is sufficient to maintain the present healthy rate of activity in British mills for the new few months. Moreover mill authority in principal manufacturing countries indicates that wool consumption is up to the level of the last quarter of 1955, which in turn promises a continued healthy rate of wool disposal and well maintained basis of values.

FINAL ESTIMATE OF JOWAR

According to the Directorate of Economics and Statistics, Union Ministry of Food and Agriculture, the all-India final estimate of jowar for 1955-56 puts the current year's area and production at 42,721,000 acres and 6,940,000 tons as against the partially revised estimate of 43,446,000 acres and 9,093,000 tons for 1954-55. Thus the present estimate shows a decrease of 725,000 acres or 1.7 per cent in area and 2,153,000 tons or 23.7 per cent in production over 1954-55 when the production of jowar reached an all-time record. As compared to the average of three years ending 1953-54, the present estimate, however, shows an increase of 1.2 per cent in area and a slight decrease of 1.7 per cent in production.

The decrease in acreage under the crop during the current year has been shared mainly by Bombay, Uttar Pradesh, Madhya Pradesh and Rajasthan and to a lesser extent by Vindhya Pradesh, Andhra, Punjab, Bhopal and Bihar and is attributable largely to unfavourable seasonal conditions at the sowing time. This decrease has, however, been offset to some extent by the increases in acreage registered mainly in Hyderabad, Saurashtra, Mysore, Ajmer and Delhi due to favourable weather conditions at the time of sowing.

RECORDS & STATISTICS (QUARTERLY BULLETIN)

Editor: R. V. MURTHY, M.A.

"The Eastern Economist" Bulletin of Records and Statistics surveys economic trends in each quarter in India and abroad with the aid of graphs and all available statistics. One of its special features is the Investment Supplement.

Annual subscription Rs. 12
For subscribers to "The Eastern Economist" " 10

The New Cloth Policy

THE new cloth policy was, appropriately enough, announced at a Press conference this week by Mr. T. T. Krishnamachari in person. No one has laboured more to resolve the bitter political controversy which stands between what it is now fashionable to call "the mill sector" and "the Ambar Charkha." The conflict between the factory system and handlooms in the textile industry is as old as the Industrial Revolution. But the Ambar Charkha, it might justly be claimed, is a modern Indian invention, however antiquated it might look in historical terms. Because it is modern and because it is Indian, its emotional impact in the great debate has been large. It required nearly a year of imaginative stonewalling by Mr. Krishnamachari to convince the Cabinet that a sensible compromise could only be found on the basis that production was not

frozen in the factory sector, which was our sole instrument for the prevention of inflation and the earning of foreign exchange in the yarn and cloth sector.

It is right that a great tribute should be paid to the manner in which Mr. Krishnamachari's philosophy—which, it might be added, is also both Indian and modern—has been translated in the terms of the resolution now accepted. According to this resolution the textile target for 1961 has been raised to 8,400 million yards which, it is believed, will suffice for domestic consumption and for providing 1,000 million yards for export. The Ambar Charkha is to provide yarn for 300 million yards of the handloom sector's 1,000 million yards additional. The handloom sector is to be modernised by the addition of

powerlooms to take production from 1,450 million yards to 2,650 million yards. 3,500 powerlooms are to be added in a pattern of weavers' co-operatives, which will thus test out new techniques with new management, providing, as the Minister for Commerce and Industry has always desired, an element of dynamism in the static sector of cloth production. Finally, 14,600 automatic looms are to be permitted to add 350 million yards of mill cloth designed primarily for export. The battle for rationalisation—which once centred on automatic looms—has thus been temporarily drawn.

The achievements of the new cloth policy are seen to be threefold. In the first place, at least for some years, the futile political controversy between the Ambar Charkha and new spinning factory units has been closed. Secondly, our foreign exchange earnings are not now immediately imperilled, since a 1000 million yards are available each year for exports, with the assistance of automatic looms. Finally, there is contained in the new cloth policy the element of a wage and management revolution in the cottage industry sector, so that it may in time build itself on the basis of a reasonable wage, instead of being as at present merely a vast pool of sweated labour. In these three ways, the Government of India has served all sections of the industry and has earned the gratitude of the whole country.

The only major issue, involved in the new cloth target, is the question of whether the target is equal to Mr. Krishnamachari's general dynamism. At his Press conference this week and again at a notable meeting of the Central Advisory Board for Industries, Mr. Krishnamachari dwelt on the likelihood of the industrial targets—and particularly the targets for consumption goods—being appreciably raised. The first effect of new consumption goods will certainly be to arrest inflation. But it is likely that the proceeds of earnings in these goods will again augment the demand for cloth which has now been showing, perhaps for the first time, a rising rate of response to increases in money income. Estimates which have been made in the Research Section of *The Eastern Economist* lead one to believe that 8,400 million yards of cloth will not meet the demand if the targets of national income in the Plan are exceeded by any substantial figure. This might look like a point of detail, but, seeing that every addition to mill capacity now requires a major political exercise, the possibility that targeted mill production may be seriously inadequate must not be evaded. The best that can be said about the present compromise is that it is politically admirable. If the position is reviewed at the end of 1957 it may be adjusted so as to make it economically wise. But there is nothing in the magic of existing figures which suggests that equilibrium has been continuously secured by an arrangement for supply which bears no precise relation to consumption behaviour. The most that can be said is that this is a pragmatic affair, in which trial and error can alone show the way.

The handloom sector has been given a splendid opportunity whereby it can display its potentialities for absorbing the unemployed in the rural and semi-urban areas. An allocation of 1,000 million yards to handlooms would put all the available genius for organisation of a vastly dispersed industry on trial. Likewise, the expansion of the powerloom sector of the handloom industry,

on the scale envisaged in the new policy, will also throw a challenge to capabilities for organisation. A programme of building up a network of co-operatives with State financial assistance for installing 35,000 powerlooms in a matter of two years has been laid down for the present. It looks ambitious if past experience in the development of co-operatives, and particularly of weavers' co-operatives, can be taken as a proper indicator. There is also another reasonable argument which needs to be heeded. Is it not very likely, as the trend of informed opinion in the trade and industry as well outside shows, that per capita consumption of cloth in the next five years will rise to an absolute minimum of 20 yards? In that event an addition of 600 million yards to the expansion targets now assumed will be necessary and this will raise the question of reallocation of shares of additional production in the sectors of the industry. These are matters of detail which can be effectively tackled year after year as the progress of the textile plan comes to be checked up. But the basic framework of the policy has been laid on sound principles and this is what really matters.

The essence of a dynamic policy lies in its readiness to assimilate changes and modifications which would seem necessary for the achievement of the final goal. The Commerce and Industry Minister has amply explained that flexibility via audit of performance each year would be the basis on which the execution of textile policy would rest. A good deal of attention has been diverted to the issue how far the targets of production that have been assigned to the different sectors in the textile industry are appropriate and some debate has also taken place whether the assumption that per capita consumption will be of the order of 18.5 yards is correct and does not err on the lower side. These are undoubtedly important issues which will affect the implementation of the plan for textiles that has been evolved in the new cloth policy. But they will merit attention at a later stage.

Elsewhere in this issue there appears from our Bombay Representative *Croesus* an evaluation of the new cloth policy, as it looks to the city of Bombay. The picture there is by no means as happy as it looks from Delhi. This need not cause excessive concern. These are only indications that the pressures of cloth politics are still intense. But precisely because cloth has been highly invested with political emotion since Independence, this is the appropriate time to ask for a period of calm in considering the Government's recommendations. *The Eastern Economist* has no major criticism to offer on these recommendations because it recognises that any economic solution to be stable must be set in the appropriate political framework. The Government of India is to be congratulated on having found a solution of many difficult problems associated with the cloth situation, which should be acceptable to the great majority of enlightened persons in the country. Since the greatest cloth for the greatest number is not an acceptable political directive, one must find some other common factor in political agreement. This now is the securing of a certain minimum of production with the maximum placation of the new mechanical deity—the Ambar Charkha. One is sorely tempted to say that all is well that ends well. But since the end is not in sight, one might, perhaps more appropriately, say that tomorrow is another day.

State Trading in Cement

IT is no secret that for some time the Government of India has had under consideration—the Minister implied this at his Press conference this week—the introduction of the State Trading Corporation as a monopolist in the distribution of cement in the Indian Union. Various circumstances have suggested that a uniform price and an integrated selling policy were desirable at a time when acute shortages of cement are likely to be increasingly felt. To admit, however, that because an integrated policy is required, a central public distribution machine is the answer is to take too simple, and, indeed, a not wholly honest, view of a situation which calls for much greater scrutiny.

In the first place, the Government of India's policy in this important industry must be related to the Industrial Policy Resolution which was promulgated just two months ago. In this resolution, the cement industry stands totally outside category A and B and thus, as recently as April 30, the Government of India pledged itself solemnly not to enter this particular field. It is quite true that the Industrial Policy Resolution contained a provision for the control of industries in category C. But it is only in a wildly Pickwickian sense that one can reconcile control as applied to category C industries with the total monopolisation of distribution of their entire product in public hands.

It is clear, therefore, that the Industrial Policy Statement has met with a violation almost from the beginning; there is, indeed, no justification for such a violation if one considers either the performance of this industry or the needs of the situation with which the Government of India is faced. It was the cement companies in the first instance who pointed out to the Government of India as long as twelve months ago that the industry anticipated a shortage and suggested that it should be met by imports; it also undertook to arrange distribution of imports on a no-profit-no-loss basis. It cannot, under any circumstances, be contended that the cement industry has behaved in any manner calling for a violation of the undertaking that the Government of India gave to this industry in the Industrial Policy Resolution. If, indeed, such a violation has occurred, the Government of India owes it to the country to give chapter and verse and explain why it has chosen to revise an undertaking given less than three months ago.

There are two arguments which suggest that this industry requires a great deal of central planning. The first of these arises from the problem of prices. In this case it happens that domestic prices—largely through the efficiency of this industry in India—are about two-thirds of imported prices. Some equalisation of prices is, therefore, mandatory when large imports enter the field. Again, in order to arrange distribution—it is for this end and for this end only that the Government of India is proposing to act—it is desirable that the product should be marketed in a manner which does not do injustice to various portions of the country. The obvious method by which this is to be done is a uniform

price with a rationalisation of movement. The issue involved in the rationalisation of transport is connected not so much with the freight structure as with the economy in the use of transport. This, incidentally, is a consideration which must apply to every field because transport, through every year of the second Plan, will be a serious bottleneck.

All this raises no necessity for a State monopoly in distribution. In the case of the iron and steel industry—this is the obvious pattern to be followed—exactly the same problem of the equalisation of prices, and, to a limited extent, the rationalisation of freights so as to permit of uniform prices is in operation. In the iron and steel industry the Government of India has thus overcome these obstacles without recourse to State trading. It is obvious, therefore, that the contention that the monopolisation of distribution in the cement industry is written into the problem cannot be described as a fair and honest presentation of the case.

It is clear that there must be other reasons for the Government of India's insistence on distribution being placed in the hands of the State Trading Corporation. One of these—and anyone conversant with pressure in Parliament is aware—is frankly political. There was evidence enough during the session of Parliament that the Government of India was anxious to placate that section of opinion which wished to encroach on the private sector. It is known, too, that cement provides a particularly profitable field for such encroachments. In the shortage which at present prevails, the Government of India via the State Trading Corporation can easily net profits by the simple process of ordaining higher selling prices. Thus there is available not merely a political tool by which the Government of India can commend itself to Leftist ideology, but also a fruitful line of profit which may be exhibited at a right moment to cover any other failure on trading account which may visit the State Trading Corporation.

It is right that the country should know the facts. These facts are, firstly, that there has been a violation of a solemn undertaking given just three months ago; secondly, if the reasons which apply are the need of uniform prices and rationalisation of transport as in the iron and steel industry, the ends of the Government of India could have been met as effectively by control as in that case. Finally, if the issue is saving the face of the State Trading Corporation by the raising of prices in order to show profits, these profits will not be the result of trading but of the use of the monopolistic powers of the Government in a form equivalent to taxation. It is right that the principles involved should be debated in the country in the light of these considerations. There is no reason for indecent haste; it would not matter much if the Government's proposals were implemented a little later. *The Eastern Economist* asks that the country should be allowed to express its opinion on these issues before an irrevocable decision is taken.

Mineral Policy: Production or Preliminaries?

THE recent meeting at Bangalore which was designed to clarify mineral policy was useful as far as it went. But it is hardly necessary to say that it did not go very far. The reason for this is not that the Government of India has no mineral policy. It has one in abundance. It is willing to negotiate on its own terms with anyone, without any prejudice in regard to the area of the world or the side of the curtain from which they come. This is appropriate enough as a catholic policy for a neutralist country. But how does neutralism in collaboration assist in the attainment of the targets either of the Plan or of the long-period structure of mineral production against which the Plan is to work? For mineral policy is not a matter of five years only; it is a matter for a generation or two against which alone it will be known if the incentives that the Government of India proposes to put in operation will work.

This, and this only, is the question. Mr. K. D. Malaviya is to be given credit for a vast amount of personal enthusiasm which he has thrown in his task. But enthusiasm of itself cannot work miracles; nor, indeed, can agreements of which he has been the architect. There have been two major agreements with the USSR for launching a programme of exploration of mineral oil in Punjab and Rajasthan. They are concluded in pursuance of the recommendations made in the interim report of the team of Russian experts which have been accepted by the Government of India in substance. The broad framework of the policy of exploration is to start operations simultaneously, or more or less so, in different areas, the operations taking the form either of actual exploration or preliminary preparations. Precedence has been given to exploration in Jwalamukhi and Jaisalmer areas. The Soviet Union has undertaken to supply complete equipment for two oil drilling rigs along with accessories and spares, the latter to cover the requirements of one full year. Two teams manned by twenty-two experts each are to be deputed to assume charge of drilling work until responsibility is handed over to Indian nationals under training. The drilling rigs under this agreement are scheduled to be delivered by the end of 1956. Another agreement entered into immediately afterwards incorporates the same terms but provides for the supply of one oil drilling rig to be delivered three months later. This marks the first experiment of oil exploration in the public sector under departmental auspices.

If agreements alone were capable of supplying incentives and of overcoming technical or any other bottleneck, here, indeed, would be a talisman with which Mr. Malaviya could go happily to work. The truth is, however, there are no talismans in mineral policy. Like industry of all kinds, one must have the requisites of production. These are no other than what they have always been, capital, management and know-how and technical skills. No agreement which the Government of India has set out bridges all the gaps which exist in the mineral field. Even the agreements with the Soviet Union in their limited context of drilling operations do not go far enough. There are stipulations in both of them for the training of Indian nationals for which a minimum period of six months has been laid down. Very likely a longer period may be required to raise a cadre of

Indian technicians in this limited preliminary operation. But the real problem of setting up elaborate organisations needed to conduct the highly risky enterprise of production of oil has not been faced.

Oil exploration is something of a gamble and the actual outlay may swell to any figure. This is illustrated in the tentative estimate of the Russian experts which puts the cost of exploration at an amount three times the amount around Rs. 10 crores allocated in the second Plan. The protracted negotiations with the Assam Oil Company for the formation of a Rupee Company raise this problem of finance. If oil production is to remain almost exclusively in the public sector with partial room for foreign collaborating companies, the necessary investment of a large magnitude must get priority in the allocation of resources. But this is certainly not the end of the problem. Managerial and technological resources will have to be found on our own to the extent it may not be possible for us to induce them from abroad. It is hardly likely that a bold ambition of this character is contemplated. It means that co-operation in a high degree for technical and similar purposes will be essential from foreign enterprises. This is obviously a function of incentives on a full scale.

The conclusion is obvious, and that is that Mr. Malaviya is promulgating a policy unrelated to production. The Ministry of Natural Resources has got itself so involved in spacious agreements that it cannot recognise that it is down-to-earth production management which is required. Who is to provide this management? The Russians? The Americans? The Assam Oil Company? If so, why are they not more forthright in their declarations of their capacity?

The Russians, as far as can be seen, have produced an excellent technical report, but have not made promises. How can they? They have not yet located oil, which is only believed to be in the bowels of the earth. Nor, indeed, has the Standard Vacuum Oil Company, whose optimism on West Bengal has been a little dimmed at present. Only the Assam Oil Company has tapped oil in comparative plenty. This is no accident, because they have been working in the area for over forty years; showing that time is the essence of the piece. But even the success of this Company has not prejudiced Mr. Malaviya in its favour. The successful and the unsuccessful are equally kept at a distance while the new mineral policy finds its shape. Thus the Assam Oil Company has not been able to conclude its agreement for a Rupee Company which has been under discussion for over twelve months. And yet here and nowhere else is the issue of production in the period of the second Plan.

Production can only come when the preliminaries to production are complete. If the preliminaries to production take two years it is anybody's guess when production will reach the target. Meanwhile, Mr. Malaviya's time is running out; the country wants production, not excellent and inspiringly neutral agreements. Cannot the Minister of Natural Resources be as successful in production as in hard negotiation? Hardly, if he fails to conclude production agreements. Exploration is only the first stage. Alas! it is not necessarily followed by the second.

The chair B.O.A.C.
designed for the sky

'Slumberette' luxury by
all B.O.A.C. First Class
Majestic services

All the comfort of your
favourite armchair

Maximum relaxation—with
plenty of leg and elbow room

Not only does B.O.A.C. offer you marvellous food and wines and really personal service... you'll enjoy the foam soft luxury of fully-reclining "Slumberettes". They're wonderful to sit up in... blissful to lie back and sleep in... scientifically designed to give you maximum comfort all the time. Much greater space between rows of seats—only 30 passengers on board—gives you spacious roominess. Sleep when you will in a luxurious full-length "Slumberette"—a superbly restful bed—and arrive at your destination fresh and well rested. Consult your local travel agent or B.O.A.C. offices at Calcutta, Delhi, Bombay or Madras

All over the world

THE WEEK'S NOTES

CONGRESSMEN'S DILEMMA IN MAHARASHTRA

THE RESOLUTION passed by the Maharashtra Pradesh Congress Committee on the future of Bombay leaves open a question which one thought would remain closed for at least five years after the Prime Minister's recent unequivocal statement. In proclaiming that Bombay city is part of Maharashtra, but that it should not be given the right to decide its future, the M.P.C.C. has unwittingly weakened the Maharashtrian case, for if the claim is so very strong, why should the result of a popular vote be feared, as seems to be the case? The Prime Minister's formula for resolving the issue had taken into account Maharashtra's desires and aspirations, and it had been devised only to ensure that no irrevocable decision is taken in the present atmosphere of tension. Instead of trying to assure the other sections in the city that they will have nothing to fear from Bombay city joining Maharashtra, the present demand of the M.P.C.C. will not fail to cause misgivings in many quarters.

The dilemma of the Congress in Maharashtra is understandable. Having roused the mob, the Congress leaders there are unable to control them and are viewing with concern the other parties taking advantage of the passions that have been roused. To refuse to go along with the popular current would spell ruin and disaster to the political careers of many of them. Even as it is, it is uncertain what the future political set-up in Maharashtra is likely to be. The Congress's future in that State is none too bright, and it is understandable if some of the leading members of the party try to salvage as much of their personal and the party's reputation as possible; and to echo the growing demand for the immediate merger of Bombay in Maharashtra appears to them the only way. But how long and how well can such leadership, fearful of giving a correct lead in grave crises, serve the people well? To serve as mouthpieces of misguided, inflamed sectional public opinion may serve one's interests all right, but it certainly cannot serve the national interests, and the national interests, which should not be confused with the interests of a particular State or linguistic area, now demand that the leaders of Maharashtra discard their sectarianism.

MR. DESHMUKH'S RESIGNATION

WHERE THE M.P.C.C.'s attempt to resolve the dilemma facing Maharashtra Congressmen by permitting Ministers to resign their offices will lead, it is still too early to predict. But the High Command's reported decision not to allow such resignations should cause such of those who had intended to leave their posts to pause and re-examine their position. If the claim of Maharashtra for the inclusion of Bombay city is strong, there is probably a stronger case for postponing such integration to a date when linguistic fanaticism will have relaxed its sway.

The decision of India's Finance Minister, Mr. Chintaman Deshmukh, to resign is, however, on a somewhat different footing. It had become known even before the M.P.C.C. started its agitation that he was opposed to the exclusion of Bombay from Maharashtra and had offered his resignation. If he had not pressed it up to now, it was because he was hoping, with other Congress leaders in New Delhi, that an acceptable formula could be evolved. His decision now to press his resignation should not cause any surprise, though there is bound to be regret that he is leaving office at this juncture in the country's affairs on an issue of this nature after the Prime Minister's assurance. It is reported that he will not be covered by the High

Command's latest decision, but there is bound to be discontent among some at least of the other Maharashtra Ministers if they are not allowed to follow in the footsteps of Mr. Deshmukh. Reflection shows that such resignations cannot achieve much beyond vindicating the stand of the particular persons concerned.

CONFUSION IN PUNJAB POLITICS

THE REGIONAL formula for Punjab, evolved after long deliberations, is blurred by mutual suspicion and prejudice. The formula seeks to give special position to Hindi and Gurmukhi in respective regions without complete exclusion of any. But the Mahapunjab Samiti is opposed to Gurmukhi as against Hindi. Punjabi as a regional language commands as much a special position as any other recognised regional language and Hindi has its importance in the regional as also the larger national context. It is unfortunate that a new cult of linguistic hatred is developing in the country. The SRC report has dwelt at length on the protection of the culture of linguistic minorities and development of languages and they have been substantially accepted by the Government. It is, therefore, meaningless to continue to oppose the formula merely on the plea that Gurmukhi will suppress Hindi. This is certainly not the time to fritter away energies on small issues. And in any event violence cannot be allowed in furtherance of any grievance, real or imaginary.

In the midst of the din of appeals to religious and linguistic sentiments came Sardar Gian Singh Rarewala's bold call for the Akali Dal's merger with the Congress. But the call has not found favour with the executive of the Dal. Master Tara Singh wants the Akali Dal to continue as a political as well as a religious organisation. Nobody can have any objection to the Dal's continuance for the cultural and religious development of Sikhs. But it is unrealistic to mix religion with politics and sow confusion. In a democratic and secular country like India, it is always essential that more than one political party functions. But an effective political party cannot limit itself to the narrow confines of a particular community. The working of democracy becomes difficult if political parties are dominated by religious viewpoints. In the interests of the country as a whole, politics and religion must keep apart. Sardar Rarewala's move is commendable, but it was extremely unlikely that he would succeed in converting the Dal to his viewpoint. The initial reverse should not, however, deter Mr. Rarewala from persisting in what appears for the time being an unpopular mission. If he succeeds in gaining support for his move, he will have done a great service to the country as well as to his community.

BRITISH PUBLIC SECTOR IN TROUBLE

BRITAIN'S NATIONALISED industries are obviously in a bad way, and the 'autonomous' corporations in charge of them are being subjected to increasing political pressures. An active policy of intervention by the Government in the commercial policy of the corporations has, therefore, been partly accepted. Wage increases in some of the nationalised industries have recently been followed by price increases. In March last, rail freight rates and canal and dock charges were increased by 5 per cent. Four weeks later increases in post and telephone charges were announced. Last month an 8 per cent rise in coal prices was announced, making a total of about 26 per cent in one year. As further wage increases are now demanded on the railways and, probably, in the coal mines, a greater measure of Governmental interference in these industries is foreshadowed.

A TOWER OF STRENGTH

in India's Economy

The Americas and the Middle East are not the only places with oilfields! Oil is produced here in India, too, and derricks are a familiar part of the landscape at Digboi in Upper Assam. The Assam Oil Company has been operating this oilfield for over fifty years, producing some 300,000 gallons of high quality petroleum products daily.

Everyone in the country benefits from this flow of home-produced oil. It speeds food production. Keeps factories running smoothly. Keeps goods moving by rail, road, sea and air. Takes people to work and provides work for them—as well as saving precious foreign currency.

The Assam Oil Company itself employs over 8,000 'oil men'. It spends much time and money in looking ahead. Not only in training technicians and executives, but also in finding new sources of oil and new methods of processing it into the much-needed petroleum products which are so vital to India's expanding economy.

Representatives of the Federation of British Industries and the British Employers' Confederation are reported to have told Sir Anthony Eden last week that "Government's exhortations to the private sector of industry to reduce profit margins and keep prices stable lost much of their force when they were accompanied by frequent large price increases in the public sector." How could private industry, they asked, keep down costs or prices of goods and services while the prices of basic materials and services, over which they had no control, were steadily raised by nationalised industries?

If the wages question should unfortunately lead to increased political interference in the working of public corporations, the more important problem of efficiency, it is feared, might recede to the background. It is recalled in this connection that managerial standards in the nationalised industries are deplorably low. Absenteeism in the coal mines is now much higher than in the pre-war years; B.O.A.C. has not succeeded in obtaining even 10 per cent of the North Atlantic passenger traffic; British railways has not improved technically although in 1939 it was one of the most efficient; and, above all, British Electricity takes up to 100 per cent longer to build a power station than did British private companies before the takeover. It looks as though excessive labour demands and technical or managerial inefficiency together could discredit nationalisation more easily than any ideological argument of the advocates of private enterprise.

WORKERS' STATE WITHOUT WORKERS' CONTROL

THE EMERGENCE and growing power of a new privileged class in the "Land of Socialism" is a familiar theme, and the only apology for returning to it here is the current availability of information on the social composition of the Communist Party of the Soviet Union and its Twentieth Congress. As of January 1956, the C.P.S.U. comprised 7.2 million members in about 350,000 local organisations of which 43,000 were in industry and 80,000 on collective farms. The army alone accounted for anything between 15 and 20 per cent of the total membership of the Party. Some 15 per cent of all the members had a higher or uncompleted higher education, 52 per cent a secondary or uncompleted secondary education and 33 per cent an elementary or uncompleted elementary education. Although there were rank and file workers and collective farmers in the 33 per cent with little or no education, the percentage of the working class and peasantry was demonstrably low. Even the few workers and collective farmers entering the Party ranks soon ceased to be workers and collective farmers. While the proportion of the urban and rural proletariat tended to fall steadily from 1952, there was an enormous increase in the representation of the technical bureaucracy. Thus, in January 1956, there were 1.9 million specialists with a higher or technical secondary education in the Party. These specialist-officials, it may be noted, are the 'commanders of production'. M. Khrushchev's resolution at the Twentieth Congress suggesting that more of the 'progressive representatives of the workers and collective farmers' be accepted, is a further confirmation of the indubitable fact that the 'workers' and 'peasants party' has become a party of higher and secondary bureaucrats.

This social make-up of the C.P.S.U. was naturally reflected in the Twentieth Congress also. Of the total of 4,355 delegates, 506 were Party officials, 177 Government officials and 20 trade union representatives and Komsomol officials. Thus 52 per cent of the delegates

were members of the administrative bureaucracy, which therefore had an absolute majority. Of the remaining 652 delegates, 438 were directors of trusts, factories, works and mines, highway administration officials, directors of State farms and machine tractor stations, and some factory foremen and collective farm chairmen. Thus, in all, the higher bureaucracy, together with the intermediate-level economic bureaucracy, comprised 84 per cent, the military group, all officers, 8.5 per cent and the group of ideological leaders 7.5 per cent. Whither, one may ask, are the rank and file workers and peasants gone? Perhaps it may be easier for a camel to pass through the eye of a needle than for a poor worker to find a place in any of the higher organs of power in the 'proletarian democracy'.

JAPAN ON THE MULTILATERAL ROAD?

THOUGH JAPAN does not appear to have permanently switched over to multilateral trade, her recent move to provide for cash settlements in her usual bilateral agreements with countries outside the dollar and sterling areas is described as a significant first step in the right direction. These bilateral agreements have always provided for a flow of trade of roughly the same order in each direction with each of the 'open account' countries and required all payments arising from transactions with each of them to be channelled through clearing agreements so that Japanese purchases from these countries could be paid for in a form of foreign exchange that could be utilised only for financing spending within Japan itself. As existing bilateral agreements fall due for renewal, Japan is consenting to replace the clearing account method of payment by one which provides for cash settlement in some mutually acceptable medium of exchange. This switch-over has recently begun with the conclusion of a new payments agreement with Western Germany laying down that business transactions between the two countries are to be settled in the German mark or the pound sterling. Japan has also concluded a new agreement of a similar kind with Italy and introduced the cash settlements formula into payments agreements with Sweden, Argentina, and Thailand. As existing open account agreements with Brazil, the Netherlands, Indonesia, Finland and France expire, they are also likely to be revised so as to substitute cash settlements for clearing accounts. As far as the sterling and dollar areas are concerned, Japan is already agreeing to arrange her trade and payments in such a way as to achieve a broad balance with each of the areas as a whole instead of with each country in the two areas.

It may be noted that the trade pacts, just revised or due to be revised, are still designed to achieve a bilateral balance in transactions with Japan's main trading partners. But the introduction of the new form of settlement means that in case Japanese imports from another country cannot be kept in equilibrium with her exports thereto, the difference can be settled in a form of foreign exchange that can be utilised for financing payments transactions with other countries. If, in practice, the new arrangements enable deficits in payments transactions with some countries to be disposed of by utilising the proceeds of surpluses with others, Japan may be less disposed to press for a bilateral balance in her trade agreements. However, the speed at which Japan can move away from bilateral principles and practices may also be determined partly by the willingness of some at least of Japan's trading partners to grant liberal access to their markets to Japanese traders. Here, at any rate, the prospects are not stated to be quite bright, for Japan cannot, even if she wants to, unilaterally bring about a full switch-over from bilateralism.

STATE BANK OF INDIA

Successors to the Imperial Bank

Bank with the State Bank

OUR country is planning for prosperity. This cannot be achieved unless the interests of the small depositor, the small trader and the small producer alike in towns and in the countryside receive the same consideration that is bestowed on the more affluent constituents and the larger industrial units.

You are not perhaps aware that the clientele served by the State Bank of India consist predominantly of persons of modest means and modest requirements. It is on the broad and secure foundation of their patronage that the Bank's structure has been built and will continue to rest.

The State Bank's services are many-sided and it would interest you to know that your varied plans and activities—no matter how small they be—can be made to run more smoothly with the help the Bank can offer.

Why not talk things over with your nearest bank agent, or write for information?

WHAT IS THE "IRON CURTAIN"?

By

ODYSSEUS

IS THE IRON CURTAIN LIFTING?

I am ready to answer: Yes. But with such qualifications as may enrage the vast numbers of decent folk whose one idea is to live and let live and to forget about atom bombs. These friendly folk are angered by what they regard as the gratuitous distrust with which the Anglo-American leaders greet every Soviet gesture. The USSR have but to announce the demobilisation of a million men for western leaders to point out that (1) the Soviets are not inspired primarily by a desire to ease international tension but by their shortage of industrial manpower; (2) the demobilised million constitute trained reserves who can be remobilised within 48 hours; (3) the value of conventional weapons having fallen, the money spent on maintaining these men in an old-fashioned army is better spent in employing them in the manufacture of atomic armaments.

Before we can decide whether the Iron Curtain is lifting we need to remind ourselves of what exactly it consists, for the "Iron Curtain" is one of those labour-saving, shorthand phrases that we use to avoid having to repeat the same explanations of fact every time that we need to refer to them, and there is always the risk that it will become a thought-avoiding piece of woolly mindedness.

In democratic countries, every citizen has a constitutional right to travel around the world as he will. No democratic country gives itself the legal right to withhold a passport on ideological grounds. I know that attempts are being made in the USA to withhold that passports on such grounds but it is vital to note that these cases have aroused widespread protests in the USA and among the democracies because of their illegality, and that they have embarrassed not only the State Department but democrats in all countries. Moreover (a) these protests, (b) this embarrassment, and (c) the world-wide publicity given to (a) and (b) are three basic facts illustrating the gulf that separates a democracy in which protests, embarrassment, and publicity are possible, from a totalitarian state in which they are unheard of. If a democracy withholds a passport on political grounds it is violating a right, whereas in a communist state a passport is not a right but a privilege granted to those who have to go abroad on state business or on officially sponsored delegations. You will find no protest in "Pravda" against the withholding of passports from anyone, nor is the Kremlin ever embarrassed by indignation meetings in satellite countries.

EMPIRE OF FEAR

The Soviet state is obsessed by distrust, not merely of foreigners but of its own citizens. The latest evidence for this well-established fact is to be found in the outstanding book "The Empire of Fear" (A. Deutsch, London, 1956, 18sh.) by Vladimir and Evdokia Petrov, the Soviet diplomats who sought political refuge in Australia in 1954. As to their credibility as witnesses, here is what the three judges who made up the Australian Commission which examined their case have to say:

"During the many months of our enquiry, we have had the credibility of the Petrovs under constant scrutiny. In this regard, they started with a heavy handicap: they were persons who had deserted their country

and its services and were prepared to divulge its secrets.... both of them had become dependent for their protection and subsistence on the Australian Government, a fact which might induce them to invent or embellish evidence to please that government; the vicious attacks on them by some Communists and like-minded persons in the Court room and in a section of the press might cause them in revenge to strain their evidence. Such considerations made it imperative that we should scrutinise their evidence and assess their credibility with the utmost care. But during the long period in which they gave evidence we had many and extraordinary opportunities of testing their credibility and their accuracy.... During that time we had their demeanour under constant scrutiny.... and their evidence was capable of being checked, and was checked, in a variety of ways at a multiplicity of points.... We feel that in the final result we should find, and we do find, that the Petrovs are witnesses of truth. We also find their accuracy to be of a high order...."

If the Petrovs are "traitors", we ought to enquire why it is that no other country in the world emits such a flow of "traitors" as the USSR. To rebut this by referring to Burgess and Maclean, or Nunn May, merely brings the point into clearer focus. First, because the "traitors" of the free countries are a few isolated cases compared with the tens of thousands who desert the USSR. The official records of the UNO show that in 1951 alone no fewer than 12,000 people abandoned their families and possessions, and risked being shot by Iron Curtain frontier guards, to escape to the free countries, and it has been calculated that for every one who gets through between eight or nine are shot or caught, which means that the 12,000 were survivors of about 100,000 starters—I repeat these figures are for the year 1951 alone. Secondly, the "traitors" from the free countries went over to the Soviet camp because they had come to believe in the Communist ideology, i.e., they were driven by some inner psychological compulsion, whereas all those who have sought refuge in the free countries were driven by fear for their lives, i.e., by an exterior compulsion—the Soviet regime itself. It is a devastating criticism of that regime that it drives its own children to flee from it. Equally, it is a legitimate point in favour of the democracies that not one citizen has ever been driven to flee from a democratic country by fear, or indeed to flee from any other motive. (I do not, of course, count voluntary emigrants who leave one country to better themselves economically in another: such migration has nothing to do with politics or with fear).

Petrov observes that in all his 21 years as a professional State Security Officer he never came across one authentic case of foreign espionage in the Soviet Union in peace time. Yet thousands of Soviet citizens were charged with espionage against their own country, and shot for it. Public scapegoats like Zinovieff, Yagoda, and Beria, were invariably accused of being British or American agents, without a shred of evidence. Yet, according to the ceaseless warnings of the Soviet authorities, the USSR is so riddled with foreign spies that vigilance alone saves it from destruction! The fact is that the vast machinery of Soviet State Security is basically directed not against foreigners but against the Soviet people themselves. Its

task is to prevent Soviet citizens from developing sympathy or admiration for other foreign countries and to suppress all criticism and protest against the government.

All this is what we mean by the expression the "Iron Curtain." Observe that if the Iron Curtain shuts off Soviet citizens from contamination by foreigners, it simultaneously cuts off Soviet officials and leaders from first hand information about the outside world and understanding of its motives.

EFFECTS OF THE IRON CURTAIN

The miscalculations in Soviet policy that arise from this ignorance are among the more alarming factors in international relations today. One manifestation was the inability of Mr. Khrushchev to understand why the British Socialist leaders thought it necessary to ask him to secure the release of the several hundred Central European Socialist leaders imprisoned without trial for the expression of views. Mr. Khrushchev's continuing anger on this point is a measure of the depths of his incomprehension of the humane, democratic outlook. Nor can the incident be dismissed as minor, because it may affect Soviet policy towards Britain and the Commonwealth when next the British Socialists return to office.

These are the qualifications that should be made when conceding that the travels of Messrs. B. and K., and the slightly greater exchange of delegations now obtaining, will do something to ease international tension. Despite all the difficulties of carrying on a conversation through an interpreter, certain elementary facts cannot have escaped Mr. Khrushchev's observation: e.g. the high standard of living of the British working classes, the multiplicity of television aerials, of motor

cars, milk bottles, and the masses thronging the well-stocked shops.

But if I conclude with the warning that progress in Soviet understanding of foreign policies and motives can only be slow, it is not mere anti-Soviet-mindedness but a reminder of the moral to be drawn from Russian history. For it cannot be repeated too often that neither leopard's nor nations change their spots (at least not overnight).

Few realise that the passport system is a Russian invention, and that Czarist Russia maintained it, not as the democracies do today because they have got tangled up in bureaucratic red tape, but to prevent free intercourse between foreigners and Russians. The Soviet-born wives who have been prevented from leaving the USSR with their foreign husbands are the great-grand-daughters of those who were not allowed to leave Russia with their foreign husbands in the seventeenth and eighteenth centuries. There is nothing new under the (Russian) sun.

The methods of the despot—the absence of the rule of law, forced labour, exile in Siberia, government by the terror of secret police—are not typical of the Soviet regime but of something deep and persistent in Russian character and history. What the causes are I do not know. But if there is to be a cure, it will be spread over generations rather than years. For a detailed, authoritative, and up-to-the-minute account of the symptoms of the disease that has made the Russians such uncomfortable neighbours over the centuries, I refer you to the Petrov's deeply moving "Empire of Fear".

[This is the final article in the series "A History of the USSR Since Stalin's Death" (June 1), "What Goes on in the USSR?" (June 8), "The Duration of the B. and K. Era" (June 15).—Ed.]

EUROMARKET AND THE COLONIES

(From Our Special West European Correspondent)

PARIS, June 15.

NEXT Tuesday, June 26, the six powers who constitute Little Europe will meet again in Brussels to continue their negotiations for (I quote the communique issued after their meeting in Venice last month) "a treaty instituting a general common market and a treaty creating a European organisation for atomic energy". Though this agenda sounds very bold and determined, the actual elaboration of such treaties probably lies a long way in the future, while the implementation of whatever treaties are eventually drafted probably lies so far in the remote future as hardly to matter. But this sceptical attitude could be proven wrong, and even in so far as it is justified it does not exempt us from examining the likely consequences of such treaties for Europe and the rest of the world. I am concerned here and now only with the proposal for a "general common market"—that is, a European customs union—and more particularly with the impact of a Continental customs union on the Asian and African dependencies of the six powers.

New Delhi has appointed herself (and the appointment has been ratified by most of the world) watchdog and custodian of the colonial dependencies of West European imperialism. This role demands some provision of economic and political developments in those territories. It is the purpose of this despatch to suggest that a common market in Europe would have such extensive effects on European colonies as to deserve the close attention of anyone interested in the fortunes of dependent territories. But first it is necessary to recall what the common market plan means.

Euromarket (to use the twin neologism of Euratom) foresees that within a space of 12 or 15 years the six countries of Little Europe (France, West Germany, Italy, Holland, Belgium and Luxembourg) will progressively eliminate all customs barriers between themselves, will unify their customs tariffs with regard to the rest of the world, and will abolish all quotas, restrictions and the like that hamper the free movement of goods within the area. The intention of the proposal is to constitute a common market of 150 million people which would compare in size with, and in many respects exceed in resources, the two other great common markets of this earth, Russia and the United States. It is an attempt to unscramble the protectionist omelette, and to restore the advantages of free trade and the division of labour over an area big enough to matter in an era of economic gigantism. It is the twin (but by no means the Siamese twin) of the proposal for the joint exploitation of atomic power by the same six countries.

Obviously there is much to be said about such a plan in its purely European aspects, but I will content myself with observing that it is in essence a proposal for synchronising rates of inflation in an area where inflation has so far been a domestic matter, and that its slim chances of early and literal realisation are the results of the extremely complicated inflationary practice in the most inflationary of all Little European countries—France. However the point that concerns us now is that four of the powers in question possess colonial dependencies to the number of 20 or so (Luxembourg and West Germany are the only two without colonies), and in the latest version of Euromarket the idea is to include at least some of these territories in

the common market. This was not the idea at first, but in Venice at the end of last month this proposed extension gained favour and will be included in the Brussels discussions next week. If any large number of colonies were included in the common market, the economic consequences could be felt all around the world, from New Guinea in both directions to West Africa, because French, Dutch, Belgian and Italian dependencies circle the globe.

Indeed many of the colonies would automatically fall into the common market, supposing Euromarket were realised, because they are already part of a common market with one or other of the Little European powers. This would happen, for instance, quite apart from any decision on the point, in the case of France and Tunisia, which is not even a French dependency any longer but which does have a customs union with France. If France now entered a common market with Italy, Germany and the rest, presumably Tunisia also would form part of the same market, and would thus be able to import goods duty-free from the other five Continental countries and would have to sell her exports in the same common market. At least, if anyone has thought of a method whereby France could belong to two customs unions which were yet watertight from each other, I have not heard of it—and if such a method exists, I would like to know what the Tunisians think of it.

So the question of the relations between Euromarket and the European colonies is bound to arise sooner or later. The first and most obvious result would be to end each metropolitan power's monopoly in the supply of goods to its colonies, which would thereafter be free to seek their supplies in any of the six member-countries of Euromarket. This would obviously be a boon to a French dependency which would theoretically be able to replace expensive French imports with cheaper German ones. But of course this is only a first, and misleading, impression: the truth is that if Euromarket were to last more than a few weeks in Europe itself, French exports would no longer be more expensive than German, because the whole meaning of a common market is that prices are equalised. As Le Monde Economique et Financier said lately, thinking of French markets in the colonies, under Euromarket: "Either we are or we are not able to stand up to competition (within a common market), but if we are, then that will be the case everywhere" (that is, in the colonies as well as in Europe). The gain to the colonies would be no less real; only, it would not consist in replacing the mother country's exports by another's but in seeing the mother country's prices brought down by the common market to the lowest prevailing level.

But this gain would be balanced by a loss which in many cases would be substantial. Many colonies sell their own exports in the protected market provided by the mother country, where prices often rule much above free world rates. Thus, as Le Monde pointed out, the artificially isolated French market offers French colonies prices that are 20 per cent, 25 per cent or even more, above the free world prices for such products as sugar, coffee, cotton, groundnut oil, zinc and nickel. But in a common European market, Italian and Belgian cotton mills are not going to pay fancy prices for cotton from a French colony, and French mills which have to sell in competition with

ASIA • AFRICA • EUROPE • U.S.A.

them will not be able to do so either. Since imperialism is never wholly in favour of the metropolitan power against the colony (whatever colonial denouncers of "exploitation" pretend), we may assume that all the colonies have some vested interest in the protected market of the mother country, and so all stand to lose something in a common European market. And it must never be forgotten that in practice Euromarket would mean that the four imperialist countries would be struggling to get their prices down to the level of West Germany, which has no colonies and buys in the cheapest market, quite apart from any sentimental or political considerations.

At this stage some Indian reader will exclaim that Euromarket at its most perfect would mean nothing more for the colonies than British free trade meant for the Empire a century ago; the same advantages and the same risks. To an extent that would be true, but only to an extent because the world has changed

a lot in that century. Most of all, the manner of investment has changed. And it is here that Euromarket would most seriously upset the colonial economies. Over 80 per cent of French investment in the French Union today is made by the State, not by individuals and companies out of their savings. These State funds come from taxes and are thus reflected in French prices—and if prices are to be equalised throughout Euromarket, German consumers will not consent to the elevation of prices for the purpose of financing French subsidies to African colonies.

Though I have merely scratched the surface of a large problem, this is perhaps enough to suggest that Euromarket is not an experiment that will be limited in its effect to the Continent. While Little Europe confers next week in Brussels, may be Asian and African economists should be working out the consequences of Euromarket for themselves and their neighbours.

MEN WHO WILL MOULD OUR FUTURE

Our scientists are the pilots of our destiny... the men who will chart our industrial progress. And in order to provide them with every equipment and facility, 11 National Laboratories were established in the First Plan. In the second Five Year Plan over Rs. 20 crores will be spent on scientific and industrial research.

In the work of our scientists, as in the training of research students in our universities, paper will play an important part. In laboratories all over the country paper will provide the means of computation and instruction.

"planning begins on paper"

AGRICULTURE

Stepping up India's Fish Production: A 50 per cent increase in India's production, in ten years from now, is quite on the cards, if the development plans, currently envisaged, go through. Every year fisheries contribute about Rs. 27 crores to the country's national income, engage about 75,000 craft of various types along a coastline of about 3,000 miles, and give employment to some 750,000 fishermen. Technological improvement and research are a vital part of Rs. 12-crore scheme for fisheries included in India's second Plan. At the beginning of the first Plan, India produced about one million metric tons of fish per annum, the average catch per head being near 2,500 lbs. Development programmes, now proposed, are expected to increase fish production during the second Plan period by about 33 per cent, namely, to 1.4 million metric tons.

U.P. Land Reforms Amending Bill: The President gave his assent to the Uttar Pradesh Land Reforms (Amendment) Bill, 1956, on May 26. In February 1956, the U.P. Land Reforms (Amendment) (Second) Ordinance, 1956, was promulgated to provide that the question of title in respect of lands included in the question of consolidation operations may be referred by the Compensation Officer for determination to the Civil Judge having jurisdiction, who should there upon refer it for determination to the Arbitrator appointed under the Uttar Pradesh Consolidation of Holdings Act, 1954. The Ordinance was to expire on May 28, 1956, and the present Bill seeks to replace it. The Bill also seeks to remove certain difficulties experienced in the working of the Uttar Pradesh Zamindari Abolition and Land Reforms Act, 1950, and also provides for extension to adhvasis the facility of acquiring Bhumidari and Sirdari rights on evacuee lands.

INDUSTRY

Development of Sports Goods Industry: Sports goods, valued at about Rs. 1 crore are manufactured on a small scale basis in India every year. Under a scheme for the development of the sports goods industry, two industrial extension centres are proposed to be set up at Meerut in Uttar Pradesh and at Jullundur in the Punjab. Also groups of small-scale units, around central workshops, are to be set up for the manufacture of sports goods. The small manufacturers will be provided with built up accommodation for their workshop and residence either on hire-purchase basis or on rent. Provision will also be made for supply of electric power and water at reasonable rates. If required, they will be given loans for their working capital also. The central workshops will be equipped with machines and tools. Qualified technical personnel will be attached to the central workshops to guide the units in the improvement of technique of production and quality of products.

Blanks for Jute Spinning Roller Discs: The Indian Standards Institution has published an Indian standard specification for blanks for jute spinning roller discs. The standard prescribes the requirements in respect of the material and dimensions of blanks for jute spinning roller discs. The permissible size and location of knots have also been specified. The recommended code of practice for the manufacture of blanks, a list of approved species of timber for the manufacture of blanks and a short description of the approved species of timber have been given in three appendices to the standard. Copies of the standard, which has been prepared by the Jute Mill Wooden Articles (other than

shuttles). Sectional Committee, can be had from the Indian Standards Institution, 19, University Road, Delhi-8, and its branch office at Bombay.

Light Coal Tar Solvent Naphtha: An Indian standard specification for coal tar solvent naphtha, light, grade I, has just been published by the Indian Standards Institution. The standard prescribes the requirements and methods of test for the material in respect of specific gravity, colour, residue on evaporation and distillation range. It also prescribes tests for neutrality, acid wash and determination of hydrogen sulphide and mercaptans content. This standard has been prepared by ISI's Heavy Chemicals (Organic) Sectional Committee. Copies of the standard, are available from the Indian Standards Institution, 19, University Road, Delhi-8, and at its branch office, 40/40A, Cawasji Patel Street, Fort, Bombay.

Steel Foundry at Chittaranjan: The Government of India have decided to set up a steel foundry at the Chittaranjan Locomotive Works for the production of locomotive steel castings, which are at present imported. The capacity of the proposed foundry will be 7,000 long tons of finished steel castings annually. The foundry will be so designed as to permit of convenient expansion of its capacity to 10,000 long tons per annum. The Government of India have invited proposals from a number of American firms of consulting engineers for setting up the foundry. The US Technical Co-operation Administration will finance the dollar expenditure incurred on the services of consulting engineers. Proposals from the firms are due to be received in the beginning of July 1956.

New Type of Hydrogen Generator Developed in India: The new type of hydrogen generator developed in India is cheap to produce and at the same time uses a comparatively inexpensive process which, though well-known, has not been commonly used before in a portable low-pressure hydrogen generator. Hitherto, India has been importing all its requirements of hydrogen generators at a cost of Rs. 3,000 each. The special type of generator now developed in the industry itself costs Rs. 340 to produce. Production of these generators has started. The generator consists of two cylindrical parts, one of which may be called the reactor and the other a scrubber. Unit charges of a chemical called ferrosilicon are dropped from a receptacle into the reactor which contains a concentrated solution of caustic soda. The Hydrogen generated by the interaction of these chemicals is passed through the scrubber containing water which removes the free alkali particles trapped in the gas and also cools the gas, which is then led through a filling nozzle into the balloon. This is the first time that this principle has been used in a low-pressure hydrogen generator.

TRADE

Export Promotion: A foreign trade wing has been constituted in the Union Ministry of Commerce and Industry to step up exports of Indian goods. Key officials of the Commerce Ministry, of the State Trading Corporation and the small industries corporation from the wing which will act as a kind of "executive" for Export Promotion Councils and Co-ordinate their activities. The foreign trade wing may also suggest measures to check any fall in exports of certain commodities, as, for example, textiles. Another step is the formation of more Export Promotion Councils. Three more Councils are being formed for mica, shal, hides and skins. Several Councils are already functioning to promote the exports of cotton, rayon and

silk textiles, engineering goods, cashewnuts, paper, tobacco and plastics. In Teheran, it is considered essential to open a show-room of Indian goods where a wide variety of products can be exhibited. In Sikkim, the Commerce Ministry is contemplating starting an export drive and in China, an exhibition of Indian handicrafts is planned.

*

Osaka International Trade Fair: Valued at 2,063,910,000 yens (75 yens equivalent to Re. 1) were concluded at the Osaka International Trade Fair which was held from April 8 to 22. It was the second international exhibition to be held in the City of Osaka and the first since Japan became a member of the Union of International Trade Fairs last year. Twenty-three countries participated and displayed their products in 1,650 booths. Approximately 434,000 people, including 8,700 foreigners visited the exhibition. Contracts for 1,252,000,000 yens of exports, 268,000,000 yens worth of imports and 543,000,000 yens worth in domestic transactions were concluded. Leading export items were: textiles (700 million yens), and machinery (300 million yens). Principal purchasing countries were the United States, India, Hongkong and Singapore.

*

Import Licences for Iron and Steel: With a view to meeting the shortage of steel in the country, the Government of India have decided to import steel in larger quantities. Most of the imported steel will be consigned to the ports of Calcutta, Bombay and Madras. To facilitate the issue of import licences and customs clearance permit in the Western and Southern zones of the country and keep a proper check on the movement of imported steel to the Consuming Centres without any loss of time, it has been decided to open two Regional Offices of Iron and Steel Controller at Bombay and Madras. Bombay State, Madhya Pradesh, Madhya-bharat, Rajasthan, Saurashtra, Ajmer, Bhopal, Cutch and Vindhya Pradesh will be under the jurisdiction of Bombay Office. Madras State, Andhra, Hyderabad, Mysore, Travancore-Cochin, Coorg and Pondicherry will be under the jurisdiction of Madras office. The rest of the States will be under the jurisdiction of the Central Office of the Iron and Steel Controller at Calcutta.

*

Japanese Exports: A new post-war export record was set up by Japan in the year 1955-56 (April 1, 1955 to March 31, 1956) as Japanese goods valued at \$2,125,594,000 were sent abroad. This represented a sizeable increase of 24.5 per cent over the \$1,707,105,000 exported in 1954-55. A tremendous increase of 46.6 per cent was marked in exports to the Dollar area, reflecting the prosperous conditions last year. Exports to the Sterling Area were also favourable, but a decline was noted in the trade with the open accounts area because of the poor foreign exchange situation of the nations in that category.

FINANCE

Japan's National Income During 1955: National income during calendar 1955 totalled 6,574,500 million (\$18,263 million), a rise of 8.4 per cent over the previous year. National income for 1954 (6,062,800 million—\$16,841 million) was 6 per cent above its previous year. The main reasons for this rise in income in 1955 were the bumper agricultural crops and rise in export. Reflecting this, income rise for the primary (agriculture-fishery) and secondary (manufacturing and mining) lines was outstanding. Also notable was the gain in proprietors and Corporate income. On the

other hand, increase in expenditures for consumption and plant and equipment investments was comparatively mild, and price trends were stable.

*

Procurement Authorizations to Aid India: The US International Co-operation Administration has announced new authorizations totalling \$500,000 for the purchase of pipes, valves and fittings for use in India. Procurement of the supplies will be carried out through the India Supply Mission in Washington. The authorizations, which are announced periodically, implement aid programmes already agreed upon by the two countries.

GENERAL

Bombay Trade Unions Amending Bills: The President has given his assent to the Indian Trade Unions (Bombay Amendment) Bill, 1956. Under Section 33 of the Indian Trade Unions Act, 1926, the Registrar of Trade Unions may make complaints in respect of offences under section 31(2) within six months of the date on which the offence was committed. The Bombay Government have found that in most cases the offences come to the notice of the Registrar after the expiry of this period. They therefore, consider that section 33 should be amended to enable the Registrar to make complaints six months after the offence came to his notice. The present Bill has been drawn up to achieve this.

*

Gram Sevikas for Central Social Welfare Board's Projects: About 1,125 Gram Sevikas or Village Level Workers for the Central Social Welfare Board's Welfare Extension Projects are scheduled to be trained in 1955-57 in 20 training centres of the Kasturba Gandhi National Memorial Trust, situated in different states. In addition to the 16 Centres of the Trust already in existence, 4 more are proposed to be opened by the Kasturba Trust, one each in Uttar Pradesh, Pepsu, Rajasthan and Hyderabad (Telangana), to facilitate training of the larger number of Gram Sevikas required. The course will commence in July next and will last for a year.

*

Employment Situation During April 1956: The employment seekers registered at the Employment Exchanges during April, 1956, numbered 1,33,574 as against 1,21,399 during the preceding month. The Exchanges submitted 84,478 applicants to the employers for selection during the month as against 86,396 during the preceding month. The number of placements effected was 16,624 as compared to the corresponding figure of 15,504 in the previous month.

*

Electricity Output: During January 1956, 731 public utility undertakings in India, produced 755.6 million Kilowatt hours (kWh) of power, of which 621.8 million kWh were sold to ultimate consumers. Power generation during the month decreased by 23.7 million kWh in comparison to December, 1955. One diesel-generating station at Begusarai in Bihar, and six purchasing undertakings at Jagatpur, Bahugram, Salepur, Kendupatna and Rourkella in Orissa and Rajpur-Sonarpur in West Bengal were the new additions during the month. Power output and sale during January, 1955 were 665.8 million kWh and 545.2 million kWh and during January 1959, 210.9 million kWh and 176.6 million kWh respectively.

NEWS IN BRIEF

INDIAN

The Government of India has sanctioned about Rs. 70 lakhs for an interim Ambar Charkha programme during 1956-57.

*

The Reserve Bank of India has fixed June 30, as the last date for making applications for transfer of bank accounts from Pakistan to India.

*

An official delegation will shortly leave for London to finalise details of the agreement signed last February with British steel interests for the construction of India's third steel plant at Durgapur.

*

The Government of India has sanctioned the issue of fresh capital by the Indian Iron and Steel Company on the basis of one right share at Rs. 13-8 for each ordinary share held. The issue of this right share will be made after November 1, 1956.

*

The Government of India has decided to license freely for export rice husk (paddy husk—outer shell of paddy) to all permissible destinations up to the end of June, 1957.

*

Export of de-oiled groundnut meal will be allowed freely to all permissible destinations as hitherto up to the end of December 1956, without any quantitative restrictions.

*

The World Bank is expected to complete negotiations before the end of June on its biggest ever loan to an Asian country—about \$70 million to \$75 million for the Tata Iron and Steel Company of India.

*

India's total trade increased to Rs. 1,248 crores in 1955 from Rs. 1,179 crores during the previous year.

*

A sum of Rs. 6,51,892 was sanctioned to State Governments and voluntary organisations for nursery schools during the first Five-Year Plan.

*

About 400 gram sevikas, drawn from 18 States, are at present undergoing training at home science training centres.

*

The number of Post Office Savings Bank Accounts in India increased to 5,384,147 in 1955 from 4,090,020 in 1951.

*

Electric meters of the estimated value of Rs. 3 crores were manufactured in India during 1955.

*

During 1955-56, 164 licences were issued for setting up new industrial undertakings as against 110 during the previous year.

*

India's exports increased from Rs. 563 crores in 1954 to Rs. 604 crores in 1955.

*

Sugar machinery of the value of about Rs. 19,03,500 was manufactured in India during 1955.

*

The Government of India have sanctioned Rs. 42.63 lakhs for road development schemes in Andhra, Bombay, Tripura and N-EFA.

FOREIGN

US employment was at its highest 1956 level during May, reaching 65,238,000. It is reported the increase resulted mainly from the usual large expansion in agriculture and a sizeable gain in construction. Total farm employment during May was 7,146,000.

*

B. A. Shawinigan jointly-owned subsidiary of British American oil and Shawinigan Chemicals, is expanding its plant in Montreal East to increase production of phenol by 50 per cent.

*

The first milk-drying plant in Costa Rica, for which the United Nations Children's Fund supplied \$106,000 worth of equipment has been opened. The plant which will conserve surpluses during the rainy season, will make possible the free distribution of milk to 50,000 children and mothers.

*

A British manufacturer has successfully installed an engine for permanent operation in water. The engine can be stopped and restarted while submerged although the starter motor is also under water. Four pipes for the air intake, exhausts, fuel and lubricating oil are above water level.

*

A high level Conference at Murree has prepared a five year plan to increase production not only to bring self-sufficiency but also to the extent of sparing wheat for export to Middle East countries.

*

Mineral production, especially of coal, petroleum and iron ore continue to increase in Asia, according to a report on Mining Development in Asia and the Far East 1954-55.

*

According to the data published at a consultation of experts for urban development held in Portoroz, there are 28 specialised organisations in Yugoslavia at present engaged in the drafting of urban projects, plans, designs and blueprints, employing 221 engineers, 91 technicians, and 16 other employees and external associates.

*

Ceylon is reported to have decided to break away from the International Wheat Agreement. It may sign bilateral agreements with wheat producing countries to get its annual requirements of 200,000 tons of wheat and flour.

*

A regular budget of \$10,700,000 for the World Health Organization in 1957 has been approved by the World Health Organization Assembly in Geneva.

*

The Chancellor of Exchequer, Mr. Harold MacMillan told the Commonwealth Correspondents' Association that Britain's long-term overseas lending in the sterling Commonwealth has been well over \$100,000,000 annually for the last four years.

*

Electrical exports from the United Kingdom in 1955 reached a record figure. It is reported £245,000,000 worth of electrical goods was sold overseas—an increase of more than 12 per cent over 1954, and the largest annual increase since the war.

*

A meeting of the member-countries of the International Tin Agreement will be held in London on the 29th inst to decide the date on which the Agreement will come into effect.

STRUCTURAL CHANGES IN BANKING—1951-1955

HOW far is the dynamism of the Indian economy, displayed in the later period of the first Five-Year Plan, reflected in a change in the pattern of the banking system? There has in fact been a steady departure from the conventional pre-1952 pattern. There is a significant shift towards greater application of banking funds to the requirements of industry in the short run, but undoubtedly of more vital importance is the larger participation of banks in financing the public sector. Quantitative growth has extended increasing assistance to the traditional classes of activity. But in the main there are healthy indications that the expansion of the system is exhibiting a capacity to meet new demands under the impact of a planned change in the economy towards greater industrialization.

During the last five calendar years which correspond virtually with the period of the first Five-Year Plan, there has been a spectacular increase in the volume of aggregate deposits by Rs. 180 crores to Rs. 1,000 crores. Over Rs. 100 crores of this increase has come through time deposits; less than half of this has been contributed by demand deposits. The increase in both types of deposits has an important bearing on the strength and capacity of the banking system to gear itself to the wheels of higher activity in both sectors of the economy. The outstanding characteristic of the growth of the system is the acceleration that started in the third year and proceeded with remarkable speed in the last two years. Thus between 1953 and 1955, total bank deposits leapt from Rs. 825 crores to Rs. 1,000 crores. This phase coincides with the phase in which development in the first Plan gained its real momentum and demonstrates the capacity of Indian banks to absorb a high proportion of the increments in currency supply pumped into the economy. This was partly but by no means closely correlated with deficit financing.

The changing pattern of the ownership of demand deposits has a direct bearing on the structure of bank advances by reason of the correlation between the two. The trends in these changes show the emergence of the relative importance of organised industry, next after this category, of financial, plantation and public utility concerns. In absolute terms, personal deposits and trading concerns must continue to dominate the pattern of ownership of deposits. Table I in this article discloses that between 1951 and 1955 the volume of deposits from these two sources remained nearly stationary. If the year of the Korean boom is ignored, personal deposits show an increase but not deposits of trading concerns. The factor which emphasises the change in the character of ownership is the decline of these two types of ownerships by 2 per cent each over the period. They have lost ground to important classes of holders of deposits in the system. Total deposits of manufacturing concerns in quantitative terms have risen by 20 per cent to Rs. 60 crores. The growing interest which the other classes of deposits are exhibiting may not show an impressive impact on the total volume of deposits, but it underlines a vital shift in the character of ownership. In effect it means that diversification in ownership tends to follow the diversification in the structure of the economy. The share of industry in deposit ownership must in future assume more rapid acceleration in growth. It is not implied that this change will upset the balance in deposit holdings in a substantial measure, but the steady development in the new direction is clear enough.

The impressive spurt in the volume of deposits has been instrumental in channelling larger funds into the credit system through bank advances. Over the five-year period the increase in the volume of bank advances has been of the order of Rs. 65 crores and if the year of the Korean boom is excluded the quantum of increase rises as high as Rs. 135 crores. Table II

TABLE I.

OWNERSHIP OF DEPOSITS OF SCHEDULED BANKS IN INDIA BY TYPES OF DEPOSITS

(Year-end Figures in Lakhs of Rupees)

GRAND TOTAL	993,53	—	909,93	—	823,07	—	814,35	—	821,62	—

corroborates the stringency of credit in the third year. But the full impact of the tempo of outlay in the last two years of the Plan is clearly seen in bank deposits as well as advances. Advances moved up by Rs. 150 crores in 1954 and 1955. As important as this overall increase is the distinct change in the character of advances made by banks. Advances to industry have risen both absolutely and relatively. Over the five years the increase in this sector has been the highest among all the classes at Rs. 27 crores. A trend of similar significance is the shift in the provision of accommodation for wholesale trade in non-agricultural commodities. It has altered the equilibrium in advances in this category and reversed the ratios of advances for trade in agricultural and non-agricultural commodities. The latter now get about three-fifths of the advances for this purpose. The new pattern of bank advances with its progressive bias to finance business and industrial activity cannot fail to acquire a stable and widening base in the second Plan period. There can be no doubt about its capacity to respond to the objectives of the second Plan with its basic emphasis on industry.

The investment portfolio of banks has come to produce a large repercussion on the public sector's

demand for financial resources. Table III gives clear proof of the role which bank funds play in this respect. Almost the whole of the increase of Rs. 100 crores in banks' investments has been directed into government securities. It raises the issue of the participation of banks in the loan programme for the second Plan on a vigorous scale. The increase in investments of banks in the public sector in the last five years has been of the order of 50 per cent of the increase in the volume of deposits. Assuming that the addition of currency over the period of the second Plan will be of the order of Rs. 800 crores, the behaviour of bank deposits in the recent years indicates a rise of Rs. 600 crores in their total volume. At the rate obtaining in the first Plan, the minimum contribution of banks to the market loan programme of the second Plan fixed at Rs. 700 crores might be Rs. 300 crores. With sufficient pressure exerted by the Reserve Bank on the investment policy of scheduled banks, their loan subscription can be pushed to Rs. 400 crores on a reasonable estimate. This is only one indication that the loan target can be pitched higher to reduce the uncovered gap in the Plan resources. And in spite of this "persuaded" direction of bank funds into public loans, a sizable surplus of Rs. 200 crores or more will be available for the requirements of the private sector.

THE AUTOMATION CONTROVERSY IN THE U.K.

BY DR. N. DAS, I.C.S.

[The writer of this article, who has just returned from a visit to the UK, was in that country when the controversy over "automation" was at its peak. He also had the opportunity of discussing the issues involved with representatives of management, both in the public and private sectors, and of labour there.—Ed.]

THE bogey of "automation", which assumed such alarming proportions in UK in April and May this year and which culminated in a strike at the factory of the Standard Motor Company at Coventry (happily settled since), has lately been placed in its proper perspective by the Report issued by the Department of Scientific and Industrial Research of that country, published on May 16 last.

The strike at the Standard Motor Works was unfortunate, inasmuch as it was brought about by the local shop stewards and not by the leaders of the Trade Union movement. In an all-out effort to keep up with its rivals in the motor-car industry (Ford at Dagenham, Vauxhall at Luton and the Austin-Nuffield Group which forms the British Motor Corporation), the Standard Motor Company announced in April last the launching of a £4 million investment programme on automation. As soon as the first steps were taken, certain workers had to be told that they were surplus to requirements. This immediately led to the strike.

Although the origin of the strike was the shop stewards' demand to share short time among all workers rather than let any become redundant, the issue soon became a national one. The question was asked whether automation, which threatened the jobs of workers and their way of working, should be introduced, in any undertaking or industry, by the management on their own responsibility, i.e., without consulting representatives of workers (the Trade Unions).

For days together, in the latter half of April and the first week of May, many of the newspapers carried such sensational headlines as "Automation—the crisis is here now!" "The Robot Revolution and You". "What will happen to Britain's industry?", etc., etc. Even sober newspapers like the "Times", "Manchester Guardian" and the "Observer" could not escape the heat that had been generated and more than one editorial appeared in each of these papers trying to sort out the issues involved and give a lead to the country.

The UK Government committed an initial blunder in the early stage of the strike. Just before Easter, the Labour Opposition in the House of Commons staged a debate on the threat of redundancy in the motor car industry. One after another, Opposition M.P.s. urged Mr. Iain Macleod, the Minister of Labour, to face the crisis which was brewing and to intervene before it was too late. Mr. Macleod's answer was cold and concise: "Ever since we came into the Government, we have held the view that the size of the labour force is essentially a matter which would not be determined by the Government." In plain language, this meant that if the management of a big concern decided to sack hundreds of men and replace them by automatic machines, and even if the men resisted by strike action, the Government of the day would not intervene. It looked as if the Government refused to share with the management and the trade unions the responsibility for planning the transition to the age of automation. As a result, even the sober section of the Trade Union movement, which did not support the strike, became critical of the principle of automation.

Later, the Government realised their mistake. As the controversy threatened to affect the working of other industries, both the Prime Minister (Sir Anthony Eden) and the Minister of Labour agreed that Government could not behave as a disinterested spectator in a matter which might affect not merely the working conditions of hundreds and thousands of people, but also the competitive position of British industries. They held urgent consultations with representatives of employers and the Trade Unions, and, finally, the strike was called off. Government also gave the assurance that the Report on Automation prepared by the Department of Scientific and Industrial Research would be given the widest measure of publicity and that all the issues raised would be discussed threadbare in consultation with representatives of those who were likely to be most affected by this "robot revolution".

What exactly does this much-discussed word "automation" imply? According to some, it is nothing but "machines looking after machines". In this sense, it is the third phase in the development of modern industry, the first being mechanisation and the second, line production. All the three phases may be said to be continuous, progressive and overlapping.

The origins of "automation" go back to the Industrial Revolution. In so far as it replaces human muscle, it continues a trend which started two centuries ago. Thus, the transfer machines now used in engineering works are the descendants of the first automatic machines used in spinning, weaving and engineering. In most countries, this has been the principal application of automation to date—to move work, with the help of machines, from one set of processes to the next and to maintain the flow of production unchecked.

But there have been two other trends in recent years. These are (a) the use of remote control techniques to measure changes in processes and to provide the necessary correctives, and (b) the use of electronic computers which started as machines to do complicated sums at great speed but which, with their capacity to "store" information fed into them, can not only make, for example, the wage calculations in a big factory, but actually control processes. The first of these techniques (this also started with some of the gadgets of the Industrial Revolution) is being used particularly in the chemical and petroleum industries, while the second is being used in some industries in the USA and possibly also in the USSR.

Now, while, in a sense, "automation" is but an extension of the principle of "mechanisation", in another sense it is slightly different. "Mechanisation" means the development of machines to replace human labour; "automation", on the other hand, means the development of machines to control other machines. The rapid growth of modern electronics has resulted in machines which can control a whole series of machines on the factory floor or in an office, and can even supervise complete industrial processes. In any case, automation has not been a brand-new development in UK. Most of her steel mills and oil refineries are already 80 to 90 per cent automated and, at the Esso refinery at Fawley, only six men at a time are said

to be needed to process nearly one-third of Britain's oil products.

The point at issue, however, is not whether "automation" is something new or whether it is merely an extension of something which has been going on over the past two hundred years. The points at issue are whether (a) "automation" is inescapable if Britain is to maintain her competitive position in the world market, and (b) how UK (and other countries) should go about it so as to cushion the human dislocation it is bound to cause.

As regards the first issue, all concerned (including representatives of labour) now agree that, if Britain is to maintain her competitive position in the world market, she must "automate or perish". The rapid strides made by "automation" in USA, West Germany, France and USSR and the consequent reduction in costs and increase in productivity leave no choice to UK in the matter and the labour movement in that country is well aware of this grim fact. Secondly, "automation" is not all hardship even from the individual worker's point of view. It would take much of the donkey work out of the manufacturing industries, thus making things more congenial for him. It would also mean higher wages, less hours of work per week and greater leisure.

As regards the second issue, it has been argued that, just as the development of machine tools downgraded operational labour while upgrading the fitter and the machine-tool maker, so the new processes would mean not only more skilled equipment-makers, more maintenance men, more design engineers, but also more scientists and more technologists. The Board of Trade in UK has recently stated that if the British factories were fully "automated", there would be treble the demand for electric power today: the demand for labour would thus be merely transferred to other fields—from operational processes to machine-making and power-making processes, from routine and semi-skilled jobs to more skilled and individualistic jobs. But this transfer or "adjustment," as some would like to call it, is bound to take time. In the short period (and the

period may not be so very short), the introduction of "automation" in existing industries is bound to lead to some unemployment and some hardship to certain categories of workers. Even in a state of full employment, as in UK, there may be local difficulties in places where an industry employs the whole local labour force. Older men might find it difficult to learn the new skills they would need in another job. To ease the transition to automation, therefore, due attention must be paid to the needs, feelings, and problems of the workers concerned and the Trade Unions should be consulted at every stage to facilitate redeployment of surplus labour. The dismissal of large groups of workers can be avoided in many cases if managements plan their manpower programmes well in advance.

It is for other reasons, however, that the transition to "automation" is not going to be easy in UK. The first is the vast quantity of money required. In the USA, the introduction of "automation" in the motor car industry alone has been costing something like two billion dollars per annum since 1954. It is doubtful if UK would be able to afford, in the foreseeable future, the huge capital investments involved in full-scale automation. Secondly, there is already a crying shortage of technical personnel for manning industry at its existing level. "Automation" would require more of such men and of a much higher standard: these cannot be produced overnight. As a matter of fact, most observers now agree that, with the best will in the world and other conditions remaining favourable, the change-over to "automation" may take some 15 to 20 years in the UK.

To us, in India, "automation" is now like a distant comet, to be viewed only through a telescope and its movements studied in the rarefied atmosphere of an astronomical laboratory. But the issues raised by this "bogey" word also apply to the allied problems of mechanisation and rationalisation. Moreover, with competition in the world market growing keener and keener every year and the rapid developments which are taking place in science and technology, one need not be surprised if the problem stares us squarely in the face in another ten or fifteen years from now.

SERVICE IN INDUSTRY

By N. BARWELL and S. S. KAR

Demy 8vo

995 pages

Rs. 37-8

This is the Second Volume of the monumental work on the Law of Service in India and, as the title indicates, deals exhaustively with all the industrial legislation in this country with particular reference to service. It contains

Economic Report from the U. S.

BUSINESS OUTLOOK FOR 1956

(By Guy Sims Fitch)

WASHINGTON, June 19.—"In spite of a good deal of talk of contraction, and worry about where our economy is going, 1956 promises to be our best year in history in terms of production, employment and earnings". This is the judgment of a hard-headed and respected economist—Dr. Emerson P. Schmidt, Director of the US Chamber of Commerce's Economic Research Department. He made the statement last week at a Chamber-sponsored symposium reviewing at mid-year the American business outlook for 1956. If Dr. Schmidt's reputation needs any bolstering—he was one of the few economists who in 1945 correctly predicted the strong and steady post-war expansion of the United States.

Farm prices have been edging up in recent months. Even with automobile sales and production lagging behind last year, 1956 will still be the third-best automobile year in history. Housing starts are down somewhat from last year, but still will equal the average rate of the last five years. A number of important "expansionist" forces, meanwhile, still are at work. New construction, particularly commercial building, is on its way to a new annual high, despite the housing dip. Business outlays for new plant and equipment, already at record levels, are expected to go on expanding throughout the year. It is worth recalling, in this connection, that the United States never has experienced a general economic downturn of any severity as long as this type of spending has held up.

Exports and imports both are at an all-time high, and with most of the world also experiencing high levels of prosperity and expansion, they are likely to remain high for the rest of the year. In Dr. Schmidt's opinion, the "conspicuousness" of the few troublesome areas (automobiles, housing and agriculture) has been causing "undue concern" about the American economy as a whole, and even in these fields, he holds the period of major decline has passed, while the rest of the national economy has continued to operate at virtually full capacity. In spite of an increase in the American labour force of nearly two million in the past year, unemployment in the United States actually is lower now than it was a year ago. Worth while employment opportunities are open both to new entrants into the labour force and to workers seeking new jobs. Consumer income and spending are expected to remain at record levels.

These views advanced by Dr. Schmidt received general support from the industry representatives taking part in the symposium. Noteworthy—despite the deary picture drawn by the spokesman of the automobile dealers—were the opinions expressed by those selling goods to the public. Department and speciality stores, for instance, expect 3 per cent sales increase this year over last year's record rate; variety stores look for a rise of from 3 to 4 per cent, and food stores of 4.5 per cent. The only serious dissent from the generally favourable outlook came from a representative of the banking community. Justin Bowesock, Executive Vice-President of the Union Trust Company here, pointed specifically to the present "tight" money policy of the US Federal Reserve Board. He likened this policy—which tends to restrict business and consumer credit at a time when some segments of the economy appear to be slipping and when industry needs financing for its huge expansion programme—as "shutting off the furnace just at the beginning of winter".

But Dr. Schmidt defended the Federal Reserve policy, holding that it has kept a potentially explosive

rate of expansion at a level consistent with economic growth, full employment, high overall prosperity and reasonable price stability. If, in the process, "tight" money has pinched in some places, that is exactly what it was meant to do. The tightening of credit policy has been debated along these lines for some time now. Whatever the merits of the pros and cons, this much is clear: the Federal Reserve is in a position to relax credit if it should see a new need for stimulating economic activity. This flexible policy is in itself an important guardian of economic stability.

THE TEXTILE PLAN

By
CROESUS

IF the stock markets have not greeted the announcement of the four-point programme for production of the additional requirements of 1700 million yds. during the second Five-Year Plan period, made by the Union Minister for Commerce and Industry at a Press Conference in New Delhi, on Monday, with a sharp rise in textile share prices, it is as much because the news has been fully discounted ere now, as because there is nothing very much in it to enthuse either the mill interests or the markets. Nevertheless, all must regard it as a very important policy statement, in that it means that the Government of India does not believe in allowing the cotton mill industry to stagnate at around the 5000 million yds. level of output as had been urged by the Karve Committee. Many would have liked the authorities to have been equally realistic in disregarding the other findings of the Karve Committee as well, but, probably as a gesture—single, not singular—to that Committee, they have accepted its estimate of 1700 million yds. increase in the demand for cloth during the second Plan period. This means Government have accepted a slightly higher 'per capita' consumption figure (18.5 yds.) than the Kanungo Committee's estimate (18 yds.). But the influence of the Karve Committee ends there. The latest Government policy obviously follows the recommendations of the Kanungo Committee than it does those of the Karve Committee.

The highlights of the latest policy pronouncement are:

(i) that the total internal cloth requirements of the country (based on a 'per capita' consumption of 18.5 yds.) for a population of 400 million by 1960-61 would amount to 7400 million yds;

(ii) that 1000 million yds. would be required for export;

(iii) that the respective shares of the mill industry, the handloom industry (a) from mill yarn and (b) from Ambar Charkha, and the powerloom would be 5350 million yds., (a) 2200 million yds., (b) 300 (2500) million yds., and 400 million yds., and

(iv) that 150 million yds. would be held in reserve, to be allocated later, presumably to that sector of the cotton textile industry which fulfils its quota duly.

Now, mill interests do not share the view that the total internal cloth requirements by 1960-61 would be only 7400 million yds. It may be recalled that, in their joint memorandum to the Planning Commission some time ago, the Bombay and the Ahmedabad Millowners' Associations had postulated this figure at around 8800 million yds. on a 'per capita' consumption basis of 22 yds. However, it is difficult to be too dogmatic on this point, although a study of the consumption pattern in this country, coupled with the expected increase in purchasing power as a result of the large outlay under the second Plan, seems to indicate that the 'per capita' consumption will be certainly higher than 18.5 yds.; even assuming that the rise will not be sudden but only gradual, say at a rate of two yds. per annum, the more reasonable figure would be 20 yds. However, it is gratifying to find that Mr. T. T. Krishnamachari has not ruled out such a higher 'per capita' target. On the other hand, during his Press conference, he categorically stated that Government was "not unprepared" to accept a higher target, say 20 yds., if competition between now and the next 12 months rises materially". He further said that, if the target increased, a decision would be taken about its allocation at the proper time.

Evidently, this relatively cautious approach of the Union Minister for Commerce and Industry today as compared to his more optimistic evaluation earlier stems from the fact that the 'per capita' availability of cotton cloth in 1955 was only around 16 yds. as the following figures show:

Mill production ..	=	5094 Miln. yds.
Handloom production ..	=	1480 " "
Powerloom production ..	=	273 " "
Imports ..	=	6 " "

Total availability ..	=	6853 " "
Less exports ..	=	873 miln. yds.
" supplies to Government of India, Defence, etc.	=	29 " " = 902 " "
	=	5951 " "

Per capita availability 5951
= 16 yds.
372

Incidentally, the foregoing figures show that, in 1955, all the three sectors of the Indian cotton mill industry accounted for nearly 150 million yds. more than the figure reported to have been mentioned by Mr. T. T. K. at the Press conference, namely 6700 million yds. On this basis, there would seem to be no balance of 150 million yds. to be allocated later to any sector. Accordingly, mill circles do not seem to entertain any hope that this unallocated balance would go to them even if they produce their quota in full—and they are in no doubt on that point. If anything, they may only expect to be asked to make up the shortfall, if any, in the event of the handloom, the Ambar Charkha and the powerloom failing to fulfil their respective quotas. In saying this, I know I am laying myself open to the charge that I am a sceptic devoid of the required faith in Ambar Charkha and handlooms. But it is much better to be guilty of this than to profess the best of intentions but unwittingly mislead a whole nation by holding out all sorts of untenable assurances. The Ambar Charkha is not without potentialities and possibilities, provided those who plead for its large-scale introduction eschew certain of their inhibitions, such as, for instance, refusal to have a leather belt, and are not averse to using quality tool steel in place of jungle wood for some of the moving parts. Economising on these items to bring down cost so as to be within the reach of the common man, as the argument often goes, is, in my opinion, false and unsound economy. Even after all these attempts at economy, the Ambar Charkha cannot claim to stand on its own feet and has to have Government subsidy. Why should any Government give a subsidy and yet not get what is needed? Rather than this, I would prefer a higher subsidy and a larger outlay on this account by Government in exchange for assured results, because, in this case, there is no sacrifice of quality and the country can at least be certain of the expected results materialising in full.

To say all these is not to anticipate the results of the unending Ambar Charkha tests. These tests have indeed, been going on all the time and there seems to

be no finality even about the pattern of the Ambar Charkha, although we were promised this by April, 1956. Yet, a couple of months ago, the Government of India did not hesitate to sanction the installation of 10,000 Ambar Charkhas at a cost of about Rs. 70 lakhs as an experimental measure. Meanwhile, the Khara committee, whose expert report has yet to be released, is believed to have recommended the immediate establishment of 75,000 Ambar Charkhas this year and 2,00,000 more next year, at a total estimated cost of some four crores of rupees. One fails to see why there should be all this hustling, if, as the champions of Ambar Charkha claim, it can stand any impartial scrutiny and can deliver the goods, and why the country cannot await the full report. The conclusion, therefore, is obvious that mere economic considerations have not influenced official policy in this behalf. Actually, if reports that are current are to be believed, even the Government, it seems, did not favour the idea at first and actually wanted to ask the Planning Commission to examine whether there were not other and cheaper ways of producing cloth and whether an equally large number of jobs as promised by the Ambar Charkha scheme could not be created through other and perhaps less costly schemes. This first and sensible reaction was, however, sacrificed later on at the altar of political and ideological expediency, and the result has been that, although as much as four crores of rupees on Ambar Charkhas and another Rs. 8 crores on conversion of handlooms into powerlooms, etc., are to be spent, we are not promised any improvement in the cloth position for at least six months to come, and all that the 75,000 Ambar Charkhas, when completely installed, can contribute, we are told, is but 30 million yds. (as against 300 million yds., which the new policy statement itself takes credit for)!

Genuine doubts can be expressed about the prospects of immediate results from the proposal to convert 15,000 handlooms into powerlooms this year and 20,000 next year at a probable expenditure of Rs. 6 crores, not all of which, however, is to be in the form of grants. This proposal, again, is in line with the Kanungo Committee's recommendation which favoured such conversion, unlike the Karve Committee. The decision to allot these powerlooms only to co-operatives is also in line with official policy, which has been to encourage the formation of as many co-operatives among handloom weavers as possible. In other words, no new powerlooms will be licenced, with the result that, eventually, if this programme is allowed to continue, there will be all powerlooms, mostly co-operative powerlooms, and few or no handlooms. This should greatly enlarge the production potential of this sector of the industry, although not immediately.

It is only after fully recognising all these limitations that the two millowners' associations submitted their 10,000 million yd. scheme, which, had it been accepted, would not only have ensured adequate cloth supplies at reasonable prices but also allowed for the development of the handloom industry to its utmost capacity. If it was an insult to the millowners that their sensible scheme was not accepted then, it is a grievous injury to them now that, out of the additional 1700 million yds. required by the country, they should be allotted only 350 million yds., even after allowing for Government's understandable concern for the handloom weaver. As Mr. Karturbhai Lalbhai, the well-known Ahmedabad millowner, has observed, the mills should have been allowed an additional quota of at least 900 million yds. on the basis of their past and present contributions. It is to be hoped that, at least in the light of the experience of the new policy in action, the mills will be given a better deal. Luckily, a silver lining to the cloud is still there in the form of a review of the whole position at the end of twelve months.

More cloth means more looms and more spindles and the increase in the latter has to be proportionately more, because the mills will have to provide yarn to the handlooms and the powerlooms in addition to their own requirements. Fortunately, the Government have had the wisdom not to depend on the Ambar Charkha for more yarn than is needed to make just 300 million yards of cloth. This means that, in addition to manufacturing the yarn required for their quota of 350 million yds., the mills will have to manufacture yarn for making over 1000 million yds. of cloth. There was at one time a suggestion from the highest quarters that, even for all these additional requirements of yarn and cloth, there was no need to licence additional spindles and looms; by making as many mills as possible to work three shifts, it was hoped to get all this extra production. From an equally powerful quarter, this suggestion was strongly resisted as being impracticable and suicidal. From what Mr. T. T. Krishnamachari said at the Press conference last Monday, it would appear that the latter view has fortunately prevailed. This is further confirmed by the announcement that permission would be given to instal 14,600 automatic looms and 2.1 million spindles in the new integrated programme for the development of the country's textile industry. It is made clear that these 14,600 automatic looms are to be earmarked for the production of cloth for export purposes only. Lest any mill should, while doing so, cut down the output of cloth it may now be producing for export, it is further laid down that mills which would be allowed the new automatic looms must undertake to continue their present level of exports. This emphasis on exports explains the relaxation in regard to the licensing of automatic looms, for, as Mr. T. T. Krishnamachari observed, automatic looms are particularly suited for the manufacture of coarse and medium qualities, which are precisely the qualities that figure mainly on our export lists.

As regards licensing for the installation of the 2.1 million additional spindles, there are, as it is, 1.9 million spindles, outstanding against licences already issued, some of which at least are not expected to materialise for want of finance or some such reason. These would naturally be cancelled and reallocated to fresh applicants, and Government have rightly promised to give licences only to those who are willing to take speedy measures for installation. However, there is some danger of this wholesome and realistic approach being adversely affected by the attempt to allocate new spindleage to meet the employment needs, the demands of the handloom industry and the cotton growers in certain areas, much as these considerations are unexceptionable. In trying meticulously to conform to these conditions, the bureaucracy in our country is quite capable of putting off till the end not of the second Plan but of even the third Plan which, in any case, we are having.

Finally, how is all the bill that this integrated textile scheme will entail—some Rs. 12 crores, puts an estimate—to be found? It is a pity that neither the Union Minister for Commerce and Industry nor any member of the Fourth Estate touched on this question at the New Delhi Press conference. There have been suggestions that either the cess or the excise duty on cloth must be increased for this purpose, and a higher excise duty was even said to be immediately in the offing. Since Mr. T. T. Krishnamachari prefers not to plaid all his cards on the table and since Mr. Deshmukh is busy preparing to leave the Cabinet, this unpleasant aspect of India's integrated textile scheme will perhaps have to wait over, and mill interests at any rate do not feel over-anxious about a decision in this behalf, as they are convinced it is not likely to be palatable to them. Whatever form the increased incidence may take, it will be an unwelcome impost to them.

BUSINESS NOTES

EQUAL ACCESS TO STEEL

THE GOVERNMENT'S decision on introduction of uniform prices for steel and pig-iron throughout the country is to be welcomed as a step in the right direction. Rail freight charges are being pooled in order to iron out wide price differentials. Even prices at railheads are being offered to ensure equal access to all. The net effect of the change over the country as a whole will be that the average prices of steel will remain virtually unchanged, whereas those of pig-iron will go up by reason of the necessity to accommodate high cost imports.

Since the location of steel plants tended to concentrate in particular areas the transport element in costs had an adverse effect on the development of steel-consuming industries in areas far removed from steel sites. In the interest of regional balance in industrial development it was essential to redress the disadvantage of higher cost of steel for engineering units situated or planned to be situated in remoter areas. One effect of the new price policy which has been highlighted relates to its bearing on engineering industries in the port towns where they are largely centred. It is pointed out that steel prices in Calcutta and Bombay would go up by Rs. 25 per ton. This is in reality not the imposition of a disadvantage but elimination of an advantage against which distant industrial centres had a grievance. The benefit and justification of the new price policy are to be gauged from the fact that in remote areas steel prices will be reduced by something approaching Rs. 35 per ton. The biggest losers are steel-consuming industries near the sites of steel factories. Pooling of freight charges has a precedent in the case of fertilizers and this measure of rationalisation in steel comes at an appropriate time when expansion of engineering industries is within sight on an appreciable scale. If freight differentials are now removed, location of new units and expansion of existing ones will continue to be influenced by normal economic factors.

AUTOMOBILE PRICES

A FERVENT plea to the Government of India to take early steps to reduce automobile prices was made by Mr. M. B. Madgavkar, Senior Vice-President of the Western India Automobile Association, at its annual general meeting last week. In India, we have a substantial nucleus of an automobile industry in such units as Hindustan Motors, Premier Automobiles, Standard-Vanguard, Ashok-Leyland, Tata Locomotives and Mahindra and Mahindra. All these units are steadily progressing towards indigenous manufacture of motor vehicles. In the changed context of our defence needs, this industry ought to be geared up to ensure independence from foreign imports. Mr. Madgavkar complained that the existence of an indigenous automobile industry has not been reflected in any substantial rise in the number of vehicles in use. On the other hand, according to him, the average annual rate of increase which was 8.8 per cent between 1943 and 1948 has declined to 3.7 per cent between 1949 and 1954. Holding that this fall is at least partly attributable to rather high prices of motor vehicles, the W.I.A.A. expresses gratification that the Tariff Commission would soon be conducting an inquiry into the industry in order to determine the fair ex-works and selling prices of the various types of vehicles manufactured in the country.

If prices are to be brought within the consumer's reach, it can only be done if the number of commercial and transport vehicles increases considerably. This would incidentally enable the manufacturers to utilise their

rated capacity to a greater extent than today. Fixation of the margin of profits for motor vehicles and spares has, no doubt, done some good to the consumers. But the recent increase in the import duty on diesels by nearly 25 per cent, it is felt, will retard the progress of motor transport. To meet the transport requirements of the second Plan, India needs at least three lakhs additional motor trucks, of which about one lakh will be required for the estimated increase in feeder traffic and about two lakhs for that in non-feeder traffic. All manufacturers have increased their output, and, early this year the Tata Locomotive and Engineering Company announced their project of doubling the output of diesel trucks. The resulting improvement should serve to reduce the alarming drop in last year's sales but it might not increase them even to the pre-Plan yearly registrations. The annual increase in the number of motor vehicles between 1920 and 1951 was as much as 16.4 per cent, whereas it was only 3.5 per cent in 1951-55! It is thus clear that the leeway to be made up is considerable.

WORLD COFFEE SURPLUS AND INDIA

RUSSIA HAS, for the first time, bought from India 500 tons of coffee worth Rs. 40 lakhs. Placing this year's crop at nearly 32,000 tons and the stock at the beginning of June at between 23,500 and 24,000 tons, it seems the Coffee Board would still be having far more coffee than is required for this country's internal needs. The main problem before the Board now is to take a decision on the quantity of coffee that can be exported without lowering the stocks for internal consumption. Last year, about 3,450 tons of coffee were exported which yielded valuable foreign exchange to the tune of Rs. 1.95 crores, the average price realised being Rs. 5,522 per ton, as against the internal average of only around Rs. 3,800. Both the Government and the Board have a responsibility for meeting the internal demand adequately and, at the same time, preventing a wasteful accumulation of stock. Unlike in the previous years, the responsibility this year cannot be placed on the growers, inasmuch as they have only a minority voice on the new Board.

India's internal demand is not more than 14,000 tons, and the prevalent notion that a large stock should be carried over to the new season demands modification. During the last few years it has been the practice to carry forward a stock of around 5,000 tons from the old crop as an insurance against shortage in the first few months of the new season. This, in addition to the new crop arrivals in these months, would make a total of about 8,000 tons to be stocked and financed. Warehousing limitations and the needs of the market seem to suggest that the Board, at its meeting this month, could safely recommend to the Government a further release for export of a substantial quantity, say, 6,000 tons at least.

The world coffee market is softening against a possible surplus of over three million bags apart from the six and half million bags carried over by Brazil. An examination of available market forecasts reveals that a serious condition is expected to develop in the world coffee market with supply outrunning demand, and that, unless effective action is taken, the impact of such a development may create heavy problems for the coffee producing and exporting countries. An international coffee agreement has no doubt been suggested as a preventive measure, but it has so far been stalled by Brazil's reluctance to commit herself to any undertaking. The African coffee producing countries have ere now met in Lisbon—in March last—to discuss the formation of an African Coffee Federation. At the same time in many Latin American countries as well as in Africa, new planting of coffee

has been going on merrily. The prospect, therefore, is hardly encouraging. True, India, with a substantial internal market, is in a relatively safer position than many other countries but still she cannot escape the effects of a worldwide crash in coffee prices. It is just as well, therefore, to explore and exploit as many export outlets as possible while the going is good.

ELECTRICITY IN THE TWO SECTORS

THE ADDRESS of Mr. K. G. Milne, Chairman of the Surat Electricity Co., Ltd. to the annual general meeting of the Company the other day is significant not only to the shareholders of the Company but also to the public at large. From the point of view of the Company's shareholders, it is noteworthy that, for the first time since the coming into force of the Electricity (Supply) Act, 1948, the Clear Profit of the Company for last year has been adequate to cover the Statutory Reasonable Return. To the public at large, on the other hand, what is significant is the voluntary promotional tariff reduction announced by Mr. Milne at the meeting. Said Mr. Milne: "In accordance with its tradition to effect voluntary promotional tariff reductions whenever circumstances permit, your Board, on an appraisal of the favourable trend of the Company's earnings at the end of the first six months' working of last year, effected downward revision of the rates for High Tension and Low Tension power, and for Residential supplies, effective from the 1st July, 1955. In addition to this, an 'ad hoc' rebate was allowed at the end of the year in respect of bills for the first six months of the year, to the consumers qualifying for it". He also gave details of the further reduction in tariff now proposed, and informed shareholders that the reduction would be a half-anna per unit in the initial rate for lights and fans (that is, for High Tension) and a quarter-anna per unit for Low Tension power. This works out to a reduction of 0.1 anna per unit of the energy charged for High Tension power, which is lower in extent than that proposed for Low Tension power.

Mr. Milne's justification for this unequal reduction in respect of its two classes of power sales throws an interesting sidelight on the efficiency and fairplay of the public sector in the electricity industry. As he rightly pointed out, the present tariff charged by the Electricity Board for the power which it sells to the Company is highly unsatisfactory, besides being inequitable. Because of the high tariff that the Board charges, the Company is hardly left with any margin of profit. How inequitable the Electricity Board's bulk supply tariff is can be gauged from the fact that the direct High Tension consumer of the Board having a demand of only one-hundredth of that of the Surat Electricity Company is entitled to a 30-40 per cent lower rate when operating under the same conditions of load factor, etc.! Although strong representations against this have been made since the past 3½ years, nothing has been done, notwithstanding the Company's public assurance that it is ready at any time to pass on, in full, to the High Tension industrial consumers any relief that may be specifically granted in this connection. In short, it is not so much the greediness of the private sector of the electricity industry as the failure of the Electricity Board to concede a just and reasonable demand of the private sector that is today responsible for the high rates charged for supply of electric energy bought from the Government.

NATIONAL RAYON RACES AHEAD

MR. KASTURBHAI LALBHAI'S presidential speech at last week's annual meeting of the National Rayon Corporation conveys the determination of the management to race ahead with the programme of expansion and ancillary production undeterred by the present difficulties. Stability and progressive growth in this competitive industry can be secured through strength derived from the benefits of large-scale production. The expansion of the rayon plant and establishment of

the caustic soda chlorine plant are keeping to the original schedule and action has been completed to place orders for machinery to duplicate the rayon plant.

The present phase through which the Corporation is passing is a period of handicaps arising from several causes. The Chairman has explained the position as regards profits and tax exemption in respect of them as well as the continuance in the last year—1955—of the liability of dividends to tax. The withdrawal of concession in respect of initial depreciation on new industrial buildings is synchronising with rising costs of materials—steel and cement. Coal supply is retarded for want of wagon capacity.

There is undoubtedly one specific strain on this industry which can be relieved by positive change in Government's import policy. Last year National Rayon's profit remained virtually static at the level of 1954 despite an increase in the output of yarn. This is because of the depressed rates of prices. This difficulty threatens to continue during 1956. As against the requirements of yarn of 45 million lbs., imports this year, calculated at the rate of last nine months of 1955, will be 51 million lbs. To this supply must be added the domestic output. Meanwhile, the strategy of foreign manufacturers to undercut prices persists. Deniers 150 and 120 which are in popular demand here are offered by them at lower prices than those charged at home. In the light of this unfair situation the Chairman's plea for import restriction in the next licensing period must be considered in real earnest.

SUSPENSION OF SURPLUS COTTON BY US

FOLLOWING THE passing of the Farm Bill in the US, the US Department of Agriculture declared a suspension of the surplus cotton sales for export, an action which has no parallel in American cotton history and which ill becomes an operation of such magnitude as the one involving disposal of as much as (reportedly) five million bales of cotton in world markets at competitive prices. Ever since details of this disposal were announced, early in the last week of April, Shippers had been on the move making arrangements to buy this cotton for purposes of export after the commencement of the marketing season, that is on August 1, 1956. But, as a result of this unexpected suspension of sales now, these shippers cannot keep up their schedule of purchases with the Commodity Credit Corporation and are naturally anxious for an early commencement of bidding.

Meanwhile, cotton interests have become apprehensive as to whether the US would fix the minimum price even below 25.50 cents in order to hasten quick disposal of cotton. Playing fast and loose with the minimum price is not at all conducive to smooth trading. The first bids in respect of the extended export sales programme were as much as 27.50 cents. Hardly after a week, the Farm Bill became law calling for the sales prices to be fixed at 25.50 cents or below! Thus, the reduction in the minimum price quoted for the CCC disposal cotton was both sudden and substantial. American agricultural officials evidently feel that, unless the price concession is substantial enough to move more cotton, there is no point in effecting a reduction. Whatever be the motive behind the latest move, it is now becoming increasingly clear that, despite all the assurances of President Eisenhower and the Secretary of the United States Department of Agriculture, America has decided to use the bait of lower prices to free herself of her cotton surplus. The temporary suspension of cotton sales, ostensibly because of the passing of the Farm Bill, may only prove to be the proverbial lull before the storm. All are anxious, therefore, to see what the cotton bids would be, when they are resumed on June 19, and to know where precisely one stands in relation to America's surplus cotton disposal plan.

Company Meeting

The National Rayon Corporation Ltd.

Speech of the Chairman, Shri Kasturbhai Lalbhai.

The following is the speech of Shri Kasturbhai Lalbhai, Chairman of the National Rayon Corporation Ltd., delivered at the ninth Annual General Meeting of the Company held on June 14, 1956.

I have great pleasure in welcoming you this afternoon and present to you for adoption the Ninth Directors' Report and Audited Statement of Accounts for the year ended December 31, 1955. Since these have been in your hands for some time now, I believe, I have your permission to take them as read.

This meeting was originally convened on May 24, 1956, but from the announcements that appeared in newspapers some time by the end of April it was found that this day was declared as a Public Holiday under the Negotiable Instruments Act. Since under the provisions of the Companies Act 1956, holding of General Meetings on Public Holidays has been prohibited fresh Notices had to be issued to convene this meeting for today. The inconvenience caused to you all is very much regretted.

The Accounts in your hands contain as usual the corresponding figures for last year. Some of the important points pertaining to the Accounts have also been covered in the Directors' Report. The amount of salaries, wages and allowances, appearing in the Profit and Loss Account, however, needs some further explanation. This amount not only includes the sum of Rs. 7,08,135 shown in the Profit and Loss Account as payment in respect of previous year which includes bonus for the year 1954 and the difference in wages but also includes the sum of Rs. 6,93,255 provided for payment of bonus for the year 1955 and since paid to the employees of the Company.

Though the actual production in the year 1955 was higher than the previous year the profits earned by the Company have remained almost the same mainly due to lower rates realised for the sale of the Company's yarn.

The expansion of the Rayon Plant and also putting up of the Caustic Soda Chlorine plant are progressing at the Plant site according to schedule. Recently steps have been taken to order out further machinery and with the placing of this order the duplication of the Rayon Plant as originally envisaged is likely to be achieved in the near future.

The advantage conceded by section 15C of the Income-tax Act exempting from tax profits up to 6 per cent of the capital employed by new industrial undertakings cannot be availed of by this Company even in this 5th and last year of the benefit period. Since the Company does not expect that the profits hitherto made will catch up with the depreciation and unabsorbed depreciation the dividends to be received by the shareholders this year also will continue to be liable for tax in their hands though there will be no deduction of tax at source. The Finance Act of 1956 has imposed fresh burdens on Companies by way of super-tax on dividends declared in excess of 6 per cent on the paid-up equity capital. However, the Company may not have to pay this tax as there is expected to be no assessable income for the year 1955 as explained earlier.

You are perhaps aware that effective from April 1, 1956, the facility afforded to industries by way of initial depreciation on new buildings has been withdrawn. Whereas it is conceded that it is necessary to find out new sources of taxation for raising finance for implementing the ambitious Second Five-Year Plan, the withdrawal of this concession would coincide with the scarcity in the country of building materials such as steel and cement which will compel the use of imported materials at a much higher cost. It is hoped the combined effect of these will not go to retard the expansion programme undertaken by the Private Sector.

As I said last year, adequate supply of power and coal are a must for expansion of industry as a whole. The electrical energy required for meeting the expansions undertaken by the Company are expected to be met from public sources of supply. However, the position regarding the supply of wagons for the movement of coal is most unsatisfactory. It appears that the Railways are behind schedule in increasing the carrying capacity to cope up with the increased movement demands consequent upon the successful implementation of the First Five-Year Plan. Demands on the transport system are bound to increase when the Second Five-Year Plan is in the process of implementation, particularly when the capital goods for the huge steel and electrical projects begin to arrive. It is hoped that the steps being taken by the Government in this connection would bring out satisfactory results and the transport bottlenecks experienced by the industries would be solved, enabling the industries to play their due part in the planned development of the country.

The policy regarding the import of Rayon Yarn adopted by the Government appears to have suffered a slight shift towards liberalisation for sometime past. Whereas it was expected that with the increased indigenous production Government would take steps to reduce imports from abroad, the actual figures of imports disclosed by the official figures for the nine months ended December 1955, reveal an import of as much as 38 million lbs. of rayon yarn into this country. At this rate, the total imports for the financial year ended March 1956 are likely to be about 31 million lbs. which together with the actual production of the indigenous industry would make available to the country a much larger quantity of rayon yarn than the estimated annual requirements of the country of about 45 million lbs. The unhealthy competition by foreign manufacturers referred to in my last speech that they sell the two popular deniers of 150 and 120 at the same rates in this market maintaining much higher rates for their domestic sales, continues. Our Government, I am sure, will bear this in mind while formulating the import policy for the next period.

This time last year the Conference Line of Steamers had contemplated to levy a surcharge of about 35 per cent on the freight rates on cargo shipped to the ports of Bombay and Calcutta. Thanks to the timely intervention of the Central Government and the speedier clearance of cargoes at both these ports, the contemplated

plated surcharge was not enforced. It is hoped that the speedier clearance and turnover effected at these important ports will continue to be maintained hereafter also for the general good of the industrial progress of the country.

To fall in line with a few important provisions of the new Companies Act, certain resolutions have been placed before the Annual General Meeting for your approval. They are incorporated in the notice convening the meeting. Explanatory notes have also been printed and sent along with it. I hope the same will, when moved at the proper time, receive your due consideration.

COMPANY AFFAIRS

IMPROVEMENT IN COTTON TEXTILE

In the beginning of the year 1955, conditions in the cloth market were not very hopeful. However, as the year advanced, the conditions took a turn for the better with a larger offtake and higher prices. Towards the end of last year, the position was satisfactory and prospects for the current year appear to be hopeful.

THE LAKSHMI COTTON MANUFACTURING CO., LTD.

The profit of the Company, before providing for depreciation and taxation, for the year ended December, 1955, stands at Rs. 21,79,447 which represents an increase of about 60 per cent over the previous year's profit figure of Rs. 13,58,668. Together with the sum of Rs. 19,080 brought forward, the amount totals Rs. 21,98,527. An interim dividend of Rs. 12-8 per ordinary share was paid in November last which absorbed Rs. 1.60 lakhs, leaving a balance of Rs. 20,38,527. The Directors have transferred to depreciation Rs. 7,81,640; to reserve for taxation Rs. 7,05,000; to gratuity fund Rs. 33,000; and to engine and machinery fund Rs. 61,143.

Out of the net balance of Rs. 4,57,744, the Directors have recommended the usual dividend of Rs. 12-8 per preference share (less income-tax). A final dividend of Rs. 30 per ordinary share makes it Rs. 42-8 for the year, free of tax. The ordinary dividend has thus been stepped up by over 60 per cent, as compared to Rs. 26-4 per share for 1954. Between them the dividends absorb Rs. 4.43 lakhs. The balance of Rs. 14,744 has been carried forward.

With a view to diversifying the productive capacity of the mill, a printing plant has been installed, and completed since, and the Bleach House capacity has been enlarged by adding modern machinery.

THE VISHNU COTTON MILL, LTD.

The working results of the Company for 1955 are highly satisfactory. As against a loss of Rs. 1,26,341 during 1954, the accounts for 1955 show a profit of Rs. 15,35,692. Adding the previous balance brought forward, the amount totals Rs. 15,57,941. Out of this sum, the Directors have transferred Rs. 7,58,199 to depreciation; Rs. 3 lakhs to depreciation, renewal and extension fund; Rs. 32,000 to gratuity fund; Rs. 2.86 lakhs to general reserve; Rs. 1,33,747 to debenture redemption reserve; and Rs. 25,000 to debenture issue expenses, which leaves a balance of Rs. 22,995. From the dividend fund, a sum of Rs. 3.37 lakhs has been transferred making available an amount of Rs. 3,59,995. Deducting therefrom Rs. 80,000 paid as interim dividend in November last at Rs. 2-8 per ordinary share, there remains Rs. 2,79,995.

With a final dividend of Rs. 5-8 recommended by the Directors to be paid per ordinary share, making it Rs. 8 per share for the year, the rate of dividend has been doubled as compared to the previous year. On preference shares, the dividend at Rs. 35 per share is the same as in 1954. Together, the dividends absorb Rs. 2,58,870, which leaves Rs. 23,125 to be carried forward.

THE ELPHINSTONE SPG. & WVG. MILLS CO., LTD.

In its working during the year ended December, 1955, the Company made a profit of Rs. 10,73,363 which is close to double of the figure for 1954 at Rs. 5,44,677. This is after providing for bonus and setting aside Rs 5

lakhs for taxation but before providing for depreciation. Adding the previous year's balance brought forward, the amount totals Rs. 11,06,159. Out of this amount, depreciation has been appropriated Rs. 5 lakhs and the interim dividend at Rs. 2-8 per ordinary share of Rs. 50, free of income-tax, absorbs Rs. 1,49,902. This leaves a balance of Rs. 4,56,257 out of which the Directors have recommended: Dividend of Rs. 7 per cumulative preference share of Rs. 100 absorbing Rs. 1.75 lakhs; and a final dividend on ordinary shares at Rs. 2-8 each (making it Rs. 5 for the year) which takes Rs. 1,49,903. The balance of Rs. 1,31,354 is proposed to be carried forward.

A bonus pact covering five years from 1953 to 1957 was concluded by the Bombay Millowners' Association. The Company had accordingly to provide Rs. 6 lakhs in the accounts of the year under review towards the payment of bonus for 1953 to 1955. In view of this additional incidence, the profits for the year are satisfactory.

THE GOKAK MILLS, LTD.

Before making provision for taxation and depreciation, the Company's profit for the year ended December, 1955, amounts to Rs. 21,71,632 as against Rs. 14,63,081 which it had earned during the previous year. With the carry forward of Rs. 37,169, the sum totals Rs. 22,08,801. The transfers made are: to reserve account Rs. 2,00,564; to depreciation Rs. 4 lakhs; to taxation reserve Rs. 7.20 lakhs; to development reserve Rs. 1.20 lakhs and to staff gratuity fund Rs. 22,087. This leaves available a sum of Rs. 7,46,150 out of which the Directors have recommended payment of Rs. 7,32,150 as dividend at Rs. 15 per share, free of income-tax. The balance of Rs. 14,000 is to be carried forward.

During the year under review, additions and extensions were made to the machinery and buildings and a 1000-kw diesel alternator was installed which is now in operation.

THE INDO-BURMA PETROLEUM CO., LTD.

The accounts of the Company for the year ended December, 1955, show that, after providing Rs. 4,82,383 for depreciation on buildings, plant, etc., and Rs. 28.90 lakhs for taxation, and transferring Rs. 2 lakhs to investment depreciation reserve account, the profit amounts to Rs. 25,76,587. This figure increases to Rs. 43,35,237 after including Rs. 63,650 brought forward; Rs. 6.95 lakhs transferred from taxation account, considered to be in excess of anticipated liabilities and Rs. 10 lakhs transferred from general reserve to cover payment of a bonus dividend of Re. 1 per ordinary share.

The usual dividends on preference shares have absorbed Rs. 2,58,125. The bonus dividend accounted for Rs. 10 lakhs and an equal amount was paid out as interim dividend at Re. 1 per share. With the payment of a final dividend of Rs. 2 per share on ordinary share capital, which absorbs Rs. 20 lakhs, there remains a balance of Rs. 77,122 to be carried forward.

During the year under review, the Company started negotiations for the acquisition of a substantial interest in Balmer Lawrie and Co., Ltd. These negotiations have since been concluded satisfactorily and 20,000 equity shares have been purchased by the Company.

COMMODITY NEWS AND NOTES

WOOL PRODUCTION

It is estimated that production of wool and hair tops in the eleven major producing countries increased by about 9 per cent in the first quarter of 1956 compared with the previous three months and totalled 277 million lb. The largest increase was in the United Kingdom where output rose by 6.3 million lb. (8 per cent) to 84 million lb. In the United States production expanded by 5.3 million lb. (16 per cent.) to 39 million lb. and in France by 4.7 million lb. (11 per cent) to 49 million lb. There was also a 4 million lb. increase in Japanese output, which rose by 18 per cent. Although figures for tops production in Uruguay are not available, some idea of the trend of output in that country can be obtained from export returns, since the greater part of the production is known to be for export.

INCREASE IN VEGETABLE OIL EXPORTS EARNINGS

Export earnings from vegetable oils rose sharply to Rs. 343,000,000 during the year ended March 1956 from Rs. 199,900,000 in the previous year. In addition to higher prices available for vegetable oils in the world markets, the quantum of oils exported rose to 5,730 cwts., from 3,230 cwts. during the year 1954-55. Demand was good for vegetable oils in general, but it was particularly so for linseed oil, the export earnings of which totalled Rs. 94,300,000 during 1955-56 compared to only Rs. 11,300,000 in the previous year. The quantum of linseed oil exports also increased from 196,526 cwts to 1,620,000 cwts. Exports of groundnut oil rose from 2,010,000 cwts. valued at Rs. 128,300,000 in 1954-55 to 2,500,000 cwts. worth Rs. 156,900,000 and those of castor oil from 603,416 cwts. valued at Rs. 35,300,000 to 778,716 cwts. worth Rs. 40,900,000 during the year under review.

DIAMOND OUTPUT IN INDIA

According to the latest figures available, production of diamonds in the country slackened in 1954 to 1,955 carats, valued at Rs. 474,326 from 2,207 carats valued at Rs. 561,620 in the previous year. Panna in Vindhya Pradesh is the only area reported to produce diamonds in commercial quantities. Most of the Panna diamonds are brilliant white or bluish white, and hence of good quality. Diamonds are also known to occur in Cuddapah, Anantpur, Bellary and Kurnool districts of Andhra. The output of emerald for which India has been famous in the past, is declining. While the country produces 550,938 carats of emerald valued at Rs. 230,374 in 1953, the corresponding figures for 1954 come to only 509,180 carats and Rs. 670,406. Ajmer, Marwara and Udaipur in Rajasthan are the important emerald producing centres.

WORLD RUBBER STOCKS

World stocks of natural rubber at the end of April stood at 822,500 long tons, according to the International Rubber Study Group. Stocks of synthetic rubber at the end of the month were 207,500 long tons. Production totalled 102,500 and consumption 92,500 long tons.

MINERAL PRODUCTION

The latest figures available indicate a general setback for the Indian mineral industry during 1954. The total value of minerals, excluding petroleum produced in the country was Rs. 1,020 million against Rs. 1,130 millions in the previous year. The diminution in the total value is mainly accounted for a shortfall of about 25 per cent in the production of manganese coupled with a depreciation of its export value.

WORLD RUBBER CONSUMPTION

World consumption of natural rubber recovered slightly in April to 152,500 tons compared with 150,000 tons in March, although still below the February level of 160,000 tons. Consumption in the first four months of the year was nevertheless some 7,500 tons more than in the same period of 1955, 627,500 tons as against 620,000 tons. Natural rubber production rose sharply during April and exceeded consumption by some 2,500 tons. In March consumption had exceeded output by 22,500 tons. Even so, the figures for the first four months of the year show that consumption has been running ahead of production by an average of about 14,400 tons a month. Stocks rose by 17,500 tons during April, but at 822,500 they were nevertheless 62,500 tons below the level at the beginning of January. A year previously they stood at 775,000 tons.

BAISAKHI LAC CROP YIELD PROSPECTS

The yield of the Baisakhi lac crop in India for the current year is expected to be lower than the previous two years, says a report issued by the Indian Lac Cess Committee, Ranchi. According to the revised reports, the yield is put at 6,72,000 maunds as against the preliminary estimates of 7,51,000 maunds, issued in March last, and the final estimates of 8,13,000 maunds for 1955. The normal yield based on the average production of 10 years preceding 1955 is 7,10,000 maunds. In the Maunbhum and Singhbhum districts of Bihar, the biggest lac-producing State of India, the arrivals of the new crop are lower than expected. Hence, the revised estimates for Bihar have been reduced to 4,25,000 maunds. In major lac-growing areas of Madhya Pradesh also the crop suffered damage due to excessive heat in the months of April and May and hence the estimates for this State too have been reduced to 1,39,000 maunds.

As far as other States are concerned the arrivals of the crop in the market have been up to expectations.

The State Bank of India

CRISIS in the management of the State Bank of India has shown itself, in its outward and visible signs, by the resignation of its

Managing Director, Mr. S. K. Handoo, followed quickly by the resignation of Dr. John Matthai, the Chairman. There is enough in Dr. Matthai's

dignified statement—ostensibly on another issue—to indicate that there is a fundamental difference between the top management of the Bank and the Government of India. Since his resignation followed quickly that of the Managing Director—whose salary, it is known, was the subject of criticism in the Rajya Sabha during the last session of Parliament—one would be justified in concluding that there are differences in the approach to recruitment and incentives in the top cadres of officers serving with the Bank. This seems particularly inopportune at a moment when expansion in the Bank's activities is required by the Plan; surely the Government of India might have waited for a happier moment to project into the Bank a reckless dose of "ceiling" ideology. The position, so far as the Managing Director and the Senior Officers of the State Bank of India are concerned, is simple. They are officers under a contract which should not be evaded because of nationalisation unless the purposes of nationalisation or the country's progress would be severely injured thereby. This principle was applied under conditions far more revolutionary—the arrival of Independence—and it was decided that the contracts of serving I.C.S. officers should be honoured to the full. Although from time to time whispers have emanated from what are called authoritative sources suggesting revision of pensions in the Indian Civil Service, it is to the honour of the Government of India that it has not allowed its desires in these matters to overtake its written obligations.

How then can the Finance Minister of India justify by any precedent the revision of contracts with serving officers of the State Bank of India? It can only be because the Directorate of the State Bank of India has not stood foursquare on a simple issue of principle, namely, that the revision of salaries can take place on a voluntary, and no other, basis. This sensible approach seems to have been defeated by pressures within. The Vice-Chairman of the State Bank of India is unfortunately a man who, by temperament and upbringing, has never understood the place of incentives in an expanding economy. It is no accident that he himself has not succeeded in building any vital institution with survival value. It is political pressures from sources such as these which have led the Government of India to give its willing ear to unwise interference in the top management of the Bank, sowing discord and disloyalty at a time when the fullest team work was essential.

One needs to understand the character of the present argument. It has nowhere been the contention of *The Eastern Economist* that any change which assists the development of the economy as a whole should be resisted. It is not contract alone which is vital, or any privilege established by custom or even by law. The final test is whether a change in a particular contract is one which does service to the country, implying that its disadvantages to the individual are more than compensated by the good of the country at large. When it was decided to accept the current rates of pay for Indian Civil Service officers, it was not on the principle of the sanctity of all contracts—a principle which no Government coming into power with a mandate for revolution can accept—but because it was felt on balance that the advantages to be gained by the country by small economies could not possibly warrant the

creation of disloyalty in the minds of the Government's senior officers. This argument applies with full force to the State Bank of India. There is nothing advantageous to be obtained either for the State Bank of India or for the country by the nibbling away of salaries of officers near the end of their current contracts.

The justification for interference cannot be found in the performance of the Bank in the last few months. The Directors of the Bank in their Annual Report have paid a handsome tribute to the Managing Director and the senior staff of the Bank, which showed this year working results of which the Government of India should be proud. It is known that in this Bank there is a vast amount of experience which has not been reduced to writing and is part, so to speak, of personality. It is not to be forgotten that the State Bank of India goes back farther than any Indian bank, tracing its origin to one Presidency Bank in the year 1806. There has been a fine tradition of conservative judgment in the offices of this Bank; even when errors have been made from the point of view of the country, its officers have tended to watch the interests of the shareholders jealously. It is to be remembered that today although the State Bank of India is a nationalised institution there are still private shareholders. It is not clear that the Government of India has a right to injure its minority shareholders by losing at this stage valuable banking experience which new appointees may not possess. The shareholders of the Bank have every right to ask that their interests should receive due consideration.

The present situation is one which provides a challenge to the Finance Minister of India. Dr. John Matthai is, after all, an ex-Finance Minister of India and his views, although at this time contrary to those held by the Government of India in the Ministry of Finance, were at one time both the policy and the practice of the Government of India. His appointment as Chairman of the State Bank of India was cheered loudly in the Lok Sabha and his great services to the country have won appreciation from all parties and from all sections of the country. If, on an issue of this small net worth, the Finance Minister of India is unable to accommodate his predecessor, it would look as though the poison of competitive politics has gone deep into a Ministry in which politics has hitherto rightly occupied a subordinate role.

The Eastern Economist holds the view that the Directors of the Bank should decline to accept the resignation of the Managing Director or of the Chairman. They should be persuaded to remain in office until the return of the Prime Minister and all the Directors of the Bank should wait on the Prime Minister of India to request that at this hour this petty controversy in the largest financial institution of the country should be eliminated by a recognition that the province of the Chairman of the State Bank of India is one which does not bear petty interference by the Ministry of Finance. If nationalisation means the incursion of petty interference into the highest reaches of nationalised institutions, it will not be very long before the dire prophecies of the critics of nationalisation will be fulfilled.

Imported Inflation?

JULY 1 will be far from a Red Letter Day in the lives of consumers of cement and coal. On that day steep rises in cement and coal prices are likely to become effective. In the case of the cement industry this is the result of the pooling of prices of domestic cement with imported cement which costs nearly 50 per cent more. In the case of coal, it is the result of the implementation of the Wage Tribunal's award, which is now applicable to the industry as no "major" appeals were launched within thirty days after May 26. Assuming that the rise in the price of coal is only Rs. 3 per ton, the minimum which has been suggested in official circles, and that cement at the pooled price runs somewhere near Rs. 102 per ton to start with, there will be a significant impact in the wholesale index of prices, but a far more substantial impact in the areas where cement and coal form a large part of outlay.

The obvious public area in which to look for such pressures, so far as cement is concerned, is the Ministry of Irrigation and Power and the Ministry of Works, Housing and Supply. Assuming for the sake of argument that the cost of cement goes up by 25 per cent in these cases, it is not unlikely that the cost of irrigation and hydro-electric schemes may shoot up something like 10 per cent. Over the period of the second Five-Year Plan one might expect an addition of the order of Rs. 100 crores in the public sector as a result of cement, steel and coal price rises. In the case of coal the position is more complicated than cement, because of its widespread use. It has been suggested that an increase of Rs. 3 per ton would add Rs. 3.42 crores to fuel costs on the railways. The fact that metallurgical coals are used—wastefully—will make the rise worse since their prices will rise more. As a consequence of the rise in the price of coal, steel might rise by Rs. 5-8 per ton, jute goods by Rs. 1-11 per ton and cement by Rs. 1-2 per ton, quite apart from equalisation charges. Nobody quite knows today what is likely to happen, but there is certainly a round of price increases necessarily involved in the changing of the prices of coal and cement. It seems a pity that here we are taking a leap in the dark.

This is, so far as cement is concerned, a case of imported inflation. One might perhaps wonder whether it would not have been wiser to scale down portions of the building programme which use cement rather than open the doors to many bags of cement at this excessive price. The case is a debatable one. But *The Eastern Economist* considers that the Government's action in this respect has been sound when all the alternatives are weighed in the balance. The shutting off of imports where there is a high internal demand might look as though it avoids price rises due to high-priced imports. But, in point of fact, it will only be establishing black markets, in which prevailing prices would be much higher than the pooled prices now proposed.

The structure of a wholesale index which uses only controlled prices may show a measure of repressed inflation which comes from shortage of supplies. Because the raising of pooled prices is quickly reflected in the index one is apt to assume that the situation has been worsened and not improved by high-priced imports. In point of fact, there has been substantial improvement for two

reasons. In the first place, the availability of cement will enable production in many productive enterprises to proceed more rapidly. Secondly, there is deflationary pressure in additional supplies of goods under price pressure. The Indian Institute of Public Opinion has shown that this relation as a whole is not symmetrical in terms of money and goods and in the Indian system as a whole; a goods factor tends to operate against a money factor only in the proportion of 3 to 7. It is not necessary here to enter into the reasons for this asymmetry but it might be said at once that, to the extent that imports are admitted, perhaps three-sevenths of their added prices (presumed to involve an addition to the money supply) would be offset by the physical imports in question. In other words, the "imported" inflation is never equivalent to the full price rise which appears in the wholesale index. Nearly half of this price rise must be offset by the reduction in prices which added supplies have made possible.

The situation is, in some respects, parallel with the position of food imports during the period 1949 to 1952. Here if food imports had not occurred, black markets in India would have been so severe that ruling prices would have been much higher than controlled prices over large areas of the country. This would have been in itself so serious a failing of public policy that it provided a justification for heavy imports even at great cost. There was justification in *The Eastern Economist's* point of view for limited subsidies on essential articles, so as to make availability a reality to the lowest income brackets. But subsidies, even in the case of necessities, can be overdone. Thus in 1948-51 they covered an unduly large urban ration, even while right in principle.

For the present, since subsidies both to coal and cement cannot be entertained without greatly increasing a deficit budget, it is clear that additional costs have wholly to be passed on to the consumer. In choosing thus to restrict black markets and to employ a measure of price rationing the Government of India has done wisely, learning, it would seem, from the mistake of generating an excessive demand for foodgrains which was the result of an unwisely large subsidy. Some excessive demand will be cut off by price-rationing.

While the Government of India's action is to be recognised as correct in the strained circumstances prevailing, it would be foolish to deny that there is a serious price rise in consequence of the Government's policy, the full effects of which will take some time to work out but will nevertheless be almost certainly effective in raising the wholesale index. Now that we may be passing the 400 mark so early in the Plan, the country should be advised how the price level contains a tax for development which is in some measure a relief from general taxation. This time at least it is not deficit financing; this may be poor consolation but it is none the less real. Every extension of the Plan will need to be paid for in some such manner. This is not too happy a situation particularly when none of our Ministries wishes to stay at the point that the Plan prescribes, but if the Plan has underestimated productive demands, how can movements in an upward direction be avoided?

The Prime Minister's Tour

ON Thursday last week the Prime Minister left on the first lap of a foreign tour which will take him to seven countries and two continents. This trip promises to be important both because of the state of the domestic economy and because of the comparative calm now prevailing in international relations. Having successfully executed the first Five-Year Plan, this country has now launched the second Plan, whose dimensions are great and impressive indeed for the Indian economy in the present situation. It is undoubtedly an ambitious experiment sought to be carried through in the democratic way. India is making a big effort to raise her own internal resources—financial, physical and human. It is only proper that they should be supplemented in a generous measure by friendly countries, partly for the sake of co-operation and partly also from enlightened self-interest. It was not, therefore, without significance that the Prime Minister has decided to pay visits to France and West Germany, two countries which are now in one way or another trying to collaborate with us in our schemes of industrialisation.

The immediate reason which has impelled the Prime Minister to undertake the present trip, in spite of the domestic situation following the proposals for the reorganisation of States, is the conference of Commonwealth Prime Ministers at London. It is certain that important subjects will be discussed at this conference, but the convention of keeping out controversial issues has robbed the proceedings of the dramatic element. This is to some extent compensated by the opportunities the meetings provide for informal, direct exchange of views between the visiting Prime Ministers. Indeed it is outside the conference hall that the conclave of Commonwealth Premiers achieves its most substantial results, and there is every reason to hope that the present meeting will offer a chance to clear misunderstandings on many issues that trouble intra-Commonwealth relations. Due to its very basis and character the Commonwealth conference eschews such problems. For this reason it is unlikely that the Kashmir issue will be brought before it. But it helps rival points of view to be explained informally, and though a way-out may remain far away, the area of divergence and misunderstanding tends to be narrowed partially at least.

Of much more significance than the London conference would have been the scheduled, but now cancelled, meeting between the Prime Minister and President Eisenhower. Mr. Nehru would have been the second great neutral leader to have visited the United States in recent weeks. The first, Dr. Soekarno of Indonesia, has succeeded, we are told, in dispelling to some extent the suspicion with which America has been viewing neutrals. The Prime Minister's visit would have helped to clarify the role and attitude of neutrals in international politics. In a famous speech during his last visit to the US, Mr. Nehru declared that where freedom is threatened or liberty endangered, India will not remain neutral, that there is no question of neutrality in such cases. It is true that his pronouncements on certain matters might have been embarrassing to the free world and might have offered comfort to the leaders of international Communism. This is understandable, as the stand of the democratic West on such thorny problems as Goa and Indians in South Africa has not been unequivocal.

There is evidence that a broadening of vision is currently taking place in those who shape America's foreign policy and consequently the free world's strategy in the battle for men's minds. It would have been appropriate if at this juncture the leader of the world's most important neutral nation, committed to the defence of freedom, had conferred with the Head of State of the foremost Western Power. Such a meeting should have taken place much earlier, and unfortunately it has again had to be postponed. But it is still not too late for the free world of the West to learn that neutrality in the cold war does not mean neutralism altogether and that neutral nations are not to be identified with unfriendly countries.

The Prime Minister's visit to the US would, of course, have had far greater significance beyond this. An understanding at the political level of the underlying motives which impel India and other neutrals to adopt a policy of neutrality will very likely encourage a climate conducive to economic co-operation and help. This country is now on the threshold of a period of great industrial progress, but the implementation of the development plans will require considerable foreign assistance. There is a great deal of scope for foreign investment in many fields and, though American investors have a vast unexplored field nearer home in Central and South America, better diplomatic relations may induce a greater spirit of enterprise. More important, the scope for the extension of assistance in the form of loans and in technical personnel is great. It is reasonable to expect that a meeting of the two great men will help to clear the air for it. A more sympathetic attitude on the part of the US to India's aspirations can facilitate ordered progress and demonstrate to the Communists that rapid rise in living standards and reduction of inequalities will be possible even under a regime which is not wedded to their totalitarian philosophy. The cancellation of Mr. Nehru's trip, one hopes, will not mean the non-realisation of all these desirable developments.

The political benefits which could flow from greater Indo-American understanding on the international plane would have been of significance, particularly in view of the protestations of love for peace on the part of the Soviet leaders. There is, in fact, a great and overpowering need to put to the test Soviet assertions to gauge their real meaning, and Mr. Nehru might have succeeded in persuading the US to make the appropriate gestures, thereby rendering an invaluable service to mankind. In fact, the Prime Minister will have an opportunity of studying from another source the real significance and extent of the recent changes in the Soviet Union. Only a few days ago Marshal Tito has returned from a highly successful Russian tour, and he is sure to convey his impressions to Mr. Nehru. But the Marshal's opinions will need careful examination as he has special reason to think well of the present Soviet leaders who are atoning for the discourtesy shown to him by Stalin. It is to be hoped that the Prime Minister will come home with a better appreciation of Soviet and Western intentions as well as the intentions of nations which are neutral in the cold war. His meetings in London and other Western capitals and his talks with Marshal Tito and Col. Nasser at Brioni and later with the latter in Cairo should help him in this.

THE WEEK'S NOTES

OPTIMISM ON PLAN TARGETS

CONTRADICTORY PROGNOSTICATIONS on the second Plan targets have become all too common to cause any surprise. But last week there was an extreme instance of such expression of opposing views by three gentlemen who ought to know what they are talking about. The Minister of Commerce and Industry, addressing the Central Advisory Council of India, expressed confidence that Plan targets would be realised and even exceeded. He was, of course, talking only of industrial targets. But industrial production is inextricably bound up with the development of adequate transport facilities for the movement of raw materials and finished goods. If the fears of the Transport Minister and Mr. K. C. Neogy, member of the Planning Commission, that the transport bottleneck will be insurmountable, prove true, the growth of industry will meet a barrier it cannot negotiate. 'The Eastern Economist' has already pointed out that transport facilities, as provided for in the Plan, will not keep pace with the requirements of the national economy. If the targets for industry and agriculture are to be raised or exceeded, attention will have to be paid to the movement aspect also.

Mr. T. T. Krishnamachari is correct in his assessment that austerity is a luxury which only the prosperous can afford. The people may put up with temporary sacrifices and shortages, but there is a limit, both in extent and in time, to such fortitude. Maybe the targets for consumer goods will have to be increased, but every revision in this sector can only be at the expense of some other, and transport is one sector which will have to remain untouched. But there is some logic in the Government's decision to revise the targets as and when it becomes necessary according to exigencies. Such revision can be undertaken having in view the availability of resources, the demand for goods, and the possibility of moving the output where it is required. While revision of targets may come just a little too late, after increasing demand has outstripped supply and set in motion a rising price trend, it is worth enquiring whether the Government has reason to hope that more resources will later be available to the nation for expanding consumer goods production, which will be all for the good, than can be foreseen now and what ground it has for thinking so.

DECIMAL COINAGE—THE NEW APPROACH

IT HAS been announced that the new system of decimal coinage, based on a division of the existing rupee into 100 naya paise, will come into force from April 1, 1957. But, as this date draws near, it is becoming clear that the changeover will not be quite smooth, since the conversion rates between the present coins and the new ones are not entirely uncomplicated. The illiterate rural folk, in particular, may not only find the conversion table confusing but will also be at a disadvantage in transactions with the educated and wiler townsmen. It is true that difficulty will be felt primarily in regard to small transactions, but the bulk of the transactions in the rural areas come under this category. In the transition period, when the new and old coins will circulate side by side, there will be many petty headaches and misunderstandings, and it is likely that the changeover will take longer than the three years envisaged by the Government.

Some of these difficulties can be avoided under the scheme of reform suggested by Mr. C. Rajagopalachari. But the major drawback of his proposal is that it has come just a little too late even for consideration. (It

is indeed a matter for surprise that the idea of keeping the value of the 'paise' unchanged should not have struck anyone, and all attempts at reform should have started with the present rupee as the basic unit in terms of which the other coins were to be minted.) This is not the only argument against C.R.'s scheme. The par value of the rupee for foreign exchange dealings will have to be fixed; however, there cannot be much difficulty or confusion arising from this. But the salaries and wages of all salary and wage earners will have to be refixed in terms of the new rupee, which will have 25 annas and 100 of the present paise. There will be a psychological resistance to the reduction of salaries and wages in terms of the rupee, though their real value may remain unchanged.

This is certainly not the only difficulty, though the new scheme has other merits too. In particular under this all existing coins can circulate freely even after the new system comes into force, and there need be no time limit for the changeover. Only the new one-rupee, half-rupee and quarter-rupee coins will have to be minted, whereas under the proposed Government scheme four new coins will have to be minted, and the four coins they will replace will have no direct equivalents in the new standard and will have to be withdrawn from circulation at the earliest. The strongest argument against the C.R. scheme is that it will require a more far-reaching change in the accounting systems of Government and the private sector than the one adopted will entail; and the task of making the accounts of past years comparable with those of subsequent years will involve quite a deal of perhaps unnecessary labour.

THE 'AMBAR CHARKHA'

THE GOVERNMENT'S policy on the Ambar Charkha announced last week follows logically on the new textile policy which was made public only a day earlier. Mr. T. T. Krishnamachari had already indicated, albeit by implication, that the optimistic assumptions of the All-India Khadi and Village Industries Board on the economics of the Ambar Charkha programme were not quite accepted by the Government; otherwise there was no need to reduce the quota allotted to the Ambar Charkha from meeting the entire additional yarn requirements in the second Plan to supplying yarn for only 300 million yards of cloth which is a reduction to nearly a fourth of the original quota.

The new policy, it is only too evident, is a compromise between political and economic considerations. Having held up the Ambar Charkha as a sure cure for a large part of the unemployment now plaguing the country, the Congress Government cannot abandon it entirely without any warning to the Ambar enthusiasts and other constructive workers. But in the first year of the second Plan only 75,000 Charkhas are to be commissioned, with two lakhs more slated for going into operation next year based on the results of this year's programme. In comparison with the 25 lakhs contemplated earlier this looks like a field experiment, which in fact it is. The Khara Committee has also recommended that the current year's programme should be reviewed by December to decide the next year's programme, but it is essential to ensure that whoever sit in judgment over the Ambar Charkha are not its fierce enthusiasts, so that an independent evaluation on overall economic grounds is possible.

There are bound to be certain practical difficulties in implementing even the reduced programme. The Committee has recommended that at least 75 per cent of the new spinners should be from weavers' families;

but members of such families may already be engaged in some subsidiary work to assist in weaving. More-over Ambar yarn will be only up to 24 counts, so that the scope for its use on existing handlooms will be strictly limited; its evenness and tensile strength have also to be proved to be equal to that of comparable mill yarn. The Committee also wants the traditional charkha to be progressively replaced by the Ambar Charkha, but the practicability of this suggestion is open to doubt.

It is indeed laudable that the Committee should want the objective to be the elimination of all subsidy, but it is unlikely that this dream will be at all realised, since, however comparable with mill costs the cost of production of yarn, the weaving will have to be done on handlooms. In the initial stages, when Ambar cloth is produced in limited quantities, the Government may be able to buy up the entire output to meet its requirements, but thereafter direct subsidy will have to be given. Even with this subsidy, at a flat wage rate of 1½ annas per hank and average daily output at 10 or 12 hanks, the wages for such work for 8 to 10 hours a day will be only about 9 annas per head per day, at the rate of work for two persons for every charkha.

TITO AND KHRUSHCHEV

A CARTOON in a British contemporary describes Marshal Tito's triumphal return to Moscow as "the return to the prodigals". The caricature is as humorous as it is pregnant. If Bulganin and Khrushchev, the prodigals, appear to have disowned Stalinism, so does Tito, the prodigal, appear to have disowned Titoism. Between the 'limited co-existence' idea of Stalin and the 'competitive co-existence' theory of Khrushchev there is a distinction without a difference and Tito is where he always belonged. If Stalin thought in terms of 'spheres of influence' between Russia and the Western Powers, his successor thinks in terms of strenuous competition, short of war, between them for influence and positions of strength more especially in the uncommitted areas of the world. And Tito, the leading anti-Stalinist, is now probably marked out for a significant role in the 'competitive co-existence' offensive. With the coming together of Russia and Yugoslavia the familiar goals of inherently expansionist Communism may well appear less frightening to the 'neutral' nations of Asia and Africa.

Perhaps there is another side to the story. The so-called uncommitted nations are probably shrewd enough to think of gaining advantage from 'competitive co-existence' without attaching themselves to either bloc. They may even wish for the failure of Khrushchev's devious efforts to woo the United States. Is the rapprochement with Tito one such devious effort? American reactions to Tito's unexpectedly strong support for Russia's German policies and China's Formosa ambitions are far from encouraging the hope that the Yugoslav leader might succeed in bringing the two Great Powers together.

EGYPT VOTES FOR NASSER

THE OVERWHELMING vote which Col. Nasser received in the recent referendum approving him as President of the Egyptian Republic was a foregone conclusion as also the approval of the new Constitution proclaimed in January. Since the abdication of Farouk in July 1952, Nasser's star has been on the ascendant and his own prescience on what the country needs has led him to oust even the respected General Naguib. Events have been proving him right and his reformist policies, particularly in regard to the land problem, have won for him the people's confidence. His foreign policy of refusing to identify himself

with either of the power blocs has further added to his prestige.

But one has to record with regret that the Constitution as now approved does not contain many democratic features, though Nasser's assurance that this is only the beginning is a silver-lining in the cloud. Candidates to the National Assembly, which is to be shortly elected, will have to be approved by the National Union, which is the Government party; and this can in practice mean that all those opposed to the ruling set will be kept out. Similarly, though the Revolution Command stands dissolved, the members can reappear in the Cabinet. Nasser will soon have to form, thus perpetuating the control of the army. There is indeed reason for all this precaution since the old political parties, though formally dissolved, continue to have some influence in certain circles. At any rate, for some time to come, the people will prefer a benevolent despotism which promises them full democracy soon to a corrupt oligarchy.

While Egypt's domestic prospect gives no cause for pessimism, the future course of her foreign policy may cause many an anxious moment in the chancelleries of the Western world. It is to be hoped that Col. Nasser will not feel compelled to assert Egypt's rights—real or imagined—against neighbouring Israel. His public utterances may not correctly reflect his intentions in this matter as he may have to talk the language of extremism to satisfy his Egyptian audience. If this assessment is right, Israel will also be advised to be cautious lest resurgent Arab nationalism be provoked with disastrous consequences all round.

LARGE FARMS BECOMING LARGER IN U.S.

A QUARTER century trend toward fewer and larger farms in the American agricultural sector is still continuing, and the number of farms has declined from 5.4 million in 1949 to 4.8 million in 1954. This is revealed by the latest Census of Agriculture in the United States. The number of commercial farms (excluding part-time and residential farms), according to the Census, has declined from 3.7 million in 1949 to 3.3 million in 1954. Such farms with sales of \$25,000 and over have increased from 1.9 per cent of the total to 2.8 per cent; those with sales of \$10,000—\$24,999 from 7.1 to 9.1 per cent, those of \$5,000—\$9,999 from 13.4 to 14.8 per cent those of \$2,500—\$4,999 from 16.4 to 16.9 per cent. On the other hand, farms with sales of \$1,200—\$2,499 have declined from 16.8 to 16.0 per cent and those of \$250—\$1,199 from 13.3 to 9.7 per cent. The factors which have contributed to this trend of fewer and larger farms are: Increased number and variety of non-farm employment opportunities in an expanding economy; technological developments that enable a given labour force to handle an increased quantity of the other resources used in agriculture; and technological developments that have increased yields per acre and per unit of livestock.

Farms of the first group are characterised by large investments in land, buildings and machinery, a high degree of specialisation and considerable use of machinery in their operation. They had more than a fourth of the farm sales in 1950. In comparison with non-farm units, however, the majority of even these largest farms are of modest size, hiring on an average 5 regular workers and having average gross sales of \$56,000 per farm. Such large farms are hardly 'factories in the field.' The medium and large family farms (groups 2, 3 and 4) now comprise, in terms of numbers, three-fifths of the commercial farms. Farms of the fifth and sixth groups represent the small, low-production, low-income farms and share-cropper units that have been disappearing from American agriculture in recent years.

We can solve your problem...

When at Bridge you've overbid your hand

A Window on the World

THE REVOLT OF THE BRITISH MIDDLE CLASSES

By
ODYSSEUS

TODAY THE MIDDLE CLASSES in all industrialised (or industrialising) democratic countries, are the world's most completely ignored people.

Democratic politicians want votes. The middle classes constitute a percentage of the population which varies from country to country, but which is invariably smaller than the number of the rural or urban masses.

Politicians go where the votes lie thickest. In return for votes they offer legislation which promotes and protects the interests and the welfare of the masses rather than of the middle classes.

Historically there is a certain rough justice in this.

Before the industrial revolution of the West, taxation and the production of wealth was usually in the broad control of an aristocracy who were normally reluctant to support any measure detrimental to their own interests (but note that this is not to say that they were never progressively minded or could not promote the causes that benefited the nation as a whole). The industrial revolution transferred power from the aristocratic oligarchies to the middle classes or, as they were known on the continent of Europe, to the bourgeoisie. The nineteenth century was in Europe and America the century of the middle classes, who attained a political power and a material prosperity previously unimagined by the richest kings or the most world-shaking emperors.

It would be idle to deny that the nineteenth century witnessed exploitation of the working masses. Misery, oppression, and bestial conditions of living were widespread in the industrial areas of Europe and America. Tales of injustice and inhumanity fill the official enquiries published by a series of Royal Commissions in Britain.

Owing to the property qualifications laid down for an elector, the "mass vote" in the nineteenth century was the middle class vote. The workers had no votes and the aristocracy were gradually swamped by the numbers of the middle classes. In Britain, this situation was created by the Reform Act of 1832 which swept away the rotten boroughs and gave votes by secret ballot to the property-owning middle classes.

Today, abolition of all qualifications has extended the franchise to the whole adult population in all the democracies—the middle classes are out and the workers are in. Today it is the middle classes whose productive capacity is exploited and whose lives are rendered increasingly miserable by taxation and inflation.

"Serve them right!" says many a worker. "We were their forced labourers yesterday. Today they're ours. They deserve it. That's the way it should be."

TODAY'S EXPLOITED MASSES

This calls for two comments. First, while admitting the appalling suffering that accompanied the industrial revolution, it is pertinent to ask why it has in

most industrialised countries of the West been virtually eliminated. The movements for factory reform and for labour legislation ran parallel with the development of the industrial revolution and they were initiated essentially by men of the middle classes or the aristocracy, like Wilberforce, Lord Shaftesbury, Joseph Hume, Francis Place, and Galdstone. In their haste to ridicule the classical economists who created the laissez-faire school that gained economics its name as the "dismal science", the followers of Karl Marx forget that David Ricardo (1772-1823), while arguing that the workers' wages, hours, and factory conditions should not be the subject of state interference, equally strenuously maintained that the workers should be allowed to combine to negotiate the conditions of their employment. At a time when trades unions were illegal, the laissez-faire economists urged that they should be legalised.

Secondly, the vital difference between the nineteenth century, in which the masses were oppressed, and the twentieth century, in which the middle classes are oppressed, is that by preaching the doctrines of free enterprise, competition, individual savings, and self-help, the middle classes of the nineteenth century created dynamic, growing, changing, abounding, national economies, which made the countries of America and Western Europe wealthier than any fabled El Dorado. If there was terrible suffering, the statistics demonstrate that the standard of living of all classes, including that of the masses, was rising from decade to decade. As against this, certainly in Britain, France, and Scandinavia, the rate of the overall increase in wealth has today been slowed to a snail's pace and, broadly speaking, existing wealth is being redistributed in favour of the masses; the nation as a whole is not becoming wealthier.

In a nutshell, no matter what damaging admissions are made about nineteenth century exploitation of the masses by the selfishness of the middle classes, (a) that exploitation was gradually eliminated and (b) the wealth of all classes was raised—by the humane ideals and the economic ambitions of the middle classes; whereas twentieth century exploitation of the middle classes by the masses is (at any rate in Britain, France, and Scandinavia), not only unalleviated but the national economies are threatened with economic paralysis. This is because although the workers in those countries expect an ever-rising standard of living, they refuse to work any harder to create the necessary addition to the national income, and they refuse to allow machinery to do the job for them. To a perilous extent, the wealth that is being created in Britain today originates in investments in equipment and machinery made decades ago, even in some cases as far back as the nineteenth century. British industry needs a vast expenditure of capital on modernisation. Her industrial leaders are aware of this and, as explained here on January 13 (Whither Britain in 1956?), when the Conservative government had removed the Labour government's impedimenta of controls and a return to economic enterprise (in the real sense of the word "enterprise") became once more a real and exciting possibility, they launched out on innumerable capital development schemes. What they had not reckoned on was the British worker's determination neither (a) to

work harder to raise productivity so that his present standard of consumption could be maintained and an additional margin for savings provided that could be allocated to investment, nor (b) to achieve the same result by working no harder but allowing economies in production methods, nor (c) to accept any diminution in his consumption. You could not find a more perfect formula to promote inflation.

HOME TRUTHS ABOUT SAVING

New factories and equipment cannot be built out of current consumption. Somebody must save to build them. If savings are not voluntary they will be compulsory. If the workers will not save either by cutting their consumption or by raising their productivity, and if the middle classes have no margin left for voluntary saving, then saving will be effected by inflation, which achieves its end by forcing those with fixed incomes out of the market. This is unjust and socially dangerous (unless you are among those who enjoy the heat, dust, and blood of revolution). The British workers contract out of compulsory savings through inflation because by threatening the employers with strikes and the politicians with loss of votes, they secure higher wages. So the middle class is left to be squeezed dry, for even if they could strike for higher salaries the additional pay would be mopped up by the penal rates of income tax in the higher brackets into which they would soon penetrate. In Britain today you get into the super tax class at £2,000 a year, yet this is the equivalent of a pre-war income of only £700. How would you like to find yourself in the super tax class, on a income of Rs. 9,100?

But—and here I come to the hub and the nub of this article—at long last the British middle classes are organising for revolt.

A group of influential liberals has launched the People's League for the Defence of Freedom, the proclaimed objects of which are: 1. To organise public support for a policy which will afford protection and help for all citizens whose standard of life or freedom is threatened by the growing abuse of power by trades unions or by administrative tribunals from whose decision there is no right of appeal to an independent judicial authority. 2. To uphold the liberty of the press by sponsoring a printing undertaking free from trades union dictatorship. 3. To seek by all constitutional means to reform the law as it affects trades unions in order that they cannot act as a state within a state or put themselves above the law. 4. To subject all expenditure of public money to rigorous and continuous scrutiny and to campaign for the progressive reduction of rates and taxes and the elimination of bureaucratic waste. 5. To combine in protecting its members from any infringement of their traditional liberties from whatever source it may come.

Preliminary success has attended the public meetings and the advertising campaign promoted by the League which rightly declares that its only chances of lasting success lie in quickly attaining a membership running into millions which will put it on a par with the trades unions as a power with which governments have to reckon.

What, I may be asked, has all this to do with India? I will tell you next week.

THE MEDITERRANEAN COCKPIT

(From Our Special West European Correspondent)

BARCELONA, June 22.

HERE beside the smooth, summery waters of the Mare Nostrum, in a city that has been in turn Iberian, Greek, Roman, Goth, Catalanian, French and Spanish, is an excellent place to consider the proposition that the Western world's strategic centre of gravity is once again moving southwards to the Mediterranean. The proposition is topical: it was stated last week by the French soldier, Marechal Juin, in an article in the *Revue des Deux Mondes* that has been widely commented; it forms the basis of a probable French approach to NATO for a reorganisation of armed strength in this area; it is part of the Italian, Greek and Spanish argument for a Mediterranean pact; it is the foundation of an alternative American strategy that is being developed with Spanish collaboration parallel to (and partly counter to) the NATO alliance. And above all, it is a fit subject for reflection in a week when the new Russian Foreign Minister is paying a series of visits to eastern Mediterranean capitals.

The Mediterranean lost its age-old central position in Western affairs with the rise of the Protestant commercial powers in Northern Europe, three to four centuries ago. Since then, Europe's destinies have been decided on the plains that stretch from Paris to Poland, while this sea—its old masters, Greece, Italy and Spain, quite eclipsed, and its African and Levantine shores under imperialist "protection"—sank to the importance of a link in the chain that held North-Western Europe to its Asian and Oceanic empires. The proposition we are considering asserts that this situation no longer holds, that the deadlock in the Northern plains, the resurgence of independent Arab nationalism, and the revival of the old Catholic powers with US help all mean that the West must once again attend to her ancient heartland, the Mediterranean.

Marechal Juin does not state the case in these general terms. As a soldier, he takes a simpler, strategic view, and his argument is still couched in the language of French and British imperialism—the sort of language Sir Anthony Eden uses when he speaks of Cyprus. Juin says: "The two blocs, eastern and western, both possess atomic weapons, and so their forces are practically neutralised in Europe. But the exploitation of (Arab) nationalisms and the tactic of 'revolutionary war' permit Russia, without intervening directly, gradually to turn the southern flank of the Atlantic fort. This outflanking threatens the NATO powers much more seriously than a possible frontal attack across the German plains". His conclusion is—notice that so far this is only a magazine article but it could mature into a formal French demarche to NATO—that "it is necessary to consider whether a reorganisation of the NATO command in the Mediterranean would not adapt it better to meet the missions that great nations like France and Britain have been fulfilling in this sector". Translated into plainer language, this means that Juin, whose policy in North Africa is among the most re-actionary and most opposed to Arab independence, wants NATO to help France and Britain hold what little they have left in the Mediterranean, namely Algeria and Cyprus.

Of course France has already, with NATO's consent, transferred almost all her armed forces out of Europe, where they are supposed to form part of the bulwark against Russia, to North Africa, where they are defending legitimate and other French interests in Algeria.

Junin explains: "But if France has made this transfer in her own interests, she none the less finds herself placed at the most threatened point of Western defence. We must make our allies understand this". So when Juin argues that the Mediterranean has once again become the centre of world affairs, he may believe it but he is also trying to rally all Western military power to the support of France in Algeria—exactly as he and others were arguing five years ago that Indo-China was no mere colonial war but the very centre of the East-West struggle—an argument that ended by convincing Mr. Foster Dulles.

One hears the same assertion that the Mediterranean is back in the centre of the stage in all the Arab capitals from Rabat via Tunis and Cairo to Beirut. Here again, the argument is based on some measure of self-interest, not to say self-importance. The Arabs point to the emergence of free Islamic nations along the African and Levantine shores of this sea since 1945, and naturally proclaim that from being Europe's backyard, the Mediterranean is going to become the world's pivot. Moreover, the imminent return of Tangier from international status to a free Morocco, and the forthcoming Egyptian inheritance of the Suez Canal will mean that Islamic nations will be in a position to control both the exits from the Mediterranean; this feeling of theoretical "control" encourages the Arab capitals in ascribing renewed importance to the region. But quite apart from Arab self-importance, and apart from possible Egyptian designs in the sense of pan-Islamic imperialism, their case is endorsed by their opponents—as we see in the strategic arguments invoked by France and Britain in support of their positions in the Mediterranean. More significant perhaps, the sudden interest of Russia in this area, exemplified by the fact that it was Mr. Chepilov's first assignment as Foreign Minister, lends colour as much to Arab claims as to Marechal Juin's fears.

Turning now to the northern shores, Greece and Italy are both in agreement that the restored importance of the Mediterranean needs to be consecrated in some form of Mediterranean Pact, complementary to, if not rivalling in importance, the North Atlantic Pact to which they already belong. Greece's "Mediterranean case" has less to do with Cyprus than with Marshal Tito: the Communist reconciliation to her north has revived fears of a Slav federation in the Balkans which might weigh heavily on Greek security. For the moment, the Yugoslavs deny any such plans but Greece would be content to join a maritime alliance that would serve as counterpoise to the hinterland danger. Italy's "Mediterranean case" is founded in the resentment she feels that the North European powers have too long called the tune in the Levant, where Italian friendships and interests entitle her to a more influential voice. Both these countries are quite ready to co-operate with the resurgent Arabs in declaring the Mediterranean to be once again Mare Nostrum, i.e. "our sea". This explains Italy's feverish diplomatic activity in the Arab capitals, especially her offers to help settle the Arab-Israeli dispute—she has several times offered the Italian army to be used as a screen along the Arab-Israeli frontier to guarantee peace. It explains too why, even at the risk of offending France, Rome has invited Colonel Nasser to make Italy his first foreign tour after the presidential elections in Egypt.

In Cairo, Damascus, Beirut and Athens, Italy has suggested the formation of a Mediterranean Pact which,

mainly attributed to the revival in the demand for Indian jute goods and the low level of production of raw jute in the years 1953-54 and 1954-55. The various measures taken by the Government to stimulate the exports of jute goods also contributed to raise the prices from the depressed levels of 1952-53 and 1953-54.

British Exports: Britain set up an all-time record for exports in May, according to provisional figures issued in London by the Board of Trade. The total value of exports in the first five months of this year was 6½ per cent higher than in the corresponding period of 1955. The value of exports in May was £283,800,000, import £329,100,000, and re-exports £13,500,000. The excess of imports (valued c.i.f.) over exports and re-exports (valued f.o.b.) was £31,900,000. The monthly average of January-May, at £51,100,000 was £14,500,000 less than in the corresponding period of 1955. British exports to North America in May were valued at £47,100,000—over £13,000,000 more than in April.

FINANCE

Revenue from Excise on Liquor: Receipts of State Governments from the excise on alcoholic liquor have shown a steady decline during the first Five-Year Plan. For Part 'A' States, the revenue has declined from Rs. 261,200,000 in 1951-52 to Rs. 238,900,000 in 1955-56 and for Part 'B' States from Rs. 212,900,000 to Rs. 173,500,000. The decrease for Bihar has been from Rs. 51,900,000 in 1951-52 to Rs. 48,100,000 in 1955-56. Madhya Pradesh from Rs. 25,600,000 to Rs. 19,500,000; Uttar Pradesh from Rs. 63,200,000 to Rs. 51,600,000 and West Bengal from Rs. 67,200,000 to Rs. 49,100,000. In the Punjab, the trend has been different. Revenue from excise amounted to Rs. 27,800,000 in 1951-52. In the next year there was a fall to Rs. 22,900,000. Thereafter there was a steady increase from Rs. 24,400,000 in 1953-54 to Rs. 26,800,000 in 1955-56. In Assam also, there has been a rise from Rs. 12,100,000 in 1951-52 to Rs. 17,200,000 in 1955-56. Among Part 'B' States, Hyderabad gets the biggest amount from excise. In 1955-56, the revenue to this State amounted to Rs. 70,500,000 compared with Rs. 94,600,000 in 1951-52.

Customs and Excise Revenue Collected in the Indian Union: According to the returns received in the department of commercial intelligence and statistics, the total gross sea and land customs revenue collected in the Indian Union during April 1956, amounted to Rs. 1209 lakhs as compared with Rs. 1214 lakhs in the corresponding month of the previous year. The comparison in the subsequent paragraphs should be taken to refer to that of the current figures with those of the corresponding period of the preceding year. Of the total, customs revenue collections, import duties accounted for Rs. 1043 lakhs, as against Rs. 963 lakhs, export duties for Rs. 154 lakhs as against Rs. 227 lakhs and land customs and miscellaneous for Rs. 12 lakhs as against Rs. 24 lakhs. The total gross collection of Union excise duties amounted to Rs. 1209 lakhs as compared with Rs. 1096 lakhs. The grand total of gross customs and union excise revenue realised was Rs. 24187 lakhs as compared with Rs. 23101 lakhs during the corresponding month of the preceding year.

Grants for Road Development: For the improvement of the roads in the town of Agartala, Government of India has sanctioned a sum of Rs. 3,84,300. This is part of the grants totalling Rs. 6,88,450, sanctioned for road development work in Kutch, Madras, Sikkim, Tripura and Uttar Pradesh. Statewise, the break up of road development grants sanctioned is: Kutch: A sum

of Rs. 43,100; Madras: A sum of Rs. 1,78,700; Sikkim: A sum of Rs. 29,850. Uttar Pradesh has been accorded Rs. 57,400 and Himachal Pradesh: Rs. 62,800.

Aid for Development of Handicrafts: Further grants and loans for the development of handicrafts including the manufacture of dollars and toys, blue pottery and cotton and silk sarees on traditional designs and for their marketing have been sanctioned by the Government of India. On the recommendation of the All-India Handicrafts Board, the Indian Co-operative Union Limited, New Delhi, gets a loan of Rs. 20,000. The All-India Handicrafts Board gets two grants amounting to Rs. 21,000. Orissa has been given a grant of Rs. 37,250. Bhopal gets a grant of Rs. 30,000. A loan of Rs. 25,000 and a grant of Rs. 11,750 have been sanctioned to Himachal Pradesh. A loan of Rs. 24,250 has been given to Manipur State. Uttar Pradesh gets a grant of Rs. 19,400. Bombay has been given about Rs. 13,300. A sum of Rs. 11,100 as grant has been sanctioned to Andhra. Hyderabad gets six grants amounting to over Rs. 20,000 and a loan of Rs. 7,000. Madras has been sanctioned a grant of Rs. 3,300, and Punjab about Rs. 2,000.

GENERAL

Wood Requirements of Rural Electrification Schemes: For phased programme of electric supply to 10,000 villages, involving nearly 35,000 miles of transmission line, about 850,000 poles would be required during the second Five-Year Plan. A correspondingly large quantity of cross-arms, bracings, pins, etc., would also be needed. According to expert opinion, the use of wood instead of steel for transmission poles is likely to reduce capital costs by Rs. 1.5 crores and the demand for steel by 45,000 tons.

Indo-Norwegian Fisheries Community Development Project: Satisfactory progress of the Indo-Norwegian fisheries community development project in Travancore-Cochin State during the first three years of its operation was recorded at the first meeting of its Standing Committee held at Needekara, near Quilon. The procedure for the preparation of schemes requiring approval and financial sanction, the recruitment of staff, the construction of buildings and the purchase of equipment was laid down. The Committee also decided to enlarge the programme of construction of boats for supply to fishermen trained in mechanised fishing; undertake development of harbour facilities for fishing boats at Quilon in collaboration with the Union Ministry of Transport; take up exploratory fishing with Norwegian schooners in off-shore waters; select a site for establishing a fishing centre at Cochin; expand the existing health centre in the project area; extend the ice factory by installing freezing equipment; and provide welfare facilities for the staff.

Shipbuilding in Korea: The Office of Marine Affairs of the Korean Government announced recently that the construction of 73 vessels totalling 3,167 tons will be completed by the end of August 1956. While Government funds of 500 million hwan, construction began in April 1956 on 5 passenger ships and freighters (560 tons), 56 fishing boats (1,863 tons), and 12 sailboats (744 tons). With another 905 million hwan to be released through the Reconstruction Bank, a project will be undertaken to construct or repair 4,500 tons of vessel by the end of the year. The Government has imported US \$2.71 million worth of shipbuilding materials. The size and type of vessel will be decided in accordance with the requests of end-users.

NEWS IN BRIEF

INDIAN

An Indian standard specification for coal tar solvent naphtha, heavy, has been published by the Indian Standards Institution. The standard prescribes the requirements and methods of test for the material in respect of specific gravity, colour, distillation range, hydrogen sulphide and mercaptans, phenols, pyridine basis, etc.

The Government of India have decided to introduce uniform prices for all controlled categories of steel as well as pig-iron at all railhead destinations in the country.

The Western Higher Technological Institute at Bombay is one of the three institutes to be established during the second Five-Year Plan period. Each institute, when fully developed, will provide for a total outturn of 1,200 undergraduates and 600 post-graduate trainees.

Three major D.P. Townships of West Bengal, Habra Baigachi, Taherpur and Gayeshpur will be supplied with electric power primarily for the promotion of medium and small-scale industries, under a Rs. 13.8 lakhs scheme sanctioned by the Union Rehabilitation Ministry.

The Government of India have sanctioned about Rs. 70 lakhs for an interim Ambar Charkha programme during 1956-57.

The Government of India is planning the setting up of technological research centres and organisations for directing exploration and exploitation of solar and wind power in the country. Proposals in this connection are being studied by the Government.

The Government of India has decided to license freely the export of hand-printed cotton sarees meant for domestic consumption, till the end of December, 1956.

The Indian Statistical Institute has set up an industrial management research unit for planning with headquarters at Bangalore.

A British mission is to visit India later this year under the joint auspices of the Colombo Plan and the Federation of British Industries (FBI) to advise on further extensions of heavy machinery manufacturing during the period of the second Five-Year Plan.

It is reported Finland has set apart two million Finnish marks (about Rs. 22,500) for technical assistance to India.

The President has given his assent to the Hyderabad (Abolition of Cash Grants) (Amendment) Bill, 1955.

A preliminary engineering survey for a metre-gauge railway line from Amjauga-Dudhnai to Darangiri a distance of 52 miles on the North Eastern Railway has been approved by the Railway Board.

Nine secondary schools in Tripura will have additional accommodation for displaced students from East Pakistan under a Rs. 3-lakh scheme sanctioned by the Central Rehabilitation Ministry.

FOREIGN

The Board of Trade announced in London recently that an agreement had been signed in Rangoon under which the United Kingdom would supply Burma with textiles to a value of approximately £1,000,000.

An \$11 million (£3.9 million) trade agreement signed between Israel and Yugoslavia provides for each side to supply goods worth \$5½ million. Yugoslavia will supply timber, metals and chemicals in return for Israel's exports of citrus fruit, cars, pharmaceutical products, tyres, textiles, industrial and farm products.

Output records were set by the US Steel industry both in May and for the first five months of this year, reports the American Iron and Steel Institute. Last month nearly 10.5 million net tons of ingots and castings were produced compared with some 10.3 million tons in May, 1955.

The International Bank for Reconstruction and Development in addition to watching the borrowing by member nations has raised the interest rates on its loans.

Models of complete blast furnace, steel-making and rolling mill plants planned and built by Demag are being exhibited in the "Haus der Modelle" at the German Industrial Fair, Hanover. They represent an investment of over 500 million marks. Major plants of this kind are planned and built at present by Demag for Egypt, India, Burma, Korea, Argentina, Iran, Brazil and the Philippines.

Production of crude steel in England in May was at an annual rate of 20.6 million tons compared with 21.9 million tons in April and the record 22.1 million tons in March. In May 1955 the annual rate of output was 20.9 million tons.

It is reported the new multilateral payments scheme with Argentina is expected to start operating on July 2.

According to the official publication "the National Economy of the USSR", the Soviet Union's population has now been officially estimated at 200.2 million, about 20 million less than the estimate made by Western countries.

The UK Government has decided to drop the proposal contained in the Finance Bill to increase the taxation liability of foreigners and Commonwealth citizens working in Britain for overseas firms.

The World Bank has approved so far in the fiscal year 23 new loans. An additional five loans now under negotiations, would probably also be approved, bringing the total of loans for the current fiscal year up to \$420 million which would exceed the previous record of \$410 million established in 1954-55.

Five major crude oil purchasers in the Illinois basin have reduced prices by ten cents per barrel—from \$3 to \$2.90. The five concerns purchase about 30 per cent of the average 226,200 barrels of oil produced each day in Illinois.

give these hands better light—at less cost!

A factory cannot afford faults—because faults mean hold-ups, unfulfilled quotas, reduced profits. That's why most modern factories have fluorescent lighting. Production experts have discovered that a good light reduces faults greatly... increases production.

Philips 'TL' Fluorescent Lamps give more than three times more light than filament lamps of the same current consumption! That's real economy! And the light is not harsh—it lights up the working bench evenly. The worker's eyes do not get tired easily if the lighting is well planned! He can do better work. Install Philips 'TL' Fluorescent Lighting and watch output go up... costs come down.

PHILIPS

'TL' FLUORESCENT LAMPS & FITTINGS
—make light work for you!

A Philips Fluorescent Lamp gives more than three times more light—lasts on an average 7,500 hours!

Can we advise you? The Philips Lighting Service Bureau will be glad to show you how you can use fluorescent lighting in your factory—free of charge and without obligation. Please write to Philips Electrical Co. (India) Private Ltd.

Economic Report from the U.S.

WORLD BANK LOANS

(BY GUY SIMS FITCH)

WASHINGTON, June 26.—Today the United Nations International Bank for Reconstruction and Development—known more popularly as the World Bank—is making its 150th loan to a member country. It is a \$75 million outlay to help India boost its production of steel. This event, significant in itself, comes one day after the bank marked the 10th anniversary of its founding. In the past decade, it has lent some \$2,800 million to 43 lands, and its membership has grown from 28 to 58 free nations in every part of the world.

These figures, impressive as they may be, cannot fully describe the impact of the bank's operations on the economies of many of its member States. Its loans have ranged from \$252,000 for a radio transmitter building in Iceland to \$80 million for hydro-electric project in the Federation of Rhodesia and Nyasaland. Other examples include loans for roads in Colombia, port improvements in Burma, a paper mill in Pakistan. All bank's undertakings have met two basic criteria: usefulness and urgency. Thus, the bank has consistently associated itself with projects that could be expected to contribute constructively to a nation's economic advancement.

Within its broad task—to provide capital for post-war reconstruction as well as for economic development—the bank has geared its activities to the needs of the time. Earliest operations were concentrated in war-torn Europe, where in 1947 it made reconstruction loans valued at \$497 million. But largely as a result of US assistance as the Marshall Plan, the bank was able to turn its attention with increasing vigour to its long-term task: economic development of member countries. Its first loan in Latin America, made in 1948, was soon followed by loans in Asia and Africa. All told, about three-fifths of the money advanced has gone to these three regions.

In the newly developing areas, the main problem has been to strengthen the foundations on which productive economic progress can be based. This has required particular attention to such basic services as power and transportation—keys to integrated industrial and agricultural development. It is not surprising, therefore, that the bank has made more loans for electric power projects than for any other purpose—a total of about \$800 million. And it has lent nearly as much for highways, railways, ports and other means of course, into industrial and agricultural projects. Indicating the soundness of the risks undertaken, not a single borrower has yet defaulted on the low-interest, long-term loans extended by the World Bank. Of the total borrowed, about \$250 million has been repaid.

Apart from its lending activities, the bank has been interested in creating an environment favourable to investment generally. Its loans are designed to supplement, rather than replace, both private international investment and domestic investment. It also has used its influence to promote sound economic and fiscal policies, and has helped a number of member nations draw up development programmes. Emphasizing the

truly international character of this UN institution, the bank's loans are made in currencies of all member nations, who themselves have helped create its capital by their contributions. The United States, largest of the contributors, has underwritten about one-third of the bank's \$1,000 million of capital stock and has paid in some \$635 million with no strings attached. In addition, US capital markets have been open to the bank for borrowing and for sale of its bonds to private American investors. All told, the bank now can trace to private sources around the world nearly half the funds it has available for loans.

Officials at bank headquarters here in Washington look back on the past decade with understandable satisfaction. When the bank began its work in June 1946, it faced a period of uncertainty, with the magnitude of its task only dimly perceived in a world ravaged by war. As it is beginning its eleventh year, it has a commendable record of accomplishment behind it and the prospect of still greater achievements ahead.

The Business World

SMALL BUSINESS IN THE U.S.

THE role of small business is an indispensable one in a competitive enterprise system of economy such as that operating in the United States today. The place assigned to it and measures of assistance taken to invigorate and stimulate it in that country should prove instructive to those who are concerned with the problems of small and medium industries and businesses in India. It is very significant that assistance takes a direct form and in no way does it penalise large-scale industries. In this approach there is a great moral for our policy-makers.

One of the most obvious examples of the importance of small business is found in the oil industry. Most of the big American oil companies, such as Standard Oil Company of New Jersey, distribute their products through the hundreds of thousands of independently owned and operated gasoline stations that serve American motorists in cities, towns and the countryside throughout the United States.

Positive proof of the importance of this type of enterprise in the US economy is to be found in the fact that the Small Business Administration, a governmental agency created by the US Congress to "aid, counsel, assist and protect small-business concerns", reported that as on June 30, 1955, as many as 4 million were out of the 4,225,000 business enterprises in the US were small businesses. Although it is not easy to define the scope of the term "small business," as used in this estimate, there are certain criteria that give it a definite meaning. The Small Business Act of 1953, which created the Small Business Administration (SBA), defined a small-business concern as "one which is independently owned and operated and which is not dominant in its field of operation."

In its function of assisting small business to get its fair share of government contracts, the SBA considers any firm that employs fewer than 500 persons a small business. In the distribution trades, the SBA uses monetary test as a measuring rod. Net sales of \$5 million a year is the ceiling for small wholesalers, while in the retail field, most firms having annual net sales of less than \$1 million are regarded as small. In this latter category are hundreds of thousands of small retail businesses, such as neighbourhood grocery stores, shoe-repair shops, restaurants, dress shops and haberdasheries whose annual net sales do not reach one-tenth of the \$1 million ceiling. Most service-trades concerns are also classified as small if their annual receipts are less than \$1 million.

There is no doubt that small-business concerns, and especially small manufacturing corporations, labour under some inherent handicaps in the US free enterprise system of economy. The limited amount of capital with which most small corporations operate is an obvious disadvantage in terms of financial stress and strain. For the same reason the small corporation generally does not have the money to set up laboratories and to hire highly skilled technicians to conduct research. Neither does it have the financial backing to conduct experiments that sometimes require years for the development of a single, complicated product. But if small business labours under inherent handicaps in a free economy, it also has certain inherent advantages. One of these is its ability to manoeuvre—to change pace. Large corporations, with their staffs of specialists and policy-makers, inevitably consume an inordinate amount of time in arriving at decisions. On

the other hand, the small concern, where very often one man makes decisions, can quickly change its policy when the need arises.

The fact that most big corporations depend upon a large volume of sales for profitable operation can also prove an advantage to small concerns. Sometimes large corporations, after having financed the research and development necessary to put a product on the market, find the sales volume of the product insufficient to ensure a profit. In such cases, the large corporation is often willing to cut its loss by turning the product over to a small firm for a consideration, or on a licence basis. The small concern, which can operate profitably with a smaller volume of business, finds this very much to its advantage.

Nevertheless, small business requires the protective intervention of government against the threat of monopoly. President Eisenhower, in his Economic Message to the US Congress in January 1956, proclaimed the awareness of this problem. "One of the clearest lessons of business history," the President commented, "is that tendencies toward monopoly are always present in some degree and that constant vigilance is needed to assure ascendancy of competitive conditions. Strict enforcement of the anti-trust laws is our primary weapon for thwarting any impairment of competition." In the US system of economy, small business has, indeed, an assured future and an indispensable place.

BUSINESS NOTES

RESEALING OF JUTE LOOMS

THE DECISION of the Indian Jute Mills' Association to put out of commission 2½ per cent of the total looms from 16th July next need not come as a surprise at all. For some time past the jute industry has been confronted with the crisis of accumulating stocks and a depressing outlook in the markets abroad. It will be remembered that there was a proposal to fix a minimum price for exports of jute manufactures, but this proposal had found little support, and for obvious reasons. Fixation of minimum prices for jute exports could not have failed to operate as a boomerang. India does not by any means hold either a monopoly or even a near-monopoly in jute manufactures and her share in the international jute market now stands around 58 per cent of the total. In this situation the course suggested would have heightened the crisis of stock accumulations.

The IJMA's decision, which has been taken in consultation with the Government of India, aims at bringing the production of jute goods into alignment with the global demand. Restriction of output has always been recognised only as a stop-gap arrangement to tide over temporary crises. It is now incumbent that attention should be diverted to the long-term problem of strengthening the competitive position of Indian jute goods. The main hurdle to be crossed in achieving the goal of reducing the prices of jute manufactures is a reduction in prices of raw jute. At the present time this poses a big question mark for the Indian industry because it has to depend upon high cost Pakistani raw jute to the extent of 20 per cent of its requirements. But a determined effort must now be made to improve this factor of raw jute prices. It is high time that the recommendations of the expert committee of enquiry which reported on jute industry were put into effect in real earnest. The major suggestions of this Committee are to improve the types of seeds and retting facilities as well as to adopt more scientific aids in line sowing and greater use of fertilisers. Cultivation of improved varieties of jute is also an indispensable reform. But it would appear that immediately it need not be given high priority because the new machinery which is being installed is capable of offsetting in some measure the effects of lower varieties on the quality of jute manufactures and furthermore current preference in the markets is largely for medium quality jute goods.

CURB ON SPOT TRADING

WHILE WELCOMING legislation on an all-India basis of the stock markets in India, Sir Chunilal B. Mehta, President of the Indian Stock Exchange, Ltd., drew the pointed attention of Government to the amended definition of Spot Delivery Contracts. It may be recalled that the Securities Contracts (Regulation) Bill, 1954, introduced in Lok Sabha on December 24, 1954, was referred to a Joint Committee of the two Houses on November 28, 1955. It is the latter that has amended the definition of Spot Delivery Contracts contained in the original Bill. The change, in the main, is in respect of a reduction in the period allowed for the completion of the said contract from three days to two days, including the date of contract, but exclusive of the time required for postal transit. In effect, in the amended form, it means that both the delivery and the payment in respect of the contract should be completed within 24 hours after it is made.

Taking very strong exception to this amendment, Sir Chunilal pointed out, in the course of his presi-

dential address at the Eighteenth Annual General Meeting of the Indian Stock Exchange, Ltd., Bombay, on Friday, June 15, that "even big institutions which will be recognised by Government for carrying on Forward Delivery business will not, in actual practice, find this a feasible proposition". In this connection, he traced the history of this issue and recalled how the question had been considered by the Morrison Committee and the Bombay Government and how the former had recommended the adoption of a period of seven days on practical considerations, while the Bombay Securities Contracts Control Act, 1925 has defined a "ready delivery contract" "as one which should be performed immediately or within a reasonable time".

In the event of there being a reduction in the period allowed for Spot Delivery Contracts, there would certainly be a considerable shrinkage in ready delivery business on all stock exchanges in India. In other words, this means that the bulk of the stock exchange business would be severely hit by the proposed amendment. It is common knowledge that ready business exceeds by a very wide margin that in futures. In Bombay, for instance, where there is a full-fledged and active forward market, only about 50 scrips are on the forward list; the rest, which are in hundreds have to be traded on ready basis only. In the circumstances, one would have thought that facilities would be afforded for the improvement of ready business, but the amendment in question, by seeking to restrict the time limit for spot delivery contracts, would not only inflict grave injustice on the large number of the investing public but seriously affect the general morale of all stock market business. To quote Sir Chunilal, "the investing public will be discouraged in investment business on account of such hardships involved, and this will be an undesirable development". Moreover, the change proposed would defeat the very underlying object of the Bill. "The basic object of the stock exchange reform," observed the Union Finance Minister when moving the Bill for reference to the Joint Committee, "is to regulate speculative activities, so that they may not degenerate into gambling; it is not the object of such reform to interfere with investment buying or selling or even with legitimate speculation as long as it conforms to the rules of the game". However, inasmuch as nearly all ready business is genuine investment business, the new definition, if allowed to stand as it is, will have the unfortunate effect of adversely affecting only investment deals.

ALLOCATION OF AUTOMATIC LOOMS

THE GOVERNMENT of India's cloth policy announcement envisaged the installation of 14,600 automatic looms but did not throw full light on how these looms would be allotted to different applicant mills. Only the broad considerations that Government had in view were indicated and even that vaguely. The position has, however, been both amplified and clarified since.

Mr. Nityanand Kanungo, the Union Minister for Consumer Industries, in his discussions with cotton mill interests in Bombay and Ahmedabad last week, explained the Government's stand on the allocation of these looms thus. The idea for the present, according to him, is that mills should be allowed to instal 14,600 automatic looms so as to raise the output of cloth by 350 million yds. which would be exclusively for export. Thus, mills intending to instal automatic looms would have to produce an additional quantity of 24,000 yds. of cloth per loom per year. Any mill which fails to export the full quantity would have to bear a penal excise duty of two annas per yard. Mills which have

not been utilising the existing automatic looms for producing cloth for export and want more automatic looms would also be required to produce the minimum of 24,000 yds. and this in addition to a certain percentage of the cloth produced by their existing automatic looms. Again, mills which have already been exporting cloth produced on automatic looms but desire more looms would have to produce not only the stipulated export quota but also maintain their present exports.

Textile circles seem to feel that the stipulated target of 24,000 yds. is rather on the high side. There are many units, especially in Ahmedabad, which would find the conditions of minimum production for export, or the alternative penal tax, particularly burdensome. There is also resentment among consumers that, in the name of export promotion, government are apparently oblivious of the need to provide relief to the indigent consumer by passing on to him the benefit of lower production cost consequent on the proposed increased output. The more appropriate policy, according to some, would, therefore, appear to be to allow these mills, with the help of automatic looms, to contribute to the export pool and, in the process, also hope their own development. In such an event, it is suggested, the export quota would have to be more broad-based and be the average of at least the last five years, instead of that of only two years, as suggested at present.

If the production and export targets are to be met, the adequacy of yarn supply must be ensured. No doubt, an addition of 2.1 million spindles is contemplated to provide yarn for 1,400 million yds. of cloth, but the Union Minister for Commerce and Industry has himself confessed to a slow pace in the installation of spindleage against issued licences. The new yarn will take at least 6 to 9 months to come in the market. Again, it is asked, will the much-advertised Ambar Charkhas be able to perform the miracle of producing yarn for the 300 million yds. of cloth allotted to them? Available evidence so far at any rate does not warrant such an optimistic conclusion.

Further, between the rival claimants for yarn, automatic looms, powerlooms and handlooms, the last two will naturally receive Government patronage, that is, preference in the matter of allocation of supplies. Notwithstanding this, one visualises, there would be a hue and cry from these quarters for supply of yarn, coupled, of course, with the customary plea for imports of yarn. It is even possible that, so as to cover any shortfalls in the output of these marvel mechanisms, Government might be induced to allow yarn import. There is nothing wrong in allowing import of yarn if the country's textile requirements warrant them, but has this been assumed in framing our foreign exchange budget for the second Five-Year Plan?

PORT DEVELOPMENT

DESPITE THE congestion in our ports for years past, it is to be regretted that a good part of the allotment for the development of ports during the first Plan period has remained unspent, indicating a delay in the implementation of the schemes. The second Plan provides for Rs. 76 crores, inclusive of the spillover from the first Plan. The Government of India is to grant a loan of Rs. 40 crores and the port authorities will have to raise the remainder by upgrading their port charges, drawing from reserves and floating loans in the open market. But it is problematic whether the port trusts will be able to raise all this money to meet the shortfall of Rs. 36 crores on their own. Of the major ports, Calcutta has estimated only a small surplus for 1955-56 against almost chronic deficits in the previous years.

The other ports, however, are relatively in a better financial position.

At the time of partition, India had five major ports with a total capacity of 20 million tons per annum. During the first Plan, the construction of a sixth major port at Kandla was taken up, and the total capacity has thus been raised to 26 million tons. It is proposed to raise the capacity further to 38 million tons during the second Plan period. In addition, development programmes for a number of minor ports in the maritime States are to be carried out.

With the reorganisation of the States, and the consequent formation of the new maritime State of Karnataka, the development of Mangalore or Malpe on the West Coast, as well as Paradeep on the East Coast, into major ports will no doubt have to be considered. Having regard to the pressing need of rehabilitation and modernisation of the ports on a large scale, it is to be hoped that the programmes are executed more vigorously than in the first Plan period. At Bombay, modernisation of the Prince's and Victoria Docks is still to be taken in hand, though considerable progress has been made on the new oil terminal at Butcher Island. One would also like to emphasise the need to take immediate steps to improve the loading, unloading and repair facilities for country craft at the major ports, particularly at Calcutta.

Emphasis should be laid on the need for greater utilisation of the minor ports for the shipment of such cargoes as coal, rice, sugar and fertilisers in order to provide more employment opportunities to the labour population residing at or near those ports. About a fourth of India's trade now passes through the country's minor ports. To keep pace with national planning and economic development, these ports also have to be well-equipped and modernised. A comprehensive expert survey made not long ago revealed that some ports, including Cuddalore, Mangalore, Kozhikode, Okha, Tuticorin, Bhavnagar and others, which handle the bulk of the minor ports' traffic, might be listed as intermediate ports and special attention paid to their development. Technical investigations have established the feasibility of developing Tuticorin as a deep-sea port. Minor ports are mainly the responsibility of the State Governments. A provision of one crore of rupees was included in the first Five-Year Plan for development of minor ports. It is now estimated that five crores of rupees will be necessary for development work during the second Plan period.

FUTURES TRADE RESUMED IN COTTON AND GROUNDNUTS

AFTER A lapse of a little over a decade—about 13 years in fact—futures trading in groundnut was resumed on the Bombay Oilseeds Exchange on Monday June 18. It was on the same day that the resumption of futures trading in cotton also became a 'fait accompli'. Both are events of equal significance to Bombay's trading interests, and, in a way, this was brought out clearly by both the functions being blessed by the Chief Minister, Shri Morarji Desai on the same day.

While inaugurating the resumption of futures trading in cotton, Shri Morarji condemned undue speculation and said characteristically: "Life itself is speculation, but speculation must not become life". Advocating that discussions across the table always produced results, Shri Desai rightly warned that "pride on the part of either body (East Indian Cotton Association or Forward Markets Commission) will not solve the problems." In this connection, he referred to the smooth way in which everything used to be done when

futures trading in cotton in Bombay was under the jurisdiction of the Government of Bombay and hoped that this tradition would be strengthened both by the Forward Markets Commission and the East India Cotton Association.

In the case of futures trading in groundnut, the question had been under discussion between the Bombay Oilseeds Exchange and the Forward Markets Commission for quite some time now. Following these discussions, it has now been decided to re-start futures trading in groundnuts, which had been stopped in 1944, on more or less the same lines as before. However, some minor amendments have been effected to the by-laws of the Association so as to suit the prevailing statistical position of the commodity in question and also to indicate the advent on the scene of the Forward Markets Commission.

The salient features of the Groundnut Contract are that the basic variety would be Bombay Bold, with three delivery contracts in a year, the months of delivery being February, May, and August. The unit of trading will be a candy. The margin system will cover all oilseeds for which trading is permitted. Trading will be free of margin in each oilseed—as also for all oilseeds taken together—up to 7,500 candies, whereafter the graded rates would begin to apply. While permission has now been given only to groundnut, the FMC is expected to extend similar permission to trading in other oilseeds also in due course.

SUGAR OUTLOOK

THE 1955-56 season's production of 17.84 lakh tons of sugar is an all-time record and is higher than the previous season's 15.94 lakh tons. It is, however, slightly lower than the first Five-Year Plan's revised target of 18 lakh tons. In spite of the higher production and the Government's decision to sell nearly 110,000 bags of British refined sugar, prices have shown a firm trend in recent weeks. This is attributed to the faulty distribution system, poor arrivals, probably due to wagon shortage, and a sudden spurt in demand. Besides, the alleged accumulation of supplies in a few hands has also had its effect on the market. It is reported that those who have secured supplies are trying to form a syndicate to handle their sales.

It is known that the Government of India's present policy is to discourage imports, and to achieve self-sufficiency. During the 1955-56 season, imports were stopped, and the Development Council has now fixed a target production of 22.5 lakh tons by 1960-61 for an estimated population of 400 millions. As the area of 40 lakh acres under sugarcane cannot be further increased, the success of the Plan will depend, to a large extent, on increasing the yield of cane per acre by intensive cultivation. The average yield in India is still very low at only 14 tons per acre as compared to 62 tons in Hawaii, 56 tons in Java and 41 tons in Peru. It is a happy sign, therefore, that the Development Council has earmarked four annas per cwt. of sugar produced from the excise duty collections for cane development and research. On the basis of an estimated production of 22.5 lakh tons in 1960-61, the annual expenditure for cane development may reach the figure of Rs. 112 lakhs, and will work out at Rs. 5-8 per acre as against only six annas during the first Plan period. Compared to expenditure in some other producing countries, however, even this would be very much on the low side. Again, the percentage sugar recovery of our cane is the lowest at 9.80 as compared with Cuba's 12.25 and Australia's 14.33.

It is only natural that more cane production should be followed by more sugar factories. It is on the cards

already that a large number of new factories will be established during the second Plan period, including a few co-operatives. At the same time, permission has also been given for the expansion of several existing units.

Though India is the largest sugar producer of the world, producing and consuming about one-ninth of the world sugar production, the per capita consumption of gur and sugar in this country is the lowest estimated at 29 lbs. as against 114.9 lbs. in Australia, 113.5 lbs. in Denmark and 110.2 lbs. in New Zealand. Even under the second Five-Year Plan, nothing spectacular is anticipated, and the development has been planned for nothing more than the maintenance of the present per capita consumption. There is, therefore, scope for considerable improvement.

There is now no statutory control as such on the distribution or price of sugar, although factories are asked to keep 25 per cent. of their production for requisition by the Government, if necessary. But the increases in excise duty and railway freight rates from last year have affected the cost of production, thereby raising the market price.

SOVIET PURCHASE OF INDIAN WOOL

RAW WOOL figures as one of the articles of Indian exports to the USSR in the trade agreement concluded on December 2, 1955, between India and that country. Recent reports indicate that a party which visited this country from the Soviet Union last May on a trade mission went through enquiries regarding raw wool among other commodities. These enquiries have finally resulted in Soviet purchase of the first lot of India's wool. The total quantity in the deal is said to be of the order of about two million lbs., prices being fixed in the neighbourhood of 75d. per lb. on f.o.b. basis. The varieties selected are largely Bikaner and Joria best qualities. The total value which is estimated to be in the neighbourhood of Rs. 40 lakhs marks a good beginning and from the Indian angle exports to the USSR comprising a wide range of goods would help the main objective of balancing the two-way trade. Although similar confirmation about final placing of orders by the USSR for Indian woollen textiles is lacking, it is a welcome development that the Soviet Union is ready to take part of our surplus.

RECORDS & STATISTICS (QUARTERLY BULLETIN)

Editor: R. V. MURTHY, M.A.

"The Eastern Economist" Bulletin of Records and Statistics surveys economic trends in each quarter in India and abroad with the aid of graphs and all available statistics. One of its special features is the Investment Supplement.

COMPANY AFFAIRS

HEILGERS GROUP OF COAL COS.

The audited accounts of the Ondal, the Borrea and the Standard Coal Companies (Managing Agents: F.W. Heilgers & Co. (Private) Ltd.), for the half-year ended December, 1955, are now available. Henceforth, the accounts of the companies will be closed and accounted annually in accordance with the provisions of the Companies Act, 1956. The companies may, however, declare interim dividends when their affairs warrant such action. The working results of each, covering the half-year under reference, are given below:

The Ondal Coal Co., Ltd.

The profit and loss account, after providing Rs. 27,082 for taxation, and including Rs. 1,05,531 brought forward from the previous account, shows an available balance of Rs. 1,00,646. Out of this amount, the Directors have recommended payment of a 6½ per cent per annum dividend on preference shares, free of tax, which absorbs Rs. 6,500. Another Rs. 37,500 are recommended to be paid out as dividend on ordinary shares at 10 per cent per annum, also free of tax. The balance of Rs. 56,646 is to be carried forward.

During the half-year, the Karanpura Mining Syndicate raised 75,768 tons of coal and despatched 75,993 tons. The Directors feel that the raisings could have been larger but for the fact that transport was in short supply.

The Borrea Coal Co., Ltd.

The accounts show that Rs. 45,717 have been provided for depreciation and Rs. 1,36,666 for taxation. An amount of Rs. 3,000 has been transferred to the tax contingency reserve, Rs. 1000 to development rebate reserve and Rs. 75,000 to coal washing plant reserve. After all these charges there is an available balance of Rs. 1,72,207 which includes Rs. 25,000 brought from taxation reserve and Rs. 98,656 brought forward from the previous account. The amount has been recommended to be disposed of as follows:

In paying a dividend on preference shares at 6½ per cent per annum, free of tax, absorbing Rs. 13,000; in paying a dividend on ordinary shares at 20 per cent per annum, free of tax, which takes away Rs. 75,060, and in carrying forward the balance of Rs. 84,207.

Both raisings and despatches during the half-year under review have recorded increases over the preceding half-year's figures. Some 77,981 tons of coal, as against 75,187 tons during the previous period, were raised. Despatches totalled 85,503 tons compared to 69,844 tons of the preceding half-year period.

The Standard Coal Co., Ltd.

After providing Rs. 1000 for depreciation, and Rs. 16,034 for taxation; and after transferring Rs. 18,000 from provision for payments under labour disputes, and including Rs. 7,937 brought forward, the audited accounts show an available balance of Rs. 57,347. The Directors have recommended payment of a 10 per cent per annum dividend, free of tax, which absorbs Rs. 40,000. That leaves a balance of Rs. 17,347 which is proposed to be carried to the next account.

Under the Tribunal Award, relief payments to workers were to be paid. At the end of May, 1956, a total sum of Rs. 86,528 had been disbursed.

SHAW WALLACE GROUP OF COAL COS.

The Pench Valley Coal Co., Ltd.

The Directors' report and the accounts of the Company for the half-year ended September, 1955, show that after providing Rs. 2,05,185 for taxation and including Rs. 38,203 brought forward, the Company's profit was Rs. 2,51,468. The Directors have placed to

development reserve Rs. 1,00,000. A dividend at 10 per cent per annum, free of tax, absorbs Rs. 1,18,125 which leaves a balance of Rs. 33,343 proposed to be carried forward.

Output and despatches of steam and other grades of coal which had declined during the half-year ended March, 1955, as compared to the period ended September, 1954, have again gone up. Raisings stand at 2,22,222 tons as compared to 2,07,654 tons and 2,15,388 tons respectively of the previous two half-years. Despatches total 2,25,767 tons as compared to 2,07,432 tons and 2,11,473 tons.

Capital expenditure incurred during the half-year on development, machinery and buildings amounted to Rs. 1,35,454, compared to Rs. 78,338 for the previous half-year. Extensive development has been taken in hand to replace some of the old collieries nearing exhaustion.

The Amalgamated Coalfields, Ltd.

The accounts of the Company, also for the half-year ended September, 1955, show the Company's profit at Rs. 4,68,203 after providing Rs. 2,83,002 for taxation. The profit figure includes a credit of Rs. 29,786 relating to previous periods and Rs. 38,206 brought forward. Out of this amount, the Directors have appropriated Rs. 2.50 lakhs to machinery replacement and development reserve. The dividend at 15 per cent per annum, free of tax, absorbs Rs. 1,91,250 leaving Rs. 26,953 to be carried forward.

Raisings during the half-year under review are 4,15,791 tons which compare favourably with 3,98,230 tons and 4,01,400 tons for the two periods ending March, 1955, and September, 1954 respectively. Despatches also have gone up to 4,36,024 tons as compared to 3,90,920 tons and 3,77,585 tons for the previous two half-year periods.

Like its sister concern, the Company has taken in hand the job of replacing some of the old collieries nearing exhaustion. Capital expenditure during the half year on development, machinery and buildings amounted to Rs. 3,00,396 as against Rs. 1,73,837 for the previous half-year.

THE BURRAKUR COAL CO., LTD.

After providing Rs. 4,30,391 for depreciation, Rs. 5,53,475 for taxation, transferring Rs. 6,900 to development rebate reserve, Rs. 55,500 to tax contingency reserve, Rs. 50,000 to debenture redemption reserve, Rs. 1.50 lakhs to ropeway rope replacement reserve, Rs. 25,000 to general reserve, and including the sum of Rs. 1,40,510 brought forward, the accounts show an available balance of Rs. 4,89,965. The Directors have recommended the following dividends: A 7 per cent per annum dividend, free of tax, on 1st preference shares absorbing Rs. 80,493; a 6 per cent per annum dividend, subject to taxation, on 2nd preference shares, taking Rs. 9,956; and a 6½ per cent per annum dividend, free of tax, on ordinary shares, absorbing Rs. 2,84,140. The balance of Rs. 1,15,375 is to be carried forward.

Raisings and despatches during the period under report were 5,16,165 tons and 5,26,106 tons respectively. The figures for the previous period were 5,13,556 tons and 5,06,261 tons.

The Directors feel that the performance of railways has shown improvement, though it cannot yet be said that transport plans are geared to the vast requirements of the second Five-Year Plan. According to them, the industry failed to benefit by the spare capacity period normally occurring between July and October.

COMMODITY NEWS AND NOTES

WORLD GRAIN PRODUCTION

According to the Food and Agriculture Organisation's latest year book of food and agricultural statistics, production of wheat in 1954 was 151.5 million metric tons harvested from the total area of 135 million hectares. Rice yield was greater—162.2 million tons of paddy—though the area brought under the crop was less—97.4 million hectares. Maize came third in production, with 137.3 million tons. Production of 59.2 million tons of millet and sargham 55.8 million tons of barley, 49.4 million tons of oat and 20.3 million tons of rye brought total grain production for 1954 to 635.7 million tons.

The greatest continental grain producer was Asia, with a total 1954 production of 277.1 million tons of all grains, compared with an annual average of 256.1 million tons for the years 1948-52. Most Asian grain production was of rice, which contributed 148.4 million tons. North and Central America in 1954 produced 167.4 million tons of all grains. European grain production was 117.9 million tons. World production (excluding the USSR) of some other major crops in 1954, according to year Book were: potatoes 166.9 million tons; raw sugar 34.8 million tons, sweet potatoes and yams 69.5 million tons; pulses 24.4 million tons, oil seeds 54.6 million tons and cotton 7.2 million tons.

INCREASE IN AREA UNDER WHEAT

The all-India final estimate of wheat, 1955-56 puts the current years area and production at 29,225,000 acres and 8,348,000 tons respectively, as against the partially revised estimate of 27,517,000 acres and 8,778,000 tons for 1954-55. The current year's estimate thus shows an increase of 1,708,000 acres or 6.2 per cent in area and a decrease of 430,000 tons or 4.9 per cent in production as compared with the partially revised estimate for 1954-55, which was a peak year so far as wheat production is concerned. As compared with the average of five preceding years estimate, however, the area and production during the current year show an increase of 4,088,000 acres or 16.3 per cent and 1,050,000 tons or 14.4 per cent respectively. The current years production of wheat equals the target of 8.3 million tons fixed for 1955-56 under the first Five-Year Plan. The increase in area during the current year has been shared by all the wheat growing states except Bihar, and is generally attributed to favourable weather conditions at the time of sowing. The increase in area is partially marked in the case of U.P., Bombay, Rajasthan, Hyderabad, Madhya Pradesh, and PEPSU.

FORWARD TRADING IN GROUNDNUTS RESUMED

Forward trading in groundnuts was resumed on the Bombay Oilseeds Exchange recently after a break of over 12 years. The contract provides for delivery at 38 centres in the groundnut growing areas of the country. Trading began for February 1957 contract, which commenced at Rs. 131.4 per hundred candies. According to amended bye-laws, approved by the Forward Market Commission, the margin system will be operative over all the oilseeds for which trading is permitted. Trading up to 7,500 candies in each oilseed as well as for all oilseeds taken together, will be free of margin and graded rates will apply thereafter. The trading in different oilseeds will be permitted to be offset against each other.

RAW WOOL EXPORT

The Government of India have announced partial modification in the existing rules regulating the export of raw wool during the period April-September 1956. A notification in this connection by the Joint Chief Controller of Exports, Bombay, says, that it has now

been decided that shippers, who had exported raw wool not in their own names but on their own risk and account from the territories now constituting Pakistan during any one of the calendar years 1945, 1946 and 1947 and or from India during any one of the calendar years, 1948, 1949 and 1950, will be treated as newcomers and granted allotments of 25 bales (8,000 lb.) each valid for shipment up to the end of September 1956, only. The notification adds that intending new-comers should submit their applicants duly accompanied by relevant documents.

BURLAP CONSUMPTION IN USA

US burlap consumption in May 1956 improved to 73,000,000 yards from 69,000,000 yards in the previous month. Total consumption during the current year up to the end of May was higher at 353,000,000 yards against 343,000,000 yards in the corresponding period of last year. Another encouraging feature was that US burlap stocks, after showing a continuous rise for several months declined to 247,000,000 yards at the end of May from 253,000,000 yards at the end of the previous month. While spot stocks appreciated further to 151,000,000 yards from 144,000,000 at the end of April 1956, afloat stocks fell sharply to 96,000,000 yards from 111,000,000 yards. With rising consumption and poor afloat stocks, it is hoped US buyers will soon enter the Calcutta market to make their seasonal purchases.

RESUMPTION OF COTTON FUTURES

After a break of about six months cotton future, has been resumed again putting thereby an end to the trouble in cotton. In getting the permission of the Government for the purpose, the East India Cotton Association has had to adopt all the amendments to its bye-laws proposed by the Forward Markets Commission. Perhaps the only point on which the Commission has yielded is on the question of the continuance of the present system of surveying of cotton. Among the striking features of the new pattern of trading in cotton futures are (i) there will be two hedge contracts one with Jarilla 25/32" fine as its basis and the other with Vijay 27/32" fine as its basis instead of a single hedge contract with Jarilla 13/16" fine as its basis. The purpose of this amendment is to provide a better hedge and offer protection to a larger quantity of cotton (ii) the delivery month for the contract have been advanced so as to ensure larger supplies of tenderable cotton during the delivery period (iii) the margin system has been tightened up and a provision for special clearing has been introduced (iv) provisions regarding the reporting of informations by members have been made more comprehensive (v) the Association is also said to have accepted the Commissions view relating to the fixation of tendering differentials on the basis of forward rather than spot prices.

NEW INTERNATIONAL TEA AGREEMENT

The proposed new agreement raises the exportable tea quotas of tea-growing countries from the present 1,091 million to 1,183 million lbs. annually. India's share of this export trade is expected to be 560 million lbs. as against the present 470 million lbs., Ceylon's 400 million lbs. against 339 million lbs. and Pakistan's 47.5 million lbs. The new agreement seeks to lift restrictions placed on the extension of acreage under tea in the various countries because, it is said, no country under the agreement was able to utilise the full acreage sanctioned for extension so far under its terms. The first auctions for the current tea year commenced on the 14th of this month.

Prospectus

A copy of the prospectus has been delivered to the Registrar of Companies, West Bengal, for registration together with the necessary documents which are required by Sec. 60 of the Companies Act, 1956.

Consent of the Central Government has been obtained to this issue by an order of which a complete copy is open to public inspection at the Registered Office (Head Office) of the Company. It must be distinctly understood that in giving this consent the Government of India do not take any responsibility for the financial soundness of any schemes or for the correctness of any of the statements made or opinions expressed in regard to them.

A licence has been obtained from the Central Government for the establishment of this new industrial undertaking of which a copy is open to public inspection at the Registered Office (Head Office) of the Company. It must be distinctly understood that in granting this licence the Government of India do not take any responsibility for the financial soundness of this undertaking or for the correctness of any of the statements made or opinions expressed in regard to it.

The subscription list opens on Monday, the 18th of June, 1956. All applications for shares must reach the Registered Office of the Company by 21st of July, 1956. The Directors may extend the date for receipt of applications, as they may in their discretion think fit.

KESORAM COTTON MILLS LIMITED

Authorised Capital:-

20,000—7% (Income-tax free) Cumulative Preference Shares of Rs. 100/- each	Rs. 20,00,000 0 0

QUALIFICATIONS AND REMUNERATION OF DIRECTORS:

Under the Articles of Association of the Company as amended by the Shareholders at the Extraordinary General Meeting held on the 6th June, 1956, each Director is to hold 200 Ordinary Shares on which all calls shall have been paid and each Director will receive by way of remuneration a sum of Rs. 200/- for each meeting of the Board attended by him, provided, however, until the sanction of the Central Government is received the aggregate of such payment to each Director in any financial year will not exceed Rs. 1,200/-.

PARTICULARS ABOUT THE MANAGING AGENTS :

The Managing Agents is a Private Limited Company with a subscribed and paid-up capital of Rs. 50,00,120/-.

Under Article 101 of the Articles of Association, the Managing Agents were entitled to a commission on the basis of gross sale proceeds of manufactured products of the Company and purchases of cotton and certain guaranteeing commission. The said basis became inapplicable from 1-4-1956 under the provisions of the Companies Act, 1956.

The term of office of the present Managing Agents will expire on the 15th January, 1957. An application is intended to be made to the Central Government for a fresh agreement renewing the appointment of the Managing Agents for another term of ten years and to fix their remuneration @10 per cent of the net profits on the basis of the provisions of the Companies Act, 1956.

RIGHTS ATTACHED TO DIFFERENT CLASSES OF SHARES :

According to the provisions of Section 87 of the Companies Act, 1956, every member of the Company holding any equity (ordinary) share capital has a right to vote, in respect of such capital, on every resolution placed before the Company and his voting right on a poll shall be in proportion to his share of the paid-up equity (ordinary) capital of the Company.

Every member of the Company holding any Preference Share capital has, in respect of such capital, a right to vote only on resolutions placed before the Company which directly affect the rights attached to his Preference Shares.

The Preference Share capital carry preferential right to the fixed amount of dividend but does not carry any right to any further participation in profits.

In case of winding-up of the Company, the rights of the shareholders as regards dividend and return of capital shall, subject to the provisions of the Companies Act, 1956, be governed by Article 127 of the Articles of Association of the Company which provides as follows:

"If the Company shall be wound-up the assets available for distribution among the members of the Company shall be applied in the first instance in payment of the cumulative dividend or dividends on the Preference Shares which may be unpaid or in arrear at the commencement of the winding-up and thereafter the balance, if any, of the assets available for distribution as aforesaid shall be distributed in manner following, as to one-quarter thereof among the holders of Preference Shares in proportion to the capital paid-up thereon at the commencement of the winding-up and as to three-quarters thereof among the holders of Ordinary Shares in proportion to the Capital paid up thereon at the commencement of the winding-up."

RESTRICTIONS ON MEMBERS' RIGHTS :

So long as any money is due from a member of the Company in respect of any shares held by him, he shall not be entitled to vote at any meeting of the Company in respect of such shares.

The Directors may, without assigning any reason, decline to register any transfer of shares not fully paid-up or upon which the Company has a lien.

OBJECTS & BUSINESS OF THE COMPANY :

The main objects are inter alia the following :

"To carry on all or any of the following businesses, namely cotton spinners and doublers, flax, hemp, jute spinners, linen and cloth manufacturers, flax, hemp, jute and wool merchants, wool combers, worsted spinners, woollen spinners, yarn merchants, worsted stuff manufacturers, bleachers and dyers and makers of vitriol, bleaching and dyeing materials".

"To purchase, comb, prepare, spin, dye and deal in cotton, flax, hemp, jute, wool, silk and any fibrous substances".

The Company has been carrying on business since about the last 36 years. The Company suffered loss

up to the year 1930 as a result of which the values of the assets of the Company were written off as on 14th January, 1931, as per Reduction Scheme and the value of the Ordinary Shares was reduced to Rs. 280 per share from Rs. 10/- per share. Since then the Company has made steady progress. Consequently in 1943, the Company capitalised a sum of Rs. 5,00,000/- from its reserves and issued fully paid-up bonus shares of Rs. 280 each on the basis of one such bonus share to every holder of 3 Ordinary Shares of Rs. 28/- each. Further the face value of the Ordinary Shares was raised from Rs. 28/- per share to Rs. 20/- per share by the capitalisation of the profits of the Company from time to time on four different dates between 1948 to 1954 amounting in all to Rs. 1,40,00,000/-. In 1955, the entire 8,00,000 Ordinary Shares of Rs. 20/- each were subdivided into 16,00,000 Ordinary Shares of Rs. 10/- each. The present market quotation for these shares is about Rs. 198/- per share.

The assets of the Company consisting of land, buildings and machinery, etc., were re-valued in the year 1950 and a surplus of Rs. 1,45,87,000/- lies to the credit of capital reserve account of the Company as on 31st March, 1956.

PURPOSE OF PRESENT ISSUE :

The Company has so far been engaging itself in the manufacture of cotton yarn and cloth and hosiery goods. After carefully studying all the pros and cons of the matter, the Company has now decided to extend its activities and with that end in view it is proposed to instal a Plant for the manufacture of Continuous Filament Viscose Rayon Yarn. There is a good demand for rayon cloth and it is expected that the rayon yarn, which will be manufactured by the Company, shall fetch a good return to the Company. A licence necessary for the establishment of a 10 ton plant for the manufacture of the said goods has been obtained from the Government of India. It is, however, proposed to instal for the present a plant of 6.7 tons capacity only. The cost of the installations of the said 6.7 tons plant is estimated to be about Rs. 3,70,00,000/- as per particulars below:

- (i) Land, buildings, roads and other constructions About Rs. 80,00,000/-
- (ii) Machinery and equipment " " 2,50,00,000/-
- (iii) Working capital " " 40,00,000/-

TOTAL : About Rs. 3,70,00,000/-

Out of the above sum the Company proposes to meet about Rs. 2,70,00,000/- for the purchase of land, machinery and equipments and certain construction work from its existing resources, bank loan, deferred payments, etc. The balance amount is proposed to be met by the present issue of shares. In the opinion of the Directors, the minimum amount which must be raised by the issue of these shares is Rs. 60,00,000/- inclusive of the 50,000 shares which have already been subscribed and allotted which sum together with the said sum of Rs. 2,70,00,000/- will cover all the expenses except working capital.

It may be stated here that a portion of land required for the purpose aforesaid has already been acquired at Mouza Raghunathpur (where the said Rayon Plant is proposed to be located) in the District of Hooghly near Calcutta. Negotiations for the rest of the required land as well as for the purchase of the plant and machinery from various parties, are in progress.

Copies of the Balance Sheets and Profit and Loss Accounts on which the report of the Auditors is based and Memorandum and Articles of Association of the Company may be inspected at the Registered Office of the Company during office hours until the subscription list closes.

The Directors may, at their discretion, pay brokerage and/or commission at a rate not exceeding 2 per cent of the face value of the shares in respect of shares already allotted or to be allotted by them.

The financial position of the Company will appear from the Auditors' Report set out below:

AUDITORS' REPORT

Messrs. Birla Brothers Private Ltd., Managing Agents, Kesoram Cotton Mills Ltd., Calcutta.

Dear Sirs,

We have examined the books and accounts of (a) Kesoram Cotton Mills Ltd., as kept in Calcutta and Gwalior in which are incorporated the certified returns from the Mills and retail shops for the five years ended 31st March, 1956 and (b) Bharat Kala Bhandar Limited, a wholly owned subsidiary of Kesoram Cotton Mills Ltd., which is audited by Messrs. Singhi & Co., Chartered Accounts, Calcutta for the five years ended 31st March, 1956 and report that subject to the completion of the audit for the year ended 31st March, 1956 of both the Companies the profits are as set out below. The audits of the Company and its subsidiary for the year to 31st March, 1956 have not yet been completed. These profits have been arrived at after charging all expenses of working and management including provision for normal depreciation on the basis allowable for Taxation and after making such adjustments as are in our opinion, appropriate.

(A) KESORAM COTTON MILLS LTD.**INCOME**

The National Interest: What is It?

IN a Leading Article "The Nationalisation of Insurance" in the issue of 'The Eastern Economist' dated January 27, it was indicated that this Blue Supplement on 'The Nationalisation of Life Insurance' was designed primarily to provide a specific answer to the question as to whether the national interest has been served by nationalisation. Obviously, if any precise meaning is to be given to this answer, we must first give a precise meaning to the words 'National Interest'. There are no words more easily abused than these. It is all too easily supposed that the national interest is served when legal ownership is spread amongst all the people instead of being concentrated in a smaller fraction. This is the first misapprehension which must be cleared. Public ownership is not necessarily synonymous with the public interest. It is arguable that in some cases it is, but it is by no means an axiom that either public ownership or public management is closely correlated with increased output.

In the two articles which follow the relations between the national interest and public ownership in insurance and the relationship between the national interest and public management in insurance are discussed in greater detail. For the present what is proposed is merely to give some indication of the areas in which national interest can be assisted or hindered by the process of nationalisation. Broadly, these might be described as three. The first of these is the volume of national income which is assisted by the process of nationalisation in itself. It is extremely unlikely that the volume of national income can be enhanced in any way by a process of nationalisation and it is likely to be reduced. This does not ignore the point that the State can compel insurance, while private insurers cannot. To the extent that savings are 'forced' by

compulsory insurance, the State merely institutes a diversionary process; such a process is likely to hurt income as much as, or more than, it assists capital formation. The second consideration is whether nationalised insurance will provide any significant volume of new employment or net welfare in forms which private insurance could not. The answer again is in the negative. It is even arguable that to the extent that (a) insurance premia are raised and (b) bonuses to policyholders are reduced, there will be injury to policyholders, who have a special place in the estimation of national interest as a result of the diversionary process. Finally, there is the issue as to whether nationalisation gives the country as a whole—not the public sector only—additional resources, foreign or domestic, for purposes of the implementation of the Plan or otherwise. The answer here is that the country as a whole is not benefited and, to the extent that our credit abroad in private markets has suffered, that we are net losers in the transaction. The net national interest conceived as a balance of economic forces—net additions to national income, net additions to welfare and net additions to total resources—has, therefore, it is argued, been injured.

While it is argued that the national interest has been injured in this operation, no attempt is made to sound an alarmist note in regard to the trend of insurance in this country. Indeed one of the most important articles in this Supplement relates to the incentive to new insurance which has been given by tax rebates in the Budget of 1955-56. It is pointed out that this is so large particularly in the group of incomes above Rs. 15,000, that the urge to extend insurance whether in the private or in the public sectors is 'ceteris paribus' overwhelming. For example, at an income level of Rs. 15,000 the income-tax rebate is over Rs. 300 per year if the

full figure of one-fifth of income is utilised for insurance giving a return of about 10 per cent on the sum of Rs. 3,000 paid as premia. Since, in point of fact, it is extremely likely at any level of income that the full rebate is utilised, it will be seen that an extraordinarily large incentive to insurance has been built into the economic system merely by the tax rebate. It is, therefore, argued that the range of total life insurance will not be reduced and will considerably extend in the next few years. This is merely an indication of the arithmetical point that every new insurance which ranks for tax rebate gives a yield as on an investment which is greater than that which can be obtained in any other investment. In other words, the last Budget introduced a differentiation in favour of additional insurance which was so marked that the disincentives of lower bonuses likely to result from government management and of less enthusiastic sales are more than offset. It by no means follows that the national interest has been served by nationalisation since this incentive would have been even more effective if it had been combined with more enthusiastic sales and private management which, by general agreement, will be less wooden than regimented government sales.

An injury not to be exaggerated has been done to the volume of new insurance to the extent of slowing down a process of capital formation via insurance which was gathering strength because of the strong inducement under the Indian tax system which neither nationalisation nor government inefficiency has destroyed. The volume of insurance is likely to continue to rise even if its rate as a percentage of national income does not. In other words, net capital formation in insurance is likely to continue to rise unaffected by the process

of nationalisation. It is almost certain, however, that the figure will now be somewhat lower than it would have been with an energetic sale of insurance policies in private hands. This is really a time lag in insurance the full effects of which should not be exaggerated.

On the financial side the real trouble arises not in respect of a reversal of insurance trends—which it is argued are impossible with the present tax inducements—but the general injury to the private sector's philosophy as a whole and the Government of India's credit in private markets abroad. This is analysed in some detail in a separate article on 'Nationalisation and Private Foreign Investment'. Here, it is believed, the loss is very great.

To sum up, the conclusion of this Blue Supplement is that the national interest—conceived as the difference between what would have happened had no nationalisation taken place and under present circumstances—has been injured. While no substantial reversal will take place in regard to insurance trends there are small losses under total national income and on receipts in the insurance sector. The first is a true loss, the second is likely to be only diversionary. The major loss is intangible, namely, in the injury that has been done to the private investment climate. This, being an intangible, cannot be measured; that does not imply that the loss is not great. It is believed by 'The Eastern Economist' to far outweigh any minor advantage which the public sector might have gained for its own narrower ends. This has been an act of insensitive haste; its cause is a blindness for intangibles in economic affairs which is, unhappily, growing greatly in New Delhi at this time.

Private Insurance: Strength and Weakness

THE two main objectives of nationalisation of life insurance set out by the Finance Minister in his broadcast speech were the effective mobilisation of the people's savings and safeguarding of the funds of the policyholders. On a third objective, of efficient service to the policyholders, the Finance Minister has remained content with being on the defensive and merely saying that there was no reason why the system of insurance run by the State should prove less efficient than private insurance business. Thus the question of safeguarding of funds is likely to figure more prominently in discussions on this subject than all other considerations. As usual, it is possible to cite instances of maladministration, and worse, in order to prove that all is not well with the present state of our insurance business. It is, therefore, necessary that both the contribution of private life insurance business as well as its shortcomings should be subjected to fierce scrutiny.

On the question of the efficiency of private insurance to mobilise the savings of the community, the statistics of new business effected year after year in the last decade speak well of the energetic attempt made to expand business and help mobilise savings. Leaving aside the non-Indian insurers for the moment, we find that the amount of new life insurance business each year has increased from Rs. 123.7 crores in 1945 to Rs. 213.3 crores in 1954, and that the net amount of life insurance business in force in India increased from Rs. 460 crores in 1945 to Rs. 922 crores in 1954. This doubling of the annual rate as well as the total business in force during the period of ten years is not indeed a low or disappointing rate of achievement. It was a period of inflation which had both advantages and disadvantages; while it created new and larger incomes, it also led to a high cost of living which

considerably affected the capacity of the people to save and to pay insurance premia. The annual rate of increase was, as a result uneven, the good years having offset the deficiency of the bad, showing a satisfactory final picture as described above. This is, on the face of it, a record of efficient business in mobilising savings.

Of about five million policies now in force, it may be said, after making allowance for more than one policy covering the same life, that not all the potential subscribers to policies have yet been covered and that, in any case, the insurance idea has not been carried to the rural areas. But this is a criticism which may well be applied in a number of other fields, progress in which may have to precede the building up of the insurance habit. For example, illiteracy has been one of the obstacles to an appreciation of the value of insurance. Also poor medical facilities and poor standards of hygiene and sanitation would have involved a higher rate of actuarial risks because of the much lower life expectation, just as high mortality in maternity cases has been a hindrance to insurance among women. In the context of the high costs involved in access to rural areas either to effect new insurance or to collect premia, these risks would have proved too high for a quick spread of business.

On the other hand, insurance business in India has derived considerable advantage from the fact that life expectation over the country as a whole, and in the particular sections of the community in which the business was concentrated, has been rising fast. The rates of premia were not promptly adjusted to this improvement in general health and longevity of the

assured, at least until very recently; it is possible that if the adjustments had been made in time the companies would have set up an even better record. When the adjustments were eventually made, a form of rate war was introduced which proved to be unhealthy and had to be checked. The existence, however, of scope for revision of premium rates is not in dispute as the leading companies have already shown. If in the future it is made possible, under a system of nationalised life insurance, it will be due not to nationalisation as such but to the utilisation of an opportunity which private business did not perhaps seize upon quickly enough.

The next important item in the indictment of private business in insurance is the resort to the unhealthy practice of offering reduced rates of premia to specified categories of people. This seems to have been the cause of a certain amount of abuse. The law made the offering and the acceptance of rebates liable to punishment and there have been some evasions through improper systems of accounting. This evil has figured year after year in the report of the Controller of Insurance who has emphasised the fact that larger rebates which divert business from one insurer to another undermined the financial soundness of the companies and defeated the objects of uniform tariffs. It was only recently that a Code of Practice was evolved to check this evil and the Code has not been in existence long enough to have proved its worth. Until a new accounting procedure is evolved and applied, the success of these measures cannot be evaluated nor can the magnitude of the evil be clearly known.

But the gravest of all charges against the management of insurance companies relates to the nature of their investments. The purchase and sale of the securities as part of the investment programme of the insurers certainly offers scope for personal gain to managements acting through their own nominees. But a graver charge has been the tendency noticed to falsify statements of investments with a view to diverting controlled funds towards other businesses in which managements have been interested. The extent to which this abuse has been prevalent is yet undetermined and it is possible that the taking over of the management of insurance companies under the ordinance would throw more light on this aspect of abuse. It is now five years since the law was amended giving wide powers to the Government to check such abuses but only seven insurance companies were under the charge of Administrators in 1954 of which only two were big. The major companies have earned a reputation for promptness and efficiency. The Finance Minister has referred to the fact that during the last decade as many as 25 insurance companies went into liquidation and another 25 had to be transferred to other companies at a loss to policyholders. Such failures cannot be held to prove a to the rule of good conduct cannot be held to prove a to the rule of general inefficiency any more than the inefficiency of individual departments of Government, of which there is no dearth, would prove the unfitness of the public sector as a whole to expand its domain. Bankruptcies cannot prove that the system of companies is played out.

The charge of misinvestments of controlled funds of insurers may be exaggerated even when it is granted there is some foundation for the charge. The breaches that occurred could have been discovered by an efficient system of inspection; indeed, even the mere suspicion that a vigilant inspectorate is functioning actively would have prevented much of the abuses. It is not clear how far the provisions of Section 33 of the Indian Insurance Act, which enable a system of investigation into the affairs of companies, have been utilised. This failure to supervise effectively prompts the question how the Government which has been feeble in its

exercise of existing powers in the insurance field would be able to undertake and run the entire business on its own.

The circumstance that most insurance companies have held a very large proportion of their controlled funds in Government securities, much in excess of the statutory minimum for such investments, should be construed as prima facie evidence of a general inclination not to misdirect this fund. If the scope of such misdirection had indeed been as much as is often believed, there would have been no reason for this high proportion of investment in Government securities. These high proportions were noticed even before 1950 when the Amendment Act came into force and increased the percentage prescribed by the law for investment in such securities. The amendment did not in effect, create any hardship. The maximum legally permitted to 151 Indian insurers in "non-approved" investments in 1954 was Rs. 34.43 crores and they could have abused it; but they actually held only Rs. 5.3 crores in such investments, proving that abuse is not widespread but infrequent. The defaulting insurers have, however, committed errors only in respect of other approved classes of investments and the total amount involved in 1954 of the defaulting insurers was only Rs. 16 lakhs, as against the sum of nearly 31 crores of rupees which were in excess of the statutory requirements in the case of investment of all other insurers.

The third major question relates to operational efficiency. There will undoubtedly be a consensus of policyholders' opinion on the point that in respect of service they dare not expect more benefits from a nationalised system of insurance. In the matter of granting policies, issuing periodical premia notices and, most important of all, in granting loans to policyholders and other concessions during periods of difficulty, the companies have shown promptness, which it will be foolish to expect under nationalised auspices. The policyholder has probably not enough concern over whether his funds are being misused or not; for that he would rely, as indeed he has a right to rely, on the vigilance of the State. What he will be more concerned about will be the concessions which he can obtain as policyholder. There is conclusive evidence on hand of a distrust of the nationalised sector in the fact that the system of Postal life insurance which was open to Government servants, who are part of the public sector, has not been availed of by more than a small percentage of those eligible, in spite of the fact that the rates of premia have been much lower than those offered by the better companies. There was also the additional advantage that Government employees were in a position to pay the premium by deduction from their salaries. Yet not many have been tempted to benefit, primarily because it did not constitute a form of saving which could come to the rescue of the policyholder or his heirs in time of need.

The private companies on the other hand have been able to settle claims and grant loans in a matter of days and even hours, partly because their agents are men who have been in close touch with their clients and it was possible for them to make decisions without much red-tape. Proof of this is to be found in the report of the Controller where it is stated that only about 22 cases were recorded in four years until 1954 in which the Controller had to intervene in favour of claimants for life insurance amounts below Rs. 2,000. It is not known to what extent even these 22 cases related to the better managed companies; presumably they did not. In a system of competitive striving for business it would have been unfortunate for any company to create the impression that it is petty or niggardly in dealing with claims. That consideration will not apply to a monopolistic and wooden officialdom which will come into being under the new dispensation.

Nationalised Insurance: Fancy and Fact

WILL a nationalised system of insurance help to preserve the virtues of private insurance while avoiding its weaknesses and at the same time satisfy the requirements of those who contribute their savings? If past performance is a guide in this matter, the outlook is not by any means hopeful. In India, the Government has been operating for a long time a system of life insurance through the Postal Department, which, though restricted to employees in the public services, provided considerable opportunity to combine service with efficiency. The rate of growth of the total life business in force has been slow, increasing from Rs. 3.38 crores in 1914 to Rs. 19.36 crores in 1939, where it remained almost stationary until 1950; even during the last eight years since Independence when employment under Government and expenditure on salaries have expanded enormously, the net addition to life business each year has not proportionately reflected the larger incomes disbursed in this sector.

GROWTH OF POSTAL LIFE BUSINESS

Year	(Rs. in lakhs)				
	New Business	Business in force	No. of policies	Sum insured Rs.	Premium income Rs.
1914	2,126	27	24,574	3,38	14
1931	9,710	150	79,058	14,86	61
1939	4,972	96	97,751	19,36	81
1946	3,552	77	92,685	18,87	75
1949	4,022	102	92,664	19,36	67
1952	8,363	227	102,944	23,16	86

This is a feature which cannot be glossed over. There was every conceivable inducement present to public employees to benefit by this system if they could only have acquired the confidence that they would be well and truly laying by for the rainy day. The Postal premium rates have been considerably below the commercial rates and payments were facilitated by stoppage at the source. But by 1952, there were barely one lakh of life insurance policies in force, which were only four times the number of policies in force in 1914. This number is only about one-sixth of the total number of Central Government employees alone, and about less than 5 per cent if all the eligible categories of public servants are taken into account. Obviously, private companies have attracted a large proportion of the business from this class more effectively than the Government could, in spite of its lower premia; the reason for their expansion may partly lie in the aggressive salesmanship of agents but a stronger inducement was the fact that in the settlement of claims and in providing other facilities, the Government could not prove itself to be imaginative and prompt enough.

On the other hand, those responsible for the administration of the Postal Insurance Department also appear to have taken an easy-going attitude, without displaying any ambition to expand the scope of their activities even under the very favourable conditions under which they could have operated. The actuarial risks in the particular class of persons eligible to postal insurance were very much lower since government servants are as a rule subjected to a medical examination before their appointment and the nature of their work compels them to more regular ways of life than other persons, making for better health and a lower rate of mortality. Secondly, the system of collection of premia from salaries reduced the expenses of management greatly. There would not have been any need for canvassing business on the scale on which company

agents had to do or to offer inducements by way of rebates. It should have sufficed merely to insist that a minimum insurance contribution was compulsory like a pension contribution. There were policies available from Rs. 100 onwards to suit all income groups. Even the latest spurt in Postal Life business is due to some such inducements in some States which have sought to combine pension with insurance.

The question of expansion of Postal Insurance facilities has been under consideration for some time. It would have been far better if Government had utilised the scope for such expansion and entered the field for its own business as a competitor with the private companies, giving an additional example of our mixed economy instead of acquiring a monopoly through the elimination of the private sector. The entry of the State into this field need not have seriously affected the commercial insurers. The Post Office could have issued policies for small sums and it had a vast network of about 55,000 Post Offices spread throughout India and this number is expected to expand to 80,000 in the next five years. Thus an agency has been ready at hand through which the State can operate almost immediately, a facility which was not available in the field of banking where the Government found it necessary to nationalise the Imperial Bank in order to find branch offices to operate in the rural sector. There is no doubt that if the State wanted merely an opportunity to prove that it could conduct the business with efficiency and with a new spirit of service, it was available to it without nationalisation. Savings in the rural sector could have been thus mobilised for purposes of development in the process of providing cover against risks to the members of the rural community, who were hitherto outside the insurance field. Together with the funds available through the expansion of business amongst its own employees the State would have been larger than the largest private life company now in existence and could in time grow to be equal to the combined strength of the dozen biggest companies.

Past inefficiency is indisputable, while the future, though uncertain, gives no particular ground for expecting a vast improvement. This drawback is not peculiar to India. In the U.K. the Post Office scheme of life insurance, established in 1864, was discontinued in 1928 because of the progressive decline of business. The British Labour Party took up for consideration in 1949 the question of nationalisation and almost the same charges made against private companies as those now made in India were then heard; but in November of the same year the National Executive of the Labour Party decided to withdraw the question of nationalisation and substituted it with a recommendation for mutualisation which meant that insurance companies would be owned by policyholders and operated on their behalf. One of the reasons which compelled this course was the large proportion of foreign business which the British companies attracted, which, it was felt, would be lost under nationalisation causing a decline in the invisible incomes to Britain.

Everywhere, there has been the realisation that the advantages claimed for nationalised life insurance, such as prevention of misuse of funds and economy in operation by the elimination of unhealthy competition, can be proved only in the abstract and not in practice. In the other countries where private enterprise has been more robust than in India, there was an additional argument that the companies secured a larger income from their varied investments than what would be possible under a cautious official policy. In these countries, insurance funds have contributed to development in

various fields and the public sector was not their direct competitor for the savings of the community. Here in India that is not the case, especially at this stage, but private insurers have already adjusted themselves to this situation by keeping larger amounts than necessary in Government securities. Only about a sixth of the assets of the Indian companies or about Rs. 55 crores (out of their total assets of Rs. 339 crores) were invested in debentures, preference shares and ordinary shares of Indian companies. This is not indeed a large contribution to the private sector and if even this is to be prevented—and there is no other way by which the public sector can appropriate to itself a larger share except the additional funds available from the normal growth of insurance—it could have been secured through other ways than nationalisation. But it is wrong to say that investments in the public sector are as such more productive and consistent with the national interest than existing investments of insurance companies in private

business. The public sector in this case can only argue that what the private sector loses on the swings is gained in the roundabouts and that even if the State takes hold of the entire savings available through insurance, it would be assisting the private sector through other institutions like the Finance Corporations, and the Development and Industrial Investment Corporations. This argument can, however, be rebutted by the fact that this involves a helpless dependence on the public sector for funds and much difficulty in convincing officialdom at several stages, which is unnecessary. Once consent for capital issues is given, all investment must be deemed to be in the national interest. At this stage, however, the debate would be carried far beyond the question of the merits of nationalised versus private insurance, into the realm of the right of the public sector to appropriate to itself the complete control over the disposition of the savings of the community in the name of protecting the policy holder.

Taxation and the Growth of Insurance

ONE of the vital questions suggested by the nationalisation of insurance is the extent to which it will alter trends in the form of receipts by way of insurance premia. Quite often advocates of private insurance make the mistake of supposing that "the system"—that is, public or private ownership or management—is a decisive factor in deciding whether or not there will be growth or its reversal. To elevate the system whether in insurance or in industrial or tertiary undertakings into a paramount determinant of the level of activity ignores the large "non-system" factors which must operate in all economic affairs. The demand for insurance is, in a sense, a "non-system" factor. Men and women seek insurance because of the hazards of old age or premature death or accidents which might lead to a

destruction of earning power. The character of this urge and its expression are both unrelated to the nature of the insurance system which is provided. All that can be said is that, in the marginal area, where enthusiastic sales promotion might turn a point, the demand for insurance might be affected. But to elevate a marginal factor into a major determinant is a serious error. In that sense the nationalisation of insurance is likely to be of the second order in assessing the growth of insurance.

What has made this assessment even more true at the present time is the character of taxation, particularly that introduced by the 1955-56 Budget which gives the highest rate of rebate permissible almost in any

REBATE IN INCOME-TAX AS AN INCENTIVE FOR INSURANCE

* Including surcharges, both on Income-tax & Super-tax.

† Including surcharge on Income-tax.

country in the world. The table on p. v shows the extent to which this rebate applies from levels of income from Rs. 4,200 per year to Rs. 30 lakhs. Since the maximum premium free of income-tax is Rs. 8,000 per year there is no substantial change in the premium allowable after an income of Rs. 40,000. On the other hand, this is by no means the case in regard to the value of an income-tax rebate. The income-tax rebate percentage increases in the interval between Rs. 40,000 and Rs. 10 lakhs. It might be assumed that almost everyone above Rs. 40,000 would cover himself in time with the full insurance eligible to rebate. In other words, there is an overwhelming tendency, certainly in incomes above a certain class, to make full provision for insurance up to an annual premium of Rs. 8,000. To the extent that this is not the case at the present time obviously nationalisation will not effect a disincentive; the reason for failure to utilise the full rebate must be elsewhere.

Below the level of Rs. 40,000 the position is less certain. Here the question which is to be considered is the volume of current consumption expenditure which the assessee considers inescapable. The chances are that between the level of Rs. 24,000 and Rs. 40,000 every assessee would strive for greater insurance. It may be that in this section half the total rebate would be in fact utilised. This would also make for much greater

insurance than exists at the present time. So far as incomes below Rs. 15,000 are concerned the rebate factor is less significant and one might wonder whether it would be as effective as in other income groups. It is also to be remembered that in this group many assesses are covered by some kind of provident fund which is equally eligible for income-tax rebate.

Nevertheless, summing up the total position, it must be obvious from the last column in the table below that there exists a very powerful incentive in all income groups to raise total insurance up to one-fifth of income allowable for rebate. This fact of supreme importance in determining the character of growth of insurance implies that the mere fact of nationalisation will not be a major deterrent. What it implies is that, while the marginal sales may be held back by government woodenness and by some lack of interest if it should happen that loans from insurance companies are delayed in the usual public sector manner, the broad character of progress in insurance is likely to be maintained.

It is not, therefore, substantially true that the character of growth of insurance will be suddenly altered by an act of nationalisation. It is much more likely that all that nationalisation has done in this respect is to damp slightly the rate of growth.

Public versus Private Investment

ONE of the questions—as will be seen a marginal one—is the problem of the likely impact on insurance receipts of the diversion of private investment to public investment on, perhaps, somewhat different principles. Fifty-five per cent of the revenues of Government Insurance Companies are by law to be invested in Government securities. Of the remainder, as the table below will show, a very considerable percentage is held in debentures, preference shares and ordinary shares of a type which are acceptable to the private sector but may, under the pressure of nationalisation, be diverted to the financing of public, instead of private enterprises. Again, as the table below will show, land and house property covered about Rs. 17 crores in the years 1953 and 1954. The figure is probably larger today but accurate statistics are not available; will not this figure be substantially changed?

Distribution of Assets of Indian Insurers in the Private Sector (Rs. lakhs)					
	1950	1951	1952	1953	1954
Debentures			13.15	14.70	20.77
Preference Shares	33.20	34.68	10.90	11.30	11.95
Ordinary Shares			17.78	19.94	22.75
Land and house property	9.59	12.48	15.31	17.58	16.59
	42.79	47.16	57.12	63.52	72.06

It may be taken as certain, and this is expressly admitted by most outspoken Government authorities, that under political pressure the character of investment of "free" insurance revenue will change with the object of fostering the public expenditure at the expense of the private sector. So far as the public sector is concerned, the additions to its resources may be considered marginal. Assuming that in the next five years the diversion is of the order of Rs. 5 to Rs. 10 crores per year, the figure over the second Five-Year Plan would certainly be less than 1 per cent of the total expenditure in the public sector. On the other hand, the position in regard to the private sector is by no means so happy. For one thing, the private sector in organised industry is much smaller and it has an onerous task in the raising of something like Rs. 300 to Rs. 400 crores of fresh capital beyond its reserves in order to finance development in the second Five-Year Plan. A diversion of Rs. 5 to 10 crores per year particularly if it falls on particular commercial houses

which have their own insurance companies, is bound to have an injurious effect on the financing capacity of these houses. It is no secret, for example, that the house of Tatas will be greatly injured in this respect by the withdrawal of the resources of the New India Life and General Assurance Company, India's second largest insurance house. Similarly there have been alliances between other managing houses and insurance companies which are likely considerably to be hampered, affecting their development plans in the next few years. If Government does not come to the aid of these houses, for example, by assisting through nationalised insurance as, say, in the taking up of the new Tata Iron and Steel issue, the effect on new flotations in the capital market in the private sector may be very marked. This might, of course, be overcome by the Government's making additional loans to the private sector. But since these loans carry onerous conditions of their own, nobody need contend that the position would be exactly the same as if the private sector had recourse only to its own funds.

There is a similar point which arises from the fact that investment decisions in the public sector are more divorced from the rate of return than they are in the private sector. With 'welfare' principles of investment predominating, such as in the great factories of Sindri and Chittaranjan, it is natural that the return in the public sector will be less than in the private sector. Assuming, say, five years from now, that the insurance revenue under life policies was Rs. 100 crores per year and the return on public sector investment was half that on private sector investment (which might conceivably have an average of 6 per cent on "free" investments), one might argue that this would involve a subsidy of about a crore of rupees a year to the beneficiaries of welfare schemes in public enterprises. This is a small figure but it raises an issue of principle.

To sum up, the position is that the diversion of private funds to the public sector involved in nationalisation will be marginal to the public sector, but may be very significant to particular houses in the private sector. It is also likely to involve a small tax on the community for the benefit of those working in public enterprises. These look like marginal gains and losses, but they are significant enough to be described in an overall picture.

Nationalisation and Private Foreign Investment

THE question is being asked all over the world as to what the nationalisation of Indian life insurance portends in the general setting of the Government of India's attitude to private enterprise. A deputation from the city of London representing British insurance houses is coming out almost immediately to seek for clarification as to the terms of compensation and other matters connected therewith. But the information already received from London as well as from other centres suggests that, even if compensation is fair, as in the case of the Imperial Bank, the step that has been taken is reckoned as one which is a powerful deterrent to future private foreign investment.

This statement must be qualified as indeed all such statements must be read in the context of India's development plans. In the first place, private foreign investment does not possess a uniform character. In the Indian context at the present time there are three separate strands which are differently affected by the Government of India's "socialistic" policy. These are, firstly, foreign business houses in India, secondly, new suppliers who are entering the Indian development market for the first time, and, finally, the private investor whose interest in India is not concerned with manufacturing or supplying, but is entirely in terms of financial rewards. They have been affected unequally in the leftward flow of economic policy in the last two years.

So far as foreign manufacturing houses in India are concerned, the nationalisation of insurance has only had a psychological effect. There is no reason to believe that the returns on manufacturing investment have in any way been affected by this operation. On the other hand, there is certainly a widespread belief that this is an additional indication that the Government of India's attitude to the private sector is one of restriction, reflecting a determination to supplant it at the earliest possible moment by the public sector. Whether or not, therefore, the level of manufacturing profits has been altered, the inducement to expand the manufacturing operations in India by foreign manufacturing agency houses has been restricted though perhaps not very greatly in the short period.

The position is quite otherwise with suppliers most of whom have no previous knowledge of the character of the Indian market, and who are only concerned with profits on orders either from the private or public sectors. In this respect the status of the Government of India as a buyer being better than that of the most

of the private enterprise houses, it may be argued that additional resources in the public sector do no injury to foreign private co-operation and to that portion of investment which is designed merely to assist collaboration and supply.

The position in regard to the private investor is again very different. Here the belief that nationalisation, particularly when the volume of compensation is not subject to appeal in a court of law, is expropriatory has gained considerable ground. Reports from abroad confirm the view that private foreign investment has been seriously disturbed by the nationalisation of insurance, and it may be taken for granted that in the next five years that private foreign investment of the kind which is not attracted by other considerations will disappear.

It is important to remember in this assessment that in the last five years much the greater portion of foreign investments in India has been attracted to the Indian market by "other considerations". It might be said, broadly, that on the total inflow of foreign capital of all kinds over the five years from 1948 to 1953 not less than half, and perhaps two-thirds, of Rs. 131.75 crores described in the Survey of India's Foreign Liabilities and Assets by the Reserve Bank of India was so to speak anchored to supply or related to preclusive investment in the Indian market. It is likely that on net account the private investor who has now been warned off the course was responsible for less than a third. In the net result, however, it is almost certain that the addition of foreign business investment in the next five years will be considerably less than the figure from 1948 to 1953.

To sum up, it is useless to deny that a vast intangible has now been introduced into foreign thinking on investments in India. The conclusion seems to be likely that both existing foreign manufacturing concerns and the private investor will tend to be very hesitant over the next few years. This is likely in practice to involve a loss of more than Rs. 5 to Rs. 10 crores per year, perhaps the full gain of the public sector from additional resources which it can operate on its own. If the question is asked whether this additional freedom of the public sector to operate on 'free' rupee resources of the insurance sector is offset by our loss in foreign capital, the answer surely is strongly in the affirmative. The country has lost more on the swings than the public sector has gained on the roundabouts.

The Future of Life Insurance

THE pros and cons of nationalisation may continue to be argued until the process is completed but no one can reasonably hope that these arguments will influence to any extent the decision that has already been taken. Though the present step is only a preliminary to nationalisation the decision would not be open to revision, however convincing the other side of the case may be. The Government will have to take the good and the bad consequences in its stride and the only thing that can be done at this stage is to guess the answers to the many questions that are being asked about the shape of things to come.

NEW BUSINESS

Will life insurance business increase at a faster rate than hitherto? There is no need to minimise or rule out the possibilities for expansion. Much of the competition that now exists, to acquire the business in some

urban areas and among certain sections of the community, may be eliminated by diverting agents to new areas. New incomes will be generated under the Plan, offering a new field of business; and it has been pointed out elsewhere that tax rebates are providing incentives at certain levels for maintaining the flow of premium income. If to these the Government adds a system of compulsory insurance the position will improve further. There is still vast scope left for increasing the net addition of life business every year if the annual loss, through forfeitures or lapses and decrease of sums assured, which now offsets 60 per cent of the new business attracted every year, should be reduced considerably. There is no particular reason to believe that the nationalised system would find a solution to this problem where the existing insurers have failed in spite of the existence of a large army of canvassers whose personal interests were closely linked with the continuance of

policies. If the lapses only indicate the undesirable results of too much competition in showing increase in business, then it must be assumed that to that extent at least the new business in future years will reflect a reduction. In other words, any reduction of lapses would correspond to a reduction of new business.

FUNDS FOR THE PLAN

The additional results which the State could thus derive for purposes of investment in the public sector assuming an optimistic rate of increase will not be considerable. If the premium income in 1955 was of the order of Rs. 55 crores and expenditure about Rs. 35 crores, part of the net addition to the life fund of about Rs. 20 crores would in any case have flowed into the public sector (to the extent of the minimum of 55 per cent required to be held in Government and approved securities). This percentage was usually larger; and making provisions for loans on policies which cannot be denied, the net additional sum would be about 5 to 6 crores of rupees, which hitherto found its way into the private sector in investments in shares. Even on the assumption that the total annual premium income would grow in five years to the somewhat optimistic level of Rs. 100 crores, it is difficult to foresee an additional availability to the public sector of more than Rs. 50 to 60 crores over the five-year period.

LESS EXPENSE?

It is arguable, however, that under a centralised administration the expenses could be reduced considerably so as to increase the size of the net addition to the life fund every year. Estimates of future trends of expenditure would, however, vary with the degree of faith shown in the working of the public sector. It is probable that the reduction of expenses will be secured not in absolute terms but as a declining percentage of the business secured during a period of expansion. At present, the evidence on the subject gives no ground for optimism. In 1954, for example, the difference between the overall expense ratio (expressed as a percentage of the total premium income) did not show much difference between six leading insurers (who may be regarded as having secured the maximum efficiency due to large-scale operation) and the other insurers; the overall ratio was 29.3 while the ratio after excluding six leading insurers was 29.6. *Prima facie*, this is no basis for expecting much improvement.

The next question relates to the extent to which the private sector in business will be handicapped by nationalisation. It is pointed out above that Rs. 5 or 6 crores now invested in shares will be diverted. There is no particular reason why this diversion should actually take place if the new set-up provides for operating the insurance business through an autonomous or semi-autonomous corporation, with freedom to make investments on the lines of the existing legal provisions. The debenture and preference shares of companies would often give a higher return on investment and it may well be that once the taint of suspicion of personal interest is removed there would be no objection to even larger investments in company shares which yield high returns. It is difficult to probe into the Government's intentions in this matter which alone will decide what restrictions or liberalisations are possible. But nationalisation as such need not rule out the continuance of the present practice of investments in shares in the private sector, and in any case the existing investments cannot be suddenly unloaded in the market.

A different aspect of this holding of shares would be the extent of control which a new nationalised Insurance Corporation or the Government would now acquire in the private companies as a result of the ownership of their shares. In the case of life insurance companies, their individual holdings in any single concern were regulated by the percentages prescribed

in the law for the proportion of a company's capital that could be controlled by the insurer through investment in shares, but now all these investments will be pooled together and it is possible that the State or the Corporation would control a substantial percentage of the share capital of certain favoured companies, if not the majority interest. In the case of debenture and preference shares, which together form a larger proportion of the investment in the private sector, there will be no control; but the ownership of ordinary shares, investments in which have amounted to about Rs. 23 crores, might raise this problem of public ownership of private capital in a new form.

NATIONALISED STRUCTURE AND EMPLOYMENT

The structural pattern of new administration would be the most interesting aspect of nationalisation. A corporation will probably be found to be the most suitable form and since the object is primarily the safeguarding of policyholders' moneys and preventing their use for promoting private self-interest, there is no reason why the Government should not agree to an independent statutory corporation which would also maintain the status quo in many other matters of working in which the national interest is not affected thereby. The existing supply of experts, actuaries and other executive personnel should prove adequate for the new agency. It is probable that the emoluments of some of the very highly paid executives would be affected but that is a part of a larger problem concerning ceilings on income. But at the lower levels too, there is some room for anxiety. Nearly three lakhs of insurance agents are left in a state of uncertainty for the time being about their future prospects because a large percentage may be left redundant under a single system of insurance. Nearly one-third of the licences issued in 1954 were to women, who for the major part might have supplemented the family income. Even in a large number of other cases, insurance was not, perhaps, the sole means of livelihood. It was probably a good stop-gap occupation even at a low level of earning in the absence of other employment. If the reorganisation and rationalisation of staff should involve greater dependence on wholtime personnel, insurance will cease to provide not only supplementary income in many cases, but also any income at all in many cases, and may worsen the position of the educated unemployed.

Finally, the policyholder whose welfare is the object of the present reform, may not get quick answers as to whether his bonus, which attracted him to the better companies, would decline steeply or not, or whether his nominee's claims or loan applications will be promptly settled. It is unlikely that there are illusions on this subject but it may be a consolation to know that when the expenses are reduced, if ever, and when there is no point in loading premia for profits, there will be some hope for the reduction of premium rates which are not now uniform and have lost the basis for the original differentiation, based on the rate of profits and efficient services which the better companies gave. The uniformity in guarantee and service and the reduction of profits and expenses must help to give the policyholder this benefit in rates at an early date; such reduction may also prove the best inducement for the growth of life insurance business in future.

There remains the question of how far life insurance nationalisation can remain separate without forcing on the Government the necessity for nationalisation of non-life business; whether there is an intention to take that step or not, non-life business will not henceforth function with any sense of confidence. Possibly when the next occasion for a reaffirmation of ideology arises, its turn would arrive; but it may well depend upon the success of the present step in the next few years.

Reactions to Nationalisation—A Roundup

By

CROESUS

THE more people begin to think of the implications of nationalised life insurance, the less they seem to like it. This is broadly the impression that I have got after talking to a fairly representative cross-section of the people, including agents, policyholders, shareholders, directors, insurance executives, bankers and business men. There are, of course, those confirmed 'State-ists' who hail the decision as not only right but also well-timed. This, incidentally, is perhaps the only class which sees no wrong even in the undemocratic manner in which insurance is sought to be nationalised—I mean by resort to an ordinance.

An eminent banker whom I interviewed began by saying that, more than the Government, it is the unscrupulous insurance companies that are to blame. He felt that no decent government could give quarter to or tolerate such abuse of trust as has been coming to light almost every day lately. But, when I interrupted him to ask whether, by a stricter enforcement of the insurance law, these instances could not have been minimised, if not avoided altogether, he nodded, and himself instanced the case of banking where today the most rigorous system of inspection prevails which has greatly reduced bank frauds and failures. It was this banker's view too that, had the authorities started enforcing the provisions of the insurance law strictly some five years ago, the need would not have arisen today for nationalising. I thanked him for saying this and thereby confirming what several business men have always held, and still hold, namely that it is not so much the lack of adequate powers of inspection or control under the prevailing law as the loose enforcement, if not non-enforcement of it that has been responsible for letting into the fold of insurance a few undesirable and unscrupulous elements who have given a handle to critics of privately-run insurance. I have always wondered why, before granting licences to persons who wish to start new insurance companies, the authorities responsible do not make thorough enquiries about their social and economic standing and bona fides. Surely, this is the most elementary precaution that the authorities are expected to take. In the case of a sound and well-established bank, for instance, no one is prevented from asking for any amount of accommodation (loan), but the bank will not grant it unless it is absolutely fully satisfied with the party and his creditworthiness. The insurance licensing authorities cannot, therefore, afford to be blind to facts in the beginning and then complain that there are bad elements in the insurance world. Like great men, bad elements, whether in insurance or elsewhere, are born, and seldom develop to be so.

The Chairman of a leading insurance company was most unhappy about the whole episode and he felt very keenly that not all their uprightness and rectitude in running their life insurance business had saved them from sharing the same fate as has since overtaken even unscrupulous and unsound companies. He was also concerned about the fate of those who have spent almost all their lives in the service of a company and have just come to occupy top positions and to receive fairly high salaries. His fear was that, under a State-regime, either their salaries might be cut or they might be asked to retire, which, according to him, would be grossly unfair.

The two other points that this veteran insurance man made were that (i) the shareholder could not hope any more to get the same dividends (if the fantastic

suggestions made from time to time, in the A-I.C.C. Economic Review are straws in the wind!) and, (ii) that the policyholder—if a 'with-profit' policyholder—would not get the high bonus for which he bargained when he chose the company with which he decided to insure. His argument was that, if it is the Union Finance Minister's intention to draw on the profits of life insurance companies to finance the second Five-Year Plan, he cannot do so unless he chooses greatly to reduce, if not deny, to the policyholders their present level of bonuses. In any case, henceforth, it will necessarily have to be a uniform rate of bonus, since all life companies are to be brought under one control. The one selling point of many insurance agents thus ceases to have any appeal.

Talking of uniform bonus rates, I must refer to my interview with a very senior insurance executive of a well-known company who has been transferred overnight into a "custodian". It was simply a case of his rising one fine morning to find himself dubbed thus. I must have asked him the maximum number of questions that a Pressman could dare, but I must say he was patient enough to answer all my questions. I reproduce, to the best of my ability to remember, (I did not start taking down notes for fear of the interview being cut short and losing time in the process in any case) these questions and answers:

Q. Do you think that Government can find enough good and efficient men, even from all the insurance companies put together, to man the Leviathan State-run insurance organisation that is to be?

A. No, there are not enough efficient men for the purpose. They will have to be trained in due course. (This means that, in the initial stages, State-run insurance is bound to suffer).

Q. Would it not be unfair to ask those who have taken the trouble to select sound and well-run insurance companies to insure their lives, in the expectation of efficient service, handsome bonuses, and prompt claim settlements, now to throw their lot with policyholders who have not experienced similar care and have, in consequence, insured their lives with companies which have proved to be of doubtful worth?

A. Yes, it is certainly unfair, but the decision is claimed to be in the interests of the country as a whole. All the same, justice demands that at least up to the time of the promulgation of the—nationalisation—ordinance, the policy-holders are enabled to get the full benefit of their respective policies as per the terms contracted with the companies of their choice. Whatever terms the nationalised insurance scheme has to offer can only apply from the actual date of nationalisation and not with retrospective effect.

Q. Do you feel that settlement of claims would be as prompt after nationalisation as it has been the case all along with respect to some well-established insurance companies some of whom are known to have settled claims even within a week or fortnight?

A. No. when the State takes over any business, it has perforce to lay down certain rules. These are always elaborate and fulfilling them or the attempt to do so takes a lot of time. (In other words—and these are mine—he seemed to convey in so many words that

bureaucracy and redtape are sworn enemies of prompt dealings.)

Q. The A-I.C.C. Economic Review speaks of the shareholder's part of the average annual surplus as the basis of compensation. Is this a proper and practicable approach?

A. Theoretically, it may be all right, but it involves so many cumbersome calculations that the game is really not worth the chase.

Q. Don't you feel that the Government has ensured full response to all its future loans by this measure?

A. Yes, the Government could hereafter ask its newly created insurance department, to subscribe a given amount, whenever it feels the response from the general public to be not quite encouraging, even as it has been making use of the Reserve Bank now for this purpose. But this is not to suggest that insurance companies ever failed to subscribe to Government loans to the maximum extent possible. Indeed, many of them actually hold even today more Government securities in their investment portfolios than they are required to do under the law.

Q. Is it not a fact that the whole position is still obscure, notwithstanding the Ordinance?

A. I am afraid it is. Moreover, fresh and further instructions are coming in which sometimes tend to place the custodians in the position in which they cannot honestly say they are allowed to carry on even the usual routine which they are supposed to be free to do under the Ordinance.

Another insurance executive, who is also a custodian, now admitted nearly all these, but said that, given time and a correct approach, many problems could be straightened out. It is noteworthy that all custodians

seem to make a point of meeting periodically and exchanging notes. I understand that, very soon—may be even before these lines are printed—there will be a conference of all these custodians with Mr. H. M. Patel of the Finance Ministry, when several issues that have arisen out of the nationalisation ordinance and the future pattern of nationalised life insurance will be discussed threadbare.

The few policyholders whom I met frankly confessed their failure yet to grasp all the implications of nationalisation. But I learnt from one of them that a retired Government official literally ran to a well-known foreign insurer and demanded the surrender value on his policy. The foreign insurer was rather intrigued. It would appear, but the Government official had his explanation ready. It seems he told the foreign insurer: "I know how long it has taken for me to get my pension. I am not prepared to wait that long. again, to have my insurance claim settled at the hands of Government".

Many shareholders too are in a similar plight. They are unable to ascertain as to when and what compensation they will get. The series of articles in the A-I.C.C. Economic Review has made some of them distinctly pessimistic about the prospects of receiving even the hitherto prevailing rates of return on their holdings.

As for investors and business men, the insurance ordinance has perhaps done more to unnerve them than any other single measure of Government so far. They feel that henceforth no sector can be too secure and too distant for coming within the ambit of State control and, what is more, they entertain genuine apprehensions about the quantum of compensation that they may receive in the event of any business being taken over by the Government. Never before in the past two decades or over a generation, as far as I can recall, was the stock market in such jitters as I find it in today.

INSURANCE TRENDS IN INDIA

Shipping in the Plan

GEOGRAPHY and history have both been favourable to India's development as an important maritime nation in the world. Our long coast-line contains many places suitable for the establishment of good ports and harbours; and coastal districts have produced sea-faring communities to whom adventure across the oceans has been a part of their tradition. Indian history provides abundant evidence of this sea-faring tradition even in the distant past. The code of practice laid down in Kautilya's Arthashastra (Book II Chapter 28) for the Superintendent of ships may still be applicable to our modern Directorate-General of Shipping. In the course of subsequent history Indian ships and sailors have ventured far in the adjacent seas, up to the Persian Gulf on the West and the islands of the Indonesian Archipelago on the East. Why then, with this respectable and creditable record in the past, should India be so poorly placed in relation to the rest of the world in the development of shipping?

Our total tonnage today is slightly less than 1 per cent of the world's total and India's own overseas trade is carried on, except to the extent of 5 per cent, in foreign ships. It is in the context of this position of inferiority that one has to view the development that

has taken place so far and the proposals being made for the immediate future. A similar line of thought influenced the Shipping Policy Committee of 1947 in laying down a target of 2 million tons to be reached in 5 to 7 years, and considering the achievements of some of the war-damaged countries, which have built up their fleets almost from scratch since the end of the war, that target was not, perhaps, an over-ambitious one. And yet we find ourselves today with a total tonnage of only 480,000 G.R.T., which falls short by 120,000 G.R.T. of the comparatively low target set for the first Five-Year Plan. It may be difficult to find any single explanation for this low achievement; possibly the major factor has been the lack of ambitious planning.

If so, this is a continuing defect, as in the second Five-Year Plan also the same conservatism has been perpetuated. On the assumption that the shortfall of 120,000 G.R.T. in the first Plan's target will be made up in the course of the next financial year the second Plan provides for an increase of the tonnage by 300,000 G.R.T., through an outlay of Rs. 55 crores, of which Rs. 10 crores are expected to be provided by the private sector. It is, of course, necessary that there should be

no unrealistic planning which does not take into account the resources available and the possibilities of deliveries by the world's manufacturers of ships during the next five years. But even as a realistic proposition the Shipowners' Consultative Committee had recommended a higher target of 445,000 G.R.T. at an expenditure of Rs. 80 crores, which would have raised the total tonnage to slightly over a million tons by 1961. Even the achievement of this higher target would have enabled Indian tonnage to carry a further 10 per cent of the adjacent trade and an additional 15 per cent of the overseas trade. The substitution of a lower target will therefore further cut the contribution of Indian shipping, particularly in the overseas trade, reducing thereby our invisible earnings of foreign exchange.

The reduction by the Planning Commission of the outlay on shipping is, therefore, very regrettable but it has been offset in part by the Transport Minister's assurance that if the proposed outlay is spent during the first three years of the second Plan it would be possible to consider the question of a larger appropriation. It must, however, be remembered that shipping is not a matter on which there can be such piecemeal planning for the reason that construction of ships, either by the enlargement of our own yards or by placing orders with foreign manufacturers, takes a long time. Indeed, there is a strong case for arguing that a plan for expansion of Indian shipping tonnage should cover a period of about 10 years, even though for purposes of five-yearly planning it has to be broken up into two parts.

From the point of view of the outlay in the public sector, the first Five-Year Plan showed a successful achievement of the modest target of expenditure of Rs. 19 crores, which was subsequently raised to Rs. 26 crores. The outlay in the next five years on shipping, as on other things, is a mere doubling of this outlay. The provision of Rs. 10 crores for the private sector does not take full account of what this sector has contributed already. In the pre-plan period up to 1951, shipowners had provided about Rs. 22 crores in acquir-

ing tonnage of nearly 300,000 G.R.T. and in the first Plan period, they had supplemented the Government's assistance of Rs. 20 crores by finding from their own resources finance to the extent of Rs. 18 crores. Considering that out of a total investment of Rs. 60 crores since the end of the war the private sector's share is as much as two-thirds, what the public sector now seeks to do for this strategic industry, during a period of bold planning, is not indeed a matter for pride. Prima facie, it may be argued that the gap here between the ambitions of the Ministry and the allocations of the Planning Commission is less than that of the Railways. The difference, however, lies in the vast disparity between the development of our railways, on the one hand, and of shipping on the other. India has to catch up with at least some of the smaller maritime States like Argentina, Brazil or Turkey and this has to be done in time before the world's fast expanding tonnage makes the position of other carriers in the world absolutely secure and established.

The case for a larger provision for shipping may rest also on other grounds of more immediate importance. It has been estimated that approximately Rs. 5½ crores are being earned by Indian shipping engaged in the overseas trade. If the acquisition of 445,000 G.R.T. as suggested by the Shipowners' Consultative Committee is accepted, increasing the share of Indian shipping in our total overseas trade to at least 20 per cent, it would increase our earnings of foreign exchange by about Rs. 15 crores a year for a total investment of Rs. 80 crores. Deducting that portion of the investment which would be diverted to the Indian shipyards, it is possible to say that the additional foreign exchange requirements for the purchase of larger tonnage might be reimbursed, strictly in terms of earnings of foreign exchange alone, in a period of about 5 to 6 years. This is in itself an important consideration, which should minimise some of the difficulties of investment in shipping which have weighed strongly with the Planning Commission. It is necessary that every effort should be made to get over the difficulties, real and imagined, which have prevented more ambitious planning.

PROGRESS OF INDIAN SHIPPING TONNAGE

Need for a Tanker Fleet for India

By C. H. BHABHA

(Chairman, Eastern Shipping Corporation)

THE need and importance of building up rapidly and successfully a tanker fleet for India has, in recent months, been sufficiently explained and does not require any further emphasis or repetition. Tankers are essential for national economy, vital for national safety and indispensable for national prestige. Till 1950, the expansion of Indian merchant shipping meant the addition of cargo and passenger ships to the Indian fleet. The President of the Indian National Steamship Owners' Association, drawing the pointed attention of the Government, early in 1951, remarked that "although India imports thousands of tons of oil every year, she does not have a single tanker which she can call her own". He recalled the statement of Sardar Vallabhbhai as to how the inability of the oil companies to supply sufficient tankers for our purpose had led to the oil crisis in India in the near past. He strongly urged the need for India owning immediately a fleet of at least a few tankers and appealed to the Government to help the Indian shipowners in keeping the tankers fully employed. The Planning Commission also laid emphasis, in their Report for the first Five-Year Plan, on the need for building up a tanker fleet for India. It has, therefore, now been recognised throughout the country that there can be no future merchant navy for India unless a suitable and adequate fleet of tankers forms an integral part of that navy.

It is, therefore, quite incidental that this problem should have come into special limelight with the functioning of the two oil refineries in India. It must not, however, be thought and should not, however, be felt that the question of building up a tanker fleet for India was either overlooked or not urged upon the Government by the national opinion in the country. Soon after India attained independence, the then Ministry of Works, Power and Mines, under which the Petroleum Division of the Government of India was functioning, was trying to explore in vain, to ascertain the components of the prices at which oil and oil products were being sold in the country through a few monopolistic organisations. The freight which the tankers charged for the carriage of oil and oil products was not only an unknown and undiscovered mystery at that time but it has also remained unsolved and unravelled even today.

With the fundamental change in the progressive policy of the country for the development of its mineral resources, the Oil Policy has also to be revised and revitalized. The natural demand of the nation for the rapid, effective, and full development of the oil resources of the country, must be met not only for the country's economy, but also for its stability and safety. The first step, which the Government, therefore, have taken, was to negotiate with the British and the American interests for establishing oil refineries in Bombay. Two refineries have already been functioning in Bombay. The third is expected to function at Vishakhapatnam from 1957 or 1958. It has not, however, to be forgotten that the oil to be refined has to be imported from foreign lands. According to such statistics as are available, imports of oil products into India rose from 776 millions of imperial gallons in 1949-50 to 978 millions of imperial gallons in 1953-54. There has thus been a rise of 40 per cent in this traffic in five years. As the demand for refined oil products is likely to witness a considerable rise in the near future, in view of the industrialization of the country, the foreign exchange that the country would need for paying the imports of

oil is bound to witness a steep rise. It is, therefore, a matter of satisfaction that steps are vigorously taken for the discovery of oil in the country, in co-operation with oil experts, even at a cost of several crores of rupees.

The value of oil and oil products imported in 1954-1955 came to Rs. 72 crores. It is difficult to ascertain the amount of freight that must have been paid to the tankers which brought these products. It may, however, be roughly estimated at Rs. 17 crores per annum. What a saving it would be to the foreign exchange of the country, if all such oil and oil products or at least a very substantial portion of the same, could be imported by Indian tankers? At a time, when the problem of finding foreign exchange, for the projects mentioned in the second Five-Year Plan, has been causing serious concern to the Planning Commission, it is almost amazing as to why they have not been using their powerful influence for enabling Indian tankers to bring oil from abroad and thus make a substantial contribution to their pool of foreign exchange, which they urgently need.

The refined products of the two refineries at Bombay have begun to move round the coast of India in foreign tankers. It is estimated that the volume of the refined products which thus move is likely to exceed a million and a half tons per annum. It is well known that our coastal trade has been reserved to national ships since August, 1950. It is, therefore, an irony of fate that the oil refineries should be allowed to move the refined products in tankers flying foreign flags round the coast of India. Not only is it an unjustifiable violation of the policy of reservation, but it ignores also completely the demand, despite assurances, which the Indian shipowners have repeatedly made upon the Government of India to help them in the building up of a tanker fleet for the country.

Broadly speaking, about 3 million tons of cargoes were carried in dry cargo ships in the coastal trade of India in 1955. This excludes the carriage of refined oil products. If we were to include the volume of refined products, which may reach up to two million tons when the third refinery begins to function, it will be apparent that out of 5 million tons of cargoes to be carried round the coast, 2 million tons will be carried in ships of foreign flags, or nearly 40 per cent of the total cargoes carried. Can anyone, having a sense of fairness and justice, characterise this humiliating position as one in consonance with the policy of the reservation of the coastal trade of India? It will not be possible for the Government even to offer the apology that Indian tankers were not available and they could not have, therefore, any alternative but to allow the refined products to be carried in tankers of foreign flags. That will be ignoring the demand of the country which had been made long before the Government signed their agreements with the Oil Companies.

While I appreciate the recent gesture of allowing one tanker owned by an Indian shipping company to carry the refined products of the refineries, on a time-charter basis of the tanker, in response to the universal demand in the country for the movement of refined products round the coast in tankers of Indian flag, it is high time that the Government should take courage in both hands and rapidly and effectively implement their own policy of reservation by arriving at such an arrange-

ment with the oil refineries that all the refined products shall be carried, from a particular date, only in tankers owned, controlled and managed by the nationals of the country. This is the least that the State owes to the public for the country's economy, stability and safety.

Nearly 4 million tons of crude oil will be imported into India for refinement in the three refineries which have been or will be established in the country. These refineries are bound to expand their activities with the rapidly rising demand of refined products in the country. More and more oil will, therefore, have to be imported into India in the future. It is, therefore, of fundamental importance that oil, which is the life and soul of economic existence and national safety in the modern world, should be made available to all industries and to all consumers at as favourable a price as possible. One has merely to study carefully the prices of oil products prevailing in other economically developed countries of the world to realise fully the serious disadvantages to which we are put owing to the comparatively higher prices of these refined products obtaining in India. One is at a loss to understand how and why this essential commodity should be available at cheaper rates in countries situated at a greater distance from the sources of supply than the sub-continent of India. No doubt, there may be many and varying factors which enter into the formation of prices of oil and oil products. Nevertheless, it cannot be denied that the freight element on oil and oil products constitutes an important element of the price structure. It is recognised all over the world that the nation which imports the oil or the oil products has an inherent right to participate in the carriage of these huge quantities which are imported year after year. Apart, however, from the contribution to the foreign exchange of the country, as mentioned above, by the carriage of oil and oil products in Indian tankers and apart from providing training and giving employment to the nationals of the country, on the Indian tankers, which would carry such cargo, it is a matter not only of fundamental importance, but also of life and death, that considerations both of safety and strategy make it incumbent on India to build up rapidly a suitable and sizable tanker fleet for this country. Even with our peaceful policy, with our friendly relations and with the best of our efforts, it may, unfortunately, become difficult for India to continue to secure sufficient quantities of crude oil to keep the refineries going. It may be that the resources of oil which we may discover in India, may not be able to feed the refineries to the extent that it may be necessary to meet the situation that will develop. To meet effectively the situation, which such circumstances may create and which may hold the country at ransom in the pursuit of its peaceful policy for co-existence and economic regeneration, it is vital that an adequate tanker fleet must be rapidly built up, which could provide the only answer to such a challenge and serve also as an important and powerful instrument for the defence of the country.

It would perhaps be worth while to say a few words in this context about our policy of coastal reservation. The long cherished aspiration to carry all our coastal trade by ships flying the Indian Flag has at least now been fulfilled. Not only have all the doubts, expressed by interested and biased quarters about our capacity and wisdom to implement this policy of coastal reservation, which was announced within a short time after attaining independence, been set at rest, but it has also considerably helped the cause of industrialisation and created a new opportunity for employment for the nationals of the country. The long struggle of the nation for securing this elementary right, the baulking efforts of the then bureaucracy with the pull and sabotaging efforts by the foreign vested commercial interests, are all matters of past history. In order, however, to

remove some incoherent thoughts still existing in some quarters, which yet aspire to fight the unholy and dishonest last ditch battle, it may be made clear once for all that the policy announced by the Government is that from September 1, 1951, no ship which is not owned, controlled and managed by the nationals of the country, shall be granted a licence to ply in the coastal trade of India.

This policy has now established firmly and finally the inherent right of Indians—so far denied to them—to carry all cargoes moving on the coast-line of India in national ships. Without an iota of doubt, it can be stated for the benefit of all concerned, that whatever expansion may take place in the quantity of cargoes to be moved in the coastal trade will have to be carried, as a matter of right, only by ships flying the Indian Flag. With the recognition of this valuable right of Indian shipping, it has also imposed new obligations and responsibilities on Indian shipowners. Can it then ever be imagined that this noble and just national right be fulfilled if a non-Indian Flag vessel is allowed to carry any of our coastal cargoes? Will it ever be possible, either through legislation or by moral pressure, to compel such non-Indian Flag vessels to carry out certain fundamental obligations and responsibilities towards the Indian nation in times of peace as well as in times of war? What guarantees can be sought from or penalties imposed on non-Indian tonnage for the non-fulfilment of such fundamental duties, even if such non-Indian tonnage was permitted to move our coastal cargoes for a short period? Any person, who is conversant and familiar with the past history and struggle of Indian shipping, will ever, by any stretch of imagination, think otherwise than on insisting to make our coastal reservation an absolute fact in every respect both in name and in deed.

Some of the provisions embodied in the agreements made with the Oil Refinery Companies are often thrown into our face and advanced as special pleas for denying the Indian Flag to carry the refined products on the coast of India. To my mind, such efforts can at best be called futile exercises in polemics. We may here quote the relevant clause which is embodied in the agreements with the Anglo-Saxon Petroleum Company Limited and Burnah Oil Company Limited, for the establishment of Oil Refineries at Bombay:

"Tankers, regardless of flag, importing crude oil or products for the refinery for marketing operations in India, will be permitted to lift products from the refinery for delivery to other ports in India. If, in future, the Government or any shipping corporation in which the Government own the majority of the voting shares shall acquire one or more petroleum tankers of a size economically suitable for use in the Oil Companies' business, the Oil Companies, subject to their then existing charter commitments will enter into discussions with the Government with a view to utilisation of a reasonable number of such tankers".

No reasonable and fair-minded person will or can fail to understand the implications of such a clause. Besides, can it ever be imagined or argued that any agreement, however special or peculiar, can abolish the fundamental principles embodied in any policy statement announced by the Government of the country? Another significant feature, which is somehow forgotten, is that the statement of national policy in this matter was announced long before the agreement with the Oil Companies was considered or concluded. Should not then the fundamental and the broad principles of national policy, already publicly announced, govern all contracts or all arrangements of whatsoever nature, that may be made after such announcements? Were

not the contracting parties aware of the announcement of this national policy and the rights conferred by it on the nationals of the country, when their agreements were concluded? Surely, a little deep thinking, with sincerity of heart and clarity of mind, will or can never lead to any misunderstanding or to the advancement of any argument against the inherent right of the Indian people to build up a tanker fleet for India and to carry all oil and refined products only in such tankers round the coast of this country.

The Tanker Industry is of vital and strategic importance to every maritime country which wishes to execute its programme of economic prosperity and national safety commensurate and consistent with its rightful place in the world. India cannot and should not be an exception to this recognised policy governing the activities of all important maritime countries.

I wonder whether it is widely known that the tanker fleet in the world is now making more rapid progress than the growth of the dry cargo vessels. The total tonnage of the world, as in July 1955, consisted of 32,492 ships of 190,565,779 G.R.T. Out of this, 3,575 of 26,454,641 G.R.T., vessels, of an aggregate tonnage of 26,454,641 G.R.T., consisted of tankers. In other words, 26 per cent of the tonnage of the world consists today of tankers. It we take into consideration the number and tonnage of tankers and dry cargo vessels that were launched in the world during the year 1955, we will find that out of a total number of 1,447 vessels with an aggregate tonnage of 5,316,742 G.R.T., launched in the world in 1955, 217 with an aggregate tonnage of 2,436,642 G.R.T. consisted of tankers. This would come to more than 40 per cent of the total tonnage launched in the world. In other words, although the percentage of the tanker tonnage to the world tonnage today is only 26 per cent, the tankers under construction represent 40 per cent. It is the opinion in knowledgeable and responsible quarters that the total tanker tonnage in the world is likely to exceed 45 per cent of the total world tonnage during the next five years. This is also warranted by the fact that while the total quantity of oil and oil products carried in tankers throughout the world, in 1950, came to 269 million tons, it shot up to 321 million tons in 1952. The figures that I have quoted will no doubt, emphasize the importance of the tanker fleet for a maritime country both now and in the future.

It will also be of great interest to note that the following seven countries own today a tanker fleet exceeding a million tons:

1. Great Britain and Northern Ireland	764	5,261,265	G.R.T.
2. America	520	4,321,425	"
3. Norway	448	4,172,631	"
4. Liberia	176	2,355,513	"
5. Panama	199	2,133,980	"
6. Italy	165	1,209,735	"
7. France	129	1,152,419	"

It may be pertinent to ask where does India stand today so far as the nucleus of a tanker fleet is concerned? Till yesterday, she did not possess a single tanker. Private enterprise has bought this year one tanker of about 8,000 G.R.T. One can only hope that we shall not be content by saying that "Yes, India has one tanker", but we shall do our best to ensure that all efforts will be put forth both by the Government and the shipowners to build up rapidly a substantial fleet of tankers owned, controlled and managed by the people of India.

The demand for building up rapidly a nucleus of a substantial tanker fleet for India receives special support from the fact that comparatively small coun-

tries like Liberia, Panama and Norway, with less volume of trade of their own, with comparatively a smaller number of ports and possessing no oil resources, own today, as stated above, over two to four million tons of tanker tonnage. It is, therefore, of vital importance and supreme urgency that India, whose requirements of oil and oil products have been rapidly increasing and will still witness a further rise in the future and which possesses large hidden oil resources, should lose now no further time in building up a large fleet of tankers as an integral part of the merchant navy of the country. At a time, when large shipping companies like the P. and O. with years of experience and useful service in the cargo and passenger trades, have decided to build up a substantial fleet of tankers instead of confining themselves to their age-long business of carrying goods and passengers, it becomes the bounden duty of India to go in, both for the country's economy and safety, for acquiring and owning a tanker fleet of her own commensurate with her needs and worthy of her position in the maritime world.

As I have stated above, India, would be importing about 4 million tons of crude oil as soon as the third refinery begins to function at Vishakapatnam. At present, not a single ton of this huge quantity is carried by any Indian tanker. Shri Lal Bahadur Shastri, Minister for Transport, stated in Bombay, in November 1954, that

"The Government of India would try to use their good offices in finding full employment for any privately owned tanker in the coastal trade of India, and, if such tankers are suitable, for the overseas trade, in utilizing them for the importation of crude oil from abroad."

No action has, unfortunately, been taken in this direction as yet. It will be agreed that if assurances are given by Ministers, on behalf of the Government, they should be followed by satisfactory performances. The Transport Ministry, it is a matter of great regret, has not said anything in several of its recent pronouncements about the steps that they may have taken or propose to take to enable Indian shipowners to bring crude oil from abroad to India in the tankers owned by the sons of the soil. It may be that the mystery surrounding the ownership of a sizable portion of the world's tanker fleet may be coming in their way. Many explanations are given about that mystery. The important aspect which naturally draws the pointed attention of a student of this question of complicated tanker business is the intimate and intricate connection and interlockings between the ownership of tankers and the world's large Oil Groups, who are only the biggest customers for tankers. Behind this mystery, the veil of which has not been lifted, it may be possible to create many manipulations, promote many possibilities and arrive at many new arrangements. Normally, neither will India be concerned, nor will she be interested to delve into these hidden skies for the expansion of her shipping tonnage, of which a substantial fleet of tankers will form an integral part. Nevertheless, if India's needs, rights and aspirations are not allowed to be fulfilled in this direction, but are hampered and checked in a variety of ways, India will not fail to explore and adopt such ways and means as may be necessary for unravelling the hidden mysteries of interconnections between Oil Corporations and Tanker Ownership and thereby make an effective arrangement which may ensure a steady flow of oil to this vast sub-continent, for strengthening her expanding economy, in Indian tankers at equitable and economic rates for the country's future progress and prosperity.

Allow me to conclude by appealing both to the Government and to the public to adopt a realistic and

patriotic approach towards the building up rapidly of a sizable tanker fleet, as an integral part of the merchant navy of the future. The building up of a substantial size and strength of the navy of supply for India, including tankers, cargo ships and passenger vessels, will prove of immense benefit and help towards the realisation of the great hopes and aspirations of mankind to

build up a real Welfare State, particularly in the under-developed regions of the world. Any such contribution to the uplift of human beings will, in its turn, prove of immense help towards the realisation of the goal of world peace, progress and prosperity, in building up finally a better and happier universe free from fear and want.

Coastal Shipping in India

VERY little is heard these days about the importance of coastal shipping in India, though during the years of British rule the question of reservation of coastal shipping for Indian companies provided a frequent topic of heated debate in the Indian Legislature. It is true that the reservation has now become an accomplished fact. Of slightly less than 25,000 G.R.T. of foreign ships engaged in the coastal trade in 1950, only a third remained in 1951 and since 1952 the coastal trade has been completely under Indian control. In this sense the subject has ceased to be controversial. But the development of coastal shipping has not been up to our expectations and the last year appears to have been the worst in recent times in respect of utilization of the coastal lines for the movement of cargo. The fact that it has synchronised with a period during which the railways also have felt difficulty in carrying all the traffic that has been offering itself shows that there has been some lack of co-ordination of our transport capacity. The benefits of a policy of expansion of the coastal carrying trade are obvious. For any country such trade offers a nursery for the growth of a merchant navy; much more so to a country with a long coastline like India. It is, of course, difficult to separate this aspect from the overseas trade in which there is ampler scope for Indian ships to participate. But the growth of our transport needs during this period of the second Five-Year Plan and the possible lack of capacity on the Indian railways makes it urgent for us to treat the coastal trade as a valuable supplement to the transport system and incidentally to build-up a strategic enterprise.

TOTAL TONNAGE EMPLOYED IN COASTAL CARGO TRAFFIC

(1950—1955)

Year	Tonnage Indian Owned	Tonnage Chartered (Foreign)	Tonnage Total G.R.T.	Total Cargo Carried D.W.T.
1950	201,959	47,063	24,390	273,412
1951	217,202	6,938	7,541	231,681
1952	255,119	67,237	Nil	322,356
1953	257,217	22,926	Nil	280,143
1954	286,912	44,151	Nil	331,063
1955	(Est.) N.A.	N.A.	Nil	255,000
				2,800,000

N.A. Not available.

During the first Five-Year Plan about Rs. 8 crores have been given by way of assistance to the shipping companies for the expansion of the coastal fleet at concessional rate of interest. It was a modest provision and all along there was hope that the second Five-Year Plan would be able to provide more ambitious targets. A Study Group set up by the Consultative Committee of Shipowners has come to the conclusion that the requirements of coastal trade alone would need a total tonnage of 400,000 G.R.T. Small though it is, the present experience of the shipping companies engaged in that trade is not such as to make them hope for a larger business, unless certain steps are taken towards co-ordination of movements of goods traffic

* Estimated.

between the railways and shipping companies. The principal commodities concerned are coal and salt in which there is a cross movement between Calcutta and the South. Normally, it should be easy to plan direct traffic from ports to other ports without difficulty and if possible to reserve much of it to the coastal trade. It has been the complaint of shipping companies that the existing freight structure of railways is such as to make it less costly to use railways than ships; the handling charges and the payments of port dues often add to the cost of coastal movement making it less attractive to use the ships. It is also observed that since the decontrol of food, the grain trade finds it cheaper to use the all-rail-route, whereas the Government was able to utilise the rail-cum-sea-route in certain sections; the congestion of traffic passing through Bezwada is due partly to this shift. The whole question has, therefore, to be reviewed with a view to making the shipping companies maintain and expand their traffic and the fact that Government has also an interest because of the loans advanced for building up tonnage must be an additional reason for an early examination. From the point of view of employment also, particularly of men in the Southern coastal States where industrialization is not large, an expansion of the coastal trade can make a substantial contribution. A maximum return from the proposed outlay on minor and major ports can also be secured by such development.

The remedies to the present difficulties have to be sought in many ways. Firstly, the railways have to provide for a larger carriage of their coal requirements by the coastal routes, besides forgoing some of the other commercial traffic. While the ultimate decision as to the use of either of the two routes in the case of commercial traffic should rest with the user who must be given free choice, incentives must lean towards a greater utilization of shipping capacity. The investigations on these matters have now taken a slow course. The report of the Study Group on transport planning made the suggestion some time ago that ship-

owners should specify the rates below which it would be clearly uneconomical for them to carry coal on the basis of a certain assured minimum of shiploads per month. The railways were simultaneously asked to study the actual cost of transport of coal and of salt. It is considered that in the case of salt the rates at present give an unnecessary measure of subsidy which does not go to the benefit of the consumer. These questions call for certain adjustments of freight rates in order to effect a more rational distribution of traffic between the two systems of transport.

An important adjunct of the coastal trade are the sailing vessels, which also ply on overseas routes. The cargo lifted in recent years by these vessels are shown below.

Year	Tons
1951-52	869,272
1952-53	811,529
1953-54	925,515
1954-55	1,499,276

The freight per ton on these sailing vessels ranges from Rs. 6 to Rs. 45 per ton, but taking an average of Rs. 15 per ton, it is estimated that the earnings would amount to about Rs. 2.24 crores, or about one-sixth of the earnings of the coastal shipping companies. In view of their importance, the question of advancing loans to the owners of these sailing vessels to enable them to effect mechanisation has been under consideration, though no provision was made in the first Five-Year Plan. In the second Five-Year Plan it is proposed to provide Rs. 40 lakhs for assistance by way of loans or subsidies and three offices have been set up in Bombay, Tuticorin and Masulipatam to organise the industry. The proposed legislation on Indian merchant shipping is expected to contain provisions for such organisation. It is clear that there is a sound base for expansion; the numbers of sea-faring men available and the experience of transport possibilities are great assets but they can be wasted if steps taken are halting.

* Estimated.

Shipping Companies: Position and Prospects

THE financial and organizational structure of Indian Shipping Companies does not have a definite pattern because the companies vary greatly in size according to the tonnage employed by them. There are about five leading companies, which together own nearly 80 per cent of the total tonnage and about 25 other companies which share the rest. All the companies owned about 126 ships on January 31 this year, with a total of 484,553 G.R.T. and their distribution as between coastal and overseas trades is shown in the table below:

INDIAN-OWNED TONNAGE

(On 31-1-1956)

Company	Coastal Trade		Overseas Trade	
	No. of Ships	G.R.T.	No. of Ships	G.R.T.
Scindia Steam Navigation	25	102,434	15	100,158
Indian Steamship Co.	1	2,124	10	73,248
Bharat Line Ltd.	11	54,665	3	9,861
Eastern Shipping Co.	—	—	6	42,293
Great Eastern Shipping	7	31,386	—	—
Other Companies (25)	48	58,886	—	—
	92	258,993	34	225,560

TOTAL G.R.T. 484,553

It will be seen that the Scindia Company accounts for nearly 40 per cent of the tonnage, with an almost even distribution between the coastal and overseas services, whereas the other companies concentrate their services either on the coastal or overseas trade. The Bharat Line and Great Eastern Shipping carry much of the coastal traffic, while India Steamship and Eastern Shipping take part in the overseas trade. The minor shipping companies are all engaged mainly in the coastal lines.

The financial structure of these companies varies, the Scindias with a capital of Rs. 9.4 crores and reserves

of nearly Rs. 8 crores being the largest. The total paid-up capital of these companies would not, however, give a complete indication, because of the assistance by way of loans which they have received from the Government; but the fact that they have been able in the last 10 years to invest as much as Rs. 40 crores in acquiring shipping tonnage besides Government's assistance of Rs. 20 crores shows that the companies on the whole have operated from great strength. At the end of the war, India owned only 42 ships of 98,286 G.R.T. and a net addition of 55 ships with an aggregate G.R.T. of 287,943 was made by 1951, at a cost to the companies of Rs. 22 crores, after replacing about 44,000 G.R.T. In the first Five-Year Plan period, obsolescence was larger and the addition was smaller, but the cost of shipping had increased by then so as to make even the smaller addition a costly matter, involving Rs. 38 crores, of which half was found by the Government.

It is thus obvious that Indian shipowners have played an active part in building up a merchant navy and have thus qualified for the assistance they received. They have recently ventured even to buy a tanker, the first of its kind in India at a cost of Rs. 85 lakhs. In view of the vast scope available for Indian shipping in our foreign trade, the setting up of the Eastern Shipping Corporation by the Government with a majority interest and the proposal for a second Shipping Corporation would not seriously affect the scope for private enterprise in this matter. The fears of nationalisation have been somewhat allayed in recent years, though the greater reliance on Government loans has led to the fear that the occasion for lending may be turned into an opportunity for the Government to acquire a part of the equity capital of companies. The statement in the Draft Outline of the Five-Year Plan to this effect is not indeed an encouraging factor but considering that the shipping policy of all the important maritime countries where such aid was given in the national interest, has been otherwise, there is no reason why shipping in India also should not be regarded as an exception

March 30, 1956

even if the rule of equity participation suggested in the Draft Outline should get accepted in principle.

Shipping companies have been encouraged by recent statements of the Minister for Transport offering assistance and support in the purchase of ships, the carriage of Government cargo in overseas trade and in securing participation in the important conference lines from which Indian shipping is still excluded. Hitherto the priority to be accorded to the Hindustan Shipyard in the matter of placing orders for new tonnage had involved the companies in certain amount of locking up finances in advance, when deliveries became delayed because of the Shipyard's difficulties. Satisfactory adjustments have now been made by way of release of a total tonnage of a lakh of tons even when its capacity increases to four ships a year. During the second Plan period only 10 more new orders are required and there should be no difficulty in allowing companies to place orders for the balance of their requirements abroad.

For half the total tonnage which is now employed in the coastal trade a major problem has been the freight structure which is kept to the disadvantage of the companies on the basis of comparative rail freight rates. Their demand for an increase in the freight rates by 10 per cent has not been fully accepted but even the Government's acceptance of a 5 per cent increase has been helpful, as an interim gesture till the receipt of a report of the Rail-Sea Co-ordination Committee. There is a real shortage of tonnage in the coastal trade, with the result that the Government's

declared policy of elimination of chartered vessels in coastal traffic with effect from April last year has not become feasible. At present about 46,500 DWT has been chartered by the Indian Shipping Companies for both trades but since the reservation policy in coastal traffic implies the exclusion of foreign flag ships, the purchase of about 25 ships to fill the gap has been considered necessary and until it materialises shipowners have been allowed to charter temporarily one vessel against each building order.

Among the other major problems of the shipping industry the rate of replacement of over-aged ships has been an important one because the cost of replacement would be several times the original value of the ships to be replaced. The suggestion recently made by the Chairman of the Eastern Shipping Corporation that a complete tax exemption may be granted to the shipping companies for a period of five years to help them to raise their own finances for replacement would, therefore, deserve the most favourable consideration. Most of the companies have recently experienced a decline in earnings and profits particularly because of the difficulties of the coastal trade mentioned above and the rise in the costs of stevedoring, transhipment and chartered rates. The rise has been due mainly to labour difficulties in the ports which may be expected to be more favourable in future because of the imaginative manner in which they have been tackled by the Vastist Enquiry Committee and the Government. In foreign lines also the British dock strike last year gave an unfavourable turn-round rate but the position is better now. Thus the fortunes of the Indian shipping companies have been mixed, but the dominant feeling at the present time is that they have turned the corner and can look forward to brighter prospects hereafter.

The Importance of Inland Water Transport

(CONTRIBUTED)

FEW people realise the extent, utility and importance of the natural waterways in North East India which find an outlet through the Delta and Sunderbuns area into the Bay of Bengal.

Inland waterways have always played an important role in the transport system of India and have helped considerably in the development of its trade and industries. This has been more particularly the case in North East India where there are some 4,000 miles of navigable waterways of various sizes within the boundaries of India and of which some 2,000 miles are navigable by large river vessels.

INDUSTRIAL DEVELOPMENT ASSISTED BY I.W.T.

The growth of powered water transport in North East India is linked directly with the development of major industries in that part of the country. It was water transport which, in the early stages, carried the labour, machinery and equipment for the tea gardens and jute presses which were being opened up in the Assam, Sylhet and Cachar Valleys and in East Bengal about one hundred years ago. It is the same water transport which today brings down approximately 90 per cent of Assam's tea crop and about 85 per cent of the jute crop, to the warehouses and mills on the banks of the Hooghli and for distribution to world markets abroad through the port of Calcutta.

DECREASE OF I.W.T. IN THE GANGA VALLEY

In Uttar Pradesh and Bihar it was with the aid of inland water transport that the indigo, sugar and grains trade of these provinces was developed in the

early stages. The expansion of the railways at a later stage on both banks of the river Ganga has, to a large extent, replaced inland water transport in distributing and conveying the produce of the Ganga Valley.

It was this extensive development and expansion of the railways in Bihar and Uttar Pradesh coupled with the widespread increase in irrigation during the latter half of the nineteenth century, when considerable volumes of water were taken out of the rivers, thereby reducing the flow, particularly during the dry season, which eventually has resulted in the consequent deterioration of navigable channels with extremely unfavourable river conditions and adverse freight rates, for continued existence of powered river transport in these provinces.

REASONS FOR CO-ORDINATING TRANSPORT

There were several reasons why all this was permitted to take place, but the lack of a co-ordinating authority to maintain the waterways, provide navigation facilities and to combine the available water, rail and road transport facilities, has been the greatest single factor which has impeded the development of India's magnificent waterways and restrained the proper progress of powered inland water transportation in India today.

IMPORTANCE OF I.W.T. TO ASSAM

In the North East corner of India, however, powered inland water transport still plays an ever-increasing important role in the development of trade and industries of the Brahmaputra Valley, Cachar and Tripura.

PERCENTAGE DISTRIBUTION OF THE INDIAN FLEET AMONGST THE SHIPOWNERS

This part of the country includes areas of North Bengal, Dooars, Assam and Cachar which are liable to annual severe flooding when rail, road and air transport facilities are completely disrupted. In these areas the advantages of water transport are fully appreciated in their ability to operate and keep the trade routes open when all other modes of transport are at a standstill.

The full importance of inland water transport to the north east corner of India may be gauged by a study of the following figures which give tonnages of major commodities conveyed between Calcutta and Assam during 1955 by one of the major inland water transport operating concerns alone.

Tonnage Carried by River to and from Calcutta and Assam

Year	Cargo	From Calcutta to Brahmaputra Valley	From Calcutta to Cachar Valley and Tripura	Totals
		Tons	Tons	Tons
1955	General	387,000	74,200	461,200

Year	Cargo	From Brahmaputra Valley to Calcutta	From Cachar Valley and Tripura to Calcutta	Totals
		Tons	Tons	Tons
1955	Tea	155,100	20,500	175,600
1955	Jute	32,900	1,200	34,100
1955	General	69	21,500	21,569
	TOTALS	307,000	43,200	350,200
	Grand Totals	694,000	117,400	811,400

ADVANTAGE OF I.W.T.

One of the main advantages which water transport possesses is the ability, on a direct mileage comparison, to convey large tonnages of cargoes over great distances more cheaply than is possible by road and rail transport. A further great advantage and one of particular interest to Assam is the ability to send by water transport heavy lifts, machinery, and length of heavy pipe section to areas where new industries are being developed, the transport of which could not be conveniently catered for by road or by rail.

With the industrial development envisaged in India during the second Five-Year Plan, it is clearly, now more than ever, apparent that all modes of transport should be co-ordinated and given equal advantages if the country's needs are to be served in such a way that its development will be unrestricted.

Labour Problems in Inland Water Transport

(CONTRIBUTED)

THE Joint Steamer Companies, the largest inland water transport organisation in India, have more than usually complex labour problems. Operating as they do in West Bengal, Assam and Bihar they employ widely differing categories of staff totalling approximately 12,000 persons, more than half of whom from the crews and in-charge ranks of their vessels. In addition there are clerical staff at the Calcutta Ghats

BASIC REQUIREMENTS FOR DEVELOPMENT

The basic requirements for the development of Inland Water Transport are river control and co-ordination. In the extensively developed countries of Western Europe and the USA where Inland Water Transport has become of national importance, the appreciation of these problems has been complete. Considerable expenditure of public funds on the development of water transport in these countries has resulted in a major measure of co-ordination to prevent unnecessary competition between river, rail and road transport.

Together with this co-ordination is the need for maximum possible freedom from national and provincial controls. This aspect has received recognition and suitable compromises have been introduced to the advantage of countries in other parts of the world. An excellent example of such co-ordination is the case of the continental countries bordering on the Rhine, where the Central Rhine Commission has made it possible for the complete development of an efficient and vast inland water transport industry within recent times. Similar and speedy development of inland water transport facilities has occurred on the vast inland waterways of the USA where the transport lift by water during the last decade has been quadrupled.

DEVELOPMENT ENVISAGED DURING FIVE-YEAR PLAN

These newly developed inland water transport systems have been to the undoubted advantage of the countries concerned and India is to be congratulated in appreciating the importance of this fact and in planning for the improvement of their own inland waterways within the second Five-Year Plan period. These plans envisage the importance of improving navigable channels with the aid of dredging and river training, the development of port facilities at a number of important river stations, and rail river junctions, the introduction of mechanical aids to navigation, the development of a system of radio telephony to assist communications on the river, the recognition of the necessity to establish facilities at border control stations and the provision of additional and modern facilities at non-tidal berths for inland water transport vessels in the port of Calcutta.

The inland water transport operators have themselves appreciated the need for modernising their fleet. During the past twenty years modern technical achievements and developments have made it possible considerably to cheapen the facilities for transport by air, rail, road and water. This movement has been apparent all over the Western hemisphere and in the USA and inland transport operators in India are now investigating the extent to which these modern developments elsewhere can be applied to powered transport on India's waterways.

New techniques of operation are also being studied and in the near future it should be possible to introduce these new developments on India's inland water transport system and thus help the producer in transporting his finished products by water to areas where it is most urgently required.

and up-country Agencies, Durwans and Watch & War Staff, Pilotage Staff in Bihar, Assam and Cachar and handling labour at all the main Assam stations.

Many of these employees have different conditions of work and terms of service due to the diverse nature of the duties they perform. They come from different parts of the country, have different political affiliations and belong to several different trade unions.

The most numerous single category is the Floating Staff. Before Partition the Joint Steamer Companies' vessels were manned exclusively by men from East Bengal who have generations of sea faring and riverine tradition behind them. The advent of Partition introduced a complication, as they automatically became foreigners in so far as Indian registered vessels were concerned. Much thought has been given by the Joint Steamer Companies to the problem of replacing these men by Indian Nationals.

The principal difficulty has been to find suitable Indian masters, serangs and engine drivers to command the ships and to look after their machinery. All the in-charge ranks, or Certificated Ranks, as they are called have risen from the ranks of lascars or coal trimmer, having served the requisite period laid down by the Inland Steamer Vessels' Act. There have been virtually no Indian Nationals with the qualifications required under the law to take command of inland steamer vessels.

This was the first problem. The second was the question of crews. Until September 1955 the system of employment in force in the Joint Steamer Companies was for the master, serang or driver to recruit his own men, usually relations or people known to him from his home village or district. In the absence of qualified Indian Certificated Ranks, there was no means of recruiting Indian deck or engine room ratings in the majority of cases. During the past few years, however, the Joint Steamer Companies have been successful in obtaining the services of a few Indian Nationals as serangs and drivers on small launches.

In January, 1956, the Joint Steamer Companies in consultation with the Government of West Bengal, have started a training ship for both deck and engine room ratings and Certificated Ranks of Indian Nationality. The latter are being given higher training to fit them for command of larger vessels, having served previously on small launches. The ratings are supplied by the West Bengal Inland Water Transport Training Centre. In the meantime the method of recruiting crews was altered.

In September, 1955, the Companies agreed to give direct—but not permanent—employment to their ratings. They now maintain a roster for the different categories of ratings. Men are selected for appointment to vessels strictly in accordance with this roster and are guaranteed a fixed term of employment which has been agreed with the representatives of the workers. This is substantially the same as the system introduced by the Government of India Seamen's Employment Bureau for the crews of deep sea vessels. The Union originally demanded permanent employment for ratings but this demand was dropped when it was realised that several thousand men would become unemployed due to the surplus of men registered over available appointments.

The Joint Steamer Companies have also introduced direct payment to ratings as they were aware that certain abuses had been practised in the past by the in-charge ranks, and they were anxious to put a stop to them. The new system of employment and payment while satisfying to some extent the ordinary ratings, has caused discontent among the Certificated Ranks, who claim with some justice that they can no longer enforce strict discipline on board their vessels.

The great difference between the system of employment in these inland vessels and in deep sea ships is due to the absence of legislation for the former corresponding to the Indian Merchant Shipping Act, which gives wide disciplinary powers to masters of ocean going

ships. The Joint Steamer Companies have endeavoured to meet this situation by the introduction of Ratings' Service Regulations which have been jointly agreed with the workers' representatives. They are aware, however, that these Regulations by themselves are not really satisfactory, and they have urged on both the State and Central Governments the need for legislation similar to the Indian Merchant Shipping Act to be applied to inland water transport. It is hoped that in time a satisfactory system will be evolved, which will achieve the dual object of ensuring discipline among the crews and the efficient operation of the vessels, while also establishing satisfactory service conditions for the men.

The Joint Steamer Companies' shore staff fall into 2 main categories: those employed in Calcutta and those working in the Agencies and Sub-Agencies along the rivers in Assam and Bihar.

The Calcutta Clerical Staff belong to the Inland Steam Navigation Workers' Union whose Executive Committee consists largely of persons who are either Communists or closely connected with the Communist Party of India. This Union has been recognised by the Joint Steamer Companies for a number of years and they have tried, not always with success, to maintain cordial relations with it.

The scales of pay and other conditions of service of the members of the Inland Steam Navigation Workers' Union were established in the Award of Sri A. Das Gupta in the year 1949, since when the Joint Steamer Companies have voluntarily introduced improvements in their efforts to maintain good relations with the staff. They have, however, been unsuccessful in convincing the Union that profit sharing bonus is not payable on the Companies' trading results, and appeals for several years are at present pending before the Calcutta Bench of the Labour Appellate Tribunal, the Union having lost their cases before the Lower Tribunal.

The staff in Assam are members of the R.S.N. & I.G.N. & Rly Co. Ltd Workers' Union, whose President is Sri Hareshwar Goswami, Leader of the Opposition in the Assam State Assembly. The Joint Steamer Companies have been fortunate in establishing good relations with this Union, and terms and conditions of service are currently fixed by an agreement which does not expire until February, 1957. This Union represents not only clerical and subordinate staff but the pilotage staff who are responsible for marking the navigable channels in the rivers both by day and by night.

The staff in Bihar are represented by the Steamer Mazdoor Union whose General Secretary, Sri Fateh Narain Singh, is a member of the Bihar Legislative Council.

Since 1954 the Joint Steamer Companies have directly employed a large force of handling labourers in Assam, who were formerly working under the contract system. These workmen are represented by local unions who are affiliated to the Assam Branch of the Indian National Trade Union Congress. There is at present in progress a tripartite enquiry commission, which has been set up to go into the terms and conditions of the work of the handling labourers and to establish a reasonable workload on which a guaranteed minimum wage can be based.

The Joint Steamer Companies firmly believe in joint consultation and they recognise all the above Unions. They are anxious to maintain cordial relations with them and to obtain a fair return from their employees for what they consider to be fair wages.

The Floating Staff are represented by the Bengal Mariners' Union which has been recognised by the Companies for many years. Due to a legal dispute over the General Secretaryship of their Union their current agreements affecting the floating staff have been signed with a Negotiating Committee whose representatives hold regular meetings with the Labour Department of the Joint Steamer Companies.

The Joint Steamer Companies' services in West Bengal, Assam and Bihar have been declared by Government to be a public utility service under the Industrial Disputes Act and the Joint Steamer Companies' constant endeavour is to avoid inconvenience to the public, who depend upon them for the transport of their goods, and they are always ready to settle the reasonable demands of their workers by joint consultation rather than by adjudication.

For a number of years the Floating Staff have been

able to earn trip bonuses calculated on the time taken to complete voyages. In 1955 the Joint Steamer Companies introduced an Incentive Bonus for their shore staff and were able to pay 25½ days' wages to their staff in West Bengal and Assam before the Puja holidays. The Joint Steamer Companies have also undertaken certain welfare activities including the housing of some categories of staff upcountry, and they have built a modern housing estate at Khargoli in the suburbs of Gauhati. Due to the increase in operating costs since the war, the Companies have not been able to allocate as much for welfare purposes as they could wish, but they hope with the co-operation of the workers and by the introduction of incentive schemes to be able to undertake further welfare activities in the future. They are confident that they can secure this co-operation provided that irresponsible political elements desist from attempts to stir up unrest and discontent among the workers with the sole object of advancing their party interests.

Progress of Shipbuilding Industry

THE shipbuilding industry in this country which is now over a decade old cannot be considered to have crossed the hurdle of its preliminary difficulties. It was quite obvious that in spite of the singular qualities of business enterprise and sacrifice shown by the Scindia Steam Navigation Company in pioneering this nascent industry, stability was difficult to be secured unless the State came forward with financial participation and massive assistance. The much-needed transformation came when in March 1952 the Hindustan Shipyard Limited which was formed a couple of months earlier took over the Viskhapatnam shipyard from Scindias.

The structure of the shipyard was strengthened with the expansion of its share capital which was raised to Rs. 2.08 crores initially and another vital element of strength was imparted to it on the technical side. This was the five-year agreement entered into in July 1952 with the French firm of shipbuilders, La Societe Anonyme Des Ateliers et Chantiers de la Loire (ACL, for short) for technical collaboration. There was a somewhat unhappy chapter in the history of the Hindustan Shipyard in the first four years since its inception, because the technical collaboration has not come up to expectations and it is no harsh reflection to state that planning and organisation on behalf of ACL were less than satisfactory particularly at the beginning. The real test of the progress and vitality of the industry needs to be judged by the criterion of the number of ships actually delivered to the purchasing companies. Expert estimation was not applied in drawing up the schedule of construction and delivery of ships and in inducing shipping companies to place orders on its strength. The shipyard started work with the help of ACL in July 1952 on the assumption that five ships could be delivered per year and this rate would be stepped up later on. This assumption was subsequently reduced to a rate of four ships per year and even then this target was described as theoretical. It is difficult to appreciate why a theoretical target was assumed when the purchasing companies were called upon to make substantial investments for outlay on new ships in advance. Including one ship which is expected to be delivered in a matter of months, the total number of ships delivered by the Hindustan Shipyard to date comes to only 3 which gives an annual average of 2 ships.

Apart from the consideration that in some advanced shipbuilding yards a penalty clause is usually inserted for non-compliance with the delivery terms, it is difficult to overlook the consequences of the rate of construction and

repeated revisions of delivery dates at Hindustan Shipyard. In this context it needs to be stressed that the full cost of a ship is recovered to the extent of 80 per cent in four equal advance instalments and to the extent of 20 per cent on delivery. This involves looking up of considerable capital of the companies. The effect of inability to deliver ships according to schedule has been diversion of orders abroad and a short-fall in fulfilling the target of the first Five-Year Plan. In recent years the prices of ships have kept on steadily increasing, for instance, the price of an average ship for the coastal trade rose between 1950 and 1955 by 82 per cent. Foreign shipyards are now reluctant, by reason of the pressure on their order books and the trends in steel costs, to accept terms of base prices subject to fixed ceilings. It means that slow construction at Visakhapatnam has involved Indian shipping companies in heavier costs.

This is not in the least to minimise the difficulties which the Visakh yard has to encounter and the odds against which it has had to fight. A highly developed shipyard concentrates on the construction of hulls and as regards important parts like the propelling engine and its auxiliaries, electrical fittings, wireless equipment, and so forth. They are supplied by adjacent specialised manufacturers. This facility of local integration is denied to Hindustan Shipyard and further the high cost of imported steel and timber has gone to increase its building costs. In view of the limited number of ships built at the yard the overhead charges are relatively very high. Delays in receipt of imported engines, boilers and other components, which are frequently experienced, not only hold up progress but go to inflate final costs. Another important and unusual factor in the high cost structure of the yard was the burden of surplus labour. It was ultimately eliminated with a payment of Rs. 7.27 lakhs for retrenchment benefits in 1952-53, marking the final phase of the graduated programme of retrenchment. Maintenance of idle labour cost Rs. 4.44 lakhs in this year and still higher amounts in the earlier years.

Much of the ground has now been prepared for the rationalisation of the cost structure of the yard. But reform in two directions is still needed. The yard has been involved in higher costs and slow execution because of a wide range of types of vessels it started undertaking to build. It is now agreed between the Yard, the Government and the shipping companies that standardisation should be introduced by reducing the number of types for coastal ships to three types at the most and to limited types for ships plying the distant trades according to their nature. The absence of a dry

dock was a factor both of higher costs and delay necessitating completion of the final part of the work in the dry docks at Calcutta and delivery there. The project of building a dry dock at Visakh is now taken in hand with a loan of Rs. 2.15 crores, interest-free for the first seven years and thereafter bearing interest at the rate of 4 per cent, repayable in 25 years. The earning capacity of the Yard would be increased by its ability to undertake profitable repairing jobs at the projected dry dock.

At the present time, subsidy is paid by the Government to the Visakh Yard to compensate for the loss sustained in selling ships at the UK price parity. The extent of the higher costs of Visakh-built ships is indicated by the fact that in 1954 a ship cost Rs. 81 lakhs against the equivalent UK price of Rs. 58.9 lakhs. The subsidy thus came to over 36 per cent. It is not uncommon with governments of countries having advanced ship-building industry to pay a subsidy of 30 per cent. Shipping companies have urged for relating the price parity for purposes of subsidy to the prices offered by

other countries at a lower level than that of UK. Recent indications are that this request would be met. The prospect for economy in the immediate future in the building cost of Hindustan Shipyard lies in scientific planning of construction schedules, avoiding waste in materials used and utilising the idle capacity of the machines in complementary production like assembly of imported railway wagons. Improvements in these directions are under active consideration.

During the second Five-Year Plan, total investment in the Yard is to be stepped up from Rs. 6 crores to Rs. 9.3 crores and the estimated production is to be increased from 50,000 GRT. to 100,000 GRT. The tonnage construction target appears within achievement and already there are orders from Indian shipping companies for half the tonnage accounting for yearly ten ships. The balance of orders is expected to materialise without difficulty. The Yard will in this manner contribute to one-third of the additional target of tonnage of expansion fixed for the second Plan. The rate of delivery would be doubled to four ships a year.

Ports and Harbours

TWO problems created by the war called for urgent solution in the rationalisation of the capacity of India's ports. They were not basically different from the problems posed for the reconstruction of the other forms of transport. Excessive strain of emergency traffic and inevitable accumulations of maintenance and replacement of equipment on an abnormal scale made it imperative that early priority should be given to rehabilitation and modernization of the capacity of ports to handle cargo. The volume of sea-borne trade kept on increasing not only during the war but also in the period following the war. It is obvious that the increase in India's sea-borne trade has come to stay. This progressive trend is certainly the more important of the two post-war tasks to which the country's port capacity has to face up. Partition aggravated the situation especially in respect of the pressure of rising traffic since one of the major ports—Karachi—was lost to Pakistan. A substantial part of the overseas trade of the hinterland of Karachi comprising large areas of North India and also, to a lesser degree, of Western and Central India had to be diverted and for this purpose there were only two outlets—Bombay and Calcutta.

The distribution of sea-borne traffic through the country's principal major ports in the post-war period is sufficiently reflected in the actual trends for the three recent years summarized in the following table:

Ports	TRAFFIC MAJOR PORTS	THROUGH INDIA'S (In million tons)	
		Imports	Exports
Calcutta	1952-53	3.32	5.34
	1953-54	2.72	4.57
	1954-55	3.24	1.94
Bombay	1952-53	4.70	1.95
	1953-54	4.76	1.95
	1954-55	5.63	0.32
Madras	1952-53	1.81	0.49
	1953-54	1.64	0.49
	1954-55	1.72	0.33
Cochin	1952-53	1.22	0.32
	1953-54	1.23	0.35
	1954-55	1.20	

These figures reveal the concentration of a large share of the import-export trade in Calcutta and Bombay. A most outstanding feature of the trade which is quite obvious is the unique position of Calcutta as a port of exports. This is expected to be continued in

any future set-up of port development because of the composition of this country's exports which will naturally seek egress through Calcutta—jute, tea, coal, mineral ores and general merchandise. Nevertheless, the decline in the traffic through Calcutta port is disquieting and underlines the need for correctives to reverse the trend. The consequences of partition are seen in the traffic trends of Bombay port which had to bear the main brunt of the loss of Karachi. Imports routed through Bombay are considerably higher than those routed through Calcutta and the disparity is widening in recent years. This is due, apart from the post-war increases in the volume of imports, to the separation of Karachi. The volume of exports through Bombay has also accentuated the post-partition pressure on this port. Madras and Cochin handle traffic consistently with the share of the South in the country's sea-borne trade.

The upsets caused by partition indicated the urgency of corrective measures and in 1949 the problem of port capacity expansion was taken in hand with the appointment of the West Coast Major Ports Development Committee. The Committee's principal term of reference was to recommend, after exhaustive technical investigation, the location of two major ports on the West Coast—one between Kutch and Bombay and the other to the South of Bombay. The Committee which reported in July 1949 selected Kandla and Malpe as the suitable additional major ports. The task of immediate urgency was to compensate for the loss of Karachi and this task will be amply fulfilled by the construction of Kandla port in Kutch which is progressing at a satisfactory rate since last year. The first phase of the construction of Kandla was over with the opening of oil traffic in April 1955. An important responsibility of large magnitude which has been placed on India's ports in the post-independent era is to provide large-scale facilities for the developing traffic in oil. Bombay, Kandla and Visakhapatnam will have to share the bulk of this new traffic.

The main objectives of the first Five-Year Plan in port development were to rehabilitate and modernize the equipment in the major ports, to increase their cargo dealing capacity and to construct a modern port at Kandla. These objectives have been fulfilled in varying degrees and it is surely a great merit of this Plan that definite progress has been registered in the work on Kandla. The capacity of India's five major ports—Bombay, Calcutta, Cochin, Madras and Visakh-

patnam—has been raised by 30 per cent from 20 million tons to 26 million tons. It would, however, be presumptuous to claim substantial credit for modernisation of equipment and overall facilities. The shortfall in expenditure cannot certainly be regarded as unimpressive. The second Plan envisages an expenditure target for major ports of Rs. 58.31 crores and aims at an increase of 30 per cent in terms of traffic clearance capacity. The distribution of outlay is likely to be: Bombay Rs. 17.42 crores, Calcutta Rs. 19.88 crores, Cochin Rs. 3.61 crores, Kandla Rs. 8.94 crores and Madras Rs. 8.46 crores. Development expenditure for Visakhapatnam is included in the Railway Plan, while Kandla is a hundred per cent Central responsibility. The remaining four major ports which will raise Rs. 3 crores out of their own resources and will require loans from the Centre for the balance of the outlay. The actual expenditure anticipated in the period of the second Plan is Rs. 40 crores. It is a significant commentary on the progress of the first Plan that this amount of Rs. 40 crores contains a carry-forward of Rs. 25.5 crores left over by it.

The present classification, which relegates all the

remaining ports handling less than one million tons of cargo to the description of minor ports has proved unsatisfactory and also inconvenient for development priorities. The category of intermediate ports is already emerging and its claim to distinct treatment cannot fail to win recognition. Minor ports, in current administrative parlance, are the responsibility of the maritime States concerned. They received a modest allocation of Rs. 2.5 crores in the first Plan and excepting for a small outlay of Rs. 30 lakhs their programme of expansion has been carried through. The rate of development expenditure is to be doubled in the second Plan with an allotment of Rs. 5 crores. The new emphasis on intermediate ports is indicated in the special provision of Rs. 1.7 crores in this allotment for the expansion of Mangalore, Paradip and Tuticorin. Five ports in Kutch—Jakkau, Lakhpet, Koteswar, Mandvi and Mundra—constitute the charge of the Central Ministry of Transport. During the first Plan their development schemes absorbed an amount of Rs. 14 lakhs, revealing a shortfall of Rs. 4 lakhs. The outlay in the second Plan, fixed for these ports at Rs. 15.6 lakhs, anticipates a somewhat higher rate of expansion than in the current Plan.

add Rs. 1 crore in 1956-57 to its issued capital of Rs. 6 crores, 74 per cent of which is Government-contributed.

The Corporation has been authorised to acquire two tankers, following representations that private shipowners should also be permitted to go into the tanker business. It may be recalled that the Government has already decided to acquire two tankers on its own account to carry the coastal oil trade which is bound to increase, particularly in the wake of the setting up of oil refineries in Bombay and Visakhapatnam. The Great Eastern Shipping Company has already acquired one tanker. The Government propose to take over the entire capital and management of the Corporation when Scindias cease to be the managing agents in August next under the new Company Law. Another shipping Corporation with a capital of Rs. 10 crores is likely to be set up to ply on uneconomic routes which private companies do not wish to operate on and to increase the share of Indian ships in the country's foreign trade.

OVERSEAS TRADES

AT the end of 1955, thirty-three Indian-owned ships of about 225,000 gross tons were plying on the various overseas routes. During the year, Indian shipping companies continued to maintain their position in the existing trades and added five ships totalling 25,000 gross tons to the India-UK-Continental cargo service. The India-UK-Continental Conference has accepted the claims of Indian shipping companies for full membership with unrestricted rights, and the Scindias and the India Steamship propose to put 15 ships each in the trade in the course of the next five years. The freight and passenger earnings of Indian Shipping Companies in 1954-55 came to Rs. 10.47 crores as against Rs. 8.59 crores in 1953-54. To bring overseas shipping interests into closer contact with the Government, the Overseas Shipping Conferences Committee was set up by the Government in October 1955, comprising seven members, two each from the Indian National Steamship Owners' Association, the Bengal Chamber of Commerce and the Bombay Chamber of Commerce and one from the Oil Industry Supply Committee. The first meeting of this committee was held in Calcutta in November 1955 and it is proposed to set up suitable local organisations at Bombay, Calcutta and Madras for dealing speedily with matters of local interest.

Notes on Shipping

RECRUITMENT AND WELFARE OF SEAMEN

THE Seamen's Employment Office, set up in Bombay in March 1954, regulates the supply of maritime labour on the principle of rotation. The number of seamen who registered themselves for employment at this office up to December 31, 1955, was 32,027 compared to 19,764 by the end of 1954. A similar office for the recruitment of seamen has been set up at Calcutta from March 1955, and 18,476 seamen have registered themselves there up to December 31, 1955. To the Bhadra (Calcutta) and Mekhala (Visakhapatnam) Ratings Training Establishments was added a third during last year at Navlakhi, Saurashtra. The National Seamen's Welfare Board consisting of representatives of Government, shipowners, seafarers, port authorities, etc., with the Minister of Transport as Chairman, looks after the welfare of seamen. There is a hostel for seamen in Calcutta and another is in the process of construction in Madras. Training for merchant navy officers is provided by Dufferin and the Nautical and Engineering College, Bombay, provides instruction in higher marine engineering.

EASTERN SHIPPING CORPORATION

DURING 1954-55, the Eastern Shipping Corporation, which was set up in March 1950 to facilitate the participation of Indian shipping in overseas trade, by the Government of India and the Scindia Steam Navigation Company, improved its position in the Madras-Singapore and the Bombay-East African passenger trades. But, owing to the unsettled conditions in the Far East trade and the limited support which Corporation ships received in the early stages of their participation in this trade, the low freights prevailing in the Australian food grain trade, etc., the working of the Corporation for the year disclosed a loss of Rs. 19 lakhs, although freight earnings more than doubled over the previous year. This compares with a profit of Rs. 4 lakhs in 1953-54, Rs. 12 lakhs in 1952-53 and Rs. 23 lakhs in 1951-52. The year 1954-55 was the first year in which losses were incurred since the Corporation was established in 1950. The Corporation is handicapped in stabilising its position in the Australian and Far East trades by the limited number of ships operated in them and the difficulty of getting additional tonnage at reasonable prices. The Corporation has six ships of 42,297 tons G.R.T. and plans to

The Nature of the Oil Industry

THE growth of the oil industry is a remarkable phenomenon even in these days of rapidly expanding economies and startling increases in production of goods and services in many countries. Comparison may reasonably be made with the rise in industrial activity from pre-war levels which in Western Europe has been some 87 per cent, about 189 per cent in the USA and approximately 64 per cent in India. The world oil industry, despite the fact that no other industry suffered such ruthless and deliberate destruction in the war years, is currently producing oil and natural gas at almost exactly 200 per cent above the 1938 rate for the world, excluding the USSR and its satellites. The figures relating to the latter are to some extent conjectural, but by including them the increase would be approximately 186 per cent. The USSR and its satellites have not been participating freely in international trade in oil and therefore have not been significant suppliers to, or customers of, the rest of the world in this form of energy. Unless otherwise stated, therefore, the figures quoted for the world are those relating to the free trading world, and exclude the USSR and countries under the Soviet control.

To realise the importance to the world of the major effort that has led to the indicated expansion of oil supply, it is necessary to realise that oil and natural gas have recently overtaken coal as the major supplier of the world's energy requirements; and taken in the context of a production of coal which is itself expanding but at a rate slower than that of oil, it is highly significant. This expansion of production and the vast machinery of processing, shipping, distribution and sales facilities, is the work of an industry composed of many enterprises, large and small, in many lands, speaking many tongues and using many currencies, but all in their own way contributing to a free and competitive system which, in essence, operates without friction and ensures that no one goes short through a

fault of his own. Until atomic energy develops on a vast scale, and that is many decades ahead of us, the world will remain highly dependent on abundant supplies of oil products readily available at the places and in the forms required. Otherwise industrial expansion cannot be maintained, nor standards of living protected and improved. Petroleum products are in universal demand. There is no country in the world which can do without them, and some are vitally dependent on them; very few can meet their requirements from internal sources of supply.

It is to be hoped that the search for oil in India will be successful, but it is sensible to recognise the risks involved, the inevitable gambles and the costs. History proves that with rare exceptions oil is produced in economic quantities only by the patient application of the combined resources of many teams, with the risks spread as widely as possible. In any event India takes her place with many other countries which are serviced by the organisations which have grown up to supply the international needs. The big reserves on which the world absolutely depends are largely in areas remote from the centres of population and industrial development. That, broadly, is the reason why the peoples of the world must be assured that the free flow of oil will not be interrupted, and also why the organisations which compose the oil industry must be fully up to the task of producing, refining, transporting and distributing its products in the right quantity and quality wherever required.

The manifold nature of the tasks that when added together make up the integrated chain of supply is not perhaps as widely understood as its importance deserves. Individual enterprises in the oil industry at various stages are faced with great problems and risks, therefore it would contribute to general understanding if we trace the development of effort from its beginning, that of the search for oil deposits.

Exploration—the Background

THE difference between the starting point—that is to say, when an oil company's geologists first go into a territory—and the conditions after oil has been located and an oil-field developed, are poles apart. It is this exploration and development stage which is so often overlooked. In the early days of the oil industry conditions were considerably easier than they are now. Most of the primary discoveries were made as the result of definite surface indications of the presence of oil, but the supplies that were so near the surface and conveniently revealed themselves have long since been charted and developed. The present-day search for oil leads the industry into more difficult, inaccessible and expensive territory.

Nature has not been considerate in the location of oilfields, and the majority outside North America are found in tropical jungles, desert wastes, Arctic cold, or under the sea. In many cases, when a concession is signed, surface maps do not even exist and the search for oil has to be preceded by aerial surveys for map purposes. Only then is it practical to start a scientific search for oil, involving field geology, gravity surveys, seismic surveys, corehole drilling, and, finally, full bore test wells. Each of these processes is itself a science, its use being to amplify or check the conclusions of the others, for the price of failure is high. Oil is now sought at depths which sometimes exceed three miles. Despite all modern techniques even in the United States around 20,000 dry holes were drilled in 1954 representing some 40 per cent of total new holes drilled in search of production. Failures every year represent a write-off of tens of millions of pounds sterling, abandonment of many hundreds of thousands of acres of concessions and, incidentally, many hundreds of miles of roads whose construction is the usual prerequisite of drilling. There are numerous cases of entire areas being abandoned after long and costly search, instances are many but the following are illustrative.

Ecuador: £9 million was spent on a six-year search for oil which was abandoned in 1950 without result.

Nigeria: £12 million and eighteen years have been spent on a search which is, so far, commercially unproductive.

Columbia: \$21 million were spent between the start of a search in 1916 and the discovery of oil in 1933, and a further \$39 million had to be spent in the next six years before the first oil was marketed in 1939.

Canada: One major company drilled 130 dry holes over a span of 28 years before the first major oilfield was discovered and the record in Australia has been as difficult and expensive.

New Guinea: One search has been held by a partnership of five major oil concerns in virgin territory against the most formidable obstacles. After 20 years' work there is a deficit of £30 million, £40 million having been spent and only £10 million recovered. In another part of New Guinea one venture has already cost £13 million with another £4 million committed, so far without success.

The fact remains that even after the skilful and preliminary geological search nothing more is revealed than the fact that the substratum is such that it is capable of retaining oil, and the proof of oil only lies in putting down the costly and arduously drilled borehole.

This is the chequer-board of failure against which success must be viewed, and it confirms that the winning of oil is still a speculative and highly hazardous

enterprise. This should not be overlooked when assessing what is the fair division of profits to be apportioned between those who provide all the technical skill, equipment, and risk capital and those who own the mineral rights. Furthermore the subsequent security of tenure in production must be such that adequate financial strength is continuously generated for further search; otherwise, the entire industry's structure of world-wide development would collapse, with effects on an energy-hungry world which would be intolerable.

THE MECHANISM OF EXPLORATION

Oil was formed by the decay of animal and vegetable remains which fell to the bottom of the sea and were buried by layers of sand and silt. Movements of the earth's crust compressed and buckled these layers causing the oil to migrate to regions of lower pressure and to accumulate in porous rocks. In some of these rocks oil has been trapped by the presence of a cap of rock through which liquids cannot pass. The form of development of these traps shows considerable variety requiring great skill in evaluation by the oil geologist.

EXPLORATION METHODS

Geological: In exploring for oil in an area it must first be decided if conditions in past geological time would have favoured its formation. Exposed rocks are mapped and a search made for oil that has seeped to the surface. If conditions are favourable, structures in which oil could accumulate are traced. One of the geologist's chief aids here is photographic mapping from the air. Aerial photographs under the stereoscope show a surprising amount of geological evidence even in densely-wooded country.

Geophysical: When the structure of rocks underground cannot be mapped by geological work on the surface or from the air, other methods are used.

Gravimetric Method: Instruments measure with great precision the slight variations in the attraction of gravity at the surface. These variations are influenced by the distribution underground of rocks having different densities. In this way structures in depth may be defined with considerable accuracy.

Seismic Methods: Artificial earthquakes produced by explosives generate shock waves in the earth's crust which are recorded by instruments placed at varying distances from the explosion. One method makes use of the fact that the shock waves travel more rapidly in hard than in soft formations. By measuring the speed of the waves it is possible to judge the type of rocks through which they have travelled and to estimate their depth. The other method, more widely used, depends on the fact that shock waves return a reflection or echo when they strike hard beds like limestone. The time taken by the wave to travel from the surface down to the reflecting layer and back to the surface again can be interpreted to give the depth of the reflecting layer.

Magnetic Method: From local variations in the intensity and direction of the earth's magnetic field the distribution of rocks having different magnetic properties can be judged. A very rapid method of mapping a large area is to make a magnetic survey with instruments mounted in an aeroplane. The tracing of formations of the same age is of great importance. The principal methods of doing this are: corehole drilling, by which structures underground are correlated in depth and thickness from hole to hole; the study of the type and character of the rocks and of the fossils found in them.

April 27, 1956.

DEVELOPMENTS FOLLOWING EXPLORATION

Oil geologists and geophysicists explore great tracts of land in their search for likely structures. Their surveys usually enable them to choose smaller areas that are worth exploring in detail. But even when these have been mapped and fully investigated it is only by drilling that the presence of oil can be proved.

DRILLING

Three thousand years ago the Chinese used a laborious method of drilling for salt. The drillers jumped on and off a spring-board, rather like a diving-board. This raised the drilling tool, and then let it pound into the earth: it was like driving a nail into a piece of wood. This principle was also used in the early days of drilling for oil.

The "Cable-tool" or "percussion" drilling system as this method is called involves a "walking beam" usually operated by a steam engine lifting and dropping the drill tool to make a hole. This method was employed in the first oil well which was successfully completed in 1859, oil being discovered at a depth of 69 feet. "Cable-tool" drilling is very slow and best suited to shallow drilling in hard formations, although a few wells have been drilled by this method to a depth of about 10,000 feet. Oil wells are still sunk by the cable-tool method, but the vast majority of modern wells are drilled by the "rotary system" as it was found better to bore a hole into the ground by using a rotary drill rather like a brace and bit. These drills can go deeper and faster, and with modern equipment oil is now produced from a depth of over 15,000 feet; unproductive wells have been drilled to even greater depths, in one case exceeding 20,000 feet.

There is still excitement to be found in the drilling and sinking of the first well in a new territory. After months of prospecting, geologists decide which is a possible oil-bearing locality, and their findings must be put to the test. An experimental well for this purpose is known as a "wildcat". Everything needed for the job has to be transported to the site, which may be hundreds of miles away, along specially built roads. In spite of all the geologist's accumulated skill, the chances are 10 to 1 against success.

DRILLING EQUIPMENT

The first step in rotary drilling is to excavate a cellar 6 to 25 feet deep and about 10 to 15 feet square to house the well-head fittings, etc., below the derrick floor, alternatively a steel structure giving a clear space of similar dimensions may be erected. A considerable amount of drilling equipment is required: the principal items are the derrick, the draw-works (or hoist) by which the drillpipe and casing are raised and lowered, the turn-table which rotates the drillpipe, slush pumps, a power unit and the drilling string. For a large unit the total weight of equipment may be as much as 350 tons, excluding the casing with which the well is lined and which may weigh another 300 tons. The steel derrick is usually about 136 feet high with a base 26 feet or 30 feet square, and is capable of handling a load of about 300 tons. For exceptionally deep holes derricks up to 200 feet high may be used, while on the other hand some wells are drilled by small portable derricks. At the top of the derrick is mounted the "crown" block from which, by means of pulleys and travelling block, the "swivel"—a rotating joint to which the drilling string is attached—is suspended on wire ropes.

The drilling string may be divided into four sections: "kelly", drillpipe, drill collars, and "bit". The "kelly" is of square or hexagonal cross-section and fits into a suitably shaped hole in the rotary table which, driven by a power unit, rotates the drillpipe and so

causes the bit to cut or chip through the rock like a carpenter's brace and bit. The power used may be steam, electricity, or an internal combustion engine. The drillpipe is screwed on to the lower end of the kelly and as the hole increases in depth, the kelly and the drilling string are lowered through the turn-table until only a short length of the kelly remains above it. Then it becomes necessary to add a fresh section of drillpipe, normally 30 feet long. This is done by raising the whole drilling string until the kelly is clear of the turn-table: the topmost length of drillpipe is then held firmly in position in the turn-table, the kelly is removed and a new section of drillpipe is added. The drilling string is then lowered, the kelly re-connected and drilling is resumed. The drill collars are hollow steel bars of large diameter added at the end of the drillpipe to give weight and rigidity above the drilling bit. (At a depth of 5,000 feet the entire drilling string may weigh 50 tons and at greater depths still more. Only a small proportion of this weight, however, is allowed to bear on the bit, the balance being carried by the travelling block which is controlled by a brake on the draw-works). Weight on the bit may be varied from a few hundred pounds to several tons per inch of diameter. Drilling bits frequently wear out; the average bit will last about 200 feet, but under exceptional conditions it may have to be renewed after drilling as little as two feet. To change a bit it is necessary to withdraw the entire drilling string; the drillpipe is then unscrewed in 90-foot "stands" (consisting of three sections of pipe) which are stacked upright within the derrick until the new bit is added. The drillpipe is run back into the hole and drilling is resumed.

Mud Circulation: Special mud is circulated by pumps which force it up a flexible pipe to a swivel joint at the top of the kelly. The mud is forced down inside the drilling string to the bottom of the well where it lubricates and cools the bit, and then returns to the surface between the drillpipe and the sides of the hole. At the well-head it is passed over a vibrating screen which separates, for examination by the geologist, the fragments of the formation through which the bit is cutting. The mud is then directed to a settling trough and subsequently used again.

Drilling Operations: The rate of drilling varies with the type of formation encountered and the type of bit used. Under ideal conditions drilling may average about 200 feet an hour while in exceptionally hard formations it may be reduced to less than 1 foot an hour. Various types of drills have been evolved to deal with the different types of rock formations which may be found. The speed of rotation of the bit varies from 30 revolutions a minute in hard rock to 500 revolutions a minute in soft rock; but when diamond bits are used, the speed may be even higher. The rate of drilling also depends on the diameter of the well—in a deep well a 23-inch bit is normally used for the first few hundred feet. The drilling string is then removed and a casing inserted. This casing is of somewhat smaller diameter than the hole, and is cemented in place, after which the new drill is passed through it.

An example of the way in which the diameter of the hole decreases with greater depth can be taken from the log of a Californian well recently drilled. It was started with a diameter of 17 inches and was completed at a depth of 18,754 feet with a 3½-inch bit. A typical casing programme of a fairly deep well would be: 16-inch diameter casing to about 500 feet, 11-inch casing to 4,000 feet, 8-inch casing to 7,000 feet and 6-inch casing to completion.

OILFIELD DEVELOPMENT

Following the discovery of oil in commercial quantities by an exploratory well, it is necessary to determine:

(a) the extent of the oil; (b) the limits of the gas cap which is formed by the free gas often found in oil-bearing formations; (c) the position of water which is invariably present with oil; and (d) the thickness, porosity and permeability of the rocks in which the oil is.

As these factors become clearer a proven area can be outlined. Further drilling can then be made within the proven area according to a well-spacing plan.

Wells are normally drilled perpendicularly, but when the oil lies under swamps or perhaps out to sea it may be better to drill directionally. In marine drilling, as in the Gulf of Mexico, a number of directional wells are usually drilled from one platform. If a well has missed the oil, present nearby, the bottom of the well is filled with cement and drilling is continued at an angle. A directionally drilled well can also relieve pressure at the base of another well that has blown out. If this fails, mud can be pumped down the directional well into the oil-bearing layer; the mud is moved by the escaping pressure into the blow-out well which it seals.

The development of an oilfield depends on correlating and identifying strata from well to well. This is done by the following four methods, on the results of which a sub-surface map is compiled.

Lithology: The identification of rocks or minerals obtained from core samples. Porous sandstone or some limestones are favourable for oil or gas accumulation.

Palaeontology: The determination of the age of fossils of plants and animals and, consequently, of the strata from which they came.

Electrical Logging: Different types of rock give different reactions to electrical impulses, which are transmitted from an instrument lowered down a well

and are recorded on the surface. Records of these reactions indicate, for instance, whether the penetrated strata are porous and, therefore, could contain oil or gas.

Radio-active Logging: The measurement of the radio-active properties of strata may indicate their nature and content, although the results are generally less definite than those obtained by electrical logging. In the normal course of field development any or all of these methods may be applied.

PRODUCTION

As long as the pressure at the bottom of a well is sufficient to force oil to the surface the well flows naturally. The pressure on the oil is due to gas and water, one or other of which usually predominates. Normally, newly drilled wells will flow for a time, but the quantity of oil produced will steadily decline as the pressure underground is reduced. Eventually there is not sufficient energy left to raise the oil to the surface, and artificial means are resorted to.

There are two methods: gas-lift and mechanical pumping. In the first method, high-pressure gas is injected into the well, usually between the casing and the tubing. The gas mixes with the oil and brings it to the surface. The second method, mechanical pumping, is the most extensively applied. This is simply a suction pump with a hollow moving piston. The pumping unit is a common sight on most oilfields, nodding up and down.

Finally, in the life of an oilwell, there will come a time when there is not sufficient energy left to move the oil to the bottom of the well, in which case it may be possible, by pumping gas or water down a neighbouring well, to move the oil in the required direction.

Demand and Supply—the Background

THE WORLD'S ENERGY PROBLEM

WORLD demand for energy is increasing at a compound rate and there are many reasons for planning for a situation in which this trend will continue. The consumption of energy is deeply rooted in technology and as an economic factor technology expands at an accelerating or sustained pace. Economic man would therefore be wise to plan for an accelerating demand for energy; furthermore its development and use is not in its later stages but still in its infancy. The application of energy and its measurement in quanta per head of population is a clear indication of the standard of living attained by a people. The reason, in essence, is that man by himself is incapable of doing much more than keep himself alive.

The demand which springs from an increased use of energy per head is superimposed on an increasing world population which itself is rising at a compound rate. From a world population of about 1,500 million in 1900, the population has grown to more than 2,600 million today and it is probable that at least another 1,000 million will have been added by 1980, but the rate at which energy demand is increasing, and is likely to continue, is at least three times the rate of population increase. This means that total energy demand will have increased to at least double, equivalent to about 6,000 million tons in terms of coal, by 1980. The main sources of commercial energy, capable of planned, organised development, are Coal, Oil and Natural Gas, Hydro-electricity and Nuclear. It is convenient to rate each form of energy in terms of a ton of coal, known as the Coal Equivalent, by certain standard conversions now in international usage. The course of events since

1920 in the development of commercial energy is shown in the chart on p. v, with 1920 as 100. Coal, though steadily increasing has been following behind the rapid expansion of Oil, and the rate of total demand is likely to lie higher than the recent 3 per cent curve. Oil, however, is taking such a rapidly increasing share of the burden that it alone will probably treble by 1980, and at least 2,000 million oil tons annually will be required to be produced.

COAL

Coal is not maintaining the rate of growth which man requires. The reason does not lie in shortage of reserves which at current extraction rates are sufficient world-wide for many hundreds of years. The coal that is useful to man is that which is economically recoverable and many of the easily accessible and thick seams have already been mined out. As shafts deepen and working faces recede from the shafts, temperatures rise and thinner seams have to be worked, production becomes increasingly difficult. Problems of supply of air to the working faces, control of water and the physical handling of coal to the surface become more costly to solve. Coal production is not susceptible to rapid rates of increase of output; it is a labour intensive industry and one that is dangerous and physically unattractive, and involving men rather than machines; its ability to expand rapidly is restrained by conflicting factors.

ELECTRICITY

Hydro-electricity as a basic source of energy suffers from the disadvantages of the enormous capital cost of the civil engineering works necessary, and the fact

that the hydro projects are often far from the most urgent and promising areas of electricity consumption. Once constructed it has, of course, the advantage of operating on an income source of energy, the perennial water supply, rather than capital energy from continuously exhausting mineral fuels. But electricity, whether generated thermally or by hydro power, has the limitations of being incapable of effective storage and requires a permanent, expensive and specialised system of connection between the user and the generator. This inevitably limits its flexibility in use.

OIL

Complementary to the other two main sources of energy is Oil, which possesses two enormous advantages: Firstly, that it is a liquid, and secondly, that it has a calorific value from 1½ times to double that of coal. A liquid is capable of being handled accurately and quickly, from the thousands of tons a day pumped through vast pipeline systems to the minute accurately metered quantities pumped at high pressure through the injectors of a diesel engine. Oil is packaged and transportable power in its most convenient and flexible form and lends itself most suitably to refining, chemical conversion and quality control through the complex system of technical preparation. It is this flexibility and the ability of the organisations that handle oil to move rapidly to meet demand that are the reasons for the steadily increasing share of oil in the energy pattern.

RIISING OIL DEMAND IN INDIA

In India internal demand from 1948 to 1955 rose almost exactly 100 per cent. This rate of expansion is typical of rates in other developing countries. It is customary to exclude the Soviet sphere in detailed studies as documentation has not been available, and including USA, the world consumption rose about 70 per cent in the same period. The volume of consumption in the USA amounted to above 65 per cent of the total and therefore has rather a heavy weighting effect.

For comparison, from 1948 to 1955, despatches of coal in India rose some 44 per cent. The picture in India of energy consumption is unusual, and as the Prime Minister has pointed out on a number of public

occasions, the country is still powered in the main by cowdung. It has been suggested that the total energy consumption in terms of coal equivalent is as shown in the diagram below:

Several interesting points emerge from a study of this problem, one is that the 'non-commercial' energy goes mainly to domestic use, the population is outstripping natural supply and the shortage is being accelerated by the drive to return cowdung to the land through National Extension Service education, a most essential and desirable step if the soil is to be revitalised. To fill the gap is a country-wide problem which neither electricity nor coal can solve for obvious reasons of geography, suitability and transport.

The most flexible source of power is oil, and it is perhaps a tribute to the foresight of the oil companies that so much capital has been sunk in building up the vast distribution network that services the country, and is capable of handling great increases in demand. Another important point is the severely limited contribution that can come from human muscles.

Compared with India's consumption of commercial energy, 0.1 tons of coal equivalent per head per annum, the USA consumes 100 times that amount, the UK 60, Russia 30, and the world average 12 times.

THE SUPPLY PROBLEM

The development of the availability and the technology of using energy is fundamental to India's progress. The trigger effect on the economy of applied power is out of all proportion to the original cost of that power, an effect that is frequently overlooked. It is important to ensure that all forms of energy are harnessed and developed in harmony—and this is an important point—without imposing unnecessary brakes on development by requiring the use of an unsuitable source for a particular purpose for reasons of sectional interest.

All the natural resources of raw material and food potential may lie before you in abundance but they cannot be touched without the organised application of a suitable source of energy. It is to be hoped that the efforts of all the parties involved in a search for oil resources in India will eventually discover and develop production of ample quantities. Until then, doubts have been expressed about the advisability of using petroleum, in view of the strategic dangers that might lie in dependence on supplies that are not wholly indigenous.

It is important to get this problem into perspective. India is so placed geographically and politically that there is no foreseeable set of circumstances which could deny India the sea-borne supplies she requires for many years ahead. The sources of alternative supply and transport are too numerous and internationally spread, and the world proven oil reserves are still gaining ground on production.

In the context of the availability of foreign exchange for import of petroleum, the problem must be critically examined in the resultant effects on the economy of the expansion of the production of goods

and services, and the expansion of ability to earn further foreign exchange. Rising productivity is the key to improved standards for all, and the application of energy is the key to production and rising productivity, especially in India where traditional methods have reached the limits of their productive capacity.

WORLD OIL RESERVES

In view of the steady expansion in the demand for energy also the relatively greater share in this total which oil is providing, it is necessary to ask the question whether or not the oil reserves of the world will stand up to this enormous drain. A clear distinction must be made between what are called proven reserves on the one hand and the total estimates of ultimate recoverable reserves on the other. Proven reserves are a calculation of the known quantities in fields already discovered which under existing conditions can be produced by present-day methods of extraction. This calculation produces a current figure of about 170,000 million barrels (25,000 million tons). Set against foreseeable rates of annual consumption, these proven reserves will be exhausted about 1975.

The total estimates of recoverable reserves show a different picture. They cover as well undetermined amounts of oil which are known to exist outside the so-called proven areas, and also large amounts still awaiting discovery in the extensive potential oil-bearing areas of the world. What is most significant is that every time this estimate has been made it is higher than before. An estimate produced in 1945 assessed total oil reserves world-wide at 485,000 million barrels (70,000 million tons). In 1954, the world's ultimate recoverable reserves were placed at 600,000 million barrels (85,000 million tons)—and both these estimates excluded the Continental Shelves. Recent data suggests that if the position were looked at again, the estimate, including the Continental Shelves, would, on present knowledge, come out well in excess of 1,000,000 million barrels (140,000 million tons).

April 27, 1956.

These steadily increasing estimates parallel the actual production experience of the industry, for, year by year, the rate of discovery has been and continues to be considerably higher than the rate of withdrawal. This is strikingly demonstrated in the chart on the previous page which indicates production, reserves and accumulative production to date.

This shows how the average annual increases in proven reserves have exceeded the average annual pro-

duction. That cannot go on for ever but, with our other evidence, it establishes that we can safely expect the ultimate recoverable quantities of oil in the ground to prove large enough to meet the increasing needs of the world economy as it moves into the age of atomic power. That is as far as prediction can go for there is still much not yet revealed to us, as for instance the possible large-scale production of liquid fuels from other sources, and the expansion of the uses of atomic energy to a widening range of application.

Marketing and Distribution

Distribution Agencies

THIS part of the oil industry differs from the others in several ways. Although fairly large capital investment is necessary to set up a distribution and marketing company, this is relatively small compared with the capital investment required for exploration, production, refining and ocean transportation. The risks involved are normal commercial ones and, unlike exploration risks, are reasonably easy to assess in advance. It is for these reasons that we find many hundreds of companies engaged in the distribution and marketing section of the oil industry, or many thousands if we include the USA.

As background to the marketing situation, it is important to appreciate that, although the outlook for oil demand is extremely buoyant, supplies are currently well ahead of demand. They are likely to remain so, so long as the various companies engaged in exploration, production and refining are left free to follow their present policies. The fact that oil supply is ahead of demand means that all marketers are keen sellers—of demand particularly those big companies with potential surplus of products. This naturally leads to keen competition in the markets on prices, quality and service. It also leads to very good coverage of the markets. The big companies, in order to achieve the big sales which they want, penetrate to every corner of the world. Even consumers in very remote parts of the world should be able to find at least two or three companies keen to compete for their business. It is said that in some parts of the world oil is actually more readily available than water.

Any marketer, large or small, must have a distribution system consisting of ocean terminals, up-country depots and service stations. Further in order that the marketer may be competitive on prices and service, it is essential that the distribution system should be very efficiently organised. However, no matter how efficient the distribution system is, and no matter how good the marketers' products are, it must be appreciated that oil cannot be successfully sold from an office chair. Thousands of sales representatives are continually engaged in covering the markets on behalf of the various companies—and they travel millions of miles every year, using every conceivable form of transportation, ancient and modern. Although "salesman Sam's" efforts have not been generally publicised, they are just as essential, and just as picturesque, as those of his exploration colleague at the other end of the line.

THE PATTERN IN INDIA

In view of the size of the country the marketing and distribution methods necessarily follow different patterns to that of smaller, more highly industrialised countries of the West. When setting up the distribution system in India, it has been necessary to recognise that the major quantity will be carried by the railways, that the possibilities of large-scale assistance through tank-road transport are limited, that consignments by tank-wagon, or boxwagon, may take as long as a fortnight

to reach the farthest points, and that oil products may have to be transhipped from one railway gauge to another. Furthermore, there are wide fluctuations in demand between seasons, and in some cases, whole areas are sealed off by the monsoon and suitable stocking arrangements have to be made before the onset.

All this means that extensive stocking points must be established all over the country—at railheads, big towns, railway junctions, transshipment points, and coastal ports. These depots contain bulk tankage for the complete range of products required and adequate cover to tide over periods of seasonally difficult supply. The organisation of supply is therefore no small task and the physical network to cover the country is costly, indeed, by normal marketing standards. But the groundwork has now been covered by the detailed work of many years, the facilities required are in and steadily expanding, the co-operative effort with the railways is working smoothly and the system is ready for any expansion that may be required.

The actual rate at which demand has been increasing and a broad split between products is shown in the chart below.

After the oil has been despatched from main port coastal installations, or refining centres, to the depots the oil companies have to make arrangements for supplies to reach consumers over the more than half million villages of India. In view of its dangerous nature, the oil companies supervise the distribution of petrol, generally in their own bulk road vehicles, to the petrol station tankage.

Otherwise in general the oil moves on through a wide and pervasive network of thousands of agents

and dealers. Most of them have equipment owned by the companies entrusted to their care, whether it be tankage, godowns and filling machines for kerosine and diesel oil, or petrol stations with full facilities. These agents and dealers are not employees of the companies, but business men working in association. Their local influence is great, and they often combine other busi-

ness of their own with the distribution and sale of oil products. As a result the agents and dealers have seen their business grow up with that of the oil companies over the years, and in many cases have had cordial and friendly dealings with the companies' staff over several generations.

The World Tanker Position

WORLD Crude Oil production in 1955 was 792 million tons and a heavy proportion of this tonnage moved in international trade, as well as subsequent movement of a proportion of refined products. To match this demand the tanker fleets of the world, moving both crude and products, have now reached a figure of about 41,000,000 tons deadweight. The t.d.w. figure is calculated relative to a tanker of a certain size and speed (the T. 2 equivalent) to provide a uniform basis for comparison of effective transportation potentials in terms of both physical volume and speed. Recent writings have shown that remarkable misconceptions exist on the organisation and function of this vast fleet, and in view of the heavy financial outlays necessary it is essential to maintain an objective view of the problems involved.

OWNERSHIP AND COMPETITION

The ownership of this fleet has a very broad base involving scores of companies and individuals in many countries and indulging in intense competition. Of the total only some 34 per cent is actually owned by oil companies, both large and small. One typical major oil company finds it necessary to operate about 7 million tons of tanker tonnage to meet its international commitments but of this tonnage owns only 2.5 million tons, the balance being obtained on the free world tanker market on long-term charter, short-term charter, or spot voyage market rates. One private tanker owner from the Middle East area who owns a fleet of tankers registered all over the world and now approaching a tonnage of 1.7 million tons operates his tonnage roughly 40 per cent on long-term charter, 25 per cent on short-term charter and 35 per cent on the spot market.

The competitive nature of the oil business provides the incentive to continuous reduction of costs, by greater efficiency of operation at all stages, to maintain the prices of oil products as low and stable as possible. In view of the wide spread of ownership and the free trading conditions which are a feature of the tanker business, it is not surprising that tanker operators' margins are squeezed in the grip of this competition. There is no mystery in the tanker freight markets of the world, where the charters and offerings are handled by ship-broking companies of many nationalities whose names are known and respected in international commerce. Nor is there any mystery in the stabilising effect on the price structure of oil products inherent in the low rates of long-term charters compared with the wider fluctuations of the spot market rates.

SUPPLY AND DEMAND

It is a matter of historical fact that no oil shortage of any note has occurred in the world in any country, attributable to a shortage of sea-borne capacity to carry oil. The competitive nature of the tanker business and its complete freedom from monopoly has provided the supply of physical tonnage required, and the stable freight rates over long periods of time bear witness to the fact that increased efficiency of operation is avoiding the necessity of passing on to the final oil consumer the rising floor of replacement costs, wages and salaries and consumable stores involved in tanker operations. The c.i.f. values of oil products to India are in no way disadvantageous compared with the relative position of other countries, a fact which is well known to the Go-

vernment of India and naturally is under continuous review in the normal course of business by all parties concerned.

NEW DEVELOPMENTS AND COSTS

It is axiomatic to those concerned with the movement of goods that costs bear an inverse ratio to the volume handled at any one operation. This is most certainly true in the tanker business and explains the trend towards the so-called 'supertanker' of 30,000 tons d.w. or over.

These large ships are costly, have a high speed, and by virtue of their size are limited in their use by the depth of water and other physical conditions at possible discharge points. But they have a lower basic cost of transporting oil and therefore provide the "base load service" in this competitive business and are responsible in no small measure for the success being achieved in the fight to hold down oil costs against other rising costs of operation.

The world's supertanker fleet has grown from eight vessels in 1950 to 103 ships in 1955, a total of 23 tankers over 30,000 tons has since been launched, but not yet completed, while another 227 vessels are on order and under construction. The average size of the super-tankers on order is 35,550 tons compared with an average of 32,560 tons for the supertanker fleet at the end of 1955. Tankers of more than 45,000 tons are now being operated and orders have been placed in Japan for two vessels of 84,000 tons each.

The picture is one of a restless struggle for technical efficiency, with tankers rendered obsolete with determination as soon as their age and design threaten to impede their competitive power, a process which is illustrated in the diagram below, which also shows how increasingly large tonnages of oil per ton of tanker are being carried due to increased speeds and reduced turn round times.

The cost of additions and replacements to the tanker fleets is running, and will continue, at an equivalent of not less than £200 million sterling per annum.

"FLAGS OF CONVENIENCE"

Those who operate ships are well aware of the difficulty of accumulating the finance for prompt and effective replacement of their obsolete tonnage, and of making financial provision for additions to their fleets. This is particularly true in the competitive world of the tanker owners, and has driven them to seek special means of reducing costs. One solution has been for some owners to register their ships in certain countries where little or no taxes are payable and they are free from legislative restriction. These are the so-called "Flags of Convenience" notable among whom are Panama and Liberia. They now lie fourth and fifth in the shipping tonnages of the world with around four million tons each.

Registration of ships in these countries is a mere formality, the payment of a nominal fee, together with an accommodation address for a registered office in Panama or Monrovia, for example, is all that is required. Of obligations there are none, since these countries do not have any body of shipping legislation and are signatories to very few, if any, of the international maritime conventions. This does not mean that safety regulations, for example, can be evaded under these flags, for no underwriter would insure a hull which did not comply with standard specifications,

such as those of the Lloyd's register. The advantages of such registration are mainly fiscal and partly operational.

In normal competitive conditions on an international shipping market, the cost of running a ship is roughly the same for all flags. The only difference, which is now of major importance, is the level and method of taxation between ships of one nationality and another. The owners of a ship registered in the United Kingdom, the USA, Norway, or Greece, are now taxed to the hilt and hedged with restrictions and the problem of flags of convenience is now of major importance to operators based on those countries.

India, if she wished, could adopt the same policy as Liberia and achieve the same startling increases which for Liberia meant a doubling in 1954 alone from 1.6 million tons to 3.2 million tons. But it would not carry with it any significant revenue whatever, or ownership, or operational responsibility by Indian nationals. The suggestion is not made seriously, but to remove certain prevalent misconceptions, and is obviously impractical in a country with a maritime history and active shipping lines which contribute to the country. The carriage of oil internationally is operated on a wide base with the spread so wide and over so many sources that the risk of interruption of supplies to any point at any time is extremely low. The capital costs involved and the returns are such that it is prudent to examine with care whether diversion of resources from more productive effort is truly worth while.

Refining and Supplies to India

FUNCTION OF REFINERY

CRUDE Oil, as it emerges from the ground, is a complex mixture of hydrocarbons, solids, liquids and gases with many different properties. The function of the refinery is to split up the crude oil into products with commercial value such as motor spirit, kerosene, lubricating oils, diesel oils, furnace oil, bitumen, etc. The first main stage in the processing of all crudes is their division by distillation into groups of similar hydrocarbons called "Fractions" which consist of products whose boiling points all lie within a narrow range. The crude oil is heated and passed through tall, vertical, cylindrical metal towers known as fractionating columns. Equipment of this nature is now a familiar sight to those who have visited the refineries in India of Burmah-Shell and Standard-Vacuum in Bombay and the Assam Oil Company at Digboi.

But the natural yield by volume of products by a simple distillation process like this is unlikely to match the demand from the market and means were discovered of altering the oil fractions to change the yield and composition, and in addition to changes in the yield these processes are capable of making notable improvements in the quality and performance of the products. These processes use heat and pressure (thermal cracking), or chemical catalysts (catalytic cracking), or combinations and variations such as Reforming, Polymerisation, Isomerisation and Alkylation.

THE INDIAN REFINERIES

To the Assam Oil Company must go the distinction of setting up the first refinery in India. This Company has associations with India extending back well over half a century and their refinery at Digboi first went into production 36 years ago. It was erected to process the oil from the Assam fields which are today providing about 8 per cent of India's total requirements.

In the past it has been the practice to locate large refineries adjacent to the main producing areas. One

good reason for doing so was that it avoided the cost of shipping the volume which is unavoidably lost and burnt in the refining process. Since the war, this practice has changed and more and more refineries are being erected in the areas of consumption.

A survey of possibilities and suitable locations for refineries was undertaken by the major oil companies in India in 1948, and subsequently agreements were made between the Government of India and the Anglo-Saxon Petroleum Co., Ltd. and the Burmah Oil Co., representing the Burmah-Shell interests in India, the Standard-Vacuum Oil Company, and Caltex (India) Limited for construction of the refineries.

The Burmah-Shell Refinery at Trombay is the largest in India with a capacity of about 2 million tons, followed by the Stanvac Refinery at Trombay with about 1 million tons capacity, and Caltex at Visakhapatnam which will have a capacity of about 700,000 tons per annum. The Burmah-Shell Refinery and the Stanvac Refinery went on stream in early 1955 and mid-1954 respectively, the agreements having been reached towards the end of 1951 and construction getting into full stride in 1953. The Caltex Refinery is expected to start operating in early 1957 and the total investment between the three will be at least Rs. 60 crores. These refineries are of the most modern type and include plant for the most advanced techniques of catalytic and other processing methods.

The advantage to India of these refineries is very great and they are making extensive contributions to saving foreign exchange. They are playing their full part in providing employment, and these gleaming silver industrial cities are associated with comfortable workers' housing colonies. They are providing the knowledge to India of a new technology and offer the possibilities of associated industries involving chemical and fertiliser manufacture from the products of the plants.

more or less simultaneously, thus suggesting some form of concerted action. In reality, however, this reflects a set of conditions in which, as in many other industries, price leadership by one large concern impels others to follow in order to maintain their competitive position. Financially weakened companies cannot hold their place in an industry against financially strong ones. Identity of price is at least as likely to indicate competition as any lack of it.

Four main reasons may be cited why in some markets the retail prices of motor spirit tend to be identical. First, they are all related to world market prices, changes in which are simultaneously known to all suppliers. Second, the unit of sale of gasoline is small (gallon or litre) and the profit margin per unit exceedingly small, affording very little scope for worthwhile price-cutting without incurring a loss. Third, there is a high degree of consumer loyalty to the various brands which minor differences in prices would not seriously disturb. Fourth, competition between all major suppliers is so intense, and so highly matched in all other respects, that they are all influenced similarly by changes in the various costs which are reflected in their selling prices. Consequently, price changes, upwards or downwards, by one concern are usually quickly followed by others who realise that if they do not follow their possible gains will be more than offset by losses in other respects and they will therefore lose competitive strength. Thus similar prices are not the result of collusion—in which, in any case, US oil companies at home or abroad could not indulge as this would offend US anti-trust laws—but the consequence of the determination of each major supplier to match his competitor, and the belief, based on experience, that all major competitors will in fact do so.

Price is the factor which is most in public view. And though prices for similar products may not vary very much, if at all, it is well to remember that as a consequence of sharp competition in the oil industry, oil prices have in general risen very considerably less than those of other commodities, while the quality of products has invariably improved. Oilmen vie with each other in many widely different spheres. The cut-throat competition in the US oil industry is proverbial and brought it near to disaster in the '30s. Allocation by State authorities has mitigated this extreme competition, but in all phases of the US oil industry competition remains sharp and even bitter. It is the main-spring of the highly exciting activity which characterises the industry there.

But whether in the USA, or elsewhere, all oil concerns strive against each other in every type of operation. Each concern seeks the most promising lands for exploration, and will bid heavily against others for proven, semi-proven, or even unproven areas. Each seeks also to have the most advantageous sources of crude oil and the most advantageous location of refineries in relation to its established markets, or in relation to markets it intends to enter. Favourable costs in this phase of operations give competitive strength. The quest for lower costs is manifested, too, in continuous investment in new and still more efficient facilities of all kinds. For example, investment in modern tankers keeps down costs, and no major company can afford to sustain higher costs through the avoidable running of obsolete ships. Investment in new retail selling points eventually brings lower unit costs, as well as improving service to the customer and, in an expanding economy, offering the promise of higher sales. The extensive and costly research that lies at the back of all oil industry activities is also highly competitive both in origin and in practice. Through research, each concern seeks to make ever better use of its raw material, to improve its processes and so reduce

operating costs and, above all, to improve its products and to be first in the field with suitable products for new needs. Dominating all functions, there is a continuous battle of managerial wits and skill to maintain and improve each concern's competitive ability.

PRICE LEVELS

The basic price levels of oil products have remained remarkably steady and compare favourably with the indices of price movements of the other world's basic commodities as shown in the charts below of the price movements of certain basic world commodities with 1937 as 100. To the general public these facts are clouded by the distortions produced by oil acting widely as a medium for heavy government taxation. It is a fact that no other basic commodity in the world—steel, food, cloth, building materials, coal, etc.—carry anything approaching the taxation imposed on the people through the medium of oil.

Many consider that this policy is fundamentally wrong and that the growth of world prosperity has been materially retarded by imposing this fiscal brake on the growth of the use of the most flexible source of world energy. As an illustration of this we quote below the facts revealed in the balance sheet of one big international group for 1954:

April 27, 1956.

OIL INDUSTRY SUPPLEMENT

xiii

Group total net income	£ 134 million
Total taxes paid on income	£ 102 "
Additional sales taxes, excise duties,	
other levies paid	£ 406 "

Of the net income only £27 million representing less than 1.5 per cent of total turnover was distributed as dividends and the remainder of the net income was ploughed back to meet expanding demand. The fiscal

taxes, other than income-tax, amounted to about 22½ per cent of total turnover.

The member of the same group of companies operating in India found that the equivalent taxes in this country were running at 25 per cent of turnover. The magnitude of the figures for duties and taxes shows the burden which the industry carries as a major tax gatherer for governments, and as it amounts in effect to an interest free loan for what is often a considerable time, the strain on fluid resources and operating capital is very considerable.

Notes on Oil Products

1-PETROLEUM CHEMICALS

PETROLEUM chemical manufacture is a relatively new but rapidly developing branch of the established oil and chemical industries. During the last fifteen years world production of petroleum chemicals has grown from less than half a million tons per annum to over ten million tons per annum, and the scope for future development is still enormous.

The principal raw materials for petroleum chemical manufacture are refinery by-products—mainly refinery gases—and natural gas, materials some of which at one time were actually flared off as waste. A wide variety of valuable chemicals is now built up, step by step, from these economically attractive basic materials.

Roughly two-thirds by weight, and about 90 per cent by value of all finished petroleum chemicals fall into the organic category—that is to say, they are compounds built up on "frameworks" of carbon atoms. Hundreds of different organic chemicals are now produced from petroleum raw materials. Many of these compounds were manufactured from other sources—vegetable, animal or coal—long before petroleum entered into their production, and today organic chemicals based on petroleum compete with their counterparts made from these older-established raw materials. A typical example of such competition is to be found in the market for ethyl alcohol, an important organic chemical formerly produced solely from vegetable materials such as molasses and grain and now manufactured on a large scale from petroleum also.

Although inorganic petroleum chemicals are produced in large quantities, they have much lower unit values than the organics, and are thus of considerably less importance. The scope for petroleum is restricted in this field, its only really outstanding contributions in this field, its only really outstanding contributions in the being carbon black (used in great quantities in the rubber tyre industry), nitrogenous fertilizers, sulphur and sulphuric acid.

The early development of the petroleum chemical industry took place in the U.S.A. The enormous increase in demand for motor spirit in that country during the twenties and thirties led to the development of thermal and catalytic cracking processes in the refineries. Large quantities of olefinic gases—potential raw materials for chemical manufacture—became available as by-products of these cracking operations, and intensive research soon led to the establishment of processes using such materials, notably in the manufacture of solvents. A parallel development was the establishment of nitrogenous fertilizer manufacture using the cheap and abundant natural gas available in many U.S. oil fields.

The second world war gave the petroleum chemical industry a new impetus and enlarged its scope, but progress was still confined almost entirely to the U.S.A. The demand for chemicals of all types increased greatly, while traditional sources of imported raw materials

were cut off or reduced. As one example, U.S. consumption of natural rubber was down to one-fifth of its pre-war level by 1945, while requirements increased rapidly. However, the petroleum chemical industry provided essential raw materials for the enormous production of synthetic rubber which made good what might well have been a disastrous deficiency.

Since the war, the petroleum chemical industry has gone from strength to strength in the U.S.A., where about three-quarters of all organic chemicals are now based on petroleum. Outside the U.S.A., the manufacture of chemicals from petroleum has been essentially a post-war development, although the first venture in this field, a synthetic detergent plant in the U.K., came into production as long ago as 1942. During the first five years after the war, petroleum chemical production in West Europe was relatively small, reaching about 100,000 t.p.a. in 1950. Since that time tremendous strides have been made, and today W. European output is of the order of one million tons per annum.

Petroleum chemicals reach the consumer in countless forms. Reference has already been made to chemical solvents, which are used primarily in the manufacture of paints and lacquers, as well as to synthetic detergents, synthetic rubber and fertilizers. Large quantities of petroleum chemicals are also consumed in the manufacture of plastics and synthetic fibres, two particularly fast-growing sections of the organic chemical industry.

For the future, it is clear that the world chemical industry must depend to an ever-increasing extent upon petroleum as a raw material, and that the growth of petroleum chemical manufacture—a remarkably dynamic section of the oil industry—will continue at a high rate for many years to come.

The Industry in India

In India the petroleum chemical industry is rapidly establishing itself as a major supplier of industrial, agricultural and public health chemicals. One of the largest oil marketing organisations in the world, itself the leader in the petroleum chemicals field, is now actively engaged in chemical marketing in India.

While imports of finished petroleum chemicals are necessary in the initial stages, the emphasis in planning has been, and will continue to be, on manufacture within India wherever possible. Even now many of the chemicals previously imported in their finished state are coming in as technical material to be manufactured here into ready-for-use chemicals. The next stage will be the manufacture of petroleum chemicals from raw materials available from the refineries, and new developments along these lines are taking shape already which will undoubtedly have an important part to play in the progress of Indian agriculture and industry.

It is not necessary to look very far ahead to see local production of many of the chemicals mentioned

earlier becoming a normal feature of the Indian petroleum industry.

II—THE MAIN OIL PRODUCTS

In the section on "Refining", reference was made to the complicated range of products that can be produced by the distillation and chemical processing of crude oil. In the following notes we start with the lightest fractions that are taken off the columns of the plant, at the gaseous end, and work downwards to the heavy products.

GAS

The gaseous yield is a complex mixture of chemicals which can be separated and used in part as fuel or converted into a remarkably wide range of chemical products, developments which have already been referred to in the section on "Petroleum Chemicals".

One of the gases, butane, with the chemical composition C_4H_{10} , is particularly suitable for use as a domestic or industrial fuel. It can be liquefied at moderate pressures and stored in steel cylinders. By opening a valve on the top of the cylinder the liquid can expand into a much greater volume of gas, and passing through a regulator to control the pressure, is piped to the using appliance. The liquefied gas is "bottled" in neat two-foot high cylinders holding 31 pounds of gas with the high calorific value of 30,500 B.T.U. per pound. The equipment is so clean and efficient that one-fifth of the population of the United States uses it for cooking and eleven million families in Western Europe. It is being produced and bottled at one of the refineries in Bombay and is already available in some parts of India. The gas can also be bottled in larger steel containers for special applications in industry.

AVIATION FUELS

Aircraft are propelled either by spark ignition piston engines driving propellers, or by gas turbines. The latter may produce their driving force in the form of a pure jet of hot gas, or in combination with a propeller producing part of the drive and a jet of gas the remainder. The aircraft flying on India's internal and external air routes are still largely powered by piston engines; the principle on which these engines operate is similar to the petrol car, but there the similarity ends. The engines in an aeroplane operate in the thin, upper air and in conditions of extreme cold as well as in the heat of ground level, and this requires very tight specifications for certain properties that are essential for safety. In addition the performance of these engines is so high that very special fuels are required. In fact these engines would never have been built if the special fuels had not been developed.

The gas turbine powered aircraft run on a distillate fuel in the middle of the range of products, of the kerosine type, but the requirements of quality and performance are just as rigidly controlled as aviation petrols. It is very obvious from the nature of flight that the overruling consideration on this side of the Oil Industry's activities must be safety, and the service it renders to aviation is one of the more exacting aspects of its work. Fuelling crews are carefully trained to understand the consequences of mistakes and a very rigid system of quality control is imposed throughout the entire distribution system, ship-shore-transport-airfield, to ensure that the products supplied are on-specification at the time of delivery.

This is not so simple as it sounds. There are five different grades of aviation fuel in normal use and three main grades of aeroengine lubricating oil. Each type of aircraft requires its own combination of the two and to deliver the wrong one could be fatal. Moreover, in

the course of storage and transportation there are various opportunities for contamination by water and dirt, all of which must be guarded against every hour of every day of the year.

The consequences of error may be engine failure and disaster, and the responsibility is very great.

The ubiquity of the service is in itself of considerable interest. At over 2,000 airfields throughout the world, fuelling crews with their specially designed equipment are ready for the service of the aircraft. India alone accounts for some 60 or so of the world's airfields in regular use of civil airliners, and operation on the ground must be carried through with the minimum of delay. The airfield equipment problem is a science in itself and under constant development. In several of the airfields of India the tank lorry is being replaced by high pressure, high capacity, underground pipeline hydrant systems that conduct fuel direct to the aircraft on the airfield aprons.

MOTOR SPIRIT

Petrol is one of the most familiar products to the general public and in association with kerosine needs no introduction. The chain of filling stations throughout the country is numerically balanced between the need to provide the public with stations at which they can buy their favourite brands at distances apart which are not too great for convenience, and a spacing which will allow the dealers enough sales to make a reasonable profit. "Service" stations now provide more elaborate facilities for car service and repair and goods for sale which are required in the normal running and maintenance of cars and lorries. Suitable stations are now providing facilities for rest, toilet and refreshment to the traveller.

The actual quality of the motor spirit is steadily rising and manufacturers of motor cars are now fitting engines with compression ratios higher year by year, giving greater economy and efficiencies and fuels suitable for these higher compressions are being provided in step with demand. Intensive research in the laboratories of the oil companies has yielded much information on the nature and difficulties of the process of burning petrol in engines. Having diagnosed the difficulties, further research has revealed chemicals and additives which cure or inhibit these troubles, which when added to the petrol improve performance and economy.

KEROSINE

Kerosine has the largest volume of sales of all petroleum products and is ubiquitous throughout the length and breadth of the towns and villages of India. In other countries it is unusual for kerosine to have such a high proportion of the trade, but in India the size of the country and the difficulties of providing alternative sources of light and heat will maintain this situation for a long time to come. It is apparent that kerosine will be forced to take a greater part in the cooking, or domestic heat supply, in view of declining supplies of traditional domestic fuels relative to the population.

Jet aircraft and turbo-propeller aircraft also burn a fuel of kerosine type, of a carefully controlled quality. The rise in demand for this purpose caused by the rapid technical development of this type of machine has made it necessary for the oil companies to make extensive alterations to the pattern of products turned out by the refineries to meet the changing conditions.

DIESEL OILS

Diesel oils are used in compression ignition engines. The characteristic differences between the petrol and the diesel engine are that the latter has no sparking plug and the mixture is fired in the cylinders by the heat

April 27, 1956.

of compression, and it also has no carburettor, the diesel oil being injected direct into the cylinders under high pressure and in small quantities in the form of a spray, pressure being applied by a pump.

Diesel engines are of two main types, each of which requires a particular kind of diesel oil. First, low speed engines which provide the motive power in many factories, large electric generating sets, workshop and some marine craft. These engines are also widely used for water pumping engines and for the engines of rice and flour mills, oil mills and cotton ginning factories. The oil they use is called Light Diesel Oil in India. Secondly, High Speed engines which are familiar to the public in many of the buses and lorries now running on the roads. These engines are also used in tractors, earth-movers, bulldozers, etc., and in the lighter forms of stationary engines such as air compressors, welding sets, pumps, mills, generator sets and high speed marine engines. The fuel they use is a more highly refined grade called High Speed Diesel Oil.

It can be expected that engines running on diesel fuels will make a notable contribution to the progress and development of India. On the roads they provide the most economical power units for transport, and it can be expected that road services will play a greatly increasing part in supplementing the railways in moving the goods and products of the country. As the road network improves this type of transport will be the only effective means of bringing the villages of India into commercial contact with each other and the rail-heads, and will assist the vital flow of goods and services.

Industrially the diesel engine provides the power that can help the village. The distances of India are so great and the distribution problem such that the spread of electrification will take time. There is a valuable service which can be provided by diesel engines generating the power for a village on the so-called "Nursery Schemes" in which the demand for electricity is built up and satisfied by portable units ready for the grid distribution to move in. The portable unit then moves on to another village and provides power for minor manufacture, water pumping, light, and driving the looms and spinning machines of cottage industry.

FURNACE OIL

Furnace Oil is essentially an industrial fuel, to provide process heat, and to burn under boilers. It is widely used to raise steam for process work, the driving of ships and the generation of electricity. It is, therefore, a complementary fuel to coal, but even where coal is abundant and cheap there is a promising market for furnace oil as it has certain advantages. As a liquid it can be easily stored, handled, and measured, it has a high calorific value nearly double that of most coals, and is economical to use as efficient installations can be designed for this type of fuel, it is flexible in use and the rate of heat output can be altered quickly, eliminating the fuel lost in lighting and banking coal furnaces, and is economical in labour charges. It plays a vital part in India particularly in areas more remote from the coalfields of the East and for particular applications.

LUBRICANTS

Technology now requires, and in its turn has produced, an astonishing range of lubricants for particular purposes and conditions of service, both automotive for vehicles and industrial. Modern machinery now requires lubricants to stand up to conditions which would have been impossible a few years ago, before industrial research discovered a complete range of oil additives which confer ability to resist extreme pressures and undertake many protective functions to the machines. The complete range of oils and greases sold by an oil company would exceed 400, each for particular condi-

tions of service, and include many not directly connected with lubrication such as oils for metal working, heat treatment, jute batching, hydraulic services, electrical and transformer insulation, and medicinal purposes.

BITUMEN

The merits of Bitumen for road building are too well-known to be elaborated here, but a complete range of the various grades for hot application and "cutbacks" for cold application are available. The Burmah-Shell Refinery at Trombay has a large Bitumen plant which goes a long way to making the country self-sufficient.

Road-making is not the end of the uses of Bitumen. It is a most versatile and useful protective coating and perhaps one of its greatest services to man is the lining of irrigation canals to prevent water seepage, an application which will be of increasing service to India, where canals pass through porous soil and efficient sealing is essential to prevent serious loss of water, or undesirable water-logging of the area.

OTHER PRODUCTS

The range of petroleum products is completed by many others which are familiar in domestic or industrial use. Among them are the following: (a) Paraffin Wax for the manufacture of candles, impregnation of matches, providing glossy finishes for textiles and many other uses. (b) Vaporizing Oil for use in small engines and tractors. (c) Solvent Oil for manufacture of tyres and rubber articles, for extraction of vegetable oils and dry-cleaning of clothes. (d) Mineral Turpentine as a thinner of paints and carrier of colour pigments. (e) Solvents of insecticides and larvicides for spreading on water to combat malaria. There are complete ranges of industrial chemicals and solvents and detergents which are wetting agents and displacing soap for many uses. The range of petroleum products in the service of man is truly remarkable and human ingenuity is steadily adding to the list.

THE GROWTH OF WORLD OIL PRODUCTION INCLUDING NATURAL GASOLINE

WORLD OIL PRODUCTION, CONSUMPTION AND RESERVES

World Oil Production (Including Natural Gasoline)
By Countries and Areas

Proved World Reserve at 31st December 1954

(Thousand million metric tons)

Regional Consumption of Petroleum Products in 1953

North America	57.1%
Western Europe	10.9%
USSR—Eastern Europe and China	9.5%
Latin America	6.7%
Asia outside the Middle East	3.2%
Middle East	1.5%
Africa	1.2%
Oceania	1.2%
Air and Ocean Bunkers	8.7%
TOTAL	100.0%

* Before oil dispute, production in Persia reached a peak of 32,300,000 tons in 1950. Output is scheduled to reach nearly 15,000,000 tons in 1955.

Best available estimates. Principal source of production is the U.S.S.R., which accounted for some 8½ per cent of the total output in the area in both 1953 and 1954.

The Spread of Incentives

THE purpose of this Blue Supplement is to examine over the time the main elements which determine the volume of incentives in productive undertakings. The emphasis throughout is on productive undertakings and there is no attempt to assess factors on grounds of social justice. The argument on social justice is admissible, but cannot take priority at this time. The reason for this was admirably stated by the Prime Minister in his address in the Rajya Sabha on May the 18th. He said in effect that, for the next five years at least, production must take priority far head of distribution. This was in fact an instrument of social justice, since there was no point in distributing poverty. The capacity to raise the standard of living of the Indian people depended for a brief period on production and production only.

While this proposition seems obvious enough, its implications are too often forgotten. If production is to expand, there must be an interest given to those responsible for expanding production to redouble their efforts. These interests are naturally varied. They include the shareholder who provides capital, the manager who provides organisation, and labour that provides manpower. There are, indeed, two different kinds of labour involved, salaried workers who tend to work on terms which do not move up or down with output of their factories, and manual labour which, whether by production bonuses or otherwise, has a close monetary interest in output.

It is shown in the pages which follow that over the last fifteen years there has been an erosion of incentive in the case of most salaried classes; whether in the public or private sector, the general standard of living of salaried workers has been considerably reduced. On the other hand, the general level of profits and of real wages has risen; not, indeed, uniformly but over the whole period substantially enough

to make it true that there has been no erosion of profits and no erosion of wages. In other words, the incentives which have been taken away have not been taken away from all factors of production. The character of the productive process has been distorted by a serious incursion into middle class standards of living particularly in the receipts of management.

Just as it is not proposed to argue the social justice case in general, it is not proposed to argue the particular social justice case in regard to the middle class. There is, indeed, such a case, but if production is paramount in the first instance, it should be paramount in this case also. In other words, it is not the general standard of living of the middle classes which should cause concern; it is the erosion of incentives in India's managers, whether in the public or in the private sector.

In the sections which follow there is first an analysis of trends in salaries of managers in the public and the private sectors. This is followed by an analysis of the movement of profits including capital gains which might be regarded as the rewards of investment. Finally, there comes in greater detail than elsewhere an analysis of the movement of real wages and a measurement of the extent to which it is related to productivity. It is argued that it is largely related to productivity, and here there has been no net benefit conferred on labour. On the other hand, to the extent that it has moved ahead of productivity—and between 1947 and 1951 it raced ahead—a bounty has been conferred on organised industrial workers at the same time as an inroad was made into middle class management standards.

The question now arises as to whether this excessive inroad into management incentives can be corrected in the short or long periods. It is argued that

it is not possible to correct these incentives at the expense of labour. For one thing labour is powerfully organised in Trade Unions with political power which makes it invulnerable to the operation of what might otherwise be called normal economic forces. Management of all kinds—top, middle and low—are in no such favoured position. It is argued, therefore, that the State will need by a conscious effort to instal incentives if the spacious targets of the second Five-Year Plan are to be achieved.

The central piece in this Blue Supplement discusses the nature of these incentives for two groups of management, foreign and national. The foreign manager and technician is believed to be an essential requisite in this period of India's economic development. His treatment will need to be somewhat different from that of the Indian national since there is danger of his attraction in other countries, which may leave India in short supply. 'The Eastern Economist' makes no apology, therefore, for proposing a level of rewards for those foreign managers considered essential for the Plan, which is in excess of that proposed for Indian managers. Here, again, there is no issue of social justice; merely the application of hard pragmatism in a short period and inescapable situation.

The argument throughout has not been in favour of making the rich richer in order to make the poor

advance. It is essentially an argument for making production rise at a pace which will allow the inequality of incomes to be reduced. It has been shown that in the income-tax group, production in the Indian Union has been a great leveller. Even before taxation the inequalities of incomes in the income-tax paying classes were reduced by this means between 1951 and 1955. Inequality not related to production has no functional justification; and incentives given to managers seem in India not to be makers of inequality.

The conclusions of this Supplement are, therefore, simple. In the first place, production will need the development of a new set of incentives for salaried managements, both foreign and Indian. The character of these incentives must be related to the erosion of incentives which has taken place in this sector since 1939, and particularly in the last three years. This erosion in order to be assessed in perspective needs to be considered against the gains of the investing class and organised labour. It is believed that by quite moderate incentives given to managers, foreign or Indian, who are responsible for projects contained in the Plan, the growth of frustration in the managerial salaried class might to some extent be stayed. There are few more important measures needed for the successful implementation of the Plan than this putting of fresh heart into the men who will bear the brunt of the Plan.

Incentives in a Planned Economy

THE OBJECTIVES OF MANAGEMENT

THE nature of incentives required to maintain production and to expand production are radically different. For a static society no additional incentive is required, seeing that each instrument of production has only to go on producing what it produced in a previous period. Therefore, the need of incentives should be linked in some manner with rising production, not with any static conception of doing what was done before. The idea that salaries or wages should rise irrespective of production is merely an instrument of reckless inflation in a period when production is short. Social justice should be secured by the State, not by an arbitrary favouritism of any one factor in the industrial process.

If an economy is progressing, there are inevitably incentives of a kind. Even if there is no conscious incentive practised, there is obtained, by the free operation of economic forces, a distribution of the increment of production in terms which provide various incentives to the contributing factors. The classical theory of distribution developed in part by Walras, Marshall and Pigou and more concretely stated by J. R. Hicks in his 'Theory of Wages' about twenty-five years ago, showed how normal economic forces tended to link distribution with marginal productivity rewards. In this assessment each factor received payment according to its marginal productivity, that is, to its product on the last unit manufactured.

In a planned economy, 'free' economic forces are restricted in operation. If production is organised for maximum profits and each factor is rewarded according to its marginal product, there is also no indication that a particular target of the Plan will be fulfilled. For once the marginal productivity of factors of production is fixed, so is output, except to the extent that resources—capital and labour—are changed. Professor Hicks has shown mathematically that output is thus determined when the volume of capital and labour employed are fixed and marginal productivities do not change. If in the Plan resources in particular industries are fixed—and this is increasingly the case—output can

only rise through changes in productivity. This calls for a new type of management, not only one that produces at the minimum cost. For there is no guarantee that minimum cost management will strike the output targets of the Plan.

In order to change what might be called normal free economy trends into the higher trend designed in a Plan, the main dynamic element must be management. This is a new function of management in the planning age, namely, that it is to determine the level of incentives or rewards (outside current marginal productivity) in order to bring real output into conformity with the Plan. There is no theoretical or mathematical solution for this problem which is essentially pragmatic. The greatest of the world's managers have been pure pragmatists, ignorant of economic theory, particularly in its more refined and modern mathematical forms. All of them have been instrumental in changing the efficiency of the factors of production. They have put into both capital and labour a new dimension. Profit was the by-product of this operation; it is the unlossing of incentives to invest, and to produce and to consume on a grand scale that was the world's great management contribution. When incentives for production and consumption are unloosed, distribution can be adjusted when it does not go right by itself.

The problem of distribution in India is, for the next five years, only a by-product of the problem of production. It is dealt with historically in a separate piece in which it is shown that the marginal productivity of capital and the marginal productivity of labour in the last six years do not provide an indication that either capital or organised labour is underpaid; the position is otherwise with some salaries. It would appear from statistics elsewhere that the marginal productivity of capital is increasing more rapidly than the marginal productivity of labour. In other words, the great increases of productivity in the last five years have been due more to the wider use of capital than to spectacular co-operation from labour. But the co-operation of labour has been shown in a reduction in

work-days lost through disputes and also in better working during hours worked.

The point that is now stressed is that in the planning age, management has a function quite different from the mere marriage of the sources of production. Essentially it is the marriage of components of production in a manner which not only attempts to keep unit cost at a minimum (a condition which in the planning age tends to be of secondary importance) but also attempts the raising of output without loss to targeted figures. In that sense while the function of management remains the same as it has always been, namely, to produce at a profit, it becomes in the planning age wedded to a proviso that this profit must be obtained with at least the attainment of the minimum targets of the Plan. Thus the responsibilities of management

are greater than they have ever been for there are two ends and not only one to be served.

In a free economy a manager has a responsibility to his shareholders, a responsibility to his workers and some (undefined) responsibility to the social purposes of the society in which he works. In a planned economy, in addition to these previous responsibilities, there is a fairly precisely defined minimum target of output, and a fairly precisely defined social purpose covered now in India by the "socialistic pattern of society." The manager has to operate within a framework of thinking, and sometimes of law, which gives him less freedom while requiring greater effort. Neither capital nor labour has had its real burdens thus increased. It is for this reason that the incentives for top management need to be increased more than those provided to capital or labour.

Salaries in the Public Sector

ONCE it is recognised that incentives to the managerial and supervisory classes, in the form of salaries, are quite as essential in industry as incentives to investors in the shape of profits and to workers in the form of wages, an analysis of how far trends in salary levels have been promoting (or discouraging) incentives assumes importance. In the present piece it is proposed to discuss the significance of the situation in this regard in the public sector, reserving to the next article the reactions of the private sector to the need for providing greater incentives to the managerial and supervisory classes. The choice of the public sector for discussion first is not by accident. The second Five-Year Plan assigns the major role in the country's industrial development to the public sector. It is true that even so the private sector as a whole will still continue to be more important than the public sector, at least for some years to come. But a large part of the development contemplated in the Plan is in the public sector, and a discussion of how far salaries in this sector will act as incentives has become both urgent and necessary.

In broad outline, there has been no uniform movement of salaries paid to Government servants at the various levels in the last 15 or 16 years. While the salaries in terms of money have increased in the lower and middle levels, the amounts paid to the incumbents of the highest posts have remained almost unchanged. But this statement needs qualification. Before 1947, Indian officers were almost completely excluded from the highest posts, which were a preserve of European I.C.S. officers. But after independence all posts have been open to everybody, so that it can be stated that there has been an improvement in the emoluments of the highest paid Indian officers since 1947. Even in the course of the war it had become necessary to appoint Indians to some of the higher posts at New Delhi, and this process was completed after 1947. Apart from this, the emoluments that go with the higher posts have not registered much improvement, if any. On the other hand, the salaries for these posts have been reduced, some of them receiving even a 25 per cent cut. The rewards for such posts as Secretaries to the Union Government have in some cases already been reduced from Rs. 4,000 to Rs. 3,000 a month. This is serious enough, but in the confused thinking which the objective of a Socialist pattern of society has given rise to, further cuts are being urged by precisely those sections who favour a higher standard of living all round, blissfully ignoring the fatal possibilities of their suggestion in postponing the arrival of the very millennium for which they are clamouring.

Salaries in the lower and middle levels have, however, registered some improvement, measured in terms

of money. The outbreak of the war and the rise in general prices and the cost of living which soon followed it pushed those who were living at the margin of subsistence below that level and this called for some relief, which was granted in the shape of dearness allowance. Admittedly the sums granted as dearness allowance could not and did not make up for the rise in living costs, and when the prices continued their upward trend, the gap became wider. This led to the appointment of the Pay Commission in 1946. It is true that the Pay Commission recommended better salaries than what were being given up to then for nearly all the lower and middle grade jobs, but their recommendations were based on the assumption that the cost of living would be stabilised at between 160 and 180 per cent of the 1939 level. The rates of dearness allowance they recommended were also based on the premise that the cost of living would not go much beyond 260 per cent of the 1939 level. Since then there has been no large-scale revision of salaries paid to Government servants.

This brings us to the erosion of incentives which has taken place as a result of the steady fall in the real value of salaries since 1939. In so far as the salaries in the higher ranges have not increased, not even to the extent to which salaries in the lower levels have, incumbents of these posts should have suffered a proportionately greater disincentive. What precisely is the extent of this disincentive can be gauged from the fact that the cost of living is at present approximately 3.3 times what it was in 1939, while wholesale prices have gone up 3.9 times. It is true that the effect of a price increase of this magnitude will be much severer on the lower levels of salary-earners, but it is in the middle levels—where a whole new range of posts have been created—and in the higher levels that the incentive aspect of salaries is more important. Here the reduction in salaries in real terms has been far steeper.

But rising prices have by no means been the only factor which has caused serious inroads into incentives in the public sector. A more or less stable salary in the ranges that are significant has suffered additional damage from the trend in the taxation of incomes. This trend has been uniformly upward since 1939 and the maximum rate of income-tax and super-tax applicable to an income of, say, Rs. 4,000 a month, has gone up from about 3½ annas in 1939 to 9½ annas in 1955. The total annual tax which was payable in these two years was Rs. 8,586 (17.9 per cent) and Rs. 16,438 (34.2 per cent) respectively. The value of the net income, in 1956, after allowing for the rise in the cost of living, will just be Rs. 8,767 in terms of the 1939 level. This,

of course, is an approximation, but it illustrates sufficiently well that a salary whose net value in 1939 was Rs. 39,414 has fallen to less than a fourth in 1956. How far a reduction of this size in real value can be and has been outweighed by the social prestige which a Government job carries it is difficult to say, but even this prestige has been declining of late with the expansion that has taken place in the private sector recently and the greater opportunities for steady, well-paid employment which have become available.

It has become evident that the proposal to counter the erosion of incentives which has taken place will hardly find acceptance in the socialistic mood prevalent today; and though the Prime Minister has refused to countenance any proposal for a further weakening of incentives by imposing a ceiling on incomes, this applies only to the private sector. But a rigid ad-

herence to existing ideas on what the salaries should be for the new class of managers of industrial enterprises in the public sector may fail to secure the services of personnel of the quality and in the number required. It is true that apart from the inhibitions imposed by the socialist pattern, there will be a certain anomaly in fixing higher salaries for managers of industrial enterprises than those given to the top officials in the administrative system. But there are definite limits beyond which appeals to patriotism will not operate, and it may become necessary to pay higher salaries than have hitherto been given for filling at least some of the top positions. Otherwise, there is the danger that private industry will attract all the best talents available, forcing the public sector to rely on second class managers for implementing important schemes for the development of heavy industries.

Salaries in the Private Sector

WHAT has been said above about the salaries in the public sector applies 'pari passu' to salaries in the private sector. There is, however, one important difference. In the public sector, prestige has always been an important alternative to high money income. Secretaries to Government for example exercise both power and influence far greater than a Managing Director of even a large managing agency house. It is difficult to compute the value of this prestige and influence, or the inevitable high place that it carries in the warrant of precedence. But almost certainly it is large. There is ground for believing that if two persons of equal ability enter, one in the public, and the other in the private, sector, the order of difference in salaries to make up for the greater prestige and influence of the public sector might be measured by a salary in the public sector about half that at the topmost appointment in the private sector.

'The Eastern Economist' has sought some practical support for this thesis by reference to some Secretaries and Joint Secretaries to Government in New Delhi. There are very few Secretaries or Joint Secretaries to Government who would be willing to resign from the public services and take an appointment with a private business house without approximately doubling their salaries before taxation. It is true this is by no means doubling the salary after taxation, but it does mean that if industry is to obtain the quality that goes in the topmost ranks in the civil services, it would need to pay substantially more than a Secretary to Government receives today.

In the table given alongside a scale of incomes is shown extending up to Rs. 7,000 per month. It may be assumed that a figure of Rs. 7,000 per month represents in the private sector a figure comparable to that of a Secretary to Government at the present time. It might be mentioned that with taxation rising very steeply a monthly income of Rs. 7,000 after taxation would be just about Rs. 1,000 more than at Rs. 4,000. In other words, two-thirds of the difference in income goes to the Government, and not to the recipient of the salary. Nevertheless, here is an element of money prestige attached to top management which is some compensation for the greater non-money prestige which a Secretary to Government enjoys. It should be recognised that this small addition of Rs. 1,000 free of tax cannot be denied by a country, whose main aim in the short period is production and whose purpose must obviously be to attract to the highest places in industrial management the best administrative ability.

Assuming for the sake of argument that normal "top managers" are allowed a pay up to Rs. 7,000 per

much before taxation, there is need of further incentive for the successful entrepreneur who should command a higher price than the average man in his group. It is difficult to determine how this additional incentive is to be obtained, but obviously there is need in the private sector for an element of dispersion of salary so that not all top managers belong to the same income category as all Secretaries to Government. There should be an entrepreneurial bonus for managers as well as a production bonus for workers.

REAL INCOME OF THE SALARIED CLASS AT PRE-WAR PRICES

For married persons only.

Monthly Income	Annual Income	Annual Income-tax	Annual Income after Tax	Annual Income after Taxes at Pre-War Prices	Monthly Income at Pre-War Prices
Rs.	Rs.	Rs.	Rs.	Rs.	Rs.
500	6,000	131	5,869	1,630	136
750	9,000	374	8,625	2,396	200
1,000	12,000	744	11,255	3,127	260
1,250	15,000	1,230	13,770	3,825	319
1,500	18,000	1,742	16,258	4,516	376
1,750	21,000	2,275	18,725	5,201	433
2,000	24,000	3,444	20,556	5,710	476
2,250	27,000	4,194	22,806	6,335	528
2,500	30,000	6,332	23,668	6,574	548
2,750	33,000	7,116	25,884	7,190	599
3,000	36,000	9,404	26,596	7,388	616
3,250	39,000	10,263	28,737	7,982	665
3,500	42,000	12,737	29,263	8,129	677
3,750	45,000	14,667	30,333	8,426	702
4,000	48,000	16,433	31,562	8,767	730
4,583	55,000	20,901	34,099	9,472	789
5,000	60,000	24,182	35,818	9,949	829
5,500	66,000	28,513	37,487	10,413	868
5,833	70,000	31,401	38,599	10,722	894
6,000	72,000	32,844	39,156	10,877	906
7,000	84,000	41,769	42,231	11,731	928

This additional incentive must be related in some manner to the specific demands of the Plan. Since the principle of an inducement to invest in new industries has been fiscally recognised by the industrial rebate, one might perhaps ask that certain selected appointments, designed either for the establishment of a new industry or for over-fulfilment of targets in existing industries, should be compensated by some fiscal means.

But the Russian and the American systems are agreed on the necessity to provide special inducement for the topmost management. It ought to be possible, following experiences in these countries, to make a percentage of the salaries of top executives, whose function is judged particularly vital in the Plan, to be tax-free for at least this Plan's duration.

Justification for the special treatment of top managements arises from the fact that in the next five years the demand for trained personnel of the highest calibre will much exceed the supply. Indeed, at the present time, the strain is already being felt to the extent that many public sector corporations are unable to find requisite talent at the top level. In the

case of some great projects, notably Bhakhra-Nangal and Damodar Valley, foreign engineers have been allowed to draw salaries far above those normally allowed in the public sector. This admits of more general application. There is no reason why a tax-free rule should be made for technicians only when shortage of supply in the top managerial classes is more pressing.

The current bottleneck in the management in both sectors will not be cured unless there is a tax inducement for foreign managers of the requisite calibre to enter and for talented Indian nationals also to give the whole mind and many years of apprenticeship to the entrepreneurial function.

The Trend of Profits

AGAINST the heavy inroad of which mention has been made in the rewards of Management, have there been any equal inroads into real profits or real wages? This and the next three pieces deal with this question.

So far as profits are concerned, unhappily no authoritative official figures are available after 1953. But the table below gives index numbers of industrial profits with 1939 equal to 100. The tables in the Statistical Section show the figures when deflated by the All-India Consumer Index after 1944. No figures for this index are available for previous years.

The Research Section of 'The Eastern Economist' has made estimates believed to be comparable with the official estimates, though made of much smaller sample, for the years 1954 and 1955. Both these years show

rises on 1953, and, indeed, 1955 shows a rise over the peak year of 1951. It may be assumed that these figures have not underrated the trend of profits.

It will be seen from these figures that in no year or at least in no series of years have profits greatly exceeded their 1940 value. In other words, real profits have not risen over the period as a whole. They have certainly risen in portions of the period quite steeply in 1941 and 1942 and moderately again from 1953 to 1955.

It is fair to conclude that industrial profits while they have not been unduly low have not been unduly high. Perhaps a fair estimate would be that in real terms they have tended to maintain their pre-war rate over a much larger monetary investment.

INDEX NUMBERS OF INDUSTRIAL PROFITS

(Base: 1939=100)

Year	ALL INDUSTRIES	Jute	Cotton	Tea	Sugar	Paper	Iron and Steel	Coal	Cement
1940	138.0	359.1	142.5	99.1	100.3	263.3	103.8	100.8	102.8
1941	187.0	344.4	316.6	146.8	137.8	284.7	133.7	82.6	128.8
1942	221.8	351.1	491.3	228.1	126.7	321.7	110.1	80.5	160.1
1943	215.0	376.3	640.0	142.3	157.8	352.8	111.8	95.6	147.9
1944	234.9	310.6	492.1	110.5	133.5	271.5	117.8	237.0	214.4
1945	233.6	327.6	423.3	150.7	108.9	279.5	120.2	258.3	211.6
1946	229.2	415.5	408.9	198.8	122.4	266.4	101.3	198.5	194.1
1947	191.6	313.2	317.7	216.3	171.5	167.6	86.1	171.8	142.5
1948	259.9	361.2	548.1	127.9	381.3	257.0	96.3	201.0	252.6
1949	181.5	89.3	192.0	138.4	216.4	316.7	116.0	287.2	295.0
1950	246.6	456.9	356.6	271.2	262.4	479.0	134.2	209.2	333.4
1951	310.5	679.1	551.1	103.9	420.8	604.1	157.7	178.4	419.7
1952	190.6	183.4	262.8	88.8	409.1	568.8	162.6	220.4	298.4
1953	261.2	326.2	397.4	391.4	419.8	512.7	179.4	145.5	279.0
1954*	292.0	268.9	386.4	830.9	329.8	432.3	214.9	151.1	340.5
1955*	319.6	290.8	403.8	n.a.	345.4	584.6	271.8	n.a.	450.5

* Provisional. n.a.—Results of sufficient no. of companies are not available to give a fair indicator of profits. Note: The figures up to 1953 have been taken from the 'Progress of Joint Stock Companies' a Ministry of Finance publication. Figures for 1954 and 1955 have been worked out by taking profits for 1953, 1954 and 1955 of same companies and relating the index for 1953 to the profits for 1954 and 1955.

The Trend of Dividends

SO far as distributed profits or dividends are concerned the most authoritative study has appeared in the Reserve Bank of India Bulletin which in its April 1956 issue presents figures for four years in regard to leading industries. According to this table, which shows dividends as percentage of paid-up capital in 771 joint stock companies in India, the average rate of dividend has tended to be between 7.2 and 8.1 per cent on ordinary shares. It is only in respect of deferred shares that profits have reached 40 per cent in a particular year, namely 1951. There are also studies in this April 1956 issue of the Reserve Bank of India Bulletin that show after tax gross profits as percentage of total capital employed. These results are best shown graphically on the opposite page.

It will be seen that so far as average gross of profits as percentage of total capital employed is concerned, there is only one single case—that of matches—where gross profits have been higher than 15 per cent of total capital employed. The average is much lower, and in the case of land and estate, vegetable oils and chemicals, it is below 5 per cent.

Similarly, in regard to profits after tax as percentage of net worth there are only two cases—iron and steel and plantations other than tea—where profits after tax have been above 12½ per cent of net worth. In many cases, such, for example, as land and

estate, chemicals and vegetable oils the figure has been less than 2½ per cent.

Again on dividends as a percentage of paid-up capital (the position of which is described in the table below) the graphical presentation shows how ill-conceived is the notion that dividends in Indian industries in these years have been exceptionally high. If one excludes iron and steel, vegetable oils and plantations other than tea there is no industry whose dividends as a percentage of paid-up capital have exceeded 12½ per cent.

These conclusions support the contention that the rewards for capital, whether conceived in terms of gross profits or as dividends distributed, do not provide excessive incentives to the providers of capital. On the other hand, 'The Eastern Economist' will not contend that these dividends are unduly low. It would point out that the erosion of return in real terms is largely compensated by capital gains which are shown in the table below. For example the table on p. xiii shows that industrial share prices in India have risen substantially from their 1939 level. It is true that there have been ups and downs. It is also true that there has been a substantial fall since the peak of 1946. Nevertheless, it cannot be contended that a shareholder who had non-taxable capital gains at the present time has been harshly treated.

The Trend of Real Wages

FOR a proper assessment of the extent to which real wages have progressed over a period of the last sixteen years, it becomes necessary to watch the trend in the index of real earnings with reference to the pre-war base. This is done by deflating the series of index of earnings by the All-India Consumer Price Index Series. The table below presents a comparable picture of (i) the index of earnings (ii) the all-India consumer price index and (iii) the index of real earnings.

Year	Index of Gross Earnings (1939=100)	All-India Consumer Price Index (1939=100)	Index of Real Earnings (1939=100)
1939	100	100	100
1940	105.3	97	108.6
1941	111.0	107	103.7
1942	129.1	145	89.0
1943	179.6	268	67.0
1944	202.1	269	75.1
1945	201.5	269	74.9
1946	208.6	285	73.2
1947	253.2	323	78.4
1948	304.0	360	84.4
1949	340.3	371	91.7
1950	334.2	371	90.1
1951	356.8	387	92.2
1952	385.7	379	101.8
1953	384.6	385	99.9
1954	381.2	371	102.7

The index of real earnings was above its pre-war level in 1940 and 1941. It reached its highest level in 1940. A declining phase then set in in 1942 and continued in the next year when the lowest level was reached. This was due to an abnormally large increase in the consumer price index synchronising with an increase of relatively much smaller magnitude in the index of gross earnings. But the steep decline in 1943 was not only arrested immediately but a heartening tone of improvement was in evidence in the subsequent years. During the years 1947 and 1951 the index of real earnings rose steadily save for a slight decline in 1950. In 1951, the index touched the level of 92—still 8 points lower than its pre-war level. This was a peak touched since 1942 and showed a striking increase of 25 points above the lowest registered since the pre-war period. In the two following years the index kept curving up by significant margins. The real advance came in 1952 when after the difficult war and post-war period of twelve years the index again overstepped the pre-war mark. The subsequent course of the index was characterized by a small set-back of 2 points in 1953, when the index was almost at the pre-war level. But in 1954 it looked up boldly to the level of 102.7.

It would be highly instructive to compare the trends in real earnings with those in productivity. The official estimates made by the Central Labour Ministry are of great help and value for this purpose. The method adopted in these estimates is to convert the trends in the two indices to equations which are worked out as indicated below:

Index of productivity —	Period covered.
$Y = 86.4 (1.002)X$	1939 to 1954
$Y = 72.1 (1.027)X$	1943 to 1954
Index of real earnings —	
$Y = 85.6 (1.004)X$	1939 to 1954
$Y = 66.5 (1.039)X$	1943 to 1954

A most important fact which is quite obvious from these equations is that during the period 1943 to 1954

the index of real earnings has advanced geometrically at an average rate of 3.9 per cent per annum, whereas the corresponding rise in the index of productivity has been of the order of 2.7 per cent. The gains registered by labour are clear enough.

In general four periods can be distinctly marked out while comparing the simultaneous variations in the two indices, namely, (i) 1940 to 1942 when the index of real earnings stood above the index of productivity (ii) 1943 to 1946 when it was the other way, (iii) 1947 to 1952 when real earnings again stood over productivity and (iv) 1953 to 1954 when the index of productivity for the second time overstepped the index of real earnings. These relative fluctuations in the two indices reveal interesting changes over the period.

Dealing with certain industries since 1948, it will be observed that it is real earnings that steal a march over productivity in individual cases. In the paper industry, for example, as will be evident from the table given below the productivity index shows an annual rate of increase of 0.04, while that of earnings is 2.07. One predominant feature is the low productivity index of 1950. On the other hand the picture presented by the average earnings is one of continuous increase but for a set-back in 1953. However, the increase in the earnings stands in sharp contrast with the low rate of increase in productivity.

PAPER INDUSTRY

Year	Index of Productivity	Index of Earnings
1948	100	100
1949	100	109
1950	88	109
1951	102	115
1952	98	122
1953	99	120

JUTE TEXTILE INDUSTRY

Year	Index of Productivity	Index of Earnings
1948	100	100
1949	96.8	125
1950	120.5	125
1951	119.3	122
1952	124.9	148
1953	129.9	143

COTTON TEXTILE INDUSTRY

Year	Index of Productivity	Index of Earnings
1948	100	100
1949	89	109
1950	89	106
1951	95	108
1952	107	115
1953	118	112

So far as the jute industry is concerned, the annual rate of increase in the adjusted productivity is 2.9 against 3.7 in the earnings. There is a steep increase in earnings in 1949 and 1952. In August 1948 jute mill workers in West Bengal were getting Rs. 12-7-5 p.m. as minimum basic wages. They also got an amenity allowance at the rate of Rs. 19-8 p.m. and the value of food concessions was Rs. 8-10-9 p.m. Thus the total earning of the least paid worker was approximately Rs. 40-10. By the Industrial Tribunal's decision of

September 20, 1948, the minimum basic wage was increased to Rs. 26 p.m. The Tribunal also directed that in place of amenity allowance and sale of food grains at concession rates the workers should be paid dearness allowance at the rate of Rs. 32-8 p.m. This meant an increase of Rs. 17-14-10 in earnings. The story in the cotton textile industry, of course, is a little different. The annual rate of increase in the pro-

ductivity index being 2.28 as against 1.14 in earnings. The average earnings in cotton textile industry in 1949, however, increased sharply by 9 per cent. There was a fall in earnings in 1950, but the earnings increased again to the peak figure in 1952. Increase in productivity in this industry is largely attributable to plant organisation and modern techniques of work study as shown by recent investigations.

Trends in Productivity

WHAT, it may be asked, is productivity? Quite simply, productivity is a means of increasing production with a minimum of capital expenditure through planning and better methods of organisation. It is based on the greater utilisation of raw materials, capital, equipment and management. It is usually defined and measured as the ratio between the volume of output of the product and the input or the quantitative expenditure of the various factors that enter into its production. Statistical difficulties in measuring accurately the productivity of all the factors of production have made rather extensive the use of the phrase productivity of labour which is the relationship between the goods produced and the labour involved in their production. The productivity of labour has the merit of statistical measurability but its consequent extensive use as a device of measuring productivity has led to the common misunderstanding that labour is the single factor which is responsible for productive efficiency.

This in fact is not the case, for it is essential to include in our thinking all elements of input even though there may be statistical difficulties in the accurate measurements of all these elements. Capital, equipment and management are as important to the productive process as labour is. It would be wrong, therefore, to think that productivity is a measure exclusively of the contribution of the workers though they also play their role. Now, that being so, it is quite erroneous to argue that the benefits accruing from higher productivity should be entirely distributed among the workers, not merely for reasons of social equity but for reasons which are purely economic. Productivity is not an end in itself, it is only a means of getting the highest possible returns on the investment of various factors of production and thereby enhancing the rate of economic development, the benefits of which would accrue to the community as a whole and not merely to a few members thereof. If the entire gains of increased productivity are distributed among the working classes, the rate of capital formation, so essential to economic development, is bound to suffer a setback since most of the increased earnings of the workers would be spent on current consumption and little if anything would be saved.

The table on page xvi shows the trends in productivity and the earnings of labour since 1939, which is treated as the base year equal to 100. The trends of real wages have been discussed in the previous article, where it is shown that real earnings have risen more than productivity in at least nine of the fifteen years under consideration. It will be seen that the index of productivity in 1940 rose to 104.2 while the index of real earnings rose higher up to 108.6. Thereafter, due to the maladjustments caused by the war in the economic mechanism of the country, productivity took a downward turn and along with it the real earnings of labour, though the fall in the former was steeper than in the latter. The process of fall in productivity was arrested in 1944 but that turned out to be a temporary arrest as the index of productivity was again falling until 1947. Having equalled in 1948 the record of 1945, namely, 79.5, the index again fell to 75.6 in 1949. The year 1950 proved the turning point in the history of Indian industry when the index of productivity took a definite upward turn. For the first time in 1953 since the outbreak of the last war did productivity surpass the pre-war period. The index in 1953 stood at 105.8 and rose to 113.0 in the following year. The figures for 1955 are not yet available but it is not likely that the trend shown by the figures for 1953 and 1954 would be reversed.

It is difficult to measure productivity in particular industries in India. In any case the only major source seems to be the Census of Manufactures. The Indian Institute of Public Opinion has developed a formula for the measurement of various productivity factors from the Census Tables from the years 1946 to 1951. These are shown below for Cotton Textiles.

It will be seen that while product per man-hour has risen by 22.6 per cent, product per wage-earner has risen by only 18.7 per cent. This should put us on our guard against assuming that productivity per man and productivity per man-hour are the same in this, or in any other, industry. Similarly the real wage per man-hour rose 27 per cent, while the real wage per wage earner rose only 23 per cent. In other words, productivity per man hour was more heavily rewarded than the real wage per wage-earner tends to show.

Year	Product per man-hour	Real wage per man-hour	Money wage per man-hour	Product per wage earner	Real wage per wage earner	Money wage per wage earner
1946	100.0	100.0	100.0	100.0	100.0	100.0
1947	109.8	112.7	127.3	105.6	108.3	122.4
1948	124.2	124.0	156.3	118.6	118.3	149.3
1949	116.3	129.9	168.9	110.6	123.5	160.5
1950	117.5	127.0	166.4	107.1	116.8	153.0
1951	122.6	127.6	173.6	118.7	123.5	168.3

Conclusion

IN conclusion, one should draw together the threads of the argument that has been developed in this Supplement. In the first place it has been shown that so far as salaries are concerned there has been a very serious erosion of real income since 1939. So far as a typical salary in the Rs. 4,000 class is concerned, this might be estimated at something like a reduction of Rs. 4,000 to Rs. 730 at pre-war prices after allowing for the effect of tax changes.

At the same time there has been a restriction on perquisites as a result of the 1955-56 Budget, which has imposed an impact variable, depending on perquisites previously in enjoyment, but substantially heavier on top executives. It is fair to say that the percentage erosion in respect of top managements is higher than it is in the Rs. 4,000 class. One might, perhaps, hazard the guess that in real terms incomes in the top-most class cannot be effectively more than a sixth of what they were in 1939.

By comparison with this remarkable change in the position of top managers, the argument has presented comparable figures for real profits and dividends, which indicate some falling off. On the other hand, there is a figure to be added for capital gains, which have assisted all property-owners during the inflationary period. There are very few property owners or owners of capital in general who have lost substantially in capital values over this period. A great majority of property owners have also gained in income since the income is augmented by its being generated by real capital which has been underestimated in current money terms. The income on "old" investments is higher than on new ones.

The conclusion on capital is by no means precise. But one might hazard the guess that the erosion of property income has been relatively small. The fact that the investment market has now recovered, and that capital in any case is available from other sources, suggests that incentives for investors are not so pressing, as they are for managements.

The case for labour in organised industries is similar. Here it is shown that real wages on the average have passed the 1939 value and in some industries the progress made has been very substantial. This is by no means the case in all industries, in some of which real earnings are below the pre-war figure. Similarly there are many States where progress has not been as rapid, and where there has been a fall in real earnings. While one should recognise that real wages on an

average have been maintained, one should not deny that particular industries and particular States have suffered in the process. Nevertheless there is ground in terms of productivity for assuming that organised labour has had a substantially fair deal in recent years.

If this conclusion is sound, namely, that capital and labour have maintained their position while management has suffered severely, the question will be asked who have been the main beneficiaries of this change. The answer is, firstly, the Government whose revenues have steeply risen under direct and indirect taxes, and, secondly, those sections of producers whose terms of trade have improved against the middle classes. This is a confused picture in which some members of the middle classes have benefited at the expense of others. But, by and large, one might say that the erosion in top managements has been shared by the middle classes as a whole; the beneficiaries have been governments and agriculturists.

If the issue were one of social justice alone, one would need to consider not merely the erosion that has taken place since 1939, but also the character of distribution in 1939, that distribution was certainly unjust both to agriculturists and to the non-managerial classes. Managers in 1939 certainly had a privileged position, and some erosion of their money incomes was justified by modern ideas of equity.

It is, however, clear that when the emphasis is placed on production, the position is far more complicated. It is the manager who is to put life into the enterprise. This has been well said in a recent book "The Practice of Management" by Peter F. Drucker.

"The manager is the dynamic, life-giving element in every business. Without his leadership the 'resources of production' remain resources and never become production. In a competitive economy, above all, the quality and performance of the managers determine the success of business, indeed they determine its survival. For the quality and performance of its managers is the only effective advantage an enterprise in a competitive economy can have."

It is because the manager is the dynamic element giving life to production that his position needs to be secured so that the vitality of the production mechanism can be maintained. There is no indication that the importance of this provision of incentives for management has yet been recognised.

Electricity and the Plan

THIS Blue Supplement is concerned primarily with the implications of the programme provided for the development of electricity in the second Five-Year Plan. This is one of the key features of the Plan since the progress of industrial development depends, in a substantial measure, upon the supply of power in different forms in an adequate measure, just as it depends upon the supply of sufficient capacity for transport. Planning for electricity is a long-term project extending far beyond the life of the individual plans of five years. The extent to which our ideas of the magnitude of the development of electric power are changing radically can be easily seen. At the time of the framing of the first Plan it was assumed that a target of installation of 7 million kW capacity at the end of the third Five-Year Plan would meet all reasonable requirements of our fast expanding industrial economy. Now this target of 7 million kW of capacity has been considerably advanced and it is accepted as the minimum that is essential for the requirements of the second Five-Year Plan. The capacity target at the end of the third Five-Year Plan has been pushed provisionally to 15 million kW.

An important question which needs to be asked in regard to the plan of electricity development for the next five years is whether the targets of production of electricity will answer the demands that will be made particularly by industrial consumption. This is so because the share of industrial consumption assumed in total electricity consumption will now advance to about three-fourths of the aggregate. The importance of the other sources of consumption need not be minimised, but the primary test by which the adequacy of the capacity and production targets should be determined is the ability of the Plan to supply the requirements of industry. Installed capacity is to be increased from 3.4 million kW at the beginning of the second Five-Year Plan to 6.9 million kW at its end which means an in-

crease of 3.5 million kW over the five-year period. In terms of generation of electricity, output of electrical energy will be increased from 11,000 million kWh to 22,000 million kWh.

All the energy to be generated will not be consumed in toto, and it is estimated that consumption will increase from 7 million kWh at the end of the first Plan to 16,600 million kWh after five years. Estimates about the probable pattern of consumption made by the Planning Commission have reached the conclusion that industrial consumption will increase from 4,600 million kWh at the end of the first Plan to 12,000 million kWh at the end of the second Plan. This amounts to an increase of 160 per cent in the industrial consumption of electricity over the second Plan period. Assuming that the increase in industrial production in the second Plan will be of the order of 100 per cent above the volume of production at the end of the first Plan, a provision of 160 per cent for additional consumption appears to be reasonable. The Plan estimates are based on a surplus of 5,400 million kWh for total consumption, partly as a standby in the case of emergency and partly to provide for the factor of seasonal fluctuations in the water flow in hydro-electric installations.

On the face of it, this plan for targets of capacity and production appears to answer reasonable requirements. But there is a vital snag in this planning which needs to be highlighted. It needs to be underlined because the entire planning cannot be expected to go through in all its details. Out of the increase of 3.5 million kW of capacity prescribed for the second Plan, 2.9 million kW have been assigned to be public sector. Of these 2.9 million kW, as high a proportion as 2.1 million kW has been allotted to the hydro-electric sector where water resources are by no means an assured quantity. The target of output naturally depends upon

the fulfilment of the target for additional capacity. It would be a bold assertion to make that the public sector will achieve its assignment of the increased target of 2.9 million kW in the second Plan.

Doubts about the achievement of the target of this order cannot be dismissed as baseless and unwarranted. If the achievement of the public sector in the first Five-Year Plan is a reasonable index of likely, or perhaps inevitable, shortfall, these doubts might prove to be quite reasonable, on the contrary. In the first Five-Year Plan there was a shortfall in installation of capacity in the public sector of the order of 300,000 kW, which was 27 per cent of the public sector's total target. If any shortfall of some such order, or possibly of a lower order, occurs, appreciable shortages of output and supply of electricity will emerge in the course of the second Plan. This is the likely gap which needs to be bridged as the progress of the Plan comes to be reviewed year by year. One of the articles on the working of State electricity projects in the recent past which follows in this Supplement examines the actual behaviour of the public sector in the electricity supply industry.

In view of a very nice balancing of requirements of electrical energy in the second Plan and its supply, without any margin of likely shortcomings in the execution of individual projects for additional power capacity, it becomes of the utmost importance that the private sector should be provided with all the aids that it will require to fulfil its assigned target. Private companies have been allotted the task of installing an additional capacity of the order of 300,000 million kW, exclusive of 300 million kW which are expected to arise from the generating plants to be installed by industrial units themselves for their own consumption. Will the private sector be in a position to discharge this responsibility? The answer to this question depends upon not merely the potential for development in the private sector but upon other factors which will be brought into play to translate that potential into actual performance. In the first Five-Year Plan the private sector fulfilled its target of additional installation of capacity

of the order of 200,000 million kW without any margin of shortfall. This achievement gives a reasonable promise that, given the necessary resources and aids, there is no reason why the private sector should not repeat its record of the first Plan.

The total outlay for generation and distribution of electricity prescribed for the private sector is of the order of Rs. 42 crores. This undoubtedly puts an appreciable burden on the present resources of the industry, but private electricity undertakings have unhesitatingly accepted the new responsibilities assigned to them. This readiness on their part to raise the necessary financial resources must, of course, be accompanied by a proper climate which will induce the flow of equity capital in the undertakings. It cannot be said, unhappily, that all the incentives necessary to secure a flow of this order are at present provided. The Electricity Supply (Amendment) Bill which is now pending before Parliament falls considerably short of the minimum requirements in respect of the standard rate of return, the needs for building up a development reserve for a dynamic industry and the provisions regarding computation of clear profits after making allowance for charges of interest on loans and debenture. These are only some of the gaps in the creation of the necessary climate for expansion. The articles that follow deal exhaustively with these and similar issues. It is, therefore, essential that while the amending Bill is still on the legislative anvil there should be modifications of its provisions to give full incentives that are necessary to build an expanded electricity industry on the scale fixed in the second Plan.

The broad conclusions reached here are that the targets of installation of capacity in the public sector need to be revised to avoid the probability of shortfalls in the supply of electrical energy. Whether in the segment of production or distribution, the onerous responsibility that has been cast upon private undertakings can be discharged if, and only if, incentives for investment of the required order are written into the Statute.

Working of State Electricity Projects

THE Electricity (Supply) Act, 1948, when it was placed on the Statute Book on September 10, of that year, originally permitted a period of two years for State Governments to constitute Electricity Boards. However, under the executive powers vested in the Central Government, this period was extended year after year, and the current notification has extended the date in respect of States other than Madhya Pradesh, Delhi, Saurashtra, Bombay, and West Bengal to March 31, 1957, the Electricity Boards in the States mentioned having been constituted in February, 1951, March 1951, March, 1954, November, 1954 and April, 1955, respectively.

A PROBE INTO ACCOUNTS

The Electricity (Supply) Act casts an obligation on the State Electricity Boards to publish accounts "in the prescribed manner and place copies thereof on sale at a reasonable price". The available accounts of the State Electricity Boards are discussed later in this article, but before going to them, it is worth while having a peep into the working of State Electricity projects available from a study of the Taxation Enquiry Commission's Report. The Commission have, in Volume I of their report, analysed the working of State Electricity Schemes which indicate that only two States (Punjab and Uttar Pradesh) "derived sizable net profits in 1953-54 from departmentally operated electricity undertakings, after meeting working expenses, depreciation and interest charges". It would be appropriate

to introduce here the summarised statement indicating net receipts under Electricity Schemes in the various States published in the Commission's Report. The apparent turn in the working results of the State Electricity Schemes is, in the main, attributed to the "increase in interest charges on account of new projects which have not yet attained full productivity". It would be fruitful to attempt an analysis of the latest available accounts of the State Electricity Boards themselves.

SOME SPECIFIC CASES

The accounts of the Delhi State Electricity Board for the year ended March 31, 1954, indicate a total revenue of Rs. 1,43,03,848 (including Rs. 5,34,133 being receipts from other sources) which works out to roughly 30 per cent of the gross block (Rs. 4,91,07,580). The total operation expenditure comes to Rs. 91,74,028, of which salaries amount to Rs. 29,71,920 (approximately 32 per cent). Depreciation during the year at Rs. 13,45,748 represents 2.74 per cent of the gross block, while the total depreciation reserve of Rs. 79,53,863 amounts to 16.2 per cent of the total gross block at the end of the year. The accounts of the Madhya Pradesh Electricity Board for the year ended March 31, 1953, show a loss of Rs. 19,06,485, while the net deficit of the working of the Bombay Electricity Board for the year 1954-55* is of the order of Rs. 26,05,674.

* Part of the period covers the activities of the former Grid Department of the Government of Bombay.

The working of the Saurashtra Electricity Board, according to the first Report of the Board for the period ending December, 1955, indicates a revenue deficit of Rs. 43,522, and the Board has visualised the need for "substantial subsidies", if it is not to suffer loss on the operation of the several rural electrification schemes.

With State Government Electricity Departments not being subject to any regulation, and thus free to operate without rigid restraints, their accounts do not reflect a true picture of the financial situation which an undertaking run on commercial lines has to face. Even in the case of State Electricity Boards, which are obliged to publish Annual Reports, statistics and returns "in such form and manner as may be prescribed by the State Government", the published work- results are not comparable with the accounts of undertakings operated by commercial enterprise. One redeeming feature about the working of State Electricity Boards, as distinct from the State Electricity Departments, is that, in terms of the Electricity (Supply) Act, "the Board shall not, as far as practicable...., carry on its operations under a loss, and shall adjust its charges accordingly from time to time." The need for State Electricity Undertakings functioning on a sound financial basis has also been recognised by the Taxation Enquiry Commission in that the Commission has seen "no objection to pricing policies which aim, over a long period, realising a surplus from the operation of the undertakings." The Commission goes on to say that, "although public purpose rather than profit should be the guiding factor in the operation of a public undertaking, every effort should be made to place Government industrial undertakings on a sound financial basis, so that losses are avoided and a reasonable return is secured as far and as soon as possible".

CHARGES AND COST OF SUPPLY

The basic conclusion thus is that the charges to the consumers levied by undertakings, whether State-owned, or operated by statutory Electricity Boards, cannot but face, as the commercially operated undertakings are obliged to face, the reality that they should be equal to the real value of the resources used up in serving them. A similar conclusion has been arrived at by the Herbert Committee, which recently reported on the UK Electric Supply Industry. Says the Committee:

"The industry could, without financial embarrassment, jog along comfortably without much effort and it could be used as a device for implementing national policies and for transferring income from one section of the community to another without the burden of these policies being properly weighed in Parliament or by the Minister. We attach great importance, therefore, to the industry being run on business lines. It should have one duty and one duty alone: to supply electricity to those who will meet the costs of it and to do so at the lowest possible expenditure of resources, consistent with the maintenance of employment standards at the level of the best private forms. Any deviation from this task should be undertaken only on precise instructions. The line between the Government and the industry should be a closer one for all to see."

These are weighty considerations which need to be borne in mind by all electric supply undertakings in the public sector, as, indeed, by all undertakings operated by State or quasi-State statutory corporations.

NET RECEIPTS UNDER ELECTRICITY SCHEMES IN THE STATES

a The figures for Madras and Andhra for 1953-54 (R.E.) are available for second six months only and have been doubled. The data for 1952-53 shown against Madras are for the composite State of Madras.

b For Madhya Pradesh the data given for 1952-53 relate to the Madhya Pradesh electricity project which is managed through a Board. No information is available for later years.

c Provisional figures.

d In Uttar Pradesh a substantial increase in net receipts is expected in 1954-55 due to a change in classification; hydel receipts which were formerly shown under the head "Irrigation" have been transferred to "receipts from Electricity Schemes".

The totals under various columns are not shown as data for certain States, are incomplete and are not strictly on a comparable basis.

N.A.—Not Available.

Growth in the Private Sector

WHAT has been the role of the private sector in electricity development? It is believed that the first electric supply undertaking in the country was sponsored by a company which constructed a small generating station in the ancient and historic city of Surat. This was in the year 1883, and the undertaking must have been one of the earliest supply companies anywhere in the world. Next year, a disastrous flood of the Tapi river submerged its plant. The Company is reported to have been sued for breach of contract by the Municipality and it went into liquidation. So, thanklessly, ended the first pioneering effort at electrification. The next major venture was the formation of the existing undertaking in Calcutta.

PRIVATE SECTOR BEARS FULL BURDEN

Apart from the general administration of the Indian Electricity Act, 1910, by the then Provincial Governments, little official interference with commercial concerns occurred until the 1930s, though, at the same time, little or no encouragement was shown. In fact, the Companies supplying energy in India today and those which, until recently, were operated by licensees not only pioneered but, for many years, formed virtually the only sources of electricity in the country. Today, there are some 320 company-owned electricity undertakings operating in the Indian Union, amongst which are a number of considerable size, notably at Calcutta (363,000 KW) and Ahmedabad (142,000 KW), not to speak, of course, of the famous Tata Hydro-Electric System, which, from its present capacity of 274,000 KW, is to become a combined hydro-thermal project with a total of 434,000 KW. There are besides

Ownership				No. of Under- takings Own- ing Generat- ing Stations	Installed Capacity of Generating Plant		Generation	
					As at 31-12-1947	Percentage of Grand Total	KWHrs Generated in 1947	Percentage of Grand Total
					KW	%	Million	%
State Owned:								
(a) Government				 97	487,112	35.73	1475.944	36.23
(b) Municipalities				 14	12,545	0.92	30.877	0.76
Private Owned:								
Companies				 229	863,608	63.35	2566.497	63.01
TOTAL				 340	1,363,265	100.00	4073.318	100.00

These figures for the year 1954 were:

Ownership		No. of Under- takings Own- ing Generat- ing Stations		Installed Capacity of Generating Plant As at 31-12-1954		Generation	
				Percentage of Grand Total		KWHrs Generated in 1954	Percentage of Grand Total
(i) State Owned:							
(a) Government and Board		..	203	1,027,536	41.2	3176.320	42.2
(b) Municipalities		..	16	27,593	1.1	44.120	0.6
(c) Power Corporations ..		..	1	154,000	6.2	169.527	2.3
(ii) Companies		..	214	1,284,507	51.5	4131.810	54.9
TOTAL		..	434	2,493,636	100.0	7521.077	100.0

Although within a short period, when more and more multipurpose projects undertaken by the State agencies come into operation, the balance of generation is bound to be tilted in favour of the public sector for a number of years to come yet, the licensees'

undertakings of medium size such as in Lucknow (18,500 KW), Allahabad (15,750 KW)*, Agra (11,500 KW), Jubbulpore (13,250 KW) and Banaras (11,750 KW).

Much publicity has recently been accorded to the ambitious new schemes of both the Central and the State Governments in the sphere of electrical development. But they are mostly integrated with multi-purpose projects or are suitable for rural electrification. No one will dispute the importance of such schemes, but that is no reason why the services of the private sector, which has contributed so largely to the common cause during the last 50 years, should be belittled. Nationalisation is no guarantee that a cheaper or more efficient service to the public would result. Experience confirms the contrary trend. Enterprises in the public sector prove a liability to the exchequer for a long initial period. Therefore, private enterprise must be permitted to function smoothly without intervention.

PREDOMINANCE STILL MAINTAINED

During the past decade, a number of power supply systems operated by private enterprise have been acquired by the State, and a number of major schemes have been brought to fruition in the public sector. In spite of this development, it is noteworthy, the contribution of the private sector still continues to be greater than that of the public sector.

In 1947, the installed capacity and generation by ownership were:

* Includes 4,000 kW set under erection.

undertakings would constitute a sizable sector of the industry and will, in addition, be the medium through which power generated by the State projects will have to be distributed to the consuming public.

FUTURE EXPANSION

Almost all undertakings have schemes for expansion during the second Five-Year Plan, and an investment to the tune of Rs. 50 crores has been visualised in the private sector. This certainly is a target which has some regard to reality, for, in the year 1953 (the latest year for which statistics are available), the private sector of the industry registered an outlay of Rs. 9869 lakhs as follows:

Name of the State	State Owned			Total
	Gov-ernment	Munici-palities	Private Companies

ELECTRICITY (SUPPLY) ACT

All the companies are financed predominantly with Indian capital, and it will not be out of place, therefore, to digress a little here to discuss the prospects for the investors in electricity shares who are mostly small holders. But discussion of this subject postulates some knowledge of the Electricity (Supply) Act and the background under which the Act was enacted.

Now, for the genesis of the legislation, one should turn to the proceedings of the Policy Committee No. 3C on Electric Power, which recommended:

- that the development of electricity supply in areas outside existing licensed areas should be actively pursued as far as possible, as a State, or quasi-State enterprise, but if, for any reason, the State is not prepared to undertake such development in any area within a reasonable time, private enterprise should not be excluded;
- that, provided sufficient and economic operation could be assured to the public, options existing under any licence to acquire an undertaking should, as a general rule, be exercised when they arise; and
- that steps be taken to eradicate any factors that retard the healthy and economical growth of electrical development on regional lines whether in State and Local Authority owned or in commercially owned undertakings.

These recommendations were accepted by the Government substantially. In February 1946, the Electricity (Supply) Bill was introduced in the legislature.

Although the Policy Committee's Resolution of February, 1945 was the main inspiration for the framers of the Act, they had also for consideration, prior to that, the Government of Bombay's demand for extraordinary powers for the projected "Grid" Schemes of the State. At the same time, the Government of India, in the middle of 1944, had circulated a set of draft principles for the control of Public Utility Electric Supply Finance so as to stabilise the situation created by the vagaries of the Advisory Boards appointed by the erstwhile Provincial Governments under the Indian Electricity Act, 1910.

Everything thus pointed to the need for a comprehensive Central legislation, and the enactment of the Electricity (Supply) Act in September, 1948 brought to fruition the efforts of the Government of India to place on the Statute Book a measure "for the rationalisation of the production and supply of electricity and to take measures conducive to the electrical development of India," as the preamble to the Act says.

The Electricity (Supply) Act, 1948 is by and large modelled on the UK Electricity (Supply) Act, 1926. The Sixth Schedule governing the financial provisions, from most Licensees' point of view, is probably the crux of the measure and, in drawing up the Schedule, the framers of the Act are said to have made an exhaustive study of the US Rate Regulation Practice, but it may be stated that the Schedule does not approach, either in form or in substance, the American Public Utility Legislation. Indeed, this Schedule is entirely a departure, aiming, as it does, at rate regulation by means of legislation, instead of through the agency of Regulation Commissions as under the American method.

SMALL UNDERTAKINGS

The role of the small-sized undertaking in the country's electrification bears brief reference. At the end of 1954, as many as 83 undertakings operated with plant less than 250 kW. Many of them are not viable and operate in areas where adequate loads do not offer themselves and where there are little possibilities of enough load developing. To most of them, the earning of a reasonable return is out of the question, but, having gone into the business, they carry on as best as they can. They are too small and, owing to the absence of load diversity, are unable to offer attractive promotional tariffs; again, owing to lack of revenue, they are unable to sustain a properly trained staff and command capital at a sufficiently attractive rate of interest to ensure full development of the area of supply.

Nevertheless an important feature which argues in their favour is that they function as instruments for opening up the countryside. This factor needs to be recognised in its full implications for the future direction of development.

OBJECTIVES

The private sector of this industry has consistently sought to promote the following objectives: (1) An overall increase in the production of electricity; (2) the generation of this increased quantum of power in the most efficient units and its distribution over a wide area through integrated power systems, and (3) development of the electrically backward areas in general. Past performance is a reasonable guarantee for future service on an extensive scale provided incentives are properly sustained.

The Concept of Fair Return

A notable characteristic of a public utility, as compared to, say, an ordinary manufacturing company, is its much greater investment per rupee of annual income. The following table illustrates the wide disparity in the ratio "gross revenue/capital employed" that exists between different industries:

Classification	Year of Account	Ratio Gross Revenue Capital Em- ployed
Hydro Electric generation and bulk supply	1953-54	0.194
Steam generation and distribution	1953-54	0.221
Distribution only	1954-55	0.296
Cotton and silk textiles	1953-54	2.295
Cement	1953-54	1.015
Manganese Mining	1953-54	2.156

It is the capital-intensity that makes it contrary to public interests to duplicate a public utility in any particular area. As the field of operation in any particular licence area is restricted to one utility, State regulation of the utility has developed to protect the interest of the consumer.

REGULATION PRIOR TO 1948 AND AFTER

Prior to the enactment of the Electricity (Supply) Act, 1948, provision for rate regulation existed in terms of Clause XI of the Schedule to the Indian Electricity Act, 1910. This regulation was exercised through an 'ad hoc' Advisory Board appointed by Government. What happened in practice, in certain States, was that an "Enquiry Committee" was appointed "to investigate the rates of all electric supply companies which were of more than seven years' standing and to recommend the maximum rates which they could be allowed to charge". This committee went into the affairs of licensees and coerced them to reduce rates by the more or less open threat to constitute a "packed" Advisory Board, under the Indian Electricity Act, 1910, if they failed to comply. This led to the need for the enactment of a comprehensive Central law, and it is against this background that the financial provisions embodied in the Electricity (Supply) Act, 1948, have to be viewed.

Now, the financial control exercised by the Electricity (Supply) Act, 1948 is through the mechanism of price control, and, in the process, what constitutes the Capital Base (or Rate Base) and the 'Reasonable Return' on that are determined. In other words, the financial provisions are so designed as to permit the licensee to earn a "Reasonable Return" so as to "enable him to raise funds in the market necessary for the proper continuity of his public duties".

EVOLUTION OF THE "STANDARD RATE"

The Electricity (Supply) Act for the present restricts the Reasonable Return permitted to be earned by the investor in the Industry to five per cent and, before proceeding to discuss the adequacy or otherwise of this limit, it would be appropriate to touch upon the various proposals under consideration before the Act pitched upon the figure of five per cent.

The Electricity (Supply) Bill, introduced in the then Legislative Assembly of India on February 7, 1946, sought to link the "Standard Rate" to the Reserve Bank Rate with a variation of 6½ per cent per annum in the case of undertakings less than 10 years and 4½ per cent in any other case. Out of this the undertaking

had to pay its own income-tax, though super tax was allowed as an expense.

The financial provisions embodied in the Bill were subsequently referred to an expert Advisory Board, and this Board recommended the linking of the rate to the redemption yield on the longest-dated Central Government terminable loan, as follows:

Nature of Investment	Rates as in Principles	Resultant Totals for 1946
Redemption yield on longest dated Central Government terminable loan	X %	2.8%
Maximum rate of interest on Debenture Capital permitted as an expense under the Principles	X plus 1.5%	4.3%
Maximum Rate of interest on Preference Capital permitted as an expense under the Principles	X plus 2.5%	5.3%
Standard Rate on Capital Base permitted under the Principles		
(a) On that portion of capital base which is in excess of Rs. 50 lakhs	X plus 2.5%	5.3%
(b) On that portion of capital base between Rs. 10 lakhs and Rs. 50 lakhs	X plus 3.0%	5.8%
(c) On the first Rs. 10 lakhs of capital base	X plus 3.5%	6.3%

Note: The rates sought to be fixed represent the maxima on investment which was to be permitted in any year.

Ultimately, when the Bill was enacted, the "Standard Rate" was fixed at five per cent flat, "all taxes on income and profits" being treated as an operating expenditure.

In fixing this rate, the Legislature has apparently been influenced by the generally accepted popular belief that, in a "monopoly" like electric supply, funds could be attracted by offering the barest minimum return. But, contrary to popular opinion, electric supply business is not totally free from competition. In domestic supply there is competition from other forms of illuminants, and, in the case of power supply to industry, there is the ever present threat of self-generation or other form of motive power being resorted to, if the utility's rate for supply happens to be uneconomic. In other words, the electric utility must be able to do the job better and cheaper in order to stay in business.

TEST OF ADEQUACY

The test of the reasonableness of the return is to be judged from whether or not it is adequate enough to promote investment in the industry without watering down the value of the existing equity. This qualification is very important, it must be noted, in the context of the statutory obligation of the underaking to expand in order to meet the growing needs for power of the area it serves. The framers of the Electricity

June 29, 1956.

ELECTRIC INDUSTRY SUPPLEMENT

vii

(Supply) Act were apparently largely influenced by the mere provision of fixing a rate of return which they considered to be "capital attractive"—a term relative to the circumstances of the case. The crux of the matter, in fact, is whether the term "cost of capital" is synonymous with a fair rate of return and whether such cost would cover equity capital, in the raising of which the Electric Supply Industry has to compete against other industries offering relatively higher return.

Another factor of serious consequence is the impact of post-war inflation giving rise to "attrition" because of high cost of new plant and the enhanced cost of giving connections to new consumers. This should not be confused with regulatory lag (which happens, in certain cases, when an undertaking's attempt to adjust rates are forestalled by Government action as a result of uninformed consumer opposition). All these factors need to be assessed in determining the quantum of the rate of return. In a broad sense, therefore, the measure of return should be adequate to maintain corporate credit and to permit a public utility company under efficient management to raise new capital "without impairing the integrity of existing investments". Also the fair rate of return should include something by way of retained earnings—an assurance against the possibility of capital dilution.

PROPOSAL FOR REVISION INADEQUATE

When the Electricity (Supply) Bill was enacted in 1948 and the "Standard Rate" fixed at five per cent the Bank Rate was ruling at three per cent. The Bank Rate has since advanced to 3½ per cent, and this, by itself, has made the Government see the necessity for an upgrading of the rate of return by proposing, in the new Electricity (Supply) Amendment Bill, a revision of the "Standard Rate" from the present level of five per cent to a link-up with the Bank Rate with a differential of two per cent. Against this has been the Industry's long-standing request for a return of at least six per cent, i.e., a differential of 2½ per cent over the Bank Rate.

An important consideration which arises in connection with the Government's proposal is the necessity to fix a floor below which the return to the Industry should not fall, lest the industry be faced with a chance of a lower return than the present level of five per cent because of the Bank Rate being lowered due to

fiscal policies of Government not directly connected with the fluctuations of the money market. Also, when other industries which compete for capital in the money market are able to earn much higher returns, there seems no reason why a differential of at least 2½ per cent over the Reserve Bank Rate should be regarded as unreasonable, especially since, as a basic industry, the electric supply industry also feels the impact, to an appreciable extent, of the ups and downs of the industries which it serves. Undertakings which have expanded recently, or started since the enactment of the Act in 1948, more or less operate on Capital Bases very near to their paid-up capital and this situation will have to be faced by others sooner or later. The effect of this is that, the more a licensee expands his service, the more difficult it becomes for him to maintain his normal dividend and the value of the equity of the investor in the industry. There is, therefore, need for a minimum Reasonable Return of 5½ per cent, irrespective of the Reserve Bank Rate, and the differential over the Bank Rate should at least be 2½ per cent.

NEED FOR ADEQUATE INCENTIVE

In the case of the small-sized undertakings, which find difficulty in raising capital, even this minimum return—5½ per cent—would be insufficient. Many of them are perforce obliged to raise loans carrying rates of interest higher than the "Standard Rate", and this problem can best be solved by State Governments sanctioning to the undertakings concerned, as a special appropriation, the difference between the "Standard Rate" and the actual rate of interest on loan capital, plus ½ per cent "risk money". Most of the small-sized undertakings perform a vital function in opening up the countryside and, therefore, any special assistance given to them would be in the best interests of the nation.

After setting a target of Rs. 42 crores to be raised by the private sector of the industry for electric power development during the second Five-Year Plan period it behoves Government not to place any impediments in the way of this sector achieving the objectives set before it. Indeed, the success or failure of the Plan itself is likely to depend, in a large measure, on a proper appreciation of what is needed to ensure more electricity, so that nothing is more important than to offer a proper incentive to the investor in this industry.

U. S. Rate Regulation Trends

THE financial provisions affecting licensees which are embodied in the Indian Electricity (Supply) Act, 1948, draw their inspiration in some measure from the US Rate Regulation practice, but with this basic difference, namely, that, whereas, under the US Regulation, Commissions conduct 'ad hoc' enquiries before fixing the rates for any given utility, in India, the law lays down a yardstick which is applied by the undertakings themselves, the process being subject to Government test audit. A study of the US rate regulation practice in relation to public utilities would, therefore, be appropriate in this supplement.

EMPHASIS ON INCENTIVES

Fundamental to the rate-making process in the US is the principle that "a reasonable return must be allowed upon the value of property dedicated to the public use"—a principle founded upon constitutional mandate and one which has been firmly established by case laws built up through half a century. In other words, the size of the investment governs a utility's claim for a return, after, of course, providing for operating expenses, taxation, depreciation and all other

proper deductions from revenues attributable to the business. Some voices have recently been raised questioning the economic wisdom of the "property-value" basis of rate-making, on the ground that it fails to give regard to the increase in value because of good management, and a study of the decisions handed down through the years indicates that the regulatory commissions have not been insensible to recognising the need for incentive to good management. Consequently, apart from giving verbal encouragement to efficiency, the Commissions have, in many cases, asserted a policy of rewarding outstanding managerial ability by conceding a higher-than-ordinary rate of return.

In an early case, the State Commission of Illinois indicated that "financial rewards in public utility enterprises should be commensurate with the ability displayed in their management." Another Commission, that of Virginia, went further by saying: "there is just as much reason why operators of public utilities should be compensated for good business judgment and achievement as private business men, and, indeed, to proceed on any other basis would be to encourage incompetence

and slovenliness in the operation of public service corporations which would inevitably reflect itself in inadequate service to the public". Following this, yet another Commission stated that a reasonable share of the savings resulting from economy and efficiency of operation should accrue to the utility, the share being sufficient to constitute an incentive to continued economy and efficiency.

MANAGERIAL PERFORMANCE—A TEST

Managerial performance is also taken into account by a kind of negative process, and this is achieved by omitting from the Rate Base (or Capital Base) assets acquired improvidently. The position of undertakings, which make investments in good faith and in reasonable anticipation of future needs, is, however, safeguarded by Commissions holding that "an improvement that is actually used in public service cannot be withdrawn from the valuation of a utility merely because it becomes apparent, years later, that the expenditure is, in fact, unwise".

Thus, by applying both affirmative and negative processes to the diverse factual situations, the regulatory Commissions have evolved a fairly workable standard of managerial performance for the operation of public utilities. While the standard set is high, it is not theoretical. On this point, it was observed by one Commission years ago that, "if utilities are ever placed on a basis where their return is limited to a fair return under the most skilful management and made subject to further deductions by way of penalisation for every error in judgment, public utility investments will necessarily become so singularly unattractive that further development in expansion in the field will become impossible".

CRITERIA FOR RETURN

For purposes of fixing the Rate Base, historical cost is generally accepted by Commissions, although, in recent years, reproduction cost basis also has been conceded in certain cases. A return of six per cent is normal, and, in a case, a return as high as 8.75 per cent has been sanctioned.

ATTRITION FACTOR

Consequent to the post-war inflation, considerable attention has come to be given by regulatory Commis-

sions and Courts to "attrition"—the gradual reduction in the rate of return caused by the necessity of connecting new consumers at high cost and the time-lag in rate revisions being given effect to. This has led to Commissions making an extra allowance in the rate of return, the mathematical formula adopted in one case being the "addition of 0.031 per cent to the rate of return for every million dollars increase in net plant". Increased return has also been considered by some Commissions to take care of the attrition factor.

DEFERRED TAX

The problem of Deferred Taxation arising out of accelerated depreciation under the Income-Tax Law has been dealt with by a number of Commissions by directing that "the income account is to be normalised by charging an amount equal to the difference between the actual taxes and what the taxes would have been if accelerated depreciation had not been used, to 'Provision for Deferred Federal Income Taxes' or to 'Provision for Future Federal Income Taxes'." There has, however, been a minority view that "saving" or "reduction" in tax should be passed on to the consumer "now" and rates increased when higher taxes are to be paid.

There is, nevertheless, general recognition that the accounting procedure should be such as to prevent an overstatement or understatement of income for the period of tax deferment and an appropriate method should be used which would reflect depreciation expense for both tax purposes and for the purpose of the company's books. The answer, according to one Commission, is "the consistent application of a depreciation method over the life of the property which would approximately offset any variations in depreciation expense".

The purport of the US Rate Regulation, therefore, is to produce the end result of the lowest possible rates which is satisfactory both to the investor in the utility and to the consumer. That the rates must give due regard to the need for a fair return is not a factor which is recognised under sufferance. As the judgment of the Supreme Court of one State has put it, "public utility rates which do not produce income sufficient to cover operating expenses and a reasonable return present a case for judicial intervention".

Problems of Taxation

AN important proposal in the Electricity (Supply) Amendment Bill is, to quote the Statement of Objects and Reasons appended to the Bill, "to provide for the electricity supply industry to avail of the benefits of the Development Rebate permitted under the Finance Act of 1955, by allowing the creation of the Development Reserve". How far the proposal is of real benefit to the electric supply industry may now be examined.

THE DEVELOPMENT REBATE

The clause in the Bill covering the proposal reads:

"VA. (1) There shall be created a reserve to be called the Development Reserve to which shall be periodically appropriated the amount of the difference between the income-tax and super-tax which would have been payable by the licensee if the Development Rebate referred to in clause (vib) of sub-section (2) of section 10 of the Indian Income-Tax Act, 1922, had not been allowed and the income-tax and supertax actually paid by the licensee after making an allowance for such Development Rebate.

- (2) The Development Reserve shall be available only for investment in the business of electricity supply of the undertaking.
- (3) The Development Reserve shall be deemed to be a part of the assets of the undertaking and, where the undertaking is transferred, any balance remaining to the reserve, together with any assets financed from such reserve, shall stand transferred to the transferee along with other assets of the undertaking, and no consideration shall be payable in respect thereof."

The first difficulty which arises is that the clause refers to the difference between the tax which would have been payable by the licensee if development rebate were not allowed and "the income-tax and supertax actually paid". It frequently happens that assessments are in arrears for years at a time and, if the strict literal interpretation of the word 'paid' is taken, the paragraph would mean that the transfer to development reserve should take place only when assessments are completed and tax paid. This interpretation is at

variance with the proposed alteration, which permits a deduction in arriving at clear profits of the amounts set apart for the development reserve and which is obviously intended to be an annual amount calculated by the licensee and his auditors before the closing of his accounts. This wording would also result in licensees, whose assessments were in arrears at the time the new paragraph first affected them, receiving a greater allowance than those whose assessments were up-to-date before the new paragraph first applied to them. It is imperative, therefore, that the word "paid" be altered to read "payable".

Another difficulty which will arise is in a case—and such cases are very frequent in expanding companies—where the licensee has a substantial negative assessable income in view of the high income-tax depreciation allowances for the purposes of the Electricity (Supply) Act. In such cases, there would be no difference between the tax which would have been paid and the tax actually payable under the proposed clause, as, in both the cases, the amount would be nil.

SOME MORE ANOMALIES

Again, there are still other possibilities which are indicated in the attached schedule. These relate to a company having a development programme spread over four years. The figures have been purposely kept small, but it will be observed that, whereas the total development rebate amounts to Rs. 17, the amount on which the development rebate may be calculated can lie between the full amount and Re. 1 only, depending upon the interpretation given to the provisions of the new paragraph. Another difficulty which would arise is whether or not arrears of development rebate can be taken into account. That is to say, in a case where there is either no assessable income or the assessable income is less than the amount of the development rebate, Section 10 of the Income-Tax Act permits the unabsorbed balance to be carried forward for set-off against the assessable income of future years. It is impossible to say, in respect of any lump sum of unabsorbed depreciation so carried forward, which portion absorbed depreciation should be set off first against future assessable income, or whether the development rebate should be set off first.

A further interpretation could be that development rebate and other depreciation may be deducted proportionately from assessable income arising in future years.

Yet another point, which appears to have been overlooked, is the effect of Section 23A of the Income-Tax Act. An example of this is as follows:

Assessable income before deduction* of development rebate	Rs. 12
Less: Development Rebate	2
	10
Less: Tax (say)	4
Minimum dividend payable under Se. 23 of I.T. Act	6
60 per cent of Rs. 6	3.6

If the effect of the development rebate is ignored, the minimum distribution under Section 23A is 60 per cent of Rs. 12 (less tax of, say, Rs. 5)=Rs. 4.2 and an additional supertax @ As. 4 in a rupee would be payable on the balance of Re. 0.6. Is this additional supertax, which would otherwise have been payable, to be

regarded as tax saved by the operation of the provisions of the Income-Tax Act dealing with development rebate?

THE DEVELOPMENT RESERVE—ITS IMPLICATIONS

One further aspect of the problem is that, in the case of some undertakings which have expanded in recent years with high cost plant, the appropriation to the Development Reserve, ranking (as it does, as worded) for priority over Reasonable Return (i.e. dividend requirements), might create chaos, either because of possible public outcry or a difficult economic situation preventing appropriate rate revisions.

A reduction in dividend will, as a natural corollary, prevent the offering of equity finance by the investor, and this, in turn, will act as a brake on development. To the smaller undertakings already in difficulties to attract capital, a prior charge like appropriation to the Development Reserve will necessitate raising the rates still further. It is for consideration, whether to meet such a situation, a proviso should not be added to the new Paragraph VA (1) making it clear that it will not be obligatory to the licensee to appropriate anything to the Development Reserve until he reaches the reasonable return.

Operation of Paragraph VA of the Sixth Schedule

	Accounting Years.				
	1	2	3	4	5
Assessable income before any depreciation	10	10	11	12	14
Less: Depreciation for the year excluding Development Rebate	3	5	7	8	7
	7	5	4	4	7
Less: Development Rebate for the year	1	6	8	2	..
Assessable income before adjusting arrears of Development Rebate	+6	-1	-4	+2	+7
Less: Arrears of depreciation b/f.	..	..	..	-2	-3
Total on which the Development Reserve is calculated	+6	Nil	Nil	Nil	+4

I. If it is assumed that no Development Reserve can be provided when there is no assessable income, the Reserve should be calculated on .. 1 Nil Nil Nil Nil= 1

II. If it is assumed that Development Reserve is provided on the amount by which the assessable income is reduced, the Reserve should be calculated on .. 1 5 4 2 Nil=12

III. If it is assumed that Development Reserve is provided whether there is assessable income or not and to the extent that the assessable income has been reduced by Development Rebate for the current year and arrears from past years, the Reserve should be calculated on 1 5 4 4 3=17

If the suggested amendment is accepted Development Rebate would be calculated on .. 1 6 8 2 Nil=17

STRAIGHTENING OUT THE COMPLICATIONS

The foregoing summary is by no means exhaustive, but it is sufficient to show that the paragraph worded, as it is, is capable of so many interpretations and complications that licensees find it impossible to operate it in practice.

It is, therefore, suggested that sub-clause (1) of paragraph VA be reworded as follows so as to remove all the difficulties:

"There shall be created a reserve, to be called the Development Reserve, to which shall be appropriated annually an amount calculated at the rates of income-tax and supertax applicable for the assessment year for which the accounting year of the licensee is the previous year on the amount of the development rebate to which the Licensee is entitled for that year under the provisions of Section 10(2) (vi) (b) of the Indian Income-Tax Act 1922."

"Provided that, if, in any accounting year, the Clear Profit falls below the Reasonable Return, the amount to be appropriated to the Development Reserve shall be reduced by that amount."

In this connection, the conception that the Development Rebate should not be the property of the licensee is difficult to appreciate. The Union Finance Minister intended that the Development Rebate should be given as a gift to assist all expanding industries and there is no valid reason why the electric supply industry should be treated differently.

DEPRECIATION ALLOWANCES AND WRITTEN-DOWN VALUES

Although the withdrawal of initial depreciation allowance by the Finance Act, 1956 and the introduction of Development Rebate in the Finance Act, 1955 have mitigated the problem of deferred taxation faced by the electric supply industry, the issue will continue to agitate the industry so long as Income-Tax depreciation is calculated by the reducing balance method and the Electricity (Supply) Act depreciation is not. With the Electricity Supply (Amendment) Bill seeking to make no provision for meeting deferred tax liability, a way out of the problem would be for the Central Board of Revenue to agree that the licensee need not claim the full depreciation allowance under the Income-Tax Act and profits for Income-Tax purposes be computed without some part of such allowances.

The considerations which bear on the problem are as follows:

(1) Under the provisions of the Sixth Schedule to the Electricity (Supply) Act, 1948, an Electric Licensee is required to adjust his rates for the supply of Electricity by periodical revisions, so that, as far as possible, his 'Clear Profit' shall not exceed the "Reasonable Return" as defined in the Act. "Clear Profit" means the profit actually earned in any year of account by an electric licensee and calculated after taking into account the various heads of Income, Expenditure, and Appropriations, as laid down in Paragraph XVII (2) of the Sixth Schedule. "Reasonable Return" means the measure of profit which an electric licensee is entitled to earn normally as "Clear Profit" in any year of account, and at present it is

5 per cent of the Capital Base as defined in Paragraph XVII (1) of the Sixth Schedule.

(2) One of the outgoings in arriving at the Clear Profit is depreciation, which must be written off from the books of the licensee on the basis of the prescribed lives contained in the Seventh Schedule to the Act, either under the straightline or the compound interest method. (Most licensees have opted for the straightline method).

(3) The accelerated nature of the Depreciation Allowances under the Income-Tax Act, as compared to the Depreciation which has mandatorily to be written off in the books of a licensee, gives rise to the problem of deferred taxation through the computation, during periods of large capital additions, of assessable incomes at figures much lower than the book profits, or as negative balances of unabsorbed depreciation to be carried forward.

(4) By virtue of the provisions of the Electricity (Supply) Act, tax savings resulting from greater (accelerated) amounts of Income-Tax Depreciation Allowances, which are not tax savings for good but merely deferments of tax liability, are currently passed on in full to the consumers of electricity, and when the taxation once deferred materialises at a later date, additional revenues would have to be found by rate revisions under conditions which may well not be conducive to such action.

AVOIDING COST FLUCTUATIONS

In the context of the position as exemplified in the points enumerated above, it is considered that the only way in which the costs of electricity supply can be safeguarded from violent fluctuations would be some assuagement of tax deferment by licensees by their use of an 'option' not to avail of some element or elements of Income-Tax Depreciation Allowances. In other words, they should be given the opportunity to pay off tax earlier and thus in a more even and regular manner, that is, 'as and when they feel they are in a position to afford to do so.'

It is, therefore, for the Central Board of Revenue to consider whether assessee who are electric licensees should not be permitted to employ an option to claim in any assessment only "Normal" Depreciation Allowances which are allowed in respect of new assets for the first five years after their requisition.

(Note: The Initial Depreciation Allowances having been eliminated under the Finance Act, 1956, this Depreciation Allowance will not enter future Income-Tax Returns. Development Rebate is not strictly a depreciation allowance, nor does it give rise to tax deferment problems. Hence it is not considered for any special treatment in this context).

At the same time, the Central Board of Revenue might issue instructions to Income-Tax Departments not to apply, in the case of assessee who are electric licensees, Income-Tax Depreciation Allowances not claimed by them under their assessments, in any subsequent computations of income-tax written-down values of assets for any purpose under the Income-Tax Act or the Finance Acts.

Sixth Schedule is designed to secure that a licensee shall earn enough to provide him with a reasonable return so that he can raise funds in the market necessary for the proper continuity of his public duties. It is proposed to confine the present discussion to an assess-

ment as to how far the yardstick which these financial provisions constitute has served to achieve the purpose of the Act.

STATUTORY AUDIT

With the application of the provisions of the Sixth Schedule and the Table appended to the Seventh Schedule of the Act to Licensees' Undertakings from the commencement of the succeeding year of account following September 10, 1948, appropriate forms were prescribed by the various State Governments with a view to the licensees rendering accounts to their respective State Governments.

In a number of States, the State Governments accept the accounts as audited by the auditors of undertakings appointed under the Indian Companies Act, while, in some others, either the Accountant-General or the audit unit created by the State Government conduct further test audits. Special fees, be it noted, are charged for such audit. It is for consideration whether uniformity could not be achieved in this respect in all States. With many States already accepting the accounts as audited by auditors of undertakings appointed under the Indian Companies Act, there is no reason why others should not follow suit. Such audited accounts are fully acceptable to the general public in other spheres, and there is no reason, therefore, why these should not be acceptable to State Governments also. Such a course will avoid duplication of work which the additional government audit involves and also superfluous expenditure.

The experience of licensees with regard to government audit cannot be said to be satisfactory. When the Sixth Schedule working of an undertaking is audited by government audit and the audit reports indicate differences of opinion over interpretation of the provisions of the Sixth Schedule, the usual procedure is for the State Government to issue to the licensee concerned a blanket directive asking him to take action on the extracts of audit reports sent to him. This would seem to imply that any view of the government audit is necessarily conclusive.

With a number of licensees, the position since the coming into force of the Sixth Schedule to the Electricity (Supply) Act has been that a number of audit objections has been raised which have been disputed by the licensees. In many cases, the correspondence remains suspended, while the onus rests with government audit to withdraw their objections or comment further.

A way out of the impasse would obviously be for the State Government or the State Electricity Board concerned to take the Electric Supply Industry in the State into confidence so as to explore possibilities of understanding and, if this understanding proves difficult in respect of fundamental issues, then resort to the machinery provided in Clause XVI of the Sixth Schedule to the Electricity (Supply) Act, namely arbitration by the Central Electricity Authority.

POINTS AT ISSUE

During the brief period of seven years that the Sixth Schedule to the Electricity (Supply) Act has been in operation, disputes have arisen over a number of points bearing on interpretation of the provisions of the Schedule. These, in the main, relate to:

- Admissibility of interest on loan capital as an operating expenditure.
- Limitation of dividends to 3 per cent until all arrears of depreciation (as distinct from the depreciation for the year in question and in-

stalments in respect of arrears) have been written off.

- Inclusion in Capital Base of costs of assets no longer in use.
- Inclusion in Capital Base of intangible assets, such as expenditure incurred on issue of new capital.
- Inclusion in Capital Base of monies expended towards work-in-progress.
- Disallowance of donations as expenditure for purposes of rate-making.
- Appropriation to Contingencies Reserve, (one Government holds the view that it should be from existing Reserves, while the licensees are of the opinion that it could be either from the revenues of the year or from existing Reserves).

Besides these, there have been a number of other minor points too which are under dispute. At the time of writing, the Central Electricity Authority has ruled in favour of the licensees on issues (a), (b) and (c) and against them on (f). As the remainder are sub-judice, inferences may not be drawn.

RATING COMMITTEES

A peep into the working of some of the Rating Committees under the Act will be appropriate here. Unlike Regulation Commissions in the US which are guided by case law, a Rating Committee under the Indian Electricity (Supply) Act, 1948, constituted to scrutinise a given licensee's charges to consumers, is obliged to apply the provisions of the Sixth Schedule and to make recommendations which "are not likely to prevent the licensee from earning clear profit—to afford him a reasonable return during the next three years of account...." This process postulates that no disputes have arisen as to interpretation of the provisions of the Sixth Schedule or that, where disputes have arisen, they have been resolved by arbitration by the Central Electricity Authority under Paragraph XVI of the Sixth Schedule.

The constitution of a Rating Committee is not a matter which can be entered into lightly by the Authorities. A mere demand from a section of the consumers who are probably misinformed, and who are unlikely to be fully versed in the laws governing the supply of electricity, is not, according to the Electricity (Supply) Act, sufficient ground for setting up a Rating Committee. Nor could differences of opinion which exist between statutory audit and licensees over interpretation of the provisions of the Sixth Schedule (and which, by law, are to be settled by the Central Electricity Authority) by themselves constitute sufficient grounds for Rating Committees being constituted.

RATING COMMITTEES IN OPERATION

So far, 24 Rating Committees have functioned under the Act, the breakdown being—Bombay 16, West Bengal 3, Rajasthan 3, Madhya Bharat 1 and Assam 1. Some of the Rating Committees have been constituted at the request of the licensees concerned, some as a result of agreement between the State Government and the licensees, and, in one case, as a penalty "for breach of the provisions of the Sixth Schedule". In cases where Rating Committees have been constituted at the request of the licensee, the cause mainly has been the need for the licensee, because of consumer opposition, to be buttressed by a government order giving effect to the recommendations of a Rating Committee. An interesting aspect in these cases has been that the recommendations of the Rating Committees actually resulted in rates turning out to be very much higher.

Code of Financial Control

WITH the passing of the Electricity (Supply) Act in September 1948, there was placed on the Statute Book a piece of pioneer legislation which attempted to draw up a standard financial code for the electric supply industry. The financial control imposed by the

than what the licensees would have charged of their own volition.

In the case of Rating Committees appointed in the Bombay State, the views expressed and the principles adopted for rate revision have unfortunately not been in line with the tenor of the provisions of the Sixth Schedule. The Rating Committees, in many cases, have been "more loyal than the King himself!" In applying the Sixth Schedule, the Committees (on majority decisions), while assuming full powers to interpret the provisions of the Sixth Schedule (notwithstanding that many important points had not then been resolved by arbitration as provided in the Schedule), were, to a large extent, influenced by the views of the State Government and even based their decisions accordingly.

Interest on loan capital was universally disallowed as an item of operating expenditure and, in many a case, the quantum of Capital Base was arbitrarily fixed. One committee enquiring into the rates of a leading undertaking in Bombay thought that provision for Deferred Taxation was 'ultra vires' of the Act and disallowed, for purposes of rate calculations, the provisions towards liability of the licensee for meeting additional income-tax! It also based its recommendations on many other issues on doubtful premises. The result was that, while conceding that the management of the undertaking was efficient, the Committee recommended, rather light-heartedly, a token reduction in earnings, whereas the circumstances justified the need for a considerable increase in rates as contemplated by the licensee!

In the case of two Rating Committees in West Bengal, the main point at issue was the creation of Contingencies Reserve from Revenues of the undertaking which the licensee concerned, in common with the rest of the undertakings, had been doing. Taking the view that "the powers of the Rating Committee, in its terms of reference under Section 57 (2)(a) of the Act, to make recommendations are wide enough to include any recommendation which appears to the

Committee as fairly reasonable in a particular case", the Committee did not permit the appropriations from revenues to the Statutory Contingencies Reserve, although no finality had been reached about the interpretation of the relevant provisions in the Sixth Schedule by the process of arbitration by the Central Electricity Authority.

This brief analysis indicates how unsatisfactory the experiment of Rating Committees has been so far. There have, however, been no attempts at judicial process to set at nought the resulting orders of State Governments, either because of special political reasons, or because, in the ultimate analysis, the licensee could not have economically enforced the rates sanctioned by the State Government.

A COAT TO FIT ALL BACKS

Although it is still too early to draw any definite conclusion as to the effect, beneficial or otherwise, of the financial principles adumbrated in the Sixth Schedule, it may be stated that the attempt to "cut a coat to suit all backs" has created its own problems. Whereas to the small-sized undertakings, the problem is one of meeting operating expense in the immediate present without further borrowings in the hope of some reward in the future for the 'entrepreneur's' efforts, to the established and expanding undertakings, the difficulty is one of raising development capital in the context of the financial control made more difficult by administrative difficulties referred to above. Problems arising out of government audit have come to be resolved with some of the decisions of the Central Electricity Authority already announced, and further process of arbitration should remove other lingering uncertainties. Nevertheless, it must be stated that the electricity industry, which is set on the road to rapid expansion, must be freed from avoidable pin-pricks, so that it may concentrate on its main task of furthering electric development within the sphere allotted to it and within the financial code laid down by Parliament.

Future of Free Enterprise

IN the field of industrial activity, it is sometimes argued, public utilities occupy a special place because of one operator being allotted a given area, where, in the ordinary course, none else is permitted to enjoy similar facilities. In a way, this is true, but a public utility like an electric supply company has still to face competition from other forms of luminant and motive power; then, again, it has to compete with other industries offering scope for higher return for finance in the money market. Moreover, it is because of the so-called special position of utilities that financial and other regulations have come to be evolved to govern their operation.

With all these regulations making for the strictest control, it is for consideration whether more could be achieved by formal State ownership of the industry, at least of those undertakings in the private sector which have records of service and which could continue to render great service to the community.

INDUSTRIAL POLICY NO BAR FOR EXPANSION

The terms of the Industrial Policy Resolution of April 30, 1956, notwithstanding their bringing the Electric Supply Industry under Schedule 'A', do offer sufficient scope for existing undertakings to continue to function and expand where public interest so requires, at least until the statutory options to acquire arise. However, if the industry is to fulfil the targets set before it, it has to be afforded sufficient incentive.

The targets assigned to electricity are not unimpressive by any standards. With a programme of an increase of about 300,000 kW in plant capacity, the industry will be called upon to expand its outlay including distribution by about Rs. 800 lakhs per year during the second Five-Year Plan period, and creating favourable conditions to raise this finance should be part of Government's electricity policy.

Incidentally, how "private" is the private sector of the Electric Supply Industry? The bulk of the shareholders are people of small means, and there are institutional investors such as the Insurance Corporation, which is an important holder of shares. The modern electric supply company is, therefore, anything but a closed institution and has, besides the attributes of a public undertaking, the added advantage of efficiency incidental to a commercial body.

ACQUISITION OUTMODED

In view of this, it is obvious that State acquisition of well run utilities is outmoded. National interests could, in fact, be served better by continuing in service the talents harnessed to some of the outstanding private enterprises. In the consideration of this question the performance of the public sector is most relevant. What has been the record of some of the State-owned undertakings since acquisition from the licensees concerned? Again, how well do undertakings conceived and operated by the State compare in performance

with the best units in the private sector? A proper appraisal could only be attempted by an inquiry of the nature conducted by the Herbert Committee, which recently went into the working of the nationalised Electric Supply Industry in the United Kingdom. A mere comparison by matching units of near sizes in both the sectors may be attempted, but it is unlikely to be of much use, in that the conditions under which undertakings in both the sectors function are not strictly comparable.

Some of the Southern States have taken an attitude bordering on complacency about the working of departmentally-run electricity systems. Maybe, they are efficient, but are they efficient enough? Here, again, comparisons are difficult, as a sizable portion of the power systems was brought into commission when prices were dead low, and there are also other factors like comparable emoluments to staff, freedom from taxation, consumer satisfaction, etc.

IN MADRAS

Madras is a classic example where the zeal for State ownership has outrun the economic need for the change-over, and this has been in inverse proportion to the capacity of the State Electricity Department to avoid disastrous power cuts year after year. Water shortage in the hydro reservoirs (for which the Department is, of course, not directly responsible) could not be met by other ways, but the general public, especially industries depending on the Department for power, justifiably get angry at repeated power cuts and have begun to wonder whether remedial measures are even now being considered. The State has an impressive programme of further hydro development, but

that, by itself, will not solve the recurring problem of power shortage during the dry months. What the State needs, therefore, is firming up by thermal power in a big way. The installation of thermal plant (initial 100,000 kW, ultimate 200,000 kW) visualised in Neyveli will depend upon the successful mining of lignite in the area. If the lignite project proves unworkable, the reality of a thermal station burning coal will have to be faced.

In the face of this, the policy of the State Government merrily continuing the process of taking over undertakings in the private sector rendering useful service cannot bear examination. The Annual Report of the Madras Government Electricity Department for the year ended March 31, 1955, claims a net revenue resulting in an "yield of 6.4 per cent". Where then is the sense in ousting licensees who are permitted by law a modicum of 5 per cent if the process is to involve in a mere change of ownership with no corresponding benefit to the consumer, and when the resources of the State could be more usefully harnessed to, say, the building up of a thermal plant which is very urgently needed?

The continuous power cuts in the State could hardly be helpful towards the State's industrialisation, and if industries gravitate to other parts of the country, no one could be blamed more than the framers of the policy for indiscriminate acquisition. When the country is set on rapid industrialisation, projection of dogmas at the cost of practical values would have disastrous effects, and one can only hope that the preoccupation in the South is an isolated instance.

Conclusion

IN the preceding pages, we traced the beginnings and the growth of the electric supply industry in this country, some of the problems it has had to face in the past, and those the industry is presently confronted with. From its humble beginnings in the 1880s, electric power service in the country has extended in a steadily increasing measure. At the end of 1955, there were as many as 735 public utilities in the country, with electricity production aggregating 8,705 million kwhs, of which 48 per cent was generated by the public sector and 52 per cent by the private sector. The per capita consumption of 19 kwhs—a mere 1/73rd of that in the United States—indicates the leeway the country has to make up in power facilities and underlines the degree of economic advance which the country has yet to achieve. Electric power has rightly been described as "the initial instrument of technological development," without which "the modern outlook cannot grow".

This is the background against which, both in the first and in the second Five-Year Plans, power development in the public sector and the private sector alike has received marked impetus. But it cannot be said that the administrative policies of the Government match the vision of the planners. The second Five-Year Plan draws pointed attention to the peculiar characteristic of electric power development, which is that a measure of imbalance—seemingly over-expansion—is necessary in sectors like development of power where investment has to be "lumpy". With such a capital-intensive industry, low returns tend to dry up resources for development and, should the undertakings be called upon to face this eventuality, a serious blow would be struck at the root of development itself.

Much publicity has been accorded to the ambitious new schemes of both the Central and the State Governments in the sphere of electric development. In all these, one cannot escape the feeling that the role which

the private sector has played, and still continues to play, in making power available to the consumers, has not been sufficiently appreciated. True, with the various multi-purpose projects coming to fruition, the public sector bids fair to become a dominant partner in generation of power, but, even so, the bulk of the power would still have to be distributed through the medium of distributing licensees.

This would postulate the functioning of the private sector in the field of power for a long time to come yet. Recognition of this factor has doubtless prompted, and rightly, the framers of the April, 1956, Industrial Policy Resolution not to disturb the existing undertakings which have been rendering efficient service to their respective consumers. In this context, the isolated instance of the Madras State seeking to acquire undertakings in that State becomes rather unintelligible, especially as acquisition results in no new assets—a test for nationalisation propounded by none other than the Prime Minister himself.

More than in any other business, in electricity service consumer satisfaction is of paramount importance, and we mean no disparagement to the public sector when we say that the private sector outshines in this branch the more rigid bureaucratic system which is, by and large, prevalent in nearly all the State electricity systems. It is perhaps this realisation which has led the framers of the Electricity (Supply) Act to plumb for Electricity Boards to operate the State Grid Systems. It is still too early to pronounce a considered verdict on the working of these Boards. While judgment on this question has to be suspended for some time to come, the urgent need of the hour is that the Act must be implemented throughout the country, of course, with the very necessary amendments which are required to rehabilitate the electric supply industry.
