APPLICATIONS are invited for the following vacancies in the National Union of Students Travel Department, from well-educated, intelligent young people, male or female, interested in travel and preferably with knowledge of the Continent.

Salaries commence from £275 p.a., according to position, experience and qualifications.

(1) Secretary to Travel Organiser. Shorthand-typing and French essential.

(2) Travel Secretary to take charge of technical rail-sea-and-air bookings for individual travel and student holiday tours. Typing, accuracy, grasp of detail and ability to deal with accounts essential. Past travel agency experience and personal experience of travel desirable.

(3) Hospitality Secretary to take charge of arrangements for accommodating student tours from abroad in private homes, student hostels, etc., and student exchange scheme. Typing essential. Experience of voluntary organisations or welfare work, and interest in students abroad desirable.

Applications, with references, to the Travel Director, N.U.S., 3 Endsleigh Street, W.C.1, before December 1, 1949.

THE CIVIL SERVICE COMMISSIONERS invite applications for permanent appointments as Assistant Experimental Officer to be filled by competitive interview during 1950. Interviews will be held shortly after the receipt of the completed application form, and successful candidates may expect early appointments.

The posts are in various Government Departments and cover a wide variety of scientific (including engineering) qualifications. Places of work are spread throughout Great Britain.

Candidates must be at least 17½ years and under 26 years of age on August 1, 1949; time spent on a regular engagement in H.M. Forces may be deducted from actual age. Candidates must have obtained the Higher School Certificate with mathematics or a science subject as a principal subject, or an equivalent qualification. Higher qualifications will be regarded as an advantage to candidates over the age of 20.

The inclusive London salary scale (men) is £230-£490. Salaries for women and for posts in the provinces are somewhat lower. Superannuation provision is made under the Superannuation Act.

Further particulars and forms of application from the Secretary, Civil Service Commission, Scientific Branch, 27, Grosvenor Square, London, W.1, quoting No. 2522. Completed application forms should be returned as soon as possible.

BRITISH Consulting Engineer now in the U.K., having over thirty years' residential, technical and administrative experience in industry and business in the Middle East and exceptional contacts there, would advise British firms regarding business and trade conditions and would undertake missions when visiting the Middle East.—Box 263

SALES MANAGER, Sales Publicity and Commercial Manager, age 37, of well-known international firm in foundry industry experience directing technical and market research, conference present job reached limit of expansion, is anxious for greater opportunities.—Box 194.

YOUNG woman, office experience, control small research office some outside staff. Experience similar work not essential London. Give age, salary required.—Box 266.

Gloom or Obstinacy?

THOSE members of the Government whose weekly custom it is to blame their troubles on the press received a powerful recruit on Sunday last in the person of Sir Stafford Cripps. Speaking to his constituents (and the occasion may perhaps explain the language), he said

There can seldom have been a period when the majority of the press have set out to mislead and confuse the people of this country as they have done over the last few months.

Taken literally, this is an absurd charge. There are 144 daily, Sunday and evening papers in the United Kingdom, and it would be a figment of phantasy to suggest that 73 or more of them had deliberately "set out to mislead and confuse the people." Wild charges of this sort usually rebound on the heads of the politicians who make them; they sound far too much like empty excuses. The press is not perhaps a very popular institution in this country. But one might (without implying any close analogy) say the same of football referees, and politicians who persistently complain of the one are as little likely to advance their reputations as players who assault the other. It sounds too much like criticising the rules to excuse defeat; and the impression that Ministers create by their constant carping against the press is simply that they are getting rattled.

Sir Stafford has hitherto had less right than any of his colleagues to complain of the attitude of the press. When he first began to take hold of the national economy in the winter of 1947-48, there was hardly a reputable newspaper in the country that did not pay tribute to his courage and fidelity. It was the press, far more than the politicians, that built up for Sir Stafford the high reputation he enjoyed a year ago. This was broadly true until the early summer of 1949, when it became apparent to any newspaper with good sources of information that the very qualities of austere rigidity in Sir Stafford that had helped the country in 1948 were beginning to impede the flexibility of policy that is necessary in meeting an ever-changing situation. Even then, the press of the country, so far from "inventing or selecting the facts to make as gloomy a picture as possible" and being "careless as to whether this distorted version of affairs harms the country or not," hung back from that frank discussion of the possibility of devaluation which might be held to have been its duty to its readers. It is doubtful— to judge by the record of the past—whether Sir Stafford himself would have shown a like discretion had he been out of office.

Nevertheless, there is something more important than spleen behind Sir Stafford's outburst of irritation last Sunday. Others of his recent speeches show that he is a disappointed, and may even consider himself to be a badly used, man. He has, after all, carried through, with some courage, a major operation on the currency which, whatever its ultimate effects, ought to have greatly increased its short-run technical strength. He has also single-handedly forced upon his

reluctant colleagues a list of retrenchments which, whether or not they fitted the measure of the economic requirements, took a major political effort to put across. Yet for all this he gets no credit. There is reason to believe that sterling is, indeed, showing great strength—that is to say, that the reserves of gold and dollars are flowing back—yet the world prefers to fix its attention on the narrow, specialised and almost wholly unimportant markets where sterling can be observed to be at a discount. No wonder Sir Stafford seeks for an explanation of this persistent preference of the shadow to the substance. To the critics who complain that the £250 million of cuts form an inadequate reinforcement to the budget surplus, Sir Stafford could justly retort that there is hardly another Minister of Finance in the world who has a surplus to reinforce. Yet in spite of this surplus, the gilt-edged market, for a week or two, recorded nothing but sharp falls. Here again, on the substance of the matter, Sir Stafford is very probably right and the public market is (or at least was) wrong. The fall in gilt-edged was, beyond much question, overdone, and even the yield basis of about 3½ per cent to which British Government irredeemable stocks have this week rebounded may yet prove to be above the normal level of the future, as of the past.

★

The Chancellor is thus quite right in thinking that some special reason is needed to explain why the public reaction to the devaluation and the “consequential measures” has been so much at variance with what he believes their real effect to have been. Where he is wrong is in finding his special reason in the malevolence of the press. There was no room at all for doubt about the genuineness of the public reaction to Mr Attlee’s presentation of the “consequential measures” a month ago. The nervousness in markets is real enough, and so is the head-shaking with which British economic policy is regarded abroad.

The special reason is a very simple one. It has been stated over and over again. Sir Stafford must know it. The markets of the world may be wrong to doubt the temporary relief that devaluation has brought to the British economy. But they are certainly right to hold

that the relief will be no more than temporary if devaluation stands as the sole concession to flexibility that the rigid mind of Sir Stafford will make. Ministers do not lag behind others in emphasising the gravity of the British economic problem; the President of the Board of Trade speaks of “Britain’s last chance” and the Chancellor himself on Sunday said “it’s a terribly tough job.” They cannot complain if the world puts their actions alongside words like these and draws its own conclusions. To devalue after repeatedly promising not to was tantamount to an admission that the previous policy was not proving to be effective; yet even the man in the street can see that devaluation is not so much a new policy as an old expedient.

It is perhaps too much to hope for bold new initiatives of economic statesmanship on the eve of an election. That is the chief reason why the election should be held as soon as possible, since it is now painfully obvious that the bold, new initiatives are urgently needed. Yet even on the narrowest electoral calculations, the Government are surely wrong in thinking that safety for them lies in simply standing pat. There is no confidence anywhere that the policies they have hitherto pursued provide a positive solution to the British economic problem. Even those who support the Government put the case no higher than that the country may just squeak through on a basis of permanent rationing and restriction, provided the Americans are generous and there is no bad luck. And the majority opinion of the world can be read in the markets—it amounts to a profound conviction that the present policies have exhausted their effectiveness and that there will be no permanent recovery until a new course has been set—with or without a change of steersman.

It is not the press of this or any other country that causes this widespread feeling of pessimism and alarm, but the obstinacy of a Chancellor of the Exchequer who can still say “I am not conscious of any change in my approach to our problems.” The only conclusion that the world can draw, and that the press can record, is that yet another crisis—political or economic, or both together—will have to be endured before British economic policy turns the corner on to the road of salvation.

Africa at the Assembly

THE claims and status of the native populations of Africa have, in the last week, been brought with considerable effect to the attention of the Assembly of the United Nations. The chief point at issue is the claim of the Union of South Africa to incorporate the former mandated territory of South-West Africa into the Union and the refusal of its Government to recognise the competence of the United Nations to pass judgment on the proposal. For the moment, the question has been shelved by the Assembly’s decision to refer the legality of South Africa’s scheme to the International Court of Justice, but the case gave rise to a new and possibly fateful precedent when the Assembly agreed to hear direct evidence on the hopes and fears of the natives in South-West Africa from their highly unofficial representative, the Reverend Michael Scott.

The case of South-West Africa occupied the fore-

ground of the delegates’ attention, but another issue, no less momentous in its possible implications, also came up for discussion. In the Fourth (Trusteeship) Committee of the Assembly, Mr John Fletcher-Cooke, the British delegate, repeated in the most uncompromising terms his Government’s determination to limit the interventions of the United Nations in the administration of colonial areas to the powers specifically granted in the Charter. This attitude was strongly endorsed in Wednesday’s debate on Africa in the House of Lords. The Trusteeship Council’s power to send commissions of inspection and make recommendations is confined to the areas formerly under mandate—that is, in substance, the former German colonies. For all other dependent areas, the metropolitan power is under the obligation only to submit technical information on economic and social matters. The British delegate

strongly attacked the claim of the Trusteeship Council’s Special Committee on non-Self-Governing Territories to extend its jurisdiction over all colonies into something comparable to that exercised by the Trusteeship Council over ex-mandates.

The fact that both of these issues were discussed against the background of riots and disorder in Nigeria only helped to underline a fact that no responsible European statesman can overlook—that the mood of world opinion, in so far as it is fairly represented at the United Nations, is hostile to the concept of colonialism and inevitably regards with suspicion much that is done by Europeans in Africa. America by tradition, Russia by ideology, the Asiatic and Arab states by memories of dependence, the South American republics by national self-consciousness, are all committed to the view that the dependence of one people upon another is an evil thing and can be tolerated only in the certainty that it will soon come to an end.

The recent proceedings of the Trusteeship Council and of its Special Committee on non-Self-Governing Territories provide plenty of evidence of this suspicion. The decision to hear Mr Michael Scott is one instance. The critical and in part tendentious report submitted by the United Nations Commission which visited Tanganyika earlier in the year is another. The European colonial powers are not unjustified in their fears that if the jurisdiction of the Trusteeship Committee of the United Nations is extended—and the pressure is steadily in that direction—they will find themselves in a position in which sound administration is impossible, in which they carry all the financial and executive responsibility for a colony while policy is constantly being made for them by outside bodies which in the nature of things are irresponsible.

★

There is thus ample justification for opposing a blank negative to the claims of the United Nations. But is it wise? World opinion is strong and remarkably unanimous on the question of colonial status. It will not be shaken or modified by an unqualified refusal to take its views into consideration. Nor is a negative reply even necessary. The aims supported by world opinion—speedy development and final self-government in Africa—do not in anyway contradict the declared policies of the colonial powers. Least of all do they clash with those of the British Government which in the last four years have brought both Nigeria and the Gold Coast to

the brink of self-government. It hardly makes sense to repeat time and time again: “We support to the full your desire to secure development—economic, social and constitutional—in Africa, but we cannot tolerate any inspection by you to see if our deeds match our words.” The need for some affirmative reply seems evident. The difficulty lies in devising a scheme which ensures that outside inspection is responsible and constructive and not an occasion for purely partisan attack upon the colonial powers.

The trouble lies, surely, not so much in the fact of inspection as in the nature of the bodies which do the inspecting and in the way in which they go about their business. The colonial powers would be in a stronger position if, instead of refusing the United Nations the right to inspect and to receive reports on all colonies, mandated and otherwise, they laid down the conditions upon which they would be prepared to accept supervision. For instance, they could ask that the Trusteeship Council be reformed to include men of genuinely expert qualifications, comparable to those who formerly worked on the Mandates Commission of the League of Nations. They could lay down conditions for the examining Commissions, refusing to consider any recommendations based on less than two years’ study on the spot of the colony in question and requiring a percentage of reputable technicians and specialists among the Commission’s members. The danger today is from ill-informed politicians taking a trip at the United Nations expense under the illusion that a week in a colony’s capital together with three talks with a disgruntled chieftain constitutes a serious inquiry.

The colonial powers could also with perfect justification refuse to accept any commission on which Soviet Russia was directly or indirectly represented. A minimum amount of good faith is required from inspecting commissions and there is no point in preserving the fiction that the Russians aim at anything but sabotage in other people’s colonial territories. It is true that it is not only from Communists that biased and unreliable criticism may come. Indeed, neither Russia nor its satellites were represented on the Tanganyika Commission. But the safeguard of excluding the eastern bloc is nevertheless reasonable. In 1947, before Russia interested herself in the Trusteeship Council, the Council did good work and even sent out to Samoa a model Commission of Enquiry, whose recommendations were accepted by the New Zealand Government. The standard of objectivity declined abruptly with Russia’s

£1,000 ON RETIREMENT...

... at age sixty-five, or on previous death, may be assured through an endowment policy for an annual outlay of £25 12s. 6d. from age thirty. Only £4 18s. 4d. more secures the right to participate in profits which, if maintained at current rates, would yield a further £607 by way of reversionary bonuses at age sixty-five.

The premiums for other sums assured, ages or terms of years will be quoted on application.

OUTSTANDING VALUE IN LIFE ASSURANCE

participation in the Committee's work. Given the general reaction to Russian policy in the United Nations today, the colonial powers would probably have little difficulty in securing the exclusion of Russian or satellite representatives from all commissions of inspection.

Once these minimum conditions of objectivity had been secured, the responsible authorities ought surely to have little to fear from international inspection not only in trust territories but in non-self-governing areas

The Hairdressing Trade

ONE of the most obvious facts of a complex industrial society is the lack of knowledge which its inhabitants possess about the environment in which they live and move and have their being. Consumers in Britain spend a tenth of their whole incomes on "other services" about which official statistics reveal nothing, but some knowledge of which is essential to any complete picture of how the economy works. Of the minor industries which make up these "other services," hairdressing, in which perhaps 130,000 people are occupied, is one of the most important.

The demand for hairdressing—and indeed, every other aspect of the trade—is divided distinctly into the sections that cater for men and women. The demand for men's hairdressing has always—at least since the end of the eighteenth century—been relatively stable; hair-cutting is a strict necessity for most of the male population and there are obvious limits to over-indulgence. The numbers of men willing to pay to be shaved have declined sharply since the advent of the safety razor. The chief demand remains, on the men's side, for the regular quick despatch of a tiresome duty. Women's demand, on the other hand, shows all the fickle characteristics of a luxury trade, fluctuating with every change of fashion, of technical contrivance and of spending power. Twenty years ago the total trade was only half its present size, and the difference is due almost entirely to women's hairdressing. In Blackpool, for example, there were four women's shops in 1918, about 35 in 1925 and 180 today. The ugly semi-masculine "bob" which appeared after the first war created a great potential demand for something to soften its first austerities. Before time could restore the simple dignity of the "bun," professional hairdressing seized a market with the Marcel iron-wave at half a crown and upwards, which an expert could make to last over a fortnight, and with the first commercial permanent wave by Eugene at ten guineas. Nature has never since been able to compete.

The trade boomed. Apprenticeship premiums were fifty—even a hundred—guineas for seven years' training at a nominal wage. The capital outlay needed for an independent shop was small, and, between the two, the adult employee paid a full adult wage was squeezed out. Prices fell steadily, particularly those of permanent waving, and ever wider markets were tapped, until in the late thirties there was a considerable trade in the seven- and -sixpenny permanent wave, with cheap materials, few curlers, and often with poor workmanship, which produced a result all too reminiscent of the wool-curling from which it was technically derived. The war exposed the instability of the demand. It withheld customers by long hours of work and high prices from

as well. Certainly this should be unequivocally the case in British dependencies. The declared policy of Britain in its trusteeship agreements and elsewhere has been to secure the economic and political development of the native peoples in Africa and to prepare them for eventual self-government. Since the aim is clear and in many areas the degree of its realisation is impressive, what have they to gain by insisting without qualification that no outside supervision shall test the result?

visiting the hairdresser, and there developed a fashion for utilitarian "rolls," for artificial plaits, or for extending the life of a permanent wave for a couple of years by shoulder-length styles. The trade has tried hard to coax fashion back into more profitable channels, but there are limits to its influence.

There is at present one hairdresser's shop to approximately every 1,300 of the population in Great Britain; to every 600 in the United States, and to every 800 in France. The sample survey of the trade in Great Britain made by the Hulton Press gives women's shops as numbering 13,600, men's shops as 11,000, and combined men's and women's shops as 10,600—a total of 35,200 in all. Of these only 2 per cent (including those of co-operative societies) belong to chains of more than four shops, and about 88 per cent are completely independent. Staffs, including the person in charge, average only 3.5 per shop, and 10 per cent of the total are actually one-man establishments.

This small-scale character is attributed within the trade to the importance of the personal attention a proprietor bestows upon each customer. It seems more probably connected, however, with the fact that a new business can be started anywhere (except in the West End of London) with a relative low capital outlay, since the stocks required are small and second-hand tools are easy to come by. It seems also to suggest the absence of any substantial "pure" profit in excess of the value of the manager's skill as a craftsman. Such multiple shops as there are can often be accounted for by the advertisement value of a hairdressing service in other multiple businesses such as retail stores.

Profits vary with locality, with personalities, and (in the women's trade) with the seasons and the general level of prosperity. The typical suburban joint shop run by a married couple is often maintained less for the size of the profit than for the value of independence in a very independent trade. Men's shops make a small profit on a quick and regular turnover. Charges are highly standardised and overheads are small. It is estimated that the average operator spends about 13 hours a week in "waiting time." The business man "slipping out" in the middle of the morning, or the factory worker on Saturday afternoon is sensitive to delays. Custom is both casual and irregularly spaced and, for a big establishment, always to keep enough assistants ready to deal with a rush of work is expensive, and only in rare cases can the price be increased accordingly.

In women's shops, prices, profits, and the scale of

operation respond to quite different circumstances. Items of service are dearer and take longer; appointment booking is universal, and most customers judge service at least as much by the price charged, the atmosphere and personalities of a shop, as by the quality of the work itself. Here, though goodwill means more than in the men's trade, loyalty attaches to an operator rather than to a shop, and the chief requirement for independence in a small way is perhaps a couple of hundred pounds and a group of friendly customers. Hence, once again, the small scale of most women's establishments.

★

It has been possible to assemble approximate figures relating to three widely different independent women's shops in London. Each is in no way remarkable, although to call them typical is perhaps to suggest a greater uniformity than actually exists.

	Annual Takings	Over-heads	Wages	Materials	Profit
	£	%	%	%	%
A. Good-class West End	10,000	32	40	17	11
B. Suburban middle-class	2,000	30	35	12	23
C. Working-class	2,000	31	45	15	9

The similarity between these three would be even more striking if the suburban shop were to promote one advanced apprentice to an adult scale. The consistent proportion of gross income expended on overheads and materials bears out the common opinion that higher prices must reflect, not only better workmanship, but better materials and appointments.

Prices in men's shops are fairly stable and rivalry takes the form of service and speed. The cut-price "tenpenny slasher" exists here and there, but there is so little room for sound economies that quality falls quicker than price. On the women's side, however, the price tends to be "what the traffic will bear." About 70 per cent of the turnover represents permanent waving; this usually subsidises the smaller items, such as trimming, shampooing, etc., which at popular prices barely cover their cost, but help to fill up the timetable. Attempts to sustain prices by trade organisations have all failed; well over half the master hairdressers in the country belong to none of the three national organisations, and defaults from voluntary agreements are hard to check. During the war these organisations, together with the leading manufacturers and wholesalers, pooled their efforts through the Hairdressers' Trade Association and succeeded in enforcing minimum prices because of general shortages and the effectiveness of blacklist boycotts. However, since less money has been chasing more goods the majority of shops have run well below the agreed scale of charges, and the strictures of the Resale Price Maintenance Committee last June coincided with the Association's virtual demise. Attempts by the biggest national organisation to revive price-fixing at lower rates and to disarm official wrath by removing defaulters from a "white list" instead of adding them to a black one, have stuck on the other horn of the dilemma—namely, protests in the trade at the organised endorsement of unprofitably low prices.

★

The recently defeated Hairdressers' Registration Bill, disguised by irrelevant appeals to hygiene and public safety, only added one more failure to those of voluntary

organisations to establish a basis for a closed shop, although such legal registration is enforced in the United States, France, and Australia. Thus the market price, fixed by competition, is once more in the ascendant, and such freedom to fix his own charges as the individual operator may enjoy are the result, partly of such market imperfections as customer loyalty, and partly of real differences in standards of performance. Competition finds expression in efforts to increase quality rather than to reduce price. Local academies—a traditional name for hairdressers' clubs—exist in almost every district, and meet regularly to pool their knowledge. Experienced members demonstrate and experiment, and the younger ones learn. These evening academies, voluntarily conducted by working hairdressers with no direct financial motive, are the real means of maintaining skill, improving techniques, and training assistants, and are understandably sources of great pride and rivalry throughout the trade. It is a commonplace that the real concern over price fixing comes from the manufacturers, the wholesalers, and the less competent of the hairdressers themselves. The position contrasts strongly with that in France, where a united and powerful association has enforced a rigid pricing system, with effective reprisals against offenders.

The customer, beyond much doubt, is the gainer, at least on balance, from the competitive and unorganised nature of the trade. But the worker in the trade is often the sufferer. Several things stand in the way of an effective organisation for collective bargaining. There is the irrational human element that has attracted into the trade more bright elementary school girls, interested in their appearance and sociably inclined, than the trade can properly hold. The common practice of two or three assistants working side by side with the proprietor makes trade union organisation difficult, and less than one worker in ten is a member of a union. Consequently, before the war, wages of 30s. or 40s. a week were normal in the provinces (where tipping is insignificant) for trained workers, and hours were long. Some improvement in average earnings has resulted in the last decade from wartime prices and shortages of labour, and to prevent a reversion to prewar conditions a Wages Council order came into force on October 17th, which fixes minimum wages roughly at those then in force in shops with cheap working-class custom, that is from 95s. to 110s. for adult male workers. Apprenticeship terms are also now fixed. To the very cheapest shops, particularly in rural areas, the new rates will mean a loss unless some assistants are dismissed.

The very cheap services, therefore, will never return. Instead, falling prices will encounter a rigid cost item, comprising 35-45 per cent of all charges, while the limitation of one apprentice to every two operators will gradually reduce the worst effects of overcrowding and low standards. It is unlikely that the demand for hairdressing will stay for long at its present high levels, and the Order will not prevent quite sharp falls in earnings, especially in the more expensive sections of the women's trade. Even so, however, the trade will probably find itself in a healthier state than ever before, with still more than enough competition to encourage efficient workmanship. The losers will be those customers who will no longer be able to afford a price that covers the lowest cost; they will have to content themselves with the belief that "A Hat Makes All the Difference."

Australia in the World

THE general election in Australia on December 10th has an added interest in view of the Labour defeat in New Zealand last Wednesday. Public opinion polls in Australia were already showing a slight balance in favour of the Opposition—the Liberal and Country parties which have joined together against Labour—and the New Zealand result may tend to tilt the balance still further, since waverers like to think that they are going to be on the winning side. It may be that the Antipodes, after a decade of Socialism, are swinging back to the centre, if not yet to the right. But it would be a mistake to prejudge the issue; seen from London, the two sides appear to be equally matched and there is every indication that it will be a close fight.

The chief domestic issues are full employment and nationalisation. The Labour Party maintain that they have been responsible for the almost complete absence of unemployment since the middle of the war and that, while they intend to proceed slowly with nationalisation, the state must control the resources of the nation if it is to advance and expand as it should. They are, however, fighting the elections mainly on the merits and demerits of the personalities concerned. Their campaign has been vigorous and forceful, but, as the late Mr Beasley is reported to have said, such tactics only work once and the Labour Party has used them before in the 1946 elections.

The Opposition parties are also in favour of full employment, but it is probable that some at least of the voters are not convinced that they would defend it with quite such ardour as the Labour Party in the event of a depression. There is, on the other hand, no doubt about their attitude to nationalisation. Both the Liberal and Country parties are vehemently opposed to it and say that they will not tolerate any further restriction of the liberty of the individual or of the independent states. They have been helped in their campaign both by the fact that Dr Evatt lost the Bank Nationalisation case before the Privy Council and by the rash statements of one or two Ministers—particularly of Mr Ward, the Minister of External territories, who said that the Labour Party would in time abolish the Senate, the chief safeguard of the interests of the smaller states.

But beyond the questions of full employment or nationalisation, the election will probably be decided by the fact that Labour has now been in office for eight years. The belief in "fair shares" can be applied to political parties, and it is almost a tradition in Australia not to give any one party too long a period of the enjoyment of the fruits of power. There are also many Australians who doubt whether the principles of the Labour Party are those that Australia will need in the next stage of its development. Some form of welfare state there must be, but its rigidities fit badly to a country that is now expanding fast. Secondary industries are springing up, migrants are arriving in large numbers, and there is an urgent feeling that Australia should build up its strength and its population as rapidly as possible if it is to survive the potential challenge of a Communist China and a resurgent Japan.

The question is being asked whether socialist policies

are the best for promoting the rapid expansion which is believed to be necessary. The close control which Mr Chifley would like to keep over the Australian economy, the insistence on a high standard of social services, the elaborate machinery for dealing with any faint signs of unemployment, all mean a slowing down rather than a speeding up of the forces behind expansion. It may be that, without prejudice to what may be necessary in the future, Australia needs at the present time a government with a more liberal attitude towards economic expansion.

★

Although in Australia itself, foreign affairs or Commonwealth relations are subjects of remote interest which barely enter into the calculations of the voters, a change of government in Australia might be a matter of some importance to the outside world. If the Opposition were to win, there would probably be a slight withdrawal at least from the limb on which Dr Evatt's energy as Foreign Minister has placed Australia. In all the major international consultations, from Bretton Woods to Uno, Australia's role, under the Labour Government, has been highly individual. Dr Evatt has been unwilling to follow the leadership either of Britain or of the United States. In spite of Mr Curtin's plea in 1942 for closer co-ordination among the Dominions, Australia has been the most strikingly independent member of the Commonwealth, at least in speech and appearance. And in the long series of economic conferences, to which American policy has attached such great importance, Australia has been a persistent dissenter. It might almost be said that while Canada has been aspiring to be the smallest of the great powers, Australia's wish has been to lead the Opposition to all the great powers.

During the postwar years, Australia has jumped into the limelight. Dr Evatt has made his government's voice heard in all the principal capitals of the western world. He has organised or broken up *blocs* with cheerful impartiality—and not always with a sense of responsibility. He has made himself the spearhead of the emotional forces against oppression and for peace—sometimes, as during the blockade of Berlin, almost to the point of advocating appeasement. He became the chief spokesman of the minor powers' right to have an equal say with the major powers. He sealed his career as a Foreign Minister by being elected President of the United Nations; and, as he himself once remarked, that was equivalent to becoming president of the world.

But from all this turbulence there has emerged a reasonably clear Australian foreign policy, wider and more definite than before. It falls into three distinct parts: it is intended first, that Australia should be the catalyst which will bring about a fusion between Asia and the West; second, that a ring of friendly buffer states should be created against possible threats from China and Japan; and third, that the prewar shape of the Commonwealth should be maintained as a source of military and economic strength for all its members.

The working out of this policy has involved the Australian Government in a number of angry disagreements with western powers. The chief bone of conten-

tion has been Indonesia, where Australia more or less openly took the side of the Republicans, although Dr Evatt was, for once, careful not to commit his government so far that they could not withdraw. The resulting clash with Holland did not improve Australia's relations with Europe, but the final outcome of the round table conference at The Hague and of the confidence which Australia has now won in most Asian countries has justified its actions. Australia also showed its new power at the Asian conference in Delhi last January; with New Zealand, it was one of the only two "white" countries represented, and its delegate succeeded in guiding the conference away from a too violent expression of anti-European sentiment.

★

In Commonwealth affairs, the present Australian Government, in spite of its independence, has on the whole been more active in promoting the bonds between the Dominions than in weakening them. In economic matters, for example, Mr Chifley has been prepared to work fairly closely with Whitehall, and at Uno it was Dr Evatt who, by persistent lobbying, saved the day for South Africa when the question of South-West Africa

NOTES OF THE WEEK

Parliament and the Future

The House of Lords put Mr Morrison out of his agony on Tuesday by rejecting the Parliament Bill for the third time, thereby clearing the way for the measure to receive the Royal Assent under the Parliament Act of 1911. Thus Mr Morrison can now report to the Prime Minister that by Christmas the Labour Party's legislative programme will have been completed and Mr Attlee can continue to ponder upon the best date in the New Year for the election with at least this problem off his mind. The only other important Bills which remain to be dealt with this session are the Justices of the Peace Bill (which may indeed still be lost if there are lengthy arguments in committee) and the India (Consequential Provisions) Bill—a measure designed to adjust the legalities which will arise when India becomes a Republic within the Commonwealth in January.

When Parliament reassembles in the New Year, the Government will have to decide whether to keep MPs busy during the pre-election period by bringing forward some of the many minor Bills which Government departments keep in their pigeonholes for years, in anticipation of just such a quiet period, or alternatively whether they should begin the election campaign by devoting Parliament's time to a series of grand debates on general policy. Much will depend on the date of the General Election. If the election comes, as still seems likely, late in February or early in March, there would seem to be little point in rushing through a series of small Bills during the closing stages of this Parliament.

It is regrettable that the one major modification made in the constitution during this Parliament, the halving of the veto period of the Lords, should have to be considered primarily in terms of its impact upon election tactics; but that has been the fate of the measure throughout. It has always appeared as a gap deliberately cut in the existing procedure to enable the Steel Bill to be bundled through in time for the election; and so strong has the circumstantial evidence been for that view, that no amount of official disclaiming has persuaded anyone to think otherwise. The Parliament Bill will become law, with the now needless clause giving it retrospective effect to cover the Steel Bill included among its provisions as a curiosity and a reminder

was first raised. On the other hand, they have been against any formal strengthening of Commonwealth ties; they dislike the idea of a secretariat or of any body with supernatural powers—even though the suggestion first came from one of their former leaders—and they are determined to preserve their freedom to act as and how they think best over any particular question.

A change of Government should not be expected to lead to any sharp changes, of course, in Australian foreign policy. Much, of course, will depend on the personality of a new Minister. But none of the likely candidates—the choice would seem to lie between Mr Menzies himself and Mr Casey—has Dr Evatt's boisterous temperament, and the headlong rushes into situations where angels have feared to tread would be replaced by a suaver and more cautious approach. There would be more verbal emphasis on the unity of the British Commonwealth. But the main outlines of Dr Evatt's policy are not his personal creation and would not pass with him. Even if the Australian people should wish it (and they do not) they cannot retreat into the role of a dutiful outpost of Empire. For better or for worse, Australia is out in the world, with interests of its own to defend and dangers of its own to face.

★ ★ ★

Labour Loses New Zealand

The defeat of the Labour Party in the New Zealand general election on Tuesday and Wednesday was not quite the landslide it at first appeared to be. The proportion of voters who swung from left to right was only about 7½ per cent of the total, but this was enough to give the conservative National Party a majority of 12 members in a parliament of 80, as against their minority of four seats in the last parliament. The new House of Representatives will contain 46 members of the National Party and 34 members of the Labour Party; all the 16 Communist candidates lost their deposits, and no independents succeeded in getting in. The National Party gains were chiefly in suburban constituencies and in electorates containing mixed urban and rural voters. The Labour Party kept its hold over the four Maori seats.

Mr Sidney Holland, who as leader of the National Party becomes the new Prime Minister, has therefore a good working majority; it will be a matter of great interest to see what he does with it. For, after fourteen years of Labour rule, New Zealand has become firmly established as a welfare state and, in spite of electioneering speeches, it is difficult to see what major changes Mr Holland will be able to make.

Almost the only real dispute between him and Mr Fraser, the retiring Prime Minister, was about price controls and import and export restrictions. While controls over trading within New Zealand can easily be relaxed, and probably with benefit to the community, the future of controls over external trade is a more complex matter. Mr Holland will have to be careful if he is not to lead New Zealand down the path which South Africa followed in 1947 and 1948. He is also likely to meet trouble on the waterfronts, and it is just possible that, in spite of his majority, he may have to go to the country before his full term is up.

From the point of view of the Commonwealth the loss of Mr Fraser in its deliberations must be regretted. He brought to the Prime Ministers' conferences common-sense and sound reasoning which will be missed.

* * *

Trouble in Nigeria

It has been known for some months, even for some years, that the situation in Nigeria was very tricky. Nationalist, anti-British feelings have been fed by a ceaseless stream of newspaper propaganda, particularly among the Ibos of the eastern provinces where trouble has now broken out. What is surprising, all things considered, is that the trouble has not, so far, taken a far worse turn.

The fact remains that twenty Africans have been killed by the police in suppressing riots. This is a serious matter for a colonial power at any time, and never more so than when, in the eyes of the world, it is on the defensive over its colonial policy—as is Great Britain even today. The prompt appointment of a commission of inquiry into the disorders, which includes two Africans, one from the Gold Coast and one from Nigeria, among its membership of four, is, therefore, greatly to be welcomed. Clearly, until it has reported, any comment on the disorders themselves should be withheld.

Their background is, however, instructive. Mr Creech Jones said in the House of Commons this week that the trouble at the Government coal mines at Enugu, where the rioting started, was not an ordinary industrial dispute, in the sense that there was no breakdown of negotiations for higher wages. The origins of the trouble seem, in fact, to go back two or three years when, owing to the lack of success of the African

trade union in the mines, a new one was formed under management sponsorship. Its leaders were promptly called management men by the disgruntled leaders of the displaced union. One of these, Mr Ogiyi, persuaded large numbers of workers not to follow the new leaders, and ever since there has been rivalry between him and his following and the officially recognised union leaders. Obviously, the best bait that both sides could use to attract more adherents has been a promise of higher wages. In this Mr Ogiyi has had a big advantage because the official trade union had not been set up when the Harrigan committee recommended higher wages, with considerable back pay, to civil servants and other Government workers; Mr Ogiyi, being the trade union leader at the time, is consequently regarded as the man who obtains for the workers their just claims. The claims of the rival leaders thus became wilder and wilder and more and more demagogic; and when it is considered that all this was taking place in an anti-British and anti-Government atmosphere, it is hardly surprising that the trouble should have spread. As so easily happens, a dispute that began between Africans was rapidly turned into an anti-British incident.

* * *

Free Trade Unions

It is now nearly a year since the representatives of organised labour in the western countries withdrew from the World Federation of Trade Unions, after a protracted quarrel between the "reformists" and the "revolutionaries." The formation of a new international organisation to speak on behalf of the non-Communist unions in the free countries is the logical result of the failure of east and west to find a bridge of compromise in the World Federation as in other international organisations. The impetus for a new organisation has largely come from Britain, the project having been initiated when British trade union leaders visited America last spring, and launched at a meeting last June in Geneva.

The conference of free trade union leaders now taking place in London is impressive both in its size and in the quality of its delegates. There are 245 delegates and observers who claim to represent over 45 million workers, not only in the industrial countries but also in colonial territories and economically more backward countries. One of the most encouraging signs is the keenness of the American delegates to make the organisation a success, a fact illustrated by the presence and co-operation of Mr William Green, president of the American Federation of Labour, and of Mr Walter Reuther, president of the United Automobile Workers and a powerful figure in the Congress of Industrial Organisations which has fought such a bitter battle in the past with Mr Green.

That there are certain stresses and strains within the conference was made clear on the opening day in discussion of the position of the Christian unions. With the exception of the French, none of the Christian groups has been invited, because of the opposition of the secular unions. A compromise solution has been accepted whereby the Christian unions will be included if they agree to withdraw from their own International, which claims nearly three million members.

The most difficult question upon which to achieve agreement is that of the emphasis to be put upon anti-Communism in formulating the views of the new organisation. It is agreed that Communism is the enemy, but the problem is to decide how far the new International should be aggressively anti-Communist; this means drawing in dubious unions from the extreme right. The AFL seems to regard anti-Communism as the main criterion. The TUC, on the other hand, and most of the west European trade unions, would rather see the stress laid on positive, social and economic advancement. The great advantage of the new organisation is that it is composed of men who are roughly like-minded and who are anxious to arrive at effective com-

promises. It is this that should prevent it from degenerating into the frustrated impotence that made the WFTU a meaningless and dangerous forum.

* * *

Mr Morrison's Tune-up

Mr Herbert Morrison, generally the embodiment of sweetness and reason, appears to be working up to a pre-election pitch of uncharacteristic shrillness. His more usual vein was apparent, at Birmingham last Saturday, in his advice to the Liberal Party not to associate with the wicked Tories, not even to try to induce them to withdraw, here and here, to let the Liberals in, lest they should be eaten alive as the Liberal Unionists and Liberal Nationals before them. The spectacle of Labour solicitude for Liberal independence and survival is interesting; it indicates Mr Morrison's personal belief that a large number of Liberal candidates would, on balance, draw more votes away from Conservative than from Labour candidates (a fact which should be borne in mind when either Mr Morrison or other Labour spokesmen claim, as they frequently do, that the Labour Party is the natural heir of the Radical tradition).

When, however, Mr Morrison turned to the recent tax-free payments in consideration of which Mr Lord and Sir John Black undertook never to serve any other firm competing with those now employing them, an unmistakable election-year acerbity crept in. He had an important theme—restrictive covenants on the one hand, tax-circumventing devices on the other—on which much could have been said, and said strongly, outside the field of party politics. He chose instead to emphasise a quite farcically irrelevant parallel with the direction of labour, which (compulsory and uncompensated as it may be) is in his view far less of an infringement of individual liberty than that to which the two motor magnates have submitted. To draw so far-fetched and superfluous a comparison suggests that Mr Morrison has the direction of Labour heavily on his political conscience.

Electioneering shrillness, however, rises to its highest pitch in his repeated attacks on the advertising campaigns now being conducted by the sugar refiners, the cement makers and the industrial assurance interests who are threatened with nationalisation by the Labour Party's election programme. Mr Morrison suggested that the money spent on these campaigns should be reckoned as election expenses within the meaning of the law and charged against all candidates standing in opposition to the Labour Party. One would be tempted to dismiss this as a pleasantry of the hustings, if it were not for a rash of obviously inspired statements by the political correspondents of the newspapers that the Labour Party is seriously thinking of bringing a test case. If the law is really discovered to be quite so absurd as to prevent threatened industries from defending themselves, it will obviously have to be changed. But it is very hard to believe that the law is such an ass as Mr Morrison makes it out to be.

* * *

Communist Doldrums

Last week-end the British Communist Party held its 21st Annual Congress at Liverpool. Despite reports of tremendous enthusiasm and despite the fiery speeches, it is evident that the Communist Party has for the time being reached the political doldrums. In his report Mr Harry Pollitt, the general secretary, writes of the party's failure to make headway with an air of bewilderment and frustration which is unusual in such literature. "The main weakness of our work is that we have still not succeeded in leading the masses into action on the scale that is necessary." The party, according to Mr Pollitt, is too small, with a membership of 40,000, for effective action. Surprisingly, it also contains too many apathetic people, unwilling to master the party line—

"we tend to be content with laying down a line of policy, and then not taking every possible measure to see our membership is firmly convinced of the correctness of that policy"—and too lackadaisical about recruiting new members. This is to be overcome by cracking the whip over the more sluggish members and adopting a more militant attitude. The Communist in trade union or factory is now to fly his own colours and pay no lip service to social democracy.

On Monday the *Daily Worker* castigated the Sunday press, muzzled by its capitalist masters, for paying no attention to the Congress, but the truth is that the political activities of the Communist Party have at the moment little news value. The Communists will put up about one hundred candidates at the General Election, but it is more than possible that they will not return one member. In the Gallup Poll figures published this week in the *News Chronicle* the percentage of the popular vote not attributable to Labour, Liberal or Conservative stands this month at one per cent (it was as high as six per cent after the 1948 Budget), which since it must be shared with Independents and Independent Socialists, can give the Communists little hope of a Parliamentary party. Their sphere of action is in fact largely limited to causing trouble in industry, and it is significant that the London dockers come in for a fatherly pat on the head from Mr Pollitt.

* * *

Dogs of Peace

Having spent nearly eighteen months trying to coerce Tito's Yugoslavia by all means short of invasion, the Cominform has seen fit to issue the most belligerent resolutions in favour of peace that bitter and suspicious men could draw up. Meeting secretly near Budapest early last month, its delegates no longer enjoyed the assistance of the Bulgarian Vice-Premier, Kostov, now accused of trying to "physically annihilate" his late Prime Minister Dimitrov; or of the Russian Zhdanov, now dead; or of the Rumanian Foreign Minister, Anna Pauker. But such old survivors as Messrs. Duclos and Togliatti attended from France and Italy, and Mr Suslov came from Moscow to move the resolution which gives the party line for the winter.

The task set to Communists throughout Europe is to woo intellectuals and trade unionists into alliance against war, and to organise the "ideological stupefaction of the working masses." So the "peace campaign," which was declared last March to be not under Communist direction, is now avowed to be under the direct supervision of Moscow. The preliminary bombardment has already been completed at Lake Success by Mr Vyshinsky; it is now for the ideological infantry—600 millions strong according to the Cominform—to press home the attack. They will be armed with slogans that have been exhaustively tested for months: persons like Mr Herbert Morrison and M. Blum are the "bitterest enemies of the working class, the accomplices of warmongers and the

A recent series of six articles in THE ECONOMIST examined Britain's present economic ills and made suggestions for their cure. These articles are to be reprinted as a pamphlet under the title

A Policy for Efficiency

lackeys of imperialism." War, they say, is being prepared to thrust Anglo-American domination on the whole world; the danger of war can only be diminished by mobilising opinion against the "humanity hating propaganda of the aggressors." "All democratic and patriotic forces" must be unified and consolidated and, says Signor Togliatti, a special effort must be made to work on Roman Catholics and to co-operate with their trade unions.

To the non-Communist such a programme and such a vocabulary are boring; but to the Communist both are exciting because they provide the outlet for frustration, hatred and the itch to agitate. Less boring and more sinister—though the power of the peace campaign should not be underrated—is the call for further effort against Tito. He, alas, has "gravitated definitely from bourgeois nationalism to Fascism"; and against Fascism no holds are barred. So the Cominform openly invites Yugoslavs who oppose Tito to work against him underground and revolt.

That such a blatant incitement to civil war can be combined with resolutions for a peace campaign illustrates once again how the meaning of words is being perverted by the cold war. The fight for peace means the advancement of Soviet interest; the warmonger is a person who calls a halt to that process. The universal desire to avoid war is being played on with the suggestion that it can only happen as a result of preparing resistance to Soviet policies.

* * *

Bad Manners at Bonn

For the last seventeen years the Germans have had no experience of parliamentary institutions and, even before that time, the Nazi minority had destroyed all sense of order in the conduct of parliamentary affairs. It was therefore inevitable that, when the experiment of restoring democratic institutions began at Bonn, the German politicians would show a certain lack of skill with their new and unfamiliar instruments of debate and discussion. Nor is it simply a question of having lived without parliament for nearly two decades; the Germans have also missed certain developments in democratic government which, in many countries in the western world, have only developed in the last ten years. The chief of these is a tendency, in all countries where there is no strong Communist Party, to move towards a certain unanimity in foreign affairs. The notion that the government and opposition ought, if possible, to work together in the foreign and diplomatic field has reached its fullest expression in the United States, where bipartisanship in foreign affairs is almost a principle of government.

This development has no part in German experience, and Dr Adenauer in his dealings with the western powers has taken little trouble to carry the largely Social Democrat opposition with him. He has made no formal arrangements for consultations and discussion, and he ratified the Petersberg agreements without reference to parliament at all. Whatever the constitutional rights and wrongs of the position, he certainly showed a considerable lack of wisdom in excluding the opposition altogether from a settlement of such crucial importance for the future.

It is possibly this failure to consult parliament that Dr Schumacher had in mind when, at the end of a stormy debate, he shouted out that Dr Adenauer was the "Chancellor of the Allies." Whatever the intention behind it, the propagandist phrase was entirely mischievous. Dr Schumacher's subsequent behaviour in refusing to retract in the slightest these foolish words has added to the growing belief that he has neither the calm nor the deliberation necessary to be a responsible parliamentary leader. The decision to suspend him for what amounts to twenty sessions is, however, too savage a censure, for if he is to be absent so long, how can he meanwhile accustom himself to parlia-

mentary manners? The winning over of the opposition to a sense of responsibility in foreign affairs should be one of Dr Adenauer's chief aims; but it seems unlikely that this sentence of banishment will do anything but widen the breach between the Christian Democrats and the Socialists.

* * *

Black Guards Behind the Elbe

There is every sign that the Russians are giving particular care to building up in east Germany a "people's democracy" strong enough to maintain its totalitarian character in any future relationship with the stronger and wealthier west Germany. Their supervision of the all-powerful Politbureau of the Communist Party through Herr Ulbricht shows through everything that is said and promised by the political spokesmen of the new "coalition" government. The tolerated "bourgeois" parties of Liberal Democrats and Christian Democrats find that all criticisms of Communist methods are ignored, in particular that only the most informal and perfunctory discussion of bills is allowed before they appear before the lower house of parliament for unanimous approval.

The high hopes of a real relaxation of Soviet control which reigned in October have faded into memories. The Soviet control commission has reaffirmed publicly that it intends to "supervise the implementation of the Potsdam Agreement," to supervise Herr Dertinger's conduct of "foreign policy" and, as regards foreign trade, to "ensure that Germany's obligations are fulfilled." General Chuikov has, to assist him in his work, not only a political adviser, Mr Semenov, but also a specialist on east European trade, Mr Semitchastnov. The political role of the diplomatic mission to Berlin under Mr Pushkin can be surmised when one recalls the role he played until recently as Soviet Ambassador in Budapest.

To brighten these rather bleak prospects, so strikingly different from those of the Adenauer government, official propaganda from Berlin and Leipzig points emphatically to a rosy future with "undreamt of vistas," including a "market from Brest Litovsk to Shanghai," and a Germany which, according to Herr Dertinger, is being "integrated into an economic area immune from slumps." Children all over the Soviet zone are now learning the new national anthem which ends with the words: "We must see to it that the sun shines again over Germany as never before." In the same category of romantic distraction falls the trade unions' appeal to all eastern Germans to work an extra hour this week, the payment for which will provide a tribute for Stalin's birthday three weeks hence.

There is much in all this which the western Powers can afford to ignore; what they cannot much longer ignore is the activity of such men as Dr. Kurt Fischer, the former Spanish civil-war commander Wilhelm Zaisser, and the former Air Force general von Weech. There is perfectly good evidence that these veteran military organisers will have ready by next spring between 35,000 and 40,000 highly trained and "politically reliable" men of the SS type. There is less reliable evidence that compulsory service for the "people's police" may be introduced for all men between the ages of 20 and 40. What is even more disturbing is the possibility that these armed "emergency squads" (*Bereitschaften*) already have a staff organisation capable of expansion and in process of building up its own communications network.

Doubtless the Russians are doing all this with open eyes; doubtless, too, there is some exaggeration in reports of airfields being handed over to the *Bereitschaften*. But there is no doubt at all that the crucial paragraph three of the Potsdam agreement—promising the "complete disarmament and demilitarisation of Germany"—is being ignored. This is a matter which Mr Bevin and his fellow Foreign Ministers should raise at the first opportunity with Mr Vyshinsky.

Pruning the Information Services

In the House of Commons this week, and simultaneously with the publication of the report of the Committee on the Cost of Home Information Services (Cmd. 7836), Mr Morrison announced that considerable economies would be made in the expenditure on home information, some of them as the result of the committee's recommendations. In the current financial year, 1949-50, the estimate of expenditure on the home information services is £5,168,050, but actual expenditure is likely to be nearly £700,000 less than this. Next year, according to Mr Morrison, the estimate will probably be £1,200,000 lower than this year's original estimate—that is, it will be about £3,968,000. These totals exclude, of course, all foreign and overseas information services, and the cost of the British Council, whose annual report was also published this week.

These economies, of £700,000 this year and a further £500,000 next, are welcome, especially in view of the big rise in annual expenditure on home information from the beginning of the war onwards. But one can surely ask, without being accused of treating the Central Office of Information and the information divisions of the various Government Departments as a perpetual butt, whether the economies could not be much bigger. The provision of Government information, in an age when the functions of government penetrate into every home, is clearly essential. The need for Government publicity, except in particular instances, is less obvious. Changes in rations and the implementation of the national insurance scheme are examples of the need for Government information. (But are the Ministry of Food's recipes really necessary?) The importance of Government publicity can be illustrated by the campaign for immunisation against diphtheria.

Even in these particular instances, however, the success of the home information services has varied greatly. The immunisation campaign has been successful. But how is it that even today so many people think that the cost of the health service is borne by their insurance contributions? It is hardly surprising, when the Government fails to get the right facts in a case like this into people's heads, that publicity on the general economic situation should, on the whole, have failed to do its job. And when publicity of this sort fails, it means that considerable sums of public money have been thrown away. The truth is that very little is known about effective methods of exposition and persuasion in a relatively abstruse field like economic policy. The Government assumed that methods applicable to commercial advertising would do the trick. They have not, and consequently there has been a certain waste of public funds. The Committee is, therefore, right to recommend that there should be much greater discrimination in the choice of subjects to which publicity should be given and in the choice of media to put the publicity into effect.

* * *

Meat Elasticities

The Ministry of Food's intentions, as displayed in their current inquiry concerning the demand for meat, are obviously excellent. They are anxious to ascertain "the amount necessary to satisfy public demand under existing methods of selling and control of distribution, and under free trade." To that end they are asking the retail butchers for one readily ascertainable fact—the percentage of registered customers not taking up their whole ration (now increased by 2d. a week)—and two opinions: What value of meat (within the range of 1s. 4d. to 2s. 2d.) would, at present prices and quality, satisfy the requirements of all domestic consumers; and what would be the effect if cuts suitable to the business could be obtained by every butcher. For the enquiry to give the Ministry a reliable picture of what the public really wants, the butchers would have to display a miraculous insight into the elasticity of demand (price elasticity and

income elasticity, economists will note) for (a) meat in general and (b) all different types of cuts in particular. Even so, it is far from clear what action would follow. But in an era when the superior wisdom of Whitehall in regard to diet and almost everything else has acquired the dignity of a dogma one must hail with gratitude any evidence that the consumer's opinion is worth consulting at all.

The naïveté of this procedure, however, is really staggering. By what conceivable reasoning are the butchers supposed to reach their conclusions? In a freely working price system it would be possible to elicit from any dealer in a standard commodity an intelligent forecast, based on past movements, of the results of a small increase or decrease in price. Indeed, it is from the exercise of judgment in precisely this field that dealers make their livings. But to ask a body of dealers, who for ten years have been denied that light on consumers' preferences which is shed by free price movements, to estimate the volume of demand unsatisfied at present prices (which is what the inquiry amounts to) is about as near the ultimate in time-wasting procedures as bureaucracy can go.

Direct research among consumers is more promising. It is conceivable—just conceivable—that by taking a great deal of trouble, plaguing a great many busy housewives, and setting up a very large battery of calculating machines, there might be obtained data of real value for policy-making. It is possible, as witness the achievements of a number of gallant unfortunates, to write, paint, and generally manipulate one's environment with one's toes. But why, with two hands available, emulate the armless? Why, in seeking light on the preferences of consumers, boycott the price system?

* * *

Soft Words on Hard Water

The report of the Committee on Water Softening* is packed with information; useful ("in order to wash an article it must first be thoroughly wetted"); statistical (".32 of a gallon of water a day must be softened for washing and bathing"); or downright incredible ("within very wide limits washing is a desirable habit.") But even more striking than what the report includes is what it omits. No stupendous scheme of capital expenditure has been set out with the insistence that its immediate implementation is a matter of life and death for the community. No monstrous sums are demanded as the price of health and security. All is moderation. Hard water is, on the whole, rather a bad thing; the efforts some authorities have already made to soften it are, on the whole, rather a good thing; when there is some public money to spare, the Government should consider whether a further elimination of the rather bad by the rather good may not be among the projects worth undertaking. Such restraint, in these days, is a thing to be grateful for.

The whole project is permeated with sweet reasonableness. No prejudice is allowed to remain skulking in its den; all are dragged out and, as it were, scrubbed with the softest of water. Hard water and soft water alike are acquitted of the charge of being unhealthy. Tea is disposed of in a trenchant phrase: "We do not think that any strong argument for or against softening of water supplies can be based on tea." The spirit of dispassionate enquiry has presided over endless shaking of soapy water in bottles, solemn tasting of untold gallons of tea, minute peering into the furry insides of kettles. Would that all prejudices were susceptible to such treatment.

The chief surviving villain is the wastage of soap which hard water involves. It is estimated that it would cost the average user of hard water 8s. 2d. per annum—if he could get the soap. The tenuous web of hypothesis which supports this figure would make a metaphysician green with envy; but it is fair to add that all available data tend to confirm it. When the ground nuts finally reach the shores of Britain the public will be able to waste soap freely; will softened water by then take the heart out of this long awaited indulgence?

* HMSO. 1s. 6d.

Arabs and the Clapp Report

Arabs would not be Arabs if they had no complaints to make about the Clapp report on the future of their refugees. Their principal objection to it is, naturally enough, that it proposes to cut down the number receiving rations from 940,000, the Secretary General's estimate of what is necessary, to 652,000 on January 1st, 1950. Mr Clapp's argument is that rations are being distributed to 200,000 more people than ever came out of Palestine. The retort from Arab circles is that plenty of people who did not live in Palestine and are, therefore, not strictly speaking refugees, have lost their livelihood through secondary effects of the war. They advance this argument while ignoring the fact that considerable numbers of Bedouins, who never had much livelihood anyway, have joined the queue for free food and that the international organisations distributing it say they have been too under-staffed to check them. Only the Quakers in the Gaza strip have been able to do so effectively. Arab circles also point out, with a good deal of logic, that they cannot keep their peoples reasonably happy if they are forced to witness, or even to organise, better treatment to the refugees than they can afford to give to their own indigent citizens.

If the Arab States are to accept the Clapp report it seems possible that the sweetener offered to them may have to be more generous. Before they condemn it, or ask for more, they would do well to wait for its second part, which deals with long-term economic aid to Middle Eastern countries. It is possible that his plans will link up, at least so far as finance is concerned, with the Point Four schemes which the Assembly has already endorsed.

As the Point Four monies are not lavish and Congress has not yet voted the American contribution, it seems clear that Mr Clapp should keep two points in mind as he drafts the second part of his report. The first is that it should embody proposals which will enable the Arab governments to tell their peoples that there is some bounty coming to the local poor, and that everything offered is not just for the refugees. The second is to evolve a long term development scheme that does not fall victim to Uno's tendency to try to achieve a lot in a little time by employing a swollen international staff, that is cheap to run in terms of international donations, and that acquires the funds it needs on a basis of paying dividends both to the local government and to the foreign investor.

Economics in Islam

The first economic conference ever to be held between Moslem countries is now taking place in Karachi. The idea of holding such a conference was first put forward by Mr Jinnah a few weeks before his death. His hope was that

Overseas Information

To enable *The Economist's* specialists to comment on events abroad a regular flow of information from our overseas correspondents and contacts is required. This information, and the judgments that are based on it, can be applied to commercial problems. Through The Economist Intelligence Unit regular reports, each designed to meet the requirements of a business or other organisation, can be commissioned.

The Economist Intelligence Unit
22 Ryder Street, St James's, London, S.W.1.

Moslem states could help each other a great deal even if their economies are similar rather than complementary. He discussed the subject with Mr Ghulam Mohammad, Pakistan's acute and downright Finance Minister, who is one of the strongest personalities in the new state. It is to him the present conference owes its creation.

Whether any startling results can be achieved is another matter. The meeting is being attended by representatives from north Africa, the Middle East, Turkey, Persia and Afghanistan. In spite of its huge Moslem population, the new Indonesia is apparently not represented. Simultaneously with the conference, an industrial and commercial exhibition—of Moslem products—is being staged in Karachi, and it is intended that both the conference and exhibition should become an annual event, taking place in each capital in turn. In opening this inaugural meeting the Pakistani Prime Minister, Mr Liaquat Ali Khan, urged Moslems not to put their faith in either western democracy or Communism. He spoke of Islam as a company of strategically placed communities, of considerable strength, in a world which wanted to use their products and their military position. He exhorted them to be strong enough to resist pressure from other large groups, to develop economic cooperation—beginning with banking, shipping and insurance—and to aim at raising standards of living through the application of Islamic principles.

The detailed work of the delegates will be to assemble information about the possibilities of greater trade between the Moslem countries represented; and some 55 commodities have been listed for study. But the wider question behind this whole meeting is, as Mr Liaquat Ali Khan's address suggests, whether Pakistan will be able to assume the leadership of widely flung peoples who, however much they may have in common, have hitherto been more noted for their "agreement to disagree" than for any effective co-operation. Pakistan undoubtedly has ambitions of this sort. If it achieved them, this might not only soothe Karachi's dangerous feeling of isolation in the shadow of India, but bring positive good to the Middle East. For the West, however, the danger could be that such a group would become exclusive and hostile, if treated insincerely and thoughtlessly. This experiment in the Moslem world should be watched carefully and tactfully from London and Washington.

Two Queues at Lake Success

The two rival queues of candidates for admission to Uno still show no signs of passing the door. The larger queue consists of those states whose claims are supported by a majority of the Security Council but vetoed by the Soviet Union; the smaller consists of those which have Soviet support but not that of a majority of the Council. Two years ago there was only Italy and Transjordan versus Rumania, Bulgaria and Hungary. Since then the lines have lengthened, until now there are nine in the one and five in the other. Only Burma and Israel have recently succeeded in jumping the queue.

Few other subjects have been so well aired at Lake Success—with so little success—or have been more persistently shuffled between the Security Council and the General Assembly. According to Article 4 of the Charter membership is open to all "peace-loving states" which accept, and are able and willing to carry out, the obligations contained in the Charter. But nowadays the word "peace-loving" is interpreted in the manner of Humpty-Dumpty: "the question is, which is to be master—that's all." A majority of the Security Council is firmly convinced that Albania, Bulgaria, Hungary and Rumania are not lovers of peace.

The Russians are concerned—quite understandably—not so much with the question of suitability as with the need

to swell the pitifully thin ranks of their supporters at Lake Success. They, therefore, make their approval of the nine candidates with majority support conditional on the simultaneous admission of their own candidates. The Soviet delegate gave the show away when he stated that his Government considered Italy qualified to become a member of Uno, but opposed it simply because the Council had refused to recommend the admission of Bulgaria, Rumania and Hungary.

The veto should clearly not be allowed to apply to the election of new members. Britain and the United States have already recognised this and have both expressed their willingness not to use it when a majority of the Security Council favours the admission of any particular candidate. In the case of Israel, Britain has already observed this principle. As a last resource the Assembly has decided to ask the International Court whether the Assembly may elect new members, whether or not they have the blessing of the Council. To by-pass the Council in this way may be the only way out of the impasse; but the legality of such a move would be doubtful.

* * *

Portugal's Picked Parliament

With a minimum of ceremony Portugal's National Assembly—the fifth since it was established under the constitution of 1933, as democratic makeweight to the dictatorship—has begun sitting. The deputies are all National Union men and over 50 per cent of them are government officials. In a pre-election speech on October 20 Dr Salazar lamented that the leading figures in business and the professions pre-

Revolt in Cephalonia

By recent arrivals from the Ionian Islands, we are put in possession of the speech of the Lord High Commissioner to the Legislative Assembly of the United States of those islands on the 10th ult., and it mentions several matters which require to be made known, in order to enable the public to form a just opinion on the late occurrences in the islands. . . . It is pleasant to find . . . testimony both from persons on the spot and persons at home, the best calculated to give an opinion on the subject, bestowing . . . approbation on the prompt and energetic measures adopted by the Lord High Commissioner. Not daunted, too, by the apparent ingratitude of those who made his first act of clemency a means to provoke a renewed insurrection, he is hastening on the work of legislative reform. He goes cordially with the Legislative Assembly, in endeavouring to frame a constitution which will promote the common interest, and make the Ionians prosperous. He is anxious to give the Legislative Assembly control over the ordinary and extraordinary expenditure of the islands as fully as it is possessed by our own House of Commons; and he proposes to lay before it a budget for the next two years, and take the votes of the Assembly on every item. . . .

But while he (the Lord High Commissioner) has put down such a vile rebellion with a strong hand, he has shown himself sensibly alive to the wants of the country. He has hastened to heal the wounds inflicted by violence, and promote an increase of health and vigour by a new and liberal regime. The public will not tolerate cruelty or injustice, particularly in conjunction with a mere policy of restrictions to secure personal or party objects. Sir H. S. Ward is sensible of this, and though he has been constrained to act with severity, he has not overstepped the bounds of justice, and he has, as soon as possible, adopted an enlarged and liberal policy that will insure prosperity to all.

The Economist

December 1, 1949

ferred to stay out of this debating chamber. He also once again spoke wistfully of his desire for a licensed opposition to offer his cohorts of yes-men. But the authorities took good care in the elections of November 13 to see that the two opposition lists, of four men apiece, at Castelo Branco and Portoalegre were defeated. The liberal-democratic adversaries of the regime had again, as in 1945, refused to compete, on the ground that the dice were loaded against them. Instead, they are reported to have addressed a manifesto to Marshal Carmona setting out their grievances.

The critics complained, with some justice, that the electoral registers had remained closed, except immediately after the Presidential contest last February—when opposition morale was at its lowest—and that the regime had worked up a prodigious Communist scare; that the new electoral law issued in the first week of October effectively ruled out the non-Government scrutineers for whom General Norton de Mattos had pressed. The Government also possesses, it is true, wide powers to disqualify candidates and voters, which it has not scrupled to use.

The powers of this tame Assembly are certainly restricted. It is a Parliament only in a Pickwickian sense. That is to say, it votes year by year in December an enabling law in general terms, authorising the collection of revenue and formulating the general principles of the budget. But it may not initiate any legislation involving an increase in expenditure or a reduction of revenue. It is also expressly stated in the Constitution (Article 92) that laws voted by the National Assembly should be confined to a statement of general principles. The Government is not responsible to it, and Ministers never come before it to defend or explain the conduct of their departments. Dr Salazar's "Cabinet," in fact, proceeds habitually by decree-laws, which need to be submitted to the Assembly only when it is actually sitting, that is, four months in the year. Yet this "Consultative Assembly" has its uses as a place for airing grievances: there was a spirited debate on the administration of Angola last spring and shortly afterwards another on agricultural policy. What it does not provide is a vehicle of informed opinion which can aspire to control the executive. It is not surprising then that Dr Salazar, in his speech of October 20, foreshadowed a diminution of its constitutional attributes and a transfer of the centre of gravity of the regime to the Corporative Chamber.

Honour and Office

In a leading article in *The Economist* of last week entitled "Honour and Office" reference was made in a paragraph dealing with the personal integrity of Ministers to the recent imposition of a fine upon a junior minister "in connection with some piece of minor company malpractice," that is as a director of a company which failed to make annual returns to the Board of Trade. This referred to Mr Patrick Gordon-Walker, Under Secretary of State for Commonwealth Relations, and was justified on information publicly available at that time. However, on Tuesday of this week Mr Gordon-Walker made a personal explanation in the House of Commons, stating that he was in complete ignorance that he was in any way associated with the company in question, that he thought he had resigned his directorship more than three years ago and was then under the impression that the company was to be dissolved. Had Mr Gordon-Walker made his explanation immediately after the hearing of the case, the reference to him in last week's article would not have been made. Now that these fuller facts are available it is clear that the offence for which Mr Gordon-Walker was fined was barely even a "minor company malpractice" and that even the Victorians would scarcely have exacted for it the penalty of resignation from office.

Letters to the Editor

Soviet Semantics

SIR,—The euphemistic charm of Soviet vocabulary is as potent in the purely economic as in the political field, and demands an antidote as effective in the one as in the other. Nowhere does the need for interpretation press more urgently than in the "underdeveloped areas," where Point Four aid, by provoking an inevitable demand for more, may well have a political effect the reverse of that intended, unless the recipients appreciate that no economic system—not even that of Russia—can perform miracles. Dollars used to build up a really forceful publicity service which will not be ashamed to use the perhaps unorthodox methods of mass education called for amongst semi-literate peoples may prove in the long run to have been well spent.—Yours faithfully,

P. G. POWESLAND

19 Banbury Road, Oxford

Kashmir

SIR,—The British press is not usually slow or reticent in condemning political immorality. Yet we still await a full and frank examination of the "Kashmir incident." Possibly the reason for this omission has been the desire not to antagonise India, but it is not realised widely enough how prejudicial to our good relations with Pakistan this conspiracy of silence has been.

The Indian claim to Kashmir rests on the decision of its Maharajah to accede to India. She is, however, morally estopped from pleading this juridical right by her own actions in reversing by force the wishes of the rulers of Junagadh and Hyderabad. In these two cases India could and did argue that her policy had the support of the peoples concerned, and no one seriously doubts that a free vote in the two states would have resulted in a very large majority for incorporation with India. Conversely, it is common knowledge that a free vote in Kashmir in midsummer 1947, or even today, would be overwhelmingly in favour of Pakistan. Hence India's recent refusal of a plebiscite controlled by the United Nations, which Pakistan accepted.

For Pakistan it is not merely the impossibility of surrendering an 85 per cent Muslim majority area: Kashmir is a strategic and economic necessity. Strategically, Kashmir in alien hands exposes three-quarters of Pakistan's northern frontier. Under Pakistan's control it gives Pakistan an impregnable northern frontier in the Himalayas and a defensible north-eastern frontier along the Ravi opposite the Pathankot tahsil of the Indian district of Gurdaspur. Economically, the

ruler of Kashmir controls the waters of the Indus, Jhelum and Chenab. Already the Western Punjab has lost by partition the canal headworks on the Ravi and Sutlej and the hydro-electric station at Jogindanagar, which supplied industrial Lahore. It is essential for Pakistan's irrigation and hydro-electric development that she retain control of the other three rivers.

No such viral issue is at stake for India, unless she intends to encircle and strangle Pakistan. Her motives appear to be a combination of political and personal prestige (Pandit Nehru is a Kashmiri Brahmin). In these circumstances the uncritical attitude of the British press (and the publicity given to Pandit Nehru's recent bellicose press interview) does a great deal less than justice to Pakistan, where our "neutrality" is most cynically regarded.—Yours faithfully,

C. W. M. GELL

P.O. Rex, Rustenburg, Transvaal, South Africa

The Karens

SIR,—I cheerfully agree with the collective assessment made by *The Economist* over the past three years of Burma's true position in the scheme of things, though I must deplore the petulance with which you dismiss Burma as just a debtor owing £30 million to the United Kingdom.

I write because any increase in the mutual understanding between the peoples of the world must be desirable, and the Burmese today are rather sensitive to the British press. Although its traditions would allow Mr C. F. Grant's letter to be published, the Burmese would tend to regard his ill-informed out-of-touch prejudices as the representative opinion of the British people. I have no desire to emulate the devotion of the Karens to the West and Mr Grant, but since my grandfather, father and mother were educated in England, the eldest brother serving under Wingate, another in the RAF and myself in the RNVR, I should not be accused of being rabidly anti-British.

The Karens, according to British records, acted as guides, spies and auxiliaries in the three Anglo-Burmese wars of annexation. There can be no moral obligation on the part of the Burmese to honour the Karens. The Burmese have, however, forgiven all this, and agreed to share their birthrights with the Karens. The Karens were allotted more than their proportionate share of scholarships, cadetships, posts, sinecures, contracts, etc.; Karens were made commanders of the Army and the Air Force. There is no hatred of Karen Christians as such, my own nanny, my son's and those of many other Burmese were Karen Christians.

A glass of DRY FLY SHERRY is the ideal aperitif, and is a gracious welcome to your guests. Obtainable all over the world from your own Wine Merchant, or from:

Mr Grant by inference defines the rebelling Burmese Communists as anti-British. Now what would that make of the Government and the majority of the Burmese who are fighting the Communists? Perhaps just something that the Karens don't happen to like?

Mr Grant says that the Karens helped Wingate. Perhaps, but in the combat areas of Wingate's expeditions, there are no Karen villages—what local help he got was from the Burmese. He says again, that the Karens rebelled months after the Communist rebellion, but according to some of the British Sunday papers, who seemed to have been very sympathetic and well informed, the Karens had been hatching their plans and collecting arms for the previous two years.—Yours faithfully,

MAUNG KYAN THET

80 King Henry's Road, London, N.W.3

Propaganda for Savings

SIR,—Your note on the above in *The Economist* of November 5th and the letter in reply from Lord Mackintosh appearing in the issue of the following week, if read in conjunction with the weekly summaries of National Savings printed by you during the past few weeks, draw attention to the serious lack of interest by the ordinary citizen in the National Savings Movement.

Is the movement, as at present designed, a spent force? Or is the acute downward drift of net savings in recent weeks in the three main avenues of popular investment, viz., Savings Certificates, Defence Bonds and Post Office and Trustee Savings Banks, due solely to the general anxiety and fear of the future which seem to haunt the minds of so many people today?

As in the business world, advertising propaganda sometimes needs radical change of method and direction especially in the absence of sellers' markets, effectively to bring the products of industry to the attention of discriminating buyers if the sales are to be increased or even maintained. It would appear that some such change is needed today in order to repopularise savings by the individual both from the self-interest and national interest standpoints. In these critical days surely the nation-wide appeal should be to save for the security of the saver himself and of his country in the hour of crisis.—Yours faithfully,

CHAS. J. MILLS

15 Danson Mead, Welling, Kent

SIR,—While the recent history of small savings is not encouraging I think, nevertheless, that more emphasis should be placed on the fact that the *weekly* intake of small savings is being pitted against withdrawals from the massive aggregate debt accumulated over many years. Much of this withdrawal, no doubt, is quite "legitimate" for instance, to build or furnish a house or for some other capital purpose originally visualised by the saver. Whether the Treasury is wise in having such an appreciable portion of the National Debt at call is, of course, another question.—Yours faithfully,

ALBERT E. BURNS

194 Seacliffe Road, Bangor, Co. Down

Political Morality

SIR,—It was with great satisfaction that I read the final paragraph of the article in your current issue on "Honour and Office." It was with corresponding disappointment, therefore, that I read the note "Labour's First Shot" on page 1172.

The earlier part of this note gave me the clear impression that you considered the statements and claims in the "Speaker's Handbook" as being, shall we say, less than

frank and your comment is "This is, of course, good electioneering form."

It appears to me that the major cause of the present political bitterness and lack of courageous policy in the face of the nation's difficulties is the current low standard of political morality. The public seems to accept with amusement rather than indignation the fact that many politicians (there are of course brilliant exceptions on both sides of the House) make statements which they know or should know to be untrue.—Yours faithfully,

ANDREW R. DAVIDSON

41 Heriot Row, Edinburgh

British Biscuits

SIR,—I agree with the comments of your Canadian correspondent on British biscuits in *The Economist* of September 17th.

The biscuits are there—in every grocery store, in every hotel shopping centre and in spite of being approximately double the price of Canadian biscuits (before devaluation) they are bought. But they would be bought on an immensely larger scale if their presentation were more imaginative. In fact, they are concealed in the familiar crinkly paper packages without a picture even to reveal the nature of their contents. This practice suits the needs of the British housewife, whose grocer, if he is not equipped with a line of glass-topped biscuit tins along his counter, is only too ready to show her exactly what they are like. But most Canadian housewives shop at one of the large help-yourself chain stores where everything not in a carton or tin—joints, bacon, prepared vegetables, biscuits—is packed in cellophane. She helps herself and there are neither counters nor assistants. Naturally to her seeing is buying.

When it is vital to step-up dollar earning exports, surely British biscuit-makers could devise a means of packing pounds and half pounds in cellophane, interlarding the packages with crinkly to their hearts' content to preserve them in transit?—Yours faithfully,

DIANA MANSERGH

Little Paddock, Oxted, Surrey

Doctors' Pay

SIR,—Your Note on the subject might leave the impression that in the national health service a national capitation fee is paid. This is not the case. The highest paid area has a fee of 17s. 10d., the lowest one of 14s. 9d. When the Minister was recently challenged by Sir Ernest Graham-Little for an explanation of this apparent anomaly he replied that the difference was to be explained by certain prior charges on local "pools" such as the payment of basic salaries, emergency and anaesthetic fees and that the method of distribution had been agreed by the profession. It is difficult to imagine that the original negotiators on either side can have envisaged a development so glaringly unjust to many practitioners. There is no immediately obvious reason why the care of a thousand patients in one part of the country should bring to the doctor £150 per annum less than he would receive in another, with a corresponding loss of certain superannuation rights.

The Cornwall Executive Council pays its doctors at the rate of 15s. 6d. per head per annum. Examination of the figures shown in the council's statement issued to all practitioners on its list on October 1st indicates that even making full allowance for all the prior charges a further sum of about £25,000 would be needed to make the gross sum available if we were to be paid at the rate of 17s. 10d. less these charges. This makes the improbable presupposition that there are no prior charges whatever in the Shangri-La area in which the higher rate is actually paid.—Yours faithfully,

DONALD M. O'CONNOR

Castle Hill House, Launceston, Cornwall

Books and Publications

Dr Schacht Unfolds His Plan

"Mehr Geld, Mehr Kapital, Mehr Arbeit." By Dr. Hjalmar Schacht. Otto Meissner's Verlag. 119 pages

EXCEPT that he can express himself briefly, Dr Schacht is typical of his country. Even the obsession with his past exploits and the wrongs of Versailles which characterise this book are only exaggerated forms of a common German phenomenon. Dr Schacht's national egotism provides a standard against which to measure the progress that has, despite everything, been made elsewhere towards European co-operation since Mr Marshall launched his plan. For Dr Schacht it is a simple syllogism that Germany is the kernel of Europe's economy; therefore it is right for America to concentrate upon the restoration of German strength. Not content with the unassailable argument that a slum Germany damages the interests of all Europe, this reasoning proceeds to the conclusion that Germany can claim unique advantages now, since the rest will benefit later.

Dr Schacht takes as his starting point the sacred determination of Germany to regain sovereign rights. He argues that the economic path offers the best promise. The main German criticism of his scheme is, he says, that it would give the Bank of International Settlements some insight into German industry. As the man who hid Hitler's rearmament from the rest of the world, he is well qualified to reassure these critics. Other Germans with whom he contends are those who argue that Germany will in any case soon regain full sovereignty, so that there is no call for compromise; and yet others who believe that the quickest way to sovereignty is to assume democracy to please the occupation powers.

By Telephone and Cable

The discoveries of the travelling correspondent who sets a girdle round the earth by a world-hop from capital to capital have their own undoubted value. Foreign news, different in kind, more balanced in perspective and more cumulative in effect, is provided by the team of staff correspondents of *The Times* posted in almost every important world centre.

A practical journalist, a student of history and a man of affairs, *The Times* correspondent in Washington or Warsaw, Delhi or Damascus has his part to play in a world-wide Imperial and Foreign News service. His primary function is to give a straightforward and accurate report, free from emotion or prejudice, on the daily march of events. From such objective reports in the News columns, supported and clarified at intervals by Special Articles on the leader page, the reader of *The Times* draws a faithful and steadily illuminated picture of world history in the making.

BRITISH EUROPEAN AIRWAYS

over one-and-a-quarter million unemployed, and steel production has been cut owing to lack of internal demand.

Nevertheless, the scheme is inflationary, that is, it assumes that there are idle resources, both of labour and capital, and that there is a need for the potential products of these idle reserves, which only requires monetary embodiment to become effective demand. All these conditions existed in 1933 within Germany. The Schachtian inflation then initiated required to make sense only within the closed circuit of the German economy; international considerations came in only in so far as it was necessary to pay for increased supplies of raw materials. Even so it was on this aspect that Dr Schacht most nearly failed. He had to go to fantastic lengths of what we now call "Schachtianism" to solve his problem.

But do the conditions exist today? There are idle resources of labour. Yes. But of the other factors of production? In the properly balanced amounts? Hardly. And, this time, to close the circuit and repay the credits, additional goods would have to be sold, not internally to an all-devouring state, but externally in world markets, indeed, in hard currency markets. It would, of course, help Germany, as it would help anyone else, to have a large sum of dollars as circulating capital, constantly re-lent. But this would not solve any nation's problem unless it can be shown that there are markets—dollar markets too—waiting to be filled, as there was one enormous mark market in 1933.

Thus it is doubtful whether Dr Schacht's master plan (to which he attaches a proposal that Germany should be allocated an unspecified "empty land" to develop) makes economic sense. And it is certainly political nonsense.

Portrait of a Great Man

"Horace Plunkett," An Anglo-American Irishman. By Margaret Digby. Blackwell. 314 pages. 15s.

SIR HORACE PLUNKETT was one of the greatest men of his age. Dr W. G. S. Adams says, in the introduction to Miss Digby's biography, that Plunkett was the greatest man he had ever known. He bases this judgment on Plunkett's courage, consistency, concentration of purpose and unselfishness. Plunkett conceived his life work as the attainment of two objectives: peace in Ireland and the amelioration of Anglo-American relations. These two objectives were interrelated, because among the obstacles to Anglo-American friendship were the unsettled Irish agrarian and political problems. His record of constructive achievement in Ireland is quite remarkable. He was largely responsible for the foundation of the Agricultural Co-operative movement and the Department of Agriculture which, between them, laid the foundations of modern Irish agricultural progress. He believed that the Irish question was mainly economic, and that the removal of the agrarian grievances would weaken the demand for Home Rule. When the course of events convinced him that he was mistaken, he became a convert to nationalism and strove, as Chairman of the Irish Convention and founder of the Irish Dominion League, to find a compromise solution that would avoid partition. In his attitude towards Anglo-American relations he was almost prophetic. His residence for ten years in the United States implanted in him an intense admiration for American people and institutions. He seems to have foreseen that the freedom of Europe would, in the future, depend upon American aid. During the first world war his personal friendships with leading statesmen in England and the United States enabled him to play the part of trans-atlantic interpreter.

Miss Digby's biography of this remarkable man, which bears the apt sub-title, "An Anglo-American Irishman," is competent and comprehensive, though not without minor blemishes. The reference to "O'Connell's campaign for Home Rule" would surprise an Irish historian; the account of the foundation of *The Irish Statesman* is inaccurate in one important respect; and the reference to Lord Grey of "Fallowden" makes a bad impression.

A Polish Indictment

"Stalin and the Poles." An Indictment of the Soviet Leaders. By Dr. Bronislaw Kusnierz. Hollis and Carter. 309 pages. 16s.

THIS book, the work of a Polish lawyer with an endorsing preface by the former Polish Foreign Minister, Mr Zaleski, is a formal indictment of the rulers of the Soviet Union modelled on the indictment drawn up against the Nazi leaders at Nuremberg in accordance with principles of international law accepted by the Soviet Union for the purposes of the Nuremberg trial. It seeks to show—and it is not difficult to do so—that under the three headings of Crimes against Peace, Crimes against the Laws of War and Crimes against Humanity, Russia has committed against Poland over the past ten years crimes similar to those for which the principal defendants at Nuremberg were hanged. As regards the Nazi-Soviet pre-arrangement of the original attack on Poland, the fact was established beyond dispute by the American publication of the vital document in January, 1948, and the suppression of that document at Nuremberg was the worst blot on the conduct of the trial. Other matters covered by Dr Kusnierz include the Katyn Forest massacre and the mass deportations from Poland in 1940-41. With regard to the latter, which involved the removal of entire families to the total of not less than a million persons on no charge beyond police registration as "politically unreliable," Soviet official mentality is sufficiently indicated by the following provision (vigorously carried out in practice) in an NKVD circular to its branches:

As the majority of the deported men will be arrested and scattered over special camps, while their families will be sent to places assigned them in distant regions, the separation of members of families from one another must be carried out without any warning.

Such methods no doubt meet with approval in King Street, but what is left of the civilised world still regards them as atrocious, and even though the perpetrators are beyond the reach of justice, it is well to have on record so competent a statement of the Polish case against Russia as that which Dr Kusnierz has prepared.

French History

"France (1814-1940)." A History. By J. P. T. Bury. Methuen. 348 pages. 18s.

MR BURY'S survey of French history from the abdication of Napoleon I to the debacle of 1940 provides an excellent framework for reflections upon the destiny of modern France. If the work possesses the characteristic of indigestibility common to all university text-books so that the "average, sensual reader" is on the whole happier to put the book down than to take it up, it none the less covers a lot of ground with a fair measure of clarity. The transition from one field of events to another—from parliament to diplomacy, from economics to church affairs, literature, art and manners—is smoothly done.

Especially illuminating are the descriptions of French society in 1815, and again a century later, and the account of the bitter struggle between Right and Left throughout the life of the Third Republic. Speaking of its climaxes in the Boulanger and Dreyfus episodes Mr Bury comments: "This clash of principles led to an exposure of military justice, but, significantly enough in spite of this . . . it did not provide any general demand for a revision of French judicial procedure. To the end of the Republic the liberty of the citizen was to remain unprotected by any *habeas corpus* and at the mercy of a police endowed with arbitrary powers reminiscent of the *Anciens Régime*." The pull of abstract principles on French emotions remains something of an enigma. To be vitally interested in politics but not in their results is perhaps less a characteristic of present day Frenchmen than of their grandfathers. Yet the vision of the République laid up, as it were, in heaven is still more magnetic than the prospect of slow plodding reform. There is the story of the visit of a distinguished foreigner to a

French Socialist constituency. Mystified by the fact that the region was populated almost exclusively by individualist vine-growers the stranger inquired what kind of Socialism this might be. "Le socialisme?" came the answer "mais ça c'est l'avenir."

Latin America

"Brazil." By George Wythe, Royce A. Wight and Harold M. Midkiff. Twentieth Century Fund. 389 pages. \$3.50.

A REVIEWER of books on Latin America who has also spent a good few years there tends to breed an affection for the land and a cynicism for the literature. But this book is a sober and factual book, supported by a judicious selection of statistics and throughout exhibiting a very high degree of accuracy. It is, in fact, an excellent book—one of the best of its kind which has appeared since the war on Brazil, or indeed any Latin American republic. The Twentieth Century Fund is an American foundation for research on economic problems, and the volume is designed to give the facts necessary for a considerable expansion of American investment in Brazil. Whether the Council of Foreign Bondholders would take quite the same view of the possibilities as does Mr George Wythe is another question.

Finance is needed in Brazil for what are roughly known as public works on contracts awarded by the State or Federal authorities. Brazilian frozen credits in Europe may be used for some of the necessary equipment, but much will have to be bought in the United States, and many technical services will be sought from there. That is the main finding of the volume.

Some of the miscellaneous facts, taken at random, give food for thought. Over half Brazil's population was under 19 years of age in 1940, as against one-third in the United States. A bag of cocoa from Bahia pays nine taxes before it gets put in a

Making American Glass

"The Development of the American Glass Industry." By Pearce Davis. Harvard University Press. London: Geoffrey Cumberlege. 316 pages. 32s. 6d.

THIS, the eighty-sixth of the Harvard Economic Studies, is an exhaustive survey of the growth in the United States of the four industrial branches of glass-making—the manufacture of window glass, plate glass, glass bottles and containers, and pressed and blown glass. The ordinary reader will probably find that the concluding chapter tells him all he wants to know about the subject, and he may be disappointed that there is no mention of those specialised aspects of glass-making which catch the public imagination, such as the giant lens for the new observatory in California or the beautiful Steuben products. The technician, also, even when his interest is industrial rather than scientific or artistic, may regret the lack of any account of the important advances made during the last twenty years; the book does not go beyond 1925.

The study will probably be most valuable to the economic historian, since it deals not only with the development of glass-making itself from a craft to a highly-mechanised, mass-production industry, but with the growth of the glass workers' unions, a significant chapter in the American labour movement, and also with the detailed effects of the tariffs on glass. Here is a clear example of how the protection justifiably given to an infant industry persists, and indeed is strengthened, long after that industry is able to stand by itself, not only on its own feet, but also on those of its foreign competitors.

AMERICAN SURVEY

Exploring the Economy

(From Our American Staff)

UNDER the Employment Act of 1946, the Congressional Joint Committee on the Economic Report, the legislative counterpart of the President's Council of Economic Advisers, is required to study the trend of the national economy in general, and the promotion of maximum production, employment and purchasing power in particular. Last March, in order to carry out this responsibility, the Committee recommended that a thorough study of investment should be made. Congress authorised not only this undertaking, but also related studies of monetary, credit and fiscal policies; of low-income families in relation to economic instability and of unemployment trends and their significance in current economic analysis. Separate sub-committees are dealing with these four problems and are supposed to report to Congress on December 31st. Whatever the nature of the report—and unhappily, the history of the Joint Committee's final reports is so far one of division along strictly party lines—the studies and hearings have been exceptionally interesting and the net has been cast very widely. As much as any past Congressional inquiry, this one on the stability of the economy has had the scope and general interest of a Royal Commission.

Each of the sub-committees has already produced some highly worth-while material. In August, well in advance of starting its hearings, the sub-committee on monetary, credit and fiscal policies circulated two questionnaires. The one sent to officials in government, and quasi-government, financial agencies contained not only questions on general financial policy but on organisation and procedure within their agencies, and on inter-agency relationships: for instance, "When there are differences of opinion between the Secretary of the Treasury and the Federal Reserve authorities as to the desirable support prices and yields on government securities, whose judgment generally prevails?" A more general questionnaire, sent to bankers and economists across the country, was no less searching: for instance, "What changes, if any, should be made in the reserve requirements of member banks? . . . What power, if any, should the Federal Reserve have relative to the reserve requirements of non-member banks?" Collected under the title of "Monetary, Credit and Fiscal Policies," the replies were available to committee members before the hearings. They have helped to give cohesion to the questioning of witnesses, many of whom had submitted full answers to the questionnaires.

The sub-committee on investment, which Senator O'Mahoney, chairman of the entire Joint Committee, is heading himself, has issued a report on "Factors Affecting Volume and Stability of Private Investment," 235 pages of closely printed text and statistics prepared by different groups within the government. Its eight major sections deal with the depression of the thirties, with investment theory, with the sources and uses of investment funds, with the question of debt versus equity, with the problems of small business, with the effects of taxation, with depreciation, and with miscellaneous proposals. Though the various sections are

of varying quality, the report presents a truly vast array of information assembled from many sources.

The review of the big depression helpfully summarises a variety of views, and concludes on the popular theme of Professors Burns and Mitchell of the National Bureau of Economic Research, by saying that "the boom of the twenties which culminated in 1929, and the subsequent depression of the thirties, when considered together, cannot be explained by any single factor. . . ." The review of theory uses Mr Harold Moulton's "Controlling Factors in Economic Development" and a quotation from *Fortune* magazine to state the case that consumption determines investment. It relies mostly on Lord Keynes and Professor Hansen for arguments that investment is the key economic variable, and largely on Mr Paul Douglas (now Senator from Illinois and a member of the Joint Committee) and the Council of Economic

Advisers, to state the prime importance of the relationships between prices, wages and profits—in which the degree of monopoly is relevant. No conclusion is attempted.

The section on the financing of investment, after a useful summary of national income data on savings and investment and of data on sources and uses of corporate funds, examines the present situation in some detail. On business equipment expenditure, it finds that "aggregate outlays are well above the secular trend . . ." but that "the backlog of demand which existed at the end of the war" has not yet been exhausted. Despite many assertions to the contrary, equity capital is not considered to be seriously lacking, though a variety of "striking changes" in corporate finance are noted. Small business, which makes up 92.5 per cent of US business establishments, employs 45 per cent of the country's workers, and handles 34 per cent of its volume of business, is found to have difficult financial problems arising from poor access to capital markets, from volatility of profits, and from taxation. The highly complex problem of depreciation tax policy and its impact on investment is treated very fully.

The two other sub-committees, on low income families in

relation to economic instability and on unemployment trends, have done part of their work together. The former has produced a report on "Low Income Families and Economic Stability," which reviews in very considerable detail the factors contributing to low income and the circumstances in which low income families live, in cities and on farms. The latter has issued "Employment and Unemployment" which describes and assesses the data used for statistical estimates of both, and the concepts behind them. Jointly, the two committees have assembled information on "Selected Government Programmes which Aid the Unemployed and Low Income Families."

DISTRIBUTION OF MONEY INCOME OF US FAMILIES, 1948

Range of Income \$	No. of Families* in Each Income Group	
	In Millions	As % of Total Number of Families
Under—1,000	4.0	10.6
1,000 — 2,000	5.6	14.5
2,000 — 3,000	7.9	20.6
3,000 — 4,000	8.0	20.7
4,000 — 5,000	5.0	12.9
5,000 — 6,000	3.1	8.1
6,000 — 7,000	1.8	4.7
7,000 — 8,000	1.1	2.8
8,000 — 9,000	0.6	1.5
9,000 — 10,000	0.3	0.8
Over 10,000	1.1	2.8
ALL INCOMES	38.5	100.0

* Excluding about 8 million "Single-person families."

The information made available in these documents is certain to find wide use. Still more important is the amount of serious thought which preparation for these hearings has inspired in the country's financial community among, for example, officers of large and small banks through the forty-eight States; economists in industry, in government and the universities, and government officials, have all made their contribution. The preliminary questions have started discussions at meetings of trade associations and other business groups, and encouraged comment in memoranda and in letters. Economic theory will always remain mysterious to many people; but these hearings are adding to the number by whom the mysteries have been at least tentatively explored.

Diesels on Rails

[FROM OUR AMERICAN STAFF]

MR. JOHN L. LEWIS, leader of the coal miners, has again justified his informal title of "the best salesman the diesel makers have." During the latest spell of idleness in the coal mines, lasting for six weeks, the Pennsylvania Railroad was amongst those which were told by the Interstate Commerce Commission to take 25 per cent of their coal-burning locomotives out of service, because coal stocks were dangerously low. As the miners went back to work, for the moment at least, the Pennsylvania Railroad announced that it had given orders for 226 new diesel-electric locomotives, to replace coal-burning steam engines.

The shift from steam locomotives to diesels, which turn oil into electric power, started around 1929. In that year there were twenty-two diesel units operating in shunting yards. They were humble bits of mechanism, 600 horse-

power strong, looking like a shoe box set on a flat car, but proving themselves flexible, efficient and easily handled. They did not have to be warmed up before use, they collected no ashes which had to be dumped, they boasted no boiler tubes to get clogged, worn parts could be replaced without retiring them to an engine shed for rest and grooming. They looked rather funny and had none of the romantic appeal which steam engines have collected, but they were economical to run and to maintain.

In the depth of the depression they caught the eye of a railroad genius named Ralph Budd who, noting the loss of passenger traffic to the private motor car, the bus and the airplane, planned to get it back by making trains as attractive as were the newer forms of transport. He went to an automobile manufacturer for help and in 1934 he had a light, high-speed, four-car train with plenty of "eye-appeal," drawn by a 600 horsepower diesel-electric locomotive, the first to be put to main line working. Thus the motor car was married to the railway with all the fanfare of which American publicity experts are capable. The new train—the Burlington Zephyr—made its first run from Denver to Chicago, sliding down the eastern slope of the Rocky Mountains and across the Mississippi Valley for over a thousand miles—a trip for which 26 hours was normal time. The Zephyr did it non-stop in half that time, pulling its stainless steel cars onto a special stage at the Chicago World's Fair just 13 hours and 5 minutes after it had left Denver.

★

The ugly duckling had turned into a speedy swan, and the public flocked to see and to ride. The next step was to convince railroad men that the diesel was as strong as it was fast. American railways cover a varied territory, with the high mountains and great plains of the west presenting problems very different from those of the narrow valleys in the east. The need for speed, strength and endurance had traditionally been answered by the building of engines that grew heavier as loads increased. Britain's opposite answer, its devotion to trains that were fast and light, seemed unsuited to American conditions. Moreover, the traditional railway fuel in the United States, as in Britain, was coal. Until Mr Lewis's miners began demanding ever higher wages, coal had been cheap as well as abundant, and for many railways it provided freight revenue as well as fuel. At first the diesels found their best friends near the oil country rather than in the stubborn coal regions.

Not until 1941 were diesels put to handling freight trains in the east. That year the New York, New Haven and Hartford Railroad (a New England railway which covers territory between New York and Boston), needing additional motive power with which to handle the traffic produced by Britain's war needs, bought 60 diesel engines, each capable of developing 2,000 horsepower, or twice as much if run in tandem. It now has 298 of them, and expects to have more; 116 of these carry double loads, pulling de luxe passenger trains by day and mile-long freight trains by night. A table of relative costs which this railway compiled during March, 1946, on the basis of actual experience, tells the tale. The 678 trains pulled by steam were reduced to 662 pulled by diesels. The

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

fuel cost was cut by a third, the repair cost by two-thirds, the use of pusher engines up heavy grades was abolished, and the total cost of the month's operations cut from \$240,000 to \$128,000.

The increase in the use of diesels all over the country has, to a large extent, been a wartime and postwar phenomenon. In 1939 the ICC reported that 639 diesel-locomotive units were in service; by 1945 there were 4,301, and today more than 8,000 diesels work the marshalling yards and run the main line tracks. In 1948 the Class I roads (that is, those which have a million dollars or more of operating revenue each year) bought 1,481 locomotives, and of these 1,397 were diesel-electric units. Half the passenger traffic and almost three-quarters of the freight are today drawn by diesels.

The cost of replacing so large a share of the country's motive power in so short a time has not been light. The Pennsylvania Railroad's 226 new diesels will come to about \$38 million, which means an average of \$167,000 apiece. A bargain in an 800 horsepower shunting engine can be had for only \$86,000, but the 4,500 horsepower giants are expensive. The financial outlay was met during the lush war years by resort to provisions of the income tax law which permitted railways purchasing emergency defence facilities to amortise the purchase price by 20 per cent in 1943 and 1944, and by 60 per cent in 1945. This amortisation privilege made it possible to buy new equipment at a fraction of what it would have cost in normal times. As a result many of the railways emerged from the war with their motive power in better shape than when they entered it.

★

The competition for diesels among railways was made more curious by the competitive situation between the manufacturers. The first shunting diesels were produced by the American Locomotive, the Ingersoll-Rand and the General Electric Companies in combination. The first main line diesel was produced by the General Motors Corporation and the Budd Manufacturing Company. During the war the entire output of diesel engines by the older group was taken by the Navy for submarine and other uses, leaving the locomotive field open for exploitation by the General Motors Corporation, who were primarily automobile manufacturers. This made it possible for them to enlarge their facilities so satisfactorily that out of 2,394 diesel electric units produced in 1948 by the four companies now making them, 1,322 were built by the Electromotive Division of General Motors, 566 by the American Locomotive and General Electric Companies together, 355 by Baldwin Locomotive Works, and 151 by Fairbanks, Morse and Company. General Motors now produces eight each day.

Steam engines are still being replaced by diesels, though not at the wartime and early postwar rate. It would be too much to say that replacement will become complete: while many of the replaced steam engines are being cut up for scrap, some are being sent to Europe and others will be stored by thrifty owners who believe in providing against rainy (or oil-short) days. Nevertheless, the keeping of water tanks, ash pits and engine-houses in order for a few remnants of the old regime is an expensive business and, as the new diesel-electric units continue to prove their economic worth, the tendency to withdraw entirely from the older system becomes more marked. It is a development which could only be contemplated by a country possessed of oil supplies in great quantity, and convinced of its ability to keep them up by whatever means may become necessary.

American Notes

Resignation of a Pioneer

The resignation of Mr David Lilienthal from the chairmanship of the Atomic Energy Commission is the latest, and one of the most melancholy, demonstrations of how difficult it is for the government to retain the services of able men. In the case of the resignation of Mr Clark Clifford, one of the President's aides, a man with three children to educate, the fact that the rewards of private work in the United States are so much larger and more certain than those of public service was the chief factor. But Mr Lilienthal has spent nearly 20 years in government service, 16 of them in pioneering two vast new federal enterprises, the Tennessee Valley Authority and the atomic energy programme, and up to now has found the satisfactions of governmental trail-blazing compensation, not only for niggardly pay, but for a constant barrage of criticism and insinuation. A model of the new type of administrator required by big government, he will not be easy to replace.

Mr Lilienthal is leaving during the temporary lull which succeeded his exoneration by a strictly party vote from the charges of "incredible mismanagement" brought by Senator Hickenlooper. But the ink of the President's deeply regretful letter of acceptance was hardly dry before Senator Johnson—another member of the Joint Committee on Atomic Energy—had accused him of a "nefarious plot" to convey atomic information to Great Britain. This diversion is accounted for by the Senator's discomfiture at having himself succumbed to television temptations and divulged to the whole world what he boasted at the time were "top secret" atomic revelations. But it is a sample of the virulent and irresponsible attacks from which Mr Lilienthal has suffered in the past and which he would have had to undergo again in June when his appointment would have required reconfirmation.

Mr Lilienthal's troubles with Congress may be due as much, or more, to dislike of the extension of government activities as to a suspicion that he treated Congress and its instructions with a touch of intellectual arrogance. But at a moment when the agreement governing the sharing of atomic information must be renewed (it expires this month) and American policy on international control is being reassessed, an administrator who has lost the confidence of a substantial minority of Congress has also lost much of his usefulness. The risk is that a non-controversial—and timid—successor may be appointed to appease the critics.

★

One of the compensations for the loss of a gifted public servant is that Mr Lilienthal, freed of specific responsibilities, will be freer to discuss, and campaign for, certain causes dear to his heart: the more rapid exploitation of the peaceful uses of atomic energy, the relaxation of excessive secrecy, the wider sharing of atomic developments with friendly nations, and, perhaps, a revision of the Acheson-Lilienthal proposals which formed the basis for the American plan for international control of the atomic bomb.

Mr Clifford's departure is a more private grief to the President and his party. It was, in large part, Mr. Clifford who, in the dark summer of 1948, not only convinced the President that he should campaign for a Fair Deal, but wrote many of the speeches which, by revealing Mr Truman in all his homespun humanity, clinched the victory. At the Department of the Interior, the substitution of Mr Oscar Chapman for Mr Krug is a victory both for merit and devotion. An able and sincere official, Mr Chapman campaigned enthusiastically for Mr Truman while Mr Krug resigned himself to a Dewey triumph.

Passengers on the Railways

From now on intending railway travellers, if they did not join the recent stampede for tickets, will find, in some cases, that it is cheaper to go by air, and only half as costly if they are willing to put up with 'bus travel. The Interstate Commerce Commission has granted an increase of 12½ per cent in passenger rates for railways east of the Mississippi and north of the Ohio and Potomac rivers. Fares in this area are 44 per cent higher than they were in 1946, and 50 per cent above prewar rates. Including the 15 per cent federal excise tax imposed during the war and not yet repealed, fares have reached the record level of 3.9 cents a mile.

Passenger revenues today amount only to an eighth of freight revenues; in the days when railways enjoyed a near-monopoly of transport they accounted for twice as large a share. But a \$560 million loss on account of passengers in 1948 cannot be ignored by an industry which earned only 4.2 per cent on its invested capital. Traffic has been falling off since the war, but the number of passenger miles carried is still almost twice what it was in 1939. The deficit—the largest on record—is the result, first, of the steep rise in labour costs; second, of unprofitable handling of mail and express shipments; and finally, of empty trains on many branch lines. Here, the worst enemy of the railways is the private motor car, whose use is increasing again, after the decline during the war, when production was suspended. Yet when the railways try to shut down these unprofitable services, they are opposed both by their own employees and by the communities served, which like to have a stand-by service in case of bad weather.

★

This fourth postwar increase in passenger rates does not arouse universal enthusiasm. The ICC was divided 6 to 4, and one Commissioner, Mr Mahaffie, believes that lower—rather than higher—fares are the railways' salvation in their struggle with airlines, 'buses, and private cars. Railway executives themselves differ over the usefulness of the increase, though no railway is likely to take advantage of its right to refuse to adopt it. A loss of 2 per cent in traffic is expected, and a revenue gain of only \$37 million compared with losses last year, in the eastern region, of over \$250 million.

One Commissioner has suggested a subsidy, and though the word is distasteful, the railways probably would not refuse more adequate compensation for carrying the mail. It is a sore point with them that the airlines, beside receiving handsome mail subsidies, share with 'buses and lorries the benefit of other government expenditures on highways and airports. Mr Sawyer, the Secretary of Commerce, in his forthcoming report on transport policy, is expected to recommend co-ordination of all federal transport programmes. This might open the way to increases in airline and bus charges designed to distribute revenue more equitably. Mr Sawyer may also recommend studies to determine whether the government should impose new charges on airlines, motor carriers and shippers for the federal facilities they use.

★ ★ ★

Local Cornucopias

Each November American voters have a chance to speed or retard the flow of schools, hospitals, highways, sewage systems, voting machines and other amenities which pour from the cornucopias of their State and local governments. In 1947, they celebrated the end of the enforced niggardliness of wartime by approving a flood of \$1.1 billion in loans for such projects; last year the figure was up to \$1.2 billion and this year it exceeded \$1.5 billion. Voters all across the country evidently want the welfare state in their own city and county halls as well as in Washington.

Californians were, however, less lavish than usual last month. On second thoughts they modified considerably the extravagant pension scheme which they approved last year and which endangered the State's solvency not only by its generosity, but by the number of old people which it was attracting to the Golden West. The age of eligibility for a pension will once more be 65, instead of 63, and the restrictions on permissible independent income will be tightened; about \$60 million a year will be saved and, more important, control of the details of the pension scheme has been restored to the State Legislature. The attack on the "senior citizens," who were living in excessive comfort at the expense of their grandchildren's education, was led by parents and teachers. They even turned the tables by obtaining approval for a loan of \$250 million for much-needed schools in poor districts.

★

New York voters on November 8th approved a stock issue of \$300 million for slum clearance. But New Jersey, swimming against the national tide in this as in its choice of a Republican Governor, rejected both a public housing loan and an ex-servicemen's bonus. Neighbouring Pennsylvania, on the other hand, approved a stock issue of \$500 million, a record for this purpose, to give bonuses to all the State's veterans, up to a maximum of \$500. It is the eighteenth State to provide such gratuities since the end of the war; the total is nearing \$2.5 billion and other States are thinking of adding to it—as are some members of the federal Congress.

Thirteen States are financing these bonuses entirely by borrowing, and it is noteworthy that, of the five bonus proposals rejected by the voters, four specified the taxes by which the money would be found, instead of comfortably postponing the day of reckoning. But the propositions on the ballot papers each November seldom contain such direct reminders that it is the voters themselves, as taxpayers, who must to a great extent refill the horn of plenty which, in their alternative roles as beneficiaries, they are so ready to empty. It is doubtful also whether the voters realise how much more expensive their welfare states will be, in the long run, if the cost includes debt charges.

★ ★ ★

Roosevelts in Two Rings?

Mr James Roosevelt, the late President's eldest son, has just, to no one's surprise, tossed his hat into California's political ring and is challenging all comers for the right to sit in the Governor's chair in 1951. The preliminary rounds, within the Democratic Party itself, will be decided in June, the finals, against the Republican and any other champions, next November. Mr Roosevelt is unlikely to have a walk-over in either contest. He has been in training in California for nearly ten years, a long time by western standards, but not long enough to silence suggestions that he is an itinerant political boxer. Another weakness is his approval of the excessive pensions for California's old people, which the voters have just decided to modify. This will be cited as evidence that he is the prodigal son of a prodigal father, but it should also mean that the pensioners will be cheering—and voting—for him next year.

A more serious flaw in Mr Roosevelt's defence is his persistent pushing of General Eisenhower for the Democratic presidential nomination last year. This the State party organisation professes to find hard to overlook, but the Democratic National Committee has now decided to forget, if not to forgive, and to put its money on Mr Roosevelt. His father's name is his greatest strength, but he has also inherited his charm and political ability; his enthusiasm for the Fair Deal gives force to his attack in the State with the highest unemployment in the nation. The Republican Governor Warren's

liberal programme has been blocked in the State Legislature by the opposition of his own party, and he is not certain of the Republican nomination should he decide to enter the fight once again. Furthermore, he lost his reputation for invincibility last year, when he failed to win the Vice-Presidency, and he also lost the non-partisan disguise which in the past has brought him both independent and Democratic votes.

Mr James Roosevelt is the present favourite in the California fight for the obvious reason that he is thought to have the best chance of winning. This is also why the odds are shortening on the chances of his younger brother, Representative Franklin D. Roosevelt, being the Democratic champion for the New York Governorship next year. He has as large, if not a larger, share than his brother of his father's political legacy. His Congressional success proved his vote-getting ability in New York City and his recent activities on behalf of Senator Lehman showed that he is also attractive to New York State; support from both is essential to victory in a State election and so far there is no other Democrat in sight who has this dual appeal. Mr Franklin Roosevelt has kept his hat firmly on his head so far and the White House is unlikely to encourage anyone to toss it into the ring for him, now that his brother is getting warmed up in California. Even Mr Truman could hardly hope to escape from the Roosevelt shadow if that shadow became two substances, one on each coast, one in each of the largest States of the Union—for at last California has more citizens than Pennsylvania.

* * *

Kaiser's Fairy Godmother

The foundation of Mr Henry Kaiser's impressive reputation as an industrial wizard was laid in 1939, when he submitted the lowest bid for cement for the Shasta Dam without owning a cement plant. He won the contract, built a cement plant, completed the job on time and made a profit. With government war contracts and government loans, the legend and his enterprises grew to include ship-building, magnesium (from which he has now withdrawn), steel plants, and aviation. Since the war he has invaded the fields of housing, aluminium, steel pipe and, with less success, the highly competitive automobile industry. The envious allege that the Kaiser magic lies as much in government relations as industrial technique; they felt justified, as well as indignant, in October when the Reconstruction Finance Corporation, the government lending agency, authorised a \$44 million loan to the Kaiser-Frazer Corporation, which, after a bold beginning that made it, in three years, the fourth largest producer of cars, lost \$8,000,000 in the first half of 1949.

In the eyes of Mr Kaiser's less favoured industrial sisters, the RFC seems to have adopted the permanent role of fairy godmother to his Cinderella; there is a suspicion that, once involved in Mr Kaiser's complicated, overlapping empire, the RFC will have to go on performing miracles of aid. The murmurs at the latest waving of the wand have prompted Mr Kaiser and the RFC to make a clean breast of their financial relations. All told, over \$250 million of government money has been lent to Kaiser enterprises, though not all has been outstanding at any one time. At present, aside from the new loan, all Mr Kaiser owes the RFC is \$96 million on account of his Fontana steel plant, which he built with government loans during the war. (Not all his persuasiveness and persistence induced the RFC to scale this debt down to the nominal sum he desired.) This amounts, however, to over 20 per cent of all the RFC's loans to business, and alone makes Mr Kaiser the largest recipient of RFC aid. Another \$54 million is owed the government on account of purchases of war plants, including Willow Run, where Kaiser and Frazer cars are made.

The new loan is really two: a short-term one of \$10 million

to finance the wholesale, but not retail, distribution of Kaiser-Frazer cars, and \$34 million to provide working capital and finance retooling for the new cheaper "people's car" the company hopes to have in its showrooms next year. High prices, caused by small-scale production and the difficulty of securing supplies on as favourable terms as other companies, have been the corporation's chief embarrassment; the RFC hopes the new loans, combined with lower material costs, will make the venture profitable again. The RFC is authorised to make loans to small business which cannot obtain capital elsewhere and to take account of a firm's contributions to employment, business stability, and the public interest. Kaiser-Frazer is only small in comparison with the automobile giants, and to them the new loans smack of subsidised competition, particularly at a time when the government is pursuing an anti-trust suit against the General Motors Corporation. Coupled with the loans to the Lustron Corporation, makers of prefabricated houses, they suggest to some Senators that the time has come for a close scrutiny of the lending policies of the RFC and tighter drawing of the terms of its charter, if not the transfer of its functions to some other agency.

Shorter Notes

No new contract for the coal miners had emerged by midnight on November 30th out of the suspense in which their leader, Mr John L. Lewis, has been keeping not only Washington journalists but also the members of his policy committee assembled in New York. At the time of going to press the men, taking it for granted that the three weeks' coal truce had expired, were once more leaving the mines, with a reluctance which may induce Mr Lewis to send them back. President Truman, on holiday in Florida, is apparently equally reluctant to carry out his undertaking to invoke the Taft-Hartley Act, which would postpone the strike for eighty days.

*

The trial of Miss Judith Coplon and Mr Valentin Gubitchev, a Russian employee of the United Nations, on charges of espionage, has been postponed until December 27th to allow the latter's counsel to familiarise himself with the case, including 9,000 pages of testimony from Miss Coplon's earlier trial. Mr Gubitchev refused to arrange for legal aid at first in the fear that doing so would prejudice his claim to diplomatic immunity—though this is rejected by the court and the United Nations. By a stroke of poetic justice the retrial of Mr Alger Hiss, now in its third week, coincides with the trial of Mr Parnell Thomas, former chairman of the House Un-American Activities Committee. The charge is that he defrauded the government by padding his payroll and demanding a share of the salaries so obtained; on the third day of the trial, he withdrew his plea of not guilty, and threw himself on the mercy of the Court. It was the House Committee which first unearthed Mr Whittaker Chambers, the chief witness against Mr Hiss, whose revelations forced the government to prosecute the former State Department official, nominally for perjury but in fact for supplying confidential papers to the Communist underground.

Combat aeroplanes will no longer be allowed to use the National Airport at Washington, D.C., in order to guard against a repetition of the recent collision between a fighter plane and an airliner, in which all the fifty-five passengers lost their lives. In October this terminal, the only civil airport serving the capital, handled 13,500 flights; at rush periods there are as many as 33 arrivals and departures each hour.

THE WORLD OVERSEAS

Ruhr Steel and the Future

(From Our Special Correspondent)

WITH the decision taken at the Petersberg, and announced last week, to reprieve the August Thyssen works and six other steel plants, the Ruhr gained its second triumph of this fateful year. The first came in August, when the return of the conservative Adenauer government removed the fear of nationalisation. Now the German steel industry can begin to plan with more certainty.

The picture which the industrialists see around them would discourage men with less determination. True, the past four-and-a-half years have shown an extraordinary recovery, for which the tenacity and endurance of the Germans, managers and workmen alike, are in the main responsible. Without this human factor the economic forces, such as the currency reform of June, 1948, and the flow of American and British relief imports, would hardly have produced the same results. From the utter prostration of 1945, the German steel industry has worked its way up in 1949 to a position where it is the fifth largest producer in the world. If the Saar were included in the German instead of French economy, Germany would occupy fourth place in the world after the United States, the Soviet Union and Britain. By the end of this year, western Germany's total output will probably be slightly under 9 million tons, compared with less than 6 million tons in 1948.

So far, so good; but before the war Germany came second to the United States with a production, at the height of rearmament, of 22½ million tons, the overwhelming proportion of which was in what is now Federal Germany. Furthermore, the steel industry has not recovered to the same extent as overall industrial production in western Germany. The general industrial index has now reached 92 per cent of the 1936 level, whereas steel output, after touching 66 per cent of the 1936 output in August, fell—owing to a deliberate cut—to about 60 per cent in October. The general index reflects the fact that many industries that were greatly expanded since 1936 are now producing very much more than in that year. The steel industry, on the other hand, once Hitler's full armament programme came into operation, was neither greatly expanded nor modernised. New plants were mainly erected, not in the Ruhr, but in Austria and the comparatively "bomb-free" territories occupied by the *Wehrmacht*. This handicap is one to which the attention of the Ruhr industrialists has frequently been drawn by investigating American steel experts.

Target for World Markets

The Ruhr has, therefore, still comparatively far to go before it reaches either the general level of western German production, or the permitted maximum of 11.1 million tons of ingot steel a year. In these circumstances the main questions which the German experts have been studying are whether the rise can go on, what production Germany needs and, above all, how much can it sell in conditions of world surplus.

It is assumed by German steel planners that, sooner or later, the limit imposed upon them by the Allies will be raised. This assumption has for a long time past been taken as the basis of calculations; and who will maintain that

German optimism is misplaced? Technical hindrances to a continued rise, such as lack of coal or power, are no longer considered serious possibilities. What, therefore, should the target be? In a land of ruined cities and out-of-date railways the internal demand for steel would seem unlimited. On this argument the German steel propagandists are accustomed to base their pleas for production running to 15 or 16 million tons a year. In practice, however, this potential demand is limited by the vast impoverishment of the nation, as well as by minor factors such as the lack of skilled labour, machines and materials. Since currency reform, consumers of steel have been starved of capital. Nothing could better point the lesson that steel production is at present limited, not by lack of coal or power, dismantlement, decartelisation, or demilitarisation, but by lack of effective demand, than the fact that the steel companies voluntarily cut their output in September and October, because crude steel had outrun orders for semi-finished and finished products. In particular, the railways, which are by far the largest consumers of steel had failed to replenish the order books.

Rationalisation and US Capital

If then, the Ruhr cannot sell its present output, why should it demand the capacity, and the right, to produce double the amount? Some industrialists, indeed, admit that it would be economically more advantageous to work to full capacity the 13.5 million tons which was left before the Bonn agreement, rather than add another 2 or 3 million tons of capacity. However, the Ruhr looks at the problem from the point of view of Germany's national strength, in a competitive world of surplus steel. That a surplus is coming the Ruhr fully realises. In the Organisation for European Economic Co-operation the Marshall nations have presented plans for expanding steel capacity which, according to expert estimates, will considerably exceed the world demand in 1952-53. Shall Germany enter this race with its feet tied by limitations on capacity and production? The Ruhr is determined that this shall not be so. If, as the German industrialists envisage, the OEEC evolves into a new international cartel and production is restricted, the figure from which German output would be cut must be (in the view of the Ruhr), not 11.1 million, but 15 or 16 million tons. A start in this direction has been made by the Bonn decision which raised capacity—after dismantled works have been "re-mantled,"—by something like one million tons of iron and steel of various types. The next steps are to secure permission to produce above the present limit, and to rationalise production with modern equipment in order to meet competition in the export markets. Then, should protective barriers in western Europe be removed according to the American desires, the Ruhr, a cheap producer economically well-situated, could look forward to the collapse of plans for establishing steel industries in such countries as Italy and Norway.

"Rationalisation" was the sign under which the meeting of steel technicians known as the *Verein der Eisenhüttenleute* was recently held in Düsseldorf. As in the '20's, all the skill and energy of which the Germans are capable will now be turned on to this campaign.

Clearly, however, all plans for modernisation are dependent upon the capital being available. So far, the steel industry—with its almost worthless Reichsmark capital cut to less than a tenth by the currency reform—has helped itself by using short-term credits for long-term purposes. The German representative in the OEEC has presented an investment programme, though as yet without detailed projects of new plant, for scrutiny. The German steel industry—though varying in its estimate of the possibility of buying the equipment and the number of years needed to procure it—agrees that several thousand million D-marks are required for modernisation.

A proportion of the required funds will be obtained as long-term credits from the D-mark counterpart fund from ERP imports, which has risen automatically through devaluation of the German currency; but the Ruhr is anxious to obtain American capital direct. Hopes have faded that the US bond issues which financed nationalisation in the 20's will be repeated, and attention is concentrated on efforts to secure American investment in new share capital. A model scheme of the kind was drawn up by the Vereinigte Stahlwerke, and presented by Dr Adenauer to the three Foreign Ministers in their November talks in Paris. With the mistaken idea that France's fears would be quietened if some of the new shareholders were French, its backers suggested French (as well as American and British) participation in the Vereinigte Stahlwerke, knowing that the capital would have to come from the United States in the first place. The idea has, however, met with a chilly reception in France. All such proposals are, moreover, blocked by the existence of old foreign debts on which no decision has yet been taken, and by Law 75, which prohibits any change in ownership until the coal and steel combines of the Ruhr are broken up and regrouped.

Plans for Reorganisation

Law 75 was first promulgated by the British and American Military Governors in November, 1948. No more important and controversial economic measure was ever taken by the two occupation powers. Partly because it appeared likely to lead to nationalisation of the Ruhr, the law was backed by the British, because it was intended to settle the question of ownership and clear the way for fresh capital, it was approved by General Clay. The French objected outright to the clause which granted the German Government the right to decide upon ownership of the Ruhr, and they maintain this stand. The American bondholders and British "Standstill" creditors have protested against the law, since it disregarded their legal rights. (It is now being re-examined with a view to clarifying and amending this point.) The Germans viewed it at the outset with suspicion, which has in the meantime melted. The Ruhr steel industry is now inclined to take the Military Governors at their word when they declared the object of the law to be reorganisation of the German heavy industry upon lines of maximum efficiency.

The Economist by Air

New second-class airmail services make it possible to quote the following annual subscription rates:

Egypt, Persia, Iraq and certain Persian Gulf Ports	£6
Cameroons (Br.), Gambia, Sierra Leone, Togo (Br.), and Zanzibar	£7

Certain other areas, at present covered more cheaply by the existing AIR EXPRESS services, may in some instances be served more quickly by the new second-class airmail: e.g. S. Africa, E. Africa, N. & S. Rhodesia, Nyasaland, Sudan (A-E.).

THE ECONOMIST, 22 RYDER STREET, LONDON, S.W.1.

Last September, a Trustee Association of German technicians and labour representatives was finally appointed to draft a plan of reorganisation. Though the plan will, according to the law, be subject to Allied approval they will have a free hand to regroup the decartelised companies combining, say, a coalmine belonging to one trust with a steel plant belonging to another, so long as objectionable concentration of economic power is avoided. What will emerge from the work of the trustees cannot yet be predicted. In particular, it is too soon to say whether the German experts will try to reconstruct the system whereby the coal mines were owned by the steel trusts, which ran them at a loss in order to sell the finished steel products at a profit. The British in Germany have hitherto contested this system; and the French and Americans are now combined in an attack on artificially cheap German coal. German views are divided, but it can hardly be supposed that a structure will again emerge such as that of the Vereinigte Stahlwerke, a conglomeration of largely fortuitously combined interests, which, through one subsidiary (the Gelsenkirchen Mining Company) owned twenty per cent of the Ruhr coalfield. Two years, however, will elapse before the trustees expect to finish their draft reorganisation.

In the meantime, the prevailing uncertainty about the ownership of the Ruhr affects the shareholders, the creditors, and plans for fresh financing; but it seems in no way to hamper the output of steel. The annual report of the Vereinigte Stahlwerke, presented last September, was significantly optimistic. Though the operation of ten companies had been removed from the company, and its plants accounted for no less than 80 per cent of the dismantlement programme, the report stated that the concern still produced 15 per cent of west German steel.

Nigerians in Committee

[BY A CORRESPONDENT]

NOTHING could have been more unfortunate—if only from the point of view of timing—than the recent outbreak of violence in the coal mines of eastern Nigeria. The actual disturbance in the mines, which resulted in the shooting of a score of workers, had nothing to do with politics; it was not even, as a Note on page 1224 points out, a straightforward industrial dispute. But in Nigeria, any sort of trouble very soon takes on a political flavour, animosity is directed against the white man, all sorts of old grievances come into the open, and—before you know where you are—a major row is on.

The other unfortunate aspect of this affair is that it comes at a crucial moment in the novel constitutional review in which Nigeria has been engaged since last March, and may well upset the apperect. Only two years ago Nigeria inaugurated a new constitution, which had been elaborated by the then Governor, Lord Milverton. It marked a good step forward, and had the merit of recognising that the three strongly distinct regions of Nigeria—north, east and west—could not be lumped together. Regional Houses of Assembly were therefore introduced, and the regional principle has, on the whole, worked very well. But the Milverton constitution was tainted from the outset, because it was imposed without "consultation." Dr Azikiwe and some of his colleagues refused to take their seats after election, and in 1948 they came in a delegation to London to put forward a constitutional blueprint of their own. Although they were refused, and later decided to enter the Legislative Council, it was clear that the constitution was not popular. A new Governor and Chief Secretary were appointed to Nigeria and announced that a complete review of the constitution would take place. They called on the public to put forward proposals as to how this should be done.

One of the suggestions made, both in Britain and in Nigeria, was that a constituent assembly be called rather than entrust the power of constitution-making to an appointed committee (as was done on the Gold Coast) who might be written off as Government "stooges." But it was not easy to discover a practical form for this constituent assembly which would be acceptable to everyone. Nigeria is sharply divided between the feudal Moslem north (where about half the population, some 12 million people, reside and are of Hausa stock), and the south, inhabited by the very different Yoruba and Ibo peoples who may be Christian, Pagan or Moslem. The south itself is divided—bitterly divided—between the western Yoruba kingdoms with their traditional and powerful rulers and councils, and the Ibo east where there is no tradition of chieftainship. Any method of election to a constituent assembly which would satisfy the north would not appeal to the south, and even between the east and the west the divergence of approach seemed insuperable. When the matter was eventually brought before the Legislative Council last March, all the stress was laid on techniques, and the council was asked to appoint a select committee which would concentrate wholly on the question of how to carry the thing through.

Four Sets of Proposals

This select committee, surprisingly enough, reached complete agreement within a fortnight. It was able to do so because it plumped immediately for the regional method of discussion. Let the north, it suggested, have its own constitutional conference, the west its own, and the east its own—and Lagos its own, too. Then let the four sets of proposals come before a central drafting committee to be welded into a whole, and only then be brought before a general conference of the country, whose members would be elected by each of the regional conferences. The suggestion went even further

and proposed that, before the regional conferences met, there should be discussions in the villages and provinces, and the views of all should be taken up to the regional conferences.

The select committee's report was approved by the Legislative Council and the constitutional discussions were immediately set on foot. For the last few months villages, divisions, provinces and regions throughout Nigeria have been discussing the composition of executives and legislatures, the division of power between the centre and the regions, electoral systems, franchise and reserved powers. The completeness of the discussion and the general interest aroused have varied greatly in different parts of the country. Some dissatisfaction has been voiced, here and there, about the composition of the regional conferences. Some have said that the lead given by Government officials was too strong; some that it was too weak. But in the east and the west and in Lagos the composition of the conferences was entirely African, including everyone of outstanding calibre and embracing all points of view. In the north many officials participated, but that was not objected to. In Lagos, where party strife is at its most intense, Dr Azikiwe's followers (who were outnumbered) walked out altogether, but the conference proceeded unmoved.

The three regions and Lagos have now put forward their recommendations, and the drafting committee (again all African except for three key British officials) is meeting to reduce them to a unity. One glance at the four sets of proposals show the extraordinary complexity of the task before it. On one basic point all regions are agreed—they all want a federal system of government, allowing each region a measure of internal autonomy. But then the trouble begins. The western region no longer wants a governor, but a governor-general as president of the legislature; Lagos wants a speaker, and a governor whose power of veto has been radically clipped. The east and north suggest continuing

with a governor. The north insists that the number of representatives on the central legislature from the west and the east should together not exceed the number from the north—this is, of course, not agreed by the others, Lagos going so far as to say that each region should have an equal number of representatives, irrespective of population. There are strong differences about the number of officials who should

be allowed seats on the legislature—the north would have all the governor's principal technical advisers, the west only six, and Lagos would have none unless they are members of the board of ministers. There are also wide differences of opinion as to the electoral system—the north wishes to continue the present system, the west talks of electoral colleges, the east of election from divisions, insisting that the basis of representation be the same throughout the country, and Lagos suggests election on a provincial basis. The north would give the franchise to male adults of 25 years or more, resident for three years; the west and Lagos mention tax qualifications; the east adult suffrage. All, except the north, want a secret ballot.

Split Between North and South

The proposals for the central executive differ equally widely. The north sees it as an advisory body only, with a powerful official element and an unofficial majority selected by the governor. The west, on the other hand, speaks of a responsible federal cabinet consisting of a governor-general, a prime minister and ministers elected by the federal parliament. The east envisages an executive, consisting of governor, six officials and twelve elected members appointed by the governor; and Lagos calls for a governor and a board of ministers of ten, including seven Nigerians elected by the central legislature from among themselves. But perhaps the most exciting controversy will arise over the north's financial proposals; it calls not only for the receipt of the full amount of the direct taxes collected in that region, but wants a share from other Nigerian revenues and even from imperial grants and loans on a *per caput* basis—which would mean that almost half the total funds of Nigeria would be devoted specifically to the north.

The drafting committee is now grappling with all these contradictions, and the difficulties, particularly with the north, have been formidable. The problem has, in fact, been to prevent a complete split in the country. The east, too, which mainly stands behind Dr Azikiwe, has been restive. Zik has resented from the start that his own 1948 blueprint, the freedom charter, was not adopted, and it will be remembered that many of his supporters boycotted the constitutional conference in Lagos. The hoped-for compromise is to go before a general conference of 53 Africans under a British chairman

in January; and the plan is for the final recommendations to be debated, first in the regional houses and then in the legislative council before submission to the Governor of Nigeria; only then will it be submitted to London.

It is at this moment, with the drafting committee in the thick of its attempts to bring together a host of conflicting viewpoints, that a state of emergency has had to be called and the country plunged into a new political crisis. It is extraordinarily bad luck for the many Nigerians—sincere nationalists themselves—who have devoted themselves to the constitutional review; and a bad setback for sorely-tried officialdom.

More Trouble in Argentina

[FROM A CORRESPONDENT IN BUENOS AIRES]

MOUNTING labour demands for higher wages in Argentina reflect the fact that Perón and his advisers are still without a policy for the country's economic ills. After four years of lavish promises and benefits to the workers and grandiose expenditure on state development projects, Argentina finds itself without the means to buy goods from abroad, unable to face foreign competition in the home market and in constant danger of pricing itself out of world markets.

When Señor Miranda disappeared from the stage last winter, even the novices who took his place recognised that Argentina's condition called for major surgery. A brutal reversal of inflation was the overriding necessity, and to be effective it had to be accompanied by firm resistance to the political temptation to raise labour costs. The collapse of the sellers' market has made such action unavoidable, but meanwhile the regime refuses to face facts and prefers instead to jump from one stopgap expedient to another.

Since the summer, when most of the food subsidies were jettisoned because the state trading monopoly, IAPI, could no longer scrape together the required funds, labour has become more and more restive. Workers have demanded increased wages, and these have usually been granted—those to railway and other transport workers alone ran into astronomical figures. Employers have been unable to afford the new increases, and on many occasions the Government has reluctantly been forced to step in and pull a new rabbit out of the hat. Current labour disputes involve the pharmaceutical trade and the flour, meat-packing and sugar industries.

Firmer Line with the Workers

The prevailing labour unrest springs not only from the pressure of rising living costs; it is in great part the result of government labour policy in the last few years, which encouraged the workers to believe that wage increases could always be had for the asking and that production was a secondary consideration. Constant stoppages, together with a mounting rate of absenteeism reduces production and thus contribute their quota to the inflationary spiral.

When at the beginning of October, the Minister of Industry and Commerce announced that the prices of certain consumer goods would be frozen, he also stated that no wage-freezing policy was contemplated. But of late the Government has shown a tendency to take a stronger line in dealing with fresh wage demands. Whether this indicates any real change of policy remains to be seen, since previous reluctance to grant wage demands have in the long run given way to political considerations. Perón's cabinet is composed of conflicting elements pulling in opposite directions, and in the end the various forces neutralise each other. The result is a deadlock and the matter is taken for decision to a high level, where Mrs Perón's influence—a very potent one—is invariably against any resolute stand on the wages issue.

In fact, given the financial policy adopted by the Argentine Treasury, spiralling wages have become inevitable. It was widely suggested that in abandoning the 25 per cent gold and foreign exchange backing of the currency, the regime's object was not only to keep within the letter of the Central Bank's charter, but, with this statutory embarrassment removed, also to set the stage for further monetary expansion; and nothing in the record of the present government gives any reason to suppose that it will neglect this opportunity to further its political ends. At the time when the gold-backing clause was suspended in September, the argument invoked by the government economists was that present-day conditions and modern economic theory called for the freeing of currency from the ball-and-chain of gold so as to secure a greater degree of flexibility. Flexibility, indeed, has been the one prevailing characteristic of Argentine monetary policy since the present regime came to power. But the flexibility has been all in one direction—that of further expansion. The note issue stood at 2,830 million pesos at the end of 1945 and by September 15th of this year had risen to over 8,000 million pesos. Gold and foreign exchange holdings fell over the same period from about 5,700 million pesos to 1,677 million pesos. Current holdings are, however, largely fictitious, since they include credits granted to Spain and other countries which are unlikely to be repaid.

Hand-to-Mouth Trade Policies

In the sphere of international trade the behaviour of the Argentine Government shows the same hand-to-mouth methods as those employed on the domestic front. What was needed from IAPI under present circumstances was an aggressive selling campaign abroad; instead it now appears to be floundering in a jungle of exchange rates which might well confuse even the ingenious Dr Schacht. With few exceptions, export prices since devaluation last month have been raised, particularly against sterling area buyers.

In part the explanation is that government officials are still living in the phantasy world of 1947 when sellers' markets were the only markets. It is probable, too, that domestic events are an important consideration in trade policy. One motive behind the price changes lies in the desire to window-dress IAPI's balance sheet at the end of the year by writing up peso assets and thus presenting a more attractive picture to offset the large sum owing to the banks. At the end of 1948 IAPI's debt to the banks was 6,496 million pesos and it is probably much higher now.

The effect of the new prices on the working of the Anglo-Argentine Trade Agreement is obvious. Britain is not bound to buy if prices are not suitable. But if Britain does not buy from Argentina, the Agreement is so much waste paper. Argentine policy since the pact was signed has given serious grounds for doubting if, in fact, there was ever any intention on the part of the Perón government to implement it. IAPI's new prices can only give further grounds. At every point the Argentine policy-makers appear to be ramming their heads not only against a brick wall but against the same brick wall—the crippling discrepancy between the country's needs and its resources. Nowhere is this clearer than in the field of imports. The nation is in urgent need of imports, both of capital equipment and even more, of consumer goods. A normal inflow of consumer goods would help to check rising prices, an operation which is beyond the administrative talents of the local enforcement authorities. But at the same time the Government dare not permit a recovery in imports for two reasons: industrial unemployment at home would inevitably follow since Argentine industry is in no fit state to withstand foreign competition, and, in the second place, the nation's reserves of foreign exchange are rapidly reaching the point where they are barely adequate for conducting day-to-day business.

Perón, a professional soldier turned politician, understands

little of economic affairs, though this fact does not prevent his making use of pseudo-economic jargon when addressing his followers. He has the added advantage that since his government turned the face of the economic barometer to the wall over a year ago by suppressing official statistics, figures quoted by him are usually the only available ones. But as a politician, he is undeniably astute. And if his policy has lost him the support of the middle class, that only provides an additional incentive to conciliate at all costs both Labour and the Army, either of which might unseat him. Right-wing nationalism and proletarian class-war can, however, be uneasy bedfellows. It may well be that Perón will soon be confronted with the need to choose between them.

Canada's Constitutional Changes

[FROM OUR OTTAWA CORRESPONDENT]

WHEN the British Parliament in 1867 enacted the British North America Act giving effect to the union of Canada (including what is now Ontario and Quebec), New Brunswick and Nova Scotia, it left the new Dominion with a federal system demanding a clear division of powers between the federal and provincial governments. More than 60 years later, when it was sought to give legal form to the independence of the Dominions, Canada found itself with no machinery of its own to replace the British North America Act. To fill this need, it was provided in the Statute of Westminster that: "Nothing in this Act shall be deemed to apply to the repeal, amendment or alteration of the British North America Acts, 1867 to 1930, or to any order,

THE CHRISTMAS PRESENT for the man who seems to have everything: that is the most difficult of all to choose. For him

the ideal gift is The Economist Diary

a memorandum book, an appointments register, and a complete reference book, combined in one volume measuring 10 in. by 8 in. Bound in red morocco-grained leather.

Price: in the U.K. (including Purchase Tax) 36/8, or 37/6 post free; overseas 32/6 post free by surface mail.

Full details are given in an illustrated pamphlet available from:

The Economist Intelligence Unit
22 RYDER STREET, LONDON, S.W.1.

rule or regulation made thereunder." Since then, therefore, Canada has had to continue to go to Westminster whenever it wanted to change its constitution.

There have been eleven such applications since 1867, but no rule has ever been laid down either in Canada or at Westminster about the method to be used. It has in fact been done by joint addresses of the two Houses of the Canadian Parliament, sometimes with, but more often without, consultation with the governments of the provinces. Whatever was done was open to criticism, and was usually criticised.

This position led to the curious anomaly that while certain provinces might feel that the necessity of going to Westminster provided some guarantee of their rights, there was in fact no "prescribed legal protection for the fundamental provision of the Constitution." The words quoted are those of Mr St. Laurent, the present Prime Minister. He has been much criticised, particularly in his own province of Quebec, for stating some years ago that there was nothing to stop the Federal Parliament from asking Westminster to abolish the right to use the French language. He was perfectly right, but it was a fact that few people wanted to face.

This is one of the things which has introduced an emotional element into the constitutional problem. The people of Quebec have no affection for the United Kingdom which would make them want to live under the government of Westminster. On the contrary, they are traditionally suspicious of all imperial ties; but the very remoteness of the Westminster parliament and the Judicial Committee of the Privy Council provided some feeling of security about the provisions of the British North America Act which safeguard French-Canadian rights. However little legal justification this feeling had, it has been competing with a growing conviction that Canada should take responsibility for its own constitution, and that appeals to Westminster, whether for legislation or judicial decisions, should stop. Mr. St. Laurent's government, with an overwhelming majority, is at last tackling the question.

No Appeals to the Privy Council

The first move is to get Parliament to pass an amendment to the Supreme Court Act making the Supreme Court of Canada the court of final resort and abolishing all appeals to the Judicial Committee of the Privy Council. The power of the Federal Parliament to do this has been upheld by the Judicial Committee itself. Next, the Federal Parliament is sending an address to Westminster asking for the British North America Act to be amended by the insertion of a new clause as Clause 1 of Section 91, which enumerates the powers of the Federal Parliament. This move has been opposed by opinions which range from the extreme "compact theory" of the Premier of Quebec and others to the more cautious attitude of the federal Conservative party, which holds merely that it would have been wiser to consult the provinces first. (The "compact theory," which the government refutes, is the theory that the British North America Act gave expression to a compact between the participating Canadian colonies which cannot be altered without their consent. Neither legally nor historically is it easy to support, but it has its passionate followers.)

The new clause which Westminster is being asked to insert will give the Parliament of Canada the right to amend the Act in everything except three classes of subjects. The Government originally proposed two exceptions, but later accepted a third proposed by the small Socialist party called the Co-operative Commonwealth Federation. The first is "matters coming within the classes of subjects assigned exclusively to the legislatures and the provinces." The second is "rights or privileges by this or any other constitutional act granted or secured to the legislature or government of a

province, or to any class of persons, with respect to schools or as regards the use of the English or French language." The third exception provides that Parliament must meet every year and that it shall not prolong its own life beyond five years except in "times of real or apprehended war, invasion or insurrection," and then only by a two-thirds vote of the House.

The government's basic assumption, as Mr St. Laurent explained, is:

that there is a line (between federal and provincial jurisdiction), but that it would not be fair for us (the Federal Government) to attempt arbitrarily to draw that line. We shall have it declared in general terms that we have the power to deal with the things that are on our side of the line. If it is felt that we attempt to do anything which anyone feels crosses the line or impinges on something that is outside our jurisdiction, there will be the courts to decide whether we are right or wrong.

The courts, it must be added, will no longer mean the Judicial Committee, but the Supreme Court of Canada.

Consultation with the Provinces

The Federal Government and Parliament have gone thus far on their own. But the final step in transferring the Canadian constitution to Canada demands consultation with the provinces. A Dominion provincial conference will meet in January to deal with the whole class of subjects in which both federal and provincial governments have an interest. Most crucial of these, perhaps, is the division of taxing powers, but there is also the whole field of subjects covered by the phrase "property and civil rights," which as a result of a series of Privy Council decisions now covers a very wide range, including labour legislation and social security. Jurisdiction over these is assigned to the provinces. Before the Federal Government could institute a scheme of unemployment insurance, for example, an amendment had to be sought to the British North America Act: it was made in 1940 after all the provinces had given their assent. A similar procedure might be necessary before the Federal Government could start a contributory old age pension scheme on a national scale. If agreement is reached at the conference, it will take one more Address to Westminster to transfer the whole of the Canadian constitution to Canadian hands. At the same time it will become possible to provide fundamental legal guarantees of provincial, language and education rights which are not guaranteed now, simply because it has never been agreed who shall have the power to ask Westminster to change them.

The prospects of agreement, however, do not look good. M. Duplessis, the Premier of Quebec, is promising intransigent opposition to all that the Federal Government is doing, and telling his followers that the rights of the French-speaking province are endangered. It is fortunate, indeed, that the Federal Prime Minister is a French Canadian and that he has the support of nearly all the Quebec members of the Federal Parliament. This gives the Government the opportunity to take action which, had it been taken by a Government headed by an English-speaking Prime Minister (even one so sympathetic as Mr Mackenzie King), might have evoked a cry that the English-speaking majority was trampling on the rights of the French-speaking minority. In the existing circumstances such a cry will be difficult to raise, and it is clearly the conviction of Mr St. Laurent's government that if M. Duplessis is too intransigent they will be able to appeal to the people of Quebec over his head and perhaps even break his hold on the provincial government.

(The British North America (No. 2) Bill, which gives Canada the power to amend its own constitution, was due to have its second reading in the House of Commons on Friday this week.)

In two darning needles lay...words

TELEGRAPHIC communication became possible in 1837, but at first messages could be sent only by Morse code. A Welshman, David Edward Hughes, a Professor of Music living in the United States, sought to invent an electrical apparatus that would transmit typed messages. One evening in 1855 he borrowed two darning needles from an old lady and began to use them as vibrators . . . Thus was born the telegraphic type-printer — the forerunner of the modern teleprinter.

The inventive spirit of Hughes is still alive in Britain today.

The electricity industry, for instance, is continually developing new appliances which increase the output of our factories and farms and make life easier in the home. On the electricity supply side, too, marvels are being done to overcome the post-war power shortage. Already electricity may be used freely at all times except at peak hours. Soon the nation will be able to enjoy even greater benefits from the new electrical age.

The Electrical Development Association explores and advises on methods by which work on farms can be made easier by the application of electricity. Consult your Electricity Service Centre, or write to E.D.A., 2 Savoy Hill, London, W.C.2

FOOD

What has engineering to do with breakfast? The answer is in the modern provender mill. Maximum production of meat, milk and eggs and the breeding of healthy beasts demand scientific livestock feeding; what is right for fattening pigs is wrong for store cattle, and the diet that gets the most work out of horses will not get the most milk from cows. The cheap and efficient manufacture of scientifically balanced rations, cattle cubes, poultry pellets and so forth for animals of all types—breeders, growers, fatteners, milkers and workers—sets many specialised engineering problems in plant design and equipment. Henry Simon Ltd are the world's leading firm of provender milling engineers, and in a dozen or more countries, from Britain and Europe to Australia and South Africa, Simon provender milling machinery is helping the farmer and stock breeder to feed a hungry world.

One of many ways in which the Simon Engineering Group serves the fundamental needs of civilisation.

Rail Charges and Efficiency

THURSDAY'S debate was intended to provide an occasion for the public audit of the work of the British Transport Commission in 1948, but it turned inevitably into a review of the reasons which have led the Commission to seek an increase in railway charges. It is less than two years since the Commission took up their duties, so there was plenty of scope for the familiar criticism that nationalisation is a guarantee of higher costs, higher prices, and lower efficiency. If the issues affecting transport were as simple as this, there would be far less to worry about. The point of real importance is that the Commission, being confronted with a large deficit, may be diverted from their long-term job of making transport efficient by the immediate exigencies of having to pay their way.

British Transport's predicament was described in *The Economist* last week. Briefly, railway takings are £7,500,000 down, with eight weeks of the year still to go. This suggests a fall in traffics of at least £10 million. A deficit several times greater than the £4,733,000 recorded in last year's accounts was already clear from these figures. On Monday, the Minister of Transport disclosed that the Commission's activities as a whole are likely to show a net deficit of more than £20 million; the estimate for 1950 might be as high as £30 million, and of course the deficits for the railways alone would exceed these net losses.

The Commission's views on the widening gap between revenues and costs were set out at length in the 1948 report, and were examined in *The Economist* of September 10th. Briefly, they argued that a general increase in railway charges was excluded because it would bring no net benefit to railway traffics and revenues "and would tend to increase costs of production." On the other hand, it would be intolerable if the railways had to pay more for wages and supplies and were not allowed to increase their charges. The Commission were evidently thinking in terms of a selective increase, and one which came close to matching the increase in railway costs since 1939 with the increase in prices and costs generally.

The terms of the application which the Commission have made to the Minister for authorisation to increase charges for merchandise by railway and dock and canal dues do not pursue these principles very strictly. The Commission are seeking an increase of one-sixth in the existing level of railway freight and merchandise rates by goods and passenger train. This increase, if granted, would raise the general level of railway freight rates from 155 per cent of the 1938 level to 181 per cent. According to an estimate given by the Minister of Transport on Monday, the weighted average of the railways' costs is now 220 per cent of the prewar level. An increase of 81 per cent in freight rates (passenger charges are to be kept at 55 per cent over the prewar rates) will be thoroughly unpopular; it will without

question increase the level of industrial costs; it will set in train consequential increases in the prices of coal, steel, farm produce, and any number of staples and industrial products. Yet, on a bare comparison of railway charges and railway costs, the increase which is being sought cannot be called rapacious. That an application was not made earlier must have been due largely to the fact that the Commission were preoccupied with the problem of settling in and acquiring their road interests, and the Railway Executive with the problem of answering union claims for increases in wages which were hopelessly beyond the earning capacity of the railways.

But it will not do to brush aside this increase as if the railways are fully justified in increasing their charges in conformity with increases in the general level of costs. Mr Barnes came near to expressing this point of view when he contrasted the 55 per cent increase in charges with the 120 per cent increase in costs. It was not, he said, a question of efficiency, but of brutal fact. This argument is quite inadmissible. It is very much a question of efficiency; the increase in charges to which the Commission are entitled is not any predetermined figure based on costs in other industries, but the lowest increase which, coupled with the maximum of efficiency, will enable them to fulfil their obligation to meet all their proper revenue charges, taking one year with another, to retire their debt and to set up a general reserve fund.

Here lies the danger of an application for increased charges at this formative stage of the Commission's work. Its success or failure is bound up with the reformulation of transport charges for different classes of railway traffic and for road haulage. Two years were allowed in the Transport Act for the complex task of working out charges schemes; already the Minister has had to use his power of extension for a further two years (to August 1951) and it is doubtful whether the task will be completed then. Charges are indeed the key to effective integration; but schemes cannot be worked out in a hurry, much less before experience has been gained in road haulage operation. But the application which is now before the Minister has nothing to do with integration or the dovetailing of different forms of transport to provide the most efficient service. It is frankly designed to get the Commission out of a hole—to find another £27 million in 1950 (if the Minister is prepared to sanction the increases from January 1st) towards meeting the expected £30 million deficit.

This explains why the application is being dealt with under the transitional provisions on charges which apply until charges schemes are in force. Section 82 of the Transport Act provides that

The Minister may . . . if he thinks it expedient so to do with a view to ensuring a sufficient revenue to the Com-

mission . . . by regulations authorise the Commission . . . to make charges additional to those in operation under (statutory) provision:

Provided that before making any regulations . . . the Minister shall consult with, and consider the advice of, the permanent members of the Transport Tribunal, acting as a consultative committee.

It is not clear whether the members of the Transport Tribunal, acting informally in this way, would hear representations from traders in public, as they did in their former capacity as members of the Railway Rates Tribunal, nor whether their advice to the Minister is to be published. Mr Barnes has expressed the view that the consultative committee "will no doubt think it desirable to consult with such representative bodies of traders as they think fit and take their views into consideration."

★

The question, then, turns on whether the consultative committee will limit their review to the formal application which the Commission have made to the Minister and to the comments on that application which are made by "representative bodies of traders" or whether they will range more widely into considerations of efficiency and competition in transport. The Transport Tribunal, when formally constituted, have the full authority of a Court of Law, but the transitional provisions set out above suggest that when the members form a consultative committee, they will be acting as advisers rather than in a full judicial capacity.

This is a point of substance. In the first place, there is no body, unless it is the Transport Tribunal, which can pronounce upon the question whether the Commission and the Executives are efficient—as the Railway Rates Tribunal used to pronounce, after being duly satisfied, upon the efficiency of the railways before the war. There are several signs of improving efficiency on the railways—the wartime bloat of staff is being reduced, and the movement of goods traffic is being more economically handled. It would be less than fair to the railways to ignore the steady improvement in operating efficiency which the monthly statistics reveal. But they are far less efficient than they ought to be. A deficit has at least some negative value as a spur towards greater efficiency and economy. But complacent agreement to wipe out a deficit by increasing charges would do infinite harm in removing that spur. The Commission are, in effect, asking for the full deficit to be made good, without first proving beyond doubt, that it is impossible for them to do anything to help themselves. They appear to hold that, despite the economies which are being made now and can be expected in the future, operating results as a whole will show no improvement.

This is defeatism. Indeed, it is worse; it is a failure to give a convincing account to the public of the reasons which prevent any improvement from within. How far are the troubles of the railways due to their inability to go out after traffic because the Commission are exercising control in detail instead of control in principle? To what extent do they arise from the over-addiction to "functional" management on the Railway Executive itself? How far have costs been increased by the centralisation of services at the Commission, with the result that they are increasingly concerned with day-to-day affairs at the expense of being diverted from their proper duty of laying down broad lines of transport policy?

December

December is balance month. The last few days of the year make heavy demands upon the staff of the bank, for every account must be "balanced" and checked. Modern office methods, involving the use of mechanized book-keeping systems and of photographic records in accountancy, have reduced the time spent in searching for the proverbially elusive penny, but even so, hard work by every officer is required at "balance time". You will soon have an opportunity of studying the balance sheet of the Midland Bank; it is clothed in conventional form, but behind its figures lies the story of great achievements by customers large and small.

MIDLAND BANK LIMITED

What advantage has been gained from splitting off the Docks and Hotel Executives, and what additional costs have been incurred? Questions such as these are the very stuff of efficiency. Can the Commission claim that their activities, either direct or delegated to the Executives, are being run with maximum efficiency?

There remains, finally, the question of competition. It has never been possible to quarrel with the words used by the Commission or the chairman, about the "C" licence. The Commission's report observed that the increase of "C" licensed vehicles "is a circumstance which vitally affects the policy of the Commission in planning, in fixing charges and in the eventual integration of their services." This might mean that the number of "C" licences would be taken into account in reaching decisions on these matters; or that steps might be taken to curtail their number. Sir Cyril Harcourt, the chairman of the Commission, stated several months ago that he did not approach the problem of the "C" licence in a mood of despair or in a threatening attitude; his instinct was to accept the challenge of competition from the "C" licence and "see how we come off." This shows a proper attitude, for the preservation of this element of competition in transport is quite vital to the public interest. It is not a view which is widely shared

by Labour supporters, and an increase in charges will reinforce the demand for curtailment from these quarters. It must be strenuously resisted.

This application for increased charges, therefore, is the first test of the Commission's behaviour towards the public and of the Minister's ability or willingness to protect the public interest on an issue which involves the monopoly powers which Parliament has given to the Commission. It is not sufficient to seek an increase in charges merely on the evidence of a deficit. The question which has to be answered is: What factors determine the size of the deficit? Many of them are beyond the Commission's control; to that extent there is a good case for granting an increase in charges, on the ground that railway charges are unduly low in relation to costs generally. But those factors which are within the Commission's control are more important than either the Commission or the Minister has yet been disposed to admit. Unless this line of distinction is carefully drawn, the public will be over-charged, the Commission and their Executives will remain less efficient than they ought to be, and a damaging precedent will have been created which will inevitably affect the scientific working-out of the charges schemes which the Commission have a duty to prepare.

The Sterling Balances

THE overseas sterling balances are probably the most persistent enemy of external confidence in sterling. Every foreign banker, merchant or politician who seeks to assess the position of sterling looks not merely at the profit and loss account—that is, at the current balance of payments—but at the balance sheet. And in the latter his eyes fasten on two items: the overseas liabilities payable on demand on the one hand, and the available cash reserve on the other. Britain's sterling liabilities, on the latest available evidence, amount to about £3,200 million; the gold and dollar reserve, even when written up in terms of devalued sterling, amounts to only about £500 million. How can there be confidence in a banker whose financial position looks as precarious as this?

It is easy to impugn the logic behind this argument. A great part of these sterling balances is not in fact payable on demand, but is immobilised. There is no immediate and direct link between these liabilities and the gold and dollar assets held in the sterling area's centralised reserve. The main backing behind these sterling balances is not the gold reserve but the productive and exporting power of Great Britain. Unfortunately, however, these refinements of the argument tend to be ignored or discounted abroad, where the massive burden of sterling debt is currently regarded as a millstone around the neck of sterling, a source of strain on the economy of Britain, and an important contributory cause of the recurrent crises in this country's balance of payments since the end of the war.

In cold fact, there is much to be said for this view. The sterling balances accumulated in the abnormal circumstances of the war have admittedly been liberated on too generous a scale. These balances touched the immoderate figure of £3,700 million at the end of 1946; they were down to £3,233 million by the middle of 1949, and if interest is added to repayment it would seem that

Britain has paid out some £550 million on these debts in two and a half years. This rate of service, and the consequential volume of unrequited exports which it has financed, has played a large part in maintaining high-priced, soft currency markets for British exports and in thus diverting resources which should have been employed in filling the gap in the hard currency balance of payments.

It is, however, one thing to acknowledge this fact; but quite another to believe that anything spectacular and heroic can now be done to tackle the fundamentals of the problem—as distinct from exercising a vigilant control over current releases. The time for any spectacular action was immediately after the end of the war. Then it might conceivably have been possible to have drawn a line across every overseas sterling account and, waving aside contractual obligations in the heat and fervour of victory, to have informed Britain's sterling creditors that, while any new accumulations of sterling would be freely expendable (subject to existing exchange control) balances acquired before VJ Day would be made available only after specific negotiations. Even in 1945, however, any such procedure would have caused immense strains and difficulties.

The balances differed very widely, in the character both of their growth and of their ownership. Some arose largely from military expenditure, incurred with the usual wartime disregard for cost accounting. Others were the product of normal commercial transactions, many of them conducted at prices dictated by the British authorities and depriving the exporters of what might have been the full fruits of their sales abroad. Again, some of the balances were held almost exclusively by the central banks and currency authorities of the countries concerned, and were thus in the form necessary for any scheme of agreed partial

cancellation and funding; whereas others were held in thousands of individual private accounts and would have defied any equitable measure of centrally negotiated immobilisation or cancellation. Even at that time, moreover, any attempt to immobilise accumulations of sterling might have dealt a serious blow to the trade of countries which depend on their sterling balances for working capital. In other words, even in 1945 a spectacular attack on the problem of sterling balances might easily have caused political frictions which would have done far greater harm to Britain and the sterling area than the good to be extracted from any equitable reapportionment of liabilities incurred in a common cause.

★

This was probably also the only moment at which any attempt to shift some of that burden on to the shoulders of other countries—notably, of course, the United States—could conceivably have had any chance of success. In some of the conversations which preceded the Bretton Woods Conference the American expert, Mr Harry White—author of the plan for a Stabilisation Fund from which the International Monetary Fund was subsequently spawned—had suggested that ways might be devised of transferring to such a fund a part of the burden of these exceptional debts accumulated by Britain. Mr White and his colleagues at the US Treasury saw clearly enough that the weight of these debts would put such an intolerable strain on sterling that there could be no question of its early return to complete convertibility with the dollar—a return for which all American officials most earnestly hoped.

It has been argued that Mr White's proposal never had much realism behind it. Even at the time it was made, the United States was showing the greatest diffidence in committing itself to a generous treatment of its postwar creditors. When the time came, in 1945 and 1946, it responded fittingly to the need of the hour and the Lend-Lease slate was wiped clean. But it is doubtful whether any US Administration in 1944, even that of President Roosevelt, would have found it possible to persuade the American public of the equity and advantage involved in their taking over a part of Britain's wartime monetary obligations. On the other hand, it is still true that no attempt was made at that time by British representatives to pick up the ball which had been thrown, perhaps half-heartedly, into their court. That was still a period when the postwar economic potential of Britain was being viewed through rose-coloured spectacles, when the burden implied by these debts was being minimised or was regarded merely as a useful guarantee of the maintenance of full employment in Britain. At that time, too, there was a school of thought in this country which strongly resented the slightest intrusion by any foreign country or international institution into the domestic affairs of the sterling family—this school indeed is not dead yet. Whatever may have been the reasons, and whoever was to blame, the fact remains that the tentative proposal to shift and redistribute the burden of these debts was never followed up.

American interest in the problem became evident once more in the American Loan negotiations of 1945. The same theme of convertibility of sterling ran through this renewed interest. The United States experts rightly judged that there could be no hope of restoring convertibility of sterling within a year of the loan agreement

unless the greater part of the abnormal sterling balances was immobilised or cancelled. This belief found expression in those clauses of the loan agreement which specified what treatment should be meted out to the balances; part should be cancelled, part should be funded, and part liberated for expenditure in any currency area in the world. Britain signed the Loan Agreement, but it has done very little to implement this particular part of it. It is true that attempts have been made in negotiations with individual creditors to immobilise a part of their claims in so-called No. 2 accounts. Arrangements are now in force involving such immobilisation, subject to agreed releases, with no less than nine countries—Brazil, Ceylon, Egypt, India, Iraq, Israel, Pakistan, Sweden, and Uruguay. But the laxity of these agreements may be gauged from the fact that during the first nine months of this year the sterling releases to these nine countries amounted to £206 million. It is quite clear that any continuation of releases on this scale would undo much of the good that may be derived from the Government's domestic disinflationary measures—such as they are. The Chancellor of the Exchequer has in fact accepted the principle that these releases must be considerably curtailed—and his announcement has already brought in a flurry of complaints from the creditors concerned.

★

The September negotiations between the United States, British and Canadian Finance Ministers raised yet another hope of the partial shifting of this burden to wider shoulders than those of Britain alone. The communiqué issued at the end of these triangular talks stated that this problem of sterling balances, "including the necessity to provide capital goods for development," was discussed by the experts of the three governments and that it had been agreed that this was one of the subjects which concerned countries other than Britain and would require further study. It is just possible to read into this communiqué a readiness on the part of the United States and Canada to bear a share of the burden of these debts. It might conceivably be done through the participation of those two countries, the United States in particular, in the development of under-developed countries under President Truman's "Point Four Programme." It is conceivable, too, that if the dollar were called in to redress the injustice represented by these balances the creditors might be more willing to accept some scaling down of their claims. A dollar in the hand might be worth more than twice as much as blocked sterling in the bush. It would, however, be unwise to pin undue hopes on the prospects of such a deal; the problem is much more likely to remain the sole responsibility of Britain and its creditors.

If this is so, there are many reasons why Britain should hesitate in seeking any spectacular solution. The first of these reasons is that any such solution would have to be generalised. This would be necessary to avoid the appearance of unfair discrimination between the various creditors. It would, however, probably be impossible—and it would certainly be undesirable—to apply uniform treatment to the balances accumulated here by, say, Australia, Palestine, India and Eire.

Secondly, any solution that would involve the definite funding of a large part of these debts would probably entail the payment by Britain of an appreciably higher rate of interest than the $\frac{1}{2}$ per cent per annum which

is now being paid on the bulk of the balances. Given Britain's present difficulties, the yearly outgoing on this indebtedness is more important than the total debt which the books may show to be outstanding.

A third reason for not seeking a spectacular and generalised solution is that the rigid releases, whether in sterling or in the form of hard currency allocations, which must go with any funding agreement might have some drawbacks. They would commit Britain to specific, defined obligations, and thus sacrifice the elasticity of the present arrangements. That elasticity has admittedly been abused. There have been excessive releases at a time when the British economy and the interests of the

sterling area as a whole would have required them to be minimised. But there is something to be said in favour of intelligent elasticity, of leaving matters in as fluid a position as possible.

The arguments for and against a frontal attack on the sterling balances therefore seem to lead to the unheroic conclusion that there is not much case now for doing anything about them other than to reduce the rate of release. The Chancellor of the Exchequer has promised that he will do so. In this, as in all the other "consequential measures" to underpin the position of devalued sterling, it remains to be seen how far his intentions are translated into action.

Business Notes

Master of the Market?

Sir Stafford Cripps must feel well satisfied with the results of his speech last week-end at Bristol, for his intervention has worked almost as well in the gilt-edged market as the winks, nods and bullyings of his predecessor. Indeed, at many points his words more or less paraphrased the familiar speeches which Dr Dalton was wont to make on the "true value" of gilt-edged securities. They were, admittedly, a little more polite—the financial commentators did at least earn the description of "these portentous and serious writers," whereas they were formerly described as "persons not of representative quality, given to irresponsible babblings."

Sir Stafford was right to claim that the Government was justified in stepping into the market three weeks ago; the narrow markets at that time were vulnerable to quite moderate genuine and speculative selling, and showed obvious signs

devaluation, and there are only a few pence between the yield comparisons over the past eleven weeks in such long-dated issues as 3 per cent Savings Bonds, 1965-75, Transport Stock and even Gas Stock.

The Chancellor's view of the market prospect has obviously played a major part in this week's further recovery:

I hope now there will be no recurrence of the fall, for there is no reason whatever in the financial or economic facts which could in my view justify even the present low-level of gilt-edged securities.

But it will not have escaped his notice that the advance in gilt-edged has also been associated with evidence of an improvement in Conservative prospects at the general election, and with the fact that a Socialist Government has been defeated at the polls in New Zealand. And the improvement has occurred despite his distinctly cool references to the gold and dollar reserves—the forecast, again repeated, that at the end of June next year the reserves "should not be lower" than they were at the end of September, coupled with the statement that it will take "years" to build up the reserves to a safe level.

Naturally, the improvement has been welcome to those institutions which in the middle of November were obviously concerned about the appearance of their end-year balance sheets, and to the underwriters of the unsuccessful South Africa issue, which has improved to $\frac{1}{2}$ discount. It also provides encouragement for the success of the Port of London Authority cash-cum-conversion operation, which still remains open. But the great question mark still hangs over the market. Is the Chancellor now effectively in charge? He has produced no evidence for his opinion that gilt-edged should go higher; under present conditions the mere fact that he holds and expresses such an opinion is enough for the market to do a good deal of work for him. Perhaps already the recovery has gone far enough to exhaust his powers of moral suasion.

Political Economy in 1950

One reason for the strength of the gilt-edged market this week has been the well-merited interest widely aroused by an article, signed by Messrs C. F. Carter and R. C. Tress, in the latest "Bulletin" of the London and Cambridge Economic Service on Britain's economic prospects during the coming year. Summarised press comment has naturally emphasised the conclusion drawn in this survey that the Government's economy measures are a good deal less inadequate than the harshest criticisms have suggested. This is indeed the drift of the argument, but on a careful scrutiny of the whole article the grounds for optimism which it seemed

to offer prove to be much less substantial than has been widely supposed.

Rather unexpectedly in an analysis which comes from academic circles, the whole approach is inspired by what the authors regard as political "realism," so that the recommendations are mainly such as might be feasible within the existing compass of Government policy. Thus, although the article admits that maintenance of the present level of employment is possible only in a "prosperous and static" community, the policy it advocates presupposes that

a tentative deflation, creating some transitional unemployment while trying all the while to minimise it, is the strongest policy one can reasonably expect.

Moreover, no allowance is made for the need for "incentive" reliefs in taxation. The survey's verdict on the Government's programme is, therefore, to be tested against this "limited objective"—indeed, the limit may have been even more narrowly drawn, so as to exclude even transitional unemployment. Beside this objective, the Government's programme is judged to be "somewhat, but not gravely, inadequate." It is considered that

if the action already taken were moderately extended, and backed by a higher rate of interest and by evidence of Government determination, we might, in 1950, achieve a precarious balance without excessive encouragement to price and wage increases, and without more than reasonable transitional unemployment. This will not of itself stop the wage inflation . . . but it might hold it within reasonable bounds.

Yet, even if these conditions are fulfilled and if the policy succeeds thus far, the consequence would be merely that the dollar position would be "just manageable." In other words, Britain might for twelve months avoid recurrence of another dollar crisis—but would do so with reserves "quite inadequate to secure us against any large decline in United States activity," and in the knowledge that "any present precarious balance is only ours because of Marshall aid, the closing date for which draws frighteningly near."

★

In short, the apparently optimistic tone of this survey lies on the surface only. Indeed, if the "Bulletin" is "realistic" in its assessment of the scope for further economies—which it expects to be needed "at the 1950/51 Budget or before"—the prospect is surely at least as sombre as the most gloomy commentators have predicted. It believes that an extra £50 million or so might be saved on Defence and that £25 million might be secured from administrative economies (on which the Government "appears to have made a good first attempt"). But, in the opinion of those responsible for this survey, these minor savings seem virtually to exhaust the scope for feasible economy. It is actually argued, indeed, that, so far from there being any scope for reduction in subsidies, the Government might have done better to increase them; that an extension of the principle of charging for National Health Service prescriptions could not yield much revenue without injustice, and that "it will be difficult enough to prevent further increases in the Health Service estimates"; that it will not be "tolerable" to save much on cash Social Security payments; and that it will be difficult to keep educational costs down. In short, if there is to be any retrenchment, it must be found within the investment programme—and, in this direction, the "Bulletin" shares the general doubts about whether the Government's intentions will in fact be made really effective.

All of which looks like a formula for keeping the whole economy frozen almost solid in its present shape. This may be "realism"—if by that is meant devising a policy which will cause no affront to cherished political beliefs. But it is also a prescription for collapse as soon as trans-Atlantic subventions end.

The Engineering Wage Claim

The largest of the wage claims to have arisen since the White Paper on Personal Incomes was presented this week by the Confederation of Shipbuilding and Engineering Trade unions; it asks for a general wage increase of £1 a week which would apply to some 2,750,000 workers. The inconsistency of this claim with the general policy of restraint which the Trades Union Congress has adopted hardly needs to be stressed. Something needs, however, to be said about the arguments by which the confederation's representatives supported their claim on Wednesday. One argument concerns "productivity": by relating the index of production for shipbuilding, engineering, and electrical goods to the manpower figures for those industries, the unions arrive at a "productivity index" (average for 1946=100) of 133 for the second quarter of this year. This kind of misuse of crude statistics stresses the need for a definition, and a standard of measurement, of productivity. To use 1946 as a base year is in any case indefensible; are the material shortages, the dislocations, and the inefficiencies of the first postwar year to set the standard for the future economics of British production?

Other arguments concern the high level of engineering profits and the supposed failure of the employers to exercise the restraint which public policy demands. The figures quoted for profits are after deduction of repairs, depreciation, administrative and other expenses, but before deduction of taxation. They do not refer to distributed profits, with which the White Paper policy of "restraint" was concerned. Indeed, Mr Brotherton, as spokesman for the confederation, made this plain when he told the employers:

Your letter seems to regard it as morally and ethically right to make as huge a profit as possible, in order that the Chancellor may have greater scope for taxation. How can this square with your protestations about the absolute necessity for restraint if the country is to be saved?

The general drift is simple. Assume that output goes up, that the volume of trade increases, and that profits rise. The unions' doctrine appears to claim not merely a reasonable reward for extra effort and for permitting the better use of its members' skill. It appears to claim the share which the Exchequer at present takes in taxes, the share which at present provides the greater working capital which increased trade (and a greatly increased money turnover) require, and in addition, any share which the consumer might hope to get by way of lower prices or better service.

Industry

The Cost of Making Films

The report of the working party on the costs of film production, which was published this week (HMSO, 9d.) is in one way disappointing. A year has passed since the working party was set up, and some hopes of clarifying the issues which confront this distressed industry had been pinned on its labours. But, after so much time has gone by, the report finds it necessary to say, in effect, that neither its powers nor the information placed before it were enough for a really thorough and authoritative examination of the subject. Information about the cost of films was collected by the Board of Trade, which obtained returns from 16 companies of the cost of 43 first-feature films, and presented the working party with an analysis of the results. But the report observes:

We must, however, frankly admit that neither the Board of Trade report, nor the additional figures we obtained later, provided by themselves a basis on which to form a judgment of the main factors leading to the present high level of production costs, and our general survey of cost problems has

of rapid demoralisation. Given such market conditions, equally modest intervention was bound to produce results as spectacular as the previous descent. So, by the middle of this week, the gilt-edged market as a whole stood almost exactly where it did on the eve of devaluation. "Daltons" were then yielding £3 10s. 9d. per cent; after falling to a yield basis of £3 17s. 3d., they have now recovered to £3 10s. 3d. per cent. The shorts and the ten-year stocks are, indeed, standing higher than they did on September 16th before

been based to a much larger extent on written and oral evidence received from both sides of the industry than on detailed analyses of the expenditure of individual companies on particular films.

The employee representatives, in an appendix, add that apart from the full information put in by both sides on wages and conditions of work, the information "has not been sufficient to facilitate the examination of the details of the cost of any single named film."

This is an absurd situation, and it is hard to avoid the conclusion that the President of the Board of Trade, when he appointed the working party, would have done well to make more sure that it had the powers and access to the information which were required for its task. But, given these unfortunate limitations, the report does probably represent (as the chairman claims) "the greatest common measure of agreement between the two sides of the industry" on the question of how to reduce costs. The producers' view is recorded that reduction of costs cannot by itself put the industry on an economic basis. But it is not disputed that costs can be reduced, and this is a point well worth establishing at a time when the industry is asking for help from the State.

The report indicates many points at which economy is needed. An attempt has been made to scale down the salaries of executive staffs, but the working party is plainly unconvinced that the expenses of management cannot be further cut. Studio staffs expanded in the years immediately after the war, and their increase "was not matched by a corresponding increase in output, quality for quality." The five-day week which was introduced in 1947 has not been followed by the smooth consultation on overtime which is necessary if a five-day week is to pay its way. The producers submitted "many examples of the apparently nonsensical situation" which arises in the studio from the demarcation of duties between workpeople, too rigidly applied. There is a clear need for better and more flexible labour relations, and some suggestions are made to bring this about. Inadequate planning of production, over-refined insistence on retakes, and failure to keep to timetables, tend to waste time and money in the studios; something has been done on this front, but more needs to be done. This is no more than a summary account of the points made; but it is enough to show that the industry has a long way to go before it can prove its claim for State support.

Mr Rank's Prognosis

The report, accounts, and chairman's statement of the Odeon group left room for further explanation on a number of points—notably on production policy and the method of valuation of films. The annual meeting of Odeon Theatres Limited on Wednesday was, however, untroubled by articulate curiosity on the part of shareholders; and Mr J. Arthur Rank used his speech as chairman not to satisfy any desire for knowledge about the company's affairs but to state once more his case for a reduction in the Entertainments Tax. The case is familiar. Mr Rank gave the example of *Henry V*, which cost about £500,000 to produce in 1943 and 1944. The film "has won great academic honours, and many millions of people of all nations have seen it." It has collected more than £400,000 in Entertainments Tax. But "it was only some four weeks ago that this great film had recouped the cost of its negative." In a tactful reference to *A Streetcar Named Desire*, Mr Rank pointed out that a stage play produced by the producer of *Henry V* had to pay no tax at all.

Mr Rank's material point was that the tax is so graded that its incidence increases disproportionately as the price of seats goes up. Therefore, the exhibitors cannot now get 1d. more from the public on the 1s. 3d. or 1s. 9d. seats without having to charge 3d. more and pay the remaining 2d. in tax

No doubt there is something here that needs examination. But in the actual state of box-office receipts in Britain at the present time, there is little support for any suggestion that an increase in the price of seats would increase the gross revenues at all; more probably it would merely keep people away. The trade (and perhaps the Odeon circuit also) therefore wants not a reform of the tax but a straight reduction.

Mr Rank's remarks on the National Film Finance Corporation are well worth quoting for the view of the prospects for film production which they reveal. The corporation cannot (he said) solve the industry's production problem because the corporation makes loans and is obliged to ask for its money back. Only if the producer or distributor were unable to find the money would the corporation have to stand the loss. "The losses, therefore, which I foresee as probable, fall on the industry"; and the basic problem remains unsolved. This Mr Rank defined as "how to establish a sound industry which can make films which audiences want to see and which yet will not bring financial disaster to those who produce them." It is a cheerless prognosis.

British Underground Gasification Trials

The Ministry of Fuel and Power is proposing to fire a coal seam at an opencast site at Chesterfield early in the new year to see if the possibilities of controlling the combustion process and the gases so obtained are sufficient to justify further experiments on a larger scale. The principle of underground gasification is to bring air down through a borehole to the coal face, ignite the seam, and bring the gases to the surface through another borehole to be used in the normal way. There must be a free passage of air between the two boreholes along the coal seam; this is provided either by a fissure induced by heat, or by a bored gallery.

The principle is suitable for seams, and only for those seams, which would not repay mining by ordinary methods whether for reasons of their chemical composition, their thinness or the angle at which they lie. In practice the possible complications of deep boreholes are also likely to restrict it to shallow seams. It is estimated that more than half the known coal reserves of Britain fall within this category. In Russia, where gas has been produced commercially by these means since 1931, the cost of the gas is said to be one-third lower than that of producer gas. Belgian experts think the figure could be brought down to one-sixth. Other claims made are that gasification greatly reduces the number of underground workers required and makes possible the recovery of 80 to 90 per cent of the coal as against 60 per cent by ordinary deep mining. This last estimate may be correct in theory, but the limited experience which has been acquired suggests that at least half the coal will remain un-gasified after treatment.

The gas obtained has not a very high calorific value, even when it is enriched by increasing the oxygen content of the air with which it is burnt. Many fuel experts considered that while other coal reserves were plentiful, underground gasification would be economic only when integrated with synthetic chemical plants which can put low-grade gases to special use. There may, however, be a new significance in the process now that it is known that gas turbines can be built on a scale large enough for electricity generation. Gas turbines burning diesel oil cannot compete for base load operation with steam turbines operating on coal. The day when gas turbines can burn coal is a long way off, but they could run on the hot, low-grade gas likely to be obtained from underground gasification.

Experiments in the United States, Belgium and Italy, which were started in 1947, have produced evidence to show that gas can be obtained from igniting the coal seam, but they have not shown whether the process can be controlled closely enough to produce a reliable supply. The British trials are

intended specifically to obtain this information. If they prove at all promising, the equally serious questions of the best layout for the process, the methods of obtaining maximum combustion of the coal, and the risks of subsidence will be the subject of trials on a larger scale.

A Sheet Glass Factory for Canada

The largest makers of sheet and plate glass in Britain, Pilkington Brothers Limited, are to build a factory in Canada at a cost of about \$3,000,000. The firm is responsible for almost the whole of the British flat glass exports, which exceeded £4,250,000 in 1948 and had already passed £4,500,000 by the end of October this year. Canada is the largest market for British glass of this type, and takes nearly a quarter of the total exported. South Africa, India and New Zealand are also large importers.

Canadian output is small, and Canada relies mainly on imports to meet her requirements. These imports in 1948 were valued at \$C6,500,000, \$2,317,602 from the United States and \$1,842,403 from Britain. The trend has been moving this year in favour of British glass; to the end of August, imports from the United States were valued at \$1,534,626 and those from Britain at \$1,396,502.

Pilkington Brothers have for long had interests in Canada, and at one time before the war were proposing to start production there, but changes in the Canadian tariff altered the market prospects. The new factory, on the outskirts of Toronto, should be in production by 1951. Its capacity has not been announced, but it will only meet a part of the demand; it will, however, be able to serve a part of the Canadian market with a heavy saving in freight rates. In the same year the company expects to start production in South Africa, where a flat glass factory is now being built.

A Great Elizabethan

The founder of London's Royal Exchange was the famous Sir Thomas Gresham, whose sign of the Grasshopper, so well known in London, is combined with the emblem of Liverpool in the Coat of Arms of Martins Bank.

The Exchange or Bourse established by Gresham was used for the business of the Goldsmiths, who were the bankers of the sixteenth century.

Martins Bank, with its agents and correspondents throughout the world, provides an efficient and complete banking service for its customers.

MARTINS BANK
LIMITED

LIVERPOOL, LONDON AND 600 BRANCHES

Flat glass making tends to be concentrated in industrialised countries because of its specialised nature and the heavy capital investment in machinery. The competitive position of Pilkington Brothers is strengthened by the firm's possession of an engineering department which produces equipment for sheet and plate glass production. It is one of a select number of British firms which since the war have decided upon a full-scale production project in Canada—as distinct from less ambitious plants for the assembly of lighter products—in the belief that the growing Canadian market justifies the investment.

* * *

Bleaching Reorganisation

A new company, Bleaching Trade Reorganisation, Limited, has been formed to buy up and immobilise surplus capacity in the piece-goods bleaching trade. While the cotton industry as a whole is afflicted by redundancy of plant (in the sense of technological redundancy, which the Cotton Working Party defined as "a condition in which the plant is too extensive to be worked by the available labour force") the condition grows more acute at the later stages of manufacture. Thus, if the spinning mills were fully employed there would still be redundant weaving plant, and if the spinning and weaving plant were fully employed there would still be redundant finishing plant. The Cotton Working Party urged a reduction of the total amount of plant in the cotton industry, with help from the Treasury, to supplement the measures of re-equipment and reorganisation which it proposed. But the Government help should be given (it held) in the same proportion in each section of the trade; therefore the finishing section, being greatly out of balance with the other sections, would have to pay for most of its own redundancy. It recommended that the

Paid for in Dollars

Rubber and tin from the East are two of our major dollar earners—there are many others in this area—and the Chartered Bank's wide network of Branches assists British business men in expanding this valuable potential and also earns dollars for Britain in the form of invisible exports. Eastern merchants and prospective traders are cordially invited to discuss their plans with the Managers of any of our offices in this country, and we shall have pleasure in placing our comprehensive Eastern banking service at their disposal.

finishing section should be given three months to formulate plans; that was in 1946.

The bleaching trade, which among the finishing trades is perhaps the most out of balance, has now decided to carry out its own concentration without any outside financial help. An agreement, which will come into effect when it has been executed by an agreed majority of firms, provides for a levy on the continuing members of the trade to furnish the funds out of which assets are to be bought up or placed under restrictive covenant, and retiring bleachers are to be compensated. Certification by the Board of Trade under the Finance Act, 1935, to permit the levy to be treated as a trade expense for income tax purposes, is another necessary condition of the agreement's entry into force. The Board of Trade was consulted at an early stage, and expressed its willingness in principle to consider the scheme; its final decision has now to be made. Success from that point onwards will depend on the terms to be negotiated with the retiring bleachers. Some of the plant to be bought out has been unemployed since the concentration of the cotton industry during the war.

* * *

The FBI and Simplification

The Federation of British Industries has arranged for the authors of the Anglo-American Productivity Council report on simplification to visit various towns to discuss their report in detail with the trade associations there. It is felt that the report itself does no more than indicate broad possibilities, and that discussion among small groups is needed to elucidate the prospects of simplification in individual cases. Conferences may be held in London and in other principal towns.

The main purpose is to persuade manufacturers of the extent to which overheads are swollen by the insistence on variety and range. The members of the team feel that the innumerable small lines made by many British manufacturers are the result less of market demand than of acquiescence over the course of years in the salesman's insistence on a product to match each product of a competitor. Some American trade associations carry out surveys to show how much business is attracted by each of a manufacturer's lines. The results invariably show that all but a few could be dropped without serious detriment to turnover or to the customer, even if the consequent benefit of lower production costs and lower prices is ignored. Unfortunately, few similar surveys have been made in Britain; the team hopes that they are one of the lines of action which trade associations will adopt. One paint manufacturer, however, did conduct his own investigation. He was marketing 15,000 different lines, and found that if 10,000 of them were dropped, his total turnover would be reduced by no more than 5 per cent. Yet all his products were based on British Standards. The team does not think that standardisation is immediately essential to reduce production costs; these will come down simply by reduction in the number of lines carried. Standardisation is a separate question. The productivity team intends, with the FBI's blessing, to spread the gospel of simplification as the quickest and least disorganising means by which production costs can be lowered.

* * *

Grey Cloth Imports and Production

British imports of Japanese cotton grey cloth were stopped in July, when the size of the Japanese balance in the trading account between Britain and Japan threatened the British Government with the prospect of a settlement in dollars. This action has caused a good deal of anxiety in the British cotton trade, since the British finishing industry can

still handle, and the merchants can still sell, substantially more cotton piece goods than the Lancashire mills can weave. The new trade agreement with Japan, which was discussed in *The Economist* last week, reopens the prospect of grey cloth imports and (if it may be assumed for a moment that the pattern of trade envisaged will be realised in the event) renders the possible dollar reckoning more remote.

The speech of Mr R. M. Lee at the annual meeting of the Calico Printers' Association this week underlines the importance of these imports. Mr Lee said that the supply of loom-state cloth from Japan had become, "in the prevailing conditions, an essential raw material to our industry." Re-exports of Japanese grey cloth after printing and finishing in Britain "have been the medium by which Lancashire has preserved its connections in finished goods with many markets." They are, therefore, "vital to the preservation of our export trade."

The consequences of the wartime decline in the output of the Lancashire weaving industry have never been more bluntly stated. Weaving output has lately taken a slightly more encouraging turn. The weekly average output reached in October a total of 41.58 million linear yards of cotton cloth and 12.74 million yards of rayon and mixture cloths. This is a useful increase over the weekly average of September, when the total of cotton, rayon and mixture cloths together was 48.75 million yards a week. It is the highest output achieved in any month since the war. But it is necessary to remember that the previous highest output since the war was achieved as long ago as last May, when the weekly average for cotton cloths was 41.32, and for rayon and mixture cloths 11.76. The intervening months have all been to some extent holiday periods; but the figures show that the increase is neither as steady nor as rapid as the cotton trade needs. If the comparison is carried back to before the war, the result will still be something of a shock to many people: weekly average output of cotton, rayon and mixture cloths together in 1937 was 79.3 million yards.

The industry is therefore obliged to import grey cloth from, among other sources, Japan in order to meet its export requirements and supply the home market. Even with such imports, it has little hope for the present of being able to meet the whole of the demand. The consequence of this is that foreign markets are competing for the Lancashire output, and in this competition it is the soft-currency markets which tend to get served. As for the dollar markets, it is worth noting that grey cloth was, before the war, a substantial element in the British export of cotton goods to Canada. Today the Canadian buyer of grey cloth has to compete against the Lancashire finisher, who has a struggle to get enough cloth to occupy his plant. The recommendations of the Cotton Manufacturing Commission, which have now been finally approved by both sides of the trade, are the best immediate hope of making possible a greater weaving output to correct this deficiency.

* * *

Rayon Staple Output Expands

The rayon industry's expansion programme has begun to produce results, particularly in the increasing supply of staple fibre. During the year Courtaulds, Ltd., who produce more than 90 per cent of the rayon staple made in Britain, have continued to install new capacity at their viscose staple plant at Greenfield in North Wales, and this is now approaching full operation. Total output of staple has risen from 7.5 million lb. in January to 12.4 million in September. The September figure is close to the full rate of output which is at present contemplated. Production figures in October showed a slight decline, but this reflects little more than the difficulty of installing new equipment without hampering the performance of plant already at work. It was stated at the annual meeting of British Celanese last week that expansion of the Spondon cellulose acetate and chemical factory

was now nearly complete. Some of the extra capacity is for the production of more acetate staple.

Output of continuous filament yarn this year has moved, by comparison, gradually. Output in March—15.48 million lb.—was the highest yet recorded. In September, a good month, it was 14.6 million lb. Courtaulds are making progress with their new plant in Northern Ireland which will use the American process for continuous spinning, the rights of which Courtaulds bought in 1945. At a cautious estimate,

the plant will be completed by 1951. Its capacity has not been announced. By 1952, and possibly sooner, total British production of artificial fibres is expected to have reached 410 million lb. of yarn a year. Out of this total, 10 million lb. will be nylon and 150 million lb. will be rayon staple. The balance will be continuous filament rayon. Neither of the new fibres, "Ardil" or "Terylene," is expected to be in commercial production by that date.

Finance

Bridging the Macmillan Gap

It is a matter for debate whether the so-called "Macmillan" gap was as significant in 1931 as it was then believed to be; but there is no doubt that the slow strangulation of private sources of finance by war and postwar taxation has widened it. The Industrial and Commercial Finance Corporation, the smaller of the institutions set up in 1945 with the object of filling the gap, was therefore presented with a stimulating challenge in a largely untried field. The fourth annual accounts of the Corporation show that it cannot fairly be accused of falling either into the trap of undue subsidisation of uneconomic experiments or into the still more insidious trap of undue caution towards unestablished enterprises.

It is, however, fair to say that it is still straddling rather uncomfortably between both dangers. In the twelve months to September 30th ICFC made a profit (before tax) of £149,000, compared with one of £85,000 in the previous year, and with losses aggregating £84,000 in its first two years. The experience in the six months of the latest period was, however, much less satisfactory than these comparative figures suggest. The accounting date has been altered to March 31st, and the formal accounts now presented for the six months to this date show an operating loss of £26,000, after provision of £250,000 for bad debts—a provision mainly required for finance extended to an agricultural engineering firm. The provision made for the six months to September 30th (i.e., the first half of the new accounting period) is £90,000, bringing the cumulative provision to £605,000. The past year's experience, occurring at the very outset of the change-over from postwar boom conditions to those of increasing risk, is a little disconcerting.

The year's profit has been achieved after some stiffening of loan rates (the average rate charged apparently bears a

close—though unintended—correlation with the yield on Consols) and after some switch in the method of financing away from secured and unsecured loans (in 1948 72 per cent of the total) towards the holding of ordinary and preference shares (in 1949 44 per cent of the total). On the other hand, the Corporation's policy has evidently been more selective. Its outstanding loans and investments now aggregate £15 million, or only one-third of its potential resources of £45 million; 39 per cent of the money invested is in advances and investments of £50,000 or more. Most of the Corporation's loans have a longer life than 15 years, and the majority of requests now made to it are to augment working capital rather than for the purchase of new equipment. The Corporation has apparently become a sort of partner to the joint stock banks in this respect. Indeed, the chairman declared that, since a bank will not normally allow its advances to any one customer to go beyond a certain proportion of that customer's floating assets, concerns in need of working capital are coming to the Corporation to provide better cover for their bank advances.

Inflation in Latin America

The sixteen countries in which the Bank of London and South America carries on business have reacted to devaluation in so many different ways that the revaluation of the bank's assets and liabilities for its 1949 balance sheet, dated September 30, must have given its accountants some bad headaches. The figures now published show that the bank's profits are down slightly (after three exceptional bumper years), that deposits have been relatively stable, that there has been a switch in the financing of foreign trade from documentary credits to bills for collection (reflecting the onset of the buyers' market) and also a switch in general lending policy from advances to loans against promissory notes.

As usual the bank's accounts are accompanied by an informative review of the South American economic scene by Mr Francis Glyn, the bank's chairman. Once again the dominant theme in his review is that of mounting inflation. The republics of Latin America seem to have discovered a formula for perennial suffering from this malady. If the markets for their staple exports are booming (as is the case with Venezuelan oil), they run a large export surplus and the high incomes created by this generate a wild excess of demand over supply. On the other hand, when the markets for staple exports dwindle, the various republics are forced to restrict imports. Since they are unable, for political reasons, to reduce internal monetary circulation and wages at the same time, this restriction of supply makes inflation much worse. During the past year the fall in the world price of such Latin American exports as cocoa, maize, wheat and base metals, has caused several countries to relapse from the first (or hard currency) type of inflation into the second (or soft currency) type.

Such a relapse necessarily brings with it pressure on exchange rates but, since straightforward depreciation would raise the internal price of essential imports and thus make inflation look worse to the workers, many Latin American republics have tried to run away from reality in 1949 by twisting their already distorted patterns of multiple exchange rates still further. This pattern has reached its apex of absurdity in Argentina, where the rate applied to Britain's meat purchases is now 9.40 pesos to the £ and the rates applied to the imports which Argentina should be taking from this country average at least 18 pesos to the £. In effect, therefore, if 9.40 pesos to the £ is in any way a realistic rate, there is now an import duty of nearly 100 per cent levied on British goods entering Argentina. Mr Glyn believes that if multiple exchange practices were viewed by the British Government in this light, official protests about them might be a little more vigorous.

Hall-mark for Dawes and Young

During the third reading of the Distribution of German Enemy Property Bill Mr Glenvil Hall confirmed some earlier but less positive pronouncements that holders of the German Dawes and Young loans would rank for a dividend in the share-out of German assets. Indeed, he went out of his way to record that "Dawes and Young loans are in a particular category and worthy, if possible, of prior consideration." But Mr Hall would not say at this stage in what order of priority the two loans, commercial debts and standstill creditors will rank. The practical significance of this Hall-mark of prior consideration for the two loans thus remains to be established by one of the numerous orders in council envisaged under the bill. The Financial Secretary's statement does, however, confirm the market view that Dawes and Young loan will rank before Konversionskasse.

While the share which may finally be earmarked for Dawes and Young loan bondholders should clearly go towards paying off arrears of interest and possibly of amortisation, it is much more debatable whether the capital portion of the loans (after excluding amortisation arrears) should rank in the distribution at all. (The sterling issues of the two loans outstanding amount to £16,553,900 in German External Loan, 1924, 7 per cent sterling bonds—the Dawes Loan—and £11,174,300 in International 5½ per cent sterling bonds, 1930—the Young Loan). But some of the parties most interested in the share-out find it impossible to reconcile Government estimates—that claims on all scores will be between £100 million and £120 million—with their own calculations, except on the assumption that the official figures include the whole amounts of these loans.

As it stands now, the Bill is hardly more than an enabling measure, for the Government has rejected all the more important amendments sought during the third reading. On almost every question of importance, the intentions will not be clear until the various orders in council are made. Mr Hall has persisted in his refusal to publish details of the assets held by the custodian, and even on points of procedure there has been obscurantism. From the terms of Mr Hall's reply to a question, bondholders might have been led to believe that their claims will not rank in the share-out unless they were lodged before January 24, 1949. In fact, it would appear that there is to be a later opportunity for the submission of claims. Yet not even this point has been put beyond doubt. Many headaches await the administrator, the advisory council and claimants before the relatively modest sum of £15 million now held by the custodian is distributed.

TDR Switching Ending?

This week, for the first time since mid-July, when the Treasury began to switch its floating debt borrowings from Treasury deposit receipts to "tender" Treasury bills, there has been a resumption of net borrowing on TDRs. Of the week's cash requirements—enlarged by the need to provide for the half-yearly dividend of 3½ per cent War Loan—£10 million was raised by net borrowings on bills and £30 million from TDRs. This change in tactics does not, of course, imply any reversal of the underlying policy, but it does suggest that, for the time being, the switching process is nearing its end. For eight weeks now, the weekly offering of tender bills has been stabilised at £230 million, compared with the "basic" level of £170 million which obtained until last July. Given this stability—at a time when, in the past, the issue has usually been increased for seasonal reasons—and given, too, this week's recourse to TDRs, it appears that the authorities are at present reluctant to raise the tender offering any further. If this is so, the maximum level for the total issue of tender bills becomes £2,990 million, compared with the present level of £2,960 million.

In other words, so long as this limit is maintained, the switching operation cannot reduce the TDR issue by more than an additional £30 million from its present level of approximately £725 million. This does not mean, however, that the TDR issue is not likely to fall further. Indeed, unless the authorities decide to repay the 1½ per cent Exchequer Bonds merely by re-borrowing on floating debt, there will certainly be another very steep fall in the TDR issue in the first two months or so of the New Year. In 1948/49, aggregate borrowings on TDRs and on tender bills were reduced by no less than £468 million between end-November and early March. Repayment on a comparable scale in the next three months, if applied wholly to TDRs, would reduce the outstanding issue below £300 million.

Meanwhile, the monthly banking figures are now reflecting virtually the full effect of the switching policy. The clearing banks' return for November shows a further decline of £56 million in the holding of TDRs and an almost corresponding rise in the bill portfolio. Thus the banks' money market assets (call money and bills combined) have been raised to the very high level of £1,764 million, bringing their ratio to deposits to the unprecedented figure of 29 per cent, while the TDR ratio, at only 11.3 per cent, is now little more than one-quarter of the peak figure reached in 1945. Thus the switching process has radically altered the shape of bank balance sheets: the ratio of relatively inflexible assets (TDRs, investments and advances) is now down to under 61 per cent, which compares with an average of 69 per cent for the whole of last year and a peak of over 80 per cent at the end of the war.

Other items in the banks' statement showed only minor changes last month. Advances have risen by a further £8,000,000, but since the Government was on balance moderately reducing its indebtedness to the banking system, "true" bank deposits declined slightly—by just under £4,000,000—and are now less than £9,000,000 above their corresponding 1948 level. This tendency of the volume of credit to become stabilised is well illustrated by the seasonally-adjusted index compiled by Lloyds Bank, now revised to a "net" basis (i.e. excluding items in course of collection from the deposit figures as published). During the past month the revised index (1938=100) has declined from 261.9 to 261.6, which compares with 261.2 twelve months ago and 249.1 in November, 1947.

Austria Devalues

The devaluation of the Austrian schilling last week in effect merely acknowledges a depreciation which had already occurred in the free markets. In an attempt to avoid increases in the cost of living, Austria did not follow sterling last September; but the pretence of the official rate could not be maintained for long—its effect was virtually to paralyse the whole mechanism of payments. In the hope of lessening the impact of devaluation on internal prices, Austria has now introduced (with the approval of the International Monetary Fund) an extensive system of multiple rates. The basic rate for the dollar has been raised from Sch. 10.14 to Sch. 14.40, but in addition a premium rate of Sch. 26 has been introduced. Austrian exporters have to sell only 40 per cent of their exchange earnings at the basic rate. The remaining 60 per cent they may either retain to finance imports or sell at the premium rate. The new effective rate for exporters is thus Sch. 21.36 to the dollar.

The new basic rate for sterling is Sch. 40.32, compared with Sch. 40.30 before Britain's devaluation. The premium rate is Sch. 72.80 and the effective rate for exporters is Sch. 59.80. Tourists will be allowed to purchase their entire schilling requirements at the premium rates, a move which now makes Austria (without any need for under the counter currency dealings) perhaps the cheapest tourist country in

Europe. The grading of exchange rates for imports—designed to soften the impact of devaluation—is intricate. For essential ECA imports such as wheat, fats, sugar, medicines, household coal, dried foods, seeds and fertilisers, the rate remains unchanged at Sch. 10.14 to the \$. Imports considered as one degree less essential will be paid for at the new basic rate of Sch. 14.40 to the \$ (or Sch. 40.32 to the £). Next comes a group of "semi-essential" articles which have to be paid for at the effective rate for exporters (Sch. 21.34 and Sch. 59.80 respectively), while luxury imports proper have to be paid for at the top rate. It remains to be seen whether the premium rate can be maintained at the new level or whether the National Bank will have to make early use of its power to vary the premium rate by 5 per cent.

Commodities and Trade

Buffer Stock for Tin?

Details of the new tin scheme are gradually becoming known despite the maintenance of official secrecy. The outline proposals were drawn up at a special meeting of certain member countries of the Tin Study Group in The Hague three weeks ago and there are still a number of problems to be solved before a draft agreement can be put before the full meeting next February. According to report, the proposals contemplate no direct control on production. They aim at keeping the market price within agreed upper and lower limits by means of export quotas. It is in fact a buffer stock scheme. When the price threatened to fall below the stipulated lower limit, export quotas would be reduced and stocks built up. When the price seemed to be heading above the upper limit, stocks would be marketed. These proposals do not differ much in principle from the buffer stock scheme set up in July, 1934. The only difference, indeed, is that the plan would this time provide for equal representation of producers and consumers in its management.

One vital question still to be resolved in these proposals is the fixing of the upper and lower price limits and the size and location of the buffer stock. Free dealings in tin were resumed in London less than three weeks ago and to imagine that, say, by next February the market will have sufficiently settled down truly to reflect the postwar patterns of supply and demand would be optimistic. Before the war the demand for tin proved to be relatively inelastic and it was in the producers' interests to keep the price as high as possible. But during the past eight years several important technological developments have occurred, by which industry has learned to economise in the use of tin or even to do without it. Demand for tin may, therefore, be more elastic than it was—how much more can be assessed only when the tin market has had time to function properly. In these circumstances, how can any reasonable price limits be set?

In 1934 the buffer stock was intended to carry 8,282 tons of tin; the removal of this quantity proved quite inadequate to stabilise the market. Even to iron out short-term fluctuations in prices a buffer stock today would probably have to be at least equal to one year's consumption—or 130,000 tons. A further point to be considered is: who accumulates and finances the buffer stock—producers or consumers or a combination of both? Again, is the buffer stock intended to cover America's strategic requirements or will these form a second reserve which might come on to the market, or, during the process of accumulation, might draw on the market? The British Government, though it looks on tin as a valuable dollar earner and seems to be wedded to a policy of keeping the price as high as possible, ought, in the interests of consumers, to be satisfied with the answers to these questions before it gives approval to a buffer scheme.

ICCH Scratched

The proposal of the Director-General of the Food and Agricultural Organisation to set up forthwith an international commodity clearing house was rejected in Washington last week. Instead, the problem of food surpluses in certain countries is to be further studied and a working party is to be set up to put forward short-term measures.

The passing of this far-fetched and grandiose scheme should occasion no regret. The original proposal was rejected by the United States as being inadequate and unsound. "Since the problem cuts across international trade and international fiscal policies," declared the head of the American delegation, "we must seek an alternative approach." The American criticism rightly struck at the very root of the proposal. Clearly, if the ICCH were to carry out the functions suggested, it would have been the dominant organisation in the hierarchy of international agencies. And as such it could hardly have existed as a mere adjunct of FAO.

Given this lead from the American side, it was not difficult for Mr Wilson, the President of the Board of Trade, to forget his instructions from the Cabinet and, instead, to use the arguments provided by his technical advisers against the scheme. He objected to the proposals because the ICCH would accumulate large sterling balances which at some future date would be convertible and which in the interim period could be used to buy commodities at present sold for dollars. He proposed, therefore, the familiar British solution of setting up a working party. Does this mean that the British Government has pinned its faith on the "commodity-by-commodity approach," with international marketing schemes for each of the staple commodities? One already exists for wheat, others under active consideration include tin, cotton and sugar. Later on, no doubt, rubber and wool could be added to the list.

* * *

Terms of Trade and Devaluation

Between March and September the prices of British exports and the cost of imports, as measured by the Board of Trade index numbers, followed a fairly consistent trend. In October, however, the first full month after devaluation, the cost of imports jumped by 9 per cent compared with September, while export prices remained virtually unchanged.

An article in the current issue of the *Board of Trade Journal* offers an interpretation of the October figures. First,

PRICES OF IMPORTS AND EXPORTS (Board of Trade Index Numbers, 1947=100)									
	Oct., 1948	Jan., 1949	Mar., 1949	June, 1949	July, 1949	Aug., 1949	Sept., 1949	Oct., 1949	
<i>Import Prices</i>									
Food, drink, tobacco	114	116	114	111	109	108	108	117	
Raw materials	123	124	127	125	123	121	119	127	
Manufactures	113	114	115	111	110	108	106	121	
TOTAL	116	118	118	115	113	112	111	121	
<i>Export Prices</i>									
Metal goods	111	112	112	113	113	114	114	114	
Textiles	116	116	116	116	116	116	115	114	
Other manufactures	110	111	109	109	107	109	108	107	
TOTAL	112	113	112	113	113	114	113	115	

the increased cost of imports shown in the trade returns does not necessarily imply that a higher sterling price was in fact paid for all these goods, since payment for some imports received during October will have been made before September 18th at the old exchange rate. The Board of Trade statisticians estimate that approximately 2 per cent out of the 9 per cent represents an increase in prices of imported foodstuffs and raw materials which was not caused directly by devaluation. The remaining 7 per cent is attributed to the higher sterling equivalent of the cost of imports arising from devaluation. Whether this represents the full increase

The Wizard in the kitchen

A cooker which burns night and day without re-lighting . . . a cooker big enough to provide for twenty or even thirty people . . . a cooker to save time, walk, health and temper . . . a cooker to gladden the heart of anyone who cooks for large numbers of people.

Here at last is that very cooker, bringing peace and order to the kitchen of a big house or small hotel and the best of good cooking for everyone. It's the Advance Cooker No. 1 . . . the Wizard in the kitchen. Write now for the catalogue number 32 which tells you all about it.

Advance Cooker

EAGLE RANGE & GRATE CO. LTD · ASTON · BIRMINGHAM · 6
WILSONS & MATHIESONS LTD · ARMLEY · LEEDS · 12
PARK FOUNDRY CO. LTD · BELPER · DERBYSHIRE

This large panel will give continuous boiling.

The main regulator gives exact control of oven heat.

COSMETICS AND CARS NEED US

We make the zinc oxide that helps to make face powder pure, smooth, white and close-clinging.

We make the Mazak zinc alloy that makes the many die-cast parts of a car—from carburettor to control knobs, from direction indicators to door handles, from shock absorbers to radiator grille.

Those are two of the ways in which we help to make the world go round. In fact there's hardly anything you use to which we haven't somehow, at some point, contributed!

**IMPERIAL
SMELTING**

WE MAKE ZINC, ZINC ALLOY, ZINC PIGMENTS, METALLIC ARSENIC, ZINC DUST, HIGH PURITY ZINC AND CADMIUM SULPHIDES, CADMIUM, SULPHURIC ACID, VANADIUM CATALYST, FUNGICIDES AND FLUORIDES

IMPERIAL SMELTING CORPORATION (SALES) LIMITED 37 DOVER STREET LONDON W1

is doubtful; some importers may have entered the sterling cost of their imports at the old exchange rate.

As for exports, the October figures are said to reflect in the main shipments under pre-devaluation contracts; hence the stability of the export price index. But, as a Note in last week's issue showed, there have been changes in the average values of particular exports—some rising and others falling. The conclusion then reached seems, however, to be confirmed by the Board of Trade figures: average prices of British exports, particularly to the United States and Canada, have not increased in terms of sterling.

Oil Trade in Dollars and Sterling

Little has been said officially about the course of the Anglo-American oil talks, which were resumed in Washington after the Cripps conversations but were adjourned a few weeks ago. The interest of the American oil trade in these negotiations is, however, keen, and enough has been said in American trade quarters to show what is the crucial matter from, at least, their point of view. This is the proposal that the American oil companies should be permitted to conduct trade in sterling much more extensively than British exchange control policy at present allows. They would at the same time accept some restrictions on their facilities to convert their earnings into dollars.

American oil companies cannot at present sell their oil to a non-sterling country and take payment in sterling. In a "normal" world they would hardly have wanted to do so, and indeed little was heard of the suggestion before last spring. But the dollar shortage, together with the expansion programmes of the sterling oil companies, has confronted them with the possibility of losing some of their traditinoal overseas trade in various parts of the world.

Mr Walter J. Levy, the American oil consultant, in an article in the *Journal of Commerce* of November 7th, outlined the difficulty facing the American oil trade and the remedies of which it is thinking. The present expansion plans of the sterling oil companies are such (he said) that if Eastern Hemisphere demand increases at the rate of 6 or 7 per cent a year for the next four years, there should be still enough sterling oil "to satisfy not only all sterling oil requirements but also more than the estimated increase in total foreign oil requirements." In that case, dollar oil sales might even fall below their 1948 level, and the development of oilfields abroad (including those of the Middle East) by the American companies would be brought to a standstill. This would have strategic and economic disadvantages for the United States; and its benefits to Britain would be dubious, since "each barrel of British oil sold for a soft currency involves an appreciable expenditure of dollars by the British Treasury."

Mr Levy suggested ways in which the American companies could reduce the dollar cost of their oil. They could make more use of the supplies and services of soft currency countries. Some of them are already building refineries in importing countries (Fawley is an example) with the object of supplying cheaper crude oil to those countries instead of expensive refined products:

It may well be possible that the American oil industry might by all these means reduce the dollar costs for its production to a figure that may not substantially exceed, or perhaps not exceed at all, the dollar costs of British oil.

The American companies might, therefore, put themselves in a position to sell their oil partly for dollars and partly for sterling. The sterling and other "local currency" they could use to pay for equipment and services which they need. The dollar payments would cover their reduced dollar costs and "some reasonable dollar profit." This perhaps oversimplifies the case; to keep sterling costs and dollar costs altogether separate would probably prove impracticable,

and some arrangement for the limited convertibility of oil earnings from sterling into dollars seems to be contemplated. An accumulation of sterling in the hands of the American companies would be likely, in any case, to create an eventual dollar claim, and it is no doubt against such claims that the British Government is anxious to guard.

Empty Pepper Pot

The insignificant peppercorn occasionally hits the headlines. In 1935 an unsuccessful attempt was made to corner white pepper—with the exemplary result that black pepper was decorticated by the ton and the corner failed miserably. Now there is a real and acute shortage. Pepper prices have risen more than fivefold between 1946 and 1949. Owing to the meat shortage, British consumption has fallen, for one of the main outlets for pepper was in the manufacture of sausages and cooked meat. There has recently been more meat for manufacturing, but still much less than before the war.

Imports of pepper into Britain totalled 72,000 cwt. in 1946; there was an increase to 146,000 cwt. in 1947 and then a decline to 35,000 cwt. last year. During the first ten months of this year, the total quantity imported was 25,344 cwt. The extra two pennyworth of meat which Mr Strachey announced last Monday will lack seasoning.

The cause of the shortage is revealed by studying the sources of British imports. Before the war, the bulk of Britain's pepper came from Indonesia, Malaya and Sarawak—in that order. All these areas suffered from Japanese occupation, and the pepper vines were either neglected or uprooted so that the ground could be used for other food-stuffs. Five or six years are required to bring a new plant into fruit; hence the shortage is likely to persist until the early 'fifties. India is another source of supply though it exports the peppercorn in an undecorticated state—that is, as black pepper. Most of Britain's imports in the postwar years have come from that source. But Britain has two formidable competitors for these relatively meagre supplies. The first is the United States and the second the Indian people themselves, who are now consuming much more pepper than formerly.

The irony of the situation is that the present high price for pepper is encouraging a prodigious expansion in output. By 1955, it is safe to predict, there will be a gigantic surplus, and no doubt the usual voices will be heard demanding an international scheme to control the supply.

Company News

The Ford Scheme

The much-heralded "bonus issue scheme" of Ford Motor was announced at the end of last week. As was widely expected, the arrangement provides for the transfer of the investment in the Ford associated companies to the American company and for a bonus issue of preference shares to the minority stockholders in Ford Motor Company (the American company holds the majority equity interest of 59.1 per cent). The avowed object is to overcome the difficulties of providing urgently needed additional working capital for the continental Ford interests. These difficulties arise partly from the obstacles to transferring funds from this country and partly from the heavy financial requirements for future developments of the British company itself in relation to its present resources. The American company is obviously in a better position to provide finance for the European companies direct. The scheme is somewhat complicated. An independent valuation of £4,256,860 has been placed on the

interests of Ford Investment Company (a wholly owned subsidiary of the British company registered in the Channel Islands) in the Ford associated companies. The American company has made an offer for these interests at the valuation estimate. The sum is to be provided by the British company from its undistributed profits, paid to a blocked account in London and then applied by the American company in paying Ford Investment Company. To match this transfer the residual 40.9 per cent of ordinary shareholders in Ford Motor will receive 3,678.925 new fully paid 4½ per cent redeemable 16s. preference shares in their company on a one for one basis.

Simultaneously with this rearrangement of the company structure of the Ford group, a new arrangement has been made for marketing, technical interchange, and associated matters. In one way this is a natural consequence. Under the agreement of 1928 the British company acquired exclusive rights of manufacture and sale in its "territory," which included most of Europe, parts of the Middle East, and parts of Africa. The associated companies in the various parts of the "territory" then acquired their manufacturing and selling rights from the British company. This has now been brought to an end, and the associated undertakings will presumably hold their rights from the American company directly.

But the character of the arrangements has also been changed. Advice has been given that the agreement of 1928 may not be enforceable under American law. Under the new agreement which has been negotiated between the British and American companies all territorial limitations are removed, and are replaced by an undertaking of a general kind:

Each company undertakes to co-operate with and assist the other to the fullest degree in promoting its export sales and general commercial interests.

An agreement on the same lines has been made between the British company and each of the associates. It is intelligible that the Ford group should be reticent about the nature of the legal objections which have arisen. Some public interest in the character of the new marketing arrangements is, however, inevitable. How (for example) is the procedure for selling British Ford products in North and South America affected? Perhaps it is not affected at all; but it would be useful to know.

Funds for Ultramar

Arrangements have been made by Ultramar to raise the £1,000,000 required "to restore the position of equality of the company with the Texas Company as regards the Mercedes Company." The Finance Corporation for Industry has agreed to furnish an additional £250,000 on the same terms as its present outstanding loan of £1,750,000 to the company. The FCI has also indicated its willingness to forgo all interest payments from the company, in the first instance until September 30, 1951, and, if considered necessary by a special committee to be set up, for a further three years at the latest. The special committee, which will consist of two members acting for the FCI and two members representing the Trustees of the Unsecured Loan Stock, may also postpone the final date of repayment of the FCI loans until September 30, 1957.

In consideration for this further assistance, the combined loans of FCI to the company are to be secured by a first charge on Ultramar's present and future holding of shares in Caracas Petroleum S.A. and loans made to that company. The remaining £750,000 is to be raised by an issue of convertible debenture stock, redeemable by the end of 1959 at the latest, and secured by a second charge on Ultramar's interest in Caracas Petroleum; this stock is to be offered to stockholders and unsecured loan stockholders, but its subscription in full has been guaranteed by a group headed by

Morgan Grenfell and Co. No interest is payable for the first five years, but the rate will be 7 per cent per annum for the final five years to 1959. The stock will carry a premium of 3 per cent on redemption and will be convertible at par into ordinary stock up to December 31, 1954.

All these arrangements are contingent on the willingness of the present holders of the £3,500,000 outstanding unsecured loan stock to waive their interest rights up to June 1, 1954, and to defer the final date of redemption to June 1, 1962. The consideration for such action would be to grant the unsecured loan stock a third charge on Ultramar's interests in Caracas Petroleum which would rank after the FCI loan and the new convertible debenture stock and possibly after a further issue of £500,000 on *pari passu* terms to the second charge. In addition, holders of unsecured loan stock would acquire the right to convert 12½ per cent of their holding into ordinary stock and would receive a rising scale of premiums—from £3 per cent to June 30, 1950 to £15 per cent after May 31, 1953—on redemption.

In all this reshuffling of rights to obtain another £1,000,000, the ordinary stockholder largely remains a passive spectator to a mounting pile of secured creditors. His equity now looks very remote indeed, and he may not be very excited by the right to subscribe for the new issue of convertible debenture stock which would increase his commitment. Is it enough merely to restore Ultramar's position of equality with the Texas Company? Or will further finance be needed in due course, beyond the £500,000 for which legal provision has been made?

Shorter Notes

The trustees for the Potash Syndicate of Germany bonds have lodged a private bill to obtain powers to convene meetings of the bondholders at which approval for "any proposals submitted" may be sought. This is an unexpected step. In their earlier statements the trustees had spoken in terms of seeking court sanction before the summer vacation for distributing the assets which they had successfully obtained for the bondholders after extended negotiations at home and abroad.

The value of new life assurances written by Standard Life Assurance in the twelve months ended November 15th shows a sharp expansion from £18,582,508 in 1947-48 to £22,176,448 this year. The value of new deferred annuities has increased from £4,609,028 to £5,855,554 in the latest year. The results of Standard Life Assurance should not be taken to suggest that the total value of new life assurances written by all life offices in 1949 may again exceed the record figures for the industry in 1947 and 1948. It is already clear that the new business obtained by a number of life offices will fall well short of the 1948 results.

It now appears that the trade negotiations with Hungary may not be concluded much before Christmas. Concurrently with the trade talks a settlement covering the Hungarian funded and short-term debts to Britain, as well as compensation claims for former British commercial and industrial interests in Hungary, is being negotiated. Under such a settlement payments by Hungary are expected to extend over a number of years; but, in addition to transfers from Hungary, creditors will to some extent be compensated out of Hungarian assets now vested in the Custodian of Enemy Property. Negotiations to have these assets unfrozen have reached an advanced stage; while some payments have already been made (where non-enemy ownership could be proved) a suggestion in last week's issue that releases to the short-term creditors had already been effected was premature.

THE BRITISH LINEN BANK

204th ANNUAL MEETING

The Annual Court of Proprietors of The British Linen Bank was held on November 29th at the Head Office in Edinburgh.

The Earl of Airlie, Governor, in the course of his speech, said: Deposits at the record figure of £74,800,000 are up by £520,000. The rate of increase during the past twelve months is considerably less than has been shown for a number of years. Bank deposits do not form a complete index of monetary levels, but it would appear that up to the date of devaluation of the pound the rate of inflation was lessening. The widespread repercussions of devaluation, which by itself is inflationary, have yet to be experienced.

Notes in circulation show an increase of £580,000 to a total of £7,780,000. It is difficult to account for the reversal of the declining tendency noted a year ago. The public demand for notes is almost entirely beyond the control of the banks. Our advances have risen by £3,500,000 to a total of £16,000,000, widely spread over a variety of industries and trades.

The profit and loss account shows the profit for the year at £242,727—a decline of £18,500.

It is proposed to pay the customary dividend, to contribute £54,000 to the pension fund, and to transfer £75,000 to contingency account, leaving £3,727 to be added to the amount carried forward.

CREDIT POLICY

Under present conditions, when the national economy is strained almost to breaking point, the role of the banks is particularly onerous. The banks are now expected to see that credit facilities are granted in conformity with the national policy of encouraging only such enterprises as are calculated to meet the most pressing needs of the community. This policy inevitably occasions disappointment and even hardship on the part of some prospective borrowers whose quite legitimate projects are not considered urgent or useful enough to warrant a share of the restricted national resources available.

Many factors have combined to create conditions in which the demand for working capital increases at a faster rate than the savings from which it must be supplied. Heavy inroads on private and corporate savings have been made by the oppressive burden of taxation. The position has been reached when increased costs of raw materials and manufactured stocks, with the resultant expansion of book debts, often compel industrial concerns to borrow for the purpose of paying their taxes. Sometimes borrowing is necessitated by the shortened terms of credit allowed to traders by public boards; while in other cases work can be carried on by contractors only if they borrow in anticipation of settlements which are subject to long delays.

SAVING URGENT

At no time was the need for fresh savings more urgent than under present conditions. It is perhaps not sufficiently understood that only from this source can be provided the tools of industry; without factories and equipment—in other words, without capital—labour would be unproductive and the standard of living would revert to a primitive level. It is very desirable that the sacrifice involved in saving should be applauded as a meritorious contribution to the country's needs, and that all efforts in this direction should receive the most active encouragement.

The report was adopted.

BRITISH CELANESE LIMITED

MATERIALLY INCREASED TURNOVER

FINANCIAL POSITION STRENGTHENED

MR G. H. WHIGHAM'S ADDRESS

The thirtieth annual general meeting of the company was held on November 24, 1949, at Winchester House, Old Broad Street, London, E.C.2, Mr G. H. Whigham, Chairman, presiding.

The Secretary read the notice convening the meeting, and Mr Lister, of Messrs Thomson McLintock and Company, read the auditors' report.

The Chairman said: Ladies and gentlemen, I regret that Dr Camille Dreyfus and Mr Hill-Wood are unable to be present. Following our usual practice, I propose that the reports and accounts be considered as read. The net profit of the Group before taxation constitutes a further record and shows a substantial increase over the previous year, although trading covered only 52 weeks as against 53 weeks last year.

Dealing with British Celanese only, net working capital at the beginning of the year under review was £5,735,000. This amount was augmented during the year by £1,122,000 represented by trading profits (before depreciation), less taxation and dividends paid, etc. From these total resources of £6,857,000, £1,437,000 was expended on buildings, plant, etc., £42,000 on additional investment in subsidiary companies and £54,000 in debenture stock redemption. These expenditures, totalling £1,533,000, therefore left us with net working capital at July 2, 1949, of £5,324,000.

GROWTH OF RESERVES

The financial position shows the steady strengthening which has taken place this year. Reserves, excluding reserve for future taxation, rose during the year from £1,666,000 to £2,274,000. I made reference last year to the plant replacement and special obsolescence reserve, to which account we have set aside this year a further £200,000.

It is interesting to note that during the past four years to July 2, 1949, total current assets increased by £4,820,000, which included a cash increase of £2,140,000 and an increase in stocks, which are not excessive, of £1,800,000. Net current assets increased by £2,400,000, and during the same period approximately £3,340,000 has been expended on new plant extensions, modernisation and replacements. The increase in the liquid position and the cost of the substantial plant extensions, modernisation, etc., which together have amounted to £5,740,000, have been achieved out of the company's own resources, other than in respect of £1,800,000 raised by the issue of first preference shares.

TAXATION AND DIVIDENDS

A further £250,000 has been placed to the credit of taxation equalisation account, which now stands at £480,000. The larger amount set aside this year follows upon the increased capital expenditure during the year, together with the increased rate of the Initial Allowance announced in the last Budget and which was effective during the last quarter of the financial year. It is important to realise how little these Initial Allowances have assisted in the problem of meeting greatly increased replacement costs. The fact remains that, over the life of the plant, only the original cost of that plant is allowed as a deduction for tax purposes. The tax relief

on the Initial Allowances in fact amounts only to the granting of an interest-free loan, which must be repaid during part of the time that the buildings and plant are in use.

The small benefit in effect obtained has been more than taken away by the recent imposition of a 20 per cent. increase in the tax on distributed profits. Profits tax, which is indefensible in a country with a steeply progressive system of taxation on personal incomes, bears particularly hard upon the ordinary stockholders in a company such as ours, having the obligation to pay heavy preference dividends and other fixed interest charges. It is a fallacy to state that profits tax has no effect upon the export trade. The export market is becoming more and more competitive and we are being exhorted to produce more and better quality goods at lower prices. This can only be achieved by modernising and increasing our buildings and plant, and this necessitates the outlay of substantial capital. I have explained that much has already been done from our own resources, but much more would have been, and could be, accomplished if we had available each year the amount provided for profits tax, which, since the ending of E.P.T. at the end of 1946, has amounted to about £600,000 after deducting income tax relief.

DEVELOPMENT HAMPERED

I therefore say most definitely that this tax is seriously hampering our development by reducing the amount available for expansion and modernisation which are essential to maintain our competitive position in the export market.

In the year ended June, 1923—roughly the same time after the first world war as we now stand after the second—if a company had distributed all its profits as dividends, it would have paid out in taxation a maximum of £36 for every £100 net paid to its shareholders. Now, apart from any exceptional circumstances, a company which distributed the whole of its profits would pay £142 in taxation for every £100 net paid to shareholders. Naturally, if any lower proportion were distributed, the ratio of taxation to the net dividend payment would rise. For example, so far as we are concerned, the amount set aside this year for taxation was equivalent to £370 for every £100 net distributed or recommended to be distributed as dividends.

In addition, the Government has an interest in the undistributed part of the company's profits for any year, because these undistributed profits are practically all placed to reserve and expended on expansion or replacement of plant, etc., which tends to ensure a continuity of satisfactory future profits, of which, no doubt, successive Governments will help themselves to a liberal portion. Every employee of the company also benefits from this ploughing back of undistributed profits, as it tends to ensure satisfactory future business which means continuity of employment. Thus Government and labour have a stake in these profits as well as the shareholder.

DIVIDEND AGAIN 8 PER CENT.

In conformity with the voluntary agreement made between corporate industry and the Chancellor, your Board again recom-

mends an ordinary dividend of 8 per cent., despite the fact that, even adopting a most conservative financial policy, an appreciable increase would have been justified. The last issue of ordinary shares was made in 1928 and the first dividend on the ordinary stock was paid in February, 1945. Apportioning over the period 1928-1949 the total dividends paid since 1945 to ordinary stockholders, including that recommended in the present accounts, the average annual return is just over 2½ per cent., less tax. This is certainly not an excessive return.

It is the ordinary stockholder who bears the greater part of the risks connected with industry. What inducement is he offered when, in the face of rising costs of living, the immediate reward is restricted by continued dividend limitation and an unjust burden imposed on him through a penal profits tax?

It was explained in the speech last year how the money received for our products, less the cost of materials, etc., was distributed between the employees, the Government and the stockholders. This year the net amount paid out in dividends is 1s. 3d. in the £. Labour received 11s. 10d., less 10d. P.A.Y.E., and the Government received in total taxation (including P.A.Y.E.) 5s. 9d. This left 2s., of which 6d. was required for repayment of Funding Certificates, leaving 1s. 6d. towards strengthening the company's position.

TRADING RESULTS

The turnover of the Group was materially increased over the previous year, despite a slightly shorter trading period. Sales of plastics failed to reach last year's level in consequence of the falling off in the demand for certain lines which I mentioned when I last spoke to you. Since then, however, there has been an encouraging recovery. The year saw a gradual relaxation of regulations governing the textile trade at home, the most important event being the freeing of clothing and other textile goods from consumer rationing control in March.

Notwithstanding increases in wages-rates granted during the year and the continued rise in price of many of the materials and services which we have to buy, amongst which coal is an important factor, there were signs towards the close of the year that the upward trend in the cost of yarn, to which I referred when I last spoke to you, was being halted. This satisfactory state of affairs was partly due to an increase in production and partly to a fall in the price of our main raw materials. The benefit of this latter reduction has now been largely nullified by devaluation of sterling.

EXPORTS INCREASED

There was a considerable increase in your company's exports as compared with the previous year; in fact, they constitute a record. This increase was general to all our main products and to the majority of our important markets; the overall rate of increase was not being maintained in the last quarter of the financial year.

Throughout the period we were struggling with the overseas difficulties of import quotas, duties and other restrictions, and, in addition, from the spring of this year competition was more intense, especially in the more important hard currency markets, namely, the Americas, Canada, Switzerland and Belgium. It so happens that these countries have highly developed competitive rayon industries; consequently, it is not easy to sell to them. Nevertheless, we had built up a steady business in some of these markets, thus earning an appreciable amount of hard currency. The devaluation of sterling will assist us further not only in the hard currency markets, but also in other markets where prices or other factors had curtailed our opportunities.

LARGE UNSATISFIED DEMAND

There is a very large unsatisfied demand for cellulose acetate rayon overseas, even in markets which are themselves large-scale producers of other types of rayon. Your company will stand to benefit provided that the restrictions, which in certain markets are hindering imports, are removed or relaxed. It is therefore important that the Board of Trade should take particular care to ensure that our industry is given the maximum scope in any trade agreements which they may make with other countries.

It is difficult to obtain the latest and most suitable textile machinery in this country, and delivery dates for home-produced machinery run into years. Without modern machinery it will be increasingly difficult for textile manufacturers to produce goods of the quality and at the price necessary to compete in foreign markets. The Government would be doing a great service to the industry and to the export drive if they would facilitate the importation of the latest machinery into this country from America and Switzerland, which are really the only sources of supply from which such machines could be obtained within a reasonable length of time.

VISITS OVERSEAS

During the year, visits have been made by the directors or executives of British Celanese (Overseas) Limited to nearly all the Dominions and a large number of other countries.

Two members of your Board and a large number of our technical and commercial executives visited the United States and Canada recently to keep in touch with general conditions and technical developments there.

We must again acknowledge the continuing understanding with which our home trade customers have accepted such limited quantities of textiles as we were able to make available to them in consequence of the high proportion of our production which was exported.

RESEARCH AND DEVELOPMENT

Research work in connection with the three main branches of our industry has continued actively throughout the year under review.

During the last year or two, considerable publicity has been given to the establishing in this country of chemical industries based upon the use of petroleum. Our own oil-cracking installation, which was primarily erected for the provision of some of the basic materials required for our main products, has now been operating for a number of years and our research staff have made a number of contributions to the rapidly accumulating knowledge of this technique. In the U.S.A. the requirements of the cellulose acetate industry in acetone and acetic acid have hitherto accounted for the largest volume of organic chemicals made from petroleum. At the same time, the wider potentialities of this rapidly developing source of raw materials are being actively explored by us.

Less easy to assess, but ultimately of equal importance for the progress of the company, are our long-term research projects. Our scientific staff realise the importance of keeping abreast of world discovery.

In the textile section, steady progress has been made in the improvement of existing processes, both by the adoption of modified techniques and the installation of new machinery, some of which we design and construct ourselves.

Our interest in plastics has continued mainly in cellulose derivatives, and during the year we have developed several new uses and methods of application.

PLANT EXPANSION

The expansion of cellulose acetate and chemical plant at Spondon embodied in our general expansion scheme is nearing completion. Modernisation of plant at Spondon has progressed well during the year. Your Board have constantly in mind the importance of maintaining the plants up to the highest modern standards, and it is their intention to undertake a considerable amount of this work each year.

As regards the proposed yarn spinning plant at Wrexham, nearly all the outstanding points have been finalised with the Industrial Estate Company. Further capital will require to be raised in order to build the first unit of the plant, and your Board are considering how best this can be achieved.

The factory buildings at Wigan are now complete and the installation of plant continues, and production has now commenced.

The Blyth factory buildings are complete and we are installing machinery. At Jarrow, we expect to occupy the main building by the middle of 1950; meanwhile, we have installed some machinery in a building which we occupy on short-term lease, thus enabling us to progress with the training of labour and to commence production pending completion of the main buildings.

GENERAL OUTLOOK

Nothing has occurred during the past year to alter the opinion of your Board that the long-term outlook for the rayon industry is still favourable and that fundamentally the outlook for plastics is also good, but we must always keep in mind the uncertainty regarding the future trading position of Germany and Japan in the world markets. In both of these countries controls are being lessened and more responsibility is being handed over to the national governments and to industry.

The immediate prospects have, of course, been profoundly modified by the devaluation of sterling. So long as we can obtain modern machinery to enable us to keep abreast of quality requirements, and so long as our costs can be kept within reasonable bounds, we can look forward to satisfactory domestic business and to an expanding and profitable export trade. As a large part of the products made by our customers from our yarn is also exported, these factors apply to them as well.

The continuance of the opportunity depends on costs. Broadly, costs which enter into our manufactures are of four kinds. They are:—

- (1) The cost of imported raw materials,
- (2) The labour cost,
- (3) The cost of materials and services bought in this country,
- (4) The cost of providing and maintaining plant.

Both the last two items will, of course, often include raw materials imported for the use of our suppliers.

RAW MATERIALS POSITION

As regards raw materials, it is important to realise the very small demands made by this company upon dollar exchange as compared with, for example, those made by the cotton industry. At the end of the financial year under review (before devaluation) the following position held:—

Five shillings of foreign exchange spent on American raw cotton bought enough to make 2½ lb. of cotton yarn, which, if exported at the then current average prices, would produce 10s. 9d. of foreign exchange.

Five shillings of foreign exchange spent on American cotton linters and other dollar materials bought enough to make 14½ lb. of Celanese yarn, which, if exported at the then current average prices, would produce

82s. 9d. of foreign exchange. The devaluation of sterling makes the comparison even more favourable to your company's products.

The advantage which your company possesses in the matter of imported raw materials does not extend to the other three factors affecting costs. In these, we shall gain or lose in the same way as all other industries in the country.

REALISTIC ATTITUDE ESSENTIAL

It is essential, therefore, that a realistic attitude should be taken by those who control what industry has to pay, that is to say,

ODEON THEATRES AND SUBSIDIARY COMPANIES

BURDEN OF ENTERTAINMENT TAX THREATENS FUTURE

MOST HEAVILY TAXED INDUSTRY

The twelfth annual general meeting of Odeon Theatres, Limited, and the annual meetings of its subsidiary companies, British and Dominion Film Corporation, Limited, Gaumont-British Picture Corporation, Limited, Odeon Associated Theatres, Limited, and Odeon Properties, Limited, were held on November 30th, at the Dorchester Hotel, London, W., Mr J. Arthur Rank, D.L., J.P., the chairman, presiding.

The following are extracts from his statement, which was circulated with the report and accounts for the 52 weeks ended June 25, 1949:—

The financial year which ended on June 25, 1949, promised well in its early months, but subsequently proved an unsatisfactory and disappointing one. Though the difficulties and setbacks we have experienced have, in varying degrees, been common to the film industry as a whole, the year has proved a particularly unhappy one for us. A falling off in attendance at theatres was accentuated by an unusually fine spring and early summer, while unfortunately the increase in the number of films we produced resulted in too large a proportion lacking the qualities and popular appeal which ensure success.

TRADING PROFITS

Trading profits show a fall of £4,321,453, which reflects a loss on production of approximately £3,350,000 after taking into account non-recurring credits arising out of the change in the basis of valuation of films which is dealt with in the directors' reports.

After providing £1,169,779 for depreciation and amortisation there is a net loss of £746,747. Taxation requires £716,729 (after crediting tax recoverable of £510,000) representing tax on the profits of certain theatre owning and manufacturing companies; the amount of the tax liability would be less but for the fact that amortisation of theatre properties, although a proper charge against profits, is not an allowable charge for tax purposes. Outside shareholders' proportion of the profits of theatre owning and manufacturing companies amounts to £669,780.

After crediting net transfers from revenue reserves of approximately £1,340,000, and the amount of loans waived by holding company of £648,757, a credit balance of £33,010 is left to be carried forward on the consolidated profit and loss account.

The loans waived by holding company of £648,757 represents an amount due by Odeon Theatres, Limited, to Manorfield Investments, Limited, a company controlled by my wife and myself. It is the considera-

suppliers, labour generally, and especially the nationalised services who enjoy a monopoly in the supply of coal, gas, electricity and transport. Restraint in their demands and a regard to the national interest is essential to enable our exporting industries to maintain the equilibrium in the balance of trade upon which the livelihood of the nation depends.

I take this opportunity, on behalf of the Board, of thanking all our employees for the excellent services rendered by them during the year under review and which have contributed to the satisfactory results before you.

The report and accounts were approved.

tion for that company's share interests in General Cinema Finance Corporation, Limited, which were acquired by Odeon Theatres, Limited, in December, 1947. It was agreed to leave this amount on loan to the company on December, 1952.

Manorfield, at the request of my wife and myself, has since June 25, 1949, made a gift of this amount to Odeon Theatres, Limited, together with the interest, £24,262 (gross) for the year to June, 1949.

FILM PRODUCTION RESULTS

At the beginning of August, 1947, a Statutory Order was made, S.R. & O. No. 1690 of 1947, which imposed a heavy import duty on all foreign films entering this country. Although this duty remained in force for nine months, no revenue was collected under it, because producers of American and other foreign films regarded it as a confiscatory measure and withheld their films.

The British industry was thus called upon to produce films so that dollars could be saved, and entertainment could nevertheless be provided for the millions of people who go to the cinematograph theatres every week. It was a duty and an opportunity; and in the circumstances in which decisions then had to be made there seemed to me only one answer.

We therefore made plans to increase the number of films we would have in production. The effect of such plans in the production field are necessarily long-term and the consequences, whether successful or unsuccessful, cannot be fully assessed for eighteen months or two years after the decisions are made.

SETTLEMENT WITH AMERICAN INDUSTRY

As you know, the settlement reached in March, 1948, resulted in the repeal of the import duty and the re-entry of American films into this country in June, 1948.

As a result a large part of the increased number of British films had to be released in competition with almost two years' output of the American studios.

Unfortunately, many of the films we produced were not of a quality to ensure even reasonable returns. It can now be seen that our plans to meet an unexpected and critical situation were too ambitious.

ENTERTAINMENT TAX

Before dealing with our plans for film production in the future I must first deal with the burden of entertainment tax with which, in my view, the whole future of the production industry is so closely bound up. In the

556 theatres controlled by this group the public paid £27,500,000 by way of admission prices, and of this no less than £10,500,000 went straight to the Revenue as entertainment tax.

Out of this £10,500,000 the amount paid by us in respect of programmes in which a British picture was the first feature was £4,500,000. Nearly all these British first features were made in our studios, and it follows therefore that in a year in which I have had to report to you a loss on production of £3,350,000 we have paid to the Exchequer out of our own theatres entertainment tax earned by British films which exceeds the loss by over £1,000,000.

When it is realised that the films we produce are played not only in our own theatres but also in theatres operated by independent exhibitors who in their turn pay entertainment tax, tax paid in respect of programmes in which these British films were the first feature must have amounted in the year to a total which cannot be less than £9,000,000 or little short of three times the losses we have made.

FUTURE FILM PRODUCTION

When the full extent of the losses had become apparent, your directors approached the problem of the future with a grave sense of responsibility.

If we can make fewer films of better quality we maintain our facilities and keep in employment a proportion of our creative talent and our technicians so that, when, as I feel is reasonably to be expected, production can be embarked upon without loss the industry can again march forward as I am sure it will. During the year important economies have been made, and these are now beginning to be reflected in our cost of production.

We have decided to plan for the shooting of between six and ten films during the six months ending June, 1950, which will keep our studios turning over and in first-class condition, and enable us to maintain the nucleus of our production organisation.

I hope that before a decision has to be made as to the period following June the Government will have considered the problems of the industry, and will have announced an alleviation of the burden of entertainment tax. Unless conditions, however, do improve we may then have to make the unwelcome decision that production must cease.

EXHIBITION

Domestic.—The welding together of the administration of two great circuits has not been an easy task, but it has been tackled energetically and successfully. The two circuits are well run today by an efficient organisation and material savings in the cost of operation have been effected.

We are booking fine programmes in our theatres, are running a special advertising campaign in connection with them, and are confident that we shall secure our share of the volume of business which is available. There are signs that the public has been forced to reduce the amount it spends on entertainment.

Overseas.—Our overseas operation continues to make progress and while not being an important source of immediate revenue to the group is in my view an asset which assists considerably in the distribution of our films overseas, and the film hire which is earned, and over a period of time will give increasing returns.

DISTRIBUTION

The policy of developing sound distribution organisations in overseas territories is continuing to bear fruit, and to prove that

from a long-term point of view it is the only way to secure maximum returns on the distribution of our films.

TAXATION'S HEAVY HANDICAP

Addressing the meeting, the chairman said: We are certainly the industry which is most heavily handicapped by taxation in this country and, as I believe, the only industry of national importance which is so heavily burdened that losses are almost inevitable. Entertainment Tax has gone up in the last ten years from approximately 12½ per cent of the box-office receipts to nearly 40 per cent today.

You may be interested to know how Entertainment Tax affected our recoupment of the cost of "Henry V." This film cost approximately half a million pounds, and has been hailed in almost every country in the world as a masterpiece of the cinematic art. It has won great academic honours, and many millions of people of all nations have seen it. But although it went into production in 1943, and was first released in London in November, 1944, it was only some four weeks ago that this great film had recouped the cost of its negative. In the same period it has contributed more than £200,000 in Entertainment Tax.

So we have a film produced by Sir Laurence Olivier, tax £400,000, and a stage play produced by him, tax nothing. Similarly, if we present Mr Sid Field or Mr Danny Kaye in the flesh at one theatre, and were to film the same act and then show the film in a cinema theatre next door, those who paid for admission to the cinema would make a much larger contribution by way of Entertainment Tax than the theatre audience, who, indeed, might, under the concession I have just mentioned, pay no tax at all.

COMPARISON WITH THE LIVE THEATRE

During the first 16 weeks of the current financial year we paid Entertainment Tax in respect of attendances at your cinema theatres of £2,990,000. If we had been taxed on the basis of the live theatre we should have paid approximately £750,000. In other words, we paid four times what the live theatre would have paid, although our costs of production and operation are as high as theirs and, on the whole, we cater for a much larger public in the lower wage groups than does the live theatre.

It is estimated that the domestic market of the United States for American films is 60 per cent of the world market and that our domestic market is 15 per cent; but in America the Entertainment Tax is approximately 16 per cent, while here it is nearly 40 per cent. If the American industry has its anxieties as it is said to have, how can we hope to succeed, with this unrelenting weight of taxation around our necks.

There is, of course, another side to this story—the export trade. America has said for many years that business follows the film; I have had many instances drawn to my attention where our films have helped the sale of British goods overseas. We have also brought back many millions from the export markets, some in hard currencies, some in soft. This not only represents a contribution to the export drive, but in addition, wherever a British film plays in the sterling area the film hire which is earned reduces the drain on the dollars available in the sterling area.

At the meeting of Odeon Theatres, Limited, the report and accounts were adopted, and a vote of thanks was accorded to the chairman.

At the meetings of each of the other companies the report and accounts were also adopted.

RONEO LIMITED

ANOTHER SUCCESSFUL YEAR'S TRADING

EXPANSION OF EXPORT BUSINESS

SIR GREVILLE S. MAGINNESS ON TAXATION BURDEN

The forty-second annual general meeting of Roneo, Limited, was held on November 29th, at the Holborn Restaurant, London, W.C.

Sir Greville S. Maginness, the chairman, who presided, said:—The accounts now before the stockholders cover—as indicated by me in my annual review last year—the nine months ended June 30, 1949, in respect of the parent company and twelve months to the same date for foreign branches and subsidiary companies. The profit on trading compared very favourably with that earned during the previous year, and this was due to two main causes, both of a highly gratifying nature. Our sales were substantially increased and, in fact, were little less during the nine months than the whole of the previous year. More important still—the level of efficiency both on the manufacturing and selling sides of our operations reached a higher standard than ever before.

CONSOLIDATED PROFIT AND LOSS ACCOUNT

After providing £59,616 for depreciation and amounts written off, the profit before taxation was £416,249. Taxation called for £284,293, or 68 per cent. of the profit—a penal percentage.

Net profit for the period amounted to £131,956. We propose out of profits earned to transfer to plant replacement reserve the sum of £46,468, bringing the total reserve under this heading to £120,000, and to general reserve a further £30,000, raising this figure in the balance sheet to £220,000.

LIQUID ASSETS

Stocks on hand and work in progress are up by approximately £107,000 due to increased turnover. Debtors are little changed, but creditors are up by about £50,000. Cash and tax reserve certificates show a satisfactory increase of no less than £100,000 compared with last year.

The liquid assets have increased to approximately £1,970,000, or more than £1,150,000 in excess of liabilities. The financial position and liquidity of your business have thus been further strengthened during the period covered by the report now before you.

DIVIDENDS

Preference dividends are today being paid for three months to June 30th last. It is the intention of your board that these should in future be paid on January 1st and July 1st in each year. Preference stockholders will, therefore, receive 15 months' dividend in the current fiscal year to April 5, 1950.

The final dividend recommended to be paid on the ordinary stock for the period of nine months (including twelve months for foreign branches and subsidiary companies) is 10 per cent., making a total of 15 per cent. for the period. This must not be taken as any indication that the future dividend on the ordinary stock will be increased.

TRADING

All sections of the business showed a satisfactory advance both in volume and value of sales, although the increase in the steel equipment department was restricted owing to the continued shortage of steel sheets which still hampers the full production and

sale of filing cabinets. Roneodex cabinets, desks, cupboards, partitioning, and all the many lines of steel office equipment in the manufacture of which the company is engaged.

The new Roneo "500" Series II Duplicator with its special inking system has won many new friends and is now firmly established on the market. Encouraged by the successful results experienced with this machine, your company introduced a few months ago another model—the Roneo "150"—well worthy to take its place by the side of the "500." This machine is the only portable duplicator on the market with totally enclosed full automatic inking, and is freely acknowledged by competent judges as an outstanding machine in its particular class. Sales both at home and abroad have fully justified its introduction and afford ample evidence that it fills a long-felt want.

EXPORTS

Notwithstanding the many continued restrictions and difficulties in the conduct of foreign trade, I am pleased to report a further substantial improvement in this increasingly important sphere of the company's activities.

Our sales abroad during the nine months ended June 30th last surpassed those of the previous 12 months by over 10 per cent.—an achievement of which we can feel justifiably proud. We have also in the present calendar year exceeded by 28 per cent. the quotas which the Government set us for our export trade. In fact, exports of the products of the company have shown a gratifying expansion since the end of the war with a substantial increase each year over the preceding year. These results have only been made possible by the production of goods of the highest quality at competitive prices, backed by the most forceful trading methods.

Conditions are now, however, much more difficult in export markets. Competition continues to grow and is certain to become more intensified in the future. The need for reduced costs is, therefore, now more vital and insistent than ever. Unfortunately, the cost of many items such as our main raw materials, coal, transport, electricity, etc., is quite outside our control and we have no say in the prices which we are called upon to pay for them. In that field, however, where we can reduce costs by greater manufacturing efficiency, improved sales methods and increased managerial competence, no effort has or will be spared to enable us to continue to market our products at home and abroad.

TAXATION

When last year I referred to the necessity of this country expanding its export trade I ventured to say that this could not be achieved by everyone looking to the state to secure him against all the risks of life, but by keeping alive the spirit of enterprise and adventure which gave this country its industrial leadership in the past, and by encouraging those who are prepared to do so to take the harder road to win the larger prize. Everything that has transpired during the past year, culminating in the devaluation of our currency, has deepened my convictions on this subject. It is being emphasised more and more that unless we expand our export trade and sell enough goods to pay for the food and raw materials which we must im-

port, we inevitably face not only the lowering of even our present standards of living but also grave unemployment and all that such a state of things brings with it. The expansion of our export trade is, therefore, the most dominating of all the problems which confront our country today, and I sincerely hope that this has been brought home to the whole nation at last.

There are some who think that this expansion of our business abroad can be achieved without harder work but merely by exhortation and Government planning. I do not discount these methods, but I hold the view that harder work by every member of the community is fundamental to the solution of our problems, and that so long as human nature remains what it is the most effective and direct incentive to harder work is—as was recently said by the Lord President of the Council—that “The man who does a better day’s work than the next man should be entitled to correspondingly better earnings.” When I speak of “earnings” I mean the money which the man retains after the state has deducted its taxes from him, and it is because taxation today has assumed such dimensions that the incentive to harder work has lost its old force and meaning. At the present time the Exchequer absorbs no less than 40 per cent. of the nation’s entire income. Such benefits as the state provides with that money appear to be taken more or less for granted. It does not seem to be realised that the Treasury is not a creator of wealth but merely the instrument for collecting and redistributing wealth earned by those who produce. We have, therefore, reached a stage, in my view, when in looking to the state as the universal provider the tax deductions from the earnings of all classes are so frustrating as to damp down the energy of every section of the community, and to make the ordinary man and woman wonder whether harder work is really worth while. If I am asked to say where state expenditure should be cut I can only reply that such expenditure is the result of national policy laid down by Parliament and that it is, therefore, Parliament which is charged with that responsibility. As I see it, it is the duty of our political leaders to create the conditions in which the natural energy and resourcefulness of our people can have the freest and fullest scope. But I think that industry would be failing in its duty if it did not voice its conviction that there must be a substantial lessening of the present burden of taxation if we are to secure the higher production essential for our national recovery.

The satisfactory results now before the stockholders are due in no small measure to team work and a common purpose between the management and the employees. The board wish to record their sincere appreciation of the efforts of all those who have made their contribution to another successful trading period, and I am sure that stockholders will desire to associate themselves with this expression of thanks.

The report and accounts were unanimously adopted.

GOLD EXPLORATION AND FINANCE OF AUSTRALIA

LIQUIDATION APPROVED

Sir Walter Massy-Green, K.C.M.G., presided at an extraordinary general meeting of Gold Exploration and Finance Company of Australia, Limited, in Melbourne, Australia, on November 30th, at which resolutions were passed approving the liquidation of the company and the sale of all assets (other than Western Mining Corporation, Limited, shares) to Western Mining in exchange for 1,476,618 fully paid Western Mining shares.

The liquidator will hold 2,739,050 Western Mining fully paid shares and he has been authorised to distribute 150 shares for each 100 units of Gold Exploration stock. Western Mining plans to pay a dividend of 6d. (A) per share equivalent to 9d. (A) per unit of Gold Exploration stock. Western Mining proposes to convert its fully paid shares into stock before the liquidator makes his distribution.

At the fifteenth annual general meeting of the company held immediately prior to the extraordinary general meeting, the members adopted the Board’s circulated statement. This reported that the control and management of the company was transferred to Australia as from January 1, 1949, and explained that the company’s principal subsidiary, Western Mining (in which it holds a 97 per cent. interest), had deferred payment of a dividend pending completion of the amalgamation. This resulted in a loss to the company of £11,936 for the year ended March 31, 1949. For the same period Western Mining profit was £A271,345.

Mr W. S. Robinson has agreed to act as adviser to Western Mining, the chairman, and Messrs. G. Lindesay Clark and F. F. Espie are already directors of Western Mining, and Mr J. Stanley Murray has agreed to join the board.

The chairman also reported:—“The company is now in liquidation, and the liquidator, Mr Leslie Edwards has asked me to indicate to you his present intentions. He proposes to enter into the Adopting Agreement with Western Mining Corporation, Limited forthwith, and, on W.M.C., Limited becoming bound by the agreement, to send to all members letters indicating the holding they will eventually receive in that company. These letters should be ready for dispatch by December 12th, and will advise the procedure necessary to enable members to become the registered holders of stock in Western Mining Corporation Limited.”

HERRBURGER BROOKS, LIMITED

STRONG POSITION

The twenty-ninth annual general meeting of Herrburger Brooks, Limited, was held in London on November 30th, Sir Louis Sterling, the chairman, presiding.

The following is an extract from his circulated report:—

The directors are pleased to report once again an increase in the profit earned over that of the previous year. Although taxation absorbs £1,750 more than last year, the net amount available for distribution has increased by £940.

The balance sheet continues to reveal a strong financial position, although its structure will show considerable alteration next year by reason of the repayment of capital at the rate of 5s per share. Liabilities in respect of creditors have increased by nearly £6,000, but this increase is of a normal nature, and arises mainly from the improved position with regard to supplies of timber required for our business. I have commented in previous years on the difficulties we were experiencing in connection with the shortage of timber, but I am now pleased to report that, at any rate so far as the immediate future is concerned, quantities of timber have become available, and purchases already made are largely reflected in the figure of stock in hand, which now appears at a considerably increased amount. “Cash” and “sundry debtors” have both increased, and the position generally is satisfactory.

The piano trade is still almost wholly devoted to export business, although the Government has given permission for a small number of pianos to be allocated to the home market subject to the satisfaction of export requirements. The report was adopted.

CABLE AND WIRELESS (HOLDING), LIMITED

THE RECONSTRUCTION SCHEME

A meeting of the ordinary stockholders of Cable and Wireless (Holding), Limited, was held on November 25th in London, to consider a scheme of reconstruction.

Sir Edward Wilshaw, K.C.M.G. (the governor), in the course of his speech, said: I think I am entitled to say that the scheme, judged purely as a scheme of reconstruction, has been universally admitted to be fair and reasonable to all classes of shareholders in the various companies involved.

At the annual general meeting of the company in April last I stated that your directors considered that it would be in the best interests of the stockholders to distribute a substantial portion of the compensation to the existing stockholders. In the present scheme your directors have gone even further than that and have in fact proposed the distribution of the whole of the compensation award, which they thought would be received with enthusiasm. After the announcement of the scheme it has, however, become evident that there is a wide divergence of opinion between various sections of stockholders. There are those who desire total liquidation; there are those who desire a greater distribution of cash and there are those who have supported the present scheme as it stands. It appears to me that none of these categories loses anything by adopting the present scheme, which does not preclude some other arrangement being made later, but which does clear up a number of legal and financial complications which arise owing to the existence of the subsidiary companies.

BOARD’S INTENTION

Your directors would not wish to regard as final any scheme which did not fall in with the views of a substantial majority of the stockholders. Therefore, your directors intend, whether the present scheme is accepted or not, to endeavour to bridge the gap between the various divergent opinions. They consider that it is not impossible nor beyond human ingenuity to do this. While, therefore, they are firmly convinced that the present scheme should be accepted—and they strongly advise you to accept it—they will in any event forthwith endeavour to put before you proposals designed to bring together as far as possible the divergent views to which I have referred.

I realise that even if those who are present at this meeting are convinced by the remarks which I have made today, there is the strong probability, judging by the number of adverse proxies lodged with us, that the scheme will be rejected. In that event no time whatever will be lost by your directors in putting before you fresh proposals to eliminate the uncertainty and stalemate which would otherwise arise.

BENEFITS FOR ORDINARY STOCKHOLDERS

It is my considered opinion that the scheme is beneficial to every ordinary stockholder, and I have yet to learn of any reason to the contrary. It provides for the outpayment of £30 million odd to stockholders—it removes a number of legal difficulties and simplifies the structure of the undertaking.

A lengthy discussion ensued in the course of which a number of stockholders spoke in favour of the scheme while others spoke against it.

A card vote was taken, and the same procedure was followed at a subsequent extraordinary general meeting of the company and at meetings of the Eastern Telegraph Company and the other subsidiary companies concerned.

THE WALL PAPER MANUFACTURERS LIMITED

MR ALFRED WHITTLE ON NATIONAL RECOVERY

The fiftieth annual general meeting of The Wall Paper Manufacturers, Limited, was held on November 30th in Manchester.

Mr Alfred Whittle, F.C.A., the chairman, in the course of his speech, said: This is our Golden Jubilee year. The growth and prosperity which your company is enjoying is mainly due to the enterprise, courage and foresight of the past and present directors supported by the loyalty and co-operation of all employees, and your directors have confidence that the organisation will continue to progress in the future as it has done during the past fifty years.

The total group assets exceed £17,250,000, of which £8,000,000 represents the net liquid resources of the group. The net profit of the group amounts to £1,224,962 against £1,204,823 for the previous period of eleven months.

We are approaching the stage where we shall be producing almost at prewar level, and we can now visualise the time when all our plant and labour will be fully engaged. In order to repair the serious damage done to the wallpaper industry by years of shortage your company is undertaking a nation-wide publicity campaign centred round “Crown” Wallpapers. Every effort is still being concentrated upon export trade, which, however, continues to be conducted with increasing difficulty as in one market after another restrictions on imports are imposed.

DEMAND FOR PRODUCTS

The Walpamur Company, our largest and most important manufacturing subsidiary, continues to prosper and the popularity of its paints remains unabated. Such products as Walpamur Water Paint, Duradio Enamel Paint, Muromate Flat Oil Paint, Marvo and Trojax are consistently in great demand.

The heavy burden of taxation today makes it exceedingly difficult for businesses to set aside out of profits the necessary sums for capital replacement and development. The general level of taxation in this country is far too high to permit concerns to maintain or increase their working capital, and the recent increase in profits tax is to be deplored. Taxation at the existing level is crippling

the industrial recovery without which the life of the country is in peril.

The relations between management and our employees are most cordial. This mutual confidence and combination of effort is an important factor in the steady progress that has been made.

Your company is one of the leading industrial concerns in the United Kingdom—it is the largest wallpaper manufacturer in the world and a leading paint manufacturer. A wide responsibility, particularly during the present economic difficulties, rests upon those companies occupying the dominant position in their own particular industry.

Unfortunately Government departments which have inside knowledge of the support the big industrial organisations have given to the Government in the past difficult years hesitate to stand up to ill-informed public opinion, thereby failing to give the necessary corrective and guidance which would help to build up a true assessment of the part played by the large industrial concerns in the battle for production and export markets.

The report was adopted and the payment of dividends of 10 per cent. on the ordinary and deferred stocks were approved.

BETTS AND COMPANY, LIMITED

IMPROVING SALES

The sixty-ninth annual meeting of this company was held on November 25th in London.

Mr S. H. Gillett, M.C., F.C.A. (the chairman), said: The trading profit amounts to £54,363, compared with £81,009. The principal cause for this was the serious falling off in the demand for collapsible tubes which manifested itself early in February this year and continued almost until the end of June. However, since then sales have improved and orders are being well maintained. Secondly, the dividends received from our French subsidiary company, Betts and Blanchard, are less by £4,178. Since the year-end, trading conditions in France, so far as they relate to the French subsidiary, have shown some improvement.

The dividend recommended of 15 per cent., less tax, on the share capital has been fully earned, and, after providing for all taxation, the carry forward has been increased by just over £4,500 to £23,484.

Considerable interest has already been evinced in the samples of the Turnerstyle container, which is a new form of container, similar in action to a collapsible tube but dis-

similar in appearance, and a number of firms have been, or are, carrying out tests in connection with it. It is hoped that production of this line will start before the end of the year.

The company’s programme is still one of expansion wherever possible, combined with increased efficiency of production, which will lower production costs. The installation of new plant and machinery for this purpose, together with the improvement in sales of our products which has already taken place, justifies a confident approach in the coming year.

The report was adopted.

FILLERYS TOFFEES

SIR HERBERT MORGAN’S SPEECH

The fifteenth annual general meeting of Fillerys Toffees Limited was held on November 23rd at Birmingham.

Sir Herbert Morgan, K.B.E., the chairman, in the course of his speech said:—

The suspension of rationing did materialise, but it was of comparatively short duration, and after a trial, rationing returned to us. Manufacturers, wholesalers and retailers alike, did their best to avoid it, but the demand of the public was so heavy that rationing again had to be resorted to.

It is obvious that the confectionery trade has something to look forward to in increased production in the future when rationing is abolished, one hopes, for ever.

Our sales this year have shown an advance on last year and this is reflected in the profits. There is no doubt that our toffees are increasing in popularity due to the maintenance of our quality: Fillerys, the Toffees of Good Taste.

Shareholders will be pleased to learn that our export trade is promising. Mr Maurice Wells, our managing director, is at present making a tour of the United States and Canada. Mr Clifford Atkins also took advantage of a visit to the West Indies to devote some of his time to investigating that market.

The business as a whole is in a high state of efficiency and we are reaping the benefit of past years of carefully planned expenditure in the improvement in our factory, plant and organisation.

Our thanks are due to the managing director, Mr Maurice Wells, whose foresight and judgment have not failed us in planning for the future, as well as to the whole of the executive staff and workers for their loyal co-operation.

The report was adopted.

NOTICES

UNIVERSITY OF ADELAIDE—SOUTH AUSTRALIA

Applications are invited for the following appointments:
One Reader in ECONOMICS;
One Reader and One Lecturer IN HISTORY AND POLITICAL Science.
Salary Scales:

Reader: £1,050—£25—£1,200 p.a. (Aust.).

Lecturer: £500—£50—£750 p.a. (Aust.).

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1. The closing date for the receipt of applications is January 31, 1950.

RHODES UNIVERSITY COLLEGE, GRAHAMSTOWN, SOUTH AFRICA

Applications are invited for the post of SENIOR LECTURER IN COMMERCE.

Salary Scales:—Men—£600 x £25—£850 p.a.

Women—£550 x £25—£700 p.a.

Plus a variable cost of living allowance, at present about £57 p.a. Previous experience and academic qualifications may be taken into account in fixing the initial salary.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1. The closing date for the receipt of applications is December 31, 1949.

CHARTERED ACCOUNTANTS. 25-35 years of age, wishing to widen their experience, are invited to apply for an appointment with a well-known industrial company. Candidates with some experience of industry and holding a University Degree will be given preference. The Post requires outstanding personality. Scale of remuneration up to £2,000 per annum. Full details of qualifications and experience to Box 275.

HIS MAJESTY’S COLONIAL SERVICE, GOLD COAST

Two regional Social Development Officers required to organise courses for Youth Leaders, direct Mass Education work and promote Youth Organisations, Boys Camps, and Community Centres. Permanent or contracts terms can be offered. Salary including pensionable expatriation allowance is £660—£1,300 plus a temporary cost of living allowance. Partly furnished quarters at low rentals. Free passages. Low rates of income tax. Generous leave.

Candidates must hold a degree, diploma or certificate of a Higher Education Institution and must have had appropriate experience.

Further particulars and application forms obtainable on written request to the Director of Recruitment (Colonial Service) Sanctuary Buildings, Great Smith Street, London, S.W.1, quoting reference No. 27259/49.

HIS MAJESTY’S COLONIAL SERVICE, TANGANYIKA

A vacancy exists in TANGANYIKA for a MALE WELFARE OFFICER, to organise Provincial Welfare work. The post is permanent and pensionable. Salary scale £840 x £50—£1,080. Quarters at low rental. Free passages. Income tax is much lower than in the United Kingdom. Candidates should be between 25 and 35 and experienced in rural community work, and handwork classes. Handwork teacher’s qualification and experience of Young Farmers’ Clubs desirable.

A form of application and further particulars may be obtained on written request to the Director of Recruitment (Colonial Service), Colonial Office, Sanctuary Buildings, Great Smith Street, S.W.1, quoting reference No. 27259/41. Closing date for receipt of applications, one month after publication.

Far East.—Gentleman having held executive position in Hong Kong, China and Japan for some years seeks new appointment where his knowledge of Shipping, Insurance, Imports and Exports as well as Accounts and General Office routine could be put to suitable advantage. Willing to travel. Available immediately.—Reply Box No. 945, c/o, Dawson, 129, Cannon Street, E.C.4.

Investment Statistics

Company Notes

Crompton Parkinson.—Trading profit of the group amounted to £1,627,362 for the nine months period to June 30, 1949, compared with £1,687,968 in the year to September 30, 1948. The dividend and bonus totalling 22½ per cent is repeated on the higher capital. It is proposed to make a bonus issue capitalising £1,538,893 of reserves by way of issuing fully paid 5s. ordinary shares (later to be converted to 5s. "A" ordinary stock units) to "A" ordinary and ordinary stock holders on a one for one basis. Net current assets, at June 30, 1949, amounted to £4,372,324 (£4,050,731) and fixed assets less w.o. to £2,207,858 (£1,912,737).

Ind Coope and Allsopp.—Consolidated profit for the year to August 31, 1949, was £2,030,712, compared with £2,623,231 for eleven months in respect of parent and fourteen months for most subsidiaries in 1947-48. Net group profit amounted to £666,177 (£778,552). The dividend of 30 per cent is unchanged. Net current assets declined from £3,621,399 to £2,179,752 over the year.

Electric and Musical Industries.—Consolidated trading profit, excluding income attributable to prior years, declined from £1,232,752 to £890,418 in the year to June 30, 1949. Net current assets were £5,764,499 (£3,820,592) at the year-end.

Harrisons and Crosfield.—Group trading profit increased from £657,538 to £748,679 and net profit from £255,057 to £415,189 in the year to June 30, 1949. The dividend of 25 per cent is maintained. Net current assets increased from £1,549,829 to £2,675,415 at the year-end.

Ansells Brewery.—Balance on consolidated trading account declined from £1,871,566 to £1,497,555 in the year to October 2, 1949. Group net profit amounted to £320,943 (£652,501). Net current assets at the year-end were £1,351,000 (£1,929,000).

Combined Egyptian Mills.—Trading profit increased from £829,876 to £1,244,750 and net profit from £275,536 to £431,008 in the year to September 30, 1949. The dividend has been raised to 6 per cent (4 per cent maiden dividend).

Birmingham Small Arms.—Group trading profit rose from £1,146,383 to £1,438,294 and group total profit from £1,298,049 to £1,635,130. Total profit included £153,904 (£20,885 in 1947-8) for interest on war damage claims. The net value of fixed assets has been reduced from £4,126,409 to £4,112,805. Net current assets are £396,000 higher at £5,960,762, of which £299,871 is represented by cash. Stocks are valued at £7,586,804 (£6,688,204), and debtors at £2,613,843 (£2,591,988).

South Durham Steel and Iron.—Consolidated profit increased from £898,336 (including £91,310 not attributable to the year's operations) to £1,361,785 in the year to September 30, 1949. Group net profit amounted to £574,397 (£270,683), of which £527,922 (£220,000) is appropriated to reserve for future development, etc. Group carry forward is £310,759, against £306,366 brought in. Net current assets have risen from £2,316,009 to £2,912,984, and fixed assets, less depreciation from £4,531,705 to £4,571,081. Stocks and work in progress are up from £2,219,255 to £2,781,595, and liquid funds are £245,000 higher, at £451,000. Capital expenditure outstanding at the year-end is estimated at £2,274,819.

Port of London Authority.—Cash lists opened and closed on November 30th and conversion lists will remain open until December 8th for the issue at £99 per cent of £5,000,000 Port of London 3½ per cent registered stock, 1966-1968. Holders of £6,975,000 Port of London 5 per cent inscribed stock, 1950-70 are given the offer of conversion into the new stock, the existing stock being called for repayment on June 1, 1950.

Howards and Sons (chemical manufacturers).—Application has been made for permission to deal in the whole preference capital of £450,000 in 5½ per cent cumulative

£1 preference shares. Capital consists of £828,000 in £450,000 of the above preference issue and £378,000 in £1 ordinary shares.

John Barker.—Shareholders' approval is to be sought on December 21st for the 50 per cent free bonus issue capitalising £553,165 of reserves.

General Electric Company.—Stockholders' approval is to be sought for raising the board's borrowing powers to an amount equal to twice the issued share capital. At present borrowing powers are limited to a sum not exceeding the authorised capital.

Fordham Pressings.—Lists opened and closed on December 2nd for the sale of 540,000 1s. ordinary shares at 3s. 9d. per share. Capital consists of £68,000 in £23,000 7 per cent cumulative £1 preference shares and £45,000 in 1s. ordinary shares.

Booker Brothers McConnell.—Some £1,000,000 of new capital is to be raised by an offer to shareholders of 817,180 10s. ordinary shares at 22s. per share in the proportion of five new shares for every eight shares held, a private placing of 44,411 6 per cent cumulative £1 preference shares, and a further offer at 22s. per share of 50,000 ordinary shares to staff members.

Redemption yields are worked out on the assumption that all dated stocks will be repaid at latest date. Such yields are marked '†'. To this rule there is one exception (Funding 4 per cent) on which the yield is taken to earliest date and marked 'c'.
(a) Net yields are calculated after allowing for tax at 9s. in £. (b) Flat yield.
* Assumed average life 15 years 6 months.

Statistical Summary

EXCHEQUER RETURNS

For the week ended November 26, 1949, total ordinary revenue was £53,402,000, against ordinary expenditure of £54,303,000 and issues of sinking funds £200,000. Thus, including allocations of £10,867,000 the Exchequer since April 1st is £15,617,000 in surplus compared with a surplus of £301,905,000 for the corresponding period a year ago.

Furthermore, if this defence system is to succeed in its purpose of preventing the next war before it starts, these minimum defence requirements must not simply exist as promises to be redeemed in wartime but as forces actually in being. If there is one outstanding lesson of this century's two great wars, it is that aggressors are not deterred by trained reserves or military potential among their enemies. The Kaiser in 1914, Hitler in 1939, the Japanese in 1941, all thought

they could win quickly. To preserve the peace—and to create the confidence that it will be preserved—western Europe needs a standing army.

If this did not pose a sufficiently formidable problem for the Atlantic Powers, there is an additional complicating factor. Britain, France and the Netherlands are, for better or worse, colonial Powers with heavy military commitments in Asia, commitments which are a steady drain on their military strength as European Powers. It is to be hoped that within the next year or two the Netherlands will be able to concentrate more upon European defence. It is possible that France may resolve the conflict in Indo-China which at present pins down the bulk of the French regular army. But Britain, which has garrisons all the way from Tripoli to Hongkong, is most unlikely to be able to draw in its horns in the east. It has, for instance, a strategic responsibility for the Middle East and the Indian Ocean which it cannot lay down for the good reason that there is no other friendly major Power capable of assuming it. Any part that Britain plays in the defence of western Europe is not an alternative, but an addition, to its imperial responsibilities. This is a misfortune, but it is a fact that cannot be dodged, since Britain is neither able to contract out of Europe nor willing to abandon the Commonwealth.

★

The exact economic implications of creating a watertight defence system in Europe without abandoning the defence of the rest of the world are impossible for a layman—and possibly for an expert—to assess. But it is painfully apparent, even at the first glance, that they rule out the possibility of any substantial reduction of defence expenditure below the level of the present year—which, in terms of the national income, is about double that of the middle thirties. Indeed, it is all too probable that an increase would be necessary, even after all possible economies were made, even after allowing for the fact that Britain is now bearing the highest relative burden of any of the Marshall nations.

This is an appalling prospect, so appalling that there is a strong temptation to say that we cannot afford a defence policy that would cost so much, and leave it at that. But even from the strictly financial and economic point of view, this would be very short-sighted. It is perfectly consistent to hold that the nation cannot afford an effective defence policy—provided that the logical consequence is drawn and the foreign policy of the country veers to neutrality and pacifism. But the British people have never in the past been able or willing to stay neutral once a major war breaks out. And if in fact we should fight, with everything we possess, once the war started, surely it is the path of economy to spend whatever is necessary now to prevent the war happening. There is a reasonable alternative to spending the money necessary to make the defence policy effective. But that alternative is not to be found in a policy of limited commitments; it is to be found in having no defence policy at all. It is tempting to the muddle-headed to say that we can keep defence expenditure down by abandoning any pretence of playing an important role on the Continent and concentrating instead on the British Isles and the Indian Ocean. This is called the “traditional” British policy, because it is the state into which British policy traditionally relapses between wars. But it is also true that major war never breaks out in Europe without

the British people finding it necessary to raise a large army for Continental operations. Historically the “traditional” British policy of limited commitments has been wildly extravagant. It has not prevented wars from starting, and it has made them infinitely expensive to win. Moreover, it cannot even be safely assumed that, in another war, a policy of British defence that started at the Channel would be enough, even at infinite expense, to win the war. Mr Baldwin said that England's frontier was on the Rhine, but his government did not follow that policy, and it was only by the narrowest squeak that Mr Baldwin was saved from being proved *disastrous* right. If 1940 were ever repeated, the very strong probability is that Britain would fall. And it is a certainty that no victory worth winning would be possible. Defeat or victory would be alike ruinous.

Whatever other arguments there may be for the policy of limited commitments (and it is difficult to imagine what they might be), it receives no support from the principles of economy. From the financial point of view, as from others, there are only two logically consistent alternatives. One is to disarm and await the will of stronger and less economical peoples. The other is to spend whatever is necessary (with all due economy in execution) to achieve a reasonable assurance that there will not be another major war this century.

This is a very grim conclusion. For to accept the necessity for an effective defence policy is to accept the cost in men and money. The present cost of defence, at roundly £800 million a year, is already very high. It may be that poor value is had for money spent; it may be that a quite small improvement in the inducements to join the regular forces would enable the present costly system of national service to be modified; it is probable that there is still an amount of waste to be eliminated. But if the number of effective British divisions standing in Europe is, say, to be trebled (and the British contribution could hardly be smaller) it is very unlikely that the budget could be cut, even if the money were better spent. It might well have to be increased.

★

It is quite certain that the British public does not understand the grim alternatives with which it is faced in defence policy. If the Government could take upon itself the responsibility of deciding on the people's behalf, popular ignorance might not matter. But the issues are far too large to be resolved by anybody other than the public itself. They will have to provide the men and the money and they certainly will not do so unless they understand why it is necessary. Defence expenditure is without doubt the most irritating way of laying out the taxpayer's money. It is purely negative; it adds nothing to the productive resources of the economy; soldiers and sailors, however well commanded, appear to civilians in peace time to be eating their heads off in the paddock. The nation feels about a peacetime government which demands increased defence expenditure as a householder feels when told that his roof must be re-tiled, that he must lay out money for something from which he can derive no pleasure and whose cost means abandoning plans for the summer holiday. This is particularly true when the total of the budget cannot be increased—rather, when it must be diminished. If the requirement is for lower expenditure in the aggregate and yet for higher defence expenditure—and neither conclusion can be dodged with any honesty—then defence and social welfare become very direct competitors.

In any such competition it is, at present, perfectly obvious who would win and who would lose. Mr Aneurin Bevan and Mr James Griffiths would get the verdict every time against Mr Alexander. This makes it the more difficult to understand the policy of complacent secrecy in which the Minister of Defence wraps himself. The British people have a choice to make fully as difficult and painful as any they have ever made in the past. Shall they freely choose to play their part—in very goodly company—to ward off war by being prepared for it, knowing

Food Policy for Europe

IN the course of the coming year, western Europe intends to spend nearly two billion dollars upon the importing of food. When the Marshall Plan comes to an end in two years' time, however, its beneficiaries will not be able to count upon comparable supplies of dollars. Less food will be bought and eaten, unless it can be secured from non-dollar sources. Yet any great expansion of food supplies in other areas can hardly be wrung from nature in a single harvest. If then there is to be in 1952—and it seems inevitable—a profound change in European food prospects, their implications must be considered now. Men can starve in one winter, even if they cannot completely reorient their agricultural system.

With these facts in mind, the Food and Agriculture Committee of the Organisation for European Economic Co-operation has prepared an interim report for its parent body, recommending some drastic changes in the food policy of western Europe. Hitherto the target for European agriculture agreed upon in OEEC has been an increase of some \$4,000 million (in 1948 prices) in European domestic output which, it was hoped, would give by 1953 a level about \$2,000 million higher than the prewar average. In spite of the fact that many nations have not yet embarked on this first plan of expansion, it is now declared insufficient to deal with the food crisis that seems likely to follow the ending of Marshall Aid. The Committee believe that European output must be increased by another \$1,250 million. Even this figure does not offer a guarantee against the possibility of short commons between 1952 and 1956. Without it, the fall in living standards threatens to be catastrophic.

It is a formidable programme. Not only does it demand a heavy outlay of Europe's scarce capital. It also drastically revises a pattern of trade that is both long-established and profitable. The New World has for

that such a policy will add greatly to their already overwhelming economic burdens? Or shall they deliberately choose to be defenceless? All sorts of elements—emotional, moral, financial, political—will enter into the answer. It cannot be given in the darkness of ignorance but only in the light of full knowledge of the facts, cultivated by thorough public discussion. To stumble on as at present, accepting the commitments without commanding the resources to discharge them, is to achieve no object—neither economy nor security nor peace.

decades been a main source of Europe's imports of cereals and animal feeding stuffs for the simple reason that the grain could be produced there more economically. Since the war, the dependence has been even greater. At the same time, output per man hour in agriculture has risen by 60 per cent in America, with the implication that the cost of grain could now be even cheaper than it was before the war. It is a grave decision to turn from low-cost food to what may be very high-cost food. It is a particularly fateful decision for Great Britain, much of whose economic strength has been derived from access to cheap food. It is true that to some extent the decision to produce more food in Europe and to lessen dependence upon overseas supplies has been taken already—especially in Britain—but the present proposals greatly, and possibly dangerously, accentuate the trend. If, therefore, there is any possibility at all of the old international division of labour, with its enormous advantages, being restored, it would be foolish in the highest degree to rule it out. The plan of forced and expensive domestic expansion is literally *faute de mieux*. It should be adopted only if there is no alternative.

The main argument for the inevitability of more home production rests on the belief that Europe will not have sufficient dollars to buy North American supplies on the old scale. There are two sides to the argument—that prices for primary foodstuffs will remain high and that, even if prices were to fall, Europe would still lack the necessary dollars. It is difficult to accept completely the argument based on the continuance of high prices. Whenever in the past the terms of trade have turned drastically against the industrial producer, it has only been a matter of time before the stimulus to agricultural production created by high food prices has reversed the trend. It may be that the present situation marks the end of the

old pattern. The determination of the governments of food-producing countries to feed their own peoples even if they eat the export surpluses has increased almost everywhere. In the United States, direct government intervention through the programme of support prices given to agriculture has prevented enormous food stocks from depressing the price level. Even so, it is difficult to believe that these exceptional conditions will, for an indefinite period, be completely effective, even in America. The possibility that support prices will be lowered should be borne in mind. A lowering of world food prices and a reversal in the present terms of trade cannot be ruled out. The old days of world-wide gluts of food and dirt-cheap prices may never return; but is it reasonable to assume that the world will for ever remain at the opposite extreme? The pendulum may not swing as far in future as in the past, but should policy be based on the belief that it will never swing at all?

A fall in price would not, however, wholly answer the second problem—whether the nations of western Europe could earn sufficient hard currency to maintain their old purchases of cereals in the New World. One of the secular changes in the world economy in the last thirty years has been the growth of industrial capacity in countries formerly dependent upon western Europe for their supplies of manufactured goods. The self-sufficient economy of the United States is the most notable and perplexing example of a nation which hopes to continue agricultural exports with a reduced need to import industrial goods in exchange. The Canadian economy is developing in the same direction. So is Australia. So, in its own chaotic way, is Argentina. The problem which the United States presents to the world is only the most acute example of a more widespread phenomenon. There is no evidence that any of these states intend to reverse the trend and take a higher proportion of their industrial needs from Europe. Is not the obverse of this fact the need for the old industrial areas in Europe to revert to a measure of agricultural expansion?

The argument is reinforced by the developments since the war in eastern Europe. In 1938, western Europe imported foodstuffs worth \$1,685 million from eastern Europe. In 1948, the volume had fallen to \$307 million, and it is the declared policy of each of the eastern satellite states to press forward with industrialisation so that it will neither need to export food nor even, perhaps, be able to do so. Thus, even if it were desirable to leave western Europe's long-term food prospects at the mercy of governments which may cease food deliveries from one day to the next for political reasons, the evidence suggests that supplies of food from eastern Europe will not in any case be available on the necessary scale.

The conclusion that it seems reasonable to draw from the evidence is in one respect clear, but in another still very ambiguous. It is clear that some movement by western Europe as a whole towards greater self-sufficiency in food and feeding stuffs is called for. The old pattern of exchange between a manufacturing Europe and an outside world of primary producers has broken down—or at the very least has dwindled in scale—and no non-European country would be prepared to revert completely to the old ways. This is the justification of the OEEC's ambitious project. This is the compulsion behind it, for though cheap food is better than dear food, dear food is better than no food at all. What is still

quite unclear is to what extent the old pattern will revive or must be written off. To assume that the present abnormal conditions of postwar readjustment will last for ever is as foolish as to assume that prewar relationships will be restored in their entirety. But no man can yet say where, in the intervening space, realism shades into defeatism. Perhaps the only formulation of policy possible at this stage is to say that although nobody can yet tell how much more food will need to be grown in Europe, it is clear that some expansion is needed.

The Food and Agriculture Committee of the OEEC are confident that expansion is possible. They do not, in this report, consider the possibilities of development in Europe's African dependencies, although such a study is essential before the allocation of capital and technical knowledge is completed. But, even apart from possible developments in Africa, the experts believe that further expansion in western Europe itself can be achieved. They specifically propose expansions equivalent to \$400 million in coarse grains, \$50 million in oilcake, \$150 million in livestock products, \$100 million in fats, \$300 million in non-cereal foods and tobacco, \$150 million in wheat. In addition, \$100 million worth of wheat could probably be saved by diverting to human consumption bread grains at present used for animals.

★

Few of the countries of western Europe, however, have so far done very much to achieve even the earlier targets of expansion laid down by the OEEC. In the harvest of 1948-49, three nations alone had advanced their food output above the prewar level—Britain by 15 per cent, Turkey by 25 per cent, Sweden by 5 per cent, France was still 15 per cent below, Belgium actually 20 per cent.

Expansion, however, is only part of the problem. As important are the methods used to achieve it. Europe's resources are not unlimited. A programme of agricultural expansion represents to a certain inevitable extent the abandonment of cheap imports, and hence of cheap food. It must inescapably react adversely on the standard of living, and any unnecessary addition to costs in working out the policy of expansion will impoverish Europe still further. Moreover, nobody can be quite sure that the present calculations of the unfavourable terms of trade and of the difficulties of penetrating the North American market may not later prove to be too pessimistic. If the prewar pattern of trade between Europe and the outer continents were, after all, to be restored in greater measure than now seems probable—a contingency that the policy-makers cannot dismiss—then a Europe that had wasted large proportions of its scarce capital resources in creating unwanted supplies of expensive food would look very silly. The more expensive the new supplies the more mercilessly would they then be exposed to reviving extra-European competition—or, alternatively, the higher would be the cost to the European taxpayer of keeping them going. The emphasis at every point, therefore, must not be on expansion at all costs but on expansion by efficiency and increased productivity. Unless this priority is accepted from the outset, Europe may find itself burdened with a completely untenable cost structure in agriculture.

The report recognises this fact. It lays only slight emphasis on the actual expansion of the area under cultivation, and the bulk of the report is concerned—rightly—with ways of improving the technical efficiency of European agriculture. Under this head it makes a

number of specific and valuable proposals. It estimates, for instance, that by a better application of fertilisers, by choice of seed and by methods of rotation, the productivity of the 25 million hectares of western Europe's grassland could be increased by 40 per cent, and further savings would be possible with improved methods of haymaking and silage—at present 40 per cent of the value is said to be lost in haymaking. In the arable areas, the adoption of hybrid maize might repeat the 25 per cent increase in productivity already achieved in the United States. Animal husbandry is not studied in detail in the report, but new methods of checking animal diseases and improving stock through artificial insemination have certainly not yet been systematically applied to European agriculture. From these and other examples, it is clear that the scope for increased productivity and relatively low-cost production in Europe is still very great indeed and that the expansion proposed in the report could be achieved, to an extent at least, on an economic basis.

Everything depends, however, upon the policies pursued by governments. In each of the main fields of action likely to encourage expansion—the investment of capital, the application of scientific methods, and the guarantee of stable markets—government action is decisive and clearly in each field it is possible to pursue diametrically opposed policies in relation to costs. For instance, the guaranteeing of agricultural prices on a "cost-plus" basis, with no relation to increased efficiency (which is a tolerably accurate description of present British policy), can achieve expansion of the area cultivated and even increases in yields, but at a cost far beyond the community's capacity to pay. In France,

China Looks South

SEVERAL months have passed since the dramatic events which marked the climax of the civil war in China, and the sense of crisis in Far Eastern affairs has diminished in the consciousness of the western nations. The first shock of Communist victory is over. The question of extending diplomatic recognition to the new regime remains unsettled pending deliberation in the next session of the United States Congress, but it is noted with relief that no great violence has so far been done to the remnants of foreign interests in China. An unpleasant shape of things to come in Chinese foreign policy is nevertheless gradually emerging, and it is the long-term rather than the short-term aspects of Chinese Communist purpose to which the western governments concerned in Far Eastern affairs should now be paying attention. What is the significance of the Communist triumph in China for the near future in international relations, as distinct from its effects on foreign trade and investment in China?

The Peking conference of Asian and Australasian trade unions has already marked out the main lines on which Chinese Communist activity is to develop. This conference, though nominally only a trade union gathering, was in fact wholly political and extremely militant in tone. The Chinese Communists, as hosts of the conference and paragons of successful revolution, read homilies to their guests, and fraternal delegates from the Soviet Union and European countries did honour to the

apart from a marked increase in mechanisation, the guaranteeing of prices appears to have played a larger part in agricultural policy than insistence upon increased productivity. M. Pfimlin, the Minister of Agriculture, has, within the last few days, felt compelled to resign since the government questioned the prices guaranteed to the sugar-beet industry. Yet the questions raised are obviously relevant. Whereas other western European governments have subsidised the price of fertiliser and have thus encouraged the farmer to double his use of it, in France the use of fertiliser is now actually a little lower than it was before the war. France, the country believed to be capable of the largest agricultural expansion, has a lower level of productivity than any of the other Marshall countries save Austria, Portugal, Italy, Greece and Eire, and, on present estimates, this disparity will still exist when the Monnet Plan and Marshall Aid both end.

Similar examples of government policy hindering, rather than forwarding, the aim of increased productivity could be quoted—ill-regulated capital investment as in the British experiment in Tanganyika, the maintenance of tariffs to protect uneconomic food development. For European agriculture, the pursuit of productivity and technical efficiency is the only alternative to high costs of living, lower consumption and permanent impoverishment. Some increase in the domestic production of food in western Europe appears to be a necessity. It remains to make a virtue of necessity. To embark upon higher production at all costs—which, as Britain has discovered, is the line of least resistance, the course into which official policies all too easily slip—would be to turn a necessity which cannot help but be in some degree painful into a positive catastrophe.

great occasion. The conference declared its support for the "national liberation" forces in Burma, Malaya, Indonesia, Indo-China and the Philippines, and such reactionaries and "lackeys of western imperialism" as Mr Nehru, Thakin Nu and Mr Soekarno were denounced with furious invective. It was finally decided to set up a permanent liaison bureau and secretariat, which, as one of the delegates explained, would serve as a "general staff" for all the Communist-led revolutionary movements in the region of the world covered by the conference. In fact, the Far East now has its Cominform.

It should be noticed that this Communist offensive is directed not only against the survivals of western sovereignties in the East—such as British rule in Malaya—but also against all those Asian national leaders, from India eastward to the Philippines, who have been trying to base the policies of their respective countries on friendly relations with the west. Although the Communists pose as the champions of colonial nationalism against western domination, it must not be thought that they are pleased at seeing any achievement of national independence which leaves the former dependency on good terms with its ex-rulers. It might be thought that such zealots of nationalist insurgence as a Nehru or a Soekarno had earned by their records a right to be regarded as anti-imperialists; but in the eyes of the true Communist all their virtue is good for nothing, unless they maintain a permanent and implacable hostility

towards the nations of the west. Their task—failure in which will be punished by Communist-inspired revolt against them—is not merely to win independence for their countries, but to carry them over, lock, stock and barrel, into the anti-western camp of which the Soviet Union is the head and China is now, it seems, to be deputy-director for south-east Asia.

What is most striking in the new "Chinese Cominform" programme is that it is to be applied over a region in which the Chinese imperial monarchy formerly held a kind of paramount position, and in which large Chinese communities have been built up in modern times by emigration from China. It is also the region which, in the abortive Japanese plan for "Greater East Asia," was to have been completely separated from all contact or connection with the west and included, together with China, in a bloc of states under Japanese hegemony. The propaganda against "Anglo-America" which poured forth from Tokyo only five years ago has now been taken over, sometimes in identical phrases, by Communist China, and with it the basic idea of "Greater East Asia," though in the new version the hegemony will be not Japan's but China's. Here indeed is a programme to appeal not only to the Marxist-Leninist, but to Chinese nationalism in all its political shades. To an extent which has not been sufficiently realised in the west, Communism has been able to outbid the Kuomintang as the prospective champion of Chinese nationalism in most of its claims and aspirations. The Chinese national resurgence which resisted Japanese conquest for eight years inspires no humble estimate of China's destiny in the world, but ideas of what is fitting for the most numerous of the world's peoples, who only a century ago still considered themselves to be the hub of the universe and the sole bearers of civilisation. They have had to endure since 1842 a long series of humiliations and disasters inducing a deep sense of frustration and resentment in the national outlook.

There are two main reasons why Communism is in a position to give an attractive lead to Chinese nationalist sentiment. In the first place, by aligning China with the Soviet Union in defiance of the west, the Communists can pursue a forward policy in the south, whereas the Kuomintang was unable to take a strong line either in the south or in the north. The Kuomintang was dependent after the surrender of Japan on American political and economic support, and this precluded a policy of trouble-making in south-east Asia; at the same time, it did not dare to offend the Russians by challenging the Yalta decision (to which Britain and America were consenting parties), and thus had to assume the responsibility for yielding China's sovereign rights in Manchuria. The Chinese Communists, of course, do not challenge the Russians either; but in return for their acceptance of a treaty position in Manchuria which was not of their

making, they have the support of the Russian bloc for a forward policy in the south.

Secondly, the Communist technique is the one which promises the best returns on a very small capital of national military power. China remains extremely weak in modern industry and heavy armaments, and the Communists, with all their energy, have little prospect of substantially altering this state of affairs for a long time. There is no danger in the near future of Chinese fleets and armies following the Japanese path of conquest to the Bay of Bengal or the Timor Sea. But Communist methods of subversive propaganda and intrigue, with the infiltration of armed bands, might have great success against weak or vacillating opposition in a region already full of disorder and unrest. This is the ideal mode of expansion for a nation which lacks real military strength, but can bring to bear politically the mass weight of a population of four hundred millions, the prestige of a traditional ascendancy and the glamour of a revolutionary gospel. In any Chinese expansion to the south the overseas Chinese would be the natural instrument of policy. It would provide pretexts for nationalist agitation and diplomatic action; in Siam Chinese immigrants now total a third of the population and in Malaya nearly half. In Burma, Indo-China, Indonesia and the Philippines they form large and influential communities. But Chinese Communism will not have to confine its organisation to these communities, as the merely nationalist Kuomintang has had to; operating with a professedly international creed, it can recruit followers also among the indigenous peoples, especially in areas where the Chinese are not—as they are in Malaya—so numerous as to create strong anti-Chinese feeling among the non-Chinese population.

From the indications given by the Peking conference the operational area of Chinese Communism will comprise all the countries of south-east Asia: that is to say, Burma, Siam, Indo-China, the Philippines, Malaya and Indonesia, and there will be links with the Communist parties of Australia to the south and India to the west. It goes without saying that the offensive will be directed against every influence or authority of the United States or European nations in the region; but it will also certainly be directed against the influence of India, which has its own strong emigrant communities and historic connections throughout south-east Asia. However much Mr Nehru may wish to keep India clear of the world-conflict between the Russian and American camps, India cannot be indifferent to a Chinese expansion in what used to be known as "Further India." With regard to Burma, the issue of Communism is complicated by the fact that a large part of the frontier of northern Burma is disputed by China—Chinese maps published under the Kuomintang show a large extension of Chinese territory there to the Assam border, and there is no reason to expect Communist China to drop this claim.

There is also the question of Tibet, which the Chinese Communists have declared they will "liberate." Having maintained complete *de facto* independence of China since 1912, Tibet has a strong claim to be regarded as an independent state, especially now that China has recognised the *de jure* independence of Outer Mongolia, which originally broke away from China in the same year. But it is for India to take the lead in this matter, for neither Britain nor the United States has any direct concern to-day with the region beyond the Himalayas. If India decides to support the independence of Tibet as a buffer state between itself and China, then Britain and the United States would do well also to extend formal diplomatic recognition to it. If, on the other hand, India prefers to abandon Tibet to its fate in the hope of avoiding a conflict with Communist China—a course which is said to have its advocates in Delhi—the western powers are in no position to object to a Chinese reconquest of Tibet.

In all the countries which have been mentioned the Russians have never in the past had any direct interest. For this reason it may well be that the Kremlin will be

content to allow China more or less a free hand in a part of the world where Chinese action can be extremely embarrassing and dangerous for the Western nations without interfering with countries which Moscow regards as being within its own sphere. In talk about the prospects of "Titoism" in China, it is generally assumed that all satellites must be treated alike by the Russians without any degrees of dependence. There have been signs that they are willing to accept from China a much looser form of attachment than is required from the East European satellites. Apart from the vast extent and remoteness of China, the fact that the Chinese Communists have had an army and territory of their own for more than twenty years, and have taken the principal cities of China by their own efforts puts the Chinese in a different category from all other non-Soviet Communists. There may be conflicts between Moscow and Peking and, if a serious heresy were to arise, Russian possession of Port Arthur would enable the Kremlin at least to set up a rival regime in Manchuria. But for the present there is no detectable heresy, and it looks as if the Moscow-Peking Axis may work about as well as did the Berlin-Rome Axis.

Coming Down to Earth

(By a Correspondent)

[On August 14, 1948, The Economist published an article by "A Wavering Correspondent" entitled "Sitting on the Fence," in which the writer discussed the outlook of the average floating voter including the service men and women whose votes by common consent swung the 1945 elections so decisively in favour of Labour. In August, 1948, he reported an atmosphere of bafflement and uncertainty about how their votes would be cast. With the approach of another general election the same correspondent discusses the present attitude of the floating voter.]

ONE paragraph from my former article I should like to repeat: "We voted Socialist last time—several millions of us. We helped to swell the enormous vote of the 'workers.' The latter will presumably vote Left once more. But what of us—the political infants? If I can offer myself as typical I would say we don't know. We shall not know until the election draws nearer."

That time has come. As the party machines gather momentum some of us, at least, have been pondering at some length on the way we shall vote. I believe that a very large number have more definite views than we had even as recently as the summer of 1948. The ex-serviceman as a political factor has disappeared. We no longer think as we did in our service days and for a little time afterwards. The hearty hand outstretched to the boys and girls who saved democracy is an outworn gesture. There is no flesh and blood about it because uniforms—and the political sentiments that went with them—are forgotten.

In 1945 I believe that the vote was exceptional because it was given for a party: the party of the brave new world of the common man. In 1950 there will undoubtedly be a tendency for habits to revert to the more usual course of voting against a party. Because of that factor, the easily-contrived destructive criticism of

the party in power may have a much greater influence than it could have had five years ago.

The Tory public relations experts have done a commendable job of work in the suburb where I live and the town where I am employed. The social activities of about 20,000 people are, apart from the local cinema, now largely organised openly or at second-hand by Tory interests. Dances, lectures, outings, sports events and so forth are extremely well organised. The young men and women in their early twenties—those on the electoral register for the first time—are, almost without knowing it, Tory voters. A slick little magazine giving all the details of the social events drops through the letter box each month. It is, of course, strongly supported by local shop advertising.

★

The Labour party also issues a magazine. It is much smaller and far too centralised in content. Syndicated material from Transport House and big names from Whitehall fail to interest readers thinking about better train services and local housing programmes.

This suburb has a Labour MP who is not standing again. It was previously Conservative for twenty-five years. To some extent, therefore, the coming fight is equal. The Conservative candidate, youthful and very English, works hard to be nice to all. His criticisms are not nearly so ill-advised as some of the posters he issues. He busies himself in affairs which are non-political. His policy reminds me of the group leader system of New York's Tammany which ensures votes so efficiently. It may be cynical, but it's grand electioneering; the ladies love it.

The lady who is the new Socialist candidate is not so much in evidence. Very probably she has not so much time to spare. Her policy seems to be one of strict regard for facts and a commendable restraint. She

makes her appeals mainly to the intellect in an area where intellect is probably at a discount. Her meetings have been of the discussion group or "any questions" type. They are poorly attended but highly enthusiastic. Organised interruptions with queries which come straight from the Conservative Central Office and familiar to every newspaper reader are cogently and dispassionately answered—often with devastating effect. Unfortunately she is heard chiefly by the converted.

There is so far no Liberal candidate—and no organised propaganda. No one, thank heaven, asks anyone else the time. Enthusiastic amateurs write voluminous letters in praise of Liberalism to the local press. They are as involved as they are sincere.

★

Someone said that the Labour victory in 1945 was won by young women pushing prams in the High Street. Whether this was true or not, both parties are acting as if it was; they are both making a dead set at the women. No one doubts, in this area filled with young couples and young children, that the youngsters look better and healthier than ever before; no one doubts that educational facilities are first-rate; no one doubts that food subsidies and price controls have alone made a standard of middle-class and lower middle-class family life possible.

But there is the unpredictable unreasonableness of the women with the prams to consider. Organised or voluntary, Tory agents have been successfully busy in the shops and the queues. They seem to come from all classes. The result is that women are blaming the Government for everything from the price of pillow cases to the small size of potatoes. If my wife is correct in her reports, women get a lot of comfort from the fact that pillow cases will be cheaper and potatoes bigger if the X goes in the right panel at the polling booths.

This seemingly universal discontent among women may be superficial. It would certainly be dispelled by as vigorous a campaign by Labour speakers and chatterers as that conducted by their Tory sisters during the past two or three years.

No doubt Mr Attlee and Mr Morrison privately admit that they would benefit from a cessation of their colleagues' help. There may by now be a contemptuous familiarity with the more ill-tempered diatribes of Mr Bevan and Mr Shinwell against those people ineligible for trade union membership. But Sir Stafford Cripps's

A recent series of six articles in THE ECONOMIST examined Britain's present economic ills and made suggestions for their cure. These articles have been reprinted as a pamphlet under the title

A Policy for Efficiency

Copies of this pamphlet (at 3/- post free) can be obtained from:

THE ECONOMIST, 22 RYDER ST., LONDON, S.W.1.

fall from grace, whether necessary for the nation's welfare or no, must have cost many, many votes. The blandness with which he barely explained, and wholly failed to apologise for, what the average voter takes to be a series of lies, and his more recent fostering of the un-English informer system, have shaken our faith in a man who, basically, seemed above party and certainly above suspicion.

Sir Stafford's new form of patriotism was one of his many personal assets. I believe that a fundamental error of Labour policy has been its inability to appeal to patriotism. Once it could offer a sort of second-hand patriotism in veneration of the Soviet Union. That is out of favour, but love of Britain has not been allowed to replace it. The hysterical and exciting reaction to the *Amethyst* exploit was an indication of the pent-up desire to believe that Britain still counted as a nation with a backbone. The man-in-the-street has seen that, even in a Uno-organised world, a strong national policy pays. He feels that a little more of the strong-arm attitude used in Berlin and Malaya might raise our prestige a little higher.

Lastly, there is the feeling among many of us that the people who have benefited most from Socialism—and how glad we were five years ago that they should—have abused their new-found security. It may be a relic of the class-consciousness of a £6 a week clerk for a £10 a week docker. But the Labour Party has itself to blame if the majority of the holders of the floating vote come home each evening irritated by the assumption that they ought to feel guilty that they are not covered in coal dust or weary from humping export merchandise.

★

We voted Labour last time; if we are to do so again, there will have to be a sensational change in the Labour Party's appeal between now and the election. Many of the votes have been lost. Some, at least, can be regained by a straight appeal to our common sense and our regard for fair play—not fair play for ourselves alone, but fair play from which we are not excluded. Forced to give an opinion, I believe that most of us would agree that the benefits we have had under Socialism are greater than those which the Tories could have given. Unfortunately this fundamental truth is in danger of being forgotten through a veneer of smart and telling criticism spread thickly by the Conservative Central Office. It is this superficiality which might control our actions in those few seconds inside the polling booth.

It may be evident that—so far as I can represent those politically uneducated people who count so much at election time—the predominant sense is not frustration, not anger, but bewilderment. We know there are brains among the Labour leaders, and we know that many of them are spoiled by an obstinate regard for their own brilliance. We know that the Tories have one brilliant 75-year-old leader; we wonder who else there is.

There is a risk, therefore, that a mass of people with no real party loyalties to spur them on will not vote at all on that cold day of early spring we are told is the likely date. Maybe the party with the most numerous and persuasive canvassers to entice us to the polling booths will form the Government of 1950.

NOTES OF THE WEEK

Permissible Persuasion

Mr Herbert Morrison is a political strategist, not an economist. Yet the funny thing is that when he talks economics he very often talks sound sense, as he did at Faversham this week, in a speech full of the kind of temperate statements that could have rallied most men of goodwill behind the Labour Party before Mr Bevan and Mr Shinwell started insulting them. But when he talks politics, he tends to put exactly the same people's backs up. His dark threats that the Government might put a stop to the campaigns of self-defence conducted by the companies and industries who are menaced by the Labour Party with nationalisation has offended many people's sense of fair play, and is therefore a first-class political blunder. Since then, the Attorney-General has been struggling to explain to a bewildered House of Commons that Mr Morrison's threat has a basis in law by saying that, for purposes of calculating election expenses, propaganda need not be directed to the support of particular candidates, that the election period does not necessarily start only after the dissolution of Parliament, and that special interests are supposed to leave the ring clear for the political parties at election time.

This may or may not be the correct interpretation of the law—only the courts could decide that—but if it is, then the law on the subject is in an absurd state. If industries or interests threatened with extinction cannot make their case known to the public, then the law needs changing. Moreover, such an interpretation would cut both ways. To charge the expenses of the campaigns of Tate and Lyle and the cement companies to the budgets of Liberals and Conservatives would certainly bring opposition campaigning to a full stop. But equally, the production expenses of a host of tendentious pamphlets, books and films—almost the entire output of certain publishing houses—would have to go down on the budget of Labour candidates.

What the law was intended to do was to prevent any individual candidate from having an unfair proportion of money at his disposal during the election period, and that is the spirit in which it should be interpreted. It should not be invoked simply because one political party has taken fright at the superior organisation of its opponent's machine.

Europe in Search of Nicknames

A touch of undergraduate flippancy is always welcomed among the diplomats who decide our futures, provided it adds not only to the gaiety of nations but also to the clarity of notions. When Benelux was thought of as the name for the economic union of Belgium, the Netherlands and Luxembourg, everyone was surprised and delighted. It rolled off the tongue like *Itma* or *Unesco*, and it sounded very much the same in most west European languages. The first half suggested that the union was bound to be a good thing; the second that this would mean the end of austerity and the return of good living to at least one corner of Europe. (How different is the impression made by *Scandalux*.)

Since then, jealous but less nimble wits have been trying to catch up. The officials who failed to coin a nickname for OEEC have been toiling with pencil and paper to find nicknames for all possible combinations of western nations. Indeed, one sometimes suspects that such dainty-sounding groups as *Fritalux* and *Scandibel* are being formed as much for the sake of their names as to woo the bright glances of Mr Paul Hoffman. Great ingenuity has been shown; *Benefit* (which appears to be the same thing as *Fritalux*) can absorb the Federal Republic of Western Germany simply by becoming *Benefritz*. The procedure seems to be:

make up a name, form a club, and then decide what it is going to do. The latest addition—*Uniscan* (or is it *Ukiscan*, or even *Scandanglia*?)—appears to be a case in point.

This casual and dilettante method of nicknaming will clearly not be good enough to tackle the difficulties that lie ahead. Room has to be found, either in new clubs or in those that already exist, for ourselves—known for diplomatic purposes as the UK—for Germany, Switzerland, Iceland and Eire, perhaps eventually for Greece, Turkey and Trieste, where the American soldiers have on their flashes perhaps the best nickname of all—*TRUST*. These names bristle with difficulties. To arrange them according to protocol—as diplomats tend to do—is clearly impossible; the result would be a meaningless jumble of harsh sounds like *Ukifritz* (unless indeed the same process of enlargement produced *Unkifritz*, which sounds like a benevolent younger brother of Santa Claus). To leave some syllables out for the sake of euphony would damage national prestige; the Belgian national news agency is already insisting that *Fritalux* should be *Finchel*. To try strictly alphabetical order is to ensure that the first trading nation in Europe—the UK—shall always be last, and that the Germans, with their ancestral fear of encirclement, will always be caught between the French and the Italians. These matters should be taken out of the hands of the diplomats and entrusted to those excellent wits that design the names of breakfast foods and patent medicines.

★ ★ ★

Does Uniscan Mean Business?

It has been announced this week that on the initiative of London, representatives of the three Scandinavian countries will meet British officials in Stockholm next week to consider ways of arranging some form of regional economic co-operation between the four powers. This action may be no more than a belated scramble to appease Mr Hoffman, the ECA administrator, who has asked that reports on regional co-operation between the Marshall nations be submitted to the OEEC (Organisation for European Economic Co-operation) by December 15th.

The proposals for the new grouping are vague, hardly more than heads for inquiry. What Britain appears to have in mind is primarily to loosen restrictions on financial transactions between the four participants. There is no suggestion of any such revolutionary move as would bring the Scandinavians into the Imperial Preference club. So long as the discussions are limited to international finance the chances of agreement are fairly bright, largely because there is little in this field that remains to be done. The three Scandinavian nations are already closely linked with sterling and two of them, Sweden and Norway, are members of the sterling transferable account group. It should thus be easy for London to achieve a propaganda success, if that is what is intended.

Unfortunately, there is no evidence that the Scandinavians will be content to take part in such a limited project. Sweden is already preparing to use the occasion for raising the awkward question of the large sterling balances it has accumulated in the past year, and both Denmark and Sweden might well suggest that one of the realistic tests of a genuine British interest in closer association would be the readiness of the National Coal Board to sell its coal as cheaply in Scandinavia as at home. Clearly, from the British point of view, if there is to be any regional co-operation with the Continental countries, Scandinavia is a first and logical choice, since there, too, collectivist planning and Government controls are the order of the day. This is the kind of grouping that Dr Dalton favours—a nice Socialist four all playing very much the same kind of bridge.

Fritalux Falters

Meanwhile in Paris the representatives of the "Fritalux" countries—France, Italy, Holland, Belgium and Luxemburg seem to have reached an impasse in their discussions for a regional grouping. Here again the most that has been achieved is preliminary agreement on financial matters. The main proposal is for a clearing bank which would make possible intra-convertibility of the five currencies at flexible rates of exchange. The bank's resources would be obtained by pooling of the five countries' "drawing rights" (grants from European creditors under the Marshall Plan) and by the use of some of the \$150 million held by ECA as a special reserve. (ECA officials have already indicated that this fund will be released only as an aid to action which would indubitably liberalise international trade; they would not regard such a bank in itself as a sufficient step in this direction).

But there seems to have been no progress at all when the Benelux representatives at Paris pressed for tariff reductions. Both France and Italy are extremely reluctant to expose their economies to the competition of Belgian manufacturers and Dutch agricultural produce.

A further difficulty is the issue of Germany. The Low Countries are anxious that Germany be invited to join Fritalux as early as possible; their economies have always been highly dependent on Germany, both as a supplier and a market. However, France and Italy have refused even to consider extending an invitation to Germany, since both fear German competition and eventual economic hegemony.

* * *

A Halt to African Federation

The proposed federation of the self-governing colony of Southern Rhodesia and the two protectorates of Northern Rhodesia and Nyasaland has reached a deadlock. In a recent debate in the Northern Rhodesian Legislative Council, a motion calling on the Imperial Government to take the initiative in establishing a Central African federation was carried by 9 votes to 5, since the official members of the Council refrained from voting. But it is generally admitted that the main purpose of the debate was to clear the air rather than to push on with the proposal. The Victoria Falls conference, at which federation was discussed between European representatives of the three territories, took place last February, and it was high time that something was said publicly of the Africans' attitude towards the proposal.

It was made quite clear in the debate that, in Northern Rhodesia at least, their attitude is quite definitely hostile. Who can blame them? No African was invited to attend the conference at Victoria Falls, not even as an observer; the federal constitution which was proposed there excluded African representation on the Federal House of Representatives; African rights, including land rights, would be guaranteed by the Federal Parliament, not by the Imperial Government. Obviously no African would be willing to lose privileges he already has—in Northern Rhodesia and Nyasaland they are represented by their own race in the Legislative Council—for the material and economic benefits of federation. What, in fact, was proposed at Victoria Falls amounted to amalgamation under the dominance of Southern Rhodesia; and when Sir Godfrey Huggins, Prime Minister of that colony, laments, as he did at the end of last week, the attitude of the present British Government towards federation, he might reflect, first, that no British Government, of whatever party, would or could agree to any such scheme in the face of African opposition and, secondly, that he and his government have only themselves to blame that that opposition has grown after the conference.

But can the matter rest there? Overshadowing almost everything else at the moment in Northern Rhodesia are the

events in the Union of South Africa; these are brought much nearer by the steady flow of Europeans into the protectorate—though doubtless some of them come out of dislike for their own Government's extravagances. A federation of the Rhodesias and Nyasaland might have formed a bulwark against the spread northwards of the intense racial prejudices

that inspire Dr Malan's government. Should the Imperial Government, in answer to Northern Rhodesia's motion, take the initiative in promoting closer union between the two Central African protectorates and the East African dependencies? The proposed railway link makes this, if desirable, more practicable than it used to be.

* * *

Conservative Gambit

The Conservative "Campaign Guide,"* following hard on the heels of its Labour counterpart, affords an interesting contrast of format. This is no mere collection of speakers' notes but a sizeable reference book, much of whose matter is presented with little or no political slant. Even when the slant is obvious and unconcealed the documentation is far fuller and the historical perspective longer than in the Labour "Speaker's Handbook." The latter is a shop full of finished articles; the "Guide" is more like a warehouse of raw and semi-finished products. Not that it does not offer a telling collection of debating points; the Department of Damaging Quotations, so to speak, is fully stocked—and it is worth noticing that the quotations in question mostly originate on the Labour Front Bench, while their pendants in the "Handbook" have largely been garnered from backbenchers or blimps. The attack on Labour is not always fairly conducted; the sections on food standards, on bulk buying, on industrial relations, and much of that on foreign policy, incorporate as much suppression and distortion as anything in the "Handbook."

The defence of the Conservative past and the claims for the Conservative present and future are another matter. The "Guide" preserves a stricter silence on the foreign

* * * "The Campaign Guide." Conservative Central Office. 693 pages. 7s. 6d.

policy of the interwar years—a topic on which the "Handbook" naturally has much to say. It conducts an unimpressive rearguard action, using the obvious but barren *tu quoque* as its chief weapon, on the topic of unemployment, the Special Areas, and the means test. It displays not merely complacency but positive pride in that disastrous prewar accumulation of high-cost-inducing, feather-bedding, rigidifying measures, public or publicly approved, which have provided so congenial a background to postwar bureaucracy and so considerable a contribution to British economic invalidism. For the future it promises not, indeed, the prospect of paradise which was Labour's best-selling line in 1945, but a welter of incompatibles of which its agricultural policy (a blank cheque for the farmers, more stringent exclusion of imports, together with lower food prices) is only the most striking example. It indignantly repudiates any suggestion that the Conservative Party's full employment target is set any lower than Labour's ideal of chronic inflationary pressure. Its proposals for economy amount to little more than an assertion that Conservatives know better than Socialists how to stretch a sixpence. For the loyal Tory it is all no doubt quite good enough. But Mr Herbert Morrison, one eye on the "Campaign Guide" and the other on the floating voter, may be imagined to murmur, "They will never kill me, James, to make you King."

Titoism is Treason

Things that will be said and done in Bulgaria during the next ten days are likely to sound as incredible as they are shocking. With general elections due on Sunday week, there has been staged for the instruction of the voters a spectacular state trial, which is likely to end in the execution of Traicho Kostov, until nine months ago the most powerful and respected Communist Minister in the country. Bulgarians will be asked to believe that the man who served the party for twenty-five years, led its resistance against the Germans, became its master as Secretary-General in 1944, wrote its policy pamphlets, drew up and directed its five-year economic plan—that this man was all the time a traitor and agent of the "Anglo-Americans."

The former Deputy Prime Minister is charged with maintaining this role "with devilish duplicity, fantastic hypocrisy, and subtle, diabolical methods." There is no jury to gape and blink at this fantastic indictment; for Kostov and 11 others—five of them former Ministers—are being tried by a "supreme people's court," elected by the Communist controlled National Assembly. There can be no appeal and it would be foolish to expect mercy. For Kostov's ideas have been branded as "Titoism on Bulgarian soil"; and Titoism in eastern Europe now means treason as well as heresy—treason against the Soviet Union.

Doubtless the trial is intended to strike terror into the hearts of those in Bulgaria and neighbouring countries who passively resist, openly grumble at what is being done to them in the name of people's democracy. Doubtless, too, it will spread that fear of war and espionage, that suspicion of hostile machinations within the Party which can be used to justify maintenance of the foul apparatus of the police state. But it must also make more urgent for many Communists outside eastern Europe the necessity of deciding whether they can accept complete subservience to Soviet interests, or whether they shall now, before it is too late, strike off into the path taken by Tito.

* * *

Signor de Gasperi's Dilemma

As the Italian peasants march out at dawn to stake out their claims and plough a symbolic furrow in uncultivated land in Sicily and Calabria and Apulia, and now around

Rome, Signor de Gasperi, the Italian Prime Minister, is caught in a painful dilemma. For the economic needs and the social necessities of his country appear to be in direct conflict.

The social problem is obvious. There are two million landless labourers, and although the amount of smallholding and of peasant ownership is very much greater than the Communist propaganda would wish the peasants or the outside world to believe, it is also true that very large estates, some of them under-cultivated, exist in most parts of Italy. By a curious anomaly, there are two or three of them almost within the city boundaries of Rome. The Communists are providing the landless peasants with leadership and, although there may be a certain risk in competing with Communist demagoguery, the Italian Government cannot afford to leave this massive discontent unanswered.

Yet Italy is a poverty-stricken country, and it could be argued that its chief need today is for increased efficiency and greater capacity to produce wealth. Perhaps five per cent of the big estates are extremely efficient; should their owners be penalised? Even where production is not efficient, will the dividing of estates into tiny holdings not retard whatever progress has been made? Above all, can Italian financial stability survive the cost of compensation and land improvement which really widespread land reorganisation would make inevitable? The special Calabrian Reform Bill provides for the distribution of 45 thousand hectares at a cost of 20 milliard lire. It is doubtful whether on this scale the nationwide reform plan can be confined to the 500 milliard lire forecast at present. Some estimates put the final figure at something in the neighbourhood of 2,000 milliard.

In spite of these formidable economic difficulties, it seems likely that Signor de Gasperi will carry through a land reform as quickly as may be. His Government is handling the peasant occupation very quietly, for they do not believe that squatting will continue through the winter. This mildness, however, is not entirely tactical; behind it is a genuine sympathy for the plight of the landless men.

* * *

German Defence Under Debate

The unpleasant row between Dr Adenauer and Dr Schumacher has been brought to an uncomfortable end. Dr Schumacher has withdrawn his accusation that Dr Adenauer is a "Chancellor of the Allies"; and Dr Adenauer has stated that he did not mean to imply that the Social Democrats were not interested in ending dismantlement. Dr Schumacher may now return to his seat in the Assembly,

A kindly reviewer has written that "no annual publication is more modestly titled than *The Economist Diary*". It is true that the space for day-to-day entries occupies less than half the volume and that our aim has been to provide a complete reference book for the desk of the business and professional man. The price of the diary (including Purchase Tax) is 37/6d. post free; 32/6d. post free for overseas destinations. Full details are given in an illustrated pamphlet obtainable from *The Economist Intelligence Unit*, 22, Ryder Street, London, S.W.1.

and on the surface the disturbance has been brought to an end. Unhappily, it has left behind a bitter feeling of party spite and competitiveness; some of the rank and file in all parties have not neglected the opportunity to poison parliamentary life.

This spirit of mutual distrust and competition is particularly dangerous in view of the urgency and delicacy of many of the problems which the Assembly at Bonn will have to discuss. On many of them it would be fatal if politicians made demagogic attempts either to exploit internal rivalries or to appeal outside the Assembly to an inexperienced and excitable public opinion.

For instance, it now seems clear that Germany's possible role in the defence of Europe is to be more and more widely discussed. Dr Adenauer has brought up the issue by declaring that, while he resolutely opposes the restoration of a German Army, he would not in certain circumstances reject the idea of a German contingent belonging to a European defence force. This original statement has received added force from a number of glosses made subsequently by the German Chancellor. At the annual conference of the Christian Democrat Party, he said that tension was increasing between the East and West, and pointed out that the nucleus of a "people's army" already exists in the Soviet zone under the guise of a police force. In face of this menace, the Allies would either have to defend Germany themselves or at least accede to some plan of self-defence on German soil.

It seems all too likely that the ball of discussion has now been set rolling. One immediate consequence of Dr Adenauer's statement was the demand by a Free Democrat deputy that a "people's army" should be established in western Germany. If the question of German defence is now to become the football of party rivalries inside the Assembly with the German people cheering on the touch-lines, the chances for a statesmanlike settlement of the problem of German defence are slight indeed.

* * *

Learned Counsels

The Royal Commission on Capital Punishment must by now be somewhat dazed by the mass of arguments they have heard on whether or not there should be more than one degree of murder. Last Thursday, Lord Justice Denning in giving evidence before it added his learned opinion that the present law of murder, including the MacNaghten Rules, could not be justified. It was wrong that a judge should solemnly pronounce sentence of death when in fact the decision to carry out the sentence or not was exercised by an "unknown person in private—the Home Secretary or his advisers." It was also wrong, he said, that one test of insanity should be applied in court—the MacNaghten Rules—and another quite different test by doctors after the trial. He proposed that insanity should be defined according to the suggestions of Lord Atkin's Committee and that culpable homicide should be divided into three categories—murder (where the malice was express, not implied, and the crime was premeditated and unprovoked), manslaughter (where the killing was with intent but either unpremeditated or provoked) and "unlawful killing" (where there was no intent either to kill or to commit a felony).

The chief objection to Lord Justice Denning's proposals is that, in order to prove murder, the prosecution would have to prove premeditation as well as malice—and this is almost as difficult as proving motive. It is not often that concrete evidence of premeditation exists. If there is no sign of preparations for the crime beforehand—and a murderer simply needs to take a pistol out of a drawer, where it has lain perhaps for several years, to kill someone—there is no way of telling what has gone on in the murderer's mind. He may have acted on the spur of the moment, or he may have been brooding over the matter for months. A jury which was

trying such a case, and which had been directed to give the prisoner the benefit of any doubt, would, under the rules suggested by Lord Justice Denning, almost certainly bring in a verdict of manslaughter rather than murder; many cases of genuine murder would therefore probably be reduced to manslaughter.

While there is a lot to be said for Lord Justice Denning's implication that the law is brought into disrepute because the sentences of death which the court passes are not always carried out, the more evidence there is on the subject the more convincing is the case for retaining the present law and procedure of murder—whether or not the penalty is altered. The one exception is the MacNaghten Rules, and it really is high time that these were revised.

* * *

Transforming the COI?

The Central Office of Information, the Aunt Sally of Conservative back benchers, has issued its second annual report (Cmd. 7830). The main interest of the report has been anticipated by the publication last week of the report of the Committee on Home Information Services and by Mr Morrison's statement in the House that its expenditure would fall short by as much as £500,000 of its budget of £4,000,000. The COI's report is very much at pains to ensure that the general public understands that it is responsible for spending only a quarter of the sums devoted to official publicity, £4,000,000 out of the total figure of £16 million, the balance being spent by the departments, the overseas service of the BBC and the British Council.

The COI is not a department of state and is, therefore, not responsible for policy. It is to the government what the publicity or advertising manager of a firm is to a board of directors—the central agency for translating its aims and policy into terms of publicity media. It is meant to ensure overall economies by scrutinising and co-ordinating official demands for publicity; in fact it is often merely a third wheel between a junior minister or under secretary who has made up his mind to spend his publicity budget in a certain way and the agency which is executing the work. The Committee on Government Information Services recognises the difficulty which afflicts the COI as a non-policy making body and specifically recommends that the "policy department should have direct contact with the executant" (that is the commercial firm doing the work) "during the planning and execution of campaigns." This represents a minor defeat for the COI, but it is good sense. The committee did, however, say "We consider their [the government information services] technical competence to be high and in our view this is due in large measure to the existence of a central agency providing specialist technical facilities."

In view of the detailed review made by the committee this is an impressive judgment, particularly since one of its members was a well-known journalist.

Journalists, particularly those on periodicals, may complain that they receive communiqués from the COI a day after their issue by the department concerned, and Fleet Street publishers may boast that they could have produced better official pamphlets at half the cost, but such complaints may possibly be distilled from sour grapes. The central point remains that a great deal of money has been wasted in government publicity campaigns which have gone very wide of the mark owing to a lack of experience among politicians and senior civil servants in the persuasive arts. Without disparaging the efforts of the COI, it is, therefore, permissible to speculate on whether it would not be better, and possibly cheaper, to leave the executive part of official publicity to the trade—after all London contains some of the best commercial artists, printers, photographers, block makers and typographers in the world—and to transform the COI from a body of minor civil servants into a small group of really

first class experts in publicity. Such a body should perhaps have its own opinion research organisation, but no other executive functions. It could advise the nation's leaders whether a speech, a poster, a film or a leaflet or any particular combination would be the best means of gaining the public's ear. They might thus avoid the pitiful and painful traps into which zeal has led many departments.

* * *

How to Choose Students

Dissatisfaction with the existing methods of selecting university students is widespread in the provincial universities, but so far very few have been prepared to take effective steps to improve their methods or to experiment with new ones. A conference on this subject was held recently in Manchester between members of the northern universities and of the Association of Headmasters which should have helped to clarify the difficulties. Such clarification is needed, because the universities are at present wrestling helplessly with the hordes of students who are pressing for entry.

Oxford and Cambridge have long been accustomed to the elaborate selective procedure of the scholarship examinations, and to interviewing in addition all candidates for ordinary entrance. With the existing competition for entry these methods of selection have put a great burden on the college staffs—a burden which has been accepted. In the provincial universities it is quite otherwise. Before the war there was so little competition for entry that almost all candidates who matriculated could secure a place. On this basis very little selection was required; the number of places more or less balanced the number of candidates. Now it is different. Even when the Higher School Certificate is used as the preliminary sieve individual faculties report figures of 755 applications for 200 places, or 400 candidates for 100 places. This situation has overwhelmed the pro-

vincial universities. Some universities interview only 10, 20 or 30 per cent of the students they admit, taking the rest on their Higher School Certificate results alone.

One great deterrent to taking more trouble over selection is that all the provincial universities know that most students, in their eagerness to get a place, apply to three or four universities. Nobody knows how many eligible students are left without a seat when the music stops, but it is certainly much less than is usually supposed, and many departments are unwilling to interview a candidate who may have been seen by three other universities. It was suggested at the conference that the northern universities might share in some sort of joint interviewing system. This is worth thinking about. But it is just as important that the University Grants Committee or some other body should try to find out what the effective demand for all university places is, when allowance has been made for overlapping applications, and what numbers of worthwhile candidates (if any) fail to secure a place at all. Until this is known many of the arguments for and against expanding the universities are founded on guesswork.

Pompey the Great

The outline plan for the Portsmouth district produced by the Max Lock Planning Group strikes a welcome note of realism in town planning literature. The limitations on capital investment and the exigencies of municipal finance have been carefully borne in mind, and the plan has been shaped with an eye to the resources which will probably be available over the next fifteen years—wisely, it looks no farther ahead. At the same time, it does promise tangible benefits to the inhabitants of the district.

The plan differs in two important respects from the one put forward by the Portsmouth City Council, which envisaged

Price 3d. every Friday

THE  TIMES
LITERARY SUPPLEMENT

a drastic reduction in the City's population, a large-scale exodus out of Portsmouth, and the construction of a new town near Havant. Mr Lock argues that such a large exodus is unwise and unnecessary. It would remove labour which is employed by the dockyards and other local industries, and it would unbalance municipal services and finance; moreover additional land can be found and reclaimed within the city confines. In the second place, the new plan advocates that the displaced population—which is put at no more than 50,000—should go to settlements on the mainland which at present are half finished. This would be more satisfactory and less costly than building a complete new town.

The new plan includes detailed suggestions about the deployment of the available building labour force, and the order in which the various constructional projects should be carried out. It is stated that the productivity of building

workers is well below the national average—a point which warrants close investigation. Even so, it is believed that the demolition and replacement of "blighted" dwellings in Portsmouth (which now contain a quarter of the population) can be accomplished within the fifteen years' time limit.

Refugees Abandoned

The General Assembly has lost a golden opportunity of redeeming some of the futility to which most of its debates have been condemned by the cold war manoeuvrings of the big Powers. Confronted by the fact that the International Refugee Organisation must close down early in 1950, with about 200,000 persons still dependent on it for legal and material assistance, it has contented itself with setting up an attenuated successor in the shape of a High Commissioner's Office in Geneva. The High Commissioner is to be responsible for the legal protection and assistance—nothing more—of these refugees. Only his administrative expenses are to be provided by the United Nations; anything else he may do must be financed by voluntary contributions. Most of these refugees will be living in camps in western Germany, and when the IRO closes down they will become the responsibility of the German authorities.

The dimensions of the Germans' own refugee problem are so large that it seems very unlikely that the non-German refugees will get a fair share of the available opportunities for employment and resettlement. They will require far more than legal protection. But the Assembly passed a second resolution, which postponed until its next session the examination of the problem of material help for the refugees. After this blatant shelving of responsibility, the accompanying appeal for support for the IRO in its closing stages has a rather hollow ring.

The problem does not end with the 200,000, for whom the IRO is, by the terms of its charter, responsible. Since that document was drawn up about 10 million more individuals have become refugees, in Greece, in the Middle East and elsewhere. The existence of this vast and tragic problem was only indirectly recognised by the Assembly when it decided that the IRO's definition of a refugee or displaced person should continue for the time being; but later the Assembly itself may set up new categories. Meanwhile, most of the countries in which these refugees find themselves simply do not possess the means to finance their resettlement or emigration.

If the members of the Assembly had not been so pre-occupied with saving money they must have realised that, even on strictly practical grounds, they were taking a most retrograde step. The refugees exist whether the Assembly recognises them or not; and ignoring the problem will not make it disappear. The voluntary societies will no doubt continue their good work, but their representatives have testified to their strong conviction that the co-operation of the IRO "has greatly increased the measure of service assistance and rehabilitation which it has been possible to provide for refugees and displaced persons." To scrap this organisation and replace it with a much inferior substitute when its own task is not completed and new tasks are pressing upon it, is as callous as it is shortsighted.

* * *

The Impossible in Jerusalem?

The Assembly's vote on the future of Jerusalem has not taken place as *The Economist* goes to press, but its Political Committee (which consists of the same delegations) has said its say. By 35 votes to 13, with 11 abstentions, it has voted for the United Nations plan evolved two years ago—that is, for the establishment of the city as a *corpus separatum* under international management. The votes for this arrangement came from the Latin American bloc (voting in accordance with what are known to be the Pope's wishes), the Arab states except Jordan (voting for any and every reduction of Israel's orbit) and the Soviet bloc (voting, presumably, to make trouble). It will be observed that Moscow is now voting against its former protégés, the Israelis.

Those voting against the plan included Israel and Jordan, who now hold the city between them and wish to partition

it, together with a clutch of the more practical-minded delegations including Great Britain, Sweden and the United States. Who, they pertinently asked, is going to wrest the city from its present holders?

Of course, there is much to be said for internationalisation. Many reasonable people at one time favoured it; so did *The Economist*. Successfully carried out, it could serve as a symbol that it is possible for men who have fought to live at peace; it could represent the spiritual and intellectual values that underpin three great religions; on the negative

AN AIRLINE TICKET to ROMANTIC PLACES!

is an ideal Christmas gift. All you have to do is to let AIR FRANCE or one of its approved Travel Agents know the name of the traveller, his or her destination and remit the fare. An open date ticket, valid for the whole of 1950, will be sent you for presentation at Christmas. The passenger has only to let us know later the date he wishes to travel.

Forks right,

A steamroller is a tough customer. But this one bought trouble—in a big way. Both its front forks were broken in a collision. The steamroller had urgent work to do—so a B.O.C. process got it repaired in a hurry. Fusion Welding, with the help of super silicon cast iron rods, did the job—in twelve hours the forks were as good as new. In these days of shortages and queues for material, B.O.C. processes make an invaluable contribution towards keeping the wheels of industry turning.

Alice in Newfoundland

Thousands of square miles of snowclad Christmas trees! Lit with the logic of Lewis Carroll's imagination, a Christmas fairyland for the children of the world. Strange to think that the Christmas tree, now so inevitably part of the festive season, was unknown in Britain until Queen Victoria's reign. Then, introduced by the Prince Consort, they marked the revival of the Christmas spirit in the home. For Cromwell's parliament had forbidden by law the Christmas carousals that had been a feature of the Middle Ages. Then, too, it was a tree that symbolized the season—the bringing in of the Yule Log signaling the beginning of festivities that lasted until Twelfth Night. Trees have always had a peculiar significance in human life, from primitive man's belief that trees had perceptions and passions, to the holy trees of the East. But the significance of trees to mankind has never been greater than today, in this first age of widespread literacy; for from forests such as those behind Bowaters mills in Canada and Scandinavia comes the paper on which are printed the great newspapers and the books of the world.

side, it would prevent an already commercialised holy city from becoming the hotbed of smuggling that flourishes wherever two dissimilar economies share a frontier that runs through city streets.

Yet the events of the last eighteen months have so shaped matters that overwhelming arguments now weight the other side. Cities can be run on international lines only when the authority that holds them is backed by military force. Is Jerusalem to be run as a Berlin, or a Trieste? It can hardly be allowed to become another Danzig. A second argument against internationalisation is the opposition to it of both Israel and Jordan. Is it not prudent to accept the *status quo* at the one point where a frontier agreement exists between them? No local group, therefore, now wants internationalisation, except the Christian communities and a few liberal Jews; and even the Christians do not speak out in the way that they might do, because the bulk of their laymen are Arabs. These last fear persecution if, having spoken up for internationalisation, they later find themselves in a Moslem or a Jewish state.

The most that the United Nations can now hope to execute is a scheme for international management of the Holy Places. This is most desirable, for it is not proper that either a Jewish or a Moslem custodian should have to adjudicate in the endless disputes over rights that riddle the relations between the Christian sects. Both the Israelis and the Jordanians would accept such a regime. Further than that Uno cannot go without a force at its disposal.

Death of the Queen Dowager

Queen Adelaide expired on Sunday morning, about two o'clock, after a painful and protracted illness. . . . The deceased Queen Dowager, Adelaide Louisa Theresa Caroline Amelia, was the eldest daughter of George Frederick Charles, the late reigning Duke of Saxe Meiningen and the Princess Louisa Eleanor, daughter of Christian Albert, Prince of Hohenlohe Langenburg. She was born on the 13th of August, 1792. When the Princess Charlotte of Wales and her infant son were, in November, 1817, consigned to the tomb, the Regent was childless, and four of the royal Dukes, Clarence, Kent, Cambridge, and Gloucester, though all advanced in life—resolved forthwith to contract matrimonial alliances. The Duke of Clarence, at the special instance of Queen Charlotte, solicited the hand of the Princess Adelaide . . . and his suit was successful. . . . However happy his union with the Princess Adelaide may have been, the hopes with which it was formed were in one respect disappointed; he had no heir, one child only, the Princess Elizabeth, having been born alive, and she was committed to the grave in a very few months after her birth. Since her marriage, 12 years had elapsed, and her Royal Highness was still Duchess of Clarence; on the 26th of June, 1830, she became Queen of England. Her position was changed, but the rectitude and gentleness of her character underwent no alteration. It was not alone as a "Lady Bountiful" that the Queen Dowager's character was favourably developed; she was a kind parent, or patroness, if it should be so expressed, to her husband's children; and though the Princess Victoria—now Queen Regnant—was not a frequent guest in the palaces of the late King, yet it has never been doubted that the illustrious personage who now descends into the tomb, inspired her present Majesty, and every member of the Royal Family, with sentiments of the highest esteem and affection. . . . The latter part of her life was one long disease, and it is no idle repetition of a thread-bare formula to say that she bore her painful maladies "with Christian fortitude."

The Economist

Franco's Philosopher

In spite of its strong political position, the Franco regime is faced with an increasingly awkward economic situation. There is no apparent political alternative to the present government without the risk of serious civil commotion—so most Spaniards support it. But this does not mean that General Franco and his cabinet can afford to ignore any means of distracting public attention from Spain's continuing economic deterioration. And there has, in fact, long been a great outpouring of officially-inspired radio and press comment on the comings and goings, the ceremonies and speeches of people prominent in the regime. The latest of these, however, has no doubt been designed with a direct if modest political purpose as well—this was the recent celebration of the anniversary of the death of the young Falangist hero and philosopher, Jose Antonio Primo de Rivera.

Part of the ceremonies took place in Alicante on the spot where Jose Antonio—son of the dictator, General Primo de Rivera—was executed by a Republican firing squad in the autumn of 1936. The other part was a memorial service held in the Escorial Palace, just outside Madrid, where Jose Antonio now lies buried, the only commoner to rest among the tombs of the Kings of Spain. General Franco attended this ceremony, accompanied by no fewer than nine of his leading ministers, as well as the President of the Cortes and the Council of the Realm and by the Captain-General of Madrid. At the same time the Falange, in speech and writing, used the day—declared an official holiday—to reaffirm its faith in its leader, "Franco, the true interpreter of Jose Antonio."

To those who recall Franco's early relations with the Falange, however, his present associations still look merely opportune, and less and less well-advised. There is no record that Franco ever even met Jose Antonio during his lifetime; and unlike the mass Fascist parties of Italy and Germany, the little Falange in Spain never provided more than a stopgap political creed for what was fundamentally a military rising. It certainly did not provide the leader. Nor, in spite of Jose Antonio's present eminence as a martyr and philosopher, has there been much in common between the stolid ways of the army and the fiery, anti-clerical, revolutionary slogans of the original Falangist leaders.

The direct purpose behind making so much of these recent celebrations seems to have been to provide something of an encouragement to the Falange, whose support has lately been persistently ebbing away. If so, it is notable that Franco should not let it die in peace, since abolition of the Falange would remove part at least of the stigma of Fascism which attaches to the Spanish state. Franco rule might be termed a dictatorship of inertia, in that it aspires neither to foreign adventure nor to domestic change; and in that it is no doubt playing for safety. But for the Caudillo to retain the Falange as a card that might one day prove useful again in home politics is to miss a possible trick at the international table.

Self-Defence of a Dinosaur

Attacked from many sides the London County Council has come to its own defence with a large and glossy book about its achievements—"Postwar Housing." For the price of 5s. the reader roams from north to south and east and west of Greater London's sprawl, through 130 illustrations of houses and flats. Yet for all its obvious pride in its 16,000 permanent postwar dwellings the LCC can hardly be said to have made its case against the critics. As a building machine it looks as ponderous as ever. As an inspirer of good design its attempts at self-justification fall far short of success. If skilful selection and photography cannot make a better show, real life certainly will not.

The book gives the impression of a colossus. In stressing the size of its building programme and of the administrative

machine behind it there emerges the outline of a complex, departmentalised organisation, so cumbersome as to make the heart sink. How does any new idea or suggestion of economy survive the interdepartmental correspondence it creates? By the time all the various departments have given their views the idea must be crushed to death.

The LCC last June had 12,000 houses under construction and another 64,000 in the pre-contract stage. The cost of these housing schemes is a heavy burden. In 1949-50 the net cost to the ratepayers of the LCC, after allowance has been made for the Exchequer subsidies, is £1,400,000, or a rate of about 6½d. in the pound. The LCC's book, while giving some valuable figures on rents, is silent about costs. Owing to the regulations of the housing subsidies flats generally show a profit, whereas houses show a loss. At present the average annual profit per flat is £7, and the average loss per house £16. The net annual deficiency covering 12,000 flats and houses is some £5 10s. per dwelling in addition to the statutory rate contribution which the LCC has to make. No wonder the ratepayers' burden is heavy.

The financial and organisational responsibilities of building new housing estates of 4,000 to 7,000 dwellings outside the County of London area are so big that it is difficult to see who else could shoulder them. Certainly the local urban district councils could not. Yet what Sidney Webb might

Letters to the Editor

The Extreme Centre

SIR,—Neither Mr Eccles nor any other Conservative has questioned your statements that much of what you urge is in the programme of the Liberal Party and that the prewar Conservatives specifically rejected the view that it is both possible and desirable for the community to exercise mastery over its economic environment. Surely the very opposite is the case, as witnessed by the historic contests on Free Trade and Tariff Reform, and in particular the rejection of Mr Baldwin's leadership on this very issue in 1923, which decision he accepted as binding although it seriously hampered him, in his view, in dealing with just those economic problems of the following years which are now being held up as a reproach against the Conservative and National Governments.

Liberals have always made the most of the argument that any Government which attempts to control the economic environment thereby exposes itself to the risk of influence by log-rolling and "pressure groups," and it may well be that the loss of support suffered by the Liberal Party since 1923 is due to its association with Free Trade and *laissez faire* generally, whereas some degree of Government control is now accepted by all parties and the differences centre on the nature and extent of the control which is considered best calculated to stimulate efficient production and a rising standard of living.—Yours faithfully,

J. R. HARDING

Sherbrooke, Compton, Nr. Winchester

Use of Electricity Off Peak

SIR,—In the commentary on "Industry and Exports" in your issue of November 5th, in the third paragraph of the first column, page 1026, reference is made to the British Electricity Authority's campaign to persuade domestic and small commercial users to use the electricity they need at times outside the Peak Hours, during the current winter. It is suggested that one purpose of this campaign is to stimulate consumption during "off-peak" hours, and that this seems ill-advised because the effect may be to increase "peak load" demand as well.

Justification for the "Use Electricity—Off Peak" campaign,

have called the second inevitability—the "inevitability of bigness"—has not yet succeeded in overcoming the ponderous characteristics of a dinosaur.

Shorter Notes

A sidelight on the cost of government publicity was given by a recent parliamentary answer from Mr Strachey to the effect that the Ministry of Food had spent nearly £60,000 since 1945 on advertisements trying to popularise herrings as a food. Could not the money have been more effectively spent on research into ways and means of removing their bones?

*

The Americans have just had to perpetrate a piece of big but necessary nonsense. Naturally the *Daily Worker* has been quite unable to appreciate the reason for ECA's request this week that seven Marshall nations refund \$30 million of their aid funds, because they failed to ship 50 per cent of Marshall aid goods from the United States in American bottoms. The refund will simply be put at the disposal of the same countries to make further purchases of Marshall goods. ECA was no doubt forced into this piece of bookkeeping in order to satisfy Congress that the clause in the original Act which protects high-cost American shipping was being strictly interpreted.

however, is given in the very next sentence of your commentary—"Appeals for economy in Peak Hours, unsupported by incentives, have yet to achieve demonstrable success with the domestic consumer."

It was because of the relative failure of negative appeals in the past, "don't do this," "don't do that," that a positive approach has now been adopted. By telling domestic and commercial consumers what they can do, and by informing them of the ways and means whereby they can use the electricity they need at "off-peak" times with minimum inconvenience to themselves, it was felt a much more effective response was probable.

There is a two-fold incentive to induce consumers to co-operate:—

- (1) the direct advantage to themselves of having their personal use of electricity uninterrupted, and
- (2) the indirect advantage deriving from the fostering of national prosperity through uninterrupted production.

—Yours faithfully,

L. J. LUFFINGHAM,
Public Relations Officer

British Electricity Authority

[The advantages described would arise from the collective behaviour of the totality of consumers—they do not accrue to the individual consumer as a direct result of his (or his family's) individual behaviour. They tend, therefore, to weigh lightly in the balance against the consumer's immediate convenience; and the campaign outlined is based on an appeal rather than an incentive.—EDITOR.]

Books and Publications

The Last Generation

"The Dictionary of National Biography, 1931-40." Edited by L. G. Wickham Legg. Oxford University Press. 984 pages. 50s.

THE Dictionary of National Biography has from the first been an exercise in discipline; without this its other virtues would no doubt have been great, but it would never have got through to the letter Z. Of the disciplinary rules on which it was built, the greatest was: "No flowers, by request." This rule becomes the hardest of all to observe in the decennial volumes which bring the main work up to date. In these the biographer is too close to his subject; indeed, he is often a follower, an admirer, or a friend. Therefore the collection breathes personal knowledge and makes wonderful reading. But this does not weaken the necessity to limit encomium to what is informative, and—conversely—not to exclude the possibility that the most admired subject may, here and there, have made mistakes. Perhaps Mr. R. C. K. Ensor, who is a master of this kind of writing, shows best in his account of Philip Snowden at the Hague conference how the boundary between sympathy and partisanship can be respected:

The preponderance of expert opinion has since been that his view was wrong and the changes unfortunate; but the John Bullish vigour with which he urged and carried them won the acclaim of his fellow countrymen, even in quarters hitherto hostile.

By no means all the political biographies in this volume observe the boundary so clearly. Thus the life of Neville Chamberlain might have told more if the anxiety to defend his foreign policy had inspired it less urgently. To record that "in a few hours at Munich the Godesberg terms were so modified that the Czech government accepted them" is not good enough; ought it not also to be recorded what pressure was put upon the Czechs? The account of Ramsay MacDonald deals with matters a little further back, but still near, and not seen fully in perspective. The anti-climax of MacDonald's last years in office is suggested, but may it not have been caused less by the venom of opponents and more by MacDonald's own tragic personal dilemma, than Lord Elton conveys?

A drawing needs black lines as well as white spaces. But it must be said that many of these portraits, kindly as they are, are intensely vivid. There is G. K. Chesterton making himself ill with too much work, food, and drink—

absent-mindedly, as a friend said, for it was only necessary to fill his glass while he talked for him to empty it again.

There is King George V admonishing, of all Ministers, Joynson-Hicks on the desirability of a dignified standard of dress, and expressing in a letter (never sent) "his disapproval of the High Court of Parliament assuming the appearance of a dormitory" in an all-night sitting. A great judge designates by the appropriate Anglo-Saxon word (following, after all, the rules of style laid down by Warde Fowler, whose life is also recorded here) the physical feature with which another great judge sat upon the Bench; this, in print, must be a precedent? Yet another judge, Scrutton—"possibly the only Englishman of his time who never shaved in his life"—is seen pacing among his pupils in the hideous gloom of his chambers, daily crashing his head against the knob of the chandelier. A great physicist, J. J. Thomson, having turned down an explanation of some phenomenon put up by one of his research workers, comes back a month later with the solution—"a detailed account of the very theory the researcher had propounded." Another, Rutherford, goes to sleep "for short periods during the daytime, waking up suddenly, and going on with a conversation where he had left off." It is suggested, rather than described, how the noises from Samuel Alexander's hearing machine used to enliven academic assemblies.

Among the 730 men and women whose lives are here recorded, it is, perhaps, those of the law and the sciences who have been most fortunate in their biographers. But Sir Ronald Storrs writes on T. E. Lawrence, Lord Simon on Reading, Professor Trevelyan on Grey of Fallodon; many other choices are as brilliant, and the writers, on the average, are only slightly less notable than the subjects. It is a source-book rather than a summing-up; but there has been none more readable.

Change or Decay?

"Stability." By F. E. Dessauer. Macmillan (New York). 270 pages. \$3.50 or 17s. 6d.

"A STATE without the means of some change," said Burke, "is without the means of its conservation." These words might stand as Mr Dessauer's motto. For his aim, in this important, historical and analytical study is precisely to discover a harmony between the rival urges which at different epochs of history have dominated the *Zeitgeist*: the ambition for progress and the longing for security.

He is nothing if not thorough in his search. Historically, he traces the two concepts and their interaction from ancient Greece to the present day, in the social, ethical, economic and international fields. Analytically, he examines the meaning of stability and its spirit as they appear to different types and classes of thinkers, the institutions and characteristics making for, or threatening, the stability of the social framework, the methods of stabilisation attempted in economic affairs and international relationships. And he winds up with a generalisation at first sight obscure, but arising logically out of the massive preceding chapters: *stability arises from the awareness of limits*. Twentieth-century thought swings back, in these words, to the doctrine of the Aristotelean mean.

It is high time that the idea of stability received this kind of detached and comprehensive attention. It is, as Mr Dessauer makes plain, a much older and more fundamental ideal than that of progress, and its return to a paramount place in the hierarchy of social aims represents perhaps the biggest change in the climate of political ideas since the Enlightenment. The trouble is—and on this theme Mr Dessauer is particularly illuminating—that stability may very well be itself a revolutionary ideal, a motive of revolt precisely against institutions making for instability. "Stability is an aggressive concept, directed against the disturbers of stability actually in power. Today the devil . . . is the business man whose restless and uninhibited profit-seeking is regarded as the source of instability." The conservative business man may, on the other hand, seek stability in the radical conscription of democracy and the establishment of a corporative state. And the more irreconcilable the clash between rival conservatism, the likelier it is that on either side there will be a loss of "the awareness of limits," an atrophying of the "means of change" which are at the same time "the means of conservation." Thus an overwhelming concern with stability may be, in the not very long run, the most potent destroyer of stability. An imposed stagnation is essentially vulnerable.

Stability in fact not merely does not exclude change, but, in an imperfect world, demands change. Mr Dessauer offers a commonplace criterion of genuine stability. "Social conditions are stable," he writes, "if the changes which are taking place do not frighten the affected." The highest quality of statesmanship is the ability to achieve necessary changes without frightening anyone, to proceed by compromise, to be in fact continuously aware of limits; and his heroes are accordingly the trimmers—Henry of Navarre and, in our own day, Mr Mackenzie King.

Today the stability most fervently sought is economic stability, which is felt to carry with it by far the best hope of stability in international affairs; and the major question arising from this search is precisely whether, in the long run, stabilising measures can be at the same time effective and elastic enough not to defeat their own primary aim. The business man or trade union leader sees no danger in a stabilising measure (cartel, support price, closed shop) which assists his particular interest; he is unaware that, in Mr Dessauer's words, "each partial stabilisation reduces the possible objects of actual change . . . which, consequently, will be more affected than they would if more objects were exposed." A support price for agriculture throws the burden of change on industry; a tariff for industry A throws it on industry B; protection for the sitting tenant perpetuates the insecurity of the homeless; the closed shop bars the way to security for the unorganised worker. Like an ankylosed joint in the human body, each partial stabilisation throws an additional strain on the rest of the organism. On the other hand, attempts to fit these partial schemes together in an overall national plan risk a flat contradiction between internal rigidity and the changeable, flexibility-demanding circumstances of the outside world. Stability of employment, for instance, brings instability of the price level, which in turn produces instability of foreign trade and of the exchanges. In general terms, and well in advance of the event, Mr Dessauer has in fact diagnosed very neatly the British crisis of 1949.

To condemn the desire for stability because of the mistaken policies in which it has found an outlet would be as absurd as to condemn the desire for health because of the vagaries of quacks. There are few conditions more uncomfortable and incompatible with happiness, in a single organism or in a society, than a state of permanent vertigo. There must be a minimum of continuity, and element of the unconditionally reliable, in the condition of man. That minimum will vary with temperament; to the stoic, no continuity is essential beyond that of his own integrity—but the stoic is an exception. Western society is at present suffering from a chronic state of seasickness in which anything, even imminent shipwreck, seems preferable to continued pitching and rolling; a state highly unfavourable to the achievement of that genuine stability in which "change does not frighten the affected."

★

"Our stability is but balance; and wisdom lies
In masterful administration of the unforeseen."

The words are Robert Bridges, and their context is not economic; but they are profoundly applicable to economic affairs. The balance concerned is not only the internal balance of opposing interests, whether of classes, parties or lesser groups, but of the whole society in its environment; and like that of a cyclist on his machine or a bird on the wing, it can only be achieved when deliberate response is supplemented

by ceaseless, flexible, quasi-automatic adaptation. Substitute for this flexible balance of the living organism the creaking rigidity of a robot, and any real stability is doomed. The pity is that the very natural impulse to seek stability has been translated into just those actions which make for a stiff-jointed repugnance to adaptation and for total incapacity masterfully to administer the unforeseen—whether the unforeseen be the blizzards of the Shinwell winter or the American "recession" of 1949. It is characteristic of the architects of rigidity that they regard all such impacts from without, and all the unpleasant lurchings and crackings of the monolith which respond to them, as evidence that yet more rigidity is wanted, that the iniquitous outside world, and not the monolithic principle of construction, is to blame—and to blame, as often as not, in a moral sense.

The logical extreme of this attitude is the erection of an iron curtain, the insulation and isolation of the economy from the disturbing effects of foreign trade, foreign events, and, so far as possible, foreign ideas; coupled with an ever more powerfully enforced internal conformity to the rigidly determined plan. The greater the strain on the rigid structure, the louder the cry for further reinforcement of its rigidity, the readier the resort to repugnant policy methods, the higher the internal tension, and the less chance—in an atmosphere of intolerance, fear and atrophied initiative—of recapturing the power of adaptation.

"Stability exists when changes do not frighten the affected." Is the community now so easily terrified that the very minimum of change, by individuals or groups, required to ensure stability, is felt as constituting instability in itself? If so, the deadlock is complete and the future dark indeed. Mr Dessauer, putting his trust in "the awareness of limits," reaches no such pessimistic conclusion. But the British reader may wonder whether his comparative equanimity would survive transplantation back from the New World to the Old.

A Wide Survey

"A Concise Economic History of Britain." From the earliest times to 1750. By Sir John Clapham. Cambridge University Press. 305 pages. 12s. 6d.

For many years Sir John Clapham was the doyen of English economic historians, a position he owed largely to his great work on the economic history of nineteenth-century Britain. It is interesting therefore to see in this posthumous volume how he approached those earlier centuries upon which he had long lectured, but about which he had written comparatively little. It is clear that he had read widely on this earlier period and had kept well abreast of modern research. His synthesis of that reading and research is well proportioned. The whole period is covered in three sections with their dividing lines at AD 1100 and AD 1500. Within the sections, the subdivisions appear rather excessive and tend unnecessarily to

break up the narrative. This is true also of the attempt to include Scottish economic history, which is difficult to treat in conjunction with English economic history so long as the border remained a frontier.

To some economists and perhaps to some economic historians Clapham's treatment may appear rather old fashioned. There is little talk of those trends and cycles which are being used in the interpretation of more modern periods. Nor is there always a full use of statistics, for example in the account of foreign trade. These omissions are not serious defects, if they are defects at all, for early periods do not necessarily lend themselves to re-interpretation in terms of trends and cycles, and statistical material for the centuries before 1750 is both scanty and shaky. What is noticeable in this work, and it is a valuable feature of it, is Clapham's strong regional sense. This appears particularly in the treatment of agriculture, where due importance is given to those regions outside the "classical" open field area. There is nothing new in this for it may be based on Gray's study of field systems, but it is well that it should be emphasised. Only perhaps when the full diversity of English agriculture is realised will one of the great gaps in agrarian history, namely the story of cattle and dairy farming, be filled. A concise history cannot fill such gaps when the basic research has still to be done, but it can, and in this case does, give a clear picture of the agrarian foundations of society. Though economic life was firmly rooted in the land down to 1750 and beyond, it was also, like agriculture itself, diversified. It is no easy task to describe that diversity with accuracy and succinctness, especially in the two centuries before 1750 when new industrial, commercial, and financial organisations were coming into existence. The problems of selection and emphasis are difficult and the dangers of generalisation are great. These problems are solved and these dangers avoided with great skill in this work, which gives a balanced account of old and new industries, of expanding foreign trade, and of the financial devices of the state and of the individual. All this is combined with a refusal to speculate too much about the unknown, and it is one of the many merits of this book that it shows not only what economic historians know, but also what they still want to know.

However closely the historian sticks to his evidence there is always room for dispute over its interpretation. Moreover, the historian who ranges over the wide field of English economic history from prehistoric times to 1750 exposes himself to sniping from the specialists. Thus, not everyone would agree with Clapham's view of the mediæval craft guild, whose importance he appears to underrate, or with his account of the "cold-blooded attack" on the Irish woollen industry in 1699. Similarly his account of wage assessment by the justices of the peace appears to assume too readily that "rates assessed and rates actually paid did not diverge widely" in the seventeenth century, though this statement is qualified by the remark "so far as we know." It is possible to question individual statements in this work, but it is hardly possible to question the scholarship and skill shown in the work as a whole. It should remain long the standard text book on the period it covers, although its usefulness as a text book would have been increased by the addition of either fuller references to sources or a select bibliography.

Italy Through Two Lenses

"Made in Italy." By Igor Markevitch. Translated by Darina Silone. Harvill Press. 226 pages. 10s. 6d.

THIS excursion of a Russian musical genius into the psychology of Italy is exhilarating and the exhilaration is expressed, not blurred, by the translation. It will be brushed aside by some as a mad outburst of enthusiasm and by others as revolutionary. The essential point to bear in mind, however, is that in truth it is a book, not about Italy, but about Tuscany—a fact which Mr Markevitch himself would be the first to acknowledge and to appreciate. About Tuscany, most fortunate and most

brilliant of the Italian provinces, Mr Markevitch knows everything that matters, at any rate about the aristocracy and about the peasants—there are perhaps a few tawdry things about the *piccola borghesia* which he has been able to escape.

Even in Tuscany the peasants have never become the owners of the land *en masse* as the French peasants did after the great revolution. It is interesting to have Mr Markevitch's account of the evils of the *mezzadria* system even here and the corrupting influence of the *fattori* or bailiffs. In Tuscany the *mezzadro*, or crop-sharing peasant, gets at least half the produce, and often there is good feeling between owner and *mezzadri*. But in the South of Italy it has at last come to a peasants' revolt because there the owners are strangely shameless parasites and the *mezzadro* only "participates," often getting a fifth or as little as an eighth of the orange-farm crops. It could only happen in Tuscany that a man like Professor Bianchi-Bandinelli shares his estate with his peasants and puts a certain proportion of profits regularly back into the land.

This book expresses the spirit of Tuscany in a thousand ways, its aestheticism, its universalism, the freedom of its spirit combined with its traditionalism, and finally its republicanism which in a way blends all these things. There is nothing Marxist about Tuscany, but it is the reddest region of Italy today because it is always in revolt against the bureaucracy, the corruption, and the police oppression which Rome now, as so often before, seems to represent.

Mr Markevitch is often politically suggestive in this book; for instance he makes an illuminating comment which strikes home to those who have lived in both Italy and Switzerland. "In reality, political freedom and freedom of the spirit do not necessarily go hand in hand," he writes. "The Swiss enjoy a political freedom of which they make scarcely any use." It would be interesting to discover where the fault lies.

"The Italian Left." By W. Hilton Young. Longmans. 211 pages. 15s.

MR HILTON YOUNG went out to Rome last year and spent a considerable time in Italy collecting material for this book. Its sub-title is "A Short History of Political Socialism in Italy," and it is a most useful and valuable work. Hitherto there has not existed in English an up-to-date, readable and authoritative account of the development of Italian Socialism from its earliest days—even before the foundation of the Socialist Party in 1892—right through the Mussolini era and into the present unsatisfactory period. Mr Hilton Young tells his story with understanding and insight. Nor does he fail to convey the accurate impression that no one can plumb the political depths of modern Italy without knowing the background of its left-wing parties, both Socialist and Communist. The Communists sprang from the side of the Socialists in 1922; with them, as Mr Hilton Young puts it, "went the wits and guts of most of the Socialist movement. The wits belonged to the Torinese tradition . . . whose most effective leaders were the two young intellectuals Gramsci and Signor Togliatti."

There has never been a Socialist government in Italy, and the Socialist story is above all one of indecision, frustration and disappointment. The Italian Socialists, like others on the Continent, have always based themselves on Marx. And it has been their fatally doctrinaire attitude which has throughout inhibited their power of tactical decision. Was it to be reform or revolution? Right from the start the revolutionaries have generally been dominant in the party, though usually lacking the do-or-die ability to throw up more than puny and local barricades, and often in effect held back by their associates who toyed with political collaboration after all.

The Italian Socialists have little excuse for their failure to achieve power. The party was strong enough, with 33 deputies, to be invited into the Government as long ago as 1903—when the British Labour Party still only had Keir Hardie and two others at Westminster; but their leader, Turati, declined. Giolitti invited them again in 1911, when Italy declared war on Turkey; but Bissolati, like Turati, declined—although the

next year a young and little-known firebrand, called Benito Mussolini, got him expelled from the Socialist party for congratulating the King on an escape from attempted assassination. By 1920 the Socialists were a mass party and, with 156 deputies, the largest in Italy. Still they refused either to help govern or to let government proceed. With the failure of their Occupation of the Factories that year they began their long slide downhill. Today, as Mr Hilton Young indicates, the Italian Socialists have learned their lesson; even the Communists "will go to almost any length to get into office." For the moderate Socialists the question has become whether they have missed the bus altogether.

This is an able, thoughtful and worthwhile book, and should be read by every student of Italian affairs. Not the least of its qualities are some admirable photographs, clearly chosen with trouble. Turati, Treves, Ferri, Lazzari, Rosselli, Nenni and Saragat are amongst those who stare vividly out from its pages.

Huntin' and Hosses

"Jorrock's Jaunts and Jollities." By R. S. Surtees. The Folio Society. 228 pages. 21s.

FIVE years before the first issue of *The Economist* saw the light of day, Surtees collected the adventures of his hearty and lovable Cockney sportsman. Jorrock's would have had no time for economics; as for *The Economist*, it has generally been on the side of the fox, and even on the side of the chicken if the fox was raiding the hen-roost. Its only adventure into horseyness was to write glowingly of the future of the horse long after the rest of the world, rightly, had decided that the motor car had arrived and was here to stay.

Jorrock's would have supported this wild judgment with all his accustomed gusto. No logic ever got the better of his zest for the chase (setting off at seven in the morning in a Bloomsbury fog for a day with the Surrey) or his good fellowship and sociability. This simple excellence and good humour is a little aside from modern taste, which will find more corney rumbustiousness than wit in Jorrock's adventures, and a whole-hearted passion for saddle and gun—a passion now unfashionable and nearly taxed out of existence. "When there's neither hunting nor shooting going on, what is a man to do with himself?" The Folio Society has beautifully dressed these robust stories to enhance their unaffected entertainment and comic detail. The hand-coloured Alken plates are a delight in themselves.

America Up-to-Date

"The United States since 1865." By Louis M. Hacker and Benjamin B. Kendrick with the collaboration of Helene S. Zahler. Appleton-Century-Crofts Inc., New York. 739 pages.

PROFESSOR HACKER has re-examined and brought up to date the history of the United States since the Civil War, which he and the late Professor Kendrick first published in 1932. It is now very up to date indeed for a history book, since it covers the Presidential election of last November as well as the war and postwar years during which, in Mr Hacker's opinion, the United States has fulfilled its destiny. The book begins with a revolution, the one which followed the Civil War, and from which dates the development of the America we know: it ends with two further revolutions, the New Deal at home and the acceptance of the Communist challenge abroad.

During the period under review America's amazing economic growth has conditioned the country's history more than any other factor, and this is naturally therefore a social and economic, rather than a political, history. Professor Hacker has marshalled his facts in orderly, but also in very close, array, so that the book is too heavy, in weight and in matter, to make easy reading. It is, however, an honest and unpretentious textbook, which is a valuable source of reference.

Captain Courageous

"Merchantman Rearmed." By Sir David Bone with Illustrations by Sir Muirhead Bone. Chatto and Windus. 332 pages. 21s.

IT is no reflection on Sir David Bone to say that the drawings by his brother lift this book out of the ordinary run of war memoirs. No written description could convey quite so well the bustling, untidy activity of, for instance, the Clyde dockyards at the beginning of the war or of the strangely unco-ordinated movements of a fleet of small ships in heavy weather. The drawings are unpretentious, but they succeed in creating with uncanny accuracy the atmosphere of merchantmen at war.

But apart from the drawings, the book is well worth reading. Sir David Bone is a seaman of great experience with a distinguished record of service covering both World Wars. He has, too, the gift of being able to say clearly and concisely what he thinks, and though some of his opinions do not bear too close an examination, the straightforward account of his experiences as a Captain and a Commodore in the merchant service is absorbing.

The narrative covers the whole of the Second World War. At its beginning, Sir David was caught on the point of retirement from the transatlantic "ferry" service—he was captain of the 17,000 ton liner *Transylvania*—and like so many other seamen of his own age and experience he was called upon to postpone his plans for another six years. He saw service first on his old transatlantic routes, carrying children to America and troops from Canada to England—in the first twelve months sailing independently without the protection of being in a convoy. He later took part in the invasion of North Africa, the landings on Sicily and at Anzio and in the invasion of the south of France. He sailed in Russian convoys, in troop convoys on the long route round the Cape to Alexandria, and finally in the last assault convoy to Malaya after the Japanese had surrendered. It brought to an end a career which had begun at the turn of the century during the Boer War.

The book, although it is occasionally marred by unnecessary purple passages, is enlivened throughout with anecdotes and a nice sense of humour.

Shorter Notices

"The South African Financial Year Book 1949." By R. Beerman. Publishers Limited, Cape Town. 1456 pages. UK price 50s.

THIS is an investors' manual and encyclopedia of South African public companies; it includes a directory of directors of South African companies, and should form a useful guide to those engaged in business with South Africa.

"The Essentials of Company Law." By H. E. Applebee. Allen and Unwin. 116 pages. 9s. 6d.

THIS is a useful abbreviated analysis of the main principles of Company Law as promulgated in the Companies Act, 1948.

"A Demographic Survey of the British Colonial Empire." Vol II. South Africa High Commission Territories, East Africa, Mauritius, Seychelles. By R. R. Kuczynski. Oxford University Press. Geoffrey Cumberlege. 983 pages. 75s. net.

THIS is the second volume of the monumental survey of colonial populations undertaken by the late Dr Kuczynski, and issued under the auspices of the Royal Institute of International Affairs. This volume, which the author was seeing through the press at the time of his death, completes the survey of the African dependencies. West Africa having been covered in the first volume. It contains a great deal of historical, social and medical information, for Dr Kuczynski quotes at length from official and private sources.

AMERICAN SURVEY

New Atomic Ventures

(From Our American Staff)

WHEN President Truman was asked what changes in the plans and projects of the Atomic Energy Commission would follow the discovery that Russia had produced an atomic bomb, he said that there would be no changes. The outline of the significant new projects submitted by the Commission on November 28th, when it held its first press conference for about a year, bore out his statement. All of them were already well advanced on the drawing board, and a number had been in the engineering and construction stage for some months.

Yet a difference in the Commission's attitude is noticeable. In the United States the owner of a patented industrial process is protected from imitators for a period of 17 years. Then the process becomes public property. As the time approaches when he is to be a monopolist no longer, the owner of a patent keeps one eye on his possible competitors and the other on the calendar, if not the clock. And he works very hard to find the basis for a new patent developed from and covering the "know-how" contained in the old one, by which he can extend his protection for a further period. Today the AEC is a monopolist turned competitor.

When the eminent physicist and former member of the AEC, Dr Bacher, said in a recent speech that the Russian advance is a "substantial achievement," he gave some indication of the degree to which the old patent is thought to have run out. The search for renewed protection is taking several main forms, in addition to the expansion of facilities of existing types for the production of plutonium and uranium 235 at both Hanford and Oak Ridge, which was announced at the end of October. One is to provide the tools and the scientists for more pure research, as, for instance, in the erection of the cosmotron at Brookhaven, Long Island, and the bevatron at Berkeley, California, now under construction, to advance research in particle acceleration.

Another is to improve the engineering aspects of atomic energy production by the construction of reactors of new and improved types, and the application of the results of experiments with reactors to the generation of electric power and the propulsion of ships and aircraft. Potentially the most important of these developments is the experimental "breeder" reactor being constructed in Idaho, to test the feasibility of transmuting relatively plentiful non-fissionable uranium into fissionable plutonium. If successful, this process would produce more fissionable material than it consumes.

This aim of an increased yield is, in a way, symbolic of the Commission's new approach. Dr Oppenheimer, the distinguished nuclear physicist, in testifying before Congress last year on the availability of atomic knowledge, used the simile of a fruit tree. He said that for years a tree of knowledge had grown through the patient accumulation and assessment of diverse scientific data. We had shaken the

tree and brought down its fruit; now we needed a new crop.

The new harvest is to be accelerated not only by the application of new machines, ideas, and men, but by a reduction in the amount of classified—that is secret—information. The more information that it is determined can safely be made available to the public, the more likelihood there is of a productive cross-fertilisation of ideas. The report submitted to Congress last January listed a number of newly opened areas in which research was invited; now the fund of knowledge in the Commission's keeping is being examined again to see if there are not additional areas in which new work, which may perhaps produce new ideas, can be stimulated. The same principle can be seen, too, in the Commission's tendency to enter into contracts for basic research to be conducted at the universities rather than at government installations, on the ground that more people will thus be made aware of the experiments and attracted into the field. Similarly, university staff members, financed by their institutions, are invited to work at government installations on material that is not secret, on a six weeks to six months basis. Training of various kinds is being given at the Oak Ridge National Laboratory, where courses are to be started for engineers from industry and employees of other government laboratories interested in reactor development.

This relaxation does not mean that the requirements of military security are taken any less seriously. In the future, the policy may be one of even tighter withholding of certain information, accompanied by the freeing of knowledge which, in the judgment of the Commission, will best forward American interests if it is worked on by many people. Only so, it is felt, will the tree continue to bear fruit, or at least to bear a fuller crop than can be produced by the limited staff of the Commission, which must deal with the parts of the programme which involve the national security as well as its more general reaches.

★

Clearly, this new phase in the Commission's activity will be profoundly affected by the personality of the Commissioner nominated to take the place of Mr Lilienthal, whose resignation is likely to take effect at the end of this year, or soon afterwards. The co-operation of Congress will also be necessary, and this continues to be endangered by the obstinate hope of certain politicians, mostly Republicans, that there is political profit to be made out of the atom. The latest campaign is an attempt to blow up out of all propor-

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

tions the shipment of uranium and confidential papers to Russia in 1943, and, by suggesting a link through the late Harry Hopkins and Mr Henry Wallace, to throw more mud on the New Deal and the memory of Mr Roosevelt—and perhaps also of the present political careers of his two sons.

In this instance, the target is not the present management of the atomic energy programme, though the accusations are not calculated to increase public confidence in the integrity of the high priests of the atom. But the Commission has already become a political issue in Iowa, somewhat to the discomfiture of the Commission's critics. Senator Hickenlooper, whose charges of "incredible mismanagement" against Mr Lilienthal were recently dismissed as groundless, is, like Senator Taft in Ohio, running for re-election well ahead of the usual time-table. He could not resist gloating over Mr Lilienthal's resignation, and he was sharply called to account in the press by Mr W. W. Waymack, a former Atomic Energy Commissioner and a widely-respected fellow Iowan. The incident has not improved the Senator's political chances.

*

A much more serious matter is the recent television broadcast of Senator Johnson, a member of the Joint Congressional Committee on Atomic Energy, concerning an atom bomb of 1,000 times the force of the Hiroshima model. At the Commission's press conference on November 28th, when Mr Lilienthal was asked about the security features of this statement, he replied: "The television broadcast you refer to by Senator Johnson involves questions, the discussion of which, so far as the Commission is concerned, cannot be carried on without serious involvement of the national security."

Probably Mr Lilienthal, who, by getting his resignation accepted just before this broadcast, was able to say that he was resigning at a moment free from crisis, is not greatly alarmed by Senator Johnson's rather Vishinsky-like rejoinder that the Chairman is concerned in an international atomic plot to give away American secrets. But Mr Lilienthal has been troubled by the Congressional conception of security and particularly by its suspicions of, and restrictions on, the Commission's grants for study and research.

Because of the failure of Congress and the President to agree on the organisation of a National Science Foundation, the Commission undertook to finance the general training of more students in the physical and biological sciences. To avoid political pressures with regard to applicants, the Commission arranged for the National Research Council, an independent body, to award its fellowships, which could be used at various universities and did not involve work on secret material. When one of the recipients was discovered to be a Communist, and another to have past associations with the party, the Commission, after an initial statement about academic freedom, decided that recipients must thereafter take an oath of loyalty to the United States and declare that they were not Communists.

But in the eyes of the sub-committee of the Senate Appropriations Committee that passes on appropriations for the independent offices, of which the Commission is one, this was not enough. It added a rider that students supported by money from the public treasury must have their characters, associations, and loyalty investigated and attested by the Federal Bureau of Investigation. During this summer's Congressional inquiry, Mr Lilienthal was critical of the arm of the Federal Government thus reaching down into education, and he is known to have been disappointed at the failure of the scientific world to come to the support of his view that

excessive security precautions are not only wrong in themselves, but, by alienating able students, damage rather than advance the national interest. But Senator O'Mahoney, who is on both the Atomic Energy Committee and the Senate Appropriations Committee, fixed Mr Lilienthal with his china-blue Irish eye on the occasion of his testimony on this matter, and said, "Mr Chairman, you are not being realistic." Mr Lilienthal has indicated that when he is relieved of the responsibilities of office he will have more to say.

Vanishing Sheep

[FROM A CORRESPONDENT IN COLORADO]

AMERICAN sheep farmers who are always being offered either carrots or sticks feel that the sticks predominate, and that they would like to know which is coming next. Recently, however, there have been several carrots. Prices are expected to be slightly better for the 1950 clip, about 45.7 cents per pound for wool "in the grease" or as it comes from the sheep, as against 42.3 cents this year. The latest Agricultural Act provides for government support of wool prices at a high level, so long as the annual US clip from live sheep is less than 360 million pounds; it was about 212 million pounds last year. The Interstate Commerce Commission has reduced railroad freight rates on wool sent east for processing from 3 to 15 per cent, depending on the size of the load.

This last carrot may be a stick in disguise, as is explained later; meanwhile, sheep farmers have felt several unmistakable blows. Currency devaluation makes it easier for their foreign competitors, particularly the Australians, to underbid them in the American market. During the war, the protective tariff on wool was cut by a quarter. Large areas of land in the National Forests are being closed to the flocks, for the reason that they destroy the ground cover and cause soil erosion. The sheep-breeder finds fewer and fewer people willing to bear the hard, lonely and exacting life of a shepherd, however high the wages. The lack of shepherds, with their special skills, has become especially acute since the war. Senator McCarran, of Nevada, the sheepmen's spokesman, has been arranging for the importation of Basque shepherds under special laws. But since he refused to relax his stranglehold on the Bill granting more generous terms for the admission of Displaced Persons into the United States, his special sheepmen's Bills have in their turn been throttled by the Senators who speak for the DPs.

*

General frustration and uncertainty, rather than any specific cause, seem to be driving the sheep ranchers into the ranks of "vanishing Americans." As recently as 1942, the number of sheep on American farms and ranches reached an all-time record of 49 million head. Since then a steady decline has reduced them to fewer than at any time since the Civil War—28 million head, and it is by no means certain that the bottom has been reached.

In spite of the sheepmen's furious denial of such suggestions, there are indications that the archaic and uneconomic organisation of their industry may have more to do with the decline than any outside forces. The American woollen industry grew up on the Atlantic Coast, particularly in New England and Pennsylvania. When sheep-raising moved west to the mountains and plains for which it was most fitted, the processing industry inertly stayed behind. Today almost

all American wool is produced west of the Mississippi River, yet there is practically no processing in that area, except for some speciality textile mills preparing wool for their own use. Virtually every pound of the clip, of which an average 60 per cent by weight is grease and dirt, is loaded on to freight cars and shipped all the way to New England, there to be cleaned and processed into the raw material for the textile industry. Thus the sheepman pays the freight for an unnecessary journey, 2,000 miles long, for well over 100 million pounds of useless dirt every year. The failure to adopt the natural and economical solution, of cleaning and preparing the wool in the west, is explained by the higher rate which the railways charge for the eastward movement of cleaned, compared with uncleaned, wool. The difference eats away the profit obtainable from cleaning wool near the farms and ranches which produce it, to such an extent that the margin is too slight to make a western cleaning industry worth while.

The present paradox is well illustrated by the difficulties of a Denver firm seeking to establish a local textile industry. Part of the time its storage space is used for wool moving eastward to be cleaned. Part of the time it is occupied by wool yarns bought from processors 2,000 miles away in the east, at something like 10 times the price of the uncleaned wool. Yet this firm does not use enough wool, nor can it see a big enough western market for processed wool, to warrant starting a wool processing business on a scale large enough to make it pay.

Governors of Rocky Mountain States got together after the war to organise a Western States Wool Council to encourage the establishment of a local wool processing industry. But the Council's efforts have been ineffective because the Interstate Commerce Commission, when it at last granted lower freight rates for the eastward movement of unprocessed wool, 60 per cent grease and dirt, refused to extend the lower rates to cleaned or processed wool. The Commission's reasons for the refusal were that there was no movement of cleaned wool, and that few persons in the west appeared to be seriously interested in establishing a cleaning industry there. It is indeed true that the official spokesmen of the wool-growers have always thrown cold water on attempts to establish a western cleaning industry, on the grounds that they must not forsake the eastern processors, their only steady customers for 90 per cent of their clip. The decision, therefore, appears to set the American wool-growing industry still more firmly in its traditionally uneconomic and inefficient pattern.

American Notes

Pensions for All?

Senator Taft is fond of calling the welfare state the "farewell state"; and it is hard to imagine a more unlikely ally for the redoubtable Dr Townsend, whose lobbyists are still assaulting Washington with the slogan "\$50 every Thursday." But it was left to Senator Taft to draw the obvious moral from the pension victories won in the steel and automobile industries, and the determination of other strong unions to provide as handsomely for the old age of their members. Mr Taft very reasonably inquires, if a steelworker or miner is entitled to \$100 a month at 65, why not a moulder or waiter?

The question is not to be taken as indicating Senator Taft's support, but as grounds for the inquiry into the problem that he believes the Senate Finance Committee

should undertake in January when it opens hearings on the Bill, passed by the House, to increase the coverage and benefits of the federal insurance scheme. Such an inquiry should estimate the probable cost of a flat \$100 pension for all, which Mr Taft puts tentatively at \$12 billion a year—a fixed cost that he doubts if even the American economy can stand. No invested reserve could be built up to meet such an outgo; the cost would have to be met from current revenue, and thus from the income of the working community. Senator Taft's aim may be to kill the proposal with kindness—and reason, as well as to point out the lopsidedness and unfairness of private pensions for the strong. Mr Tobin, the Secretary of Labour, untroubled by such considerations of cost, has, however, seized with enthusiasm upon the goal of immediate pensions of \$100 a month for everyone.

The miners, though they were first in the field, are receiving no pensions at present, because no contract has been signed to replace the one that expired in June, although Mr Lewis has reinstituted the three-day week. This last somersault, performed a few hours after the fourth coal strike of the year had begun, has the advantage of allaying the miners' growing grumbles and making federal intervention unlikely. Local unions have been authorised to seek independent agreements, and the three-day week, which does not quite replace the coal withdrawn from stocks for consumption, may bring forward a "coal Bethlehem," a company or section of the industry, perhaps the anthracite owners, willing to make the first concessions and set a new pattern. Until the new contract is signed, Senator Bridges, a welfare fund trustee, whose approaching resignation makes him willing, for once, to brave Mr Lewis, is unlikely to consent to renewed payments from a fund run in a signally improvident manner in the past.

The newest and largest recruit to the ranks of the pension-

51 Berkeley Square Bush House, Aldwych

givers is the Bell Telephone System, which ordered an immediate increase in the minimum monthly pensions it pays, from \$50 to \$100 less federal security payments. But the union, instead of welcoming the concession, without a shot being fired, of one of its main claims, turned and bit the hand that fed it; it proposes to bring unfair labour practice charges against the System for having increased the pensions without consultation and collective bargaining with the union.

The winning of these private industrial pensions in the steel, coal, and telephone industries, and the foothold secured in the automobile industry, mean that the unions have secured formidable allies in their campaign to force Congress to raise federal old-age pensions, which now stand at the pitiable average of \$26 a month—only slightly more than half the national average old-age assistance awarded by the States to those whose only claim is based on need. For as federal pensions rise, industry's commitments fall. Another lever to pry open the federal treasury has been suggested by the state chairman of the Congress of Industrial Organisations in New York, who would have the state government supplement the incomes of old age pensioners until federal payments reach \$100 a month. But even the results of the last two elections have hardly chastened Mr Dewey and the Republican legislature to this extent.

* * *

Butter in ECA's Mouth

The bridge across the dollar gap certainly is not paved with butter. But it has caused some temporary embarrassment to the Economic Co-operation Administration and Mr Hoffman, who, when he is not urging Europe to concentrate upon the American market, is spreading on the other side of the Atlantic, with equal fervour, the gospel that Americans must increase their imports by at least \$2 billion

a year, if they do not wish to continue present subsidies to the Marshall countries.

After devaluation, it was found that Danish butter could be sold in New York at three cents below the domestic price, and importers were prepared to take the 4,400,000 lb. offered. Import licences have, however, been refused, on the ground that with the Commodity Credit Corporation holding nearly 100 million lb. of surplus butter, imports would interfere with the orderly liquidation of these stocks, which the Department of Agriculture is endeavouring to sell. Butter is one of 15 fats and oils whose import may be suspended to make possible orderly sale of "temporary" surpluses. Mr Hoffman is not alone in looking slightly yellow; the State Department, which negotiated trade agreements to permit the entry of 60 million lb. of butter a year at a reduced tariff of 7 cents a pound, points out that these concessions were subject to American ability to carry them out, but this is poor consolation to Denmark and New Zealand, which have not withdrawn the reciprocal concessions made at that time.

The villain in this collision between the freer trade policies of the State Department and the Department of Agriculture is, of course, the agricultural price support system continued by one Congress after another with an eye to the farmer's vote. Given the law, it would be unreasonable to expect the United States to provide a haven for foreign butter when each pound imported sent a displaced pound of the domestic product into store, at a cost of 62 cents. Nor can deficit economies expect to pay their way by carrying coals to Newcastle, or butter to the dairy. But the domestic effect of high butter prices in the past can be seen in the decline of butter consumption from 17.8 pounds per person in 1935-39 to 10½ pounds this year. Americans, recovering from this year's recession, are expected to spread slightly more butter on their bread in 1950, but the creameries are turning out nearly 20 per cent more than they did last year.

* * *

Whose Credit Policy?

One of the controversial questions to which the Joint Congressional Committee on the Economic Report is seeking an answer, is whether the Federal Reserve Board is still able to carry out its function of adapting credit policy and interest rates to the economic situation, or whether, with the growth in the Government debt, it has become a mere instrument to maintain cheap money rates for the benefit of the Treasury. Mr Eccles, in testimony written with that pungency and disregard of official corns which may have been responsible for his demotion last year from the chairmanship of the Federal Reserve Board, hotly espoused the latter view. The Board's warnings, he said, were frequently disregarded by the Treasury; it had become a "mere engine of inflation," since cheap money for the Government meant cheap money for all. Mr Eccles was particularly critical of the decision to hold the interest rate on a new series of one-year certificates at 1½ per cent, which he said took no account of the Board's belief that short-term interest rates should be allowed to rise slightly to check possible inflation.

Mr Snyder's warm endorsement of a balanced budget relieved the doubts raised earlier about his financial orthodoxy; but everything he said reinforced the suspicion that, to the Treasury, any departure from a cheap money policy is unthinkable. This is understandable, in view of a public debt of \$257 billion, the interest on which already absorbs over 13 per cent of the national budget, and in view of the need for further heavy deficit financing and refunding in 1950.

Mr Snyder testified he had always found the FRB co-operative—which was just what Senator Douglas feared. Mr McCabe, chairman of the Reserve Board, had equally kind things to say of the Treasury, and cited the agree-

ment of the Treasury in an announcement last June favouring easing of credit and interest rates. But to Senator Douglas, that agreement had no more virtue than the agreement of a small boy to accept a box of sweets, and he wanted to know whether the Treasury would be as amenable if the Board felt it necessary to raise interest rates. Pressed as to whether the Board wholeheartedly approved the continuation of low interest rates in its forthcoming January financing, Mr McCabe begged to be excused from replying.

Further testimony on this clash was to be heard in private session. One remedy, put forward by the president of the Federal Reserve Bank of New York, would have Congress instruct the Treasury that its management of the public debt must be carried on "within the structure of interest rates appropriate to the economic situation." Another would create a national advisory council on credit policy; still another would give the board power to restrict private credit while maintaining cheap money for the government. None of these legislative devices appealed to Mr McCabe, who urged Congress to have confidence in the responsibility—and co-operation—of officials and keep them free of political bias and control.

* * *

New York Runs Dry

The announcement that drinking water will only be served in New York restaurants on request climaxes the barrage of warning and advice which the city's water shortage has brought about the ears—and eyes and living habits—of its inhabitants. They have been told to wait for a full supply of dirty linen before switching on the washing machine that needs 45 gallons each time it is used and to wash themselves under showers, which only use 5 gallons if turned off while soaping, instead of in baths which take 25 gallons to fill to a comfortable level. If these economies are not effective, water pressure will have to be reduced. Already there are places in New Jersey where there is no water at all in the pipes.

The reservoirs to the north-west of New York City, which largely supply it and have a capacity of 300 billion gallons, are only 37 per cent full; there is only enough left for 60 days consumption at the normal rate of over a billion gallons a day. The immediate crisis springs from the exceptional heat and drought last summer, but it is also due to the increase of a million in the city's population since 1940. If this growth continues, as it looks like doing, only temporary relief will be found from the new reservoirs in the watersheds of the Delaware River which will add some 540 million gallons a day to the city's supply by 1956.

*

New York's difficulties are shared, although less acutely, by other growing cities in the supposedly water-rich east. Such rapidly expanding industries as oil refining and chemical manufacture are heavy users of water. So is the industrialised agriculture of today; it is said that five gallons of water are needed to produce one of milk. The modern love of clean, cool comfort is another culprit. But the problem still reaches its most serious form in the arid western half of the country, with annual average rainfalls ranging from 20 inches down to 10 inches or less a year. Here lack of water is the main check on both agricultural and industrial expansion, especially in areas like Los Angeles where the ground water supplies are being used at double the rate of their natural renewal. Here water rights are the subject of bitter argument and litigation not only between individuals, but also between cities and States.

In recent years there has been sufficient rain in the great plains to keep the Dust Bowl muddy and, therefore, out of the news, but the Department of Agriculture has not forgotten the need for soil conservation. It is only one of the many government agencies that are concerned with the country's water supplies, and lack of co-ordination and agreement among them is one of the barriers in the way of the development of water resources on the wide regional scale

that is called for. Another is the absence of basic knowledge and research on the subject, which the US Geological Survey is trying to remedy.

Shorter Notes

In mid-November total employment, at 59,518,000, was as high as at any time this year and unemployment, at 3,490,000, was well below the ominous 4,000,000 mark which it reached in July. At that time there were 35 areas in 14 States with 12 per cent or more of the total labour force out of work; between July and the end of September over \$80 million in federal procurement and construction contracts and loans went into these depressed areas. It is difficult to judge how much of this government expenditure was due to the emergency programme for relief of these areas but, in combination with the general improvement in business, it has provided substantial alleviation for many of them. A few, however, are said to be suffering from a chronic condition—the exhaustion of a coal vein, for instance—and to require more drastic treatment, which is to be prescribed in the "not too distant future."

*

The Feinberg Law, under which school-teachers in New York State were liable to dismissal for belonging to an organisation which the State Board of Regents considered subversive, has been declared unconstitutional by the State Supreme Court. The judge condemned it as an unlawful Bill of attainder, inflicting punishment without judicial trial, and found further that it established guilt by association and that its terms and procedures were too vague to guarantee a fair trial. The law's threat to civil liberties had already been widely recognised, but the problem of how to protect the State's schoolchildren from Communist influence still remains.

THE WORLD OVERSEAS

Europe's Lagging Dollar Exports

THE depressing level of western Europe's exports to the dollar world is one of the most baffling and intractable aspects of the entire dollar problem. Probably no topic related to the Marshall Plan has had more talk and analysis lavished upon it—with less fruitful results. It is true that since the end of the war western Europe's dollar exports have staged a remarkable recovery, but they have still not regained their prewar volume. And, even more important, the exporters of the Marshall area have failed to maintain their prewar share of the market in the United States. Their sales have not kept pace with an American market which has grown considerably for a variety of imported products since the years before the war.

U.S. IMPORTS BY ECONOMIC CLASS (Billions of Dollars)			
	1936-38 Average	1948	% Increase
Crude materials	0.8	2.2	175
Semi-manufactures	0.5	1.7	240
Finished manufactures ..	0.4	1.3	225
Crude foodstuffs	0.3	1.2	333
Manufactured foodstuffs ..	0.4	0.7	75
TOTAL	2.4	7.1	200

As the table above shows, the United States last year imported nearly three times as much in value as it did in the period immediately before the war. But meanwhile the value of total exports from the Marshall countries scarcely doubled—it rose from an average of \$600 million in the years 1936-38 to less than \$1,000 million in 1948. In other words the ERP nations provided one-quarter of United States imports before the war: last year their share was only one-seventh. The inability of European exports to retain or improve their position in the American market was most conspicuous in the case of semi-manufactured and finished goods, the two categories which accounted for the bulk of Europe's dollar exports before the war. This fact is graphically illustrated by the following chart, reproduced from the latest pictorial survey of European recovery, published by ECA (Economic Co-operation Administration). It shows the current share which the ERP group provides of total American imports of finished and semi-finished goods as a percentage of the prewar share.

Current share (1949—6 months) as % of 1938 share.

(a) Excluding German shipments of iron and steel-scraps in 1949, which, if included, would increase the prewar share to 26 per cent.
(b) Excluding unusual Netherlands shipments of tin in 1949, which, if included, would increase the prewar share to 81 per cent.

Generalities such as these tend to swallow up some of the significant changes that have occurred in the American market for European products. And if the trade between the two areas is dissected, commodity by commodity, it becomes a good deal plainer why and where European producers have run into trouble. Before the war the "food and drink" group of industries was Europe's biggest single dollar earner; in 1948 it had dropped to third place, partly because Europe itself was short of such articles as cheese and partly because the United States was producing more at lower prices (cheese and wine) and found the European product either superfluous or too expensive. Still another obstacle to European sales of food has recently appeared in the shape of US farm support prices. These have resulted in a large holding by the American Government of surplus stocks of butter; and therefore the only way butter exporters, such as Denmark, can earn dollars with their product is to sell to American occupation troops in Germany. It is, however, in the category of vegetables and vegetable preparations that the greatest expansion of American food imports has taken place, and here neither Italy, the chief prewar exporter, nor France, has shown any competitive strength.

Textiles were Europe's second biggest dollar earner before the war and they have now risen to first place, in spite of the discouraging fact that the American market for cotton and flax goods has shrunk. In terms of steady consistency Europe's best record to date is for exports of woollen textiles. The Marshall nations also enjoyed an early and spectacular success with synthetic fibre exports, which fell off abruptly last spring when the American recession set in and when the main suppliers—France, Holland, Italy, Switzerland and Britain—priced themselves out of the market. However, those countries which have recently devalued may be able to repair the damage.

New Sources of Supply

Third in importance among Europe's prewar dollar exports were wood pulp and newsprint. These products now run a poor fourth, although American imports have more than trebled in value since before the war. Here the explanation lies in the development of American and Canadian resources which are fast replacing the more expensive Swedish wood pulp and newsprint.

Diamonds came fourth on the list of Europe's prewar exports to the United States; they now rank seventh. Last year American imports of diamonds from the whole world had multiplied fourfold as compared with prewar, while exports of diamonds from western Europe, largely Belgium, to the United States had risen by only 46 per cent. A substantial part of this large expansion was due to purchases for the American stockpile, which have now slackened. The reason for Europe's declining share in the market is the popularity of diamonds as a convenient form of transporting capital from one country to another, thereby making a profit from the differential free rates that exist for various European currencies.

On the other hand, metals and metal manufactures have shot from fifth to second place in western Europe's schedule of dollar exports. They reached nearly five times their prewar value last year and thus captured almost a quarter of an enlarged American market for this type of imported goods.

Included in this group, however, are a number of such unreliable items as iron and steel scrap and old brass clippings for which the market may be temporary and indeed already appears to be passing. But although these particular articles may decline in importance, "semi-manufactured goods" is a category which is growing and which fills an obvious gap in the postwar American economy.

Watches and clocks deserve special mention because last year Europe sold, in monetary terms, six times as many watches to the United States as it did before the war, and they now occupy fifth place instead of tenth in the export total. Their sales success in the United States goes far toward explaining why Switzerland has the best record for increased dollar exports of all the Marshall nations.

The complete tale of success and failure can be read behind the details of the following table.

(Million of dollars)			
Main US Imports from ERP Countries			Total US Imports
	1936-38	1948	1948 as % prewar
Food and drink	78.5	101.0	129
Textiles	64.8	131.0	202
Wood pulp, newsprint	46.5	81.2	175
Diamonds	29.6	43.2	146
Metals and manufactures ..	23.4	115.3	493
Furs	23.1	17.5	76
Antiques	20.1	15.0	75
Cigarette leaf	19.2	44.4	231
Chemicals	14.7	16.1	110
Watches	9.2	60.0	652
China	2.3	9.3	404
Cars, tractors	1.4	42.0	3,000
TOTAL	773.7	2,195.9	284

On the whole, then, the general pattern of Europe's exports to the United States is much what it was before the war. There has been some reshuffling among the main traditional exports, but very few new items have made their

appearance. Probably the most diligent seekers after new American markets have been the Italians, but all their ingenuity netted them no more last year than an extra \$12 million, made up of such miscellaneous products as cherries in brine and sewing machines. All in all, the American markets that the Marshall nations have lost for their old and tried products seem of far greater importance than any new markets they are likely to gain.

The relative decline in the exports of western Europe to the United States has not affected all the Marshall nations with equal force. Some, either by luck or initiative, have done better than others. Switzerland heads the list with dollar exports which are over four times their prewar value. Turkey and Portugal follow close behind. The worst performers in 1948 as compared with prewar were Germany, the Netherlands and France. Britain occupied a midway and unsatisfactory position with dollar exports at a mere 67 per cent above their prewar value.

Nazi Groups in Western Germany

[FROM A CORRESPONDENT IN FRANKFURT]

SINCE the cancellation in the American zone of licences for political parties, a number of hitherto subversive groups are beginning to come into the open, and a certain wry amusement has been caused among correspondents in Germany by the publication by the Office of Public Affairs of the American High Commission of the findings of a survey which has come to the conclusion that

there is no evidence of any recent upsurge in nationalist feeling among the German people. Interviews with a representative cross-section of the population indicate that whatever

Shortage of police man-power is likely to be a major problem for many years to come. It is unfortunate, therefore, that thousands of police must daily be employed on traffic control duties. Anything which will assist in putting them back on the beat is playing its part in beating the present crime wave. ELECTRO-MATIC VEHICLE-ACTUATED SIGNALS are already doing this at thousands of busy (and not so busy) traffic intersections up and down the country. Have you considered them in relation to the man-power problems in your area?

changes have occurred in trends since the establishment of the German Federal Republic have been on the side of less nationalism.

Yet during the period under review the British authorities saw fit to ban a projected rally of the "Friends of Otto Strasser" in the Ruhr; Minister President Peter Altmeier forbade a meeting of Professor Noack's *Nauheimer Kreis* in the French zone (an action which the Professor is turning into a court appeal against the stifling of free speech); and August Haussleiter's *Deutsche Union* joined with some smaller organisations to form the *Deutsche Gemeinschaft*, an embryo *Rassemblement* on Gaullist lines. It also saw the emergence of the first post-Nazi political machine, the "Union of Independents," which obtained 11 per cent of the votes in the Austrian national elections—an event which cannot be considered separately.

In a narrow sense, the American statement is partly true. A strong body of opinion in Germany supports the Bonn Government's declared intention of dealing ruthlessly with right-wing radicalism, and the diplomatic successes of Dr Adenauer which culminated in the signing of the Bonn Protocol, have spiked a number of nationalist guns. Nonetheless, a number of post-Nazi groups still exist. Continually splitting, splintering and rejoining, with leading and minor figures emerging in various guises in the petty struggle for administrative posts, their present weakness is counter-balanced by the threat that they might combine together in the event of widespread economic distress or a shift in the international balance of power.

Activities of the "Black Front"

At present three main groups can be distinguished. First, there are the radical right-wing deputies, mostly former minor Nazis, who have been elected to the Bonn Parliament and who, as the *Deutsche Rechtspartei*, are seeking to wean away all but the orthodox conservative elements from the Liberal Party and the *Deutsche Partei*. Their activities at least take place in public. Second, there are the extra-parliamentary groups, such as Professor Noack's *Nauheimer Kreis* and the *Deutsche Union* of August Haussleiter; and, third, there are the more or less underground conspirators of the Otto Strasser persuasion. Some idea of the confusion of the more esoteric elements may be gained from the fact that no less than four groups profess to represent Strasser's "Black Front" philosophies, distribute his news letters and circulate clandestine German language pamphlets, such as the *Kurier* (which is published in Canada and usually carries a Strasser leading article) and neo-Nazi publications such as *Die Brücke* and *Der Weg*, which filter through Switzerland from Buenos Aires.

Strasser's principal prophet in Germany is Karl Sprengel, who lives in Wildehausen, a small town in the province of Lower Saxony, with a group of adherents calling themselves the *Bund für Deutschlands Erneuerung*. Two genuine former "Black Fronters" named Bauer and Kampf, who were active with Otto Strasser in the days before his organisation was banned by Hitler in the 1930s, have formed the *Freundeskreis Otto Strasser*, their principal fields of activity being in Bremen and the Ruhr. Where Sprengel seems to be toying with the idea of a political party along more or less orthodox lines, the other groups are definitely conspiratorial in character, and seek to set up a whole underground network of cells, ready to emerge at the decisive moment.

Another splinter group, calling itself the *Nationale Freiheitspartei*, run by two more "Black Fronters," called Peschke and Frese, operates in the Hanover area, while another more independent group with growing strength in Lower Saxony, called the *Sozialistische Reichspartei*, has been founded by Fritz Doris, who was once associated with the ubiquitous Joachim von Ostau. Doris and Ostau parted company and Doris joined the *Deutsche Rechtspartei* for long enough to be elected to the Bonn Parliament.

New Names for Old Ideas

Joachim von Ostau has been one of the prime movers in the formation of post-Nazi groups, of which no less than seven have collapsed under him or have been banned by military government. He has managed to ring one more set of changes out of the half-dozen nouns with which all these organisations juggle for nomenclature and now heads the *Nationale Union*. Himself a minor textile manufacturer in the Ruhr, he is at present toying with Professor Noack's *Nauheimer Kreis*, with specious promises to enlist the financial aid and assistance of Ruhr magnates more prominent than himself.

The chief characteristic which distinguishes the *Nauheimer Kreis* from its fellows is the amount of favourable comment which is devoted in the Russian zone press to its programme for the neutralisation of Germany, the withdrawal of occupation troops and the installation of a unified German government. The group is chiefly active in Lower Saxony, although Noack himself lives in Bad Nauheim, north of Frankfurt. Noack has incorporated a like-minded movement in Hamburg called the *Freiheitsbund*, and another organisation calling itself the *Sammlung zur Tat*, led by a former Nazi named Steinfeld in the French zone of Germany. His chief contact in the Russian zone is Otto Nuschke, head of the rump Christian Democrats.

This leaves for consideration the most important and best led of all these groups—the *Deutsche Union*—in which August Haussleiter, former Deputy Chairman of the Christian Social Union in Bavaria, and Major von Stauffenberg, brother of the July 20th bomb-thrower, play the leading roles. This apparent contradiction is explained by the fact that the *Deutsche Union* itself is in a state of imminent dissolution in its present form. Originally formed in Berlin by Stauffenberg and a journalist named Guenther Scholz as a non-party national group of liberal-minded conservatives, its centre of gravity moved to Bavaria with Haussleiter's adherence.

At a meeting in Frankfurt a few days ago with representatives of such organisations as Pastor Goebel's refugee-based *Tatgemeinschaft freier Deutscher*, a co-ordinating committee, calling itself the *Deutsche Gemeinschaft*, was formed into which Haussleiter is likely to lead his purely nationalist wing of the *Deutsche Union* with a programme designed to attract *Entrechteten* of all types—ex-Nazis, refugees and those bombed out of their homes. The ultimate aim is to form a radical right-wing political party, leaving the original members of the *Deutsche Union* to their vague freemason ideas at their former headquarters in Berlin. Haussleiter himself is a man of vigorous personality and unquestioned political capacity. He is one of the leading contenders for the role of human magnet which all the neo-Nazi elements are seeking. His platform is a plan for a permanently neutralised Germany with its status guaranteed by the four Allies. If his appeal to the refugees and the new underprivileged succeeds, his party could well become the third largest party in the state overnight.

Australian Election Issues

[FROM OUR MELBOURNE CORRESPONDENT]

RARELY has a political party gone to the polls promising less than the Australian Labour Party in the general election on December 10th. The Prime Minister, Mr Chifley, in his policy speech, made only one specific pledge—that if Labour were returned to power it would "again do everything to make Australia a better place." In plain words, Mr Chifley's Government is seeking re-election on its past record alone. On the main highly contentious political and economic issues, such as bank nationalisation, petrol rationing, or socialisation of industry, no specific promises have been given by the Government. The electors are again being asked to give Labour a blank cheque for three more years.

The Opposition, represented by the Liberal and Country Parties, are asking for anything but a blank cheque. They postulate with all the force at their command that the vital issue of the elections is socialism and that a return of Labour will mean a general mandate for the Government to proceed at full speed with a policy of nationalisation, as shown in airlines and shipping, and as unsuccessfully attempted (because of constitutional barriers) in banking and free medicine. Although obviously extravagant, almost grotesque, this sentence from the policy speech of the Leader of the Country Party (Mr Fadden) expresses the tenor of the anti-socialist line of the Opposition parties:

If you choose the Labour Party, then your ballot paper will truly be your last will and testament, disposing in your own lifetime of your liberties and your property and condemning your children and your children's children to the living death of Socialist regimentation.

The Opposition Leader, Mr Menzies, undertook in his policy speech to give endowment to first children, to obtain petrol and subsidise it if necessary, to repeal the Bank Nationalisation Act and to amend the Constitution to prevent such future legislation without referendum; to declare the Communist Party subversive, unlawful and dissolved; to uphold White Australia, to enforce defence service, and to reform coal mining. In addition, Mr Fadden, who has joined Mr Menzies, pledged himself to abolish petrol rationing if a Liberal-Country Party Government is returned, a pledge which is certain to have a wide appeal to an important section of electors. "Empty out the Government and fill the bowsters" may be an effective catchcry among motorists who are by no means confined to anti-Labour supporters.

Impressive Record of Progress

Besides all these political issues, which are being debated with much heat and vilification on the hustings, the Chifley Government is able to point to an impressive record of economic progress in Australia achieved in the four years

Collective Security provided by Chubb Safe Deposits

PRESTIGE and profit are two results of the installation of a Safe Deposit for the use of customers or of the public in general. Facts about the demand for this type of service, and the most effective means of meeting it, are contained in the attractive and informative brochure "Collective Security." Among the many illustrations are photographs from various aspects of modern Chubb Safe Deposits and a plan of a typical installation. Write for a copy now.

since the war ended. It is able to show that unemployment is virtually non-existent, while at the same time there are soaring figures of national production and personal incomes, all factors which affect the individual directly.

This, the Opposition is careful to point out, has not resulted from any inspired policy of the Chifley Government, but from the fortuitous coincidence of its being in office during a period of unprecedented high commodity prices and buoyant markets as a result of conditions generated by the war. But it would indeed be a foolish Government not to claim the major part of the credit for a period of prosperity achieved during its administration. And this Mr Chifley is exploiting to the full.

His policy speech was much more a recital of things done rather than things to do. He showed that the Government had deliberately fostered and encouraged the development of private industry in Australia, the number of factories having increased from 27,000 to more than 37,000 since Labour took office. Since 1938-39, employment in factories had increased from 542,000 to 823,000. Great hydro-electric, water conservation and primary development schemes had been planned by Labour or were actually under way, and the Government had £A743 million of essential public works planned which would be a potent factor in maintaining spending power and employment should Australia again find itself threatened with a depression. Only 1,067 persons were today receiving unemployment relief out of a total labour force of 2,429,000; unemployment in 1938 was 9.3 per cent of total wage earners. Since the war there had been five successive cuts in direct taxation. Today a single person did not become liable to income tax, apart from social service contributions, unless his income exceeded £A500 a year, and a married man with two children did not become liable to tax unless his income exceeded £A827 a year, or nearly £A16 a week.

It might well be, of course, that the electors will want something more specific than a policy based on the past and

BANK-UNITS

AND DEVALUATION OF THE £.

INVESTORS in Bank-Units secure a freely marketable investment spread over the shares of 45 Dominion, Colonial and Home banks and discount companies. The Trust Fund, 55% of which is invested overseas, is as under:

Canadian \$ bank shares	31%
Other Dominion, Colonial & Overseas banks	24%
Home banks	29%
Discount companies	11%
& Trustee securities	5%

Next year Unit holders should benefit from the devaluation of the £ and the Managers' policy during the past few years of investing in the \$ shares of Canadian banks (now nearly one-third of the Trust Fund). The sterling income from these \$ banks will increase. Distributions on Bank-Units for 1950 should therefore exceed those for 1949 and enable the recent steadily rising trend to continue.

Units can be freely bought and sold at quoted net prices (and information obtained) through any Stockbroker or Bank.

Offer Price 8th December 21/10½. Yield (conservatively calculated on net cost which includes commission and 2% Government Stamp Duty) £3/12½%, subject to reduced rate of tax allowing for D.I.T. relief.

Trustees: Martins Bank Ltd. Bankers: Barclays Bank Ltd. Managers: Bank Insurance Trust Corporation, Ltd. 30, Cornhill, London, E.C.3.

not on the future. Such a policy succeeded in 1946, but it gained no ground for Labour. Since 1946, however, the major issue of bank nationalisation has been raised, but not irrecoverably disposed of, even by the Privy Council's decision. There seems little doubt that public reaction to bank nationalisation was hostile when it was originally announced in August, 1947. Whether it is still so hostile remains to be seen. The Victorian State elections, fought on that issue in November, 1947, resulted in the Cain Labour Government being thrown out of office—which is probably why Mr Chifley and his senior ministers seem to want to regard the bank nationalisation issue as dead, although it has been resuscitated with vigour and frequency by the Opposition.

The progress of the election campaign has disclosed, however, cases in which the leaders have met on common ground on even some of the most controversial issues. For instance, Mr Chifley and Mr Menzies have both stated that if any utility were not being conducted efficiently in the public interest, or were exploiting the public, it should be nationalised. Both the Labour and Opposition Parties also subscribed to the principle of full employment, but they differ in the means of achieving it. And in the extension of social services, the Labour Party has by no means the monopoly, for Mr Menzies himself made it a cardinal point of his policy speech that he would endow the first as well as other children as at present.

New Organisation of Constituencies

The redistribution of electoral seats which became effective for this election seems to have given Labour more "certain" seats than it has given to the Opposition parties. The new organisation of constituencies, which was passed by both Houses of Parliament a few months ago, provides for an increase in the number of seats in the House of Representatives from 75 to 123 (including two without full voting powers) and an increase in the States' representation in the Senate from 36 to 60 members—that is, ten senators for each State. In the old House of Representatives, Labour held 43 seats against 32 held by the Liberal and Country Parties and Independents combined. Labour held 33 seats out of 36 in the Senate (only one half of the senators come up for re-election every three years), but in this election 42 candidates will be elected under a proportional representation system (a preferential system is followed in the House of Representatives), which is an innovation. Under the proportional representation system it is claimed that it is impossible for one party to win more than four Senate seats in any one state.

Mr Nehru Discovers America

[FROM A CORRESPONDENT IN NEW DELHI]

NEHRU'S "discovery" of America is the way in which Indians, and Nehru himself, have referred to his visit to the United States. But no one for a moment supposes that the process of discovery has penetrated very far, or indeed beyond the off-shore rocks and shoals. It was high time that the two-way process should begin, and that real contact should correct a distant and illusioned view. Nehru's visit was, ostensibly, a goodwill mission. These are apt to be written up fulsomely by the press of any country and soon forgotten, the Indian press being no exception. For Nehru, there was goodwill in America pressed down and running over. But from the very beginning comment in India seemed to realise that more than just goodwill would be involved. The American Ambassador had flown home in advance of Nehru; Pandit Nehru was accompanied by Sir Girja Bajpai and by Sir Chintaman Deshmukh, both formerly of the Indian Civil Service, and probably the best political and economic brains, respectively, in India today.

The Prime Minister's programme was so full that there would clearly have been little time for serious talk with

President Truman or his colleagues. But subjects might be started which it would be well to follow up, and this was to be the function of Pandit Nehru's advisers. Three pressing issues were likely to arise—and they did. First, where does India stand in the east-west cold war? Second, what is India's attitude towards recognition of Red China? Third, how far is the US Government prepared to help India, immediately and practically, to solve its economic difficulties, particularly by giving or lending a million tons of grain? The answers to these questions have not, so far, been satisfactory to either party; the further study of their implications will provide the first steps towards the understanding which both countries desire.

Dollars Without Strings

The attitude of the American press has been quoted in India thus: "Nehru wants our dollars, but will not take our side." To this, intelligent opinion in India has replied somewhat as follows: "We understand America's interest in India. Nationalist China is broken, and the western democracies are looking for a stable anti-Communist base in Asia. India is the obvious base. We are stable, we are large and we are not weak. But we are not a great power. We can hold no balance of power in world affairs, nor even mediate effectively in our neighbours' affairs. We see no object in taking sides openly in the cold war. But why worry? Short of taking sides, have we not done everything else to declare our sympathies? We have not been gentle with our own Communists; we have provided ourselves with a democratic constitution; and we are members of the Commonwealth. If you want to rush us into some system of formal military and political alliances, and the leadership of some South-East Asian league of small countries banded together in a declared defensive hostility towards northern aggressors, would that not be inviting, while we should still be collectively weak, the consummation of the very aggression you are hoping to prevent? Mao Tse Tung would then have an excuse for marching openly into Tibet and Indochina, with probable infiltrations into Burma and Malaya. It is no use reminding us of Europe in 1940. Our heads are not in the sand; but international Communism is farther away from us than Hitler was from Holland. There is still time (though not much) for what we consider the better course, in your interests and in our own. Help us to build up our economic strength, and particularly to remedy our shortage of food, the root of all our other economic troubles. It was less dignified than we could have wished to bring out the begging bowl so soon. We are honestly trying to help ourselves by encouraging foreign capital, extending compulsory savings, stimulating exports. But we need your help. A million tons of your surplus wheat, for which we need not pay cash down or by mortgaging our valuable, strategic raw materials, would do the trick. For goodness sake, let your generosity and your commonsense once more overcome your hard-headedness and suspicion. We cannot see eye to eye with you in all things overnight. Rightly or wrongly, socialism, nationalism and humanitarian progress mean more to us, probably, in our present circumstances, than they do to the western nations from whom we imbibed these ideas. If we cannot throw ourselves at once into your arms, we can still be your friends."

Goodwill and Home-Truths

That, by and large, sums up what Indian commentators, with great unanimity, have been saying. There are flaws in the argument of course, and several question marks; but the views are sincerely held. There is no disposition to claim that Nehru's American tour was roses all the way, or that Americans (and Indians) have not been disappointed in some respects, or that American aid is just round the corner. What is rightly claimed is that the visit was, in the context of world affairs, most opportune; that friendship based on honest recognition of differences at the outset is more likely to be firm and enduring, and that scarcely any

other statesman in the world could have exchanged goodwill for home-truths as charmingly as Nehru has done in America.

Since the Prime Minister's return, the Delhi Secretariat has not been working overtime, as might have been expected, to follow up the ideas and subjects which arose in the course of his tour. This is because his deputy, Sardar Patel, had already given them plenty to think about and work on while Nehru was away. Politics went into the background and, as one paper puts it, "a new edge was given to economic decision." The effects of devaluation provided cause enough. Such attention as is given to Pakistan these days is not in connection with Kashmir, but over the price of East Bengal's jute. Export promotion, company law amendment, rationalisation and the right of employers to retrench, the reconciliation of controls with a fair run for private enterprise, economy in government spending, relief of direct taxation and income tax investigation, the integration of States and Union finances—to say nothing of the new Constitution and a session of Parliament which hopes to crowd fifty Bills into eighteen working days—all these are keeping officials busy, practically to the exclusion of the effects of the Prime Minister's tour.

The Commonwealth Conference in Ceylon, in January, will pick up some of the threads, and briefs have to be prepared for that. Mao Tse Tung's glances towards Tibet have stirred some interest, and may suggest conditions for India's recognition of the Chinese Communist Government. The negotiations for exchange of American wheat for Indian manganese and mica are in a sticky patch, but India feels no pressing urgency, fortified by a good harvest and a successful deal for 390,000 tons of Argentine grain. These are about the only echoes of the tour that can be heard today, while other hammers are at work. But the voice of America, and the beginning of mutual understanding and friendship, are beginning to work already, without reverberations, on Indian confidence, as well as on its prejudices—and in ways which may come as a surprise to Pandit Nehru himself. A few days before his return a fellow Socialist remarked that the Government of India seemed to have reorientated their entire economic policy in favour of capitalists; and Nehru, questioned on the point in his first press conference after his return, was equivocal in his reply. Is he perhaps beginning to wonder whether facts are not already overtaking doctrine?

Civil Aviation in Hongkong

[FROM A CORRESPONDENT]

SINCE the Communists took over the greater part of China, the China National Aviation Corporation and the China Air Transport Corporation found themselves faced with the loss of about two-thirds of their routes. They still had, however, an important role to fill in linking up cities in Central China and connecting them with the outer world through Hongkong. With the defection to the Communists of both managing directors and a number of members of the staffs, who took with them ten CNAC planes and two owned by the CATC as well as spare parts and equipment amounting altogether to about £156,000 in value, the two companies suffered an even heavier blow, as they no longer knew whom they could trust. As a result they had no option but to cancel the registrations of their aircraft and to leave them grounded at Kai Tak.

As both concerns are largely Government-owned—the Nationalists having an 80 per cent interest in the CNAC (20 per cent being American interests) and possessing a majority interest in the CATC, which was formerly the Eurasia Air Corporation with a majority of German shareholders and reorganised after the last war—the Communists, who now regard themselves as the Government of China, consider themselves the legitimate owners of the 84 aircraft in Kai Tak. The Governor of Hongkong, however, has considered the matter of sufficient importance to issue a statement explaining that as long as the British Government has not

extended full diplomatic recognition to the People's Republic none of the aircraft will be given clearance to fly into Communist territory. In any case, they will have to be re-registered and flight schedules will have to be negotiated on an individual basis before they can be flown out of the Colony.

In the meantime, not only China but also Hongkong are suffering from the cancellation of the CNAC and CATC flights. They had spread such an efficient network of flights into the remotest parts of this vast country that not only Chungking but also Kunming and other towns are feeling the deprivation.

Second Airfield Needed

In the course of his recent visit to Hongkong Mr Rees-Williams, Parliamentary Under-Secretary of State for the Colonies, found time to visit the airport at Kai Tak, which stands on the Kowloon side to the east of the harbour. He was surprised at the amount of traffic handled, and he stated that he would press for the development of the new site at Deep Bay in the New Territories at the western end of the Colony. The importance where Hongkong is concerned of an early decision by the British authorities for work to proceed on the new site cannot be over-estimated. No matter how quickly the work may be carried through, it cannot be completed for at least two years and aviation developments are not likely to stand still during that period—to which must be added that the recognition of the Communist Government will most certainly bring increased air traffic through Hongkong. The fear that Hongkong may be side-tracked as a result of the use of larger aircraft has already been fulfilled in at least two cases: one important line from Scandinavia has had to make Bangkok its terminus, with a connection to Hongkong by smaller types of aircraft because Kai Tak airfield does not offer facilities for the larger ones now coming into use; in the same way the large stratocruisers used by an American line stop at Tokyo, using smaller planes as a link with the Colony. Even the new BOAC Canadair aircraft can at present only use the airfield up to a capacity of 74,000 lb., although it is hoped that as a result of the resurfacing of runways the weight will be increased to 80,000 lb.

As far as air traffic goes Kai Tak comes second in the British Empire and third where world aviation is concerned, and this position has been attained in the last three years in spite of handicaps imposed by the inadequacy of the airfield's size and the dangers from down draughts over the runways caused by the high hills surrounding it. The claim that Kai Tak is one of the three largest civil air bases in the world is justified by the figures for the past ten months issued by the Hongkong Civil Aviation Department, which show that from January to the end of October 23,675 aircraft used the airfield, comprising ten different nationalities and carrying between them 298,766 passengers, 287,485 kilograms of mail and 5,253,692 kilograms of freight—a daily average of 78 aircraft, 983 passengers, 945.6 kilos mail and 17,281 kilos freight. This is not a bad showing compared with the daily number of movements at London airport for the twelve months ending July last, which averaged 89. In October, which started with record figures but fell off after the taking of Canton by the Communists, 2,337 aircraft used the airfield, carrying 26,523 passengers and 27,061 kilos of mail and 1,366,185 kilos of freight.

With the present large air force in Hongkong, the airfield has often been hard put to it to arrange matters satisfactorily for the aircraft using its two runways; frequent comment is made by travellers as to the speed and efficiency with which such formalities as are required by the immigration, customs and medical departments are complied with. It is a matter of pride to all concerned with Kai Tak that accidents to civil aircraft have been reduced to a minimum, notwithstanding that the port is subject to high winds and fogs at certain times of the year which make landings particularly hazardous.

Infra-red Photography

Astronomers today are able to photograph stars invisible to the eye, pilots can take aerial photographs through fog and haze, and detectives are able to expose forgeries of anything from bank notes to Old Masters—all by means of modern infra-red photography. Although infra-red rays are similar to the radiations which we call visible light, they cannot be seen by the human eye. Nevertheless, photographic plates can be made sensitive to these rays by treatment with certain dyes. These plates can then be used to photograph objects that are invisible. A boiling kettle, for example, can be photographed in complete darkness because of the infra-red rays which it emits. Infra-red rays can also be used to photograph distant landscapes or stars because they can penetrate the atmospheric haze which scatters normal light.

The first crude forerunner of the infra-red photograph was made just over a century ago by Sir John Herschel. He exposed to the sun's rays a piece of blackened paper, the reverse of which had been moistened with alcohol. But during the decade following the end of the first world war investigations by W. J. Pope and W. H. Mills and their collaborators at Cambridge contributed greatly to the systematic study and preparation of infra-red sensitising dyes.

STEEL TAKE-OVER POSTPONED

What does this mean to you?

It means that thinking men and women of all parties who are increasingly uneasy about the nationalization of steel and its effect on prices, exports and employment have a real chance to ask for this question to be reconsidered.

The choice is between nationalization and the present proved policy. This policy is:—

- 1 To retain healthy competition in service, costs, quality and inventiveness.
- 2 To stimulate progress through co-operation in research, recruitment, training, etc.
- 3 To protect the public interest by Government supervision of the industry through a board, representing management, workers and the public.

Under this policy output has been raised, prices kept down and traditional good labour relations maintained.

STEEL

is serving you well

THE BUSINESS WORLD

Conversion and Monetary Policy

THE Government's conversion offer, announced at the end of last week, to holders of the maturing $1\frac{1}{4}$ per cent Exchequer Bonds has a significance extending much beyond the limited and professional circle of investors to whom it is primarily addressed. Rightly construed, this operation should set at rest many recent questionings about the role which monetary techniques are intended to play in the Government's economic policy as a whole.

The offer itself is simple and straightforward. During the seven business days up to and including Monday next, holders of the £787 million of $1\frac{1}{4}$ per cent Exchequer Bonds maturing on February 15, 1950 have the right to convert at par into a new $2\frac{1}{4}$ per cent Exchequer Stock redeemable exactly five years after that date. The significance of this operation lies, in fact, precisely in its straightforwardness. Among the various alternatives open to the authorities, an operation of this type was the only one which promised hardly any disturbance of the existing investment pattern. Indeed, if the authorities wished to avoid disturbance, they had scarcely any choice but to offer a "money market" security of this character. On the one hand, mere repayment of the maturing bonds out of the proceeds of additional floating debt borrowings from the banking system would have increased the Government's difficulties in dealing with future maturities and would also have been condemned as a relapse into a lax monetary policy reminiscent of 1946. On the other hand, recourse to a funding issue of medium or long dated stock would scarcely have been feasible in the present distinctly shaky state of the gilt-edged market's convalescence and would, in any case, have necessitated a yield basis involving much loss of face for the exponents of cheap money. Between these two extremes there lay only the limited range of "money market" securities. Within this range, the authorities could conceivably have contemplated the two-year bond which some City circles had been discussing; but to borrow as short as this would have involved an "unfunding" only one stage less objectionable than repayment by floating debt, and would have been construed as an admission of defeat. Each of these alternatives, it will be seen, would have involved a distortion of the existing equilibrium, such as it is, between money and securities. Once they had all been ruled out, there remained—as suggested in these columns a fortnight ago—only a security with a life of about five years.

In making its choice within this narrow range, the Treasury has wisely heeded the strongly held view in the money market that, for an issue of this character, a single redemption date is greatly to be preferred to the "spread" of dates which had become the rule (and from which, indeed, the maturing bonds were the only exception). The result is a bond which will mature in the only proximate year—except 1952, when the £1,911 million of $3\frac{1}{2}$ per cent War Loan becomes optionally redeemable—which previously had no compulsory maturity. By

issuing a short-dated security the authorities will minimise both the proportion of the maturing bonds which they will have to repay in cash and the amount of credit expansion which the operation may involve. This follows from the fact that a high proportion of the Exchequer Bonds is held by institutional investors who would be prepared—and may even be anxious—to exchange into the new security.

Of the total of £787 million, fully half was probably already held by official agencies before the conversion was announced, while the bulk of the remainder was in the hands of the banks, discount houses and other financial institutions. Among these, only the discount market is unlikely to convert the greater part of its holding. Although a five-year bond is technically a "money market" security, it is virtually the longest permissible date for the discount houses, and it would be undesirable for them to carry any substantial proportion of their portfolios in this form. Thus, although Lombard Street's holdings of the Exchequer Bonds had been reduced substantially in recent months—to a total of perhaps £80 million or so—only a part of them is likely to be converted. The unconverted portion, which will be repaid in cash, will not, however, involve any credit inflation. In effect, the repayment will simply mean that the discount houses will be carrying more bills and fewer bonds. A similar switching of banking portfolios would also occur if, and to the extent that, the banks abstain from converting. From this it follows that the only net creation of credit which this operation may involve will arise from the marginal sums which may be needed to repay unconverted bonds held outside the circle of financial institutions.

★

In each of these ways, therefore, the operation proves to be a strictly "neutral" act of monetary policy. Moreover the authorities have been careful to ensure that this neutrality extended to the precise terms of the issue. Just before the Chancellor's announcement, the $2\frac{1}{4}$ per cent National War Bonds, 1954-56, which are the nearest comparable security, stood at $101\frac{1}{2}$, and at that level returned £2 4s. 11d. per cent to their earliest date (3 months short of five years) and £2 6s. 4d. to the latest date. The indicated yield for a five-year bond was thus one penny or so above $2\frac{1}{4}$ per cent—and the sacrifice of this tiny fraction was plainly a negligible price to pay for the advantage of a single-dated security. In other words, the terms were strictly in line with the market.

Needless to say, many people have not been slow to point out that these same terms would have been strikingly above the market had the issue been made three weeks ago. On November 10th, at the moment of worst demoralisation, the 1954-56 Bonds stood a fraction below par, and their yield to the earliest date was rather more than $2\frac{1}{4}$ per cent. The difference between that situation and last week's is very largely due to the intervention of the Chancellor and his "creature," and is the

measure of his success in sending the bears scurrying for cover. For all that, responsible City observers are not disposed to draw from this sequence of events the same conclusions as were rightly drawn when apparently comparable tactics were employed by Dr Dalton. The renewed weakness in the medium and long-term market this week derives partly from a feeling that the Chancellor has now shot his bolt, and also reflects doubts about the reasonableness of the flattering yield basis produced by the bear covering. Second thoughts are now giving place to third thoughts. But, despite this scepticism about the current level, it is generally conceded that the fall in early November was overdone, almost to the point of demoralisation, and that the authorities acted sensibly and rightly in intervening. The City bears no grievance against the Chancellor for the $\frac{1}{4}$ per cent or so which has, in effect, been lopped off the yield of the new bonds by City activities—though tolerance on this occasion doubtless owes much to the fact that end-year balance sheets can now be contemplated without the terrors which confronted institutional investors a few weeks ago.

Even so, it is questionable whether City comment would have been as lenient if the rise in gilt-edged on the eve of the conversion really had been engineered by the methods of three years ago. In other words, if the Government broker had bought aggressively in an obvious attempt to resist the major trend of the market—or even if, without necessarily buying heavily, he had followed the market upwards in his dealings—the tactics would rightly have been condemned as rash and inflationary and even, given the imminence of the conversion, as dishonest. But, in fact, the authorities did neither of these things; they merely timed their momentary and modest intervention to ensure that the bears were given a push at the psychological moment, in the knowledge that, given the narrowness of the market, mere speculative covering would do all that was necessary. The fact that any intervention in the market necessarily involves a corresponding creation of credit does not mean that it ought never to take place. The authorities cannot be denied the right to “manage” the gilt-edged market in a technical sense; and the test of the quality of their management is whether it is conducted with restraint and whether it stops short of the point at which artificial conditions are created by efforts to swim against the tide. By these standards, official policy for some time past has been almost blameless. The only real lapse, which has caused much raising of eyebrows in the City, has been perpetrated by Sir Stafford Cripps himself, in his

The Economist — BY AIR

A further large extension of second-class airmail facilities makes it possible to quote reduced airmail rates for all Commonwealth and most other destinations in the Near, Middle and Far East, and in Australasia. Annual subscription rates are:

Near East	£6
Middle and Far East	£7
Australasia	£8

The validity of existing airmail subscriptions for these areas will be extended and subscribers will be notified individually. Air Express services, which are in all cases cheaper than the above rates, will remain unaffected. Enquiries about specific destinations should be made to:

The Economist, 22 Ryder St., London, S.W.1

remarks a fortnight ago at Bristol—remarks since echoed by Mr Douglas Jay and all too reminiscent of Daltonian efforts to “talk” the market higher.

With this one exception, all the recent evidence suggests a determination to follow a circumspect monetary policy. The lesson to be drawn from the terms of this conversion operation, and from the preparatory methods of the previous few weeks, is that the Government's intentions in this sphere have altered much less than many people were beginning to suspect. At least until last month's intervention, every observer of the monetary scene was impressed by the contrast between the monetary policy of the past two years (and especially of the past twelve months) and that of the Dalton phase. In that phase, monetary policy was a blatantly active influence, aggressively working against the avowed objectives of economic policy in its wider sense by rashly creating credit in the hope of forcing an unnatural reduction in interest rates. By contrast, in the past two years, especially in the past six months, the drift of gilt-edged values has been steadily downwards, and yet the authorities have made no perceptible effort to stem the decline.

Especially after the long-term interest rate had broken through the $3\frac{1}{2}$ per cent resistance point and began to rise towards 4 per cent—carrying it to levels beyond even the prewar normal range of “cheap money”—the continued inertia of the Government broker led many people to wonder whether the authorities were not becoming converted to the view that rising interest rates could impose a valuable discipline to supplement their physical controls. If this had indeed been the official view, it might even have been expected that, sooner or later, the whole structure of interest rates would be brought into line with the higher yields on gilt-edged. In itself, the fact of the Government's intervention last month was not sufficient to rule out such possibilities—because it was so restrained, and because it was clearly designed to correct the extremes of technical weakness in the market. But, in conjunction with other evidence—such as the Chancellor's refusal to alter the lending rates of the Public Works Loans Board and his decision that “there is no advantage to be gained” from a rise in short money rates—it is clear that rising gilt-edged yields, though they may have been tolerated, are still regarded as undesirable. On the other hand, there is no sign whatever that the authorities are slipping back into a Daltonian frame of mind. However much they may dislike the downward trend of the gilt-edged market, they now know that it can be dangerous to offer any large resistance to this trend.

The timing and form of this latest conversion, as well as the absence of any aggressive effort to check this week's relapse, are the final proofs that this is indeed the shape of official policy. While there is no longer any danger of a strongly negative policy such as Dr Dalton pursued, there is equally no hope of the strongly positive monetary policy which could powerfully reinforce—and even progressively supersede—the instruments of physical control. The aims of monetary policy, in short, are strictly neutral. Marketwise, this means that the degree of underlying pressure upon gilt-edged will be determined, not by monetary devices, but by the extent to which the various economy measures are inadequate to achieve a true disinflationary equilibrium. And, superimposed upon whatever underlying pressure is thus generated, there will remain the risk of sudden “liquidity” crises such as that which followed the devaluation.

Future for Films

NO cure-all for the ills of the British film industry was to be expected from the report, published this week, of the Plant Committee.* The committee has done what was required of it—

to consider, against the background of the general economic situation in the film industry, the arrangements at present in operation for the distribution of films to exhibitors and their exhibition to the public in the commercial cinemas, and to make recommendations.

In doing so it has also enabled the economic state of the industry to be seen in its relation to the state of the British economy as a whole; this is a great service, and something of a novelty.

Public attention tends to be concentrated on the producing end of the film trade. A week ago the report of the Gater Working Party showed that in the organisation and method of film production in the British studios, all is far from well; but it left little doubt (and the same suggestion is an underlying assumption of the Plant Report) that the producing end is also weak in its revenue-earning position and in its bargaining relationship to the distributing and exhibiting sections, to an extent which an internal reorganisation of production itself would be unlikely fully to correct. How, then, can production be put on its feet? By giving it a bigger share at the expense of the middleman? Certain recommendations of the committee tend in that direction. By reducing taxation? This the committee supports; but taxation can be reduced only at the expense of something else, and the proposal therefore concerns fiscal policy in general. By increasing the total earnings of the trade? This, again, is a general question, since what is spent additionally on films will be diverted from some other outlet. But further, in urging an expansive course, the committee uncovers some of the factors which restrict and depress the trade; and it is illuminating to note how far these correspond to general tendencies at work in the British economy as a whole.

The circuit system, together with the degree of vertical integration of the film industry, was inevitably a first candidate for attention. As the report points out, nearly a third of the 4,800 cinemas in the United Kingdom

* *Distribution and Exhibition of Cinematograph Films*, H.M.S.O., 1s. 3d. Lord Portal, the first chairman of the committee of inquiry appointed by the President of the Board of Trade, died on May 6th, and Sir Arnold Plant succeeded him as chairman.

are owned by companies which control not less than 20 each; and 974 of these are controlled by two groups which have also their own distributing companies, their own film producing companies, and their own studio space. The groups are the J. Arthur Rank Organisation (310 cinemas in the Odeon circuit and 414 in the Gaumont-British; the group also extends further into film processing and the production and sale of film-making equipment and cinema equipment) and the Associated British Picture Corporation (414 cinemas in the ABC circuit). These figures do not express the real power of the circuits, which is based largely on their control of the big cinemas. The three circuits own a third of the aggregate seating capacity, and the average capacity of their halls is 1,481 seats—double the average size of all the rest. They own 71 per cent of all cinemas with more than 1,500 seats; these are the “first run” halls which can charge the higher prices, and any distributor seeking to put a film on the market must therefore come to terms with one of the three circuits. It is the entrenched habits of the distributing and exhibiting trades which give the big groups their important place in the question. The report shows that these entrenched habits work in a restrictive and uneconomic way; and the power of the big circuits aggravates their effect.

The “barring” system is one example. Under this long-established custom a cinema which hires a film can make a condition to bar the showing of the same film in a competing house at the same time or immediately afterwards. Thus the competing house may not even announce the film as “coming shortly” so long as the prior run is on. Commercially the practice is defensible, and the report defends it, with a qualification:

The practice should, however, so operate as always to ensure that the cinema owners pay the best price they can for the best films and that exhibition is not unreasonably delayed or restricted.

But it is precisely these conditions which existing custom fails to observe. The “competitive” areas are often too large, and in country districts “they frequently embrace several small towns between which transport services are infrequent and so costly as to make a visit to see the film impracticable for many people.” Although the bar remains in force for only a fortnight in theory, the neighbouring cinemas often do not get a copy until

the public has forgotten about the film. Thus the producer, as well as the smaller exhibitor, loses revenue. Finally, it is not always the largest cinema, or the one with the highest earning-power, or the most appropriate cinema, which gets the first offer of a film:

That is due to the bargaining power of the circuits, which are strong enough to require that some of their smaller or less suitable halls shall take precedence over larger or better ones in the same district as their condition for booking a picture at all.

Here again, the producer and the trade as a whole lose revenue; only the exhibiting circuit gains.

★

The committee does not propose to demolish the circuits or dismember the vertical groups. It did consider such proposals, but felt that the present objectionable practices would quite possibly survive the demise of the circuits. Individual cinemas "in certain monopoly situations" ought, perhaps, to be detached from the circuits, and an inquiry by an independent body is recommended into this question. (This independent body would also have other duties.) But more weight is put on a series of arrangements which are proposed to create in each "competitive" district a competitive situation. The essence of these new arrangements is that in each district the renter would be obliged to offer a film to all the houses able to bid for it, and would be obliged to accept the most remunerative offer. Class distinctions would clearly have to be made between houses capable of bidding for a pre-release run, ordinary first-run houses, "A" and "B" houses—each according to size, prices, and box-office record. The novelty would be that an independent cinema could, if its earning power was higher, displace a circuit cinema in the competition for the prior run of a film which both were anxious to obtain.

This is representative of the committee's proposals, which express one fundamental contention:

The introduction of more active competitive trading at each stage of the process of film distribution and exhibition is an essential condition for any real revival of prosperity in the industry.

With this thesis constantly in mind, the committee has produced suggestions to serve three general purposes. The first of these is to increase the total box-office yield. The changes in booking methods already outlined are designed to bring each film to its best commercial outlet, and thereby "to stimulate and satisfy public demand."

The second purpose might have been expected to be to increase the share of the net box-office yield which goes back to the producer. But the committee has decided that the exhibitors—even after the reforms suggested—could not sustain a marked increase in their percentage payments for film hire; here, therefore, the committee set itself a different objective:

We have applied ourselves to the task of formulating proposals which will in our opinion make the payments by the exhibitor to the distributor for each and every film, whether a first or second feature or a short, more closely commensurate with its full potential value to the public.

Clearly the reintroduction of competitive bidding would go some way to secure this. To reinforce it, the committee suggests that the maximum of 50 per cent for film hire, maintained by the members of the Cinematograph Exhibitors' Association after their trials with

Gone with the Wind, should go. The committee is probably right in regarding this as a restraint of trade; but the exhibitors are themselves faced with many such restraints, and the abandonment of this one ought to be conditional on removal of the others. The report contends that exhibitors, while they pay less than full value for a really first-rate film, pay more than they should for the inferior films. If both practices could be cleared away, it hopes that features and supporting films would begin to get something equivalent to what each one is worth. The next proposal appears to follow from this: distributors should be prohibited from making the hire of one film (which the exhibitor wants) conditional on hiring another film (which he may not want). But here one of the members, Mr J. H. Lawrie, makes a reservation: this proposal would in his view add to the already formidable discouragement of new entrants and experimenters in film production.

The third purpose is to reduce distribution charges. The distributors keep on an average 25 per cent of their gross receipts from first-feature films: that is, in 1948 the exhibitors paid £10 million in film hire for British first features, the renters kept £2,500,000 out of this, and £7,500,000 was left for the producers. This, the report suggests, is in general too much. It is also not spread in a reasonable way; some films sell themselves easily, while others require an effort; the producer ought to be rewarded for making a film which sells itself, and the renter ought to be rewarded for a successful sales effort. Various measures are suggested for giving the producer greater control over the distribution of his product, a voice in the sales budget, and elementary information which would help him to assure himself of fair treatment. And it is suggested that a distributor's charge of 15 per cent, "after the deduction of disbursements," is enough on a film of average merit; for exceptionally successful films the renter might reasonably get as little as 10 per cent.

★

If these proposals are considered side by side, it is not difficult to see that most of them relate to the same general condition. The film trade, though it is not an old industry, appears as one of those industries which have already taken on a settled, rigid, and in some ways uneconomic set of habits. Distribution has assumed a fixed pattern which does not adapt itself to the individual possibilities of the films which it has to handle. The dealings between exhibitors and distributors take too little account of the potential earning power of each exhibiting unit; they also allow too little room for the exercise of the retailer's proper function, which should be to judge the taste of his customers and to back his judgment. In the practice of the trade, public taste has to an astonishing extent come to be disregarded. In consequence, public demand is not "stimulated and satisfied," and the net earnings are neither as great as they might be, nor as closely related as they might be to the potential earning capacity of each film.

In certain ways Government policy towards the industry has aggravated this tendency to pay less and less attention to the consumer. The high quota is one example. The committee is not concerned primarily with the quota, but it observes:

The quota requirement is high in relation to the output of British first feature films, and most exhibitors find them-

selves compelled to book almost all the British films, good, bad and indifferent, which are offered to them, if they are to comply with their statutory obligations. The public is not, however, compelled to go and see them, and box-office takings record their discrimination.

Demand for many commodities today in the British home market is inelastic; the goods are scarce, and if they come up to a reasonable minimum standard of serviceability they will be bought. This will go on so long as inflation persists. But it does not fully apply to the film industry; people can stay at home.

★

The present restriction of the number of copies made of each film is an excellent example of how an industry of this kind is not stimulated. An economy in film stock was enforced by the Board of Trade during the war; the number of copies made of each film was cut down, the number of concurrent showings reduced, and the exhibiting life of each film extended. After the war the rationing was officially ended—but the Board of Trade stipulated a continued thrift in the use of film stock. As a result, 35 or 40 copies of an average film are made today, while (the committee points out) 100 was not an unusual figure before the war.

As a consequence, an arbitrary and unbusinesslike limit has been placed on the number of concurrent showings of a film at the time when public interest in it is at its peak. We have had evidence that exhibitors trying to book a film have met with the reply that no copy was available. . . . Producers' receipts are both delayed and smaller in total. It is for this reason that the London general release area is today divided into three districts; the north-west gets "first-run" showings in one week, the north-east in the second, the south in the third.

The film industry is too heavily taxed; this the committee states firmly. Perhaps, however, it is worth remarking that not merely the film industry but the whole national economy is too heavily taxed. Entertainments Duty takes 36 per cent of the gross revenue of the

cinemas. This does not impede the supply of imported films. But home-produced films depend substantially on their earnings in the British home market, and this puts them at a disadvantage:

If the number of first feature films exhibited were 210, the average return to the producers would be £89,200; if 300 films, it would be £62,500. On either assumption, the average cost of production cannot be recouped at present from the cinemas in Great Britain.

High taxation is one cause of this. But it is also worth noting that the Government has used its influence to discourage any increase in the price of seats, and the tax is so graded as to make price increases unrewarding.

What, then, is to be done? The committee suggests not a direct subsidy to production, but a reduction of tax; if, it contends, the restraints of trade could be removed and competition fostered, the benefits would distribute themselves. As to imported films, the relief of Entertainments Duty could be offset by an import duty of equivalent yield.

The committee has been concerned with the film industry alone, and all its proposals arise from one assumption: that "it is an accepted aim of national policy" to make possible a certain level of British film production. Plenty of Government pronouncements have suggested that this is, indeed, the policy. The difficulty arises when an attempt is made to relate this policy to the trend in national economic affairs as a whole. There are other national policies, of a different tenor. A high level of sumptuary taxation is one feature of national policy. The restriction of prices by artificial means is another. The committee attacks both of these. It attacks restraints of trade. It urges freer competition, better rewards for successful enterprise, and heavier penalties for failure. Most shocking of all, it seeks openly to devise means for making the consumers' taste the final arbiter of failure or success in business. To concede these things for one industry would indeed be a breach in the dyke.

Business Notes

Dollar Incentives

The President of the Board of Trade attracted much public attention on returning to this country by his remarks about incentives to dollar exporters. His references to the Dutch scheme, whereby 10 per cent of dollar earnings may be retained by exporters, suggested at least the possibility that Mr Wilson had been persuaded by his observations in the United States that such a scheme would assist dollar exports from this country. On Thursday, he disclosed that no scheme was at present under consideration by the Government, but that the Dollar Exports Board was reviewing "all possible incentives" and that its views would be received with "a very open mind."

That the Government should be prepared to spare any time for the consideration of incentive schemes is, perhaps, a mark in its favour—though the Chancellor of the Exchequer also put forward on Thursday the astonishing proposition that he was tired of arguments which called for "bribes" (that is, incentive payments) to people whose plain duty was to do what the Government told them, irrespective of sordid economic considerations. It is an objection difficult to square with tax-free payments to informers about infractions of the exchange controls. But there are wider questions about specific incentives to dollar exporters. The Government earlier this year examined proposals of this kind, but rejected them on the ground that the prospective

increase in dollar earnings would not justify the administrative complications which would be involved. Mr Wilson suggested that they would be particularly difficult to operate "in the particular circumstances of this country"—which presumably means that they would fall foul of the doctrine of "fair shares," among other things.

More fundamental issues, however, are at stake than this nonsensical addiction to absolute equality. Why are specific incentives needed for dollar exporters? Surely, because the whole direction of economic policy still makes it too easy to get a comfortable living in the home market and the sterling area. Dollar incentives—whether in the form of 10 per cent of the dollar proceeds, or dollar food for workers and nylons for their wives—are simply an admission that an economy burdened with inflation at home (and in the sterling area) and shackled by suppressed prices and suppressed exchange movements, is incapable of producing the shifts of manpower, production and selling effort which the dollar shortage obviously calls for. It is an attempt to introduce a spurious "flexibility" into a system which itself becomes increasingly inflexible. As for the administrative complications, they would be legion. How does a firm which happens to be at the dollar exporting stage share the 10 per cent (if that is the right proportion) among its own workers and—no less important—among its suppliers? Or do the latter get their incentive in the form of higher sterling prices for their contribu-

tion towards dollar exports? If that step is conceded, surely the argument comes full circle in favour of more flexible economy in which relative prices and wages again have significance, and in which such neo-Schachtian devices as special dollar incentives would be dismissed in a howl of laughter.

Development Councils and the Law

The deterioration in the Government's relations with certain industries over the setting up of development councils has been growing more marked for some time; and the wool textile industry, which has been the most open and the best-organised opponent, took a step last week which can only mark the opening of a new phase in the question. In a letter addressed on its behalf to the Board of Trade, the Wool Textile Delegation made known its intention of taking action in the courts to test the legality of the Government's actions. Precisely which actions are in question—and whether they are actions already taken or merely intended—has not been made known, and comment on the substance of the matter would in any case, perhaps, not be proper at this stage. But two things are clear. One is that the Wool Textile Delegation has taken a serious step which removes any possible doubt of its refusal to fall in with the Government's wishes. The second is that the development council timetable has, in consequence, been suddenly upset. The order to set up the development council for the wool textile industry was to have been debated in the Commons on Thursday; and the debate was postponed. It may be supposed that the Board of Trade is seeking advice before deciding whether or not to proceed further in Parliament before the legal issue is settled.

Following this news, it has become known that one of the organisations in the clothing industry has decided to take steps to test the legality of the Government's actions so far as the development council for the clothing industry is concerned. This presents the Board of Trade with a somewhat different problem. The order for the clothing industry has already been approved by Parliament, and the President of the Board of Trade should, in the normal way, announce the membership of this council by January 1st. Presumably, therefore, he now has to decide whether the institution (or, rather, the threat) of legal proceedings requires him—or even entitles him—to postpone the discharge of his obligations.

Banking in South Africa

The large changes in economic conditions in South Africa during the past year or so have left a marked imprint upon the balance sheet of Barclays Bank (D. C. and O.), roughly one-half of whose business is transacted with or within the Union. The large deflation of the banking structure in South Africa, and especially the running-down of the Union's London balances, are clearly reflected in a sharp contraction in the bank's deposits. In the year to September 30th, these fell from £387 million to £341 million, their first significant fall since the bank's formation in 1925. Among the bank's assets, the counterpart of this contraction is mainly to be found in its cash holdings, which dropped by £40 million—or by slightly less than the decline in its balance with the South African Reserve Bank.

Despite the declining trend of deposits, the year has been one of intense banking activity, principally because of the successive drives by South African importers to secure the maximum of supplies before import restrictions took effect. Thus the bank's advances have not merely been maintained at the high level reached in 1947/48, but have actually risen by a further £2,000,000 to £106 million, or appreciably more than twice the level at which they stood three years ago. Deposits, by contrast, are now some £10 million below their

1946 level, so that over these three years the advances ratio has risen from 14 to nearly 31 per cent. Thanks to this activity—which also extended to the bank's business in bills, despite the small decline shown in the portfolio at the balance sheet date—profits have risen further, though at a slower rate than in 1947/48.

In his annual statement published with the accounts, the chairman, Mr Julian S. Crossley, emphasises the inevitability of the emergency measures which South Africa has lately had to take. He considers, however, that the improvement in the Union's terms of trade which devaluation has brought about will give a significant relief. Although restrictions on dollar imports may have to be maintained for a time, "it seems certain that South Africa should, in the near future, be able to restore her sterling resources to a figure which will permit of normal imports from the United Kingdom." This is a more cautious view than has been apparent in certain recent press reports from the Union; even so, it seems to presuppose a continued inflow of capital from Britain.

Higher Railway Charges

The debate on Thursday of last week on the first report of the British Transport Commission was hardly more successful than the debate on the Coal Board's report as an essay in the working out of a technique of public audit of nationalised industries. It was inevitably concerned more directly with the Commission's application for increased charges on freight traffic, of which an account was given in last week's issue. The Minister of Transport praised the work of the Commission in 1948 and the excellence of its report and accounts; he outlined the conciliation machinery which has been set up. The rest of his speech was almost entirely concerned with charges.

Mr Barnes denied that he appeared as the apologist of the Commission. But he certainly acted as a very sympathetic interpreter of an application on which he has to give judgment. The flat increase of one-sixth in present freight charges is an emergency measure which has no connection with the charges schemes which the Commission has the duty of preparing. On these schemes, Mr Barnes added little to the information in the Commission's report; the general principles which have been worked out on conditions of carriage and standard mileage will soon be made known, but the major tasks of classification of goods and schedules of rates have yet to be tackled.

The Minister very properly dismissed the idea of a subsidy as a temporary way out of the railways' difficulties:—

I do not consider that this House should influence the industry to assume that its problems can be transferred from the industry to the taxpayer.

To be quite fair to the Commission, such suggestions came almost entirely from back-bench supporters of the Government, not from the industry, as Mr Barnes was ready to recognise. But he would have none of the argument that the deficit confronting the railways was due in any degree to inefficiency. Every test, he claimed, proved the contrary, but the tests he quoted were confined to examples of rising costs cited in the 1948 report.

Silence on the "C" licensed vehicle was not the least of the omissions in a speech designed to put a fair complexion on the work of the Commission and to deal in a receptive manner with its claims for increased charges. This is far from encouraging. The members of the Transport Tribunal will be sitting in private early in the New Year to hear the contentions of bodies affected by the proposed increases. There will be no occasion then for an examination of the efficiency of the Commission or of the railways. Their report will be purely advisory on the merits of the application alone. Its consequential effects will be far from negligible—is. to

4s. on a ton of coal according to distance hauled, and about 5s. on a ton of crude steel. Here is a problem of major public interest. Who is to act as the custodian of that interest? Not, on last week's showing, the Minister of Transport.

Industry and Trade

Coal Output and Finance

Coal output rose again last week, and the total of 4,572,100 tons was the highest recorded this year; deep-mined output rose by 86,000 tons to 4,355,000 tons, and opencast production increased by 20,000 tons. The cumulative total from both sources for the first 48 weeks of 1949 is 198,778,300 tons, and a reasonable chance now appears of reaching the lower of the two target figures for the year (215 and 220 million tons) which were mentioned in the *Economic Survey*.

The quarterly statistical statement of the National Coal Board for the third quarter of 1949 shows something of the course of the board's financial affairs during the year. The surplus for the quarter, after allowing for interest and interim income to coalowners, and after deducting £650,000 for estimated liability for profits tax, was £2,350,235. This is £141,500 less than in the second quarter of this year, but since operations in the third quarter are considerably more disturbed by holidays it is by no means an unsatisfactory result. The third quarter of 1948, by contrast, showed a deficit of £373,000.

Perhaps the key figure at which industry will look is the cost of producing a ton of coal. This rose by nearly 4½d. as against the second quarter (from 45s. 2.2d. to 45s. 6.6d.); and it was nearly 1s. higher than in the first quarter of the year. It was still, however, below the level of the third and fourth quarters of last year, and it can be blamed on the

holidays. It is still possible that, when the figures for the full year are available, it will appear that the general trend of coal costs is now slightly downward. Proceeds per ton in the third quarter, at 48s. 2.8d., were higher than in the second quarter, and 6.7d. higher than in the third quarter of 1948. This the board attributes "partly to the price adjustments introduced in May, 1949, and partly to improvements in coal preparation resulting in the marketing of better qualities of coal."

In commenting on the statistics, the board draws attention to two "substantial provisions" which have not yet appeared in the accounts, but which "may yet prove to be necessary." The first of these is a possible increase in liability for workmen's compensation cases arising before July, 1948; it appears to turn on the question whether the five-day week constitutes in law a "change in rates of remuneration." The second possible liability will be of interest to many industrial enterprises: it is for a "taxation reserve" to cover the initial tax allowance for depreciation. This, as the board points out, has reduced current liabilities for taxation, but will add to future liabilities.

Fall in Free Sterling

The decline in the quotations for transferable and bilateral account sterling, which began very soon after the first surprise that the new official rate had been fixed as low as \$2.80 had been overcome, has gathered momentum in the past fortnight. The discounts now prevailing look distinctly threatening. As these discounts widen, third country trade in a growing range of goods and commodities becomes possible. Estimates from New York suggesting that sales of "cheap" sterling there amount to £125,000 a day or more (against £250,000 a day before devaluation) may or may not

COMPLETE WORLD-WIDE BANKING SERVICE

With the immense strength of its combined resources and experience, the Three Banks Group is exceptionally well-equipped to fulfil the many varied functions of a modern Banking Service. Although the Group serves the interests of many large and important concerns, it is careful to preserve the personal touch that has been a tradition of each of its members during two centuries.

ROYAL BANK OF SCOTLAND
Founded 1727 Edinburgh, London and Branches
GLYN, MILLS & CO.
Founded 1753 London
WILLIAMS DEACON'S BANK LIMITED
Founded 1771 Manchester, London and Branches

Traders and industrialists looking for opportunities in the undernoted Territories should get in contact with the National Bank of India. Topical information on business matters and a comprehensive banking service are ensured by a network of branches in these areas. Your enquiry is welcomed at Head Office.

Deputy General Manager: N. W. Chisholm
London Manager: W. Kerr

measure the volume of such trade with fair accuracy. But arithmetic apart, there can be little doubt that free sterling rates have fallen to a level where interest in commodity shunting has quickened, and the risk of losing dollars to third countries has increased. The table below gives recent movements in free sterling:—

FREE STERLING IN NEW YORK						
Dollars per £						
Type of Sterling	November 11th		November 29th		December 6th	
	Price \$	Discount(a) %	Price \$	Discount(a) %	Price \$	Discount(a) %
Accounts:—						
French	2.60-2.63	7	2.55-2.60	8	2.45-2.50	12
Belgian	2.61-2.64	6	2.53-2.55	10	2.44-2.47	12
Dutch	2.70-2.75	3	2.73-2.76	2	2.73-2.76	2
Chinese	2.60-2.64	7	2.50-2.55	10	2.43-2.46	13
	2.60-2.63	7	2.50-2.55	10	2.42-2.55	10

(a) Based on middle prices.

The first quotations after devaluation were around \$2.75; October saw a decline to around \$2.62 with a few quotations in one or two centres down to little more than \$2.50. The new and much more serious decline set in during the second half of November; by Wednesday of this week Dutch account sterling had fallen a further 3 cents to \$2.40-\$2.43. This discount is now fully 14 per cent compared with about 25 per cent during the summer months when the existence of the free sterling market was an important factor both in the decision to devalue and in the choice of the new rate. If, indeed, it is true that daily sales of “cheap” sterling now run well into six figures, the Chancellor of the Exchequer might surely seek reasons other than the mere assertion that “if people in this country did not go out of their way to deery sterling it would be all right.”

Freight Market Recovery

Freight rates in the tramp shipping market are beginning to revive. Many factors often combine to produce renewed activity at the turn of the year, but it is generally the chartering of new season grain in the Southern Hemisphere which affects most of the world's trade routes. In this respect the River Plate chartering market has once again provided the key to tramp freight rates. Outward chartering from the Plate, which has been stagnant for longer than usual, showed signs of activity in the last week of November, when a ship was chartered for the Continent, December loading, at 33s. 6d. The next ship for similar business obtained 35s., and current rates for January loading are in the neighbourhood of 42s. For vessels available in the first three months of 1950, the prospects are that rates will harden further, since shipments of maize, which have been held up by the Argentine authorities since October, will begin to flow according to agreements with (amongst others) France, Italy and Britain. Argentina has also entered into contracts with India and Japan to exchange commodities, and shipment of these will begin early next year.

The improved prospects of homeward employment have naturally been reflected in a fall in outward rates for coal to the Plate, which have declined several shillings from the level of 42s. 6d. Dollar freights for United States coal to Europe, however, failed to revive after the end of the American coal strike, and this market has been superseded by the revival of Continental and United Kingdom coal chartering for Mediterranean countries. Outward coal rates from UK/Continent have improved from about 17s. to 22s. for West Italy and about 19s. 6d. to 26s. for the Adriatic.

The movement of grain from Australia to the United Kingdom is still a matter for conjecture, since the disagreement over prices has not yet been resolved, but Australian grain is moving to Japan, the Far East and Middle Eastern

destinations, and in this trade there have been many fixtures at slightly improving rates. The general increase in rates can be attributed partly to seasonal chartering and trade movements, and partly to an accidental improvement in the distribution of available tonnage. Increasing demand for the carriage of North Pacific lumber to Atlantic ports, for example, has drawn off some of the tonnage which had accumulated in the East. At the same time, the decline in trans-Atlantic coal traffic has caused the laying up of many high-cost ships which need dollar freights to justify their existence.

Employment in Ship Repairing

It is easy to understand that experience has made industry on the Tyne, Clyde and Mersey sensitive to threats of unemployment in shipbuilding and ship repairing. But the agitation which has begun to appear, and the pressure on Members of Parliament and Ministers to take political action, make it necessary that the roots of the matter should be properly examined. It has to be recognised that the immense wartime expansion of shipbuilding and repairing activity could not be expected to last for ever. More than 100,000 workers were brought in from other industries during the war to deal with the abnormal demands on the shipyards, and the yards themselves were obliged to farm out much work to sub-contractors. Naval work fell off rapidly at the end of the war, but the enlarged labour force was still needed to attend to the large volume of merchant ship reconversion and arrears of maintenance.

This abnormal work was bound to come to an end, and throughout 1949 it has been declining as the ships concerned have gone back into service. Many of the workers involved are employed by firms which are not primarily shipbuilders or repairers, but which normally engage in other engineering or “finishing” trades. But they may have been classified during the war as engaged in shipbuilding and repairing, and it is likely that many are still retained as such in Ministry of Labour statistics. The regular shipbuilding and repairing firms, which are now relying much less on assistance from other industries, regard those figures as inflated. This may explain the somewhat alarming figures which were quoted at a meeting of trade union delegates in Newcastle last Saturday, when it was claimed that the industry had already shed 75,000 men and that another 75,000 were likely to find themselves unemployed before long. Such statements have to be viewed in the light of the fact that ship repairing firms employed directly only about 30,000 men on the average before the war, and never more than about 80,000 at the wartime peak.

It need not be denied that large numbers of men are finding, and will have to find, alternative employment as the ship repairing industry returns to more normal and competitive conditions. The shipbuilders have still a solid background of orders for new ships which will keep them fully employed for some two years, although the volume of work will then fall off sharply if new orders cannot be attracted at a higher rate than at present. The future level of employment, in fact, is largely a matter of competitive price in an international market, and of the ability of workers and managements to meet competition. The moment is not, therefore, a happy one for the Confederation of Shipbuilding and Engineering Unions to insist on its claim for an extra £1 a week for its members. At the same time the ship stewards have been busy lobbying MPs with some highly coloured proposals—one of which would prevent British shipowners from having their ships repaired overseas. These pay no regard to their obvious long-term effect on the maritime industries. But it seems likely that Lord Hall and Sir Stafford Cripps, who are to discuss questions of employment with representatives of the unions, will bear the longer-term considerations in mind.

Progress with Atomic Energy

In reply to a question in the House of Commons on Monday, the Minister of Supply made it clear that Britain has still only two atomic piles in operation. Both are at Harwell and are of too low a power to be more than research tools, although they can supply radio-active materials for routine industrial and medical uses. The smaller pile came into operation in the summer of 1947 and the second nearly a year later. Neither of the two piles at Sellafield in Cumberland is yet ready. This plant was to have three chain-reacting piles designed to produce fissile materials, but work on the third has been stopped. The official explanation speaks of a review of the programme and “possible developments in the near future.” The rate of progress at Sellafield must to a large extent control the speed of development throughout the entire programme because the fissile materials, at present limited to uranium and plutonium, are essential to the production of atomic weapons and will probably be the basis of any commercial development of atomic energy.

The siting of a third plant near Chester was announced a little over a fortnight ago. Beyond saying that it is “connected with” the atomic energy programme the Ministry of Supply has given no indication of the purpose of the plant.

A new cyclotron, claimed to be the most powerful in Europe, was successfully tested at Harwell this week. Although low energy piles have long superseded the cyclotron as a source of radio-active material, cyclotrons remain one of the basic tools of nuclear research. The Harwell cyclotron is one of the few to have sufficient power to produce mesons—which are believed to be the link holding together the particles in the nucleus of the atom. Since the whole atomic programme begins with the deliberate disintegration of this nucleus, knowledge of the character and behaviour of the mesons may suggest a new approach or at least simplify present methods. Hence, the importance of the cyclotron lies in its use for research into these fundamental problems. Similar lines of research are being followed in the United States.

Anglo-American Visit to Japan

The representatives of the British and American cotton textile industries have concluded their talks in the United States, and have agreed that a joint mission from both industries should visit Japan soon. The British cotton industry has been urging such a mission since last year; but the Americans showed at first some reluctance to undertake it, and were in general less interested than Lancashire in the dangers of Japanese competition. Four delegates from each of the two countries are now suggested; and the task of the mission will be confined to fact-finding. This is probably the best arrangement that could be made. Too little is known in the west about the course of affairs in Japan, and

about the considerations which are likely to govern the revival of the Japanese textile trade, for any firm proposals produced at this time to have much chance of acceptance. There is, in any case, little doubt that the picture of Japanese trade has been changing in the past year and has not finished changing. A survey and a report—if they do not proceed from unreasonable or restrictive premises—may therefore give Lancashire a better basis on which to frame its trading policy.

It is known that, where the British tend to be concerned with Japanese questions, the American cotton textile industry is more interested in its sales prospects in the sterling area and the other places (including North America itself) where British and American cotton textiles come into competition. The cautiously worded statement which was issued at the end of the talks expresses this interest. The British representatives gave an assurance that they would not use currency difficulties or Government “administrative procedures” to make “unnecessary barriers” to American textile exports. The Americans expressed understanding of the British need for dollar earnings. These general and guarded assurances may mean little; or they may conceal a genuine approach to understanding.

Trade Talks

The two-day review of trade and payments by the Anglo-French economic committee this week was concerned with the sudden emergence of a sterling surplus in France—until recently France suffered from an apparently chronic sterling deficit—but the official communiqué gives no hint of any measure to reverse the new condition. The changing trend in payments, if it persists, will call for an early revision of France's drawing rights on this country; the committee discussed this question but decided to leave over a decision until early in 1950. At the moment, French drawing rights in sterling exceed France's needs and considerable sums have not been taken up.

The trade and payments talks with Sweden were expected to be concluded by the end of this week, but some of the really difficult aspects of the negotiations have still not been resolved. Indeed, the Swedish delegation in London holds that it has gone as far in making concessions as its brief allowed, and has returned to Stockholm. One of the difficulties, it is believed, is the gap between the amount of timber Sweden is willing to supply and the amount Britain would take. On the financial side, Sweden's anxiety about its sterling surplus must be rising as the value of the pound declines in the free market. Sweden has accumulated further sterling this year—its balances now exceed £40 million—and it is most anxious to continue the revaluation guarantee under which its sterling balances must be written up in terms of kroner in the event of any sterling devaluation not followed *pari passu* by Sweden.

THE ORGANISATION OF

While talks with France and Sweden are beset by difficulties because the two countries command at present sufficient, if not excessive, sterling, talks with Spain and Poland are conducted against a background of too little sterling. Thus the review of Anglo-Spanish trade for 1950 was unable to envisage any great expansion because Spain's sterling shortage persists. The Spaniards invariably come to these meetings armed with long lists of goods they would like to buy here; but they find it hard enough to pay for even their present level of imports.

The renewed talks with Poland concern compensation for British assets and a settlement of Polish debts. Like all negotiators from the iron-curtain countries, the Poles are unable to deviate an inch from their instructions, and when they were told, firmly, a fortnight ago that their offer was quite inadequate, they went back to Warsaw for consultations. They have now returned, more quickly than was expected, with new proposals.

* * *

Cable Scheme Rejected

The Cable and Wireless scheme (described in *The Economist* of November 5th) required 75 per cent approval. The proposals submitted to the ordinary stockholders of Cable and Wireless (Holding) failed, in the event, to secure even a simple majority. This result is the more convincing because the directors could already command the support of ordinary stock held by the constituent or associated companies. Out of £6,883,103 of ordinary stock on the register, holders of £2,447,461 voted for the scheme and £2,546,792 against, and the voters against outnumbered those for by two to one.

Although Sir Edward Wilshaw affected to be perplexed by the attitude of stockholders at the meeting a fortnight ago—they had been offered £32 million, yet they spurned it—their vote is decisive in one respect. It may not commit the opposition to the principle of liquidation and nothing but liquidation, but it clearly commits the directors to find an acceptable compromise. The criticisms of the size of the investment trust which was proposed and the cost of running it clearly struck home. No doubt in the event some stockholders who have recently argued strongly for liquidation might on certain terms be prepared to settle for a larger distribution to the ordinary shareholders and an investment trust of smaller size.

But in principle the arguments for an orderly liquidation of the company's assets and their total distribution have not been overthrown. It is no answer to this case to say that realisation will involve throwing good stocks on to a bad market; properly conducted, realisation need do nothing of the sort. The chairman has promised to give "some form of analysis" of investments in "future balance sheets." Surely, such an analysis should be given with the new proposals, assuming (as is probably safe to assume) that they are a diluted version of the original scheme and provide merely for a larger distribution of assets and a smaller investment trust. Without it, stockholders would again be invited to discuss their own fate without access to sufficient facts.

Commodities and Prices

Argentine Maize Mystery

The Ministry of Food has again succeeded in creating a mystery—this time by its purchase of 300,000 tons of maize from Argentina. It is hardly to be congratulated either on the way in which the purchase was made or on the secrecy in which the deal was encased. The contract was in fact concluded some little time ago. It was made in London by direct negotiation with one particular firm, instead of being put on to the market for general tender as in the past. (The Ministry had promised to buy through the trade and had

discussed terms for this year's Argentine contract with the informal committee of grain shippers). The deal was also made over the heads of both the British Food Mission and the British Embassy in Buenos Aires. The Ministry must clearly adapt its buying procedure to particular circumstances. But it seems odd, to say the least, that its own representatives in Argentina were not consulted, especially as they had been trying to secure a lower price for Argentine maize. This inadvertence is not likely to be lost on the Argentine negotiators in the present discussions on the revision of the Argentine meat price.

The trade agreement signed last June provided that Britain would buy £20 million worth of maize—say, 1,000,000 tons at £20 a ton. Argentina had large stocks of maize, but the Ministry decided to wait in the hope that Argentina would offer a lower price. Then it was discovered that Argentina had sold large quantities to France and Germany and that the amount still available for export had dwindled considerably. Thereupon the Ministry suddenly decided to purchase the 300,000 tons and to accept the Argentine offer of £21 a ton. This price is a decided improvement on last year's, which was £28 a ton; the current Chicago price is a little over £18 10s. a ton, and the difference between it and the new Argentine price may be a fair premium to pay to avoid expenditure of dollars. But stocks of maize are very large in the United States, and if British requirements are not covered by supplies from other sources, American maize may have to be bought with ECA funds.

If bulk purchase is to function efficiently, the department concerned must be able to take quick decisions. But on this particular decision some explanation is clearly necessary. The Ministry went back on an undertaking given to the trade. No chance was given to other firms to make competitive bids, though the price at which the Ministry bought was the lowest that had till then been offered. Moreover, there was no consultation with the Ministry's own representatives in Buenos Aires. There may have been good reasons for these actions, but so far the trade has not been able to find them.

* * *

Prices since Devaluation

The rise in sterling prices of many foodstuffs and raw materials since September is putting to the test the Chancellor of the Exchequer's optimism about the effects of devaluation on prices. It is, of course, necessary to distinguish sharply between movements in the index of retail prices (about which his forecast of less than a point rise by the end of the year is the most explicit) and movements in industrial raw materials. The latter show a rising, but not entirely consistent, trend.

Immediately on devaluation, prices of non-ferrous metals, in sterling, rose by practically 44 per cent. Since then, copper has risen, but lead and zinc have fallen. Tin, of course, is a special case; the sharp fall here has followed the reopening of the market, and it is rooted in the clear prospect of freer supplies. Again, cotton has been fairly steady though there has been another large American crop and the spot price is not much above the support level. Wool has risen, particularly in the last two months. A significant pointer is perhaps cocoa, whose price in New York has risen by over 25 per cent since September. Coffee has risen to a fantastic height owing to the threat of scarcity; the dollar price for tea has fallen while the sterling price has risen; the same condition is also true for rubber.

Some of these price changes are the direct consequence of devaluation; others arise only indirectly. All of them will affect the level of costs, including the cost of living, in Britain sooner or later. They go far to underline the conclusions reached by Professor R. D. G. Allen in a study of devaluation and prices which appears in the current bulletin of the London and Cambridge Economic Service. Professor Allen's method and conclusions are broadly similar to those

A NEW PRODUCTION METHOD

THE 'NELSON' WELDING GUN
A better job because of BAKELITE

stepped up output...
lowered costs...
guaranteed accuracy

The 'Nelson' welding gun (marketed by Crompton Parkinson Ltd.), which fixes studs to steel surfaces by welding instead of drilling and tapping, is now produced to specification much more quickly by transfer moulding the main body in BAKELITE high-strength material Grade X199/3 Natural. This moulding incorporates many metal inserts, including a heavy copper solenoid, and is characterized by its precision and great strength. There is a BAKELITE material for every known application—and among them one which may help you to simplify some operation, speed it up and reduce its cost. Why not avail yourself of our co-operation? Ring our technical representative at Sloane 9911 (London); Midland 5911 (Birmingham); Central 4908 (Manchester); City 6825 (Glasgow).

published in *The Economist* of September 24, 1949. Four basic assumptions are made; that purchase prices for imports, in terms of local currencies, are unchanged; that insurance and freight increase proportionately with the general level of import prices; that the composition of imports from different sources and the domestic element in all sterling prices remain unchanged.

On the basis of the pattern of imports in mid-1949, it is estimated that import prices may rise by slightly over 15 per cent as a direct result of devaluation. The rise in the Ministry of Labour's index of retail prices is put at 3.3 per cent and the food component alone at 5.2 per cent. Professor Allen adds that although certain factors might tend to keep down the rise in import and retail prices, the "factors operating the other way are likely to predominate." If the indirect effects of devaluation are taken into account—as they should be, though, of course, they are impossible as yet to measure—import prices must be expected to rise by more than 15 per cent and the index of retail prices by "at least 3 per cent by the end of the year" and perhaps by 5 per cent or more by next spring. If these estimates prove accurate they will certainly confound the official optimists.

* * *

Wool at a Peak?

The wool market has been exceptionally firm in recent weeks. When the London sales opened three weeks ago, demand was concentrated on crossbred types and their prices rose sharply to some 50 per cent above the level of last July. The switch from merino to crossbred was no doubt encouraged by the recent high prices for finer wools. Bradford did most of the buying; its stocks have been at a relatively low level for the past six months. During the second week, however, there was a reverse. Bradford purchased much smaller quantities and Continental countries also gave little support to the market. Crossbred prices fell by 5 to 10 per cent. This week the same somewhat cautious tone prevailed but prices were maintained.

The sharp rise in wool prices since devaluation could not be expected to continue if inflationary conditions in Europe

were curbed—that, of course, is not a certainty. The United States has been buying certain quantities of wool since the devaluation of sterling but on a much smaller scale than was generally expected. The wool market is, therefore, influenced more by the level of European demand. On present showing, the market may again become vulnerable in the early part of next year. Purchases in primary markets in the past two months have been heavy and this wool should be available for consumption in February or March. Moreover, the Australian clip is expected to be at least 5 per cent larger than last season, while the consumption of wool in Europe is at last year's level.

What is more interesting is the steady improvement which has taken place in the quality of the Australian clip since 1946-47. The accompanying chart shows that last season merino wools accounted for 74 per cent of total output against 68 per cent two seasons earlier, while 40 per cent of the total clip consisted of 64s and finer wools. This trend is expected to continue during the current season. If these expectations materialise, there is more reason to expect some check to the rising prices for high quality wools, if not a fall.

* * *

Buying Copper

The Ministry of Supply has apparently decided to continue its policy of buying Rhodesian copper at the prevailing American price converted into sterling at the devalued rate, with suitable adjustments for freight and grade. No official announcement has been issued, but the news has been given by Mr A. Chester Beatty in his annual statement to shareholders of Mufulira Copper Mines. The system has been in force for some years, but after devaluation the Ministry of Supply suggested a revision, seeking presumably to limit the rise in the sterling price of copper. No agreement, however, was reached with the Rhodesian producers, so the old system was retained. Mr Chester Beatty also mentioned that the Ministry's contracts with Mufulira which were for six months' delivery have now been reduced to three months' delivery. The Mufulira output for January has been contracted for on the basis of 17½ cents a lb. f.a.s. for electrolytic copper and for February on the basis of 18½ cents a lb. The current American price is 18½ cents a lb. Mr Chester Beatty gave a personal opinion that during the current financial year either the London Metal Exchange would be reopened for other base metals or that bulk buying would cease, although there was no indication of either event happening at present.

Canadian copper producers were not a little disturbed recently when the Ministry of Supply announced that it was prepared to receive tenders for 15,000 tons of special shapes of copper for delivery during the first quarter of 1950. In the past, the Ministry bought these shapes direct from specific Canadian producers. But as ECA funds were being used for the purchase, the ECA authorities suggested that the purchase should be made by competitive tenders from both American and Canadian producers. The latter feared that the Americans might undercut them. As it happened the whole contract with the exception of 700 tons went to Canada because their tenders were more favourable. Similar requests for tenders will be made for each of the following quarters. The quantity will be approximately the same as for the first quarter.

* * *

Commonwealth Sugar Production

Discussions at present taking place between the Ministry of Food, Australia, South Africa and the sugar producing colonies are expected to be concluded next week. Last August, representatives of the British West Indies visited Britain to discuss future sugar policy; in order to satisfy the other Commonwealth producers it was decided to do nothing until November, when the Ministry of Food would determine its buying programme with each producing country. There is no suggestion of a Commonwealth agreement, although, as with other commodities, the form of long-term contract (if that method of procurement is decided upon) will be basically the same for all.

The problem is threefold. In some of the colonies, such as the British West Indies, unemployment is large and an expansion in sugar production might alleviate some of the social distress. In that case, the approach may understandably be social rather than economic. Secondly, if British consumption of sugar is to expand, output from the sterling area would have to be increased. Yet some of the Commonwealth countries—Australia is an example—are high-cost producers,

and either the taxpayer or the consumer would have to pay correspondingly more. Thirdly, there is the problem of surplus supplies in the dollar area—chiefly in Cuba. In the past, ECA funds have been allocated to Britain to purchase Cuban sugar, and so long as Marshall Aid is available, such allocations are likely to continue. But reports have suggested that Cuba would be willing to accept sterling rather than accumulate cumbersome surpluses, provided an international sugar scheme existed.

These problems hold out little prospect of a single solution. The social development of the colonies is clearly a matter for the Colonial Office rather than the Ministry. The Commission of Inquiry into the sugar industry of Leeward Islands, Antigua and St. Kitts rejected, on a majority verdict, the suggestion to nationalise the sugar factories, but recommended the use of under-cultivated land, improvements in wages and working conditions and the establishment of a Wages Board to improve industrial relations. A commission in British Guiana has now proposed a subsidy or bonus to sugar growers of £1 (at the old dollar rate) for each ton of sugar raised in the next fifteen years. Such a proposal would undoubtedly increase profits from growing sugar, but its contribution to the social welfare of the colony would be secondary. A subsidy is generally the easiest solution but seldom the best. The West Indian proposal is apparently a ten-year contract with guaranteed prices.

Clearly a series of long-term contracts is the likely solution, though opinions vary as to their length. Increased sugar production within the Commonwealth should be encouraged, so long as the risk of inflated costs is avoided. If the colonies have a guaranteed market for their output, the development of their sugar industries could be studied from a social standpoint. On the other hand, the long-term contracts could be fitted within the framework of an international marketing scheme in the same way as the American contracts for Cuban supplies were before the war.

Export Prospects

Canada to Buy British Steel

The British steel industry expects to send 160,000 tons of steel to Canada within the next twelve months; orders have recently been signed for rails worth \$1.850,000, and orders under negotiation for other steel products are expected to bring the total to between \$15 and \$20 million. Under normal conditions, Canada imports between 700,000 and 1,000,000 tons of steel a year. The bulk of the imports has always been supplied by the United States. The Canadian steelmakers themselves produce about 3 million tons a year.

But Canadian imports have been increased to 1½ million tons this year, and the figure in 1950 is expected to be the same. Consumption will remain at a high level for several years to meet the needs of big capital investment projects. The Canadian government expects \$3 billion to be spent over the next five years on oil equipment to develop the Alberta and Manitoba oilfields and to build the refineries connected with them. An iron ore industry is being opened up on a large scale in Labrador, and a big hydro-electric development programme is in hand. The biggest demand at present is for steel for the pipelines from Alberta to the Great Lakes and to Vancouver. The Canadians hope to obtain some pipe from Britain, but will make most of it themselves from increased imports of special rolled slab from the United States. A good deal of heavy structural steel is expected to come from Britain and also a certain amount of sheet, some of it deep drawn and some motor body sheet. To supply the latter, Britain imports slab from the United States for re-rolling into sheet in this country.

Canada would buy now considerably more steel from Britain if more could be spared, but the British steel mission which has recently toured Canada expects, in the long run,

severe American competition at every point. In spite of Canada's present need for steel, and her willingness to buy it from Britain, the individual orders now being placed have been won in the face of competition. With one exception of purely local significance, there are no restrictions on the import of American steel into Canada, and the American steel strike appears to have made surprisingly little difference to supplies. Devaluation has helped the British exporters, but they still have to compete with American works which are only a short distance across the American border from the biggest centres of Canadian demand. Canadian firms themselves cannot compete with these firms when they have long-distance freight charges to bear.

* * *

South Africa Eases Motor Imports

The South African Government has allocated £10 million for the import of motor vehicles in the first half of 1950: £5,000,000 for imports from hard currency areas, £4,625,000 for imports from the sterling area and the balance of £375,000 for imports from various Continental countries. The bulk of these will have to be assembled in South Africa. Since July no licences have been granted for the import of assembled cars, and most of the British manufacturers, lacking assembly facilities in South Africa, lost business. In 1948 the Austin Motor Company was selling more cars in South Africa than any other British manufacturer. But these were assembled cars, and the company did not begin assembling in South Africa until October of this year, and then on a very small scale; it is unlikely that more than 350 Austins have been assembled there in the past six months.

In the long run the American exporters, though they have big assembly plants, are likely to be in the worse position. Both Ford and General Motors have recently built new factories believed to have cost between £1,500,000 and £2,000,000 each. The import licences granted to American exporters are not nearly enough to keep these factories working to capacity or their labour force fully employed. The South African Government has done what it can to help them by giving the largest British allocations to the two American-owned firms, Ford and Vauxhall, which use the assembly plants of their parent companies. Vauxhall have been promised licences for 3,700 cars and Ford for 3,278 cars. The Government has also encouraged American motor concerns to stretch their dollar allocation by getting from their British subsidiaries as many components as possible for incorporation into the American cars assembled in South Africa.

The share of the other British companies has been based on the capacity of the assembly facilities which they already have in South Africa, and the length of time it will take to get these plants into smooth running order. The Austin company has been allocated 2,367 cars, the Nuffield group (Morris cars) just under 2,000, the Rootes group (Hillman cars) just over 1,000 and Standard half this number. Altogether 13,000 British cars will be imported in the first six months of 1950 to the value of about £3,000,000. The balance of the sterling allocation is for spares, heavy commercial vehicles and a few motor cycles. The British manufacturers are not disposed to make any long-term plans on the basis of these new arrangements, which they consider as an expedient devised by the South African government to tide over a period of difficulty.

* * *

Markets for Farm Machinery

The British Agricultural Machinery Mission, which returned from Canada in June after a fact-finding tour, recently published its report (HMSO, 2s.). It found that with

one or two exceptions British manufacturers could supply machinery suitable for the Canadian market at competitive prices. The weak point is distribution. If British manufacturers can arrange for adequate supplies of spares—the report suggests the formation of a British spare parts organisation—they could sell machinery, though the market is difficult.

The report does not underrate the work involved, but it might have given more attention to the inherent difficulties of operating from factories several thousands of miles from the market. Because American and Canadian farming practice is identical the length of the 49th parallel, American manufacturers are able to treat the Canadian farming belt as part of their home market. They can give excellent service, carrying \$20 million worth of spares at each of their big machinery depots, and delivering parts to the farmer within 24 hours. To take customers from these firms, British manufacturers must offer equal facilities; it is hard to see how they can do this, at least without arrangements with Canadian distributors of the kind which enables the British Ford Motor Company to distribute Fordson tractors through the Ford Motor Company of Canada.

The problem is common to all exporters of farm machinery. Big American producers like International Harvester have found it easier to set up factories abroad. They have been producing certain types of equipment in British since 1946, while 1,300 combines have been built in the 1949 season by one of the British factories of the Canadian undertaking, Massey-Harris. This firm is expanding its activities in Britain, and has just publicly opened at Kilmarnock a second factory which is designed to turn out 400 heavy duty tractors a month, driven by the 42 h.p. Perkins diesel engine, and 3,500 combines a year. Allis-Chalmers is another American manufacturer with British factories.

By establishing subsidiaries in Britain, the Canadian and American firms gain freedom to retain and expand their markets in spite of barriers to trade and currency transfers. From Britain they supply more than the British market; they export to countries in the sterling area and elsewhere which lack the dollars to buy from the parent firms in North America. The market for heavy duty tractors and combines in this country and in the rest of the sterling area is becoming increasingly competitive. One of the advantages of the new plants laid down by American and Canadian firms in this country is that much of their output consists of equipment which is urgently needed by British farmers (such as one-man pick-up balers and self-propelled combines) which were formerly obtainable only by the expenditure of dollars. British manufacturers might not necessarily find in establishing factories in Canada the particular advantages which have induced Canadian and American firms to come to Britain. They might be ill-advised to open factories overseas unless they, too, were introducing new equipment. General duty spraying equipment is one field in which the British agricultural engineers may have such an advantage.

Shorter Note

The scheme of the Peruvian Corporation to extend the moratorium on its debenture stock which has been in effect since 1933, received court sanction this week with some amendments. A definite extension up to the end of 1951 has been granted. A further period of one year is provided for by the judgment on the condition that by the end of 1951, the debenture holders' committee—to be renamed the supervision or control committee—is reconstituted so that a majority of its members are not holders of the corporation's ordinary stock. The power to terminate the moratorium before December 31, 1952, is not affected by the modifications laid down.

COMPANY MEETINGS

BARCLAYS BANK (DOMINION, COLONIAL AND OVERSEAS)

VERY LIQUID POSITION

MR J. S. CROSSLEY'S REVIEW

The twenty-fourth ordinary general meeting of Barclays Bank (Dominion, Colonial and Overseas) will be held in London on December 28th.

The following are extracts from the statement by the chairman, Mr J. S. Crossley, which has been circulated with the report and accounts for the year to September 30, 1949:—

We shall propose to you that the dividend of last year be repeated; as the figures show, it now enjoys the protection of a good margin. We are transferring £200,000 out of profits to the Bank's reserve fund, bringing this up to the figure of £8,000,000, and £150,000 is being applied in writing down the premium on the new capital subscribed for the Development Corporation, which was issued at a premium of 50 per cent.

I am glad to say that the Corporation is becoming increasingly active, and we believe that the foundations for a useful and valuable business are being laid. I feel sure that our stockholders will not expect to see quick results or spectacular profits. We have, as you know, always held the view that results could only be shown over a period of some years. In the meantime, it is satisfactory to know that small profits are being earned. These have only been made possible by keeping running expenses low and strict attention is paid to this aspect of the matter.

DEPOSITS AND INVESTMENTS

Turning to the balance sheet, the most striking change to be noticed is the sharp reduction shown in our deposits. On the assets side advances to customers remain as much the same figure as last year, and, consequently, represent a substantially higher proportion of our resources. They slightly exceed the total of our investments, so that the ratios of these items to our total deposits now stand at 30.88 per cent. and 29.02 per cent. respectively. Although cash has fallen sharply to 20.27 per cent., the balance sheet still shows a very liquid position, more especially since under the heading of bills discounted we hold over £42,000,000 of Treasury bills of the British and South African Government, and British Exchequer bonds maturing early in 1950.

The investments, which are the second largest item in our assets, stand at £99,832,156 and include for the first time our shareholding in the National Finance Corporation of South Africa. Although the amount is not large—£75,000—it has a rather special interest for us. The new Corporation, which was established in terms of an Act passed by the Union Government, has a capital of £1,000,000 subscribed for by the South African Reserve Bank, the commercial banks, building societies, mining houses, insurance companies and other financial institutions. It commenced operations on September 19th. Its object is to help to integrate the financial structure of South Africa. Your bank is represented on the board of the new concern, which is designed to play an important part in the financial life of the community; its progress and development will be watched with close interest.

CHANGES IN SOUTH AFRICA

The shrinkage in our deposits reflected in the current balance-sheet is notable for being

the first decline of any importance in this figure to be recorded since this bank was formed in 1925. The fall in deposits has taken place almost entirely in South Africa where great changes have occurred during the past twelve months. As an illustration it is interesting to see that whereas on September 30, 1948, our balance with the South African Reserve Bank stood at over SA£65,000,000, this figure had shrunk to SA£23,000,000 twelve months later.

The great change which has come over the picture in South Africa during the past year has been due to more than one factor. While opinions may differ as to the main cause, it seems to me that the whole matter may be best summed up in simple language by saying that South Africa—like the United Kingdom, and, for that matter, like numerous other countries—has for some time been living beyond her means. The effect of the heavy adverse trade balance is clearly shown not only in the figures of our own bank but also in the published figures of the South African Reserve Bank, where the reserve ratio on September 9, 1949, fell to 29.1 per cent., the lowest recorded.

NEED TO CONTROL IMPORTS

It is no doubt true that some slowing down in the phenomenal rate of progress of recent years had to come but the underlying factors governing the situation were for a time obscured by the flow of capital from the United Kingdom, which reached altogether abnormal proportions during the year 1948. When this flood tide eventually receded the bare facts quickly became exposed, showing unmistakably the need for drastic regulations to control imports. It was inevitable that adoption of these measures should create inconvenience and hardships but when considering the whole picture we should not allow our view to be obscured by these temporary factors; although at the time they loom large on the horizon, they are in reality symptoms of maladjustment rather than of any fundamental change. It is, perhaps, true to say that those who recently took an unduly gloomy view of the picture were doing as much harm as those who, a year or two ago, felt that there was scarcely a limit to the opportunities for expansion and profit.

DEVALUATION

It is too early yet to say exactly what effect the recent devaluation of sterling and of the South African pound will have on the economy of the respective countries, but in the case of South Africa, it must, I think, be admitted that until this change took place the "terms of trade" were weighted heavily against her; while on the one hand she had to pay greatly increased prices for her imports, she was obliged to dispose of her staple article of export at the old price.

The "terms of trade," however, have now moved once more in her favour, and, although the dollar price of gold remains unchanged and restrictions on imports from the U.S.A. may have to be maintained for a time, it seems certain that South Africa should in the near future be able to restore her sterling resources to a figure which will permit of normal imports from the United Kingdom.

WALTER SPENCER AND COMPANY, LIMITED

SUBSTANTIALLY LARGER PROFITS

The thirteenth annual general meeting of Walter Spencer and Company, Limited, was held on December 7th at the Royal Victoria Station Hotel, Sheffield, Mr E. Ransom Harrison, F.S.S.A., the chairman, presiding.

The following is the chairman's statement circulated with the report and accounts for the year to September 30, 1949:—

As in previous years, I am giving with the report and accounts a brief review of the company's activities during the past year, with notes on the accounts. The substantial increase in profits is very gratifying, especially as this has been accomplished during the completion of the overhaul and improvement to existing plant.

Expenditure on new plant during the year has been considerable and the commitment for new capital expenditure and further improvements is estimated at £30,000. All the plans have been approved and contracts placed and it is hoped to complete the scheme before the end of the next financial year. In this connection, your directors feel that it is prudent to place to a Contingencies reserve a sum equivalent to the initial allowances arising out of the capital expenditure during the year under review.

With regard to taxation, members will observe that estimated taxation on profits earned for the year to September 30, 1949, has been charged in the profit and loss account. The deferred repairs, for which a provision was made in the last accounts, having been executed, the excess profits tax allowance has been agreed and repayment made.

TURNOVER AND EXPORT TRADE

The volume of turnover has been well maintained and taking into account the reduction in the price of some of our products, production has actually increased. Every effort is made to increase the export trade, but this is getting increasingly difficult, owing to the restrictions imposed by the importing countries.

With regard to the future, it is very difficult to predict, but we have a considerable amount of work on our books and as a large proportion of our output is of a specialised quality and design, we look forward to the future with reasonable confidence if no further handicaps are imposed. I am pleased to say that our employees will again share in the prosperity of the firm and this has been allowed for in the accounts. Your directors recommend a final dividend of 10 per cent., less income tax, making with the interim dividend of 5 per cent., less income tax, paid on May 31st last, a gross dividend of 15 per cent., less income tax, leaving a sum to be carried forward of £7,904.

It is desirable that longer time be allowed for the preparation of the accounts for submission to the shareholders and therefore the annual general meeting next year will be called for at least a week later than has been usual. The board again wish to place on record their appreciation of the continued good service and co-operation of the staff and workpeople during the year, without which the results shown could not have been achieved.

The report and accounts were unanimously adopted; the proposed dividends were approved; the retiring director, Mr Oscar S. McNery, was re-elected and the remuneration of the auditors, Messrs Hart Moss Coppley and Company, was fixed

NATIONAL BANK OF AUSTRALASIA LIMITED

CONTINUED RECORD OF EFFICIENT SERVICE
MR H. D. GIDDY ON DISTORTION OF ECONOMY

The ordinary general meeting of The National Bank of Australasia Limited (with which is united The Queensland National Bank Limited), was held on November 30th in Melbourne, Australia.

Mr H. D. Giddy (the chairman), in the course of his speech, said: It is with pleasure I once again submit for your approval a balance sheet recording the continued progress of our institution. The balance sheet totals of £176,935,000 are approximately £19,000,000 higher than a year ago, and, of course, constitute a record in the history of the bank.

Though I believe our nation has got a foothold from which great development is possible, a really forward movement cannot come until we shake off the prevailing lethargy toward work, toward enterprise and risk-taking, toward rapid completion of the task in hand, and toward the conversion of ideas and vague aspirations into practical achievements. I am certain that two main causes of this lethargy are the present inflationary bias and unduly high taxation, but it is to the former that I propose to address myself today.

To be in the grip of an inflationary drift, a community does not have to be rapidly smothered to death under a plethora of paper money as, for example, Germany was in 1923. It is not the acute form of the disease that as yet is troubling Australia so much as what might be termed the chronic, maiming variety, which has now spread into the fertile field of the real costs of our domestic industry and business. Its entrance into the system may well have been through wartime credit expansion, but the illness now is more deep-seated and accordingly more difficult to combat and cure.

DEVALUATION OF STERLING A NEW FACTOR

Twice during recent years it appeared that something approaching equilibrium in the fight against inflation was in sight. Hopes rose in 1946 and again around the close of last year, when export prices had steadied. Then, on September 19th, came the sudden announcement that the United Kingdom Government had devalued sterling in terms of U.S. dollars by no less than 30.5 per cent., and along with it the decision by the Commonwealth Government that the Australian pound would be retained at its old rate of exchange with sterling.

One of the early effects of devaluation has been to lift our export prices once more. British costs and prices have also tended to be pushed higher, and this, together with the obvious fact that our essential imports from the North American continent must now cost much more, will lift prices still further over a wide range. All this means another whirl of our inflationary spiral. In addition to producing a feeling of perplexity, virtually on a nation-wide scale, the inflationary bias has been responsible for the development of a serious distortion in the Australian economy. In this, our primary industries and those which produce in the main the capital equipment of the community have suffered most.

I feel the weakness in the present Federal Government's policy is that it has tended to encourage the community to be satisfied with money without seeing that it gets value for it.

PRODUCTION LETHARGY MUST BE OVERCOME

I am convinced that our inflationary drift cannot be answered on the monetary side, if for no other reason than the existence of a widespread fear that any deliberate deflation of monetary incomes might upset full employment—something which nobody wants to do.

I am equally convinced that improvement in the value of our pound rests very largely in the willingness of every person in the community to take a new interest in national production and creative effort. This requires a change in the psychological outlook of not a few of our people. It involves a realisation that the mere earning of money, no matter how much, is in itself not enough, and that value can only be put into the money earned as a result of productive and creative effort.

CHANGE NEEDED IN NATIONAL POLICY

I am bound to plead that national policy be modified and its emphasis changed so that the willing and capable workers of all classes, who are, of course, in the very great majority, will be encouraged, by one means or another, to give of their best in the daily round.

The attempt to destroy the trading banks and to establish in their place a Federal Government monopoly bank represented the peak of the Government's efforts to change the social and economic pattern of Australia.

When I addressed you last year, we were awaiting the hearing of the Government's appeal to the Privy Council. On July 26th the Privy Council gave its judgment dismissing the appeal, and late last month the reasons for its decision were made public. You may recall that at the time the Judicial Committee granted the Commonwealth leave to continue with its appeal, the Committee reserved its opinion as to whether or not it had jurisdiction in the actions. In the end, the Government's appeal was dismissed precisely on this point, because the Privy Council concluded that it did not have jurisdiction in the matter unless the Commonwealth Government first obtained a certificate from the High Court of Australia, permitting an appeal to their Lordships. This the Commonwealth had not done.

OTHER METHODS OF ACHIEVING BANK NATIONALISATION

Though one possible method of destroying the trading banks has been rejected, the expression of opinion given by the Privy Council nowhere constitutes a firm guarantee that a nationalised banking system could not be established in Australia. With such a vast step there are a number of possible methods by which that objective might be reached. Some may be slower than others, some may require, as it were, more than one bite at the apple, and there are conceivably one or two that might precipitate nationalisation at one bold stroke.

It is true some Government leaders, but some only, are doing their utmost to induce people to forget the Bank Nationalisation Act of 1947—the most unpopular measure ever passed by an Australian Parliament. On one hand, they are endeavouring to lead the community to believe that the Government has changed its mind and will not now attempt to gain control of the people's money; on the other hand, statements by these leaders continually imply that the trading banks have designs to attack the 1945 Act with the object of taking unto themselves banking and credit control, which rightly rests with Parliament. Any such suggestion is entirely without foundation.

As an integral part of the system, I believe that our bank has played and continues to play its full part in giving Australia one of the most efficient and most secure banking services in the world. That is not to say the service cannot be better still. We have ever in mind the duty of improving our efficiency and substantially widening our present services to the community.

The report and accounts were adopted.

HARRIS LEBUS LIMITED

RELAXATION OF TIMBER CONTROL

The second annual general meeting of Harris Lebus, Limited, was held on December 8th in London, Sir Herman Lebus, C.B.E., J.P., chairman and managing director, presiding.

The following is an extract from his statement, circulated with the report and accounts for the year to July 15, 1949:—

In my review last year I referred to difficulties beyond the control of your directors resulting from "the furniture industry still being under the control of the Board of Trade and dependent upon the Government for the supply of most of its material, in particular timber, which is allocated to individual manufacturers by licence to purchase and consume." This situation continued into the year under review. In the first half of the year the quantity of both hardwood and plywood available to the company for manufacture into furniture, while varying from one allocation period to another, remained quite insufficient for full-scale production.

The second half of the year proved to be very different and a really satisfactory situation developed. The relaxation of control by the Board of Trade of most types of hardwood resulted in more and better timber being available, enabled production to be increased, timber waste to be reduced and a saving in costs of production to be achieved. Various amendments to the specification which were made by the Board of Trade further eased the situation, and your company was able to produce once again furniture to which its organisation and equipment are best suited. The new designs sold excellently and a large order book was carried forward at the end of the period under review.

The available net profit for the period, after deducting taxation, is £114,522. After charging the 4 per cent. Preference dividend of £22,000 and the proposed 6 per cent. Ordinary dividend of £66,000, the balance of profit remaining undistributed is £26,522. Of this sum the directors propose to appropriate £20,000 in reduction of preliminary expenses and to increase by £6,522 the balance of unappropriated profits. The balance of £28,898 brought forward from the previous year is thus increased to £35,420, which is carried forward.

The profits for the last six months of your company's financial year were very satisfactory, and I am glad to be able to add that this state of affairs has been maintained into the present year.

IMPROVEMENT CONTINUED

The Chairman, addressing the meeting, said: In my review I said that the profits for the last six months of the company's financial year were very satisfactory. I also said that since the close of the company's year there had been a significant improvement on those results. I am happy to report that our internal accounting figures show that this improvement in profits has continued up to this date and this in spite of some increases in the cost of some of our ancillary raw materials. In addition, I can report that our current rate of sales and the state of our order book remain entirely satisfactory.

I am still not going to venture upon any forecast of what may be the final result for the current year. There are still seven months of the year before us and in the present circumstances of the country it would, in my view, be both bold and foolish to do more than place on record, as I have done, the factual position to this date. I will, however, go so far as to say that unless circumstances develop which seriously change your company's present situation, I trust we shall, at our next annual general meeting, place before you results with which every stockholder should be satisfied.

The report was adopted.

MUFULIRA COPPER MINES LIMITED

MR A. CHESTER BEATTY'S STATEMENT

The twentieth annual general meeting of Mufulira Copper Mines Limited will be held in London on December 15th.

The following is an abridgment of the statement of the chairman, Mr A. Chester Beatty, dated November 24, 1949, which has been circulated to the shareholders:—

COPPER PRICE

For some years the pricing basis for the copper delivered by us to the Ministry of Supply has been the American quotation converted into sterling at the official rate of exchange, and adjusted suitably by freight and grade differentials. I have previously stated that our sales to the Ministry are for delivery six months ahead. Last July at the Ministry's request we reduced this pricing period to three months.

It is public knowledge that the Ministry, subsequent to devaluation, asked the Rhodesian producers to consider some new pricing basis. This matter has been the subject of consideration for some weeks, and although I am not in a position to announce any final agreement, the Ministry has indicated that the previous pricing basis shall continue, that is to say, the American quotation converted into sterling at the new rate of exchange will be used as the pricing basis.

However, I am not in a position to say what price this will result in, at the present time, as there are other matters still under discussion with the Ministry on which agreement has not yet been reached, namely, questions relating to the freight and grade differentials. An official announcement will be issued in due course as to the result of the negotiations.

RESULTS OF THE YEAR

Production was restricted during two months of the year, due to the fuel position. In spite of this, copper production for the year was 70,966 tons (53,360 tons during the previous year). The cost of production was £54 12s. 2d. (£58 10s. 1d.) per ton of blister copper. This is the first time in 10 years that the upward trend of costs has been reversed. However, the devaluation of the £ has altered the whole outlook and costs will undoubtedly be affected, although it is too early to say by what extent they may increase. The ore hoisted was the record of 2,973,935 tons. The whole production of blister copper was sold at an average price of £121 8s. 9d. (£115 8s. 9d.) per ton.

A provision for replacements has been made this year in the sum of £500,000 (£400,000). In the year ending June 30, 1948, a sum of £500,000 was transferred to general reserve as a first instalment towards the eventual cost of the electrolytic refinery, and this year the sum of £550,000 has been transferred to general reserve, which may be regarded as the second instalment.

The board recommend the payment of a dividend of 8s. 6d. per share for the year, of which 3s. 6d. was distributed as an interim dividend in May.

PROGRESS OF THE COMPANY

These results will, I trust, be as gratifying to shareholders as to those of us who for so long had to watch Mufulira struggling to overcome the difficulties which beset it in its early years. I have recently been reading some of the reports of the proceedings at the earliest shareholders' meetings of this company and of Rhodesian Selection Trust Limited. I submit that events have justified the confidence which I always expressed in the Mufulira Mine. For instance, 20 years ago, in addressing a meeting, I described Mufulira as already a very valuable mine,

and I looked forward to it becoming one of the premier copper mines of the world. Again, three years later, I described Mufulira as ranking as one of the largest high grade sulphide copper mines ever developed; that it was a remarkable mine with first class equipment and high grade ore, and that it should be capable of producing copper on a large scale at a price to compete with the lowest cost producers in the world. With these high expectations of the mine it was disheartening to watch its ill-fortune, first in reaching the stage of production in the middle of the depression of the early thirties and later during the war years when this company was affected so exceptionally by the severity of the excess profits tax.

MINE CONDITIONS

The diamond drilling for the location of the Peterson Shafts has exposed new sections of the ore bodies, which outline approximately a further 34,400,000 tons of ore at 4 per cent. copper, which are not yet included in the published ore reserves. The caving methods, which account for an increasingly large proportion of the mill feed, are working well.

The Peterson Shaft programme is proceeding satisfactorily, but until certain parts are completed, it is unlikely that, for another year or two, the production rate will be exactly up to the planned maximum production of 285,000 tons of ore per month. For the current financial year the production may be in the neighbourhood of 80,000 tons copper, provided there are no delays due to fuel shortage. It will be necessary in the near future to begin the process of augmenting our copper stocks, and it is likely, therefore, that sales for the current financial year will be less than the full production for the year.

LABOUR RELATIONS

The last year has seen the formation, under Government sponsorship, of an African trade union. Within a short time the union had formulated certain demands and at conciliation proceedings agreement was reached resulting in an adjustment to some of our native labour wage scales. There is no progress to report on the subject of the advancement generally of Africans in industry, following the discussions referred to last year, between the Government, the Salaried Staff Association, the Northern Rhodesia Mine Workers' Union, and the companies.

There is a dispute between the Copper Companies and the Northern Rhodesia Mine Workers' Union, the union having requested the companies to recognise the principle of a 40-hour week. The dispute was referred to conciliation, at which no agreement was reached, and there the matter stands.

GENERAL

The coal position is still not satisfactory. We should receive more coal this year, but it will still be necessary to undertake intensive wood-burning.

The outlook for the copper market still depends largely on the business outlook in the United States. At the present time, the copper market in the United States is in a sound position.

The London Metal Exchange has reopened this month for transactions in tin. No indication has been given of the market being reopened for the other base metals nor has any indication been given of the cessation of bulk buying. I should, however, expect that there would be developments in one or both of these directions during the course of the current financial year, although I am only expressing my own opinion in this matter.

CONSOLIDATED GOLD FIELDS OF SOUTH AFRICA, LIMITED

DEVALUATION BENEFITS

The annual general meeting of this company was held on December 8 in London.

Mr Robert Annan, the chairman, in the course of his speech, said: The profit and loss account of the operating company, New Consolidated Gold Fields, covers a year in which the difficult conditions which have prevailed in the gold mining industry for some years past continued unrelieved. The operating company having declared a dividend of 12½ per cent., less tax, on its ordinary shares, your directors recommend the payment of a like dividend by the parent company.

In our own group the start of milling operations at Libanon last March raised the number of producing mines under our administration in the Union of South Africa to ten, and the tonnage milled, just exceeding eight million tons, was a record.

Turning to future prospects, the picture has been completely changed by the rise in the price of gold following on the simultaneous devaluation of the pound sterling and the South African pound, the effect of which was to increase the price from 172s. 6d. to 248s. 3d. per fine ounce, an increase of approximately 44 per cent. It was not to be expected that the mines would retain the whole of this benefit, and the Chamber of Mines took immediate steps toward meeting some of the claims of labour, whose position in terms of basic earnings had deteriorated by comparison with other industries. Other consequential effects of devaluation are difficult to estimate at this early stage, but it is probable that the overall increase in costs for the producing mines will be between 10 per cent. and 15 per cent.

The report was adopted.

AMALGAMATED BANKET AREAS LIMITED

SCHEME FOR AMALGAMATION

An extraordinary general meeting of Amalgamated Banket Areas Limited was held on December 5th in London.

Major-General W. W. Richards, C.B., C.B.E. (the chairman), said:—

This meeting has been convened for the purpose of presenting for your approval a scheme for amalgamation, whereby this company would acquire the undertakings and assets, subject to liabilities, of the Gold Coast Banket Areas Limited, and the South Banket Areas Limited, and certain mining concessions from Banket Gold Fields Limited.

I should like to mention a few of the financial and technical advantages that we confidently believe would follow:—

1. Economies in administrative expenses, both in West Africa and London.
2. Pooling of ore reserves; concentration of development work; and general centralisation of operations.
3. Delivery of ore from all sectors to one central mill, with corresponding reduction in treatment costs.
4. The ability to utilise the full capacity of the central mill with good-grade ore from the Underground sections; and the construction of a separate milling unit for the low-grade ore of the Pepe deposit.
5. The pooling of the European and African staffs, and the utilisation to the best advantage of the bungalows and villages; also the hospital, welfare and sanitation services.
6. One central store in the place of the three now operating.

The resolutions were carried.

At meetings of Gold Coast Banket Areas Limited, and South Banket Areas Limited, the scheme was also approved.

GREAT UNIVERSAL STORES, LIMITED

RECORD TURNOVER AND PROFIT

MR ISAAC WOLFSON ON THE OUTLOOK

The thirty-first ordinary general meeting of the Great Universal Stores, Limited, was held on December 5th, in London, Mr Isaac Wolfson (chairman and managing director) presiding.

The following are extracts from the chairman's statement circulated with the report and accounts:—

I am again happy to place before you the consolidated accounts of the group showing a further increase in trading profits. The year under review has been a record one in the history of the group both as to turnover and profit. The results disclosed have been brought about solely through a substantial increase in the volume of business transacted by the group, having suitable stocks available, and as a result of sound planning in previous years.

A SATISFACTORY RESULT

The consolidated trading profit of £4,576,290, which is an increase of £1,647,842 over the previous year, will, I feel sure, give to stockholders every satisfaction. To the above-mentioned trading profit must be added £64,905 in respect of dividends from trade investments and sundry items receivable, making a total revenue of £4,641,195. From this has been deducted £332,517 for depreciation, £41,539 for auditors' remuneration of the group, £370,013 for interest paid, and £364,497 for the proportion of profits relating to outside shareholders of subsidiary companies.

This leaves a resultant balance of 3,532,629 Out of which taxation takes the substantial sum of 2,091,760

£1,440,869

Appropriations made by subsidiary companies and the recommendations made by the directors in respect of the parent company then take the following amounts:—

	Parent Co.	Subsidiary Cos.	Total
Amount written off "good-will" item	£	£	£
Transfer to reserves	437,500	439,166	439,166
Prof. dividends of parent co.-spt.	61,738	113,169	523,960
Out. dividend of parent co.-net	285,133	...	61,738
And that the balance of profit be utilised to increase the carry forward to profit and less account	448	103,494	285,133
	784,819	656,050	1,440,869
			1,440,869

RESERVES STRENGTHENED

Over a period of years your directors have ploughed back much of the earnings of the group and it is with considerable pleasure, knowing the conservative valuation which has been placed upon our current assets, that I am able to report that the revenue reserves and undistributed profits (apart from £1,395,701 reserve for future income tax) have increased by £619,127 to the sum of £2,345,189, and furthermore the capital reserves of the group, which include share premiums, amount to no less than £3,806,946, which is an increase of £1,067,968 over last year.

The total group capital and revenue reserves now amount to £6,152,135, which is

over one and a half times the amount of the total issued preference and ordinary capital of the parent company, or over four and a half times the amount of its issued ordinary capital.

EXCESS OF ASSETS

Total current assets at £29,203,913 represent an increase of £3,475,849 in relation to last year, whereas total current liabilities have only increased by £659,962. The surplus of current assets over current liabilities is now £11,465,432, as compared with £8,649,545 last year, which is a very large addition to the surplus.

Total net assets (deducting £1,395,701 reserve for future income tax) amount to £17,443,476, of which £7,741,362 is attributable to outside shareholders in subsidiary companies, leaving £9,702,114 as the net asset value of the Great Universal Stores stockholders. This amount is represented by £2,250,000 preference and £1,299,979 ordinary stock of the parent company and total reserves of £6,152,135 applicable thereto.

GROWTH SINCE 1933

I now refer to the acquisitions which have been made since the last annual general meeting. In all cases these have, or will, contribute to the consolidation of the group's activities. In no instance have any additional bank facilities been utilised for the purpose of making these purchases which have either been acquired as a result of issues of shares of the parent company or for cash paid out of the resources of the group.

Here I might be permitted to refer to the time when I assumed control of your company's affairs in 1933. Then the capital of the parent company was only £600,000, with net assets of £707,000, and the year before a trading loss had been shown. In the succeeding sixteen years you have seen your company and its subsidiary concerns grow into a large and important undertaking whose profits have steadily increased to the present level and whose reserves are now over £6,000,000. I have steadfastly maintained my objective of establishing the Great Universal Stores, Limited, as one of the most sound and progressive trading organisations in the country, built up on giving the best possible value to its customers. I hope that you will agree that I can claim some small measure of success.

CURRENT YEAR'S PROSPECTS

Last year, in my supplementary remarks, I stated that we were budgeting over a four-year period (which includes the year under review) to earn annual trading profits in the group of not less than those shown for last year—namely, £2,928,448. Also that on this basis we should be able to add substantial sums to reserves of the group which would provide additional working capital. I am happy to state that the budget for the first year has been realised with a substantial margin. Despite the difficulty in forecasting the future trend of business which is subject to price control and other legislation which naturally affects resultant net profit, I see no reason to alter my views.

I am able to state that turnover of the group for the current year to date is in excess of last year, and I anticipate that profits for this year will be no less than those for the year now under review. Our organisation is ready to grapple with and overcome more difficult trading conditions should they arise.

The report was adopted.

E. W. TARRY AND COMPANY, LIMITED

The annual general meeting of E. W. Tarry and Company, Limited, was held on December 7th, in London.

Sir H. Fortescue Flannery, Bart. (the chairman), in the course of his speech, said that it gave him much pleasure to report the completion of another successful year. A record turnover was reached and exceeded that of the preceding year by £296,654, notwithstanding the control on dollar imports into the Union of South Africa towards the latter part of 1948. He was also glad to say that the gross profit earned had been well maintained at all their branches. They had, he thought, sufficient stocks on hand to meet the demand.

Although there had been an overall rise in costs, mainly in respect of higher wages and salaries, the gross profit earned had been steady, and they had made a trading profit of £208,878, as against £143,582 for the previous year. The provision for taxation made an unduly heavy inroad into profits and absorbed no less than £110,500, and illustrated forcibly the stultifying effect of the high profits tax in addition to income tax on a successful year's trading.

The net profit for the year was £78,309, and with the balance of profit brought forward from last year, made a total of £99,862. The directors recommended that a dividend of 15 per cent be paid on the ordinary shares.

In these uncertain times he hesitated to make forecasts, but he was pleased to report, however, that during the current year there had been no serious decline in sales and, although the imports into the Union of South Africa were now on a much reduced scale, the supplies to their Rhodesian branches had increased and their sales had improved, but any curtailment in imports must of necessity be reflected in their turnover.

The report was adopted.

PRICES TAILORS, LIMITED

TWENTY-ONE YEARS' PROGRESS

The twenty-first annual general meeting of Prices Tailors, Limited, was held on December 5th at Leeds, Sir Henry Price, chairman and managing director, presiding.

The following is an extract from the chairman's circulated statement:—

This is the twenty-first annual general meeting since we became a public company, and I feel that it is particularly appropriate that on our "coming of age" I can report upon a year the financial results of which give solid grounds for satisfaction.

The net profit of the group amounts to £297,531. After various provisions there remains £349,426, of which 35 per cent. has been appropriated as ordinary dividend and 65 per cent. has been retained in the group. Net current assets of the group are £1,374,727, a satisfactory figure.

In 1928 we took over 75 retail branch establishments and one factory in Leeds. The business has been continuously and systematically developed with every extension carefully planned, so that on June 30, 1949, we had 350 retail branches and nine factories.

Production grew in volume proportionately to the new branches and factories opened, but we never lost sight of the need for continued improvement in quality and style, and I am confident that our products today are the very best that can be bought at the price. We have always had a policy as regards price to provide a suit at the cost of not more than the average man's weekly wage.

I have not the slightest doubt that with our experience and resources, together with the undoubted loyalty of all our staffs, factory, retail and administrative, we shall continue to make sure and steady progress.

The report was adopted.

BRAZILIAN WARRANT COMPANY, LIMITED

THE DOUBLE TAXATION BURDEN

The annual general meeting of the Brazilian Warrant Company, Limited, was held on December 2nd, in London.

Mr A. K. Graham, the chairman, in the course of his speech, said: The figures in the accounts represent the Brazilian currency converted to sterling at 75 to the £1. As a result of the devaluation of sterling and the revised rate for the cruzeiro to 52, the sterling surplus of whatever may be the balance at December 31, 1949, will be considerably increased which will create liability for United Kingdom taxation as profit in exchange, which in turn may create a difficult problem because of the severe restrictions imposed by the Brazilian authorities which limit the amount to be remitted to a quota regulated by local conditions having no relation to commitments abroad.

Your board have been giving serious and continuous consideration to the possible ways and means by which we might do something to mitigate the heavy burden of double taxation, and I am glad to say that we are now, with the aid of our professional advisers, on the lines of a policy which we hope will provide a real solution or as satisfactory a solution as is attainable under the very difficult conditions of taxation that exist today.

I am under the impression that so distinguished a person as the Lord Chancellor, after a visit to Brazil last summer, was greatly impressed with the potential wealth and future of that country, and in stressing the good will that was evident on all sides for Great Britain, and the courtesy and hospitality of the people for those of this country who were fortunate enough to visit Brazil, concluded with the opinion that Brazil's economy was complementary to that of Great Britain.

The report was adopted.

TANGANYIKA CONCESSIONS LIMITED

DIVIDEND OF 10 PER CENT

The annual general meeting of Tanganyika Concessions Limited was held on December 8 in London. The chairman, Mr Maurice Hely-Hutchinson, MC, presided.

After crediting an amount of £630,599 received from the Union Minière Company in respect of dividends and royalties for 1948 and £249,950 in respect of amount received from the Benguela Railway Company on account of redemption of 4 per cent income

debentures for 1948, and after providing £475,000 for taxation, the surplus on profit and loss account was £388,244, appropriated as to £126,818 for dividend on the preference stock at the rate of 10 per cent, less tax, and £172,682 for dividend on the ordinary stock at the rate of 10 per cent, less tax, the balance of £215,680 being carried forward.

Gross operating receipts of the Benguela Railway for 1948 amounted to £1,571,903 as against £1,128,354 in 1947, and after transferring £65,000 to renewal reserve account, the excess of income over expenditure was £793,804 as compared with £250,865 in the previous year, but in 1947 £360,000 was charged against operating expenditure in respect of the renewals and betterments reserve account, compared with £65,000 in 1948.

Milling operations at the Geita Mine showed that improved results were to be expected consequent upon the rise in the price of gold.

The Uruwira board has obtained an advance of £160,000 from the Patino interests, who have already a substantial investment in the Uruwira Company, and this will enable mine development to be continued, particularly on the 9th level.

The report and accounts were adopted.

UNIVERSITY OF BIRMINGHAM

The Faculty of Commerce is undertaking a Sociological Survey for the City of Coventry, and requires skilled interviewers.

Qualifications should include training or experience in case work, social work, anthropology and sociology.

Applications in duplicate should be submitted to Professor P. Savant Florence, the Dean of the Faculty of Commerce and Social Science, The University, Edgbaston, Birmingham, 15.

LADY ACCOUNTANT

Lady of personality required by West End firm. First-class knowledge of book-keeping, ability to keep complete set of books and prepare trial balance sheets and PAYE statements are essential. Age not over 35. A progressive post for the right applicant. Salary by arrangement.—Box 291.

THE COUNCIL OF INDUSTRIAL DESIGN has a vacancy for a Liaison Officer concerned with the exhibition of shipbuilding and heavy engineering to be held in Kelvin Hall, Glasgow, as a part of the Festival of Britain, 1951. Essential qualifications: good general education (preferably graduate) and a capacity for clear expression in speech and writing; ability to mix easily; experience in position of senior responsibility in industry, commerce or the Civil Service. Temporary post to end of 1951. Starting salary £1,000 p.a. Write, giving full particulars of age, education, qualifications and posts held, with dates, to Recruitment Officer, Council of Industrial Design, Tilbury House, Petty France, London, S.W.1, marking envelope "G" and enclosing addressed envelope for acknowledgement.

ECONOMICS GRADUATE, Chartered Secretary (Top Prize) 29, seeks change. Administrative experience, some journalism, public speaking, ex-Patfinder Officer. Salary approximately £800. What offers?—Box 292.

A Company in the North of England has openings in its Market Research Department for one or two executive trainees. This Market Research Department is a comparatively large one, and it operates in most fields of Market Research. The successful applicants will be aged between 22 and 30, and have a good educational background which includes mathematics, statistics or one of the scientific subjects, preferably to University standard. An initial interest in Market Research is desirable. The training given is very comprehensive and includes a certain amount of field work. The commencing salary for a man aged 22 will be above the average for this type of traineeship. In fixing the commencing salary for an older man, his additional age and experience will be taken into account. The prospects for promotion to an executive appointment within the next few years are good. Please write in the first place to Box 278.

MARKET RESEARCH department of company manufacturing consumer goods invites applications for post of ASSISTANT STATISTICIAN to undertake analysis of consumer survey results. On appointment training will be given in all work of department, including field research. Salary and future prospects are attractive and there is a Pension Fund. Applicants aged 25-30 with good qualifications in mathematics/statistics and/or economics, should write, giving details of career and reasons for their choice of this kind of research work, to Box 279.

THE International Wool Secretariat invites applications for the post of Director (Male) in their Department of Economics. Essential qualifications are a good honours degree in Economics, ability to write, and considerable experience in economic research or economic journalism. Applications with full particulars of experience, specimens of written work and salary required, to The Secretary, International Wool Secretariat, 18/20, Regent Street, London, S.W.1.

WANTED for Railways in Peru. Young man for accountancy work, knowledge of Spanish and South American experience desirable.—Write, Box "C.R." c/o J. W. Vickers & Co., Ltd., 7-8, Great Winchester Street, London, E.C.2.

Investment Statistics

Company Notes

Avon India Rubber.—Net profit fell from £289,901 in the 53 weeks to October 1, 1948, to £166,936 for the past year. The distribution of 10 per cent is unchanged.

John Holroyd.—Consolidated net profit declined from £106,935 to £90,264 in the year to September 30, 1949. The dividend of 20 per cent is maintained. A free bonus issue to ordinary shareholders on a one for three basis is proposed.

Bass Ratcliff and Gretton.—Net profit for the year to September 30, 1949, amounted to £612,133 (£609,672), after charging £680,017 (£665,971) taxation. Miscellaneous exceptional losses and debts of £30,221 have been charged to contingency reserve. A total distribution of 24 per cent, tax free, is recommended for the year, compared with 25 per cent, tax free, for 1947-48—the dividend of 20 per cent, tax free, is maintained, but the bonus has been cut from 5 per cent, tax free, to 4 per cent, tax free.

Hammonds United Breweries.—Group profit declined from £608,968 to £499,192 in the year to September 30, 1949, before deducting £237,811 (£276,668) taxation. The dividend of 20 per cent is unchanged.

Proprietors of Hay's Wharf.—Consolidated trading profit for the year to June 30, 1949, amounted to £402,413 (£448,666) and total income to £441,587 (£490,122). The ordinary dividend is 10 per cent for the year (same).

Butler (W.).—Group trading profit for the year to September 30, 1949, amounted to £448,298 (£497,069), and net profit to £208,124 (£229,095). The dividend of 16 per cent, tax free, is maintained.

Singer Motors.—A loss of £44,069 was sustained in the year to July 31, 1949, compared with a profit of £90,480 before tax for 1947-8. No dividend has been recommended on the ordinary capital, against 5 per cent. Retooling for the new model restricted output during the year to 55 per cent of the previous year's level, but current production is double the 1948-49 rate.

Humber, Limited.—Consolidated trading profit increased by £88,395 to £864,458 and

net profit from £258,632 to £380,520 in the year to July 31, 1949. The dividend of 15 per cent on both the preferred and deferred ordinary capital remains unchanged.

Meyer (Montague L.).—Group trading profit declined from £355,753 to £282,834 and net profit from £138,336 to £92,181 in the year to March 31, 1949. A dividend of 25 per cent is recommended on the increased ordinary capital (equivalent to 100 per cent—same—on capital before the bonus issue).

Allied Bakeries.—Consolidated gross earnings amounted to £2,869,758 (£2,855,077), and group net earnings to £1,131,828 (£1,276,070) in the period April 4, 1948, to April 2, 1949. The ordinary distribution is unchanged at 20 per cent.

H. and G. Simonds.—Net profit for the year to September 30, 1949, was £247,283, compared with £313,909 in the previous year. The total recommended distribution for the year is 28 per cent (30 per cent).

Aerated Bread Company.—Consolidated total profit fell from £715,219 to £512,396 and net profit from £262,901 to £169,443 in the year to October 1, 1949. Net current assets at the year-end were £558,118 (£736,185).

Slaters and Bodega.—Trading profit declined from £180,072 to £112,515 in the year to September 30, 1949. Net current assets amounted to £189,622 (£294,763) at the year-end.

Rhodesian Anglo-American.—Consolidated profit amounted to £7,382,912 (£5,746,199) for the year to June 30, 1949. Group net profit attributable to the parent company was £1,723,503 (£1,237,864). The market value of investments in subsidiary companies has fallen from £21,589,246 to £13,340,414 on the year, but the book value at cost remains at £11,159,044.

Capital Issues

2½ per cent Exchequer Stock, 1955.—Lists will remain open until December 12th for acceptance of the conversion offer of 2½ per cent Exchequer Stock, 1955, in exchange for 1½ per cent Exchequer Bonds,

1950. The total amount of the old stock outstanding is £787 million.

South Essex Water Works.—Tenders are invited for ordinary (1935) 5 per cent maximum stock at a minimum price of £100 per £100 stock. It is intended to issue stock to raise, including premiums, £288,537.

Fremfins.—Lists opened and closed on December 9th for the issue of £1,300,000 4½ per cent redeemable debenture stock 1962-80 at £100 per cent. In addition to the loan capital subject of the issue the share capital is £1,050,000 in £350,000 7½ per cent cumulative preference stock and £700,000 in £1 ordinary stock (including an offer now made to ordinary shareholders of 350,000 £1 ordinary shares at 28s. per share).

Morgan Brothers (Publishers).—Application has been made for permission to deal on the London Stock Exchange in the whole issued capital of £473,250 in £200,000 7 per cent cumulative £1 preference shares and £273,250 in 5s. ordinary shares. Profit for years ended March 31st before deducting income tax: 1939, £36,505; 1948, £123,239; 1949, £138,131. Assets as at March 31, 1949: Fixed assets, £77,058; total current assets, £348,895; net current assets, £210,389.

Redemption yields are worked out on the assumption that all dated stocks will be repaid at latest date. Such yields are marked 'f'. To this rule there is one exception (floating 4 per cent) on which the yield is taken to earliest date and marked 'e'.
(a) Net yields are calculated after allowing for tax at 9s. in £. (f) Flat yield.
* Assumed average life 15 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) Assumed dividend 18½% after capital bonus. (f) To latest redemption date. † Free of tax.
(m) Yield basis: 35% after capital bonus.

EXCHEQUER RETURNS

For the week ended December 3, 1949, total ordinary revenue was £64,817,000, against ordinary expenditure of £96,504,000 and issues of £120,000. Thus, including fund allocations of £10,987,000 the net revenue since April 1st is £47,424,000 compared with a surplus of £268,844,000 for the corresponding period a year ago.

LONDON OFFICES: 37, Nicholas Lane, E.C.4; and 18/20, Regent Street, Piccadilly Circus, W.1.

Every description of Banking Service undertaken

SUDAN GOVERNMENT

The Finance Department requires a qualified Accountant, aged 30 to 45, for service in the Sudan. The person appointed will be required to take charge of the Accounts and Accounting Staff of the Public Works Department under the direction of the Director of Works. Candidates must be either Chartered or Incorporated Accountants, or possess equivalent qualifications.

Appointment will be on Short Term Contract for an initial period of three years at a salary between £E.900 and £E.1,400, with special post-service bonus. The actual starting rate will be fixed according to age and experience.

A. Grade of Salary Allowance varying between £E.180 and £E.390 per annum according to the number of dependants, is at present payable. There is at present NO INCOME TAX in the Sudan. Free passage on appointment. Full particulars and application may be obtained on application to: Sudan Agent in London, Wellington House, Buckingham Gate, London, S.W.1. Please mark envelopes "Accountant P.W.D."

BEDFORD COLLEGE FOR WOMEN

(University of London)

REGENT'S PARK, N.W.1

The Council of Bedford College invites applications for the office of Bursar of the College, vacant from October 1, 1950. The Bursar is responsible for the control of the domestic side of the College administration. The post is open to women only; the scale of salary is £800 x £50—£1,000 per annum resident. University degree and responsible and relevant experience essential. Last day for receiving applications January 30, 1950. Further particulars from the Secretary.

A. B.Sc. (Econ.) (Hons.), seeks progressive position at home or abroad. University, army, administrative and commercial experience. Good knowledge of India and some spoken Hindustani. Other languages, French and Italian.—Box 277.

B. A. (Soc. Adm.) does translations English-German and vice versa.—Box 282.

FOR SALE: *The Economist*, 1945 (2 short), 1946 (6 short), 1947, 1948. Offers to Box 281.

Election Calendar

FOR some months past, speculation about the date of the general election has dominated the political conversation of the nation. Political activity is quickening. Ministers and their opponents are embarking upon high-pitched oratory and low-pitched insinuation, the inevitable accompaniments of election time. Back benchers are trickling away from Westminster to raise the fiery cross in their constituencies. Figures of the various opinion polls are discussed and disputed with vehemence, and straws in the wind—South Bradford, New Zealand, Australia—are being built into haystacks. The Right, though it discounted President Truman's victory a year ago, now claims that the recent defeats of Labour in New Zealand and Australia are portents of things to come in Britain. The Left, having hailed the American election as a sign of the invincible march of Labour, now professes to ignore New Zealand and Australia.

The Prime Minister, having decided against an election this year, has now to find the most advantageous date in the first six months of next year. But the magnitude of his mistake in not having already gone to the country has become very apparent. This he could have done with the whole of the Labour Party's 1945 programme on the statute book, if the Government had been prepared—or alert enough—to make the same compromise in July with the House of Lords over the vesting date for steel nationalisation as they did, in fact, make in November. Parliament could then have been dissolved at the end of the summer session; an election could have been held in October or November, and there would, by now, be a new government in office refreshed by a new mandate to tackle the tasks ahead.

By postponing the election until next year, the Prime Minister has set himself and the nation a very difficult problem. The choice he must now make is between an election held in January or February or possibly March (difficult campaigning months even in a mild winter) and an election postponed until after the middle of May. This awkward choice arises from inescapable duties of government which far transcend the niceties of politics or calculations of party advantage. Expenditure has to be approved and taxation provided for. And in April there are the local government elections. These two facts virtually rule out the possibility of a general election in the fourth and half of the fifth months of next year. Mr Attlee is left with two extremes, one physically and politically unpleasant, the other nationally disastrous.

His dilemma is apparent by turning over the political calendar for January to June. There is no bar to a general election during the months of January or February. Parliament, having been prorogued this week, could be recalled for dissolution immediately after Christmas and the election could be held any time between the third week of January and the end of February. From the Government's point of view the main deterrent would be the weather, which would certainly produce a low poll. On the other hand, a date in late February, say the 23rd, would enable the enthusiasm engendered by

the party's jubilee rally on February 3rd to be effectively deployed.

But late February is the last date on which a general election could be held without running into difficulties. It is conceivably possible to have an election in March since the necessity to scrutinise the expenditure of the Crown for the coming financial year can be confined to voting part of the service estimates and passing a vote on account to cover expenditure until the Estimates are formally passed in the summer. But to dissolve Parliament in the first week in March for an election in the fourth week means that the state visit of the President of the French Republic will occur at the height of the election fever. To have an election early in March with a view to reassembling Parliament in time to pass a vote on account before March 31st would immediately anticipate the publication of the new electoral register.

It is equally necessary for Parliament to be in session at some time in April; with the start of the new taxation year Parliament must scrutinise the Budget. In theory, it would be possible to introduce the Budget on April 5th next year (two days before Good Friday), to pass a quick series of Ways and Means resolutions to give effect to the Budget changes until the Finance Act is passed and then to dissolve Parliament. But, in practice, this timetable would involve the political disadvantage of having the general election campaign side by side with the county council elections in mid-April, and the administrative drawback of leaving any changes in taxation largely in the air for a month or more.

A dissolution in the middle of April for an election at the beginning of May would be pointless since the borough elections must be held about May 10th. Mr Attlee seems, therefore, to be faced with the choice either of going to the country in January or February, or of following Mr Baldwin's example in 1935 and dissolving Parliament about May 10th for an election at the beginning of June.

★

Confronted with this choice, and reckoning on the possibility that the sterling reserves will improve, that exports will continue to rise after the recent devaluation, —or governed merely by the inertia which ties politicians to the cares of office—some members of the Cabinet will doubtless urge on Mr Attlee the advantages of waiting until the summer.

A moment's reflection, however, shows how undesirable this course would be. The Parliament which is due to reassemble in the third week of January would have no important legislation before it and would be bound to fritter away its time in wordy battles intended for the consumption of the electorate. With an election fever on the country, no politician could behave with detachment, and all would make fools of themselves at one time or another. The economic affairs of the country would be debated in an atmosphere of acrimony and vote-catching. The result would be to lower the confidence of the public in the leadership of Parliament and to blunt the edge of its interest in the issues of the election. The effect upon the sensitive points of the economy—industrial output, trade and the Government's credit—would be profound. If the Prime Minister wishes the election to be fought with a maximum of bitterness and folly, he could promote it by no surer means than to postpone the decision until June.

But the domestic setting of the election is not the only aspect to be considered. Quite apart from the necessity for giving some galvanic direction to home policy, the movement of events in the world at large will not be arrested while the British have their general election. In the first six months of 1950, profound and far reaching adjustments in British policy may have to be made. The debates on Marshall Aid in Washington—which will last, perhaps, for the whole period from January to June—may well produce a scaling down of the third instalment which will call for swift and drastic action in Whitehall. The Colombo Conference in January may involve important decisions about Britain's commitments to the Commonwealth. Almost certainly, far reaching decisions will have to be made on Britain's role in the defence of the west and its contribution to Europe's economic liberation. Such decisions cannot be taken by a Cabinet and government which is idling in neutral gear.

★

The British constitution rightly gives the Prime Minister in office the power to decide when, within the five year limit, he will lead his party in an election. No Prime Minister ever lacks advice from the party managers about the balance of electoral advantage between one month and another. But, in the last resort, the decision is his, and his alone. Mr Attlee must be well aware that public opinion forms gradually during the lifetime of a government but that, once formed, it stays formed and is not profoundly altered by the excitements of an election campaign. The majority of the British public are unlikely to revise their opinions, whether the sterling reserves, the meat ration or the gilt-edged market go up or down, or whether the election is held in June or January. Moreover, the spectacle of a government dawdling on from inertia or love of office does not please the British electorate. It was just such action on the part of A. J. Balfour in 1905 that contributed, in large part, to the Liberal landslide of 1906. The Prime Minister, if he waits till June, could well be accused of risking public confidence at home and British prestige abroad to alter only slightly the pattern of a die that is already cast.

The decision rests entirely with the head of His Majesty's Government. There is nowadays no separate element in the British constitution designed to safeguard the national interest as opposed to a political interest. The Prime Minister, the sole arbiter, must make the distinction within his own heart and mind however much he is convinced that the return of his own party is essential to national salvation. Mr Attlee is a wise man whose record of quiet statesmanship suggests that he would go further than most Prime Ministers in bearing this distinction in mind.

Having committed the initial blunder of failing to dissolve this year, the national interest positively demands that he faces the consequence and permits the nation to decide on a new government at the earliest practicable date in the New Year. He may incur the odium of candidates and canvassers tramping the bitter streets and the cold moors, but he may be reviled by the whole nation if inertia or miscalculation induces him to delay the decision and to waste four critical months during which Britain's greatest need will be strong and wise leadership.

Mr Bevin's Record

WITH the end of this session, Mr Bevin has completed his last full year of office in the present parliament. If—as is devoutly to be hoped—an early dissolution is decided upon in 1950, the record which the Foreign Secretary must place before the electorate is virtually complete. It is not an easy task to assess its electoral appeal or its intrinsic value. Mr Bevin is undoubtedly the most striking personality among Labour leaders. Few of them have anything of his force. But personalities are not policies. In the case of Mr Bevin it is not easy to say whether the achievement is to the measure of the man.

It is true that the Foreign Secretary's four years of office have covered a period of great difficulty and confusion. Foreign policy is relatively easy to pursue when relations between states are stable and the balance of world power is familiar and well recognised. Mr Bevin has had to deal with a world in which many of Britain's traditional diplomatic concepts have become obsolete. The war completed the creation of a new international balance with the United States and Russia dominating the new scene. Between them, the old centres of power in Europe were shattered, while Britain itself was too gravely weakened to continue to fulfil its old role. It was—and is—a revolutionary situation in which new directions had to be set for British diplomacy.

The Foreign Secretary's greatest claim on the country's esteem is that in this critical period, when the seas were largely uncharted and the barometer pointing to storm, he set the helm on the only course capable of bringing the country into calmer waters—full co-operation with the United States and the other western democracies in building an international community proof against Communism. In 1945 and 1946, such a course was far from obvious. At that time, many would-be pilots in the Labour Party were pushing up to the bridge with courses set in very different directions. Mr Bevin was practically the first to see that the chart labelled "socialist solidarity with the great Soviet Union" would take the ship on to the rocks, but he had no easy task in persuading the lower decks of the Labour Party to accept his view. Even when the implications of Soviet rule in eastern Europe had sickened all but the tiny group of fellow travellers, the traditional Socialist dislike of "capitalist America" gave a certain impetus to the search for a third force in the shape of a neutral socialist bloc in Europe lying between the so-called extremes of right and left. Again, it was above all Mr Bevin's realisation that democracy in Europe could hardly survive without the closest support of the democracies beyond the ocean—in the United States and in the Commonwealth—that relegated the third force to the pages of the pamphleteers and prepared the ground for the Marshall Plan and the Atlantic Pact.

It can thus be said that the Foreign Secretary, more than any other European leader, has been responsible for formulating the general policy of close co-operation within the western world. During the first three years of the present administration, his achievement in the shape of the European Recovery Programme, the setting up of the Organisation for European Economic Co-operation, the Brussels Pact, and the negotiations leading up to the signature of the Atlantic Pact would seem to be

sufficient to establish the record of any statesman. Indeed, if Mr Bevin had left office early in 1948, blemishes already apparent in his handling of affairs—for instance, in Germany or in Palestine—must have seemed minor compared with the achievement of western solidarity. But Mr Bevin has continued in office for eighteen months since the signing of the Brussels Pact, and for over two years since his quick reaction to General Marshall's Harvard speech set the Marshall Plan in motion; his latter period has unhappily done much to confuse the earlier picture of achievement and purpose.

★

The paradox of the Foreign Secretary's record is that, having established the right general principle—close co-operation with the Commonwealth, America and western Europe in pursuit of a stable international order—he appears to have drawn none of the necessary conclusions. In the last two years, the chief need of British statesmanship has been to expand and fill out this general idea of co-operation by means of specific applications of policy to particular areas and problems, but when one endeavours to discover what the particular policies may be, the record is one of disconcerting obscurity. In Europe, for instance, who can say what precisely is Britain's attitude to closer co-operation? It is over a year since Mr Bevin declared that the time for Western Union was ripe, but it is still impossible to say what he meant by it then or means by it now. It is not close economic integration. It cannot mean some mere regional arrangement—and even if it did, such notions as "Uniscan" would still have to be dismissed as window dressing. It is not federation. It foresees no particular developments in the Council of Europe. Behind much of the discussion is the implication that Britain has special Commonwealth interests to safeguard. But they have yet to be specifically defined and reconciled with European needs.

At the same time, there is evidence of uneasiness and questioning in the Commonwealth about Britain's relations both with its imperial partners and with Europe. The conference at Colombo may clarify these doubts, but it is not far from the truth today to say that, while Europe cannot be sure of Britain because of its special place in the Commonwealth, the Commonwealth is perturbed about the implications of Britain's special links with Europe. Yet it should surely have been possible to dispel the uneasiness of at least one set of partners.

The sense of uncertainty and fumbling in British foreign policy seems, however, most noticeable in Britain's crucial relations with the United States. In the last year, it has become increasingly apparent that the future of western world order may well be determined by the relations between the dollar and the sterling areas. It has become equally obvious that present policies—generous as they have been on the American side—are insufficient to close the dollar gap. By restoring prewar levels of production, the Marshall Plan has done four years' work in two. The new problem—of re-establishing equilibrium in world trade—cannot be solved without new measures demanding a new phase in the Anglo-American partnership. Yet, in spite of the Washington Conference in September, it is doubtful if

understanding between the two peoples is as close as it was even a year ago. On the American side, various *ballons d'essai*, one of them at least more specific than General Marshall's address at Harvard, have gone up—the President's "bold new programme" for investment in backward areas, the State Department's privately circulated project of Atlantic Union, the widespread unofficial canvassing for an American move to underwrite part of the sterling balances. It may be that the British response to some of these overtures has been as quick and as frank as Mr Bevin's reaction to the Harvard speech. If so, public opinion on both sides of the Atlantic is unaware of the fact.

★

This, then, is the present position, in such marked contrast with the picture of, say, 1947. What is the explanation for Mr Bevin's very uneven record? There are, of course, extenuating circumstances. American policy has hardly pursued a constant course and, particularly in Palestine and in Germany, the zig-zags and reversals have made any British attempt to keep in step extremely arduous. It is also true that Mr Bevin has been called on to preside over a phase of policy which few nations have conducted with complete ease and dignity. Britain is no longer the dominant world Power. America has taken its place and it is not always easy for Britain to accept the new relationship with generosity and grace. Even so, there are undoubtedly particular reasons for the stagnation of British policy in the last eighteen months and for this Mr Bevin must bear at least part of the blame. Ideological prejudice, for instance, against "capitalist America" has not been wholly banished from Britain's relations with its chief colleague. Doubts seem to persist whether a socialist policy at home is really compatible with an American partnership. To a lesser extent a similar distrust of Continental conservatism has hampered the development of a consistent British policy towards Europe.

Stalin and His Heirs

(By a Correspondent)

DURING the war Stalin once boasted to President Roosevelt that he had made all the arrangements necessary to ensure the smooth functioning of the Soviet leadership after his death. He had settled, he said, the problem of his succession and was confident that the settlement would work. The story, if true, would illustrate the narrow-minded conceit of the man: he seems to believe that history will obey his commands even after his body has been embalmed and laid by the side of Lenin's in the mausoleum. The story also throws a sidelight upon the democratic pretensions of Stalinism: the leadership is to be bequeathed by the leader, as if the Soviets had by their "most democratic Constitution in the world" been transformed into an hereditary and absolute monarchy.

The orgy of hero-worship indulged in by the faithful on the eve of Stalin's seventieth birthday—which falls next week—gives new point to speculation about the succession. The incense burnt to the septuagenarian has an almost funeral smell. For a long time now Stalin has been conspicuously absent from the party and state occasions at which he used to take the salute or address

Another difficulty has arisen from divided authority at the highest level of government. In the last four years, economic problems have become the very stuff of diplomacy. The result has been an uneasy overlapping of command between Treasury and Foreign Office, and Mr Bevin's dislike of any incursions into "his" field has led on occasion to remarkable reversals and obscurities in British policy, particularly in Europe.

The gravest charge, however, is that in the last eighteen months it has become more and more apparent that Mr Bevin has, in fact, no foreign policy worthy of the name. In all diplomacy, but particularly in diplomacy dealing with a revolutionary world, two elements are needed. One is the caution, the assessment of national interests, the careful balancing of pros and cons—all functions of the permanent Foreign Office official. The other, the role of the statesman, is to provide the imaginative grasp of policy, the capacity of seeing foreign relations in the round, of providing both the impetus and the vision which troubled times demand. At first Mr Bevin appeared to have—indeed had—that quality. But the drive has slackened, the grip on policy has relaxed. His interest has become spasmodic, his interventions unpredictable. More and more he appears to be in the hands of his permanent officials whose very function is to assess difficulties, measure obstacles and counsel caution. The conduct of policy thus becomes a succession of defensive acts and the ship of state, instead of keeping to its course, tacks from expedient to expedient.

That is the defect of Mr Bevin's record. After a promising and worthy start, he has shown little capacity for following up an original policy with its detailed application. As a result, British diplomacy now bears a negative stamp. It is, indeed, difficult to avoid the conclusion that, whether or not the Labour Party wins the next election, new leadership will be necessary at the Foreign Office.

the crowds. The few visitors who have seen him since the war have as a rule been struck by the signs he has been showing of physical decay. The recent reshufflings in the Politbureau and the government may have been made in preparation for the day when Stalin is no more. Contrary to rumour, Molotov seems so far to hold first place in the line of succession. At the official gatherings he takes the stand or the seat usually reserved for Stalin. But Molotov's role is very much like that of an heir presumptive acceding to the throne very late in life; his accession is bound soon to create a new problem of succession. That is why the much younger Malenkov has, in recent months, moved so rapidly into the limelight.

More important, however, than the identity of Stalin's likely successors is the wider problem of the succession: can the Stalinist system go on without Stalin? Stalin himself believes, or pretends to believe, that it can. He must, of course, insist on those inherent merits of his method of government which should enable the method to survive its inventor. For different reasons, this view has gained wide acceptance among Stalin's enemies and

opponents. The same question, it is pointed out, arose when Lenin died; and the Soviet regime withstood that shock pretty well. A totalitarian society, it is further argued, is devoid of all spontaneous impulses for domestic change, and the continuity of totalitarian government can be insured in advance by the political police. No totalitarian regime has ever collapsed or changed under pressure from inside; the Nazi and Fascist tyrannies were destroyed only by foreign invading armies.

★

This question points back to another and much older one: what is the role of the individual in history? Can a regime addicted to the cult of a single leader have enough stability and inertia to be altogether independent of the personality of that leader? It seems that in a system in which the leader is extolled and exalted as much he is in Stalinism, his death should produce at least a crisis. A whole Russian generation has been brought up in the belief that it has owed its achievements and victories to the wisdom, vigilance and genius of the "Father of the Peoples." What will happen when that wisdom, that vigilance, that genius are no longer there to serve the people? So much authority has been concentrated in one person that it would be surprising if the disappearance of that person were to result in no confusion of authority.

One of the reasons why the crisis after Lenin's death was overcome by Stalin—although not without bitter struggle and bloodshed—was that under Lenin the Bolshevik Party had not yet become so hamstrung by the belief in the *Führerprinzip* as it is to-day. It had still retained something of the outlook of a normal political party, with a collective mind and will of its own, to carry on after Lenin's death. In contrast, the legend of the living Stalin has become so supremely important in the Stalinist system that it is not so easy to see how the one can exist without the other.

It is not difficult to guess how Stalin himself and the Politbureau envisage a solution of this problem and on what Stalin bases his confidence in the workable character of his alleged settlement. Leaders are made and unmade, they can be built up or destroyed by propaganda—this is the crude, cynical view which the men of the Kremlin take of the personal cults initiated by themselves. Since the propagandists have succeeded in building up the Stalin legend, why should they not be able to manufacture a Malenkov myth? This reasoning

begs quite a few questions. It assumes, first, that the propagandists and their bosses behind them are all agreed as to who should be the bearer and the chief beneficiary of the next legend. It further assumes that the propagandist is all-powerful, that his legends can, indeed, thrive and captivate the mind of the people regardless of a country's social needs, political climate and moral condition. Both assumptions may be unreal.

The Stalin legend undoubtedly met, at least at first, some psychological needs in the Bolshevik party and beyond its ranks. The Leninist phase in Bolshevism had been bound up with the expectation of imminent world revolution. Stalinism, with its original emphasis on socialism in one country, weakened that expectation and psychologically adjusted Bolshevism to intensive domestic development in a condition of isolation. It seems that the real need of Russian society now—a need that is likely to be aggravated and to become more articulate after Stalin—is to rid itself of the successive legends, Leninist, Stalinist or post-Stalinist, and to face its own problems soberly. From this unsatisfied need spring the strains and stresses in Soviet society, of which the outside world is every now and then made dimly aware by outbursts of heresy hunting and purging.

★

The legacy which Stalin will leave behind is full of the most glaring contradictions which can hardly be covered up for long. He has presided over a great industrial revolution in his country but has kept the bulk of his people in such abject poverty as must impede the country's further advance. The Russia he will be leaving behind is armed with atomic energy but, metaphorically, still goes barefoot. He has carried through a veritable cultural revolution among the peoples of the Soviet Union and has never ceased to oppress their minds by his spiritual despotism. He has forcibly driven a semi-Asiatic community to assimilate the industrial and scientific techniques of the west and is now preaching an obtuse, malignant contempt for the west. He continues to instil some basic ideas of freedom and Socialism into the new generation and compels it to practise the opposite of those ideas. This tangle of contradictions cannot for ever, or even for very long, be covered up by clever legends and hypocritical purges. There is too much explosive stuff in it, and Stalin's disappearance may act as a cataclysm in the explosion.

But has any totalitarian regime ever broken down (or

relaxed) under internal strain? Contemporary political theory tends to answer this question in the negative; but, perhaps, it does so under the still fresh and exaggerated impression of Nazism. It is too often taken for granted that totalitarianism is a novel phenomenon, peculiar to our own age. This is not so certain. It might be said that history is, in fact, strewn with the wreckage of totalitarian systems. In Russia, Ivan the Terrible and Peter the Great were as much totalitarian rulers as Stalin himself. Yet their respective methods of government did not survive either of them. The reign of Ivan the

The Co-operatives—I

Manchester Leviathan

THE Co-operative movement is, at one and the same time, a vast business concern and a voluntary organisation inspired by a social purpose. It is proposed to examine in three articles these twin aspects of the movement and to attempt a tentative evaluation of its efficiency as the one and its constancy and political value as the other.

Many people—even among those who shop at Co-operative stores—have only a vague idea about how their business is organised. It is therefore worth outlining it in brief. There are roughly ten million members belonging to 1,030 retail societies (the local “Co-ops”). These societies, each completely independent, are the mainspring of the movement, but they have organised themselves in a variety of ways for special purposes. In the first place they have formed two wholesale societies, one each in England (the CWS) and Scotland (the SCWS) to handle their wholesaling and also to produce certain goods solely for them. Retail societies buy over half their goods from or through wholesale societies; they also run their own insurance company and banking department through the wholesale society. In addition, retail societies have got together on a purely local basis for making certain goods or to take over factories already run by the workers on “co-operative” principles, and the products of these industrial societies often compete with those of the wholesale societies; similarly they have formed 82 local federations for retailing perishables like meat and bread which need a wider market than some of the smaller retail societies can command alone. Finally, all the societies have combined to form a Co-operative Union, whose chief function, like that of the TUC, is to call an annual congress for the discussion of common problems, but which also provides a host of services—legal, financial, informative and educational—for its members.

To deal first with the retail societies, the proportion of the total retail trade of the country done by these societies is at present roughly as follows:

Milk	...	...	32%	Meat	...	...	14%
Sugar, butter, bacon,	...	...	...	Footwea.	...	...	10%
cheese	...	...	25%	Clothing	...	...	7%
All groceries	...	...	20%	Household furniture	...	...	7%
Coal	...	...	20%	Pharmacy	...	...	6%

At first sight these are impressive figures but, measured by the resources of the movement, they are surprisingly small. The commodities in which co-operative retail trade is strongest are the staple everyday necessities,

Terrible was followed by the Time of Trouble. Ivan's principal instrument of power, the *Oprichnina*, in some ways the prototype of Stalin's political police, broke into pieces as soon as Ivan's hand was removed from it. His centralised state fell a prey to confusion, and ever new pretenders to the throne rode into and out of the Kremlin. What Time of Trouble may awake Russia after Stalin's death?

On the other hand, who can say how many happy returns of the day may not come to Stalin? Caucasians sometimes enjoy astonishing longevity.

highly standardised and lending themselves to mass-production. In clothing, footwear and furniture, on the other hand, buyers demand a wide variety of choice, and the movement's working-class traditions keep it limping far behind public taste. The expressed aim of supplying all goods and services to all consumers is still a very long way from realisation, in spite of the unbroken growth in size and trade which still continues. In certain lines conditions of supply do not favour the retail societies—they have difficulty over dividend payments with books, newspapers and branded articles. In others, the market requires skilful retailing with a personal “service” element—as with sports goods, cars or jewellery, where the traditionally working-class character of the societies would be a disadvantage in attracting the number of customers necessary to meet overheads.

But by far their greatest handicap in the process of drawing more retail trade into co-operative channels is the unavoidable conservatism of those directing the organisation. It is too loosely-knit to be galvanised from above; it relies on the still small voice of idealism to prod the solidly respectable members who give more time to directing retail societies into the appalling risks, the feverish overwork, and the braving of criticism which true enterprise demands. “No gambling with the members' money” was probably the motto that prevented the demand for cheap restaurants or sixpenny bazaars from being met on co-operative lines, and allowed private enterprise to capture the huge market for entertainment, sport and holiday facilities. In these and the numerous other new markets of the last fifty years, the Co-operatives' resources would have given the movement a running start if it had the vision to anticipate and educate demand as its competitors have done.

Local differences are another factor in holding back progress that needs a unified national effort. In the industrial north, where the Co-operative societies are older, they are smaller, more numerous and their membership is more loyal. In the south, where they grew up later, they came into keener competition with existing commercial firms and made their way by greater efficiency, by spreading their services over wide areas to cater for the rural as well as for the urban populations. These bigger societies allow more elbow room to the full-time officials and the management committees to experiment with new ideas without having to meet the eye of reproachful members at every street corner.

Wider integration, more professional management, and standardisation of advertising might seem to provide the obvious keys to expansion, but these could only be achieved by the sacrifice of a valuable business asset in the shape of great loyalty and semi-proprietary interest. It is arguable from the purely business point of view that the gain would be worth it; that indeed only by ruthlessly modernising the whole administrative structure and cutting adrift from its parochial swaddling clothes can the co-operative societies keep abreast of progress, and compete with large-scale profit-making business, let alone achieve its declared purpose of a co-operative commonwealth.

The fact that the retail societies own over two hundred factories and workshops up and down the country, producing many of the goods they sell, is commonly regarded as their strongest claim to efficiency, since this cuts out the “middleman.” Certainly the mere size of co-operative production, although it tends to obscure certain drawbacks, does confer very real advantages. Bulk buying of services and secondary materials are only two of the most obvious economies of tying together a wide variety of manufacturers for consumers' needs, although united financial control probably constitutes a temptation to “carry” the less efficient units. But the advantages which are usually associated with linking up production and retailing under one ownership are not all found here, for two reasons. The first is that most of this production is carried on by the two wholesale societies. Two-thirds of the goods supplied by these societies to local retail societies represent the normal wholesale merchandising of other peoples'—often their competitors'—goods. Production of the remaining third, therefore, is only one limb, and that not the biggest, in the leviathan wholesale societies. All sales from co-operative factories are handled through the same merchandising channels, and by the same travellers, as the bulk of the business. CWS brands enjoy less, not more,

NOTES OF THE WEEK

Mr Strachey on the Spot

A curtain raiser to the Lords' debate on the East African groundnut scheme was provided by Mr Strachey's hurried and unplanned visit to Tanganyika. His sudden departure at the end of last week under, so it was alleged in the debate, an assumed name (some are suggesting that this was Plummer's Mate) naturally had the effect of making what has become a matter of personalities more personal than ever. There was little that their lordships could add to the list of technical and scientific mistakes, which are well recognised by the Government no less than the Opposition. Even here, however, there is still room for the inquiry which the Opposition is demanding, because the decision to curtail the scheme so drastically to 600,000 acres, with the consequent writing down of capital that it will involve, can only be endorsed if the public has some reasonable assurance that groundnuts can be grown profitably on this limited acreage.

But more than anything else an inquiry should provide an opportunity for restoring the confidence of the workers in East Africa in the scheme and in those who control it. Lord Hall, speaking for the Government, declared that Mr Strachey had gone to Tanganyika to reassure them that the Government intended the scheme to continue. To this Lord Milverton retorted that a more effective step to restore morale would have been for Mr Strachey to have stayed in London and announced his own resignation or severance from the control of the scheme. A paragraph of Lord Hall's

of the single-minded sales pressure and marketing techniques devoted by commercial firms to their products.

The second weakness is that, in spite of the extent and variety of the goods manufactured by the two wholesale societies, they are not allowed to sell them outside the movement; thus the sale of over fifty different lines of production is restricted to the selling capacity of the co-operative retailers. Originally the retail societies set up the CWS and the Scottish CWS for their own purposes, primarily to manufacture and wholesale for their needs, and only incidentally to return any profit to them as dividend. “Investment for need, not for profit” is still the rule, so that the productive plants have never had a free hand to explore the economies of large-scale production. Finishing processes, like tailoring or soap-making, probably have a co-operative market far bigger than they need. But a stage further back, at weaving or fat-importing, the optimum size may be much larger than this ultimate market allows.

Both as retailers and as manufacturers, the co-operative societies are often regarded with fear by their competitors as a powerful menace to normal profit-earning enterprise. But what would not a Rockefeller or a Nuffield have made of such potentialities? Normal profit-making enterprises in direct competition with co-operatives in many spheres of trade accuse them frequently of sinister designs and unscrupulous methods on counts so palpably false as to reveal all too clearly the fear they inspire. To the unprejudiced observer, however, judging the movement not by the lip-service it pays to the goal of a “Co-operative Commonwealth,” but by the use it makes of its opportunities, its actions speak loudly of a middle-aged complacency. In spite of its large resources, in spite of its millions of devoted customers, it does not dominate a single market, and has not been responsible for a single one of the half dozen or so major innovations in the consumer trades of this century. The race is not to those who rest on their oars.

speech was very revealing. Last month, in the Commons debate, Mr Strachey said:

I went out to East Africa last June, and I was very careful to interview, privately and alone, all the senior members of the executive out there and to ask them their opinion and attitude, because these allegations have been made about the chairman and the leadership of the corporation, and their replies were that the allegations which the hon. member has just made [of a lack of confidence in the chairman among the executive staff] were not in fact true.

Lord Hall said that the Minister had asked him to say that these words were not intended to convey the only impression they could possibly have conveyed—that Mr Strachey had asked for and received a declaration of confidence in Sir Leslie Plummer. In fact, at the meeting in June, the question of confidence was not even raised, and Mr Strachey's statement implying that it was, and that he had received a positive declaration of confidence, caused great and justifiable resentment at Kongwa. This alone may have been enough to provoke Mr Strachey's visit. The whole incident is an excellent illustration of the way in which, throughout the unhappy groundnut story, the truth has been hidden.

A Selfish Strike

Whatever genuine grievances the 2,500 men on strike at the four London power stations may have had, it is impos-

sible to excuse their action. An electricity strike hits the public where it is most vulnerable—at home, in the offices and factories, in the streets and on the railways, as the nation learned only too painfully in the 1947 fuel crisis. The Government acted promptly to prevent any serious dislocation of supply, and although the introduction of troops irritated the men—indeed it was the cause of the strike at Barking—the decision was undoubtedly correct.

The dispute has been simmering for some time. Indeed, one of the criticisms made by the shop stewards was the slowness of the negotiating machinery. The trouble arose from the proposal agreed by the industry's Joint Industrial Council on May 31st to merge into a general increase of 1½d. an hour certain bonus payments formerly made to men at stations where conditions were abnormal. This was part of the British Electricity Authority's scheme for rationalising the industry's wage structure and getting rid of some of the anomalies which existed under private ownership. The general increase involved about 110,000 workers and the bonus payments applied to another 7,000. But none of this latter group, it was stressed by both the authority and the union leaders, would be any worse off actually, though they might be relatively to their fellows. A joint committee was set up to see where excess payments were and were not justified. The stations involved in the dispute were held not to qualify, though it was agreed that special payments could be negotiated for specific occupations.

The strikers agreed on Thursday to return to work, on an assurance given by the official union leaders that their grievances would be considered. But a last-minute hitch over the terms on which they should return has kept the men out at three of the four stations concerned. The dispute has left a nasty taste. It is, however, difficult to fasten responsibility on to any particular elements. Mr Frank Foulkes, President of the Electrical Trades Union, is a Communist, but has from the start been urging the men to return. If there were Communist elements behind the strike, they do not appear to have had much backing from headquarters, although the *Daily Worker* has chanted delightedly about use of "blackleg" soldiers. Mr Foulkes and his colleagues took the sensible course in agreeing to meet the men's leaders at an early stage, rather than insisting on a return to work first, as has been the case in some recent strikes.

End of Session

The fifth session of the present Parliament, distended to fourteen months in order to secure the passage of the Parliament Bill, has at long last come to an end. Its closing stages were occupied partly by a rush to complete certain outstanding items of legislation such as the Justices of the Peace Bill, partly by two major debates (on groundnuts in the Lords and films in the Commons), and partly by a series of acrimonious motions whose purpose was primarily electioneering. On Monday the Commons debated a Conservative motion designed to arouse sympathy for gas stockholders whose compensation stocks have suffered in recent months, and on Thursday it dealt with a Labour back bench motion on the publication of political accounts and a front bench motion on nutrition. Mr Quintin Hogg tabled a strongly worded motion attacking the Attorney General and Mr Morrison for their views on electoral expenses, and a group of Tory members raked up a three month old report of a speech in order to have a go at Mr Harold Wilson. These are a reminder of the mood of acrimony which will develop if Mr Herbert Morrison does not fill the proposed new session in the New Year with enough real work to keep members busy until the election date is finally promulgated.

The session which is just ending has seen the passage of some hundred public bills, including the five private members' bills which have survived the winnowing process of second reading and committee. Other private members' measures, such as the Analgesia in Childbirth Bill, though not

passed into law, had the important effect of rousing public opinion and stimulating the necessary administrative action. Of the major Bills, the Iron and Steel Bill (now the Iron and Steel Act) was, of course, the giant, and this week the Royal Assent has been granted to its companion on its tortuous passage through both Houses, the Parliament Act. The other measures were for the most part non-controversial—the National Parks and Access to Countryside Bill, the Juries Bill, Legal Aid and Advice, Criminal Justice (Scotland), the Housing Bill (dealing chiefly with the conversion of large houses), and the Nurses Bill.

A glance back over Hansard during the weeks since the King opened the session on October 26, 1948, brings sharply to mind the way in which economic affairs came from last spring onward to be the dominant general issue facing Parliament. In all there were only three full scale debates in the House of Commons on foreign affairs (including one on the Atlantic Pact), and one on the Palestine situation. But from April onwards the economic crises claimed more and more time. The combined economic and Budget debate lasted four days. In July came the Chancellor's first statement on the renewed dollar crisis, followed by the two-day economic debate in the same month. In September, there was a three-day debate on devaluation, and in October a two-day debate after the Prime Minister's statement of the cuts in expenditure.

Victory Speeches in Australia

In the first flush of success, Mr Menzies has not kept his head quite as well as he might have done. It may be that a veil should be drawn over post-election victory speeches as well as over what is said during the heat of the campaign; but, if Mr Menzies really intends to outlaw the Communists he will store up a great deal of unnecessary trouble for his government.

It is always bad politics to ban a political party, even though its existence constitutes a threat to the state. The inevitable result is to drive its members underground, where they will be sure of winning far more support than they ever enjoyed on the surface. A more sensible method is to tighten up the regulations governing the trade unions—to insist, for instance, on a secret ballot of all members on any major decision—and to enforce the sedition laws more strictly still. By such means as these, the claws of the Communists can be clipped without running the risk of driving into their arms every young hothead in the country with a taste for secret service.

As for petrol rationing, which Mr Menzies has promised to abolish, it is worth recalling that Mr Chifley kept it on after the war mainly at the request of Britain; the object was to ensure a more even distribution of oil throughout the Commonwealth and to relieve pressure on the sterling area dollar pool. If Mr Menzies can find other means of financing the extra purchases, well and good; but, if he fails, it will be Britain which will get the dirty end of the stick.

But the abolition of petrol rationing and the banning of Communists are, after all, only the extreme flanks of Mr Menzies' policy declarations. The solid centre is almost wholly praiseworthy. Relations with the United States, which Dr Evatt had to some extent neglected, are to be improved and strengthened; Australia is to play a more active part in Commonwealth affairs and Mr Menzies is already talking of trying to get together another economic conference; defence responsibilities will not be shirked and may be increased; there will be fewer government controls over internal commerce; and there are a number of financial proposals which are discussed on page 1368.

From the political point of view, Mr Menzies will have

a good working majority in the House of Representatives. In the Senate, however, the Government parties will be in the minority, and if the Senate should block any of his bills Mr Menzies will be forced to call for a dissolution of Parliament and for all the seats in the Senate to be contested. (Normally, only half the number of senators are elected every three years.) This would mean another general election and might entail some risk for Mr Menzies, in view of the very small difference between the actual number of votes cast for and against the Liberal and Country Parties.

China's Vicars of Bray

The last phase of conquest in western and southern China has been marked by the extreme rapidity of the Communist advance and the even more striking eagerness of Nationalist generals and politicians to pass over to the camp of their enemies. Hardly any fighting at all appears to have taken place, and Communist control of the Chinese mainland is now virtually complete. Some leaders, whether because of real anti-Communist conviction or because they feel themselves too deeply compromised by their past records to be safe under Communist rule, have withdrawn either to the islands of Formosa and Hainan, still held by Nationalist forces, or—like the acting president Li Tsung-jen—to the safer distance of Hongkong or America, while remnants of the Nationalist army in Szechwan are reported to be retreating into the mountainous Tibetan borderland province of Sikang. Sikang is too remote and isolated to be the seat of a government hoping to retain any contact with the world outside China. After successive moves of the capital from Nanking to Canton, from Canton to Chungking and from Chungking to Chengtu, the Nationalist Government has now flown—literally so, for there has been communication between Formosa and Szechwan only by air—to Taipei in Formosa, where it is for the time being under the protection—and control—of Chiang Kai-shek's own troops who were brought to the island from Chekiang.

The speed of the Communist conquest of southern and western China has borne witness both to the overwhelming military prestige the Communist armies have gained as a result of their earlier victories and to the longing of the Chinese people for the end of the civil war and the restoration of national unity under whatever leadership. For the moment there is no effective military or political opposition to the Communists on the Chinese mainland, and it remains to be seen whether the sea-moats separating Formosa and Hainan from the continent (respectively about 100 and 15 miles wide) will serve for any length of time to preserve a residue of the defeated faction from the further advance of the conquerors.

There are, nevertheless, elements of instability in the situation of the Communists arising from the very ease of their success. The wholesale defections which have given the Communists the southern and western provinces have brought into the Communist camp great numbers of army officers and civil officials, who are merely Vicars of Bray and who cannot possibly be regarded as reliable from a Communist point of view. If the popularity and prestige of the Communists were to ebb in the process of building up their regime, all these old-timers would be potential agents of counter-revolution. The Communists certainly know this and may be expected to strive to consolidate their power by developing police control and by a series of purges and eliminations in the approved totalitarian manner. But such a policy may itself precipitate revolts, as certain individuals who thought they could strike bargains with the Communists discover that they are destined for political, if not physical, extinction. Consolidation will not be easy for the new regime, and the difficulties to come may have a decisive effect on its relations with the outside world.

Two Views on Formosa

The Americans appear to have decided not to attempt to occupy the island of Formosa in any circumstances—even with a token force—to withhold this last Nationalist stronghold from the Chinese Communists. And this decision has put the last ingredient into a diplomatic Christmas pudding which is making mouths water among the experts. (The diplomat—in handling international relations—has to consider not only the reality of power but also its outward form.) In China, at the moment, the western powers are faced with one of the most delicate of all questions in international relations; how and when to withdraw recognition from one government and give it to another, which has not only come to power by force but whose existence is—to say the least—distasteful to them, if not a positive and lasting reminder of defeat. In this respect Formosa now looks like providing some light relief.

Since the Chinese Nationalist Government, now established at Taipei, have not asked the Americans to "occupy" the island, they are understood to have decided that nothing would be gained by doing so. With some of its strategists dissenting, Washington has abandoned Formosa to be captured by the Communists as best they can. In arriving at this decision Formosa has been treated as Chinese territory—a realistic view, since it has been regarded legally as "Chinese-occupied territory," following the agreement reached at the Cairo Conference of 1943 that the Japanese should hand it back to China when the war was over.

On the other hand, for the purposes of recognising the new Communist regime in Peiping as the Government of China, Formosa is likely to find itself on a very different footing. Mr Acheson, the American Secretary of State, has taken the lead in saying that, so long as the Nationalists retain a foothold on the mainland, there can be no question of Washington recognising the Communists. And, while he has not committed himself about what may happen when they do lose that foothold, his thoughts in this respect seem to lie along lines very similar to those which London is following. Recognition of the Communists, that is to say, may be granted under cover of the fact that Formosa is not technically Chinese territory—as indeed it is not, until a Japanese peace treaty is actually signed. By sitting in Taipei, therefore, the Nationalist Government is in exile. The diplomats look like having their Christmas pudding and eating it too. It is a dismal ending to the story of the Kuomintang.

Free Trade Unions Under Way

The new International Confederation of Free Trade Unions, which was formally established last week, starts off with a formidable agenda. Its ultimate purpose, of course, is to act as a counterpoise to the World Federation of Trade Unions, the body from which it has split off and which after its recent meeting in Peking appears to be concentrating on creating labour unrest, especially in the colonial areas, under the direction of Moscow. There is general agreement that the Confederation will best fulfil its purpose by pursuing a positive social programme, rather than by adopting a purely negative attitude of opposition to Communism, although the American Federation of Labor, at any rate, intends that the new body shall be aggressively anti-Communist. Its final declaration of social and economic aims—its charter for the free trade unions—is a spirited enough document, but the new International will have to move rapidly if it is to counter the very powerful propaganda machine of the WFTU.

In membership, the Confederation has made a promising start. The conference credentials committee reported a total representation of 48,224,335 workers in 53 countries and it was at pains to ensure that these should be *bona fide* unions and not what Mr Deakin called state "stooge" organisations

—it was on these grounds that the Thai and Dominican delegates were excluded. Fears that the British or Americans would dominate the Confederation have, it seems, proved groundless. Both, in fact, are taking a back seat. The headquarters of the new organisation is to be in Brussels, not London, and the presidency and secretaryship have gone to a Belgian and a Dutchman respectively. This does not mean that policy will not in fact be largely influenced by the labour leaders of two major nations, but it does show the anxiety of the British and American trade unionists to spread responsibility.

While there will not be the same deep ideological cleavages which wrecked the original WFTU, the new body will have to proceed cautiously, as the London conference showed only too clearly. Mr Tewson, the general secretary of the TUC, wisely emphasised the need to keep out national party politics (Lord Citrine gave a similar warning to the WFTU in 1945) for there are differences between Catholics and Protestants and between the ideas of the European "socialist" elements and the American "private enterprise" unions. Undoubtedly the colonial problem is the most urgent that faces the Confederation. Delegates from the West Indies and Cyprus were highly critical of British rule, and warned the conference that unless living standards were improved, the colonies might well become a happy hunting-ground for Communists. The regional machinery which the Confederation proposes to establish may be of value in counteracting Communist influence in the sphere where the WFTU is most anxious to increase it.

More British Beef?

The Smithfield show was a welcome reminder that Britain is capable of producing beef of the highest quality. Unfortunately, the average consumer has little reason to remember the fact. Nowhere are austerity standards so obtrusive as in the reduced quantity and quality of meat supplies. In a recent paper at the Farmers' Club, Sir Henry Turner stated that home production of carcass meat was 30 per cent, and imported supplies 17 per cent, below the pre-war level; yet there are two million extra mouths to feed in Britain. The White Paper on food consumption levels (Cmd. 7842) published this week estimates civilian consumption of beef to be 36.2 lb. per head in 1948-49 as against a prewar average of 54.7 lb. Australia and Africa, in the course of time, and South America, if trade relations improve, may be able to supply Britain with more meat—if it can afford to buy. But the prospects of a really large increase in meat imports are distant and uncertain.

It follows that there is enormous scope for increased home production. Meat production, sandwiched between the emphasis on crops and the emphasis on milk, was the worst sufferer from wartime farming policy and is inevitably the slowest to recover. In beef production an increased number of cattle are producing much less beef than before the war. The reason for this lies partly in the disproportionate pre-occupation of farmers with milk production, partly in the longer period over which cattle are now fattened.

The development of good beef breeds has been sadly neglected. Before the war, British farmers produced both the best and the worst beef on the market. Today, the latter sort predominates. The present system of Government control both discourages consumers from expressing their preferences and producers from meeting them. It is time the system was drastically modified at both ends, and a higher premium put on quality as well as on quantity.

It is reasonable that the Government, without increasing the total cost of its agricultural commitments, should offer stronger incentives to this section of the industry even if it means weakening the incentives to other forms of production. It has always been intended that the price

mechanism should be used to vary the emphasis of production. In the special circumstances of meat production, it may be worth considering an increase in the subsidies available to farmers of hill and marginal lands where cattle and sheep raising takes place; (not the same thing as subsidising marginally efficient producers). Lord Lovat recently urged this course on the Government in a Lords' debate. The results—whilst hardly matching his vision of Highland glens restocked with numerous cattle—might be worth the cost.

Cruelty to Children

Not satisfied with the results of the Curtis Committee on the care of children deprived of a normal home life, Members of Parliament of all parties passed a resolution on Monday asking for another inquiry—this time into cases of children neglected or ill-treated in their own homes. Cruelty to children is a subject which naturally appeals more strongly to the emotions than to the intellect. It says much, therefore, for the courage of Mrs Nichol, Labour member for North Bradford, who was a member of the Curtis Committee, that she was able to go against the general sense of the House and query the usefulness of the proposed inquiry.

As she pointed out, it would be virtually impossible to lay down specific terms of reference for the committee of inquiry and determine where it would stop. An essential fact to remember, in all these discussions of neglected or cruelly treated children, is that it is only working-class parents who come before the courts—or indeed are warned by inspectors of the National Society for the Prevention of Cruelty to Children, health visitors and the like. In other words, the obvious cases of cruelty and neglect, for which evidence can be produced, are confined to the working classes simply because they happen to include a larger proportion of the dull and backward section of the population than do the other classes. Yet the subtler, subjective forms of cruelty and neglect are found, as the Home Secretary rightly reminded the House, among all classes of society. Would the proposed committee be allowed to consider the lot of spruce and well-fed children who are nevertheless completely neglected by their parents? Or of those who, at an early age, are sent away to be utterly miserable in boarding schools? Children, fortunately, are far more resilient than most members seemed to think.

There is also a real danger, as Mrs Nichol emphasised, that another committee would merely add to the demand for trained people to implement all the recommendations it would be bound to produce. Already the Curtis Committee's reforms are suffering from shortage of staff. Unsuitable, ill-qualified people, pushed through a training course, and then given the delicate task of investigating alleged cases of badly treated children, as a result of which the children may be separated from their parents, would do far more harm than good. There is a great deal that could be done, under the existing law and social welfare machinery, to improve the lot of the children of dull and backward parents, and the Home Secretary announced that he has a working party looking into the extent to which the existing means are being neglected. For the time being, official inquiry should confine itself to this.

Patchwork Policies in France

To many Frenchmen it is now clear that M. Queuille should not have been allowed to go. For his departure in October marked the end of that promising phase of "third force" stability that began in the autumn of 1948. It is, of course, possible—especially if Communism and Gaullism regain their impetus—that a new coalition may be formed

among parties which are, in M. Queuille's own phrase, "condemned to live together." But at present the extremists are as frustrated as the moderates, so that M. Bidault and his re-shuffled team of ministers can play the same old game of jockeying for position. The Socialists in particular feel free to indulge in their hobby of sniping at their own representatives in the Cabinet.

Indeed, they have good reasons for doing so. The rise in the cost of living during the last three months has all but wiped out the fall that occurred between January and July, so that the poorer classes—whether wage-earners or *rentiers*—are again losing confidence. Amid what is called abundance, 10 per cent of Frenchmen are worse off than in 1946. So the Socialists—and M. Bidault's own party, too—must champion the needy lest the Communists capture all their votes.

In fact there is very little that can be proposed honestly by any party which would redistribute wealth and raise the standard of living of all the workers at once, save perhaps a rise in income tax. Certain adjustments are already being made: for example, 30 per cent of the wage fund goes (unhonoured and unsung) into social security and family allowances. There is also the levelling tendency within the working class represented by the way in which the pay of women, apprentices and young workers, is drawing up to that of fully qualified male workers. But the only healthy means of increasing absolutely the wage fund are higher production and productivity. This is the development to which the investment plan looks forward—but in several years' time.

In a situation in which the popular press writes of the danger of social disorder, M. Petsche—more of a technician than a politician—is not swerving from his deflationary policy. The Bank of France is, with very small variations, maintaining the credit control system established in September, 1948. Now, indeed, when it is proposed to free wages from government control the threat of inflation seems to come

as much from employers' willingness to pay higher wages—at least in some sectors of the economy—as from the bargaining power of labour. M. Petsche's budget, the main features of which are discussed by our Paris correspondent on p. 1357, is condemned by producers, manufacturers, traders and artisans for its proposed taxes and by labour for its renewal of old ones.

Apartheid Postponed

It would be a mistake to read too much into the announcement in Capetown last Monday that *apartheid* legislation had been abandoned for the life of the present Parliament. Dr Malan has in no way given up his intention of ending the Cape franchise for coloured voters and of abolishing the special native representation in the House of Assembly. Indeed, he has expressly reserved the right to bring in the necessary legislation after 1951. The announcement, therefore, does not mean any change of policy towards the non-European races; nor is there any indication that Dr Jansen, the Minister of Native Affairs, will now slow down the present policy of tightening up the existing regulations and restrictions governing the Bantu, Asiatic and coloured peoples. Dr Malan is in fact simply placating his partner in the coalition, Mr Havenga, and possibly also trying to strengthen his case for taking over the three High Commission territories—Swaziland, Basutoland and Bechuanaland.

In the present South Africa Parliament, Mr Havenga, the leader of the Afrikaner Party and the Minister of Finance, holds the balance between Dr Malan and General Smuts. He is the political successor to General Hertzog, who was one of Dr Malan's most bitter opponents and who laid down the principle that, in their striving for political power, the

Afrikaners should never go against the constitution which is embodied in the South Africa Act. Dr. Malan, by making it plain that he intended to carry through his *apartheid* legislation by a simple majority instead of by the two-thirds majority which the South Africa Act calls for in all legislation affecting the natives, showed that he cared nothing for General Hertzog's principle and deeply offended Mr Havenga. A compromise was necessary if Dr Malan's Government was not to fall, and that compromise was reached last Monday.

Mr Havenga is not, however, against the policy of *apartheid*, with which he has publicly associated himself and his party; his objection was to the breach of the constitution which Dr Malan had proposed. It is nevertheless unlikely that Dr Malan will ever secure a two-thirds majority in Parliament; therefore, the *apartheid* legislation should continue to be postponed for as long as Mr Havenga continues to hold the balance of power. There are, unfortunately, many other ways of putting *apartheid* into practice besides that of passing a Bill in Parliament, and the postponement of legislation will change very little the present circumstances of the natives.

* * *

Leaving Out Germany

One of the more obvious elements of fantasy in the various plans for regional union among the western European nations is the determination of most of them to ignore the existence of western Germany. Only Belgium and Holland have shown any enthusiasm at the prospect of including Germany in these experiments, and their interest was icily doused at the recent "Fritalux" meetings when both France and Italy declared that the subject was temporarily taboo. During the "Uniscan" preliminaries there has been no public mention of Germany, although it is possible that Sweden might raise the question of its inclusion. The reason for this general unwillingness to invite Germany is, of course, the fear of competition from its industries.

By shunning Germany the Marshall nations hope perhaps to hide the facts from themselves, or at least to postpone the evil day when the facts must be faced. The plain truth is that before the war Germany's trade within western Europe was larger than that of any other European nation, Britain included; it accounted for over a fifth of total trade in what is now the Marshall Plan area. It is difficult to see how any action on the part of its neighbours can prevent this pattern from being ultimately restored; indeed, the trading weight of Germany in western Europe may even tend to increase if only because it has been partially cut off—by the cold war—from its substantial prewar markets in eastern Europe.

The force of the argument in favour of including western Germany in one or more of the western European economic unions is identical with that put forward by those who advocate a political union of Europe. It will be better for all if German recovery takes place within and not outside the rest of western Europe. If Germany is left out then its reconstruction programme will inevitably be based on something very akin to economic warfare.

Report on Police

The second part of the report by Lord Oaksey's committee on the police* is a good, workmanlike document. It contains very few startling recommendations and only one which is likely to cause much controversy if the Government decide to accept it. The bulk of the report is concerned with a large number of minor improvements in the conditions of service in the police. Some small changes are recommended in the disciplinary code; there is a plea for civilian welfare

* Cmd. 7831. H.M.S.O. 2s.

officers to be attached to all the large forces; better canteens and an extra ration of cheese for those on arduous duty or without canteen facilities are asked for. The committee vigorously attacks the local authorities for not providing enough houses for married policemen; and some improvements in the present system of police representation are suggested.

The controversial recommendation is that "the legal powers of appointment, promotion and discipline in borough forces in England and Wales (now vested in the watch committees) should be conferred on the chief constables as in other forces." The recommendation was first made by the Desborough committee in 1920, but since then no government has tried to put it into practice. It will inevitably mean a fierce struggle between the local authorities concerned and the central government, for such powers as the watch committees possess will not be surrendered lightly. There is a great deal to be said in favour of the recommendation; it has for long been an absurdity in the organisation of the police that the chief constable of a borough force should have no disciplinary authority over the men under him. In practice, however, most chief constables of borough forces today get on reasonably well with their watch committees and their lack of disciplinary authority is not quite so serious as it appears to be on paper. It is also worth considering whether, in view of the modern trend towards centralisation and the danger of the police developing into a state service, it would not be wiser to leave the powers of the watch committees as they are and so to ensure that local control over the police is not weakened. However reluctant he may be to use it, the Home Secretary possesses the means for bringing watch committees to heel if need be, and, on the face of it, it seems unnecessary to stir up trouble simply for the sake of rationalisation.

Problem for the Welfare State

As it becomes more obvious that the social services cannot fulfil all the calls upon them, there is a growing demand for a financial recompense for contracting out. The latest manifestation of this claim occurred at a meeting of the Middlesex Education Committee last Monday when the committee discussed the principles on which parents with children attending fee-paying schools could receive assistance from the county council.

The issue at stake is relevant to the education and the national health services particularly. In the case of the schools the contention is that if parents choose to send their children to fee-paying schools, they are entitled as ratepayers and taxpayers to a refund of what it would have cost to educate their children in a state school. Put crudely like this the argument carries little conviction, and in prewar days the middle-class parent would rarely have thought of using it. But owing to the acute overcrowding of the grammar schools, the argument can now be presented in a stronger form. Parents can now argue that they are doing a positive service to other children in the free-place schools by removing their children to the fee-paying ones, and they ask either for the full fees, or for the costs they are "saving." In the hospital service, the actual practice is somewhat different. Regional boards pay the full cost of a patient in a private hospital who cannot be found a bed in a state hospital, but they do not do so unless they themselves have placed the patient. They do not subsidise privately made arrangements.

The answer to this question is not easy. On the one hand the state, by making medical treatment and education free, has assumed obligations and implied promises which it cannot fulfil, and the private citizen has some justification for assuming that the state will make good its failures by paying an indemnity. On the other hand, when beds or school places become available in "free" institutions, then

there cannot be a justification for paying for places elsewhere to suit the preferences of individuals. In the case of the hospitals the distinction is fairly easy—an empty bed is an obvious bed. But in a school who is to decide if there is an empty place? A parent and a local authority may take a very different view of what is the desirable size of classes. The whole problem is complicated by the fact that by and large it is the middle-class family which is concerned. It is therefore temptingly easy to make the issue a political one, when in reality it is a problem inherent in the evolution of the welfare state which needs dispassionate consideration.

* * *

Exodus from London

A recent leading article in *The Economist* asked whether the Government was in earnest about the proposal to disperse population and industry out of London on a large scale. The Ministry of Town and Country Planning has now put some tentative proposals about decentralisation to the local authorities concerned. The memorandum lists, in addition to the eight new towns, sixteen existing towns as being suitable "reception areas" for Londoners. They include towns as far afield as Ashford (Kent) and Bletchley, and a majority of the new centres are actually outside the London planning region. A broad plan is put forward for linking the reception towns with suitable London districts, based "on the natural inclination of people to move outward along the lines of communication"; five such

evacuation sectors are distinguished, three to the North and two to the South of the Thames. The congested boroughs will keep separate housing lists of residents wanting to move to the new centres. However, the Ministry states, perhaps not emphatically enough, that priority in the reception towns will be given to persons who will work there.

Its proposals are broadly in line with the Greater London plan; but they must be regarded as no more than a first instalment. The total eventual movement of population which they envisage is no more than 500,000, including those going to the new towns. But even this first instalment presents difficulties. The reception towns cannot afford to build houses on the required scale or to undertake what in some cases would amount to complete remodelling of the town centre. Some method must therefore be found of sharing the cost of dispersal equitably over the whole region.

The Ministry states that the proposals "must be considered experimental, because there is no previous experience to be drawn on." Humility from a Government department is always welcome, so long as it is not a cover for half-heartedness. It must be said again that a policy of dispersal will only be successful if it is carried out on a broad scale, is backed by the full weight of all Government departments (and not merely by a junior Ministry).

Dollar Premiums for the Middle East

The American diplomats from Middle Eastern capitals who met at Istanbul in the last days of November ended their conference with an unrevealing communique about "economic and social development" as the "promising path to stabilisation in the area." What they did not publicly admit was how often their discussion dwelt on the mounting problem of finance. Congress is getting tighter fisted. Yet talk kept reverting to the political and social vacuum which, in western interests, they want to fill. The question was—and remains—how is the job to be done without spending too much money?

The unevenness with which American governmental aid is spread over the area is little realised. Counting Greece as part of the Middle East—as it is in American military thinking—the Greeks come first on the list. As far as military aid is concerned, \$371 million worth of military equipment was made available to them under the Truman Aid programme; the Turks received \$175 million worth over the same period. Since then, the two countries combined are obtaining a further \$211 million worth under the Mutual Defence Assistance Act programme for 1949-50. Persia is to receive \$9 million worth of military equipment under this same Act, and has also had a loan of \$26 million for further military purchase.

Non-military aid is large chiefly because Greece and Turkey belong to the ECA group of countries, and get Marshall aid. Greece, as the only war devastated country, understandably tops the list. It has received over \$600 million in the period from January, 1945, to mid 1949. Turkey, whose share of American bounty is always thought by its middle eastern neighbours to be much larger than is actually the case, has received (in addition to its two ECA grants of \$39 million and \$61 million, respectively) one credit of \$36 million and another of \$16 million, largely earmarked for the repair of ships. Elsewhere, Israel has had \$100 million this year from the Export Import Bank, Saudi Arabia \$15 million from the same source, Afghanistan \$21 million, and Egypt a small loan for a specific purpose. Other states have so far failed to proffer the specific plans and guarantees of fulfilment for which the American lender is now beginning to ask before he puts his hand in his pocket.

If this list is studied map in hand two points emerge clearly. The first is that Congress has, even in its most openhanded mood, paid out liberally only where it considers that it is paying the premium on an insurance policy—that is, on the borders of the Soviet Union. The second is that, if the purse strings are now tightening, Congress is unlikely to be generous in countries where no military threat appears to exist. The most likely field for further middle eastern aid therefore appears to be Persia.

A kindly reviewer has written that "no annual publication is more modestly titled than The Economist Diary". It is true that the space for day-to-day entries occupies less than half the volume and that our aim has been to provide a complete reference book for the desk of the business and professional man. The price of the diary (including Purchase Tax) is 37/6d. post free; 32/6d. post free for overseas destinations. Full details are given in an illustrated pamphlet obtainable from The Economist Intelligence Unit, 22 Ryder Street, London, S.W.1.

Leadership Needed

These reflections suggest that there is at present more of goodwill than of substance behind the Clapp plan (described in *The Economist* of November 26th) for turning the provision of work for the Arab refugees into the first step towards internationally sponsored schemes for developing the Arab states. The Uno Assembly has now approved it by 47 votes to nil, with 6 abstentions. It will cost, for eighteen months, only \$54.9 million. Yet, to judge by what happened last time the hat went round for contributions towards this particular refugee problem, very few of those who voted will feel it a duty to contribute.

This means that the brunt of the expense will once more fall upon the United States. American officials have spoken of an American "fair share" of some 50 to 55 per cent of the total. But they have to satisfy Congress with their replies to such questions as: "Where does this lead?" and "Who else is contributing?" As things stand, they have to admit that Arab delegates are saying "no hand-out and no kind of job will make these people forget home." They cannot conceal that Mr Bevin has little zest for squeezing a corresponding contribution out of the British Treasury; or that the French, though so ready to resume a role in the Middle East, are too absorbed with the affairs of the French Union to spare francs for new overseas investments.

Given the inspiration of an imaginative lead, Congress might yet be persuaded that there is a useful yield to be had from Middle East investment not only on the borders of the Soviet Union but also farther south. From time to time a man of vitality and vision can charm them into action, as could General Marshall or Count Bernadotte. It is just possible that Mr Clapp is another such figure. If he is not, if—like so many of the Americans who have lately darted in and out of the Middle Eastern scene—he drops the topic because he must return to his own concerns at home, then success depends on his working for the appointment of an outstanding personality as director of his new agency. If

The Spoiled Bantling

It is within the recollection of every man in the empire, that agriculture was continually spoken of in Parliament and at public meetings, by our statesmen and our clergy, by most public writers and public speakers, as the great and vital interest of the State—that it was described as giving health to the body and peace to the mind—while other occupations were described as enfeebling and corrupting, filling the community with pauperism and crime—that it has long been spoken of as exclusively a *native industry*, and guarded like a tender babe against the rough weather to which other interests and pursuits are exposed. It has in truth been doubly wronged. It has been brought up to rely on protection. It has been continually cheated, as Mr Disraeli explained, by mere phrases and meaningless cries, and that irritating truth it has now learned. It is a spoiled child, encouraged in waywardness and idleness, indulged in the gratification of all its imprudent desires, praised in all companies, far before its brethren, as a paragon of perfection; and now it is snubbed and flouted for claiming its usual indulgences. To correct a spoiled bantling is necessary for its own welfare; but we admit that it has been wronged by the injudicious favour, and must suffer by the ruggedness of the cure, though indispensable to its permanent safety. The agriculturists may justly complain of the dotting Legislature which pampered them into weakness, and mistaking its power, now feels itself compelled to expose them, like the rest of their brethren, to the rough treatment of nature.

The Economist

December 15, 1849

there is to be just another committee, then the new United Nations Relief and Works Agency may become just another name on the list of commissions which, born of the Palestine problem, have tried and failed.

The End of the Strand

The announcement that the *Strand Magazine* will cease publication next spring is one more sign of the decline of the monthly magazine. To the two generations which read their first instalment of Conan Doyle, E. Nesbit, W. W. Jacobs, or Kipling in its pages, its disappearance will be the removal of a landmark as characteristic as those denizens of the same street, Romano's and the Lyceum. One of the difficulties that nowadays afflicts a magazine dependent upon good story tellers is that a penal rate of taxation makes it wholly unprofitable for successful writers to contribute to such a journal. Moreover the triple calculation of overhead and production costs, advertising revenue, and circulation revenue has told against monthly newspapers at the same time that it has favoured weekly periodicals.

The history of journalism is strewn with the wreckage of first-class publications which could not make ends meet, the *Pall Mall Gazette*, the *Westminster Review* and many others. But the case of the *Strand* is rather different. It is controlled by a publishing house, George Newnes Ltd., which owns a number of highly successful trade and other papers and which last year reported a net profit after tax of £526,092 on a capital of £1,232,472. It is hard to believe that, if the British press is as enterprising as it made itself out to be to the Royal Commission, the resources of a publishing house of this size could not restore a magazine with as much existing goodwill as the *Strand* to its pristine position, redesigned and reorganised to suit contemporary taste. A publishing house is a business enterprise whose projects must be financially sound, but it is also a trustee of the affections of the reading public, in Britain and overseas, and of that public's standards of taste. It is sad that George Newnes Ltd. should have decided that of the three pocket monthly magazines which they publish, they should dispense with the *Strand* and concentrate on the publication of *London Opinion* and *Men Only*.

Another Snoop

Another obnoxious snoop has been revealed. A doctor writing to the *British Medical Journal* says that he has been asked by the clerk of his local executive council to provide three prescriptions for imaginary patients. These—if he had agreed to sign them, which he did not—would have been taken by the council's "agent" to be made up by the chemists whose dispensing the council wished to test. When they were made up, the chemists would have been told their real purpose, and the drugs would have been sent off to be tested.

Doubtless, if Mr Bevan is asked about this procedure, he will defend it, as exchange control informing has been defended, on the grounds of precedent, for the testing of chemists in this way was carried out under national health insurance. But an obnoxious practice cannot be hallowed merely by reason of its old age, and the sooner it is stopped the better. As the *British Medical Journal* points out, an executive council can always test a chemist's dispensing by selecting a preparation already made up for a genuine patient. There is not the slightest need to obtain a doctor's collaboration in catching the chemist out even if such a practice were not in itself highly objectionable.

Correction

In the table of US imports in the article last week on "Europe's Lagging Dollar Exports," the totals were transposed. Those at the foot of columns 1, 2 and 3 should have been at the foot of columns 4, 5 and 6 and vice versa.

AN AIRLINE TICKET to ROMANTIC PLACES!

is an ideal Christmas gift. All you have to do is to let AIR FRANCE or one of its approved Travel Agents know the name of the traveller, his or her destination and remit the fare. An open date ticket, valid for the whole of 1950, will be sent you for presentation at Christmas. The passenger has only to let us know later the date he wishes to travel.

Letters to the Editor

The Dilemma of Defence

SIR,—Your article "The Dilemma of Defence" states the problem very clearly, but gives little indication of how the British people should make the choice which lies before them.

The question is really one of security. We want economic security, which demands efficiency; we want social security which involves social services, and we want political security which necessitates defences. Without adequate armed protection we are politically insecure. Without economic security, both armed protection and social security are impossible. It is obvious that the deciding factor is economic, but history shows that in a world of power politics there is little point in being economically secure without also being politically secure. There must therefore be a balanced fulfilment of the social, political and economic conditions, and it is the achievement of this balance which constitutes the problem. So that the choice is not Social Welfare or Defence, but how much of each.

Defence is plainly subject to the same economic considerations as the social services. It is in fact exactly similar to National Insurance and the Health Service. It is an insurance against political ill-health. Why should we not then, in these days when social service is identified with government service, regard defence as a social service? It would then be a matter of deciding in what proportions to have the various social services. Mr Alexander would become as important as Mr Bevan and Mr Griffiths; the people would realise that all three are subject to Sir Stafford Cripps; and that without them all playing their full part, we could not have even Mr Attlee!—Yours faithfully,

J. A. BALDWIN

St. Catherine's Society, Oxford

Economic Documents

SIR,—During the last few years readers of your journal must have become aware that international economic co-operation has expressed itself in the formation of a large number of international organisations. These new institutions, with their strange titles, ITO, OEEC, ECA, FAO, etc., may well play an extremely important role in world economic development.

From time to time articles describing and commenting on their work appear in your columns and the reports they publish are, I suppose, read by a few financial journalists and economists. There does not, however, appear to be a general appreciation of the fact that a new and important economic development has taken place since 1945. The period 1945-49 has been in strong contrast with the period 1918-22 in this as in so many other respects.

Economic co-operation has, we must hope, come to stay. Its organisations are numerous but not very well co-ordinated. As their actions may have such far reaching consequences, ought not their plans and reports to be submitted to careful and expert analysis and a far wider public? Is there not a need for the integrated study of these documents and for this new development to be explicitly recognised in your columns, by the BBC and in the Universities?—Yours faithfully,

S. J. LANGLEY

The University, Sheffield

[The problem that Mr Langley raises is a real one. The flow of international official documents is now a very large one, of varying quality and availability. The Economist does what it can, both in its own columns and in the *Records and Statistics* supplement, to inform its readers of the existence of these documents, to summarise (or at least to indicate the nature of) their contents and, when it seems called for, to comment upon them. But a reasoned and comparative critique of all of them would be beyond the powers of any but a well-endowed institution.—EDITOR.]

The Law and Its Effect

SIR,—A recent "red petrol" case in Portsmouth seems to me to raise a matter of some public concern. The circumstances are these: the offender was a disabled ex-Service man who had built up over a period of three years a private hire business: the business grew sufficiently to require two cars, but despite repeated applications a second petrol allocation was not granted. The second car was therefore run on the basic petrol allowance only. Inevitably, the time came when an order could not be met for lack of petrol; it was then decided to take the risk and use red petrol. This was undoubtedly a rash and ill-advised decision, particularly in these days when the more enterprising have only to put a foot wrong for the less enterprising to feel it their bounden duty to inform the police. And this is precisely what happened.

The offender was fined £25 and had his driving licence and Road Fund licence suspended for a year. The effect of these penalties, in this case, was to fine a man while at the same time removing his means of paying that fine by destroying his business and livelihood. To this is added the likelihood that the offender may be involved in the loss of both his cars through inability to maintain hire-purchase payments on them.

Usually, we must all try to regard "red petrol offences" as serious and the penalties imposed in this case were not, perhaps, unduly harsh in themselves. But is it really the intention that the effect of punishment should be to put a man out of business and wreck the hard work of years? No such serious consequences result in the case of a private citizen who uses red petrol for pleasure motoring—a much less excusable offence. It is surely a rather less than adequate answer to maintain that as the penalties are known the consequences of transgression must be accepted. The effects of a just punishment may not themselves be just, and if this—very properly—is not the law's concern, it certainly should be the public's.—Yours faithfully,

P. DALLAS SMITH

18 Lennox Road South, Southsea

Steel Imports

SIR,—I have read, with considerable interest, your note, "Canada to Buy British Steel," on page 1319 of your last issue, and am concerned as to the misunderstanding which not only may arise but has already arisen, regarding the statement contained therein that, apart from structural steel, Britain is also to supply to Canada a certain amount of sheet, some of it deep drawn and some motor body sheet. To supply the latter, Britain imports slab from the United States for re-rolling into sheet in this country.

While Canada is a considerable importer of this class of sheet from the United States and would undoubtedly be a willing buyer from this country, the supply position does not permit exports of deep drawn or motor body sheet. Until our new plant begins its operations next year, supplies of this class of steel are restricted. We have in fact bought certain quantities from the United States and also a limited quantity of slabs for processing here. This country is now self-supporting in slabs and will be in sheets next year, but for the time being exports must necessarily be severely curtailed in the interests of the finishing industries in this country.—Yours faithfully,

EDWARD W. SENIOP

Roosevelt and Stalin

"Roosevelt and the Russians: The Yalta Conference." By Edward Stettinius, Jr. 367 pages. Doubleday and Company Inc. New York.

It is not improbable that the next twelve months will see Stalin pressing in his own peculiar fashion for another three-Power conference like that held in Yalta in February, 1945; and decades from now the humorous historian of "1945 And All That" will probably say that Yalta was for the Russians "a good thing." Yet no one will want to commit himself irrevocably to this view until Mr Churchill's account of his Crimean meeting with Stalin and the late President Roosevelt has been published. For the time being, it will be wise to treat each personal record strictly on its merits and to eschew any premature attempts at a comparative study of evidence.

Judged from this narrow point of view, this record by the former Secretary of State, Mr Stettinius, is important, highly interesting, but unconvincing. Mr Roosevelt emerges as starry-eyed, not by American or liberal British standards, but by those of Stalin himself and of Mr Churchill in Marlburian mood. The President had constantly in mind the possibility that the people of the United States would in less than two years swing back to isolationism, that it would be satisfied with nothing less than a world organisation as a reward for its sacrifices, and that the main purpose of the Yalta meeting—apart from the need to co-ordinate military operations with Stalin—must be to get the Russians into that body. It is quite clear from Mr Stettinius's record that the Russians were at first lukewarm about the United Nations, but became hot for it once it was clear that the Americans would regard their interest and collaboration as a vital concession. Stalin said quite frankly that it struck him as strange to enter into a political organisation which would include governments which had not thought fit to have diplomatic relations with the Soviet Union. The result was that on the crucial issue of the conference, the future status and government of Poland, President Roosevelt gave way sufficiently—at any rate on paper—to make the Russians think they could have their own way in Warsaw.

Mr Stettinius puts up a stout defence of his President and nothing in the book is more impressive than the intelligent loyalty he shows to his chief; but he gives the game away when he points out how strong were the cards in the hands of Stalin, who could give his colleagues day by day reports of the Red Army's tidal sweep across central Europe, while Shaeff was only just recovering from the shock of the German offensive in the Ardennes. Mr Stettinius even suggests, on what appears to be very slender evidence from Mr Harriman in Moscow, that Stalin's hands were being tied by members of

the Politbureau who thought he was giving away too much to his allies. This is probably the greatest compliment yet paid to the Generalissimo's diplomatic skill. As a contrast it is piquant to read of Stalin countering Mr Churchill's warnings of what British public opinion would say about the agreement on Poland with the assurance that there was no possibility of the Labour Party winning the next general election. Mr Stettinius makes it seem doubtful whether the Americans and the British can be said to have suffered defeat at the Yalta conference; but there is more than a suspicion that they had their legs pulled.

The verdict of Mr Stettinius is sober but damning: the Russians failed to honour the agreements in which their most vital interests were affected. Thirteen days after Yalta ended the Rumanians were being bullied, the Lublin government was being "widened" and not "reorganised," and there were serious delays in the Russian collaboration in plans for controlling Germany. It is true that the sudden termination of Lend-Lease affronted Moscow, that Stalin could not be expected to switch in a matter of weeks from a security system based on spheres of influence to one based on an embryo world organisation. But there were more instances of Soviet bad faith than any reasonable man can be expected to excuse.

The Wicked British

"Plot Against Peace." By Ralph Parker. Moscow, 1949.

SINCE 1946 Soviet propaganda has spared no efforts to instil into the Soviet public, through the press, the radio, the cinema and other means, the idea that western governments are evil and hostile. Most recently (perhaps inspired by Kravchenko) it has started publishing the reminiscences of citizens of capitalist countries who have changed their allegiance to the Soviet side. The first of these books appeared under the name of a former typist of the United States Embassy in Moscow, who remained in the Soviet Union in order to marry a Soviet singer (she could not, of course, have hoped to marry him had she returned to the United States). This first book exposed the imperialist and anti-Soviet policy of the State Department, and described sensationally the political and personal "crimes" of American diplomats in Moscow. For the second book of the series, which has now appeared, we are indebted to the *Daily Worker's* Moscow correspondent, Mr Ralph Parker; and this time it is the turn of the second main "imperialist" power, Great Britain.

The "plot against peace" is British foreign policy over the last twelve years, and the "plotters" are the successive reactionary and non-representative governments of Britain, and their able henchmen in the Foreign Office. Here is Mr

Spotlighting Waste

Administrative and productive costs tend imperceptibly, but steadily, to rise. Every unnecessary record, every needless operation pushes costs up. Our new booklets "500 Unnecessary Miles" and "An Invitation to Industry" tell you how we can help to get them down and keep them down. Why not write for a copy? Consultancy Division, Remington Rand Ltd., Dept. 3, Commonwealth House, 1-19 New Oxford Street, London, W.C.1.

Chamberlain as "the zealous propagator of Hitler's racial theories"; here is Mr Bevin opposing any attempt at de-nazification; here are our Balkan Ambassadors busy with a hundred monstrous intrigues; here are whole legions of secret agents (none of them secret enough to escape Mr Parker's exposure); and here, of course, is the ever-laudable Soviet Utopia that defeated Hitler single-handed and goes on now to fresh triumphs. In brief, it is simply the Soviet version of recent history, identical, even in the phraseology, to what *Pravda* has long been saying. Mr Parker has been brought to a new and true understanding of the events which he himself described so differently as correspondent of *The Times*, and the fact that he has been able to master so thoroughly the new viewpoint shows that he must be an apt learner—or perhaps that the Soviet Union is an apt teacher.

This book will do real harm in the Soviet Union by its "revelations" about the anti-Soviet activities and spying carried on, supposedly, by the British Embassy in Moscow. These cannot but sow suspicion and mistrust amongst ordinary Soviet citizens. The isolation of foreign diplomats in the Soviet Union will become greater, and the measure of real understanding, already small, which they can get or impart, will become smaller still.

Withal, Mr Parker is a clever journalist, and he improves his repetition of stale material with some lively personal touches—mostly malicious. The recollections of the pretentious Lancashire town where the author was born have the ring of sincerity; and the descriptions of Foreign Office personalities, diplomatic social life at Moscow, and the British Ambassador's tea-party, while not giving much impression of sincerity, have enough poignancy to make them a *succès de scandale* amongst those described. Keeping his most astonishing revelation till the last, Mr Parker ends his book by declaring that he has written it in order to further friendly co-operation between England and the Soviet Union. Unfortunately, those who write books like *Plot against Peace* are guilty of something very like the book's title.

Hitler and Traditional Diplomacy

"Documents on German Foreign Policy. 1918-1945." Series D. Vol. I. September 1937-September 1938. Neurath to Ribbentrop. US State Department. 1,220 pages. \$3.25 and HMSO 21s. Vol. II. 1937-38. Germany and Czechoslovakia. US State Department. 1,070 pages. \$3.25.

THE two volumes of German diplomatic documents which it is now possible to study in translation show the western Powers, so late as 1937 and 1938, still propping up the corpse of the old diplomacy which Hitler had stabbed in the back. Their representatives collected accurate information about traditional things which had become irrelevant. If one tried to suggest to them what we now find to be true, that the Sudeten-German party in Czechoslovakia was working for the incorporation of all Bohemia and Moravia in the German Reich ("at heart it desires nothing more ardently..."), Henlein's report to Hitler, November 19, 1937, one was dismissed as a madman, a cynic, an anti-German fanatic. It is a slight consolation to discover that—at least by August 10, 1938—Lord Runciman was aware that he was only marking time. "Success," he wrote to Lord Halifax, "depends on whether or not the Führer wants to go to war. If he does, the excuse will be found easily."

It has sometimes been supposed that Hitler's decisions were based upon inaccurate information from men who were afraid to tell him the truth. Certainly a good deal of nonsense was reported to him by Nazi Party people of the Büro-Ribbentrop and the *Auslands-Organisation*; but, allowing for their habitually chauvinistic outlook, the professional diplomats informed Hitler correctly.

It is particularly interesting to have the precise evidence that Eisenlohr, the German Minister in Prague during the most difficult period of Czech-German relations prior to Munich,

sent fair and not unfriendly reports of his conversations with Benes at a time when Goebbels was working up a picture of the President as a veritable ogre. Further, Eisenlohr made it perfectly clear (Report on Czechoslovak Foreign Policy, January 12, 1938) that the Czechoslovak Government was reticent and sceptical towards its Russian ally at a time when the Minister, for the enlightenment of the German people, was depicting the Czechoslovak Republic as a Communist spear-head pointed at the German heart of Europe. To reward his services, as we have known since the Nuremberg Trial (when many of the documents now published were quoted), the German Minister in Prague was marked down for assassination by his own people, if this should prove the most convenient way of provoking a crisis at the moment designated by the Führer.

Not only Eisenlohr, but also Dieckhoff from Washington, Dirksen (for the short time he was here) from London and even von Papen from Vienna reported unwelcome facts. Secretary of State Weizsäcker at the Wilhelmstrasse, according to the records kept and perhaps revised by himself, resisted Ribbentrop's exhortations to blind faith in the Führer, and more than once urged that the western Powers could not be hoodwinked indefinitely. On the other hand, he seems to have been nicely indifferent as to whether the "chemical" should give way to the "mechanical" process when Austria or Czechoslovakia were to be destroyed.

It is useful to have now the authentic evidence of the quarrels within the Austrian Nazi Party or within that of Henlein, quarrels which were often said to be the malicious invention of Jews and Freemasons. By admitting their close connections with Germany and their preference for violence, SA people such as Leopold, Kasper and Haider were apt to interfere with the more refined methods of the SS leaders. It can be seen that the objections of Dieckhoff to Kuhn's *Bund* in the United States were, *mutatis mutandis*, much the same as Papen's objections to Hauptmann Leopold. But Hitler allowed the apparent indiscipline of the SA people because it suited him; it served to bewilder and unnerve the outside world. He despised his professional diplomats not least, perhaps, because he deceived them, too, over this.

It was Hitler's rise to power in 1933 which killed traditional diplomacy. Nor did direct contact between the heads of states take its place; for the documents confirm what was apparent at the time, that Hitler, who was temperamentally incapable of negotiation, used personal meetings as propaganda. He exploited the spectacular possibilities each time, but he often scarcely bothered to find time for private conversations even with Mussolini, and if he found time it was in order to deliver his harangues. A memorandum by Bülow-Schwante on his casual talks with the Duce when accompanying him on his Berlin visits in September, 1937, confirms the impression that the dictators deliberately avoided business-like conversations.

Thus from 1933 to 1939 Hitler ignored the advice and information of his own diplomats, while the western powers persisted in their futile attempt to lead him back to the ways of the old diplomacy. Like other things which Hitler destroyed, these methods of diplomacy have not yet been restored.

Light on the Victorians

"Charles Dickens and Early Victorian England." By R. J. Cruikshank. Pitman. 303 pages and 14 Isotype charts. 20s.

"WE cannot escape the Victorians. We may think of them as museum pieces, despise their standards and detest their cruelties, but they haunt us. They are in our blood.... Who in the end can escape his father and grandfather?" Now that the Age of Shoddy—the nineteen twenties and thirties—is behind us, says Mr Cruikshank, we turn back with increasing interest to review the achievements of the middle Victorians, like a family for whom nothing has fallen out well—fortune gone, hopes disappointed, faith lost—a family suddenly remem-

Easy with that throttle!

Easy with that accelerator! This isn't a car where you put your foot down and wait for it to go faster. This is a car that you tell what to do. And it does it.

You thought you were getting into a comfortable family car.

Well, so you are. But wait a minute.

Find a clear road. You want to go up into the seventies? All right—just put the needle where you want it. The stuff is in this car, just waiting to be used. Now put it into a bend. Go on—give yourself a chance to be surprised. There you are—much faster cornering than you'd expected—and no roll to notice. Safe as houses.

And what about the bumps that you remember on this road? Nobody's mended them yet—they just got kind of lost on their way through the torsion bar suspension of this car.

Yes—you can take your family. Up to six; with luggage. But you can still have driving fun.

Top speed 78 m.p.h. Acceleration 0-60 m.p.h. in 22.2 secs.

Horizontally opposed flat-four 50 B.H.P. engine.

bering the peaceful lives that its grandparents lived, and wistfully returning to its springs and origins for health and strength.

And there is no better guide to the ancestral mansion—perhaps one of those beetling palaces at Norwood or Beulah Hill which he describes so well—than Mr Cruikshank.

This is not a book about Dickens; it is not strictly about Early Victorian England, for the author taking the span of Dickens's creative life from 1837 to his death in 1870 comprehends the middle period as well. But it uses the characters and the imagination of Dickens as the centre light to illumine the scene, leaving other torch bearers to light up dark corners and obscure alleys. The author wisely relegates the facts and figures of Victorian development to a sort of Clapham-in-pictures at the back of the book. It is an imaginative attempt to capture the quality, the feel, the smell, the colour of Early and Mid-Victorian England. Seldom has the material been better used; Mr Cruikshank brings to the task many of Dickens's own qualities, a sense of pity for misery which is intense without being sentimental, the unphilosophical radical's biting anger with wrongdoing and injustice, an ability to get inside the skin of other people's lives, an imagination that is not only perceptive but also accurate, and, most important, a deep knowledge of and feeling for London. And what diverse material it is to work upon: the festering human heritage of the industrial towns, George Hudson and John Henry Newman, the grandees of the suburbs and the gaunt gaiety of the gin palaces. Mr Cruikshank's sensitive fingers unravel two threads that run continuously through every facet of Victorian life—one is the interest in religion, "The Victorian debated the themes of Faith not only without self-consciousness, but with positive zest. Sex was *their* embarrassment, as religion is ours." The other is the macabre quality of the Victorian imagination:

There are two elements in the great Victorian age which are not taken into sufficient account nowadays—the violent and the sinister. . . . The daintiness of its sentimental art and writing masked its spiritual corruptions. The awful authority of Mrs. Grundy prevented its writers of genius, such writers as Dickens and Thackeray, from doing more than murmuring hints of the wickedness they knew. The villains in Dickens are commonly thought to be merely comical nowadays. To the contemporary reader they were real enough in essence, if not in speech. They were emanations of that ferocious and concentrated malevolence, the joy in evil for its own sake, which lay beneath the enamelled surface painted with pretty scenes from the "Idylls of the King." It is hard to understand how a legend grew up that Dickens is primarily the celebrant of Christmas cheer. . . . Guilt and blood tormented his dreams. Sometimes he walked the streets in a trance, half-believing the brand of murderer was on him. That mind, so sensitive to all the deep impulses and quivering vibrations of his age, was obsessed by the barbarous savagery of its underworld. Carlyle said of De Quincey that he had the face of a child, but of a child that had seen Hell. That might have been applied to Dickens when he was wrestling with the lost spirits that called on him to make their torments articulate.

The book is beautifully illustrated. It is a book that is not only a delight for the hour, but is worthy of a permanent place on the bookshelf beside Mr G. M. Young's "Portrait of an Age."

Social Myths

"Le Pouvoir et l'Opinion." By Alfred Sauvy. Payot, Paris. 188 pages. 450 Francs.

M. SAUVY, who is director of the National Institute of Demographical Studies and member of the Economic Council of France, has given this masterly work the sub-title "An Essay in political and social psychology." In effect the book is a condensed treatise on the observation of economic and social facts and on the proper role of informed authority in the

modern world. It is also a plea for general education in politics. M. Sauvy's main theme is expressed in the preface:

What is certain, is that the time-lag in general knowledge about modern technique and objectives is hindering the functioning in those fields of a democracy conceived a century and a half ago. The complexity and scale of the problems to hand are gradually removing them from the competency of institutions with whom it is a point of honour not to evolve.

Until, therefore, public opinion—therein included the public's co-dupes, its elected representatives—is educated enough to evaluate the cardinal features of an economic and social situation, democracy will remain, intellectually and institutionally, a shadow.

The theme is not new. What is novel is M. Sauvy's sensitive examination of the manner in which error is formed—often in face of accessible scientific truth—and of the whole chain of false reactions to which it gives rise. Thus M. Sauvy is led to describe the attitude of various types to their environment; the man in the street, the businessman, the civil servant, the politician and finally the ideal economic and social "meteorologist." Different social groups hold different characteristic assumptions which have the power of myths. These semi-conscious myths and illusions are expounded by M. Sauvy with great force and convincing illustrations: the myth of the past golden age; "there is plenty for all *now*"; certain suggestions by advertisements, for example, that the citizen must own a car and drink alcohol; above all—at least in France—the notion of the intrinsic value of economic liberation.

M. Sauvy gives some interesting (and somewhat unnerving) instances of the incapacity even of high authorities to free themselves from the influence of the current dominant myth: for instance, M. Blum's assumption when initiating the 40-hour week that the measure would not reduce production "because factories were already working less than 40 hours"—a contention which could immediately have been disproved by available statistics; or Lord Keynes's double miscalculation in regard to war-damage in France (1914-18) and Germany's postwar national revenue. In both these instances, M. Sauvy suggests, facts were unconsciously discarded or selected in support of the myths of the moment.

In the field of foreign policy M. Sauvy instances several tenaciously held illusions: by England in 1919 that France was more powerful than Germany (and should therefore be opposed as the leading continental power); by France between the wars that a policy of military alliances with Germany's eastern neighbours was compatible with the defensive strategy of the Maginot Line: by the Allies in 1945 that Western Germany could support an influx of 10 million Germans from the East. It is hard for anyone to read M. Sauvy's analysis without receiving some stimulus to comb out a rich crop of error from his own suppositions and thoughts. For his book is inspired with the kind of patient scepticism that is rarely found beyond the French borders.

Encouragement to Music

"Music." Political and Economic Planning: on behalf of The Arts Inquiry. 224 pages. 15s.

MOST books about music are concerned with its aesthetic side. This book is unusual in that it is concerned with its economic side and with the conditions which make the creation and performance of music possible. As such it does an important service in bringing to the public's notice the precarious conditions under which music is produced in this country, and the steps which have to be taken to make that position less precarious.

Three things stand out in this account of Britain's musical life: the first is the vitality and development of musical ideas during the past generation and particularly in the last ten

years; new orchestras and new opera companies have been created, more music is being written and performed and more people, particularly young people, are listening to music. The second is the dependence of those who create and perform this music on public funds; without ENSA during the war and the Arts Council and grants from local authorities since the war many of the new companies would never have come into being or would have died a quick death. And the third is the spread of musical education among the schools; until children are bred in a more musical tradition in their schools there can never be a sufficient audience for musical performances. Fortunately progress in the schools has been encouraging.

The book includes two very interesting chapters on the growth of orchestras and opera companies. In 1939 there were only two full time orchestras—the BBC Symphony Orchestra and the London Philharmonic—and five regular part time orchestras: there are now nine full time orchestras, five regular part time orchestras, four string orchestras, and a few irregular orchestras. Of all these eleven receive grants from the Arts Council. On the side of opera the most spectacular development has been the establishment of the Covent Garden Opera Trust with a grant from the Arts Council of £120,000 for 1948-49 (compared with public grants of £250,000 for opera in Prague, £600,000 in Paris), but other companies have also been established or have extended their performances. Chamber music has also increased.

To support all this activity requires both more and better musicians and a larger and better educated public. The report criticises the existing training of professional musicians and makes suggestions for improvements, but its criticisms and recommendations about music as a part of general education are even more valuable. The aim must be to get school children "literate" in music as well as in the three Rs, and not to concentrate mainly on individual piano, violin or other

instrumental lessons. For this work a new kind of class teacher is required, and for this work the existing training schemes are inadequate.

It is evident from the report that music on the present scale will not be self-supporting for many a long day, if at all. This is also a field where government economies are easy to make. Yet the report makes it clear that something approaching a musical revolution has been created by the war and subsequent events. How much of it will survive if cuts are made?

Irish Plays

"Collected Plays." By Sean O'Casey. Macmillan. Two volumes: 314 and 354 pages. 12s. 6d. each.

ALL Dublin playgoers will remember the excitement aroused by the production of the O'Casey plays in the Abbey Theatre. The Irish dramatic movement had been mainly concerned in its early days with peasant and legendary plays. Lady Gregory and Synge had portrayed the Irish country folk in a series of brilliant plays, while Yeats had revived the heroic age of ancient Irish myths and sagas. O'Casey, for the first time, showed the Dublin public their own city in all its squalor. The public conscience about housing conditions had been awakened by James Larkin and James Connolly. This appalling social problem was now dramatically displayed to the astonished gaze of the Abbey audience. O'Casey created a whole series of characters, grim and gay, that came to life on the stage, and, amidst peals of laughter, took the fourth wall out of a tenement house. Macmillan's have performed a valuable service in reprinting eight of these memorable works of genius in an edition that is convenient to handle and cheap to purchase. The plays are, at the same time, amusing as literature and invaluable sociological documents.

Deafness . . . and the business executive

The greatest handicap to the active business executive is increasing deafness.

Inability to take a full part in conferences, executive meetings, social life, means the undermining of confidence, so essential to every business man.

Better hearing is available to those who want it, through the medium of BONOCHORD, a modern, unobtrusive aid to hearing, developed as a result of extensive research in electronics.

Business executives faced with the prospect of forced retirement or a severe restriction of business activity have found in BONOCHORD the answer to a need for improved hearing under all conditions.

If deafness is YOUR problem, send for full details of BONOCHORD today, it may well be the means of restoring you to a full and happy business life. There is no obligation.

AMERICAN SURVEY

Foreign Policy in the Doldrums

(From Our American Staff)

IT is a curious paradox that American foreign policy, which is traditionally negative, should have had a brilliantly constructive period during the two years when the government was divided and a Democratic President was opposed by a Republican Senate and House of Representatives. The impetus of those two years carried over and, until recently, obscured the fact that, since the election, there have been no new ideas and no imaginative developments of existing ones. Point Four of the inaugural address—the programme of technical aid and capital investment for backward countries—seemed for a time to be such an idea, but the mountain of publicity and speculation with which it was greeted has so far produced a mouse of a programme—and a cowering and timorous one, at that. This return to negativity is partly a reflection of the mood of the country, contemplating a budget deficit of over \$5 billion, and partly the product of uncertainty within the State Department, in which disagreements over where to go next have led to decisions not to go anywhere at the moment.

That the end of the constructive period should have coincided with the retirement of General Marshall is not the explanation. Mr Acheson was himself the first to propose the programme which later became the Marshall plan and his reputation has always rested on his ability to accept imaginative ideas and his courage in fighting for them. Mr George Kennan, brought into the Department by General Marshall, has continued to head the planning staff, and his decision to leave the Foreign Service—if not permanently, at least for two years—may well be due to recognition that, though policies can still be planned, there are reasons outside the Department why they cannot be put into effect. The factors now inhibiting action are either domestic political ones over which the present Secretary of State has no control, or external situations that he inherited.

In the Far East he had no time to do anything but pick the fruits of compromise between General Marshall's policy of letting China stew in its own juice and Congressional insistence on helping General Chiang Kai-shek. This resulted in token appropriations for aid to the Generalissimo, accompanied by sabre-rattling out of all proportion to the aid. Neither was of any appreciable value to the Nationalists, but succeeded in enraging the Communists and making future relations unnecessarily difficult. Last January was certainly too late to do anything about China and there was by then no alternative to letting the dust settle, though it may have been unwise to say so with such bluntness.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

But the constructive period of foreign policy had not, in any case, touched the Far East. It was in Europe that the United States dramatically assumed leadership in 1947, with the European Recovery Programme, and in 1948, with the Atlantic Pact, growing out of the Vandenberg resolution. And it was in Europe, in 1949, that the United States began to drift into a policy of letting George do it and, other prospective Georges, Britain in particular, having either refused the role or been considered inadequate, appeared to have chosen Western Germany for the job. When Mr Acheson came back from his visit to Europe with nothing but inordinate praise for what he had seen at Bonn, everything seemed ready, on the surface, for a repetition of the story of the nineteen-twenties. But, in his decisions about Western Germany, too, he was a prisoner of much that had happened before he took office, in particular of the agreement of June, 1948, which made the growth of two Germanies and the competition between east and west for their manpower inevitable, and of those happy days when announcing the tonnage flown into Berlin by the airlift each day was a substitute for policy.

American objections to the Soviet Union have always been more ideological and less strategic than those of other countries. Even if Russia were not expansionist, the United States would still feel uneasy in a world which contained the Soviet Union. Anti-Communism is the motive force of most of American postwar policy, just as anti-Jacobinism was the original cause of English hostility to Bonaparte. In both cases external aggression by the revolutionary forces came to the rescue and made respectable what was essentially fear of a challenge to the existing order. But it is still the fear of ideas which predominates, rather than the fear of armies, and the policy-makers are left with few answers to the military argument that all anti-Communists should be welcomed in the crusade. So the necessary preliminary sanitation of Dr Adenauer is under way.

The press, which includes a number of men who knew pre-war Europe well, has not, so far, been very helpful. The *New York Times*, two weeks ago, published some very important despatches from its correspondent, Mr Drew Middleton, then in Munich. Mr Middleton quoted, from an official report from the office of the American Commissioner for Bavaria: "It is very important to recognise that renazification has left Bavaria largely in the hands of those who controlled it under Hitler." He added his own observation that "Bavaria is not alone. Investigation in the other states of the United States zone reveals a resurgence of Nazi-ism. . . . All along the line, the democracy the United States tried to implant is losing and authoritarianism is winning." Somewhat unkindly, the *New York Times* printed, on the page opposite the second of Mr Middleton's pieces, Mr McCloy's opinion, undocumented, that "there . . . has never been in my experience as much thought, attention and inquiry to the problem of making Germany democratic as at the present

time" and quoted him on the need to differentiate carefully between "healthy patriotism" and "sinister nationalism." Neither the correspondents stationed in Germany, however, nor those who have been there lately for a visit, are impressed by Mr McCloy's own ability to make the distinction.

It would be wrong, despite all the evidence to the contrary, to believe that this official enthusiasm for Western German democracy is anything but induced—except, perhaps, on the part of Mr McCloy. It is induced largely by what are considered the exaggerated and too persistent French fears of German revival and the timid retreat of Britain into isolationism. British and French policies, however inevitable they may be, are to a considerable extent responsible. So also is the American failure to understand the limitations on Ministers under the parliamentary system. Every American official is painfully aware that he can agree to nothing which will not later be accepted by Congress—and some, at least, make good use of this incapacity in their negotiations—but most of them forget that a British or French official cannot take responsibility for policies for which public opinion is not yet prepared and which it is likely to reject. (The German Government, with a people used to taking orders, is better placed.) It is easy, therefore, for an American to complain that nothing is being done about European union and to admit at the same time that European union would make little sense without the participation of the United States. Since that is politically impossible at the moment, however, it would make things much easier with Congress if only Europe would get together.

★

But, if Britain has lately been disappointing as a corps commander, so has the United States as an army commander. The mood of the country, to which policy is so responsive, may well be negative because it has been offered no chance of being positive. It would have been a brave man who, in the summer of 1947, would have predicted overwhelming support for the European Recovery Programme and there are brave men who think today that another show of leadership at this moment would find an equally great response. But there has been no inspired leadership and no coherent explanation of what is happening. The Economic Co-operation Administration, having achieved much of its original purpose—the rehabilitation of European industry—much sooner than most people dared to hope, is now unable to explain why Europe is not self-supporting. The country has been told that Europe has failed to integrate, but it has not been told that Western Europe cannot be fed by integration but must get agricultural products from behind the Iron Curtain. The American people are being lectured on the need for accepting imports, but not on the reason why getting Europe "on her feet and off our backs" is not a sufficient objective for the world's leading Power.

The concentration on European integration has been, in some ways, a smokescreen behind which American leadership has been able to doze. A tendency to mistake the Duke of Plaza Toro for King Henry V is noticeable. General Marshall was able to say at Harvard that "the initiative . . . must come from Europe" because he had already said that "the United States should do whatever it is able to do." To cry "Integrate—or else" and to take no part in the integration, is to try to lead the regiment from behind. The United States has temporarily forgotten that Henry V could shout "On, On, you noblest English!" and get an immediate response, because those who listened knew that he himself would lead them into the breach.

Texas Transformed

[FROM OUR AMERICAN STAFF]

THE industrial revolution which the second world war brought to large areas of the United States came partly from the impetus of wartime demand, but it was also a continuation of the peacetime trends that have characterised American industrial growth and decentralisation over the last two decades. And since the war it has merged with and developed into a changing pattern of American industry that is particularly noticeable outside the older manufacturing communities. In few regions has this change been more marked than in Texas and the adjoining States which comprise the Gulf Southwest. The federal census of manufactures for the year 1947, released recently, showed that during the eight years since the last census the industrial growth of Texas was equal to that during its entire preceding history of more than one hundred years.

The census showed that "value added by manufacture" in all Texan industries increased from \$453 million in 1939 to \$1.7 billion in 1947. This quadrupling of the annual net value of manufactured products indicates, after allowance is made for inflation of values, that the physical volume of goods was doubled. In the same period the number of industrial wage-earners increased from 126,996 to 242,014. While this is not quite double, here again it would seem that the volume of goods produced was doubled, since technological advances meant that each man produced more.

The percentage of increase in Texas was about twice as great as in the United States as a whole, but percentages do not tell the whole story. The really dramatic aspect of Texas's industrial expansion is that in a few years Texas has changed from a predominantly rural to a predominantly urban State, as far as the residence and occupations of its inhabitants are concerned.

This change has been accompanied by a corresponding change in the character of Texan agriculture, which began during the late nineteen-twenties. At that time the failure of foreign markets for Texas cotton, which had constituted more than half the American export crop, together with the dwindling domestic demand as the depression cut down demand and synthetic fibres increased competition, forced a drastic reduction in the cotton acreage and a consequent readjustment in the State's entire agricultural industry. Between four and six million acres have been diverted from cotton to diversified cropping or grazing. There has been a rapid decline in farm tenancy, a corresponding increase in farm mechanisation, a dwindling in the number of farms and a sharp increase in their average size.

★

This rapid shift in agricultural methods has pushed between 500,000 and 700,000 people off the farms. Fortunately, this great contraction in the demand for farm labour has been followed by a record increase in the demand for industrial labour. Usually, the transition from a so-called "colonial" and rural to an industrial and urban economy develops gradually over a long period of years. In Texas it has come with startling swiftness and, because of an exceptional combination of circumstances, almost painlessly, in spite of its rapidity. The wartime demand for industrial output, the desire for decentralisation of industry both for reasons of national security and to escape the organised power of trades unions, the long-term trend of American industrial development, all played their part in speeding and easing the

transition. Texas's position midway between the Atlantic and Pacific coasts, yet with deepwater ports on the Gulf of Mexico, has been a peculiar advantage. Another has been the great diversity of its raw materials—crops, livestock products, forest products and minerals. Outstanding has been its production of oil and natural gas, with practically half of the known American underground reserves of both.

With the close of the war, most of the big "war industries" were abandoned, or put into stand-by condition. This was especially true of ordnance factories, though one large plant near Texarkana has been converted to a military repair shop employing almost as many as it did during the war. The shipbuilding plants at Houston and Orange have only a small fraction of their wartime output, and synthetic rubber, at Houston, Port Neches and Borger, is largely on a stand-by basis. The big airplane factories at Fort Worth and Dallas, closed down completely after the war, are now running at about half the peak wartime rate. Of course, much of this activity is actually "wartime" production. It would be much less than it is except for the strained relations with Russia.

Postwar development of peacetime industries, however, has offset the decline in war production. Industrial expansion

in such interior cities as Dallas, Fort Worth, San Antonio and Waco has been largely in the lighter manufactured goods and in lines that have long been staple products in the American market. But notable in the entire history of American industrial progress has been the rise of the big chemical industries along the Texas Gulf coast. The principal cause has been the great abundance of cheap natural gas, which at 4 cents a thousand cubic feet at the well is roughly equivalent in thermal value to bituminous coal at 65 cents a ton at the mine. This development began before the war, was accelerated in some branches and restrained in others during the war, and has since gone ahead with the investment of many hundreds of millions of dollars.

Near Kingsville the Celanese Corporation makes chemicals used in manufacturing synthetic fibre from wood cellulose. A large nylon salt plant belonging to the Du Pont Company, at Orange, makes the substance from which nylon thread is drawn. At Freeport the Dow Chemical Company extracts magnesium, bromine and more than a hundred other chemicals from seawater. This last plant was begun before the war, expanded to meet military demands, and diverted after the war to peacetime operation at practically full capacity. A large fertiliser and diversified chemical plant at Texas City (owned by the Monsanto Company), which was destroyed by the explosion of a chemical-laden ship at its wharf in

1947, has been rebuilt with increased capacity. Near Brownsville, Carthage Hydrocol makes petrol and miscellaneous by-products from natural gas. At Port Lavaca the Aluminum Company of America is building a factory to utilise imported bauxite. At Corpus Christi the Corn Products Company is planning to make starch, dextrose sugar and other products from Texas-grown grain sorghums, a development with great promise for sorghum growers.

Another revolutionary industrial development during the last few years has been the utilisation of East Texas iron ores in blast furnaces at Houston and Daingerfield. This was the outcome of the discovery of excellent coking coal in Southern Oklahoma, which brought to fulfilment the efforts made for over a century to utilise the great quantity of ore that lies near the surface in East Texas. Many small furnaces operated from the period of the Civil War until about forty years ago, using charcoal or imported coke.

The combination of contracting farm population and expanding urban population is creating a new population pattern in Texas. The population of the State increased from 6,414,824 in 1940 to an officially estimated 7,530,000 on July 1, 1949. Yet, of the 254 counties in Texas, population was stationary or declining in nearly 200 and the big net gain has come from the mushroom growth of industrial centres in only fifty or sixty counties.

American Notes

Invitation to a Political Party

The Administration proclaimed a Fair Deal victory over the Republicans in New York in November but, before the month was out, a cannonade from the rear announced a revival of revolt inside the Democratic Party. At the Southern Governors' Conference, which in 1948 gave birth to the Dixiecrat rebellion against President Truman's nomination, Mr James F. Byrnes, a former Secretary of State, broke his remaining links with the White House and called for a fight against the centralisation of power in Washington and the inroads of the security state. For Mr Roosevelt, Mr Byrnes, of South Carolina, provided an invaluable bridge between the northern wing of the party and southern conservatives; this has now been blown up. Implicit in Mr Byrnes' speech was an invitation to the Republicans—short of money, ideas and self-confidence after 17 years out of office—to join with the southern supporters of States' rights to build a barricade across "the road to statism." Misery loves company.

Mr Byrnes cast a new mantle of respectability over the Dixiecrat movement, which was conceived in white supremacy and nourished by tidelands oil; the conference elected as its chairman Mr Thurmond who, as the Dixiecrat candidate, deprived Mr Truman of 39 electoral votes in 1948. It was noticeable that, when Mr Barkley, the Vice-President, launched the 1950 Congressional campaign in New York with an attack on those who wanted to turn back the clock, energetic efforts had been made to bring nine Southern Governors to hear him and attest their loyalty—a demonstration which suggests that the Democratic organisers take the Dixiecrat threat seriously.

Mr Bricker, the rather ingenuous Senator from Ohio, also took it seriously, for without further thought he embraced the idea of a new political party, proclaimed the identity of views between the Republicans and the southern conservatives "except for a few side-lines," and announced his willingness even to abandon the name Republican to secure allies in the one-party Democratic south. But among the "side-lines" which Senator Bricker dismissed so airily lies the whole civil rights issue; more thoughtful Republicans are unwilling to

trade their traditional principle of fair treatment for the Negro—and Negro and labour votes in the north—for allies whose support on other issues is often automatic. Nor would the Southern Democratic doctrine of States' rights sit easily on the conscience of a party historically bound up with the growth of the central government.

There is nothing new in the idea of an ideological realignment of the political parties to take the place of the present historical and sectional division. It used to be the pot of gold at the end of the rainbow for frustrated liberals. That the Republicans and the Southern Democrats should now be attracted by it is a measure not so much of their identity of views as of the degree to which both feel cut off from political power and the jobs and prestige that go with it. The Republicans may well make inroads on the south in coming elections, but a Presidential candidate—such as General Eisenhower, who since 1948 has clearly chosen the road to the right—selected to lead a formal coalition would find his double role exquisitely embarrassing to play.

* * *

Doctors Shoulder Arms

Mr Oscar Ewing, the Federal Security Administrator, is visiting Europe to gather ammunition with which to repel attacks on President Truman's health plan. At his press conference in London last week, he fired a preliminary volley back across the Atlantic. The over-emphasis he gave to his not-very-well-documented discovery, that "certain" American medical groups (two, in fact) have been coming to the financial aid of rebellious British doctors, may ricochet. But he shot straight in his remarks about the prejudice with which previous American visitors to Britain have distorted their reports on the health service.

The American Medical Association, mobilising in Wash-

ington while Mr Ewing spoke, is also about to send an exploratory expedition across the British frontier, and is for once planning to spend three months, instead of three days or weeks, in Europe. The cost will be met out of the \$25 which each of the Association's 143,000 members must contribute this year to the fight against "socialised medicine." Dues have not hitherto been payable to this national medical organisation, but the threat of compulsory health insurance can evidently only be met by adopting the enemy's compulsory methods. It is expected that \$3,000,000 will be raised, instead of the \$2,000,000 produced by last year's voluntary contributions.

Many of the members, well aware of the insoluble economic problem which illness presents to the poor, have been unwilling to contribute to the Association's negative campaign against the government plan. To many doctors, the constructive answer seems to lie amongst the many schemes for voluntary health insurance which have grown up all across the country. The AMA has sugared the pill of the compulsory levy by agreeing to co-operate in these schemes, which it used to find as abhorrent as it now finds government insurance. Last June, the Association dramatised its conversion to modernity by forcing the resignation of its flamboyant oracle, Dr Fishbein, whose obstinate refusal to discuss practical remedies was driving the patients into the government surgery.

AMA's new weapons are being attractively wrapped by an aggressive firm of publicity agents, and apprehensive Democrats think the President would be well advised to hold his fire until after next November's election. This he shows no sign of doing, but, nevertheless, it seems likely that the main battle over health insurance may not be fought during the coming session of Congress, since even such champion liberals as Senator Douglas find the government scheme too ambitious in its present form.

there's business waiting
— it won't wait long — **in USA**
fly now by AOA

Vast new markets are now open in the USA — for which businessmen everywhere are rushing. It's more than ever important for you to go without delay ★ ★ ★ Only AOA offers you the facilities of its 77 offices throughout the USA, Canada and Mexico to assist you on your sales trip.

You save over £58 if you go now, for there are special 60-day round trip fares for journeys completed before April 30 ★ ★ ★ **Daily luxury Stratocruiser services** ★ ★ ★ AOA air freight will get your samples there ahead of all competitors. Dust Settles on Formosa

The first and most definite shape to emerge out of the Chinese dust is the island of Formosa, to which the Nationalist Government is withdrawing. The \$75 million, which is all that the US Congress has provided for aid to non-Communist China, would have been only a drop in the continental ocean, but on the island it might be a strengthening shower. Moreover, there are strategic as well as political arguments for trying to save Formosa from a Communist fate. The reinforcement brought by these arguments to the professional Congressional critics of the Administration's Chinese policy was shown when Senator Alexander Smith, of New Jersey, a respected Republican member of the Foreign Relations Committee, neither a Chiangophil or a MacArthurman, demanded that American troops occupy Formosa in order to make certain that it does not fall into Communist hands.

The island abuts on the outer ring of American bases in the Pacific, which runs through Japan, Okinawa and the Philippines, but even so, Washington does not agree with the military leaders on the spot that Formosa is of vital military importance. The Joint Chiefs of Staff evidently feel that the difficulty of finding the forces needed to occupy it and the likelihood that the United States would, as a result, be directly involved in the Chinese war have more immediate significance than the probability that Formosa will before long be controlled by Communists, unfriendly to the United States but lacking the sea and air power which would enable them to threaten its bases.

If the Chiefs of Staff had decided otherwise, the political implications would have been even more embarrassing than the military. Not only would the United States have once more become inextricably involved with the Nationalist Government, which has demonstrated its corruption and unpopularity as clearly in Formosa as it has elsewhere, but there would also have been a very hollow sound about any future American protests against Russia's expansionist tendencies. And the American vote in the United Nations last week for the maintenance of Chinese territorial integrity would have sounded more hollow yet, since Formosa was Chinese until 1895, was promised to China in 1943 and has been administered by China since 1945, although it is technically part of Japan until a peace treaty has been signed.

Atoms for Allies

With the failure of Senator Hickenlooper's charges against Mr Lillenthal, ammunition for the anti-Administration exploiters of the atom must now be dredged up from that remote era of good feeling when the Russians, having repulsed the Germans at Stalingrad, were considered to be entitled to every aid America could send. The ending of the American monopoly of the bomb is now to be laid at the door of New Deal idealism—or treachery. The allegations made by Mr Racey Jordan, a wartime Army captain, and stage-managed by Mr Fulton Lewis, Jr., the most relentless enemy of Mr Roosevelt on the air, divide themselves into two parts. Some—such as the story that

small quantities of uranium and heavy water were shipped to Russia in 1943—are true, but old; they have been thoroughly exploited before. Those that are new—such as the charge that the late Harry Hopkins or, alternatively, Mr Henry Wallace, overruled the military in sending atomic information to Russia—are full of discrepancies, and quite unsubstantiated.

Two parallel investigations were put in hand at once, one by the Joint Committee on Atomic Energy, the other by the House Committee on Un-American Activities. For once the latter found a tall story hard to believe—perhaps because its Republican members were scattered from Puerto Rico to California. The heaviest blow to the Jordan sensation came from General Groves, wartime head of the atomic energy programme, who, after certain cryptic statements that threw no cold water on the fire, seems to have realised that he himself might be burnt. To the Un-American Activities Committee he testified that no pressure to divulge atomic secrets had ever come from Mr Hopkins or Mr Wallace; that the amounts of uranium and heavy water licensed to be shipped could not have aided the Russians materially; and that to withhold uranium would have aroused Russian suspicions and perhaps put them on the track of the bomb.

General Groves seems reluctant, however, to have his testimony taken so seriously that the inquiry is dropped; it may be useful if, as the symbol of water-tight Army control of the atom, he attempts to unseat Senator McMahon, who wrote the Act providing for civilian control. Republican members of the Un-American Activities Committee, indignant at what they regard as a hurried whitewash by the Democratic majority, probably will oblige him. Whether this latest, and shabbiest, sensation will induce Congress to lock the stable door against America's new atomic allies—Britain and Canada—is hard to judge. In the talks now going on over atomic energy co-operation, the United States takes the view that, on the grounds of economy, Britain should not attempt to produce atomic bombs, but should have access to the American stockpile in event of a war in which both nations were involved. In return, however, for making no calls on the supply of uranium for bomb production, Britain would also like access to American installations for British and Canadian scientists. Such sharing of information, however, is prohibited by the McMahon Act and could only be authorised by its amendment or a joint resolution of Congress.

Attacks on Segregation

The President has already begun to get into training for the tug-of-war over equal rights for Negroes which is expected to be the first event on the Congressional calendar in January. In the middle of October he appointed a Negro, Mr William Hastie, Governor of the Virgin Islands, to be a Federal Appeals Judge, the first Negro to rise so high on the Federal Bench. Early this month, the US Solicitor-General, Mr Philip Perlman, with Mr Truman's approval, announced that, in future, government funds would not be available for financing new houses and flats, whose occupancy was to be restricted on a basis of race, creed or colour. Thus Federal policy will be brought into line with the Supreme Court's decision that agreements barring Negroes from owning real estate are legally unenforceable. An attempt to include somewhat similar provisions against racial discrimination in this year's Housing Act was defeated because the Administration feared that a Congressional majority would be unobtainable for the Act in that form.

The building industry received Mr Perlman's announcement with dismay, relieved only by self-satisfaction that its

predictions had been fulfilled: the Government was imposing such intolerable conditions on its financial help that private building would stop, and an excuse would be provided for an extension of public housing. The Federal Housing Administrator, who is responsible for government loans to private builders, hastily wiped away these crocodile tears by pointing out that, since the Supreme Court's ruling, the restrictive covenants have been transformed into unwritten "gentlemen's agreements" to which the new government policy cannot apply. For this and other reasons, it need, apparently, make little difference to FHA operations.

The President's attempts to abolish racial discrimination in the Armed Forces, begun over a year ago, have had little more success as far as the Army is concerned. At the end of September, it finally brought itself to produce a programme for the establishment of racial equality which the Secretary of Defence could approve. Negroes are now eligible for all Army schools and types of training, but they apparently have no guarantee that they will be permitted to use their skill once it is acquired, since they can still be assigned only to Negro units or to a certain proportion of "overhead" posts. The Air Force, after some difficulty, has set an example to the Service of which it was once a part, by completely integrating its basic training courses for whites and Negroes.

The Department of Justice at least has shown itself not only sincere but bold in its attacks on racial discrimination. It has challenged the whole basis of segregation, the doctrine that the Negro's constitutional rights are satisfied if he is given facilities "separate from but equal to" those provided for whites. The occasion of this challenge is a case, which has now reached the Supreme Court, in which a Negro is suing the Interstate Commerce Commission for allowing segregation in a railway dining car; the Justice Department, although nominally a defendant, has asked the Court to decide in favour of the petitioner.

Oil's Indian Summer

The oil industry, alarmed by a prolonged Indian summer uncomfortably reminiscent of last winter's costly mildness, has welcomed the cold snap which at last is beginning to make inroads on the record high stocks of oils for home heating. Stocks of heating oils and petrol are 15 per cent higher than last year because the industry prepared to supply the greatly increased number of oil-burners in a normally cold winter. On the east coast petrol prices have had to be cut, for the first time since before the war, and in December Texas cut back the production of crude oil after three successive increases in the permitted monthly yield.

Price concessions on fuel oil, made when the consumer, heedless as any grasshopper of the coming winter, refused to listen to the industry's warning to fill his tanks, are now being rescinded. This will not be lost on the Senate Banking Committee, already investigating what it considers the suspicious coincidence that petrol prices were raised in the spring, just as the motoring season started, while fuel oil prices moved up in the autumn, when consumers normally begin to lay in stocks. The defence of the industry is that there must be incentives to produce either more fuel oil or petrol from every gallon of crude; and also that the price of one must rise when the other falls, since the price of crude is held stationary by state regulations which cut back the supply. Petrol is still the industry's cash crop, but the demand for fuel oil is becoming the determining factor in production; the industry's peak demand now comes in the first (and chilly) quarter, rather than in the third, when most of America takes to the road. Critics hold that but for an undue tenderness for profits, the necessary adjustments in production could be made by cutting, rather than raising prices.

More alarming even than the recent Indian summer, or the coolness of some Senators, is the wintry long-term prospect of a world oil surplus resulting from overseas expansion and the dollar shortage. The alarm of companies with overseas fields lest they be displaced from foreign markets is shared by the independents, who have no foreign sources of supply. Their long hostility toward oil imports is inflamed by the fear that oil displaced abroad will now try to find a haven in the United States.

The expected 25 per cent increase in imports next year, from 676,000 to 850,000 barrels daily, hardly seems to justify the Small Business Subcommittee's apprehension that domestic production may soon be reduced to supplementing imports. Consumption is now 6,000,000 barrels daily, and net imports are negligible. But the increase in imports will satisfy the expected rise in domestic demand at a time when the American industry could produce another 1,000,000 barrels a day. It has revived the pressure for an increased duty or the quota of 5 per cent of domestic production which failed of passage by only one vote in the Senate last summer. But as long as new drilling remains near the 1948 peak, and the industry shows no greater signs of disorganisation, the Administration is likely to agree with the importers that American oil resources must be conserved and that it is impossible, both for economic and political reasons, to turn imports on and off like a tap.

Shorter Notes

The advertising firm of Benton and Bowles has gone into politics. Governor Chester Bowles of Connecticut has given his old partner, Mr William Benton, the Senate seat left vacant by the appointment of Senator Baldwin to the State Judiciary. Mr Baldwin was a Republican and Mr Benton is an independent, which causes some heart-burning among Governor Bowles's Democratic supporters. Mr Benton has experience both of education, as vice-president of the University of Chicago, and of international affairs, as an Assistant Secretary of State in the two years after the war, when he was responsible for American overseas broadcasts and for US participation in Unesco.

Last September the Bureau of Labour Statistics confessed that faults in its system of weighting samples had caused it to exaggerate the number of persons in non-agricultural employment for several years past—by almost 1,000,000 last June, for example. Now a similar inadequacy is said to have been discovered in the Federal Reserve Board's index of industrial production: one of the steel-fabricating series has been found to measure only changes in pig-iron output. The effect of the steel strike on industrial production in October was therefore much less than the Board's advance estimate; the drop was only 4.6, instead of nearly 12, per cent.

The UN Food and Agriculture Organisation, having shown its independence of the United States by voting to move to Rome, found next morning that, according to its American Director-General, it could not afford this transfer whose chief purpose was to save money, particularly dollars. The United Nations, however, taking warning from this decision and from that of the World Health Organisation to establish itself in Geneva, has decided to postpone indefinitely plans for the building at its New York headquarters which was to have housed the specialised agencies as well as the national delegations. The latter have shown no signs of being ready to commit themselves to rent space in the new building.

THE WORLD OVERSEAS

Return to the Frontier Villages

(From Our Special Correspondent in Greece)

ON November 18, 1947, guerrillas led by Ypsilantes attacked the Epirote village of Vasiliko five miles from the Albanian border. They were driven off, but some of the villagers fled to safety in Ioannina. Christmas Eve brought a second attack: eighteen houses were burnt and twelve people killed, and once more there was a small exodus. The village became a no man's land between the army and the Andartes and in the New Year the remaining inhabitants were evacuated. Those few who could afford it went down to Athens. The rest clustered round Ioannina, finding what shelter they could and swelling the number of refugees already there. Only a dog was left behind, and seven old women who refused to have their last years disturbed. The same events were seen in hundreds of Greek villages.

By the spring of 1949 about 700,000 Greeks—10 per cent of the population—had left their villages to swarm to the towns where there was comparative safety from attack. From its normal population of 25,000 people Ioannina sprang to 60,000; Larissa was doubled in size; no town was without refugees. Some had fled when their villages had been attacked and looted or burnt; others, like Vasiliko, caught in the main areas of fighting in Epirus, Thessaly and Macedonia, had been evacuated by the army to prevent their being an unwilling source of recruits and supplies for the Andartes.

They crowded into mud huts thatched with rush that they built themselves, and into tents divided into sections by low mud walls. The more fortunate got crude lath and felt shacks provided by the government or an odd room in the town itself. Most of them were farmers and some had owned large houses in their mountain villages. Seven lived in a room four yards by eight, and one tent would have to house two or three families. Their possessions were gone except perhaps for a mattress, a thick blanket and a few cooking utensils. Their draught animals, on which their whole livelihood as farmers depended, had been stolen or sold by them in the towns to obtain money for food. Some had lost everything.

There was occasional work on the roads for a small daily wage and a new road to Konitza was built by refugees; but generally there was nothing to do but patch the rush roofs and mud walls as the winter rain dripped in, to trudge through the mud in a hopeless search for the work that meant food—and to wait. Men who had worked their land for thirty or forty years were now dependent on the state and on a daily ration of flour which sometimes did not come. A small allowance of money (9d. per day for the head of a family, 6d. for each member) and the little earned at work hardly supplemented their diet. In poverty and idleness the size of families increased.

Queen Frederika's "Childtowns"

For two years, or even longer, these men, women and children lived in enforced exile. Some of the children were sheltered in the cheerful and ably-run "childtowns." These, founded on the initiative of Queen Frederika and maintained by her energy, took charge of orphans and children whose parents could not look after them. Some were the children of Andartes. Here, in improvised buildings and Nissen huts, they were—and still are—fed, clothed and taught. But

these were the fortunate few—18,000 out of the total of 338,000 refugee children.

In 1949 hope reappeared. General Papagos brought a new spirit to the Greek soldier; the initiative was at last won, and eight thousand Andartes were driven across the border into Albania. The three thousand who remained in Greece were split into small bands, with their morale gone. That was in October; since then daily surrenders have diminished

their numbers. Now men again walk by night and repatriation has begun.

Two years have wrought a change in the refugees. Village unity has been retained, and the older men and women still greet strangers with patient dignity and express their longing to be home. But there is uncertainty about the future, and life in the towns has had an insidious influence on the older boys and girls. They have seen town life for the first time; their food, though meagre, has been provided without work on their part; they have watched men and women in factories making a steady wage without the exhausting labour demanded by a rocky soil—a soil to which they no longer want to return.

There is some apathy and there is still fear. Winter is here and people dread the possible return of the Andartes and the flight back to the towns through the snow. In Kastoria a refugee woman epitomised this apathy: "How can we go back?" she said; "it is winter, and we have nothing in our village. We can be sure of bread here, not elsewhere." The empty village of Ieropiya, which looks from western

Macedonia across to the Albanian mountains, is silent witness to fear; its one street deserted except for a sprawling table, a broken chair, and the shutters of the butcher's shop rattling in the wind. More important are the physical obstacles which prevent the return of the majority, despite their determination to go. Whole villages have been burnt and cannot be rebuilt in winter; mountain tracks become impassable in rain and snow—and winter came early to Greece this year.

Courage and Bad Planning

Tools, animals and food supplies are not always sufficient for the returning villagers. Over one third of the 700,000 have been sent back, but in Thessaly, where repatriation was begun too hurriedly, many found life unliveable in their villages and drifted back to the towns where there was no longer provision for their feeding. A few sold the wood and bricks given them for reconstruction and tried to start a business in town with the ready money.

Repatriation goes on in the face of these difficulties, and the Greek virtues of courage and endurance survive the Greek vice of inefficient planning. The return of Vasiliko was completed on a brilliantly sunny day that gave the occasion an air of festivity. The army had secured the heights round the village and the gendarmerie had followed behind them with about thirty armed villagers as home guards. A fortnight later came the families bringing their few possessions and some of the supplies that should have been allocated to them. The flour was there (though not the full two months' allowance); the money allotment had arrived, and the seed for an acre apiece was promised. But there were no ploughs, and only two hundred draught animals between the three hundred and fifty villages of the area.

Truck after truck drove off from Ioannina, leaving behind the emptied tents and huts that had been homes. The road went due north, past Kalpaki where the Italian advance had been checked in 1940, then branched west along the rough track which only the munificence of a rich villager had completed. Soon the grey summit of the Albanian mountain Nemerçke frowned in the distance and Vasiliko appeared ahead on a hill slope.

The villagers were seeing their houses for the first time for nearly two years. Their vineyards were unpruned and the grapes tiny from lack of cultivation. In parts of Macedonia the Andartes had grown crops and this year the Greek peasants reaped them; but here the fields had lain untilled and only the chestnut trees provided any harvest. The dog was still alive, but four of the old women had died and only two and a half ("half," said the people, because she was lame) were here to greet them.

On the Albanian Frontier

Trucks filled the little village square to unload their cargoes. From one emerged a family of seven with two hens, a donkey, beds and mattresses, a dustbin lid, three sacks

A glass of DRY FLY SHERRY is the ideal aperitif, and is a gracious welcome to your guests. Obtainable all over the world from your own Wine Merchant, or from:

FINDLATER MACKIE TODD & CO. LTD.
Wine Merchants to H.M. The King.
Wigmore Street, London, W.1.
The price is 20/- a bottle.

of flour, and odd pieces of cardboard to patch their roof. Their house was stripped bare, but already along the ceiling hung a few bunches of the small grapes and in the corner lay a pile of chestnuts that a relative—one of the home guards—had collected. A stranger coming to the house met immediate hospitality and could not refuse a glass of *tsipouro* and a handful of chestnuts. The new village president (his predecessor had been killed in the second attack) outlined their future. The village would be entirely dependent on the state for food over winter, but if crops could be sown it would be producing by July. All they needed was peace.

This was the cheerful side of the picture. North-eastwards in the fertile plain by the Prespa lakes, where Greece, Albania and Yugoslavia meet, the fields were deserted except for a man and his wife digging potatoes that the Andartes had sown in spring, and an old black-clad woman sitting motionless watching the road for mine-laying. Unpicked tobacco was in flower and going to seed; fields were unploughed and the vines straggling; there was no sign here that the land would be producing next year.

Further south, in Kroustalopiya which looks down the road to Albania, only a few villagers had returned; and these stayed with one eye on the army detachment that occupied their village. There was a man here busily painting and it seemed that reconstruction was after all beginning. But he was only deleting Communist slogans; and he felt himself too near the border to carry out his task with complete conviction. The fields that huddled along the road in the bottom of the valley were dried pale brown by the sun. But a few were dark from recent ploughing, and the contrasted colours indicated the possibilities of the future—barrenness, or the cultivation on which the survival of Greece depends. For this survival, repatriation must succeed.

The French Budget for 1950

[FROM OUR PARIS CORRESPONDENT]

It had long been feared that M. Petsche's budget for 1950 would be the biggest ever. There was, however, some consolation in the belief that the National Assembly would at least pass the thing by the end of 1949. But the government crisis in October and, later, the stormy Radical congress at Toulouse have since somewhat blackened the prospects. Some people are consequently beginning to speak of a vote on the "provisional twelfth"—a much deplored practice followed last winter, whereby parliament supplies a month's credit in advance without prejudice to its ultimate decision on the budget as a whole. At any rate the *projet de budget* is at present held up by the financial committee of the National Assembly, and the Radicals are exerting pressure to reduce the volume of investment proposed by M. Petsche and thus to wipe out some of the taxes which to them seem exorbitant and with which the investment is to be financed.

Things are even more difficult in the *Conseil de la République* where prominent Radicals, such as MM. Dulin and Laffargue, seem to be making their support for the budget conditional upon guarantees about certain other legislative measures. It is only when these party manoeuvres cease that the Assembly will be able to vote the series of "ceilings" for the heads of expenditure of which the law itself consists. (In fact these ceilings are not necessarily final: last summer, for instance, supplementary credits were voted when deficits in the nationalised industries became manifest.)

The 1950 budget amounts to 2,275 billion francs (approximately £2,321 million). It exceeds its predecessor by some 400 billion francs. (The 1949 budget, it has been pointed out, was itself about two and a half times that of 1913—the comparison being charitably made between the receipts of the two years calculated in francs of 1913.) Military expenditure has risen this time from fr. 384 billion to fr. 420 billion; a sum, even so, enormously inferior to that requested by the military authorities, who asked for over fr. 200 billion for Indochina and got fr. 115 billion. Ordinary civil expenditure has been increased by fr. 230 billion of which figure fr. 60 billion represent a raise in civil servants' salaries—the third of a series; fr. 34 billion, an increase in social security charges (partly due to new allowances to the under-employed); fr. 30 billion, higher subsidies (especially for the railways); and fr. 23 billion, an increase of the public debt.

The main items in the "budget for reconstruction and investment" are: credits for the *Plan Monnet*, fr. 319 billion (fr. 269 billion in 1949); renewal of war damage through the *caisse autonome de reconstruction* (fr. 251 billion) and the rehabilitation of the railways and merchant fleet. The total of investment proposed under Part II is equal to about 10 per cent of the national income of France. The fact that nearly half of the fr. 740 billion in the investment budget must be levied by taxes is, naturally, at the root of the opposition to M. Petsche's *projet de loi*. "Sack the civil servants" and "cut down the investments" are the battle cries.

The new taxes are certainly fierce: 7 per cent (instead of 5 per cent) on wages, to be paid by the employer; 13 per cent (instead of 12½ per cent) on production; 1.1 per cent (instead of 1 per cent) on all transactions; and a nasty rise in stamp-duties will make life hard for many producers and traders, large and small. Much criticised is also the 10 per cent tax on undistributed profits of companies. It is argued that this levy (of which the yield is relatively small) is bound to prevent the self-investment of enterprises which the authorities themselves desire. M. Petsche is thus accused of punishing private capitalism in the interests of state capitalism as a sop to his ministerial colleagues of the Left. To re-equip the French economy through the extraction of funds by fiscal force is, it is suggested, tantamount to abandoning in perpetuity all confidence in private investment. The *Conseil National du Patronat Français* and a number of other employers' and artisans' organisations have issued a violent joint condemnation of this "excessive fiscalité."

M. Charles Rist of *La Vie Française* has criticised the Government's whole policy of investment, arguing that the world's economy is now in a quite different phase from that immediately after the war when the *Plan Monnet* was first launched. The main features of the contemporary economy are a slackening of demand and a fall in prices. At such a moment, the writer believes, it is dangerous for a country to forge ahead with an investment plan because of the risk of accentuating a threatened over-production. France should furthermore, curb its investments in the interests of budgetary stability, which is still the main economic objective, undertaking only those investments which may be covered by Marshall aid counterpart funds and loans. Thus, at least some of the new taxes might be abandoned.

Another school of thought, while supporting the investment plan, holds that a less injurious means of acquiring revenue would have been an increase on income-tax. It maintains that the new taxes (especially on wages and trans-

actions) must result either in a slackening of production and exchange, or, in spite of a law designed to prohibit it, in the incorporation of the tax in the price—whereas there would have been little harm in lopping off more income from the individual.

Without entering into an analysis of this suggestion, it is interesting to consider the fiscal status of a wealthy French

THE FRENCH BUDGET FOR THE YEAR 1950 (1,000 Million Francs)			
Expenditure		Receipts	
PART I (General Budget) :—

GRAND TOTAL	2,275	GRAND TOTAL	2,275
* Of which 115 billion for Indo-China.		* The fiscal system of 1949 was intended to yield 1,301 billion: the increase of 204 billion budgeted for 1950 represents surplus revenue from larger incomes and turnover (90 billion) and anticipated successes in removing illicit profits and combating fraud (88 billion). The remaining 26 billion come from a 1 per cent increase on the wages tax.	

citizen as determined by the fiscal reform of 1948.* If he has a net income of fr.3 million and no children, he pays fr.1.128 million surtax. With the same income and 4 children, his surtax is reduced to fr. .502 million. If he has 4 children and a net income of fr.10 million, he has to pay about fr.3 million of surtax.

Prescription for Portugal

[BY A CORRESPONDENT]

At the meeting of the Committee of Ministers in Paris no one, it appears, suggested Portugal as a possible candidate for membership of the Council of Europe. Readily accepted as a founder-member of the OEEC, in the interests of European economic co-operation in Africa, and invited into the military alliance of the North Atlantic Treaty (despite the "democratic" test of the preamble), it remains, with Franco Spain, a political outcast. Given the terms of article 3 of the Council's statute, it is true, Dr Salazar's authoritarian state excludes itself. If, indeed, Dr Salazar wanted to make alignment with the other nations of western Europe impossible, he could scarcely have done so more effectively than by the political discourse with which, on October 20th, he regaled a gathering of district civil governors, national union

* i.e. after payment of the proportional tax of 18 per cent which is itself subject to various exemptions according to the nature of the income and the number of children of the assessor.

executives, outgoing deputies and candidates for the new Assembly. That speech was far more important as evidence of the way things are going in Portugal than the elections of November 13th.

As was indicated in an article published in *The Economist* on March 12th, 1949, Dr Salazar is acutely conscious of the need for criticism, for some counterweight to the *amenistas* (yes-men), of the regime. But, whenever it comes to a test, the thrusters of parliamentary democracy make a practice of standing on their dignity and refusing to champion a lost cause. They did so the other day, as in the previous elections for the National Assembly in November, 1945; and they withdrew their candidate, General Norton de Matos, in the presidential elections at the eleventh hour. So Dr Salazar is confirmed in his view that democracy, as we understand the term, will not serve his purpose. And he is harking back to the idea of development towards "organic democracy" which has always been his private fetish.

No Use for Party System

The speech of October 20th, as it happens, contained more in the way of a political programme than any Salazarian disquisition for a long time. The negative aspect was Dr Salazar's firm repudiation of the party system. Party loyalties, he admitted, were likely to persist for many years—and the presidential election had revealed their continued vitality in Portugal. But almost everywhere that particular brand of democracy was extinct as the source and support of government. To return to it, then, would be to adopt a system which was already out of date. It was essential that human freedom in relation to the state should be preserved, but the liberal technique based on the citizen in the abstract, the individual divorced from family, class or profession, had been tried in the balance and found wanting, while Socialism was but a transitional stage towards Communism. Two fundamental needs, however, in Dr Salazar's scheme of things remain to be fulfilled: some means must be provided of preventing the misuse of power and of ensuring reciprocal communication between the Government and the nation. The remedy, he says, must lie in the co-ordination within the state of all the political elements of society on a basis of natural groupings. While, therefore, the political vehicle provided for in the constitution would remain as a forum for the discussion of general principles—in his election address at Oporto on January 7th he had spoken of it rather as a sop to the whims of lesser mortals—the task of the newly-elected National Assembly should be to carry out a job of revision of the constitution whereby the "Corporate State" implicit in it should be at last realised. What he had in mind, Dr Salazar explained, was that in future the Corporate Chamber (of which Dr Marcelo Caetano, the white hope of the *Estado Novo* has just been elected President) should share legislative power with the Government, and, specifically, act as an electoral college for future presidential contests. This is in line with statements made at the time of the presidential election that never again should the country have to face the risks of a constitutional *coup d'état* such as the candidature of General Norton de Matos had embodied.

National Labour Code

The Constitution of 1933, it is true, describes Portugal as a unitary and *corporative* Republic. But in fact the framework has never been filled in. There are, in the first place, district, regional and national vocational groups which are the professional guilds—the legal, medical and engineering professions with the title of "order." These go to form the 25 sections of the Chamber of Corporations, duly classified into economic, social and cultural groups, which elect their respective *procuradores*. (A *procurador* cannot be at the same time a deputy in the National Assembly, and, as Dr Salazar has lamented, the best talent has thus too often been drained off into the professional chamber). Membership of these associations is, in theory, not compulsory. What happens is that certain of them are recognised by the state

as representing the interests of all the people in that particular branch of economic (social/cultural) activity, and they are entitled to make collective agreements which are binding on all the people in that branch. A national labour code safeguards the normal workers' rights and prerogatives, a technical corporative council looks after professional standards, a national provident institute caters for pensions, health, accident, insurance, housing, etc., and the whole edifice is crowned by the under-secretaryship for corporations and provident institutions attached to the Prime Minister's office. Actual corporations were created on paper on November 12th, 1938, but the war came too soon for them ever to function; and they still have no material existence. One result of this uncompleted structure is that the chamber of corporations is definitely weighted on the side of capital as against labour: the provision of *Casas do Povo* and *Casas dos Pescadores* (based on the unit of the parish) for the organisation of agricultural labourers and fishermen respectively has failed to readjust the balance. The whole system incidentally, was the subject of a commission of enquiry set up in 1945, and the conclusions of the commission published in April, 1947, have largely been implemented.

In comparing this hierarchy of functions with, for example, Mussolini's corporative regime, the striking fact is that the state in Portugal plays an unobtrusive role: the driving force of the organisation is—nominally at any rate—economic or social, and at no point hitherto has it crossed the borderline of the political system. If the new projects of Dr Salazar are carried out, however, that will no longer be the case. He contemplates the establishment at an early date of a Ministry of Corporations and a recasting of the legislative function: the National Assembly would have its powers limited to the passing of basic laws; decree-laws, by which the Government usually operates, would be drawn up with the assistance of the corporative chamber; while decrees embodying regulations would be exclusively the business of the government.

It is clear then, that the evolution of the *Estado Novo* is going to be away from rather than towards parliamentary democracy, and the process will have the weight of informed opinion behind it. Undaunted by the failure of his prophecy in 1930 that within 20 years in no country would there be any such thing as a legislative assembly in the ordinary sense, Dr Salazar now (in the same October 20th speech) stoutly maintains that Portugal is not to be regarded as backward but as several years in advance of other nations in regard to political theory and practice. But it is clear that the Doctor's prescription is one appropriate only to his fellow-countrymen, whose "passionate unruliness" may possibly preclude the working of liberal democracy.

Recovery in Ireland

[BY OUR DUBLIN CORRESPONDENT]

MR COSTELLO's inter-party Government has been in office for nearly two years. Its prospects of living out the full five-year period, which seemed infinitely remote when it came to power, have been materially improved by the result of the recent by-election in west Donegal. The vacancy occurred through the death of a *Fianna Fail* member. It was filled, after a closely contested campaign, by a member of *Fine Gael* (Mr Costello's party) standing as an Inter-Party candidate. Mr. McBride's party, *Clann na Poblachta*, ran its own candidate in external association, as it were, with the nominee of the other parties in the Government.

On the whole, there was something for everybody in the result. *Fianna Fail* (Mr. de Valera's party, now in opposition) can point to an increased poll, probably the result of a drift back from *Clann na Poblachta*. *Fine Gael* also increased their poll and can congratulate themselves on their first gain from *Fiana Fail* at a bye-election for very many years. *Clann na Poblachta*, for their

part, can claim to have conclusively demonstrated their utility to the Government. In sum, the Government won a seat that might well have been retained by the Opposition. Modern Ireland tends to support Governments rather than oppose them; and the result seems to augur well for the completion of the remaining three years of the present Parliament. This may turn out to be a good thing. The present lines of party division are clearly artificial, based as they are in so many cases on the choice of side made by voters (or, perhaps nowadays, by their fathers) in the Civil War of 1922. It is possible that the historical importance of this Government will lie in the fact that it affords a breathing space for regrouping on the lines of more modern issues. Here and there, as in the case of the draft social security scheme, there are signs of political realignment.

Better Balance of Trade

Trade and production statistics, always valuable electoral ammunition, show an encouraging revival in Ireland. This comes none too soon. The balance of visible trade has been heavily adverse. In 1947 it stood at £91.8 million, in 1948 at £89.1 million. It has fallen to £52 million for the first nine months of the present year. At that rate it seems probable that the balance of current payments is near to equilibrium. The improvement in the visible trade balance has been brought about to some extent by a fall in imports, and indeed much of the heavy purchases of 1947-48 must have been due to restocking. More encouragingly, there has been a marked recovery in agricultural production and exports. This change was badly needed. The volume of agricultural production has been static over recent decades; and its sluggishness has adversely affected many aspects of the Irish economy. Even now, the standards of twenty years ago have not been regained; and the test of the Irish farmer will be whether he can not only equal but surpass the output volume of the later 'twenties. Indeed, much more, as will be seen, will depend on that.

The Government's policy of extensive capital investment has received fresh emphasis from a speech delivered on November 19th to the Institute of Bankers in Ireland by the *Taoiseach*, Mr Costello. He hinted that a capital budget would be submitted to the Dail next year in addition to the ordinary Budget. He pointed out that current savings might not be sufficient to finance the programme of investment that is contemplated, and that if necessary sterling assets would be repatriated. He agreed that the extent to which these holdings could be transferred was limited and that it was desirable to maintain a certain level of foreign investment at all times. He added that the bankers were not merely the trustees of their depositors' savings but also trustees of the savings of the community. The Government was entitled to indicate how these savings could best be utilised in the national interest. These last sentences were probably directed to the reported refusal of the Standing Committee of the Irish banks to give the Dublin Corporation all the accommodation that was asked for a housing loan, and they should no doubt be interpreted according to their special context. But the policy of investment at home, if necessary by the realisation of past savings, must be viewed against a wider background.

It would be unfortunate if this speech, or the policy that it outlines, were mistakenly related to Irish irritation over the devaluation of sterling or to the Partition dispute. Mr Costello expressed thoughts long held in Ireland. In the past, the Irish economy, particularly agriculture, has suffered from chronic under-investment; and in seeking to divert the flow of savings the Government is adopting a line of action that would be taken by any conceivable administration. The increased availability of capital goods and the progress of the Marshall Plan programme make such action both desirable and necessary. It would seem that the principal items of investment will be land fertility and drainage, housing and afforestation. Individually each one of these objects needs attention. Agricultural productivity has been stagnant for a

generation, before the war there was a lag in housing, and Ireland has a smaller wooded area than any country in Europe.

IRE'S BALANCE OF PAYMENTS
(£ Million)

	1944	1945	1946	1947	1948
Current payments	37.5	50.4	83.0	143.1	149.0
of which :					
Imports	28.2	40.7	72.0	131.3	136.3
Profit and interest	7.9	8.3	9.0	9.7	9.8
Current receipts	70.1	85.0	102.7	113.2	129.0
of which :					
Exports	26.1	35.2	39.0	39.5	47.4
Investment income	15.1	15.0	16.6	17.8	18.0
Emigrants' remittances :					
U.K.	7.4	7.1	6.5	6.0	5.6
Other countries	1.9	2.5	3.3	3.7	3.2
Current Account balance	+ 32.6	+ 34.6	+ 19.7	- 29.9	- 20.0
Capital Account :					
Additions to external assets	37.7	40.3	32.3	14.1	12.3
Decreases in external assets	5.1	5.7	12.6	44.0	32.3
Decreases in foreign assets (+) Increases (-)	- 32.6	- 34.6	- 19.7	+ 29.9	+ 20.0

The extent of the sterling assets—if indeed it is susceptible of precise estimate—is a closely guarded secret. So far as they can be traced, they were gradually accumulated in the closing decades of the last century and were rapidly expanded in the era of high agricultural prices that ended in 1920. Between the wars they appear to have fallen, but that trend was reversed in some years of the present decade, when Irish exports to Great Britain were what it is now fashionable to term "unrequited." Their gross total is put at around £400 million; their net total, for there is a heavy counter-item in favour of the United Kingdom, is thought to be around £225 million. These holdings have been a most valuable protection against hard times in the past; and an attempt at wholesale repatriation is as unlikely as it would be undesirable.

In two darning needles lay...words

TELEGRAPHIC communication became possible in 1837, but at first messages could be sent only by Morse code. A Welshman, David Edward Hughes, a Professor of Music living in the United States, sought to invent an electrical apparatus that would transmit typed messages. One evening in 1855 he borrowed two darning needles from an old lady and began to use them as vibrators . . . Thus was born the telegraphic type-printer — the forerunner of the modern teleprinter.

The inventive spirit of Hughes is still alive in Britain today.

The electricity industry, for instance, is continually developing new appliances which increase the output of our factories and farms and make life easier in the home. On the electricity supply side, too, marvels are being done to overcome the post-war power shortage. Already electricity may be used freely at all times except at peak hours. Soon the nation will be able to enjoy even greater benefits from the new electrical age.

The Electrical Development Association explores and advises on methods by which work on farms can be made easier by the application of electricity. Consult your Electricity Service Centre, or write to E.D.A., 2 Savoy Hill, London, W.C.2

THE BUSINESS WORLD

Sterling in Europe

IN the movement to establish closer monetary relations between Britain and the Continent of Europe, a new stage was reached this week with the opening of negotiations in Stockholm for some form of monetary union between the United Kingdom and the Scandinavian countries. The British delegation, headed by Sir Henry Wilson Smith of the Treasury, includes representatives of the Foreign Office, Board of Trade and the Bank of England. It is a strong team capable of talking business and intended to do so. What can it do? First, it can and should avoid like the plague all attempts to form or christen new *blocs*. The Stockholm talks should be regarded as a modest step towards the restoration of what used to be regarded as normal international monetary relations. There should be due humility about this objective and, therefore, no attempt to crown it with any of the fancy names—Ukiscan, Scanuk, Scandanglia—that have been tentatively bestowed on it. There should even be no formal attempt to invite the Scandinavian countries into the sterling area. Such an arrangement would be as meaningless as it would be inimical to the constructive and desirable objective of these talks.

The substance of what is under discussion is unmistakable and requires no new nomenclature. The ultimate object is—or should be—to ensure that trade within the group comprised by the sterling area and the

seasonal swings in their balances of payments. Exchange rates within the group should remain stable unless altered by common consent and within the framework of the International Monetary Fund agreement. Though each party to such an arrangement would remain entirely responsible for its hard currency payments, it would be reasonable to assume a broadly uniform policy towards imports from hard currency countries—indeed, such a common policy already exists in principle, as a result of these countries' participation in the Organisation for European Economic Co-operation.

All these strands which could pull the sterling and Scandinavian countries together would be strengthened by the basic similarity of their attitudes towards economic

policy and of their concepts of social justice. These countries, together with the Netherlands (whose present link with the "Latin" bloc in Europe appears distinctly precarious), are attached to the principle of salvation through order and stability. Some of the critics of their economic policy might with justice claim that the line of demarcation between stability and rigidity is one which all too often becomes blurred and overstepped. But, leaving this debatable issue aside, it can at least be claimed that there is homogeneity within the groups.

As between these countries there is at present no appreciable disequilibrium in current payments. The sterling balances of the Scandinavian countries are not greater than could be deemed adequate for the provision of working balances and currency reserves. Swedish balances tended to rise earlier this year and the movement became marked in the period just before devaluation. During the past few weeks, however, they have been relatively stable. At present Sweden has about £35 million which is probably more than it would like to hold as a permanent asset. Denmark's holding is very modest, probably under £5,000,000, while Norway's present balance is likely to be below the desirable minimum. If greater freedom in the use of sterling in

Scandinavian countries is free from all quotas and other quantitative import restrictions, and that payments within the group are completely free both for current transactions and for such capital operations as pass through the mesh of the capital issues controls of the countries concerned. And if payments are to be free, it follows that the currencies of these countries must be freely convertible one into another. Such convertibility, in its turn, calls for a readiness on the part of each to hold the others' currencies in sufficiently substantial amounts to allow for

the payments between these countries could be achieved and if quantitative restrictions on their mutual trade were abolished, it is probable that a more equal distribution of their total sterling balances would be established before long. Neither in the technical sphere nor in that of psychology, therefore, are there any serious obstacles to the establishment of closer relations between the sterling and the Scandinavian monetary areas.

The problem of monetary relations between Britain and other OEEC countries, however, presents far greater difficulties. The Southern or Latin bloc are trying to find salvation, not through stability and order, but through the economic dynamism of free economies. And just as stability becomes rigidity when seen from the other camp, so the road of freedom is all too readily labelled by others as that of economic anarchy. The present attitude of the British financial authorities to the problem of monetary relations with countries such as France, Belgium and Italy is that of the *cordon sanitaire*. It may be compared with the precautions taken by other British authorities against foot-and-mouth disease, the Colorado beetle and rabies—all of which tend to come from the same shores as those which now breed economic freedom—or anarchy. If the Fritalux proposals were carried through in their present highly tentative form—as a group of currencies among which there would be convertibility, but at fluctuating rates of exchange, and with the cross-rates of currencies outside the group left more or less to their own fate—the British authorities in their present mood might even wish to sever relations altogether and to regard the new group as a hostile combination.

This British official attitude is not merely a psychological reaction from the "freedom" of the Latins. It also derives from the fact that recently this "freedom" has succeeded so well that the countries concerned have been accumulating considerable amounts of sterling. France, which last year ran a substantial deficit with the sterling area, has this year built up current sterling balances of slightly over £30 million. No part of the £42 million of drawing rights available to France in the sterling area for the second year of the Intra-European Payments Scheme (which began on June 30th last) has yet been utilised. Italy's accumulation of sterling now exceeds £55 million. Belgium holds a little less than the critical £15.3 million at which the gold convertibility clause in the Anglo-Belgian monetary agreement comes into operation. This group of countries, in short, not merely desires to exercise freedom in exchange

transactions but has the power to cause instability in the affairs of the sterling group.

As the tables accompanying this article show, a partial explanation of the accumulation of sterling in French and Italian accounts is afforded by the trend of their direct visible trade with the United Kingdom. Other factors in the situation are invisible items, particularly the tourist expenditure by British visitors to France during the past year, and transactions with other countries of the sterling area, the transferable account group, and even—though these are of less significance—of the bilateral account group.

The supply of "cheap" sterling offered from European accounts for sale in the free markets of the world has therefore been partly fed by the deteriorating balance of trade between Britain and Europe. During

(a) Estimate taking 1/2 of 1948 trade.

the first nine months of this year Britain's visible trade with twelve European countries showed an excess of imports of some £65 million, compared with a surplus of £20 million in the corresponding period of 1948. This, however, is only part of the tale. Invisible trade, especially tourist traffic, has this year burdened Britain's balance of payments with Europe. The supplies of "cheap" sterling have also been fed by releases of accumulated sterling balances to countries such as India, Egypt and Palestine. Some of this sterling has found its way into European accounts by direct commercial operations between the countries in question. Indian and South African imports from Switzerland, for example, have played some part in maintaining Swiss sterling balances at approximately their gold ceiling. In other cases the voyage of this sterling has been more

devious, and the operations have made their way through various channels in the transferable account system. Thus the trade figures suggest that very little sterling can have gone into Dutch accounts as a result of direct Dutch-sterling transactions. Yet the Dutch have been among the main operators in "cheap" sterling and in this traffic their membership of the transferable account group has stood them in good stead. More recently, the scope for these activities has been considerably reduced by the measures taken by the British authorities to restrict the availability of sterling offered by other countries in the transferable account group, particularly Egypt, to transfers in settlement of direct commercial transactions between the countries concerned and the transferee country.

It should be noted, however, that the published trade figures show the position only to the end of September and do not, therefore, reveal the effects of the devalua-

tion of sterling. There are welcome indications that, since the devaluation, the sterling area's balance of payments with Europe has been improving and that even in Italy and France the growth of sterling balances has come to an end. The new circumstances, therefore, do not justify the excessively defensive attitude which official British quarters are maintaining towards the less disciplined of the two main groups into which European currencies are tending to divide themselves. It would be a grave disservice to the cause of European reconstruction and co-operation for Britain to do anything to encourage the crystallisation of these separate groupings. It is therefore to be hoped that in the conversations that have begun in Stockholm nothing will be done to give formal shape to any alignment of currencies. However defined or described, any such arrangement could hardly avoid the appearance of segregation from, and even hostility to, the rest.

Softwood Shortage

LAST July when the Chancellor of the Exchequer announced the latest round of cuts in dollar imports, including a substantial cut in dollar softwood, he added that "we may be able, by further purchases from non-dollar sources and otherwise, to carry through the housing programme without any substantial reduction." The Government housebuilding programme has not been cut, but only because private housebuilding has been entirely suspended. In fact the previous attempt made to switch softwood supplies from dollar to non-dollar sources was unsuccessful and imports during the first half of this year were substantially below the level of consumption. More recently, the President of the Board of Trade has attributed the shortage of softwood to "black market activities" and therefore promised new measures to tighten the timber control. These came into force last month. All they amounted to was the withdrawal of the monthly allocation of £1 worth of home-grown and "recovered-unclassified" softwood which hitherto could be purchased without licence. The amount of timber absorbed by giving the week-end carpenter enough timber for a new rabbit hutch can hardly have been very large.

At the same time, however, local authorities were urged to use softwood in house construction with the most stringent economy. The memorandum sent to the authorities was surprisingly frank:

Supplies of softwood timber for some time to come will be smaller than at any time since the end of the war and it is essential as never before that they should be used to the fullest advantage.

Here, certainly, is no question of black market activities. The plain facts are, first, that Britain cannot spare dollars to buy timber from Canada and the United States, and, secondly, that supplies from European sources are still very limited. There has always been hope of expanding them—presumably that explains why stocks of softwood in this country were allowed to fall to a dangerously low level during the first half of this year. Stocks were rapidly used up, and fell from 466,000 standards at the end of 1948 to 206,000 standards by the end of June. By itself, the mid-year figure would not be conclusive, for stocks are always at their lowest level then. The really disquieting fact is that they were halved in the twelve months period ending on that date. There are

some statistical difficulties even in this comparison, since the 1949 figures exclude timber awaiting discharge at the ports and certain stocks held by British Railways. In March, such stocks totalled 33,600 standards. Even if an allowance of this size has to be made in appraising the June figures, it still leaves a serious depletion to account for.

Two main factors have been at work. In the first place, imports during the last twelve months or so have been much smaller, particularly during the first three months this year. Negotiations with Scandinavian suppliers were protracted in an attempt (which was successful) to obtain more favourable prices. In the second place, although there was little chance that imports this year would equal those of the previous year, softwood consumption was not reduced. Indeed, between January and March, imported softwood was being used at a peak rate of 98,000 standards a month. The following quarter saw some decline, but consumption was still appreciably higher than in 1948. It might have been expected that some attempt would have been made to husband supplies during this period, but the Timber Control deemed otherwise. Nor was prompt action taken in June after the Chancellor of the Exchequer had announced the cuts in imports of dollar timber. Consumption for the eight months to August (the latest month for which figures are available) was 5 per cent higher than in the corresponding period of 1948, while imports and home production taken together were 11 per cent smaller.

In the result, stocks have been run down to a level which allows no elbow room at all. In future, consumption will be dictated by imports, whether this is palatable or not. This is clear from the figures given in Table I, which shows monthly averages of imports of softwood from principal sources. Supplies from Canada were relatively small during the first quarter of this year, amounting to somewhat over 9,000 standards a month; they increased steadily during subsequent months to more than 27,000 standards in October. Indeed, after June, imports from Canada were at a higher rate than

in 1948. Clearly, by the autumn no cut in dollar imports had been reflected in actual receipts; presumably therefore a sharp fall in imports of softwood from Canada is to be expected either in November or December, or, more probably in 1950. Shipments from the United States, on the other hand, were much smaller than in 1948, but here again the October imports were surprisingly large. Supplies from Sweden have somewhat exceeded the 1948 level, while imports from Finland, Poland and the countries of Eastern Europe have expanded considerably. This increase, however, has to some extent been offset by a sharp reduction in imports from Germany. As for Russia, under the recent contract Britain was to receive 100,000 standards to be shipped before the end of the year; by October, more than 35,000 standards had arrived.

★

Although some switching in supplies had taken place, until the middle of the year the average level of imports was below that of 1948. Then an improvement took place; by the end of October, imports were 4 per cent higher than for the first ten months of 1948. If the recent rate of imports is maintained to the end of 1949, total supplies of imported softwood should exceed those for 1948 by approximately 120,000 standards. To match the contracts signed, British imports for this year should amount to 1,100,000 standards, or 80,000 standards more than in 1948. This quantity is made up of 315,000 standards from North America, 265,000 standards from Sweden, 190,000 standards from Finland, 100,000 standards from Russia, 85,000 standards from Yugoslavia, 70,000 standards from Poland and 75,000 standards from Germany, Czechoslovakia and Rumania. There are in addition certain quantities still outstanding from the 1948 contracts. But, even if these imports materialise, consumption in 1949 is likely to be too high to permit any rebuilding of stocks by the end of the year to the level of twelve months ago. The problem then remains: what happens in 1950?

As a result of the cuts announced in July, imports from Canada and the United States will be substantially reduced. Some imports from North America may be financed by ECA, but they are likely to be modest, while the amount of free dollars for buying timber will be very small indeed. Supplies from the western hemisphere are therefore likely to be about 150,000 standards

lower in 1950. Can Europe expand its present volume of exports of softwood to Britain sufficiently to make good such a cut?

Most of the European countries increased their production of softwood last year, though in Sweden, France and Italy output was lower. During the first quarter of 1949 European production was more or less maintained. Prices have tended to fall—for the lower grades by 7 to 14 per cent—while costs of production have remained fairly rigid. Thus there seems to be some lack of incentive towards higher output, except perhaps in eastern European countries which need sterling to buy capital goods and raw materials. More cutting and transport equipment are required by several important producing countries before they can overtake the ravages of war and increase their output materially. Many have made good progress, with the assistance of World Bank loans, but recovery has not yet reached the stage at which the consuming countries of western Europe could curtail imports of softwood from North America and still escape the risk of having to reduce their consumption. Such reductions have already taken place. They have, indeed, gone beyond the mere correction of dollar expenditure; by 1948 the most urgent needs of the importing countries had been met and it was no longer necessary to make purchases without consideration of price. But prices have fallen, particularly for inferior grades (and with every indication of a further fall), while the substantial reduction in freight rates from the Baltic has also reduced the landed cost of timber imports.

★

One important factor in the European timber market is Germany. Under allied control, Germany became a large timber exporter. But with the establishment of a German Government, this policy has been reversed and next year Germany may be a net importer—as it was before the war. This year Germany has already contracted for appreciable quantities of softwood from Scandinavia and such purchases might be maintained or even increased in 1950. If Germany were to emerge as a large-scale buyer, Britain's prospects of obtaining increased supplies in the immediate future might not be very cheerful. European output is unlikely to increase appreciably, and, although some consumers may buy less, it seems doubtful if total demand will fall so far that Britain can secure, say, another 150,000 standards. Such

additional imports cannot be regarded as certain until much larger supplies are forthcoming from eastern Europe.

This is not auspicious news for the housing programme. The programme is to be cut by £35 million, representing a reduction of between 20,000 and 25,000 houses. In terms of softwood this cut might achieve an ultimate saving of 40,000 standards, but there are still over 190,000 permanent houses under construction in Great Britain which require timber. Hence the more stringent economy measures recently issued by the Ministry of Health. Hitherto, houses of 1,000 feet superficial area have been limited to a bare average of 1.5 standards of softwood; this is now to be considered an absolute maximum "to be applied for only in exceptional cases." The suggested economies include the use of substitute materials; using structural members of the most economic dimensions and spaced as widely apart as possible; and reducing the dimensions of other components made of wood. Some alternative materials are fortunately in better supply. Most hardwoods are now free from control and these will be used to an increasing extent for cupboards, fitments and doors. The supply of plywood has also improved and in future 400 square feet will be allowed for each house. In the past the average quantity used was about 300 square feet a house.

Business Notes

Uneasy Gilt-edged

The uneasy state of the gilt-edged market after its large recovery in the second half of last month has been demonstrated again this week by a further slight sagging of prices, despite the success of the Exchequer Bond conversion. The Chancellor announced on Tuesday that £723 million of the outstanding £787 million of 1½ per cent Exchequer bonds had been converted into the new 2½ per cent 5-year stock. This result is not, of course, quite as spectacular as the figures themselves might imply, because at least one-half of the maturing bonds was understood to be held by official quarters even before the conversion was announced, and during the conversion period the authorities must have been substantial buyers on balance. Even so, the modest block of £64 million of "unassented" bonds which remains out of the total of perhaps £300 to £350 million of bonds held outside official quarters represents a satisfactory technical achievement. From the point of view of the banking system, it means that the large reduction in the volume of Treasury deposit receipts achieved by the recent Treasury policy of switching floating borrowings to tender Treasury bills is likely to be carried a big step farther in the New Year, since the revenue surpluses of the first two months will not—as had at first been thought likely—be largely bespoke for repayment of maturing Exchequer bonds.

For the gilt-edged market, the influences which flow from this operation are somewhat conflicting. It was arguable that last week's weakness in the medium and long-term sections might have been attributable to offerings in a narrow market for the purpose of switching into Exchequer bonds for conversion into the new stock, since many investors welcome any reasonable opportunity to shorten the average life of their portfolios. With this influence withdrawn, it might have been hoped that the market would rally. As it is, it has merely succeeded in reducing the easing to minor proportions—except in the shorts, where the movement has been rather pronounced. This particular movement has led to suggestions that the authorities must have been taking good care to hold the position so long as the conversion offer

These economies are expected to save 0.15 standards a house. On the assumption that 200,000 new permanent houses are completed in Great Britain next year, the annual saving in timber would be of the order of 30,000 standards. If the cut in the housing programme is included, the total saving projected in the use of softwood would be 70,000 standards with, say, another 30,000 standards through the withdrawal of the licence-free monthly allocation and other economies. It should be emphasised that these figures represent the maximum rather than the minimum economies likely to be achieved.

The prospect for 1950 can therefore be summarised as follows. If imports of softwood from dollar sources are in fact "substantially reduced," total imports next year may be some 150,000 standards less than in 1949. A maximum saving of 100,000 standards might be effected, leaving a gap of 50,000 standards to be drawn from stocks or to be saved by a further reduction in consumption. If stocks are again allowed to decline, the quantity held at the end of December, 1950—normally the time when stocks are at a maximum—may well be under 300,000 standards. The risks of allowing stocks to run down to such a low level are so great that action is needed now either to increase imports from Europe (which will be difficult) or to cut consumption still further (which will be painful).

remained open, and are now content to leave the market to its own devices.

This judgment is perhaps a little harsh, for at no time in recent weeks has there been any evidence of any large official intervention. The renewed sagging may be due less to this cause than to the market's own reactions to its assumption that the authorities have now shot their bolt. There is also the knowledge that each interlude in the recurrent malaise is likely to be the signal for the appearance of new borrowings. At the end of last week the Port of London Authority issue—3½ per cent stock, 1966-68, offered for cash and conversion at 99—was successfully launched at an opening premium of ½, which has since improved to ¾. On Monday next the lists will open and close for the £3,000,000 issue of the Agricultural Mortgage Corporation. It takes the form of 3½ per cent debenture stock, 1965-67, also offered at 99.

Colombo and the Sterling Balances

The Dominion Ministers' conference at Colombo will in the main be devoted to discussions of the great political and strategic problems that now face the Commonwealth. The ministers, however, will not travel without their economic advisers—in these days they dare not. It is probable that the officials concerned (Sir Henry Wilson Smith of the Treasury will be there for Britain) will review the progress made in implementing the decisions reached at the last Commonwealth Finance Ministers' meeting in London. This discussion at the "official" level will thus be mainly concerned with the problem of the gold and dollar reserves and its related issues of the curtailment of dollar imports and the increased drive for dollar exports. Devaluation has intervened since the finance ministers' meeting and there should be an abundance of new material on which to fasten discussion. The progress of sterling releases must also come up for debate though it is unlikely that any formal shape can be given during the Colombo meeting to the Chancellor of the

Exchequer's declared intention to secure a general reduction in the rate of such releases.

The problem of the sterling balances is before the US-UK-Canadian continuing committee in Washington, but its deliberations on this subject have hitherto not gone beyond the purely factual, informative stage. Explanatory documents have been circulated by the British delegate to the members of the committee and the discussions have not advanced to the point of formulation of any proposals, however tentative. No official significance should be read in the interesting suggestions on the settlement of sterling balances made by a study group on monetary reconstruction formed by the United States council of the International Chamber of Commerce. The group, headed by Mr William Mitchell, formerly of the house of Morgans and now president of the Central Trust Company of Cincinnati, advances several possible solutions, one of which would involve a substantial writing down of the debts in question and US participation in repaying the remainder over a period of five years. It is reassuring to know that influential and well-informed Americans are thinking about this problem along such lines, but it would be unwise to assume that this line of action would commend itself to the general body of American opinion and, in particular, to Congress.

What is a Balance?

A good deal of attention has been attracted this week to a series of lengthy replies given by Sir Stafford Cripps to questions put to him by the London correspondent of *U.S. News and World Report*. Many of the Chancellor's statements merely retailed anew the bulky material handed out at recent Press conferences; a noticeable feature of each of these utterances has been their close intermingling of fact with opinion. Sir Stafford recorded again his view that transactions in "cheap sterling" are not "at the present moment on a scale to jeopardise in any way our sterling-dollar recovery." He also reiterated that if European integration meant a linking up "through organisations like customs unions which might jeopardise the position of the sterling area," then the United Kingdom would not wish to participate.

Apart from these and other now familiar observations, what most caught the City's eye in the interview was a comparison between the aid which Britain has received from and granted to countries overseas since the end of the war. To illustrate the "practical things" which Britain has done to help the rest of the world, and Europe in particular, the Chancellor declared that, between the end of the war and mid-1949, Britain had made available a grand total of £1,498 million in gifts or loans, releases from sterling balances, overseas investment, etc., whereas it had received only a slightly larger sum—£1,538 million. There is, of course, no reason to question the arithmetical accuracy of the calculations which underlie these figures, the breakdown of which was given in detail, though for a slightly longer period, in a reply to a Parliamentary question just over a fortnight ago. But any such comparison as this can be grossly misleading. The Chancellor's tot of aid provided includes not only such items as the cost of relief given through UNRRA and the IRO (£166 million) and the cost of civil supply to Germany (£207 million) but considerable sums representing the counterpart of surplus military stores left abroad and not specifically paid for under the postwar financial settlements with the countries concerned. Including such items as these, the total of gifts (for the period to end-September) was £400 million, of loans and recoverable aid £493 million and of exercised ECA drawing rights £65 million. For the period to mid-June the drawing down of sterling balances amounted to £423 million and other capital transactions accounted for about £140 million. On the other side of the account, the aid received of course mainly comprised the North American credits and ERP; the Chancellor's

figuring naturally excluded drafts on the United Kingdom gold reserve, but it also omitted purchases of dollars from the IMF as well as the £154 million Lend-Lease terminal settlement.

The risk of misconception which such comparisons as these may cause does not, however, arise primarily from misunderstandings about the constituents of the figures themselves but rather from the broader conclusions which may seem to flow from any such neat balancing of capital receipts and payments. To the uninitiated, the impression given is that Britain has been broadly paying its way and that in its balance of payments difficulties it is principally a victim of world circumstances and of long-term trends beyond its control—Sir Stafford Cripps referred to tendencies extending over a period of 50 years. The first assumption is, of course, quite untenable; if valid, it would mean that Britain had been in "overall" equilibrium on its current balance of payments in the whole period since the end of the war. The arguments which lurk behind these figures are the more dangerous because somewhat similar reasoning has been publicised recently with reference to the brief period earlier this year in which the whole account really was approaching equilibrium. That brief and approximate equilibrium has been regarded as demonstrating that Britain's problem has ceased to be one of domestic inflation—an argument which wholly overlooks the fact that Britain's export surpluses to the soft currency areas have been made possible only by the fact that they are so largely paid for from sterling credits and releases and, moreover, have for that very reason commanded higher prices than could be got in the vital dollar markets. It cannot be too strongly emphasised that "overall" equilibrium achieved by such means is, so far from being a meritorious condition, a positive source of dollar disequilibrium.

No "Hiving Off" for Dorman Long

Sir Ellis Hunter's comments at the diamond jubilee meeting of Dorman Long were inevitably concerned not with celebrating the past achievements of the company or its record production of 1,642,595 tons of steel ingots last year, but with the effect of nationalisation. He disclosed a matter of immediate concern to stockholders. The Government has recently refused to entertain the scheme which the company drew up for the segregation of its engineering interests. Sir Ellis had no difficulty in showing that this decision was completely at variance with the general undertakings given by the Minister on the question of "hiving off" and he declared quite flatly:

Our discussions with the Minister revealed that the Government's refusal to permit segregation of our engineering interests was inspired by a desire to acquire the company's substantial share of the structural engineering industry without any mandate.

This decision relates not merely to the structural engineering interests of Dorman Long in this country, which represent some 30 per cent of the total capacity engaged in structural steel work. It involves also Dorman Long (Africa) which accounts for 60 per cent of the structural steel industry of South Africa, and British Structural Steel (Buenos Aires), which is the largest concern of its kind in South America. All these interests are, it seems, to be acquired, though they have nothing to do with steel making in this country.

Dorman Long is a company which is treated with conspicuous unfairness by the Government's decision to pay compensation based on the market prices of its securities. There is no longer any pretence in Government circles that such a method of compensation requires the owners of a company for the whole of their undertaking which the Government takes over; all that is claimed, and all that can be claimed, is that the individual stockholder gets not less

than he would have received from the sale of a small proportion of the company's total capital on a particular day. The consequences for Dorman Long are familiar, but they bear repetition. Aggregate compensation for the whole of the loan and share capital of the parent company will come to about £13 million; this is the price for a concern whose trading profit last year was more than £5,000,000 (the accounts were analysed in the *Record and Statistics Supplement* of November 26th) and whose net current assets alone are nearly £12 million. A million pounds is a derisory payment for the group's fixed assets. It has spent far more than that in the last year or two on such successful extensions as the central ore unloading plant and the new preparation and sintering plants at the Cleveland works.

Finance and Investment

Australian Pound after the Election

During the past week rumours have been trickling out of Canberra that the new Australian Government might raise the value of the Australian pound to—or at least towards—parity with sterling. It is fairly generally accepted now that Mr Chifley's decision to devalue by 30½ per cent last September—and thus to maintain the exchange rate of £A125 equals £ sterling 100—was taken with both eyes on the approaching election. After ten years of full employment and trade union feather-bedding, and four years of sharply rising prices and wages, the Australian economy was in no shape painlessly to absorb any recession in internal demand such as would follow any reduction in the internal value of export incomes. In particular, such a recession would have caused a rash of unemployment in what Professor D. B. Copland has called the "milk-bar sector" of the Australian economy—that is to say in the sector of secondary industry which is likely to languish once the boom subsides. Mr Chifley was evidently not prepared to risk setting such tendencies in motion on the eve of the election, particularly as there was some doubt whether a counter-cyclical policy of public investment could have been put into effect while economy in dollar spending had to be maintained.

In the event, however, the sterling prices of Australia's staple exports have risen so sharply since September that there might have been no significant fall in the internal value of export incomes since then even if the Australian pound had been allowed to appreciate against sterling. All that devaluation has done for Australia therefore has been to aggravate the existing inflation—and the problems to be faced when any fall in world prices makes retrenchment inevitable. Because of this experience it was widely believed that Mr Chifley would rescind his previous devaluation decision if he were returned to office; the same belief would also have been held if Mr Menzies had been returned to

A recent series of six articles in THE ECONOMIST examined Britain's present economic ills and made suggestions for their cure. These articles have been reprinted as a pamphlet under the title

A Policy for Efficiency

Copies of this pamphlet (at 3/- post free) can be obtained from:

THE ECONOMIST, 22 RYDER ST., LONDON, S.W.1.

power with a clear Liberal majority in Parliament. In the meantime, however, a new figure has appeared on the scene in the shape of Mr Fadden, the leader of the Country Party in the incoming Coalition Government. Mr Fadden, alone among Australia's political leaders, seems to have committed himself to the view that exporters' incomes (especially farmers' incomes) should be maintained as long as possible. Whether he will stand firmly by this view now that the election is over (and now that the cost of living index is beginning to rise) is a matter for speculation at the moment. Unfortunately, so long as that speculation lasts an inflow of hot money into Australia from other sterling area countries seems to be inevitable. The rumour that any decision will be put off till after the Colombo conference is not exactly helpful in this respect.

Firmer "Free" Sterling

In the past week quotations for "free" sterling have recovered a few cents of the sharp fall of the preceding fortnight. Dutch account sterling, for instance, which declined to \$2.40-\$2.42 recently, has now improved to \$2.43-\$2.46. Belgian account sterling has remained virtually unchanged around \$2.75. The fact that Belgian account sterling has remained so close to the official parity while the discount on Dutch sterling widened to 13 per cent affords an illuminating pointer to the way in which "cheap" sterling is used. Belgian account sterling stands so close to par, not by virtue of any intrinsic strength of its own, but simply because the Belgian franc is a hard currency. An American importer of Belgian steel products, to take an example, may purchase Belgian francs at the official rate or, alternatively, buy Belgian account sterling to pay for his Belgian exports.

Since Belgian account sterling can be used to buy something not readily obtainable elsewhere in Europe, it stands at a very small discount. Belgium loses no dollars from such transactions for, although the American buyer pays for the steel exported in sterling, it is sterling which he has bought from a Belgian holder against dollars. Dealings in Dutch account sterling, on the other hand, become profitable only at wider discounts. Holland has relatively few indigenous dollar

(a) Dollars per £. (b) \$Cents per franc. (c) \$ Cents per francs 100. (d) \$ Cents per guilder.

exports. To earn dollars from shunting business, the Dutch have to re-export goods obtained from outside Holland. Such deals are relatively costly and, to attract American demand for shunted goods, Dutch sterling must be offered more cheaply. This is agreeable to the Dutch merchant because he can make high guilder profits by selling American goods which he is able to buy from the dollar proceeds of his sales of cheap sterling. Hence it is possible for a seller of Dutch account sterling to offer pounds at a lower dollar quotation in New York than a seller of Belgian account

sterling; in Belgium the opportunity for making abnormal profits from, say American motor cars or nylon stockings is much smaller.

Security sterling has improved; the rate relating to government securities, recently as low as \$1.45, has recovered to \$1.60. It was inevitable that security sterling should remain well below parity even after devaluation since each £ remitted in interest now commands only \$2.80 against \$4.03 previously. Indeed, it might have been expected that the discount would continue to be 55 per cent even after devaluation. Although the discount has narrowed New York brokers report some enquiries for sterling securities. But most prospective buyers are put off by the prohibitions on switching.

Kaffir Dividends

Despite some stirrings towards the end of this week, the post-devaluation blaze appears to have burnt itself out, for the time being, in the Kaffir market. It may require more than the increases in the half-yearly dividends, satisfactory though they are, to revive the embers. It is quite possible that the revenue-costs equation over the past half year will prove to be as favourable as most of the mines can expect in future. They benefited from the higher gold price in respect of three full months' production and in most cases for a substantial part of the September output. At the same time the rise in wages arising from the recent agreements has operated for less than three months, while the full effect of other cost increases resulting from devaluation is still to be felt. A lull in activity was expected to follow the first flush of enthusiasm, since the mines required time to adjust their milling

* Post devaluation peak.

policy to the new gold price and to measure the effect of devaluation on costs.

The accompanying table shows the extent of the reaction of share values from the peak 1949 level established after devaluation. The setback in the developing mines is particularly surprising. Speculative prospects there are still bright though certainly more distant than for the established producers. The explanation of the chill among these shares is lack of speculative fervour, founded in part on the long period required to bring even the most advanced mines to the production stage and on the recent dearth of the development and borehole news which was so plentiful just after devaluation. But the now recognised possibilities of the new mining propositions in the Klerksdorp area, not to speak of the unplumbed depths in the OFS itself, may well be the centre of renewed attention in 1950.

Fiduciary Issue Raised

As expected, the latest Bank return reveals an increase in the fiduciary issue by £50 million to £1,350 million—an increase which is £25 million more, and which takes place a week earlier, than that effected for the two weeks of the Christmas season in 1948. This year, presumably, the issue will have to stand at its increased level for three or four weeks instead. In the first three weeks of the Christmas shopping rush (that is, in the period to December 14th) the active note circulation has increased by just under £52 million, compared with an increase of just under £54 million in the three weeks to December 15, 1948. In other words the earlier and sharper rise in the fiduciary issue this year has been due not to a greater seasonal efflux of currency but to the fact that the general trend of the note circulation in 1949 has been upward, so that the reserve of notes and coin in the banking department before the efflux began was £25 million smaller this year than last.

It is difficult to make any accurate comparison between the general trend of the active note circulation in 1949 and that in 1948 because the figures last year were affected by the final lappings of—and the subsequent backwash from—the extraordinary reflux of currency notes which the rumours of a currency exchange set moving in 1947. Even when allowance is made for this factor, however, it does seem fairly evident that there has been a slight increase in the general level of the active note circulation in 1949 (compared with the sharp fall in 1948). Part of the increase in the general level this year has been due to larger holdings of till money by the commercial banks (particularly in the spring when there was some hold-up in vetting old currency notes following a request from the printing authorities that as many old notes as possible should be reissued). Most of the increase, however, must surely have been due to the slow upward pressure on money-holding habits which the steady increase in prices over the last few years has exerted. There seems to be little evidence to support the suggestion made in some quarters that this slight rise in the general level of the active circulation is evidence that black market transactions (which usually involve payments in cash) have increased sharply in 1949. After all, a rise in the note circulation was only to be expected in a year in which small savings have declined.

Trade and Industry

Record Exports

Exports from Britain since devaluation have shown a marked improvement in value. Last month's exports reached a new record level of £160.4 million, some £4,400,000 higher than in October and also £400,000 higher than the previous record of last March. Exports usually rise during the fourth quarter, but this year the rise has been sharper than the seasonal trend. The daily rate of exports for November was 3 per cent higher than for October and 9 per cent higher than for November, 1948. No estimate of the volume of exports for last month is yet available. Imports rose last month by only £2,600,000 to £201.5 million, and the visible trade deficit (£35.2 million) was the lowest since March.

Dollar earnings of British exports have shown a marked though not complete recovery. The accompanying table shows the trend of exports to the United States and Canada during the current year expressed as monthly averages in American and Canadian dollars, with the total expressed in terms of American dollars. The immediate effect of devaluation was to reduce the dollar earnings from American and Canadian trade considerably. The total for October was \$US 33.5 million, compared with \$US 40.3 million a month in the third quarter, when indeed orders for British goods were not being placed freely. In November, however,

dollar earnings rose sharply; sales to the United States almost regained the level of the first quarter of the year, but sales to Canada, though appreciably higher, were below the monthly average for the third quarter. A more detailed assessment of the impact of devaluation on Britain's dollar-earning capacity would have to take into account exports to the American account countries, the Belgian monetary area,

BRITISH EXPORTS TO USA AND CANADA
(Monthly Averages—Million Dollars)

To	Unit	Year, 1948	1st Qtr., 1949	2nd Qtr., 1949	3rd Qtr., 1949	Oct., 1949	Nov., 1949
USA.....	US \$	22.2	21.2	13.4	15.1	15.6	20.5
Canada.....	Canadian \$	24.2	26.7	26.5	25.2	19.7	23.0
TOTAL.....	US \$	46.4	47.9	39.9	40.3	35.3	43.5

Switzerland and Persia, as well as exports from the sterling area to the dollar market. Such figures are not yet available. But if British exports to North America are indicative of the general trend, the prospect is reassuring.

Last week the President of the Board of Trade, on his return from the United States, said that there was a "big and unsatisfied" demand there for more of Britain's traditional exports, such as whisky, fine china, certain types of worsteds, cashmere and outerwear. Time of delivery rather than price was now the main difficulty. He told exporters that "markets in the west and deep south characterised both by considerable goodwill and cheap freight rates provide an easier and more profitable line of delivery into the United States."

No Quarter for Gas Stockholders

The most interesting thing about last Monday's debate on the injustice caused to recipients of gas stock by the fall in gilt-edged prices since the vesting date was Mr Gaitskell's revelation that only £15 million out of £180 million of the original list of gas stocks now remains to be valued. It is certainly high time that this prolonged business came to an end. Certainly holders of gas stock have come to no good by it—though some of them had reason to hope that by the operation of the war damage clause in the Act they might do so—and the longer it goes on the greater the danger of capital loss.

It is not surprising that complaints have fallen on wholly unsympathetic ears. When backbenchers are arguing that no compensation should be paid or that interest should be withheld, it is easier for a Minister to make a parade of fair dealing. But if there is ever another issue of compensation stock for a nationalised industry, it must not be made until all stockholders can be paid out at the same date. It is grossly unfair that the small investor in a gas undertaking for which compensation terms were not decided on April 1st should have been exposed to the risk of the market's movements since April. And it is totally irrelevant to say that if gas stock had gone up in the meantime, he would have made a profit. The point at issue is that for nine months these stockholders have been unable to make any disposition of their property and, when they come to do so, it is far less in cash than they would have been able to get last April. The harm is done, and there is no remedy. But this unhappy episode will long leave a bitter taste of unfair dealing, unsweetened by a note of apology or regret from the Government side.

* * *

The Film Debate

The decided criticisms of the Entertainments Duty made by the Plant Committee were followed within a few days by a joint statement from the British Film Producers' Association and the Cinematograph Exhibitors' Association. This

joint memorandum attacked the duty as a burden not only on film production but also on cinema managements; this, no doubt, was for the producers the price of unanimity. But agreement, even for a moment, is remarkable in the film industry; and this is perhaps the only important topic on which it exists. In the Commons debate on Wednesday the President of the Board of Trade made some play with such an "unaccustomed and almost sinister unanimity," but he showed no sign of yielding to it. He rejected out of hand the now dying idea of a subsidy for production from the Entertainments Tax revenue:

Both Parliament and the country would reject any facile solution of the film industry's problems by simply handing back money to an industry, admittedly convicted of considerable extravagance, without guarantee that this money would not be swallowed up in further extravagance.

This was hardly news, and the customary refusal "in any way to anticipate my right honourable and learned friend's Budget statement" could mean much or little for the prospects of tax relief.

*

But the President was later pressed rather hard by Mr Oliver Lyttelton to say whether he accepted the figures given in paragraph 64 of the Plant Report. This paragraph relates to each other the total earning power, the number of films needed to fill the screens, and the cost of production of a film, and concludes that the average cost of production cannot at present be recouped from cinema earnings in Britain alone. Mr Wilson said that he accepted "most" of the views of the Plant Committee, but he would not say which views these were. And he firmly refused to include paragraph 64 in his approval:

I am certainly not going to say tonight that I will... place the whole of the blame, as to a considerable extent the Plant Committee do, on Entertainments Duty.

The debate has to be scrutinised less for indications of a new policy than for signs that some process of mental ferment, which might in time produce a new policy, is at work. Of this there was little sign. The familiar admonitions to British exhibitors—that as a matter of public duty they should give "a fair, indeed more than a fair, showing" to British films—were heard from the President once more. This is quite a different matter from the approach of the Plant Committee, which was concerned with creating the commercial conditions in which British films could best be made profitable and rewarding to all concerned (including the cinemagoer).

* * *

The President and the Rank Group

It is not long since admonitions to the exhibitor were coming from Mr J. Arthur Rank as freely as from Mr Wilson. But this situation (Mr Wilson seemed to suggest) has begun to change. Mr Rank, he pointed out, is playing a smaller part in production and has talked of withdrawing from production altogether. The identity of interest between the Rank circuits and the largest British production group is therefore disappearing. What does this imply?

Apart from the quota legislation, there will be now no security that these two circuits will not seek to maximise their revenue regardless of whether they are showing British or foreign films.

In view of its recent accounts, he would be a hard man who would blame the Rank group for seeking to do something about its revenue. But the general impression which Mr Wilson gave is, no doubt, correct; the main burden of financing production is passing over from Mr Rank's enterprises to the National Film Finance Corporation. Of all the aspects of the Government's policy for the film industry, the corporation came in for least criticism on Wednesday. Criticism, when it comes, will turn on how much this method of financing production is to cost; what proportion of its

From drawing-board to assembly line, from the loading at British ports to the ultimate sale of goods abroad—all these activities need money. Money and services, technical information, decision, speed—such are the requirements of the present situation. The District Bank, in world-wide touch with every important centre where British goods are marketed, provides both practical guidance and ample finance.

You are invited to discuss your problems with the local Manager.

DISTRICT BANK

outgoings can be recovered; and how much more money it will need if it is to perform its task effectively. To these questions the debate furnished no answers.

A Persistent Improvement in Steel

The performance of the steel industry in recent months leaves little doubt that the maintenance of control of steel supplies will come actively into question next year. Steel supplies to most industrial consumers (the motor manufacturers, with their special requirements, are a conspicuous exception) have become notably easier this year, and the continued necessity of control and allocation has already begun to be a subject of contention.

The *Economic Survey* made a forecast of 15½ to 15¾ million tons for production of steel ingots and castings in 1949; and there is now no reason to doubt that the higher of the two figures will be reached. The average output in the first nine months of the year was 297,100 tons a week, representing an annual rate of 15½ million tons. October improved on this average with a weekly output of 306,900 tons; and the weekly average for November was 314,600 tons—equivalent to an annual rate of 16.36 million tons a year. This is not the highest output yet achieved by the industry in any month; the weekly record of 316,000 tons established last May still stands. But the November results appear high enough to offset the fall which may be expected in December because of the Christmas holidays.

Pig-iron production, with a weekly average of 187,400 tons, was only slightly higher last month than in November, 1948. The industry's stock position has, however, improved notably in the past year. The *Statistical Bulletin* of the Iron and Steel Federation shows that total stocks of pig-iron (including blast furnace ferro-alloys) stood at 778,000 tons in October, compared with 479,000 tons a year before. Stocks of scrap at steelworks and steel foundries are shown as 834,000 tons in October, compared with 483,000 tons in October, 1948.

This steadily improving position can only be welcome to the Government. But if, as seems likely, the improvement persists, the question of policy which it will raise cannot fail to be thorny; for the control and allocation of steel supplies is one of the key controls on which the system of Government economic planning reposes.

Dual Prices: The British Case

Dual prices are still under discussion by the trade committee of the Organisation for European Economic Co-operation in Paris, and the argument grows more brisk with each passing week. The committee's labours follow from a resolution of the council of OEEC on November 2nd, which instructed the executive to inquire into ways and means of eliminating dual prices in intra-European trade. They have revealed that the subject is more widely ramified than may at first have been thought; and inevitably, since the procedure offers to every member-country an opportunity to draw attention to price differentials which may prejudice its own interests, the discussion is becoming many-sided. On a simple question of British and German coal, a consensus of opinion against dual pricing is not hard to mobilise. But when not only British and German, but also French and Belgian steel, British and Norwegian sulphate of ammonia, Swedish timber, Swedish and French iron ore, French phosphate rock—and perhaps, also, Italian hemp and Norwegian whale-oil—are brought in, a unanimous outcome begins to look more remote.

But from the manner in which the question arose, as well as from the special importance of the coal trade itself, the British defence of the differential prices now being charged

to home and export users of British coal must inevitably play a central part in the argument. The British case rests in general on the contention that differential levels of home and export prices are, in themselves, neither new nor of necessity bad. They are a common practice in many trades; and in addition to the European examples which are now being brought out and discussed, they are maintained for some commodities in a number of countries outside Europe (including United States steel). The General Agreement on Tariffs and Trade does not condemn dual pricing so long as the duality exists for commercial reasons.

Duality in coal prices, in particular, is by no means new: before the war it happened to work the other way, and British coal was commonly sold for export at a price longer than it fetched in the home market; the reasons for this were commercial. Although American coal export prices (f.o.b.) correspond to American home prices, this is held to be an accident, arising partly from the marginal nature of the trade done, but also largely from the fact that the landed price of American coal in foreign ports is in any case so high that the traffic would hardly bear any increase.

One European Market for Coal?

The scarcity of coal in Europe is not yet ended, and it is scarcity (the British argument runs) that keeps the prices high. But although British export prices were high at the time when the dual price question began to attract attention, devaluation has brought them down sharply in relation to the prices of the other principal exporters, whose currencies did not follow the pound. If American coal is now the dearest that can be bought in Europe, Polish coal is not much cheaper, and Ruhr coal is substantially dearer than British; the comparison is based on the landed cost at the European port. The British, more than any other of the four exporters, could sell more coal if they could spare it.

If then, the condemnation of dual pricing is accepted, what ought to happen to British coal prices? Ought the export price to be reduced to the home price level? If that is done, two things will happen. The demand for British coal in Europe will become keener still; and the commercial inducement to the National Coal Board to produce and set aside coal for export will be weakened. At present the Coal Board relies on the higher export price to balance its Budget. Deprived of this recourse, it could equally seek to balance its budget by closing the "uneconomic" collieries—pits which cannot produce at the present home prices, and many of which, as it happens, are pits in South Wales and Durham working largely for export. By closing those pits more rapidly than it opens up new pits and new seams, the Board could at any time reduce the average cost of its coal—but it would also reduce its total output, and would be able to export less.

From what is known of the American attitude, the alternative line of action—to raise home prices to the European level—would give little pleasure. It would, in any case, not be practical politics in Britain at the present time; its effects on the level of British costs and prices would be convulsive. A compromise between the two, if it were to be effective at all, would tend further to cut the supplies available to Europe.

At the root of this situation is the fact that British coal prices are kept by controls at a lower level than would be produced by the play of demand and supply. British domestic consumption is restricted by rationing to considerably less than its prewar level, and British industry, though it gets broadly the amounts of coal which it requires, is restricted in its consumption of the scarcer qualities. If a single market were suddenly created for the whole European area, the market would require to have homogeneous conditions: either rationing by control, or rationing by price. At present there are no such homogeneous conditions, and differential prices express that fact.

Swedish and Italian Trade

The new trade agreement with Sweden, covering next year, marks another attempt to reduce Sweden's sterling surplus. It provides for exports from Britain valued at £73 million and for Swedish exports of £60 million. Once again, it will not be "fully possible" to meet Swedish requests for British coal, coke, steel, oil and certain other essential commodities. Sweden is expecting to buy from the United Kingdom machinery and vehicles worth £27 million, textiles to the value of £20 million and chemicals worth £6 million. It is always questionable, however, whether export planning of this kind means more than a benevolent intention; the task is now for British exporters to fulfil these estimates, and if possible to improve upon them. Exports of British manufactures in 1949 have fallen short of the amounts contemplated in the last agreement, and since German competition is reviving in the Swedish market, it remains to be seen whether the 1950 estimates will prove close to the mark. Moreover, the agreement does not cover trade between the overseas sterling area and Sweden which in the past two years has been favourable to Sweden. It remains to be seen whether Sweden will supply all the timber asked for. And, now that the import of pulp is to be handed back to the trade (on April 1st) no estimates have been made to assess pulp requirements.

The new monetary agreement—which awaits formal signature—is to run for one year only, and replaces the Five-Year Agreement concluded in March, 1945. It is a compromise agreed to with some reluctance by Sweden. All sterling now held by the Bank of England for the Riksbank will continue to be guaranteed against any loss which might arise if the pound were devalued in relation to the kronor. But any new sterling accumulated after January 1, 1950, will cease to carry any guarantee.

The first talks since devaluation with Italy (another country where the course of payments persists in defying drawing-board estimates) opened in Rome on Monday. A new payments agreement is needed to replace the agreement which expired this week. Italy has continued to accumulate sterling, and its balances are now reported to exceed £55 million. British imports from Italy in the first nine months of this year were £28.4 million against £21 million in the same period of 1948 (these figures, of course, need to be supplemented by invisible imports represented by tourist expenditure), while exports rose more modestly from £9.5 million to £14.2 million. Exports of machinery and equipment should improve with the aid of credits the Italian government is to grant to Italian buyers of such British goods.

Two Chairmen on Devaluation

The effect of devaluation on export sales was described this week by the chairmen of Tube Investments and the Austin Motor Company, two concerns which are the biggest producers and exporters in their respective fields. Mr L. P. Lord, speaking at the annual general meeting of Austin Motors, said that the "overall direct effect" has been to increase the value of exports by 15 per cent, and that the increase came from the North American, Swiss and Belgian markets. In the past financial year, which ended in July, the company's production had increased 48 per cent; in the past three months it had been at an annual rate of 150,000 vehicles a year. This rate will increase with the higher steel allocations in the New Year. (The motor industry's present rate of total production is 400,000 passenger cars and 230,000 commercial vehicles a year.)

Exports in the past financial year rose by more than 40 per cent; the 76,000 vehicles sent abroad by the Austin company were valued at £24 million. In the first quarter of this financial year the improvement continued, and 25,000 vehicles valued at over £8,000,000 were exported. The best market

was Australia, followed by Canada. Assembly plants set up in South Africa and India to overcome restrictions on the import of assembled cars should increase future sales to those countries. Identical restrictions on the import of bicycles have led Tube Investments to open assembly plants in the same countries during the year. The chairman, Mr I. A. Stedeford, said that direct exports by the group had risen by £2,000,000 to £12.75 million in that year. While he took the same sanguine view as Mr Lord on export prospects generally, he had quite a different report to make on the United States market since devaluation. Austin found the market frankly disappointing and the £149,774 loss made by the American subsidiary is no longer ascribed to the necessary expense of entering a new market. There have been "bargain-counter" sales following devaluation, but when these subside, Mr Lord thought that the main advantage would be felt in increased sales to sterling area countries unable to pay American post-devaluation prices. The big motor sales period, however, comes in the United States in spring and summer, so the effect of devaluation in a time of full sales activity has yet to be seen. Tube Investments sent a mission to North America after devaluation, and it has reported favourably. Mr Stedeford said there was "keen interest," and his chief concern appeared to be with possible defensive measures which may be taken by United States manufacturers against successful competition from abroad.

Wages and the Cost of Living

The series of conferences this week between the Economic Committee of the Trades Unions Congress and the representatives of unions whose wages are related to a sliding scale based on the cost of living has not yet produced any concrete results. The unions concerned want to discuss the position with their full executives before coming to a decision. It may, indeed, not be until January 12th, when the TUC is to hold a special conference of trade union executives, that any final decision will be reached.

The TUC's proposal was agreed by the general council last month after prolonged discussion. It is that all sliding scale arrangements should be suspended for one year—provided that the interim index of retail prices does not rise from its present level of 112 points to more than 118. The Iron and Steel Trades Confederation and the National Union of Blastfurnacemen have already agreed to give up their sliding scales, but have made their assent conditional on the other unions doing the same. But the TUC seems to be having some difficulty in persuading the remaining unions to adopt this course. The National Federation of Building Operatives has already forgone a claim for increased pay and shorter hours. It is reluctant to abandon the builders' cost-of-living clause, particularly since this provides for an annual, not a monthly, adjustment, and the next adjustment is due to be made in February. The conference at Blackpool—meeting as *The Economist* goes to press—may decide the issue, so far as this union is concerned. The employers in the building trade are not anxious that the building trade unions should make any gesture of self-sacrifice; they feel that, instead of an orderly adjustment, they would merely be faced with a general and disorderly pressure for special increases, and that this would make costing difficult.

Altogether nearly 2 million workers are affected by the TUC proposal. Boot and shoe operatives and hosiery workers, who met the Economic Committee on Wednesday, are understood to be equally unwilling to abandon their sliding scales. The miners are in a special position. They recently asked the Coal Board to revise their cost-of-living allowance, which had remained stationary since June, 1947, so that it could be used for the benefit of the lower-paid workers in the industry. The mineworkers' affair is likely to go to arbitration, but it can be doubted whether the miners

Dilemma in Sugar

Discussions between the Ministry of Food and Commonwealth sugar producers on the Ministry's long-term buying programme have encountered some difficulties. Two years ago the Ministry contracted to buy the entire export surplus from Commonwealth countries up to 1952; the present talks are concerned with the subsequent five years to 1957. Last week-end it was announced that an agreement had been reached with Australia. The Ministry of Food has guaranteed a market for an annual export of 600,000 tons, of which 300,000 tons would come to Britain. This would more or less restore the average prewar import of Australian sugar. The price is to be negotiated each year. Agreement with South Africa is also reported to be imminent.

The main problem has been to make arrangements with colonial producers (in particular, those in the West Indies) which deal fairly with the native growers and also with the British consumer. The economics of the matter are, however, complicated by questions of colonial policy and social improvement. Sugar is the main export of the West Indies and there is no technical difficulty in expanding the output. Since unemployment is distressingly high, the West Indian producers argue that a large guaranteed export market at favourable prices would promote employment and social improvement. Their case is simple and straightforward. But it turns on the question of prices. Britain maintains that the price paid for sugar must be based on the world market. There may be a case for special assistance for a particular colony; if so, the subsidy should be borne directly by the taxpayer and not by the sugar consumer. Moreover, the price paid for West Indies sugar would also have to be paid to the other Commonwealth producers. Since devaluation, the price paid to Commonwealth sugar producers under the existing contracts is below the Cuban "free market" price, and some adjustment may be needed. But that is a contractual matter which does not bear on the question of a welfare payment to be included in the price of sugar.

* * *

No Canadian Eggs and Bacon?

December is usually a month of some strain in Anglo-Canadian economic relations. The season of goodwill is also the time for the annual negotiation of Canadian food contracts. In each of the past three years, Britain has curtailed its purchases of Canadian meat, bacon, cheese, eggs, apples and tinned salmon, owing to the dollar shortage. Since 1948, Britain has imported no Canadian apples, and this year it took no beef or salmon. Canada was presumably prepared, therefore, for further retrenchment in 1950, but the Dominion has been shocked to learn that Britain is willing to buy only wheat and cheese. Wheat, of course, will come to Britain under the existing contract which expires next summer and will be paid for in part from ECA funds. Cheese also ranks as an "off-shore" purchase under ECA, despite the threat of surplus supplies in the United States. It is hardly surprising, therefore, that the Canadian Government should be concerned, not merely about 1950 but also about 1952 and after.

The Canadian Minister of Agriculture, Mr J. G. Gardiner, stated last week in Parliament that Britain accepted the 160 million lb. of bacon and 46 million dozen eggs this year only under Canadian pressure. At present, Canada has no

alternative market for exports of food. Domestic production in the United States is more than sufficient to cover the present level of consumption; Belgium is probably the only country in Europe which could afford dollars to increase its food imports, and its requirements are small. If the British market is closed to Canadian farmers a profound readjustment will be needed in Canadian agriculture.

The dollar shortage is not the only reason for the British policy of cutting down imports from Canada. There is also the problem of prices and the effect of devaluation. To pay the same prices in Canadian dollars as in 1949 would mean a rise of 31 per cent in its sterling prices. And it is not merely this direct increase which would be involved; in addition, Britain would have to pay higher sterling prices for food supplied by Denmark, the Netherlands and other soft currency suppliers. The complications and confused bargaining of Government trading would be bad enough in a single currency system. But Britain, having played off the hard currency suppliers against the soft currency suppliers, is now in a distinctly equivocal position. Production of bacon and eggs is increasing in Britain and Europe, but it is doubtful whether the increase next year would be sufficient to offset the lack of supplies from Canada.

Shorter Notes

In the case against a London firm of diamond brokers alleging the illegal export of diamonds to Tangier fines of £281,175 were imposed at Clerkenwell Court on Wednesday. Messrs. Hennig and Co., diamond brokers, of Hatton Garden, London, one director and a manager, were summoned for fraudulent evasion of Customs restrictions and certain provisions in the Exchange Control Act, 1947, in respect of rough diamonds valued at £75,254. The essence of the prosecution's case was that although the diamonds were ostensibly exported to Tangier, their true destination was New York. In addition to the fines, prison sentences of nine months and six months respectively have been imposed, and diamonds worth £26,134 have been seized from two New York diamond firms and a bank in Tangier. Notice of appeal has been given by all defendants.

*

Total British coal output last week was 4,598,300 tons, the highest weekly figure since June, 1940. Output of deep-mined coal was 4,378,700 tons, the highest for the year. Combined open-cast and deep-mined output for the 49 weeks amounts to 203,380,000 tons compared with 197,441,100 tons in the same period last year.

*

During the third reading of the Distribution of German Enemy Property Bill in the House of Lords on Tuesday one government amendment was incorporated to exclude, at the discretion of the Board of Trade, from the distribution to creditors, assets in this country of German subsidiaries of British firms.

*

The Ministry of Supply has made new arrangements for the flight testing of service aircraft. Official flight tests are at present carried out at one of the Ministry's establishments, and many of them duplicate those already made by the manufacturer. Under the new arrangement, manufacturers will be able to apply for approval to make official flight tests. The Ministry will still carry out the final stages of testing, but delegation of some of the work will not only reduce the delays caused by congestion at the testing establishments, but will give these establishments more time for one of their primary functions, the evolution of testing techniques. Some reduction in the time taken to evolve a new type and bring it to a state of readiness for operation may eventually result.

THE COMMERCIAL BANK OF SCOTLAND, LIMITED

SATISFACTORY YEAR'S RESULTS

EXPORTS AND PRODUCTION PRICES

LORD ROTHERWICK'S REVIEW

The annual meeting of the shareholders of the Commercial Bank of Scotland, Limited, was held in the North British Station Hotel, Edinburgh, on December 15, 1949. The Right Hon. Lord Rotherwick of Tynney, the deputy-governor of the bank, presided in the absence, through illness, of the governor, the Earl of Mar and Kellie, K.T.

Before commencing the business of the meeting, the deputy-governor made suitable reference to the loss sustained by the bank during the year through the deaths of two of the ordinary directors, Mr Joseph Ellis Inglis and Mr John Houston, and one of the extraordinary directors, Dr Robert Robertson.

In submitting the report the deputy-governor said:—

I am sure we all very much regret that illness has prevented the governor of the bank, the Earl of Mar and Kellie, from taking his accustomed place today, and I propose, with your approval, to express to him our sympathy and the hope that he will soon be restored to health again.

His Lordship's absence provides for me the opportunity and pleasure of meeting you and of submitting a report by the directors which I trust you will regard as satisfactory.

IMPORTANCE OF STRONG RESERVES

Because a banking institution is able to meet times of stress and difficulty with earnings not greatly diminished, there may be a tendency in some quarters to assume that undue profits are being earned. It is hardly necessary for me to remind you of the simple explanation. Those who have been entrusted in this country with the operation of our banking system have, throughout the years, been keenly alive to the prime importance of strong reserves, which not only fulfil their protective purpose, but also, being employed in the business, materially assist in the maintenance of earnings. The only other comment I need make on that subject is that, to those of you who have been keeping a watchful eye on the course of gilt-edged security prices during the past few months, the existence of these reserves must have taken on a new significance.

CRISIS OF UNDER-PRODUCTIVITY

Since the last annual meeting much has happened to give rise to deep concern over the country's economic condition. The governor spoke then of the crushing burden of taxation and of ever rising costs, both of which seemed to stand in the way of a real national recovery, and expressed the hope that positive action would be taken by all concerned to bring about the necessary improvement in our balance of payments. The *Economic Survey*, published in the spring of this year, gave an indication of some considerable progress having been made during 1948, and forecast that 1949 would be a year of consolidation, although it seemed likely that taxation would remain at a high level with all its attendant disabilities. Unfortunately, by midsummer we found ourselves in the midst of yet another crisis, but on this occasion for a different reason. In the immediate postwar period the root cause of our troubles was a world shortage of commodities. We could sell our exports

easily, but were restricted as to the food and raw materials we could purchase. The result was continuation of austerity on the one hand and production at any cost on the other. Today the situation must be viewed against a different background—a background of world deflation—but, so far as this country is concerned, it is a crisis of under-productivity and of production costs which are too high. We can now obtain most of the food and raw materials we require if we can pay for them; but our trouble is that we cannot pay because our exports in the main are too expensive.

DEVALUATION PROBLEMS

The uncertainty of the position has not, however, diminished. Our dollar deficit continued to widen, and in late September we were brought to the point of devaluing the pound sterling in an attempt to alleviate the situation. That the country was unprepared for this serious move, with all its implications, is something which I need not stress; nor need I remind you that, by itself, devaluation will not solve our problem. The immediate advantage in the shape of lower export prices in terms of dollars cannot be other than of short duration, and is likely to be offset by the rise in import prices which must follow. It seems to me, therefore, that if any real benefit is to accrue, the lowering of the value of the pound must be accompanied by a substantial reduction in Government expenditure and production of a greater volume of export goods at prices which are competitive in world markets. How these objectives are to be attained is as yet by no means clear. The programme of cuts and economies announced by the Government in recent weeks seems inadequate in relation to a problem of such magnitude, and, if the fall in gilt-edged prices is any indication, has failed to restore confidence.

EXPORTS AND PRODUCTION COSTS

With regard to exports, we have moved away from the "sellers' market," and, of necessity, must build an economy suited to the new conditions. What we need is not production at any cost, but production at an economic cost; not a multiplicity of rigid controls, but incentives and rewards for harder work and greater efficiency, both in the case of industry and of the individual. For too long we, as a nation, have been living beyond our income, but from now onwards it seems certain that our standard of life will be dictated by our earnings.

CONDITIONS IN SCOTLAND

With regard to Scotland, mention was made last year of the changing face of the economy which was gradually becoming apparent, and the governor expressed the view that the diversity of lighter industries throughout the country was something which would stand us in good stead for the future. I also incline to that view, and am glad to say that, within the limits imposed by the present financial difficulties affecting the country generally, we in the North have no real ground for despondency. The exhibition held in September last, and sponsored by the Scottish Council (Development and Industry), was an outstanding success, and proved that the spirit of enterprise is still

very much to the forefront in Scottish industrial circles. There again, of course, the rate of progress and achievement will be governed very largely by whatever measures may ultimately be introduced to improve the national condition, and, for the moment, I think it would be idle to indulge in speculations as to future prospects. I am certain, however, that if the national difficulties, and the remedies required to put them right, were fully understood by the people, the response of Scottish men and women would be as wholehearted in this emergency as heretofore.

BALANCE SHEET ITEMS

Turning to the balance sheet, which is our more immediate concern today, you will find that paid-up capital at £2,600,000, and reserve funds at £3,900,000, stand at the same figure as a year ago.

Notes in circulation, amounting to almost £12,300,000, are higher on the year by approximately £400,000; but the circulation figures vary from day to day and no definite conclusion can be drawn from this relatively small increase.

Deposits and other credit balances at £113,592,000 are less than a year ago by £2,300,000, the shrinkage being rather less than might have been expected in view of the more stringent financial conditions now ruling.

Acceptances and engagements on account of customers, at £4,050,000, are down on the year by £400,000, but the slight fall has no special significance.

ASSETS

On the assets side, cash, balances with other banks, money at call and short notice in London, British Government Treasury bills, British Government Treasury deposit receipts, and our investments—which are almost entirely British Government securities—produce a total of £103,800,000, equivalent to almost 83 per cent. of our liabilities to the public in respect of notes in circulation and deposits. The market value of our investments is in excess of the figures appearing in the balance sheet.

At £27,000,000, bills discounted and loans and advances, together show an increase of almost £2,000,000, and while it is a welcome sign that our customers are relying upon us to a greater extent to assist them in their various enterprises, it also points—as was mentioned a year ago—to the shortage of working capital which is generally apparent. Higher prices and the necessity to carry larger stocks—or perhaps similar stocks of greater value than formerly—are factors which weigh very heavily on the capital structure of all businesses at the present time, and while we are ever mindful of the needs of our customers, we must give heed to the restrictions which have been laid upon all banking institutions from time to time in recent years, and which have the effect of keeping certain types of borrowing within what are considered to be, reasonable bounds.

YEAR'S PROFIT

As to the results of the operations of the year, you will observe that the profit is less by £34,000, which may be considered satisfactory when account is taken of the burden of taxation, increasing costs, and the difficulties of the financial situation generally. Out of the sum available the directors have allocated £100,000 to contingency fund; £100,000 to increase the fund for officers' pensions, and £25,000 to the widows' fund.

DIVIDENDS

Interim dividends on the "A" shares of 7½ per cent., and on the "B" shares of 5 per cent., less income tax, were paid in

July last, and it is now proposed that a further distribution of 7½ per cent. on the "A" shares (making 15 per cent. for the year), and 5 per cent. on the "B" shares (making 10 per cent. for the year), both subject to income tax, be approved. After payment of these dividends and allocations, the carry forward to next year's account amounts to £62,129.

TRIBUTE TO STAFF

It would not be appropriate were I to conclude without referring to the valuable service rendered by all members of the staff, the result of whose efforts are reflected in the report which I have presented to you today. On behalf of our shareholders, and, I am sure, of the customers, I offer them our sincere thanks. There is another matter, however, of which I would make special mention. Since 1932, the general manager has guided the affairs of the bank with a sure and expert knowledge; but, in addition to that all important task, his knowledge and experience have been freely available in many directions for the benefit of the community, and some months ago, it was a very great pleasure to all of us to learn that the honour of knighthood had been conferred upon him. The staff has taken the opportunity—joined by the directors—of marking the occasion by arranging to present him with his portrait; but I know I am speaking for all when I offer Sir John and Lady Erskine our congratulations and warm good wishes.

The deputy governor then moved the adoption of the report, and the motion having been seconded by Sir John Duncanson, was put to the meeting and carried.

At the close of the meeting cordial votes of thanks were accorded to the directors and the staff for their services during the year and to the deputy governor for presiding.

SECOND INDUSTRIAL TRUST, LIMITED

SAVING IMPOSSIBLE

The thirty-eighth annual general meeting of the Second Industrial Trust, Limited, was held on December 15th in London.

Mr Lionel A. Stride (the chairman), referring to the problems which beset the management of an investment trust, said: Devaluation can only prove a remedy for our troubles and not a palliative if it enables us to increase our exports considerably to hard currency countries. To achieve this, given a free market, we must be able to compete with other producers in the same field. This we can only do by increasing production, working longer hours if necessary, cutting costs and by allowing enterprise and initiative to go unfettered. Yet we are not doing these things even now, though a realistic approach to our difficulties is imperative for survival.

There is one final point to which I would draw your attention, and that is the impossibility under existing levels of taxation for saving, either by trading companies, firms or individuals. The trading company relies on what it can put by out of profits for the replacement and renewal of its machinery and equipment which it must do if it is to retain its efficiency and thus compete on level terms in the markets of the world. The firm or partnership has the same problem, with the additional one of finding capital for expansion from its own resources. The small shop-keeper who needs more capital to carry the same amount of stock is particularly hard hit. The individual, especially the professional man, has to look to his savings to maintain his business. The incidence of taxation today is such that none of these things can be done except from past savings where they still exist.

The report was adopted.

THE NATIONAL BANK OF SCOTLAND, LIMITED

EXPANSION OF ADVANCES

The one-hundred and twenty-fourth annual general meeting of the Proprietors of The National Bank of Scotland, Limited, was held in the Bank's Head Office, on December 15th.

The Most Hon. The Marquess of Zetland, K.G., P.C., G.C.S.I., G.C.I.E., the Governor of the Bank, in the course of his speech, said: There has been a decline in our deposits from £101,500,000 to a little less than £95,000,000, but that is entirely due to the withdrawal of certain special sums which as I hinted last year when I commented upon the then increase of £13,000,000 were likely to be with us for a very temporary period. These sums to which I refer had an undue effect upon the 1948 balance sheet and a better picture of the progress the Bank has made and continues to make can be obtained by a comparison with the figures of 1947 when the deposits were £88,000,000. As has always been our custom, a high liquid ratio continues to be maintained with cash and other equivalent resources of £31,000,000, in addition to which £4,000,000 is held in Treasury Deposit Receipts.

Advances, together with bills discounted, continue to expand, and at £22,000,000 constitute a fresh record, with an increase of nearly £2,400,000 over the corresponding figure of a year ago. The profits, at £293,000, are about £2,000 higher, and we adhere to our very conservative policy of distributing the much lesser part in dividend.

Perhaps the two outstanding events of this year have been the devaluation of sterling and the consequent fall in the quotations for British Government Securities, which in some of the longer-dated issues fell as much as 15 per cent. between May and October. Notwithstanding these wide fluctuations in prices, I am pleased to give you the assurance that once again our Investments appear in the balance sheet at figures below the quotations current at November 1st.

TRADE AND INDUSTRY

It is right that all due credit should be given to the Scottish Council for their constant efforts to develop Scottish trade and industry. The Exhibition which they promoted was an outstanding success in making the general public, even the Scottish public, better acquainted with the wide variety and quality of Scottish manufactures and in demonstrating that Scotland can furnish to the world at large goods that are attractive and capable of meeting many wants.

It is pleasant to record that our largest industry, that of agriculture, has had a successful harvest, and although the expense of ploughing and reaping continues to increase, there should be left a reasonable surplus to encourage the intensive efforts that are being made to attain as great a measure of self-sufficiency as the available land will permit. Sheep farmers too have had an encouraging year. They have built up their flocks and recovered from the disastrous losses of the spring of 1947.

It was, however, a different story with our fishing fleets, for their catches of herring from the north-east coasts were the poorest for many years, and unfortunately the results obtained at their East Anglia autumn fishing have also disappointed.

IRON, STEEL

In iron and steel, our Scottish furnaces have, through their efficiency, more than provided their quota of the increased production that was called for, and in engineer-

ing and shipbuilding active conditions have prevailed. What is, however, disturbing is that orders for new ships are not now coming along and some uncertainty as to the future must be expressed.

Our textile industries, both woollen and knitwear, continue to play their part in the export trade, Hawick in particular sending the greater share of its production overseas.

As to the Dundee jute trade, which has had its difficulties in the restricted supplies of jute obtainable because of the disputes between Pakistan and India, to which I referred a year ago, the future is very much bound up with the price of the raw material. Most of the jute is grown in Pakistan, which has not devalued its currency, and they have been holding out for a 44 per cent. increase in their price.

GENERAL FINANCIAL SITUATION

It is much too soon yet to assess the full consequences of devaluation. There are certain general aspects of the question which are already fairly clear, and on these I might offer the following comments. So drastic an expedient is bound to be attended by grave disadvantages, and the one obvious advantage that is claimed for it, namely, that it will stimulate our export trade with the dollar countries, may easily be overestimated. Indeed, I am disposed to think that in the long run its chief advantage may prove to have been that it has shocked the public into a realisation of the true facts of our economic plight. For it is no exaggeration, surely, to say that for the past four years they have been living in an economic wonderland as divorced from reality as was that depicted by the whimsical pen of the late Lewis Carroll. You may, perhaps, recall the answer given by the Cheshire cat to the question put to him by the bewildered Alice, as to which way she should go—"It doesn't much matter which way you go, so long as you won't mind where you get to!" Looking back over the last few years it seems to me that we have been light-heartedly proceeding upon that principle with the result that we have suddenly discovered that we have reached the brink of a precipice at the foot of which lies national bankruptcy.

I say "suddenly" advisedly, for the decision to devalue the pound was admittedly reached in a hurry and against the preconceived ideas and intentions of those who took it. Yet I cannot refrain from recalling the fact that when addressing you two years ago, I pointed out that failing a successful effort on the part of British industry to overcome the difficulties arising out of the gradual disappearance of the sellers' market, we should inevitably be faced with the risk of having to devalue sterling in order to adjust our prices to the requirements of the external market.

It is, no doubt, easy to perceive in retrospect the factors which have given rise to the complacency of the public in face of a situation which, in view of the vast destruction of wealth effected by six years of total war, should have been crystal clear. Prominent among them, as it seems to me, have been (1) The temporary easement of the financial tension brought about by the American and Canadian loans followed by Marshall Aid. (2) An unwarranted feeling of security induced by the food subsidies; and (3) A similarly deceptive feeling of optimism springing from the temporary effects of the drive for cheap money, to the dangers of which I ventured to call your attention three years ago.

The report was adopted.

ENGLISH, SCOTTISH AND AUSTRALIAN BANK, LIMITED

ASSETS EXCEED £100,000,000

THE HON. DAVID BRAND'S REVIEW

The fifty-seventh ordinary general meeting of the English, Scottish and Australian Bank, Limited, was held on December 14th, at 5, Gracechurch Street, London, E.C., the Hon. David F. Brand, the chairman, presiding.

The following is an extract from his statement, circulated with the report and accounts for the year to June 30, 1949:—

Since I addressed you a year ago the Commonwealth Government's appeal to the Privy Council has been heard, and I am happy to be able to report that it was dismissed. The judgment was to the effect that the Commonwealth Government's appeal could not be heard without a certificate from the High Court of Australia.

While this view was conclusive of the case, their lordships went on to express their opinion on the various points argued before them. They gave their view that the section of the Act under which the Government set out to take power to prohibit the conduct of banking by the trading banks offends against Section 92 of the Australian Constitution.

Whether this finally disposes of any question of nationalisation of banking in Australia remains to be seen. In the meantime, the Government retains wide powers of control over the banking system of Australia under the 1945 Banking Act, and the trading banks must therefore rely on the continued wise administration of this Act to enable them to perform their function of providing a competitive banking service to the public of Australia.

GROWTH OF DEPOSITS

The major movement in balance-sheet items since last year is the increase of £10,708,000 in deposits, current accounts, etc., making the total £79,050,000. The deposits throughout the banking system increased substantially during the year as a result of a heavy addition to the overseas funds of Australia, and because of some further expansion in bank advances. The gold and balances abroad held by the Central Bank moved from £A.253 million in June, 1948, to £A.392 million in June, 1949. This expansion resulted from an increase in the volume and value of exports, from capital transfers to Australia and to some extent by deferred payment for imports, and by prepayment for exports.

The desire of Australian exporters promptly to fix the Australian equivalent of overseas currency proceeds of sales, and of importers to defer the conversion of overseas currency prices to Australian currency arises from the view of many traders that a revaluation of the Australian pound is a factor that cannot be disregarded in assessing the outcome of trading transactions.

EXPANSION OF OVERSEAS BUSINESS

To meet the need of Australian importers we have provided acceptance credits and other facilities in London during the last year, which explains the expanded title of the item "Bills receivable in hand, in transit, and amounts receivable under acceptances." The increased total of £7,823,000 further indicates a satisfactory expansion in the volume of overseas business being handled.

The demand from our customers for accommodation on overdraft was very active during the year, as evidenced by the increase of £5,415,000 in the total of advances, which appears in the balance-sheet at £50,384,000.

The banks' liquid position has been well maintained. The total of cash in hand, etc., money at call in London, special account

with the Commonwealth Bank, and bills receivable, etc., represents 12s. 8d. in the pound of deposits, current accounts, etc., as against 12s. 4d. in the pound last year. If the Commonwealth Bank of Australia special deposit account is added to public deposits, the proportion is 10s. 4d. in the pound, compared with 10s. in the pound last year. It will be observed that the total of assets exceeds £100 million sterling for the first occasion in the history of the bank.

The report and accounts were unanimously adopted.

CANADIAN BANK OF COMMERCE

STEADY GROWTH OF CANADIAN INDUSTRY

The eighty-third annual meeting of the Canadian Bank of Commerce was held on December 13th in Toronto.

Mr Stanley M. Wedd, the President, in his address to the shareholders, dwelt at length on international developments and their significance to Canada. Noting continued increase in production and employment, he felt that business for 1949 would probably reflect an overall gain, as compared with 1948. Agriculture was in a good position and the steady growth of Canadian industry and development of natural resources was largely responsible for the country's strong economic position. Industry had some 33,000 plants across the country and turned out goods valued at more than \$10 billion a year, a peace-time high for Canadian industry. If oil production continued to increase and more wells were found the industry might rival agriculture and might also eventually play an important part in the solution of trade deficit with the United States.

MINING PROJECTS

Reviewing mining developments he referred to major projects including vast possibilities of the Quebec Labrador iron ore development. Initial operations projected at a minimum of ten million tons per annum, but some years must elapse before actual production would be under way. Also in the Lower Quebec region production of titanium was expected to commence in 1950 with an objective for 1952 of 220,000 tons titanium and 175,000 tons pig-iron per annum.

The results following devaluation of the pound and other currencies could not likely be determined for a considerable time. If devaluation led eventually to free convertibility of currencies, an objective much to be desired would have been accomplished. Trade and tariff regulations had not appreciably altered during the course of the year. The president closed by stressing importance of foreign trade. Totalitarianism made orderly trading difficult, but the advantage of commerce as a world instrument of peace was so apparent that it was difficult to do other than believe in its eventual supremacy wherever right thinking and common sense existed.

GENERAL MANAGER'S STATEMENT

Presenting the bank's annual statement, the general manager, Mr James Stewart, C.B.E., referred to the bank's strong position and said that assets had reached a new record of \$1,646 million. Deposits had increased by \$122 million, and significantly this increase included \$58 million of personal savings, a striking example of the thrift and economy of Canadian people. Commenting on investments, he pointed out that great strides had been made in expansion and improvement of industrial and commercial plant equipment involving heavy capital expenditure which had been a sustaining influence on high level of business and employment.

Having regard for past experience, there must be an annual capital investment which fits in with orderly growth of national economy. It was important to this economy that private capital investment be encouraged and climate continue to be developed where risks and returns come into line and individual and corporate judgments be given adequate scope. Continued business expansion and a generally healthy economic picture were reflected in an increase in current loans of \$59 million. Number of new customers, borrowers and depositors, as well as shareholders, had increased proportionately with growth in assets and liabilities.

The report was adopted.

KLINGER MANUFACTURING COMPANY, LIMITED

NEW FACTORY AT MARGATE

The thirty-sixth annual general meeting of this company was held on December 15th in London, Mr J. L. Callow (the chairman) presiding.

The following are extracts from his circulated statement:—

I would first draw your attention to the increase in the company's issued capital, which is now £164,750, consisting of 659,000 Ordinary stock units of 5s. each. I would, however, again remind you that the effective capital actually employed in the business is represented by the issued capital, reserves and balance of profit and loss appropriation account, which together amount to £639,353. This figure, which compares with £488,308 a year ago, does not fully take into account the real value of our fixed assets, which were heavily written down in the past.

The net profit for the year is £111,837, compared with £80,321 for the previous period, which was for eleven months. Your Board recommend the payment of a final dividend of 15 per cent., free of income tax, on the increased capital, an interim of 10 per cent., free of income tax, having been paid on May 31, 1949, on the capital at that date.

TWO SIGNIFICANT DEVELOPMENTS.

I mentioned to you at our last annual meeting that we were widening our range in the hosiery trade, and during the year under review there have been two significant developments in this direction. We have started the production of ladies' and children's ankle socks to be sold under the trade name of "Three Fairies." The setting-up of this new department has been successfully accomplished, and during the last two months of the year a new high level of output was reached, while further installations are being made month by month. We have also expanded our full fashioned stocking department, and here, too, additional plant is continually being installed. Most of our full fashioned output will be in nylon.

Your Board have been forced to recognise that expansion at Edmonton has many limitations, and after considerable research with the co-operation of various Government departments, arrangements have been made by which the Margate Corporation is to build for us at Margate a large factory on the most modern lines. It is hoped to have these premises available for occupation in 1951.

In addition to the "Klingsil" circular stockings (in nylon, rayon and lisle) for which the company is well known, our output now includes "Klingsil" fully fashioned nylon hose and "Three Fairies" children's and ladies' socks, thus embracing three main ranges instead of one. I am confident that this broadening of our activities will prove of great value in future years.

The report was adopted.

TUBE INVESTMENTS LIMITED

NEW RECORDS IN OUTPUT AND EXPORTS

ADVANCEMENT IN REDEPLOYMENT TECHNIQUE

MR. I. A. R. STEDEFORD ON TOMORROW'S WORLD TRADE

The annual general meeting of Tube Investments Limited was held at Birmingham on December 14th.

Mr I. A. R. Stedeford (chairman) said that the year was one of good progress. Trading results were satisfactory, and the company's position in all its aspects had been strengthened. This was in large measure due to the good relations which existed within the T.I. community. Believing that there should not be different sides, but only different functions, within a company, T.I. contrived, through joint consultations, internal bulletins, etc., to keep every employee as fully informed as possible on developments within the Group. Early in the year, a general meeting of employees was attended by 600 representatives of management, workpeople and staff from all the companies. It was addressed by himself and other directors, and an opportunity was given for questions, which were freely asked and frankly answered. Without a clear definition of functions and responsibilities, discussions round a table, however agreeable, could endanger industrial efficiency. No amount of joint consultations should obscure the basic job of management, which was to manage—to initiate policy and see that it was properly and successfully carried out. From T.I.'s experience, it was believed to be a division of labour which had the general approval of the workers, a number of whom in the Group had already joined the ranks of management.

FINANCIAL POLICY

Output had greatly increased and turnover was up by £4 million. Despite the large addition to turnover, profits were a little lower than last year's. He pleaded no special circumstances for this trend, for it resulted from a deliberate policy. If the company were to play a full part in assisting the internal economy of British industry, the time was bound to arise when a choice had to be made between higher profits or lower prices. The choice made was not for higher profits. A high proportion of increased costs had been absorbed, and a further response had been made to the Government's appeal for lower prices.

Throughout the company's life, substantial reserves for development had been set aside each year, and the rewards for this prudence were being reaped. Over £18 million had been needed during the past four years to finance postwar developments and expanding trade, and this had been found from the company's accumulated resources, without seeking additional capital or borrowing.

While serious account was taken of the Government's appeal for dividend limitation, they would not, he thought, have recommended a change this year. So long as the present economic difficulties persisted, and while T.I. was carrying out its programme of expansion, as distinct from modernisation—the benefits of which had gone to increasing competitive efficiency rather than profits—he hoped that shareholders would be content, assuming that inflation was kept in check, if the same dividends were paid as had been paid in each of the last three years. This, before tax, amounted roughly to 3½ per cent. of the capital actually employed. It was little

enough, but it would be the shareholders' turn, he hoped, one day. As over £5,000,000 had been spent in expanding the business since the war, with more yet to spend, the position from the shareholders' point of view was, he felt, not without promise.

HIGH EFFICIENCY OF FACTORIES

The Group's factories in this country had, by an expenditure of £6½ million on modernisation, now reached a high degree of mechanical efficiency; and further impressive results had been achieved by redeployment. At the factories where it had been completed, the increase in productivity had been not less than 25 per cent., and often much more. Workers' earnings had considerably improved and labour costs substantially reduced; furthermore, there had been no wholesale dismissals. While particular instances could be misleading, in that results depended on so many factors, he would give an example. At this particular works, production per man-year had risen by 44.6 per cent. since 1947, and wages had increased by about 18 per cent. Fewer men, using less plant, had increased output at lower cost. Greater productivity depended, not on longer hours or exhortations, but on the quality and technique of the management and the will of the workers to work well.

Despite increasing competition, the closing of, or severe restrictions in, important markets, and the long prologue of rumour and denial to devaluation, an all-time record in exports had been achieved. Direct exports, at over £12½ million, exceeded last year's record by £2,000,000, and were nine times greater than the best prewar years. As T.I. were very large suppliers to manufacturers of consumer goods, indirect exports, too, were considerable. All the Divisions had contributed to this fine result.

Exports had expanded rapidly under the impetus of the drive exerted continuously since the war. Whether T.I. had reached, or already passed, the peak with the present range of products was a matter which future figures alone would decide. The Commonwealth and the Crown Colonies again were by far the best customers, but important markets had been built up in Europe and Central and South America. Exports to the U.S.A., Canada, and the Argentine had increased by 14 per cent. before devaluation.

OVERSEAS DEVELOPMENTS

Overseas manufacturing activities had been extended by the formation of T.I. Cycles (South Africa) Limited, and T.I. Cycles of India Limited, arrangements being made to produce bicycles in both countries. In accordance with the principle emphasised last year, T.I. had received, in both cases, recognition in the form of free share capital, as opposed to cash payments, for experience and goodwill. The investments would increase in value with the prosperity of the companies, and it was fully intended that they should prosper. A further company, T.I. South Africa (Pty.) Limited, had been formed to develop export trade in that country.

Record sales had been achieved by the Cycle Division, but the industry's separate development plans had proceeded at such a pace that Britain's cycle production potential had probably outstripped future demand.

Since these conditions were bound to arise sooner or later, prudent manufacturers would undoubtedly have taken them into account. T.I. companies had increased capacity conservatively and efficiently substantially, and their policy of providing high quality machines to the peoples of the world at keen and attractive prices should enable them to hold, and even increase, their present proportion of the available world trade. Delivery of components to home cycle manufacturers had not been unsatisfactory, first preference having been given to them well beyond their prewar purchases.

The aluminium division had a difficult year, in which supplies of raw materials were threatened by reduced Canadian deliveries and the dollar crisis. A break in supplies was avoided by a judicious use of virgin and secondary aluminium, but the position could not be regarded with full confidence until either large-scale production was started within the sterling area, or the exchange situation with Canada was founded on a more satisfactory basis. The aluminium rolling mills at Oldbury were running at full capacity, and the foundry plant at the new works at Resolven, South Wales, was operating and supplying all T.I. requirements of extrusion billets and rolling slabs. There was indication that the demand for aluminium sheet and strip would absorb the full capacity of the rolling mills being put down there.

STEEL STRIP SHORTAGE

The results of the steel tube and general divisions continued to be satisfactory, in spite of keener competition from the Continent in some export markets, and a serious shortage of steel strip for electric welded tubing. T.I. introduced this process to Britain 22 years ago, and today its welded tubing compared in quality and price with the best in the world. While plant was available to give good deliveries, a number of mills were idle, or working short time, for want of steel strip. Other companies had experienced the same difficulties. In view of this, it was disquieting to hear of orders being fulfilled for additional welding mills for companies new to tube-making. Before steel strip was diverted to newcomers, existing manufacturers would expect that their present requirements would be satisfied.

T.I. could offer additional benefits to customers for steel tubes if a greater degree of standardisation could be achieved. The co-operation was sought of all interested designers by inviting them to consult on the most economical tube for a purpose, before deciding on any particular quality or size.

The re-organisation of production in the electrical division was practically completed, and they believed that the necessary flexibility had been achieved to accommodate the changing and difficult conditions. Demand for installation material still kept ahead of output, and T.I. sales amounted to about 25 per cent. of the total purchases in the highly competitive electric cooker market, a proportion which was likely to increase. Exports had been increased by 30 per cent., despite the closing of the South African market. In most overseas territories open, electric power was in short supply, and any considerable increase in exports of domestic appliances awaited a solution of the problem which faced home consumers of electricity.

TOMORROW'S WORLD TRADE

Devaluation had shown itself to be a stimulant to overseas trade in dollar and other markets, and T.I. was taking special steps to secure the maximum advantage from it. The results to date had been encouraging; more goods had been sold to America, and prospects were interesting, but devaluation, concluded Mr. Stedeford, was no cure for

Britain's difficulties. The sharpening of competition it would cause might create American domestic problems.

It had been indicated that all that need be done by dollar-starved countries was to raise sales by a small percentage of America's total purchases, but, as the range of dollar-earning products was relatively small, reaching the overall volume needed would mean capturing a substantial proportion of America's total demand for them. Were this achieved, there was little need to ponder American manufacturers' reactions if order books were short, or the American people, if unemployment resulted. There was the further point that U.S. low production costs depended on mass sales, and, if order books ran short, American manufacturers would set about world markets, and could quote prices which would cut through our bone to the marrow. A price war would follow and, because of America's tremendous resources, Britain and other countries could lose much of their overseas trade.

INTERNATIONAL AGREEMENTS NEEDED

In conclusion, he said: Given a bare understanding of mutual problems, there is no reason why this trading anarchy should fall upon the world. A way out is clearly marked in the direction of international agreements for the better regulation of trade in and between countries—or groups of countries—than has hitherto been achieved.

Before reaching hasty conclusions that this is a plea for more restrictions—which it is not—let me remind you that every country—free enterprise, Socialist and Communist alike—has long since accepted the principle that trade must be regulated; and has been doing it as best it can by indirect means, such as tariffs, import restrictions, currency regulations and the like. Acceptance by countries of the necessity for the regulation of trade is thus demonstrated. The difficulty arises only when it comes to deciding the nature and degree of regulation.

I share the American dislike of cartels. They often do harm not because they bring order to chaos, but because usually they lead to closed markets and non-competitive prices. I equally dislike uneconomic competition, not because it is competition—that is necessary for good industrial health—but because in this extreme form it is destructive, leading to unbalance and impoverishment. Both uneconomic competition and cartels can ruin the efficiency of an industry, and the one usually follows the other. This is the vicious circle which threatens world trade, and post-war signs of it have already appeared.

CRUX OF THE PROBLEM

America has insisted upon a closer integration of Western European markets. The problem is receiving the earnest and urgent attention of all the Governments concerned, and it may be expected that in due course the difficulties standing in the way of agreement will be ironed out.

But in the long term, the crux of the problem, as I see it, is not so much the trading and diplomatic relationships between European countries: the limelight is being directed to the wrong centre. The giant which casts the great shadow over the world's economic future is not in Europe; it is to be found in the present tremendous production potential and resources of the United States.

An international plan is needed; an understanding as to America's future world trading intentions in contrast to the smaller efforts, jointly or singly, of other industrialised countries.

The report and accounts were adopted, and the final dividend of 12½ per cent. on Ordinary stock, making a total of 25 per cent. for the year, was approved.

GLAXO LABORATORIES, LIMITED

EXPANDING BUSINESS ANTIBIOTICS PRODUCTION

The fifteenth annual general meeting of Glaxo Laboratories, Limited, was held on December 13th at Charing Cross Hotel, London. Sir Harry Jephcott, M.Sc., F.R.I.C., Ph.C., the chairman and managing director, presided. The following is an extract from his circulated review:—

Expanding business, at home and overseas, has resulted in a satisfactory increase in trading profit and a corresponding increase in the provision for taxation.

Expenditure upon capital assets in this country and overseas continues to be substantial, and still further expansion is in hand. It is estimated that this will call for a capital expenditure of £750,000. The programme includes considerable sums for plant and buildings in India, Italy and New Zealand, to increase the manufacturing and trading facilities of our subsidiary companies. In Australia, Pakistan and elsewhere expansion will be undertaken as soon as licences and materials are available.

INCREASE IN TURNOVER

Both at home and overseas there has been a considerable increase in turnover, especially in pharmaceutical and antibiotic products. Total turnover of the company and its subsidiaries, at home and overseas, has increased in less than two years by a little more than 50 per cent. and exports by 100 per cent. These increases are not reflections of rising prices. On the contrary, the prices of the majority of our products have not been raised since 1939, and for the product representing the largest individual sale—penicillin—there have been five price reductions since June, 1946, the price now being approximately one-third of what it was then.

EXPORTS

To-day we have no less than nine overseas subsidiaries in Argentina, Australia, Brazil, India, Italy, New Zealand, Pakistan, South Africa and Uruguay. Apart from the territories covered by overseas subsidiaries, we maintain sales promotion staffs in many other countries.

During the past summer a highly successful overseas conference was held in London, and was attended by members of senior overseas staffs from 19 countries. At the present time the deputy-managing director, Mr H. W. Palmer, is visiting our subsidiary companies in Australia, India, New Zealand and Pakistan, and I hope myself, early in the New Year, to visit our companies in Argentina, Brazil and Uruguay.

In almost every market sales have steadily progressed; in the aggregate overseas turnover has doubled during the past two years, and is now ten times what it was in 1938-9. When allowance is made for the war years, this is no mean achievement, and reflects the greatest credit upon those associated with our export business, both overseas and at home. Full advantage is being taken of the increased opportunities afforded as a result of the revaluation of sterling. We confidently expect enhancement of sales, but must not overlook the increase in costs of some goods which must also occur.

The capital employed by the company in the overseas subsidiaries amounts to £1,600,000. The total of overseas employees, including those in the subsidiary companies, exceeds 2,000.

MANUFACTURE OF ANTIBIOTIC SUBSTANCES

The company's new factory at Ulverston is now in production and as a result it has become possible to make streptomycin freely available to the medical profession in this country. It is expected that there will be a surplus for export.

Further development has taken place at the Barnard Castle plant during the year and

extensions are in progress at Ulverston. To date we have expended more than £1,500,000 on these plants.

In addition a new research laboratory is being set up at Sefton Park, Bucks, to ensure that we shall maintain our position in the antibiotic field. Only sustained research and its industrial application can ensure that these factories continue to compete successfully in the world's markets with the very large output of the flourishing United States antibiotic industry.

CAPITALISATION OF RESERVES

It has long been known that the issued capital did not reasonably represent the capital which the company employs; but for the bonus tax appropriate action would have been taken by the board at a much earlier date. It is now proposed to capitalise £716,715 (£488,053 from capital reserves: £228,662 from the profit and loss account balance) and to issue an additional nine 10s. units of ordinary stock for every one unit now held. These new stock units will range equally in all respects with the existing issue.

When effect has been given to this proposal, the company's reserves will in sum be approximately one and a half times the total issued capital.

THE NEED TO REWARD CAPITAL

The board realises to the full that the ability to undertake the very large programme of expansion that has characterised our activities during the last few years, and to finance this programme out of our own resources, has been made possible by the patience shown for many years by the holders of ordinary stock. In the board's view it is our duty as a manufacturing concern in a rapidly developing field to take risks and, should it as a consequence become necessary, to suffer losses. By that same token it is proper for successes to bring rewards to those who have taken the risks of bearing losses. Your directors have for two years acceded in the national interest to the request of the Chancellor of the Exchequer not to increase the dividend. As a result, upon a total capital employed and attributable to the ordinary stockholder of over £3,000,000, no more than £100,000 gross, before tax, has been paid by way of dividend. This represents less than the current return on Government stock. Today the ordinary stockholder has been penalised for his patience in past years.

Although your board has no intention of altering its conservative policy or of ceasing to exercise restraint, it is firmly of the opinion that incentive must be offered to capital no less than to labour if the finance, upon which the industry of the country will be developed, is to be provided. It has been said that whilst research in Great Britain is unsurpassed anywhere in the world, development lags in comparison with some other countries. It is precisely in development that large financial risks must be taken: if the appropriate reward for taking these risks is to be denied it is unreasonable to look to the public to take these risks with their hardly accumulated savings.

THANKS TO STAFF

The men and women working for your company merit your warmest congratulations. Calls for continuous effort have been made upon them and the response has indeed been praiseworthy.

The reports and accounts were adopted.

At a subsequent extraordinary general meeting resolutions to capitalise reserves for distribution to ordinary stockholders were approved.

DORMAN, LONG AND COMPANY, LIMITED

NATIONALISATION WITHOUT MANDATE

NO SEGREGATION OF D. L. STRUCTURAL ENGINEERING INTERESTS

The sixtieth ordinary general meeting of Dorman, Long and Company, Limited, was held on Thursday, December 15, 1949, at Caxton Hall, Victoria Street, London, S.W.1.

Sir Ellis Hunter, chairman and managing director, who presided, said:—

Last month Dorman Long attained its diamond jubilee, having been incorporated as a public limited company on November 2, 1889.

As the report and accounts show our diamond jubilee year has been marked by exceptionally successful operations and in different circumstances we might have recognised the occasion in some special way. Under the provisions of the Iron and Steel Act, 1949, we are, of course, precluded from doing so.

EXCESSIVE TAXATION BURDEN

The main beneficiary from the results of our year's work is once again His Majesty's Treasury which takes no less than £2,400,000 by way of taxation as against £1,700,000 available for strengthening the company's reserves and paying modest dividends to the shareholders. Thus the state, without providing any capital or taking any risk of loss, secures by far the greater part of the profit. The amount payable to the Treasury is excessive. A substantial part of this would be far better left in the business for the purpose of still further improving efficiency. It was never more necessary than now for profits to be conserved and applied in this way, a policy which the company has consistently followed for many years past.

Our own efforts to raise production during the year and to improve efficiency have been successful. We have achieved a record ingot steel production of 1,642,595 tons, an increase of almost 100,000 tons. Rolled steel output at 1,313,003 tons compared with 1,261,298 tons, is also a record.

The constant increase in output is indicative of the spirit of all associated in the industry and is a result of their enthusiasm and pride in their work. Those who so lightly seek to change the basis of our enterprise and substitute a system of remote official control, do not understand the tradition and close community of interest which has gone into the development of our different works. These things are outside the experience and beyond the comprehension of the theorists but they are, none the less, vital to the country's industrial life and should not be destroyed.

The recent decision of the Government to reach a compromise with the House of Lords on the date of the operation of the Iron and Steel Act, 1949, will enable the country to pronounce upon the Government's intentions. The unanimous opposition to nationalisation of the directors of Dorman Long remains unchanged. Your board are more convinced than ever of the folly of such a step.

WEARY OF NATIONALISATION

The country is wearying of nationalisation in all its aspects. This is true of those who are not directly affected as well as of those who are. Enthusiasm for an extension of the experiments in state ownership already undertaken is on the wane. In fact, nationalisation seems to be going out of fashion. It would be surprising if this was not so in view of the circumstances in which the country is now placed.

This growing aversion to an extension of nationalisation may have been stimulated by the change of ground apparent in the Govern-

ment's arguments in favour of state ownership of steel. Originally the theme of the nationalists was that the inefficiency of so vital an industry demanded its transfer to the state in the public interest. Four years of increasing productivity knocked the bottom out of that argument and another had to be found. The nationalists have now developed a different line of attack. It is against the public weal, they declare, that so powerful an industry should be left in private hands. In recent months Ministers have drawn horrifying word pictures of immense power concentrated in the hands of a few steel barons, power which ought immediately to be transferred to the more competent and disinterested care of Ministers of the Crown.

GOVERNMENT SUPERVISION SINCE 1932

Government spokesmen do not, of course, mention that since 1932 the steel industry has been under governmental supervision and that under the direction of the Iron and Steel Board such supervision was close and fully effective. They do not tell the country that the industry has never rebelled against this supervision but has accepted it and has, indeed, offered to discuss means whereby it may be rendered more effective, if so desired. They do not say that we have been prepared to see the relations of the industry and the Government placed on a permanent basis which would secure the public interest and the progressive development of steel production.

One is forced to the conclusion that the advocates of steel nationalisation in the Government have allowed their desire for power to outrun their interest in efficiency. They see in the acquisition of iron and steel by the state not only a great extension of political power but an opportunity to extend that power far beyond the limits of iron and steel manufacture.

NO HIVING OFF

During the past year there have been discussions with the Minister of Supply on proposals for the segregation of Dorman Long structural engineering assets in the event of nationalisation. A reasonable scheme was drawn up which would have left our structural engineering activities outside a nationalised steel industry. I regret to have to inform you that the Government have refused to agree to the segregation of our engineering interests.

This attitude is completely at variance with earlier declarations of policy and is clearly prompted by a desire to extend public ownership beyond the iron and steel industry into fields for which no mandate was ever sought at the last election.

Your board waited until the terms of the Bill were issued before making concrete proposals for hiving off activities outside iron and steel manufacture. We submitted a scheme which conformed with the Minister's requirement, stated on January 26th this year, that it should be "a good business case" for segregation.

Our discussions with the Minister revealed that the Government's refusal to permit segregation of our engineering interests was inspired by a desire to acquire the company's substantial share of the structural engineering industry without any mandate.

The satisfactory level of trading profits must to a considerable extent be attributed to the company's policy in past years of ploughing profits back into the business and expanding and improving capacity in the

parent company and in the subsidiaries. The earnings are so far in excess of the distributions that they make nonsense of the Government's proposal that in the event of nationalisation compensation should be based on market prices. In our case the aggregate amount of compensation for the whole of the share and loan capital would come to approximately £13 million, and this for a concern which has earned over £5,000,000 in the past year and whose net current assets amount to practically £12 million, after deducting provisions.

PROPOSED COMPENSATION DERISORY

We have had no recent valuation of the fixed assets, but having regard to the high cost of new plant and buildings now ruling as evidenced by the £8,000,000 we are spending at Lackenby and Cleveland in the present stage of our developments, it must be obvious to anyone that the fixed assets of the group are worth far more than their book value. The case of Dorman Long is outstanding as an example of the complete lack of comprehension on the part of those responsible for the Iron and Steel Act, 1949, of the comparative values of the undertakings engaged in the industry.

A notable event during the year was the bringing into commission of the central ore unloading, ore preparation and sintering plant at the Cleveland works. This important addition to our plant came into operation in April and has thoroughly justified itself. The ore preparation plant is also giving good results, the advantage of using prepared burdens at the blast furnaces is apparent in appreciable savings in fuel per ton of iron produced.

The board have authorised a start on the second stage of our major development plan. This provides for a further capital expenditure of over £8,000,000 in the provision of an open hearth steel plant on the Lackenby site with a capacity of 10,000 tons of ingots per week, new blast furnace ancillary equipment and the extension of the ore grading plant already mentioned. We anticipate that this work can be completed by September, 1952. The site of the Lackenby open hearth plant has been substantially levelled and actual construction has commenced. Continuity of development is assured by these decisions which, in due course, will be followed by the installation in the Lackenby area of extensive steel rolling mill equipment. Approximately 60 per cent. of the work now envisaged will be undertaken by the engineering departments of the Dorman Long group.

Our fabricating shops at Middlesbrough and in London have been fully employed and our order books, though not so heavy as a year ago, ensure work for a considerable time ahead.

OVERSEAS BUSINESS

Your company has consistently endeavoured to take the national view by developing its overseas business to the maximum but we have been hampered in the past by difficulties in obtaining export licences. The position is now much easier and we shall make every effort to expand the volume of Dorman Long exports. In the past year over nine per cent. of our finished steel from the mills was shipped overseas and seven per cent. of the output of the Middlesbrough constructional shops was exported.

Further progress has been recorded during the year by Dorman Long (Africa), Limited, where all the five branches have been fully occupied. Our other subsidiary companies—Redpath Brown, Tees Side Bridge & Engineering and British Structural Steel (Buenos Aires) have each had a successful year. Their order books are satisfactory, their business is expanding and they continue to develop their modern engineering resources which compare favourably with any in the industry.

The report was adopted.

MALAYAN TIN DREDGING LIMITED

BURDEN OF PROFITS TAX

The thirty-eighth annual general meeting of Malayan Tin Dredging Limited was held on December 15th in London.

Mr H. Ashworth Hope, chairman of the company, presided.

The following is an extract from the statement of the chairman circulated to shareholders:

The working profit for the year to June 30, 1949, is £208,570. After providing for United Kingdom taxation and crediting stores previously written off, recovered, there remains a balance of £131,278 which, with the unappropriated balance from June 30, 1948, makes a total credit of £187,828. Dividends totalling 40 per cent. have been paid in respect of the year, and a further 10 per cent. is recommended, making 50 per cent. in all and leaving a balance of £132,828 to be carried forward.

AN M.P.'S VIEW

I have read the debate in the House of Commons on the profits tax, and I must confess I do not pretend to understand the mentality of those Socialists who spoke in favour of it, particularly those who are directors of public companies.

I would draw attention particularly to the remarks in Parliament of one Socialist M.P., who, incidentally, is a director of a tin-mining company. He said (*inter alia*):

"This is a tax on distributed profits. There have been very many suggestions that, in some way or other, it would increase costs, or interfere with the piling up of reserves. I entirely fail to see why. We have not only expert opinion that a profits tax does not increase costs, but I should have thought that it stood to common sense that it did not increase costs. I have never yet heard any clear explanation of why it was supposed to do anything of the sort."

In my submission it is a fact incidental to all businesses, including tin mining, that it does increase costs.

"Marginal surplus" is more appropriate to tin companies than "profit," because tin-mining land is a wasting asset and the production and sale of ore are in reality a progressive disposal of the companies' capital asset. I submit the real reason for the tax is to appease the T.U.C., who in turn wish to appease the wage-earners at the expense of the thrifty middle classes and the vital cash reserves of tin-mining companies.

The effect of this tax on Malayan Tin Dredging Limited and Southern Malayan Tin Dredging Limited is to increase the costs by approximately 20 per cent. Here is one result of the profits tax upon Malayan Tin Dredging Limited and Southern Malayan Tin Dredging Limited.

The total profits tax of the last three years, £206,000, represents the gross value of the tin in 32 acres of our property. The effect is that the equivalent of 32 acres has been virtually confiscated by Government. Somebody must bear the cost of working in order to produce this £206,000, and since Government does not contribute to it in any way, it must be borne by the companies alone. This burden is represented by working costs of approximately 8d per cubic yard of ground worked, to which, I repeat, the Government makes no contribution.

I feel bound to say that I cannot understand how any politician who is a company director can reconcile his action in speaking and voting in the House of Commons in support of the profits tax, or approving dividend limitation, with his duty as a director, to protect the interests of his shareholders and company.

I can only say that in my view the Socialist member whose remarks I quote above was speaking as a politician, and not as a representative of the tin-mining industry.

SOUTHERN MALAYAN TIN DREDGING LIMITED

SECURITY IN MALAYA

The twenty-third annual general meeting of Southern Malayan Tin Dredging Limited was held on December 15th in London.

Mr H. Ashworth Hope, chairman of the company, presided.

The following is an extract from the statement of the chairman circulated to shareholders:

The working profit for the year to June 30, 1949, is £328,433. After providing for taxation, there remains a balance of £156,825 which, with the unappropriated balance from June 30, 1948, makes a total credit of £228,926.

Dividends totalling 55 per cent. have been paid in respect of the year, and a further dividend of 5 per cent. is recommended, making 60 per cent. in all, and leaving a balance of £86,201 to be carried forward. The distribution of 60 per cent. for the year is estimated to represent approximately 20 per cent. on the total capital invested in the business.

I may, however, say that during the Japanese occupation some of the dredges were taken off the course originally set for them and, to work the property to the best advantage, it was necessary to get them back on to their respective courses. To do this some of the dredges had to work through lower grade ground and, in some cases, ground which had previously been dredged. This is responsible for the lower output, although we had an extra dredge operating for four months.

Since drafting my supplementary remarks my attention has been called to the view recently expressed by Mr. Donovan Touche to the stockholders of the Cedar Industrial Co., of which he is chairman and managing director, and I should like to give the following extract, with which I am completely in agreement:

"This crisis has blazoned before the world the utter falsity of the economic principles upon which the Government has been working since it took office, yet there has been no genuine reversal of policy, no abandonment of pet ideas which have proved erroneous, no drastic measures such as the national interest requires."

"What was required was a slashing reduction of Government expenditure to the tune of probably £750 million per annum, and a far firmer handling of the matter of the sterling balances."

FAILURE TO REALISE FACTS

How long it will take to restore pre-war security no one can say, but the heavy costs of the military police force are reflected in Federal taxation, and in our own costs are included the maintenance of armed guards, expenditure on protection of our mines, our offices and housing of the staff.

It is not fully realised in the present Government that the Chinese, whether squatters or ordinary labourers, do not comprehend what we understand by "social duty," such as helping the authorities by giving information against their own people. It is foreign to the national character of the Chinese, most of whom belong to or are dominated by secret societies of one kind or another. Whatever theoretical value, exhortation or appeal by wireless by high Government officials in Malaya may have in relation to the more educated Chinese, it is of little value regarding the rest of the Chinese community unless backed up by strong military and police forces.

It was the failure to realise these facts by the Colonial Office that is largely responsible for the present terrorist activities in Malaya. The report was adopted.

KRAMAT PULAI LIMITED

MINING LEASE CONDITIONS

The forty-first annual general meeting of Kramat Pulai Limited was held on December 15th in London.

Mr H. Ashworth Hope, chairman of the company, presided.

The following is an extract from the statement of the chairman circulated to shareholders:

The working profit for the year is £29,724. After providing for United Kingdom taxation and prospecting there remains a balance of £14,233 which, with the unappropriated balance from March 31, 1948, makes a total credit of £20,552.

A dividend of 3d. per share is recommended, together with a bonus of 3d. per share, making 6d. per share in all, and leaving a balance of £15,052 to be carried forward.

It is now over two years since we sent in our claim for war damage, and no payment has yet been made. As our tributaries were not afforded any financial help by the Government in regard to rehabilitation, the board incurred the risk and advanced the money, which has since been repaid.

With the diminution in the scale of our mining operations and no fresh reserves being found, decreased profits must be anticipated and a repetition of the bonus dividend is improbable.

We had hoped that it would have been possible to have carried out a geophysical survey over the scheelite area during the year, but owing to the danger from bandits we were advised by the authorities that it would not be safe to undertake this work at the present time.

For the same reason we have been unable to start drilling the area issued to us under a prospecting permit, but it is hoped that this district will be sufficiently safe to enable a start to be made early in 1950.

ARDUOUS CONDITIONS IMPOSED

We are concerned at the growing tendency by the Government to impose arduous conditions on the issue of mining leases. Owing to the war and other causes, prospecting for tin has been held up for about ten years and costs of boring are now very high. It cannot be expected that directors will risk shareholders' money in prospecting large areas if there is a possibility of onerous terms, which cannot be anticipated, being imposed.

This company has been operating since 1908 and has made large financial contributions to the Malayan Government over the past years. I should like to express the appreciation of the board for the sympathetic consideration it has received at the hands of the Menteri Besar (Prime Minister) and Mines and other Government departments on its effort to secure further areas for the purpose of the company, and we feel it is a recognition of the valuable work done.

We are anxious to ensure that the future of this company shall not be less successful than in the past. The financial resources of the company are not sufficient to carry out the policy we have in mind, and the board of Malayan Tin Dredging Limited has undertaken to Government, as a condition of its granting the permit, to be responsible for the financial expenditure that will be necessary if the values justify our taking up the land. We shall in due course invite you to approve a scheme in which Malayan Tin Dredging Limited and Kramat Pulai Limited will collaborate in the working of these areas.

It is too early to give a more definite intimation of our policy, but the above will indicate what is in the minds of your board. The report was adopted.

RHOKANA CORPORATION, LIMITED

SELLING PRICE BASIS FOR COPPER

The twenty-seventh annual ordinary general meeting of Rhokana Corporation, Limited, was held on December 13th, in London.

Mr S. S. Taylor, C.M.G., D.S.O. (deputy-chairman), who presided, in the course of his speech, said: You will have noticed that the directors' report this year is fuller than it has been in the past and that it contains items of information under various headings which in past years have been dealt with in the chairman's speech at the annual meeting.

PRICE OF COPPER

There are on this occasion certain matters of considerable importance to which I should refer. The first is the price to be paid by the Ministry of Supply for our copper. After the announcement of the devaluation of the pound the Ministry invited the Rhodesian Copper Producers to consider the adoption of some method of price calculation different to that which had obtained up to that time. We informed the Ministry that we would be quite willing to investigate the question but the problems involved were very complicated. We have had discussions with the Ministry and I can inform you that they have indicated that they are willing that the previous price basis shall continue, that is to say, that the American quotation converted into sterling at the new rate of exchange should be used as the pricing basis. The Ministry however have asked us to accept certain adjustments in the factors with regard to freight and differentials between electrolytic and blister copper which affect the calculation of the price. We are still discussing these matters with the Ministry and I can say no more at the moment on that point.

I must also refer to our relations with the Northern Rhodesian Mine Workers' Union. We have been asked by the Union to agree to what they call the principle of a 40-four week. We felt unable to agree to this demand and an attempt to settle the differences between the Union and the Companies on that point was referred to conciliation. No agreement was reached before the conciliator and there is no further information to give you at the present time.

THE COAL POSITION

The coal position remains difficult. Coal received by the four copper mines has averaged 37,332 tons per month since July 1st, and in November, 1949, was 39,437 tons. It is impossible to make any definite forecast with regard to the future and though we still hope that we shall receive considerably more coal from now onwards it will undoubtedly be necessary to continue wood burning for some time to come.

Notwithstanding our difficulties we have earned increased profits, the balance carried from the profit and loss account to the appropriation account showing an increase over the previous year of £750,000, this is after the payment of a bonus of 32 per cent. on basic wages to our employees who receive benefits based on the profits of the Northern Rhodesian Copper Mines. Taxation in the United Kingdom and Northern Rhodesia will absorb £390,000 more. While your directors do not recommend to you an increase in the final dividend, which remains at 75 per cent., they have placed to reserve £1,125,000, being over £450,000 more than last year to assist in meeting our large future capital requirements.

The report was unanimously adopted.

CRITTALL MANUFACTURING COMPANY, LIMITED

ENCOURAGING EXPORT FIGURES

IMPORTANCE OF REDUCED COSTS

The twenty-fifth annual general meeting of the Crittall Manufacturing Company, Limited, was held on December 14th in London, the Rt. Hon. Lord Braine, chairman and managing director, presiding.

The chairman, in the course of his speech, said:

The consolidated profit and loss account shows the trading profits of the group to be £506,701, a decrease of £11,301 against last year. The turnover for the period was, in fact, greater, but the reduction in profit is more than accounted for by the fact that last year's account included half a year's profits of a subsidiary company, Wood Surrounds, Limited, which, as I told you last year, was closed down during the period.

DEPRECIATION AND TAXATION

Depreciation and taxation have been provided on the same basis as last year and, in connection with the latter, there is a credit of £14,269 in respect of taxation provided in previous years, but now no longer required. The Scottish Metal Window Company, Limited, a subsidiary at Paisley, made a larger trading profit than last year, which profit has been retained in that business.

After making the appropriate adjustments, the net profit of the company for the year amounts to £241,373, as against £219,128. A final dividend on the Ordinary stock of 10 per cent. actual, less income tax, is recommended, making 20 per cent. for the year. The balance on profit and loss account carried forward is £160,521, as compared with £159,111.

The success of the Crittall hot dip galvanising process, as applied to the standard cottage window at Witham, led your directors to decide during the year to apply this process also to the more expensive purpose-made window product. As a result, a plant is now in course of erection at Braine Works which it is expected will be in operation during the next six months. The greater part of the capital expenditure contracts outstanding at August 31, 1949 (£90,000), is represented by the expenditure on this project, to which we were committed at that time.

EXPORTS

Our hopes of a considerable increase in export for the period as against the previous year have not been realised, the figure being practically the same, where we had anticipated a substantial increase. In some markets it is because import licences are not being granted, and generally there is an increase of sales resistance. The fact, however, that housing is a world-wide shortage leads us to believe that we have not nearly explored all the possibilities. We realise that sales will cost more to get; that is to say, we must increase our sales force so as to cover every country which can possibly use our products. It will mean that some of this business taken alone will be at un-economic prices, but, averaged with the rest will be worth gathering up.

An encouraging feature during the period has been the increase in our export to hard currency countries, which, this year, is three

times as great as last year. There are indications that this figure can be very materially increased, and the dollar area is receiving our concentrated attention.

STEEL PRICES

During the period, steel prices were increased by the removal of subsidy, the effect of which was to increase window sections by approximately 13 per cent. We were most anxious to limit the effect of this increase on our products, but, in the case of painted standard windows, we were compelled to increase the price by 4½ per cent. The extra for galvanising these windows has, however, been reduced by a figure which absorbs more than half the extra. I am glad to say that we did not apply the 13 per cent. increase in the cost of steel to purpose-made windows, and that there has, in fact, been a readjustment in price of this group of products which amounts to an all-round reduction.

I lay particular stress on the vital necessity of keeping costs down generally and because it concerns the future of this company, particularly the cost of building. It is true that a great deal of building remains to be done to replace war damage and a great deal more to bring our power plants and industrial equipment up to date. Unfortunately, the prevailing idea is that, because of this volume of work ahead, prices will stand a comfortable margin of profit. The fact that a large proportion of building now going ahead is costing more than an economic price, and would not be undertaken except as a matter of sheer necessity, is being ignored. I suggest that it is sound policy for manufacturers of building materials to keep prices down by every means in their power, such as passing on to the consumer the results of any economies which they can make.

PREVENTION OF RUST

The bugbear of rust and consequent high cost of maintenance has long been recognised as the outstanding barrier to the one hundred per cent. use of steel windows, and the industry is now committed, as an item of post-war policy, to treating steel windows with a coating of metallic zinc as a "must." Sherardising, zincspray, cold or electro galvanising, and hot dip galvanising are all methods which will achieve a coating of metallic zinc.

We have chosen hot dip galvanising in spite of the fact that this is the most expensive process and uses the most zinc. The equipment which is now being installed at our Braine Works to deal with our purpose-made product is a very large and expensive installation, and requires the demolition and rebuilding of the original buildings of the Braine Works factory.

Unfortunately, the future price of zinc, which has an important bearing on the cost of galvanising, is not predictable. It is fully alive to the necessity of keeping the cost of galvanising as low as possible, and when our new plant comes into operation we hope that the resultant reduction in cost will make a substantial contribution to our business.

The report and accounts were unanimously adopted.

An extraordinary general meeting of the company, at which new articles of association were adopted, will be held in the near future.

The report was adopted.

WOOLWICH EQUITABLE BUILDING SOCIETY

A YEAR OF SUSTAINED PROGRESS

The one hundred and second annual general meeting was held in London on December 13, 1949, G. Leslie Wates, Esq., J.P., the chairman, presiding.

CHAIRMAN'S SPEECH

The figures for the year to September 30, 1949, showed a further substantial expansion of the society's business. In many respects the present accounts represented record figures in the history of the society, but he was not much enamoured of the word "record" in this regard, as the striving after records for their own sake might well affect one's judgment as to what it was right to do from time to time. Their total assets amounted to £56,976,398. They had lent £13,850,836 during the year and their mortgages, at £47,212,049, were substantially up on last year. There was also a substantial increase of £4,211,491 in their paid-up investment shares. Their investments, other than mortgages, stood in their books at a million pounds or so less than last year, this money having been used to finance part of the increase in mortgage business. This degree of reduction in the society's investments in relation to the total assets was, in truth, a good thing. It was more profitable to have the society's funds invested in mortgages than in Trustee securities or on deposit at the bank.

One of the vital matters affecting the stability of any building society was its liquidity ratio. As their share capital was subject to withdrawal at short notice, and as their ordinary mortgages could not be called in, it was clearly of importance that they should maintain a reasonable portion of their total assets in liquid form. There were many opinions as to what was reasonable in that regard. Too high a figure meant loss of productivity; too low a figure might mean a risk of delay in meeting the withdrawals of shareholders and depositors. The Building Societies Association, in giving advice to building societies, had said that the net available liquid resources should never be allowed to fall below 7½ per cent. of the total liability to shareholders and depositors. The society's comparable figure at September 30, 1949, was 13 per cent. so they were well on the safe side of this recommendation.

There was a statement on the balance sheet of the Stock Exchange market value of their quoted investments as at September 30th. This showed a deficiency of £103,425 on the book value. This deficiency need cause no anxiety. Last year they set aside £50,000 in a special reserve account to meet such possible depreciation, and that was done with some prescience at a time when the balance sheet showed an excess Stock Exchange value of £174,622. This year they had added another £50,000, so that the special reserve account now stood at £100,000, and was substantially equal to the amount of the present deficiency. He did not attach great importance to that deficiency because all their securities affected were dated securities redeemable at par.

They were there to help the citizens of this country to own their own homes and gardens. That was a praiseworthy object. To do so they accepted money from investors; and the rates of interest paid by borrowers to the society, and paid by it to investors, were both fair and reasonable. The expenses of management were modest in relation to the society's size, and taxation was inevitable. Their organisation throughout the country was efficient, and they were in good heart. The board would serve the society in the future with that whole-hearted loyalty and care which had characterised the board for the last one hundred and two years.

The directors' report and statement of accounts for the year was adopted.

SCOTTISH AUSTRALIAN COMPANY, LIMITED

RECORD TRADING PROFIT

MR. J. N. EGGAR'S SPEECH

The annual general meeting of the Scottish Australian Company, Limited, was held on December 9th in London.

Mr. John Norman Eggar, the chairman and managing director, in the course of his speech said: This has been a memorable year in the history of this old company of ours, for not only have we produced record results but we have been able to develop further our constructive policy with respect to cattle raising and sheep breeding, to the ultimate advantage, we hope, not only of ourselves but of Australia and this country.

The most noteworthy event has perhaps been our acquisition of the whole of the capital of the Anthony's Lagoon Pastoral Company, Limited. Anthony's Lagoon is property of 1,800 square miles in the Northern Territory.

Our Aberdeen-Angus stud and herd at Texas continue to do well, and Mr. Brewer's enthusiasm and careful management have been rewarded by several prizes.

THE FUTURE

As to the immediate future, I can only tell you that weather conditions on almost all our stations continue favourable, though losses of sheep from the blowfly pest continue severe. Wool prices are firm, and there is no early likelihood of supply overtaking demand. Meat prices should continue good, and sales of new crop wheat already made to Japan and elsewhere are bound to yield good returns. But there are some disquieting features to which I must refer. It is of course, natural that in these days of high values there is a demand for land.

Quite recently the New South Wales Government has forced through Parliament the Western Lands (Amendment) Bill, which empowers the state to resume forthwith all leasehold land in the Western Division. It also deprives lessees of the right, conferred by previous Acts, to compensation. In lieu, lessees are to receive two home maintenance blocks in perpetual lease of an area capable of carrying a maximum of 10,000 sheep, and one area capable of carrying 5,000 maximum sheep, on lease for the same term as the lease withdrawn. This Act amounts to confiscation, and is a complete repudiation of the state's obligation. It affects Corrella-Warraweenah of 249,000 acres, whose leases expire in 1972 and 1974, where we have an average of 40,000 sheep and over a long number of years have produced magnificent wool. The land is said to be required for soldier settlement, but it is not suitable for running on a small scale, particularly in times of drought. In four successive drought years in the thirties the station made heavy losses.

AN UNFAIR ACT

Seeing that we have already voluntarily surrendered over 59,000 acres in the State of New South Wales, and in so doing have received in compensation much less than their true value, it is putting it mildly to say that this new Act is unfair and unjust to our company and to all lessees.

The final profit of the Scottish Australian Company for the year is £235,071, which constitutes a record for the company. We propose to pay a final dividend of 6 per cent making 10 per cent for the year.

The report was adopted.

DICTOGRAPH TELEPHONES, LIMITED

SATISFACTORY RESULTS

The thirteenth annual general meeting of Dictograph Telephones, Limited, was held on December 15th in London, Mr Philip V. Summer, the chairman, presiding.

The following is an extract from the circulated statement:—

In the face of an increasingly unsatisfactory economic situation, your company has not only maintained its position, but has again moved forward. Arrears of orders have been absorbed by increased production and prompt deliveries can now be made, both in the home and overseas markets. Orders on hand for new work are at a satisfactory level.

The volume of exports of our subsidiary, Gramplan Reproducers, Limited, includes a proportion of trade with hard currency areas, which it is anticipated will be extended in the future. Having regard to general conditions prevailing in the radio industry, satisfactory profits have been made.

As mentioned in my statement last year, further Ordinary shares were issued in December last to the extent permitted by the Capital Issues Committee, and while the net proceeds have been adequate for current needs to date, it is possible that further capital may be required before the end of 1950 for expansion of the business.

The consolidated profits for the year under review, before taxation, are £113,203 (against £103,083). From this amount is deducted £63,128 for taxation. The board recommend a final dividend of 10 per cent., making a total distribution of 20 per cent., less income tax, for the year.

Having regard to the particular nature of the trading of your companies, the directors anticipate that they will be able to present to you another satisfactory report next year. The report was adopted.

MALAYALAM PLANTATIONS, LIMITED

HEAVY TAXATION DEMANDS

The twenty-eighth annual general meeting of Malayalam Plantations, Limited, was held on December 8th in London, Mr H. J. Welch (the chairman) presiding.

The following is an extract from his circulated address:—

Exportable tea realised about 1½d. per lb. and rubber about 1½d. per lb. more than in the previous year. Unfortunately, the f.o.b. cost of production of tea exceeded that of the previous year by over 3½d. per lb. and the f.o.b. cost of rubber by over 1½d. per lb. For tea this was partly due to the reduction in the crop by over 965,000 lbs., caused principally by adverse climatic conditions and by blister blight. In the case of rubber, however, the crop exceeded that of the previous year by over 250,000 lbs., and included 171,611 lbs. of sole crepe.

Notwithstanding the increases in realised prices for tea and rubber, the profit remaining, after taxation, was £63,089 below that of the previous year. The directors propose to pay a final dividend of 10 per cent., making 15 per cent. for the year. I would again draw attention to the heavy taxation demands upon the company necessitating the provision this year of £234,488, or nearly 64 per cent. of the profits before taxation.

Given favourable climatic conditions, we estimate during the current year to produce approximately increased crops of 14,000,000 lbs. of tea and 5,774,000 lbs. of rubber, and according to our present information at a somewhat reduced cost for tea but a slightly increased cost for rubber. As far as we can tell at present, both tea and rubber also should realise higher prices, and therefore it is reasonable to expect better results this year than last.

The report was adopted.

STRAND HOTEL, LIMITED

MAJOR M. GLUCKSTEIN'S REVIEW

The forty-second ordinary general meeting of The Strand Hotel, Limited, was held on December 15th at the Trocadero Restaurant, Piccadilly Circus, London.

Major M. Gluckstein (the chairman) in the course of his statement said: Our industry, like others, is suffering from the imposition of theory by those with insufficient knowledge of the trade; a dogma which, in the minds of those with the power and inclination to interfere, transcends practical knowledge and experience. For the good of industry and the country we hope that, whatever party is

in power, this era will be short lived. The reference, in the statement accompanying the accounts, to the fact that we are denied the stimulus of freedom has implications which extend far beyond the confines of our own industry.

The best brains of the commercial world are despairing as they see their efforts frustrated by complicated legislation. Industry's vitality is being drained away through state interference, and the willpower and fibre of our people are being steadily sapped. Short hours create leisure; leisure is costly to the individual, and with purchasing power of wages decreasing the worker finds his daily life expensive. It is cheaper to be at work than at play.

When the state did not presume to run industry, but left it to those whose job it was, businesses were not fettered with theoretically-inspired boards, organisations with their attendant time-wasting committees, sub-committees and functionaries. Today, too much valuable time is devoted to talking instead of doing, and if the time spent could be assessed what startling figures would be revealed!

I have spoken generally, but all I have said applies to our own industry. Among our heaviest handicaps are the regulations of an Order made under the Catering Wages Act; and it is welcome news that, at long last, an inquiry is to be made into its operation.

The report and accounts were adopted.

LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE

(UNIVERSITY OF LONDON).

Applications are invited for two or more Adult Scholarships, of the value of up to £300 per annum, intended to give an opportunity for full-time study for a first degree to suitably qualified students who have shown promise in previous studies. Further information and application forms, which should be returned by March 1, 1950, may be obtained from the Secretary, the London School of Economics, Houghton Street, Aldwych, London, W.C.2.

MARKET AND ECONOMIC RESEARCH

There is a vacancy for a fully experienced man with a degree in Economics or Statistics to take over the Research Department of Osborne-Peacock Company, Limited, 47, Cannon Street, London, E.C.4.—Please address applications, in confidence, to the Managing Director.

IMPORTANT chemical manufacturing organisation has two vacancies for executives in its Export Department at London Head Office. Candidates should be 25-40, have had previous experience on the commercial side of the organic chemical industry, and preferably, but not necessarily, be qualified chemists. Fluent knowledge of at least one language, particularly Italian, Spanish or Portuguese, will be an advantage. Salary £600-£1,000 according to qualifications and experience.—Apply in strict confidence, to Box 296.

QUALIFIED Chartered or Incorporated Accountant required, preferably with degree in Economics, primarily to supervise installation and control of mechanised accounting system covering total importation of specific fruit from South Africa. General business capabilities essential as eventual scope will cover wider field. Applicants should not be over 45 and should apply, stating salary required, to Box 297.

ASSISTANT required to work with Manager of Market Research Department of major oil company. Should be bright and energetic, under 30, and have university training in economics. keen interest in current affairs essential. Good opportunity for promotion within firm. Write, stating age, qualifications and salary required to Box Z.N.145, Deacon's Advertising, 36, Leadenhall Street, London, E.C.3.

YOUNG EXECUTIVE, Qualified Secretary, with accountancy experience, initiative and personality (preferably some knowledge printing, publishing or allied trades). Excellent prospects promotion. Salary according to experience. Apply with fullest record, to Denton, Hall & Burgin, Solicitors, 3, Gray's Inn Place, W.C.1.

GENTLEMAN (59), recently retired from administrative position in important concern, offers services, part or full time. Main object active occupation, rather than large remuneration. Widely travelled; linguist.—Box 295.

FOR SALE.—Economist, 1946, 1947, 1948 (1-5445), 1949 (to Aug. 20), Records and Statistics, 1947, 1948 (1-51), 1949 (to Aug. 20).—Box 284.

BRITAIN'S Middle Classes are organising for mutual protection. For details write Hon. Sec., Middle Classes Union, 43, St. Martin's Lane, London, W.C.2.

EXPORT MANAGER required by large public company manufacturing and selling a wide range of electrical and light mechanical engineering products. Successful applicant must have travelled in Europe, South America and preferably the Dominions; experience of selection, education and development of agencies in these territories essential.—Write giving age, education, past experience, salary required to Box No. 301.

ECONOMIST, 1944-49, 220 issues, good condition. What offers?—Parsons, 1, Trowell Grove, Long Eaton, Nottingham.

The Economist's Bookshop Ltd.

caters for specialists and students in

Economics and the Political and Social Sciences

11-12 Clement's Inn Passage, Aldwych, W.C.2.

WEST END BRANCH: 30A Bury Street, St. James's

Investment Statistics

Company Notes

Bass, Ratcliff and Gretton.—Group trading profit declined from £1,763,886 to £1,657,844 in the year to September 30, 1949. Group total profit amounted to £1,808,432 (£1,950,334) and net profit to £591,584 (£645,798). Net current assets at the year-end were £5,434,493 (£5,640,941) and liquid funds £4,957,702 (£6,076,647).

British Lion Film Corporation.—Net consolidated loss after provision of £1,388,797 for estimated loss on films and film advances amounted to £1,197,191 in the year to March 31, 1949. For 1947-8 a net profit of £43,843 was shown, but no provision was made for film losses. Neither preference nor ordinary capital receive a payment for 1948-9 compared with 10 per cent. on the preference and 30 per cent. on the ordinary in the previous year.

Mitchells and Butlers.—Balance on consolidated trading account declined from £1,855,738 to £1,441,279 in the year to September 30, 1949. Net profit amounted to £496,000 (£722,460). Net current assets at the year-end were £1,648,648 (£2,220,274) and liquid funds £1,435,321 (£2,365,174).

British Northrup.—Trading profit increased from £260,743 to £545,845 and net profit from £83,232 to £212,765 in the year to October 31, 1949. The recommended final dividend is 7½ per cent. (same), making a total of 10 per cent. (same). Net current assets have increased from £262,306 to £409,450 and fixed assets from £921,409 to £1,064,647.

Avon India Rubber.—Balance on consolidated trading account for the year to October 1, 1949, was £286,296 and total group profit £291,397. Net current assets of the group at the year-end were £678,000. No comparative figures are available for 1947-8.

Clutson and Kemp.—Consolidated trading profit increased from £274,514 to £391,212 and net profit from £118,690 to £232,009 in the year ended August 31, 1949. Net current assets were £333,000 (£188,000) at the year-end.

Allen and Harburys.—Consolidated profit declined from £564,062 to £441,258 and net profit from £167,623 to £124,384 in the year to June 30, 1949. The total dividend of 3s. 6d. for the year is unchanged. Net current assets at the year-end were £381,000 and liquid funds £171,585.

British Coated Board and Paper Mills.—Total group profit fell from £95,995 to £72,563 in the year to June 30, 1949.

Brickwood and Co.—Total group profit declined from £206,652 to £64,071 and net profit from £292,894 to £214,827 (after taxation of £302,058 in 1947-8 and £210,619 in the past year). The dividend has been reduced from 25 per cent. to 20 per cent.

Birfield Industries.—Consolidated trading profit fell from £1,133,010 to £880,333 in the year ended August 31, 1949. The dividend of 12½ per cent. is unchanged.

British Benzol and Coal Distillation.—Net profit for the year ended October 31, 1949, was £50,477 (£60,789). The total distribution is unchanged at 17½ per cent.

Hector Whaling.—Consolidated trading profit increased from £1,168,744 to £1,304,027 in the year to July 31, 1949. Net profit amounted to £314,289, against £293,076. Total cash at the year-end was £98,272 (£57,849) and net current assets £116,000.

Woolwich Equitable Building Society.—Balance on profit and loss account for the year ended September 30, 1949, amounted to £1,120,455 (£1,054,706). Of the total amount available for appropriation, £936,385 (£887,024) represented interest to shareholders, £50,000 (£50,000) transferred to investments reserve, £200,000 (£200,000) to general reserve, and £45,793 (£58,627) is carried forward.

Raleigh Industries.—Group net profit declined by £11,000 to £583,000 in the year to August 20, 1949. The ordinary distribution is maintained at 20 per cent.

Ilfringworth Morris.—Net profit of the group increased by £43,363 to £201,388 in the year to September 30, 1949. The total distribution of 15 per cent. for the year is unchanged.

Capital Issues

Agricultural Mortgage Corporation.—Lists will open and close on Monday, December 19th, for the issue of £3,000,000 3½ per cent. debenture stock 1965-67 at £99 per cent.

William Collins and Sons (Holdings).—Lists opened and closed on Wednesday, December 14th, for the sale of 429,000 5 per cent. redeemable cumulative £1 preference shares at 21s. per share and of 297,000 £1 ordinary shares at 26s. 6d. per share. Capital consists of £1,550,000 in £20,000 5 per cent. redeemable cumulative £1 preference shares and £1,030,000 in £1 ordinary shares. Consolidated profit, subject to taxation, for years ended December 31st: 1938 £56,720; 1947 £612,924; 1948 £386,831.

Haigh and Hamer.—Application has been made to the London Stock Exchange for permission to deal in the issued capital of £120,000 in £60,000 6½ per cent. cumulative £1 preference shares and £60,000 in 2s. ordinary shares.

Kirklees (rayon manufacturers).—Some £300,000 is to be raised by an issue of 500,000 5s. ordinary shares at 6s. 6d. per share and £150,000 4½ per cent. unsecured loan stock at £99 per cent.

Redemption yields are worked out on the assumption that all dated stocks will be repaid at latest date. Such yields are marked 'r'. To this rule there is one exception (Funding 4 per cent.) on which the yield is taken to earliest date and marked 'e'.
(a) Net yields are calculated after allowing for tax at 9s. in £. (b) Flat yield.
* Assumed average life 15 years 6 months.

(a) Interim (b) Final (c) Whole year (d) Int. paid half-yearly (e) Assumed dividend 18½% after capital bonus (f) To latest redemption date (g) Free of tax (h) Yield basis 35% after capital bonus

Statistical Summary

that he can bring the proceeds of the sale home if the sale is prevented by quota restrictions. It is only when quotas are replaced by tariffs—which can always be surmounted at a price—and when money earned by traders of one country through sales to a second can be spent by them in a third, that trade will flow again. To produce those conditions in all categories of goods and in relations with all countries is impossible at one bound; but the obvious task is to remove import quota restrictions on goods and exchange control restrictions on payments over as wide an area, both of goods and countries, as possible.

★

There are several reasons why this is a propitious moment for a fresh effort in this dual direction. The first is the pressure coming from America. It is not many weeks before the third annual appropriation for the Marshall Plan will have to be laid before Congress. It is difficult to remember a year when there was not apprehension of grave difficulty in persuading Congress to pass some important and necessary piece of legislation, and some Europeans, perhaps particularly in London, are inclined to apply quite a heavy rate of discount to some of the warnings that are coming across the Atlantic. They have, nevertheless, an urgent ring to them and they should not be disregarded. The Americans call for "integration," and though the literal meaning of the word is something more far-reaching, there is little doubt that a genuine act of liberation for European trade and payments would greatly lighten Mr Hoffman's task of persuasion in Washington.

It is not only in America, however, that reasons can be found for saying that it is now or never. There is impatience on the Continent too. The majority of the European countries are determined to be rid of at least the more rigid of the restrictions that at present bind their mutual trade. There are, it is true, elements of almost comic excess in the revival of European "liberalism," and it is not difficult for the British adherents of the welfare state to point out the social irresponsibility of many of the ideas that have taken possession of Continental minds. But the European move away from *dirigisme* cannot be ignored; it is a fact. It is in full flow in Italy; there is a strong movement in France; Switzerland and Belgium have never been in any other mood. And what is perhaps most significant of all for British policy, the Germany that is so rapidly moving back into the place of the most powerful economic unit of Continental Europe (and the most direct competitor of Great Britain throughout the world) is a Germany whose economic policies are based on the assumptions of a free market.

That the devaluation of sterling did not get a better psychological reception on the Continent was only in quite a minor degree due to the manner of its announcement; it was mainly due to the fact that it was not accompanied by any action, or even any tiny gesture, in the direction of liberating sterling. Right or wrong, the Europeans do not trust or wish to hold a currency which does not look as if it will ever be free for them to spend as they desire. There are prophecies going round that before long many of the European currencies will be made fully convertible, as Belgian and Swiss francs are now. This is perhaps an excess of "liberal" optimism; but it is not inherently impossible. What would be the position of Britain if the pound sterling were the only

important currency still blocked? What would happen to British trade if sellers avoided sterling? And what still worse fate would befall the City of London, with its still very large invisible earnings?

These are the reasons for making haste. But though they are perhaps more visible than they have been, they are in no way new. What is new, and all-important, is the willingness of the United States to permit and encourage partial solutions. It has not been sufficiently remarked in public, but perhaps the achievement of the September conference in Washington that is of greatest immediate importance is the agreement of the United States (tacit at least) not to stand upon the letter of the famous Article Nine of the Loan Agreement of 1945. The policy of non-discrimination is in at least partial and temporary suspense. The significance of this is immense. Hitherto, any proposal to make holdings of sterling convertible into any other currency have had to be extended to make them convertible into dollars—at least in theory. That was the trouble with the ill-fated convertibility of sterling in 1947. The pound could then safely have been made convertible into most of the world's currencies; but unfortunately the Agreement insisted that it must also be convertible into dollars. It is a great step forward from those days that European countries should now be able to relax their import quotas and their exchange restrictions in favour of each other without immediately extending the same concessions to the dollar world. This is the essential new condition which permits progress by stages, and thus makes progress, for the first time since the war, practically possible.

★

The various plans that are put forward differ in their technical details. But circumstances force upon them a considerable resemblance in general outline. On the commercial side, they would require the European countries to remove quota restrictions on the import of each other's goods over a wide range of categories. On the financial side, they envisage breaking away from the present network of strictly bilateral payments agreements and establishing some central mechanism of clearing for the European currencies among themselves. The British plan is believed to be based, in large part, on a reversion to Keynes's original plan of a Clearing Union, which would be operated by the Bank for International Settlements at Basle. A clearing is of very little value, however (as the existing Intra-European Payments Scheme has shown), without some satisfactory provision for the settlement of the net balances which result. The defect of a scheme that makes no provision for the settlement in gold or hard currency of net debts is that it provides the debtor with no incentive to become a creditor. The defect of a scheme that provides for such settlement in full is that it imposes such a terrible penalty on debtors that they will throttle their trade rather than run up a deficit. Clearly, therefore, the path of wisdom is to make the debtors redeem some part, but not the whole, of their debts in hard currency. If the United States were willing to put some dollars into the scheme—and the unallotted \$150 million of the current year's total funds is offered—creditors could get more dollars out of the scheme than the debtors put in. For habitual debtors and habitual creditors there will also have to be an appropriate set of pressures to mend their ways—pressures strong enough to achieve some result

but not so strong as to amount to dictation. It is here that some flexibility of exchange rates would be useful.

The efficacy of any such scheme would clearly depend first on the extent of the initial local currency contributions that the member countries were prepared to make to it—that is, on the fresh overdraft facilities that they will give each other—and secondly on the effectiveness of the measures intended to remove chronic disequilibria in the balances of payments of the European nations with each other—for without them, any clearing union would quickly be deprived of its dollar resources and glutted with soft currencies.

It is not therefore—as much American comment assumes—a simple matter of faith and good will to liberate the European economy. There are real and obstinate difficulties to overcome. It is safe to say that without British collaboration no such system could be made to work. But if the British contribution is the most essential, it is also the most difficult. Some Americans, and most Europeans, still fail to realise how genuine and special some of the British difficulties are. There is the whole complex of questions arising out of Britain's relationship with the sterling area—questions which are not simple matters of whom the British love most, but difficult matters of the diversion of trade and supplies. There are also difficulties arising out of the past pattern of trade. Before the war, Britain was, generally speaking, in deficit with western Europe and a steady supplier of dollars for European needs. If the liberation of trade meant a simple reversion to this pattern, it would be ruinous to Britain in a degree which finds no parallel on the Continent.

Burma in Dissolution

HIGH on the agenda of the Colombo Conference will certainly be the affairs of Burma. The chaotic disorder into which that unhappy country has fallen directly affects the security and food supply of India, important commercial interests of Britain and the interest which Australia has acquired since the war in the maintenance of peaceful conditions in South-east Asia. The fact that Burma was a British dependency until two years ago gives the Commonwealth a special concern with its fate. But Burma is a world problem, especially in view of the recent extension of Chinese Communist power to its north-eastern borders and the possibility that it may become one of the liveliest sectors of the international "cold war." The situation in Burma should not be beyond the range of vision of the United States, nor should reference to the United Nations—as in the case of Kashmir—be excluded from any proposals for assistance to Burma which may be discussed among members of the Commonwealth.

When power in Rangoon was transferred to Burmese hands and the last British Governor took his departure amid demonstrations of the friendliest feeling on all sides, Britain certainly wished the new Burma a prosperous and successful future. Today Britain has neither the will nor the capacity to resume control in Burma, and British good will towards the Burmese people has in no way diminished. But nothing is to be gained by euphemism, and some plain speaking about the new Burma cannot be avoided. The deplorable fact is that of all

But if there are these real difficulties it is only fair to say that there are also some unreal bogeys to which far too much attention is paid in Whitehall—bogeys arising out of the fears generated in 1947 or out of ideological dislike of the Continent's revulsion from *dirigisme*. There is one school of thought in London which sees in all of these plans a plot to prevent sterling from resuming its natural role as the currency of account in European trade. There is some substance in this; but the distressing fact is that sterling is not yet ready to resume this role, be the fault whose it may; and events will not wait.

Real or unreal, the difficulties must now be resolved. There are risks for Britain in engaging in any of these initiatives of liberation of trade and finance in Europe—risks to the British balance of payments and risks to the sovereignty of domestic economic policy. But the political and economic risks of not going forward are still greater. On the political side, Britain is already in danger of being cast for the role of dog in the manger. On the economic side, there are all the risks of being progressively excluded from the commercial and financial community of the world.

The ominous fact is that Britain has come perilously close to a position of isolation. This may perhaps be not wholly unwelcome to the present mood of many of the British people, badgered and beset as they are by the cold realities of a world they did so much to save. But if so, the greater is the need for statesmanship to give a clear lead in taking the calculated risks. For there is no country in the world of which it is more obviously true that isolation spells ruin.

★

These conditions undoubtedly faced any Government of Burma with an extremely difficult task. They would perhaps have justified a postwar period of direct British rule to restore the essentials of law and order and get Burma's economy back into working order before handing over power to inexperienced Burmese politicians. But the Burmese nationalists had no doubt of their ability to run their country, and on the principle that self-government is better than good government the British authorities gave way to them; above all, the transfer of power in India made it impossible to treat

Burma differently, for there is nothing that Burmese so much resent as any suggestion of inferiority to Indians.

Having been given power, however, the Burmese must be judged on their record, and the serious initial handicaps from which they have suffered cannot alter the fact that the record has been one of utter disintegration and collapse, in the most painful contrast not only to India, Pakistan and Ceylon, but also to Siam and even—since the excesses of the immediate postwar period—to the Indonesian Republic. Assassination has eliminated several of Burma's ablest leaders; there have been, not one, but several, civil wars of armed factions going on simultaneously, and government over a great part of the country has been reduced to the collection of tribute by local gangsters at the point of a gun. The economic life of a nation almost uniquely favoured in proportion to its size with exportable surpluses of food and raw materials in demand on the world market has been thrown into such confusion that the Government is faced with bankruptcy and foreign companies, even when their assets have not been expropriated, find themselves unable to carry on.

In this depressing picture, the Karen revolt is an element of particularly sombre significance. The Karens are a people who were oppressed under the old Burmese kingdom and sided with the British during the Burmese wars; they are therefore associated in Burmese minds with the imposition of a foreign rule, while the Burmese in their thoughts represent an ancient tyranny. The old cleavage was renewed in 1942, when with a few exceptions on each side, the Burmese joined or did not resist the Japanese invaders, while the Karens and other border peoples of Burma remained loyal to the British. The resistance of the Karens brought on them not only savage reprisals by the Japanese, but also massacres by the Burmese irregulars who first aided the Japanese and then came over to the British side when the Japanese power was crumbling. By subsequently quitting Burma the British left all the minority groups in Burma which had stood by them in their adversity at the mercy of the Burmese. The British Government was anxious not to interfere in any way in the internal affairs of the new Burma and incur the charge of using the minorities to put pressure on the Burmese leaders; on the other hand, some British ex-officers who had served in Burma and felt strongly that the Karens had been let down encouraged their agitation for autonomy to an extent which put a great strain on British-Burmese relations. Some British unofficial pro-Karen activities have been, to say the least of it, indiscreet in a foreign country—which Burma now is. Yet Britain certainly has a moral obligation towards the Karens and the Karen revolt is the most serious single issue now confronting the Burmese Government.

If a settlement with the Karens could be obtained, the prospects of success for the Government against other rebellious groups, including the Communists, would be greatly improved. In a sense the demands of the Karens have already been granted, for the Burmese Government originally agreed in principle to the formation of an autonomous Karen state within the Burma Union. But it has always also insisted that the Karens must first give up their arms; the Karens, however, have learnt from bitter experience that without weapons in their hands they are exposed to massacre by Burmese mobs or undisciplined troops which the Government, whatever its intentions, is unable to control. There is further the question of the boundaries of the autonomous state; the scattered ethnic distribution of the Karens is such that no compact territorial unit including all the Karens is possible without virtually surrounding Rangoon itself. The only solution—though it is a *pis aller*—seems to be an exchange of populations with a Karen state comprising Tenasserim and the Moulmein region;

if the Karens cannot live in security in the Irrawaddy delta, as it appears they cannot, they will have to be accommodated in a national home further to the east. A settlement on these lines is possible, and would probably be durable, but as things are now, the hatred and distrust between the Burmese and Karens are such that warfare can go on indefinitely and even a Burmese victory would bring no real peace.

The essential point as regards the present economic position in Burma is that it is useless to put foreign money into Burma for economic rehabilitation, whether in the form of a loan to the Burmese Government or

of new capital expenditure by private enterprise, until a certain minimum of law and order has been re-established. In general, it is a sound principle that to preserve a country from Communism it is not sufficient to provide arms and supplies to a would-be "strong" Government; it is necessary also to reduce the popular appeal of revolutionary extremism by promoting real economic progress. But in such conditions of anarchy as exist in Burma money spent on the economic development of the country, without some restoration of responsible authority, would be merely poured down the drain. The transport on which depends the movement of rice, teak and tin to the ports is nearly everywhere intercepted by marauding bands who levy "contributions" on trade; the oil companies have been trying to operate their business with their pipe-line in the hands of rebel forces. It is vain in such circumstances to expect political improvement from an economic recovery, when the economic recovery is thwarted by civil war and banditry.

Priority must, therefore, be given to the task of

strengthening the central Government and its military forces, so that the authority of the state can be restored in at least the key areas of the country. Only when this has been done will it be practicable to undertake tasks of economic rehabilitation and development in Burma, whether by loan or fresh private investment. The Government's political and military recovery depends on the political leadership of the Prime Minister, Thakin Nu, and the military capacity of the War Minister, General Ne Win; both are men in whom it is reasonable to place hopes for a revival of Burmese national life. If assistance is given to them, it is desirable that as few strings as possible should be attached, so that the Burmese Government may not be exposed to the charge of selling out to "imperialists." But one condition should certainly be imposed: that the Burmese Government invite the good offices of a mediator to be appointed by the United Nations for the purpose of a settlement with the Karens. It is intolerable that British arms and supplies should be used—as they already have been—

The Co-operatives—II

Finance and Customers

WHAT has been said in the preceding article in this series about the co-operative movement's attitude to retail markets and to manufacturing enterprise can equally well be said about its finances, namely that the size and scale of its past achievements have produced a cautious conservatism in its present habits of thought.

In 1948, from a turnover of just over £500 million, the retail societies made a net surplus (after paying share interest at 2½ per cent) of a round £40 million. Since the average dividend was 1s. 5½d. per £ of sales, about £36 million out of this £40 million must have been repaid to members, although a great deal of this doubtless found its way back into the movement through such channels as thrift clubs, house purchase schemes, savings banks, etc. Share and loan capital and sundry funds increased by £3½ million in 1948, which may represent roughly the extent of members' accumulation.

The retail societies operate under the Industrial and Provident Societies Act, with £1 withdrawable shares of which no member may hold more than 200; £24 is, in fact, the average holding. Since these societies constitute the membership and supply the funds of the wholesale societies, their capital is the basis of the whole movement. The published figures for the British and Irish Societies at the end of 1948 show the retail societies to have had between them total resources (in round figures) of £398 million. The two main sources of capital are share capital (£245 million) and loan capital (£60 million). Out of this total of £398 million, no less than £270 million was not employed directly in their own trade, but was invested, most of it in the Wholesale Societies.

The English and Scottish Wholesale Societies together showed at the same date total resources of £322 million, but of these only about one quarter was employed directly in their own trade. By far the biggest item among their assets consisted of investments totalling £242 million. These are represented by holdings in other co-operative undertakings, and other investments

for the suppression of a brave people to whom Britain owes an unpaid debt of gratitude; without such unilateral aid the Burmese have no prospect of decisively crushing the Karens, but as long as the war against them continues, the Burmese army will prefer to fight them rather than to oppose the Burmese Communists.

The Burmese-Karen war must be brought to an end; then progress can be made. But if the Burmese Government were to refuse even this condition for international assistance, it would be impossible to save it from disaster. The time is likely soon to come when it will be unable to pay such troops as it has; in the sequel not only the Karens, but also the Chins and Kachins would probably break away from a derelict Burma, and if the Chinese intervened in Burmese politics, as they well might, an Indian counter-intervention would almost certainly follow. Only statesmanship in Rangoon can now preserve Burma from still greater evils than it has had to endure in the last eight years.

held by the CWS's own banking department. The Co-operative "Bank" handles, in effect, the proceeds of a gigantic thrift organisation, and acts as a central agency for investing the accumulated savings of the movement.

On the footing, presumably, that its function is to be the repository of savings which, in the main, not only come originally from the poorer sections of the community but also are normally less mobile than ordinary bank balances, the CWS "Bank" has never been burdened with the obligations and conventions which are imposed upon the commercial banks. In particular, it is not subjected to the Treasury prohibition of payment of any interest on customers' current accounts or to the low maximum rate which the Treasury prescribes for deposit accounts; neither is it required to take up a quota of the Government's week-to-week issues of low-yielding floating debt (this offers only ½-¾ per cent per annum) or to keep in the form of cash the customary minimum proportion of its deposits. Because of these immunities, the "Bank" has been able to employ some nine-tenths of its resources in higher-yielding gilt-edged securities, mortgages and advances which necessarily are less liquid and offer greater risk of depreciation than the very liquid assets which must be substantially held by banks the bulk of whose deposits are payable on demand. This investment policy enabled the CWS banking department to offer to its depositors much higher rates of interest than those paid by the clearing banks even before, on the outbreak of war, the Treasury began to impose its own control; since then, and especially since 1945, the disparity has become much more marked.

So long as the CWS "Bank" adhered strictly to its function of acting as a thrift organisation, there was, perhaps, little justification for the restiveness occasionally shown in commercial banking circles at these privileges. The peculiar status of the CWS banking department began to raise quite different issues, however, as soon as it began, after the war, to attract the banking business of local authorities away from the com-

mercial banks and, more recently, to assume the banking business of the North Eastern Gas Board. If the CWS is to continue in this business, it ought to assume the obligations which are imposed upon the commercial banks.

★

The British co-operative movement is founded on the consumer. But nowadays the co-operative consumer's role is in the main a passive one. Broadly speaking the societies in the south, facing keener competition, aim at achieving market prices, while in the north slightly higher prices and dividends seem to be the rule. The original conception of dividend was that it was only incidental, a by-product of the attempt to abolish private profit. More and more, however, it has come to hold the centre of the stage; action is taken to defend it; it has even given rise to the absurdity of co-operators protesting against the price control squeeze of all profit margins on the grounds that they do not allow a "fair dividend" to be paid by the co-operative sector. There are, no doubt, excellent reasons of expediency for defending the dividend. It is a thrift forming device for the poor, and an excellent advertisement; moreover, low prices are all too readily identified in retail trade with poor quality. It has, however, raised a hornets' nest of accusations, suspicions and resentment among those outside the movement which grows as the movement grows, and which lends some colour to the view that if it is to appeal successfully to the whole population, the movement should aim at a straightforward policy of charging the lowest prices that will cover cost, and letting the dividend-hunters go hang.

Appealing to middle-class custom in general is a problem that co-operators have not yet faced. Social snobbery, acting in fifty undefinable ways, is no doubt a big obstacle. Even the housewife who shops for household goods by means of the telephone and quarterly account is not generally catered for, though such services are near necessities for many business women. But all middle class custom involves including an element of

service which the co-operatives have so far studiously avoided. In their relations with working class customers, they have a tradition of discouraging the unnecessary proliferation of services, on the grounds that these are only devices for diverting attention from the prime necessities of price and quality. In so far as delivery services in urban areas, credit accounts, elaborate showrooms and big stocks of more expensive foods would increase the prices of commodities to the mass of poorer customers who have no use for these things, the retail shops are no doubt justified in sticking to their old character. But there are no signs that they are even seeking to discriminate where they can. A small charge on the dividend rates of those concerned, for example, would enable credit accounts and van deliveries to be provided everywhere, without sacrifice of principle, for those who find them worth while.

Advertisement is a slightly different case. Until recently it was regarded in much the same light as any other squandering of profit on inessentials. Now that this attitude is changing, however, the lack of any strong centralised organisation to co-ordinate advertising campaigns on a national scale is becoming an obvious drawback; the individual and unwieldy nomenclature of the thousand-odd separate societies is another; perhaps worst of all is that fumbling mouthful "Co-operative Movement" of which "Co-op" provides but an undignified stump. This is not mere fancy. There is a lot in a name, as every experienced advertiser knows, and when all the retail societies in 1948 agreed to cut their foodstuffs prices for a year, the main attempt to present the facts to the public had to be made (somewhat ambiguously) under the name of the CWS.

The movement's attitude to the consumer market seems in fact to be, "If you want me, you know where to find me." So far it has worked. But there is nothing to suggest that the colonel's lady will follow Judy O'Grady into the Co-op store without a lot more coaxing.

(To be concluded)

Alas, Poor Dobbin

(From an Old-Fashioned Correspondent)

PERSONS whose opinions proceed rather from sentiment than from reflection may find matter for regret and misgiving in the contemplation of London's horse-traffic; regret for its vanished glories, and misgiving for its future survival. Those, however, who take pleasure in speculating upon the significance of trivial incidents cannot but feel the singularity of the circumstance that when a horse bolted into the crowd at the recent Lord Mayor's show, even in this year of grace when people have so long been pampered by mechanical contrivances, a young gentleman appeared from among the bystanders, seized its head, soothed its terrified plunging with a skilful touch and, in short, reduced the emergency to a commonplace mishap to be put right as coolly as a loose bootlace. Familiarity with horses, as well as sentimental regard for them, is happily still widespread among town dwellers. Fifty years ago, half a dozen men in any crowd might each have stopped a runaway without

exciting remark. Fifty years hence it is debatable whether horses of any description—from spirited runaways to such as fall down when taken out of their shafts—may not have become as rare a sight upon the streets of London as prancing elephants.

All but the most youthful readers will clearly recollect that in September, 1907, *The Economist* ventured to predict that the sentence of commercial death, universally pronounced upon horse traffic with the arrival of the motor car, would prove to be premature. No doubt they have since been awaiting a reconsideration of the subject. Although this earlier optimism may be said to call for some modification, nevertheless one cannot but feel that it has for a long time been vindicated by events. In 1911, of the 71,000 vehicles entering the City of London, no fewer than 52,000, or 77 per cent were horse-drawn. Today, the proportion in the City is less than 1 per cent, and in the whole Metropolitan

area about 2 per cent. The absolute number, however, although no exact figures are available, is still remarkably high. Just before Hitler's war, for instance, in a 12-hour census in Greater London, no fewer than 60,000 horse-drawn vehicles were observed—surely a surprising testimony to the species' power of surviving the revolution in every aspect of its environment. How bizarre it would seem, if our perceptions were not blunted by its daily familiarity, to meet amid the towering omnibuses and fuming lorries on the Commercial Road two classically beautiful shire horses, no more disturbed by the uproar than if they were in the middle of their own green field; or to glimpse between the flashes of those long, low "automobiles" that glide silently about the streets of St. James's the old milk van, its pattern unchanged in living memory, rattling and swaying behind a brisk-trotting cob, a "reglar little 'oss coming along rayther sweet."

Moreover, this truly remarkable persistence of draught by animal power in our urban thoroughfares can in nearly every instance be justified by the creature's economy, the grand *desideratum* in all questions of commerce. For short broken journeys, for stopping and starting in traffic, for a constant alternation of exertion and recovery, the constitution of the horse is ideal; he gives of his best where the wear and tear on a petrol engine is most excessive; he can be switched from an empty to a full cart without delay, and removed altogether from fish and meat carts while they are hosed. The so-called mechanical horse or detachable petrol motor for trailer-vans is but an ironical form of flattery.

For light work on a tradesman's delivery van the capital expenditure on horses is very low. A young cob can be bought for £40 or £50 and with care and good luck may give from ten to twenty years' service, and even then be worth a substantial proportion of his price at an auction. The case for the heavier shire horses is a more debatable one. A first-class young shire horse may cost anything up to £200; he eats, if he is in a railway stable, about 32 lb. of fodder a day, and in consequence of "the 'ammer, 'ammer, 'ammer on the 'ard, 'igh road" wears out a set of shoes every few weeks. Many long-term questions like the growing scarcity of farriers, the increased prices of harness and fodder, and fluctuations in the prices of horses themselves, make expert comparison of the cost of horse and motor transport for heavy loads a matter for nice dispute.

Dickens averred that no cabhorse could perform three consecutive miles without going down, a source of entertainment vastly to be preferred in what he called "these

days of universal lassitude" to "them carriwans of hominibuses." The accident rate on London streets, however, has not declined *pari passu* with the number of horses, a circumstance all the more remarkable in view of the present-day fashion for many gentlemen—and ladies, too—to drive their own conveyances, a steady, well-conducted and sober class of persons having thus largely taken the place, so it would seem, of drivers with habits and character the very reverse. Modern horses, on the other hand, are the most careful road-users; they keep their feet more cleverly than their ancestors appear to have done, in spite of the slime which a light shower often spreads treacherously over the tarmac.

★

Standards of care and attention are commonly agreed to be higher now than they ever were. The Easter parade of light turnouts in Hyde Park attracted 340 competitors in 1949, from costermongers to big dairy firms, while the heavier horses have their parade at Whitsun. These van horsical events, as Tristram Shandy would have called them, focus attention on the horse's welfare, not on its pedigree. There is, unfortunately, a cynical reason for the greater care of horses since the war; cast-off animals command a good price for slaughter, and the Royal Society for the Protection of Cruelty to Animals find that those auctioned for destruction or export need a sharper eye kept on their welfare than those still at work in the streets. The society has also been largely instrumental in ending the old controversy about docking horses' tails; an Act prohibiting the practice comes into force in January, 1950, and the enthusiasts for hygiene must bow to the humanitarians.

Railway horses, of which there are above a thousand in London, are universally admired for their spruce condition. Chosen for plain work, not showmanship, they nevertheless make a fine sight; any pair of them, breathing smoke on a sharp morning and nodding away like clockwork on their solemn progress, is worth a second glance. An even heavier class of horse belongs to the brewers, whose tightly-packed drays of barrels carry about four tons. Theirs is the slow business of delivery to individual premises, and they experience more inconvenience from the banishment of slow-moving traffic from busy thoroughfares in working hours than do the dairies or railways. Whitbreads' stables were praised over a hundred years ago—"the beauty and amiability of the horses is quite affecting"—and although the number of horses there is now only thirty, these are all first-

rate animals, fit for the honour, which is still bestowed upon them, of drawing the Speaker's Coach on state occasions.

It is the lighter equipages which have suffered the most serious decline. Apart from the delivery vans and the little carts, which still hawk logs or vegetables through the residential streets, there is hardly a light turnout to be seen and few of any elegance. Your correspondent can recall only Dapple, who pulls the van of Lloyd's Register of Shipping, the spanking bays of Messrs Johnson Matthey, the Hatton Garden gold merchants, and the smartly liveried turnout of Messrs Scott, the West End hatters. There may be one or two barouches or victorias mouldering in forgotten mews. Even the Royal mews, which fifty years ago had as many as one hundred and forty horses, now house only thirty—all carriage horses—although they still maintain seventy-one equipages ranging from the state coach through landaus and broughams to homelier luggage brakes and dog carts.

Even more noticeable is the disappearance—apart

NOTES OF THE WEEK

Arms Across the Atlantic

The agreement between the United States, Canada and this country to begin gradual progress towards standardising weapons, equipment and training is to be warmly welcomed—on one condition. The condition is that American service advisers are ready for more give and take in staff work, more genuine exchange of ideas and sharing of tasks than they were during the last war. Unless there has been, or there is in progress, some such change of heart, the three partners must expect irksome and protracted arguments, which will delay the economies and improvements in efficiency which standardisation could bring. With the best will in the world progress must be slow—a matter of years—and a lot will depend on the mood in which the first exchanges are made.

Standardisation is, of course, not just a matter for staff officers and civil servants. It affects industry—and peacetime industry at that—down to the very screws and their threads. For a decade or more it will mean expensive and complicated double-stocking. There will have to be an interchange of ideas and plans on a scale and at levels never before attempted within an alliance of free and equal governments. Even to agree on the design of a standardised jeep is—as the French and British know—a diplomatic task of a delicacy indescribable.

With this agreement between nations that speak the same language the first difficult step has been taken: each government's observers will be watching in the other two countries demonstrations and tests which may produce results of "common interest." As weapons and equipment are standardised, so will be training in their use. What arrangements will be made about patents and payments are not revealed; in this field alone there is much to be clarified and agreed.

Hundreds of Brass Hats

A curious feature of this arrangement with the Americans and the Canadians is that its three-cornered pattern cuts right across the political, defence and other patterns drawn across Europe and the Atlantic area by British foreign policy. The British do not belong to the North American group of the Atlantic Pact, in which the Canadians and Americans collaborate. Nor do the Americans belong to the west European group with which the British are principally concerned. Is it therefore intended that French and Belgian

from a few officers of the Guards and children in Rotten Row—of the saddle horse. The independent gentleman of modest means who detests the public transport system nowadays flaunts his bowler hat above, not a cob, but a bicycle. Only the dignified horses of the mounted police and the splendid black chargers of the Household Cavalry remain to comfort the solitude of London's many equestrian statues.

Horse-drawn transport promises to survive for some years yet, but it will disappear, when it does so, abruptly. Like its romantic counterpart the sailing ship, it is not an expression of one skill but of many. Just as a sailing master cannot command a schooner without having at his back a whole army of riggers, sailmakers, and experienced hands, so also a London stable depends upon the services of breeders, farriers, harness-makers and veterinary surgeons; decline in the whole business is cumulative with vanishing skills. But how much we shall miss horses when they go. What mere motor ever earned—really earned—the name of Dumpling?

standardisation should be only with the British? Or is it intended that the British should pass on American and Canadian ideas and designs to the Continent? In Paris this English-speaking arrangement will certainly be once again interpreted as a sign of British determination to play a separate hand with the Americans—whether for security or other reasons.

Indeed, the whole committee organisation of western defence is ripe for searching review—before it expands to bursting point. There is a real danger that each of the five planning groups in the Atlantic Pact organisation will now start developing on the generous scale of the Brussels Pact committees. The Norwegians and Italians cannot be expected to show any less zeal for paper-passing and sub-committee forming than the British and Americans; and the time is not far off when the number of those who deal with some aspect or other of western defence plans will number not hundreds but thousands. A tremendous brass-hat interest is being built up at great cost in men and money.

At the root of this cancerous tendency is the determination of each government to "hold its own." In the capitals of western Europe fear of the political implications of co-operation is almost as strong as the desire for its benefits. Even in the agreement on standardisation this fact stands out in the statement that

Co-operative arrangements for this purpose do not impair the control of any country concerned over any activities in its territory.

Either this means nothing and is therefore superfluous or it means that governments still think they can really carry out the purposes of the Atlantic and Brussels pacts without some diminution of national sovereignty. In fact, the main obstacles to any real integration of forces such as might save money and lives are still political; and the multiplication of committees and papers is one of the ways in which the politicians—among them Mr Alexander—keep their real problems from rising to the top of their in-trays.

Stalinmas—1949

In the story of Stalin's birthday and of what the Communist party is making of it there is much that is ludicrous and much that is sadly impressive. In the tributes and the presents that have been collected for the "genial father of humanity" Byzantine ostentation, vulgarity, mass flattery

and propaganda nonsense jostle with genuine respect, sincere personal feeling and shrewd party calculations of political profit.

It is a far cry from the Alfa Romeo car of Hollywood magnificence, offered by Italian Communists, to the iced cake sent by women admirers in the Isle of Wight; from the fawning tribute of European intellectuals to the "giant of thought and action" to the breezy message from Mrs Ball of Camden Town—"It's my old father's birthday, too—same day, same age"; from the massive red lace sent by the Mayor of Calais to the pledge of the Pishma copper electrolytic refinery that it will produce 24.5 per cent more refined copper than in 1948. Sufficient pairs of socks have reached the Kremlin to last the whole Politbureau half a century; and if there is any question whether members of that body will survive that long, it can be answered by astrologers with the aid of the planetarium which is being presented by the Zeiss workers in eastern Germany.

For Soviet propaganda purposes it is a happy coincidence that the span of Stalin's life should have reached three score and ten in the year in which their "peace campaign" has been raging. Indeed, this birthday falls so close to Christmas that in some simple minds the two festivals have become confused. The Communist press of western Europe, especially in France and Italy, has been full of touching little stories revealing how the meek and humble and ignorant have been dazed and misled by the incessant repetition of the charge that the Americans and British want war, whereas only the Russians and their allies want peace. The confusion reaches its height, as one might expect, in eastern Germany; there a certain Johannes Becher, president of the Communist-controlled Culture League, has said:

It is Stalin's incomparable historical merit that the time is drawing near when the great dream of humanity, the 2,000 year old message of peace on earth, is at last becoming a tangible reality to the joy of all peoples.

It is clearly a matter of some importance that Tito's birthday on May 25 should be celebrated on similar lines.

Return to Incentives

There seems to be an implicit recognition on the part of Ministers that the present Government has made the least headway in the very field of policy in which a party grounded on Socialist theory and backed by Labour votes might have been expected to be most successful—the planning and fulfilment of a proper distribution of manpower between the various industries. Last week the Minister of Labour announced that "the ring fence" which at present forbids workers in agriculture and mining to leave these industries is to be abandoned from January 1, 1950, although the other aspects of the Control of Engagement Order, including the unused weapon of the direction of labour, would remain. On Wednesday of this week the Minister's Joint Consultative Council, the astral body which brings the representatives of labour and the employers together, met to consider hours of work and questions of labour direction.

It is plainly right that, whatever else can be done to improve the direction given by the Ministry of Labour to floating labour, the "ring fences" around the two industries should go. They conflict with every principle of freedom, and although the law has been sparingly applied, Mr Arthur Horner is probably right in saying that they have discouraged recruiting in coalmining. But the removal of a restriction on liberty does not constitute a positive policy. The Attorney-General, speaking at Brighton last weekend, frankly confessed himself in favour of a policy of economic incentive, including a study by the trades unions of the possibility of a new wages structure linked more closely to production and less to

old-fashioned differentials, together with an adjustment of taxation to give greater incentive to earnings. He is undoubtedly right. It has taken Socialists, whose creed was largely evolved in reaction to the brutal effects of an excessive addiction to economic incentives, a long time to realise that to abolish them altogether leaves a government which wishes to control the economy with the alternatives of acquiescing in stagnation and chaos or of using force. And the present Government, like any other British Government, is ready enough to assume the legal panoply but not to wield the bludgeon of force. It is, therefore, slowly and painfully being forced back to a recognition of the part that economic incentives must play in a sensitive economy. The sooner it is recognised that too little reliance on material incentives can do as much harm as too much, the sooner will the political parties and special interests which support them be able to devote their energies to more fruitful forms of argument.

* * *

Is Labour's Patience Exhausted?

One of the least pleasing features of the Government's pre-election psychology has been its gradual acquisition of a combined persecution mania and permanent sense of moral outrage. When, last year, Mr Bevan characterised the British press as "the most prostituted in the world" most people charitably ascribed the outburst to Celtic temperament, but now the whole Government front bench is denouncing its critics in similar tones, if not with equally unbridled choice of epithet. Concerns threatened with nationalisation should not—must not—protest. If the law as it stands cannot be interpreted (a kinder word than stretched) to scotch Mr Cube and Sir Loin, then the law must at the earliest opportunity be altered; so says Mr Herbert Morrison. Periodicals must not run feature articles criticising the groundnut scheme, still less must they invite comment (shaped in the usual journalistic conditions of optional anonymity) from anyone connected with that scheme; so says Lord Addison. Members of the Opposition must not cast aspersions on the terms of compensation awarded to gas stockholders, they demonstrate thereby that "the gilt is off" their own patriotism; so says Mr Glenvil Hall. The Conservative Party must not exhibit posters implying that they are interested in child welfare—so impudent a claim shocked Sir Hartley Shawcross. The Stock Exchange and those who use it must not mark down the price of those Government securities which fail to hold the public favour, nor talk about the reasons for that failure—such "goings on" call, says Dr Dalton, for "further measures" to curb "money lenders."

Further evidence of persecution mania is provided by the successive campaigns, official and unofficial, to blame the wicked foreigners for everything that goes wrong. The wicked Americans' prices were too high and are now too low; the wicked Canadians will not enter the sterling area; the wicked Belgians have seduced half of Europe into deflation; the wicked Argentines think the price of coal is relevant to the price of beef; innumerable wicked governments, emulating Sir Stafford Cripps, have thrown austerity spanners into the export drive; sterling, as every Government supporter now knows, was devalued because the whole wicked outside world ganged up to overthrow it.

If Labour's spokesmen were to pause and, as it were, listen to their own voices they might get a salutary shock. They might reflect what speaker and what regime could have been unhesitatingly identified ten years ago by addiction to rage against critics, oburgations against scapegoats and a general obsession with encirclement. It is through fear and self-

righteousness rather than an active taste for oppression that men commonly become tyrants.

* * *

Departmental Diets

On Thursday of last week the House of Commons debated that perennial subject—the nation's food—for which material had already been provided by the publication of a White Paper on food consumption in the United Kingdom (Cmd. 7842). Unfortunately, the debate, which took place on the adjournment was concerned only with nutrition. Members, therefore, spoke about calories, proteins, vitamins and "fat deficiency" and about the relation of nutrition to the fall in infant mortality and the rise (in Scotland) of the death rate from tuberculosis. In short, they talked about things that had some meaning during the war when food supplies were always problematical and it was a matter of real concern that enough of the right foods should be available for consumption and distributed according to need.

Today, the position is quite different. Food supplies have now reached a point, both in total amount and in variety, which allows all but the most foolish of housewives to provide, if she wants to, a diet that the nutritionists would call balanced. It is indeed high time that that word "calories" disappeared from statements on food supplies. During and shortly after the war, it had a certain use in that it provided the only available measure of what those total supplies were compared with what they should be. Now, however, it has become virtually meaningless to point out, as the White Paper points out, that the calorie level rose by 3 per cent to 2,980 in 1948-49. Mr Walter Elliot, in fact, put the calorie firmly in its place by declaring that the consumption of calories in Beda and Zuru in Nigeria was respectively 2,639 and 2,947.

The average person in this country does not want to know about such esoteric matters as calories and proteins. He wants to know, first, why he cannot have more meat and sugar; secondly, what is going to happen to food prices; thirdly, whether there is any chance of rationing being abolished or at least greatly relaxed; and, fourthly, if he has an eye on the future, what will happen to food supplies when the next balance-of-payments crisis comes along. He can have found no satisfactory answer to any of these questions in last week's debate. The housewife's dream of being able to buy what she likes, where she likes and when she likes will have been rudely shattered by Dr Summerskill's apparent belief in rationing for rationing's sake:

We look forward to the day when we can allocate that balanced diet, which has its full complement of every nutrient that hon. members of the House would like to see, without having to consider the supply question.

But perhaps Dr Summerskill's belief that the "dark days of 1947 have gone as far as food supplies are concerned" and that housewives "may look forward to the future with confidence" is due for a rude shattering as well.

* * *

Funds for Federal Germany

For some time past, it has been clear that one of the chief obstacles to further economic revival in western Germany is the acute lack of capital. The new agreement signed between the Federal Republic and Mr McCloy, the United States High Commissioner, who is also head of the ECA Mission in Germany, should go a little way towards easing the problem. The agreement allows for the release of just over one billion marks from the ECA Counterpart Fund to be invested in western Germany. The four largest categories of investment are to be heavy industry, the expansion of electricity, agricultural projects, including the settle-

ment of refugees and—a smaller sum—the development of housing.

This agreement has political as well as economic significance. It is one more milestone in Germany's progress towards equality of status with its neighbours in western Europe. Since the coming into being of the High Commissioner's office, all American aid to Germany, whether from State Department or from War Department funds, has been administered through the ECA mission, so that the conclusion of the agreement brings ECA procedures in Germany virtually into line with those adopted in other European countries.

The Germans hope that this release of a billion marks will pave the way for further investment. Nevertheless, Dr Erhard, Federal Minister of Economics, estimates that another four billion is urgently needed if full reconstruction is to be achieved. Part of this sum, he believes, may be provided by German savings, provided the taxation system is designed to encourage private investment. But the bulk of it must, he declares, be attracted in the shape of foreign capital from abroad. By this he does not mean the continuance of governmental aid, but the free development of investment between German and American private industry. Indeed, for a state official, Dr Erhard expressed himself with some firmness on the question of state loans and state investment. "I should like," he told an audience in Germany recently, "to see the half-wit who will entrust his money to the state to invest it for him."

* * *

Rebuke to Soviet-German Enterprise

More revealing than official statistics of progress in the economy of the Pieck Republic is the experience of businessmen in federal Germany: they find that the managers of publicly-owned enterprises in the eastern zone can be bribed with a pound or two of butter. But even the statistics—as given by Herr Fritz Selbmann, the Communist Minister of Economics, at a recent conference of managers of enterprises confiscated by the East German State—are a poor advertisement for Soviet planning in Germany.

Monthly output has indeed risen by no less than 83 per cent, but only when expressed in values, and only when compared with the first half of 1948—a period of blockade by the west. Quantitative output, despite the lifting of the blockade, has not risen to anything like the same extent, except in the steel industry (now employing many more men than before the war), and in the production of motor tyres and of window-glass. In the heavy industries, to which every incentive is given, the modest Two-Year Plan will be fulfilled by the end of the year, but many other branches of industry lag behind. According to one reliable estimate, total production in eastern Germany is not more than 55 to 60 per cent of what it was in 1936, whereas in Federal Germany the percentage attained is now 93.

Moreover, the east German increase in output has not been nearly as great as the rise in the number of men employed. Many works with more labour are producing only half of prewar output. In the metallurgical industry, for example, the ratio of wages to output has increased by no less than one hundred per cent.

Herr Selbmann also showed great concern at the shoddy quality of the goods that are being produced. This is a particularly serious matter because the eastern republic must rely on exports for much of its food and raw materials. The Russians are extremely critical buyers; and even the inter-zonal trade partners across the Elbe are now too well-placed to consider the purchase of low-quality goods. Hence the new campaign in the eastern zone to create "activists of quality," who will join the production "activists" on whose performance and example all Soviet states rely

Where Planning Goes Wrong

The financial situation described by Herr Selbmann was equally unsatisfactory. The Ministry has completely failed to control the confiscated enterprises, which work under its command; with "well-nigh criminal irresponsibility" they have indulged in an orgy of building, without regard to the central investment plan. The consumer goods industries are so heavily indebted to the banks and the central budget that they have "jeopardised the liquidity of all other publicly-owned enterprises." Part of the trouble is due to the fact that firms are holding stocks of unsaleable goods that had cost millions of marks to produce. In addition to censuring all those concerned, including the trade unions, Herr Selbmann gave a warning that enterprises must find some way, apart from raising prices, of absorbing the rise in costs that will follow the recent abolition of subsidies on coal and other raw materials.

Another cause of anxiety to the rulers of eastern Germany is the constant smuggling of assets to the west. For years past, firms have been shifting their headquarters out of reach of the Russians, share packets have been transferred, and plant removed. In an attempt to prevent the mortal decline of the eastern zone, an example is to be made of businessmen, officials and politicians who are accused of transferring assets of the Continental Gas Company to the west. "The criminals of Dessau" are to be tried, and a general witch hunt is going on among business managers and the workmen who—for reasons so incomprehensible to the Soviet mind—aid and abet them.

* * *

The Technologist's Rainbow

Sir Lawrence Bragg has thrown his own colours on to the mixing palette of technical education. He was speaking at the Home Universities conference in London last Saturday on methods of improving technological education in Great Britain. The end of producing better applied scientists for research and industry is universally approved; the means are as widely disputed. Sir Lawrence selected three important aspects of the controversy. First, there was the relative absence of freedom in the technical colleges, most of which are owned by local authorities, which keeps them in the position of poor relations of the universities. Secondly, he advocated as an ideal the establishment of new centres of higher technical education which, like the universities, would be free to decide their own courses and standards, and would presumably receive an Exchequer grant with the same freedom from internal interference as the universities. Thirdly, with or without the existence of such institutions, he maintained that one end of the wide spectrum of technological education had a place in the universities, and that if separate institutes were at present impossible then the universities must do as much in this sphere as they could.

These are sound suggestions. There should be no rigid line of demarcation between technical college, technical institute and university department and the metaphor of the spectrum is apt. The trouble is that the middle colours are missing. At one end there are the technical colleges and at the other the universities. Between the two there is nothing but the beginnings of five highly specialised colleges of advanced technology such as those for rubber, foundrywork or clock-making.

The universities had doubled the number of students in their technological departments between 1938-39 and 1947-1948 and it is probable that some of them could still expand a little more without seriously affecting the balance of studies in the universities. But these possibilities of expansion do not meet the nation's demand for advanced technical education. It is difficult to avoid the conclusion that several para-university institutions are required, perhaps in the same towns as universities, on the lines of the Massachusetts Institute of Technology.

But even this is not enough. At bottom almost all the arguments in this controversy spring from questions of prestige and money. Hence the reluctance of those who are already in the technical departments of the universities to support expansion outside the university orbit. One possible method of bringing together all the different institutions might be to follow the precedent of a Royal college, which would award degrees (B. Tech.) to the non-university students and elect fellows from the universities, technical institutes and colleges alike. This would secure a recognised standard of degrees in all non-university institutions, and it would bring together the post-graduate elements inside and outside the universities. These at the moment lack the exchange of ideas and experience vital to bridging the gap between pure and applied science which many observers have noted as a characteristic weakness of the British economic scene.

* * *

The Dons' Dilemma

Oxford and Cambridge have now decided to pay higher salaries to their dons—a decision which the provincial universities reached six months ago. The decision has not been without its embarrassments. Overtaken by the tide of devaluation and economic crisis, both the older universities have been caught in the awkward situation of voting themselves higher pay at almost the exact moment when civil servants and trade unionists were being told to tighten their belts. The dilemma was faced in the open at Oxford when an amendment was moved and rejected for postponing until 1951 all increases in salaries over £900 a year except those for medical appointments. Oxford teachers were not prepared to deny themselves what had been gained already in other universities. Nor, one suspects, were the non-medical professors enamoured of an amendment which would have given to the "medicos" still greater advantage over them.

At Cambridge the debate took a slightly different course, but again the salaries of the staff in the medical faculty were a bone of contention. This is a bitterly controversial subject, common to all universities, of which the last has probably not been heard. It springs from the Spens report on the "Remuneration of Consultants and Specialists" (Cmd. 7420), published in May, 1948. The report concerned the national health service, and in that context seemed reasonable enough. Its object was to provide a scale of salaries for consultants who joined the national health service whole or part-time. The unintended effect was to bring to public notice the difference between the earnings of a consultant in a hospital and a full-time medical professor paid by a university.

We regret

to announce that we can no longer accept orders for the 1950 edition of THE ECONOMIST DIARY. The size of the edition was substantially greater than for 1949, but it was, nevertheless, insufficient to meet the heavy demand from home and overseas.

We suggest

that the best way of ensuring that you are not too late next year is to instruct us to notify you when the 1951 edition is ready. All you need do is to write your name and address on the back of a postcard and send it addressed to: 1951 DIARY, THE ECONOMIST, 22 RYDER ST., LONDON, S.W.1.

The difference was glaring. And so by the well-known process of the spiral, first the clinical medical, then the preclinical medical and then all the non-medical professors have had a rise in salary, and with them all their junior staff. This rise was possibly necessary to deal with the cost of living, but it has not obliterated the invidious distinction between the medical and non-medical faculties. (Only at Cambridge have the medical staff not secured the full measure of preference.) In 1939 the average professor's salary was £1,115 a year. In 1946-47 it was £1,534. The new scales lay down a basic salary for professors outside the medical schools of £1,600 (plus a block grant, originally intended for supplementing the salaries of particularly distinguished or senior individuals, but in fact used by most universities, in part or in whole, to increase the minimum to £1,800 or £1,900), of £2,000-£2,500 for medical professors and of £2,250-£2,750 for clinical professors. An ironic feature of the whole affair is that Government economies have forced the hospitals to make fewer appointments of consultant status than was expected, so that in some cases those at the spiral's centre have benefited others more than themselves.

Paper for Periodicals

The President of the Board of Trade has given the periodical press of this country a most acceptable Christmas present. He announced in the House of Commons on Thursday of last week, that, as from March 1st next, existing magazines and periodicals "will be allowed to use all the paper they can obtain." The restrictions on new publications will also be withdrawn. Newsprint, unfortunately, is still scarce and the newspapers will continue to be strictly rationed.

It is wrong to look gift horses in the mouth. But it is perhaps permissible to point out that this is another illustration of the present Government's unwillingness to remove restrictions until they have become virtual dead letters. Not very many periodicals have been using their full ration for some time past, and if a free market had been restored a year ago it is doubtful whether it would have exerted more than the slightest upward pressure on prices. For a year longer than necessary, there has been official discrimination against the more successful of the existing periodicals (since they alone have been kept short of paper) and an official ban on new periodicals (save those of insignificant circulation).

The Economist, as it happens, is one of the minority of periodicals to which the removal of the restrictions will make a substantial difference. It was in July, 1945, that the decision was deliberately taken to print *The Economist* on very thin paper, in order to keep within sight of the demand for copies without reducing the number of pages below the minimum necessary to provide the service that readers have come to expect. At that time, the circulation was some 75 per cent in excess of the highest prewar figure. The present circulation is more than two-and-a-half times that of July, 1945, and four-and-a-half times that of 1939. This has financial consequences to which we confess that we are not wholly indifferent. But the justification of the thin paper policy is not mainly a commercial one; it lies in the fact that it has enabled us, broadly speaking, to provide a copy of *The Economist* for everybody who wanted one. The indulgence of readers has, therefore, been given to each other as much as to the journal itself.

It will be an unmitigated relief to be able to choose paper for its suitability alone, and not for its weight. We hope, later in 1950, also to restore the grey cover of prewar years.

* * *

The Manstein Trial

Trials for war crimes may serve two purposes, which are distinct, though they are often confused. The first is what

may be called the restriction of national vengeance. When a nation at war suffers atrocities committed by the enemy against its prisoners of war and civilians and subsequently wins the war, it is natural that there should be retaliation; and it is a gain for reason and humanity that the retribution should not be indiscriminate, but applied according to a recognised code of law and by a proper procedure of legal trial to the individuals responsible. But, however legal and however fairly administered, such measures remain fundamentally a taking of redress by the injured party.

The wider aim of war crimes trials should be, and has been widely intended to be, the firm establishment of a system of impartial international criminal law commanding respect even from the vanquished enemy. Unfortunately, this aim cannot be realised as long as the law is applied only to the vanquished and the victorious nations openly set themselves above it. Charges of the most terrible kind have been fully proved against the leaders of Nazi Germany and their subordinates, from the killing of war prisoners and execution of hostages to the deportations for slave labour and the horrors of the concentration camps. But west Germany is full of refugees from the east who know that similar outrages were and are characteristic of Russian practice; and if it is said that Russian atrocities in Germany or Austria were only the outcome of German cruelties in Russia, a German can reply that the Russians did even worse to the Poles and Balts who had never invaded them.

As for the western Allies, though the grosser kinds of war crime have not been charged against them, it is unlikely that they would emerge unscathed from judgment by a tribunal strictly applying the international law of 1939 in such matters as the bombing of non-military objectives. In any case, whether charges against any one of the United Nations are true or false, there is no tribunal before which they can be brought, and the contrast with the rigour of the law applied to Germany is glaringly obvious.

*

The most striking feature of the Manstein trial has been the fact that he was tried before a British court on charges of acts committed exclusively in Poland and Russia. Both Poland and Russia demanded his extradition, and it has never been officially explained on what ground it was refused. Presumably it was considered that it would have a bad effect on German opinion at a time when western co-operation with the Russians had broken down and the western allies were beginning to consider German feelings. But, as a compromise, the British Government decided to give Manstein (and others who have been kept from the court by death or illness) a trial by a British court. So Germany has witnessed the strange spectacle of one of its most brilliant generals being tried and sentenced by the British four years after the end of the war for what he did to Russians, thereby showing a disinterested passion for justice which would be impressive if it were not of such limited application.

* * *

Syria without Statesmen

"A third *coup d'état*" is a thorough misnomer for last Monday's upset in Syria. By comparison with the true *coups* of last April and last August—in the first of which President Shukry Kwatly was kidnapped and banished, and in the second of which Marshal Zaim and his prime minister were shot at dawn—this third piece of army dictation was a tame affair. No one was killed. The same government carries on. All that happened was that one of the many army cliques that is opposed to union with Iraq administered a sharp rat-tat on the door of Syria's new and weak "provisional chief of state." Its purpose was to teach him to mind his p's and q's and not to sign a presidential oath binding him "to act for the accomplishment of the unity

of the Arab countries." It succeeded. Mr Atassi sent a message to the Assembly saying that he was too ill to take the oath. The idea of union with Iraq is shelved.

The incident gives a sorry but true snapshot of the state of Syrian politics in 1949. In the first four months of the year a cabinet of businessmen, with some grasp of the country's economic needs, did its best to repair the ravages caused by years of rule by nationalist diehards who had quarrelled with the Lebanon, the oil companies and other possible contributors to the Syrian exchequer. In April, Colonel Zaim overthrew them in the name of patriotism. Everyone hoped for a Mustapha Kemal; but power went to Zaim's head. By August some thought him mad and, again in the name of patriotism, Colonel Hinnawi murdered him. This time, the army put in his place a caretaker government with instructions to draft a new constitution and to go back to democracy. Elections followed in November. They took place in an atmosphere of complete public apathy. That only 39 per cent of the roll troubled to vote is not explained by the boycott proclaimed by the nationalists. The public trusted no one. Syrians are not famous for moral courage and most of the best men had retired into business or to their estates.

The party that was returned to power, which is liberal and calls itself Populist, represents chiefly the merchant class of Aleppo and is young, inexperienced and *parvenu* in the eyes of anyone who does not belong to it. It holds under 50 out of 114 seats and is confronted by a majority of independents. It cannot raise a finger against the army. Yet the army itself is divided and demoralised by its recent intrusions into politics; just as Hinnawi threw out Zaim so, now a Colonel Abid Shishakali has thrown out Hinnawi. The political equipment with which Syria starts the year 1950 is, therefore, an army full of embryo Napoleons and a chamber full of embryo plans, but without the patience or the capacity to see to their administration.

The Clapp Approach

This portrait of one Middle Eastern state makes a gloomy introduction to part II of the Clapp report—that is to the long term recommendations by the United Nations Economic Survey Group that has been studying the Arab Refugee problem in relation to Middle East development. This report will not be published in full until mid-January, but Mr Gordon Clapp, on his way through London this week, gave an adequate summary of the thoughts that he is going to utter.

The keynote of his plan is that the Middle Eastern governments must work for any help they are to get. They must want it and ask for it, and produce plans for it through national development boards which (where these do not exist already) they must set up for the purpose. The plan's second new feature is that the benevolent body to which these new boards will turn for long term aid will supplement, but will not be the same as, the United Nations directorate which (as was described in *The Economist* of November 26th) is to help them with providing work for the Palestinian refugees. The new body will be different in nature because it will be appointed and financed only by the powers contributing money and experts to the long term schemes—in the first place only by America, Britain, France and Turkey. It will consist, presumably, of four men who are a cross between pro-consuls and engineers, and the organisation they set up will, at an initial cost of only \$10 million, provide sponsors, advisers and general advocates on behalf of the local boards already described.

As an illustration of the kind of help this body would be prepared to give, the report will set out four sample "pilot schemes" of the type it would be prepared to consider—one in Arab Palestine, one in Jordan, one in Syria and one in

Lebanon. The report's concentration upon these small beginnings should pour a salutary cold douche upon fantasies "of more than Oriental splendour" to which Mr Clapp's name has been linked in Middle Eastern newspapers. One, for instance, envisaged "the rapid construction of a canal from the Euphrates to the Mediterranean."

*

It is just possible that this new international body, if composed of men of sufficiently arresting and informed personality, will have for the Middle Eastern governments an attraction that, in their mistrustful xenophobia, they have never felt for other foreign bodies at their disposal—the Middle East Supply Centre, the International Bank, the American Export Import Bank, or the British Middle East Office. It is also just possible that one or two successfully accomplished pilot schemes might set a fashion of leaving some matters to the hitherto mistrusted foreigner. It is advisable not to be too sanguine; several of the local governments are shaky; the expert development boards they have tried are apt to quarrel with their politicians; few of them want to borrow money unless they may spend it without foreign restraint. Perhaps the best augury for Mr Clapp's new "approach"—his own word—to Middle East development is that two of his pilot schemes are in the area administered by King Abdullah. For Jordan, under its present ruler, is one of only two Arab states—Saudi Arabia is the other—that do not think it below their dignity to trust efficient foreigners with a measure of direct management.

The LCC takes Notice

It must be accounted for grace to the London County Council that it has accepted public criticism of the architectural quality and administrative organisation of its housing programme. On Tuesday last, only a fortnight after the publication of its own book which sets out the present organisation in all its ponderousness, the Council decided to transfer the prime responsibility back to its architects' department, from whose hands it was removed in 1945. There are, however, two reservations to be made. A return to the pre-war organisations will not itself effect improvements—the LCC's prewar housing schemes were not of a high quality. It is up to the architect's department to show that they can build dwellings worthy of the world's largest housing authority. Secondly, the architect's department is only to take charge of schemes approved after January 1, 1950, so that it will be two years before the public will have an opportunity to judge the merits of the change in policy.

Measure for Measure

The President of the Board of Trade, in reply to a recent Parliamentary Question, said, "Where intoxicating liquor is supplied in quantities of less than half a pint in England and Wales, and in quantities of less than one pint in Scotland, sale by Imperial measure is not compulsory, nor is the quantity supplied required to be stated in terms of measure." It was perhaps no surprise to the House to learn that a tumblerful more or less is all one north of the border, but a Scottish Nationalist may well feel that if the Sassenachs can stoop to examine the minute gradings of their "nips" and even discuss them in Parliament, then indeed Westminster is no place for him. The English, on the other hand, are more likely to be disturbed by this revelation of the quicksands of private enterprise beneath their feet where they are accustomed to the firm foundations of legal regulation; the absence of statutory compulsion in any field of buying or selling is discovered these days with shocked surprise.

Publicans, if challenged, claim that they sell "by the price." Few of them trust their barman's elbow; some use little bucket measures; but most use the intriguing automatic pourer which is graded "5 out," "6 out" or "7 out," etc., according to the helpings it measures out of a spirit gill. A "7 out" pourer, for instance, gives 36 measures to the bottle. Which kind he uses depends on the proprietor's judgment. In one bar, a prosperous custom may justify the use of a "4 out" and a charge of perhaps half-a-crown for whisky; in another a poorer class of custom may prefer smaller helpings at a lower price without the indignity of having to ask for them. For most customers, however, the distinction between a "single" and a "double" will remain the only one they bother to remember. This field of free enterprise, it appears, is under the eye of officialdom; there is a committee at present engaged in studying the retail sale of intoxicating liquors. If consumer-research is any part of their project, now is the season to call for volunteers.

The Wages of Death

THE Society of Friends, by the unostentatious manner in which they consign their dead to the tomb, have long set others . . . an example they ought to follow. We have procured, and we publish, the expenses of the funeral of one of the most distinguished members of that body—a man who in life possessed of all the advantages of a large fortune and high consideration.

[The bill then followed. Including a "super flannel dress, sheet, pillow, and mattress," "a stout lead coffin . . ." and "a smooth elm case . . ."; it totalled £25 9s. 6d. It was then contrasted with two other bills, of which one follows.]

	£	s.	d.
To one lead coffin, one oak coffin and inside shell	18	10	0
Coffin cloth	1	14	4½
Drugget	1	4	9½
Making	0	2	2½
Three ministers' handkerchiefs and scarfs, six yards each; 18 yards of crape	4	10	0
Clerk's handkerchief	0	12	6
Sexton	0	18	1½
Two beadles and staffs covered	1	19	0
Six pall-bearers and scarfs	9	0	0
Six bearers	2	8	9
Five coachmen	2	0	7½
Coffinmaker and scarf	1	10	0
Undertaker	1	10	0
Assistant	1	10	0
Youth (sic)	0	12	6
Six mourners and scarfs	8	2	0
Five pair of men's gloves	0	12	6
Ten ditto	1	7	6
Thirteen gentlemen's ditto	2	5	6
Nine ditto	1	13	9
Fifty-six handkerchiefs	0	14	0
Use of best pall	1	1	0
Use of seven best cloaks	0	14	0
Opening vault, funeral fees, etc.	3	5	2
Coaches	13	11	6
Five coachmen	0	10	0
Fees to two beadles	0	4	0
Fees to two bearers	0	6	0

£80 19 10½

Such a contrast must promote that reform in undertakers' bills which has long been demanded. Certainly there is no greater mockery, or more offensive spectacle, than that which is called a "splendid funeral."

The Economist

December 22, 1949

Perón Attacks the Press

The Peronistas have seemingly become restless over the degree of freedom permitted to the local opposition and to foreign agencies in Argentina. Another gun has now been fired in what will possibly turn out to be a *gleichschaltung* operation. Last month two members of the anti-Argentine activities committee made a surprise visit to the two great independent dailies, *La Prensa* and *La Nación*, and installed auditors in the business offices. Their ostensible object was to scrutinise the accounts for any evidence that the two papers had received donations from the opponents of Perón in the 1946 elections. To make sure of adequate publicity the visitors took the precaution of inviting along a corps of reporters and press photographers from the leading Peronista organs. The inquisition was later extended to the Communist organ, *La Hora*, the American news agencies, the National City Bank's local office, a branch of the Bank of London and South America, and the Argentine Jockey Club.

These operations are the latest in a series of attacks on the independent Argentine press which the regime usually accompanies with dark warnings against "foreign meddlers." Both *La Prensa* and *La Nación* are widely read in Latin America and have an international reputation for news coverage and balanced editorial comment. Both are critical of Perón's policy, especially of its economic aspects. To date there has been no direct interference with their editorial work but further trouble appears to be in store for them. Representatives of the police have remained on the premises ever since.

Perón recently announced to a large conference of the press that he would bring a libel suit against the two papers for printing a report alleging that the President had enriched himself in office. They were said to have given too much prominence to Perón's denial that while in office he went from rags to riches. The process, Perón claimed, had been in the reverse direction, and to prove his point each reporter was presented with a photostat of a bank statement certifying the existence of a mortgage on his country estate. The Federal prosecutor will handle the suit which will be brought under the provisions of the so-called "disrespect" law.

Secrets of the Soviet Navy

One of the major puzzles of the North Atlantic defence planners looks like remaining a puzzle for some time to come. Estimates of the size and quality of the Soviet submarine fleet have been bandied about with happy irresponsibility, since few people are in a position to challenge the figures. This week, the publication of the 1949-50 edition of "Jane's Fighting Ships" shows that the secrets of the Soviet Navy are still closely kept. In their foreword, the editors state that they gathered a large number of reports about the Soviet Navy, but that these reports could not be reconciled one with the other and that some could scarcely be credited. After this warning, they go on to say:

Under the current naval construction programme, within the next five-year plan, it was hoped to have 1,000 submarines completed for service by 1950-51, of which 400 were to be in the Far East, 300 in the Baltic, and the remainder in the White and Black Seas; but it is extremely doubtful whether the Russians have the shipyard capacity and the trained technicians necessary to build an underwater fleet of this size in such short time.

They report that, in fact, possibly more than 100 Russian submarines were put in hand for delivery this year.

The successful planning of how the defence resources of the 12 Atlantic Pact Governments are to be apportioned depends largely on reasonably accurate information of the size and performance of the Russian submarine fleet. The long supply lines to Europe constitute one of the most vulnerable parts of the whole defence network; if the threat

to them is likely to be at all formidable, the Allied navies and naval air arms will continue to demand substantial fractions of the national defence budgets—in Britain £189 million, in the United States \$4,920 million. Official opinion in America and this country—as publicly expressed—has wavered between uncertainty and confident assurances that things might be worse; but at the back of every naval expert's mind is the question: how well have the German technicians served their Soviet and Anglo-American captors?

Germany, it should be remembered, began Hitler's war with 57 U-boats; by the end of August, 1942, 304 operational U-boats had been built and of this number 105 had been lost. Yet, during the whole of 1942, with about 100 U-boats continuously at sea (if not simultaneously in action), the Germans sank a monthly average of about 500,000 gross tons of shipping. Anti-submarine measures are much better now than they were then, but submarines are improving, too. If the Russians are in fact building submarines at the rate of 100 boats a year, it can only be because they believe sheer weight of numbers might overcome the technical superiority of the Atlantic navies.

Shorter Notes

In a leading article in *The Economist* of last week reference was made to Mr Baldwin's dissolution of Parliament on May 10, 1935. This should have read "May 10, 1929."

The sixth annual report of the Catering Wages Commission has some strong words on the apathy of Government departments towards the tourist industry. It mentions five recommendations which were put forward to various departments as a means of encouraging the tourist trade—or rather of getting rid of its worst handicaps—and the replies it received were as follows: from the Ministry of Works, "the hotel and catering industry can be given no priority"; from the Ministry of Fuel and Power, "the recommendation will

How to capture cash from Canadians

IF YOU WANT to do business with Canadians . . . now is the time to take advantage of the great opportunities opened up to you! Fly to Canada yourself—and establish *personal* contacts in this valuable hard-currency market. And in the U.S.A., too! Remember, orders will go to those manufacturers who get in first.

Trans-Canada Air Lines offer you the most frequent direct service to Canada. At London or Prestwick, you step aboard one of T.C.A.'s famous North Star pressurised Skyliners. Only a day later, and you are in Montreal, with immediate connections to any of 32 important cities throughout Canada and the U.S.A. Moreover,

you can save dollars by booking T.C.A. right through to your final destination beforehand. Fast T.C.A. services leave Britain for Canada daily. Let T.C.A. take you there—and you will take the orders!

WINTER HOLIDAYS IN SUNNY BERMUDA

Enjoy dollar-free winter holidays in sunny Bermuda and the West Indies! T.C.A. offer you through bookings at special rates—you fly in North Star Skyliners, via Montreal to Nassau, Jamaica, Trinidad and Barbados. No dollars necessary, because T.C.A. pay overnight expenses in Montreal.

TRANS-CANADA Air Lines

IT'S ONLY A DAY BY TCA

be borne in mind"; from the Ministry of Food, "no relaxation of the price control on meals can be granted at present"; from the Board of Trade, "policy . . . is as flexible as it can be . . ."; from the British Transport Commission, "the matter is already under consideration." As the Commission points out, this is not the right attitude to adopt towards Britain's biggest dollar earner.

The new Australian Cabinet was announced last Sunday. Mr Menzies, the Prime Minister, is keeping himself free from departmental responsibilities; Mr Fadden, the leader of the Country party, is to be Treasurer; Mr Casey is to take over a new department of National Development, and Mr P. C. Spender, K.C., is to supersede Dr Evatt as Minister for External Affairs. For the first time in Australia a woman, Dame Enid Lyons, who is the widow of a former Australian Prime Minister, is to be given cabinet rank as Vice-President of the Executive Council—a post much the same as that of Minister without portfolio. The new Cabinet has 14 Liberal and five Country party members. The only surprise was the appointment of Mr Casey, who was generally expected to take over the department of External Affairs; he is, however, an experienced mining engineer as well as a diplomat, and his new department will meet an urgent need in Australia today.

The Voortrekker celebrations which have been going on in South Africa reached their climax last Saturday during the unveiling of the huge monument to the Great Trek outside Pretoria. It was generally feared that the celebrations would lead, as the centenary celebrations in 1938 did, to a new wave of extreme nationalist feeling. Instead, Dr Malan, Mr Havenga and General Smuts all met on a common platform, and the occasion seems to have been marked by a welcome softening of policy on the part of Dr Malan and his party—at least as far as the European races are concerned.

LET THIS 'Fast Thinker' SAVE MONEY FOR YOU

Another important reason for the speed and flexibility of Underwood Sundstrand Accounting Machines.

You're looking at the control plate of an Underwood Sundstrand Accounting Machine. This little device does virtually all the "thinking." The operator simply inserts forms and enters figures. From there, the Control Plate takes over and enables the machine to complete the work automatically. You get controlled accuracy, too. Printed evidence of accuracy is automatically

Simplicity in Aligning Forms. Operator inserts forms directly to the writing position in one fast, easy motion.

Books and Publications

British Foreign Policy

"Documents on British Foreign Policy, 1919-1939." First Series. Vol. III. Edited by E. L. Woodward and Rohan Butler. HMSO. 909 pages. 32s. 6d.

THE first two volumes of the first Series of this collection having given us the minutes of the Allied Supreme Council for the second half of 1919, the third begins the publication of the Foreign Office archives for the same period, for the six months following the signature of the Treaty of Versailles. Further volumes will appear on this period, for, as was obvious in advance, the documentation is on an exceptionally large scale in 1919; and this first instalment from the British records, of more than nine hundred pages, covers only three of the pressing problems which had to be faced in these months: the withdrawal of German troops from the Baltic provinces, developments in Russia, and the Polish-Ukrainian conflict over Eastern Galicia.

These problems derived their urgency and their inter-connection from the fact that Russia and the territories that bordered on her in the west had become a political no-man's-land, a power vacuum, as a result of the almost simultaneous collapse of the Russian, the German and the Austro-Hungarian Empires. This was the formidable situation which faced the Allied Supreme Council and the individual governments of the remaining Powers. The Council tried to legislate for it; but its arrangements were inevitably incomplete; and events in the second half of 1919 bore constant testimony to the gulf which exists between paper settlements and political realities. If the peace had been signed, the war was still on. If a settlement had been reached, it had still to be applied; and its application was a matter, not of fixed and long-range policies, but of waiting on and wrestling with day-to-day developments.

It is this which gives a special character to the documentation in this volume. In the first place the prevailing confusion must have made the editing of the material a particularly difficult task. The topics dealt with were simultaneous and interconnected; but they must be presented in separate chapters if they are to emerge with any clarity. The material itself is more than usually complex; and to this difficulty is added the unavoidable multiplication of the British channels of communication at the time, as well as the over-lapping of British and inter-Allied channels and springs of action. Mr Butler, who is responsible for the First Series, has dealt most admirably with these complexities, the more technical of which are explained in a lucid introduction.

One other result from the nature of the situation is that the material adds little that is new or startling to previous knowledge about the broad lines of British foreign policy. To take but one of the topics, the general British attitude to developments in Russia, the documents add very little of substance to Lloyd George's speech on April 16, 1919, to the House of Commons, which is printed as an introduction to that chapter. What they reveal is the execution, against the background of day-to-day events, of the attitude outlined in the speech; and, valuable as it is, this casts no light on the formation of British foreign policy. The same criticism has been levelled with such monotony against the later volumes in this collection as to leave no doubt that, for light on the formation of British foreign policy after 1930 at least, the unrestricted access to all Foreign Office archives, which the editors enjoy, is not enough. With reference to the present volume, however, although it may be true that access to other archives would be more rewarding on this subject in this period of Lloyd George's

ascendancy, the documents themselves give out a more authentic and substantial ring than do some of the later volumes. They suggest that, if the formation of policy does not emerge, it is chiefly because no policy was being formed, because no clear policy could be formed in the situation which obtained.

Journalists on Themselves

"Dateline: Washington." The Story of National Affairs Journalism. Edited by Cabell Phillips, Duncan Aikman, William C. Bourne, Homer J. Dodge and William A. Kinney. Doubleday and Company. 320 pages. \$4.00.

THIS book is a symposium gathered by a committee of its members to celebrate the 40th birthday of the National Press Club in Washington, a city referred to by all too many of the twenty-one contributors as the "news capital of the world." The National Press Club is a remarkable institution, which, thanks to one of those mysterious real estate deals which were so common before, and so responsible for, the slump of 1929, owns an imposing building in the middle of Washington. On its top two floors (floors which, under the local building regulations, should not be there but were added while the building was in progress by special act of Congress, thanks to the pressure of Washington correspondents on their local Senators and Representatives) it has its spacious, but seldom aired, premises, for which it pays a rent of \$1 a year. On the eleven floors below are the offices of newspapers from all over the world. (The floor immediately below the Club, for instance, houses *The Times*, *The Daily Telegraph*, *The Christian Science Monitor*, *The New York Herald-Tribune*, *Chicago Daily News*, *Baltimore Sun*, *New York Daily News*, the magazine *Newsweek* and a dozen others.) Most of the 1,400 journalists who hunt for news in Washington belong to it. It has the worst cuisine of any club in the world, but its bar is the unofficial news exchange of the city and every morning men with some piece of information from the Department of Agriculture, which they do not intend to use, will be there ready to barter it for something from the Treasury which fits the piece they are presently writing.

The symposium is what is called a labour of love. With the exception of four of the eighteen pieces (some are the work of more than one hand) it is on the intellectual and stylistic level of the Old Boys' section of a school magazine. It is curious that men trained to report an intricate story clearly and without delay should become so self-conscious when given time to correct their copy. (In one short chapter an exclamation mark is used thirteen times to underline a joke. Another chapter begins: "On a May morning in 1908 that section of F Street about seven blocks east of the White House was quiet in the sunshine of a drowsy Washington spring.")

The remaining four pieces, however, are good enough to make the book worth buying. The two best are Mr Wallace Deuel's account of the life of a diplomatic correspondent, which includes a beautiful analysis of the diplomatic lie—delivered by Mr Stimson when he was Secretary of State—and Mr Thomas Stokes's bird's-eye view of the whole field of news coverage today. Mr Bruce Catton has some valuable things to say about the uses and possible abuses of the press release and the Departmental Information Officer, who is as ubiquitous in Washington as in London but is also more circumscribed in his activities. Congress watches carefully to see that he gives only factual information and is discouraged from becoming a press agent for his political chief. And, finally, the history of censorship and information services in both wars is written, much too briefly and all in one chapter,

by those who know most about it—Mr George Creel, who handled both for President Wilson, Mr Byron Price, Director of the Office of Censorship after Pearl Harbour, and Mr Elmer Davis, Director of the Office of War Information.

But generally it is a disappointing book and must be considered a lost opportunity. Its weakness is that, like Congress, it suffers from the seniority system. It has been written, with the exception of the four good chapters, by those who have been longest in Washington and, for that reason, know least about the rest of the world. The immortal American phrase—"Fancy this happening to little me"—is implicit in the wide-eyed surprise of one writer after another who has travelled from reporting crime in Kansas to attending the President's press conference once a week.

The Estate of the French

"Mise en Valeur de la France." By J-F. Gravier. Le Portulan. 378 pages.

M. J-F. GRAVIER's motto is that of *Candide*: *Il faut cultiver notre jardin*. The garden in question is France; and this ambitious and stimulating book is a survey, a stocktaking and a preliminary blueprint for his conception of the France of the future. Here is the national estate—its geographical position and characteristics, its resources in soil, minerals, energy; here are its inheritors—too few, too predominantly old, above all too unevenly distributed; here are the technical possibilities, the essential changes of organisation, economic emphasis, psychological attitude, political structure; here, finally, is the estate as it should be, region by region, a balanced entity fitted once more to fill its historic (and in M. Gravier's eyes inevitable) role of European leadership.

It is, for all its remorseless geographical detail, a book which even a foreigner finds it hard to put down. M. Gravier brings to his task that loving enthusiasm which one can often hear ringing in the voice of a man who, having just acquired an old, rather dilapidated, but beautiful house and garden, explains its possibilities and outlines his future improvements. His economics are, indeed, of a crashing naïveté. He calculates the optimum population of France—and of her neighbours—according to the resources of each in food production and energy, without it apparently entering his head that the nature of economic activity and the degree of the division of labour, geographical and other, may have anything to do with the question. He scorns economic liberalism ("the free fox in the free chicken-run") without ever displaying the faintest understanding of its mechanism. He rejects with equal contempt the impressive mass of evidence that the secular root of economic progress lies away from primary production towards secondary and tertiary activities; he takes an almost physiocratic view of agriculture. When his facts can be checked by a foreign reader, they are much too often fantastically wrong or wrongly interpreted. How pleasant it would be were every farmhouse in England equipped, as he says they are, with running water and electricity. And how very peculiar is his deduction, from the proportion of building achieved in this country by public and private enterprise over the last four years, that the former must be the more economical instrument. His admiration for Britain and British methods is gratifying, and, one would like to think, deserved, but its foundations are decidedly shaky.

Yet, when one has said all this—and one could say more to the same effect—one still cannot help feeling that M. Gravier has hold of the right end of the stick; that his plea for decentralisation, regionalism, the rebirth of local initiatives, and for a shift of emphasis, in policy or in education, towards technical and agrarian betterment, is more adequately founded than are the economic arguments with which he supports it. There are few circumstances, after all, in which *Candide's* dictum is inapplicable. This country could do with some of M. Gravier's spirit if not of his methods.

Shipping: Commerce or Strategy?

"British Ships and Shipping." By Peter Duff. Harrap. 240 pages. 10s. 6d.

THE British interest in an expanding volume of world trade, which tends to be overshadowed at times by questions of self-sufficiency and the balance of foreign payments, could hardly be more clearly exemplified than by a survey of the shipping industry such as Mr Duff has produced. Exclusive and mercantilist policies are old in the shipping business, and this account recalls that British shipping interests met the repeal of the Navigation Acts with forecasts of ruin. But, as it happened, world trade expanded, and British shipping was sufficiently strong and efficient at the time to hold its relative place; so that British tonnage increased from 4,420,000 tons in 1850 to 8,450,000 tons in 1870. By 1914 British and Empire shipping was 21 million out of a world total of 50 million tons.

Although the aggregate size of the British and Commonwealth fleets had not changed greatly by 1948, their place in the world picture had begun to look different; for world tonnage by now was 81 million tons, and the United States registration had risen (because of the vast American war building programme) to nearly 30 million tons. Unfortunate though this relationship may at first sight appear for the British shipping industry, it is still more embarrassing for the United States, which cannot hope to keep a fleet of this size profitably employed in a competitive world. But the American merchant fleet, if it cannot be used, is unlikely to reproduce itself; what becomes, then, of the American strategic policy of keeping an adequate merchant fleet in being against the possibility of war? The various devices so far adopted by United States maritime policy—the reservation of the coastal and inter-coastal and even the Hawaiian trades to the American flag, the subsidies on building, the discrimination over ECA cargoes—have by no means removed the effects of the great competitive disadvantages under which the American merchant fleet labours. Mr Duff draws the outlines of a possible reassessment of United States maritime policy which would recognise frankly that the American need is strategic and not commercial—and would abandon, or at least moderate severely, the attempt to keep the strategic shipping reserve employed in commerce.

The writer's concern is not, primarily, with American affairs, or indeed with world affairs except in so far as they concern the British shipowner. He gives a lucid account of the composition of the British merchant marine, and of the technical and economic considerations which govern its development. He is frankly sympathetic to the shipowner's point of view: but his account of the shipowner's problems is not the less useful for its frankness, and is rendered readable by the studiously plain language in which it expounds what are often specialised or technical matters.

A Sound Tradition

"Brown Studies." By W. J. Brown, MP. Latimer House. 224 pages. 9s. 6d.

THOSE who, in the bureaucratic paradise of the more or less planned economy, wistfully or passionately wish that a Cobbett or a Chesterton could be resurrected for a day to speak for England, may return thanks for Mr W. J. Brown. He may not equal the first in energy and output or the second in mastery of the glories of the English tongue, but he is in a sound tradition. He knows that tyranny is no less tyranny when its procedure is correct, meticulous and regulation-abiding than when it is arbitrary, private and blatant. He knows that the piecemeal erosion of freedom is more dangerous than a frontal attack. He knows that the best of causes will go bad in the hands of doctrinaires, of men who "ave no backs to their heads." He knows that there is a time to advance and a time to reconsider the direction; twice, and effectively each time, he tells the story of the one Gadarene swine who,

to the scorn of his comrades, "reacted" against the magnificent solidarity of the rush down the steep place.

Regular readers of the *Evening Standard* will find themselves familiar with most of the essays here reprinted, and the rest appeared originally in other periodicals. But they all bear re-reading extraordinarily well. Robust humour, equally robust commonsense, a most enviable knack of placing punches, and an unfailing grasp of human values, give them a more than ephemeral place in the literature of political controversy. It will be a bad day for Britain when the Browns lose their voice.

A Stiff Pudding

"Distributive Trading." By Margaret Hall. Hutchinson's University Library. 200 pages. 7s. 6d.

WITH one exception this is a worthy addition to Hutchinson's present series of handbooks. It is short, up to date, and (within the limits of its subject) sets forth the main factual basis in a readily accessible form. The writer has not, however, pampered her audience. Although this is an introduction to the subject for the general reader, she has not always taken the extra trouble that is involved for an academic economist in calling a spade a spade.

Once a management takes into account that price reductions (intended to increase sales) may bring about price reductions on the part of its competitors, the attractions of price competition are reduced, probably eliminated. A market in which managements take into consideration the effects of changes in their price policy on the price policy of others has been called an oligopolistic market. Conditions of oligopoly are widespread in this country and in the United States.

and so on. This may be easy writing, but might not the general reader catch on more easily if simply reminded that when a handful of firms dominate the market, price wars between them no longer pay?

Like all modern books on applied economics, it contains the usual cold slap of indigestible abstract theory, complete with diagrammatic marginal analysis on axes *x* and *y*. Apart from the fact that the elements of conventional theory cannot be boiled down to twenty pages and retain any meaning for the average reader, the very attempt is itself a confession of failure. If pure theory has any relevance to the real world, surely it is the author's job, not the reader's, to fit them together? A Chinese scroll and a Chinese grammar are not the same thing as a good translation; Chinese scholars will despise the grammar and the rest will merely admire the pretty pictures. Perhaps it is unfair, however, to expect a book of this kind to flout current fashion by dispensing with this conventional badge of economic respectability. Besides, Chapter Eight gives us very good measure in a spirited attack on resale price maintenance.

Light on Incentives

"Human Relations in Modern Industry." By R. F. Tredgold. Duckworth. 190 pages. 8s. 6d.

THIS short book contains the substance of a series of lectures by a psychiatrist to groups of students, business men, trades unionists, personnel managers, nurses and doctors. The author believes that much industrial strife and inefficiency and some ill-health amongst workers can be avoided if those who have to deal with groups of people in industry have some knowledge of elementary individual and group psychology. This he provides.

In his discussion of "incentives," a subject which so often degenerates into a slanging-match between political opponents, he makes it plain that there are in fact numerous reasons why men work, that these reasons alter in one individual from time to time and that they vary in importance from man to man according to his temperament and character. Those who

believe that there is some simple solution to present problems by increasing "incentives" plainly underestimate the complexity of the subject.

An important section is devoted to neurosis in industry, which is more important as an economic factor than most people realise. It is estimated, for example, that between a quarter and a third of all sickness is due to this factor. In this connection, a little space could with advantage have been found for discussing the influence of social security measures such as the Industrial Injuries Act and sick-pay schemes upon this problem. In dealing with morale, leadership, "groups," and "tensions" Dr Tredgold keeps his language simple and avoids the jargon of social psychology.

The Happy Warrior

"Pipes of Peace." By Sagittarius. Jonathan Cape, Limited. 142 pages. 9s. 6d.

WHO is the happy journalist? Who is he Whom every prosy scribe would wish to be? It is the gleeful spirit who declares The paradoxes in the world's affairs, Disarms our criticism with comments wrought Centres upon some verse that pleased our childish thought, Who mocks at fools but at the same time shows That most exist among his party's foes, Whose partisanship is redeemed by grace, But yet sometimes when called upon to trace Some awful issue in which Heaven has joined Great issues, good or bad, for human kind, Speaks for us all, and voices, as few can, The indignation of the common man, Then, e'er the mists of time obscure his cause Reprints, in certainty of more applause. This is the Sagittarius. This is she That many a journalist would wish to be.

Shorter Notices

"Practical Investment." Compiled by The Investors' Chronicle. Eyre and Spottiswoode. 326 pages. 12s. 6d.

THE unrivalled experience of the staff of the *Investors' Chronicle* in the discussion of practical investment has been applied in this volume to sketch a pattern of the whole field open for the investment of British capital. In twenty-one chapters which are short and to the point, the scope ranges far beyond the immediate sphere of stock exchange investment, though here the description is more detailed, particularly of investment in commodity and mining companies. Other avenues such as investment in real property, building societies and life insurance are also given authoritative treatment. Perhaps the book is most useful in its clarification of taxation problems, in detailing the inner workings of the investment machinery, in clearing the fog from such subjects as bonus issues and official intervention in the gilt-edged market, and in analysing company earnings.

"The Pattern and Finance of Foreign Trade." Published for the Institute of Bankers by Europa Publications Limited. 231 pages. 15s.

THESE lectures, delivered at the recent International Summer School of the Institute of Bankers, were briefly commented on in a Business Note in *The Economist* on September 17th. They include enlightened critiques of Britain's inflationary position on the eve of devaluation by such lecturers as Sir Hubert Henderson and Professor R. G. Hawtrey and detailed case studies of particular sections of Britain's foreign trade mechanism and problems by Mr Harold Wilson, Mr W. Manning Dacey, Mr Paul Bareau, Mr Maurice Megrah and others. The Institute of Bankers is to be warmly congratulated on so speedily making available in book form this well-blended potpourri of opinion and information. It is, however, a cause for rueful comment that, despite the intervention of devaluation, very few of these lectures—and certainly not those on exchange control—look in any way anachronistic.

Letters to the Editor

The Dilemma of Defence

SIR,—In your article of December 10th, you pointed out that at £800 million Britain's defence budget, in terms of the national income, is now about double that of the middle thirties.

It is significant that this point—the proportion of their national incomes devoted to the common defence pool by the Atlantic Pact signatories—was recently discussed by the American House of Representatives Committee on Foreign Affairs. The Committee's report, No. 1265, finds that if a common percentage were struck, Great Britain could reduce her defence budget by £147 million.

This thinking is quite clearly in the right direction. It is equally clear that if the dilemma you pose is to be resolved at all, practical steps need to be taken in this direction. Throughout the entire participating defence area, the citizens who have combined in defence of freedom and justice are engaged in what is an emergent federal defence function. Where there is federal function, there also must be federal finance. The general interest, economic and political, would surely be well served by a decision to integrate the defence budgets of all participating States in accordance with this principle.—Yours faithfully,

J. L. GIBSON

The Beeches, Gravelly Hill, Caterham

Sterling Deals

SIR,—Considering the British Treasury's loathing of deals in sterling at a discount supposedly in contravention of the rules of the Exchange Control, the article entitled "Argentine Maize Mystery" in your issue of December 10th is apt to bewilder many a continental and American student of finance.

To the foreign spectator the fact that the British Government have been willing to pay for the recent maize purchase from the Argentine a sterling price at a premium of about 13½ per cent—if compared with the Chicago \$ quotation—would seem to exhibit a similarity with certain much criticised sterling deals in non-British centres. It will be noted with interest that you consider that "the new Argentine price may be a fair premium to pay to avoid expenditure of dollars."

Amsterdam

BANKER

Electricity Off Peak

SIR,—I notice that the correspondence in *The Economist* on the subject of incentives to shift electricity consumption to off-peak periods makes no mention of differential rates to consumers. No doubt the differential would be impossible to administer in the case of small domestic consumers but industrial and commercial users, whose own peak hours are at all flexible, might be glad to pay for the cost of installing a clock

controlled meter in order to obtain this advantage.—Yours faithfully,

MICHAEL VVYVAN

Odums, Carlton, Nr. Newmarket

Communist Vocabulary

SIR,—In your issue of December 3rd you publish a paragraph, "Dogs of Peace," in which you misquote the recent resolution of the Information Bureau of Communist Parties.

"The task set to Communists throughout Europe," you say, "... is to organise the 'ideological stupefaction of the working masses'."

What the resolution in fact stated is: "Thus similar to the Fascist aggressors, the Anglo-American bloc prepares a war in all directions:—military-strategical measures, political pressure and blackmail, economic expansion and enslavement of peoples, ideologically stupefying the masses and intensified reaction."

I know it would be useless to expect you to publish a letter outlining a policy which does not suit your book. But this is not a matter of opinion, it is just a question of plain distortion and falsification. And by so falsifying and distorting the resolution, you have in fact proved the accuracy of the statement in the Cominform Bureau Resolution that one side of the war preparations of the Anglo-American bloc is the attempt at ideological stupefaction of the masses.—Yours faithfully,

WILLIAM B. HALL

9 Haslemere Road, N.8

The phrase "ideological stupefaction of the masses" is not—and was not intended—to be read as a quotation from the Cominform resolution. It is an expression that is common in the Communist Party vocabulary, and was used in the Note in question to express the view of *The Economist* that Communists spend much time accusing others of what they are doing themselves. It is our habit to put quotation marks around such expressions as this in order that readers may be aware of their source and significance. Mr Hall may find it helpful to read the leading article on Soviet Semantics in *The Economist* of November 19.—EDITOR.]

Cruelty to Children

SIR,—I have read with interest your comments on the debate which took place in the House of Commons recently in regard to Cruelty to Children. There was, however, one serious mis-statement—that "it is only working-class parents who come before the Courts or indeed are warned by Inspectors of the National Society for the Prevention of Cruelty to Children." That assertion is not true. The Inspectors of the NSPCC warn, and have prosecuted when the need has arisen, people in all classes, including those who have ample means.—Yours faithfully,

DAVID SMITH, Vice-Chairman

National Society for the Prevention of Cruelty to Children

AMERICAN SURVEY

Santa Claus and the Multiplier

(From Our American Staff)

ACCORDING to the census of 1940, there are in the United States some 300,000 persons who are Dutch by birth or parentage, and another five million odd who are German. The first group brought in Santa Claus (said by the Oxford English Dictionary to be of United States origin out of a Dutch dialect character spelled Sante Klaas) and the second the Christmas tree. Given the multiplying effect of factory production and the American propensity to spend, the mark of these two immigrations on the character of the American Christmas is out of all proportion to their numbers.

The traditions of other nationalities emigrating to the United States during the last three centuries and a half also survive. The English holly and the mistletoe wreath chandeliers and hang from door knockers, the Latin Catholic manger is dimly lit (by electric light) in churches as well as in museums, the Spanish *misa de gallo* is sung in New York as in Madrid. But while Christmas, like so many other features of American life, is a racy and incongruous mixture of customs brought across the Atlantic and those that have grown up since, the two symbols that dominate all others are the white-bearded fat man in the red suit and the decorated evergreen. So potent is their spell that even the children of orthodox Jewish families, told that Christmas is merely an adaptation of an earlier Jewish holiday, reject the Talmud's teaching and insist on celebrating the gift-giving virtues of the Dutch saint and the German tree.

This year those gifts are lit with neon, washed with gold and spangled with rhinestones. The amount of glitter would dazzle an Alpine climber at high noon. Fifth Avenue looks as though it has sacked the riches of the world, not only those made by American factories, but also the rarities of other lands which have returned in quantity for the first time since the war. Clay donkeys from Italy, wines from Hungary, printed silks from France, saris from India, lacquer from Japan and caviar from Russia, even raincoats from England, crowd the Christmas counters, competing with American specialities such as cocktail glasses made to dribble down the unwary front and lipsticks wrapped in a gold-illuminated scroll bearing the Christmas hymn.

All these items and a thousand more are supposed to make their way into gift wrappings and under the Christmas tree by way of Santa Claus' pack, and not all of them are destined for children. "Easily the most seductive gift," says one reporter, "is a pair of cuff links made of solid gold and fashioned in the shape of naked ladies." The white-bearded fat man in the red suit is still the children's friend, but his wages are paid by the Salvation Army and the department stores. Outdoors he rings a bell and solicits alms for the Salvation Army. Indoors he makes sure that hovering parents know what dear desires the child whispers to him, and can find them without leaving the store. So successful is he, in both roles, that his work has become a short-term profession, though not yet unionised. The same men, corpulent by nature or by padding, apply for jobs year after year, and there is even talk of a school which trains them in mild

jokes and smiling patience. Outside of fiat feet, the only occupational hazard is the inflammable false beard.

At the turn of the century there was competition between the stocking that Santa filled at midnight and the tree that parents trimmed as the resting place for gifts, but this now seems to have been resolved in favour of both. The tree is admittedly the more picturesque. It may be six inches high, made of plastic and bought at the ten cent store, or it may be 168 feet tall like the Douglas fir set up by a town in the State of Washington. Wherever it stands it must be lit—with candles or their electric counterparts—and it must wear on its topmost branch a star that glitters.

*

The American willingness to believe that two of any item has more than double the virtue of one has a special affinity for Christmas madness. Two pairs of nylons (sold in cigar stores for \$1 a pair) are known to be more than twice as good as one pair because they amount in fact to three pairs—the original two and the one that is left when ladders develop in two stockings of the original four. Two diamond clips are advertised as more than twice as good as one because together they may be combined into a third of a different shape. At least two radio sets are essential in a well-found house (this axiom has yet to be applied to television) and if one of them is portable its range may be extended so that two become three, four or five times as useful as one.

The multiplier is the keynote of those illustrated advertising booklets which reach the potential donor so conveniently early. You would like to give your great-aunt a blanket for Christmas? A good one will cost you \$15, and will, of course, be incomplete without a blanket cover which, costing an additional \$4.95, is itself a two-fold gift as it "protects your blanket and makes a lovely bedspread as well." Your uncle needs a coat-hanger? Have it monogrammed, and send six. Your brother wants a box to hold his cigarettes? Here is a new design with a plastic bird at one side which, when the appropriate lever is pushed, will pick out a cigarette in its long bill, and offer it. This says the merchant, provides not only a cigarette box full of cigarettes, but also a "conversation piece" which "operates with one-fingered ease." Box, bird, conversation and ease are a bargain at \$4. The more expensive jewellery stores will provide playing cards picturing the Republican elephant at two packs for \$3—the Democratic donkey is not displayed. Or they will sell you a pair of jewelled duck pins with ruby top-knots and emerald eyes for \$5,600. These compete with Cadillacs done up in cellophane and mauve bows, ready in the garage on Christmas morning.

There are moments when this incrustation of merchandising around what used to be the children's holiday seems too heavy to be borne, and one wonders how long the warm heart and the Christmas spirit can survive it. But the pangs of abundance afflict only the grown-up. Unlike the pleasures of austerity, they do not yet have to be explained to the young.

The National Security Resources Board

[FROM OUR AMERICAN STAFF]

ON November 16th the *Washington Post's* first leader consisted of a single sentence, under the heading "Memo to Mr Truman": "The National Security Resources Board has been without a chairman since last December." Another December has now come round without a nomination. A "Help Wanted" sign is also hanging out at the Research and Development Board; Dr Karl Compton resigned several months ago, and there are no indications of a successor. The Munitions Board was also without a chairman until it was taken over recently by Mr Hubert Howard, a Chicago coal merchant. But the National Security Resources Board needs more than a chairman. It needs agreement on its functions in both cold and hot war, particularly in view of the new machinery of defence established under the Atlantic Pact.

The NSRB was set up under the 1947 Act which established the Department of Defence and the Joint Chiefs of Staff, co-ordinated intelligence through the Central Intelligence Agency and established a formal link between the State and Defence Departments in the National Security Council.

In the minds of a number of the people who had a hand in the drafting of the legislation, of whom Mr Ferdinand Eberstadt, never a man for half measures, was one, the National Security Resources Board was to complete the structure by providing an agency through which military requirements could be related to the civilian economy. In short, it was to do in embryo the job that the War Production Board had done during the second world war. It was on this assumption that the Board's first chairman, Mr Arthur Hill, proceeded to operate; the phrase "intended to be a nucleus" was on his early organisation charts. But the assumption soon ran into brisk opposition.

The NSRB, apart from its chairman, consists entirely of members of the Cabinet who, being the heads of other departments, would not naturally be inclined to favour the growth of a super-agency. The Commerce Department in particular, sensitive to the relatively minor role which it played in the last war, probably hopes to do better in the future. When the difference of opinion became sharp enough for the President to be asked to clarify the functions of the new agency, he supported the Cabinet view that the Board should be merely advisory. This ruling not only left the Board in a somewhat undecided position, but drew attention to a difficulty in its structure with which the Hoover Commission dealt promptly, in its report on the National Security Organisation: the chairman of the NSRB, a Board composed of Cabinet members, is himself of sub-Cabinet rank.

Actually, the Board has not been materially handicapped by this situation during the last year. When, after Mr Hill's resignation, the Senate refused to confirm the appointment

of Mr Mon Willgren, Mr Truman made Mr John Steelman acting head of the Board, with Mr David Stowe as his assistant. In effect, this carried out the recommendation of the Hoover Commission that the NSRB be made part of the executive office of the President, since Mr Steelman is Assistant to the President and Mr Stowe is also a member of the White House staff. Mr Steelman, in his primary capacity, attends Cabinet meetings and the Board can, therefore, now meet informally after Cabinet sessions to discuss such matters as are not disposed of by the interdepartmental staff group which normally represents the members. And the acting chairman has no problem in securing access to the President. But this can hardly be a permanent expedient, and the present statutory position of the chairman would become increasingly inadequate if more action and fewer surveys come to be required from the Board.

As adviser to the President, the Board has two other advisory agencies with which it must get along, the Council of Economic Advisers and the Joint Chiefs of Staff. With the former, it is likely to have only the difficulties arising out of amicable overlapping. But its dealings with the latter are affected by the disagreements within the Services of which much was heard this autumn. It is the NSRB's function to estimate the country's economic capacity in relation to the requirements of the armed forces. But super-aircraft-carriers and B-36 bombers are not made of the same materials, by the same industries, with the same skills, or in the same places. As a result, it is to be assumed that there is some tentativeness about the strategic plan which was passed last summer by the Joint Chiefs, converted into items of equipment by the Munitions Board, and handed on to the NSRB for its practical industrial feasibility to be assessed. These tests of feasibility

—you tell us what you want, we tell you whether you can get it—have been made in respect of a considerable number of items of equipment, the major metals, petroleum and shipbuilding; phantom orders for war supplies have given manufacturers some idea of what they might be asked for. The results of most of the tests are secret, but the NSRB has made no secret of the fact that, for the present at least, the armed forces cannot have as much manpower as they would like if the civilian economy is to produce the required amounts of supplies.

Among the early detailed industry studies made by the Board, that on machine tools was probably the most important; other types of enquiry have included energy and utilities—electric power, coal, gas, and the water which the west has always known is short but which New York is only now coming to appreciate. A third set of estimates concerns transportation. The work on sea transport under Captain Granville Conway, former War Shipping Administrator, ties in directly with planning on the Atlantic Pact. Captain Conway's preparatory visit to Britain last summer, to investigate the shipping capacities of the Western Union nations, pro-

THE NATIONAL SECURITY ORGANISATION

The President of the United States

vided American background for the sub-committee of Atlantic Pact signatories that is to consider sea transport next month.

Yet, however much the NSRB has accomplished in the way of surveys, if it is to be merely a survey-making, advisory agency, there is no organisation ready to do the job that the War Production Board did in the last war. As long as this is the case, the civilian side of the balance between the civilian and the military components of national policy-making is going to be up in the air. In the National Security Council, the balance between the Secretary of State and the Secretary of Defence is already somewhat distorted by the fact that Mr Johnson, the Secretary of Defence, is a personality of much greater influence in the Democratic Party than Mr Acheson. The belief that the United States is very probably facing a long period in which a high proportion of the national product will be used for defence purposes, and will be subject to government action, is causing much sober concern. Dr Vannevar Bush, former head of the wartime Office of Scientific Research and Development, has recently given a great deal of space to the subject in his book, "Modern Arms and Free Men."* The Committee for Economic Development, a nation-wide group of leading businessmen, has just released a report on "National Security and Our Individual Freedoms," which considers further development of both the National Security Council and the National Security Resources Board essential to the effective exercise of civilian supremacy in the national economy.

American Notes

Cotton at the Crossroads

This year the Secretary of Agriculture, Mr Brannan, did not receive the usual invitation to address the annual convention of the American Farm Bureau Federation. This pointed omission dramatised the separation of the ways between the Administration and the Federation, who are no longer struggling hand in hand, as they have been since 1933, along the road to permanent prosperity for agriculture. To the Federation the path now chosen by the Administration—the Brannan plan, promising high incomes to farmers and low prices to food consumers—leads directly to socialised agriculture and national bankruptcy. In Mr Brannan's opinion, bankruptcy also lies at the end of the flexible price support route advocated by the Federation's president, Mr Allan Kline. Furthermore, it would, according to Mr Brannan, leave the city consumer sitting hungry by the wayside without lifting the burden of regimentation from the farmer.

This last contention is substantiated, as Mr Brannan has been quick to point out, by the tribulations that the cotton farmers are now undergoing as the result of the Cotton Act of 1949, which regulates the imposition of acreage controls and marketing quotas. Congress wrote this Act under the guidance of the Farm Bureau and refused to give the Department of Agriculture the discretionary powers for which it asked. In consequence the Department can now do nothing to help the big cotton farmers, who already lead the opposition to Mr Kline within the Federation. The protection which the Act gives to small farmers means that some of the big farmers are having to reduce their cotton acreage by 50 per cent or more, even though the total national cut this year is only 23 per cent (to 21 million acres).

Resentment against the Act did not, however, drive the cotton farmers to reject the marketing quotas, limiting the amount they may sell, which are being applied to cotton for the first time since 1941. Tobacco is also subject to these quotas, but it is not yet certain whether surpluses of the other basic crops—wheat, maize, rice and peanuts—will

* Simon and Schuster, New York.

be large enough to require them. Next year all will be under the acreage controls without which they would not, since the new Agricultural Act, be eligible for the high price supports to which they are accustomed.

★

But Congress did not direct the Department of Agriculture to apply these limitations in their most drastic form, the only one in which they can hope to be effective. Farmers are still free to grow what other crops they like on their diverted acres, instead of being obliged to plant non-competitive soil-conserving crops such as clover. Southern farmers, for example, can produce soya beans, or even maize, instead of the prohibited cotton; these feed crops will take the place of the maize which middle-western farmers are not allowed to grow. The Government is therefore likely to find itself nearly as heavily involved in the purchase of surplus crops next year as it has been this. The Commodity Credit Corporation has already let it be known that its present borrowing authority of \$4.75 billion will not be enough.

If it becomes obvious that the new Agricultural Act will not work without much stricter regimentation, one of the chief objections to the Brannan plan will lose much of its force with farmers. They are in any case being drawn towards the plan by its guaranteed income, which is becoming very attractive as their net income declines; it has gone down by about 20 per cent in the last two years. Southern farmers are already showing an interest in new methods of guaranteeing cotton prices and it is by no means certain that all of the 1,400,000 farmers represented by the Farm Bureau are convinced that Mr Kline's policy is better than Mr Brannan's. The National Grange, the other big farm organisation, has also condemned the Brannan plan, but some of the 850,000 members would nevertheless like to give it a trial run. Next November farmers will be able to say themselves which road they want Congress to take.

Pensions and Prices

The United States Steel Corporation, the most reluctant and grudging of the large steel companies to grant non-contributory pensions to its workers, has proved the first to pass on the costs of the new scheme to the consumers of steel. Prices have been raised by an average of \$4 a ton for finished products, and the rest of the industry, though it deserted US Steel on the pension issue, is expected to follow its traditional bell-wether on prices. The increase is not greater, rather somewhat smaller, than had been expected in industrial circles, in view not only of the estimated annual \$80 million increase in social security costs, but also of higher prices for raw materials.

Steel at approximately \$100 a ton adds another \$8 to the cost of an automobile, \$3 to a tractor, and 50 cents to a refrigerator. But it does not follow that prices to the ultimate consumer will be raised by this amount; competition will force some buyers of steel to absorb the increase. It is likely, however, to rule out some reductions that would otherwise have been made, and industries which themselves are committed to pay new insurance costs may be forced to make the consumer shoulder all or part of the burden.

The moderating effect of the return of competition makes the present rise in steel prices less inflationary than that in

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

1948, but this will not excuse the steel companies from having once again to justify their price policy to the appropriate Congressional committees. These are now controlled by Democrats, rather than Republicans, and consequently more vocal, though it is hard to see how they can do more than lock the stable door.

The board appointed in the summer by the President to study the steelworkers' claims against the industry recommended that the union, if it won old-age pensions, should forgo a wage increase, which might have an inflationary effect on prices. But the board went on to suggest that steel profits were high enough to permit prices to be reduced and that, if this did not take place, the union would be justified in pressing for higher wages to enable it to participate more fully in the industry's prosperity.

It is not unnatural that the steel companies should be anxious to recoup as soon as possible some of their losses in the six-week strike. But the union (now prevented, by the terms of its contract, from pressing new wage demands until November, 1950) is more impressed by the fact that the profits of the US Steel Corporation, at \$133 million for the first nine months of the year, were running, until September, at a level higher than at any time for twenty years past. In the wake of the strike, operations are nearly 95 per cent of capacity, and the price increase itself suggests the industry expects no early slackening in demand.

It is healthy, no doubt, that the nation should realise that even non-contributory pensions must be paid for. But the lesson would have been accepted with a better grace if US Steel had not been so eager to act as the instructor.

Veterans Learn Their Lessons

Before long the voice of the veteran will cease to be heard on the college campus. Only 20 per cent of this year's freshmen are ex-servicemen and women, instead of the 50 per cent that has been usual since the war. In 1947 there were nearly one and a quarter million veterans studying for a university degree; now there are about 900,000 and only about one-third of college students are veterans, compared with three-quarters in 1946. It is no longer the undergraduate, but the graduate and professional schools, which are stretched to bursting point by the influx of ex-servicemen. That influx, when it began in 1946, raised college enrolment to record levels but, in most, although not all, universities, its subsidence has only reduced the average rate by which the student body is increasing, instead of causing the absolute decline which had been expected. This year's freshmen are evidently finding that their parents' prosperity is an adequate substitute for the government bounty that has seen their older brothers and sisters through college. The university authorities are saying good-bye with regret to these comparatively mature and experienced ex-service students, who have nearly always taken their education seriously. Their needs have been met by changes and improvements in college curricula and methods, many of which are likely to be permanent.

Should jobs become harder to find, it is possible that some veterans may return to college and that others may decide to take advantage for the first time of the opportunities which the government offers them. So far only comparatively few ex-servicemen have exhausted all the educational benefit to which they are entitled. The government pays tuition fees of \$500 a year and a subsistence grant of from \$75 to \$120 a month for periods which vary with length of service, disability and so on. Nearly half of this year's appropriation of \$5.6 billion for the Veterans' Administration will be spent on education and training, which since 1945 has cost the country about \$7.5 billion. During that time over \$35 billion has been spent on aid to veterans, which also includes compensation and pensions, hospital care, business loans, unemployment benefits, and so on.

Two million veterans have gone to college under the scheme and an additional two and a half million have received other forms of teaching; of these 500,000 have completed their elementary education. The number of veterans taking technical training is still increasing; it has gone up from 600,000 at the end of 1947 to about 800,000 now. Many new trade schools have been founded since the war to cash in on the government's generosity, and the VA has constant difficulty in preventing abuses. This is partly due to the frequent political pressure put upon it to relax its regulations regarding the courses which it is prepared to finance. It has, however, succeeded in making the veteran who wants to learn about dancing or fishing, or to develop his personality, prove that the study will help him to get a job.

Bulls in the Coffee Shop

In the middle of November, Senator Gillette's attention was directed to the high price of coffee when the Senate coffee shop gave the death blow to the traditional nickel (five-cent) cup, already moribund elsewhere, and the Senate restaurant abandoned its "bottomless cup" policy of giving free refills. Mr Gillette already had a committee investigating the gap between the price of food at the farm and on the counter. It at once began to inquire into its chairman's allegation that speculators were responsible for the well-publicised rumours of a coming coffee shortage. The price had almost doubled in recent months and the New York Coffee Exchange had been forced to lift its ceiling on daily increases in green futures, from 1½ to 2 cents a pound. The rise was halted by the news of Senator Gillette's concern, but not before it had driven wholesale and retail prices up by 20 to 25 cents a pound. Even so coffee is still selling at well below the \$1 a pound about which shopkeepers

A Strategic Connection at a Convenient Location

Many firms in international trade find it helpful to maintain a connection with this old established New York bank.

The London office is situated conveniently at 7 Princes Street, E. C. 2.

**CENTRAL HANOVER

(Incorporated with Limited Liability in U. S. A.)

LONDON . . . 7 Princes Street, E. C. 2

NEW YORK . . . 70 Broadway

have been whispering; fear of this emptied their shelves and filled housewives' store cupboards.

The representatives of such trade organisations as the National Coffee Association and the Pan American Coffee Bureau were not particularly convincing when they protested their lack of speculative intent before the committee. There is no doubt that Mr Truman will improve the occasion by pressing for the tighter control of the commodity markets which he has been advocating for some time. There was also some conflict between the estimates given by various

UNITED STATES COFFEE CONSUMPTION

Year	Imports (thousand bags of 132½ lb.)	Annual Consumption a head (lb.)
1937-39 (average)	14,358	14.38
1940	15,536	15.57
1941	17,045	15.62
1942*	12,962	13.77
1943*	16,618	12.55
1944	19,707	16.31
1945	20,539	16.75
1946	20,632	19.39
1947	18,854	17.81
1948	20,946	19.04

* Coffee was rationed in 1942-43.

government officials, one of them rushed hot-wing from Rio, on the effect the recent drought in Brazil will have on next year's coffee crop.

The drought certainly opened the doors of the coffee shops to the bulls and they were pushed wider by exhaustion of the stocks of Brazilian coffee which have been overhanging the market for many years. This encouraging event has been brought about by a decline in output, the recent recovery in European demand and the apparently irrepressible rise in US consumption. Impossible as it seems, the habit of drinking coffee is still growing in the United States and does not seem to be dependent on present prosperity. Individual consumption continues to go up, in spite of higher prices; the population continues to increase, and most of these new citizens have hardly yet reached coca-cola, let alone coffee, drinking age.

Since the United States already takes 70 per cent of the world's exportable coffee and must import all its supplies, this autumn's spectacular rise in coffee prices was only an extreme symptom of what is likely to be a long-term trend. This will last at least until newly-planted coffee trees begin to bear in five years' time, but Latin Americans are not as enthusiastic as the American housewife would like about planting these trees. They remember when coffee sold at one-fifth of its present price; they are anxious to escape from their one-crop economy; and they see an answer to their troublesome dollar problem in their near monopoly of this American necessity.

Encouraging Imports

The trade returns for October, the first full month since devaluation, show a sharp decline in the excess of American exports over imports, but a clearer indication of the success of the policy of encouraging imports is provided by the alarm of some affected industries in recent weeks. In October, the export surplus was only \$289 million, the lowest figure for nearly a year, but reduced exports, due in part to the steel strike, played a larger part than the increase in imports. The latter were \$29 million higher than in September, while exports were down almost \$56 million. Further increases, in British exports to the United States, at least, took place in November, but most of the foreign goods tempting American Christmas shoppers were bought before devaluation.

One very useful guide post to the dollar-hungry has been provided by the National Retail Dry Goods Association in a report to the Economic Co-operation Administration. This

is a list of 400 items which it feels could be sold in quantity in the American market. The great value of the report is that it specifies the price ranges in which such goods should sell, and the characteristics that will be demanded by American shoppers. To reach these friendly counters, however, foreign goods must pass through the needle's eye of the US Customs. The Treasury, which controls the customs, feels it has already introduced such reforms as are possible without Congressional approval; and Mr Snyder recently summoned customs inspectors from all over the United States to instruct them that the United States policy is no longer protectionist, and that they must extend a friendly and helping hand to importers.

As soon as Congress meets, it is expected that the Treasury, backed by the State Department and Economic Co-operation Administration, will submit legislation to amend the Customs procedures laid down by the Smoot-Hawley Act of 1930. The chief aim is to simplify classification and valuation so that importers may know, without undue delay, what rate applies to their goods. American foreign trade circles hope that this may mean the end of "foreign value" or cost of production as a standard of appraisal. International reform of arbitrary and antiquated customs procedure is part of the Charter of the International Trade Organisation, and the State Department puts ratification of the ITO charter first on its legislative list for the next session of Congress. But the charter is controversial, and hence legislation to amend customs procedure is likely to be made a separate measure.

Even so, its passage may not be early or easy. Czech competition is felt in shoes and berets; cheap foreign steel is reappearing, and even the toy industry, sheltered by a tariff that goes as high as 70 per cent, is sponsoring a quiet "Buy American" campaign and refusing to accept foreign advertising in its trade journals.

Shorter Notes

During the past three weeks, any parent living in the area served by the New Haven Railroad has been able to take the family to the nearest city to visit Santa Claus for only 25 cents a child for the round trip. The limit was 13 children to a parent, which the railway thought would be enough for most families. In one Florida town Santa Claus, arriving by parachute, landed on the electric power lines and completed his descent ignominiously by ladder. Park Avenue in New York is again lined with Christmas trees, lit with white and yellow bulbs only, to avoid confusion with the red and green traffic lights. Even sailors in the Pacific will have Christmas trees; four thousand were cut for the Navy two months ago in the Californian mountains and sprayed with a special liquid plastic to keep them green.

It is a year since the Supreme Court ruled that the Bermuda military base, which the United States leases from Britain, was an American possession. It has now, however, decided that the similar base in Newfoundland is in a foreign country. The immediate sufferer from this semantic contradiction is the widow of an airline employee who had hoped to obtain compensation from the Federal Government for her husband's death in an accident at the Newfoundland base.

Since controls on instalment purchases lapsed last June, outstanding consumer credits have risen to over \$17 billion. This record high level is due in part to price increases, but the ratio between instalment credits and disposable personal income is higher than it was in 1929. There is also an ominous reappearance of the easy credit terms and "no down-payments," which entice consumers to contract debts they cannot pay and were in part responsible for the collapse in 1930. However, bankers feel that there is no cause for concern so long as national income remains high.

THE WORLD OVERSEAS

Trial and Death of Traycho Kostov

(By a Correspondent)

THE incredible monstrosity of the case of Traycho Kostov, former Secretary-General of the Bulgarian Communist Party, stands out even against the background of the long and sickening list of judicial murders in Eastern Europe. Kostov and his ten co-defendants, all ex-Cabinet Ministers, Communist leaders of long standing, and high Communist officials, were tried according to a retrospective law passed only last month for the specific purpose of dealing with them. The President of the newly-created "Supreme People's Court," which tried the case, was also President of the "Election Commission," which ensured the 97 per cent government majority last Sunday, a mere 48 hours after Kostov had swung from the gallows, as a sort of "eve-of-the-poll" appeal to the voters.

The trial itself did not take place in the Sofia Law Courts, but in the ballroom (specially decorated for the occasion) of the Military Club, which was packed with several hundred "shock-workers" assembled there to enjoy the show. The indictment was such a fantastic document, even for a Communist trial, that neither the "people's judges" nor the accused and their counsel bothered to analyse it seriously or in detail. All they did was to shout in unison—with the notable exception of Kostov—that "terrible crimes" had been committed and that "the heaviest punishments" should be inflicted on the traitors, spies, saboteurs and wreckers. Kostov's counsel, an elderly Communist lawyer and a Communist M.P. went so far as publicly to rebuke his client for not having "confessed" in court. He fully accepted the prosecutor's view of Kostov's "guilt" and argued that "in a Socialist country it is the duty of the defence counsel to assist the Public Prosecutor in his noble task." Finally, several hours after Kostov's hanging, the Communist press published a sort of "posthumous confession,"—it was three weeks later in the case of Petkov—in which Kostov was alleged to have praised his death sentence as "absolutely correct and corresponding to the interests and peaceful development of Bulgaria in its struggle against Anglo-American imperialists and their agent, Tito."

"Confession" Withdrawn

The sensation of the trial was, of course, Kostov's pleading not guilty, repeated after the half-hour "rest" granted him "to refresh his memory," and defiantly reiterated, at the last day of the trial, when he delivered his "last words" before the Court, drowned in hisses and boos by the spectators. Kostov admitted that he had held "anti-Soviet sentiments," though he had always "respected the Soviet Union." But he denied having ever been a police spy, a Tito stooge, or a British agent. He was supposed to have confessed to all these crimes in a 32,000 word statement, written "in his own hand" during his long months of imprisonment. Baffled and panic-stricken by Kostov's "not guilty" plea, the presiding judge asked him incredulously: "Do you mean to say that you reject your confessions written in prison?" "Yes, I do," replied Kostov, amidst the "indignant" shouts and hisses of the audience. Whereupon judges, prosecution and defence counsel, after a hurried conference, decided

simply to ignore Kostov's statement before the Court and to stick to his "written" confession.

Soviet and Communist commentators everywhere were furious at Kostov's defiant attitude. In fact, for the first 48 hours, obviously waiting for instructions, neither the Russian nor any other satellite radio station or paper dared to comment upon it. On the third day of the trial *Pravda* described Kostov "as a shrewd, experienced and determined enemy," with a "soft and oily voice" and "the cunning eyes of a thief." *Pravda* poked fun at Kostov's "bent back," not mentioning, or perhaps not even knowing, that Kostov had been a hunchback ever since 1924, when, as a Communist organizer, he threw himself from the top floor of the Sofia police building, where he had been tortured, in an unsuccessful effort to commit suicide.

Plots and Counter-Plots

The main charges in the indictment, fully substantiated by the "confessions" of Kostov's co-defendants, were three: (1) that Kostov had been a Bulgarian police agent and a British agent since 1942; (2) that he had plotted, under British orders, to proclaim Bulgaria a federal unit in Tito's Yugoslavia in 1944; and (3) that he had plotted, in 1947 and 1948, with Tito—and again under instructions of the "Anglo-Americans"—to overthrow the Bulgarian Communist Government, to assassinate Dimitrov and to "detach Bulgaria from the camp of peace and democracy, led by the glorious Soviet Union."

Kostov dismissed the first charges with great skill and an obvious contempt for his accusers. He pointed out that all files of the Bulgarian police were captured by the Communists in 1944 and that from these files, published officially by the Communist Party after the war, it was proved that Kostov had never betrayed anyone, even in the face of inhuman tortures, and had never been a police agent. To back its charges the prosecution brought to the court the chief of the Bulgarian Secret Police under King Boris, Andrey Pramatarov, who was condemned to death by the Communists in 1945, but, as has now been revealed, was not executed at the time. Pramatarov, whose life-long career had been to hunt down Communists, enjoyed himself before the Court testifying against the leader of the Communist Party, who had been his most dangerous enemy for over twenty years.

The second charge—the Tito-Kostov plot in 1944—is from a political point of view the most interesting. It is quite true that in November, 1944 Tito and the Bulgarian Fatherland Front government were engaged in secret negotiations for the immediate proclamation of a South Slav Federation. These negotiations, however, were fully backed by the Soviet Union, as part of the Russian political and military offensive in the Balkans at that time. The Federation was not proclaimed only because of energetic opposition on the part of the British and American governments. Now, at the Kostov trial, the prosecution "proved" that these negotiations were a vile British plan to subjugate Bulgaria to Tito's Yugoslavia. But there are embarrassing official

documents on the subject: the British Notes of protest to the Soviet and the Yugoslav and Bulgarian governments. The Court explained this easily as a British trick of camouflage—Kostov had plotted to proclaim the federation but, in order to fool the Soviet Union and the world, the British had promised to register their official opposition to the plan.

Concerning the third charge (conspiracy with Tito in 1947 and 1948), Kostov pointed out that he had always talked to Tito and to Rankovich in the presence of Dimitrov, and that the Soviet government, and Vyshinsky in particular, were kept well informed of the Yugoslav-Bulgarian negotiations. Kostov did not deny that concrete plans for a union of South Slav republics had been made between Belgrade and Sofia; but, he argued, this had been the official Soviet and Communist policy at that time. Moreover, in the Stalin-Tito controversy, Kostov had taken Stalin's side completely. He was, he pointed out, one of the signatories of the anti-Tito proclamation produced by the Cominform in 1948.

Kostov's co-defendants presented the sorry spectacle of frightened, broken-down Communist leaders who went out of their way to denounce themselves as spies, traitors and enemies of the people, to ask for the heaviest punishments for their treacheries and finally to beg "with tears in their eyes" for mercy and forgiveness. Up to two or three months ago, these people held the top posts of the Bulgarian Communist Party and government administration. Ivan Stefanov was Finance Minister; Tzoney Tzoneyev, governor of the National Bank; Nikola Pavlov, chairman of the powerful Control Commission of the Communist Central Committee; Nikola Nachev, vice-chairman of the Cabinet committee for economic and financial affairs; Vassil Ivanovsky, chief of the propaganda department of the Communist Central Committee; Ivan Tutev, Minister of Foreign Trade; Boris Hristov, Bulgarian economic representative in Moscow, and so on.

Stefanov admitted that he had been a British spy since 1932 (when he was a high Soviet official in France). Tutev revealed that he had worked regularly for the British Intelligence since 1935 and that he had become a Communist only because the British had ordered him to do so.

Chaos in the Bulgarian Economy

The confessions of sabotage and wrecking activities by several of the other economic ministers are more than revealing in that they indicate the chaotic conditions of Bulgarian economy today. According to Stefanov, the Five-Year Plan was based only on "very rough estimates, which did not give a true picture of the financial situation." The income tax system for 1946, 1947 and 1948 was also defective and "did not correspond to the actual incomes of the population." The credit and bank systems were "complex and unworkable" and caused the "discontent of the people, especially in the villages." The whole system of the govern-

ment quotas for wheat, rye, meat, eggs, potatoes, wool, vegetables, and so on, was "arbitrary" and "disorganised."

The desperate economic plight of the country was confirmed by the latest decree of the Central Committee of the Communist Party, published during the Kostov trial. The decree speaks of an "unhealthy and harmful attitude on the part of the government economic departments in the provinces," and complains that "there is no state discipline." The people's councils (local Soviets) are proclaimed guilty of "wrecking tendencies" in connection with the government requisition of food produce. The official Communist paper, *Rabotnichesko Delo*, in a leading article, states: "The situation has become much worse, thanks to the sabotage economic policy of the treacherous band of Kostovites in the country." Only 52 per cent of the government quotas have been fulfilled, and in some provinces the quota has not reached more than 10 per cent and even 4 per cent. Again, because of sabotage activities, 180,000 bread ration cards were distributed to people who had no right to possess them.

These Communist admissions point to an almost complete breakdown of the state administration and the party machine, which is not surprising, as Kostov was—and had been for many years—the supreme controller of both. It is surprising, however, that the Russians should have chosen this particular moment to destroy the very loyal and, in many ways, very able and efficient leadership of the Bulgarian Communist Party.

Striking Force in the Eastern Zone?

[FROM A CORRESPONDENT IN BERLIN]

WERE the para-military formations of the East German police, commonly known at present as *Bereitschaften*, expanding anything like as swiftly as some reports have suggested, there would be little cause for alarm. A really effective striking force of 200,000, or even of 100,000, is not nowadays created from nothing in a year. Only loose bandying of the generic term *Volkspolizei* has given rise to the popular misconception that the *Bereitschaften* are so many. The *Bereitschaften* are an élite training corps within the *Volkspolizei*, which counts among its numbers some 30,000 Frontier Police, some 30,000 ordinary constabulary, the whole of the criminal police, and the new women traffic police. If the *Bereitschaften* were already as numerous as the entire *Volkspolizei*, they could be but poorly equipped, ill-trained, and of questionable reliability. As it is, they have come into being slowly, after very careful staff work. Approximately 35 *Bereitschaften*, each 1,200 strong, have been formed since September, 1948. It is expected that by about the middle of next summer there will be 50—a total force of 60,000 well-armed men whose training will not have been scamped, and whose military efficiency must be respected.

It became generally known in Germany in 1935 that, in his capacity as *Reichsfuehrer SS*, Heinrich Himmler was organising armed formations complementary to the *Leibstandarte Adolf Hitler* and the virtually unarmed *Allgemeine* or general SS. They were called *SS Verfuegungstruppen*, "Disposal Troops." Apart from their obvious usefulness in the event of trouble at home, it is doubtful whether Himmler appreciated at first how he would eventually want to dispose of them. When the pattern of the future became more clearly discernible, they were no longer called *Verfuegungstruppen*. Required for known ends they were expeditiously regrouped into the formidable divisions of the *Waffen-SS*, whose role was beyond doubt.

Something similar is happening in eastern Germany today. A totalitarian government, supported by only a minority of the 18 million people it rules, yet consumed with ambition to

extend its authority over another 45 million Germans beyond the Elbe, is making as careful provision as it can for adventures that are certain to come but are still unpredictable in detail. The *Bereitschaften* of the *Volkspolizei* are the German Communists' *Verfügungstruppen*—a reserve of force and experience that can be relied upon in fair or foul political weather anywhere inside Germany. In the meantime the rank and file of the *Bereitschaften* continue to train within their barracks, neither taking part collectively in ordinary police duties, nor being posted individually to units outside. So absorbed are the *Bereitschaften* in training that they are referred to from time to time simply, but rather misleadingly, as "the Police Schools." The syllabus of the earliest-recruited formations is not planned to end before next May.

Wehrmacht Generals in Charge

Nominally the whole of the eastern German police force comes under the control of the Minister of the Interior, Karl Steinhoff, an unimpressive personality whose appointment can be attributed only to the intention of Walter Ulbricht, the Deputy Premier and Germany's most influential Communist, to keep the real power in his own hands. Immediately beneath Steinhoff comes Kurt Fischer, Chief of Police at the Ministry of the Interior, one of the group of German Communists who fled obscurely to Russia in 1933 and returned in 1945 in the wake of the Red Army. From Fischer's desk the orders pass down two separate channels of command, one leading to the Land Police (frontier, criminal, and traffic), the other to the administration for training, which means the *Bereitschaften*. On matters concerning the Land Police, Fischer reports normally to his chief, the Minister of the Interior. On matters concerning the Department of Training, he reports directly to Walter Ulbricht, the dominating figure in the east German Politburo, a man, like Fischer himself, trained and trusted in Moscow.

At the head of the Department for Training, immediately supervising the *Bereitschaften*, is another Communist of long standing, General-Inspector Wilhelm Zaisser. As "General Gomez," Zaisser commanded the Thaelmann Brigade in the Spanish civil war. In the last war the Russians put him in charge of a school for German prisoners, from whom he singled out many of the experienced Wehrmacht officers who are helping him in Germany now, including the former generals von Weech, Wulz, Lattman, Freitag, Ulex, and Heinemann.

They have put in some hard work in the past twelve months, these competent professional soldiers and their political confederates. Their administration for training is divided into four main departments, responsible for technical training, political indoctrination (Politkultur), general staff duties, and supplies. The 35 *Bereitschaften* which they have brought into being are stationed in the larger towns and principal strategic areas of eastern Germany. Six of them are within fifty miles of Berlin—at Potsdam, Eiche, Luckenwalde, Falkensee, Kyritz and Brandenburg.

Training in Infantry Weapons

The *Bereitschaft* has an establishment of four companies each of 250 men, and an additional 200 men with extra-company duties. The company is divided into four platoons, which are subdivided into four sections, each composed of 15 men. The sections specialise variously in the arms available. These include infantry guns, heavy and light machine-guns, machine pistols, and rifles. The equipment was at first of Czechoslovak, Polish, and Russian origin. In recent months General-Inspector Zaisser and his colleagues, in a bid to standardise equipment, seem to have been able to get hold of a good deal of old German stock. There are reports that one formation, the *Ernst Thaelmann Bereitschaft* at Grossenhain,

between Dresden and Leipzig, has been equipped with anti-tank rifles, and that other formations are to be given some Russian T34 tanks. They have not yet been satisfactorily confirmed.

While driving from western Germany through the Soviet zone to Berlin a few weeks ago, the present writer was hailed for a lift by what appeared at first sight to be an officer of the *Volkspolizei*. It was established in the opening gambits of conversation that the German had hitch-hiked from Torgau in Saxony that morning, and was on his way home for a few days' leave. Torgau, formerly a Wehrmacht prison, now houses the police school, or *Bereitschaft*, from which the son of Max Reimann, the western German Communist leader recently deserted to the west. The young policeman—he was nineteen—said that his father, a forester, was a refugee from Insterburg in East Prussia. Unlike most of his comrades at Torgau, he himself, was not an ex-prisoner of war. He, too, had wished to take up forestry, but had been advised "by the Russians" that, since there were already too many foresters, he would do better to join the police. So there he was at Torgau, until next May, studying police duties (particularly frontier duties), mathematics, map-reading, and Russian, and listening to political lectures by German police officers and Soviet army officers.

Two Uses for the Future

What will become of the *Bereitschaften* when the first 35 formations are ready in May? The answer lies with Walter Ulbricht, the east German Communist Politburo, and their Soviet mentors. It is possible that the *Bereitschaften* may have to continue their training for a while longer, until it is decided whether the Soviet Army of Occupation is to leave Germany or not, and what sort of striking force the east German Government will then require in support of its policies. The *Bereitschaften* are already strong enough to guarantee Communist law and order within the boundaries of the Soviet zone, if not beyond. If western Germany remains an obviously unassailable province it is probable that the *Bereitschaften* will evolve finally into first-class Communist police schools, from which officers and NCO's will be posted regularly to the various organisations of the *Volkspolizei*. But they will always be there as powerful, independently-operating reserves of force.

In the circumstances it is surprising that the three western Foreign Ministers have not yet closely questioned Mr Vishinsky concerning the breach of the Potsdam Agreement which the training and arming of the *Bereitschaften* constitute. They allowed the blockade of Berlin to be imposed stage by stage until they were driven to make the costly stand of the air lift. What defensive action may have to be regretfully taken one day against the *Bereitschaften*? Eastern Germany, with a population of 18 million, already has a total police force of some 200,000, of which the para-military formations compose 21 per cent. Western Germany, with a population of 45 million, has a police force of 100,000 men, whose only arms are a stock of rifles and pistols which can be drawn upon in an emergency.

Trust Busting in Canada

[FROM OUR OTTAWA CORRESPONDENT]

THE conflict between the pure liberal philosophy of trust-busting and the control measures taken in Canada (as elsewhere) during the war has landed Mr St. Laurent's government in a storm of unexpected trouble. Canada has had a Combines Investigation Act for many years, but it has been constantly amended; even the Liberal party has wavered in

its fidelity to the pure principle of economic liberalism that agreements to restrict competition or maintain prices must always be bad. After a low point in the early 1930's when the Bennett Conservative government watered down the Combines Act to almost nothing, the Liberals have made progressive amendments, putting teeth into the Act.

By the amendments of 1946, Mr Mackenzie King's government gave a civil servant, called the Commissioner, the power to start an investigation into suspected combines without authority from any Minister, to seize files and interrogate witnesses, and then to make a report which the Government was bound to publish within 15 days. Prosecution was not bound to follow, but it was held—and this was Mr King's main point—that automatic publicity was in itself the strongest possible weapon against combines which operated against the public interest. The Commissioner clothed with these powers was Mr F. A. McGregor, a man who had been private secretary to Mr Mackenzie King in the early days of his premiership and who had been associated with the fight against combines since the First World War.

During the second world war, when proceedings against combines were subordinated to price-control and production directives from the Government, Mr McGregor became enforcement officer for the wartime Prices and Trade Board; in that capacity he could both see that industry complied with wartime orders and also exert some influence over any formal authority that might be given to a particular industry to restrict competition. With the end of the war, the Canadian Government embarked on a policy of gradual decontrol. Mr McGregor, believing that the danger of combines operating against the public was greater than it had ever been, returned to his job as Combines Commissioner. He kept a watch on each industry as it was decontrolled. In September, 1947, when both the flour-milling and the interconnected baking industry were freed from controls, Mr McGregor found grounds for investigation, and, as a result of his report on the baking industry, prosecutions are now pending. As a result of his report on the flour mills, however, the Liberal Government has been going through some difficult times and he has resigned.

Report on the Flour Mills

The investigation into the flour mills covered the period from 1936 until September, 1947. The report, summarising thousands of seized documents and interrogations, found that throughout this period the Canadian National Milling Association and eleven member firms had operated an illegal combine. The report was completed and delivered to the Minister of Justice on December 29, 1948. This Minister happened to be newly appointed, a former premier of Manitoba, Mr Stuart Garson, who did not get to Ottawa until several days after the report had been delivered. He was later to plead that with the best will in the world he could not have digested the report and had it published before the statutory date, January 13th, as required by the Combines Act.

On this technicality, he had universal sympathy. But the report was not actually published until November 7, 1949, by which time the Combines Commissioner had resigned in depression and futility, and the Liberal Government had won a June election—with the flour mills report neatly and illegally hidden in the Government vaults. What happened between January and November would normally be a privileged matter of discussion within the Cabinet and between senior civil servants, but, because of the peculiar circumstances, the veil has been lifted on some of these events.

When Mr Garson, the Minister of Justice, in the midst of many cares attending his new office, finally read the report on the flour mills, he realised it dealt with the period of wartime controls about which he knew nothing. So he consulted the Minister who, remaining from Mr Mackenzie

King's wartime administration, knew most about them. This was Mr C. D. Howe, who had been Minister of Munitions and Supply, and who, when he saw a summary of the report, promptly insisted that the millers had had Government sanction for their wartime collusion, and that it was impossible to attack them now for the co-operative arrangements they had made in carrying out the Government's wartime policies.

Arguments in Secret

In the argument which developed—still in secret—neither Mr Howe nor Mr McGregor could convince the other; and Mr Garson, the Minister responsible for Mr McGregor's department, was caught in the middle. The wartime controls on milling had been complicated and unique. Wheat was exempted from price control. Most of it was sold overseas and earned whatever price it would fetch. But a free price for wheat in domestic consumption would have wrecked the structure of price controls; so an arrangement was made whereby the millers would sell their products below a ceiling based on a certain prewar period, and they would get a subsidy to make up for whatever their wheat cost them above a certain fixed price. In return for this subsidy they agreed to the strictest profit control taking in export as well as domestic sales. It was therefore argued by Mr Howe and senior officials of the Prices Board that the flour millers' wartime co-operation could not be against the public interest. They could make no excess profits, and any widespread price reductions would merely have cost the taxpayers more in subsidies.

Mr McGregor was unimpressed. He had turned up letters and agreements between milling companies which had every air of being furtive and conspiratorial. The Government could produce no formal authorisation to the millers to agree on minimum (as well as the enforced maximum) prices;

Rockefeller Project, Economic Commission for Europe, Geneva.

Applications are invited for the post of Senior Research Assistant to Doctor Ingvar Svennilson who is at present engaged on a Rockefeller financed research project carried out within the United Nations Economic Commission for Europe at Geneva. The project is mainly concerned with long-run changes in the structure of European economy and selected industries. Applicants should have post-graduate experience in research concerning problems of industry and trade (structure and location of industry, restrictions of competition and trade), including experience in handling statistical material. Possibilities of publishing contributions under Assistant's own name. Working knowledge of English, French and German is required. Annual salary U.S. \$6,700, payable in Swiss Francs subject to United Nations regulations. Family travelling expenses payable on acceptance of a two-years' appointment. It is desired to fill this post as soon as possible. Applications, stating age, qualifications and experience, should be addressed to the Personnel Officer, United Nations, Palais des Nations, Geneva, in an envelope marked "Rockefeller Foundation Project."

and he believed that a prewar combine had been perpetuated throughout the wartime control period.

The Government therefore found itself legally bound to publish the report, but practically it could not do so without one of its senior ministers (Mr Howe) and some of its senior civil servants (including Mr Donald Gordon, the wartime head of the Prices Board) publicly contradicting it. It chose illegality to embarrassment. It suppressed the report, and went ahead with preparations for the election of last June in which it won an overwhelming majority.

It may be claimed that no embarrassment after an election is as bad as a lesser embarrassment before one. But Mr St. Laurent's government has had a bad time since these facts came to light. Mr McGregor, an honest and conscientious civil servant, resigned at the end of October. In explaining its actions the Government had to reveal much more than it would have liked. The Opposition and the press pursued it fiercely, not necessarily in support of Mr McGregor, but at least in indignation at the suppression of the report. It was argued that if parliamentary democracy were as healthy here as in Britain, at least one minister would have had to resign. That is not going to happen; but the reaction of parliament, press and public has been enough to present a stern warning to this or future governments. And parliamentary democracy cannot be in too weak a state when a Government enjoying the support of 190 out of 260 members of parliament has been driven into a position of such humiliating self-defence as this one has.

Trading in Spain

[BY A CORRESPONDENT]

THERE are no commercial secrets in Spain. Every transaction, whether import, export or re-export, is open to public investigation, and full details are available to anybody who is interested in his competitors' activities. This information is given, not only *post factum*, but, in many instances, even in advance.

The Ministry of Commerce publishes full details of every import and export licence issued and, as all foreign trade is licensed, the interested parties can learn in advance what their competitor intends to do in the near future. The data give the name of the licensee, and also the quantities, prices, country of origin and final destination of the goods. The issue of import and export licences may, however, give an incomplete picture of actual trade transactions because licences may be left unutilised; but for a payment of about £15 a year one can obtain full and detailed information of the extent to which these licences were taken up.

In Malaga there exists a publication marked "confidential" which is available to anybody who subscribes to it; it gives details of the manifest of every ship, large or small, arriving at or leaving a Spanish port. The editors or compilers of this publication, the *Informaciones Totelo*, have access to copies of every bill of lading, and tabulate the information contained therein according to country of origin and destination and the type of merchandise; they give full details, including name and address of consignor and consignee, as well as nett shipping weights and the full value of the goods as declared on the invoices.

The publication rips open all important business secrets. In any other country it would be looked upon as containing most valuable trade information, and it would immensely help any live firm to expand its business activities into fresh fields. But not in Spain. There the volume of business done seldom depends on commercial experience, drive or ingenuity. In Spain trade is done, not by the firms who excel in salesmanship and ability, but by people with contacts and access to the right channels.

No Fixed Rates of Exchange

The selling and buying price of export and import goods, as given in pesetas, is a riddle which only few can solve. One hundred pesetas can stand for anything between 10s. and £2 10s. It all depends on who receives and on who pays for the goods in question; a fixed rate of exchange does not exist. The *cambio* (Spanish term for a rate of exchange) has more than a hundred different values. Every commodity, either imported or exported, has a different rate of exchange, and it often happens that the same commodity has a rate of exchange varying by as much as 75 per cent, according to the firm which figures as exporter on the invoices or bill of lading.

This rate of exchange, which is the key to any business transaction, is often fixed by arbitrary officials of the Ministry of Commerce in conjunction with the Money Institute. It happens that, for the very same commodity, one firm is obtaining an exchange rate amounting, for example, to 50 pesetas to the £, while his next-door competitor may obtain as much as 150 pesetas because he succeeded in finding the right contact and the right person to submit his case to the officials who fix the *cambio*.

Officially, the rate of exchange for the pound sterling varies at the moment from 45 to 75 pesetas. In practice, there are many commodities for which the Spanish exporter can obtain as much as 250 pesetas to the £. This is achieved by the loophole known as "free sterling." The Government allows the importers to import freely any commodities they require for a part of the sterling earned on the exports to Great Britain. In the black market this free sterling fetches as much as 250 pesetas according to the commodity imported. If, for example, the free sterling is used for motor-cars, luxury goods, or certain chemicals, it will fetch nearly 250 pesetas on the semi-official black market. In many instances fabulous fortunes have been made in the last two years by Spanish exporters who used their sterling earned through the so-called Combined Accounts for importing from Britain and the Commonwealth goods which were in short supply in Spain, and for which exorbitant prices were charged.

Affair of the Fruit Juices

There are also some cases where the rate of exchange is fixed in a very irrational manner. It happened last year, for instance, that exporters of natural citrus juices from Spain obtained 50 per cent free sterling, but this concession was denied to the exporters of orange juice concentrate. It is well known that it is always in the interest of the exporting country to ship concentrate rather than natural juices, because the former is manufactured, while the latter is a raw material. Nevertheless, because of the special connections which the shipper of the natural juice had at the Ministry, he succeeded in obtaining the rate of exchange of nearly 75 per cent higher than that of the shippers of juice concentrate, and in this way forced several factories to work short time because they could not stand the competition from the specially favoured firms.

Foreign trade missions, especially the British Trade Mission in Spain, have on many occasions tried to convince the Spanish authorities of the necessity for stabilising the position, but so far without result. Negotiations are always protracted and difficult, especially where the syndicates of the various trade organisations are involved. There are also the so-called Committees of Study, who try to investigate every problem, but who are often afraid to make a decision lest it may adversely affect anybody more influential than themselves. No agreement is made on a long-term basis because the "contacts" prefer short-term agreements and frequent changes which make their position stronger and more influential. It is hardly to be wondered at, therefore, that trade in Spain is restricted; the opportunities for expansion while the present situation prevails are very small indeed.

GETS YOU UP-TO-DATE
KEEPS YOU UP-TO-DATE

"Recordon" ensures your being up-to-date in every sense of the word... the magnetic Dictating Unit for the modern age.

Its clear crisp recordings make for greater accuracy and speed all round. The recording discs are inexpensive, unbreakable and will go through the mail. "Recordon" recordings will remain permanent

or can be erased at will, the discs being used over and over again. For real economy and infallible service the "Recordon" has its place in every business—from the one man office to the big industrial undertaking.

STEEL TAKE-OVER POSTPONED

What does this mean to you?

It means that thinking men and women of all parties who are increasingly uneasy about the nationalization of steel and its effect on prices, exports and employment have a real chance to ask for this question to be reconsidered.

The choice is between nationalization and the present proved policy. This policy is:—

- 1 To retain healthy competition in service, costs, quality and inventiveness.
- 2 To stimulate progress through co-operation in research, recruitment, training, etc.
- 3 To protect the public interest by Government supervision of the industry through a board, representing management, workers and the public.

Under this policy output has been raised, prices kept down and traditional good labour relations maintained.

STEEL

is serving you well

THE BUSINESS WORLD

Saving on Dollar Oil

SIMULTANEOUSLY with the resumption of the Anglo-American oil talks in Washington, the Government has announced its decision to "require" importers of oil into Britain to "absorb the surpluses of the sterling oil companies" before they draw supplies from dollar sources. The importers concerned are the American-owned companies which developed their British market as an outlet for the products of their parent undertakings—and which at present still deal almost entirely in dollar oil. They are companies which have served the British economy well.

The decision takes effect next month; and while, for a matter of months or weeks, technical difficulties may hold up its full application, there is little reason to doubt that the import licensing system is able ultimately to enforce it. Its effect will be greatest in fuel oil, the commodity of which the British companies (and Anglo-Iranian in particular) happen to have the largest surplus. Half the British inland requirement of fuel oil is at present supplied from dollar sources, and the whole of this share is to be replaced by "sterling" fuel. But fuel oil for ships' bunkers may not be affected at all—and at first sight this seems a possible loophole.

It would be naïve to expect the Government's decision to be met with dumb acquiescence. The American oil companies, themselves embarrassed by a surplus of fuel oil (which can arise at Abadan, Ras Tanura or the US Gulf from not dissimilar causes), will not take much comfort from the prospect of keeping their selling organisations busy with supplies bought from their competitors under virtual compulsion. But there is no doubt that they will also see a wider significance in the new departure. For some time past the spokesman of American oil interests have been expressing alarm at the rate at which British oil development was catching up with the customary British markets. They observed that, if oilfield and refinery development went according to plan, "sterling" oil supplies would be more than able to meet—outside the United States itself—an expansion in demand of 6 or 7 per cent a year for the next few years. They drew the inference that their customary markets would be threatened by oil which could be paid for in a more plentiful currency than theirs.

The statement issued by the Ministry of Fuel and Power on Tuesday would seem to indicate that this has begun to happen:

As a result of increased production and the maintenance of restrictions on consumption, British oil companies expect to have available in 1950 some surplus of oil over and above what they will need to supply their established markets.

Oddly enough, it was not in the sterling area but in other regions that the Americans seem to have expected the pressure to arise first: in Europe, for instance, and South America. British policy, whether commercial or official or both, has so far avoided upsetting the habitual division of the markets in any really serious way.

Perhaps now, by taking a slice out of the American oil trade in Britain, the British Government has deferred the threat which the Americans see to their interests elsewhere. It is hoped to take the same slice out of their trade with the rest of the sterling area, if the Commonwealth governments agree; to get the co-operation of Mr Menzies, who has taken office committed to some vicarious generosity with petrol, will be no mere formality. This would absorb a fairly substantial surplus of sterling oil. If it gives the American companies a reprieve in Sweden or Madagascar, they will not be much consoled. They are by no means willing to lose trade in Britain or the Commonwealth, or indeed anywhere at all.

★

The figures published this week do not give the whole story, but they are worth quoting. The net dollar cost to the sterling area "arising from oil transactions" is estimated at \$625 million for 1950, on the basis of current prices. This is the largest item in dollar expenditure. The sales of American companies in the sterling area account for \$350 million of it; the remaining \$275 million arises from the world-wide operations of British oil companies (in which term the Royal Dutch-Shell group is included). It is necessary to note that this \$275 million also is a net figure—it represents the dollar cost of sterling oil less whatever comes in from the sale of sterling oil for dollars. Curiosity as to the actual dollar cost of a barrel of "sterling" oil remains unsatisfied. But it is estimated that the sterling companies produce and distribute about 80 million tons of oil a year; more than half of this is sold outside the sterling area.

By comparison, the sales of the American companies to the sterling area are modest—about 13 million tons a year. But it is from this American trade that the Government hopes to save between 5 and 10 per cent of the \$625 million in 1950. Assuming that the whole sterling area is brought in, and the full saving of 10 per cent is actually achieved, this means \$62½ million—or nearly a fifth of the expected trade of the American companies with the area. If it is remembered that the loss is to be distributed, as between different oil products, in a manner designed to fit the sterling surpluses rather than the convenience of the American companies, it is obvious that the blow is severe.

The oil talks in Washington have now been proceeding, off and on, since the summer. If they had been more productive, arbitrary short-term measures of this sort might have been avoided. As it is, the British Government is doing its best to explain to the American interests concerned that it is merely trying to save dollars, that it has no hostile designs against American trade as such, and that it hopes to see more permanent arrangements made which will enable the British and

American surpluses to find markets without hardship to either side. The rest of the world, which relies for its supplies on the one source or the other, can reasonably insist that this should be done; many countries will find the talk of "surpluses" difficult to understand.

The British protestations are sincere, and it is to be hoped that the Americans will accept them as such. Clearly a point must come at which the Americans will sell less oil—unless the United States can bring itself to buy more foreign goods in return. But it needs also to be realised that the present cuts are being made in the way which is, of all ways, most repugnant to American feelings. This manner of making economies

Money for Nothing

THE creation of capital out of thin air is an art confined almost exclusively to governments and rogues. It has had an enthusiastic, though necessarily secret, body of supporters ever since the early days of the eighteenth century when such incidents as the South Sea Bubble and Mr Law's banking activities in Paris showed what a little imagination and a great deal of confidence could do. Indeed, fraud ranks as probably the most skilled of all crimes. The ingenuity of the artist in fraud is always certain to elicit grudging admiration from the public.

Because of the unknown number of undetected frauds, it is impossible to draw any hard and fast conclusions about the relation between the volume of fraud and general economic conditions. In general, the number and size of frauds seems to increase, as one might expect, as inflation develops and to decrease as disinflation sets in. During each boom in the past 250 years, there has been a crop of large-scale frauds, and during the inflation of the postwar years, fraud has undoubtedly increased. When money is easily obtainable by the honest citizen, there is the greater temptation on the part of the fraudulent to get hold of some of it illegally and the opportunity for doing so is sometimes almost childishly easy. There is one other important factor. During a boom, critical standards tend to become relaxed and even normally cautious people do not examine commercial propositions with the same care as they would during a recession or slump. Because the value of pigs is rising, there is a marked increase in the tendency to buy pigs in pokes.

The variety of tricks which the skilled practitioner

allows no shadow or suggestion of competition in the ordinary commercial sense. It treats consumption restrictively—can nothing really be done to find "outlets" for the stocks of fuel oil that are piling up? It ignores in principle (though minor alleviations may be found in practice) the operating economics of the companies concerned. Innocent though the intention is, the device adopted can only sharpen fears that the trade of the world is in course of being divided into tight compartments. The oil trade, which is not a national trade—for hardly any of this "sterling" oil is produced in British territory—lends itself ill to such treatment.

of fraud has at his disposal is large, but they can all be loosely classified into seven main categories: confidence tricks; obtaining credit by false pretences; false or misleading advertisements; long firm frauds; the type of financial swindle known as "kite flying"; share pushing; and the fraudulent use of trust funds. Most frauds

fall into one or other of these categories; a few combine two or more of them and all largely depend on successfully cultivating the victim's confidence.

The simpler forms of the confidence trick are seldom encountered today. They are usually only one remove from straightforward begging, and it does not need much insight to recognise them for what they are. There are the few elementary preparations; then the victim is encouraged to believe that the swindler is, say, a wealthy merchant on a visit from another town who, unfortunately, has not yet completed his arrangements to transfer his bank account. The victim is at length asked to cash a cheque—and, in these days, he usually refuses. In the more complicated form of confidence trick of the "gold brick" type, the victim is led to believe that he is the one who is being trusted. He is given a large

sum of money or special facilities for making money easily and quickly; thereafter, he is induced gradually to part with his own money until the gang—usually two or three men are involved in this type of fraud—decide that they have got all they can out of him. Even this type of confidence trick is on the wane, for its pattern is familiar, and no creative artist, even if he is a swindler, wastes hard work on perpetrating something well known to the public. The era of the “con men” is passing, for whatever may be said about this modern age, it is not unaffectedly gullible.

★

Much the largest number of frauds comes under the heading of obtaining credit by false pretences. There are many ways of obtaining credit, and the criminal who practises this kind of fraud spends most of his time working out new methods. Self-confidence and a prosperous appearance form the necessary stock in trade. A case last year provides a good illustration of modern technique. Three men conspired together to defraud a large firm of wholesale dealers in wines and spirits. They stole some printed stationery from a London club and a cheque book which had been issued by a branch of a leading bank. One of the men then wrote to the West End office of the wholesalers, saying that he wished to purchase large quantities of sherry and whisky. An appointment was arranged, and a second member of the gang called at the wine merchant's office. This man said that he had just bought a hotel which he intended to open that week-end and that he would like the wholesaler to quote a price for the immediate delivery of a large quantity of wines and spirits. After agreeing on the price, he said that he would have to get his partner's signature as well as his own on the cheque, which he promised to deliver later that morning. Meanwhile, he asked that the warehouse where the liquor was stored should be warned so that he could arrange for its collection that evening. During lunch, when he knew that only the typist would be in the office, he telephoned to say that he would not be able to see his partner until 3 o'clock that afternoon—after the banks had shut—but that he would send the cheque with the driver of the lorry which was to collect the liquor. The lorry duly arrived and the driver gave the warehouseman the cheque and a note scribbled on the club's stationery. Unfortunately for the gang, they could only load half the consignment on the lorry, so they had to make arrangements to collect the rest of it the following day. After they had left, the warehouseman noticed a slight mistake in the cheque and informed the West End office. The fraud was exposed the next morning when the bank was asked to verify the cheque. The signatures were fictitious. One member of the gang was arrested when he called to collect the rest of the consignment; the other two were caught within a few days.

★

A fraud of this kind calls for a good deal of ingenuity, confidence and showmanship. Frauds by false or misleading advertisements are at the other extreme. The criminal usually sets up a spurious mail order business, taking in the public's money but failing to deliver the goods. The police today keep a strict watch on such advertisements, and it is difficult for the criminal to get many replies before being caught. This is the lowest order of commercial fraud. Long firm frauds, on the

other hand, tend to be complicated by deliberate ramifications which, if they are skilfully carried out, make detection of the full extent of the fraud difficult. The basic pattern of a long firm fraud can be summarised thus. A, B and C, with the help of false references, rent three sets of business offices in different parts of a certain town. Each has his own stationery printed and they all do what they can to give the appearance of carrying on a genuine business. Once they are settled in, A places an order for a large quantity of goods with a manufacturer X, in another part of the country, giving B and C as references and asking for three months' credit. B and C do the same with two other manufacturers, Y and Z. All three men, A, B and C, give each other glowing references and then wait for the goods to arrive. They sell them quickly, usually at cut-rate prices, shut their premises, and move on to another part of the country. If their plans are carefully laid, it may be some weeks before the fraud is exposed, and even then it is often difficult to link all three men together as conspirators. Occasionally, one or other of them will stand his ground and will try to avoid a criminal charge by pleading bankruptcy. Fortunately, it requires a fair amount of capital to launch a long firm fraud which is consequently somewhat rare.

★

“Kite flying” is the process of building up a fictitious appearance of a great volume of trade by the use of “accommodation” or “cross-firing” cheques. The object is to persuade the victim, normally a bank, to advance a large sum of money on little or no real security. The criminal induces four or five people of modest means to allow him to operate bank accounts at different banks in their names. He then pays into his own bank cheques for large amounts which they have signed, but before those cheques are due to be met, he pays back into their accounts the same amounts of money as have been withdrawn. After a few months, his own account will show an exceptionally large turnover—in one case in 1947-48, the turnover at the end of twelve months was more than £1,000,000—and he then uses this turnover and a number of other confidence tricks to convince the bank that he is engaged in major business transactions. The next stage is to persuade the bank to allow him to run up a large overdraft for some transaction for which he needs ready money. In the case referred to, the perpetrator succeeded in obtaining £76,000 from his bank and in bankrupting five innocent people, including his cook and his chauffeur.

Perhaps the most remarkable thing about fraud is the amount of sheer hard work which is required to make it pay. The odds are heavily weighted against success. Since 1946, the Home Office, the Treasury, the Board of Trade and Scotland Yard have taken special steps to combat the growing volume of fraud. The City of London and the Metropolitan Police forces have joined together to form a fraud squad, which is manned by specially trained police officers, who not only investigate allegations of fraud but also try to prevent frauds in their initial stages. There are also a number of commercial protection associations and the inspectors of the banks themselves on the lookout for potential frauds. The defences against the criminal who practises fraud are much stronger than they were twenty years ago. The best advice to those who think it is still easy is to be found in a current radio tag: “Learn a trade.”

Business Notes

Dividend Limitation—Stage III

It is difficult to quarrel with the joint recommendation of the Association of British Chambers of Commerce, the Federation of British Industries, and the National Union of Manufacturers, that

no change should at present be made in the practice of restraint in dividend limitation and that unless circumstances change or new economic factors arise, it would be wise that when Boards of Directors of industrial companies come to consider their recommendations to shareholders in the ensuing year, this policy should be continued.

The conclusion is reached after a careful analysis of the economic and financial factors, in which—to the credit of the three bodies—there is not even an indirect reference to the Chancellor's grudging references to industry's co-operation in the past or to his veiled threats of statutory enforcement.

It proceeds from four basic points. The nation is living beyond its means; inflation is still present and devaluation has intensified it; industry has difficulty in finding enough finance even to maintain its efficiency; and costs of many products are high and competition is growing keener. The remedies are emphasised. There should be a drastic reduction in capital expenditure to permit an appreciable reduction in taxation. Incentives must be available for harder work, greater skill and the undertaking of risks. There must be relief of taxation on sums put aside to reserves. And since the full benefit of improved productivity cannot be realised at once, industry must make its contribution towards curbing inflation.

The memorandum points out that the General Council of the TUC have worked towards restraint in wage claims, and that although there is no direct parallel between the stabilisation of basic wages or salaries and a standstill in the distribution of profits, many people associate the two things psychologically. Obviously, as the statement claims, there would be no likelihood in existing circumstances of any general increase in dividends if voluntary restraints were removed. But undoubtedly to suggest a departure from that policy would tend to increase inflationary pressure and—more important—would be liable to serious misinterpretation. The employers' bodies are to be congratulated on a careful statement and a statesmanlike decision.

★ ★ ★

Who Speaks for the “House”?

Dr Dalton's latest attack on the Stock Exchange is of no importance whatsoever in itself. The ex-Chancellor, whose boast it was that the City would one day erect a statue in his memory, knows too much about rigging the market to suppose that his diatribes will carry much conviction. They were couched in terms of the “narrow interest of moneylenders of London; very disgraceful goings-on on the Stock Exchange; deliberate attempts to talk down the national credit; making money out of rumours derogatory to the credit of this country.” All this is hysterical rhodomontade, and Dr Dalton knows it. But it is always a safe rule to hit at “moneylenders”; they have been the object of scorn and hostility over the centuries; the “machinations of international finance” and the “monopoly capitalism of the Wall Street bankers” are two recent totalitarian examples which Dr Dalton may like to add to his collection of abuse.

So the ex-Chancellor, speaking presumably for himself but in the now fashionable mood of pre-election conditional, says that it “may be necessary to take further measures” to ensure that “small unpatriotic cliques in the

City of London are prevented from doing damage to the welfare of the country as a whole.” The notion that the Stock Exchange is a place where values are recorded and not manufactured ought to be familiar to Dr Dalton from his past exploits in the gilt-edged market. He could have been under no illusion then that it was his policy which was driving prices ever higher—albeit at grave inflationary cost. Presumably Dr Dalton would include among the “unpatriotic cliques” holders of gas stock, and also of the eponymous “Daltons,” for which they paid 100 only three years ago, and have lost 30 points of capital. Unpatriotism takes many forms, but surely not self immolation on such a scale.

Attacks of this kind may be irresponsible, but they have an effect on the public mind. So does the kind of argument advanced last week by the Churches Committee on Gambling before the Royal Commission which, associating the Stock Exchange with greyhound racing, football pools and fruit machines, submitted that “the gambling transactions of the Stock Exchange should be restricted and, if possible, eliminated” by immediate legislation. No market is perfect, and at present the Stock Exchange is hampered by the effect of high taxation from functioning as freely as it should. But it is still an indispensable part of the machinery for collecting savings and investing them, within the framework of a free democratic society. If Dr Dalton wants to alter that, let him say so without veiling his threats. And if the Stock Exchange has any regard for the value of informed public opinion in a democracy, it will lose no time in asserting its claim to be regarded as a useful and progressive institution.

★ ★ ★

Bonus Issues as Incentives

The Chancellor of the Exchequer recently expressed some opposition to the demand for incentives. Now he appears to be offering an incentive in a most improbable and irrelevant form. He has issued new instructions to the Capital Issues Committee which, although they add nothing new to the principles which he laid down in April this year, call for strict interpretation of the existing instructions. Sir Stafford Cripps's letter to Lord Kennet, the chairman of the CIC, declares:

I am sure that we can rely on the CIC, in combination with departments, to continue to provide, in the field of investment in the private sector, the maximum reinforcement of the Government's current policy, and to ensure that, in their recommendations, all applications for permission to make new issues of capital are realistically judged by reference to the criteria of the national interest which are indicated in the memorandum of April 14th last.

Thus the investment cuts, about whose adequacy there is considerable room for doubt, are to be reinforced by a more critical examination of private investment projects.

There is, of course, no incentive in this part of the Chancellor's letter. That comes later, when the Chancellor declares that he is now prepared to remove the absolute suspension on bonus issues (which was imposed in October in order to prevent “misunderstanding”) on certain specific conditions. The CIC is asked not to permit (in official form, “not to make any recommendations to the Treasury to permit”) any bonus issue unless it is satisfied that

each bonus issue in question is necessary to enable the company to continue, or to expand its production or to increase the volume of its exports.

There are certain cases where a rearrangement of capital involving a bonus issue may be desirable or even necessary to enable a company to continue in business (perhaps Cable and Wireless is one) or to obtain new finance to increase its

production and, consequently, its export potential. But the Chancellor's letter then proceeds:

I should consider that, in the case of a company which was exporting a considerable percentage of its production to hard currency markets, the onus of proving such necessity would be very much lighter, and that consequently your Committee could make a favourable recommendation more freely.

There seems to be no more rational basis for this indulgent treatment of hard currency exporters than for the previous suspension or for Dr Dalton's earlier tax on bonus issues. It takes a preoccupation with the dollar problem verging on the morbid to suppose that easier conditions for hard currency exporters to obtain sanctions for bonus issues will act as an incentive. A rearrangement of capital which has no real content—which is as good a definition of a bonus issue as any other—has nothing whatever to do with export trade.

* * *

Record Exports Under Scrutiny

Exports last month rose by £4.4 million to a record value of £160.4 million. The volume of exports in November has been provisionally estimated at 162 per cent of the 1938 level, a rate 14 per cent above the third quarter average and also 4 per cent above the average of the first three months of the year. Analysis of the detailed figures for November does, however, take a little of the bloom off the record totals. Proportionally the largest increase in value of exports during the month was in raw materials, exports of which rose from £7,700,000 in October to £9,900,000 in November. Coal and raw wool were the main items. Coal exports increased by almost £1,000,000 to £6,000,000; Denmark, France and Italy took much larger quantities, Argentina somewhat more than in October, while shipments to Canada fell. Exports of domestic grown wool increased to virtually all markets. The United States took almost a third of the total quantity exported while much heavier shipments went to Italy, Belgium and Germany. The rise in value of wool exports was mainly due to higher prices.

Exports of manufactured goods rose by £1,300,000 to £136.7 million. Exports of vehicles alone increased by £2,700,000 to a record figure of £31.6 million. Motor car exports reached a new peak with a notable expansion in shipments to Canada, Belgium and the United States. Here the result of devaluation is immediately apparent. These three hard-currency customers were only excelled by Australia. More commercial vehicles were also shipped abroad, again with the emphasis on hard currency markets. Agricultural tractors more than maintained their recent level, but exports of motor cycles and bicycles declined. Of the other items in the vehicle group, ships showed a very large increase, but exports of ships tend to be erratic from month to month.

November's achievements by the vehicle group was outstanding, but unfortunately exports of other manufactured goods tell a less encouraging story. Machinery in particular increased by only £500,000. Shipments to South Africa, India, Russia and most western European countries increased but, in the main, exports to hard currency markets were lower, though shipments to the United States provided an exception. Less steel was shipped abroad in November, fewer cotton goods and wool goods, smaller quantities of chemicals and less electrical equipment.

Thus, the main success of the export drive last month was flagged by coal, raw wool and vehicles of all kinds, and these items accounted for the month's record values. It seems a narrow basis on which to found any premature optimism about the success of the "shot in the arm." No doubt the stimulus of devaluation has yet to be reflected in increased exports from other industries which, for good technical or commercial reasons, have been slower off the mark.

Industry and Shipping

Expanding Television

The start of regular transmission from the Birmingham station at Sutton Coldfield has confirmed the previous unofficial estimates of the transmitter's range. Very strong, clear reception is almost a certainty within a 30-mile radius. Good, though not totally reliable, reception can be expected within 80 miles. This means that about 10 million people are now within receiving range compared with the original estimate of 6½ million. Good pictures have been reported from 150 miles away, but reception at such distances derives from peculiarities of geography, and some of those regions will get a much better service from the North of England station at Holm Moss when it opens next year. The transmitter has already been delivered; although it is of the same power as Sutton Coldfield, it will probably have a still wider range of reception, since the aerial is on higher ground. The site for a third station in Scotland has been settled and tenders for the transmitter invited. The two new transmitters, like the one at Alexandra Palace, have been built by Marconi and EMI.

The radio industry is hoping that besides expanding the sales of receivers the transmitter will improve their export prospects, although few countries would at the moment want so powerful, and therefore so expensive, a transmitter. But the chances of a standardised European television system have been in jeopardy ever since the Italians were given, ostensibly on loan, a television transmitter operating on the 525-line negative modulation system used in the United States. They are now adjusting this transmitter to 625 lines while retaining negative modulation. Until this happened there was agreement among the European countries (not obtained without difficulty) to accept positive modulation, on which the British transmission service is based. Italian engineers are being invited to see demonstrations at Sutton Coldfield which, it is hoped, will convince them that there is nothing to be gained by persisting with negative modulation.

Meanwhile Pye Limited, who, with Marconi and E.M.I., produce transmission equipment as well as receivers, have been studying the United States market for transmission equipment. This looks so promising that they are considering arrangements with an American firm to provide the necessary coast-to-coast coverage for sales and servicing. The American market is more attractive than the British, because of its opportunities for spreading development costs over more than one transmitter. The company already has a factory in Canada building receivers for the American market and a few weeks ago took £200,000 of transmitting equipment to the United States for demonstration. All of it, including a small industrial-type transmitter, has been sold. Prices were 15 per cent lower than those quoted by American manufacturers, and delivery dates were three months instead of twelve. American press reports indicate that the demonstrations vindicated the British claim to transmit a better picture.

Export Orders for Civil Aircraft

The first export order for British civil airliners powered by gas turbines has been signed by Canadian Pacific Airlines for two de Havilland turbo-jet Comets; negotiations for several more are still in hand. The aircraft will be delivered in 1952-53; the date suggests that de Havilland are well ahead with the 14 Comets they are building for BOAC. Although it has been known for some time that operators were taking a serious interest in the aircraft, it was believed that none of them would give firm orders until they had had time to study the performance figures, which have only recently been obtained. The Canadians have been far more receptive to the idea of turbo-jet civil airliners than other

AUSTRALIA

As a market for British manufactures and as a source of food and raw materials, Australia plays an important part in Britain's economy. Whether your interest is in imports or exports, the services of the Commonwealth Bank of Australia can be of considerable assistance. With over 400 Branches in the Commonwealth and New Guinea, and guaranteed by the Australian Government, the Bank can provide the British trader with up-to-date, authoritative information on every aspect of Australian commerce.

COMMONWEALTH BANK OF AUSTRALIA

London Branch: 8, Old Jewry, E.C.2

Also at Australia House, Strand, W.C.2

GEORGE II WAS KING

The private bank of Glyn, Mills & Co. was founded in 1753. It withstood the vicissitudes of the uneasy 18th century. It grew strong in the expansion of the 19th, aiding many a small enterprise to rise to international prominence. Today it is still a private bank. It still acts as financial guide and mentor to many great industrial concerns. It has large resources, and a completely modern yet personal banking service available to those firms now planning expansion in the mid-20th century.

GLYN, MILLS & CO.

BANKERS

HEAD OFFICE: 67 LOMBARD ST., LONDON, E.C.3

Associated Banks: Royal Bank of Scotland, Williams Deacon's Bank, Ltd.

Sell to dollar markets NOW—

IN THE UNITED STATES

With a coast to coast network of correspondent banks, a New York office of Barclays Bank (Dominion, Colonial and Overseas), and a representative in San Francisco covering the West Coast, we can: Get information for you on markets in the United States; Introduce you to agents who can handle your goods; Provide all the necessary banking services.

IN CANADA

Barclays Bank (Canada), a Canadian Chartered Bank, with branches in Montreal, Toronto and Vancouver, offers the same service.

Ask any Branch Manager of Barclays Bank Limited to explain to you how easily exporters can make use of these facilities, or write direct to 54 Lombard Street, London, E.C.3.

THE BARCLAYS GROUP OF BANKS

Have you read this?

If you are contemplating manufacturing in Australia, the booklet "Industrial Australia" gives you the information you require on industrial resources, markets and labour in Australia.

At every stage you can count on the expert assistance of The Union Bank of Australia whose branches cover the whole Commonwealth.

overseas operators; the only other such airliner flying, the C-102 built by Avro Canada, a subsidiary of the Hawker Siddeley Group, was commissioned by Trans-Canada for internal flights. Canadian Pacific Airlines propose to fly the Comet on the Vancouver-Tokyo route.

In the mixed reception given to the Comet, unstinted praise for the feat of aeronautical engineering which it represents strove with doubts of its commercial feasibility. The Canadian order implies that the grounds for those doubts have been weakened. Responsible critics suggested that with a maximum capacity of 36 passengers for a stage of 2,000 miles, the aircraft would not be economical to operate. It was also feared that turbo-jet aircraft could not be handled at busy airports without radical alterations in ground control techniques. It is now known that the aircraft can carry 48 passengers, and since the 6,000-mile journey will be covered in stages of up to 2,000 miles, the extra passengers are not being accommodated at the expense of fuel-carrying capacity—and therefore the range—of the aircraft. There is not much traffic on this particular route, but Tokyo airport itself is busy.

The British aircraft industry hopes for a big export trade in gas turbine aircraft once the operators' initial reservations about the new power units have been overcome. There are signs that this is happening. Vickers is negotiating with operators from Europe, Australia and America for the sale of its medium-range turbo-prop Viscount. Its hand has been strengthened since the aircraft was granted a Certificate of Airworthiness in the autumn. Armstrong-Whitworth is negotiating in Europe over the turbo-prop Apollo; this aircraft is still undergoing trials, but could probably be delivered abroad earlier than the Viscount. The smaller 20-seater Marathon of Handley-Page, the only aircraft of its class, is going on a demonstration tour of North Africa, Australia and the Far East. This is a piston-engined aircraft designed for conversion to turbo-prop engines if desired; and the second version now being tested is powered by turbo-props. None of the reports of American development suggests any immediate prospect of overtaking the British lead in gas turbines in civil aircraft. Even if licences are granted for the manufacture of British-designed aircraft abroad, a considerable time will be needed to produce them.

* * *

Productivity in Rayon Weaving

The reports of the teams sent out by the Anglo-American Productivity Council are not producing quick prescriptions to bring productivity in Britain into line with productivity in the United States. They are, however, performing a valuable service. They show how complex and how inter-related are the social and industrial factors which govern productivity. They indicate the routes along which the possibilities of improvement may be studied.

The rayon weaving team, which has just reported,* would probably have been wrong to bring back a set of firm models for imitation. In the United States it saw an industry which uses automatic looms almost exclusively and concentrates very largely on a limited number of fabrics produced in long and uninterrupted runs. Clearly these characteristics of the American industry make for high productivity. But how far ought the British industry to follow the same example? On this the team does not pretend to be certain:

The British manufacturer, with his eye on the various export markets which he has to satisfy with widely differing qualities, has to produce in relatively short runs the particular type of fabric demanded by each of his many customers.

This raises questions of commercial policy, and the productivity team, having pointed to them, does not attempt answers.

* Productivity Team Report: Rayon Weaving. Anglo-American Council on Productivity. 1s. 3d.

Granted that these questions are unanswered, others arise concerning the mood and temper in which an industry is conducted. The report makes it clear that the differences of attitude are great. It remarks on the punctilious time-keeping practised in the American mills. It observes "a genuine willingness" on the worker's part "to accept changes in his working conditions which would lead to greater productivity". It mentions the active use which workers and managements in the American factories make of the suggestions box. Full work loads appeared to be the rule. Great attention was evidently paid to the fullest use of skill:

Assistance went to the weaver when required; the weaver did not have to go in search of assistance.

United States taxation, the team observed, did not fall so heavily on the pay packet as does PAYE. Incentives were more commonly in use than in Britain, but (not less important) they were more tangible, and the plenty of consumer goods made them harder to resist. These things help to form an industry's attitude.

* * *

Transport Charges Scheme

Towards the end of last week the Transport Commission issued a pamphlet setting out the principles to be embodied in a charges scheme for merchandise traffic. The Commission has offered it as a basis for discussion with trading bodies which it desires to undertake early next year. The draft principles cover all merchandise traffic conveyed by rail, road or canal, except, for the present, coal and coke.

Since the Commission is charged by statute to regard its undertaking as a single whole and to integrate the various facilities which it provides, its first task has been to determine the principles which should underlie the scales of charges, before attempting to fix the charges themselves. Eventually the completed draft scheme will come before the consideration of the Transport Tribunal which is empowered by the Transport Act to confirm the scheme, with or without alteration.

The Commission proposes that common conditions of carriage and common chargeable distances should apply to all three transport services. In general, traffic will be conveyed at carrier's risk (this would end the present option of the trader to send his goods at lower rate at owner's risk). A maximum limit of liability is proposed, unless higher values are declared and a premium paid to cover them. In the classification of goods, "loading capability" is proposed as the prime factor; loading capability is a new concept on the railways (though not in road haulage) and it involves the comparison of bulk to weight or the quantity capable of loading in the normal operating unit, together with cost of handling and other characteristics. The scales of charges will cover transport from door to door, with appropriate charges for consignments of one ton or more for station and siding traffic.

To avoid the separate calculation of millions of distances, it is proposed to introduce a grouping system, based on the 10-kilometre grid system of the Ordnance Survey. Chargeable distances between groups will be measured by the road mileage (by A or B roads) between selected places near the centre of each 10-kilometre square. Thus the same chargeable distance will apply from any place in one square to any place in the other square. Special consideration will be given to chargeable distances between places separated by rivers or estuaries which are joined by circuitous road routes compared with their rail links. The Severn and Forth are obvious examples of such cases. Basically, the principles seem to have been carefully worked out, though they will have to stand up to detailed examination. Only after that has been done will it be possible to proceed with the far more difficult task of deciding on the schedules of rates to be submitted to the Transport Tribunal.

Stage Army in Industry

Labour turnover in British industry is at last receiving some of the attention it deserves. The publication of an analysis of labour turnover (the first of a series) by the British Institute of Management comes as a useful supplement to the figures which the Ministry of Labour has produced each month since last autumn. Neither set of figures is entirely satisfactory, and it is to be hoped that some way will be found of combining the BIM's detailed analysis with the Ministry's wider coverage.

The BIM's analysis, which refers to the first six months of this year, shows that of the 300,000 or so employees of 173 firms covered by the survey, 32 per cent on an average change their jobs in twelve months. The average of the Ministry's figures for the same period is 35 per cent, but this excludes those who leave within a month of joining, and it should probably be revised to about 40 per cent to allow for this. The firms included in the BIM survey were mostly large concerns with highly developed personnel departments, and it is reasonable, therefore, that their labour turnover should be below the national average. The British average, incidentally, compares favourably with the 50 per cent turnover in American manufacturing.

This picture of a restless and ever shifting labour force does not receive much support from the available data. It is true that a turnover of 30 or 40 per cent means that 2½ to 3 million workers in British manufacturing change their jobs each year. The "stage army" which moves from job to job at intervals of a month or less is responsible for only one in seven of all terminations, so that the proportion of the industrial labour force which falls into this category of extreme changeability must be rather small—perhaps 5 per cent. Women, it appears, are no more restless than men; the total turnover of female labour is admittedly higher—42 per cent as against 27 per cent—but the disparity is materially due to domestic and health reasons.

Unfortunately these figures give no indication of the mobility of labour between industries and localities, as distinct from particular employers, beyond the fact that 5 per cent of those leaving were moving from the district. The whole system of classifying terminations by reasons for leaving is full of difficulty, and it seems doubtful whether the complicated method used by the BIM is worth the trouble. However, a simplified breakdown shows that roughly three-quarters of those leaving did so of their own accord, the remainder being discharged or declared redundant. The variation between firms in the rate of discharge and redundancy is the main reason for the wide variation in total turnover, which for males ranges from 8 per cent to 79 per cent. This suggests that there are certain black spots in industry which create their own "stage army."

These studies of labour turnover are projects to which industry should give full support, for a more comprehensive picture of the movement of labour and, in particular, a better estimate of cost of turnover is still required.

* * *

BOAC versus Charter Services

Friction between the state air corporations and private air charter companies, never far below the surface, exploded in Parliament last week when the award to British Overseas Airways of a contract to fly Overseas Food Corporation personnel between this country and Africa was debated. In 1948-49 the work was performed by Hunting Air Services, Ltd., under charter contract with the Overseas Food Corporation. Hunting Air Services is one of the largest private air companies, and its fleet of Viking aircraft was largely engaged on weekly flights between London and Dar-es-Salaam. According to statements in the House, it was alleged that BOAC were assured by the OFC that the 1949-1950 charter contract would be theirs if the BOAC tender came

NEW IDEAS FOR THE NEW YEAR

**Overhaul—Systematise—Improve Results
..... And Save Money**

**HERE ARE SOME PRACTICAL IDEAS FOR
SAVING ON SALARIES AND WAGES....**

The dearest thing in your business to-day is . . . MAN-POWER. Nowadays, your very shortest cut to economy is to cut down staff and get more output.

Running right through your business . . . affecting almost every little thing you and your executives do . . . is filing.

You may not think filing all that important. In itself, maybe it isn't. But it is when you want correspondence in a hurry—when someone waits on the phone—then the filing is important because it affects FINDING.

But this message isn't merely about filing—though Shannograph is the foolproof filing system. It isn't even about the money you can save by way of wages and/or wasted time.

It is to point out that in these days of national and personal retrenchment, you must make your old equipment do new duties—*earn* more.

And your filing can. It can be used to control sales. To chart production. To "progress" export contracts. To *make visual* hidden facts and past and future activities.

Below are a number of concrete plans to help business men. One or more must inevitably interest you. Please tick those that do. Full details regarding it will be sent you by return.

Shannon Systems

FIRST IN FILING

The Shannon Limited
455 Shannon Corner New Malden Surrey

Branches at: Kingsway—London, Birmingham, Bristol, Glasgow, Leeds, Leicester, Liverpool, Manchester, Newcastle, Southampton. I am interested in the Shannographic plans (ticked). Please send me full details by return, free of obligation.

| 5. Stocks & Purchases | 12. Printing |
| 6. Production | 13. Plant & Maintenance |
| 7. Factory Manager | 14. Textiles |

within 10 per cent of the Hunting tender. It was further alleged that in the negotiations BOAC gained an unfair advantage over the private company by virtue of earlier contact on the subject between the chairman of OFC and the chairman of BOAC, and subsequent official exchanges of information between the two state corporations. These allegations have been denied by the gentlemen concerned.

The conflicting evidence makes it difficult to disentangle the circumstances under which the new contract was awarded to BOAC. But it is certainly not easy to understand the economies of BOAC's tender. Hunting obtained the 1948-1949 contract on the basis of charging £63 per passenger, given a 100 per cent load factor. In practice, the average load was about 90 per cent and in the end it cost the OFC perhaps £70 to £75 to move each of its several thousand passengers. For the 1949-1950 contract Hunting tendered at £50 18s. per seat on a 100 per cent load factor basis. The BOAC tender is stated to have been accepted on the basis of £72 10s. per seat. But against this apparently higher charge, BOAC run four scheduled flights in each direction and their Solent flying boats do the journey, as far as Nairobi, in 28 hours against three days taken by Hunting's Viking aircraft. A more interesting question is how BOAC can afford to fly OFC passengers at £72 10s. when the price charged to other passengers is £146 per seat. BOAC may contend that since they are in any case running four flights a week (on as little as a 60 per cent load factor), every additional passenger carried helps to reduce the loss sustained on this route, even though they may be carried at a cheap rate. The answer to this line of argument would surely be that BOAC ought in that case to reduce the frequency of their flights until the load factor attains the normally profitable 75-80 per cent. Who asked BOAC to fly four times a week? If BOAC is to carry an increasing number of "charter" passengers at greatly reduced rates (there is some talk that BOAC have already cast an eye on the Sudan leave scheme flights at present carried out by private operators) together with passengers paying normal fares, dual prices will indeed prove double-edged.

* * *

Advances in Shipping Statistics

A paper read by Professor M. G. Kendall (until recently statistician to the Chamber of Shipping) to the Royal Statistical Society last week adds greatly to the amount of up-to-date information about the British shipping industry. An analysis of the composition of the British merchant fleet as at June 30, 1949, was followed by a discussion of the compilation of an index of tramp freight rates on a 1948 base, the weighting of which was described in detail. Professor Kendall then proceeded to a detailed exposition of the results of an inquiry into the "invisible export" earnings of the industry in 1947; these results were outlined in *The Economist* on September 3rd.

On the first of these questions—the composition of the British merchant fleet—the available information has not hitherto been sufficiently selective for the industry's needs, and in 1948 the Chamber of Shipping began to compile records which serve its purposes better. Vessels owned and registered in the United Kingdom and engaged in commercial trading are classified by types (liners, tramps and tankers) and by employment ("foreign-going" and "coasting and home trade"). Each category is shown first according to age and propulsion, and secondly by size and propulsion, of its component ships. The accompanying table summarises the results.

It can be seen that only about one-fifth of the British foreign-going fleet now burns coal, as compared with about half in 1935 and more than 85 per cent in 1914. Motorships comprise 37 per cent of the present total; the remainder are oil-fired steamships. The composition of the fleet by size and age reflects the distortions caused by the war building

programme; in consequence, as ships wear out their replacement in an ordinary way—distributing the shipbuilding load

VESSELS OWNED AND REGISTERED IN THE UK, JUNE 30, 1949.
BY TYPE AND PROPULSION

	Coal-Fired Steamers		Oil-Fired Steamers		Diesels		Total	
	Number	Gross Tons ('000)	Number	Gross Tons ('000)	Number	Gross Tons ('000)	Number	Gross Tons ('000)
FOREIGN-GOING:-

TOTAL	1,236	3,462	910	6,343	1,134	5,552	3,280	15,357

as evenly as possible over a number of years—will not be an easy matter. With the Chamber of Shipping statistics it will at least be possible to get some idea of the possible course of demand for new ships, though other factors will no doubt interfere.

* * *

An Index of Tramp Freights

The task of resuming, after the war, the preparation of an index of tramp freight rates presented many complications to the Chamber of Shipping. Official direction of the employment of ships, together with control of freight rates themselves, persisted for some time after the war, and controls were removed unevenly, by stages; many artificially controlled rates still existed until last December. Professor Kendall indicates that the Chamber of Shipping index which has been constructed with 1948 as the base year can only be considered as temporary. As it turned out, however, the index for some months before and after the final relaxations of freight controls showed a steadiness which supports the good judgment of those responsible for the transition from war to peace operation. The index remained fairly steady until June of this year, when a decline set in which brought the index as low as 70 in August. It recovered to 72 in September, the last month quoted.

The remainder of Professor Kendall's important paper deals with the inquiry into the contribution of shipping to the balance of payments in 1947, which was conducted by the General Council of British Shipping at the request of the Minister of Transport. The year 1947 was chosen not as being representative—he shows that it was not—but because it was the only possible choice if the inquiry was not to be postponed. It was an elaborate inquiry, and Professor Kendall's explanation of the methods adopted is useful; he explains also the differences which distinguish

the results of this inquiry from the figures used in the White Paper on the United Kingdom balance of payments. The latter figures refer not to the performance of British shipping alone, but to total British earnings and outgoings for shipping services. Some idea of the scale and elaboration of an inquiry of the kind which the General Council of British Shipping undertook can be gathered from estimates made of the burdens thrown on the office staffs of companies. One tanker company gave the time taken to complete the returns as 1,500 man-hours, and a big liner company estimated its own contribution at 7,500 man-hours.

Trade and Finance

More Imports Freed

A further stage will be reached next month in the plan to free intra-European trade. In November the Council of OEEC requested member countries to aim at removing restrictions on at least half of their imports from all other participating countries by December 15th. For this purpose imports were divided into three broad categories: food and feeding stuffs; raw materials; and manufactures. The Council specified the items to be included under each head and fixed 1948 as the base year; the 50 per cent relaxation was also to apply to each separate category of trade.

This latter provision has meant that Britain has had to widen the list of goods which will in future be importable under open general licence. In September, the President of the Board of Trade announced an imposing list of goods which could be freely imported from the so-called "soft currency" countries. These relaxations covered 83 per cent of Britain's imports of food and feeding stuffs on private account, as distinct from government account, from the participating countries (excluding, of course, Belgium, the Belgian Congo, Luxembourg, Switzerland and western Germany) 37 per cent of raw materials (excluding oil) and 49.7 per cent of manufactured goods. The new range of goods to be imported under open general licence comprises mainly mineral products and metals (from abrasives to zinc ore and concentrates), chemicals, textiles and machinery; it will come into force on January 5, 1950. There are at present no further relaxations for food and feeding stuffs. Pulp, paper and board, other than newsprint and insulation board, will be added to the list on April 1st when private trade in these products is to be resumed, while oranges and grape fruit (at present imported by the Ministry of Food) will be included next May.

This new list more than meets the OEEC request. As before, 83 per cent of the private imports of food will be under open general licence. This may seem to be a high proportion, but most of Britain's food imports are, of course, undertaken by the Government. In raw materials total relaxations will amount to 68 per cent of the trade with

participating countries and in manufactured goods to rather over 50 per cent. The range of countries to which the open general licences apply remains unaltered. The main exceptions are the United States, Canada, the dollar account countries, Argentina, Uruguay, Russia, countries of Eastern Europe and the four hard currency countries of Western Europe.

Britain has at least given a welcome lead in attempting to liberalise intra-European trade, but there still remains a large area of government trade to be freed. The Board of Trade argued last week that some of the trade on government account was covered by open general licences—"it is conducted in accordance with the principles of the draft Havana charter, a basis equivalent to unrestricted private buying." On this score it was estimated that unrestricted imports by both private traders and the Government represent 71 per cent of total imports from participating countries, or £291 million. Most of the remainder (£121 million) consists of trade with countries with which an adverse balance might involve losses of gold or dollars.

* * *

Trading with Argentina

On paper, Anglo-Argentine trade has been brought into equilibrium, but it is a spurious kind of balance, achieved only by reducing the volume of goods exchanged. Argentina is still shipping meat to Britain—at the originally agreed sterling price—and is receiving in return petroleum and coal. But trade in "non-essential" goods remains at a standstill. Argentina is granting very few import licences, and British exporters are not willing to ship goods—even in those isolated instances where licences are available—until they can be sure about payment. The level of trade between the two countries is thus far more restricted than was contemplated under the trade agreement, and it is more by accident than by regulation that imports and exports happen for the time being to be in balance.

The development of Franco-Argentine trade, however, provides an interesting contrast. France has increased its exports to Argentina quite remarkably in recent months. In the first eight months of this year they amounted to Frs.10,366 million compared with Frs.2,442 million in the corresponding period of 1948. Imports from Argentina, however, have been almost halved, from Frs.13,033 million last year to Frs.7,431 million this year. One important French export has been steel, and another textiles, particularly wool yarn. The pesos acquired have been used by French traders to buy, among other things, wheat, wheat offals and oilcake. France itself has little need for any of these products. But wheat can be traded with Germany against coal, and offals and oilcakes with Denmark and other European countries against sterling. The extension of this re-export trade with other European countries in sterling may be a contributory factor in France's

ability to balance its sterling payments without the need to use any of its drawing rights on Britain under the Intra-European Payments Scheme. France seems, in fact, to be emerging as a European broker for Argentine produce, a position hitherto filled by Britain.

Until the Andes agreement in 1948, British purchases of Argentine meat and grain covered the requirements of certain European countries. But the Argentine Government objected and decided to sell only on condition that the supplies were consumed in Britain. No such condition is apparently made with French traders. Nor is it likely that France is paying exorbitant prices for imports from Argentina—otherwise it would hardly be able to resell to other countries at a profit. It is an example which the proponents in this country of Government trading and bilateral bargaining might study with advantage.

Payment Talks with Italy and Switzerland

The Anglo-Italian Economic Committee concluded its review of trade and payments at the end of last week, without putting forward any new proposals to bring Anglo-Italian payments into balance. The two parties agreed to retain the present lire-sterling cross rate until June 30, 1950, thus extending the most important aspect of the payments agreement for a further six months. In agreeing to retain the \$2.80 cross rate, the Italian representatives had to overcome considerable opposition from their own traders, but Britain made it quite clear that no departure from parity could be tolerated. In fact, although Italy's sterling holdings are buoyant, it is hard to believe that Italy will always show a sterling surplus. For instance, Italy has this year been earning sterling from the re-export of dollar goods (for the direct import of which licences were not forthcoming) often at a premium of about 30 per cent in the sterling price, thus giving the Italian trader an exceptional profit, increasing Italy's sterling holdings and bringing dollar goods here at the price not of settlement in hard currency, but in sterling.

The first review of Anglo-Swiss trade since devaluation was recently concluded with evident satisfaction to both sides. The talks centred upon "non-essential" Swiss exports. British imports of these Swiss "non-essential" goods usually form a hard core of contention which has caused Anglo-Swiss negotiations to drag on for months. Britain, to make partial amends for the inevitable exclusion of Switzerland from the open general licence system, has agreed to increase the value of import licences for "non-essentials" to February, 1950, by £400,000. Moreover the list of goods has been revised to substitute goods, for which the demand exceeds the licences granted, to replace certain Swiss "non-essential" exports which have not found a ready market here. This stop-gap arrangement ends a prolonged argument since devaluation whether under last year's Anglo-Swiss trade pact import licences should be granted on the basis of the sterling figures or of the Swiss franc figures which appeared alongside. After devaluation, the Swiss claimed that the sterling figures should be ignored.

Price Trends in Base Metals

The fillip which the London tin market enjoyed last week was short lived. Until ten days ago the spot price was fairly steady at around £605 a ton. Last week, it rose to £610 a ton but fell back again this week to £604½. The backwardation, however, has narrowed. Three months' delivery had been quoted at £565 a ton and last week it rose to £584. But though the spot price returned to its former level the forward quotation declined to only £573½, bringing the margin to £31 against £40 ten days ago. Since Monday the forward price has tended to harden.

The New York market did not follow last week's rise and the subsequent fall. The price of tin in that centre has been virtually dictated by the Reconstruction Finance Corporation which sells the output from the Texas smelter and last week it reduced its price from 81 cents a lb. (£648 a ton) to 79 cents (£632). Since then the price has dropped further by half a cent. The RFC, however, has announced that in future it would compete with tin importers. This decision has important repercussions for the Ministry of Supply, which recently transferred 3,000 tons of its stock to the United States in order to sell spot in New York. So far, its sales have been very modest because, in an effort to limit the fall in price, it has been content to follow the RFC's lead rather than undercut and dispose of its stock. The limitations of such a negative policy will become all the more obvious now that RFC is to compete with importers (including the Ministry of Supply), some of whom will no doubt have acquired their supplies from Europe with "cheap" sterling.

The other base metals have remained firm in recent weeks owing to the recovery in American demand. Consumption of copper in the United States has been maintained at a high level and deliveries from producers and customs smelters during November were the largest since March, 1948. Sales during the present month have, so far, been double those of a year ago. The strength of the market can be gauged by the recent rise in price for copper scrap from 15 cents to 15½ cents a lb. Lead scrap is also slightly dearer while the forward price for zinc has tended to rise. It seems, therefore, that unless inflationary pressure in the United States is curbed, a general rise in non-ferrous metal prices is not out of the question. In Britain, too, scrap prices have hardened in the past week or so and demand for virgin metal has also started to recover. But the outlook for the dollar account is none too cheerful, for the price of tin—one of the sterling area's major dollar earners—is falling, while prices of the other base metals—which to a greater or lesser degree involve a dollar expenditure—are tending to rise.

* * *

Recovery in Rubber

The rubber market has been unusually firm since devaluation, and ten days ago the London spot price reached ¼d. below the postwar peak. During the past week, however, the price has fallen slightly and on Tuesday was quoted at 1s. 2½d. a lb. The general upward trend has continued for the past five months, but the actual rise has been quite modest. From the beginning of August to September 16th the London price rose from 10½d. a lb. to 11½d. When sterling was devalued, rubber jumped to 1s. 1½d. a lb. and in the past three months, after a slight fall, it has risen by 1½d. The American market has followed this general trend, though owing to devaluation the New York price for near delivery dropped from 18½ cents to 17 cents a lb. in the third week in September. In the following week, December delivery was quoted at a little over 16 cents a lb. The price is now over 17½ cents, so that the fall after devaluation has almost been made good.

The recent firmness in the rubber market is attributed mainly to American and Russian buying though other countries, including Britain and France, have also been active. In the first ten months of the year, the United States is thought to have procured some 90,000 tons of rubber for its stockpile, while total Russian purchases amounted to 97,500 tons. There is little doubt that this year Russia will have bought appreciably more than its usual 100,000 tons. World production during the period totalled 1,200,000 tons which was only slightly in excess of consumption, estimated at 1,190,000 tons. American consumption showed a marked increase in October, but synthetic consumption also rose though to a lesser extent. It is still not possible to assess the effect of devaluation on the demand

HOLIDAYS FOR BOILERS?

Steam boilers should work efficiently all the time. Unnecessary holidays are to be deplored. But if boilers use untreated water, scale will certainly form, and some sort of holiday however inconvenient and costly to other people must be given in order to dismantle and descale. But scale need never form if the modern method of boiler water conditioning with Calgon (sodium metaphosphate) is used. Calgon prevents scale. It saves endless trouble and far more money than it costs, as you will find if you consult Albright & Wilson's Technical Service Department. A really fit boiler does not need a holiday.

CALGON

a very little Calgon prevents a lot of scale

for natural rubber in the United States, or the effect of the recent relaxation of the restrictions imposed on the use of natural rubber.

The rubber market is largely influenced by Russian buying and American stockpiling. Past experience has shown that funds appropriated for American stockpiling are usually exhausted by January or February, though the sterling counterpart funds may subsequently be used to give limited support to the market. On the other hand, little is known about Russian requirements. It has a synthetic rubber industry

within its own boundaries and in addition has use of the plants in the Soviet Zone of Germany. If the rubber market could rely on an annual demand of 100,000 tons of natural rubber from the Soviet Union with, say, a further 100,000 tons a year for the American stockpile the problem of surplus supplies would not press. But both these supports to the market are not permanent. A further factor is the possibility of increased production of natural rubber from Indonesia now that political stability seems more assured.

The rise in rubber prices has been a contributory cause of higher prices for British tyres, announced at the beginning of last week. The increase varies from 5 to 12½ per cent. All imported raw materials for tyre manufacture have risen since September; rubber by over 20 per cent, cotton by 25 per cent, and carbon black and other materials by over 35 per cent.

* * *

Who Borrows from the Banks?

The latest quarterly classification of bank advances in Great Britain (which embraces all members of the British Bankers' Association) shows that aggregate advances have hoisted themselves over the £1,500 million mark for the first time—the actual figure reached in November being £1,532½ million. This is £35½ million more than the value of advances shown in the August classification and £153 million more than that shown in November last year (when, however, the figure had been very sharply contracted on the eve of classification by a heavy repayment of advances by the British Electricity Authority out of the proceeds of a new issue).

The rise this year is therefore not as startling as might at first appear, while the rise over the last quarter is more than accounted for by increases of just under £21½ million in bank loans to public utilities (whose borrowing now amounts to just under £42½ million) and of just under £15½ million in loans to the food, drink and tobacco section. The increase in lending to Public Utilities may reflect further demands for electricity, and also borrowings by the Gas Council, so that the new credit in this category has probably accrued mainly to the public sector. The increase in lending to the food, drink and tobacco group is partly seasonal and partly, no doubt, a reflection of the higher level of food stocks now held.

The classification also reveals that there has been a moderate increase in loans to the retail trade, but moderate

decreases to the engineering, iron and steel, textile and chemical industries. The "other financial" group shows a further expansion, by £2½ million, to £131 million, presumably reflecting the "stickiness" of the new issue market. Personal and professional advances have actually declined fractionally and have therefore shown a perceptible fall proportionately (to 26.6 per cent of the whole). These results provide a wry commentary on the Chancellor's recent appeal to the banks to go slow in their lending policy. Advances to private manufacturing industry and to private individuals are already apparently on a tight rein. When the public boards or those responsible for handling the people's food come asking for more loans, would the Chancellor really be happy if the banks shut the door in their face?

* * *

Where the Purse Pinched

The fortieth report of the Customs and Excise Commissioners, published last week, covers the twelve months to end-March, 1949. During the last part of this period Crippsian disinflation was beginning to eat into national overspending and some clue is provided in the report to the nature of the not very frightening sacrifices which the British people had to bear. The consumption of whisky and gin dropped 10 per cent below that of the previous financial year and the consumption of light wines in the second six months of 1948 was less than half that in the first half of the year. The tax-exclusive value of trade in goods chargeable to purchase tax also declined, from £710 million in 1947-48 to £680 million in 1948-49 and, in the second half of the fiscal year at any rate, expenditure on entertainment dropped sharply so that receipts from entertainment tax over the year were 5½ per cent down. By the autumn of 1948 the pressure on purses had extended further down the social scale; the consumption of beer in the six months following September, 1948, was 15 per cent lower than in the six months before it. Despite a 5 per cent increase in price, however, home consumption of tobacco remained stationary at 212 million lb.—either the elasticity of demand for this conventional necessity is now really equal to zero or the last financial year saw a trend away from stimulants which fostered gaiety towards narcotics which soothe the people's nerves.

As a pointer for longer-term policy, the report reveals that the Customs and Excise Department collected £1,554.5 million of taxes in 1948-49 (67 per cent of them from gamblers, smokers and drinkers) at an administrative cost of £0.59 per £100 collected. On this evidence the administrative cost of collecting indirect taxes seems to be little more than half the administrative cost of collecting direct taxes—the Inland Revenue's expense ratio was 1.13 per cent in 1947-48. The traditionally low administrative cost incurred by the Customs and Excise Department was therefore maintained in 1948-49 despite an apparent increase in petty offences against the law in consequence of increased controls; the number of convictions secured by the Department in 1948-49 was nearly 10 per cent above those secured in 1947-48, although the aggregate value of fines and the bag of "imprisonments without option" were both down. For the rest, the report is again the source from which the reader may learn such widely differing snippets of information as that 1948-49 was the year in which the dog population of Great Britain (or at least its licensed dog population) climbed back to its prewar level and also the year in which imports of snuff, for some unfathomable reason, were nearly 6½ times above the imports of 1938-39.

Testing Electrical Equipment for Canada

Representatives of the Canadian Standards Association are opening an office at the British Standards Institution in

January. Most Canadian firms insist that electrical equipment fitted in their factories shall have been approved by the association; in some provinces, the law requires approval to be obtained. The Canadian association was originally concerned with electrical equipment for a special purpose—to test whether the equipment qualified for reduced fire insurance premiums with the big American insurance companies. Its approval has come to have the wider significance of a minimum standard requirement.

There is no doubt that standards formalities have hampered British exports to Canada. The association does not publish its standards; samples and prototypes have to be sent backwards and forwards across the Atlantic for testing, comment and subsequent modification. This wastes time, and requests for approval from Canadian manufacturers and from exporters to Canada have become so numerous that congestion adds to the delays. The difficulties have deterred some otherwise well-qualified British manufacturers from seeking trade in Canada. Others have had to postpone delivery while they waited for approval to come through. All exporters to Canada are in the same position except the Americans; electrical equipment in the United States is already designed to meet the same standards as were originally laid down by the American insurance companies. Some British firms have even been shipping electrically-driven plant without the motors, and fitting Canadian-built electric motors on arrival but the field for such substitution is limited.

A delegation representing the British Standards Institution and the interested trade associations went to Canada recently. The outcome of their visit is an agreement under which the British Standards Institution will carry out in Britain the tests necessary before the Canadian Standards Association can approve equipment. The British electrical industry attaches importance to this, because its members have met strong sales

COMPANY MEETINGS

HARRISONS & CROSFIELD, LIMITED

ANOTHER SATISFACTORY YEAR

The forty-first annual general meeting of Harrisons and Crosfield, Limited, was held on December 20th in London.

Mr H. Eric Miller (the chairman), in the course of his speech, said: "We are able to report another satisfactory year's trading, achieved by sustained hard work on the part of all concerned. After providing for overseas but not U.K. taxation, the available profit for the year amounts to £591,700. Provision for profits tax and income tax in the U.K. absorbs £323,316, leaving a net profit of £268,384 against £235,633 for the previous year."

STRENGTH AND LIQUIDITY

I would like to emphasise the strength and liquidity of the balance sheet which shows current assets more than £3,000,000 in excess of current liabilities.

Finality has not yet been reached in clearing up the many problems arising out of enemy occupation of those Eastern territories where the company operates.

With regard to devaluation, a colossal united national effort is clearly needed if we are to hold our footing and prevent any further slide.

I refrain from measuring in figures the effective aid which the H. & C. Group as a whole is rendering towards the closing of the dollar gap, but you can take it from me that it is an impressive total, especially in shipments of rubber and tea.

TEA AND RUBBER INDUSTRIES

In the course of his review of the Tea and Rubber Industries he said:—

Tea crops in 1948 were abundant, India and Pakistan producing 616 million lbs.—a record for all time—and Ceylon 298½ million lbs., thus equalling her 1947 record. Assuming U.K. consumption in 1949 to have been about the same as in 1948, which was 404 million lbs., there has been some opportunity to build up U.K. stocks which had, we believe, declined to rather a low level.

We are glad to know that the International Tea Market Expansion Board are continuing their campaign to enlarge the demand for tea particularly in the U.S.A. and it will be interesting to see whether the startling rise in the price of coffee aids them in their efforts. We have recently been advised that our government intend continuing bulk buying next year but have not heard, as yet, whether the Indian and Ceylon governments will agree. We think they probably will, in spite of the fact that the former have frequently expressed their desire to have all Northern Indian teas sold in Calcutta.

Looking to 1950, we are not likely to know for some time how much the Eastern governments will allow to be tendered for sale to the Ministry of Food, so the trend of the market cannot be foreseen, with any degree of certainty at this juncture.

It may fairly be said that available stocks, of rubber equal to little more than 2 months' consumption, are definitely on the low side. Hence the recent upswing in market sentiment. After many barren years shareholders in rubber-producing companies are fully entitled to a compensatory spell of reasonable prosperity and no one should begrudge them that. In New York, however, the price of first quality sheet is still below that of synthetic, an anomaly which should soon be corrected, for natural rubber is one of the few important industrial materials available at pre-war prices, and it certainly has lost none of its usefulness.

The report was adopted.

resistance here and there through uncertainty whether their product would meet Canadian standards. This concerns not electrical goods alone but all machine tools and capital equipment which incorporate electric motors.

Shorter Notes

Coal output last week was 4,781,600 tons; the deep-mined output of 4,566,200 tons was the highest for ten years. Total output for the 50 weeks of the year has now reached 208,166,000 tons, of which 196,057,000 tons—5½ million tons more than in the same period of last year—is deep-mined. Absenteeism has fallen steadily in recent weeks; from an August figure of 13.66 per cent., it had delined to 10.15 per cent in the week which ended on December 10th.

*

Reports from Iraq suggest that the prolonged negotiations to obtain £3,000,000 loan from Britain to extend the Iraqi railway system have been concluded. The terms on which the loan has been granted are not as yet known. Iraq has for some time been drawing on the sterling securities held as backing against the Iraqi currency. By obtaining funds in Britain it will prove possible to purchase railway material without further depleting Iraq's exchange reserves. The railway programme is held to be somewhat ambitious and while there are good grounds for building a river bridge, some parts of the railway station programme may be less easy to justify.

MARCO REFRIGERATORS

PROGRESS IN VOLUME OF SALES

The twentieth annual general meeting of this company was held on December 21st in London, Mr A. E. Leach, M.Inst.R. (chairman and managing director), presiding. The following is an extract from his circulated statement:—

The period covered by the accounts has been, as is commonly appreciated, a very difficult time for industry in general, and while your company has continued to progress in regard to volume of sales, the change-over to a buyers' market has involved a lowering of prices and an increase in selling costs. These conditions are reflected in the accounts by a fall in net earnings (before taxation) from £80,573 last year to £66,711 in the trading year under review. The position has been mitigated by economies in cost brought about by the operation of the Byfleet factory and a reduction in outside purchases.

The available surplus for the year (after taxation) is £30,310, and your directors propose, with your approval, to pay a final dividend on the ordinary stock of 17½ per cent. (less tax), making 30 per cent. (less tax), for the year, thus maintaining the dividend at the level held for the two preceding years.

As to the future, one hesitates to attempt to forecast in prevailing conditions, but it can be said that so far as your company is concerned the immediate prospects do not by any means appear discouraging.

The continued development and production of attractive new models and leadership in the application of refrigeration to the needs of the bakery and other trades are factors which encourage the opinion that your company will continue to advance its position in the industry.

The report was unanimously adopted.

ASSOCIATED TALKING PICTURES, LIMITED

EALING STUDIOS' FULL YEAR OF PRODUCTION

DIFFICULTIES OF THE CINEMA INDUSTRY

DIVISION OF BOX OFFICE RECEIPTS: NEED FOR READJUSTMENT

MR STEPHEN L. COURTAULD'S SPEECH

The twentieth annual general meeting of Associated Talking Pictures, Limited, was held on December 15th at Ealing Studios, Ealing Green, London, W.5, Mr Stephen L. Courtauld, M.C. (chairman of the company), presiding.

Mr Leslie F. Baker, A.C.A. (director and secretary), having read the notice convening the meeting and the auditors' report,

The chairman said: Gentlemen,—The report and accounts have been in your hands for some weeks, and with your permission I will take them as read. (Agreed).

I propose, with your approval, to follow the precedent established over the past few years and ask your managing director to address you on the detail of these accounts and to answer any questions which you may have in relation to them, confining my own remarks to matters of a more general nature.

The manufacturing activities have again been carried on solely through your subsidiary company, Ealing Studios, Limited, which has once more had a full year of production.

THE YEAR'S FILM PRODUCTION

Looking at the seven films which were delivered during the year, I think I may safely say that this year has done much to enhance still further the prestige of Ealing. Scott of the Antarctic, as I mentioned to you last year, was selected for the Royal Command Film Performance of 1948, and in addition to this Ealing did the "hat trick" with Passport to Pimlico, Whisky Galore and Kind Hearts and Coronets, all of which were outstandingly well received both by the critics and by the general public.

Another of the seven films delivered during the year was Eureka Stockade, the second film made by Ealing Studios in Australia. Shooting on the third film made in Australia, Bitter Springs, has now been completed and further production is planned for the future in Australia, where Ealing Studios, Limited, has acquired a long lease of the Pagewood Studios, Sydney, to form the base of future operations in the Commonwealth.

It is possible also that films may be planned for production in other parts of the British Commonwealth.

Ealing Studios, meanwhile, has a continuous programme of production for its studios at Ealing for the year 1950.

CONDITIONS IN THE INDUSTRY

You have seen in the national Press so much about the difficulties that the industry as a whole has to face, that there seems to be nothing I can usefully add to the general information in your possession; but I should like to remind you that the production side of the industry has even more problems than the rest.

It is, I think, true to say that, due to the rational policy followed by your directors, Ealing has suffered less than some others; nevertheless, the industry we know is indivisible, and it is impossible for your company to remain unaffected by adverse conditions.

It is hoped, however, following the representations that are being made—particularly in regard to the punitive taxation—and as a result of Government inquiry, that conditions will eventually be created under which stable British film production can exist; but until such conditions are created surely Ealing's record of production proves that under present circumstances profitable British film production is beset by almost insurmountable difficulties.

Two outside factors have reduced box-office receipts—the prolonged spell of fine weather from which we suffered this year, and the general falling off in public spending power, including that available for entertainment. The result has been that even outstandingly successful films such as I have mentioned did not mature to the full the revenues which the films themselves merited.

The situation is likely to be extremely difficult for some time to come. Your directors will continue to make every endeavour to reduce production costs, but their measures to this end, however drastic, can hardly by themselves establish and maintain a proper balance between costs and revenue. We must ask for the essential changes in conditions to which I have already referred; for some reduction or alteration of taxation, and for some readjustment of the division of box-office receipts; the present system is grossly unfair to the primary producer.

HOUSE OF COMMONS DEBATE

Yesterday, after this speech had been drafted and approved by my colleagues, there was further discussion of the film industry in the House of Commons, as, no doubt, you have seen in the papers. The President of the Board of Trade, in the course of his remarks, spoke of the "sinister unanimity" of the industry in protesting against the existing entertainment tax. On being challenged, he explained that this unanimity suggested "private deals."

I am going to risk whatever penalties there may be for criticising a member of the Government and say that I consider the two phrases quoted are absurd. If an industry is in difficulties and subject to terrifically high taxation, no sinister deals are needed to cause it to protest with one voice. (Hear, hear.)

I am reminded by the French natural history book which describes some wild animal: "This animal is very naughty; when one attacks it, it defends itself." Mr Wilson says of the film industry:

"This industry is very sinister; when one squeezes it, it cries out."

I now call on the managing director to address you on the subject of the accounts.

MANAGING DIRECTOR'S REMARKS

Mr Reginald P. Baker, F.C.A. (managing director): Mr Chairman and gentlemen,—I think perhaps I ought to do my best today to explain a number of things which, on the face of the accounts as circulated, do, I think, call for a measure of explanation. It is a matter of difficulty, as shareholders will

appreciate, to present accounts in accordance with the new Companies Act so that everything to which one desires to refer is abundantly clear to shareholders.

Your company, as you know, has a controlling interest in one subsidiary, Ealing Studios, Limited, holding 51 per cent. of the shares in that company, and also has a 50 per cent. interest in a second company, Associated British Film Distributors. That is basically the position—the old parent company, A.T.P., controls 51 per cent. of the new production operating company, and has a 50 per cent. interest in the distribution company, A.B.F.D. It is for that reason, of course, that in accordance with the provisions of the Companies Act details of the company in which you hold 51 per cent. are incorporated in the figures sent out to you in the form of a consolidated balance sheet. I will also refer in due course to the consolidated profit and loss account, which I must confess, even from my point of view, does present a somewhat complicated document for shareholders to comprehend to the full.

I have here the detailed accounts of the two companies to which I have referred—that is, Ealing Studios, Limited, and Associated British Film Distributors, Limited—and perhaps it might be useful to shareholders if I ran through the detailed balance sheet of Ealing Studios, Limited, so that you can perhaps have a fuller appreciation of the situation of that company.

PARENT COMPANY'S BALANCE SHEET

If I may digress for a moment, I think that the position regarding Associated Talking Pictures, Limited, on the balance sheet which has been circulated to you, is reasonably clear, but there is one point to which I would like to refer, and that is this. You see on the credit side of the balance sheet a debit balance on profit and loss account of £133,868. On the other side you will see provision for taxation of £108,400, and in addition there has been paid by your company on account of the notional liability to excess profits tax a sum of approximately £45,000, so that the debit to profit and loss account in respect of taxation, in round figures, is something in excess of £150,000. After providing that sum of money in excess of £150,000, we have a debit balance on profit and loss account of £133,000, approximately, so you can see that—we take no particular credit for it—your company has, in fact, subject to this peculiar incidence of taxation, done a little better than level pegging over a period of some twenty years. I draw attention to that because I think it is significant.

The reason for incidence of taxation at that level is because, as those shareholders who were with us a few years before the war will remember, we did, rightly or wrongly, take a conservative view of the valuation to be placed on the stock of films in hand at the end of each financial year. Subsequent events proved that more revenue was to be derived from those films than we had originally calculated, and when the revenue was derived, it came into the periods which were chargeable to excess profits tax. That situation, however, is under discussion with the revenue and representations are to be made that this is a case—as certain representatives of the Inland Revenue themselves admit—that may call for some special treatment. I do not put it higher than that and I do not want shareholders to anticipate fruitful results to be forthcoming from whatever discussions may ensue.

EALING STUDIOS' ASSETS

On the assets side of your balance sheet you have shares in subsidiary company; that refers, of course, to Ealing Studios. On the

Ealing Studios' balance sheet, we have freehold land, roads, studios and buildings, sound, electrical and general equipment, and all equipment, including motor vehicles, standing at present at the sum of approximately £177,000. The actual capital cost of those assets was not quite £286,000; by that you can see that over the period of operation of Ealing Studios we have written off depreciation of getting on for £110,000.

The next item on the balance sheet is sinking fund policies and life policies which stand at a figure of £100,915, which is the amount of premiums paid to date on those policies. Those policies were taken out in 1932. They were taken out at the time when these studios were first built and we had to arrange for the finance of the building of the studios, which we did at that time on the broad back of your chairman through an insurance company to a degree. One of the things we did was to take out these policies which mature to £150,000 in a period of twenty years. Today they stand in the balance sheet at the figure I have quoted, although the surrender value is £117,000, and the cash value at auction in the open market is, of course, higher, because when these policies were taken out the computation was on the basis of 3½ per cent. compound interest, which, of course, is a thing entirely unknown today.

FILM PRODUCTIONS AND RIGHTS

Then we have an asset which is really the focal point or the turning point of the operations of the company, and that is film productions and rights, which come under three headings. Preliminary production expenses on films which will probably be made in the future total some £36,000; films in production, at cost, after deducting contributions which are made by our distributors to that cost, total approximately £157. When I say "contributions by our distributors" I do not mean our own distributors, A.B.F.D.; I mean the distribution company which is part of the Rank organisation, which takes our films for distribution and makes a definite contribution towards their negative cost.

Then we have another item which is much heavier—that is, completed films, which amounts to just over £393,000. That item is made up of expenditure on the films, less contributions made by those distributors to whom I referred just now, and also after deducting the revenues we have received from those films and after deducting the amounts that we consider should be provided against future shortfall of revenue.

BASIS OF VALUATION OF FILMS

In relation to that item, I think perhaps I should tell you the basis on which we value films. At the end of each year we receive from the distributors a schedule showing the expectation of revenue, not only from this country but from all territories of the world in respect of each of the individual films. Based upon that, and perhaps what we know ourselves in addition, we carry forward the value of our stock-in-trade. It would, perhaps, not be wrong for me to say at this point that the overseas market does present certain difficulties. In many countries, of course, where our films go for exploitation, you have very material currency restrictions. You have frozen currency in many territories which you cannot touch. Shareholders may be interested to know that in respect of our small company—I use the word advisedly because in relation to other film companies we are quite small, although we have a longer record—at the end of June last we had upwards of £110,000 overseas in frozen currency, which we would not touch at all. We take no account of that in arriving at the value of our films, except where anything may have been received between the end of the year in respect of which the accounts are

being drawn up and the date when we, in fact, draw up the accounts, so you can see there is something there which we hope one day will come in and will show, perhaps, a somewhat larger measure of revenue than we are envisaging in the preparation of these accounts.

The next item in the balance sheet is debtors and prepayments; the total, including repayment of income tax to which we are entitled, is £66,000. Cash at bank and in hand is £5,600. We then have the final item, which is debit to profit and loss account, of £172,000, which includes the adverse balance in respect of the past year to June 30th last of just over £54,000.

On the liability side, we have share capital, which is quite small, £5,000, of which your company holds £2,550, and in the main the balance is made up of bank and other loans and the liability to Associated Talking Pictures, the parent company, of £24,000, which, of course, has been repaid since the date of this balance sheet. You can see, obviously, that with that amount of assets and a share capital of £5,000, the only basis on which it can be operated is by bank borrowing or borrowing from other sources, practically the whole of which is borne on the shoulders of your chairman, plus certain personal guarantees from Sir Michael Balcon and myself. I have referred to those assets in detail because it seems to me that the information might be welcomed by shareholders, and it may well amplify the information which is given in the consolidated balance sheet.

VALUE OF FIXED ASSETS

Additionally, I think shareholders will have noticed that the fixed assets of the company—that is, Ealing Studios—freehold land, buildings, equipment and so on, figure in the balance sheet at £177,000, and I did advise shareholders two years ago that in order to see where we were getting to, we asked some professional valuers to come through this place, go through it in detail, and see what value should reasonably be attached to these fixed assets, and I did tell you at that time that it came to a very considerable sum. It was, I think, in those days, half a million pounds. We do not take any credit for that. I think we ought, perhaps, to congratulate ourselves that during the war, when we were in a very vulnerable area, we had the good fortune to suffer nothing more than fire bombs on our roof, which we managed to put out. We also managed to get the place repaired and managed to find alternative accommodation during the period repairs were being effected. It has not been our policy to take any notice of that valuation, other than to bear it in mind and keep it at the back of our heads, but I think it will show you that although we unfortunately have a debit balance on profit and loss account which is quite substantial, if one takes into account the more recent valuation of the fixed assets, the position at least is somewhat better than that disclosed by the detailed balance sheet, to which I have just referred.

CHAIRMAN'S PUBLIC-SPIRITED ACTION

I ought, perhaps, to make one other point. I referred to the fact that the company has been financed entirely by borrowings, and the bank have figured very largely in that. By virtue of the position of A.T.P. in 1941, and the vulnerability of these studios, at that time it was not at all possible to obtain any finance to carry on the operations of A.T.P. In the face of the position that had then arisen, it became necessary to make other arrangements, and I am telling you this so you will know the kind of burden your chairman has borne in a very uncomplaining way, and if I may say so, a very public-spirited way, in the years that have passed since that time. At all events, the bank held the view

that they could not allow the company to borrow any more money. We therefore formed another small company which borrowed money from the bank on the strength of the guarantee of your chairman, reinforced subsequently by such—I am not going to say financial weight—but such moral weight that Sir Michael Balcon and I could bring to bear. That money, when borrowed from the bank, was forthwith lent to your subsidiary company, Ealing Studios, up to the extent of £490,000. That is in addition to the direct borrowing from the bank. I am telling you that for the reasons I have already given you, and also to let you know that adverse as the situation may appear to be on the face of these accounts, the bank have now agreed that all borrowing shall be on behalf of Ealing Studios direct, and accordingly that arrangement has been made since the date of this balance sheet. It shows that bad as the industry may be, and you will know how bad it is because you have been reading about it, at all events the bank feel that Ealing Studios is still reasonably credit-worthy.

RESULT OF THE YEAR'S OPERATIONS

The adverse balance on that company's operations, as I say, is approximately £54,000, of which your company has a 51 per cent. share, so the parent company's share of the loss on Ealing Studios is £27,000 odd. A.T.P., as you see, has a profit for the year of £15,548; that leaves a wrong side up to the extent of the difference between those figures—the difference between some £27,000 and £15,000, which is £12,000.

At this point I ought to refer to Associated British Film Distributors. That company during the year we are referring to made a profit of £36,000; half of that profit attaches to your company, so that against the adverse balance of under £12,000, we have a credit balance on another subsidiary company of £18,000, so that taking it through the year it seems that equilibrium has just been maintained and that is all. We do not hold that out to shareholders as being a satisfactory result, but in the light of the figures that have been published recently in relation to those organisations which may perhaps be more fortunately placed than we are, it does seem that we have, at all events, just held our own.

PRIMARY PRODUCERS AND BOX-OFFICE RECEIPTS

When I went through these figures last year I did say to shareholders—I think you will find it reported in certain financial papers—that I personally, and I know my colleagues shared the view, saw no reason at that time for any optimism. The industry has attained a stature that was the subject of debate in the House yesterday. Various things are blamed for the present situation. One of the things that I personally think is to blame—and it is a song I have been singing for the last twenty years, but nobody takes much notice, I am afraid—is that if you examine the division of the box-office receipts which the public pay to go into a cinema, certain points may be brought to your mind. It is an acknowledged fact that entertainment tax takes a full 36 per cent. of the amount the public pay at the box office. That leaves approximately 64 per cent. Of this 64 per cent., it is acknowledged that the theatres retain roughly 60 per cent. of that figure, leaving 40 per cent. of that figure, which is roughly 25 per cent. of the gross amount available, for the man who makes the picture and the man that sells the picture to the cinema. Out of that approximately 25 per cent. of the gross amount paid by the public the cost of distribution of the film, plus cost of the copies and advertising, takes a full one-fifth. I do not want to overstate it, but it is fully one-fifth, which means

that that 25 per cent. becomes reduced to 20 per cent of the public entrance money.

ENTERTAINMENT TAX NOT THE WHOLE PROBLEM

So far as the primary producer is concerned, this means that under prevailing conditions he is asked to manufacture for a maximum of £20 a commodity for which the public is prepared to pay £100, and it gives one, I think, some food for reflection when you consider that the entertainment tax takes on a good picture twice as much as the primary producer; and on an indifferent picture the comparison is even more favourable towards the Government. I am not suggesting that the entertainment tax is the whole problem we have to face, but it does seem to me—if I am being rather verbose about it, please forgive me—that the division between the various sections of the industry, outside the question of entertainment tax, could do with a measure of revision in favour of the primary producer; because it is a peculiar thing—a given cinema will take, for example, £300 one week and £600 the next week, and the only thing that is changed in the theatre is the primary producer's film which goes through the projector. That is the only difference.

DIRECTORS' EMOLUMENTS

There is one other point I would like to refer to, and that is in relation to the consolidated profit and loss account which appears on the back of the report which has been circulated. Under Ealing Studios, Ltd., arrangement with its distributors—that is, with the company known as General Film Distributors, which is part of the Rank Organisation—they take our films for distribution not only in this country but in all countries of the world. A part of the arrangement we concluded with them was that they should also take an investment in our films. The investment is proportionate to the cost of producing the films, and in relation to the cost of production of those films certain charges have to be established, and among those charges are remuneration to various people who are associated with the manufacture of those films. I say this because there is an item here which in shareholders' eyes must I should think, stand out very vividly. None of your directors has ever either desired or has had a contract of employment prescribing any remuneration whatever in relation to the operations of either your company or either of the two subsidiaries, but the distributors laid down that the negative costs should provide for certain remuneration so far as your actively engaged directors are concerned, and, moreover, they laid down the extent of that remuneration. That is why you see in this profit and loss account: "Emoluments of the directors of Associated Talking Pictures, Limited, from Ealing Studios, Limited, £36,000" odd. You will notice that there is in parenthesis there a statement to the effect that £18,000 of it is undrawn.

If you examine these figures more closely you will see that a little lower down there is a figure of amounts chargeable to and paid by the distributors, £39,889. That is in respect of directors' emoluments and depreciation of equipment. You will see that if the £36,000 I have referred to as directors' remuneration is reduced by the amount of £18,000 undrawn, you have a net figure of some £18,000. If the total figure a little lower down of £48,000 is reduced again by £18,000, you will see that after deducting the amount chargeable to and paid by the distributors, your company is in the unusual position of finding that not only are no emoluments of directors charged against your company or the subsidiary in any shape or form, but in point of fact you make a profit out of your directors out of the proportion paid by your distributors.

I mention that because if anybody

examines this balance sheet, which is drawn up in accordance with the provisions of the Companies Act, it shows a very adverse position, and then examines the profit and loss account which again is drawn up in accordance with the provisions of the new Companies Act, they may feel that the directors are having a high old time at the expense

of shareholders, whereas in point of fact, in view of what I have told you, you will see that the company is, in fact, making a profit out of its directors.

After Mr R. P. Baker had replied to questions, the report and accounts were adopted, *nem. con.*, and the formal business was transacted.

SOUTH DURHAM STEEL AND IRON COMPANY, LIMITED

RECORD LEVEL OF PROFITS

NO REDUCTION IN OUTPUT

FATE OF INDUSTRY RESTS WITH ELECTORATE

MR J. H. B. FORSTER ON THE STEEL ACT

The fifty-first ordinary general meeting of South Durham Steel and Iron Company, Limited, was held on December 21st at Cargo Fleet Ironworks, near Middlesbrough.

Mr J. H. B. Forster, the chairman, who presided, said: You will observe that the estimated amount of capital expenditure outstanding at September 30, 1949, as authorised by your board, amounts to £2,274,819. This sum represents the board's policy of concentration of ingot production for plate manufacture at the West Hartlepool works, together with improvement to the slabbing mill, which will enable plate production to be increased. Included in this sum is the estimated cost of replacing a blast furnace at Cargo Fleet with a modern unit. These projects have been finally approved by the British Iron and Steel Federation.

The amounts which we will ultimately receive for our collieries, coke ovens and other properties which were taken over by the state on January 1, 1947, are still not known, nor can I forecast when these payments are likely to be received. The value to be paid for our coal properties is contained in the district sum for the County of Durham, and individual compensation is a matter to be decided by the District Valuation Board, as is also the price to be paid for our ancillary assets such as coke ovens and other properties which were acquired at the same time, and for which we are to be compensated outside of the global sum awarded for coal interest values.

THE STEEL ACT

Since I addressed you 12 months ago, the Bill to transfer the iron and steel industry to the state has now become an Act of Parliament and has received the Royal Assent. There is no need for me to repeat the remarks I made to you on your board's views of this measure, except to remind you that the evident intent of the sponsors of this Act is to obtain further powers for their own ends. As matters stand at the present time, the fate of your industry, with which the future of this country as an industrial nation is irretrievably bound up, rests with the decision of the electorate within the course of the next few months.

In your capacity as proprietors of this company, I consider it is your duty not only to defend your own position against the virtual confiscation of your properties, but also in the forthcoming struggle to play an active part against the attempt to submerge private enterprise and so abolish individual incentive.

BOARD'S PROPOSALS REJECTED

The Act, as it exists at present, goes much further than the manufacture of steel products, since it embraces the steel fabricating departments of a diverse and complicated nature of the principal steel producing firms. Your directors presented a case to the

Minister of Supply to endeavour to segregate the non-steel-making activities of your companies from their steel manufacturing activities, but I regret to inform you our proposals, along with others of a similar nature, have not been accepted.

Thus, in the event of control passing to the government, the state will be engaged in competition with free enterprise in this country and in world markets, not only in the production of steel materials, but also in the sale of engineering products comprising, as far as your companies are concerned, pipelines for hydro-electric and supply purposes, steel tanks for storage purposes, steel-frame buildings, and many general engineering products. It is our hope that the nation will be wise enough to prevent this chaotic state of affairs from coming into existence.

POLICY OF IMPROVEMENT

I referred at an earlier stage to the capital expenditure which your directors have authorised to improve the all-round efficiency of both the West Hartlepool and Cargo Fleet works. Irrespective of the ultimate destiny of the industry, it has been the policy of your directors to proceed with these schemes as soon as the requisite sanction from the Ministry of Supply has been obtained, as it is our view that national interests must take priority. Arrangements have been made to cover the estimated capital expenditure involved in these developments, and which may be in excess of the profits which will be retained. It is anticipated this expenditure will be spread over the next 3-4 years.

Though our achievements in increased production during the last twelve months have come up to your board's expectations, the object of these further developments is to enable increased outputs to be obtained at a lower cost of production. The principal items involved and which comprise the capital expenditure referred to on the balance sheet, consist of:—

West Hartlepool—(i) Improvements to the blast furnace plant; (ii) Two additional steel furnaces and improved scrap charging facilities; (iii) Improvements to the slabbing mill to enable 15-ton ingots to be manipulated; (iv) Additional heating capacity at the heavy and light plate mills.

Cargo Fleet—A new blast furnace of 20-feet hearth diameter which will enable pig-iron output to be increased by 50 per cent. Since the end of our financial year the British Iron and Steel Federation have recommended to the Ministry of Supply that an additional steel furnace should be installed at Cargo Fleet. This will secure an increased output of ingots for the rolling mills which have been modernised in recent years. In view of the possibility of curtailment of supplies of imported scrap, which have been largely derived from Germany over recent years, it is our intention to endeavour to get the new blast furnace in production

within the shortest possible time, in order that there may be a minimum of disruption of supply of materials for the manufacture of steel products.

STEADY GROWTH OF OUTPUT

During the last two years the outputs of the steel industry have continued to show a steady increase, and in each year previous records of production have been surpassed. Comparing the present calendar year with 1948, it appears that the national ingot production will approximate 15½ million tons, equivalent to an increase over 1948 of 4 per cent. Taking as a basis of comparison the last two financial years of your companies ending on September 30th in each year, their increased production of ingots and finished steel is:—

	Ingot	Finished steel
South Durham, for year ended September 30, 1949	9.7%	17.5%
Cargo Fleet, for year ended September 30, 1949	10.3%	12.25%

Since the end of our financial year there has been no reduction in the level of our outputs, and accordingly for the calendar year, 1949, the percentage increase in production at both West Hartlepool and Cargo Fleet will exceed the national percentage increase by a considerable margin, for which full tribute to management and workmen should be accorded. At the West Hartlepool plant, production of steel plates for this financial year constitutes a record, and we are now producing from our two mills the greatest tonnage of sheared plates on the north-east coast.

ALLOCATION OF PROFITS

You will have observed from the group profit and loss account that the profits of South Durham and its subsidiary companies amount during the year to £1,361,785. This figure represents a record level of profit in the history of the company and its subsidiaries, and is an indication of the foresight of your board over a long number of years in retaining in the business a large proportion of earned profits in order to maintain a high level of efficiency. From the profits arising from the year under review, allocations are:—

	£	%
Interest on debenture stocks (net)	42,000	3
Sinking funds for Four per Cent. Mortgage debenture stocks	25,000	2
Dividends (net)	42,000	3
Provision for taxation	454,000	33
Depreciation and reserves for future development and other purposes	761,000	56
Directors' and debenture trustees' fees, auditors' remuneration and staff pensions and life assurance schemes	38,000	3
	1,362,000	100

You will see from this statement that a sum amounting to 56 per cent. of the year's profits and exceeding three-quarters of a million pounds has been retained within your company.

During the last two years, and ignoring a figure exceeding half a million pounds provided for depreciation, a sum amounting to £850,000 has now been set aside from profits to finance the projects to which I have already referred.

DIVIDENDS

You will further observe that dividends paid on all classes of preference and ordinary shares are equivalent to only 3 per cent. of our total profits. No justification can exist

for statements which have been made from time to time to the effect that shareholders are receiving an undue proportion of the earned profits and that insufficient provision is being set aside for future developments. Both in achievements of increased outputs and ability to maintain costs of production at an economic level, the iron and steel industries have clearly proved their case to continue as industries devoid from State management which is already causing grave concern in the increased level of costs in these sections of national production and services where State ownership is being applied.

The proposal to increase rail traffic rates on both raw materials and finished products must bring with it grave consequences, both in this industry and throughout industry in general in this country. The addition of these increased costs will entail a further rise in the cost of production which will have serious effects on our ability to maintain the existing level of exports.

The provision for taxation is a large amount, and though initial relief is received on capital expenditure, the present high level in force constitutes a crippling burden on industry. In this respect, the Government must bear in mind that, should a contraction in trade occur, industry may not have sufficient profits available to set aside for development unless taxation is substantially reduced.

THE FUTURE

It is a difficult problem to forecast the future level of production for our industry. As far as steel plate production is concerned, the tonnage on our books and orders coming in show at present no appreciable reduction. The fact, however, must not be overlooked that shipbuilders are finding it increasingly difficult to book orders. There is no doubt that the present high level of cost of construction is a deterrent for the placing of new contracts for ships of all types. A high level of production of steel plates is closely bound up with shipbuilding, and I hope that it will be possible to avoid any further increases in costs, failing which there will come a deterioration in the demand for steel. We have now completed our range of production of broad flange beams, and in our heavy mill at Cargo Fleet we possess the only mill not only in the United Kingdom, but in the British Commonwealth, which can produce these beams.

Our steel pipe department at Stockton, where important hydro-electric pipe lines for export are being manufactured, has sufficient work to ensure a high level of production for the next 12 months, and our order books are satisfactory at the steel tank and welded fabrication departments.

NATION MUST TAKE STOCK

I consider the time has come when the nation must take stock of its position and appreciate that the conditions enjoyed over the last few years are not likely to continue indefinitely. If the steel industry is allowed to retain the incentive and initiative arising from individual enterprise, then we will survive as an industrial nation. Should the alternative method of bureaucratic control by the State be imposed on this industry, the whole structure of our national economy will inevitably collapse, since the value of our "direct" and "indirect" exports of steel are by a long way the largest single item in our world trade.

I wish to close my remarks with congratulations to our managers, our officials, our clerical and other staffs, and to our workpeople for the excellent results you have before you to-day, and finally I want on behalf of his colleagues on the board to thank Mr. Talbot for his invaluable assistance and foresight in his capacity as managing director.

The report and accounts were adopted.

ANSELLS BREWERY, LIMITED

SATISFACTORY TRADING

The forty-ninth ordinary general meeting (being the forty-eighth annual meeting of stockholders) of Ansell's Brewery, Limited, was held on December 19th at Birmingham, Mr A. E. Wiley (chairman and managing director) presiding.

The chairman, in the course of his speech, said: The past year has been one full of difficulties, some of which have been caused by legislation, and have involved the company in considerable expense over which your directors have very little control. In spite of these extra charges, we feel that the stockholders have every reason to be satisfied with the year's trading.

FACTOR AFFECTING PROFITS

The trading profits of the group for the year under review amount to £1,497,554, which is a decrease over last year of £374,012. In November, 1948, the Catering Wages Act became operative, and this Act has involved the company in a very considerable increase in the wages paid to managers and staff in the company's licensed houses. The Chancellor of the Exchequer, in his Budget of April, 1949, reduced the selling price of our main article by 1d. per pint to the public, but he altered the rate of duty so that an extra charge of 3s. per barrel was levied on the brewer. This, of course, is a considerable charge on your company, and the accounts under review have had to bear six months of this extra burden. In addition, repairs to licensed houses have increased very much during the year under review, owing to the easing of controls. This expenditure was necessary, due to long delay caused by the last war and controls on the building industry. The net profit, after charging all items of expense, income tax and profits tax, as detailed in the consolidated profit and loss account, amounts to £490,672, giving a decrease of £123,897 over that of last year. Adding to the net profit the balance from last year of £311,201 gives a disposable balance of £801,873.

THE TIED HOUSE SYSTEM

The past year has seen a Private Member's Bill introduced by Mr Bing, seeking to abolish the tied house, and, when that failed to get a second reading, a motion was put on the Order Paper for an inquiry into the tied house system. It is quite clear that this campaign is not based on any practical knowledge of the system under which the industry works, nor has any satisfactory alternative system been put forward. At the same time, it is alarming to find that the tied house system, as it has come to be called, is so little understood not only by the public but by many Members of Parliament.

Mr Walter Scott (deputy chairman and joint managing director), in the course of his speech, said: Intricate licensing laws regulate the supply of our products, and the tied house system, the principle of which has been endorsed by the Royal Commission on Licensing and which has been evolved and administered by brewers, provides the most truly democratic and friendly meeting place for all and sundry. The so-called "tied house" is by no means unique, as many manufacturers in other trades own a series of establishments for the exclusive sale of their own products.

In Ansell's public houses, when the type of licence permits, national bottled beers and stouts, wines and spirits, cider, lager, mineral waters, cigarettes, etc., and food, as well as our own beers and stouts, are sold. Ansell's are still able to produce a comparatively good beer because the present restrictions are based proportionately on the strength they brewed at before the war.

The report was adopted.

HORROCKSES, CREWDSON AND COMPANY, LIMITED

SATISFACTORY RESULTS

BURDEN OF TAXATION

The annual general meeting of Horrockses, Crewdson and Company, Limited, was held on December 21st, at the registered office, Yard Works, Stanley Street, Preston.

Lieut.-Colonel T. M. Brooks (chairman) presided.

The following is the directors' report, which was circulated to shareholders with the report and accounts:—

Before dealing with the accounts, the directors wish to record with deep regret the death of their colleague, Mr L. W. Brown, who was mainly responsible for the early progress of the subsidiary Horrockses Fashions, Limited. By his untimely death the board has lost not only a colleague of great experience and charm, but a friend.

Your directors submit the audited accounts for the year ended August 31, 1949, which, as on previous occasions, include the comparative figures for the previous year.

PROFIT AND DIVIDEND

The combined net profit for the year of the company and its subsidiaries, after deducting all working expenses, but before taking account of taxation, amounts to £605,911, compared with £525,608 for the previous year.

Profits tax and income tax on the profit of the year require £295,417, against £273,042. After setting aside this amount, there remains a combined net profit of £310,494, as compared with £252,566 last year. All the subsidiaries made profits which are retained in their accounts and the net profit taken up by the parent company for the year is £246,342, as compared with £189,416 for the previous year.

Your directors recommend a dividend of 10 per cent. and a bonus of 5 per cent., requiring £41,030 after deduction of tax. Of the remaining balance they have transferred £14,236 to the debenture stock redemption account, £100,000 to the re-equipment reserve, and £75,000 to general reserve, leaving £16,076 to be added to the balance brought in, thereby increasing the amount to be carried forward to £150,794.

RE-EQUIPMENT RESERVE

As in previous years the charge for depreciation has been calculated on the sums at which the fixed assets are carried in the books. The annual amount required to be set aside in order to replace these assets at present prices is, as stated in the Report last year, approximately £150,000. In order to bring the provision for depreciation into reasonable relation with this amount, the directors have transferred out of the profits of the year a sum of £100,000 to re-equipment reserve.

A trade investment has been disposed of during the year. The amount received to date, less the sum hitherto appearing in the books, has been taken to a reserve, to which

will be added a further amount which we expect to receive during the current year.

NORTHERN IRELAND FACTORY

Last year we expressed the hope that the installation of machinery in the factory in Northern Ireland would commence in the spring of this year. It is a source of much disappointment that restrictions in the supply of building materials, etc., added to other difficulties over which we had no control, have retarded progress so much that it seems unlikely that production can commence before the summer of 1950. The time lost would have been invaluable in the training of workers, and the frustration which we, in common with other progressive firms, have to meet in starting new ventures is illustrated by the delays with which we have been confronted.

With regard to our mills in Lancashire, progress in the direction of increased production has been negligible, and with the exception of the intake of juveniles at school-leaving age, the increase in the number of our operatives shows little improvement.

COTTON MANUFACTURING COMMISSION REPORT

It is to be hoped that the principles of redeployment, as outlined in the report recently issued by the Cotton Manufacturing Commission, under the chairmanship of Mr R. Moelwyn Hughes, K.C., will be accepted by the industry and that a serious effort will be made by all concerned to implement, wherever practicable, the recommendations contained therein. Your directors have on more than one occasion in previous years referred, in their reports, to the advantages to be gained in certain instances by both the company and its employees from the adoption of methods devised to give greater production per man-hour at work-loads scientifically determined to be well within the capacity of the operator.

INCREASED PRODUCTIVITY AND RELIEF FROM BURDEN OF TAXATION ESSENTIAL

Quite apart from the vital need for facilities to purchase our raw material at competitive world prices, two requirements must be met in order to make our industry capable of holding its own in the buyers' market of the future and, at the same time, build up sufficient reserves to re-equip itself with modern machinery as and when that becomes necessary. These are, first, an increase in productivity per man-hour; and second, some real relief from the burden of taxation. If an increase in productivity cannot be attained with the available labour force, the inevitable alternative lies in longer hours of work. If, as seems likely at present under the weight of Government expenditure, no reduction in taxation is possible, although such a step would be an important factor in making our prices more competitive overseas, then it may at least be hoped that steps will be taken to bring about a more equitable distribution of the burden.

In this connection your directors are glad to note the appointment of the Tucker Committee on the taxation of trading profits and trust that its report may be the means of bringing profits subjected to taxation into closer relation with the true profits of trading concerns.

Under present conditions initiative and the will to work are slowly being stifled, and

we are convinced that a reduction in taxation, a real incentive to increased production at lower cost, would not only give a needed stimulus to all sections of the Lancashire cotton industry, but would re-establish confidence abroad in its stability.

FOSTERING EXPORT TRADE

During the year visits by directors have been made to a number of overseas markets, including U.S.A., Canada, Australia, New Zealand and South Africa. Every effort is being made by our overseas representatives to maintain and develop the company's trade in the markets which they serve, in spite of the many serious difficulties under which export trade has to be conducted in these days.

Progress continues to be made by the subsidiary, Horrockses Fashions, Limited, and the policy of manufacturing garments overseas from piece-goods made in Horrockses' mills in Lancashire has been extended during the year.

TRIBUTE TO STAFF

The directors wish to thank the management and employees for their co-operation during the year. Throughout the organisation there exists an excellent spirit, which we feel sure will carry the company through any difficulties which it may have to face in the future.

The directors retiring (in accordance with Article 100) Lieut.-Colonel T. M. Brooks and Mr W. M. Murdoch were re-elected.

Messrs Price, Waterhouse & Company informed the company of their willingness to continue in office as auditors. A resolution was adopted at the meeting in respect of their remuneration.

S. SMITH AND SONS (ENGLAND) LIMITED

FURTHER PROGRESS

The annual general meeting of S. Smith and Sons (England) Limited was held on December 21st in London, Sir Allan Gordon-Smith, K.B.E., D.L. (the chairman), presiding.

The chairman drew attention to the consolidated profit and loss account which showed before taxation £860,143 (£857,844 last year) and the net figure £346,718 (£251,844 last year).

The Kelvin and Hughes accounts indicated satisfactory progress by this important subsidiary company. New and important products have been developed.

Smiths Motor Accessories Limited had improved their position. The demand for car heaters and all equipment had been so great that a large factory had been acquired at Witney.

Smiths English Clocks Limited, when its manufacturing facilities were fully developed, would become the largest combined clock and watch manufacturing concern in the world. The factories were turning out clocks and watches at the rate of approximately five million per year.

Smiths Aircraft Instruments Limited had made further progress. The heavy demands both on productive capacity and research and development departments had necessitated considerable additions to laboratories and factory at Cheltenham.

Smiths Industrial Instruments Limited had made satisfactory although slow progress and the demand for their industrial instruments was steadily increasing.

The chairman then referred to "the power behind the product" and said that a team of experts in each factory engaged in improving machines and methods had enabled

recent increases in material and labour costs to be absorbed and little or no increase in their selling prices had been necessary.

Considerable progress had been made towards making the divisions self-contained units which with headquarter services and specialists were linked up as one integrated body under the Smiths Group Managing Director, Mr Ralph Gordon-Smith.

Dealing next with export, the chairman said that this had been at a high level. He had recently returned from a world trip of some 27,500 miles in U.S.A., Canada and New Zealand and Australia. He had been greatly impressed with the possibilities there.

He considered it his duty as chairman to express his views that rationalisation of any industry was undesirable and if it became general it would mean the end of this country as a great industrial nation because it would stultify enterprise and initiative.

The report was adopted

THE ROVER COMPANY, LIMITED

RECORD PRODUCTION

The fifty-fourth annual general meeting of the Rover Company, Limited, was held on December 16th at Birmingham, Mr E. Ransom Harrison, F.S.A.A., the chairman, presiding.

The following is an extract from his circulated statement:—

Last year I made particular reference to the Land-Rover, which had only then been introduced to the public, and since that time this vehicle has become firmly established, both at home and overseas. It has a large market for military purposes, as well as for agriculture and industry.

The total number of vehicles produced during the year was over 13,000, which is a record total for this company. Of this total, approximately 68 per cent., or nearly 9,000 vehicles, were sent abroad.

THE NEW "75"

I feel that you would like me to say something to you about the new "75" model car which we announced and exhibited at this year's Motor Show. In making such a radical change in design our sole object has been to produce a better motor car. I would lay stress on the fact, as I have always done in past years, that the quality of our product has still been maintained. We are very pleased with the reception it has been given and we are quite confident it will live up to the Rover reputation for dependability.

Once more I have to express regret that we are unable to satisfy our numerous customers in the home market. This is brought about by the present economic situation, and we shall be just as happy as you will be when we can resume delivery to our very patient customers. Although we have changed our model, there will be no lack of spares available for previous models.

The profit on trading at £611,996 shows an increase as compared with last year, when it was £565,110, and after taking into account the various items of income and expenditure the net profit amounts to £158,098, as compared with £132,199 last year. To this profit is added the balance brought forward from July 31, 1948, of £73,203, making a total available balance of £231,301. Against this is shown the interim dividend of 10 per cent. less tax, already paid, amounting to £35,132, the proposed appropriation to general reserve of £60,000, and the proposed final dividend of 5 per cent. and bonus of 5 per cent., both less income tax amounting to £47,127, leaving the balance to be carried forward £89,042.

The report was adopted

CROMPTON PARKINSON, LIMITED

DEMAND AT HIGH LEVEL

MR ALBERT PARKINSON'S REVIEW

The thirty-sixth annual general meeting of this company was held in London on December 16, 1949, the chairman, Mr Albert Parkinson, M.B.E. presiding.

The chairman, in the course of his speech, said:—

The manufacturing and trading operations of your company have been carried out during the period under review in conditions which have not differed to any great extent from those of the previous year. The continuing inflationary effect of the national economy has been reflected in higher costs, which we have been able to offset in part by improvements of manufacturing and administrative technique. Some selling prices have been increased and some have been reduced. Despite fluctuations in both volume and selling prices of individual categories of products, the demand for the company's products as a whole has remained at a high level throughout the period and the results of the combined operations of the group are reflected in the consolidated profit and loss account which is now presented to you.

MANUFACTURING AND TRADE RESULTS

The financial periods of your company and of all its subsidiaries now end on June 30th. The accounts include the results of the parent company and of The British Transformer Company, Limited, and of one other home subsidiary company for a period of nine months only. On the other hand they also include the results of two important subsidiary companies in this country and two overseas companies for twelve months, four overseas companies for fourteen months and three other subsidiary companies at home and one overseas for fifteen months.

The consolidated balance sheet shows that the group has a total capital of £6,888,439 which is £383,325 more than at September 30, 1948. Nearly £300,000 of this sum has gone into fixed assets in addition to the amount of £195,664 provided for depreciation and reinvested in such assets. The total net current assets have increased by more than £80,000 and the main reason lies in the figure of stock-in-trade and work in progress which has increased by £433,853.

A year ago I ventured to foresee a reduction in our investment in stock-in-trade and work in progress based on a more ready availability of raw materials and parts. These have, in fact, been more readily available, but the resultant reduction in the volume of stock has been largely countered by a continuance of the rise in costs. The import and currency controls in overseas territories now necessitate the retention of a greater volume of finished goods for longer periods and have thereby increased our investment. This item is under constant close review as we fully realise the need to minimise our investment in stocks, etc., without interfering with the efficiency of production.

OVERSEAS POSITION

Any consideration of the overseas position of your company is strongly influenced by the devaluation of the £ sterling. Its most obvious effect was an almost immediate considerable increase in the price of certain government controlled non-ferrous metals which form an important item of cost of

many of our products. It became necessary to increase some of our selling prices but in spite of this devaluation has increased our ability to compete in some overseas markets against the local manufacturer and in many overseas markets against some foreign competitors.

Except in regard to Canada our dollar earning capacity is not great, but we are looking forward to an early expansion of business with our Canadian friends and in South American countries in due course.

In other countries, government protection of local manufacture will, to some extent, prevent the exploitation of our advantage, but, in general, I would expect to see an increase of business.

We have improved and consolidated our overseas connections and are well placed to secure a share of the available business from most markets of the world.

The development of our manufacturing plants and business interests in the British Commonwealth has continued with favourable results.

DIVIDENDS AND NEW ISSUE

Your directors again recommend a final dividend of 7½ per cent. and a cash bonus of 7½ per cent. on the ordinary and "A" ordinary stocks of the company. Not only does this recommendation conform to the moral responsibility inherent in the undertaking which your board has again given at the request of the government, but also to the policy of conservation of the resources of the company which has been followed for many years and which is in the best interests of the company and its stockholders. You are asked to sanction the recommended final dividend and cash bonus for payment on December 31, 1949.

A further sum of £5,000 has been allocated to the central benevolent fund.

An extraordinary general meeting has been convened to increase the authorised capital of your company and to authorise the free issue of "A" ordinary stock to holders of ordinary and "A" ordinary stock in the ratio of one new unit of "A" ordinary stock for each unit held. This free issue is to be made on December 31, 1949, in the form of renounceable allotment letters. The sanction of the Treasury has been obtained to this issue.

This issue of free shares does not imply any change of your board's profits distribution policy. The total amount of money stockholders will receive in dividends will not be increased beyond that which they would have received if this issue had not been made.

THE FUTURE

The events of the past months have underlined the wisdom of avoiding prophecy as to the long-term future of the company. Short-term forecasting is a matter of day-to-day judgment and is a necessary part of the function of your directors and the other senior executives. The progress of your company indicates the degree of success of such judgments.

It is your board's policy to plan with reasoned optimism and, as a result, I consider your company is well equipped to maintain its position in the world of industry.

The report and accounts were adopted.

BIRMID INDUSTRIES

ANOTHER SUCCESSFUL YEAR

The annual general meeting of Birmid Industries Limited was held on December 16th at Birmingham, Mr Cyril C. Maudslay (chairman of the company) presiding.

The following is an extract from the chairman's circulated address:

Your directors are pleased to report yet another year's successful trading.

The capital and revenue reserves amount to no less than £3,140,589, or almost 330 per cent. of the capital subscribed, and that the total capital employed is over £4,000,000.

The consolidated profit and loss account shows a net profit for the year of £282,933, after charging £373,840 in respect of taxation. The charge for income and profits taxes represents some 38 per cent. of the total profits.

A GOOD MEASURE OF SUCCESS

Production has generally been well maintained in the face of increasingly severe competition and the ending of the sellers' market. Your managements are fully alive to the increasing need for higher efficiency and productivity, and spare no effort to keep the group factories in the forefront of their several specialised activities.

Import embargoes in various foreign countries have retarded the progress of some of our customers.

Substantial increases in output were achieved by all the iron foundries in the group and the Midland Motor Cylinder Co., Ltd., in particular, reached an all-time record.

Production from the aluminium and electron magnesium foundries has continued on a healthy basis. Our foundry equipment business, Pneulec, Limited, is well employed.

Costs have gone against us in the case of a number of basic materials, particularly aluminium. Virgin aluminium advanced by £10 per ton. The resultant increase in selling prices makes competition with other materials more difficult.

Since July last the devaluation of the pound sterling has caused a price increase of a further £22 per ton. Despite this, the strong and medium aluminium alloys, particularly the corrosion-resisting Birmabright series, have so established their technical and economic value that I am confident in our ability to go forward. Magnesium electron shows a pleasanter picture. There was no increase in cost during the year. Zinc actually fell during the year by £22 per ton, though devaluation has since cancelled out this fall.

The iron foundries suffered cost increases during the year of 9 per cent. on coke and 12 per cent. on pig-iron.

INDIRECT EXPORTS

Export is hardly possible in respect of your foundries, in the direct form. As important components of cars, commercial vehicles, agricultural tractors, etc., it may be assumed that some 75 per cent. of our castings output is ultimately exported.

Birmetals have maintained through the past year a direct export ratio of 20 per cent. approximately of their total output. I still feel that our people have not been told convincingly enough of the present and increasing danger of an economic disaster which would bring distress and suffering on everyone. We cannot be saved by Acts of Parliament. We can save ourselves by national unity and tolerance, by hard work and, where needed, by a longer working week.

All whose words and actions tend to division and animosity, or to the belief that we can have anything for nothing, render a great disservice to the nation.

The report and accounts were adopted.

KOLOK MANUFACTURING COMPANY, LIMITED

MR E. S. DUMONT'S REVIEW

The forty-first annual general meeting of the Kolok Manufacturing Company, Limited, was held on December 16th at the company's offices at Tottenham, Mr E. S. Dumont (chairman and managing director) presiding.

The chairman, in the course of his speech, said: The net profit of the company amounts to £75,812, as compared with £84,012 for the preceding year, and although reduced by £8,200 is the second best figure of profit in the history of the company. The turnover was slightly in excess of last year's record figure, but the upward trend of costs continued, and it was not possible fully to recover these in our selling prices.

The cost of certain raw materials has again advanced as a result of the devaluation of sterling, and import restrictions in overseas markets are, if anything, worse than they were last year. South Africa, for example, is practically closed to us at present, but we are hopeful that the effect of devaluation in this case will be to improve conditions there and will enable some importations to be permitted in the near future.

As against these adverse factors, however, I am glad to say that the volume of business in hand remains satisfactory, and assuming a resumption of trade in some of our export markets and the benefit we may derive from devaluation by additional sales to countries outside the sterling area, the results for the current year should compare favourably with those for the year under review.

During the year negotiations were satisfactorily concluded for the purchase by your company of the whole of the share capital of an old-established carbon paper and inked ribbon manufacturing business for the sum of £26,050. The purchase consideration is wholly represented by realisable assets, no amount has been paid for goodwill, and in the opinion of your directors the business is conservatively valued. The additional manufacturing resources provided will prove to be of considerable assistance, and your directors are confident that the investment will show a proper return in due course.

FINANCIAL POSITION MAINTAINED

The financial strength of the group has been well maintained, as shown in the consolidated balance sheet, in which current assets, less current liabilities, stand at £210,106 as compared with £210,602 for the preceding year. The accounts submitted are generally self-explanatory, but I call attention to the further reserve of £10,000 for superannuation which your directors consider it desirable to make under present circumstances. The pension scheme mentioned in my remarks last year is approaching completion and, if accepted by our employees, should operate from January 1st next. Your directors feel there should be no change in the rates of dividend declared for the preceding year and, therefore, recommend a final dividend of 110 per cent. (less tax) on the Deferred Ordinary shares, making a total of 150 per cent. for the year, and a final dividend of 6½ per cent. (less tax) on the Preferred Ordinary shares, making a total of 30 per cent. for the year. These dividends will absorb £8,801 and leave a balance of £44,978 to carry forward, as compared with £35,774 last year.

Finally, may I, as last year, take the opportunity of expressing my thanks and appreciation to all our executives, staff and employees for their loyal and devoted services rendered during a difficult year, and to the members of the board for their continued co-operation?

The report and accounts were adopted.

WRIGHT SADDLE COMPANY

ANOTHER SUCCESSFUL YEAR

The thirteenth annual general meeting of the Wright Saddle Company, Limited, was held on December 20th, at Birmingham, Mr Arthur Colegate (the chairman) presiding.

After he had dealt in detail with the accounts, the chairman said: I am glad to be able to tell you that we have had another successful year in which the turnover once again exceeded that of the previous year. The increase in turnover would have been very much greater than actually it was had there not been interruptions in the supply of raw material. These interruptions are, of course, very costly and it is partly due to them that the profits show a fall over the previous year. The main cause, however, of that fall was the fact that, since January 1, 1948, in spite of increases in costs in all directions, as a matter of policy we did not pass on any of our increased costs to our customers. I think I may say that this action of ours has been greatly appreciated, but the time has now come when, with further increases in costs in prospect, we no longer feel justified in carrying the whole burden ourselves. We are, therefore, with very great regret, increasing our prices, at any rate to a modest extent. Furthermore, I am glad to tell you that, in consequence of certain steps we took we are now getting very much more regular supplies of raw materials, with the result that our production, although still insufficient to meet all our orders, has risen very considerably and, since the end of the financial year, has week after week passed all previous records in the history of the company. But, of course, an increase of this kind, some 300 per cent. over our average prewar production, brings difficulties and problems of its own. Already, the capacity of our new factory, acquired at Selly Oak in 1946, is fully utilised and we may have to consider the problems of further expansion. We are, moreover, continuing to follow our policy of improving, as far as may be possible, the quality of our products. Nothing less than the best will satisfy us and much costly equipment has been installed during the past year, which should help us to attain this objective.

THE OUTLOOK

So far as the future is concerned, I can add little to what I have already said. No one today can foresee all the complications which arise from Government action. In all parts of the world licences to import are given and withheld at short notice. Regulations are made by different Governments, the effects of which are often very different from what is intended by the authors of these irksome restrictions. I cannot help but believe that, if all Governments would try to give as full play as may be possible to natural economic forces and to the working of the price mechanism, there would be a material decrease in costs and, therefore, a very material increase in the real wealth of the world.

However that may be, I am happy to say that there appears to be no falling-off at all in the demand for our products and you can be quite certain that we shall make every effort to meet the requirements of the market, both in quantity and quality. Provided that we continue to get raw materials, we can look forward to the prosperous year to which our efforts and the very large amount of capital which we have ploughed back into the business entitle us.

The report and accounts were adopted.

LIVERPOOL WAREHOUSING COMPANY, LIMITED

SUCCESSFUL YEAR

CHAIRMAN'S SPEECH

The fifty-fourth annual general meeting of the Liverpool Warehousing Company, Limited, took place in Liverpool, on December 20th. The chairman, Mr W. Milligan, presided and, addressing the meeting, said:—

Although the directors report and statements of accounts present a very clear picture of an active and successful year's work—that work has been throughout entirely normal.

Licensing delays have retarded all efforts to speed up our construction programme, and broadly speaking demand continues to exceed availability of storage space. Recently however further licences have permitted work to proceed on some additional sites.

EARNINGS INCREASED

Trading and investment earnings have increased by £76,712 to £413,593. Taxation is £223,488 plus £26,813 profits tax on the capital increment distributed last June. General reserve it is proposed should receive £75,744 making same £885,000. Building reserve to have £41,289 making £130,000. With balance of preference dividend and a final dividend of 17½ per cent. on ordinary stock, the carry over will be slightly higher (£120,664) than last year.

PROPOSED CAPITALISATION OF RESERVES

If the proposals are approved next year the capital of the company may be shown as more closely in accord with the fixed assets, and the reserves with the investments, by consent to increase the nominal capital to £2,000,000. Application has been made to the Capital Issues Committee for permission to issue new shares. Our request is in abeyance, but when the obstacle is removed you will be called upon to agree to transferring £650,000 from general reserve to capital account and to the issuing of 650,000 new ordinary shares of £1 each to members. These new ordinary shares would be at once converted into stock and each stockholder would receive one 4s. unit for each unit now held. 375,000 unissued ordinary shares would remain to be dealt with as and when future circumstances required.

SANDON MOTORS SUBSIDIARY

Our subsidiary has added £10,000 to our year's revenue—their first dividend since 1941. "Sandon" results provide good grounds for satisfaction, having regard to the adverse factors still being encountered by the home motor and engineering industries.

SPLENDID STAFF WORK

Expeditions and efficient service to meet our appreciative customers' demands has frequently proved able to accomplish the seemingly impossible—making room where none exists.

The efforts of management and staff alone make our customers' many compliments possible, and in your name I thank each and everyone of our employees: from the managing director, Mr Cooper, to the most humble worker, for their whole-hearted efforts.

The report and accounts were adopted and the chairman received a cordial vote of thanks.

AGAR, CROSS AND COMPANY, LIMITED

RECORD SALES AGAIN

MIR V. C. FISHER'S STATEMENT

The forty-third annual general meeting of Agar, Cross and Company, Limited, was held on December 20th at Armourers' Hall, 81, Coleman Street, London, E.C., Mr Valentine C. Fisher, C.A., the chairman, presiding.

The following is his statement circulated with the report and accounts:—

You will have seen from earlier public notices and from the directors' report herewith that Mr Donald Moir resigned the chairmanship of your company on August 8, 1949, but I am glad to say will continue to serve as a director. During his term as chairman your company has grown from strength to strength, and it is now my privilege to report to you on this his last full year of office. I take this opportunity of expressing my appreciation of the trust which my colleagues have placed in me by appointing me as Mr Moir's successor.

The accounts for the year to June 30, 1949, submitted herewith again show the results of record sales.

BALANCE SHEET ITEMS

The balance sheet has been prepared on the same lines as last year, and, when read with the comparative figures, calls for amplification in few instances. In accordance with our usual practice, we have recommended substantial transfers to revenue reserves, and the balances for "Contingencies" and "Additional bad debts" have been increased to £311,675 and £289,448 respectively.

Except where stated otherwise, the balance sheet has been prepared at the exchange rates of 17.00 Argentine paper pesos per £1 sterling, the approximate official standard rate for imports, and 4.02 American dollars per £1 sterling. The "free" remittance rate at June 30, 1949, was 19.37 pesos to £1, and the provision for exchange loss on Argentine current assets has been increased by £145,864 to £442,733 to give effect to the further exchange loss arising through the year's operations.

The outstanding features of the balance sheet are the large increases in the balances of "Sundry creditors," "Provision for U.K. taxation" and "Cash at bankers." These increases are caused through the restrictions on the remittances of profits and financial services to the United Kingdom, also the continuance of the stoppage placed by the Argentine authorities in May, 1948, on dollar transfers to the U.S.A. covering merchandise received, or to be received under dollar prior import permits already granted. In other words, these balances would be much smaller had we been permitted to transfer funds freely.

PROFIT AND LOSS ACCOUNT

In spite of the general increase in costs, also the restrictions on imports, the record turnover has resulted in a record trading profit of £1,666,170. This in its turn has meant an increase in the provision for taxation—both Argentine and U.K.—of £57,399, bringing that figure to £916,294.

Thus after all charges, provisions for taxation and provision for the additional estimated loss on exchange at June 30, 1949, there remains a balance of £576,086, which it is proposed be allocated in accordance with the recommendations contained in the directors' report.

It will be appreciated that the balance sheet submitted herewith is at June 30, 1949, and that effect has been given to the exchange rates ruling at that date. Since then we have had sterling devaluation and a reduction of the Argentine "free" rate from 19.37 to

25.26 pesos to £1. As the company's working capital and reserves are invested in Argentina, this means that a further and very substantial loss on exchange has now been incurred, and your directors have recommended an appropriation of £250,000 out of the profits for the year to June 30, 1949, as a contribution towards this loss.

DOLLAR TRANSFERS

Again I would like to extend to our friends in U.S.A. our appreciation of their understanding of your company's difficulties. Every effort has been made to ensure that your company's indebtedness to them will be liquidated when the Argentine authorities are able to allow dollar transfers.

What the prospects are for the current year it is impossible to tell at this date. While every effort is being made to maintain turnover by the distribution of local manufactures, the continuance of the almost complete ban on importations from U.S.A. and the severe restrictions on importations from other sources are resulting in a contraction of sales. Costs are still rising, and Argentine income tax has been increased from October 1, 1949, by a 20 per cent. surcharge on existing rates. Further, there is the substantial exchange loss to be contended with. Benefits were expected from the Anglo-Argentine Trade Agreement, 1949, but it is now too late in the current year to hope for much assistance from this source even should permits be soon forthcoming. We have left the record-breaking years behind, and we are now beset with new problems which require careful investigation if we are to solve them successfully.

I tender the thanks of the board to the managers and staffs of your company in London, Argentina and New York.

The report and accounts were unanimously adopted.

THE INDUSTRIAL CREDIT COMPANY, LIMITED

The sixteenth ordinary general meeting of this company was held, on December 14th, in Dublin.

The chairman's remarks in moving the adoption of the report and accounts included the following:—

The balance sheet now before you deals with a total of £1,384,045.

During 1949 there has developed a change—possibly only temporary—in conditions in the Dublin capital market as compared with, for example, 1947 and 1948. Whereas in those years some of the issues which we sponsored were oversubscribed to an embarrassing extent, two issues which we handled in the present year were not fully subscribed.

The yield position in the matter of long-dated fixed-interest securities is reflected in prices of industrial equities, but one can look forward to the possibility that even during 1950 conditions in the Dublin capital market may revert to such as obtained before the devaluation crisis.

The gross profit for the year is £109,943. Salaries, wages, directors' fees and office and general expenses are £16,459, showing an increase over the previous year of £4,360. Of this £330 was due to increases under the head of salaries, wages and directors' fees. Taxation absorbs £31,170. Deducting expenses and taxation and adding in the amount brought forward from last year, which is £19,708, the amount available for disposal at the meeting is £82,022. Your directors propose to repeat the dividend of 4 per cent., which, if you agree, will absorb £21,599 (after deduction of tax) and to add £40,000 to investment and other reserves, being the same amount as last year. These allocations would leave undivided profits amounting to £20,423.

The report and accounts were adopted.

Investment Statistics

Company Notes

Lancashire Cotton Corporation.—Profits have attained a new record level with a rise in trading profit of £58,506. Taxation provisions have risen from £823,000 to £1,100,000. Net profit is struck at £1,435,992 against £1,195,186. The ordinary dividend is maintained at 10 per cent.

Park Royal Vehicles.—Subject to final audit, consolidated trading profit for the year ended September 30th is given as £512,349 against £346,113. Taxation requires £306,596 against £201,028. The ordinary dividend again takes £28,500. Carry forward is up from £71,703 to £182,655. The company is now controlled by Associated Commercial Vehicles.

Levy and Franks.—The ordinary dividend for the year ended September 29th is cut to 200 per cent against 225 per cent paid in the previous twelve months.

Amalgamated Cotton Mills Trust.—The full accounts for the year to August 29th show a rise in combined profits to £1,188,037 compared with an (adjusted) profits figure of £940,918. Net profit has risen from £297,757 to £414,709. The ordinary dividend of 25 per cent tax free is repeated.

Fresnillo.—Consolidated gross revenue from metals and ores less operating and general expenses, in the year ended June 30th was \$4,191,248 compared with \$3,272,336. Net profit rose from \$2,037,007 to \$2,588,480. Dividend distribution is raised from \$1.31 per share to \$1.41.

Associated Engineering Holdings.—The preliminary figures for the year to September 30th show a decline in consolidated profits from £744,653 to £674,731. Net profit is up from £208,133 to £241,261. Normal depreciation takes £141,723 against £125,819, while additional depreciation is down from £79,910 to £7,000. Taxation requires £284,747 (£330,791). General reserve of subsidiaries, £100,000 (nil). Carry forward £93,540 (£93,821). The ordinary dividend is maintained at 15 per cent.

British Benzol and Coal Distillation.—Trading profit for the year ended October 31st has declined from £125,851 to £116,630. After deducting depreciation, taxation, directors' fees, auditors, net profit is £50,477 (£60,789). Ordinary dividend, 17½ per cent (same).

Apex (Trinidad) Oilfields.—The preliminary statement discloses a rise in profits, after taxation taking £710,000 (£530,000), provisions for development and contingencies, from £330,299 to £469,113. The higher profit includes £133,456 (after tax) earned from sales made in 1947-48. General reserve is allocated £300,000 (£130,000). The ordinary dividend of 30 per cent (tax free) is repeated.

Yorkshire Copper Works.—Total profit for the year ended July 31st has declined from £911,636 to £771,719. The ordinary dividend is 10 per cent on the trebled ordinary capital compared with 20 per cent paid in the previous year.

Capital Issues

Tilley Lamps.—Application has been made for permission to deal on the London Stock Exchange in the issued preference capital of £150,000 in 6 per cent cumulative redeemable £1 preference shares. The ordinary capital consists of £14,317 in 1s. ordinary shares.

Newcastle and Gateshead Water Company.—Tenders are invited for £500,000 4 per cent redeemable preference stock, 1969. Minimum price is £100 per £100 stock.

Textorial Holdings.—Application has been made for permission to deal on the Manchester Stock Exchange in the issued capital of £175,000 in £75,000 5½ per cent cumulative redeemable £1 preference shares and £100,000 in 5s. ordinary shares. Combined profits subject to directors' remuneration and income tax for years ending in March: 1939, £5,986; 1948, £92,864; 1949, £211,043.

Dividend Announcements

Rates are actual, unless stated per annum or shown in cash per share. Rates for previous year refer to total dividend, unless marked with asterisk to indicate interim dividend.

Statistical Summary

EXCHEQUER RETURNS

For the week ended December 17, 1949, total ordinary revenue was £68,217,000, against ordinary expenditure of £101,202,000 and issues of sinking funds nil. Thus, including sinking fund allocations of £12,087,000 the deficit incurred since April 1st is £76,665,000 compared with a surplus of £235,167,000 for the corresponding period a year ago.

HIS MAJESTY'S COLONIAL SERVICE—NIGERIA

A vacancy exists for a Senior Marketing Officer in the Department of Exports and Marketing, Nigeria, to carry out functions in connection with the controlled marketing evacuation and shipment of produce from Nigeria. The appointment is permanent and pensionable on a scale £1,060-£1,200 (including expatriation pay). Candidates must be under 45 and should have some knowledge of the produce trade and a sound general education, preferably with a university degree.
Further particulars and forms of applications are obtainable from the Director of Recruitment, Colonial Office, Sanctuary Buildings, Great Smith Street, London, S.W.1, to whom inquiries should be made in writing.

OXFORD UNIVERSITY Tutorial Classes Committee, in co-operation with the North Staffs Committee for Adult Education (including representatives of the Stoke-on-Trent, Staffordshire and Burton-on-Trent Education Authorities and the North Staffs District of the W.E.A.) invite applications for the post of Warden of the Wedgwood Memorial College, near Stoke-on-Trent. Candidates should have had wide experience of adult education and must have a good Honours degree in one or more of the following subjects: Economics, Politics, History, Philosophy, Literature. Salary, £900 per annum, with free accommodation. Superannuation under F.S.S.U. Particulars and application form from the Organising Secretary, Oxford University Tutorial Classes Committee, Rewley House, Wellington Square, Oxford. Closing date, January 23, 1950.

THE AUSTRALIAN NATIONAL UNIVERSITY

CANBERRA, A.C.T.

RESEARCH SCHOOL OF SOCIAL SCIENCES

The Interim Council, having decided to establish Readerships in Economics, Statistics and Political Science, invites applications from scholars qualified to carry out research in those fields and who would be available for appointment as Reader.

The salary for Readers is £1,250-£1,940 per annum. The University will make provision for superannuation under a scheme similar to the F.S.S.U. Readers will be entitled to one year's leave in each period of six years, together with an allowance for travel. A statement of conditions of appointment and general information may be obtained from the Administrative Officer in the Department of Economics, Australian National University (London Office), 6, Bedford Square, London, W.C.1, with whom two copies of applications should be lodged before January 13, 1950.

Applicants are asked to state date and place of birth, status, and war service (if any), and to give particulars of academic record, publications (together with single copies of papers where available), and appointments held. Three persons should be named to whom reference may be made.

STATISTICAL SUMMARY - - - 1496

Farewell to the Forties

IT is astonishing how many people have fallen into the elementary chronological trap of supposing that the first half of the twentieth century comes to an end at midnight on Saturday. In America, the heresy seems to be almost universal. But in that competitive society something must doubtless be allowed for the dread of being left behind; it is surprising only that the really enterprising did not begin celebrating the half-century twelve months ago. Here in Britain we shall be able, next December, to console ourselves for being a year behind others by the knowledge that we are not a minute ahead of the calendar.

What does, however, beyond any question, come to an end this week is the decade of the forties, and certainly no one will be sorry to see them go. The forties began in that strange winter of the phoney war, when war was still exciting and almost romantic, when no one (except the Poles and the Finns) had yet been hurt or suffered anything more serious than the blackout and the evacuation, when Chamberlain could still think that Hitler had missed the bus and the British public was busy rolling out the barrel and hanging out its washing on the Siegfried Line.

It was well for that very merry Christmas that it did not know the hell where youth and laughter were to go before 1940 was half-way run. An article in *The Economist* of January 6, 1940, could find it possible to hope that the forties would be an improvement on the thirties, for which it could hardly find a good word.

It was more than a year of disaster that died on Sunday night; it was a whole decade of frustration. . . . The ten years enclose a tragedy of classical form and completeness. . . . The thirties have ended in disaster; we can only now, among the ruins of our hopes, attempt to draw the lessons. . . . Sometime in the forties, if we are lucky, we shall have a chance to apply these lessons.

Have we been lucky? At least we can say, with Siéyès, *J'ai vécu*, and considering what the forties have turned out to be, anyone who is still alive, fed, clothed, active, free and sane has plenty to be thankful for. The ten years have not, of course, been all of a kind. There is, to begin with, the distinction between war and peace. And each half likewise divides itself into two: 1940, 1941 and 1942 were years of grim hanging on; 1943, 1944 and 1945 were years of victory. In the non-fighting years, there is the reverse distinction between the period when hopes of peace and prosperity were still high and the period—set by the quarrel with Russia over the Marshall Plan in July, 1947, in the one case, and by the fuel crisis in February, 1947, in the other—when hopes of building something better had to be modified into a mere determination to hang on to what there was.

But, take it for all in all, it has been a beastly decade. We barely yet comprehend the horrors that it has seen. It has been dominated by war—from beginning to end, for the shadow is with us yet. It has brought back into ordinary men's lives a general fear of the future such as has not been known for many centuries. In slaughter, in

destruction, in unreasoning cruelty, this last decade would be hard to equal and impossible to exceed. If the 1840s were the Hungry Forties the 1940s deserve to be the Bloody Forties.

★

And yet what really matters is not what the forties have seen and done, but where they have arrived. Where do we stand today? Looking not back but forward, what can we hope for? The only thing that is reasonably certain is that the fifties will be different—different from the forties and different from what we expect them to be. Nobody can tell what the normality of the fifties will be. It may be that there is a sharp change of weather ahead such as ushered in the twenties and the thirties and the forties. It might even be reasonable to expect such a change, since we are still so obviously in a period of postwar transition, of which the wonder is only that it has already lasted so long.

But whatever the new conditions will be, it is they, and not our present state, that will put the stamp on the next era. There is some historical evidence for the view that the centuries always begin in the middle—that there is a periodicity of about a hundred years in human affairs, but that the milestones are to be found in the forties and fifties of the calendar centuries, not at their numerical beginnings. The pattern can be traced: a new order of ideas then firmly establishes itself; within a few decades it begins to breed its own corruptions and contradictions; the established ideas are challenged; the conflicts mount up to a great clash of arms and ideas, out of which a new century is born. So it was (to go no further back) with the Renaissance in the middle of the fifteenth century, which produced the great challenge of the Reformation and the blood-letting of the religious wars, from which, in the middle of the sixteenth century, the absolutist national kingdom

Interim Victory in Greece

NO people in Europe deserve greater sympathy and understanding than the Greeks at the present time. It is five long years since the first Communist attempt to seize power in Greece was frustrated by British troops, since Mr Churchill and Mr Eden conferred in Athens on Christmas Eve with government leaders and initiated that policy of assistance in the cold war which was carried on first by Mr Bevin and then by Mr Truman. Now the Greeks stand at that most difficult point in any struggle, when the immediate task of fighting seems to be over and a long slow road of painful reconstruction still lies ahead. The military victory over the Communist-led rebels achieved at the end of last summer has thrown back, for the moment at least, the threat to Greece's existence as part of the political community of free Europe. But otherwise it has done little more than clear the way for the country to begin where the rest of war-weary Europe began four years ago. It is to the task of catching up on this road to recovery that the whole Greek nation must now apply itself.

The temptation is of course to relax and lean back on allies. The Greeks feel that they have been in the front line of a war in which we are all engaged; and to a considerable degree they are right. Their bloody struggle

emerged. That too was challenged and plunged into civil wars in most of western Europe, from which, in the 1650s or 1660s, new established orders emerged. The revolution of the 1750s was economic and technical as well as philosophical; the potion it brewed led very quickly to the gigantic explosion of the seething decades from the 1790s to the 1830s. The liberal era was settling down to its long reign just a hundred years ago; and we know in our persons all the consequences of the challenges and counter-challenges in which it met its end.

This may be no more than a pretty historical conceit, unworthy even to be regarded as a theory. But the fact remains that the second half of each of the last five centuries (one might almost say the third quarter) has been more settled and more serene—without being reactionary or unprogressive—than the earlier decades. And if settlement and serenity seem very far removed at the moment, it is also a comforting reflection that each of the recent decades has turned out to be very different indeed from what the watchers at its birth expected.

What the fifties need, as the forties did, is a clear sight of the goal and a confident determination to achieve it. They need Assurance of Victory, to quote the title of an official pamphlet of just ten years ago—which proved in the end to be right, and for the right basic reasons too. Now, as then, the human and material resources exist in plenty. The free society has no reason to despair; it has immense reserves and commands deep and fierce loyalties. Now, as then, what is needed to fuse these resources into weapons of achievement is the moral magic of leadership, offering courage and calling for devotion and confidence. Now, as then, it is true—not as a New Year apostrophe but as a sober statement of fact—that free societies (and they alone) can accomplish anything to which they really set their mind and hand. Now, as then, among all the perils there is nothing to fear as much as fear itself.

has been the prototype of just the sort of unofficial, localised *maquis* campaigning that might take place anywhere across the face of Europe—and probably Asia too—if the present cold war warmed up. It has been neither an old-fashioned civil conflict nor a regular international campaign in the normal meaning of the terms. With foreign powers lending active support on both sides for political reasons, the struggle these last three years has none the less been waged between individuals, between families and between different areas of the same country, often with no well-defined front. Yet the Greeks can claim with justification that their unhappy land has been used as a testing-ground of methods and forces for a far wider struggle—rather as Spain was used before Hitler's war.

For all these reasons, they deserve not only sympathy but a continuation of the positive and active aid which they have already been receiving, first from the British and, since the declaration of the Truman doctrine in 1947, from the Americans. If that aid had not been given, Greece would certainly now lie behind the Iron Curtain, Russian naval and land forces would be on the Mediterranean, and the West would have received a setback at least as serious as would have been the failure of the Berlin air-lift. And if it were suddenly to cease,

there would be little chance of turning the present military victory in Greece into economic and political recovery.

But, that having been said, the fact remains that the Greek situation can only be put right by the Greeks themselves. It is for this reason that the most remarkable and gratifying feature of the present scene is the degree to which all sections of Greek public opinion have lately come to see the Communist rebellion for what it is—a cynical attempt to destroy the Greek state. There has been mounting popular revulsion against Communist aims and methods. Indeed, the country is now probably more united than it has been for several years, and in a better position to carry that purpose into effect. It is more than ever up to the political leaders in Athens to make good use of this hard-won breathing space and the current mood.

★

It is all too easy—and immensely irritating to the people of Greece—for the west to sit back at a distance and say what ought to be done. Few people have received more academic and presumptuous foreign advice than they have since the war. But the American and British advisers, now so very close to the government in Athens, have the opportunity and the duty to put frankly and simply their analysis of the facts and their suggestions for action. And the Greek leaders should be prepared to come at least half way to meet these friendly advisers.

The problem is tremendous, though it would be wrong to think that no appreciable headway has yet been made in the tasks of physical reconstruction. Nine years of warfare have wrought crippling damage: 1,500 towns and villages have at one time or another been virtually destroyed; nearly all roads, harbours and public service facilities have been more or less seriously damaged. At the worst period only 840 out of 2,679 kilometres of railway track remained usable; bridges, tunnels, viaducts and rolling stock were wrecked on a large scale; 750,000 people, or one person in every ten, have been driven from their homes. Today, thanks very largely to American help, much of the transport has been restored to use; only a week or two ago the railway from Athens to Salonika was reopened. And the refugees have been pouring back into the villages for the last three months, creating new problems as they arrive.

Greece is faced with other burdens at least as serious. There is the huge army to maintain, if not intact, at least somewhere near its present strength of almost 200,000

men; if it were seriously reduced, the guerillas across the borders would certainly try again—they may in any event. There are many armed men in the country not in uniform, members of village home guards, who might yet be tempted to try their hand at politics, the natural occupation of every true Greek. The politically unreliable detainees have to be converted, released or retained in island camps. There are former sympathisers with the rebels to absorb into a new life. And, not least, there is the whole atmosphere of peace and security to be recreated, martial law to be gradually relaxed all over the country—it has just been abolished in Athens and the Peloponnese—and the traditional economic activities of the country to be restored.

★

Even this is not all. Many years of stress and uncertainty have raised special psychological obstacles to recovery and accentuated many of Greece's traditional temperamental difficulties. In spite of the unifying wave of disgust with the Communists, the country is still split into extremes, inspired by the spirit of "he who is not with us is against us." In political terms, just as the Populists came in on a programme of king and anti-Communism in 1946, so there is once again a danger that, in the proposed general election next April, moderates will be forced by the nearness of recent events to vote for extremes. Disillusionment is widespread and there is no enthusiasm for any of the political leaders. There is talk in Athens of abstaining from voting in the elections, of a third force to replace the well-worn Populists and Liberals—though no party appears to have a feasible programme—or even of a possible dictatorship under Field-Marshal Papagos, the successful and able war hero who put new heart into this year's victorious campaign. Lastly, there are the permanent Greek characteristics to reckon with: an inherent and rampant individualism, each man's profound belief in his own superiority, and a strong tendency to mistake temporary benefits for permanent achievements.

All these factors combine to present a solid wall of difficulties which have to be overcome before any policy can succeed. The guiding features of policy must be moderation with determination behind it, and a zeal for reform tempered by understanding of what is practicable. Most important at the moment is the fact that military victory has provided the opportunity for a display of moderation by those in power. Yet there can be no question of allowing the Communists and their fellow-

£1,000 ON RETIREMENT . . .

. . . at age sixty-five, or on previous death, may be assured through an endowment policy for an annual outlay of £25 12s. 6d. from age thirty. Only £4 18s. 4d. more secures the right to participate in profits which, if maintained at current rates, would yield a further £607 by way of reversionary bonuses at age sixty-five.

The premiums for other sums assured, ages or terms of years will be quoted on application

OUTSTANDING VALUE IN LIFE ASSURANCE

travellers back into any position from which they could launch another attempt to seize power; the specious plea, put out in the autumn by the rebel radio, for the re-admission of the Communist party into a coalition government must be rejected out of hand. At their strongest the Communists represented the views of no more than a fifth of the Greek electorate, and now they certainly represent much less. Democracy must be given a chance to fire, if necessary, on five cylinders instead of six; but it is better that it should do that than fail to run at all.

It is in the economic sphere that the need for reform is most urgent. The circumstances of the past few years have brought a great levelling down between rich and poor, and truly excessive wealth is now exceptional. Yet there are still too many who evade the law for their own profit, and Greece would be a very different place if the laws could be enforced. Step by step with the development of a simpler, less centralised and more efficient administration, the law should be made to fit the facts; and of these the most important is that public opinion will support the government's writ only if it either

The Co-operatives—III

The Social Aspect

TWO previous articles have suggested that when co-operative societies are judged by the simple test of asking what an ordinary business would do in the same circumstances, they appear to be missing their opportunities in many directions. Co-operators would say, however, that to judge them by ordinary business standards, without regard to their ideals, is completely meaningless. This article therefore deals with their social rather than their business aspect.

"What distinguishes Co-operation from all other movements is that it is at once a strong, calm and wise business, and a strong and fervent and proselytising faith." This was Alfred Marshall, in the year before he published the *Principles*. "It will educate the working classes in the moral strength of united public action for public purposes." Even here, traces of two distinct aims can be seen; first the promotion of the co-operative ideal of voluntary democratic action, and, second, the social education of the poor. It can be fairly said that both aims have been kept equally firmly in view, right up to the present time, and each made to help the other. The best propaganda for co-operative principles has always been to beat profit-making business at its own game, and this is not possible so long as consumers are cowed by the myth that business is a rare skill peculiar to the upper classes.

The sceptical are inclined to doubt the reality of democratic control by consumers in the co-operative movement. They see it as a vast machine dominated by a self-perpetuating small clique, in the interests either of their own jobs or their own self-importance with the mass of members taking no part whatever. Apathy is of course a common failing in any democratic organisation, for which no simple remedy exists, but all the machinery of democratic control is provided within the movement for those who wish to avail themselves of it, and the surprising thing is that so many do so. The people who "run" the co-operative societies provide in themselves ample justification of the movement's claim to provide

respects or fears it. In spite of much abuse that has been hurled at Athens since 1944, the Greek Government is not that of a police state. Its power to instil fear is therefore no greater, and should be no greater, than in any democratic country; but it must earn respect if it is to succeed.

That the Greek people are willing to respect and follow the leadership of those they have cause to believe in, has been demonstrated by the extraordinary regard and affection which have lately been extended to Queen Frederika. The energy and determination of her work for the children and the refugees have set a new standard in modern Greece, which politicians should emulate. For, unless someone does emerge from the April elections with the power and will to build a new Greece, even American aid cannot in the long run save the country from relapsing again into the chaos from which it is now beginning to emerge. Neither political nor economic security can ultimately be guaranteed at all, if Greece does not achieve reasonably soon a position in which it can function without foreign aid.

an outlet for talent, common-sense and public spirit among working men and women. Lack of education may debar a man from political activity. Her occupation may keep a woman out of trade unionism. But many thousands of people with no advantages beyond those of ordinary wit and judgment have found in the local "Co-op" a chance to develop their powers, to direct a business that concerns themselves, and to further the cause of the under-privileged in a practical way. Even if these motives be doubted—even if both idealism and self-help be rejected as incentives—it is still necessary to explain why, over so large a section of the consumer-trades, the profit-earner has been ousted by people willing to perform his function as a voluntary occupation.

In retail societies the rule is "one member, one vote"; managing committees are dissolved and re-elected periodically, and are responsible to the quarterly members' meeting. The typical business at these meetings is not very exciting; reports of the business are followed by trivial customers' complaints interspersed with irrelevant resolutions such as a call upon the Government to seek better relations with Russia (which are invariably passed and promptly forgotten). The degree of proprietary interest and intelligent control by members varies, of course, with the size of the unit. In the sprawling societies of the south, which serve more than one town or borough, the formal machinery is reinforced by members' councils or local committees. The optimum sized business unit is never the same for all lines, and is rarely the best for democratic control by consumers. In many societies active participation by members is only bought at the cost of overriding the expert opinions of employees by amateur interference. The balance between democracy and business efficiency is a delicate one to hold at all levels and in all societies, but it would be a mistake to assume that efficiency always wins the day.

The direction of affairs of national importance lies, in the business sphere, mainly with the wholesale societies.

The CWS board is generally held to have more real control over its permanent officials than its counterparts in retail societies. It is elected by delegates from the societies which are its shareholders, and it is responsible to them. This indirect election by people who themselves hold responsible positions and have had practical experience in the movement removes the chances of the ambitious demagogue being elected by a mass vote, but weighs also against the chances of the innovator, the risk-taker, the man with any strongly independent line. The same procedure also applies to the election of the National Executive of the Co-operative Union, the body which provides a focus for all the independent societies.

Leaders on the national level include men who started as shop-boys or working miners. Civil honours are more plentiful than university degrees; and life long service to the movement is the rule. These are the fruits of genuine self-government. No other modern business of comparable size would deny itself the right to attract leaders of academic training, to recruit men with wide experience in other businesses, or to promote them from above by merit rather than elect them from beneath by vote. The movement's deliberate sacrifice of business efficiency on this count alone is one measure of the extent to which its social purpose predominates.

The non-trading activities of the movement all combine education, entertainment and propaganda for co-operative ideals. Besides *Reynolds News* with a circulation of about three-quarters of a million, the Co-operative Press publishes a host of lesser journals, leaflets, and bulletins which only circulate among the members. Men's and women's guilds exist to stimulate interest and provide social contacts among members. Under the heading of education, grants of over £370,000 a year are made. Although a good deal of this expenditure is spent on propaganda or entertainment, the work actually done in trade-schools, in cultural societies or in the one-year residential courses at the Co-operative College form a substantial supplement to the state-provided primary education. There are critics who feel that too few academic results can be seen for such a large expenditure. On the other hand, although it is hard to measure, there must be a considerable influence exerted upon the many people who grow up "in the movement" by the constant reiteration of ideas of self-help, voluntary action, and democratic participation.

An even more important aspect of co-operative education is that it must often give point and definition to political ideas which would otherwise remain vaguely in the background. Co-operation embodies an essentially liberal philosophy—the presumption that all voluntary combinations of individuals for their own ends are in the social interest, until they are proved the reverse. It is men, not theories, however, who make a movement, and the majority of the more active members have been Labour supporters for a long time. Co-operative propaganda and education therefore have inevitably reflected ideas more favourable to the Labour than the Liberal Party. Even the movement's official attitude to politics is probably less important, in total effect, than this tacit understanding, among the movement's active element, about where working-class interests lie.

The Co-operative Party is not a party in the ordinary sense of representing individual voters. Its membership consisted in 1948 of 671 "affiliated" societies, which,

since they included all the bigger ones, represented 87 per cent of the Co-op's total membership, and whose affiliation fees were £18,000. It performs two distinct functions. Locally, societies form party branches, "affiliate" with local Labour parties, occasionally finance their own candidates when these are adopted by the local Labour Party, and generally promote the Labour interest in the constituencies with, so to speak, a co-operative postscript to their remarks. Nationally, the Co-operative Party has a voice in Labour Party policy and uses it on all matters affecting co-operative interests. How powerful it is can only be guessed from the results. The movement has always declared its support for nationalisation of all natural monopolies, like transport, gas and electricity, and certain heavy industries like iron and steel, shipbuilding and chemicals, where consumer-control was not a workable possibility. For all trades where consumer choice was desirable and consumer control practicable, however, co-operation has been their obvious answer. They define economic democracy as the maximum possible degree of participation by all concerned in economic decisions. Nationalisation, even where it is accepted, is by ideal standards a second-best, since it tends to create a nation of mere spectators of the economic game. Hitherto this doctrine has marched in step with Labour Party policy in all essentials, but Labour's attitude to the distributive trades has never been defined. Mr Attlee's book *The Labour Party in Perspective* suggests that the boundaries of national, municipal and co-operative trading are "not a matter of principle, but one of convenience." But beyond that the rest is silence.

★

Other parties, sounding the alarm of "universal nationalisation ahead" have besought the movement to flee from the wrath to come by joining them. This line of propaganda supposes three things. It assumes first of all that retail distribution will become a major political issue in the near future, which is by no means certain. Secondly, it asks the mass of members to reverse their views on general political issues as if these were unimportant compared with co-operative ideals, whereas the backbone of both Labour Party and Co-operative Movement consists by and large of the self same people who pursue the general idea of working-class emancipation by both methods at once, and are not likely to abandon either of them in a hurry. In the third place, it neglects the possibility of the Labour Party itself being influenced from within by co-operative ideas. The recent change of party policy from nationalisation to consumer control in the case of industrial assurance can no doubt be attributed to several causes, only one of which was the desire to please the co-operative movement; nevertheless, if the Labour Party can adopt "co-operation" in such an unsuitable field, there is no reason why it should not gradually adopt it elsewhere. The Co-operative Party sees its political mission in terms of leavening the socialist lump; of reserving a useful and effective role for the private individual in a socialised economy, and of converting non-Socialists, bit by bit, by the force of practical example. "In the long run Labour's own success depends not on what it does for the people, but on what it enables and encourages them to do for themselves." Even the men of Rochdale could hardly have improved on this as a restatement of their aims in the terminology of a more politically minded age. It is socialism with a difference, but it is still socialism.

Reserves for the Kremlin?

THE successes of Communism since the closing stages of the war have been won by the might of the Soviet army and by the collapse of the German and Japanese military-administrative machines. The Yugoslav, Albanian and Chinese Communists built the foundations of their government in the territories wrested from the invaders by guerilla war; but even they received substantial help from the Soviet troops which liberated Belgrade and Manchuria. In the rest of eastern Europe and in northern Korea, Communists have been placed in power by various forms of Soviet intervention. Both types of revolution, the genuine and the prefabricated, were made possible only by war. Hitler, in fact, has been to an even greater extent the midwife to the new birth of Bolshevism than was Ludendorff to the first.

Yet it would be a dangerous mistake to attribute Communist successes solely to this immediate cause. The roots of Communism go much deeper; they are part of a great historical process still imperfectly understood. For lack of a better phrase it must be described as the impact of the west on the rest of the world. For many generations, but especially in the last fifty years, western economic and cultural influences have spread from their base in north-west Europe and north America, forcing themselves upon more backward countries and peoples. These have been caught up in the world-wide movement of commodities and ideas. The pace of modernisation, both material and intellectual, has been rapid but uneven. In eastern and southern Europe, Asia, Africa and South America the process can be observed today at varying degrees of incompleteness. In different parts of the world, the twentieth century exists side by side with the eighteenth, sixteenth, thirteenth or even with the prehistoric age. The distortions arising from this process have created explosive forces, which are at the bottom of most revolutionary movements of today.

★

The principal economic distortion is to be seen in rural overpopulation, a direct result of the public security, improved communications and medical services brought from the west, which have interfered with the traditional—and natural—regulating factors of massacre, famine and disease. First in imperial Russia and Austria-Hungary, then throughout Asia, and today in Africa, the agricultural population has begun to outstrip the rise in agricultural output and the creation of jobs in industry, greatly though these latter have also increased. As Asiatic and African medical services—still very scanty—improve, pressure of mouths on food supplies will further increase. The gloomy words spoken at meetings of the UN Food and Agriculture Organisation on the prospects of such countries as Egypt, India and Java are based on a formidable array of facts.

If the economic distortion of overpopulation is one of the most alarming of the effects of the west's impact to be expected in the future, it is the political and cultural distortions which most quickly produce trouble. They result from the emergence among the backward peoples of a westernised intelligentsia. The outlook and life of the Bucharest or Beirut lawyer have long been nearer to

those of a French lawyer than to those of a Rumanian or Lebanese peasant. Some of the new intellectuals gladly accepted the role of agents of the west in their own countries: their activities would bring them a pleasant life in the short term, and might bring their nations advantage in the long term. Others, however, were appalled by the contrast between the progressive social and political ideas which they had learned in western universities and the squalid oppression in which their peoples lived. They became national and social revolutionaries.

★

This class first played an important part in the Russian and Austro-Hungarian empires. Its activities were one of the underlying causes of the clash between the half-conscious, half-blind imperialisms of those two powers which precipitated the First World War. It made its appearance in the Middle East, China and India, and is now appearing in tropical Africa. Everyone has heard of the frustrated revolutionary intelligentsia of Imperial Russia; but there is nothing specifically Russian about the phenomenon. On the contrary, the revolutionary intelligentsia is the typical leading class of all societies in which education and political ideas have advanced more rapidly than economic development—typical, that is, of all nations outside western Europe and north America, typical of four-fifths of the human race. The political ideologies of these revolutionary intellectuals were sometimes advanced, sometimes reactionary. Some were directed against the west as such, some only against western capitalists—examples of the first are the Slavophile movement in Russia, the Rumanian Iron Guard, and some forms of Egyptian and Japanese nationalism. The most striking example of the second is Russian Bolshevism, from which has grown the world Communist movement of today.

It is wrong, therefore, to think of Communism as solely, or even mainly, a movement of industrial workers. It is of course to the workers that the Communists appeal in the west; but their chances of achieving power are poor, even in France and Italy, where the majority of organised workers follow their lead. Of the two methods by which Communists have hitherto attained power, infiltration of the state machine has proved impossible in both these western countries, while destruction of the state from outside can be achieved only by war. In Asia, however, where the state machines are weaker than they have been for more than a hundred years, and where social and cultural conditions have something in common with those of the old Russia, the prospects are better.

The importance to the Kremlin of these backward countries can be explained by a phrase often used in Stalin's speeches and writings. The Russian civil war—which, in the Bolshevik view, was a struggle between the bourgeoisie and the proletariat—was won by Lenin because, by securing peasant support, he converted the peasantry from a "reserve of the bourgeoisie"—to be used against the workers to defend bourgeois interests—into a "reserve of the proletariat" which would swell the ranks of the army which smashed the bourgeoisie. Similarly, on the international plane, the victory of world

Communism can be secured only when the peoples of Asia and Africa can be converted from a "reserve of the imperialists" (that is, colonial armies to be used against the "land of socialism") into a "reserve of the democratic (i.e. Soviet) front" (that is, "national liberation movements" to undermine and then storm the citadel of "capitalism").

Here, as so often, Stalin's turgid phrases express a real and immensely important issue. The outcome of the struggle between the Soviet Union and the west for the leadership of Asia and Africa will decide whether Soviet Communism can consolidate its gains and become an irresistible force. If Moscow wins the leadership, the west is sooner or later doomed. If the west wins it, Moscow will be unable to keep control of eastern Europe and China, whose cannon and factory-fodder are essential to its world-wide plans.

The struggle is thus a matter of life and death, in which military strength, economic effort and political warfare will be equally indispensable. What is more, an attack must be made on the economic and cultural distortions which give Communism its opportunities in the new independent states and backward areas of the world.

★

The British and French empires face today many of the problems which beset the rulers of Austria-Hungary and Imperial Russia. Impoverished peasants, revolutionary intellectuals and nationalist movements abound, in various stages of progress towards power. The experts in London and Paris, in Algiers and Singapore, like their predecessors in Vienna and St. Petersburg, in Sarajevo, Warsaw and Tiflis, argue whether this nation is yet fit to govern itself, or that nationalist movement can be disarmed by economic reforms. Yet the melancholy fate of the two earlier empires shows that political and economic reform cannot be separated. The best economic reforms fail if handed out with the contemptuous benevolence of an alien bureaucracy: the most admirable written constitutions are useless if no attack is made on poverty.

The lessons of Tsarist and Austrian experience are relevant today in Asia and Africa. The former Indian civil servant's distrust of the Calcutta "Babu" may have had some justification. But even if the British government had not recognised the justice of India's claim for independence, Britain could not have found the funds or the manpower to run a modern state in India. And the "Babus" of the Congress party had won the support of the Indian masses, which the British administrators, for all their virtues, had lost. The Slovak and Transylvanian politicians of 1913 were coarse and crude in comparison with the elegant Magyar aristocrats who would not share power with them: but when Great Hungary burst asunder they had their brief inglorious term of power. The head waiter at the Café Central in Vienna might well laugh at Mr Bronstein, holding forth daily over his *Kaffee mit Schlag* on how to overthrow the Tsar: yet People's Commissar Trotsky laughed at least a little longer than Nicholas II. If the methods of Dr Malan recall those of the Tsars, the gentlemen of Whitehall are sometimes not unlike the well-meaning and irresolute advisers of Franz Josef.

Yet if complacency is pernicious, defeatism is deadly.

And there is no need to despair. Western Europe and north America possess far greater material resources than had Imperial Russia or Austria. They also possess the immense advantages of a great administrative tradition and a free public opinion. Even in South Africa progressive forces are powerful. On the other hand the Soviet world is far less strong, far less "monolithic," than its champions claim. The threefold struggle—economic, political and cultural—can be won by the west. It is true that in none of these three fields can Utopias be achieved, but enough can be done to frustrate and defeat the Communist bid for world supremacy.

South Asia and Africa will not fall under the Soviet yoke, and the victories of Communism in both China and eastern Europe will prove short-lived, if the west can win the friendship of the independent Asiatic peoples, and can convince the dependent Africans that real efforts are being made for their welfare and progress. It is being increasingly understood that economic success requires an effort from both western Europe and America, through the United Nations and outside it, even at the cost of postponing the improvement of the standard of living of some western nations, including our own. It is realised too that political success requires above all tact and human understanding in the official and unofficial contacts of westerners with Asiatics and Africans.

★

What is less generally recognised is the fact that the cultural task is perhaps the most difficult of the three. In the colonies measures to check the growth of frustration among the intelligentsia, and to mitigate the grievances of those who already belong to this unfortunate category, require concerted action by educational, economic and political administrators. In cultural relations with the independent nations of Asia, not only must the western world be presented in a more sincere manner, but the truth about the Soviet world must be explained in intelligible terms. And before much progress can be made in this direction, there must be more co-ordination of knowledge and planning in London, Paris, Washington and other western centres. The isolation, each in their own sealed compartments, of the economic and political specialists, and of the experts on Europe, Asia and Africa, is not only absurd but dangerous. These men can and must help each other with their different types of experience, all of which are related to the central problem of defence against Soviet imperialism. And in Britain at least, the study of Communism, its historical, theoretical and practical aspects, should be given a high priority in the seats of learning and the seats of government.

NOTES OF THE WEEK

Questions for Colombo

The instinct and sense of duty that drive Mr Bevin, though ailing, to travel all the way to Ceylon to meet his colleagues of the Commonwealth do him the greatest credit. He is needed in Colombo not only as the one statesman who can see Commonwealth and European problems as a whole, but also as a personality whose magisterial and veteran presence may relax, if it cannot remove, some of the tensions which are pulling at the lightly woven unity of the older and younger partners in the Commonwealth. The friendly observer will see much to admire in the fact that governments which are deeply divided on some issues can meet to conjure up that spirit of arbitration and conciliation which has presided at the six Commonwealth conferences held since the war; the hostile observer will see a group of ministers who are confronted in Asia with vast and unpredictable prospects of political and economic struggle but are unable to settle among themselves such relatively limited problems as the future of the sterling balances and the cold war that goes on between India and Pakistan.

The ten-day meeting that begins on January 9th is not part of a regular pattern of conferences, although there are signs that such a pattern is beginning to form, and that the years ahead may see something like a Commonwealth secretariat emerging. It will not settle such matters as the date and manner of recognising the Communist government in China, or the common attitude to be taken to the proposals heard in Washington and elsewhere for reducing or shifting the burden of the sterling balances from the shoulders of the British economy. What may be settled—because everybody wants it settled—is the procedure to be followed in ending the state of war with Japan, for Commonwealth governments reject the Soviet proposal that a peace treaty should be drafted by the Council of Foreign Ministers in which their views would be represented by Mr Bevin alone.

What may also be agreed is a common view of the threat to Asia of Communist campaigns directed from Moscow and Peking. This could then be dovetailed with the reports presented in Bangkok later in the month by American diplomatic representatives to Mr Jessup, the American Ambassador at large, when he has completed his tour of inspection of missions in Asia. Mr Bevin may not find it easy to convince some of his colleagues of the need to co-ordinate quickly a Commonwealth policy towards Communism—if such a thing is possible—with the economic programmes that Washington may have in mind. On the other hand, he should not find it difficult to convince them that his policy of “integration” in western Europe—even in its military aspects—does not in its present phase jeopardise any vital Commonwealth interest.

It will be a pity if the Colombo meeting brings no fresh approach—however informal—to the task of restoring stability in Burma, and to the problem of sharing equitably the cost and responsibility of defence in the Indian Ocean and the eastern approaches to India. And it will be little short of a tragedy if the governments of India and Pakistan go on exchanging punch for punch in economic warfare while Mr Nehru is solemnly discussing world problems at the same table as Sir Mohammed Zafrullah Khan.

Indonesia Independent

On Tuesday, three hundred and forty seven years of Dutch rule in the East Indies came to an end and the new Republic of the United States of Indonesia was officially

born, linked to the Netherlands only by union under the Dutch crown. For the second time in a few months, Mr Mohammad Hatta, the genial, clear-headed Prime Minister of the new state, flew half across the world to Amsterdam—this time to attend the historic ceremony at which Queen Juliana of the Netherlands transferred sovereignty. His previous flight had been to take part last August in the ten-week conference at The Hague, at which the terms of this settlement were finally agreed. Another ceremony also took place on Tuesday in what was until then Batavia and is now called Djakarta; after the Dutch tricolour had been lowered, the red and white flag of the new Indonesia was run up to the tunes of the two national anthems. Nearby, Mr Lovink, the last Dutch High Commissioner, signed a protocol of independence before boarding a plane for Europe. Henceforth another 75 million people in Asia are on their own, their Government already recognised as independent by Britain, the United States, India, Pakistan, Australia, Canada, South Africa and the Philippines.

These events rank in importance with two others that have taken place in Asia since the Japanese surrender: the transfer of power in India and the recent setting up of the Chinese Communist regime in Peking. Unlike these changes, the independence of Indonesia is partly the work of the United Nations. There may, indeed, be a tendency at Lake Success to express too much self-satisfaction about the way things were handled; but the very existence of Uno and the facilities it offered to the Indonesians for presenting their case before world opinion undoubtedly gave them the courage to go through with their plan of resistance to the Dutch. During the last few months, however, credit for detailed work on the present agreement has belonged particularly to the Dutch Premier and Foreign Minister, Dr Drees and Dr Stikker, together with Dr van Royen of the Dutch Foreign Office, to Mr Merle Cochran, the American leader of the United Nations Commission for Indonesia and, as much as anyone, to Mr Hatta himself. The United States, whose public opinion and diplomacy pressed so strongly for settlement, will now find both parties looking to it for aid in overcoming the economic and political difficulties they must meet.

Jugoslav Trade Pact

It has taken ten months to negotiate the five-year trade agreement between Britain and Yugoslavia, signed in Belgrade on Boxing Day. The essence of the pact—which is discussed in more detail on page 1490, is that in the next five years, trade between the two countries will amount to over £100 million each way, and Britain is to provide the Yugoslavs with an £8,000,000 long-term credit. The length of the negotiations has been due to a number of points—for instance, the scale of compensation and the precise size of the long-term credit. But the chief obstacle arose over the Yugoslavs' request that they should be assisted by short-term credits to import British equipment and machinery for which they had not yet earned enough sterling to pay. At first, the British Government appears to have been unwilling to intervene in negotiations between the Yugoslav Government and individual British firms, but British traders had insufficient confidence in Yugoslavia's economic and political powers of survival to risk credits themselves and it seems that the British Government has after all decided to guarantee British firms against losses incurred by extending credits to Yugoslavia.

This fact is certainly surprising when one considers the apparent disproportion in the strength of the two bargainers. It is true that Britain is glad to buy maize and non-ferrous

metals from other than dollar sources. It is also true that the maintenance of a thorn in Stalin's side could be worth a great deal in terms of political warfare. Nevertheless, the Yugoslav position is weak. Marshal Tito's obstinate decision to continue with his five-year plan of industrialisation at a time when the Soviet blockade has cut him off from almost all commercial intercourse with his neighbours has intensified the hardships which his people have to undergo. Even if he could survive a political struggle with the giants of the Kremlin, the economic feasibility of his ambitious plans are open to doubt. He may conclude that the economic plight of Bulgaria and Rumania is so much worse than that of Yugoslavia that any comparisons would be in his favour. Even so, a steel mill may not necessarily be compensation for the risk of starvation. That, in these circumstances, Marshal Tito should have secured an agreement favourable enough to set his immediate anxieties at rest shows that his obstinacy has paid a dividend once again, and that, in western eyes, Yugoslavia is an important political asset.

TUC's Sense and Nonsense

On the Thursday before Christmas the General Council of the TUC approved a statement of its policy towards wages and the economic situation generally which was released for publication early this week. The statement is intended to serve as the basis for a conference of trade union executives to be held in London on January 12th. It is not in any sense a new document, but rather an amplification of the report of its economic committee adopted in November, which recommended that wage scales should be stabilised and sliding scale arrangements suspended unless the index of retail prices rises or falls by six points. But it is one further recognition of the fact that the TUC, although not necessarily all its member unions, has nailed its colours to the mast of wage stabilisation. It could hardly offer a more convincing token of loyalty to the Labour Government; and the Government, to judge by the recent appeal of that rare visitor to domestic politics, Mr Ernest Bevin, to the representatives of employers' federations, is in its turn doing what it can to back the TUC up.

The report is a sober document which makes no attempt to minimise the continuing gravity of Britain's economic position. It does not flinch from telling trade unionists that the upward spiral of prices and incomes could wreck the advantages of devaluation, and that increased incomes unrelated to increases in output would result in severe deflation and unemployment. But the TUC feels that its self-imposed restraint should be matched by equal sacrifices from the rest of the community. It views with distaste recent increases in salaries, industrial, professional and academic—a view which disregards the fact that the salaried classes were making severe sacrifices at a time when organised labour was making none. It is alarmed at the general level of profits, which it regards as the Government's duty to keep down by swingeing taxation, and it is particularly concerned that devaluation may cause certain export industries to earn very high profits indeed (concerned, that is, that devaluation may have exactly the effect that was intended). But further than that it expresses a general belief that, even after being taxed to the hilt, industry is not using its profits to bring prices down.

The members of the TUC are as honest and patriotic a body of men as any in the country, and, furthermore, they have embarked upon a policy which cannot be popular with their member unions and which may well weaken the cohesion of the trade union movement. All this should be ascribed to them for merit. But it must nevertheless be said that their thinking on the economic situation, and especially on the question of profits, is still shot through with fallacies.

In an era of inflation, of over-full employment and of production at any cost, the profits of industry cannot fail to be high. When production cost as a criterion of economic

efficiency is abandoned, when genuine competition between firms is in abeyance, when everything that is produced, however expensive can find a market somewhere, high profits are the inevitable result. Moreover, high profits and high wages march in step. In any one firm and any one year wages and profits may be competitors for a fixed amount of resources; but over the economy as a whole it is the clear evidence of experience that the two march up and down together since they are both products of the same cause.

The TUC will get nowhere by fulminating against profits, even if it manages to persuade the Government to tax them still further. So long as inflation continues, profits will be high and far too easy to earn. For exactly the same reasons, wage increases, if demanded, are easily conceded, and the TUC has difficulty in holding its member unions in line. If the TUC ever got its way and profits were seriously reduced, it would find itself faced with the task of holding wages up, not down. It is crying for the moon to ask for half of each alternative.

Difficulties for the Miners

It is difficult to judge what reception the TUC's report will meet with at the conference in January. The two large general unions will support it, but it is doubtful if the Confederation of Shipbuilding and Engineering Unions will forgo their claim for an all-round increase of £1 a week. In the meantime the TUC has received great support from the decision of the Executive of the National Union of Mine-workers to support its policy, a decision which was ratified by a special delegate conference on Thursday.

The internal affairs of the NUM appear to have become suddenly complicated by a report (which had not been officially confirmed when *The Economist* went to press) that Mr James Bowman, vice-president of the National Union of Mineworkers, had decided to accept the National Coal Board's offer of the chairmanship of its new Northumberland and Cumberland division. If this is true it will leave both his union and the TUC seriously weakened in leadership. Mr Bowman is one of the ablest and most constructive union leaders and has been a bulwark against Communist influence among the miners. However much the Coal Board may gain, he will certainly be missed from the active field of union affairs at this critical stage.

His departure would leave a vacancy on the General Council of the TUC, for which there will be keen competition. It might normally be expected that Mr Arthur Horner, as the union's secretary, would be nominated by the miners' group to fill the position. But Mr Horner was recently defeated for the miners' nomination for next year's General Council, and as he is a Communist there will be strong pressure to keep him off at a time when the TUC is urging the unions to remove all Communists from official posts.

Mr Horner himself is in a difficult position. He was appointed by the union executive to move the resolution supporting the TUC's wage policy at the miners' delegate conference this week. This means abandoning the NUM's own claim for a revision of the cost of living bonus, to benefit the lower paid workers. Mr Horner's personal views on the TUC policy are well known—they are those of the Communist party. But the Communists are not alone in opposing the wages standstill. As was shown by the narrowness of the vote in favour of the policy at the executive and delegate meetings, many other district leaders are prepared to join forces with the Scottish and South Wales Communist leaders on what is an economic, and not a political, issue. The miners' final decision will not, however, be known until a special ballot vote has been taken of all the branches and lodges before the TUC special conference of union executives takes place.

Mr Attlee Takes to Groundnuts

The most significant thing about the latest statement on the East African groundnut scheme, issued shortly before Christmas, was that it should have come from 10 Downing Street. There could hardly be better evidence of the scheme's having become a first-class political issue than that the Prime Minister should have to concern himself with it. His reluctance to intervene until directly appealed to by the Tanganyika staff of the Overseas Food Corporation in indignation at Mr Strachey's remarks in the House of Commons, has been a potent factor in prolonging the trouble.

The statement itself was mainly remarkable for its omissions. It dealt with Mr Strachey's sudden visit to Tanganyika and mentioned that there had "undoubtedly been some internal friction as a result of the recent events and the discussions of the matter in public." (Here again, incidentally, is the infuriating and wholly improper implication that the public must not discuss what happens to its money.) What, however, was missing from the statement was any reference to Sir Leslie Plummer, chairman of the Overseas Food Corporation. The question of confidence in Sir Leslie Plummer on the part of the East African staff was raised by Mr Strachey during his visit—in fact, it is hard to believe that it was not the chief reason for his making it. Why, therefore, did the Prime Minister's statement contain no reassurance on this question of confidence? When Parliament is reopened for the new session, the Opposition should press for a clear and unqualified statement from Mr. Strachey on this point, especially in view of the misleading statement that he made in the House of Commons in November.

Two things seem to stand out clearly from the maze of statements made during and after Mr. Strachey's visit. First, the Government seems to hold the view that to dismiss Sir Leslie Plummer would be wrong since it would imply acceptance of the principle that a chairman of a public board could be liable to dismissal as a result of agitation in the House of Commons. But this attitude has forced the Government into adopting the equally wrong principle that an appointment to a public board must stand no matter how bad it turns out to be. Secondly, the whole matter is now inextricably caught up in the general election. It would hardly be possible for Sir Leslie Plummer to go without Mr. Strachey's resignation taking place at the same time. But the senior members of the Government are apparently obstinately determined to keep Mr Strachey—which may reflect favourably on their sense of personal loyalty, but certainly not on their sense either of the public interest or of their own electoral advantage. One can only hope, in fact, that amid all this political entanglement someone will be able to keep an eye on the technical, but all-important question of whether groundnuts can be profitably grown in Tanganyika by the Overseas Food Corporation.

* * *

OEEC Marks Time

During their brief discussions in Paris last week the eight-man Ministerial group of OEEC (Organisation for European Economic Co-operation) appear to have covered very little ground. Because the participating nations failed to do their homework, the Ministers had to postpone until January such pressing topics as the trade liberalisation programme, which Mr Hoffman was promised by December 15th, and also the plans for regional economic groupings. This delay is especially unfortunate because the time is fast approaching when both the OEEC and the American authorities must complete their progress reports to Congress, so that it can give early consideration to the third instalment of Marshall Aid. As yet, all the superficial flurry of activity of the last two months has produced few tangible signs of that closer co-operation which Congress would regard as "progress."

It was, however, hoped that the Ministers would on this occasion create the illusion of vitality which has always eluded OEEC in the past. The main proposal before the group was that they strengthen the organisation by appointing as its head a European statesman of the calibre of M. Spaak. At the conclusion of their conference an agreement was announced which calls for regular monthly meetings of the Ministers to be attended also by Mr Harriman, American special representative in Europe for the Economic Co-operation Administration (ECA). This compromise is not likely to satisfy for long those who advocate greater powers for OEEC.

Ever since its inception the Americans and a few scattered Europeans have insisted that the Organisation be strengthened by being given more authority and prestige. It was in response to this agitation that the Ministerial group itself was brought into existence last spring. Consisting of seven high-ranking Ministers and presided over by the Chairman of the OEEC Council, it was supposed to provide forceful leadership and to send dramatic directives to the Organisation.

Experience has shown, however, that a body of this kind is, if anything, more cautious than the international civil servants whom it is supposed to galvanise into action. This particular gathering of Ministers can point to very few of their own achievements which equal in courage the forthright "Interim Report" prepared by the OEEC secretariat itself last December. The truth is that this same problem overhangs all international organisations and it is one that will not be solved simply by installing a man of talent and vision—or even a team of men—to supervise its operations.

* * *

Continued Deflation in Italy?

It is not yet certain whether the devaluation of sterling will sharply reduce the sterling balance of some £70 million at present held in Italy. In theory it should, since the Italians all through the summer blamed high British prices for their inability to buy more British goods. The old rate of sterling also encouraged Italian merchants to do a part of their trading in cheap sterling on the free market. But one of the reasons for Italy's tendency to buy less than it sold may well have been its domestic policy of strict deflation—in which case, the devaluation of sterling may not reduce the Italian balance very speedily. It is, not, however, certain that deflationary policies can be maintained indefinitely. The Left wing of the Christian Democrats are perturbed by the plight of over two million men in continuous unemployment. Moreover, the autumn movement of the peasants to occupy land in Sicily, the south and round Rome appears to be working more immediately and irresistibly against continued deflation.

The disturbances seem to have arisen as a result of the dilatoriness of the official bodies responsible for allocating uncultivated land to peasant families and of the attempts of some landlords to take back land which two years ago they were obliged by the Government to place at the peasants' disposal under a two-year agreement. But whatever the origin of the movement, which for the last two months has caused turmoil in the countryside and led to bloodshed and even death, it is certain that it has now exacerbated the problem of Italy's landless men to a point at which the Government must act or risk the loss of the countryside to the Communists who alone at the moment are directing and supporting the peasants in the field and village.

Every group in Italy—save the Extreme Right and the 8,000 landlords chiefly affected by proposals to divide the larger estates—admits that land reform is necessary. In the spring, the Government itself published proposals—the Segni project—designed to redistribute over 4 million acres to 500,000 families. The difficulty lies in the cost of the undertaking. Clearly, to settle peasants on land without capital, equipment, buildings or even roads will not content

them or increase output. It is estimated that the cost of compensating landlords and undertaking even a minimum programme of agricultural reclamation and development will be in the neighbourhood of 800 or 1,000 billion lire. This is the formidable figure which must, if land reform is seriously undertaken, entail a financial policy incompatible with continued deflation.

Businessmen in China

One of the great uncertainties in the new China is the future of its foreign trade. It was the lure of commerce that originally drove westerners to penetrate the country, and then demand and obtain from nineteenth century Chinese governments special political and economic concessions. Today western business men are fully aware that the conditions then created have gone, almost certainly for ever. They are less clear as yet about what has taken or will take their place. The new regime in Peking is both nationalist and Communist. Does that mean expropriation of foreign factories, and state trading bodies to take the place of all foreign merchants? Or will there at least be an interval before a fully Communist and exclusively Chinese system is instituted?

Up to the present, the Communists have made no coherent move to expropriate foreign holdings. Indeed, they have shown distinct signs of continuing to use foreign business houses—as they must, if they are to benefit from many decades of marketing experience—to conduct overseas trading deals. But conditions for foreign firms are very far indeed from being even rational, let alone acceptable on a long-term basis. The most that can be said is that these businesses have been tolerated as unwelcome, but temporarily necessary, and on an equal footing with Chinese capitalist organisations. In the first days after the Communist arrival in Shanghai, for instance, when many people expected the city and its elaborate metropolitan industries to collapse for want of materials, of support from the authorities and of any reasonable restraint in workers' wage demands, a period of suspended crises was somehow—and surprisingly—resolved without irretrievable breakdown. And now, although workers still come and perch for hours on their managers' desks with impunity, a rough and ready commercial and criminal justice is being established through peoples' courts. It is at least just sufficient to allow economic life to resume.

It is clear that China would lose a great deal if it banned all foreign business on its territory, but it is just as clear that a Communist government would not flinch from making this sacrifice if it seemed desirable for political or ideological motives, such, for instance, as the desire to express resentment at non-recognition. What foreign nations would suffer from such a policy it is difficult to say. Crudely calculated in cash, estimates of British investments in China are in the region of £300 million, while American investments—certainly far smaller—are put at \$100 million. But these can only be the roughest of guides and must depend as much on political circumstances as on the range of business included in the calculation; presumably invested capital would be worth nothing if holders were expropriated tomorrow without compensation. All that can be said is that if the Communists do cut off their nose to spite their face, some western faces will be disfigured also—and nobody would gain from that.

The Jamaican Elections

Mr Bustamante and the Labour party (which is Labour in nothing but name) have, after all, won the Jamaican general election. The popularity which gave him 23 seats out of 32 in the House of Representatives at the last election in 1944 has diminished in the last few years—partly because he, like everybody else, has failed to find a cure for Jamaica's

chronic unemployment and underemployment. He did, however, make one clever move this year. After the British Labour party had announced the nationalisation of sugar as part of its programme for the next British election, Mr Bustamante denounced the proposal. When it became clear, therefore, just before the Jamaican election, that the West Indian sugar producers were not getting all they had asked for in the sugar negotiations with the British Government, he was able to put himself forward as the sugar champion.

Nevertheless, the results of the voting should be salutary for him. He has won only 17 seats this time, and the (Socialist) People's National Party, led by Mr Norman Manley, who is the island's ablest politician, has won 13 seats. For the first time, therefore, under Jamaica's present constitution, which gave it a considerable measure of responsible government, there is something like a Government party and an Opposition party in the lower House. Under this constitution, however, the party that is given a majority at an election is still without responsibility for government, and one of the first tasks of the new House of Representatives will be to discuss proposals for a new constitution. The three main causes for dissatisfaction with the present one are, first, the composition of the Executive Council, which is exactly divided between officials and nominees, and elected members; secondly, the existence of a bicameral legislature; and thirdly, the committee system of the House of Representatives which allows the members of the committees to discuss the affairs of the Government departments but gives them no means of having their proposals carried into effect. Jamaica's new House of Representatives will have the difficult but responsible task of working out a sensible solution to these problems.

Orange of Discord

The resignation last week of the Northern Ireland Minister of Education (*writes our Belfast correspondent*) has caused much disappointment to those who had cherished hopes that the frozen political parties were beginning to thaw at the edges. It is now clear that the Minister's resignation is a victory for the northern extremists who objected to his decision to pay employers' national health insurance contributions for teachers employed in denominational schools. The decision—a wise one in this dual community—was opposed by the younger members of the Unionist Party and by the Orange Order, but was at first supported by his Cabinet colleagues. Now it seems that such powerful pressure has been brought to bear on the Prime Minister and his colleagues that not only has the Minister resigned, but the Prime Minister has decided to review the whole educational system with a view to getting "a more popular system."

We regret

to announce that we can no longer accept orders for the 1950 edition of THE ECONOMIST DIARY. The size of the edition was substantially greater than for 1949, but it was, nevertheless, insufficient to meet the heavy demand from home and overseas.

We suggest

that the best way of ensuring that you are not too late next year is to instruct us to notify you when the 1951 edition is ready. All you need do is to write your name and address on the back of a postcard and send it addressed to: 1951 DIARY, THE ECONOMIST, 22 RYDER ST., LONDON, S.W.1.

About six hundred Roman Catholic schools and three hundred Protestant were affected by the Minister's decision. The Orange bigot tends to forget the three hundred, while the Roman Catholic thinks solely of the six hundred. Thus the baleful bogey of discrimination is likely to be revived.

The issues are not identical with those raised in Great Britain by the Roman Catholic community's attitude to its schools. The Roman Catholic minority in Northern Ireland is sensitive about its position in the state. The case for not only just but generous treatment is strong, and in the political sphere it might pay surprising dividends. Many of the minority here are lukewarm about inclusion in an All-Ireland republic and critical of the educational system of the Irish Republic with its underpaid, discontented teachers and its compulsory Erse. The detachment with which the Catholic minority—the Belfast minority especially—is beginning to view partition causes antipartitionists much concern.

The record of Northern Ireland Government in education is good, and educational facilities in the North are on the whole superior to those in the Republic. But the avowed aim of a completely secular system has given rise to serious misgivings among the Roman Catholic minority and a substantial number of Protestants. The Prime Minister in his search for a more popular system will have a difficult task—first he must persuade someone to accept the politically dangerous Ministry of Education and then he must avoid even the appearance of playing into the hands of his extreme supporters. Once again it is significant that the Irish apple of discord should prove to be an orange.

Medical Certificates

The growing demand for medical certificates has been a constant complaint of doctors for some time. They have three main grievances. First, they resent the burden of clerical work which the demand for certificates thrusts upon them. Secondly, they resent having to give certificates, as part of the free personal medical services they have undertaken to provide, when the persons demanding them are not being treated for an illness, but want a certificate to satisfy some Government department. Thirdly, they resent unreasonable requests for certificates to support a demand for priority treatment in respect of food, fuel, petrol, corsets, employment or housing.

The report of the inter-departmental committee set up to consider whether medical certificates could be reduced in number and simplified shows that these complaints are justifiable. It performs a much-needed service in summarising, under each department, the documents that are required, and in showing whether they are strictly medical certificates at all or medical reports or mere attestations and notifications. The number of such documents that legislation throughout the years requires to be produced is hardly credible.

The committee has three main recommendations for lightening the burden on doctors. First, it proposes that the Ministry of National Insurance should provide, at the request of insured persons, extracts of certificates of incapacity that could be used for more general purposes than at present. This would relieve doctors of having to give more than one certificate in respect of the same patient and the same illness. Secondly, it recommends that the National Health Service Act should be amended to provide for the free issue only of "such certificates as may be prescribed, being certificates reasonably required under or for the purposes of any enactment." Thirdly, it recommends that Government and local authority officials should be included in the list of persons authorised to sign as an attesting witness. On the doctor's third grievance, however, the committee does not speak so strongly as it might. It points out, rightly, that the demand for certificates for priority purposes has lessened as shortages have ended. But it does not denounce sufficiently the practice of placing upon doctors the responsibility of making a deci-

sion that is essentially an administrative one. Housing authorities, for instance, far too often allow applicants to believe that a medical certificate will enable them to jump the housing queue, and force the doctor to choose between refusing a certificate, and annoying his patient, and giving a certificate and worrying his conscience.

Egypt's General Election

Next week's general election in Egypt will have a familiar pattern. It will be one more sample of the struggle between King and Wafd that has gone on since the inception of the 1923 constitution and the days of King Fuad versus Zaghlul. There was recently a chance that the shape of events might be different. Though the Wafd had been unrepresented in Parliament for nearly five years owing to its boycott of the 1945 election, some of its leaders agreed to return to the government last July. This looked a most patriotic action at the time, for the country was in poor political shape. Neither King nor Government had confessed to the people what a waste of effort the Palestine war had been, and they were governing jointly with the aid of a strict press censorship and martial law. By these means they had curbed the unrest which had caused the murder of two successive prime ministers; but neither the King, who is—to say the least—wayward, nor the ministers, who were little more than his puppets, enjoyed any real popular respect. The Wafd, though in the wilderness, was the only political party with a nationwide organisation.

The question then was whether the coalition cabinet could survive long enough to keep the elections free from "rigging." The chances of success, surveyed in *The Economist* of September 17th, unfortunately fizzled out. For the coalition, composed of Saadists, Liberals, Nationals and Wafdists with an independent Prime Minister, Sirry Pasha, had several delicate election problems to tackle. One was to form the 55 new constituencies made necessary by the growth of Egypt's population. Another was to decide, in the interests of preserving the coalition, whether the parties should share out the constituencies between agreed single candidates or fight one another for each. The Saadists, Liberals and Nationals, with the King behind them, were all for agreement; but the Wafdists argued that to deprive so many electors of the chance of choosing their candidates was contrary to the constitution. At one time agreement seemed possible, and the quarrel raged around 50 constituencies only. But the disagreement over these was sufficient to reveal that it would be impossible to return a balanced coalition without unduly interfering with the electors' choice. The coalition thereupon broke up.

Since November Sirry Pasha has governed with a cabinet of virtually unknown figures, mainly ex-officials. Outside it parties have indulged in a free-for-all, with no holds barred. In such conditions the likelihood is that the Wafd will win, provided that there is no interference at the polls. The only possible goal for the King and his henchmen is to keep its majority small by financing "independent" candidates and other means. If they behave with moderation they will set an example of importance to the other Middle Eastern democracies. If, as so often happens in the Middle East, they misuse the powers that are always enjoyed by the man in the saddle, they will present a disastrous spectacle to the many Arabic speaking electorates that are regular listeners to Cairo radio.

Red Cross—New Style

The attitude of the Russians to international Red Cross conventions is a most regrettable illustration of their ability to execute a complete *volte-face*, when it suits them, and of

This is the sign of a group of companies which for seventy years have been designing and building specialised plants to perform various industrial processes better and more cheaply. Coal, steel, gas, electricity, chemicals and food are typical of the essential industries and public utilities which are served by Simon coal washeries, coke ovens, power stations, chemical and gasworks plants, flour mills, granaries, and engineering installations of many other kinds in Britain and abroad. With overseas companies in Australia, New Zealand, South Africa and South America, the Group directly employs more than 4,500 people and sends visible exports of machinery and invisible exports of scientific knowledge and experience to some forty countries throughout the world.

There are many ways in which the Simon Engineering Group serves the fundamental needs of civilisation.

the difference between the Soviet and western approaches to international problems. Before the last war the Russians refused to adhere to any of the Red Cross conventions then in force. At the lengthy conference in Geneva last summer, when nearly sixty countries negotiated four new Red Cross conventions, the Russians (and several east European governments) were not only represented, but were conspicuous for the way in which they pressed for the most theoretically perfect and comprehensive solutions to the problems involved in the care and protection of wounded and sick combatants, prisoners-of-war and civilians. This desire for the perfect pattern was again obvious in the reservations made early this month when twenty-seven nations met to sign the new conventions. They evidently sprang from a feeling that the conventions, as they stood, did not go nearly far enough. The representatives of western countries, on the other hand, claim to have taken a more practical approach, and have been concerned to secure conventions which are reasonably foolproof and legally enforceable, even if incomplete and imperfect.

Three of the new instruments are designed to strengthen three prewar conventions on the care of sick and wounded combatants and on the treatment of prisoners-of-war. The categories of persons to whom the rights and privileges of prisoners-of-war must be accorded have been enlarged to include members of organised resistance movements wearing a distinctive badge or uniform and carrying arms openly. But the qualifications attached to recognition of these partisans (which would actually have excluded most of those operating in the last war) are a reflection of the fear of fifth columns which events since 1944 have inspired.

A Word to an Angry Contemporary

RESPECT for the gentlemen whom we have reluctantly felt it our duty to oppose in their well meant attempts to improve the condition of the needle women of London by a large scheme of emigration . . . have rendered it impossible, in treating on that subject in a foregoing article, to allude to the coarse vituperation of a morning contemporary, against the remarks which we made last week. A subject so deeply important to the interests of humanity cannot be handled in the spirit and style adopted by our contemporary. The *Economist* is "the Hudson of the press"—because it is notorious for its "garbled statistics"—"doctored estimates," and "cooked tables." Hard words these (though it is difficult to understand what they have to do with the subject under discussion)—but they are not the more true from being hard. . . .

We lay claim to no special exemption from error. We do not mean to say that unimportant errors do not exist in some of the figures which are to be found in the pages of the *Economist* (though we are not conscious of any); for it is not uncommon to find two official returns, purporting to give the same information, differing slightly from each other. But we do challenge our contemporary to point out a single instance, during the whole of the years this journal has existed, in which inaccurate statistics were used for the purpose of propping up any deduction or theory, any inaccuracy, which, if corrected, would in any material degree alter the result. In estimates and statements derived from ordinary commercial advices, we are, like all others, dependent on the judgment and opinions of correspondents; and such figures can only be taken by any one with such latitude. But we challenge our contemporary to point out a single case in which statistics have been applied inaccurately, with a view to any particular result, and which depended on such application.

The Economist

December 29, 1949

The fourth convention is the first ever to be completed on the care and protection of civilians. It is designed to protect both those who are stranded on the battlefield between opposing land and air forces, and those belonging to a country overrun and occupied by the enemy. It attempts to prevent any repetition of the concentration and forced labour camps in which so many millions of civilians suffered in the last war. One of its chief provisions—for the establishment of neutral safety zones—provoked much controversy and showed up the difference between the Soviet and western approaches. The Russians wanted establishment of these zones to be obligatory on all signatories of the convention. The British delegate—true to form—pointed out the practical difficulties involved, especially in small countries. It was decided as a compromise that these zones "may" be set up by mutual agreement between combatants.

It is easy enough to be cynical and realist about these conventions both because of the way they have been violated in the past and because of the impossibility of enforcing them save by an appeal to the human conscience. But the Red Cross idea must be judged by the good which it has achieved and not by the evil which it has failed to prevent. Many countries in the past have loyally fulfilled their obligations under these conventions. Countless soldiers, sailors and airmen remember with gratitude the aid of individuals inspired by the spirit of the Red Cross. It is most important that this tradition of mercy should be maintained at least in the continent that produced it.

* * *

Commercial Education

Those who have doubts whether there is such a thing as commercial education will have them confirmed by the report of a committee on this subject of which Sir Alexander Carr-Saunders was chairman.* The argument which strives to make bedfellows of general education and the acquisition of technical skills in typing, shorthand, book-keeping and other commercial subjects is, it seems, a poor matchmaker.

The report is sensible enough in attempting to eliminate typing and shorthand from the curriculum of the secondary modern schools whose pupils leave at fifteen, and in deprecating any teaching of the techniques of commerce in the universities. What it does not do is to carry conviction that in the various schools and institutions between these lower and upper extremes, the teaching of commercial subjects is anything but the teaching of techniques—techniques essential for a livelihood and for modern society but not in any proper sense educational. It is for this reason that the suggestion that in addition to secondary grammar, technical and modern schools, there should also be secondary commercial schools is to be deplored. Secondary education is already quite sufficiently divided.

The strongest argument in favour of providing commercial education in schools after the age of 15 is that failure to do so will encourage parents to remove their children to some of the less desirable institutions where general education is given no more than lip-service. If a boy or girl can be said to be learning commercial skills in school, then his parents may consent to leave him there and he may thereby continue his education proper. There is some strength in this argument, but it is not altogether honest. Secretarial skills are better learned intensively, and not scattered among normal school subjects.

On the question of commercial education at the universities, the Committee found that the majority of the business men whom they consulted were lukewarm towards the idea of degrees in commerce, and were, by and large, indifferent to subjects which their recruits had studied at the universities.

* Education for Commerce. HMSO. 1s. 6d.

Letters to the Editor

Soviet Statistics

SIR,—Much in Soviet "statistics," especially the indices of industrial production and national income, is simply propaganda. Most other data are inaccurate, incomparable for one or another reason, or otherwise defective. The reviews of the Soviet economy in *The Economist* in the past two years were almost entirely based on those data and are not likely to bring any clarity with reference to the Soviet potential. Space permits to mention only three items.

In the issue of December 25, 1948, it was stated "the record grain crop harvest of 1940 (or of 1948) was only fifty per cent or so above Russia's crops before the revolution." This statement was made with disregard of the fact that before the revolution the grain crops were underestimated, while the 1940 and 1948 crops were determined in the field prior to the harvest and a considerable discount is needed to bring such estimates down to the basis "harvested." Before the revolution Russia exported over 10 million metric tons of grain and had almost twice as many horses than there were in the USSR in 1940, horses being heavy consumers of grain. Together with the difference in estimating procedure, analysis of the utilisation of the grain crops leaves no doubt that in a comparable territory the 1940 grain crop was not larger than that of 1913 and that the 1948 crop was substantially below both of them.

In the same issue it was stated, incorrectly, that "the mass of the food-producing peasantry was undoubtedly consuming more than it had done before." The official data on the total output of meat and milk, as well as on the distribution of foodstuffs by the collective farms to their members and on the own production of the latter show that the 1940 diet of the peasants was greatly inferior to that of the time either before the collectivisation or before the revolution. The peasants had less even of bread. In 1948 the situation was still worse.

The analysis of the Soviet industry in *The Economist* of December 11, 1948, is based on the official indices in money terms, characterised introductorily as no good. On the basis of those data, the 1948 output appears to have been 14 per cent above that of 1940. Official data in physical terms show that the 1948 output exceeded the 1940 level only in the case of a few important industrial products, namely timber (but not lumber), cement, and window glass. The 1948 steel output was slightly below 1940 and this makes it irrelevant that the output of civilian machinery exceeded the 1940 level. The excess in coal output in tons in 1948, if any, was accompanied by a greatly increased proportion of poor coals in the total output. The 1948 output of consumers' goods was substantially below 1940, of the important cotton goods by almost fully 20 per cent. Doubt exists only with reference to the exact percentage by which the total 1948 industrial output was below that of 1940.

It certainly is important to know how much the USSR spends on her armed forces. Basing his statement on the official data, your correspondent wrote in *The Economist* of February 14, 1948: "total national expenditure on schools is still nearly 50 per cent higher than the expenditure on defence. . . . The 'cultural revolution' is still in full swing." A rouble in the Soviet state budget is not equal to another rouble. Producers' goods are relatively the cheapest. Salaries and wages occupy the intermediate position. Consumers' goods are the most expensive items. They are made so by turnover taxes, which amount to 50-80 per cent of the retail prices of the principal such goods. But the armed forces are exempt from turnover taxes. The expenditures on them consist largely of cheap armaments and likewise cheap consumers' goods. Expenses on education on the other hand are made up mainly by wages, which are relatively high, and consumers' goods for which the full price has to be paid. Duly revised, 1948 expenditures on the armed forces were more than 50 per cent above those on

all cultural expenses, which in addition to education include health services, social security, and help to mothers with numerous children.

The data on grain production are taken from my *Socialist Agriculture of the USSR*, Stanford University, 1949, pp. 532-550; on grain utilisation pp. 550-62 and 748-60, and on consumption of animal products pp. 91-96. Data on industrial output and allocation of national income and budget are from my talk delivered in Washington D.C. a short time ago.—Yours faithfully,

NAUM JASNY

Food Research Institute, Stanford University, USA

[The main argument in the criticised article on Russian agriculture was that the development of Soviet farming was highly inadequate in relation to the needs of the Soviet economy. This was shown to be true even in the light of official Soviet statistics. Our argument is strengthened, and not weakened, if our critic's view of Soviet farming is correct. Some discount of Soviet harvest estimates ought probably to be made; but it is highly doubtful whether it should be as large as Mr Jasny suggests. If Soviet grain harvests in 1940 and 1948 had not exceeded the crop of 1913 several questions would have to be explained: how did the Soviets manage to feed, even on a minimum basis, their urban population which grew by about thirty million people within little more than the last prewar decade? Where that section of the peasantry that has been diverted from production of food to the cultivation of technical plants fed from? Last but not least, how did the Soviets manage to lay in their emergency stocks of grain in the thirties, which by all accounts were enormous and which did after all help Russia to survive and fight after the loss of the Ukrainian granary?

Our statement about increased rural consumption of food was based *inter alia* on accounts of agriculturists who, as deportees, worked on Soviet collective farms and who were not inclined to view the collective farms through rosy spectacles. We should be very surprised if official Soviet statistics (which, Mr Jasny says are "simply propaganda") showed the peasants' consumption to be "greatly inferior" to pre-revolutionary standards.

Mr Jasny's attempt to determine the real value of the Soviet expenditure on education and health services is not convincing. Average wages and salaries paid to the Soviet teaching personnel are not higher—they may indeed be lower—than those paid to army officers or civilian officials and workers. Books and school aids are among the cheapest consumer goods in Russia. Soviet education must be criticised and the ground of its one-sided, propagandist character; but in part it is precisely for this reason that it holds a very high, indeed—the highest—priority in governmental expenditure.

Some of the points about the industrial situation raised by our critic were made in the criticised articles; on others Mr Jasny is not convincing. The rise in the output of "civilian machinery" is certainly not irrelevant for an estimate of the value of the total industrial output, even though the output of coal and steel is relatively inadequate, as was repeatedly pointed out in *The Economist's* surveys, including the one criticised by Mr Jasny.

Finally, a few words about the treatment of Soviet statistics. Anybody who takes the trouble to re-read the criticised articles will find out how dishonest and ludicrous is the suggestion that they were based on an uncritical acceptance of Soviet statistics. The student of Russian economics is likely to commit errors of over-estimation or under-estimation, in part because of the fragmentary and deliberately vague character of the information available. In the heyday of the Russian alliance western commentators tended to over-rate Russia's industrial achievement. The prevalent tendency now is to under-rate it, as was strikingly illustrated in the assumptions made until recently about Russia's technological incapacity to solve her atomic problem quickly. *The Economist's* surveys of the Russian economy have been conducted on the principle that economic research should not be affected by political sentiment about Russia.—EDITOR.]

Books and Publications

Fabulous Survival

"Human Action: A Treatise on Economics." By Ludwig von Mises. Hodge. 880 pages. 42s.

PROFESSOR VON MISES holds among economists an almost legendary position; he is the limiting case, the last heir of Bastiat and Senior, the *ne plus ultra* in *laissez faire* theory. Few in Great Britain have actually read his works; few, presumably, will read "Human Action." Nearly 900 pages of relentless Teutonic philosophy offer too repellent a prospect. This is a pity. "Human Action" is a magnificent book; intellectual power roars through it like a great wind; it has the impetus of first-rate polemic and the impeccable coherence of Euclid. Its language is appallingly stiff for anyone untrained in formal logic, its style is heavy, and its manners often downright bad; but the thought thus unbecomingly clothed is crystal clear and the pursuit of its development is an intellectual delight.

Having said this, one can only add that as a guide to policy "Human Action" is irrelevant almost to the point of craziness. Individuals rationally seek to better themselves; in Professor von Mises' words, to "remove uneasiness." Such is the primary datum of praxeology, the "science of human action" which comprises economics. From this datum there follows the impossibility (apart from Government intervention) of trade cycles, general unemployment, exploitation, monopoly (except in unimportant and temporary instances) and war; the folly of collective bargaining, the social services, the Pure Food and Drugs Act, and credit control; the unconditional equivalence of profitability and public interest; and the unqualified imbecility of Lord Keynes, Professor Pigou, Professor Myrdal and indeed practically every major economist of the last half-century. It is not, of course, an intellectual crime to be in a minority of one; but the arrogance with which Professor von Mises dismisses all contemporary economics without ever condescending to meet his adversaries on their own ground is nevertheless remarkable. (He does, indeed, punctuate his exposition some half-dozen times to remark, in effect, "so much for Keynes," but this is not controversy, it is dogmatism. In fact, he never begins to confront the General Theory, let alone refute it.)

His failure, however, is not merely a failure to recognise that there may be something wrong with Say's Law of Markets. It lies far deeper. What his science of human behaviour ignores is that human inconsistency, irrationality, and intellectual immaturity are just as much primary data as are that power of rationally envisaging means of self-betterment which distinguishes man from the beasts or that deficiency in perfect altruism and charity which distinguishes him from the angels. To modify, as for any realistic purposes one must, his primary axiom in this sense is to undermine the whole majestic structure built on that axiom. To assign, in consequence, a possibly positive and useful role to State intervention in the self-betterment process is not, necessarily, as he asserts, to project onto the state one's own autocratic value judgments. It is merely to recognise that in some respects (e.g. in respect of time horizons, of gross discrepancies of economic power, of gross divergences between immediate private and other benefit) reasonably well chosen individuals at the vantage point of central authority may, in spite of their own deficiencies, usefully correct or counter the irrationalities of the other individuals making up the general public. This—not merely the mystical claptrap of the supreme state, not merely the superiority of the all-in economic plan, not merely the wisdom and consistency of existing governments—is what Professor von Mises denies. Thus he discredits the cause which he has most at heart, the cause of freedom, reason, and progress, and fortifies tyranny, unreason and stagnation.

A Main of Gasmen

"The History of the Gas Light and Coke Company, 1812-1949." By Stirling Everard. 383 pages. Benn. 63s.

THE sober title of this inordinately expensive book covers a lively story of the men who started the first gas company in the world and developed it into the largest. The founders of the Chartered Company faced entirely novel problems of organisation and technique, and met them with ingenuity, enterprise, and improvisation. For fifty years the Company had direct competition to meet. This was sometimes sharp, and the accepted rules were fairly wide; they allowed you to connect a new consumer to your competitor's mains, and then try to charge him for your competitor's gas. But it was thought to be going too far when, the Chartered Company having won so notable a consumer as the Duke of Sutherland from a competitor, the losers not only disconnected their own service pipe, but also cut the Chartered main, inserted a large lump of clay, and reconnected it. Lest this should be thought fanciful, the twentieth century can offer parallels: the author quotes a local authority which in the middle 30s filled up the gas pipes in its council houses with concrete, thus at once helping its electricity department and protecting its tenants from freedom of choice. The early Governors appear as enterprising, long-suffering, patriarchal men, willing to experiment, ready to forgive and forget when a sufficiently penitent defaulter came before them. It can only have been after much provocation that they decided to stop selling gas on credit to "Billiard Table Keepers or Gaming Houses when the proprietors are not known."

After 1860, local monopoly took the place of the cut and thrust of direct competition; the Governors lost their faint halo, and became solid personages with whiskers. The Company grew and grew, mostly by absorbing its competitors—why, it is never made quite clear—with signs of growing pains. By 1880 competition from electricity was to be reckoned with, and the Company began to turn increasingly to cooking and heating for its future loads. It never stopped expanding: by 1939, the Gas Light and Coke Company covered more than 500 square miles, supplied 1,500,000 consumers from Southend to Windsor with a sixth of all gas sold in the country, and controlled 30 other gas companies through a holding company.

Hitler's war and the aftermath brought new problems for the company: the loss of street lighting and of evacuated consumers, bombs on gas works, torpedoes in colliers, 6,000 mains broken, 65,000 service pipes connected, 20,000 incidents for its repair gangs, and in May, 1949, socialisation into the North Thames Gas Board. What a pity the successor of *The Gas Light and Coke Company* is not just *The Gas Board*. After all, that title would be at least as accurate as the present one—for no miracle of planning can get the Borough of Richmond or the Nine Elms Gas Works on to the proper side of the river.

This book is not an economic history. It raises for the student more questions than it answers. It is startlingly bare of tables or charts. But it is a first-class, if kindly, story of human endeavour and achievement. It stirs a hope that in the North Thames Gas Board the soul of the Gas Light and Coke Company may go marching on.

Theory and Action

"Economic Thought and Policy." By D. H. MacGregor. Home University Library. 177 pages. 5s.

WITH this volume the Home University Library diverges perceptibly from its usual pattern. To define such a pattern, common to a large range of contributors, may seem rash; but it is possible to discern, as a rule, the guiding principle that matter and presentation may demand of the reader

intelligence, assiduity, a wide vocabulary and an educated habit of thought, but no prior special knowledge of the subject. Professor MacGregor's contribution to this series is sufficiently stimulating, urbane, written, intrinsically interesting and generally civilised, to encourage the reader wholly unversed in economics to persist hopefully long after he has really ceased to follow the argument. But any such reader who succeeded in really profiting by Chapter Two ("The Representation of Supply": perfect and imperfect competition, marginal and average costs, supply curves and Marshallian "particular expenses" curves, etc.) would have some claim to recognition as an intellectual paragon.

In another respect, too, Professor MacGregor diverges from the norm, which is that of a complete monograph with a beginning, a middle and an end, devoted to the development of a single theme. The matter of this book consists of half a dozen related, but only loosely related, essays whose subjects range from the changing content of the Malthusian theorem through the origins, development and dissolution of *laissez faire* theory, the anticipations of Keynes to be found in the classical economists, and the rationals of democratic socialism, to the economic aspects of war. The connecting link is implicit in the title; theory and policy interact and can only be fruitfully considered each in relation to the other's contemporary development. But there are few references back, in succeeding chapters, to the conclusions or arguments of their predecessors.

Not all these essay-chapters are, mercifully, as stiff as that on the Representation of Supply; and all alike display a quality which one associates particularly with Professor MacGregor's master of forty years ago—Alfred Marshall: a certain breadth, a capacity for seeing both wood and trees and displaying them in proper perspective, an equal ease in technical and non-technical exposition, and a total lack of the *odium theologicum*. This is a valuable addition to a valuable series.

Where the pound now buys more

Just a year ago, the average number of people buying the Daily Mirror every day was 3,700,000. To reach this number of prospective buyers, advertisers spent £11.16.4 on every column inch of space.

Now, the number of people buying the Daily Mirror each day has gone up to over 4½ million. With the largest daily sale in the world, advertisers still only pay £11.16.4 per column inch. In other words, in twelve months the value of the pound invested on space in the Daily Mirror has increased by 21.6%.

To advertise to 1,000 people costs only 79 of a penny per column inch.

THE GREATEST INFLUENCE IN DAILY JOURNALISM

Genes and Defects

"The Biology of Mental Defect." By Lionel S. Penrose. Sidgwick and Jackson. 240 pages. 21s.

LEST the general reader should be deterred by its uninviting title from exploring this book, it should be stated at once that less than one-third of it is devoted to clinical description. The remainder demands only an elementary knowledge of genetic and statistical principles, and will be of wide interest to all those concerned with education, delinquency and crime, eugenics and sociology.

Of the numerous topics discussed, two are of particular and immediate interest. First, it is well known that mild defectives and borderline defectives have a much higher fertility than the more intelligent groups of the population, and it has often been asserted that implicit in this fact is the threat of a decline in the general intelligence of the nation. The author answers this assertion with an ingenious explanation of how different fertility rates in various social groups may yet be consistent with biological equilibrium.

On the subject of eugenic measures Professor Penrose is extremely cautious—in contrast to dogmatic statements which have been made by some radical but ill-informed enthusiasts. From deep knowledge of his subject he casts doubt upon the eugenic efficacy of such measures as the sterilisation of defectives, and even goes so far as to conclude:—

Sub-cultural mentality must inevitably result from normal genetic variation and the genes carried by the fertile but scholastically retarded may be just as valuable to the human race, in the long run, as those carried by people of high intellectual capacity.

This is a point of view seldom expressed; coming from such an authority, and with such a weight of evidence behind it, it must command respect.

AMERICAN SURVEY

Paper, Paper Everywhere

(From Our American Staff)

THE American daily press is, since the moral collapse of so many of the British penny papers, the best in the world. Unfortunately, it is not nearly as good as its owners and operators believe it to be. And it is not improving. Nor is it likely to improve as long as the present mood of mutual congratulation obscures the need for self-examination. Plenty of stirring speeches are made at banquets, where the freedom of expression in the United States is extolled and compared with its absence behind the iron curtain. But such speeches are unnecessary. Nobody denies that even the Hearst press is preferable to *Pravda* and any comparisons should be drawn with some higher standard.

When the ridiculous charges of Mr Racey Jordan against Mr Harry Hopkins were spread across the front pages, his story, that atomic secrets had been given to the Russians during the war, collapsed as quickly as the press had inflated it. Mr Luce's publications, having been approached some time earlier by Mr Jordan and taken the elementary precaution of checking what he had to say, delivered some well-merited lectures. "For making such a gullible spectacle of itself the US press had only its own bad reporting to blame," said *Time*, while *Life* added that the public had been "misled and insulted by a disgraceful abuse of the news." Although many newspapers that should have known better were guilty in this case, those that value their reputation above their circulation were not. But it is not in these occasional, and sensational, incidents that the American press is failing to maintain the high standard it affects, but in its day-to-day lack of attention to details.

★

The newspapers in the United States suffer, above all, from a surfeit of newsprint. To this surfeit nearly all their weaknesses can be traced. It is obviously impossible for any one man to edit a paper of over a hundred pages and, without the firm hand of an editor, even the *New York Times*, the most valuable of them all, becomes a diamond mine when it should be a jeweller's shop. It is the job of an editor to do the mining and present the results to his readers. Too often they are left to do their own. So large a paper must also, if it is to fill its space, employ many men whose talent for their job is doubtful. The best are used as reporters, and sub-editing is often left to the ignorant and illiterate.

Size is also responsible for the divorce of editorial opinion from the news. Since few papers have enough presses to print a whole edition at once, leader pages and, in some cases, whole editorial sections are printed early in the day. The leading articles are, therefore, comments on the news of the day before, and often have no relevance to any news in the same paper. At times stories and comment in the editorial section are made unnecessary or ridiculous by later stories in the news pages.

These are technical problems, and they are technical prob-

lems created by the surfeit of paper. There are also moral problems, of which the pressure of the advertiser, who is impotent when paper is scarce, is the most dangerous. The existence of this pressure is always hotly denied, even in the face of strong circumstantial evidence. The history of the attempts of the Arab Information Office to place advertisements in the *New York Times* and the *New York Herald Tribune* to counteract the flood of Zionist advertisements does not suggest its absence. Nor does a recent incident in Washington. The Great Atlantic and Pacific Tea Company, against which the US government is bringing an anti-trust suit, had been placing without difficulty full-page advertisements attacking the government's case. The National Federation of Independent Business, representing the small business man on whose behalf the government's action was being taken, tried to place an advertisement supporting the government. It was refused by three of the four Washington dailies, the *Washington Post* later explaining that it "rejected the advertisement because it seemed possibly libellous." Nevertheless, the advertisement was printed, with impunity, by one of the papers, whose management admitted airily that they probably would not have accepted it if they, like the other three, normally received any advertising from the "A. & P."

A more regular source of irritation than the effect of advertisers on policy is their effect on the appearance of the paper. To accommodate their needs, stories are cut up and shreds of them printed in different parts of three or four columns. The *Washington Post* (which in many other respects, it should in fairness be added, is one of the best newspapers in the country) some time ago achieved eminence in this sport; it managed to print all but two lines of a story in one column and then divided the balance between two others—one line to each.

★

The competition for advertising affects the policies and the appearance of newspapers and distends their bulk to a point where they cannot be properly edited. The competition, equally fierce, for news has largely destroyed all style and literacy in its presentation. The ability to find news is more important than the ability to write it coherently. Reporters are becoming more and more technicians in news-gathering. If an editor were to dismiss one of his staff on the grounds that he could not write, the reason would be felt to be irrelevant. The form of a story has been standardised, and almost anybody can be trained to pour his own into the mould. The whole story must be compressed into the leading paragraph and then its separate parts expanded in later paragraphs. As editions follow each other and new stories appear, with more importance, or at least more novelty, the original story can be shortened by cutting off its tail again and again until only the first paragraph is left. And after each operation the story must still seem complete.

During the war the pressure was relaxed. There was more advertising than paper; the cost of living and, therefore, of producing a newspaper was not rising fast; and the costs of employing war correspondents was largely paid for by a grateful Army and Navy. But since 1946 costs have gone up steadily and staffs have, as a consequence, shrunk. There are few left of the great corps of foreign correspondents who worked in Europe and the east during the nineteen-thirties; one of them is Mr A. T. Steele of the *New York Herald Tribune*, who is still abroad. Mr Drew Middleton of the *New York Times* and Mr Howard K. Smith of the Columbia Broadcasting System, both of whom began work in the last days of the golden period, are the only new names fit to place beside those of the men who awoke the United States to the danger of what was happening to the world before 1939.

To take the place of that brilliant band of individualists, there has been an extension of the use of the columnist and of the new agencies. The good columnists—Mr Walter Lippmann, the Alsop Brothers, Miss Marquis Childs, Doris Fleeson and Mr. Thomas Stokes—though they must be tempted, when they remember the size of their readership, to become pontifical, have great value in a country where distance prevents any newspaper from getting more than a local—or at best a regional—following. For a few dollars a day an editor in a small town can get material he could not afford in any other way. But there are also bad columnists and ignorant ones. Recently, one of them gave a detailed account of very confidential decisions which, he said, had just been made by King George of Greece. Most of the editors who subscribed to his column forgot that King George had been dead two years, and printed the story.

That, in spite of its many weaknesses, the American press should be the best in the world should be a matter of concern instead of congratulation. *Time* and *Life*, having decided that one episode "should give pause to every publisher, news editor and radio executive in the land", might well tackle next the growing slovenliness of newspaper production. By testing Mr Jordan's story and finding it wanting, the Luce papers showed a greater sense of responsibility than many of their daily contemporaries. They also set an example in production, in careful editing and in writing. There are many complaints about *Time's* style—but it has a style. No daily paper, except the *Christian Science Monitor*, which is in a class by itself, can say as much.

A Creed for the Free

[FROM OUR AMERICAN STAFF]

UNTIL very recently, the poverty of political thought in the United States has been conspicuous when contrasted with the wealth of achievement that has taken place within the prevailing governmental system. That system was, of course, thought out in the eighteenth century. Except for rephrasings by Abraham Lincoln during the civil war period of the eighteen-sixties, very little has been done to restate the theory in terms of modern complexities. To an extent that is continually surprising to visitors from across the Atlantic, political orators and writers depend on the phrases of Adams, Jefferson, Hamilton or Jackson to make their points, and even to explain what is happening. In an era of streamlined trains and supersonic air flights, most of the political thinking of the United States is still in the horse and buggy age.

This gulf between the word and the fact has, in the last three decades, rendered the American particularly vulnerable

to attack from nations provided with a more up-to-date political vocabulary. It is, in part, the reason why the criticisms of Karl Marx are accepted as modern. They may be a century old, but at least they were written in sight of factories rather than of fields. The other reason is that his attack, and that of his followers, is directed not so much at the ideological basis of democracy as at its functioning. Marx and the Marxists insist that industrial capitalist democracy will not work and that it is certain to collapse of its own weight; to an American, that is a criticism to be taken far more seriously than any assertion that there is about it something morally or philosophically wrong.

The American understands things that work, he likes things that work well, and he will defend them for the reason that they work well even if in so doing they approach the border of a moral doubt. It is no accident that the most distinguished American contribution to philosophic thinking is William James's formulation of the empirical doctrine. Confidence in, and justification of, the thing that works well is bred in the American bone.

★

Until the great depression, democracy worked well enough in the United States, and when it failed to work there was at hand no group of articulate critics to insist, loudly enough to make a permanent impression, that they knew a way which would work better. But the depression of the nineteen-thirties brought about the conversion to Communism of a group of men who were far more persuasive than earlier heretics had been. Moreover, they could point to a great country which was operating under Communist doctrines and at that time, and across a distance of six thousand miles, the manner of that operation, as well as its purpose, was veiled in happy illusion.

Ever since then, and despite the evidence accumulated during the war, a secret doubt has gnawed at the back of the American mind, a fear that perhaps the Communists may be right, that perhaps eighteenth-century doctrines are not adequate to the strains imposed by modern industrialism, perhaps the great depression was in fact the first sign of the coming downfall. The doubt made a few converts to Communism, most of them temporary and many of them frivolous. What was more important, it created a state of shock, which in turn produced fear, denial, and then, in order to ward off fear and to bulwark denial, a neurotic persecution of people who could be suspected of thinking, for as long as a single moment, that the Communist doctrine might work better than does the democratic doctrine on which the United States is founded.

It is only against this background that one can understand the real importance of the reassessment of American democracy which Dr Vannevar Bush has carried out.* His is an affirmation, in the most modern and concrete terms, of those verities which the American must believe or die. It is made with all the vigour of which a highly trained New

* "Modern Arms and Free Men," by Vannevar Bush. Simon and Schuster. New York, 1949. \$3.50.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

England mind is capable. Not only does he assert that democracy is still a good thing—far better than any competing system yet invented. He also says that it will last longer than others for the very reason that it is more flexible and more adaptable to the changes that come with growth. These are standards of judgment that Americans understand, stated in a form from which they can take renewed confidence. The statements have the added virtue that they come, not from a politician or a professor (Dr Bush's professorial functions are sufficiently outgrown not to prejudice his authority), but from a scientist with an engineering background. It took a war, and four postwar years of probing the performance that lies behind Soviet diatribes, to produce the finest statement yet made of the case for twentieth-century industrial democracy. This book is the fruit of four years of listening to the words of the Molotovs, the Vyshinskys, the Gromykos and the Lysenkos, quite as much as of testing the American performance.

Dr Bush makes his attempt to measure and analyse the strength of the democratic process as part of his discussion of the present role of science in ministering to it. He did his early work at the Massachusetts Institute of Technology and went on to the Carnegie Institution in Washington, which oversees the wide-flung scientific research endowed by the late Andrew Carnegie. In that position he was expected to measure the progress of the most advanced work being done in the various sciences throughout the United States.

It was with that background that Dr Bush was, in 1940, made chairman of the National Defence Research Committee, the nucleus of the larger Office of Scientific Research and Development. That same year the Advisory Committee on Uranium, parent of the Manhattan District Project and the atomic bomb, was placed under his direction.

It is therefore from a position of particular advantage that Dr Bush surveys what has been done and what lies ahead. He disclaims the role or the temperament of a prophet. He states his two chief conclusions at the beginning of his book with the humility of a scientist advancing hypotheses which he intends to prove:—

I believe, first, that the technological future is far less dreadful and frightening than many of us have been led to believe, and that the hopeful aspects of modern applied science outweigh by a heavy margin its threat to our civilisation. I believe, second, that the democratic process is itself an asset with which, if we can find the enthusiasm and the skill to use it and the faith to make it strong, we can build a world in which all men can live in prosperity and peace.

He then challenges his readers to play their part that this may not fail:—

We cannot take refuge in the assertion that these are matters for specialists. . . . We are not a dictatorship, where a single distorted mind names the tune and all the lackeys dance to it. We are a free people, and as we think so will our public servants act.

Here, in this book, are the words that bridge the gulf between the founding fathers and atomic power. It is a weapon in the cold war made to America's hand, and if it is used with the same depth of understanding that has gone into its writing the future of the country will have a quality of greatness which has been lacking in high places for much too long. But it is more than that. Dr Bush knows that neither the United States nor its fellow democracies will stand long if they try to stand alone. Here is a chart for the second half of the twentieth century which free men wherever they are will do well to ponder.

American Notes

A Prosperous New Year

The stock market is seeing out the old year from new peaks; the Dow-Jones industrial average, already higher than at any time since 1946, is nearing 200. The automobile industry's Christmas gifts to the country are the smoother, shinier, cheaper new models with which it expects to go on breaking sales records next year. Department store owners were cheered by taking in more money and selling more goods in the last weeks before Christmas than ever in their history, after disappointing business during the autumn and

BUSINESS EXPENDITURE FOR NEW PLANT AND EQUIPMENT

early winter. The Federal Reserve Board's New Year greeting is a prophecy that in 1950 credit will not contract as much as it usually does during the early months of the year.

This buoyant mood is very different from the apprehensions with which 1949 was ushered in, and which now, in the light of the short and mild mid-year recession, seem almost laughable. Last spring business took the dose of deflation that it had been dreading for years, and found it not a poison, but a tonic. It may have to swallow a second and less pleasant dose before the end of 1950, but meanwhile its self-confidence has been sustained by the Secretary of Commerce's forecast of a prosperous New Year, based on the present satisfactory health of the national economy. Mr Sawyer's year-end figures show that gross national production in 1949, at \$259 billion, was only 2 per cent below 1948's record and the same was true of net national income, at \$222 billion; furthermore, the reduction was accounted for by a fall in prices. Employment, however, also fell by 2 per cent, to 58,500,000, and this drop, coupled with the increase in the labour force, brought the average number of unemployed up to 3,500,000.

While total wages and salaries were higher, both in value and purchasing power, than in 1948, earnings of both farmers and corporations declined. The output of crops was the largest since 1932, but plentiful supplies and reduced foreign demand brought agricultural prices down. Industrial prices were also lower, and so was industrial output. It was still, however, 66 per cent above 1939 and at a level at which it might well be stabilised, in the opinion of the National Association of Manufacturers. Consumer goods industries, such as textiles and electrical appliances, which were especially sorry for themselves during the summer, have picked up well. Moreover, their prospects for the next few months are good, since Christmas sales have drained stocks, which had in any case fallen unusually low during the recession; the

depletion of inventories during 1949 is one of the year's most notable differences from 1948. With the exception of automobile manufacturers, the durable goods and metal-working industries are still ailing and their condition has been made temporarily worse by shortages following the recent steel strike.

The rise in steel prices may put a further brake on business plans for new plant and equipment. Construction of this kind has been falling below 1948 levels since last spring. But this decline has been more than offset by increases in public works and in house building; construction in 1949 was valued at \$19 billion, 3 per cent higher than in 1948. After dropping off in the early part of the year, building activity revived surprisingly and contract awards were still breaking records at the end of the year. This unexpected trend is the source of much New Year optimism, since new houses mean new demands for equipment, furniture and fabrics.

Republicans Look Right

Fifteen Republicans selected this week in Chicago by the National Chairman have been entrusted with the task of drawing up their party's New Year resolutions: a formula which at one and the same time will answer the growing doubt of the rank and file as to what the party stands for, and will also guarantee success in the 1950 elections. The strategy committee was in no doubt about what was required; the Republicans must turn their backs upon the temptations of the welfare state, abandon "me-tooism," and strike out in relentless opposition to everything the Fair Deal stands for. The ferocious anti-New Dealers who are included in Mr Gabrielson's policy group will not find it difficult to follow the recipe.

For over a decade, it has been the lament of the conservatives that Republican candidates slavishly danced to the tune called by the Democrats, only stopping to assure the voter that they could play it better, and more cheaply. Mr Dewey was bitterly attacked on this score after both his defeats; and the announcement that he does not propose to try again in 1952 weakens a moderating influence on the extreme right wing. A magnet turning it even further to the right this year is the necessity of persuading the party's rich contributors to replenish a treasury down to a mere \$50,000. A figure of nearly \$2,000,000 has already been approved for the Congressional campaign in 1950; this dollar gap must somehow be bridged.

The party leaders who met in Chicago are convinced that there is a Republican happy hunting ground among the 46 million voters who failed, last November, to go to the polls and that they can be galvanised into activity by an aggressive campaign. But Senator Vandenberg's first action, after his illness, was to come to the defence of the bi-partisan foreign policy which a number of Republicans include in their blanket condemnation of me-tooism, and most of the party's real policy makers in Congress have yet to be heard from.

Senator Lodge and Senator Ives have already submitted their objections to an indiscriminating policy of opposition; they can, if taxed, point out that Mr Dulles lost on such a platform in New York, while the solitary Republican victory went to Governor Driscoll, a liberal. Senator Taft himself, with his nose glued to the Ohio electoral trail, could not either conscientiously or profitably attack welfare measures, some of which bear his own name. Democratic observers, consequently, are keeping their fingers crossed. They believe that a Republican commitment to out-and-out conservatism would guarantee a series of glittering Democratic victories but they fear that, as the election approaches, the Republicans will find their New Year resolutions too costly to keep.

Cultivating Latin America

Mr George Kennan is to precede his two years' sabbatical leave from the State Department's policy planning staff by last assignments in Latin America and Africa. In the next three months Mr Edward Miller, the able Assistant Secretary for Latin America, will also be meeting the diplomats who look after US interests in that area. This intensive cultivation of the Latin American garden is perhaps inspired by a guilty consciousness that, while the United States is spraying weedkiller on Communism in Europe and wondering how to keep it from spreading to Asia, nearly as noxious Fascist growths are shooting up on Washington's doorstep.

Last September the Secretary of State deplored the constant plotting and counter-plotting in the Caribbean area. More recently, he has had to condemn the Dominican dictator's demand for power to declare war on his country's neighbours as "entirely inappropriate" to the peaceful principles on which hemisphere relations are supposed to be firmly based. Even more disquieting has been the surrender of Colombia, a country which last year dealt comparatively democratically with a threatened revolution, to a dictator closely linked with the Spanish Falange. Most disturbing of all is the seizure of power in Panama, the hub of America's strategic communications, by General Arias, who has in the past been strongly suspected of working against US interests there.

The Argentine dictatorship is, of course, an ever-pricking thorn in the State Department's flesh, but there is some hope that the pain may eventually be slightly relieved by a commercial treaty. Negotiations with Brazil are further advanced: discussions on the means of encouraging the flow of US capital into that country have been going on intermittently for some months. A treaty was actually concluded with Uruguay in November, the first comprehensive commercial pact with any American Republic since 1927. It is called a "treaty for economic development" and has additional importance as a sample of what may be expected under the President's Fourth Point plan for under-developed countries. The most noteworthy provisions are those dealing with the rights of US investors (and of Uruguayan investors in the United States) and with means of easing exchange controls.

Treaties of this kind are intended to fertilise the soil so that US private investment abroad may flourish. Such varied cultivation by individuals is, in the opinion of the State Department, a better answer to the difficulties of the western hemisphere than the long-range governmental assistance which Latin Americans want. But the repeated postponement, amounting to virtual abandonment, of the overdue hemisphere economic conference, supposed to be held in Buenos Aires, is explained as much by Latin-American inability to agree on the form such assistance should take as by the State Department's lack of enthusiasm for either assistance or conference.

Rewiring the CIO

The piecemeal purge of Communist-led unions from the Congress of Industrial Organisations has now reached the Office Workers and Public Workers, both of whom have been summoned before a committee of three, authorised to recommend their expulsion to the executive. The prudence of the CIO in tackling its rebellious red-headed offspring one by one is demonstrated by the legal difficulties now facing the new-born International Union of Electrical Workers. The United Electrical Workers, which it is designed to replace, has taken speedy refuge in the courts, and has not disdained to use the hated injunction to prevent the new union from laying hands on the funds and buildings of the

old. Mr James Carey, directing operations against the left wing, has been served with 400 restraining orders and has been provoked, in consequence, into an injudicious attack upon the courts, which he feels should not extend legal protection to those who only recognise the law when it serves their own ends.

The new union, which has just held its organising convention at Philadelphia, claims to have issued 133 local charters and to enjoy the allegiance of 60 per cent of the 500,000 electrical workers. But so far only one of the big employers, the Westinghouse Corporation, has joined with Mr Carey in petitioning for immediate elections to determine which of the rivals has the right to represent its workers. These must be won before the IEW can claim the bargaining rights now held by the old organisation, most of whose contracts do not expire until March. Other large employers, noting the militancy with which Mr Carey and his followers at the convention espoused a fourth round of wage increases and new pension and insurance schemes, have hesitated to jump from the frying-pan into the fire and are content to honour their contracts with the UE until directed not to do so by the Labour Relations Board. On the plant-by-plant basis for elections, which the new union has had reluctantly to accept, the UE may well retain its hold on some sections of the industry.

But the IEW has the explicit blessing of the Administration, delivered in person by Mr Tobin, the Secretary of Labour. And even the abominated Taft-Hartley Act can provide some useful weapons for the CIO in the battle with its former Communists. The NLRB has ruled that a union whose officers have not signed the anti-Communist affidavits cannot claim a legal right to the privileges of collective bargaining. The Electrical Workers, forced into a corner, had already complied, but certain of the affidavits recently filed have been turned over to the Department of Justice for investigation. It has also been made impossible for a union officer with embarrassing affiliations to dodge the requirement by relinquishing his title, while continuing to exercise the functions of an officer.

Farmers on the Line

The American farmer, who is usually associated with combine harvesters and electric milking machines, possesses few of the nation's telephones. Out of the 1949 total of 40 million telephones, only about 3,000,000 serve the rural population, and nearly half of these have been installed since the war. To remedy this situation Congress in October granted the Rural Electrification Administration \$25 million with which to make 35-year loans, at 2 per cent, to existing private companies and co-operatives, and to help to start new ones. But this step, which might have been regarded as a blessing for firms dealing with country areas where houses may be ten miles apart, aroused strong opposition in Congress from the telephone companies.

The opposition was led by the Bell system—that is, the American Telephone and Telegraph Company and its affiliates—which is responsible for 82 per cent of the nation's telephones, and was joined by the United States Independent Telephone Association, representing 2,500 of the 6,000 independent operators. Although some of the independent companies are very small, others, like the General Telephone Corporation, serve over a million subscribers. The present peace in the telephone world has only recently been achieved; the last big city system competing with the American Telephone and Telegraph network—in Philadelphia—was bought up as late as 1944.

These companies fear that the REA, which can choose the company to which it grants a loan, provided there is no fear of duplication of service, will give preference to co-operatives. In the past, the REA, in making grants for the development of rural electrical facilities, has shown a partiality for co-operatives, which have received the vast

majority of grants, to a total of \$1,900 million, while private companies have only obtained \$6,000,000. In the telephone field the 50,000 mutual systems, now often in a state of decay and dilapidation, may thus become rivals to the private companies; there is also a possibility that many new telephone co-operatives will be launched under the new Act.

The postwar boom in telephones has not yet ended, but the Bell system and its competitors are presumably looking forward to a time when the concentrated and easily served market in the cities will be satiated, and when they will need new fields to conquer. They will also jealously watch the rates charged by companies benefiting from REA loans, as most operators wish to raise their present rates. The increased cost of labour since the war has not yet been offset by inventions which will, in time, permit one operator to dial any number direct to any part of the United States, and allow call and time limits to be recorded entirely by machinery. But for the present, at least, the provision of telephone facilities in country districts will be held up by the severe shortage of cabling and wires; these are more difficult to manufacture than the instruments themselves.

America's Sweet Tooth

American sugar producers have received somewhat sourly the estimate of the Secretary of Agriculture that Americans will consume 7,500,000 short tons of sugar in 1950. They had hoped for a lower figure. This paradoxical situation arises from the elaborate quota system of the Sugar Act passed in 1947 and first put into effect in 1948. A quota of 4,300,000 tons of sugar (never wholly filled) is reserved for domestic producers, which includes those in Hawaii, Puerto Rico, and the Virgin Islands, as well as the beet sugar farmers of California and Colorado and the cane men of Louisiana and Texas. Foreign producers share a market equal to the difference between domestic production and the estimate of domestic consumption. Usually they provide about half America's sweetening.

Because the amount of sugar allowed in affects the price—which is down to 5.8 cents a pound raw—the Secretary of Agriculture, as he attempts to predict the size of the nation's sweet tooth, has the domestic producer on one side pointing out the disastrous effects on home sugar interests if the foreign quota is too large, and the large domestic users—manufacturers of sweets and soft drinks and preserves—on the other painting dire pictures of an imminent sugar famine. This year sugar consumers sought an estimate of over 8,000,000 tons; producers hoped the Secretary would set it as low as 7,200,000 tons. His figure is a little less than actual consumption this year, but the disappointed sugar trade fears that the setting of a quota larger than that fixed at the beginning of last year (and later raised) will send prices down further.

The task of estimating consumption—and thus fixing quotas—is an ungrateful one. Consideration must be paid to the welfare of domestic producers, but also to the reasonableness of the resulting price to consumers; to the cost of living and the growth of population. On the last two occasions the estimates have proved wrong—too high in 1948, too low in 1949. America's sweet tooth has not yet recovered from the effect of the war, when it went on short rations. Annual consumption between 1935 and 1939 stood at 97 pounds a head; in 1949 it is estimated to have been about 94 pounds per person.

Correction.—In *The Economist* of December 17th, the article "Texas Transformed" contained inaccurate references to the Monsanto Chemical Company's activities at Texas City. Its plant there makes styrene, not fertiliser, and the ship laden with chemicals, which exploded in 1947, was not at the company's wharf, but a public dock nearby.

AN IMPORTANT ANNOUNCEMENT FOR BRITISH INDUSTRIALISTS SEEKING AMERICAN MARKETS

*The industrial research facilities of McGraw-Hill,
America's largest business and industrial
publisher, are now available to British companies.*

This means British industrialists can now use the same marketing survey facilities that many American manufacturers are using—to name a few: Dupont, R.C.A., Allis-Chalmers, Anaconda Copper, General Electric, United States Rubber, SKF Industries, etc.

McGraw-Hill, because of our unique position in American industry, are unquestionably the best-equipped organization in the U.S. to carry out your industrial market survey. We have made hundreds of successful surveys to date.

McGraw-Hill maintains 400 field investigators in all parts of the U.S.A., plus a trained staff of research analysts in New York City. Surveys can be made to cover large or small areas, whole industries and markets, or samplings of them. Prices are surprisingly reasonable. British clients can readily maintain a continuing contact through our London office while surveys are in progress. For further information telephone HOL. 0056 or write:

THE WORLD OVERSEAS

Democracy and the Vatican

(From Our Rome Correspondent)

THE year 1950, like each half century since 1300, save only for two, is a Roman Catholic Holy Year. The two exceptions were 1800, when the French occupied Rome and 1850, when Pius IX, who had been—in present parlance—a Left Wing hero, returned from brief exile to a lately rebellious Rome supported by French bayonets. His fifth successor, the present Pope, also had his moment as the object of Left Wing acclamations, for on June 6, 1944, after the German withdrawal, he blessed from St. Peter's balcony a crowd of Roman citizens carrying mingled red and white flags. It was a moment of brief appeasement born of the common struggle of Christians and Communists against neo-pagan racialism. But by 1948 the Papacy had fully resumed the position in revolutionary demonology which it held after 1848. Holy Year 1950 is the object of bitter scoffs from the Marxists and no great cordiality from the Italian "lay" parties of the Centre and Right—Social Democrats, Republicans, Liberals, Monarchists and "Homesicks" or neo-Fascists.

The opening of the Holy Year has coincided—and there is something in the atmosphere which links the two events—with a secondary but significant and passionately discussed Government crisis. The occasion was given by the latest Socialist split which weakened the most substantial of the three small "lay" parties represented in the present (fifth) De Gasperi Cabinet, bringing about in November the impetuous "provisional" resignation of its leader Vice-Premier Saragat and two colleagues. Signor De Gasperi appointed interim Ministers to the three vacant posts and promised to resolve the crisis in January. Through December the question raged whether Signor De Gasperi, who has now completed four years of impressive premiership, would succeed in building his sixth Government on the same basic lines as the fifth. In the fifth, the three "lay" parties of the Centre, although holding only 57 seats in the Chamber to the Christian Democrats' 306, held 7 out of the 20 Cabinet posts.

Idealists Among the Clericals

Each of the "lay" parties has had its malcontent wing, fretful at being linked to the enormous "clerical" party during times of industrial unemployment and rural upheaval. A common determination to hold the Communists at bay has alone kept the small parties joined with the great. But the fretfulness has been fully echoed in the great party. To the young and the left of the Christian Democrat Party, the presence of "lay" party personalities like Saragat, Sforza and Pacciardi in the Cabinet may be tolerable, but they find it exasperating that the parties behind these men should be giving instructions to fight for particular lines in the Cabinet. The leader of the Christian Democrat Left is an ardent and fascinating speaker, Professor Giuseppe Dossetti, a 36-year old Professor of Ecclesiastical Law, Deputy, and member of the party directorate. His vision of the task of Christian Democracy in Italy is that it should stir the country to its depths towards a programme of social justice inspired by Catholic faith. The slightly older Minister of Labour, Amintore Fanfani, author of numerous treatises on social economics, shares these enthusiasms. It is evident that they worry Signor De Gasperi, who views the

political arena as a place where men and groups who differ in ideas and ideals often meet in their pursuit of practical ends.

Devout churchman that he is, Signor De Gasperi remembers how often in a century the Italian public has swung between extremes of feeling about the role of the Church in politics. He has steadily worked to perpetuate a wider basis for state democracy in Italy than can be afforded by a party whose strongholds are the rural parsonages. At the moment of writing the Prime Minister is engaged in extracting from his own party's organs an authorisation to offer to the "lay" parties sufficient political guarantees and offices to keep them in the new Government. He enjoys the indispensable leader's power of pressure upon these organs. Yet his sixth Government will be born, not like the fifth in 1948 under the sign of a shared victory over Communism, but under that of a pressure, on the Christian Democrat side, to be allowed to cope with industrial reorganisation, agrarian reform, syndical discipline and moral and scholastic education on its own lines of Christian tradition and dynamic; and on the side of the "lay" parties, to have a substantial share in dignities and responsibilities alongside the larger party which, in their view, owes its great parliamentary predominance to the fear of Communism in 1948 rather than to national sympathy with its particular philosophy.

Work of Catholic Action

Holy Year throws into strong relief that side of Christian Democracy which is attached to the clergy, the Hierarchy, and the Holy See. Signor De Gasperi and his Ministers do not, as readers of frivolous Italian publications will suppose, call at the Vatican for instruction and guidance; the swish of silk cassocks is not heard in the corridors of Government offices; nor, indeed, at meetings and congresses of the Christian Democrat Party are the clergy or monastic personages as much in evidence as they were in the heyday of the Popular Party, its pre-Fascist predecessor.

Yet the array of ecclesiastical interests in politics is impressive. True, there is a most definite formal differentiation between the Christian Democrat Party and Catholic Action, the great organisation for "collaboration" of the laity in the apostolate of the Church, which works under a committee of three Cardinals, but whose effective manager is Dr Luigi Gedda, one of the most forceful men in Italian public affairs. Catholic Action controls a nation-wide network of men's, boys', women's and girls' societies, students' and school-teachers' clubs, and has general secretariats for (among other questions) press and theatre. Dr Gedda, incidentally, is said not to belong to the Christian Democrat Party. Yet distinct as are the political party and Catholic Action, the latter has strong political interests which only the expert distinguishes from those of the party. It was Dr Gedda who, at the 1948 elections, formed Civic Committees in all towns for withstanding Communism, and flooded the walls with hard-hitting and expensively produced propaganda. It is from the Labour groups (ACLI) of Catholic Action that the new "white" trade unions have largely grown.

To the anti-clerical zealot, sincere or factious, Christian Democracy, Catholic Action, and Papacy are all one, and

the immense religious processions in Rome which preceded the commencement of Holy Year, the concentration of building power on beautifying ecclesiastical sites, the eager expectancy of the Rome tourist industries and of tradesmen for thousands upon thousands of pilgrims (640,000 journeys have been booked through Church channels alone) combine to give the impression that affairs have turned a full cycle between 1850 and 1950 and that Pius XII is the sovereign, with Togliatti storming against him as Mazzini stormed against Pius IX.

Whoever else believes in that picture, Signor De Gasperi does not. No one is more dutiful towards his spiritual Head than the statesman who was once a junior librarian in the Vatican; but he obviously does not base his political calculations on mistaking a mild and much loved Pontiff for a new Hildebrand.

The Jute Quarrel

[FROM OUR KARACHI CORRESPONDENT]

EVER before the Indian rupee and the Pakistan rupee parted company, jute was a fairly prolific source of inter-Dominion disputes. This was an almost inevitable consequence of a situation in which East Pakistan grew the bulk of the jute, but had no mills of its own, while India's immense jute industry had to depend mainly on East Pakistan for its raw material. Under the Commodities Agreement, the Indian mills were assured of 5,000,000 bales in the 1948-49 season, and 4,000,000 bales in the current season, out of the total East Pakistan crop, which should amount to about 6,500,000 bales in a good year. Prices, however, had risen sharply since partition, and the Indian Jute Mills Association argued that, if the mills were to make any profit at all, the new prices would put jute goods clean out of the world market, and encourage the use of substitutes. Pakistan retorted that the rise in Indian labour costs was largely responsible for this and it was the turn of the East Bengal cultivator to make a decent profit from his main crop.

The devaluation of the Indian rupee naturally brought about a crisis, for it meant that, if the new exchange ratio were recognised, the mills would have to pay 44 per cent more for the raw material if Pakistan's export prices remained unchanged. Both sides tackled the problem energetically but, alas, independently. The Indian authorities fixed a maximum price of Rs.35 (Indian) per maund for all bottom grades delivered at Calcutta, which they claimed was the highest price they could economically pay. At the same time, they increased the export duty on hessian goods from Rs.80 to Rs.350 per ton, which contradicted this claim by providing a clear indication that there was scope for paying more for the higher grades of the raw material. The Pakistan authorities fixed a minimum price of Rs.23 (Pakistani) per maund for bottom grades delivered at the baling centres. This represented a slash in prices of about 25 per cent as compared with the average prices ruling previously, but even so meant that, at the official Pakistan rate of exchange, jute could only be delivered at Calcutta at Rs.10 (Indian) per maund above the official Indian rate.

Suicidal Trade War

With good will on both sides, the gap could be bridged, but good will is totally lacking. The situation is bedevilled by political motives and prestige considerations, a trade war is being fought with no holds barred, and there is real danger that both sides will, before it is finished, have gravely damaged the jute trade, which, for both countries, is the chief producer of foreign exchange, and of dollars in particular.

The heat has been generated by hasty assumptions on both sides. India immediately jumped to the conclusion that Pakistan's decision not to devalue was inspired by political

considerations, while Pakistan was equally quick to assume that the Indian Jute Mills Association, with the support of the Government of India, was deliberately trying to crack the Pakistan rupee and bring East Bengal to its knees, by refusing to purchase jute at prices acceptable to Pakistan. Both assumptions were wrong. The Pakistan non-devaluation decision was taken on purely economic considerations, and the mills, for their part, were quite genuine in their feeling that Pakistan prices were uneconomic. Unfortunately, there is little sign of better feeling developing. It is true that a better appreciation of the Pakistan point of view was recently discernible in Calcutta, but the Pakistan authorities have forfeited much of the sympathy which was coming their way by holding up some 60 flats (barges) containing about 300,000 bales of jute bought by India, mostly loaded before the devaluation date, and duly cleared through the Customs. The pretext for this action is that Pakistan requires proof of payment, but the Jute Board's attitude in regard to this matter appears to be obstructionist and is quite indefensible.

In the early stages of the deadlock, Pakistan mobilised its resources with great energy. A Jute Board was appointed, with headquarters in Narayanganj, the main baling centre, and was given almost dictatorial powers. A National Bank of Pakistan was brought into existence—much earlier than had been contemplated—to finance jute purchase by granting advances to agents appointed by the Board. The function of the agents is to purchase jute from the cultivators or middleman. If they are unable to sell it, they are entitled to sell it to the Board at the fixed minimum prices. The Board is undoubtedly displaying great efficiency and drive, with the result that optimism is growing in East Bengal.

New Customers Overseas

The main problem, of course, is the disposal of the jute crop in the absence of buying support from India, hitherto the recipient of about two-thirds of the crop. Some six weeks ago the outlook was grim, because foreign buying had not commenced, but since then the United Kingdom, France, Italy, the United States, and some other countries have now entered the market. The Jute Board is optimistic and, proceeding on the basis of a crop of 5,000,000 bales, reckons that it will have only 1,500,000 bales to dispose of during the January/June 1950 period. The Board intends to keep 500,000 bales as reserve or buffer stock, while they hope that the remaining 1,000,000 bales will be absorbed into the foreign market during the January/June 1950 period. The trade considers these figures somewhat inflated, and the strength of the foreign demand over-estimated.

Transport and shipment also create serious problems, for the Jute Board has put a stop to transit shipment through Calcutta, thus throwing the whole weight on Chittagong. An expert view is that not more than 1,240,000 bales could be transported to and shipped from Chittagong between December 15, 1949 and June 15, 1950, when the new crop will be beginning to appear. According to this view, Pakistan will be left with 1,260,000 bales on its hands, which will involve an enormous storage problem. Most of this will be unsold, and one cannot eat "the golden fibre" any more than King Midas could eat gold.

Nevertheless, the course of events is more favourable to Pakistan than anyone would have supposed two months ago. Smuggling, which was a serious chink in the armour, has been brought partly under control, and jute is being bought at the baling centres at prices slightly above the minimum. It would not be true to say that Pakistan is winning the jute war, for it is a war in which both sides must lose, but the indications are that India will be the heavier loser. The Indian mills may be able to carry on till the end of March, but there is a probability of their having to close for two or three months before the next jute season begins. The prosperity of Calcutta rests primarily on its jute industry, and closure would be disastrous from several points of view. Meanwhile, some of the mills are undermining the policy of their own

side by purchasing Indian jute at black-market prices, thereby also weakening the claim of the Indian Jute Mills Association that the maximum prices are the highest that can economically be paid.

Negotiations between the two Dominions are urgently needed. Even if this season must be written off, it would be folly to allow the deadlock to be projected into the next season. The Pakistan Government must decide its future policy within the next few weeks. If there is no prospect of India coming forward as a buyer, it intends to aim at a reduced target of no more than 4,000,000 bales. The reduction in the crop will not mean a dead loss, for the resultant switch over to rice production will obviate a drain of foreign exchange and will make East Pakistan self-sufficient in the staple foodgrain of the Province. The loss of revenue will, of course, seriously affect Pakistan's budget, for the reduction in the crop will mean a decrease of about Rs 5 crores in export duty. This would be a heavy sacrifice, having regard to the fact that the whole proceeds of direct taxation of incomes, including company taxation and business profits tax, amount to only Rs 9 crores. India hopes to increase its own crop to 5,000,000 bales within the next two years, but, even if this somewhat ambitious target is reached, it will hardly be enough and the quality will not be up to East Bengal standard. Unfortunately, prices cannot even be discussed until the Government of India recognises the exchange rate. If, in fact, Pakistan has made a mistake by not devaluing, the Pakistan rupee will, in the long run, be subjected to higher pressure and put to a more genuine test under unreal trading conditions than when trade is impossible.

The Franco-Polish Dispute

[FROM OUR PARIS CORRESPONDENT]

AFTER a mirthless pantomime, more inane even than previous exhibitions of Communist "justice," a Polish military court in Wrocław last week sentenced four French citizens and two Polish nationals to lengthy sentences of imprisonment for espionage and sabotage. The condemnation of Mademoiselle Bassaler and her fellow accused marks the end of the first stage in the anti-western campaign undertaken by the Warsaw government, which was opened by the arrest on November 18th of M. André Robineau, a French consulate employee, as he was boarding the plane to Paris. The Wrocław "trial" was conducted in conditions of perfect illegality: false witnesses who had been held *incommunicado* were brought straight from prison into court; counsel for the defence, first presuming the guilt of their clients, added their weight to the prosecution; and the French diplomatic mission to Poland was explicitly mentioned in the terms of the accusation. During the proceedings, the Polish authorities devoted themselves entirely to invective.

The current campaign in Poland—in so far as it is Polish and not part of an overall Soviet measure designed to thicken the Iron Curtain—nevertheless differs from previous Balkan frame-ups by being directed specifically against France. It would doubtless have been possible to trump up charges against members or employees of any of the western missions. It seems that, in this instance, the Polish Communists had two objectives, one domestic and one anti-French. First, they wished to incense Polish opinion against "foreign saboteurs" who were to serve as the whipping boys for the government itself, which had been proved so disastrously incapable of maintaining industrial production. Second—and this may well have been the campaign's principal object—the Polish government wished to sever all bonds between the French mission to Warsaw and the human world outside its embassy and residences, and thus condemn French envoys to that state of suspended animation in which they and their western colleagues subsist in Moscow.

All western missions to Warsaw are, as past fracas have shown, unpalatable. But French influence, emanating in one way and another from the 400 French citizens at present living in Poland, may well be especially "dangerous." French culture having for centuries represented something like an ideal stamp of education and the standard of civilisation, it is understandable that the French Institute in Warsaw (of which the arrested M. Robineau's father was the director) and its branches in Cracow and other towns have, by their mere presence, been a thorn in the flesh of other culturalists from the east. For even a trickle of the acid of French scepticism must prove corrosive to Soviet propaganda material. The subsequent expulsion from Poland of all French teachers, uncharged, has lent colour to this view.

Round-Up of "Spies"

In French circles it is considered improbable that these acts of political provocation will lead to a breach of diplomatic relations by France. The French government naturally shrinks from abandoning entirely the task of protecting those French citizens remaining in Poland. Nor is it obvious that the convenience of removing Polish representation from France would, for the French, balance the disadvantage of losing an observation post in Communist territory. The tendency in the cold war appears to be rather to hang on for "nuisance-value" than to decamp in a huff.

Meanwhile the Polish offensive seems to have offered a useful opportunity to the French Ministry of the Interior. The raids and expulsions since effected by the *Sûreté Nationale* had long been planned for the day when Poland should give suitable provocation. Thus the French authorities by the prompt deportation of 17 Poles and the arrest of Mr Sczerbinski, Polish Vice-Consul in Lille, have been enabled to disperse a Communist spy-ring engaged on "economic and social sabotage of the Republican institutions of France." Those expelled included the editor of the *Gazeta Polska* in Paris and the president and the secretary-general of the National Council of Poles in France. On the premises of the associations of Polish Youth, of Polish Scouts and the union of Polish Women, documents were found which, according to the French authorities implicated these organisations in Communist conspiracies against the French State. The *Sûreté Nationale* has also stated that Polish Communists have interfered in French strikes. (The expelled Poles possessed, it was discovered, cards of the French Communist Party.) The Polish Vice-Consul in Lille, who is awaiting trial for espionage and who is the only Pole still under arrest in France, is to be defended by Maître Nordmann, who appeared for the defendants in the Kravchenko lawsuit in Paris early this year.

Latin America's Dictators

[FROM A CORRESPONDENT]

THE roots of the present drift towards regimes of force in Latin America goes back to the unsuccessful attempt by Mr Spruille Braden, then US Ambassador in Buenos Aires, to influence the Argentine people to vote against Perón in the February, 1946, presidential election. Mr Braden's appeal was unsuccessful, and with the election of Perón to the presidency a blow was struck not only at United States prestige in Latin America, but at democracy in the hemisphere.

Immediately upon his inauguration, Perón began to extend his influence beyond Argentina. "Labour attachés" were sent to each of the Argentine embassies and legations in America. Their purpose has been to carry the good word about the "Perón Revolution" and to line up the trade unions and other labour groups on the side of Perón's own labour organisation. At the same time, the military clique,

of which Perón is the outstanding figure, is widely believed to have more or less close connections with similar "lodges" and secret organisations in other Latin American armies which have been influential in establishing recent dictatorial regimes.

Perón's propaganda has been effective. The labour attachés have built up sympathetic followings in most of the countries of the continent. In Panama the largest labour group is avowedly Peronista, while in Haiti, Cuba, Mexico, El Salvador, Peru, Brazil and other countries there are larger or smaller groups which are in sympathy with the Perón administration and its labour appendage. The relations with—or at least the model of—Perón's military group, however, have been more important in bringing about the recent trend towards dictatorship. The Second World War, with its demonstration of the fate of Europe's most powerful military group, and the democratic feelings which were aroused in its prosecution, acted for a while as a deterrent to over-ambitious military men. But the successful example of Perón in Argentina, where a military group made a bid for, and won, the support of large segments of the population has had a profound effect throughout Latin America. The overthrow of the old dictatorships and the rise of democratic regimes in Peru, Venezuela, Brazil, Cuba and other countries in the last months of the war and the first year thereafter, seriously disturbed the groups which have dominated many of these countries for generations, but they are recovering their footing and they have jumped at the least opportunity to return to "safe" dictatorships.

Mistakes of the United States

Errors by the United States have played their part, too. That country's apparent unwillingness to do anything decisive to put a stop to the dictatorial trend, the insistence of American military staffs on continuing to "rearm" their Latin counterparts, regardless of the role which those armies are playing in their countries' political life are undoubtedly important. It is also probably true that the anti-Communist hysteria in the United States has been a contributing factor. The arrest, prosecution and deportation of Communists make the United States appear to the Latin Americans as less democratic than it sees itself to be, and thus discredits democratic theories. Some Latin American governments have used the American example as an excuse to take similar measures—not only against the Communists but against any group which is opposed to those in power.

Whatever the cause of the dictatorial trend in any individual country, several important nations have succumbed to dictatorship since 1947. The first of these was Peru. In 1945, in the first democratic and free election in a generation, the voters of Peru elected Jose Bustamante as their president. He was successful only because he was supported by the *Aprista* party—a left-wing, non-Communist group which has been the country's majority party for nearly a quarter of a century but has been outlawed during most of its existence. Bustamante was not an *Aprista*; at first he co-operated closely with them, but later he came increasingly under the influence of conservative-minded military men, who made up his cabinet after the resignation of *Aprista* Ministers in January, 1947. Affairs came to a breaking point on October 3, 1948, when a naval mutiny was blamed on the *Apristas*, and President Bustamante outlawed the party. Three weeks later Bustamante, having served the purpose of the reactionaries—by outlawing the *Aprista* party—was himself ousted by a military group headed by General Manuel Odria.

The Odria regime has been rigorous. All leading *Apristas* were either imprisoned, exiled or went into hiding. The trade union movement was hamstrung while the government attempted to oust the *Apristas* from control of it. At the same time President Odria, who has been closely advised by Argentine officials, has sought to gain the support of the

workers by creating various social laws—minimum wages, improvement of social security, and so on.

The Peruvian upset was followed closely by the expulsion of the democratic left-wing government of President Romulo Gallegos in Venezuela. President Gallegos was the first popularly elected chief executive in the country's history; he was the titular leader of a left-wing, non-Communist political party, the Democratic Action, which itself came to power in a *coup d'état* in October, 1945, and he had carried out a broad programme of political, economic and social development.

The Democratic Action regimes aroused the anger of the military cliques by building up popular forces such as political parties, trade unions and peasant movements which might in time be capable of challenging the position of the army, who has always been dominant in Venezuelan politics. This, plus internal rivalries in the army itself, brought the

military coup of November 23, 1948. The resulting regime has followed a policy not unlike that of President Odria in Peru. And in both Peru and Venezuela there is considerable indication of Argentine influence among the dominant military group.

The latest and perhaps most serious event has been the establishment of a virtual dictatorship in Colombia. This country had had a civilian and peaceful Government for over fifty years and it was rated as one of the few real democracies of the continent. So much was this so that even the Minister of Defence was usually a civilian. But after the Conservative party had again elected a president in 1946 (as a result of a split in the ranks of the dominant Liberal party), an extreme element seized control and during the last two years there has been a reign of terror against Liberals—first in isolated urban and country districts, and more recently in the principal cities and towns. Early in November, 1949, the President, Perez, established a state of martial law, dissolved the Liberal-controlled Congress, and imposed a

close censorship. He went forward with presidential elections, from which the Liberal candidate withdrew claiming that a free election was impossible. As a result Laureano Gomez, admirer of the Nazis in the 1930s and now a friend of Franco (he spent over a year in Spain from 1948-49) was elected president on November 27th. He is surrounded by a group which established a Black Shirt organisation in the late 1930s. The members of this group are now provincial governors and cabinet ministers.

Meddling By Perón

Other countries have also suffered from this trend towards dictatorship. The Haitian president, Dumarsais Estimee, proclaimed a state of siege in the middle of November, 1949, and outlawed all opposition parties and half a dozen newspapers in Port-au-Prince in "preparation" for congressional elections in January, 1950. Chile has been constantly plagued by intriguing on the part of reactionary civilian elements and military men influenced by Perón. At one point the Chilean Government forced the withdrawal of the First Secretary of the Argentine Embassy for meddling in Chilean internal affairs. Panama, too, has recently been subjected to a military *coup d'état* by the National Police Force.

Fear is widespread in the remaining democratic countries of Latin America. These governments are on the constant alert for an attempted uprising on the part of the army or of reactionary conservative elements. While making gains in the cold war in Europe, the United States may soon wake up to find it has lost, almost by default, a local cold war with Perón and his militarist and reactionary allies throughout the Americas.

Nazi Revival in Bavaria and Austria

[FROM A CORRESPONDENT]

No study of post-Hitler right wing radicalism can be complete without paying special attention to the situation in Bavaria. It is here, and in the mountain valleys of next-door Austria, that the most concentrated nexus of post-Naziism has grown up. The Alpine Redoubt, which was an Allied nightmare in 1945, shows signs of becoming a postwar political reality.

Denazification in Bavaria has been a farce. A recent American intelligence survey reveals that the Bavarian administration is largely in the hands of those who controlled it under Hitler. Overall figures show that 20,682 of the 49,445 *Beamten* belonged to the Nazi Party or its affiliates. A total of 14,443 of these were dismissed and later reinstated in the service, while only 5,780 new members were admitted to this privileged class. At the beginning of this year, the Bavarian Minister of Culture announced that almost all the 11,000 teachers who were removed for political reasons have been reappointed. This group represents roughly 60 per cent of the teaching staff employed by the Ministry. 60 per cent of the 15,000 employees in the Finance Ministry are former Nazis, 77 per cent of the 1,918 in the Food Ministry and 81 per cent of the 924 judges, magistrates and prosecutors in the Ministry of Justice. With its extraordinary loyalty to the state as such and to the emoluments derived therefrom, the *Beamten* class made the transition from the Weimar Republic to the Third Reich without difficulty, and would probably tolerate another such transition with a minimum of protest.

There are 6,947 *Bürgermeisters* of Bavarian communities with less than 10,000 inhabitants. Of these, 1,589, or 22.9 per cent of the total have been elected to office despite in-

crimination under the denazification laws. Moreover, the pensioning of officials who served Hitler's Reich appears to be the rule rather than the exception. A good many former senior Nazis, too black to be reinstated even under present conditions, still draw good pensions from the state. In a typical instance, the former police inspector for Defence District XIII, Major-General of the Police and former SS-*Standartenführer* Paul Will, who lives in Nuremberg, received 1,162.67 Reichsmarks per month from the Ansbach district of the state government when he was pensioned off. After currency reform his pension was "reduced" to 1,024 Deutsche Marks.

Loritz the Demagogue

Bavaria has also provided a personality who, by the very fierceness of his individuality, lies outside the various groups who were studied in a previous article* and whose forceful appeal and fantastic gifts for demagogic oratory mark him as a potential national figure—Alfred Loritz, head of the Economic Reconstruction Party, which elected 12 members to the Bonn Parliament. The fact that, like Otto Strasser, Loritz has a record of opposition to Hitler, does not make him any less of a right-wing nationalist. His hysterical and ululating appeal to the "wonderful German people" in all their trials and tribulations and his wild constitutional ideas, which include government by a cabinet of appointed experts, could one day well find him a successor to the political heirs of those he claims he killed by planting the *Bürgerbräukeller* bomb in Munich in November, 1939. To see Loritz gestulating and swooping behind the battery of microphone shafts like an emaciated gibbon is one of the sights of the Bonn Parliament; and to all the oratorical tricks that Hitler ever had, he adds a mordant sense of humour, whose shafts have more than once turned Chancellor Konrad Adenauer pale with fury. Both Loritz and Joseph Baumgartner of the Bavarian Party unashamedly based their recent national election programme on contempt for the established democratic parties and on appeals to the refugee and former Nazi elements.

But it is in Austria that the sudden strength of organised right-wing radicalism in a sterile political situation has been most vividly shown. With Social Democrat opposition canalised into a coalition with the People's Party, right wing malcontents have been quick to seize the opportunity to bite the hands which have re-enfranchised them over the last four years. Four hundred and fifty thousand Nazis have recovered their civil rights. In the recent national elections the "Union of Independents," formed only six months earlier, obtained 450,000 votes. Yet three major groups of independents presented themselves at the polls. Josef Dobretsberger's association of enlightened liberals obtained a few thousand votes in the whole country, and the "Fourth Party" was almost completely disregarded.

The two government parties have made much of the existence of an action group known as "Organisation Spinne" (Spider) which maintains close liaison with Bavarian Nazi groups for the purpose of bringing about a second *Anschluss* with Germany. Dr Canaval, editor of the *Salzburger Nachrichten*, who has set himself up as a private scourge of the Union of Independents which are led by Herbert Kraus and Viktor Reimann, delights in producing reams of typewritten evidence that three former SS *Obersturmführer*, Erich Kernmeyer, Wilhelm Höttl, and Karl Schachermeyer, are the leading spirits in this conspiracy, which he alleges is financed out of former Gestapo treasure chests still lying hidden in the caves of the Salzkammergut.

Broadly speaking, the professional officer class in Germany has, with a few exceptions, remained aloof from the network of intrigue which surrounds these nationalistic strivings. Major-General Remer, the commander of the Berlin garrison

* see *The Economist*, December 10, 1949, p. 1301.

unit which foiled the July 20th revolt, has appeared on political platforms, but is at the moment in eclipse, and General Natzmer and Field Marshal von Manteuffel were at one time identified with some of the earlier and abortive von Ostau groups. Elaborate "welfare" organisations ensure that former officers keep in touch, but their interest is far more the purely professional one of waiting to see whether the needs of western European defence will result in the setting up in western Germany of some counterpart to the Soviet sponsored "People's Police" in the east. However, each nationalist group has a few officer members who are popularly supposed to be carrying out liaison functions.

It is a witches' brew that the Bonn Government is called upon to watch. While firm policies and continuing economic prosperity will do much to keep this subterranean menace in check, any faltering in recovery might lead to a sudden crystallisation of the new race of "have-nots" into a potent single organisation whose attack on German democracy would be deadly.

Titoists in Norway

[FROM OUR OSLO CORRESPONDENT]

WHEN a national congress of Communists took place in Norway in February the Danish Communist leader Aksel Larsen was present as a guest. When the meetings were at an end he rose and said he had the impression that there were two Norwegian Communist parties—not one. Thus, when the leaders of the party, Emil Lövlén and the ex-member of Storting, Strand Johansen, suddenly in October declared that there existed a "party-hostile centre within the party" it was not a surprise. But it certainly was a surprise that the minority represented by Johansen and Lövlén had the power to declare the general secretary, Peder Furubotn and his group, as "Titoists" and expel them from the party. Anybody with any pretence to knowledge of developments in Communist circles would have expected Peder Furubotn and his group to receive authority from Moscow to expel the other group. As it is, complete chaos exists within the party—but support for the Titoists is growing.

With Peder Furubotn has gone the vice-chairman of the party, Roald Halvorsen, the director of the Communist publishing house, Tom Rønnow, the chief editor of the Communist periodical *Vår Vei*, Haavard Langseth and several others. This group retained some support from the Communists in Trondheim, Namsos, and at Mo in Nordland. Opposing them are Lövlén, Johansen, and the majority of Communists in Oslo, Skien and Bergen. The chief editor of the Communist daily paper *Friheten*, Jørgen Vogt, also sides with Lövlén.

Immediately after he was declared a "Titoist," Furubotn "went underground." It was several days before he reappeared. Rumour said he was in Moscow. This is improbable, but it is probable that he visited Sweden in an effort to obtain allies among leading Swedish Communists and the representatives of the Cominform there. Strand Johansen, who had been very active during "the purge" suffered a nervous breakdown and is now in hospital.

It is very hard to find the real reasons for this split and it will take some time before the final results emerge. It is likely, however, that personal controversies played a great role. Obviously it is very hard to take a defeat like the one the Communists suffered in the October elections without considerable quarrelling among the leaders of the defeated party. There is some speculation about the possibility of the Communists who have been thrown out by Lövlén and Strand Johansen becoming members of the Labour party. This happened to several Norwegian Communists when they suffered such a severe set-back during the years 1924-1930.

One of the Communists at that time was Fredrik Monsen, who later became a Labour member and eventually president of the Storting. This time, however, it is most unlikely that Labour will receive any Communists. Not only are they regarded as professional trouble makers, but also Labour today has candidates enough for leading jobs.

Quarrels Among the Defeated

There is, in fact, little doubt that the October elections must have been the time when the fuse was lit which has now caused the explosion. The personality of Furubotn also accounts for a great deal. During his prewar years as leader of the Communists, Furubotn showed only a few of the qualities of a political leader. He was a typical "Marxist theologian," with his head full of Marxist theory. From the very start different sections of the Communist Party struggled against each other. One of these sections was the so-called *Mot Dag* group under the leadership of Erling Falk, who translated "Das Kapital" into Norwegian. Furubotn succeeded in 1929 in throwing out Falk and the *Mot Dag* group as "counter-revolutionaries and place hunters."

During his prewar years as leader of the communists, Furubotn showed only a few of the qualities of a political leader. He was a typical "Marxist theologian," with his head full of Marxist theory. From the very start different sections of the Communist Party struggled against each other. One of these sections was the so-called *Mot Dag* group under the leadership of Erling Falk, who translated "Das Kapital" into Norwegian. Furubotn succeeded in 1929 in throwing out Falk and the *Mot Dag* group as "counter-revolutionaries and place hunters."

About 1930, there was a new development. Furubotn was called to Moscow and stayed in Soviet Russia until 1938. He then settled in Bergen and lived in comparative retirement until the war came. He then became very active in the underground, and, in 1941, was again made general secretary of the *Norges Kommunistiske Parti*. He organised his own partisan movement and often took the initiative contrary to the will of the Home Front leaders. After the war, without giving any reasons, he gave up his job as general secretary, but under pressure from the Party he agreed to carry on. At the second national congress of Communists in February this year he was absent and his opponents got him removed from the Central Committee of the party. However, his adherents got the majority in the national committee which appoints the members of the central committee, and he was thus able to retain his position. Since that meeting he has carried on the activity which his opponents, Lövlén and Strand Johansen, have called "Trotskyist Titoistic Bourgeois-national."

During the occupation years, Furubotn did, in fact, regard himself as a "Norwegian Tito"—a name which the Swedish Communists gave him, but which has little relevance to his performances, and since then he appears to have suffered from megalomania.

Nevertheless, well-informed observers consider Furubotn to be entirely loyal to Moscow. Moreover, he is still the leader of the secret organisation which Moscow uses in Norway for gaining information and for making trouble. It should also be noted that when people in other countries who were apparently in the same position, expressed any sympathy for Tito they were immediately attacked by Moscow. But Moscow has not to this day uttered one word against Furubotn. The whole matter is left open. It is beyond doubt that Lövlén and Strand Johansen were authorised by Moscow to start a purge in Norway. But Moscow still does not attack Furubotn openly. This caution may be because Furubotn knows so much about the secret Communist organisation. Be that as it may there is no doubt that the purge in Norway is a hard blow to Communist influence in industry. Their vote at the elections fell from 170,000 to 101,000. If elections took place now they would probably lose at least another 40,000 votes.

Reflection

Your Board Room or Office is a reflection of your efficiency and should be a forceful part of the business of selling, whether it be sales or services. You will find this efficiency in Catesby Office Furnishings and we offer you our full experience and tradition of service. We invite your enquiries for a single item or complete new office to our Director of Contracts.

Your enquiries for floor-coverings, and for any assistance are cordially invited.

A NEW PRODUCTION METHOD

THE 'NELSON' WELDING GUN
A better job because of BAKELITE

BAKELITE LIMITED • 18 GROSVENOR GARDENS • LONDON • S.W.1 • SLOANE 9911

stepped up output...
lowered costs...
guaranteed accuracy

The 'Nelson' welding gun (marketed by Crompton Parkinson Ltd.), which fixes studs to steel surfaces by welding instead of drilling and tapping, is now produced to specification much more quickly by transfer moulding the main body in BAKELITE high-strength material Grade X199/3 Natural. This moulding incorporates many metal inserts, including a heavy copper solenoid, and is characterized by its precision and great strength.

There is a BAKELITE material for every known application—and among them one which may help you to simplify some operation, speed it up and reduce its cost. Why not avail yourself of our co-operation? Ring our technical representative at Sloane 9911 (London); Midland 5911 (Birmingham); Central 4908 (Manchester); City 6825 (Glasgow).

New Weapons Against Pests

OVER a million acres of land in Britain were sprayed last season to protect crops from damage by weeds and pests. This acreage is perhaps four or five times the area sprayed before the war. It indicates the growing interest and belief in chemical methods of pest control, methods which have been increased in efficiency and reduced in cost by the development of several new materials. Most of the materials now used are complicated preparations not heard of in agriculture before the war. That they have succeeded, so far, in earning the confidence of farmers and fruit growers in so short a time is an argument in favour of their effectiveness.

These new chemicals are of several kinds and are applied for a number of distinct purposes. For example, the selective weedkillers destroy only certain classes of plants; hence they can be sprayed on certain growing crops to kill particular weeds. There are two distinct types of such selective weedkillers. One class consists of "di-nitro" compounds which kill the plant at the point where it puts on new growth; if the growing crop is shielded by its own leaf formation, the weeds take the full effect of the spray and the crop grows on unharmed. Such "di-nitro" sprays can be used on cereal crops, grassland, peas, flax and lucerne. The second class of weedkiller, based on the new knowledge of hormones, kills by stimulating growth to an unnatural extent. These preparations are absorbed into the root system of plants. Cereals and grasses are not affected by them, but weeds (and indeed crops other than grass or cereals) undergo a biological explosion and perish. The application of both kinds of weedkillers needs careful control to avoid damage to crops. Again, the balance between the application of weedkillers and the application of fertilisers requires further research.

Insecticides are simpler to apply and more direct in their effects. Selective weedkillers are new; but there are many familiar insecticides which, with few exceptions, will destroy or control most insect pests. Applied in the form of sprays, these insecticides remain effective for a comparatively short time. Sun, wind or rain may remove the droplets from the plant or trees; the active chemical itself may have only a short life; and some of the worst pests breed fast. Good pest control, therefore, has always meant frequent spraying, which is costly and may put the control of insect pests beyond the reach of backward or unprosperous growers. Research has added several new insecticides, more persistent in their effects, to the older preparations. Two of them, DDT and certain preparations based on phosphorus, kill on contact, and a third type makes the plant itself poisonous. DDT is not a universal killer. It destroys several species previously immune but not, among others, the red spider mite; for this reason DDT created a red spider infestation in its first trials simply because it killed the natural enemies of the mite. Most of the phosphorous insecticides, particularly parathion, kill a very wide range of

insect pests. Another class, also based on phosphorus, is known as "systemic" insecticides; these preparations are absorbed into the plant system through the surface of the leaves and render the plant poisonous to any sap-sucking insect for as long as four weeks. Such "systemic" compounds have several advantages. It is not necessary to cover the plant with spray, since the whole of it, and not merely the part touched, becomes poisonous. Rain will not wash them away. And since the natural enemies of the sap-sucking pests are left unharmed, they are able to destroy any of the pests which may have survived a non-lethal dose to lay the foundations for an immune species. Naturally, systemic insecticides can only be used to protect those crops which are attacked by sap-sucking pests, but many of these pests belong to species which, because of their rapid breeding, are particularly hard to control.

Some of these new preparations are not without their dangers, and it is entirely proper that the public health authorities should watch their use and results very closely. Phosphorus insecticides (particularly parathion), "di-nitro" compounds and systemic insecticides would be lethal if carelessly handled. Protective clothing and air-conditioned tractor cabs are among the necessary precautions. Even so, the first two groups have caused chemical poisoning in Britain and in the United States. A wider risk lies in infecting the crop. Manufacturers warn the grower that no crop must be harvested within 30 days of treatment with parathion or six weeks with systemic insecticides. These precautions should give a wide safety margin to protect the consumer; but as the regulations stand, it is the responsibility of the grower to see that they are respected.

Even this does not complete the account of new insecticides. Recently, two new insecticides have been developed to kill pests which had previously been invulnerable. One is benzene hexachloride, already used for destroying locusts, which can be applied as a cereal seed dressing to kill wireworms if they attack the seed. The other is a soil fumigant which kills the root-knot eelworm; this pest is not found in Britain (at least outside glass-houses where it gives great trouble to tomato growers) but it does tremendous damage to crops in tropical countries.

The techniques of these new weedkillers and insecticides have been worked out more quickly than their economics. There is room for a good deal of argument about costs and returns. The costs vary according to the material and the way it is applied; the return, in higher yields, is easier to demonstrate than to measure. Many farmers still doubt whether the results obtained cover the cost of using these materials. Apart from the

cost of the chemicals themselves (which may be quite low), their application to the crop is costly. In a case of serious infestation, spraying may make all the difference between failure and a fair crop. But the average farmer is hard to convince, particularly in the many marginal cases where the damage to be expected from pests is not likely to exceed the average cost of spraying.

Fruit growers are easier to persuade. Some of them spray six or more times a year with different sprays for different pests. It should be possible to reduce this number, and, with the advent of the newer products, winter washes may conceivably become unnecessary. In some cases two treatments could be combined, DDT being sprayed with a red spider insecticide and with some fungicides. (This is not all gain. Growers have found that having killed the apple blossom weevil, they have to pay high wages to have the blossom thinned. The weevils did this for nothing though they could not be relied on to leave the right number of fruits.) Again, the greater persistence of the new insecticides should warrant fewer applications a season. DDT spray remains active for a week or so compared with a day for nicotine treatment. A systemic insecticide has been applied experimentally for control of aphid on hops, and the results suggest that only two sprays will be needed compared with six at present.

*

Spraying costs vary from 15s. an acre when the farmer does his own work of simple weed control, to 63s. charged by some contractors, usually for more difficult operations. Pest Control Ltd, the biggest contractors in Britain, make an average charge of 43s. an acre. Charges can rise as high as £7 an acre for difficult work among high or densely planted crops. But since some strawberry growers spend up to £60 an acre on cultivation—mainly hand hoeing to keep down weeds which harbour pests—the economy of reducing the number of sprays or of replacing hand labour by the mechanical application of chemicals is self-evident.

A less valuable crop offers no such straightforward evidence of saving in costs; this is usually true of field crops where the balance between the cost of application and extra yield is difficult to weigh. Farmers who produce average crops without spraying their corn, their beet, or their brassicas ask where the gain lies. Yet even if there is no apparent advantage, the farmer may overlook the risk of storing up trouble for himself if he grows, year after year, the crop which gives him the maximum return. Pests and weeds thrive on inattention, because their ideal breeding conditions are annually reproduced. That is an argument for crop rotation, by which the farmer can limit the conditions which favour major infestations of weeds and soil pests. The rotation of sugar beet with other crops is compulsory to prevent infestation by eelworm, but the rule was not introduced until the pest had already devastated the best beet-growing regions in Europe.

The negative advantages of treatment—the damage which would have been done had the treatment not been carried out—are often impossible to assess. A much-quoted figure says that ten per cent of the world's food crops are destroyed annually by insects, but its statistical basis is obscure. The value of spraying tends to be based on the price of the crop in a year of severe infestation—

a scarcity price. But the guide which farmers want would be based on prices in a bumper year; and on this footing, a direct calculation might often show that the treatment would not pay. Weedkiller sprayed on a poor field of infested corn may increase the yield by 150 per cent; on a good field it may not increase it at all, though it would keep the land clean without great labour. The average farmer asks whether spraying will produce 2 cwt of wheat or 1½ cwt of barley per acre to cover its cost. Many farmers evidently believe that spraying is worth while—or are doing well enough not to look too closely at the cost and return. Although the new selective weedkillers have only been on the British market since the war, between five and ten per cent of the total cereal acreage and about one per cent of the permanent pasture in Britain was sprayed with them this year. One manufacturer estimates that within ten years each of the figures will rise to 40 per cent. This, if nothing else, is a mark of the enthusiasm with which these new discoveries are being developed commercially.

*

Already, however, the prospect of some eventual fall in farm prices and profits is affecting the course of experiment. The cost of chemicals is relatively small in most uses, though it may sometimes amount to half of the total; but they are applied in weak solutions which entail much handling of water. One weedkiller, for instance, is at present sprayed at the rate of 3 pints of chemical in 100 gallons of water to each acre; the carrier might be reduced to 10 or 15 gallons if special equipment were used. Experiments suggest that an oil carrier, instead of water as at present, may be satisfactory and economical. This is encouraging to the petroleum companies who find a good market in oil-based winter washes, a market which they might lose if winter spraying were superseded. Low-volume spraying holds out the possibility of saving time and labour on water-carting, often under difficult conditions.

Low-volume spraying may also be important to firms with an eye on pest control contracts in tropical and sub-tropical regions. Spraying from the air is the only reasonably economic method for such large areas, where the crops are often too dense for tractors and wheeled sprayers to pass between the rows. Anything which reduces the weight of the spray applied from the air is an advantage. Fixed-wing aircraft are not wholly suitable for this work; helicopters are more satisfactory, and would be ideal if they were fully reliable. The initial cost of a helicopter is at present very high—£20,000, compared with a tenth of that sum for simple small aircraft; and some recent experiments suggested that helicopters cost 21s. to cover an acre compared with 12s. for a fixed-wing aircraft. Nevertheless, the experts in this field are convinced that helicopters are the only possible machines for general aerial spraying, and most of the big chemical companies are co-operating in development tests. Pest Control Limited, which uses helicopters as part of its normal contracting equipment, makes the same charge for spraying by helicopter as for spraying by tractor, and has, indeed, found that on occasions the helicopter has proved far cheaper than a land vehicle. Under tropical conditions, the technical advantages of the helicopter are obvious. It is being used in Africa against cotton pests, and it is hoped to use it against the mealey

bug which is spreading disease in the cocoa groves. The economic future of aerial spraying, however, has still to be proved.

The materials and techniques are still in their infancy, and at present the available business would hardly support a number of aerial spray contractors trying to pay their way simply by contracting without any ancillary interest in chemical manufacture. The potential field in less developed areas where insect damage cannot be checked in any other way is enormous, but it is being wisely tackled on a modest scale by small field trials. The truth is that, in many areas of this kind, it

Brewery Share Outlook

AFTER their collapse early in the year, when they first felt the effects of falling beer consumption and the sting of interim dividend cuts, brewery shares have remained friendless throughout most of 1949. Prices have drifted steadily lower until yields of less than 6 per cent on good brewery shares have become the exception. The dry summer gave a fillip to consumption, but shareholders approached the dividend season with no great expectations. The best that can be said of recent brewery company reports is that they are no worse than was to be expected. At any rate, dividends have generally been maintained and profits, though lower, have not revealed any sensational falls. Among the batch of companies whose trading periods cover the twelve months to the end of September, whose results are analysed in the accompanying table, only three have paid lower ordinary dividends for the year. Two other companies have announced a lower percentage rate of distribution, but in each case this is the counterpart of an increase in capital resulting from a bonus issue. Another company has simply omitted its jubilee bonus of 1947-8.

There can obviously be no serious complaint about recent dividends. But what of profits and earnings? Aggregate trading profits of the nineteen companies analysed showed a fall of 15 per cent, but this average result conceals wide differences in the experience of individual companies and of particular districts in the country. In comparison, total beer consumption during the same 12 months fell by 3½ per cent, from 28,800,000 bulk barrels to 27,743,000 bulk barrels. Although this falling trend of consumption has justified a cautious view about brewing profits, it is significant that the producers of nationally-advertised bottled beers have stood up best to falling demand.

The performance of Arthur Guinness is a good example. The trading profit of the parent company in 1948-9 declined by only 1½ per cent. An increase in export sales has helped last year's results, and home market sales have been maintained although costs have risen. Arthur Guinness has clearly benefited from the increasing public preference for bottled and higher gravity beers. Indeed, Guinness seems to have been better placed in this respect than another concern with a national market—Ind Coope and Allsopp, whose trading profit (adjusted to a yearly basis) would seem to have fallen by as much as 29 per cent. Bass Ratcliff and Grettton, a third company in this group of brewers

would be a waste of money and energy to apply these new methods of pesticide until cultivation is improved, simply because these areas would be rapidly re-infested.

The conclusion, therefore, is that these new methods of pest and weed control are promising rather than fully proved. In horticulture and market gardening, where the crop is valuable and vulnerable, the economic advantages are clearer than in grassland or arable cultivation. There has been enough money in the farmer's pocket to give the new techniques a good start in the past four years. What has now to be done is to prove their worth as a regular ingredient of good farming practice.

*

The results of companies in the Midlands have been patchy. Here again there is no very ready explanation. In terms, say, of the distribution of employment over the area during the period, but there have evidently been differences in turnover among the various companies, and an uneven impact of the general rise in costs. Mitchells and Butlers, and Ansells, both centred on Birmingham (which has certainly not lacked prosperity) have done poorly. Wolverhampton and Dudley, mainly operating farther afield, has been more fortunate and its sales of draught ale were a record. From the sample of results in the table, it is clear that country brewers in the west of England have had a poor year; both Usher's Wiltshire and Stroud Brewery reveal a decline in trading profit well exceeding the average for the country as a whole. Results farther south have again belied the prophets. The south of England might have been expected to feel the full force of falling consumption. Certainly in centres such as Watford, Norwich and Luton profits have held up very well. For London, the only available company for this period is Wenlock Brewery whose trading profit is 21½ per cent lower. The chairman considers this result to be "a true reflection of the past year's trade in

London." This experience is matched by that of a much larger London brewery, Watney Coombe Reid, whose trading profit for the year to June last fell by nearly 24 per cent. This company, of course, enjoyed less than three months of the "penny off the pint" which the Chancellor conceded last April, and its experience last year was that the falling off in trade was much more marked in the southern half of the country. Other companies south of the Thames, in "the Strong country" and on the south coast have reported that sales dropped appreciably.

*

Fortunately for brewery shareholders the impact of the fall in trading profit on net profits and equity earnings has been greatly softened. The average decline in net profit of the nineteen companies in the table was 12 per cent, compared with a fall of 15 per cent in their trading profits. The reason is not far to seek. Provisions for taxation on the year's profit have been substantially reduced. This result of lower taxation is not magical, nor does it represent a real alleviation of the heavy burden of taxation; to some extent, it reflects credit taken for initial allowances on capital expenditure, which in future years may have to be made good from taxed profits. The chairman of Wenlock Brewery remarks that "in 1938 when our gross profit was less than it is now, our net profit was almost fifty per cent greater." Expenditure on deferred repairs by this group of companies has been largely financed from provisions, which has relieved the charge falling upon revenue. To this extent, the past year's profits figures have not had to carry such a heavy burden as would otherwise be the case. But there are some companies whose recent results have been particularly affected by heavy expenditure for repairs and maintenance charged to revenue without benefit of a compensating transfer from provisions. A

few companies, such as Strong and Co. of Romsey, give a separate statement in the accounts of total expenditure on repairs and the amount financed from provisions. Rather more than half the total of £127,577 spent by this company has been financed by calling on earlier provisions. Thus the impact of expenditure on repairs has varied quite widely between particular companies. This is a point of some importance for the future. Permits to proceed with repairs have been more readily obtainable, and expenditure on deferred repairs and ordinary maintenance appears to have been speeded up in the past year. Further, the time limit for obtaining EPT refunds on expenditure from provisions for deferred repairs has been extended into 1952, but some companies have already spent their full provisions under this head and have taken full credit for tax refunds. The conclusion for the future is that, since there are still substantial arrears of repairs, a higher proportion of the work will fall to be charged in coming years to current revenue. This fact, coupled with the high cost of repairs, may indeed act as a deterrent to new outlays, and the recent cuts in the building programme will also have their effect in holding up projected schemes. But at the very least, the cost of rehabilitation in future is likely to put an effective ceiling on brewing dividends, and at the worst, it might make future reductions in dividends more severe than they would otherwise be.

*

Of the many influences which restricted the level of profits last year two were particularly onerous. First, the reduction of 2s. per barrel in the beer duty in the April Budget was far from being an unmixed blessing to the brewers for they were saddled at the same time with an obligation to find an additional 3s. per barrel towards the total reduction of 24s. per barrel. It is diffi-

cult to say how far the reduction of a penny a pint stimulated sales in the summer months, but it can hardly have gone very far—certainly not so far as to relieve the brewers of any part of the extra 3s. a barrel.

The second factor which has contributed to increased costs is the Catering Wages Act, which was effective throughout the whole of the past year. Its incidence has varied according to the type of trade, but some estimates put the increase in wages costs for beer distribution and hotel and catering business as high as 50 per cent. Some of the most onerous orders under the Act were amended as from June 1, 1949, but its provisions are still a heavy burden and are likely to remain so until further revisions are made. The enquiry into the operation of the Act, for which Mr Isaacs, the Minister of Labour, has recently asked "as a matter of urgency," may eventually lead to some improvement.

*

Reserves remain traditionally strong in the brewing industry, but some of the most secure companies must have been looking hard at their depleted cash balances at September 30th. Inflated costs of raw materials, the expense involved in modernisation and extensions, the cost of new properties, the conversion of limited licences to full licences, amalgamation schemes and other increases, in particular in wages bills and power charges, have all contributed to the drain on liquid funds. Brewery companies are perhaps better furnished with cash than the general run of industrial companies at the present time, but they are likely to heed every pound to meet the backlog of repairs and plant replacement.

Recent dividend announcements have, at least temporarily, reprieved brewery shares in the eyes of their holders. But the narrower earnings cover for current dividend rates has certainly not escaped attention. There is general agreement that unless beer consumption is at least maintained even the profit levels of the past year will be impossible to hold. The element of overhead costs would rise steeply, per pint or per bottle, if a further drop in consumption were to take place. The chairman of Watney Coombe Reid, after summing up all the factors affecting demand, concluded that for his company the expectation of lower profits was inevitable. This expectation is likely to be shared by the majority of brewery companies during the current year. For the first ten months of 1949, output did not quite reach 22 million bulk barrels; for the corresponding period of 1948, output was almost 23 1/2 million bulk barrels. The October figures were the poorest, for that month, since 1940. It is hardly surprising therefore that brewery shares should be yielding as much as 6 per cent if their dividends are well covered, and 7 per cent or more in cases which may admit of doubt. When social habits changed, and beer drinking for its own sake disappeared in favour of the moderate pleasure of the glass, combined with food and social meeting, the brewery industry successfully made the transition, and to its own profit. Now it is faced with stiffer problems, for whatever it can do to attract custom will involve it in considerable expenditures and will hold out no greater expectation than the maintenance of its profits. It might not be wise to conclude too soon that brewery shares have permanently lost their old investment status. But at present they are mild and bitter, not strong ale.

For Export

At the quay-side, the import-export procedure is reaching its final stages, but the earlier steps were equally important. Markets had to be found, references exchanged, restrictions complied with, payment arranged and documentation completed. At each of these steps the services of the Westminster Bank can usefully be employed. To help those who are engaged in foreign trade, the Bank has issued a booklet which may be obtained without charge at any branch. Ask for *The Foreign Business Service of the Westminster Bank*.

Business Notes

Spending and Saving

Reports from retail trade and from other recipients of Christmas spending sit ill beside the Chancellor's pleas for restraint and his hopes of a more effective disinflation. It is too soon, however, to form any reliable judgment about the extent of the Christmas trade, and it would certainly be unwise to regard such evidence of it as is yet available as a measure of the extent of inflation present in the national economy. The statistical evidence of Christmas trade is, indeed, susceptible of different interpretations. Much has been made, for example, of the fact that encashments of National Savings in the week to December 17th reached £23.6 million—a new high level. Disquieting though the trend of savings certainly is, it ought to be noted that these encashments were not a great deal larger than the £22 million for the similar week of 1948. Since new savings subscriptions were again below their 1948 level, the week's dis-saving amounted to nearly £10½ million compared with just over £8 million. This deterioration is not, however, greater than that experienced in previous weeks and cannot, therefore, fairly be regarded as proof of a sudden spending spree.

Similarly, the Christmas demands for additional currency did not differ markedly from those of 1948. Unfortunately, no precise comparison between the two years is possible, because in neither period has the Bank return disclosed the full extent of the Christmas demands, and this year's pre-Christmas return was made up three clear business days before the holiday. An approximate allowance for these differences does, however, suggest that the seasonal outflow of notes this year was probably a little less than in 1948. Measured from the low point reached in October, the note circulation in 1948 rose by £65.6 million to a peak of £1,296.4 million (shown in the Bank return dated two days before the holiday); the corresponding movement this year has been an increase of £63.2 million to a peak of £1,321.9 million (shown in the return dated one day after the holiday).

If allowance is made for the increase in prices during the year, neither the savings figures nor the movements of currency suggest any extreme level of seasonal activity. The official index of retail prices shows an increase of virtually 4 per cent over the year, while wholesale food prices have risen by 16.5 per cent and those of industrial raw materials by just over 4 per cent. By contrast, the active note circulation expanded by less than 2 per cent. In the absence of actual figures of retail trade, it seems that evidence of inflation in the consumption trades should be sought not so much in the volume of expenditure as in the means of its financing. It now seems evident that the full fiscal year, 1949/50, will show an appreciable deficit on National Savings. The cumulative figures for the period to mid-December showed net dis-saving of £67.7 million, in contrast with only £15.3 million in the similar period of 1948. It is fair to point out, however, that last year holders of small savings securities benefited from a substantial repayment of Defence Bonds at maturity. Such repayments, as distinct from encashments before maturity, are not included in the statistics published by the National Savings Committee. If they are brought into the reckoning, it will be found that the difference between the aggregate dis-saving through National Savings media this year and last has been almost negligible.

Bevan Plays King Canute

Another chapter was added last week to the foolish tale of the lending arrangements of the Public Works Loans Board, when the Government issued an admonitory circular to the various local-authority borrowers. Owing to the fall in gilt-edged values, the yields obtainable on Government

securities have, as *The Economist* has repeatedly pointed out, long been much above the rates charged by the PWLB on its loans; yet the Government obstinately refuses to revise its terms. The absurdity of this policy was neatly demonstrated a few weeks ago when, as a consequence of the post-devaluation collapse in gilt-edged, the concealed subsidy to local authorities reached its maximum at the very moment at which the Government was announcing that cuts in the housing programme were to play a major part in its programme of "consequential measures." The margins between gilt-edged yields and PWLB lending rates have narrowed a little since mid-November but they are still very wide. In its recent operation, the British Treasury had to offer 2½ per cent for five years in order to convert the maturing Exchequer bonds; yet it will lend to local authorities, via the PWLB, for the same period at ½ per cent less. On longer dated loans, the disparity is, of course, still greater. PWLB loans of 15 years or more cost only 3 per cent, yet 3½ per cent can be earned by investors in the 23-year British Electricity Stock and 3½ per cent (flat) by those who care to buy "Daltons" (with a life of 25 years or more).

There is a good deal of evidence to show that these un-economic lending rates are encouraging extravagance on the part of local authorities; but even if it could be demonstrated that physical control is strong enough to prevent the subsidy from stimulating the actual volume of physical investment that is set in motion, these arrangements would still be undesirable. Finance officers of the authorities concerned have naturally taken the view that they would be failing in their duty to those whom they serve if they did not borrow in anticipation of future needs—for, by so doing, they can make a useful "turn" by reinvesting the proceeds in the gilt-edged market—a procedure which, incidentally, has much the same monetary effect as does the direct intervention of the Government broker when supporting the market.

★

Having provided such inducements to borrowers from the PWLB, the Government now seems surprised to find that they are having their natural effect. But, instead of taking the obvious step by removing the real source of the trouble, the Minister of Health is falling back upon mere exhortation. A plaintive circular from Mr Bevan last week gave the following warning:—

In recent months there has been a marked increase in the volume of loans drawn from this source. Such an increase is not warranted by the volume of capital expenditure which has been authorised.

The advantages of borrowing from the Board will be readily apparent to local authorities. But it is incumbent upon each local authority to ensure that, by the fullest use of other available resources, no greater proportion of their sanctioned loans than is essential is drawn from the Board, that loans are not taken up earlier than is necessary, and that any advance under a loan sanction is limited to an instalment of the full amount immediately necessary. The Government confidently look to all local authorities for full co-operation in this matter.

In order to satisfy themselves that this arrangement is understood, the Board will, when applications are made to them for advances under sanctions, take such steps by questionnaire to the local authority as may seem appropriate.

It will be interesting to see the effect of these Canute-like tactics. To judge from the weekly Exchequer return, loans to local authorities have totalled £90 million in the past 12 weeks, an increase of 50 per cent on the total for the similar period last year. For the financial year to date, new loans aggregate £222 million, or £44 million more than last year and only £12 million less than the estimate for the full financial year.

Changes in "Counterpart" Funds

Among the various tenuous rumours which have been circulating recently to the effect that the United States authorities have been toying with new financial arrangements that would give relief to Britain and/or the sterling area as a whole has been a suggestion that the ECA "counterpart" fund might in some way be made the vehicle for action of this kind. Given the fact—repeatedly emphasised and explained in these columns when the initial ECA accounting arrangements were being hammered out—that in Britain the counterpart fund is only a book-keeping device in the internal accounts of the British Government for giving formal documentation of Britain's proper usage of the aid according to the principles laid down by ECA, it was never possible to conceive how it could be employed in the manner rumour seemed to be contemplating. It is now clear that these reports were very wide of the mark. All that is in question is a shifting of ECA's preferences as to the disposition of the fund between the several uses to which it may be put under American law.

Originally, ECA preferred that Britain should use the funds for debt redemption; the British Treasury accordingly arranged for a specifically segregated portion of the national debt (the special Treasury interest-free Notes which are held by the Bank of England as the literal counterpart of the funds outstanding at any time on the Treasury Special Account at the Bank) which is redeemed as and when the ECA authorities sanction releases from the Special Account. Now, however, it appears that ECA is taking the view that an ability to point to a pile of cancelled interest-free Notes is not a very satisfying demonstration to Congress (which it must soon approach for a new appropriation) of the real fruitfulness and good usage of ERP dollars. It thinks it expedient to have more positive evidence available, and apparently would like to see instead the receipted bills for a newly-erected rolling mill or power station.

Such real investment, of course, proceeds quite regardless of the procedural forms of ECA; and, as people have recently had good reason to appreciate, its extent depends very much upon whether the Government's disinflationary policy is sufficient to provide a current surplus (automatically used for debt redemption) of "public" savings which will make good the deficiency in private savings. No matter how the use of ECA funds is documented, the real measure of Britain's compliance with the true aims and spirit of ECA is the adequacy of its disinflationary support both for the dollar export drive and for necessary industrial investment. The changing preferences of ECA on the point of procedure therefore involve only internal Government book-keeping, and have no practical significance for Britain—except, of course, in that ECA's judgment in these matters may influence the eventual vote in Congress. This assertion requires one important qualification, also made here when the original accounting was devised. If ECA, or Congress, wanted to see as "counterpart" the receipt for a rolling-mill (or any other investment) which is not already in Britain's investment programme as lately pruned, the addition would impose a new inflationary strain upon Britain's economy, and would therefore have vital practical effects quite opposite to those which ECA really has at heart.

Industry

Power Programme Makes Slow Progress

Until the last day of the year efforts have continued to bring new electricity generating plant into service. The total addition to generating capacity achieved in 1949 cannot, therefore, be known for a few days yet. That it will fall well below the official programme is, however, beyond question. This has come to be an accepted thing. In 1948, when it was officially forecast that 1,100,000 kilowatts of

new plant would be commissioned, the amount achieved was only 566,000. The "Economic Survey" for 1949, in reporting this melancholy result, forecast that about 1,000,000 kW of new plant would be brought into service in 1949. This forecast appeared no more than an aspiration at the time it was made. It was reduced to 875,000 kW in May, and if all has gone well in the last few days the new plant actually commissioned during the year may amount to 700,000 kW; more probably, it will be a little less. Peak demand has probably increased by rather more than the amount of new plant installed, and the gap between peak capacity and peak demand has not been reduced.

This must clearly present the planners with a problem for 1950. Are they to bow to experience, and cut their forecasts? Or are they to persist in estimating on an ambitious scale? The dilemma has arisen before, and it cannot be hastily concluded that the forecasts were at fault; the performance may have been below what could reasonably be expected. What are the difficulties that have frustrated performance? The answer to this question was obscured for a time by the failure to co-ordinate the building of power stations with the manufacture of the generator sets themselves; in the result, turbo-alternator sets had to be stored for lack of buildings in which to install them. Since the actual building and civil engineering work on power stations employ only a hundredth of the national labour force in the building and civil engineering industries, it is hard to believe that this was unavoidable. Although perhaps a dozen major turbo-alternator sets are still waiting in store in various parts of the country, the building and civil engineering difficulties have now been so far overcome that it is apparent that they are not the essential bottleneck.

★

The place of honour is now held by the fabrication of steam-raising and steam-distributing plant: water-tube boilers, high-pressure piping, and valves. Boiler drums themselves, whether forged or fusion-welded, are in adequate supply. No great shortage of tubes is perceptible, and such a shortage, if it appeared, could easily be overcome. It is in the manipulation, processing, and finishing of the tubes for assembly into boilers that the difficulty now appears to lie. Order books in the trade appear to have become inflated, and other demands are competing successfully against the power programme. The boiler-making firms have had, from the British Electricity Authority alone, orders amounting to more than £100 million for delivery in the three years ending in 1952; but these orders are being completed at the rate of only about £12 or £13 million a year. The further bottlenecks in high-pressure piping and high-pressure valves can, perhaps, be connected with the progress that has been made in supplying plant of this kind for oil refining, oil development, and chemical plants. But the question is clearly one of priorities and of organisation. The power plants which are projected can be built if their requirements are given precedence over other demands. But it has to be realised that these "other demands" include the demands of dollar-saving and exports. The decision is a serious one. If it is not to go in favour of the power plants, it will be best not to make cheerful forecasts of generating capacity next winter.

★ ★ ★

The Oil Refineries

The past few months have seen some material progress in expanding British oil refining capacity. This is no more than the first-fruit of the home refining programme; the units which are to give full flexibility and enable a full range of products to be turned out are still to come.

At the Anglo-Iranian plant at Llandarcy the main crude distillation unit, with a capacity of 2,000,000 tons a year, was completed in September. This refinery—which, two or

three years ago, was able to handle only 360,000 tons a year—has now a throughput of 2,500,000 tons, to be expanded to 3,000,000 tons when the project is complete. But the distance still to go is greater than these figures would suggest; many units have still to be added to make Llandarcy a complete modern refinery, and the work will take until 1953. Marshall aid to the extent of more than \$7,000,000 was appropriated for Llandarcy in September. The Grangemouth refinery of the same company, which handled about 360,000 tons of oil in 1947, has been enabled to double its output, largely by improvised methods, so that it is now handling about 700,000 tons a year. New distillation units and a cracking plant to produce premier-grade spirit are to be added; the capacity will have risen by 1953 to 1,500,000 tons a year, but it will also have gained in flexibility, economy, and variety of product. The appropriation of Marshall funds to the extent of \$6,500,000, which was announced in November for Grangemouth, is to finance, not the refinery itself, but the petroleum chemicals plant which will adjoin the refinery, and which will use refinery products for chemical synthesis.

★

The Shell refinery for Middle East crude at Stanlow started production at the end of November, some weeks ahead of the scheduled time; the distillation unit now working, which has a throughput of 1,000,000 tons of crude oil a year, represents about a third of the projected bulk capacity. It makes possible substantial economies in the provision of feedstock to the Shell chemical plant which has been in operation since the summer at the same site. The Shell-haven refinery on the Thames is not so advanced, but elaborate engineering work is in progress.

The project of the Anglo-American Oil Company to build a refinery at Fawley which will be the largest in Europe has not (as has been suggested) been upset by the recent decision of the British Government to require the American companies to take "sterling" oil. Indeed, the Fawley project was designed largely to meet the necessity of cutting dollar oil imports. It is the interim period, before the refinery is completed, that is facing the company with difficulties in its British trade. The work so far done, in the few months since the decision to proceed with the Fawley scheme was finally announced, includes the grading and levelling of the huge site, the laying of the railway spur and sidings, and most of the construction of a housing camp for the large labour force which will be employed. The foundations for some units of the plant have been started. Test piles are being drilled for the jetty which is to be built in Southampton Water to provide four berths for tankers of between 26,000 and 37,000 tons each.

★ ★ ★

Reorganising the Northern Coalfields

The report that the scattered and various coalfields of the Northern division are to be reorganised into two divisions had not been confirmed by the National Coal Board as this issue of *The Economist* went to press. Its trade union implications are discussed on page 1457. Technical and administrative arguments to support such a step have been apparent for long enough. The division covers Northumberland, Durham, and Cumberland—too large an area to form a natural administrative unit, divided by the Pennines, and comprising coalfields on the east and west coasts. The figures of output, employment, and financial results show it to be, after South Wales, the problem division of the National Coal Board.

Measured by the number of mineworkers employed (about 158,000, out of a national total of 708,000) the division is the largest in the Coal Board's organisation. The next largest, the North Eastern (the Yorkshire coalfield) has about 138,000 workers. Before the war the coalfields of Durham,

Northumberland, and Cumberland together had a larger output than Yorkshire. But the relationship has now changed; the total saleable output of the Northern division in 1948 was less than in the North Eastern division. The attendance record of the Northern division is better than anywhere in the country, but good attendance is not enough to

NORTHERN DIVISION OF THE NATIONAL COAL BOARD IN 1948

Area	Saleable Output	Cost Per Ton Saleable	Loss (Profit) Per Ton Saleable	Loss (Profit) on Colliery Operations
	Tons	s. d.	s. d.	£
North-East Durham	3,771,677	50 11-3	3 11-4	395,159
Mid-East "	5,228,566	51 1-6	3 1-0	806,152
South-East "	3,635,059	47 7-7	8 7-7	132,433
South-West "	3,875,354	54 3-1	6 2-1	1,195,975
Mid-West "	3,592,102	54 10-6	8 1-6	1,122,399
North-West "	5,503,888	53 8-6	4 0-5	1,111,400
South Northumberland	3,937,232	49 9-6	4 3-0	645,788
Central "	4,551,646	45 5-8	2 8	53,376
North "	3,742,239	47 3-3	7 3	114,274
Cumberland	1,092,438	66 4-2	13 6-4	678,326
TOTAL—NORTHERN DIVISION	31,650,241	51 0-7	3 4-7	6,422,415

offset the poor output per man-shift, which is lower than anywhere in Britain except South Wales; OMS for all workers in the Northern division in 1948 was 0.95 tons, compared with 1.11 tons for the whole country. It had recovered to 1.04 tons by November this year, but this was less than the average for the same region in 1938—while the national OMS in November, 1.21 tons, was higher than the national average in 1938.

These facts, together with the figures of operating results of the ten areas in the Northern division which are given in the accompanying table, merely reflect the intractable technical difficulties which beset the full exploitation of the coal reserves in this region. An administrative regrouping will not remove the difficulties, but it may facilitate the essential task of reorganising the collieries themselves. And it will be in line with a general tendency towards greater decentralisation in the affairs of the National Coal Board.

★ ★ ★

Still Larger Tankers

The two tankers of 31,000 tons deadweight which have been ordered from Vickers-Armstrongs, Limited, Barrow-in-Furness, by a Greek shipowner with interests in New York and Panama, will provide employment in the shipyard for about 2½ years. These vessels have other claims to distinction, for they are the largest tankers so far ordered in the world, and indicate that the limit of size for tankers has not yet been reached. Before the war the standard size for economic ocean-going tankers was about 12,000 tons deadweight, and this is still the most common size in the British and Dutch fleets. British companies at the end of the war placed orders for vessels of 16,000 tons and later 21,000 tons. Norwegian owners are now taking delivery of tankers up to 24,000 tons deadweight, and a few 28,000 tonners have so far been the largest on order in Great Britain. Several tankers of up to 30,000 tons deadweight are under construction in the United States, as well as two in France, but none of these equals the dimensions (625 feet length between perpendiculars and 86 feet beam) of the new vessels ordered from Barrow. These, like the majority of the largest tankers, will be single-screw turbine steamships, with a normal shaft horsepower of 12,500, giving a trial speed of about 16 knots. The two French ships, however, will be powered by diesel engines of 13,600 h.p., giving 15 knots speed. The more normal 12,000-tons British ship has diesel engines of 3,100 h.p. and 12 knots speed.

There is a close relationship between the size and the speed of tankers; the faster they are the bigger they must be. It seems, therefore, that the desire for speed is dictating the

EBORACUM

YORK, as we call it to-day, was the military capital of Roman Britain. The Emperor Hadrian visited the fortress in the year 120. Six hundred years later the city became one of the most celebrated places of education in Europe.

The offices of Martins Bank in York's historic Coney Street and the Cattle Market are links in the

chain of nearly 600 branches throughout England, Wales, and the Isle of Man providing finance for every kind of business.

increasing size of new tankers. Fast vessels have a special value in wartime, being less vulnerable to submarine attack; on the other hand they present larger targets and greater cargo risks, and they are limited in their range of ports. There are still many adherents of the theory that smaller and slower tankers are the most economical form of oil transport by sea, provided that there is a sufficient number of units to keep the flow of seaborne oil steady in the marine "pipeline" between oilfields and markets.

Outlook for Car Production Costs

It has begun to appear that the motor manufacturers are finding some difficulty in keeping their prices steady in the face of the rising cost of materials. The Ford Motor Company raised its prices (that of the Anglia by £15) at the beginning of December. This was the first increase by Ford for nearly two years; the reason given was "rising costs." Two weeks later the Standard Motor Company announced that £50 was being added to the Vanguard on the home market. Sir John Black said the step was necessary to meet the rising price of materials, the cost of additions and improvements to the design, and the lack of marginal profit on export sales. Export prices remain unchanged.

Since the beginning of the year the prices of steel (including "extras" charged for testing, guarantees, heat treatment and other processing), zinc, rubber and tyres have risen. They have added about £10 to the cost of a £300 car and the industry is threatened with a further 10s. a ton on steel if the proposed increase of one-sixth in railway freight charges is approved. Moreover, the full effect of devaluation on the cost of imported raw materials has not yet been fully felt. The big exporters have also another burden, the maintenance of assembly plants in several of their chief markets. With any volume of sales—and these must be large to justify the erection of a plant at all—the system is less economic than the dispatch of fully assembled cars from the parent factory. There is nothing to show how much these plants add to direct costs, because manufacturers are prepared to accept losses in some markets, balancing their accounts with higher profits in the home market and in any export market which will stand a profitable price. But in Eire, to quote one example, the basic cost of a car shipped from Britain and assembled there is £50 more than the same car ex-works in Britain.

That prices have remained as steady as they have has been due largely to economies in other directions. An increased volume of production has absorbed some of the excess capacity in the industry and reduced overheads. The one or two per cent increase in the coming steel allocations for the first quarter will carry this relief a little further. The price reductions of speciality cars (Allard, Healey, Frazer-Nash, Daimler and Jowett) have been made possible by an increase in orders sufficient to give a substantial production flow. Jowett, in particular, reduced its ex-works price in the autumn from £738 to £695 and offered the same car with a less elaborate finish for £595. The industry expects that a steady increase in production should absorb any further increases in the cost of materials in 1950.

Exports in November—28,000 cars and 9,000 commercial vehicles—were the highest for the year. Sales on this scale owed a good deal to the easier shipping position—a factor marked by the shipping of more than 11,000 vehicles to Australia, the most congested route. The effects of devaluation were reflected in the dispatch during November of 1,600 cars to Belgium, 1,400 to the United States, and 4,250 to Canada.

Safety in Industry

The loss of manpower through industrial accidents continues on a disquieting scale. The report of the Chief

Inspector of Factories for 1948 estimates that the loss to industry through accidents—not including cases which caused death or permanent disablement—was equivalent to 25,000 workers. Though the total number of accidents (201,086) was slightly less than in 1947 (203,236) the number of fatal accidents rose slightly. No very encouraging conclusions can yet be drawn about postwar trends, and the report strikes a somewhat pessimistic note.

Many of the accidents—perhaps more than half—could have been prevented; workers were careless or took unnecessary risks. In building the fatal accident rate from falls was one in 17; this—described as "indeed alarming" in the report—is attributed partly to the commando training in risk-taking and partly to a false idea that to take precautions is soft. In the same way, workers are reluctant to buy safety boots and shoes, preferring "more elegant" footwear, and the inducement of freedom from coupons no longer operates. There was the usual crop of hair entanglement accidents because of unsuitable hair styles, but though there is evidence of some "sky-larking" among juveniles, their high accident rate is attributed mainly to lack of proper supervision. Progress in organising safety measures is not so rapid as it might be, partly because of the prevalent idea that attention to safety detracts from production.

A more encouraging feature of the report is the steady progress made with welfare and feeding facilities and the introduction of lighting and colour improvements in factories. The figures on industrial health, too, are fairly satisfactory. Good progress has been made with the campaign against byssinosis (a dust disease) in the cotton industry, and for the second year since 1899 no fatal case of anthrax was reported.

Aircraft Operating Costs

The Society of British Aircraft Constructors has been working out in the past year a standard method of calculating the direct operating costs of aircraft; the results of its work have now been accepted by the society's members, who include all the British airframe and engine manufacturers and most manufacturers of components. An operator who wants to work out the direct hourly cost of flying a particular aircraft over a given distance has been able to get figures of cost and performance from the manufacturer. But these only cover such factors as the price of the aircraft, speed, payload and fuel consumption. The operator then has to apply, by his own rule-of-thumb methods, the other factors which affect direct costs—the annual rate of utilisation, the costs of spares and maintenance, insurance and landing dues—all expressed as cost per flying hour. To find out, for example, the cost per hour for obsolescence of the airframe and for carrying spares, an operator makes the following calculation:—

Cost of airframe + cost of spares — residual value at obsolescence
Obsolescence period × utilisation per annum

The society estimates that spares are carried to the value of 10 per cent of the price of the airframe; that the residual value of airframe and spares at obsolescence is 20 per cent of their original price; that the obsolescence period is eight years and that the aircraft is flown 3,000 hours a year. Assuming that the first cost of the airframe as given by the manufacturer is £80,000, this gives:

$$\frac{£(80,000 + (0.1 \times 80,000)) \times 0.80}{8 \times 3,000} = £2.93 \text{ per hour}$$

The SBAC standard figures have the great advantage of having been drawn up by the manufacturers' representatives in close co-operation with operators, including the charter companies. The Air Transport Association in the United States performed a similar task for its members (the airline operators), but the assumptions underlying those standards were never fully accepted by the American aircraft industry,

which had no part in drawing them up. Agreement is important because most airline operators select their aircraft on the basis of operating costs.

The Society of British Aircraft Constructors is aware that the standard figures cannot apply in every case, and it is therefore suggested that manufacturers, where they dissent, may give their own suggested alternative figures. Disagreement over engine maintenance is not improbable; not all engine manufacturers approve of the standard figures given. The new formulae, since they have been reached on the basis of experience with piston-engined aircraft, will not apply with the same accuracy to aircraft with gas turbines, but it is hardly yet possible to devise standards that would apply to this type of engine.

Finance and Trade

Non-Transferable Sterling

A further restriction in the freedom with which transferable sterling can be used has followed recent negotiations between British and Dutch Government officials in London. The opportunity was taken at this meeting to bring home to the Dutch representatives the dissatisfaction and resentment with which Dutch use of transferable sterling facilities was viewed in official circles in London. Dutch traders have been among the more resourceful users of transferable sterling in the conduct of their entrepot and third party operations and they have been very prominent operators in the free market in cheap sterling. Many complaints have in the past been made to the Dutch authorities on this score, but without avail until this latest occasion when evidently arguments of rather more convincing character must have been used by the British representatives. The result has been to extend to Dutch transferable accounts the restrictions which have already been publicly applied to Egyptian,

Spanish and Czech transferable accounts. These limit the use of sterling in such accounts to direct commercial operations with the other party in the transfer, or to third party transactions which must in each case receive the consent of the Bank of England.

If the practice of restricting transferable sterling in this manner gains ground, transferable sterling will before long have lost all its reality. The transferable account system will be dismantled, and for all practical purposes the use of sterling between non-sterling countries will be restricted to bilateral operations. This is a retrograde step and reflects the persistent attitude of the British monetary authorities, who seek to maintain the efficacy of exchange control by plugging the successive leaks which appear in that control rather than by more fundamental methods of making sterling a currency so strong, so deserving of confidence, that leaks will no longer occur. In the short run this purely defensive restrictionist policy will appear to pay dividends, and already a considerable hardening in the rate for transferable sterling, which over the past fortnight has risen from \$2.40 to \$2.52, reflects the new barriers which are being placed in the way of its use and the diminution in its potential supply. Taking the longer view, however, it can hardly be claimed that this move is calculated to improve that confidence in sterling which is the prime condition of recreating its position as a truly international medium of exchange.

The recent decision to make all payments out of Chinese sterling accounts subject to the permission of the Bank of England is yet another straw showing the direction of the wind. In this case, however, other considerations may have weighed in the decision. On the threshold of recognition of the new regime in China the true ownership of much of the existing Chinese sterling may be called into question and special care must, therefore, be exercised in authorising all transactions in these accounts.

Not so funny for Mr. Nash!

Mr. Nash's sudden transformation from a dignified business man to a sprawling figure of waving arms and legs struck some passers-by as funny. But

when he was helped to an ambulance with an injured back and head, Mr. Nash could hardly be blamed if he did not share the joke. He was unable to work for many months, while expenses mounted. Yet he was able to convalesce with an easy mind, for under his "General" Personal Accident Policy he received £10 a week until he was fit.

Peace of mind costs very little

£4 a year covers you for £10 a week accident benefit. Are you wise to face the risk—and all that it means to your dependants—without this cover? It's worth while finding out more about this and other benefits of the "General's" Personal Accident Policies—just send the coupon.

Please send me full particulars of "General" Personal Accident Policies.

Undeclared Dollar Holdings

An interesting initiative has been taken by the British Treasury in starting an action before the American courts to compel an American bank to hand over to the British Government dollars deposited with that bank by a British resident. The account in question has been left undisturbed in the American bank for many years. The dollars should have been handed over under the Exchange Control regulations during the war, and the depositor is still under an obligation to sell them to the Government under the Exchange Control Act. For reasons which have not yet emerged, the authorities in this country, though they are fully aware of the identity of the depositor, have chosen not to proceed against her direct, but to seek the authority of the American courts to compel the depository bank in New York to hand over the dollars. This attempted extension of the principle of extradition to contraventions of Exchange Control regulations is a novel and significant development. Minor precedents for it have been set in the arrangements made between certain monetary authorities to exchange information about exchange control infringements by their respective nationals, even though this has meant breaking the traditional pledge of secrecy between the banker and his customer. A new chapter will, however, have been opened if the force of exchange control measures introduced in one country can acquire the backing of sanctions applied in another.

A COW & GATE PRODUCT

Even in the leisurely days of William Shakespeare apparently it was possible for man to become satiated with good eating. The science of food as we know it now was unheard of then, as were for that matter the "meat" shortages which we all regret.

In the bustle of life in this day and age a man need no longer suffer if time, or years, will not permit him to assimilate his food, or if he lacks that "pep" which only a generous protein intake supplies.

He can get adequate and enjoyable nourishment from a cup of PEPTALAC, the predigested milk and wheat food drink.

PEPTALAC is an ideal source of protein for the busy man—and his family too. It imposes no strain on the digestion and can occasion no regret.

Made in an instant by the mere addition of hot water—"The milk is in it!" Get a tin today and enjoy "the pep" that only PEPTALAC can supply.

of arbitrament; nevertheless the impression must remain that the balance between economic advantage and disadvantage to Britain is very finely struck in the new agreement.

Briefly, it is provided that Yugoslavia will pay out the £4,000,000 odd of compensation still outstanding for British property nationalised in Yugoslavia over the course of the next seven years; on the other hand Britain is to lend approximately twice that sum (£8,000,000) to Yugoslavia over the course of the next six. Having thus paid for past pork out of money loaned for new pigs, Marshal Tito has consented to fling open the door for mutually advantageous Anglo-Yugoslavian trade which is expected to amount to the considerable figure of £100 million over the next five years (and which will apparently be partly financed by short-term British credit guarantees). British exports to Yugoslavia in this period are scheduled to include £30 million of capital equipment, £32 million of raw wool and wool and cotton yarns, over £5,000,000 of crude oil and petroleum products, small quantities of dyestuffs and rubber products and a varying quantity of miscellaneous goods. In return Yugoslavia promises to send to Britain some £58 million of hardwoods and softwoods, about £14 million of maize, £7,500,000 of non-ferrous metals (lead, copper, chromium and zinc) and various other goods, mostly "inessential" foodstuffs, such as prunes and tinned fish. Britain is at present purchasing some of the goods cited in this list (including non-ferrous metals) from dollar sources and it is in this dollar-saving that the main potential virtue of the new agreement lies.

Past experience suggests, however, that it would be unwise to measure the volume of Anglo-Yugoslavian trade in the next quinquennium until the trade begins to flow. The 1948 Anglo-Yugoslav Trade Agreement, which expired on September 30th of this year, provided for £15 million of trade each way; reference to the trade returns reveals that British imports from Yugoslavia in fact amounted to just over £10 million and British exports to Yugoslavia to just under £3,500,000 in the twelve months concerned.

* * *

Sterling Rationed in Brazil

Brazil has decided to treat sterling as a hard currency and to apply to it the rationing system which has been in force for dollars and other "arbitrable" currencies since last March. The latest "Fortnightly Review" of the Bank of London and South America reveals that henceforth Brazilian commercial banks must pass on to the Central Bank all sterling purchased from exporters and other sellers. This sterling will then be distributed by the Central Bank among would-be purchasers according to a pre-arranged system of priorities. Goods of the first priority (which are exempt from the rule under which closure of exchange will not be authorised until 45 days after the application for exchange is registered) include agricultural machinery, fuel, scarce metals and pharmaceutical products not manufactured in Brazil. Other goods at present exempt from import licences (together with insurance settlements) are given second priority, sterling, required for most financial remittances third priority, that required for transfer abroad by transport and communications concerns (together with a few oddments such as travelling expenses), fourth priority and importers of inessential goods are apparently to be left to pick up any crumbs of sterling that remain. The present Brazilian Government is very anxious to encourage foreign (and particularly American) investment in the country; this anxiety no doubt accounts for the welcome fact that neither in this new rationing system nor in the Brazilian schedule of differential exchange rates are financial remittances given the role of Cinderella, which they are forced to play in so many other Latin American republics at the present time.

Apart from this one bright feature, however, the news of the new Brazilian import restrictions must be regarded as unmitigatedly depressing. In prewar years, whenever the price of coffee was booming, Brazilian trade statistics tended

to show an export surplus with the United States and an import surplus with the United Kingdom. In 1948 there was some sign that this prewar pattern of trade might be restored. In that year Brazil had a small visible surplus of some \$16 million with the United States, and a small visible deficit of some £2,500,000 with the United Kingdom. Although Brazil's dollar surplus on merchandise account was insufficient to pay off its accumulated dollar debts, the re-appearance of a dollar surplus in visible trade was heartening. Unfortunately, however, this surplus was not repeated in the first half of 1949 (although the visible deficit of just under \$5,000,000 was still appreciably less than that in the first half of 1948); simultaneously Brazil's visible deficit with the United Kingdom widened to nearly £10 million in the half year. Sterling devaluation, which has made many British industrial goods competitive with United States goods in southern Latin America, must have had the effect of making this visible deficit wider still. Although Brazil is believed to hold sterling balances to the value of some £35 million, about £16 million of these must be earmarked for payments now due on formerly British-owned railways and railway stores. So long as exact bilateral balancing of accounts between each country remains in fashion, therefore, some tightening up of controls on Brazilian imports from the sterling area was probably inevitable. The pity of it is that it has been Britain, following in the footsteps of Dr Schacht, who has been chiefly responsible for spreading the gospel of bilaterally balanced accounts in Latin America.

* * *

Intra-European Payments for November

The Bank for International Settlements has recently completed its compensation of intra-European payments for the month of November. For Great Britain the most striking feature of this operation is the fact that for the second month in succession no settlements in gold or dollars should have been made under payments agreements with other OEEC countries. Neither did the United Kingdom have to exercise any drawing rights under the intra-European payments scheme, or make use of the Belgian credit in order to complete compensation of payments during November. These developments reveal the undoubted improvement which has occurred since devaluation in the balance-of-payments between the sterling area on the one hand and Belgium, western Germany and Switzerland on the other. This improvement has, however, been matched by a deterioration in the balance of payments with the other OEEC countries.

The details of the latest compensation of intra-European payments also throw some light on this reverse side of the medal. Drawing rights granted by the United Kingdom were exercised during November by Austria (£423,000), Greece (£782,000), and Turkey (£395,000). On the other hand France had up to the end of November failed to use any part of its bilateral drawing rights equivalent to \$81 million on the UK or of the \$12 million carried forward from the preceding payments year. When the drawing rights for the current I.E.P.S. year were arranged it was estimated that France would run a deficit equivalent to \$120 million with the sterling area. Of this, \$81 million was to be covered by new bilateral drawing rights, \$12 million by the carry-forward from the previous year, and the balance of \$27 million by the use of multilateral drawing rights established in France's favour. In fact the experience so far shows that France has run a surplus and not a deficit with the sterling area.

Apart from other general considerations the complete miscarriage of the estimates of the balances of payments between member countries demands a fundamental review of the intra-European payments scheme. This will be one of the first tasks to which OEEC will have to bend its energies in the weeks to come. A mass of ammunition is already piling up for this new operation. Up to date no less than seventeen separate schemes have been forwarded to OEEC, and now that private organisations have joined in the

Currency Inflation in West Africa

The latest report of the West African Currency Board reveals that in the twelve months to mid-1949 the value of currency issued by the Board against payment in London amounted to £20,131,000, or nearly three and a half times the amount required in the preceding year (£5,985,000) and two and a half times the previous record issue (£7,945,000 in 1946-1947). As a result of the year's operations, which involved shipment of notes to the coast by every available means—including specially chartered aeroplanes—the total value of notes and coin in circulation in West Africa rose from £47.8 million to £67.7 million. Most of this rise was accounted for by an increase of some £14½ million in the note issue; coins in circulation rose by only £5,500,000 so that the ratio of coins to notes dropped from 66:34 to 55:45.

This rapid rise in the note issue provides a sorry commentary on the results of the attempt to control inflation in West Africa through the control of off-farm prices by produce marketing boards. Nigeria and the Gold Coast have long been archetypes of what the Americans call "export economies"; their monetary circulations are liable to vary enormously from year to year as the prices of cocoa and palm oil rise or fall (bringing violent swings in export or import surpluses with them). Whenever an export surplus is allowed to generate an expansion in monetary circulation in a community of this sort, inflation takes the native economy by the ears; as soon as pound notes arrive in the villages in sufficient numbers, they become the recognised unit of account for quite small transactions with illogical rapidity and internal prices seem to bound up with the express purpose of allowing them to become so. If a fall in the world price of cocoa sets in and brings with it a drain of pound notes from the villages, these internal prices are likely to stick at their inflated levels for some time and thus give rise to much misery (and to a revival of the old curse of peasant indebtedness).

The situation will in fact be aggravated in any future slump because the new (September, 1949) regulations for the West African Colonial Currency Board still postulate, in effect, that any deficit in a colony's balance of payments must be matched by an exactly equivalent drain from the colony's internal note circulation; there is no provision for an internal fiduciary issue to absorb part of the blow. Several schemes have been mooted—and in fact tried out—for cushioning the cruel impact of worldwide cyclical forces on these native economies. The marketing board system for maintaining stable off-farm prices through slump and boom was one such scheme; this has now degenerated in most cases into a system for holding back as much of the crop's proceeds as is politically possible in time of boom in order to pay some sort of a subsidy in time of slump. Other more direct systems of quantitative monetary control have been tried out under American supervision in export economies in northern Latin America (where not all of them have yet gone on the rocks); a scheme of the same sort—also with American parentage—is now being worked out to replace the former colonial currency board system in Ceylon. No doubt research on the proper technique for monetary control in colonial economies has a long way to go yet, but the present British system of control, which has now allowed monetary circulation in West Africa to increase by over 40 per cent in a single year, certainly seems to be in need of some fairly immediate strengthening.

* * *

National Income Estimates

The official annual estimates of the national income have notorious limitations, and it is not to be expected that quarterly estimates, compiled unofficially, provide more than an impressionistic study of a moving picture. But to sketch

the main outlines themselves is an enterprising task on which the Oxford Institute of Statistics is to be congratulated. The latest estimates, which appear in the December Bulletin, bring the record up to the end of the September quarter. The money value of the net national income (that is, after providing for depreciation) is put at an annual rate of £10,470 million for the third quarter, compared with £10,370 million for the second and £10,050 million for the first quarter. These figures have, of course, been corrected for seasonal factors; when they are corrected also for price movements, the third quarter shows not an increase but a very slight decrease in the real national income. It is not necessary to make any serious point about this check, for, as the bulletin shows, the June quarter showed a remarkable expansion in production.

Other tables in the article throw some interesting preliminary light on the trend of the balance of payments—subject, inevitably, to any delay, in the period before devaluation, in payments for British exports. The net export deficit was, according to these figures, running at the same annual rate (£130 million) in the third quarter as in the second but when correction for seasonal variation is applied, the annual rates appear as follows:

1st Quarter—£55 million surplus
2nd Quarter—£35 million deficit
3rd Quarter—£55 million deficit

In "overall" terms, these figures tend to support the impression that the balance of payments for the full year will show a deficit, but not of an intolerable size.

But perhaps the most significant table is a new analysis of personal income, which shows movements in personal savings in relation to total personal incomes. The table is reproduced below:

AGGREGATE PERSONAL INCOME £ mn.—At Current Prices, seasonally corrected								
	1948				1949			
	I	II	III	IV	I	II	III

Source: Institute of Statistics, Oxford, Bulletin Vol. II, No. 12

The first quarter of 1949 showed a considerable increase in savings. As the Bulletin points out, industrial expansion was slowing down; exports continued to rise and Government expenditure to increase, but there was little increase in consumption and savings expanded. But when exports levelled off in the middle of the year, consumption increased much more rapidly than personal incomes, and personal savings again fell to a level at which they became "barely adequate to cover death duties, implying substantial dis-saving by sections of the public to balance institutional forms of saving." These figures are certainly in step with general economic observation during the changing phases of the Government's economic and financial policy. The time for "consequential measures" was before, not after, devaluation.

Shorter Note

Coal output from the mines last week was 4,076,300 tons; an opencast output of 225,300 tons brought the total for the week to 4,301,600. The cumulative total for the first 51 weeks of 1949 is 212,475,700 tons; of this total 200,141,400—nearly 6,000,000 tons more than in the same period of 1948—is deep-mined output, which therefore seemed likely to reach the lower of the *Economic Survey* targets for the year (202 million tons) in the three full working days which remained to complete the year. Opencast output for the year will fall somewhat short of expectation.

COMPANY MEETINGS

BANK OF MONTREAL

INCREASED BUSINESS

The one hundred and thirty-second annual general meeting of the Bank of Montreal was held on December 5th in Montreal.

Mr B. C. Gardner, M.C. (the president), in the course of his address, said: The past year has seen some far-reaching changes in the Canadian business climate. For many, these changes have brought pressing problems, especially with respect to conditions and prospects in export markets. Indeed, the complexities of the international situation, climaxed by the currency devaluations of mid-September, have overshadowed the entire Canadian economic scene, heavily re-emphasising our independence on conditions beyond our own borders. Nevertheless, as far as domestic developments are concerned, the course of events has had a good many healthy and reassuring aspects.

The most noteworthy feature of the Canadian business trend during the year has been its relative stability as compared with the course of developments in the United States. The divergence of trend thus far might be interpreted in terms of the traditional time lag. In my opinion, however, the explanation goes somewhat deeper. In Canada, as in the United States, there have been cyclical forces operating on the down side. But in Canada, in large part offsetting these recessive influences we have a vigorous programme of industrial expansion based not so much on the outlook for business next year or the year after as on an appraisal of this country's magnificent long-term potentialities. It may not be too much to suggest that Canada is currently undergoing a phase of dynamic growth which, relatively speaking, is not unlike that experienced by the United States in the years following World War I.

DOLLAR PROBLEM

Overall, we do not live beyond our means on international account; our exports, visible and invisible, are still somewhat more than sufficient to pay for our imports of goods and services. But without convertibility of sterling into United States dollars we have to cope with the dual problem of earning an adequate supply of United States currency, while at the same time maintaining our exports to sterling area and other markets from which our imports are relatively small.

The devaluations of mid-September must be regarded as a long stride toward realism. Before many months have passed, some of the new rates may prove to be over-valued; some may be under-valued. And to the extent that such dislocations occur, the result will inevitably be to prolong reliance on restriction and bilateralism and to delay the return of convertibility. I suggest, therefore, that it may well be time to ask whether the ends of expansion of trade would not now be better served by permitting a range of variation in exchange rates, cushioned perhaps by a stabilisation fund designed to prevent violent short-term fluctuations.

Mr Gordon R. Ball, general manager, said *inter alia*: Net profits for the year, after appropriation to contingency reserve and after provision for depreciation of premises and equipment and for Dominion and Provincial taxes, amount to \$5,816,570. After providing \$3,600,000 for dividends and extra distribution equivalent to \$1.00 per share, a balance of \$2,216,570 is left to be carried forward to profit and loss account.

Our total assets at the year-end amounted to \$2,140 million, an increase of \$148 million during the year. This is a record high level of resources at the end of any fiscal year of this bank. Total deposits reached a figure of \$2,019 million.

The report and accounts were adopted.

AMALGAMATED TOBACCO CORPORATION, LIMITED

STEADY PROGRESS

The third ordinary general meeting of the Amalgamated Tobacco Corporation, Limited, was held on December 29th in London, the Right Hon. Lord Llewellyn, P.C., C.B.E., M.C., T.D. (chairman) presiding.

The following is an extract from his circulated statement:

It is very gratifying to report another satisfactory year. Our gross trading profit for the year to May 31, 1949, amounted to £287,153, and net trading profit to £194,319, and as these figures were not inflated by fortuitous profits arising from increases in tobacco duty, as were the profits for the preceding two years, they show an improved result on actual trading.

Steady progress is indicated by the figures for trading profit for the past three years. That net profits have not shown an equally marked improvement is due to the greatly increased interest charges we have had to bear in financing the crushing increases in duty imposed on tobacco, which it should be noted have involved manufacturers in additional interest burdens without any corresponding increase in their profit margins. We have been able to achieve these satisfactory results by developing and expanding our business wherever opportunity could be found, and by resolutely overcoming difficulties as they arose.

In my statement last year I told you that I had every confidence that we would maintain and even improve upon our past record, that our profits were running satisfactorily, that we had satisfactory stocks, and that our current production and sales were higher than the previous year's average. I am pleased that the results have fully justified my statement and I am even more pleased to be able to say that I can repeat that statement as a comment upon our current year's operations up to date.

SOUTH AFRICA

You will observe that our profits include for the first time the item "Dividends received, £9,263." This item represents the dividend to March 31st last on our holding of Preference shares in the South African company. At the first annual general meeting of that company the chairman was able to report a small profit on the first year's working sufficient to warrant the payment of the Preference dividend, although no payment of dividend was made on the Ordinary capital. That result cannot be regarded as unsatisfactory in view of the fact that the South African company had to start, so to speak, from scratch and to build its business from the ground up in a highly competitive market.

We have every hope that the South African company will make steady progress and show improved results as it becomes more firmly established, and we trust that in the years to come we shall receive many, and more substantial, dividends from it. Our managing director is in South Africa at the present time using his unrivalled knowledge firmly to establish that company.

We have signed contracts for the purchase of the majority shareholdings in Walkers Tobacco Company Limited, and a similar offer is being made to all other shareholders for the acquisition of their shares, which we hope will be accepted. With Walkers, we enter the pipe and cut tobacco trade, and are sure this new association will prove of increasing value to us as time goes by.

The report was adopted.

TENNAMARAM PALM OIL

The twenty-sixth annual ordinary general meeting of Tennamaram Palm Oil Company, Limited, was held on December 21st in London, Mr J. Bligh Orr (the chairman) presiding.

The following is an extract from his circulated statement:—

Taxation has again taken a heavy toll of profits, which, nevertheless, show an increase over last year of £11,633. The directors recommend a final dividend of 4 per cent. on the 6 per cent. Participating Preference and Ordinary shares, making 12 per cent. for the year on both classes.

The whole oil palm output was sold to the Government, as in the previous year. The price fixed over the calendar year 1949 was £82 per ton f.o.b., duty on buyers' account. For 1950, the Government have agreed to again buy the whole output, but at the reduced price of £74 per ton, duty on sellers' account. Palm kernels continue to be sold at varying, but on the whole satisfactory, prices.

From the foregoing it is clear that there will be some falling off in our profits for the current year. Every endeavour is being made to reduce production costs but, until the replanting programme is completed, estate expenditure is bound to remain high.

The estate is reported to be in an excellent state of cultivation. Regular manuring of all fields at yearly intervals has now become part of the general routine. Good progress is being made with the replanting programme. All buildings are reported to be in good condition. The labour position remains much as it was 12 months ago, barely adequate.

The report was adopted.

The directors have declared an interim dividend of 4 per cent. on both classes of shares for the year ending June 30, 1950.

BIRMINGHAM SMALL ARMS COMPANY, LIMITED

BURDENS ON ENTERPRISE

The annual general meeting of The Birmingham Small Arms Company, Limited, was held on December 22nd, at Birmingham.

Sir Bernard D. F. Docker, K.B.E. (chairman of the company), in the course of his speech, said: The trading profit for the year ended July 31, 1949, is £1,438,294 (as against £1,146,383 in the previous year). The gross dividend represents 1.3 per cent. of the turnover while, after deduction of tax, it represents only .7 per cent. Wages and salaries on the other hand come to over 35 per cent.

The burden of regulations which governments of various countries, certainly not least our own, have placed upon the back of commercial enterprise in these days is a serious hindrance. We regard the nationalisation of steel as industrial and political madness.

The B.S.A. tool group has continued to make satisfactory progress. A feature of the year has been the increase in export sales. The production and sale of motor cycles and cycles has again been a record. We have had a considerable amount of trade in sporting rifles, particularly in the dollar markets.

There is a considerable demand for Daimler cars among discerning people in this country, and were it not for government restrictions we could increase our home market to the great advantage of our overseas and dollar-earning trade. I believe there is no justification whatever for the imposition of a double purchase tax on industries that must have, by their very nature, the highest degree of technical skill and craftsmanship. The double-deck and single-deck bus chassis continue in steady demand both at home and overseas, but some governments have placed restrictions on imports.

The report was adopted.

HUMBER, LIMITED**A SUCCESSFUL YEAR**

The forty-first ordinary general meeting of Humber, Limited, was held on December 22nd at Coventry.

Sir William Rootes, K.B.E., the chairman, in the course of his speech, said: The trading results of Humber, Limited, and its subsidiaries for the year ended July 31, 1949, amounted to £864,458, and after deducting depreciation, debenture interest, auditors' remuneration and taxation, there remains a net profit of £380,520. While the net profit shows an increase of £121,888 over the previous year, your directors have decided to recommend that the deferred ordinary stock dividend remains as hitherto. There is, therefore, available a total of £325,000 to be ploughed back into the business, by the addition of £200,000 to reserve for price fluctuations in stock and additional ton amortisation, and by transferring £125,000 to general reserve.

With these additional reserves the capital and revenue reserves of the company and its subsidiaries now stand at over £2,300,000. Current assets appear in the consolidated balance sheet at £6,577,983 and by comparison with current liabilities and provisions at £4,105,455 show a satisfactory surplus liquid position.

SHORTAGE OF SHEET STEEL

Your company's premises and plant are in sound productive condition. Unfortunately they are not being utilised to full capacity owing particularly to shortage of sheet steel. In saying this I cast no reflection on the steel manufacturing industry for that has done and is still doing its best to assist us; I have no doubt that as and when the additional capacity the steel manufacturers are creating at great cost comes into production, our problems will be greatly alleviated.

In the meantime your company is in a difficult position, and is still not working to much more than two-thirds of its capacity.

The question, therefore, that arises is: Should we not purchase more sheet steel from abroad? If this could be achieved your company's increased production could all be allocated to the overseas markets. At present both cars and commercial vehicles are having to be strictly rationed.

EXPORT PROBLEM

Export is not an easy problem, particularly in the magnitude in which it has to be faced today, but I am sure you will agree that the automobile industry as a whole has done a magnificent job and its total contribution to the country's overseas trade is quite remarkable. Nevertheless, much more can be done and we are fortunate in having, through Rootes, Limited, who handle your company's exports, a world organisation and enthusiastic and loyal team of workers in all the principal trading countries of the world.

There are, unfortunately, restrictions through quotas, licences and financial regulations that make business in certain territories sometimes unprofitable and uncertain. It must, therefore, be one of the major tasks of whatever Government is in power energetically to move towards the establishment of less restriction in world trade.

You will appreciate the frustration sometimes caused in your plants through not working to full capacity and generally by reasons of our not having a sufficiently free hand to work and achieve the objects for which we aim. Moreover, we are prevented from attaining that rhythm and tempo so necessary if we are to lower our costs and be in a position to meet the intense competition which will face us throughout the world, particularly from the Continent of Europe.

The report was adopted.

HECTOR WHALING, LIMITED**PROFIT ESTIMATE EXCEEDED**

The twenty-first ordinary general meeting of Hector Whaling Limited, was held on December 29th in London, Mr R. de B. Trouton, the chairman, presiding.

The following are extracts from his circulated review—

As a result of the preferred share issue in February last the capital and surplus have been increased by slightly over £1,000,000 as compared with a year ago. About half of this £1,000,000 has been invested in the three ships formerly owned by United Whalers, Limited, enabling that company to meet the cost of its new whalecatchers. The remainder has been invested in Hector Tankers, Limited, to enable it to meet part of the cost of the tanker "Biscoe" and in shares in, and loans to, Hector Whaling South Africa (Pty.), Limited, which company has taken over our interest in the South African shipyards. The increase of £314,791 in the item for shares in subsidiary companies consists of £250,000 in Hector Tankers, Limited, £48,000 in Hector Products, Limited, £10,000 in Hector Whaling South Africa (Pty.), Limited, and £6,791 in purchasing further United Whalers, Limited, shares. We own the entire issued and paid-up capital of these three new companies and over 99.8 per cent of the ordinary share capital of United Whalers, Limited.

The estimate of profits contained in our prospectus of January 27, 1949, was satisfactorily exceeded. Your directors decided to appropriate £50,000 of the excess in raising this year's depreciation charge to £505,000, so as to write off at one stroke certain capital expenditure which has proved to be in excess of our estimates.

Last season "Balaena" made 197,000 barrels (almost 33,000 tons) of whale oil and sperm oil. Not only was this her record production but it was the best result of any whaling expedition last year. Moreover, "Balaena's" total oil production for the three-year period in which she has operated has exceeded that of any other expedition, while her total production of by-products has far exceeded that of any competitor.

We have sold all our whale oil production for the coming season at £80 per ton and have also made a forward sale of all our meat meal production.

THE CURRENT YEAR

We anticipate that some curtailment in the length of the season will take place as there is a substantial increase in whale catchers to be used by our competitors who have built many powerful catchers and have about doubled the number of corvettes in use for towing whales. Two years ago United Whalers, Limited, introduced the first two corvettes to the whaling industry, but this season the industry will be using more than twenty for towing.

We have always emphasised the speculative nature of the whaling industry. We are confident that you appreciate this and realise that virtually no conservation of resources, however drastic, can, in a trade such as this, ensure the maintenance of dividends at a steady level. This being so, your directors feel that, having made ample allowance on account of depreciation and having made adequate allocations to reserves, it is our duty to the shareholders to make as generous a dividend distribution as the profits of the year in question permit. But I must again stress the fact that, though we have been favoured with three successful years, we must be prepared to face our share of misfortune and bad years, and I can assure you that it requires a very great element of ill fortune or of bad weather to affect seriously the trading position of a company such as this.

The report was adopted.

BANGRIN TIN DREDGING

The twenty-ninth annual general meeting of Bangrin Tin Dredging Company, Limited, was held on December 22nd in London.

The following are extracts from the statement by the chairman (Mr Kenneth O. Hunter) circulated with the report:

The total output of tin ore for the year was 306.82 tons as against 106.76 tons obtained in 1947 when No. 2 Dredge alone was operating for some six months. Both dredges operated 95 per cent. of the possible working hours, and the ground worked amounted to 1,412,309 cubic yards with an average yield of .49 lb. of tin ore per cubic yard.

In the course of my remarks last year on the accounts at December 31, 1947, I expressed the hope that it might be possible to pay a small dividend when the results of the year 1948 became known. Unfortunately such hope has not been justified by events, but, as some compensation, your directors feel able to declare an interim dividend of 3 per cent., less income tax, in respect of the earnings of the current year.

No. 1 Dredge gave rather disappointing returns until September, when output rose satisfactorily. No. 2 was idle for nearly four months owing to an exceptionally severe drought resulting in a scarcity of water. The results obtained were variable but, on the whole, satisfactory. No. 3 gave very good returns for the first half of the year, but then began to fall off. Stockholders no doubt realise that, when dredging a large area which contains uneven values, returns are bound to fluctuate in this manner. In March last an unusually severe electric storm damaged some of the dynamos in the power house and caused several days loss of dredging time.

The report was adopted.

SIAMESE TIN SYNDICATE

The forty-second annual general meeting of Siamese Tin Syndicate, Limited, was held on December 22nd in London.

The following are extracts from the statement by the chairman (Mr Kenneth O. Hunter) circulated with the report:

The mine working account reflects the results obtained from operations at our Ngow, Koe Kien and Peek mining areas. Four dredges were worked, of which three operated throughout the year, and one, Ngow No. 2 dredge, started on February 12th. The rehabilitation of Ngow No. 3 dredge was still uncompleted at the end of 1948. The total output of tin ore obtained by the four dredges during the year was 920.92 tons and the ground worked amounted to 4,520,700 cubic yards, showing an average yield of .46 lb. of tin ore per cubic yard.

After making provision for amortisation and depreciation of properties, plant and equipment and paying the very heavy charge of £94,656 to the Siamese Government by way of export duty, we were left with a mining profit of £119,931 for the year compared with £28,617 for 1947, when three dredges only were working for periods of considerably less than a full year.

As regards the current year an interim dividend of 5 per cent. has been declared. You have been kept regularly informed of our production, which up to the end of October amounted to 1,015 tons and 133 tons at Kota Bahru. These bare figures may seem encouraging, and, indeed, up to a point, they are, but you will no doubt realise that, except under favourable conditions, dredges nowadays do not always work continuously at a profit; in fact, there have been periods this year when Ngow No. 1 was operating at a loss.

The report was adopted.
