The Sociology of Colonies :
An Introduction to the Study of Race Contact
By RENE MAUNIER

"Professor Maunier is in his element and his analysis of the expansion of the State in colonial conditions is brilliantly done."—*The Economist*.
In the International Library of Sociology.
2 Vols., £3 3s. net the set.

Problems of Economic Planning :

Papers on Planning and Economics

By E. F. M. DURBIN

With a Foreword by the Rt. Hon. Clement R. Attlee

"This book, published posthumously, remains as evidence that, if he had lived and been free from duties, he would have been one of the few men best able to analyse Socialist's contemporary problems and future needs."—*Tribune*.
15s. net.

Cultural Contacts of Mining

By M. H. HADDOCK, Principal of Coalville Mining and Technical College

"If the mining industry of the future, and particularly the coal industry, is to attract scientific talent into its executive posts, and if there is a need for the visionary who can combine a spirit of adventure with consideration for the day to day issue, Mr. Haddock's book is a worthy contribution to that end."—*Iron and Coal Trades Review*.

Deserts on the March

By PAUL B. SEARS

"Professor Sears does not panic; he does not denounce, though he is not chary of blame; there is no shrillness about him; and there is not a dull page in his book. No 'general reader' wanting to know what all this erosion business is about, no student seeking an introduction to serious study, could do better than begin with 'Deserts on the March.'"—*The Economist*.
10s. 6d. net.

ROUTLEDGE AND KEGAN PAUL

betray their fatherlands. Indeed the modern technique of allegiance to the One Socialist Country with its pallid cultural affiliations and sickening professional proletarianism cuts a sorry figure beside that of the old pioneer revolutionaries. Whatever its vices Leninism at least had no use for the likes of M. Aragon. It is perhaps M. Thorez' misfortune to have been born out of his time. For somehow he has neither the style nor the physique of a functionary of the Kremlin.

Mediterranean Magic Carpet

"Mediterranean Background." By Bernard Newman. Robert Hale. 282 pages. 16s.

MR NEWMAN is a prolific writer, an inveterate traveller and a persuasive student of life in our time. It is not surprising therefore that this book is easy to read and has the touch of the expert. Like the driver of a magic carpet, to whom it is forbidden to speak while en route, Mr Newman conducts the reader backwards and forwards across the Mediterranean, beginning with Spain in the west and ending with Palestine in the east. A chapter is devoted to each country possessing a doorstep on that blue and ancient sea, even Gibraltar and Malta each getting one of their own.

But if the reader may not speak, Mr Newman does plenty for him. The difficulty is to make up one's mind—as the magic carpet puts its flaps down and turns in for the approach to each country in turn—how far this is meant to be no more than a readable traveller's guide, and how far a book of reference. It succeeds best in the first role. As brief studies, these sketches would be excellent for introducing the Mediterranean countries, one by one, to potential visitors for the first time. They do not, however, quite stand up to the objectivity and completeness required of a work of reference. Why, for instance, give two different figures for the Greek minority in Albania on pages so close together as 164 and 170? And with Spain, is it altogether correct "in 1948 to take a glimpse of the country after ten years of Franco rule"? Such stretching of minor facts perhaps matters little when attempting to give no more than the feel of a country—which Mr Newman has a flair for doing. But they sap the confidence of the more exacting reader.

American Statistics

"The Statistical Agencies of the Federal Government." By Frederick C. Mills and Clarence D. Long. National Bureau of Economics Research, New York. 201 pages. \$2.00.

THE US Federal Government has more than 10,000 full-time employees engaged on statistical work; it receives more than 200 million forms a year, all providing statistics of one kind

or another. What is the product? In physical terms the output of statistics is manifestly large; Dr Arthur F. Burns, in an introduction to this book, uses a phrase suggesting that the ton is the proper unit of measure. But there are many who think that the American output of statistical data has run ahead of their use, and that analysis is too stereotyped and not sufficiently inventive. This small book throws at least a little light on the matter.

The book is the text of a report made to Mr Hoover's Commission on Organisation of the Executive Branch of the Government. Because of the short time allowed to the authors, the report is sketchy in its description of the Federal statistical organisation. The reader needs to know quite a little about the American scene to appreciate this part of the report. However, the British reader can follow, with profit as well as interest, the authors' own appraisal and recommendations. For the difficulties and deficiencies of US official statistics, as described in the report, raise corresponding questions on British official statistics. There are many statistical areas more cultivated in the United States—for instance, statistics of hourly earnings, and of instalment credit. We can learn a good deal from American experience. The learning is not all on one side, for Americans can look with some envy on British statistics on such matters as wage rates, employment and unemployment, and on the *Monthly Digest of Statistics*. But the interesting point is that the gaps which the authors see in American official statistics are generally the same gaps which appear in British statistics. Amongst the more important are regular surveys of consumer expenditure (by family budgets and otherwise), data on the volume and costs of construction, and input-output statistics on the structure of industry.

The American deficiencies on the side of statistical analysis are also very similar to our own. Many index numbers now calculated are of more than doubtful quality. Margins of error are seldom attached to national aggregates and, if they were, they would prove to be "too large for complacency." The remedies? The authors suggest better use of modern sample techniques and better training of the middle grades of statisticians in the government service.

There is one trend in the United States which is approved by the authors of the report and which should be closely scrutinised in London. The primary collection and tabulation of statistics, assembled regularly and on a large scale, are being more and more concentrated in the hands of one agency, the Bureau of Census. This applies not only to censuses proper but also to the collection of such data as those of overseas trade. Collection and tabulation are separated off from the analysis of data; the former is large scale business, the latter specialised and small scale. Such an organisation may not be suitable in this country. But the success of the US Bureau of Census does suggest that British official statistics may be improved by a greater concentration of census and survey work and greater separation of this from the various groups concerned with statistical analysis.

COMMERCE AND ECONOMICS

● **The B.Com. or the B.Sc.Econ. Degree** of the University of London may advantageously be taken by men or women seeking executive appointments in commerce or industry, government or municipal posts, or as a teaching qualification. Study for either Degree, which may be taken without residence at the University or attendance at lectures, covers a course of wide and interesting reading. Candidates are required to pass, after Matriculation, two examinations, the Intermediate and the Final. U.C.C. founded 1887, prepares students by post. The College is an Educational Trust, not conducted primarily as a profit-making concern. Highly qualified Tutors. Moderate fees: instalments. Free re-preparation in the event of failure.

● **PROSPECTUS**, giving full particulars, post free from Registrar,

AMERICAN SURVEY

State of the Unification

(From Our American Staff)

ON October 6th, with ceremony suitable for such an important occasion, the President signed the Mutual Defence Assistance Act. Among the conditions on which aid under this Act is to be provided to the other signatories of the North Atlantic Treaty is one withholding funds, beyond \$100 million, until western Europe has integrated its defence plans. This condition was the result of much high-minded discussion in the Senate of the need for an outlook broader than a merely national one; it was also a paternal warning to the planners of Fontainebleau, where, according to reports, all was by no means multilateral sweetness and international light. Even before the Act had passed both Houses, the admonitory attitude of the Senators had been made slightly ridiculous by the antics of their own Navy. Four days after the White House ceremony, the row between the Air Force and the Navy, of which everyone in Washington had long been aware, swept into the open and continued, in all its fury, before the Armed Services Committee of the House of Representatives.

Quarrelling between the Services is not new—nor is pressure for their unification. There was steady support even before the war for some system which would drive the Army, which then included the Air Force, and the Navy into each other's arms. The disaster at Pearl Harbour, the severity of which was increased by jealousy and bickering between the two commanders on the Hawaiian Islands, only made some definite move more certain. When Mr Roosevelt, an ardent collector of ship models and Assistant Secretary of the Navy from 1913 to 1920, died his place was taken by Mr Truman, the commander in 1918 of Battery D, the time had obviously come.

Though not, as in Britain, technically the Senior Service (the Secretary of War outranked the Secretary of the Navy), the Navy has always been the favoured one. Armies, in democracies, are fatally lacking in glamour, and it has always been easy to stir the imagination of the American public with tales of heroism at sea. The careers of John Paul Jones and Stephen Decatur have a fascination which those of Generals—no matter how solid their virtues—cannot hope to equal. But, while the Navy, fighting almost exclusively in the Pacific and doing most of the work in that theatre, was collecting headlines and apparently assuring its future, it failed to notice that, in other theatres, a young rival had come on the scene with as great a love for publicity as itself and many fewer scruples about ways of obtaining it. And,

as the postwar pattern of international rivalries emerged, the only potential enemy was seen to be one admirably suited for the attentions of the Air Force, but possessing, in terms of seapower, only submarines, the detection and destruction of which had always been considered one of the Navy's least aristocratic occupations.

When it realised that the President, the Congress and public opinion seriously intended to unify the three Services, the Navy methodically set about the job of taking the bone and the muscle out of the National Security Bill which, by the time it passed in July, 1947, only enjoined the Services to get together, but forbade them to merge. Hoping to make everything ship-shape, the Admirals also bargained for, and obtained, the promotion of their own Secretary, Mr Forrestal, to the new post of Secretary of Defence. Mr Forrestal, who had loyally argued their case before the Bill became law, spent eighteen months trying desperately to administer an organisational monstrosity before the impossibility of the task drove him to his death. His place was taken by a less sensitive man, Mr Louis Johnson, whose tough talk and tactless action soon brought the Navy to a point which would, in many parts of the world, be called mutiny. They referred to themselves, even when answering the telephone, as the "Water Division of Johnson's Air Force." And, as zealots will, they found men willing to sacrifice themselves and their careers to bring their complaints to public notice.

★

The first of these was Mr Cedric Worth, who circulated anonymously a memorandum making accusations about the award of a contract for the manufacture of B-36 bombers. When these were proved groundless, he finally confessed his authorship with the exaltation of a Soviet deviationist. The next volunteer was a regular officer, a Captain Crommelin, who had caused some stir two years ago by his account of a secret society, called the Green Bowl, open to a few of the best pupils at Annapolis each year. He complained to a Congressional Committee that it formed an unofficial *élite* and divided the best appointments among its members, of whom the Captain was not one.

Captain Crommelin's present crusade is more to the taste of the naval aristocracy. His first effort—a public statement that the Navy was being "nibbled to death"—having misfired, he then spent an afternoon skulking in the National Press Building, handing out, with a conspiratorial air, copies of a confidential report from an Admiral in the Pacific on naval morale—a report which had "gone up through channels" acquiring endorsements from senior officers on the way. This action should have been too much for anyone, but, in fact, it produced exactly the reaction which, it must be assumed, the Admirals wanted. The Armed Services Committee of the House of Representatives decided to hear the Navy's case.

During the Committee hearings attention has been concentrated on the Navy's assertions that the B-36 bomber is

too slow and vulnerable for inter-continental missions; implicit in its arguments, and at times explicit, has been the corollary that bombing raids on land masses in enemy hands should be conducted from a mobile base, such as would have been provided by the super-carriers, construction of which was begun this spring—and stopped by Mr Johnson soon after he took office.

To point their argument that the B-36 is no more than a "siege weapon," the Admirals attacked the whole concept of strategic bombing as "ruthless and barbaric," neglecting, perhaps even forgetting, that, until they lost the carrier and with it the means of participation, they had been as eager for strategic bombing as anyone. In the hope of being able to start work again on the super-carrier, which, they insist, is not super but merely the next stage in the logical development of carriers, they contended that each Service should be able to use its appropriations as it thinks best, without interference from the other Services; yet they spent much of their case in trying to interfere with the Air Force when it was practising what the Navy preached. It is true that they made an ingenious distinction between freedom to produce prototypes and freedom to indulge in quantity production; but that was a distinction which would allow the Air Force to build one bomber while the Navy built one carrier—like the pie that was half-and-half, one steer and one oyster.

★

What strength there was in the Admirals' case was there by mistake. The knowledge that the Russians now had the atomic bomb had invalidated strategical ideas—among which were the Air Force's plans for using the B-36—based on an assumed monopoly. But the Air Force was able to answer the charge that it was putting all its eggs in one basket by pointing out that only four groups in a forty-eight group Air Force would be composed of B-36 bombers.

The hearings, in fact, have produced nothing positive. They have made the public rightly suspicious both of the Navy's desire to invest hundreds of millions of dollars in one vulnerable ship and of the Air Force's preoccupation with long-range bombing. Worse still, they have shown the public, and the rest of the world, that unification, in its present form, is a failure. The disagreements between the Services are deeper and more dangerous now than before unification was attempted. General Eisenhower, when he was called to Washington in the spring to preside over the Joint Chiefs of Staff and try to bring them together, admitted that real unification would take time—it would be, perhaps, a full generation before inter-service rivalry was eliminated. But there is a difference between slow progress and the serious worsening of relations which the last few months have seen.

What faith can the United States have in Chiefs of Staff who behave like children? What faith can the other powers who signed the North Atlantic Treaty have when their strongest partner shows much internal weaknesses? Only the Congress can now take the steps necessary to make unification a reality and to give the Secretary of Defence the power to enforce it. And the Congress at the moment seems as divided in its opinions as the Chiefs of Staff themselves.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial respondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed with attribution is prepared in London.

One Year After—Michigan

[FROM A CORRESPONDENT IN MICHIGAN]

LAST November the liberal and labour voters, who gave Mr Truman the Presidency, also provided local New Deals for a number of States by choosing liberal Democrats as Governors. One of these was Michigan, a traditionally Republican State. But the wine of victorious liberalism does not now taste as sweet to Governor Williams as it did when he took office last January, the first Democrat to govern this mid-western State in six years. He is learning that militant idealism and personal popularity do not necessarily bring success in politics and administration.

The young Governor is a complex personality who came into politics in complex circumstances. Like his predecessor, Frank Murphy, who moved with the New Deal from the Michigan Governorship to the US Supreme Court, his concern is for the "little people." But he himself is a child of wealth and Republicanism: his nickname—Soapy—comes from the shaving cream made by his grandfather, Gerhardt Mennen. With little political experience, Governor Williams won last November's election after a 12,000 mile tour of his State in a battered car, on money obtained by mortgaging his house on the outskirts of an expensive Detroit suburb.

Democrats are fond of saying that Mr Williams won the election on his merits, being selected as candidate over the heads of the more conservative elements in the Democratic Party. In fact, while labour and liberal support gave him the nomination, it was a split in the Republican ranks that put him in office. His Republican predecessor was Governor Sigler, formerly a Democrat, who in 1946 upset the Republican "old guard" in a whirlwind campaign after his spectacular exposure of corruption in and near the State Legislature. By 1948 the independents who had voted for Mr Sigler two years earlier found him irritating, and the "regulars" were willing to take almost anyone else. The Republican organisation had fallen to pieces and the Democrats, aided by the Presidential campaign, won without much real opposition.

★

When the new Governor took office the Republicans had not yet recovered from their consternation, but they were far from powerless. They still held office in counties all over the State and they still dominated both chambers of the State Legislature. Even on the State Administrative Board, a peculiar Michigan institution composed of eight elected officers, Governor Williams was chairman in name, but in fact only the head of a minority.

He asked for bipartisan harmony in his inaugural address: "We must assume that citizens in both major parties are interested in what is good for all of Michigan." A highly intelligent planner, whose slowness of speech masks considerable shrewdness, the Governor knew that his programme would stand or fall in the Legislature. To encourage harmony, he offered the shaken Republicans a beer and pretzels party at his own house. His children romped with staid Republican lawmakers who had never before seen a Governor at home and who, having lived for two years with Mr Sigler's chill personality, were eager for a breath of humanity.

The bipartisan honeymoon lasted just a week. Then hard-headed Republicans took a second look and found Mr Williams likeable, but a Democrat. They found him hinting that a \$60 million deficit was confronting the State govern-

ment. They found that his appointees to State offices were close to the labour organisations. They found themselves with votes enough to block a whole series of his campaign promises. Before the Governor could give the Legislature his carefully prepared message asking for housing aid, fair employment practices, the repeal of "restrictive" labour laws and other liberal measures, the Republicans beat him to the draw. A Republican "legislative policy committee" of key party leaders wrote its own programme in broad generalities. By and large, that programme won.

This was the first setback for the Governor, but there were compensations. The Republican programme covered some of his points and Democrats could argue that had the Governor not loomed as a warning to conservatives, Republican stand-patters would have continued to stand pat. There were other setbacks. Governor Williams wanted to make a labour official director of unemployment compensation. This required confirmation by the State Senate, which the Republicans were unwilling to give, and the Governor's appointee vanished. This happened more than once as he sought to cement his hold on the State administration.

★

The inter-party feud was to have been expected but, as the weeks rolled on, the Governor appeared to be getting into trouble with those independent groups which are crucial to a Democrat's success in Michigan. He looked into the State's penal system—a veteran of State service resigned charging "political pressure." His Liquor Control Commission decided to rid itself of a retired brigadier-general who had been its executive director—the same cry of "politics" rose again. Almost a decade ago Michigan voters, disgusted with political spoilsmen, had written civil

... the Barclays Group can help

IN THE UNITED STATES

With a coast to coast network of correspondent banks, a New York office of Barclays Bank (Dominion, Colonial and Overseas), and a representative in San Francisco covering the West Coast, we can:

- Get information for you on markets in the United States;
- Introduce you to agents who can handle your goods;
- Provide all the necessary banking services:

THE BARCLAYS GROUP OF BANKS

service provisions into the State constitution. The Governor had campaigned as a friend of a civil service strong enough to keep from politicians all but a few policy-making jobs. The penal and liquor disputes raised doubts as to his support of the merit system and his ability as an administrator.

After he appointed labour organisers to his personal staff there were the usual cries of "labour domination," but perhaps without justification. If Governor Williams's feet travel along the same road as labour, it may be because his eyes look at the same problems and the same goals. He also knows that in Michigan the Democrat seeking State office must look to labour for votes; in that state, organised labour is almost synonymous with the Democratic party.

The young Governor is one of the most personable chief executives in Michigan's history. In political rally, banquet and conference he has appeared a sincere and public-spirited citizen. Even Republicans like him. In the confusion of 1948 they feared that he would win votes because he seemed able to win friends. Now they think that voters approve of him as an individual, but are hesitant about him both as political leader and as administrator. Under ordinary circumstances he would be Governor for a two-year term only, but the Republican situation may help him to win again in 1950. Without a Governor as their titular leader, and with too many ambitious men eager to reach the top, the Grand Old Party in the State is in trouble, for the moment at least. There are two potential candidates for the Governorship who might win the nomination but would split the party ranks. Two other aspirants, acceptable to the regulars, might lose to Governor Williams. If he should win re-election next year his fame would extend to the national scene and Republican Michigan would have stumbled into a political revolution.

"It's easier to do business with a man than an address!"

Sydney last month, Johannesburg last week . . . New York next week! As my firm's export manager, I find it pays to do business with a man and not just an address. Correspondence is cut to the bone, misunderstandings are prevented, problems are solved on the spot.

That's where Speedbird service and B.O.A.C.'s 175,000 miles of world-wide routes come in. B.O.A.C. usually flies where I want to go, and Speedbird service gets me or my freight there in a hurry and on schedule. Arranging my trips is easy—I leave everything to my local B.O.A.C. Appointed Agent. About the actual flight—it's good, really good. Everything from the prompt, courteous attention to the complimentary meals reflects B.O.A.C.'s 30-year-old tradition of Speedbird service and experience.

American Notes

Is the Communist Party Guilty?

When one of the longest criminal trials in American history, that of the eleven leaders of the American Communist Party, came to an end in New York last week after nine months, it did not take as many hours for the jury to reach its decision. It found America's "Politburo" guilty of conspiring, and of organising groups, to advocate, and of teaching the desirability of advocating, the overthrow of the United States Government by violence. The accused had offered in their own defence only party-line propaganda and complaints of political persecution which cross-examination easily exploded. Their attorneys had consistently attempted, by endless delays and insolent disregard of the Court's rulings, to provoke either a mistrial or a breakdown in the judge's health. For this contempt of court, the lawyers have now been sentenced to terms of imprisonment varying from one to six months. Ten years in jail is the longest sentence that the Communist leaders themselves can receive, which even to their prejudiced eyes must contrast favourably with a Hungarian gallows. Appeals against both sets of convictions are already being prepared.

Public relief at this seemingly simple answer to the Communist problem was expressed in a paean for the judge's endurance and the jury's sagacity. The professional red-baiters put on a new mantle of respectability and went about their work with fresh energy. Before long both their most spectacular quarry, Mr Alger Hiss, and their long-time bogey, Mr Harry Bridges, will be on trial once again on the same old charges, the first for perjury, the second for concealing his Communist membership when seeking US citizenship.

★

But the New York jury convicted only eleven individual Communists, not the Communist Party as an organisation. The judge specifically stated that the Party was not on trial and also that there was no question of the legality of the Smith Act of 1940, under which the charges were brought and which is widely believed to outlaw Communism. Many Americans, whose hatred of Communism is beyond doubt, nevertheless feel that the constitutional guarantee of free speech is endangered by this Act, which makes illegal, in time of peace as well as in time of war, not only an actual attempt, but also advocacy of an attempt, to overthrow by violence any Government in the United States.

Unless some flaw is discovered in the conduct of the case, the appeal will presumably be based on this constitutional point, on which, it is hoped, the Supreme Court will be forced to come to a decision. The Court may, however, succeed this time, as it has before, in avoiding the basic issue of the guilt of the Communist Party as such. Even so, if it upholds the conviction of the Communist leaders, the 70,000 other members of the Party will have to go underground if they wish to continue to sap the foundations of American democracy. The alternative would be for the Party to follow the example of other immigrants and allow itself to be assimilated into that democracy. But it is more characteristic of Communism to force assimilation on others than to be itself assimilated.

Congress puts up the Shutters

Congress, after having been bound to the wheel through a long, hot summer, at last has adjournment within its grasp. Only three hard nuts remained to be cracked last week before the shutters could finally be put up; and, as always, the eagerness of Congressmen, at the end of a session, to be away put a premium on obstinacy. The House, by an almost unanimous vote, refused to cut the funds it had voted for a 58-group Air Force, and the Senate bowed to

force majeure, putting its economy crusade for a 48-group Air Force away in its treasury of good intentions. It also gave some ground on the cut it had voted in the funds available for the stockpiling of raw materials. The Bill for national defence in the current fiscal year thus stands at more than \$15.5 billion, excluding the \$1.3 billion since voted for military aid to western Europe and other nations.

The prospect of adjournment may have done the Air Force a good turn (though it remains to be seen whether the Secretary of Defence will allow the windfall to be spent), but it has cheated the Displaced Persons and their friends. Senator McCarran, chairman of the Judiciary Committee, has been sitting all session on an Administration proposal to liberalise the Act admitting DPs into the United States, clucking angrily at bipartisan efforts to have it reported out. By the time he left for Europe—to call upon General Franco and collect more anti-DP ammunition—the egg was thoroughly addled. The Committee reported the Bill out in the end, despite his transatlantic squawks, but by that time Congressmen were already packing their bags, and the threat of a protracted filibuster by Senator Cain persuaded the Senate not to prolong the agony. The Bill has been recommitted until January 25th next year, when Senator McCarran will be on hand himself to peck his ugly duckling. The measure passed by the House would have extended the life of the Act by a year until January, 1951, increased the number to be admitted from 205,000 to 339,000, and eliminated its thinly veiled racial and religious bias. The 100,000th DP to be accepted is now on the high seas.

Even the controversial farm price Bill has at last been settled, until next session at least, after it had begun to look as if the two Houses would not be able to agree, even in order to forestall the coming into effect of the rigours of the Aiken Act. The House conferees had heavy backing for a simple extension of the present high and rigid supports, the Senate conferees narrower backing for a flexible programme, to begin in a year's time. But here again obstinacy paid: By digging in its toes, the Senate finally induced the House to accept flexibility, although price supports will only be reduced by stages, beginning in 1951.

★ ★ ★

Strike Deadlock

Dr Edwin Nourse, in the speech which made it certain that this time his resignation from the Presidential Council of Economic Advisers would be accepted, laid the blame for his apprehensions about the future of the American economy on the preoccupation of both management and labour with their own security—nor did he spare the Administration. A demonstration of the attitudes he deprecates is provided by the present steel and coal disputes, both of which have arisen over welfare questions. Immovable mine-owners and steel executives are facing equally immovable miners and steel workers; the inevitable deadlock so far shows no sign of breaking.

But the miners have now been on strike for nearly five, and the steel workers for nearly three, weeks. Mr Lewis, the head of the mine workers, has tried to counteract the growing attractiveness of a return to work by rallying not only his own union, but also the leading members of the American Federation of Labour, to the financial aid of the steel workers; they are, he says, under a "vast and barbaric attack" from an industrial bloc which wants to "decimate" all unions. Mr Green of the AFL has refused to be rallied by one old enemy to the aid of another. But the steel workers' leader, Mr Murray of the Congress of Industrial Organisations, knows as well as does Mr Lewis that the two unions win or lose together. And on this occasion, Mr Murray is driven by pressures within his own organisation to be as intransigent as Mr Lewis habitually is. Not only has his right-wing rival, Mr Reuther, already obtained for some of his automobile workers the non-contributory pen-

sions for which the steel workers are striking, but any weakening on Mr Murray's part would strengthen the fellow-travelling dissidents who must be dealt with at the CIO's convention, which begins on October 31st.

For this reason, as well as because he likes to see his labour supporters happy, President Truman would welcome speedy concessions by the steel companies to the union. It cannot in any case be long before Washington is forced to apply to both strikes something more drastic than the ineffective efforts of the government mediators. Apart from the President's reluctance to use the Taft-Hartley Act, which he has so severely condemned, its procedures are hardly suited to the steel dispute, in which a fact-finding board has already played an important part. If the President's personal attempts at mediation fail, he may fall back on government seizure of steel mills and coal mines. Mr Lewis has already demanded the latter.

Such action cannot, however, be justified until the health of the national economy is seriously endangered; the recent improvement in it has already been halted by the strikes, and it cannot be long before they cause a noticeable deterioration to set in. At present it is chiefly the strikers themselves, about one million of them who are unemployed as the result of the stoppages, but the Secretary of Commerce estimates that by November 1st two million, and by December 1st five million, will be out of work in direct consequence of the strikes. Small firms which have not been able to build up stocks will be the first to be affected. It has already been announced that a shortage of skates, tricycles and mechanical toys is inevitable this Christmas and the public demand for an end to the strike will grow once a drop in temperature calls attention to domestic coal cellars.

★ ★ ★

Natural Gas in the Senate

The refusal of the Senate to confirm the appointment of Mr Leland Olds to a third term on the Federal Power Commission is a blow to government regulation of the gas, oil and electricity industries. Mr Olds has been the most active advocate of regulation on the five-man Commission, which has usually split 3-2 on important decisions. He is one of the few remaining New Dealers on the firing-line. In his place Mr Truman has put forward Mr Mon Wallgren, whom the Senate Armed Services Committee viewed with justifiable scepticism when the President recommended, eight months ago, that he be made chairman of the National Security Resources Board. Mr Wallgren, former Governor of Washington, and receptive to any job his old friend the President might suggest, conspicuously lacks Mr Olds's long experience and special knowledge of the complexities of rate-making. But this has proved no bar—indeed almost the opposite—and the Senate has lost no time in giving its approval.

Indian Givers

An Indian giver, in the American vernacular, is one who, repenting of his generosity, asks for the return of his gift. This may be a slur on the first Americans, but it describes with some accuracy the Bill recently passed by Congress for the rehabilitation of the Navajo and Hopi tribes, the largest, as well as the poorest, most illiterate, and disease-ridden representatives of the far from vanishing redskin.

ON SALE TODAY 6d.

A map of the Western United States showing Indian Reservations in 1930. The map includes state boundaries and names: Washington, Oregon, California, Nevada, Idaho, Utah, Arizona, New Mexico, Texas, Montana, Wyoming, Colorado, Kansas, Oklahoma, Nebraska, South Dakota, North Dakota, Minnesota, Wisconsin, Illinois, Indiana, Michigan, Ohio, Pennsylvania, New York, Vermont, New Hampshire, Maine, Massachusetts, Connecticut, Rhode Island, Delaware, Maryland, Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, and Texas. Indian Reservations are marked with black squares. A legend in the bottom left corner shows a black square followed by the text "Indian Reservations".

The Indian's status is the most anomalous of any American minority. He is a ward of the Federal Government, but Congress has never given the Indian Bureau enough money to carry out its responsibilities. Yet he has been a citizen since 1924, and even reservation Indians recently won the right to vote in Arizona and New Mexico. His lands are frequently inferior (though oil and timber have made some Indian millionaires) and incapable of supporting him, yet his numbers have steadily increased since 1900 and by 1980 there may be 700,000 Indians, as many as there were when

Eggs and Bacon

Earlier this year it was expected that pork would provide another example. Plentiful stocks of corn and high meat prices have encouraged farmers to breed more hogs, as well as more hens, during the past year. But the peak of the summer marketing season went by without any need for price supporting operations and it is possible that the winter peak will do the same, provided that the present strikes do not last long enough to affect seriously the demand for meat. The price of hogs has fallen to about \$18 a hundredweight from \$28 a year ago, but this is still about \$1.50 above the support level. Pork would be even more expensive to store than eggs; they only have to be dried, but it must be frozen and kept under refrigeration. Nor would Britain be likely to have dollars for pork, even at half price. If there should be a glut of hogs, Britain might even have to eat American dried eggs without Canadian bacon since, once hogs are officially surplus, Marshall dollars can no longer be used for off-shore purchases of pork and its products.

Oregon has begun the biggest reforestation project ever undertaken in this State, which is nearly half covered by commercial forest lands. During the next 14 years 300,000 acres of burned-over land will be restocked with fir trees planted by hand and with seeds scattered from helicopters. The project will cost \$10 million, and the trees will be ready for cutting in 75 years, provided of course that the area does not catch fire in the meantime, as it has three times in the last sixteen years.

(From Our Paris Correspondent)

The best proof of this is the attitude of the CGT itself, which presumably knows a mass-movement when it smells one in the offing. The Communist movement has, in fact, voiced nothing but contempt for the amateurish methods of the non-Communist militants, dismissing them as "pure bravado" and "unscientific." The Communists themselves have evidently taken the pulse of the workers and found it weak: the masses, if dissatisfied with their lot, being also dissatisfied with professional agitators. Indeed, nothing comparable to the dogged spirit of the Canadian-British dock-strike has occurred in France this summer, where the tendency has been towards one-day token stoppages, such as those of the tramways at Strasbourg and Marseilles at the time of the commercial fairs or, recently, the miners' chain-strikes in the northern coalfields. In spite, therefore, of the routine chorus of wage demands which grew in volume and plausibility after the devaluation of the franc, the disruption of the Queuille Government was due, primarily, to the political initiative of the Socialist M. Daniel Mayer, who had become gravely apprehensive of his party's electoral eclipse.

In the meantime, the trade unions regard the special bonus, which was proposed by M. Moch—but is now presumably in abeyance—as a laughable palliative. In the opinion, for instance, of the Christian unions (CFTC) it is unsatisfactory for at least three reasons. Being a once-for-all payment, its practical effect will be small and, when it is not repeated, its psychological effect detrimental. Since the increment is tapered off so as to disappear at the wage-level of 15,000 francs, the gain to a worker earning, say, 14,500 will be negligible; since the re-introduction of collective bargaining, to which the *prime d'attente* is intended to serve as a prelude, will take many weeks of parliamentary bargaining (in the face, perhaps, of counter-proposals to change the law regulating strikes) the bonus will not serve to cover the interval. Thus the CFTC continues to ask for a 15 per cent increase in the present legal scale of wages on the basis of a forty-hour week. (Owing to electricity cuts, many factories have been forced to reduce their hours from 48 to 40.) In addition to this, the CFTC is asking for a productivity bonus,

During the recent parliamentary crisis the CFTC, wishing to explore the possibilities of unity of action between the main unions against the *patronat*, issued a draft agreement for the creation of an interconfederal cartel to be composed of the four main confederations (CFTC, CGT, FO, CGC). In return the Communist CGT published a counter-proposal. The dissimilarity between the two documents is revealing. The CFTC was naturally concerned to preserve for the non-Communist unions complete political independence. Thus Article 2: "This agreement is not intended to affect in any way the autonomy of each *centrale syndicale*"; Article 4: "A decision binding the whole cartel must be unanimous,

each organisation having one vote." "Each organisation undertakes not to claim for itself the initiative in positions taken in common." In short the conception of the CFTC was of a united directorate at the top in which the different unions would have equality of status, to which they would be individually loyal and whose action would be limited strictly to specific objectives to be determined by agreement.

The Communist view of the matter was quite another story. After some staggering unilateral wage demands their draft refers to the need for cartels similar to the inter-confederal one at all levels (factories, local unions, departmental unions, federations); these cartels would take whatever action they considered necessary in their own sectors and that action, *whatever it was*, would be supported by the interconfederal cartel. If local action proved insufficient there would be a national assembly of the representatives of the *cartels de base* which would decide what action should be taken on the national level. In other words, the Communist plan envisaged what the CGT had elsewhere described, with florid imagery reminiscent of the Paris *métro*, as "a movement rising up from the very depths of the world of labour." Further, Article 9 of the Communist draft stated:

The cartel being formed on the basis of a minimum common programme, the participating organisations reserve entirely their right to pursue their own policies outside the common programme.

This reservation alone was enough to scare off prospective partners. As things turned out, both *Force Ouvrière* and the *Confédération Générale des Cadres* (senior staff union) refused to participate in a joint organisation with the Communists, with the result that the CFTC (which may in fact have produced the original draft with its tongue in its cheek), has undoubtedly gained credit as the foremost "free" confederation.

So far the CFTC has been relatively weak outside the clerical workers; but the day may come when it may gain strength in industry at the expense of the Communists. This would result most probably from an electoral recovery of the MRP which, after a brilliant start after the war, has now sunk in prestige. At present, however, both the left-centre parliamentary coalition and the free trade unions are countered by an opposition from the extremes that is strong enough to paralyse them.

If in 1951—or previously, in the event of a dissolution of the Assembly—the Socialists and MRP between them could wrest 50 seats from the Communists (who at present hold some 180 out of a total of 620), France could again be governed. In those circumstances the free unions would have the opportunity of abandoning their pose of arid opposition to the *pouvoirs publics* and partnering a sympathetic government.

Pakistan's New Trade Policy

[FROM OUR KARACHI CORRESPONDENT]

AFTER three weeks of intensive activity the Pakistan Government has announced a new trade policy in answer to the challenge it has set itself by its decision not to devalue the Pakistan rupee. The issues at stake are vital, for it is not too much to say that a soundly based and carefully nurtured economy has been placed in grave jeopardy, not so much—to do the Government justice—by Pakistan's non-devaluation as by the devaluation of the other currencies of the sterling area.

Viewing the problem in isolation, there was no intrinsic reason for depreciating the Pakistan rupee. Why, it was

asked, should Pakistan, with a favourable trade balance not only with the sterling area, but even with the United States, take a step which would mean higher costs of imported goods, without bringing any compensating advantage in increasing the volume of exports? There was no elasticity in the demand for Pakistan's export commodities, for these were already in keen demand and Pakistan had no difficulty in selling them. Devaluation would thus, on this view, merely have given a fillip to inflationary tendencies just at a time when the Government had got them well under control, and would have necessitated Pakistan paying higher prices for capital goods from the United States and other non-devalued countries when it was on the threshold of a vast programme of industrial development.

Across the Indian Frontier

However plausible and theoretically sound these arguments are, the fact remains that a country whose prosperity depends so largely on its exports cannot afford to act *in vacuo*. (The governing factor is whether the demand for Pakistan exports is in fact elastic, a point which was discussed on page 741 of *The Economist* three weeks ago.) Jute, cotton, tea, wool, and hides and skins are the life blood of Pakistan's economy, providing not only the bulk of the country's foreign exchange earnings and a considerable slice of the Government's revenues, in the shape of export duties, but also the main source of income of millions of primary producers. The bulk of these exports goes to countries which have devalued their currencies. In the year 1948/49, in fact, about 42 per cent of the seaborne exports went to India and the United Kingdom, the two best customers; and this tells only half the story, for the value of exports to India by the land routes (mainly jute) was about equal to the total seaborne exports. Precise figures are not available because complete statistics of the over-land trade were not maintained during the year in question. Because there is no real control of trade across the frontier with India, a differential exchange rate between the Dominions cannot be maintained, unless this rate is counter-balanced by alterations in their price levels.

If Pakistan can dispose of its exports without having to reduce its prices, and this is the crux of the whole matter, there need be no fear of any deflationary effects emerging. The manner in which the Government is facing the problem, the gravest in its history, leaves the average businessman uncertain whether to admire its sangfroid, or to deplore its failure to grapple with the realities of the situation. "To exporters," said the Minister of Commerce at a press conference at which he announced the new trade policy, "my advice and request is to accelerate, increase and improve their exports." This is easier said than done, and exporters would have appreciated some advice as to how they are to persuade their main buyers to pay anything up to 44 per cent more for the same goods. It had been confidently expected that the Government would share the loss with the producers by removing, or at least reducing, export duties, which are as much as Rs. 60 per bale of cotton and Rs. 20 per bale of jute, though it was recognised that this would seriously upset budget calculations. But it transpires that there is to be no reduction, except for a trifling one from Rs. 60 to Rs. 40 in the case of short staple cotton.

A Fighting Chance of Success

There is a fighting chance that the new policy may succeed, for there are certain factors in its favour. Both the cotton and jute crops are on the short side, and it has been admitted for some time that prices of both have been too high and could stand a substantial fall. Cotton can still compete with American cotton, in view of the dollar difficulty, although prices are about 16 per cent above American prices. Although buyers are holding off at present in the expectation of a fall in

Above is based upon report in London "Evening News," 18.2.49.

Shortage of police man-power is likely to be a major problem for many years to come. It is unfortunate, therefore, that thousands of police must daily be employed on traffic control duties.

Anything which will assist in putting them back on the beat is playing its part in beating the present crime wave. ELECTRO-MATIC VEHICLE-ACTUATED SIGNALS are already doing this at thousands of busy (and not so busy) traffic intersections up and down the country.

Have you considered them in relation to the man-power problems in your area?

With the "Recordon" you can dictate confidential messages with confidence by means of the "Codit" Scroll—an exclusive "Recordon" refinement. "Codit" Scrolls are made only in specified numbers of matched sets to an individual pattern. Only the person holding the duplicate scrolls can replay your message. Any attempt to replay the message with any standard or other "Codit" Scrolls will scramble the speech and make it unintelligible. This ingenious fitting enables the funnelling of correspondence through your Typing Pool whilst preserving the completely confidential nature of the contents of the letters. "Recordon" has no equal for efficiency and economy. Your messages are recorded on magnetic paper discs (costing only a few pence each) which can be erased and used over and over again an indefinite number of times.

- Look at these other "Recordon" features:
- Easily carried. Weighs only 11½ lbs.
 - One machine records and plays back.
 - Visual "Record" and "Play-back" indicator.
 - Audible warning when approaching end of record.
 - Paper discs can be air-mailed—saving expensive long-distance phone calls.

prices consequent on India's reluctance to buy, it is probable that Pakistan will still be able to dispose of the crop.

Jute is a far more serious problem, but here again the Government has for some time past been content to contemplate a fall in prices. Whether the fall will be catastrophic or not depends mainly on the question of whether the Governments of the two Dominions will be able to evolve some reasonable *modus vivendi*, for well over half the crop normally goes to the Indian jute mills, and the Indian Government is refusing to pay the prices for which Pakistan has asked. At the same time, the situation is not desperate. Much depends on the size of the jute crop, and the East Bengal Government now places the crop at no more than 3,300,000 bales instead of the earlier estimate of 5,500,000 bales. Should this be anywhere near the true position, a keener demand must obviously be expected, prices will not fall too steeply, and transport and shipment will be less of a problem.

Caution in Import Policy

If the Government's export policy errs on the side of boldness, the import policy is open to the charge of excessive caution. One of the main points justifying the non-devaluation decision was that Pakistan would get its imports cheaper, and the cost of living would thus be reduced. Consequently it was expected that the Government would cheerfully continue letting imports flow in freely, at cheaper prices, making their contribution to the general well-being (and also incidentally swelling the customs revenues). But, partly in order to cushion the shock for dealers who have large stocks on their hands, and partly to ensure a healthy balance of trade, the Government has decided to cancel the Open General Licence under which nearly all classes of goods from the soft currency areas could be imported without licence, and to replace it by a more restricted system. It is understood that machinery, drugs, medicines and selected chemicals, metals and ores, mineral oils, coal, and a few other items will be covered by the new Open General Licence, but all other imports will be licensed in accordance with fixed ceilings of expenditure for each category. Cotton cloth and yarn, however, is to be licensed more freely. The ceilings for luxury goods will be extremely low, and other kinds of consumer goods will be allowed on a restricted basis.

Was all this really necessary? Out of total seaborne profits of Rs. 109 crores in the last financial year cotton piecegoods and yarn alone accounted for nearly 35 crores, and vehicles to over 4 crores. The result is that the market is glutted with cotton goods, and that British cars, for which a year ago dealers had long waiting lists, can now be had for the asking. Natural conditions of supply and demand should, therefore, have corrected the temporary disequilibrium and artificial restrictions should hardly have been necessary. Nevertheless, the Pakistan Government may perhaps have taken a wise step in giving itself time to watch the trend consequent on the altered exchange ratio.

Brazil's Sterling Trade

[FROM OUR RIO DE JANEIRO CORRESPONDENT]

LAST week the Brazilian Government finally decided to maintain the cruzeiro's official parity with the dollar, which makes it about 44 per cent dearer in terms of the pound. Cocoa shippers, with their eyes on West African competition, have been urging multiple exchange rates, but little criticism of the straightforward adjustment has come from other quarters. This is hardly surprising, since coffee exports are flourishing at all-time record prices. Coffee, which since the beginning of the year has accounted for over half of all Brazilian exports, is now bringing in dollars at a rate which may wipe out Brazil's commercial debts within a few months.

Nevertheless, over a third of all Brazil's exports go to

soft currency markets, a tenth of them in cotton, and coming months may see some close price bargaining between the São Paulo cotton growers and their British customers. Last year Brazil supplied a sixth of Britain's medium staple imports, and although São Paulo crops (which compete with dollar cotton) have been declining in recent years, next April's crop is expected to be the largest since 1944. Britain this year has bought 56,000 tons, and the São Paulo market expects to be cleaned out by December; but next year's picking may leave at least 110,000 tons for export, and it is understandable that the growers are anxious to know the prospect of sales to Britain. The Royal Cotton Commission is reported to have offered an 18 per cent increase in sterling prices, and the attraction of Brazilian supplies as an alternative to American cotton will doubtless depend on the outcome of such negotiations. If British demand is sustained, it is believed that São Paulo could provide 150,000 tons a year.

In fact, São Paulo's medium staple cotton is Brazil's greatest sterling earner, a point of importance now that the level of Anglo-Brazilian trade is so largely determined by Brazil's ability to expand its commodity shipments to the sterling area. Another advantage is that the São Paulo crop moves at a different season to northern hemisphere harvests, enabling consuming markets to carry smaller stocks.

Dwindling Market for Textiles

While the growers are anxious to maintain their exports, the better organised textile manufacturing interests here (whose exports have shrunk by about 90 per cent in the past year) have been pressing for protection against imports of woollen, cotton and linen yarns from Britain. Although domestic mills are unable to replace many of these imports and in fact could not produce some of their higher quality goods without them—the protectionist claim is being strongly pushed, and seems likely to carry some weight. The growers are unsympathetic to an attitude which, as one grower puts it, makes it difficult to encourage an expanding sterling market for raw cotton.

Brazil seems in any case destined to be a dwindling market for British textiles. But there are many other needs which Britain seems well placed to supply, including those of both the growers and manufacturers of cotton. The growers are interested in agricultural machinery and fertilisers, and perhaps one of Britain's most promising markets here is for textile machinery. In the past Britain has equipped about half of the Brazilian textile industry, and, if it can supply the goods, it could now meet probably about 80 per cent of Brazilian orders. Except for woollen and worsted spinning, which uses the "French system," Brazilians recognise British machinery to be better value than either Swiss or American makes. The industry has about 3½ million spindles and 100,000 looms, and most of its equipment is said to be at least 25 years old.

The demand for re-equipment is strong, and Brazilian cotton masters are said to have reserves for the purpose amounting to 600 million cruzeiros (worth £12 million in devalued sterling). This is the fruit of their wartime boom. There are signs that British suppliers are alive to the possibilities. A new São Paulo spinning mill has been fitted with English machines said to be more modern than any in Lancashire. But the field is still competitive. Other new mills have installed Italian machinery, and there is now some interest here in a Japanese automatic loom. More could be done by British manufacturers. Recently, for instance, an English maker is said to have refused to supply a few looms to an industrial training school on the ground that he was only interested in equipping factories. Brazil's industrial training system is an important adjunct of Brazilian industry, and the looms used for training are likely to be installed in the mills.

The inevitable modernisation is unlikely to provide serious competition for Lancashire except in the Brazilian domestic

market. A cotton spinner who operates one of São Paulo's most modern mills holds that Brazil can never become another Japan, and his view seems justifiable. The Brazilian population is growing at the rate of 1,500,000 a year, and provides a vast and promising market for local mills, as even the most modern mills now recognise. British industry would have everything to gain by bidding for the coming modernisation of the Brazilian textile industry.

Return To Peking

[FROM A CORRESPONDENT]

IN restoring Peking as the capital of China the Communists have made a decision which was already being discussed in Nationalist circles in Chungking during the war against Japan. Chiang Kai-shek himself was said to favour the project. The main reason for the desire to move back to Peking instead of to Nanking after the prospective eviction of the Japanese from China was the traditional prestige of Peking as the imperial city and its possession of a group of ancient buildings giving it a grandeur and dignity which Nanking entirely lacks. The obvious excuse for the choice to abandon Nanking would be the devastation which befell the city in the fighting of 1937 in contrast to the preservation of Peking, which was virtually unscathed by the Japanese invasion; in view of the urgency of restoring the national administration, the material advantages of moving the offices of the central government to Peking on the termination of hostilities could be held to justify overriding the will of the revered Sun Yat-sen, who had laid it down that Nanking must be the capital. That the move to Peking was not made in 1945 was due, not so much to a free decision to go back to Nanking as to the Russian occupation of Manchuria and the widespread rule of the Communists in North China—

factors which made it too dangerous for the Nationalist Government to give such a hostage to fortune before they could gain full military control of Manchuria and North China.

Peking was the capital of a unified China under three dynasties from 1280 to 1912 except during the first two reigns of the Ming dynasty when it was at Nanking. It is worthy of note that of these three dynasties two—the Yuan (Mongol) and the Ching (Manchu)—were set up by conquerors from the north who wanted a base for power within China, but as near as possible to their own homelands in Manchuria or Mongolia. Conversely, for a Chinese monarchy whose main preoccupation was defending China against the northern nomads and keeping an ascendancy over them it was an advantage to have the capital close to the frontier and its armies rather than in central or southern China. If it is considered desirable for a capital city to have a central position, Peking is fairly central in relation to China's total territory including Manchuria, Inner Mongolia and Sinkiang; in "China proper" on the other hand, that is to say China south of the Great Wall, it is on the northern periphery, and Nanking, or some other place in the basin of the Yangtse, would have a better claim to be metropolitan.

The old cleavage between north and south in China has indeed had much to do with the issue between Peking and Nanking as capitals. Under the old Manchu regime, China was divided into northern and southern sections (Nanking being included in the southern) for purposes of civil service recruitment, and the south got only as many offices as the north in spite of having a larger population; this created a sense of grievance in the south and was one of the means whereby the Manchus played off Chinese against one another. But in the nineteenth century it was the south which was the more affected by western influences penetrating particularly through Canton and Shanghai, and it was from the south that revolution came—first in 1911 and then again in 1926.

The Kuomintang was from the beginning, and has always remained, primarily a party of southerners, and along with all the designs for regenerating China there has always been the less advertised idea that men from the provinces where the party was first built up should enjoy the plums of office in all China.

North of the Yangtse the Kuomintang troops and officials came as invaders, and although local recruits were gathered to the cause and bargains struck with established provincial magnates, the north continued to regard the Kuomintang regime as a southerners' ascendancy. It was indeed a turning of the tables, a *revanche* for the former privileged position of the north under the Manchus, and it was symbolised in the transfer of the capital from Peking to Nanking. The purpose of the transfer in Sun Yat-sen's mind was partly, no doubt, to make a break with the monarchical past. Nanking was to be modern, businesslike, up to date in appearance and atmosphere; though it had links with tradition by having been a capital before in remote periods of history, it had hardly any old buildings and no flavour of recent majesty. But over and above these considerations, there was certainly the feeling that this was the southerners' capital, close to the areas from which the Kuomintang drew its main military and political strength, a place from which the north could be dominated.

Centre of Communist Power

The interest of the Communists is just the opposite. The Manchu monarchy is too long dead for its haunting influence to be dangerous to the people's new administrators; it is the heritage of Kuomintang officialdom that must be avoided. The Communists can now claim as their own the traditional prestige and glories of Peking with safety, for it is in the midst of the region where their power is most strongly established. Although they, too, started in the south—for the Communists as an urban workers' party had their first roots in Canton and Shanghai alongside the growing Kuomintang, and before the famous "long march" their chief rural stronghold was in Kiangsi—they are now primarily a party of northerners. During the war years and since 1945 they have taken advantage of the greater disintegration of the pre-war Chinese state and society in north China and Manchuria as compared with south China (due to the longer and more thorough Japanese occupation) and have also exploited anti-southern sentiments to gather political forces in opposition to the return of Kuomintang carpet-baggers. The Communists have still much of south China to conquer, and even if and when they do complete their conquest, it is likely that their power will be less secure there than in the north. Peking as capital represents a return of the political centre of gravity in China to the north; the fact that neighbouring Manchuria is to be both the principal industrial area of the new China and also the zone of Soviet-Chinese joint defence further reinforces the significance of the northward shift.

Japanese Subsidies

[FROM OUR TOKYO CORRESPONDENT]

THERE is a current Tokyo legend that the Prime Minister Shigeru Yoshida, turning angrily on anguished business critics of his programme for cutting subsidies, jabbed a cigar at a photograph of the young Japanese swimmers who smashed world records and said:

We didn't have to steal a 20-metre start for them to beat the world, did we?

Yoshida-san is facing difficulties from inside his own conservative party, as well as from a sullen section of his business supporters, in breaking down the hot-house structure of domestic and import subsidies which has been extensively built around the Japanese Occupation economy. By his own natural political inclination and under the belated spur of

American directives, Yoshida-san favours the sweeping removal of the subsidies which are estimated at 202,200 million yen for this fiscal year.

Of this total, 115,200 million yen had been allotted as government subsidies for "stabilisation" or basic commodities (such as coal, iron and steel, chemical fertiliser, copper and soda), 83,300 million yen as import subsidies for approximately thirty essential items (staples, fishing net, rubber) and 3,700 million yen as internal price subsidies.

This subsidy ratio (the proportion of existing subsidy to the theoretical consumer price in the absence of subsidy) ranges from 40 to 70 per cent, and brings the level of consumer prices of subsidised goods well below the general price level. An impressive comparison may be made with American prices for the so-called Japanese "stabilisation" commodities (based on an American index of 100 and the official exchange rate of 360 yen to the dollar):

Coal (for special industries)	40
Pig iron (for casting)	34
Steel bars (19 mm. in diameter)	36
Copper	58
Ammonium sulphate	62
Soda-ash (only parity item)	100
Caustic soda (solid)	86

Mr Joseph M. Dodge, the prim and implacable little Detroit banker, who came to Tokyo to compel MacArthur and his Japanese people to face the economic facts of life has insisted that this fantastic Oriental opium dream, for which the American taxpayer was paying, should end by the latest in 1951. Yoshida-san, blandly acquiescent, has already demanded an initial cut of 35,000 million yen in the subsidy vote, and has started vigorously with coal, copper, iron and steel, which have been suddenly exposed to the searching winds of an unsubsidised world. The price of raw steel has been increased by 50 per cent, and many business-leaders and most exporters are now speculating wildly on the end of the chain reaction which this increase will provoke in correlated industries. Many of Yoshida-san's political henchmen are keeping an alarmed eye on the popular reaction to a possible rise of eight per cent in the cost of living.

Industrialists Forecast Bankruptcy

Japan's Economic Stabilisation Board, which includes business leaders and acts as expert adviser to the Government, first offered a paltry 19,900 million yen subsidy cut in response to Yoshida-san's demand for a 35,000 million yen cut. Reluctantly, the Board has since scraped and whittled to make the required saving of 32,312 million yen. This figure, however, includes some typically Japanese sleight-of-hand "estimates of the difference between the wrongly anticipated exchange rate of 330 yen to the dollar and the actual exchange rate of 360 to one."

Meantime, exporters are throwing together some agitated estimates of the disastrous effect on export prices of the withdrawal of subsidies on steel. With the hearty and calculated pessimism of the Japanese postwar industrialist, machinery, rolling stock and shipbuilding interests forecast bankruptcy, "Motors (for general use) will cost 85 per cent more than at present," reports a black-edged bulletin prepared by representatives of Japanese heavy industry; "bicycles, 58 per cent more; automobiles, 52 per cent more; agricultural implements, 20 per cent more; cotton spinning machinery, 46 per cent more; cast iron, 73 per cent more."

Despite this pressure and opposition inside his own ranks, Yoshida-san doggedly defends the Dodge Line: Japanese industry must stand on its own feet. If the Japanese iron and steel industry does not pay without government subsidies, it would be better to import pig iron and some steel. The policy, it seems certain, will painfully but inexorably prevail. Weak, inefficient and improvident industries will fall or be trampled. Unemployment will rise. But basic and vital industries will be streamlined and strengthened.

announces the

BUSINESS EFFICIENCY EXHIBITION

OLYMPIA · EMPIRE HALL · LONDON

9-19 NOV. 1949

Public Admission 2/6 Open daily 10 a.m.-8 p.m. (except Sunday)

Here at last is a cooking range to gladden the heart of any hostess who gives large parties. It brings peace and order to her kitchen and the best of cooking for her guests.

The Advance Cooker No. 1 provides sufficient hotplate and oven space for twenty people—or even thirty with an auxiliary oven. It will burn night and day with the minimum of solid fuel, replenished only once or twice in twenty-four hours—according to the type of fuel. In the morning the kitchen is warm, the fire is quickly revived and cooking temperatures reached in a very short time. This is a range which brings a new joy to cooking—to save time, work, health and temper—The Advance Cooker No. 1.

Write for folder Number 34, which tells you all about it.

Caustic soda (solid)	160	160

Swiss Trade and Prices

[FROM A SPECIAL CORRESPONDENT]

It has been seen that the federal machine of the Swiss constitution is creaking under the strain of the necessity for fiscal readjustment, and it has been seen that an important element in this situation is the protection of agriculture by the Federal Government. This requires the additional taxation of the community as a whole and at the same time keeps food prices high. Some months ago there was a housewives' strike in several Swiss towns—the majority of the *ménagères* simply refused to buy meat at all for a couple of weeks. Prices, especially of sugar, wine and grapes are artificially high, and this summer there was also trouble over the price of cherries.

In the first half of 1948 Swiss foreign trade reached peak figures and it was so easy to earn money that high prices did not matter very much. Trade in both directions then dwindled, but although the volume of exports in the first half of 1949 was smaller than that in the same period in 1948, their value was greater.

SWISS FOREIGN TRADE FIGURES

First Six Months of	IMPORTS		EXPORTS		BALANCE
	10-ton Waggon	Millions of Francs	10-ton Waggon	Millions of Francs	
1948	542,518	781.3	50,045	618.4	— 62.9
1949	474,044	2,811.2	51,969	1,532.7	— 1,218.5
1949	352,828	1,964.5	24,250	1,657.9	— 326.6
First Nine Months of					
1948	656,543	3,860.0	46,195	2,414.8	— 1,445.2
1949	514,185	2,807.8	57,129	2,495.4	— 312.4

There is no noticeable unemployment as yet—5,036 persons by the end of September, 1949—even in the watch-industry where it is always most feared, but nearly all foreign (mostly Italian) labour has been sent home. Wages are good, and it is calculated that the industrial workman's standard of living is at present appreciably higher, in spite of high prices, than it was on the eve of the last war. The new interim financial programme is to reduce prices a little and to bring relief to low income groups; for medium groups a very rough comparison shows a Swiss citizen paying about 25 per cent of his income in taxes where a British citizen pays about 40 per cent.

Results of Sterling Devaluation

The Swiss expect, as the British did before 1939, to import much more than they export and to pay the difference out of their assets abroad. Recently imports had tended to equal exports (in July they even sank below the export figure); this was partly owing to the expectation that

sterling would fall, as importers preferred to wait for cheaper goods. But, with so much governed by bilateral agreements, the decline in Swiss imports meant that trade stagnated because other countries soon lacked the francs with which to pay for Swiss goods; like the United States, Switzerland, too, has been suffering from a surfeit of the world's gold, and the Swiss franc even rose as against the dollar. It should be added that the internal financial crisis was accentuated by the diminution of imports because the Swiss federal budget is based upon the proceeds from customs duties.

For reasons of this kind the devaluation of sterling was officially welcomed by the Swiss. On September 27th Herr Nobs, the Minister of Finance, who is also President of the Confederation this year, said in a speech to the Chamber of Deputies, that there was no comparison with 1936 because sterling devaluation had this time bought sterling and the Swiss franc into a relationship which reflected their real value, whereas in 1936 the Swiss franc, before its devaluation, was being quoted at an artificially high figure. Moreover, he pointed out, roughly half of Switzerland's exports were at present destined for the countries which had not devalued, notably the United States. With regard to the other half, he considered that the immediate effects of devaluation would soon be softened for Switzerland by a rise in prices inside the sterling area.

During the postwar boom period in Switzerland there has all along been an undercurrent of anxiety on account of the precarious condition of the outside world; capital has felt little confidence in European markets or supplies, while labour has feared a sudden contraction of employment and of wages. For the last twelve months the anxiety has been growing and British devaluation has brought it to a head. Roughly it is true to say that the majority of Swiss industrialists are satisfied that it has now taken place, while the trade unions are disturbed.

In 1947-48 wages were extraordinarily high. Late in 1947 a wages standstill agreement prevented their legal increase, but there were many extra ways of earning money in those days. Now with the shrinkage of foreign markets the extras have disappeared and prices have remained very high. Rents are pegged low, but new flats are so expensive that in prosperous Switzerland the ordinary young married couple have to live with their parents as often as in the countries directly impoverished by war. The only reduction in domestic expenditure has been made by cheaper clothes in the last few months. With a slight easing of taxation and a few cheaper goods from abroad it is almost certain that labour will be forced to beat some kind of retreat. The Social-Democrats are already on the defensive; they lost seats in the last general election which was held two years ago, and on September 11th the day of the voting on the first Initiative, they lost their control of the town council of Zürich which has long been regarded as a "red" city and Socialist headquarters. The new mayor of Zürich is a radical.

Some Swiss industries, of course, have felt themselves hard hit by sterling devaluation. The most obvious and the most vociferous of these is that of the *hôtelières* and any others which depend upon the profits of the tourist industry. The latter is reckoned to have been bringing in about 18 per cent of the national income in the last year or two, although it employs a much smaller proportion of the working population. Tourist traffic counted particularly upon British visitors and expected to cater for their tastes. In his speech before Parliament on September 27th Herr Nobs indicated that the Federal Government will come to the help of the tourist industry, whose representatives have already come forward with suggestions of facilities (cheaper currency and railway tickets) to be offered to British clients. Even if half of their plan is carried out it will mean more charges on the Federal budget which is already causing so much trouble. The attempt to reduce the National Debt will have to be abandoned; indeed with the heavier military expenses which are planned the Debt will probably have to be increased.

SERVICE ON WHEELS

Fourteen years of scientific tyre-reconditioning by the Tyresoles process have helped to kill the prejudice against retreads and set new standards for the whole retreading industry—besides making Tyresoles the largest international retreading organisation, with over thirty factories in Britain and others in twenty foreign countries. The Tyresoles process served the armed forces in war and is now serving Government departments and countless commercial and private vehicle users in many parts of the world. By giving new-tyre mileage over again at approximately half new-tyre cost, Tyresoles cut road transport charges, save rubber imports, and release new tyres for export—helping in every way to keep the wheels turning.

One of many ways in which the Simon Engineering Group serves the fundamental needs of civilisation.

The EXPORT VALUE of BRITISH INSURANCE is £33,000,000 a year

£33,000,000 a year is a lot of money. And that is what British Insurance brings into this country from overseas.

For two reasons these earnings are specially valuable today.

★ First, some £20,000,000 of the total comes in the form of badly needed dollars.

★ Second, it is all clear gain, calling for no imports of raw materials, making no demands on shipping space.

£33,000,000 a year is the value of the confidence that other countries have in British Insurance. We simply cannot afford to forfeit their confidence.

THE BUSINESS WORLD

Gilt-Edged Quandaries

DEALINGS started on Tuesday in the New Zealand loan, with an inauspicious discount of a quarter of a point. The authorities must have been hoping for a better curtain raiser than this to the winter season. They pitched the terms of the New Zealand issue attractively and it had all the support of a conversion issue with cash subscribers scrambling to apply for stock if they could get it. What happens now? South Africa is no doubt anxious to proceed with its first loan of £10 million (the second is to follow next year) and Northern Rhodesia is also high on the list. But once again the market has deteriorated. The "undated" stocks are on a seemingly insecure yield basis of $3\frac{1}{4}$ to $3\frac{1}{2}$ per cent "flat." On the "longs" redemption yields to final date range from $3\frac{1}{4}$ to $3\frac{1}{2}$ per cent. And investors are not prepared to buy stocks on a $2\frac{1}{2}$ per cent basis except with a life of no more than seven or eight years.

The past week has thus produced a marked slide in gilt-edged values. A review of "Interest Rates Now," which appeared in *The Economist* of August 27th, showed that $2\frac{1}{2}$ per cent Treasury Stock ("Daltons") was yielding £3 10s. 4d. per cent "flat"; this week the yield has risen to £3 13s. 2d. and the price (68½) is at an all-time "low." The impact on the dated stocks is less marked, but evident enough. Most of the dated issues are still a point or two better than the low points touched during the first ten days of August. But they are uneasily better; they have the appearance of having taken too much punishment recently to make much show of resistance to a new crisis of confidence. The accumulating evidence of economic difficulty and indecision is enough to give them pause. Apart from the wider background, however, they are worried by a specific issue: will the Government be prepared either to countenance or to contrive, as part of a disinflationary policy, a significant rise in interest rates?

★

On the desirability of some rise in interest rates, many authoritative voices have lately spoken. The argument is not that a tolerable rise in interest rates would of itself remove the congestion in the economy which is being caused by excessive work on new investment, but that some rise would be consonant with the stiffer controls which Ministers are now apparently considering to reduce the overload which has now arisen. What is happening is a reaction from the Keynesian doctrine that the rate of interest is what the Government cares to make it by suitable monetary policy to a more old-fashioned viewpoint that, monetary management apart, the demand for real resources to invest in new houses, factories or plant, does respond to the rate of interest. To make the rate of interest artificially low is to run the risk of excessively stimulating the demand. To raise the rate when demand is plainly excessive is to take the first step to choke it off. This is clear and acceptable. The fruits of unduly cheap money are still being gathered in

this latest phase of recrudescence of inflation. There are some capital projects in mid-course, started in the heyday of the Dalton boom, whose economic prospects are clearly less bright than was first supposed. It is part of the price of ultra-cheap money that projects which appear to justify themselves at a low rate of interest squeeze out others which would pay a higher rate—and pay it more quickly.

Yet the policy remains. If the Exchequer were to go to the market for a thirty-year loan, it would have to pay $3\frac{1}{2}$ per cent or something near it. But the Public Works Loan Board, which acts as its instrument in making loans to the local authorities, still charges 3 per cent, as it has done for months past. So, much of the housebuilding now being carried out in the country is being financed on loans which are themselves artificially cheap, even by comparison with the terms on which the Exchequer could borrow if it wished. For another quarter of one per cent, a private borrower can obtain a

twenty-year loan from his local authority to buy a house. These are terms which scarcely measure the risks entailed in even the best form of personal covenant or the best type of house property. They are symptomatic of the distortion which has taken place in the structure of interest rates during a period when the capital market has been largely monopolised by one borrower.

That borrower, however, is not the powerful force in the market that it was less than three years ago. Early in 1947, in the proud days for patriots, $2\frac{1}{2}$ per cent Treasury Stock did stand at ½ premium. To have lost 32 points in as many months is fast travelling; so is the rise in the yield from its contrived $2\frac{1}{2}$ per cent to $3\frac{1}{4}$ per cent. Such a change is an admission that there is no scope for the injection of credit on a sufficient scale to

drive the gilt-edged market better. The authorities, to give them their due, have attempted no such thing since the discarding of Dr Dalton's financial policy. Whereas he used the whip, they have for many months seemed to act as if they had lost the whip hand. The Budget Speech last April disclosed that the Chancellor had no intention of dealing with the $2\frac{1}{2}$ per cent War Bonds 1949-51 at the first optional date. He has to repay on February 15th next some £787 million of Exchequer Bonds. That is the first operation in a decade which promises to be as difficult for the Chancellors of the day as any in the history of British public finance. Eight issues must be repaid before 1960; they include several $2\frac{1}{2}$ per cent War Bond issues and they total nearly £4,000 million. There is the enigma of $3\frac{1}{2}$ per cent War Loan—£1,911 million of it, and callable from December, 1952, but now devalued to the status of an undated stock. About 4 per cent Consols (nearly £400 million outstanding) which can be dealt with from February 1957 there may at present seem less doubt; but the eclipse of War Loan is a warning against taking too much for granted. Finally, there are £1,261 million of $2\frac{1}{2}$ and 3 per cent stocks whose first optional dates for repayment fall within the decade.

★

Altogether, more than one-fifth of the funded debt has to be refinanced in the next ten years, and as much as two-fifths could be so dealt with if the circumstances were propitious. Final maturities fall in every year except 1952, which the authorities had reserved in the hope of something bigger in the shape of War Loan. This is a rigid timetable, leaving little or no scope for manœuvre or opportunity for creating a pliant market and bending it to the shape of a Chancellor's will. It is enough to inspire caution on the part of the authorities, for a false step early in the series of refunding issues might profoundly affect the success of later operations. If beggars cannot be choosers, borrowers with such a programme before them can hardly be bullies.

In strategic terms, therefore, the authorities will do well if they succeed merely in holding the line. They can hardly make a sortie on the market as each occasion arises, and a mistake might involve retreat. This shape of things to come in the fifties is an important element in present calculations. The last thing the authorities will want is a sliding market during the whole decade; the last thing they could do, short of wholesale credit creation, would be to prevent one if it got fairly started. Therefore they must make holders of gilt-edged their allies, rather than their enemies. Equally they would be wise to make in-

terest rates the ally of the physical controls on new investment activity. The two things are not so contradictory as at first sight may appear. They point alike to the desirability of some rise, moderate and orderly but significant none the less, in the market rate of interest.

So far the authorities have consented to a rise in interest rates by the negative act of abstaining from a credit expansion which would keep them lower. This must be regarded as the limit of official policy. Positive action would involve changes in the whole structure of interest rates, from the shortest to the longest. There seems no need in existing circumstances for the *bouleversement* which would occur in Lombard Street if Bank rate were raised—particularly since "existing circumstances" have brought a cheaper pound but no step towards convertibility. It is true that a rise in Bank rate at the moment of devaluation might have had a profound effect on public opinion both at home and abroad, but this psychological step, for what it was ever worth, has been missed. The intimacy with which short-term rates were wont to play upon long-term interest rates has long since weakened. Under modern conditions, it is better to regard the fates of the money market and the gilt-edged market as being determined by different sets of forces. Certainly, the Exchequer, with a quarter of the National Debt in floating form, would not relish the budgetary effect of any rise in short-term rates. Here, at any rate, it is master of the situation still. But in the long-term market, its writ is far less effective than it was.

It would not be difficult, of course, to gain real institutional support for a wise policy in the gilt-edged market. The annual accretion of funds from institutional sources (particularly insurance funds of all kinds) is large enough, given the maintenance of a high level of employment, to bring powerful support to the gilt-edged market. Those responsible for the management of such funds will not be anxious to face the consequences, in terms of capital losses, of any breakaway rise in interest rates. For the bulk of such institutional investment, there simply is no place of refuge other than the gilt-edged market. But the trend of interest rates has put a full one per cent or more on the yields obtainable from the "undated" stocks in the three years since the passing of the cheap money peak in 1947; so the instinct of institutional investors, as of others, has been to err if at all on the short side—to pay correspondingly more for the security of a date than they were prepared to pay during the active days of the cheap money drive. This policy is likely to persist, and its effects on the programme of refinancing which the Exchequer faces in the fifties

will be profoundly interesting. They are likely to point to a carefully devised programme of short-term financing, having as its general object the transfer of the maturities of the 'fifties into the next decade. On this argument, the protection afforded by the short dated stocks is real, and the consequential effects of any moderate rise in interest rates on the ten-year stocks should not be nearly so marked as upon the "longs" or the "undated" stocks.

The likelihood of a return to orthodox monetary discipline is small enough for any modern Government, and small indeed for a Labour Government. But the adjustment which would have to be conceded as part of a policy of stemming the excess of new investment

activity (the stemming being applied both to Government sponsored and private investment) need not be large. It means a rate nearer 4 per cent than 3 per cent on the "longs." To be sure, such a modest rise in rates would be ineffective in itself to get rid of the excess; but at least it would be in the same direction as the Government's attempts to do the same thing by physical controls. What is more, it is only too likely to occur if the authorities pursue a neutral monetary policy. While this possibility remains on the cards, the attractions of stocks with fairly near dates will be little dimmed. But the position of the "longs" (and even, perhaps, some of the 4 per cent stocks which still stand at proud premiums) still looks vulnerable.

Recovery in Rice

THE improvement in economic conditions in South-east Asia during the past twelve months, faint though discernible, owes much to the increased supply of rice. World production is still far below what would be needed to restore the prewar level of consumption, and many years are likely to elapse before the deficiency can be made good. But the increase during the past two seasons (due mainly to a larger acreage planted) has at least been enough to justify ending the international allocation of rice and to provide for an increase in consumption in countries which depend upon imports for their rice supplies. The Asiatic rice economy is far from normal, but it is beginning to work once again. Pressure for higher wages, causing higher costs, is waning, and so, too, is the smuggling of rice and other foodstuffs. This has been the common postwar pattern in most countries, whether in the eastern or western hemisphere. But in South-east Asia in particular a thriving black market in basic foodstuffs has lowered the economic incentive towards increased output of other goods, and has produced an alarming increase in absenteeism.

Note.—1 bushel of rice=45 lb.

quantities of grain to Asia to stave off impending famine, and after the war Europe had to go short. The Food and Agriculture Organisation of the United Nations has continually urged that food must be sent from the western hemisphere to the East to raise the level of nutrition in "backward areas to a satisfactory standard." A clause has been incorporated in the international wheat agreement to allow relief shipments to Asia and other "deficient areas" once the contractual obligations of the exporters have been met.

The primary cause of the dearth of rice since the war was the slow recovery of South-east Asia from disruption and occupation. But there are more deep-rooted factors which the mere rehabilitation of war-shattered economies will not overcome. In the 1948-49 season, world production of rice totalled 7,500 million bushels—a welcome increase of 4 per cent compared with the previous season and 2 per cent above the prewar average. But world exports of rice, which amounted to 8,700 million lb in 1948 (nearly half as large again as the exports in 1947), represented less than half the prewar trade of an average year. To some extent, this difference in the relation between output and exports has been due to economic conditions which might be rectified fairly soon—for inflation seldom stimulates exports, and if inflation in South-east Asia could be curbed the volume of trade in rice might increase significantly.

*

There are, however, important political factors which affect rice. The emergence since the war of new independent nations in Asia has encouraged policies designed to expand domestic food consumption. Some countries, which before the war imported rice, have increased their own production, and reduced their dependence on imports. Others which were formerly large exporters have increased their own consumption and reduced the volume of their exports. Burma used to be the main supplier of rice to the rest of South-east Asia; but independence has brought increased domestic consumption of rice as well as political instability which has retarded Burma's recovery in rice production and disrupted its prewar pattern of trade. Although the acreage under rice in Burma increased last season, it was still 22 per cent lower than before the war, while exports were only two-fifths of the prewar level. Many years may be needed to overcome these political obstacles to the restoration of world trade in rice.

The estimates of world rice production given in Table I have been obtained from the US Office of Foreign Agricultural Relations. Considered by themselves, they show quite an encouraging picture. Output has been steadily rising during the past three seasons, it is now 2 per cent higher than before the war, and the new season's crop may be just as large. Two important points, however, need to be borne in mind. First, the population of Asia has increased by 12½ per cent or more in the past decade; to restore world consumption of rice to its prewar level would require an increase in world output to at least 8,250 million bushels, compared with 7,475 million bushels produced last season. Secondly, the acreage of rice which was harvested last season was the largest on record and in many countries weather conditions were exceptionally favourable. The largest increases in acreage occurred in importing countries; given a continuation of this trend, the world's

consumption of rice could increase without any corresponding increase in exports. Production in Asia is back to its prewar level: in India, Pakistan and Siam it is well above that level, while in Burma, China, French Indo-China and Indonesia it is well below. Output in both the United States and Brazil has expanded very appreciably during and since the war and in Africa, too.

A study of the world trade in rice in recent years, however, offers much less ground for optimism. Before the war Asia was a net exporter, having a surplus over imports of 4,500 million lb. of milled rice—nearly a quarter of the total export of 20,000 million lb. for the world as a whole. In 1948, Asia imported 1,000 million lb. more than it exported, and its total exports were less than a third of the prewar average. The deficiencies in exports existed in Burma, Formosa, French Indo-China, Korea and Siam. On the other hand, North and South America, which before the war had an import surplus of 500 million lb., had an export surplus of nearly twice that amount in 1948, while their total exports (mainly from the United States and Brazil) quadrupled. In Africa, too, by 1948 a prewar import surplus had been converted to an export surplus. Imports into Europe were barely one tenth of their prewar level.

Thus there has been a great expansion both in the production and the export of rice in continents other than Asia. But it is clear from Table II that the problem of supplying sufficient rice for Asia is, in the long run, one which only Asia itself can solve. The real difficulty is to stimulate exports from Burma, French Indo-China and Siam to something nearer the prewar rate. Last year, exports from Burma represented only 42 per cent of the prewar average, from French Indo-China only 13 per cent and from Siam 61 per cent. If political conditions render any such expansion of exports out of the question, the main rice importing countries (India, Malaya, Ceylon and Indonesia) will have to increase their own output—if they can. China has been a fairly large importer in the past, but the recent change in its political complexion may considerably disturb its trade relations with the rest of Asia.

The main obstacle to a large expansion of rice production in those countries which have depended in the past on imported supplies is that rice cultivation requires much labour. Some increase in yields can no doubt be achieved by greater use of fertilisers, and some saving in labour could be affected by using machinery. In the United States, rice production with modern machinery has proved highly successful. Rice planting by aircraft has been generally adopted in parts of California, while reapers, binders and combines are used extensively. To establish such methods in Asia would first involve a social revolution. The transplanting of seedlings would have to be discontinued and the small rice fields would have to be incorporated into larger tracts. Rice would lend itself to large-scale cultivation, but that would mean breaking in new lands. In the end, agricultural revolution in Asia may enable the rice-eating countries to feed themselves comfortably. But quicker results are needed. As it is, a great increase in rice production in, say, Malaya, can be achieved only by raising the cost of labour for other produce such as tin, rubber and vegetable oils. The recovery in output and trade is welcome, but much more needs to be done before Asia can once again feed all its hungry mouths.

Business Notes

No Forced Saving

Sir Stafford Cripps's speech to the rally of National Savings workers on the eve of National Savings Week was chiefly significant for the emphasis it laid upon the principle of voluntary saving and upon freedom of the individual "to spend his money or to save it as he thinks best." Rumour in recent weeks had toyed with the possibility that the Government in its search for disinflationary expedients might turn to some device of forced savings. The fears thus aroused will perhaps be set at rest by the Chancellor's statement that "we have adopted the democratic way of voluntary savings and have set ourselves against the totalitarian way of forced loans to the state."

This is not as specific an assurance as might have been wished, but it surely makes it quite plain that no devices of forced saving are among the "consequential measures" at present envisaged. As for voluntary savings, the Chancellor naturally joined his exhortations to those of the leaders of the Savings Movement. But, if the Government does not give a strong lead by introducing radical measures for a genuine disinflation, and if it is not prepared to cut expenditure still further in order to make possible some "incentive" relief from the deadweight of taxation, it would be idle to hope that voluntary abstinence will play any large part in restraining the pressure of excessive demand.

In the financial year to date, that portion of the nation's voluntary saving (and dis-saving) which passes through the National Savings Movement has produced, not a net saving, but a large net drain upon the community's resources. In the first 28 weeks of the fiscal year, repayments and encashments of "small" savings, excluding the interest portion of disbursements against encashed Savings Certifi-

cates, exceeded new savings by no less than £42 million. In the comparable period of 1948-49, there was a net drain of £14 million, whereas in 1947-48 there had been a net credit of nearly £74 million. If, in the financial year as a whole, the Savings Movement is merely to break even—that is, to avoid any net drain on Exchequer resources apart from the disbursements required for interest on encashed Certificates—net new savings during the next six months will need to run at an average rate of nearly £2,000,000 a week, or rather more than the actual yield in the corresponding period of 1948-49.

* * *

Jay-Talking

Mr Douglas Jay's remarks last week-end provided an ominous curtain-raiser to the anxiously awaited statement on "consequential measures" which Mr Attlee is to make to Parliament on Monday. The Economic Secretary to the Treasury affirmed that the Government had "not the slightest intention of abandoning the policy of financing the social services out of taxation of profits." This doctrine of earmarking certain revenues to certain policies is new and unfamiliar in British public finance. If taxation of profits pays for the social services, what does taxation on beer, tobacco, the cinema and dog racing pay for? In any case, it scarcely needed Mr Jay's statement to demonstrate that the Government, given its political leading strings, has left itself no scope to devise any genuine disinflationary remedy for Britain's malady. To ensure that would require large cuts in blocks of expenditure which the Government regards as sacrosanct; but, if expenditure cannot, for political reasons, be cut sufficiently, it is now equally impossible to induce an

adequate disinflation by raising taxation—least of all can this be done by further increases in the already penal rate of taxation of profits.

Mr Jay's fiscal principles may be intelligible in terms of party politics, and it might have been thought that he would have been content to defend them on these grounds. Instead, he has been at pains to try to find an economic justification. "There are few worse frauds on the public at the moment," he affirmed, "than the argument that Labour's policy of taxing profits and using the revenue to provide social services has the effect of raising industrial costs. It largely does the exact reverse." Taxation of profits, we are told, cannot affect costs or prices, whereas social services "enable the wage-earner to maintain a higher standard of living than his wages alone permit"; hence the transfer from profits to social services "actually lowers industrial costs and export prices." This will not be welcome news to American opinion; for if it is true, does it not amount to an export subsidy by the British Government? Evidently, Mr Jay would deny that "disincentive" taxation—such as the tax on profits which leaves the rentier untouched yet falls with geared-up severity upon the equity of a business—has any effect upon entrepreneurial and managerial effort to reduce costs or expand output. He seems quite unaware, too, of the lessons of EPT, that excessive profits taxation (which equally did not "enter into" costs) has been a potent cause of inefficiency, and has greatly weakened employers' resistance to all cost increases—not excluding demands for increases in wages. Yet these were lessons which even Dr Dalton, Mr Jay's former master at the Treasury, eventually learned.

This curious argument that expenditure on social services has disinflationary effects would, moreover, be equally untenable even if the expenditure were financed by taxation which had no such disincentive effects. Food subsidies and the like admittedly keep down the cost of food but, by leaving the public with more to spend on other things, they merely divert inflationary pressure from one segment of the economy to another; and in these days, as successive wage claims demonstrate, the workers are no longer content, if they ever were, to measure their cost-of-living merely by the prices of the things which the Government chooses to subsidise.

Government Aid for Dollar Exporters

The scheme announced this week by the Exports Credits Guarantee Department for promoting exports to the North American market goes well beyond the credit insurance work which the Department has hitherto carried out. Briefly, the department is now prepared, in addition to these established functions, to bear part of any losses incurred by exporters to the North American market which may arise from the cost of market research, advertising, or the holding of stocks. It is well known that the success of the export drive to the dollar area has been greatly hampered by the inability—and sometimes the unwillingness—of exporters to shoulder the financial burden of such activities as these on a scale large enough to be effective in the United States.

The department is now willing to give exporters a guarantee covering a share of any losses if the cost of market research, advertising or stock holding in the North American market is not recovered over "a period of time." It hopes to keep its finances on an even keel by taking a percentage of future profits from enterprises that are succeeding in their American venture. This is a new departure. Exporters have been able in the past to insure with the department against losses arising from default abroad or other commercial risks arising out of actual contracts. But the department is now to go beyond such insurance operations and guarantee part of the cost of untried experiments in the dollar market. It is even proposing to take the initiative in persuading exporters

to enter the American market with the support of these guarantees.

It is impossible to know whether in the long run this new service will prove to be a form of export subsidy to the dollar market. In explaining the operation of the scheme, the department, perhaps inevitably, has been very vague about the period of time over which an exporter will have to try his hand in the American market before he can claim to have made a loss. Guarantees for stock losses will doubtless be invoked fairly speedily, and here the department will carry a share of "any loss arising." These new facilities will reduce the risk implied in any decision to leave profitable soft-currency trade for the uncertainties of the dollar market. But, while the Government is taking pains to lessen the risks of failure in such enterprises, it is showing on the other hand a disposition to impose penalties on success by sharper use of the taxation on profits. Is this the right way to achieve its purpose?

* * *

Division of Marshall Aid

The problem of division of Marshall Aid has returned to the melting pot. The provisional allocations agreed by the OEEC last summer are to be scaled down by 4.4 per cent in order to provide the \$150 million pool required under the ECA legislation for certain purposes including the restoration of free trade and currency convertibility between ERP countries. The only agreed allocations that will not be affected by this cut are those to Belgium and Sweden, in each case because their prospective contributions to other ERP countries are approximately equal to or even greater than their prospective dollar deficits. For the United Kingdom, this cut means a reduction of the proposed allocation for 1949-50 from \$962 million to \$920 million. It should be added that the ERP countries will receive the \$150 million in the "pool" in accordance with the schemes for liberalising trade and payments which are yet to be finally approved. It is possible, therefore, that Britain, if it behaves in the necessary liberal manner, will recover from the pool even more than the amount by which its provisional aid has been cut.

The division of Marshall aid is, however, subject to far greater adjustments as a result of the devaluation of European currencies and the consequent unsettling of the Intra-European Payments Scheme. No real attempt has yet been made to revise the scheme in the light of recent exchange adjustments. It is evident that the agreed contributions and drawing rights, incorporated in the agreement and expressed in dollars at the former parities, bear no resemblance to the prospective balances of payments between the countries concerned. It is unlikely that the estimates framed in national currencies on which these figures were based will themselves survive the recent changes in exchange rates. It may well be, therefore, that new bilateral calculations of balances of payments will have to be made. The matter is becoming pressing, for the new IEPS was due to come into operation from the beginning of October. The Bank for International Settlements may find itself without instructions when it comes to tackle the monthly compensation for October on which work must begin in the near future.

Finally, to make the situation still more uncertain, account must be taken of the latest and fundamental change of ECA view on the division of aid, namely that it should be granted as from the beginning of 1950 "according to merit" and no longer on the basis of need. If, as Mr Hoffman has recently implied, this is an irrevocable decision by ECA, it means that OEEC will have to abandon the one real function it has performed. No conceivable "points" system operated from Paris could satisfactorily achieve the "just" division of aid according to the deserts of each recipient. That task would

The table shows some of the goods that the Anglo-Egyptian Sudan bought from Britain in 1948. There is a market, too, for many other British products.

have to be done by ECA. If it is, then much of the effort that has gone to building up OEEC must be written off and the work started all over again.

Finance

Flight from the Dollar?

One rather unexpected consequence of devaluation has been to cause certain European central banks to show an added preference for carrying their external reserves in gold rather than dollars. The central banks of Italy and Belgium have lost no time in converting part of their reserves of liquid dollar assets into gold, while the Bank of France, needing to replenish its dollar account, has preferred to do so by borrowing \$100 million dollars against gold collateral instead of by the natural procedure of merely selling gold. The Italians have acquired as much as 112.5 tons of gold worth \$138.8 million at \$35 per ounce, increasing their gold reserve in this one operation by something like 50 per cent. The Belgian purchases are believed to be smaller; the central bank returns of recent weeks show, incidentally, hardly any change in gold holdings.

These moves are designed against the contingency—which a persistent crop of rumours in New York and Washington has envisaged—that the dollar itself may be devalued. Some of the rumours, indeed, actually suggested such a move to be imminent, and even specified its extent—involving an increase in the dollar price of gold from \$35 to \$45 per ounce, equivalent to a devaluation of no less than 25 per cent. This is a case in which official denials can surely be taken at face value. It would be fantastic if the American authorities, having long argued the case for correction of overvaluation of European currencies, were now to face about and take steps to cancel the effects of the adjustments which have been made.

That is not to say, however, that the dollar price of gold must remain for ever at \$35 per ounce. A strong recrudescence of inflationary pressure in America is by no means inconceivable; and, if prices in soft currency areas could be held in check despite a rise in American prices, the dollar might eventually prove to be itself overvalued by the new structure of exchange rates. At this stage, however, it is scarcely possible even to guess what the future may hold. It is far from certain that the devaluations in the sterling area and in Europe will produce the massive flow of exports to the American market which the dollar rumours implicitly presuppose. In any case, it is worth bearing in mind that, if such a flow occurred, and if the United States took fright at the consequential effects upon its own balance of payments, it would in effect be retreating from the very principles of good behaviour by creditor nations which it has so recently reaffirmed during the Washington talks. As for the behaviour of the European central banks, it may perhaps be said that authorities entrusted with the safe keeping of their countries' reserves dare not found their policies upon an assumption that such principles as these would be unquestionably upheld in the face of the political pressures which would arise if sterling goods and European goods made really large headway in the American market. The switches from dollars to gold may be unnecessary and are certainly premature; but they are at least excusable.

Disinflation for South Africa?

South Africa's hopes of an early approach to the London market (£10 million is to be borrowed this year and £10 million in 1950) have obviously not been furthered by this week's debut of the New Zealand loan. This issue, it will be recalled, was oversubscribed, but instead of the opening premium originally expected, there was on Tuesday an opening discount which widened at one time to $\frac{1}{2}$ per cent.

Meanwhile, South Africa's preparations for borrowing from the United States and Switzerland are going ahead—regulations empowering the Ministry of Finance to borrow from any foreign bank or institution against prescribed security have now been published in Pretoria.

It is still not clear how far the stiffening in South African interest rates, following last week's rise in the bank rate from 3 per cent to 3½ per cent, is to be regarded as an integral part of a new disinflationary policy, and how far it is merely another device for attracting capital from abroad. Increases in commercial banks' deposit rates may do something to stimulate savings, just as increases in their loan and discount rates may damp down investment, but it is improbable that the South African economy will be righted without a disinflationary budget policy or without some more direct pruning of Government-sponsored investment in secondary industry. Some details of the growth of this were given—with obvious pride—by South Africa's High Commissioner in a speech at the Bradford Textile Society's annual dinner in London this week. Employment in private industry in the Union is now 50 per cent greater than in 1938, the total industrial wage bill is two and a-half times greater than it was then, and the contribution made by industry to the national income is now larger than that made by either mining or agriculture. In view of the inflexible wage structure in the Union—where the differential between skilled and unskilled labour is greater than in almost any other country—South Africa will have to consider very seriously whether this twisting of the economy is really in its long term interest. In any case, even the prospective inflow of foreign loan moneys will scarcely suffice to avert the need for at least temporary curtailment of this sort of secondary development.

The Switch to Treasury Bills

During the past week, for the first time for two months, the Treasury has been borrowing money from the banks against Treasury deposit receipts. This is only the second occasion on which any new issue of TDRs has been made since the policy of switching floating debt borrowings from TDRs to "tender" Treasury bills was started in the early days of August. This resumption of TDR borrowing should not be taken to mean, however, that the switching process has come to an end. Maturities of existing deposit receipts in the past week were abnormally heavy, and are estimated at £69 million, the largest figure since the early months of the year. As the new borrowing amounted to only £30 million, there was even this week a substantial net repayment.

Although the switching process is evidently not yet complete, it has already drastically altered the structure of the "active" floating debt. At the end of July, just before the increases in weekly offerings of tender bills began, the total of these bills outstanding was £2,210 million; it has now risen to £2,770 million, and by the end of the coming week is likely to be £2,830 million. At the same time, the total of outstanding TDRs had fallen from £1,258½ million on July 23rd to £836½ million by Saturday last; allowing for the estimated repayment during the past week, the total must now be below £800 million, its lowest for seven years.

The coming week will be the last in which maturities of tender bills will be running at the old "basic" level of £170 million. But although maturities thereafter begin to rise, they will not reach the current level of the weekly offering of new bills (£230 million) until mid-December. Even in the absence, therefore, of any further increase in the amount of the weekly offering, the total of outstanding bills will rise a good deal farther—its maximum, on this assumption, would be £2,990 million, or £220 million more than the present total. It seems evident, therefore, that the total volume of TDRs, although already little more than half its level at the date last year, is still destined to fall steeply, since at the

STABILITY IN CHANGING CONDITIONS

A customer of the Three Banks Group has the comforting knowledge that however rapidly trade conditions may change either at home or overseas, he has at his disposal the combined skill and wide experience of a Group in touch with financial and business interest in all parts of the world, and the benefits of a Banking Service that is adaptable, individual and complete in every detail.

Special services for all kinds of information regarding import, export and trade regulations in force in Iran.

ADMINISTERS NATIONAL SAVINGS

turn of the year the Treasury will be entering the season of big revenue surpluses.

It is worth noting that between October 23rd last year and March 12th, the total of tender bills and TDRs combined was reduced by no less than £475 million. If the Treasury in the coming months could again command resources of this magnitude, it could, merely by maintaining the weekly bill issue at its present level, reduce the total of outstanding TDRs below £100 million. Whether any such drastic change as this will in fact occur will depend, however, not only upon the flow of current revenue but particularly upon the manner in which the authorities refinance the £787 million of 1½ per cent Exchequer Bonds which mature next February.

* * *

Transport and Depreciation

In a recent address, Sir Cyril Hurcomb (Chairman of the British Transport Commission) has referred to the Commission's depreciation policy—a subject which, in his words, has been “widely misunderstood and even misinterpreted.” Depreciation is a vital matter of public policy, and Sir Cyril in his speech was entitled to put the policy of the Commission beyond doubt, though the Commission's report and accounts had already made it perfectly clear. The argument boils down to this. The Commission have made “full provision” for depreciation, rolling stock and other assets which are used up, and for renewal of permanent way and structures. But they have changed the method of making “full provision” for depreciation to what may be called normal commercial practice. That practice is based on the original (or historical) cost of the assets and the estimated number of years' work which they do.

The railway companies (or most of them) pursued a different policy, since they charged against revenue the cost, at current prices, of renewing assets as their life expired. The difference in the two methods of treatment (as the Commission's report disclosed) was to limit the depreciation provision needed last year to £19½ million, some £8,500,000 less than would have been required to continue the former policy of the railway companies. It is this difference which has attracted comment. “Full depreciation” has been provided according to the ordinary commercial rules. But the rules are, in the great majority of cases, far excelled in practice. For it is the general policy of industrial companies, so far as their taxed profits permit, to set aside additional sums for depreciation beyond those which the revenue will allow by way of deduction from taxable profits or those which accounting conventions demand by reference solely to historical cost.

At present, the Commission is in no position to find these additional sums. It would like to do so, no doubt; but last year it had no surplus of revenue even to find the first £2,500,000 instalment towards the redemption of its capital stock. This double burden of providing for depreciation on fixed assets and redeeming the Commission's financial capital is illogical, and the adequacy of the Commission's provisions for depreciation cannot be justified by reference to the statutory obligation to redeem its capital. If it does less than provide, at current prices, for the assets which it uses up, the Commission is not keeping its real resources intact. And on the showing of its own report, it did not succeed in doing so in its first year of operation.

Industry and Trade

European Refinery Programmes

The oil committee of the Organisation for European Economic Co-operation has been at work since July on the preparation of a co-ordinated programme of refinery building. Its report, published this week, incorporates the results

of a “detailed scrutiny” of probable consumption in 1952-53 “to determine whether the member countries were basing their expansion plans on the most realistic estimates of probable oil needs.” The committee has found these requirements “in total” to be reasonable, though doubts are expressed here and there whether some countries can provide themselves with enough of the necessary oil-consuming equipment. The requirements, as set out in the accompanying table, imply an increase in consumption of the order of 9 per cent a year between now and 1952-53; and this seems high, even when it is related to the “planned” increases of 6 per cent a year in industrial activity and 10 per cent a year in agricultural activity over the same period.

The report also faces the unpleasant necessity of criticising some of the individual projects. A proposed catalytic cracking unit of 150,000 tons capacity in Portugal seems larger than is really needed there. A Turkish project for a refinery of 1,000,000 tons capacity near Alexandretta promises Turkey a glut of crude oil (“which might be hard to dispose of in the open market”) and an unrelieved shortage of kerosene; and the pipeline which is to feed the Turkish refinery across 400 miles of rough country from Ramandag “would be a costly venture, especially in view of the nature of the crude

to be transported.” A secondhand American refinery to be re-erected in Sicily “is not in line with the pattern of inland consumption requirements of Sicily, and it is considered uneconomic to reship finished products.” The Benelux countries are presented as a unit, but it appears that the Belgian anxiety to have new refineries on Belgian soil may lead to an export surplus of motor spirit which may be hard to sell. The heavy French export surplus which is in prospect does not escape comment; some of the surplus is intended for distant overseas territories, but some is apparently intended for neighbouring countries “where, in many cases there are already plans for refinery expansion.”

*

Comments of this kind on individual projects make it a little difficult to see how the committee comes to approve “in principle” a European refinery programme which will give a throughput of 62.4 million tons in 1952-53. But this total does not include by any means all the national projects; some of the most recent are left for later consideration. Further, the committee refers to strategic considerations, adduced in support of home refining, on which it is unable to pass judgment. It points out that to attempt to weigh the merits of oil investment plans against the merits of other forms of investment would be outside its competence.

More Reliable Parts for Rayon Machinery

A better job because of BAKELITE

These ‘Topham’ spinning boxes, used for high-speed winding of Rayon yarn, are quickly and accurately moulded in BAKELITE acid-resisting materials. Because they are more reliable in use, they increase productivity. Many components now being moulded in BAKELITE plastics are not only cheaper and quicker to produce, but are also more resistant to fracture and wear. There are possibilities for all types of engineering in the wide range of BAKELITE materials. A letter to the address below, or a phone call to SLOANE 9911, will bring you all the information and help you require.

In the export factories, where speed in handling, as surely as speed in production, can write the next few chapters of British history; at the Docks, where the speed of unloading and loading directly affects our day-to-day lives, manpower has an ally. The electric truck, economical, simple, speedy, rugged and easily maintained, is saving time and man-hours where saving counts most. Batteries power these trucks: and the hard worked ‘electric’s’ reputation for freedom from breakdown is a measure of what its battery can take. The Chloride Electrical Storage Company has played an outstanding part in the swing to ‘electrics’. Three out of four British electric truck manufacturers fit Exide-Ironclad. Behind each Exide-Ironclad, Chloride and Exide Battery lie the experience and progressive improvements of over 50 years of battery manufacture.

A HANDFUL OF TROUBLE

Removing scale from the inside of a steam boiler is one of those costly operations which can be avoided by the use of Calgon or other suitable phosphate in the boiler water. The modern way is to prevent the trouble before it starts. First determine the chemical composition of the feed water and then decide on the correct phosphate to use. Phosphate conditioning will prevent scale and the boiler troubles that go with it. It saves far more money than it costs, but it costs nothing at all to consult Albright & Wilson's Technical Service Department.

CALGON

a very little Calgon prevents a lot of scale

Warning from the Shipowners

The president of the Chamber of Shipping of the United Kingdom, Mr Colin S. Anderson, expressed a deeper gloom than might, perhaps, have been expected when he spoke at the annual dinner given by the Chamber last week:

We stand upon the threshold of a time during which not only we, but our country, will need all the support that each can give to each.

The nature of the support which the country needs from the shipping industry needs no explaining. But what kind of support was Mr Anderson thinking of in the reverse direction? Moral support only? That would be a reasonable demand. But the Chancellor of the Exchequer, as well as the Prime Minister and other members of the Government, were present when the speech was made. And at one point Mr Anderson referred to the possibility that the shipping industry might be forced to apply for "the shelter of some counter-action—a garment which . . . only the state would be able to provide."

The necessity of maintaining freight rates was one point which Mr Anderson had in mind: "Plainly we shall seek to hold the market of the world to a reasonable level of freights." The significance of this intention must depend on what is meant by "reasonable." A high level of freight rates is not an obvious British interest. Britain is not only the principal maritime country but also the principal importing country; high freights, while they bring in shipping revenue, also raise the cost of imports and therefore tend to inflate industrial costs and the cost of British exports in turn. Government action to keep freight rates up would come strangely from Britain at the present time.

But Mr Anderson's main concern was with foreign competition, actual or anticipated: Italian, German, Japanese, American—"every week adds to the lurid hues that have already displeased us." It was in this connection that he mentioned the sharp increase in "our" fuel oil prices—that is, the increase of about 38 per cent in the sterling prices of ships' bunkers at foreign ports, which takes effect on November 1st. This necessary consequence of devaluation is an unfortunate thing, but it would be hard to show that it damages British shipping as against its foreign competitors. Other countries which have devalued will find that the price of oil to them, too, is increased. Those which have not devalued will enjoy economies in their outgoings in foreign ports, but their own charges for their services, relatively to the charges of soft-currency shipowners, have suddenly risen without benefit to themselves. Indeed, the transatlantic passenger lines have raised their sterling charges by 44 per cent in order to maintain the pre-devaluation position.

It may be true that the competitive advantage which British shipowners have recently gained over, for instance, their American competitors is of questionable value, because American ships are protected by subsidies. But what is the proper British policy towards such practices? To seek to moderate and, where possible, remove them? Or to join in the game?

* * *

Purchase Tax and "Uplift"

The Crown this week secured judgment against A. W. Gamage Limited for a disputed amount of purchase tax. The case, which arose over water-softeners which the defendants manufactured for sale in their own shop, has

been useful in drawing the consumer's attention to the methods by which the inflated prices which he has to pay are arrived at—a matter usually settled over his head. Although it was fought as a test case, the facts were not quite the typical facts, and the principle on which purchase tax ought to be determined cannot be regarded as finally settled by the decision.

Purchase tax was introduced early in the war, and since the seller's market has prevailed for nearly a decade, the Commissioners of Customs and Excise have from the outset had things very much their own way. Where a manufacturer sells his product direct to a retailer, the Act provides that a notional wholesale margin (oddly called an "uplift") must be added before purchase tax is calculated. Most of the disputable cases arise where a manufacturer is equally prepared to sell either to the retailer or to a wholesale merchant at the same price. Many kinds of goods (women's coats, for example) are dealt with in this way. The retailers contend that the price at which the manufacturer sells is, in that case, the open market wholesale price, since it is the price at which any retailer can buy if he chooses. But it is still open to wholesalers to buy too, and to resell (if they can) at a higher price. The Revenue has contended that where this could happen, the proper "wholesale" price is the price at which the wholesaler might have sold the goods if he had done so. It has further contended that, in the seller's market which the Commissioners of Customs and Excise presume to exist, the "open market" wholesale price is the highest price that is legally possible. There is an element of fiction in this argument; as the retailers observe, the fact that some wholesalers can sell some garments dearer does not prove that all garments could be sold dearer in all circumstances.

But the retailer, like the consumer, has never had any standing in the discussions which fix purchase tax. "Uplifts" and taxable prices are matters between the manufacturers, the wholesalers, and the Revenue, and have in fact been determined for the most part by agreements between the Revenue and the trade associations. Most of these agreements were made at a time when the manufacturers' associations had no reason to be greatly concerned whether the final selling price of their products was high or low. This position is changing. Manufacturers in some trades have begun to show an interest in price reduction, and have become anxious to challenge the existing agreements. Many of them have been waiting for the result of the Gamage case. Now that the case is decided, pressure for revision of the notional prices—which need not be exerted through the courts—is likely to grow.

The Market for Bicycles

The British bicycle manufacturers opened their second post-war exhibition this week. For many years, Britain has been the world's largest producer and exporter of bicycles; last year more than 60 per cent of the British output of just under three million machines was exported. The American industry is a smaller producer than the British, and a much smaller exporter. The German industry, though it also is a smaller producer than the British, is the most formidable potential competitor in exports; its output rose last summer to about 145,000 units a month. Britain exported complete machines valued at £11.8 million, together with components of the value of £3.6 million, in the first nine months of this year. The biggest markets are in the less industrialised countries such as India, Pakistan, Malaya and the African colonies. A good number of machines go to the Middle East and South America.

Although exports to the United States are slightly lower than they were last year, and South African import restrictions have virtually stopped deliveries there for the present, the total volume of business is increasing. A factor which will

eventually change the pattern of the trade is a growing economic nationalism in some of the best markets, where the governments are giving every encouragement to local assembly. The Indian tariff on British bicycles was recently raised from 24 to 60 per cent. The three largest British manufacturers, Tube Investments, Raleigh Industries, and the B.S.A. Company, are setting up factories in India for assembling bicycle components imported from Britain. In South Africa, Tube Investments have bought a recently established local firm. It is unlikely that these steps would have been taken if no political pressure existed in favour of local assembly.

This means that British manufacturers will divert their attention increasingly from the export of complete machines to the export of components. The two largest firms, Tube Investments and Raleigh, produce components for hundreds of small bicycle manufacturers as well as for their own use, and their market is therefore large enough to offer the full advantages of mass production. Component exports, in turn, are exposed to the threat that the importing countries may develop their domestic engineering industries to a point at which they can make enough components for their own needs. A survey by PEP,* discussing the industry's prospects, points out that Australia, which before the war assembled bicycles from imported components, now makes components at home. But, as the more backward countries themselves are developed, more roads are built, standards of living tend to rise, and the demand for bicycles expands. The export trade is likely, therefore, to be maintained for many years. The British industry will have to meet competition from Germany and probably from Japan, and its success will depend on its flexibility in design, but largely also on the extent to which it maintains its present lead in production efficiency.

*The Cycle Industry. Political and Economic Planning.

The Supply of Bricks

Stocks of bricks have run down rapidly in the past year, from an average of over 500 million in 1948 to 219 million in August. A serious shortage on the North-East coast during the summer was averted only by moving in a million bricks from other parts of the country. Supplies have improved again, but builders are still complaining that the uncertainty of brick deliveries makes it difficult for them to plan their work.

The accompanying chart shows that, throughout most of 1948, stocks of bricks were fairly high, although output was lower than in 1947. Output began to rise again when the

fall in stocks gathered momentum. Unexpected behaviour by the Government, and, more recently, by the weather, has been the reason for fluctuations in supply. At the end of the war, the brickmakers had great difficulty in attracting labour

and reviving their production. It took them until October, 1947, to restore output to 467 million bricks a month; even this was well below the 1938 average of 650 million. In the following month, the Government announced the 1947 cuts in capital investment. The big brickmaking companies kept their labour at work and their yards in full production until March, 1948, when stocks began to be excessive and activity had to be reduced. But, in the meantime, the restraints on capital investment had themselves begun to weaken. Building restrictions were being liberally interpreted. The work authorised in the spring and summer of 1948 went ahead almost without interruption throughout the exceptionally fine winter, and this deprived the brickmakers of an accustomed seasonal breathing-space. By the spring of this year, stocks held in the large brickyards were almost exhausted, and production was rising again. It did not improve at a rate fast enough to keep pace with consumption, because labour had been lost and was hard to recover. The mechanised brickyards prepared plans to buy handling equipment from the United States to overcome the labour difficulties, but those purchases have been stopped. Monthly production has risen by now to well above the August figure of 451 million bricks. But the brickmakers are wondering if the new cuts in capital investment, which have become inevitable, are to mean that the cycle of the last two years will be repeated.

Trade and Investment

By-passing Shannon Airport?

A deputation from the American Civil Aeronautics Board discussed the future of Shannon Airport with the Eire government last month. The airport was built by Eire at a cost of well over £2,000,000, and the work is still going on. Its location on the west coast was

dictated by the need for a re-fuelling base for transatlantic aircraft. The airlines using the airport signed agreements with the Eire government by which they were to call at Shannon if they used the Irish air; and this assured the government of revenue from landing dues and from rent for administrative buildings. Eire is naturally opposed to any reduction of this revenue, which is already said to give an insufficient return on the capital invested.

Aircraft of the Stratocruiser class, which are coming into operation on the transatlantic crossing, no longer need to refuel at Shannon. The American airlines have been flying an increasing number of aircraft direct to British or European airports, and have been avoiding the flight over Ireland. Pan-American Airways, for example, now call there only once a day. Since Shannon is an inconvenient place for travellers to Eire to land, the American companies have asked for permission to land at Dublin instead. The matter was taken up on their behalf by the Civil Aeronautics Board, but without apparent success. Dublin airport is frequently fog-bound and has only one runway suitable for transatlantic aircraft. Having sunk more money than it could really afford in building and developing Shannon, the Eire government is not willing to repeat the process at Dublin.

The British transatlantic aircraft are in the same position as the American, but the British corporations have a 50 per cent holding in Aer Lingus, which handles the Shannon-Dublin air traffic. This gives them a certain interest in the present arrangement, but it is obviously of minor importance compared with the losing of time on the transatlantic crossing simply in order to call at Shannon.

As the performance of transatlantic aircraft improves, less and less traffic is likely to pass through Shannon. The same consideration applies to some other airports which are primarily refuelling bases: Gander and Prestwick may well feel its effect. It is unfortunate for the Eire government that it should have spent so much of its own money on what

now promises to be a temporary facility. Warning might have been taken from the seaplane base which was opened a few years before the war at Foynes; this has been in disuse since seaplanes stopped flying on the transatlantic route.

* * *

The Whaling Fleet Sails

The new whaling season is about to open, and this week saw the departure of the first British factory ship to the Antarctic. The full international fleet will consist of 18 ships: three from Britain, one from South Africa, ten from Norway, one from the Netherlands, two from Japan and one from Russia. This is the same number as last season. The new season's catch will again be restricted by international convention to 16,000 blue whale units. A blue whale unit is a common denominator for all the different types of whales which are likely to be caught. Thus, one blue whale is equivalent to two fin whales, or two and a half humpback whales or six sei whales.

Last season's Antarctic catch, which closed a week before the due date, yielded 352,851 tons of whale oil, of which 103,319 tons was the combined British and South African yield. Total production of whale oil for the season amounted to 391,184 tons, compared with 341,515 tons in 1947-48. Ten years earlier, world production reached 607,000 tons, of which 557,000 tons came from the Antarctic, but then no restriction on catch was in force. The new season's catch should provide between 350,000 and 400,000 tons of whale oil. Reports are current that whales now caught tend to be smaller in size, though last year's experience did not confirm this. The Ministry of Food has again bought the entire prospective British catch, and the price has been fixed at £80 a ton for No. 1 oil. Last season's price was £90 a ton, and but for devaluation this year's price would undoubtedly have been substantially lower. During the past year there has been a steady improvement in world supplies in oils and fats.

Whalemeat is still sold privately for whatever price it will fetch. Judging from current retail prices it has become a very profitable subsidiary trade, though apparently more of it is being sold for animal than for human consumption. The whaling fleet will face higher costs this season for bunkers, and a lower price for its main product. Bumper profits were earned immediately after the war. Now the outlook suggests less comfortable times for the industry.

* * *

Base Metals in America

Earlier events this year invest the American metal market with particular importance for British industrial consumers. During the past week, there has been a strong demand for copper, but relatively small interest in lead and zinc. It is difficult to determine, at this stage, what part the American

steel strike plays in these movements. Brass mills, wire mills and manufacturers of domestic appliances have all been buying copper for delivery in October or early November, and those purchases seem to be for actual use rather than for stock. It is estimated that consumption of copper is at present running at about 30,000 tons a month in excess of American mine production, output from the smelters and imports. Deliveries in September for home consumption amounted to approximately 93,000 tons, and a further 10,000 tons went to the strategic stockpile. The October figures are expected to be even larger. In a more highly organised metal market, the current price for copper would be higher than the 17½ cents a lb. (equivalent to £141 a ton) at present ruling in New York. At least the American scrap market is reflecting the firmer tendency, and heavy wire scrap has risen by ¼ cent to 13½ cents a lb during the week. At the beginning of this week, the Ministry of Supply reduced its buying price of rough copper from £110 to £100 a ton.

In contrast to copper, lead has been weak on the American market, and the price is now down to 13 cents a lb (£104 a ton), which is only one cent above the low point reached last May. The Ministry of Supply has faithfully followed the New York market, and reduced its price of lead by £6 to £105 a ton. The weakness in the United States arises from two factors. First, there are clear signs of falling consumption, and secondly, offerings of foreign lead have increased. Demand for zinc has also slackened (since most of the large galvanisers are out of the market because of the steel strike) though the price has remained unchanged. On the other hand, supplies of high grade zinc are tight; output from three smelters has declined, one owing to a strike, while the demand for die-casters and brass mills has been well maintained.

* * *

Outlook for Raw Cotton

The prospect of adequate supplies of raw cotton has improved. The latest official estimate puts the new American crop at 15,446,000 bales compared with the September estimate of 14,943,000 bales. The trade had expected the crop to be no larger than last year's, which amounted to 14,868,000 bales. The first estimate of the Egyptian crop is 1,620,000 bales, compared with 1,845,000 bales a year ago. But as first estimates often have to be revised upwards, it may yet be found that this year's crop is not much smaller than the 1948 crop, despite persistent reports of damage by worm infestation. World carry-over stocks at August 1st have been revised from 15 million to 14.7 million bales. Since this reduction has been more than offset by the higher estimate for the American harvest, world cotton supplies for the coming season may be some 500,000 bales greater than in 1948-49.

The key to the cotton situation lies in the trend of consumption. The accompanying table has been compiled from

'Not old Mac?.. I can't believe it!'

The news came like a thunderbolt to everyone in the firm. Old 'Mac' of all people - such a gentlemanly old chap! He had been with the firm for donkey's years - started as an office boy and must have handled untold thousands of pounds as chief cashier. One day an auditor's query led to a thorough-going investigation, and 'Mac' dazed and white-faced, went straight to the Managing Director. He had gone on for a year and more stealing cash and falsifying the books in a desperate attempt to recoup losses on investment deals. Hundreds of such cases are reported every year, and more occur but are not made public. It is part of the duty of wise management to provide against such risks.

Peace of
mind costs
very little

For about £5 a year (perhaps less, depending on length of service and other factors) a cashier can be covered up to £1,000 under a 'General' Fidelity Guarantee Policy. Your entire staff, secretaries, clerks, branch managers, travellers and collectors, can also be covered individually or collectively. Each case is treated on its merits; send us full particulars of duties and degrees of responsibility and we will gladly quote a rate for your needs. Get in touch with us today.

ESTABLISHED 1835

48 Gracechurch Street, London, E.C.3

WORLD CONSUMPTION OF COTTON
('000 Bales—Years beginning August 1st)

* Provisional.

The trend of cotton prices, as of many other prices, will depend largely on the level of activity in the United States. Under the new price support formula, American cotton prices could decline by about 2 cents a lb. from their present level of 30½ cents a lb. but not by more. The Commodity Credit Corporation already holds large stocks of cotton and is still taking in supplies on loan. The devaluation of sterling and other European currencies may tend to push the American price towards this lower limit. But, conversely, it has already had the effect of raising the price of Egyptian cotton, and on Monday the Raw Cotton Commission again increased its selling prices for Egyptian and similar growths by between 2d. and 2½d. a lb.

Devaluation came just at the right moment for the Orange Free State developing mines. In the first flush of enthusiasm in the gold share market, attention was mainly directed to the immediate benefits likely to accrue to the Rand producers. But in the further rise in gold share prices during the past month, the Orange Free State companies have made the best of the running. As a result, the appropriate market conditions have been created to launch the first big new issue to provide finance for the next stage in bringing the field into production. It is estimated that some £150 million of new money will be required for this purpose. As was expected, Western Holdings has been quick to take advantage of the favourable market conditions.

is considered sufficient "together with proceeds received on realisation of investments in other companies" (presumably *inter alia* St. Elena, in which 212,295 original shares were received by way of rights) to finance the company for another year, when the No. 1 shaft should intersect the basal reef. Existing shareholders are to be offered 975,000 new shares at 50s. per share in the proportion of one new share for every five old shares held. A further 150,000 shares will be subscribed at the same price by Anglo American Corporation, the controlling group, which has also underwritten the issue for a cash commission of 2½ per cent on the issue price. The terms reflect the beneficial effect of devaluation; on the eve of devaluation the price of the old shares was 52s. compared with 64s. 6d. immediately before the announcement of the issue.

★ ★ ★

Where there's a will there's a way. Both parties to the recent wage negotiations on the Rand have shown unusual readiness to arrive at an agreement without delay. No sooner had the original offer of the Gold Producers Committee for a 12½ per cent increase in basic wages been turned down than another offer of a 15 per cent increase was made and accepted. The increase will come into effect at once. Before devaluation, the mineworkers were claiming an increase of 30 per cent; their readiness to accept half of what they claimed may have been encouraged by the bait of £2,000,000 offered as an immediate cash gift by the producers. This sum will be distributed on the basis of £25 to each daily paid employee with a year's service and *pro rata* for those with less. Any balance left over will be used to increase benefit payments under provident schemes.

COMPANY MEETINGS

NEEPSSEND STEEL AND
TOOL CORPORATION,
LIMITED

MR S. C. GOODWIN'S REVIEW

Mr S. C. Goodwin, J.P. (chairman), presided at the twenty-ninth annual general meeting of Neepsend Steel and Tool Corporation, Limited, at the registered office, Neepsend, Sheffield, on October 13th. His survey showed consolidated reserves and surplus £1,095,496 against £922,427. There was an assets excess of £1,061,690 and the group was in a very sound position financially.

Consolidated profit and loss account showed trading profits before taxation £528,649 against £459,430 in the previous year. After providing for transfers to reserves, dividends and bonus, the carry forward was £528,397 against £386,703 brought forward. The dividend declared on the ordinary stock represented approximately 11 per cent., less tax, on the capital employed in the group.

They were experiencing a distinct recession

in orders for steel, but departments producing files, saws, engineers' and other small tools, and magnets were heavily loaded with orders and their prospects appeared good for some considerable time ahead. They continued to use maximum endeavours in export trade but were increasingly hampered by import restrictions in many markets. They would be fortunate if they could maintain during the present year's trading similar results to those enjoyed in the past year.

The report was adopted. At an extraordinary meeting it was decided to make a bonus distribution of one new 5s. share in respect of each 5s. unit of stock held.

VITAMINS LIMITED

VALUE OF BEMAX

The annual meeting of Vitamins Limited was held in London.

Mr H. C. H. Graves (the chairman), in the course of his speech, said that they heard many complaints all round of a feeling of frustration, of undue fatigue, of being "under par." They heard, even in these days, of listless children, and of infants who did not

grow as rapidly as they should, or who perhaps went down before infections of one kind or another that childhood (and indeed all mankind) was heir to.

How different many of the frustrated and listless would be if they put themselves on Bemax. Some recipes for good health were a little unpleasant and not easy of acceptance, but Bemax with milk or fruit juice, in soup, or sprinkled on cereals, was so delicious and added such zest to life in a very short time, that it was difficult to understand how anyone who had the opportunity should fail to give it a trial: still less how anyone could deny their children the benefit of it.

Some thought that after that phenomenally fine summer, there was risk of a severe winter, with resultant toll of infection and sickness. How wise it would be if all such would go to the nearest Chemist's and purchase—and see that their family used—Bemax, the most famous natural vitamin, protein and mineral supplement in the world.

Continuous and intensive campaigns directed primarily to the medical profession had resulted in substantial increases in the sales of their pharmaceutical preparations.

The report and accounts were adopted.

LEEDS COLLEGE OF COMMERCE

PRINCIPAL: E. V. ROBERTS, B. Com., A.C.A.

Applications are invited for the post of Senior Assistant in Statistics and Marketing, to take up duties as soon as possible after January 1, 1950.

Applicants should have a good degree; suitable business experience a recommendation. Salary scale: £700-£25-£800, with additions for degree and approved training.

Candidates who applied in response to a previous advertisement for this post need not submit a fresh application.

Further particulars and application form may be obtained by sending a stamped addressed foolscap envelope to the Director of Education, Education Office, Leeds, 1.

B.C. invites applications for the post of Research Assistants in the Lister Research Department, Entertainment Division. Applicants must have a good educational background and should have qualifications or experience in either social research, market research or mathematical statistics. The ability to interpret qualitative material and to prepare succinct summaries or written replies to questionnaires is essential. Starting salary £355 (may be higher if qualifications and experience are exceptional) rising by £20 to £475 maximum per annum. Detailed applications to Appointments Office, B.C., Broadcasting House, London, W.1 within 7 days marked "Research Econ." For acknowledgement please enclose stamped addressed envelope.

GENTLEMAN, aged 40, sound knowledge Finance and Administration, good linguist (German, French and Danish), experienced negotiator and thoroughly acquainted with most European countries, seeks position of responsibility.—Please reply to Box 231.

CHARTERED Accountant (18), wide experience home and abroad, commercial and professional, at present holding executive post in nationalised industry, desires position as Finance Director, Controller or similar post.—Box 232.

Company Notes

Aspro.—Group trading profit amounted to £450,808 in the nine months to March 31, 1949, compared with £583,241 in the previous year. Net profit was £160,617 (£216,452 for 1947-48). The dividend of 26½ per cent represents an annual rate of 35 per cent as in 1947-48. Net current assets at March 31, 1949, were £487,513 (£579,122).

British Overseas Stores.—Total profit of the group declined from £168,871 to £156,028 in the year to June 30, 1949. The dividend of 10 per cent is repeated.

United Steel Companies.—The balance of profit available for appropriation declined from £888,847 to £827,008 in the year to June 30, 1949. General reserve receives £250,000 (£307,372); the dividend is maintained at 8 per cent; carry forward is £615,807 (£613,485). Tax relief on capital expenditure (applied to the provision for deferred taxation) amounted to £571,123 (£260,500 applied to depreciation provision).

British Celanese.—Consolidated trading balance increased from £3,611,738 to £3,822,122 in the year ended July 2, 1949. Net profit amounted to £1,230,599 (£1,011,208). Appropriation to plant replacement and special obsolescence reserve is unchanged at £200,000; general reserve is allotted £400,000 (£150,000). The dividend is unchanged at 8 per cent.

Horlicks.—Group trading profit increased from £463,878 to £472,070 in the year ended March 31, 1949. Trading profit of subsidiaries declined from £89,053 to £38,797. Net profit of the group rose from £141,112 to £149,338. The dividend of 30 per cent for the year is repeated. Net current assets at the year-end amounted to £1,137,813 (£1,138,550).

Crossley Brothers.—Consolidated gross profit increased from £354,071 to £433,120 and net profit from £137,036 to £164,046 in the year to April 30, 1949. The dividend or the deferred units is unchanged at 12½ per cent.

John I. Thornycroft.—Consolidated trading profit amounted to £786,237 (£571,041) in the year to July 31, 1949. These

Investment Statistics

figures include approximately £180,000 (£95,000) in respect of delayed settlement of contracts prior to the start of the year. Net group profit increased from £256,213 to £333,029. An ordinary dividend of 22½ per cent is recommended.

Hawthorn Leslie.—Net profit increased from £177,019 to £202,444 in the year to June 30, 1949. A final dividend of 10 per cent on the ordinary capital is recommended.

Thos. W. Ward.—Net profit amounted to £474,287 (£477,233) in the year to June 30, 1949. The dividend is unchanged at 15 per cent for the year.

Manchester Lines.—Trading profit declined from £572,635 to £552,562 in the year to June 30, 1949. Total profit amounted to £602,494 (£620,972) and net profit to £261,525 (£202,601). Fixed assets, including shipping property, less written off were valued at £389,075 (£510,581) at June 30, 1949.

J. and F. Stone Lighting and Radio.—Trading profit and sundry income increased from £332,035 to £380,065 in the year to July 30, 1949. The dividend of 40 per cent is unchanged.

OTHER ISSUES

East African Power and Lighting.—Lists opened and closed on October 21st for the issue of 1,000,000 cumulative 4 per cent preference shares at par. Capital consists of £4,213,333 in £300,000 7 per cent cumulative £1 preference shares, £1,800,000 in 4 per cent cumulative £1 preference shares, and £2,113,333 in £1 ordinary shares. Profit subject to income tax for years ended December 31st: 1939, £75,721; 1947, £153,076; 1948, £181,981.

Bairns Wear.—Preference and ordinary shareholders registered on October 5th are being offered 50,000 5½ per cent cumulative £1 preference shares at 22s. per share and 138,500 5s. ordinary shares at 12s. 6d. per share. Preference shareholders are offered one new preference share for every three shares held, and ordinary shareholders are offered one new share for every five shares held.

General Mining and Finance.—Shareholders are offered 379,374 £1 ordinary shares at £5 5s. per share in the ratio of three new shares for every ten shares held.

A Policy for Efficiency

THE problem of British economic policy, as earlier articles have argued, is to restore to the public consciousness a lively concern with the efficiency of the economic mechanism without losing sight of the two other objectives, which can be summarily labelled full employment and social justice. It is the qualification that makes this a policy of the Left. So many political landmarks have disappeared in recent years that possibly there is a sincere attachment in all parties to full employment and to social justice; perhaps we are now all on the Left. But it is at least equally possible that the ideas of the Right are not quite dead. There may still be people who prefer a fluctuating economy to a stable one (or who, at least, are unwilling to pay any political price for stability) and who are not attracted by the ideal of diminishing the inequality of incomes and property. There is a great deal of logic behind such views. But they do not inspire the present inquiry. The purpose of the present series of articles is to try to reason out the policy that is best designed to preserve as much as possible of the gains of the Left in recent years. Indeed, they are inspired by the belief that this is the last chance of so doing, that if a radical solvent of the creeping paralysis that now frustrates the British economy is not quickly found, full employment and social justice will have to go to the wall in a mad scramble to secure, at any cost, enough efficiency to survive.

★

The object is economic efficiency. This involves a high standard of productivity, but it involves much more as well, since a nation is hardly efficient if it is making enormous quantities of things that cannot be sold. Price comes into efficiency; but even productivity plus price is not a comprehensive definition. That economy is efficient which is patently in command of its market, which supplies goods and services at prices low enough (relatively to the incomes of the purchasers) for demand to be constantly tempted onwards, which is moving round the rising spiral of low prices, high demand, satisfactory profits, high investment, rapidly improving technology, high output per head, rising wages and still further expanding demand. This sort of economic efficiency arises from the most effective combination of the basic factors of production; it is secured by bringing labour, capital and enterprise together in ever more productive combinations. The one essential condition of its existence is mobility and adaptability of resources. Unless both labour and capital are free to move to where they can more productively combine, there can be no experiment and no progress. This, then, is the first condition of efficiency—freedom to move. But freedom by itself is not enough. There is no natural tendency for labour and capital to come together productively. Indeed, there is no natural tendency for human beings to put out the effort that produces labour or to practise the thrift that produces capital. In addition to freedom to move, there must also be some motive force to move in the right direction. A nation that wishes to be efficient must not only permit its labour and capital to move in search of efficiency, it must put pressure on them to do so. If the last four years have proved anything at all,

it is that neither Ministerial exhortation nor bureaucratic planning schemes provide sufficient pressure. This does not mean that the dream of the purposively directed economy must be abandoned; but it does mean that it cannot proceed either by prayer or by command. Self-interest is not the only motive that stirs in the human breast; but the attempt to get along without it has been a miserable failure and it will have to be recalled. The only way to get capital and labour to move to where they are wanted is to make it worth their while to do so. These incentives to movement are not wanted merely between one industry and another. It is just as important within each industry to get the work and the capital and the raw materials into the hands of those who work efficiently. The means to efficiency is, in every walk of life, to let the best man win.

This can be done only if there is freedom of prices and wages and incomes to move. This, then, must be the primary object of an economic policy that seeks efficiency. The price controls of all kinds, including the control on the movement of wages, are the enemy. The path to efficiency lies through the destruction of as many of them as can be contrived, without infringing the basic requirements of social security.

But simply to abolish all price controls while the present state of inflation continues would be to invite disaster. Inflation is, by definition, a state in which the demand for everything (or almost everything) exceeds the supply. To liberate prices in such circumstances would merely lead to an all-round increase and the inflationary spiral would go through several damaging revolutions before any substantial adjustment of resources to needs took place. Freedom of prices and incomes is a necessary condition of efficiency. But disinflation—enough of it to re-create a healthy state of competition in the economy—is a prerequisite of price freedom.

★

Thus the two main pillars of a policy are, first, enough disinflation to bring total demand slightly below total supply, and, secondly, the removal of as many controls over prices, wages and incomes as possible—in short, the restoration of a competitive market. Perhaps it is as well to pause at this point and recall that this is put forward as part of a policy for the Left. It would undoubtedly be a bitter doctrinal draught for many on the Left to swallow. The imperfections of the market economy as an adjustment mechanism have been very well advertised in the last two generations, and it would be foolish to deny that it produces some very odd results, especially so long as inherited wealth can make as strong a claim upon the market as economic deserts. Indeed, it is hardly possible to advocate any restoration of the price economy without also proposing an even more severe set of restraints upon inheritance than exist today. But the essential point for the British Left to grasp in 1949 is this—that they are sorely in need of some adjusting mechanism, that the market economy does the job with more successes than failures, and that they have as yet utterly failed to find any workable alternative.

Disinflation and decontrol—in that order—are the

two essential elements of policy. But there is a condition attaching to each of them. Purely monetary action, designed to reduce the aggregate total of demand below the aggregate of supply, will not suffice to restore a competitive market if it is simultaneously frustrated by the whole vast array of restrictive practices, price rings, production quotas and general cartelism that has grown up in Britain in the past generation. There is little point in abolishing official price controls if the private price controls remain. Unless there is a real campaign against all these manifestations—except the minority that can prove a case in the public interest—a policy of monetary disinflation will either be ineffective, or else will have to go to extraordinary and damaging lengths of deflation before it can create the necessary flexibility.

The other necessary condition is that the offering of monetary incentives to efficiency (for that is what the liberation of prices would be intended to secure) will not achieve its object unless money is worth having—or, more accurately, unless additional money income has a sufficient real value to serve as an effective incentive. There can be no liberation of the economy without a substantial reduction in taxation.

★

By this process of reasoning, a policy for efficiency can be built up consisting of five parts, separate but fitting in with each other. These five are here briefly recapitulated, in roughly chronological order, and will be further considered in later articles:—

1. A determined disinflation, sufficient to make a job worth holding and a profit difficult to come by. It is unlikely that this can be achieved without calling in aid the traditional weapons of the rate of interest and of credit control.
2. A substantial reduction of taxation, without any reduction of the budget surplus—that is, a really significant reduction in expenditure. As a target, the figure of 35 per cent of the total of private incomes should be aimed at as a maximum for all forms of taxation.
3. As many as possible of the present governmental restrictions on the free movements of prices, wages and incomes to be removed.
4. A really vigorous campaign against all forms of combination in restraint of trade. The old bias of the common law should be revised and re-stated, and the onus of proving a case in the common interest placed upon those who wish to practise any form of restriction.

5. The poorest sections of the people to be protected against any possible tendency of the liberation of prices to drive them below the subsistence level. The reduction of taxes on income to be accompanied by new restrictions on inheritance.

★

The policy here sketched has been argued in terms of the domestic economy alone. This has been done in the double belief that Britain's failure to adjust itself to its external difficulties is largely or mainly due to rigidities and inefficiencies at home, and that anything that is done to restore economic health at home must also assist the restoration of the balance of payments. It may be as well, however, to relate the ideas here set out to the devaluation of the currency which provided the occasion for the debate.

Clearly no such policy as this could have been initiated, in its entirety, so long as the pound was held at an over-valued level. The liberation of prices, even after a real disinflation, is likely to lead, at least in the first stages, to many more price and wage rises than falls. Experience of the inter-war years showed how very strong and passionate are the defences that will be put up against any reduction in money rates of wages. This means that not many prices can fall very far, at least to begin with, and that any general liberation of prices is thus likely—again, at first—to mean a rise in the general indices. This need not occasion very much alarm, because at the second stage, as the compulsions to efficiency began to operate, costs—and therefore prices—would fall without dragging wages down with them. But so long as the pound was over-valued and reserves are low, the risks of waiting for the second stage would have been too great.

This is what is meant when it is said that devaluation provides an opportunity for unfreezing the British economy. It creates some elbow-room within which a policy of price liberation can be started and the risk of price increases run. The elbow-room would obviously have been all the greater if the new rate of the pound had not been determined until after the sorting-out process was over. But even with the new fixed rate, the margin should be great enough to allow the process to proceed—though it will probably be wise to push the disinflation rather farther, as a precaution, than would have been necessary with a floating rate. The one policy that is nonsensical is to have fixity of the exchange rate plus just as much fixity of prices and wages as before, just because the Cabinet cannot summon up enough courage to initiate an effective disinflation.

The Future of OEEC

THE Organisation for European Economic Co-operation, the chosen instrument for turning the Marshall-aided nations into a prosperous entity, was, even at the original launching, a fragile craft. The sailing has never been smooth, but in the past few months OEEC has run into some really heavy weather. The first storm signals appeared with the effort last spring to evolve a new intra-European payments scheme that would bring more flexibility into the arrangements made the year before. After many weeks of tension, a compromise was finally reached, but not before the British Government's seeming intransigence in the matter had stirred up widespread bitterness on the Continent. There were fresh squalls throughout the summer as the participating countries failed to reach agreement on the distribution of the dollars to be provided by Congress for the second Marshall year. It was these difficulties that brought Baron Snoy, the chairman of the OEEC Council, and M. Marjolin, its Secretary-General, to the point of declaring that the dollar gap was "a problem for which our organisation can find no solution." Naturally, the crew did not take this cry to mean a call to abandon ship and they were, therefore, thoroughly shocked when it was discovered that the British bo'sun had slipped quietly over the side and made his way to Washington. There can, unfortunately, be no doubt that the secrecy and the unilateral character of the British devaluation—unavoidable though they may have been—have dealt European co-operation, and OEEC in particular, a crippling psychological blow.

This series of events has led some critics to proclaim that OEEC's usefulness is ended, and many even of those who take a more optimistic view do so only because they still regard the Organisation as a useful propaganda device for reminding people that European unity should be the ultimate goal. To understand why matters have come to this pass it is necessary to go back eighteen months to the time when the Organisation was formed and to recall what its founders had in mind. Their prime intention was to create a European body that would serve as an opposite number to the Economic Co-operation Administration (ECA) in Washington. Its actions were to be bound by the same objectives as those laid down for ECA when Congress passed the recovery programme. Thus the nineteen Marshall nations, working together at OEEC, pledged themselves to expand production, to reduce trade barriers with a view to restoring multilateral trade and to establish internal financial stability. These three objectives were straightforward, but much of the difficulty has arisen from the fact that there is a fourth objective which was not made explicit at the start, but has come to have an importance, at least in American eyes, equal to all the rest. To many Americans, the special contribution expected of OEEC has come to be that of securing a pooling of Europe's resources, some tangible proof of "mutual self-help" in the struggle to regain prosperity.

On the European side there has always been considerable foggy about what, in concrete terms, nineteen more or less bankrupt nations could contribute to each other. The American authorities were equally unsure by what exact steps Europe was to help itself, but they

were dead certain on one point. OEEC was to be the midwife attendant on at least the economic unification of Europe. This economic goal was part and parcel of a political hope, until recently very popular in some American quarters—the creation of a collective Great Power, embracing western Europe and, perhaps, Africa and the British Commonwealth, and strong enough to stand up to Communist encroachments without the constant need for American reinforcements, economic and military.

★

In itself, the OEEC is simply a band of civil servants, whose authority does not run to policy-making or to innovation, and its functions have been limited to a very few—to those tasks the Americans have insisted that it perform, to those which the nineteen governments were willing to relinquish to it, and to the collection of statistics and the handing out of advice. Given these limitations, the achievements of the Organisation have been far from negligible. It produced last winter a workmanlike and courageous report on the nature and size of the problem of European recovery. It is now engaged in making an exhaustive analysis of production programmes in western Europe—though what success it will meet in curbing the more flagrantly uneconomic projects remains to be seen. By far its greatest contribution, however, has been in the realm of trade. It has helped to evolve a payments scheme for Europe which, though not ideal, has stimulated the flow of goods through long neglected channels, and it is now providing the focal point for the first postwar assault on the blight of import quotas. Paris should shortly be the scene of a conference where quotas instead of tariffs will be under negotiation by the majority of the Marshall nations.

At this juncture in the history of Europe, however, the failures of the OEEC are, perhaps, of greater importance than its achievements. These failures are due in far larger measure to the shortcomings of the governments themselves than to inadequacies among the individuals representing them at Paris, and even some of the bureaucratic timidity of which the officials in Paris are often accused only reflects the unwillingness of the participating countries to become involved in an adventure whose results cannot be foreseen. The economic unification of Europe has, in theory, been desired by most, but not desired enough for any positive steps to be taken to achieve it. It may be—the argument has been stated in these columns—that economic unification in Europe would contribute very little to the immediate crisis which arises out of a shortage of dollars. But if this is so, it should have been clearly stated and argued out. As it is, policy has drifted into the disastrous position of accepting an objective which it does not intend to achieve. As a result, for the Americans at least, the failure of the OEEC nations to move toward closer association has been a profound disappointment.

This disappointment might have been less sharp had there been more numerous signs of genuine co-operation short of union. The separate nations could surely have taken more energetic action individually to strengthen

the collective effort. It is a poor advertisement for the Marshall plan when the French nation can still claim to cover with its exports no more than ten per cent of its dollar imports. Another black mark has been the parlous state of French domestic finance, corrected early this year and now again threatening to get out of hand. Equally disquieting has been the tendency of some members to use the argument that union is not a feasible course as an excuse for making less than the maximum co-operative effort. Here Britain is—or at least appears to all its partners to be—one of the chief offenders. And its offence is the greater because Britain enjoys on the Continent and with the Americans a reputation for political wisdom and economic power far surpassing that held by any other European nation. Those who are on the inside of British policy claim that no European country has either done so much to put its own affairs in order or made as many practical suggestions for the expansion of intra-European trade as Britain—the recent initiative in the matter of import quotas is a case in point. Possibly this assertion could be documented; if so, it certainly should be, for British policy has left the universal impression, especially in the sphere of international trade and finance, that its attachment to bilateralism and airtight domestic plans is deeper than its determination to co-operate in a return to convertibility and multilateralism. As on the home front, tardiness and overstrain on limited staffs rather than any deliberate wrong-headedness may be the explanation. But when to this impression is added Britain's obvious preference—and often downright necessity—for dealing with Washington instead of with OEEC, it seems plain to most people on the Continent that Britain's heart lies elsewhere than in European co-operation.

★

In themselves, the difficulties that have beset OEEC are a disturbing sign that something is radically wrong—either with the original concept for co-operation, or with its execution. These troubles and uncertainties can no longer be shelved, since there is a distinct risk that without more tangible and colourful evidence of co-operation in Europe, Congress will not vote a third instalment of Marshall aid. This fact explains the dejected stocktaking of OEEC and the earnest review of its functions now proceeding in Paris, Washington, and London.

Only the most tentative remedies have so far been advanced. The first is that OEEC should be relieved of the job of allocating dollars, which would be handed back to the Americans. There are also a number of proposals in the air for encouraging small groups of nations to move toward a monetary union with the view to securing convertibility among themselves at an early stage. The chances for success in these undertakings are thought to be greater if their membership is kept small—as opposed to the cumbersome numbers of OEEC—and if they are confined to the Continent, where there is a stronger antipathy against controls than in Britain.

Whatever decisions are taken, OEEC, as originally conceived, is moribund. This is a condition that the Council of the Organisation when it meets at the end of this month will have to recognise, examine and prescribe for. Whether or not "unification," or anything grandiose enough to deserve the title, was a practical possibility in 1947, there is no doubt about the disappointment that American opinion feels, and that Congress will express, at the failure to attain it. Whether or not the British Government has done all that it might have

done to advance the cause of co-operation, there is no doubt that the result will be profoundly harmful to British interests. For the reaction on American policy will either be towards writing Europe off as more trouble than it is worth, or else towards leaving Britain out of America's European policies. The third possible course, which British official opinion has always hankered after—that American aid should be addressed to the European states individually, leaving "unification" to be pursued as a long-term project—may have a great deal of logic behind it, but is by now psychologically out of court.

Is there nothing that can be saved from the wreck? The answer is that there is plenty of material for a fruitful compromise between the idealist, utopia-in-a-hurry attitude of many Americans, with which the Continentals agree in their speeches, and the practical, sceptical attitude of the British Government which (as Whitehall insists) is all that can be seen in the actual proposals of the Continental governments. One arm of this compromise would be a disposition to admit that, without prejudice to wider objectives, the subjects that are actually on the immediate European agenda are not projects of "unification" but rather an attempt to get back to the conditions of 1938, at least so far as concerns the convertibility of currencies and the liberation of trade from quantitative restrictions. If this be "unification," then Europe—west of Dr Schacht—was unified before the war.

The other arm of the compromise is that the British Government should put its heart, and its back, into achieving at least this degree of "unification"—"de-atomisation" would be a much more accurate and not much uglier description—over as wide a range and with as short a delay as possible. Not only should it do so; it should leave no room for doubt that this is its determination. It may be that the attempt has been made before—without success—though nobody appears to have noticed that it was made. In any event, it must be made again. Circumstances have changed. The pound has been devalued, putting a very large additional tariff barrier round the non-dollar world. Moreover, willingness, both in America and on the Continent, to accept more limited projects—that is, projects limited to the possible—has grown. Europeans are beginning to realise that Britain simply cannot afford to accept schemes that would have the effect of draining away its last reserves of gold and dollars, and that projects for the inter-convertibility of European currencies must therefore, at least for the time being, exclude their convertibility into dollars. Fortunately, the American insistence on maintaining the non-discriminatory provisions of the Loan Agreement and other treaties—provisions which, if enforced, would prevent any purely European arrangements for convertibility or freer trade that were not immediately extended to cover the dollar and American goods—is sensibly weakened and might even be tacitly withdrawn.

There are possibilities of making real progress in reviving European trade by co-operative action. One of the essential ingredients is a willingness in London to review the whole of British policy, and the attitudes through which it is expressed. There should be the greater willingness to undertake this because the alternatives are not merely the collapse of an idealist's pipe-dream, but the practical disaster for Britain of finding itself forced into an isolation that would be as poverty-stricken as it was inglorious.

The New Hospital Service

THE hospitals have, after all, been spared the axe. Although the cost of running them accounts for about two-thirds of the total spent on the national health service, there is not only to be no reduction in the Budget estimate for the present year, but that estimate is certain to be exceeded because, for one thing, of the increases in medical and nursing salaries that have taken place since it was drawn up. There may have been good administrative reasons why, at this late date in the financial year, no reduction could be made in the expenditure on the hospitals. But it should have been possible to introduce a small charge to patients to cover at least some of the cost of their food during their stay in hospital. Once the principle of making a charge had been conceded, by imposing a charge of up to one shilling for prescriptions, the opportunity should have been taken of relieving the taxpayer of part of the cost of board and lodging, which, after all, is not part of hospital treatment.

Exemption from the cuts will, however, relieve the minds of the hospital authorities considerably. After all the chopping and changing that have already taken place in their budgets for the present financial year, a cut at this stage would have upset even the best-established administration. The new hospital machinery, on the other hand, is still being run in and is still not running smoothly. How could it when it had to follow a number of such contradictory principles? For instance, the boards of governors of teaching hospitals, the regional boards and the hospital management committees are expected to have considerable freedom from departmental control. Yet the Minister of Health has to account to Parliament for the public money spent on the hospitals, which means that his supervision of their activities must be fairly close. Again, the management committees are appointed by the boards and are their agents for the day-to-day administration of the hospitals; yet, by the wish of Parliament, they are supposed to have a free hand in their own sphere—as is emphasised by the separate corporate status given to them. Again, the main reason for setting up regional boards was to enable the hospital services to be planned and co-ordinated; yet it can never be forgotten that the hospitals are there to serve the patients and not the planners.

The mass of circulars issued by the Ministry of Health to boards and committees since July 5, 1948, should be regarded in the light of these contradictions. A recent circular, for instance, dealing with this question of grouping and co-ordinating hospital services, goes a long way in the direction of unplanning. Strong public protest has sometimes been aroused when boards of governors or regional boards have declared their intention of changing the use of a hospital, and the Ministry has, therefore, declared that before taking such a step the boards would do well to hear the views of the public

particularly where it is proposed to use a small local general hospital for other purposes, since the local loyalty that such hospitals command must not be ignored even where re-organisation is expected to produce greater medical efficiency.

The same circular also attempts to reinstate the cottage hospital, staffed by general practitioners, which is so often despised by the planners; for the boards are asked

not to allow the organisation of regional consultant services to deprive the public of the opportunity of being treated by their family doctors in their local hospital.

Then there is the much deplored circular known, by its reference number, as “(49) 49.” This seemed to belie all Mr Bevan’s assurances in the House of Commons that the management committees were to have a large measure of independence within their own sphere. It laid down, in brief, that they were to obtain the consent of their regional boards before they incurred expenditure on specific items and increases in staff not included in their budget estimates, even though—here was the rub—the total expenditure for the particular sub-head of their budget would not thereby be exceeded. Interpreted literally, this circular meant that a management committee could not, without the consent of its regional board, engage an extra ward maid over and above the number it had budgeted for even though it could do so without exceeding its total budgeted expenditure on domestic staff.

In this country most things are eventually judged by how they work out in practice, and it may well be that the outcry which greeted the appearance of “(49) 49” will prove to be the last that is heard of it. It appears to have originated at the instance, not of the Ministry, but of one or more regional boards who wanted to obtain a tighter control over their committees’ expenditure because of the cuts imposed earlier in the year on hospital budgets. It also appears, however, to have been considerably modified in application, and probably many committees, with the tacit or open approval of their board, have filed it away and thought no more about it. What is certain is that, in so far as the need to keep a firm control on the finances of the health service allows it, the Ministry of Health has no intention of going back on the decision to allow the management committees as much independence as possible.

At the present time, however, the need to keep a firm control on hospital finances is all-important, and of all the criticisms of the new regime for the hospitals the most constant and sustained is against the methods through which that control is exercised by the Ministry. Under the present system, budgeting for the hospital service begins with the management committees, which submit estimates to the regional boards. The boards examine and criticise them, and submit them, with their estimates of their own expenditure, to the Ministry of Health. When they have been approved by the Ministry, they form part of the departmental estimates presented to Parliament.

The initiative in budgeting thus comes from the management committees—a fact which, on the face of it, ought to enhance their independence. But in practice, as the first year of budgeting has shown, the present system is not having the effect that was intended. One drawback is the time-table. For the first full year of the health service, that is, from April 1, 1949, to March 31, 1950, the management committees began budgeting in the autumn of 1948. The budgets were sent back to the

regional boards by the Ministry in February of this year with an instruction that they should be cut. The hospitals replied that they could not do this to the extent asked for except at the cost of their patients’ welfare. In June, therefore, the Minister asked for revised budgets—still for the year 1949-50—which, while making all possible economies, would not involve the closing of beds. These budgets had not been finally approved before the time came for the hospitals to start budgeting for the next year, 1950-51.

★

It is small wonder, therefore, that the main burden of the management committees’ complaints against the present arrangements should be “If only we knew where we are. If only we were given a certain sum that was ours to spend.” As a result, it is being widely suggested that the hospitals should be financed in much the same way as the universities. Parliament, that is, should vote a certain sum of money—or one sum for maintenance and another for development over a period of years—which would be allocated by the regional boards among their management committees. There would be no detailed supervision by the Ministry of how the sum was spent, and none by the boards provided that the committees’ spending was consistent with the regional hospital plan.

The suggestion is attractive, but it is virtually certain that neither the Treasury nor Parliament would agree to it. Parliament, indeed, speaks with two contradictory voices. In the passage of the National Health Service Bill, the Commons could ask for assurances that the greatest possible independence should be given to the boards and management committees. But their Committee of Public Accounts can question the freedom from departmental control allowed to the universities by the system of block grants. If a block grant of under £20 million is criticised, it can be taken as certain that expenditure of £200 million of the taxpayer’s money would never be freed from annual scrutiny by the Treasury and Parliament.

Yet the existing arrangements are so unsatisfactory that some changes ought to be made, if only in the

interests of economy. The management committees claim that the old departmental principle, under which balances unspent at the end of the year have to be surrendered to the Treasury, is an incentive to extravagance. There can be no doubt that budgeting which is detailed to the extent that is required of the hospitals leads to the danger that management committees are more concerned about an item being in the budget than whether it is really worth while. Moreover, departments inside each individual hospital tend to put forward requests for, say, new equipment that they may not really need because once an item is in the budget, and the budget has been accepted, the subsequent ordering of the item is comparatively easy. “It is in the budget”—and the rest follows.

It is, in fact, impossible to budget accurately for hospital work so far ahead as the present timetable demands. Before the health service came into force public demand for hospital services was limited by economic factors. It was then slightly more advantageous financially for a household to keep a senile grandmother at home than to contribute to her maintenance in a local authority hospital. Now that she is maintained free, there is no incentive to keep her at home. The elimination of all charges for hospital services means that once new facilities are introduced in a hospital, a totally unpredictable demand is automatically created.

Budgeting for the health service, and the hospital service in particular, is very different, therefore, from budgeting for education. The number of schoolchildren can be estimated accurately, but it is quite impossible to estimate the number of people who will want to use one or other of the hospital services. Except in a few cases, the demand will be limited solely by the extent of the provision made, and there will be constant pressure, supported by all the humanitarian appeal that sickness arouses, for the provision to be increased. To keep this pressure within reasonable limits would be a constant and difficult task for a Minister of Health even in normal times. But to achieve it, and at the same time to keep the hospital service flexible and unbureaucratic, he needs a more efficient tool than the old departmental method of budgeting.

NOTES OF THE WEEK

Political Economy

The Chancellor’s speech at the opening of the two-day debate on the government’s economy measures was so similar to all his speeches since he took office—couched in the same harsh pseudo-technical language which is itself the mark of a crisis—that it might have been a recording of some previous debate. Once again the House heard about “frustrating production” and once again that verbal monstrosity “quantify” ousted its intelligible synonym “estimate.” To Mr Eden’s credit he brought the debate back into the realms of the King’s English and had the frankness to argue bluntly for further economies in government expenditure. Whether this is a politically successful line for the Conservatives remains to be seen, for Tory candidates may find their audiences highly unappreciative of the need for less government spending, but it is at least a positive line of action.

The economy measures have been accepted by the Labour back benchers with a docility which reflects the imminence

of the Election. Six months ago a charge for prescriptions or a cut in the food subsidies would have been regarded as sacrilege; even more significant is the way the Government have been able to escape with very little objection to a trivial cut in defence expenditure—once the favourite hunting ground of restive back-benchers. This docility is the result, partly, of the demand for solidarity, partly of relief that the cuts were less severe than the rumblings within the Cabinet Room indicated, and partly to a feeling that on the whole the economy programme has certain electoral advantages. It will, so many Labour members argue, plug the breaches in the British economic position until after the Election, and at the same time enable the Labour party to press home their cherished thrust that the Tory party in advocating more drastic economy measures is concerned not only with the national finances, but also with creating enough unemployment to keep labour in order. The Liberals, who can show that as far back as their Hastings conference they advocated reducing food subsidies and increasing family allowances and pensions, have also called for further re-

trenchment. The crisis is, indeed, an opportunity of which the Liberals could make effective use if they wish, for they are free enough to be able to state the type of bold policy which many people consider the electorate would follow.

TUC in Travail

Ever since the announcement of devaluation, the General Council of the TUC has presented an even more painful spectacle than the Cabinet of disagreement, procrastination and despair. Mr Vincent Tewson, the Secretary of the TUC, has been moved by this to declare that there is no split among trade union leaders over economic policy—but union leaders have spoken with different voices in their various union journals and some like Mr James Bowman, the vice-president of the National Union of Mineworkers, and an influential voice on the General Council, are known to be critical of the Government's policy. This week another union leader, Mr Willis, the secretary of the London Society of Compositors, has accused the Government of timidity and of failing to spread the burden of the cuts fairly between rich and poor.

The Council has now given itself another fortnight in which to make up its mind. If at the end of that time it produces merely a series of pious expressions about the need for continued wage restraint, it will very seriously have devalued its prestige in the eyes of the nation. Even if it cannot bring itself to advocate or accept a definite wages policy, it must at least define its attitude to certain urgent problems.

Foremost among these is the future of wage rates which are geared to the cost of living index, covering about one and a half million workers. It is significant that the representatives of unions with such arrangements have been called into the next meeting of the TUC Economic Committee. They are unlikely to be enthusiastic about a reported proposal that sliding scales should be suspended for a period of three years. Yet, if their wages are allowed automatically to increase with the retail price index, there cannot fail to be strong pressure from unions in industries without such arrangements. Already, the miners have decided to seek an adjustment of their cost-of-living allowance which will benefit the lower-paid workers. Technically, the National Union of Mineworkers is on strong ground, for their cost-of-living bonus has remained stationary at 2s. 8d. a shift since July, 1947, when the new retail price index was introduced. On the ground of the national interest, however, it is difficult to justify the claim, which would undoubtedly be followed by pressure from other groups who have not received as many concrete benefits as have the miners.

Three other important wage claims are now under consideration. The Confederation of Shipbuilding and Engineering Trade Unions will have to reply to the employers' appeal to them to drop their claim for a £1 a week increase. The National Federation of Building Trade Operatives, now in conference at Blackpool, have wisely decided to defer a claim for a 6d. an hour rise—a claim which would certainly strengthen the threat of unemployment in their industry. The Civil Service Clerical Association's application for a 15 per cent increase in wages and for parity between temporary and permanent clerks is now before arbitration, having been rejected by the Treasury.

Economies in Education

The Minister of Education is the first departmental Minister to give a detailed statement of the effects of the new cuts on the activities of his department. Last Wednes-

day he took the opportunity of the opening of a new village college near Peterborough to elaborate Mr Attlee's brief summary of what educational services are to come under the axe. Fortunately for him, the axe has been a light one and has struck in at least one place where economies were already overdue—the needlessly lavish lay-out and finish of some of the new schools—lavish, that is to say, for a nation living on the brink of the Marshalsea.

Mr Tomlinson's good fortune is as much due to the strength of his position as to the nervousness of the Cabinet. The educational building programme is already concentrated almost exclusively on meeting the effects of a rising birth rate and the needs of new housing estates which would otherwise lack schools altogether. With the prospect of a million more children in the schools by 1952 and in the presence of widespread complaint about the present size of classes the case for meeting these minimum requirements is very strong.

The cuts in capital expenditure are to be secured mainly by building the same number of schools at a lower cost per school. It may be that certain desirable education facilities will have to be sacrificed, but there are grounds for hoping that a good deal of the squeeze will be taken by reducing inessentials. When it is realised that the building costs of secondary schools providing the same ratio of classrooms, special rooms and teaching space per pupil can differ by as much as £300 per place the opportunities for squeeze are clearly considerable. Mr Tomlinson gave no figure for the size of the capital cuts involved beyond saying that a ten per cent reduction was the aim for 1950. At present £47 millions worth of building is actually under construction and another £8,000,000 worth is on the point of starting.

On current expenditure Mr Tomlinson has found his position just as strong and he has had to sacrifice a mere £5,000,000—principally by charging an extra penny (6d. instead of 5d.) for each school dinner. The real strength of his case lies, however, less in the value of any group of services rendered by the education authorities as by the fact that about 45 per cent of the educational expenditure is on teachers' salaries. The Burnham salary scales for teachers are not controlled by the Minister. The only way for him to make a large saving in educational expenditure would be to tell local education authorities to dismiss large numbers of teachers and to have larger classes. It would take a very ruthless Government to do that.

Low Bid from Berlin

The claims to special Soviet favour and virtual independence made by the Ministers of the Peck Republic when first appointed are already being scaled down. The Foreign Minister, Herr Dertinger, now denies having said that he expected a peace treaty with the Soviet Government within three months, and the latest utterances of his colleagues on this and related matters have become cautious in content and moderate in tone. This does not mean that the challenge of the new republic to Allied policy in Germany is less serious than was at first thought; it simply means that the auction for leadership of a united Germany starts with a bid from the Communists of the east that is lower than they had expected.

It is said that the Allied High Commissioners do not take seriously the news from Berlin, and that they are loth to advise their Governments to start outbidding the Russians for German favours. There is good sense in that view, provided it does not mean that the nature of the threat is misunderstood. It is not the Allied occupation that is in danger; what will be challenged from Berlin, by every means that Communist ingenuity and organisation can employ, will be the attempt of a moderate government in Bonn to rule by parliamentary methods and to co-operate in such ventures as the Council of Europe and the Atlantic

Pact. The challenge will be made by propaganda and pressure through the nationalists of western Germany, who are by no means all Communists. At the first sign that the challenge is having success there will be Soviet concessions to the eastern republic sufficient to make millions of ignorant Germans in the west think that "equality of rights" is being conceded faster in Berlin than in Bonn.

In such tactics the Communists will, of course, count on the Allied High Commissioners to help with the kind of delays, differences and confusion of purpose that have marked their first few weeks of authority. They will hope to see repeated a situation in which there is no government in France, in which a British Foreign Secretary is weakly obstinate, and in which the American High Commissioner lets it be known by indiscretions that he either disagrees with or looks ahead of his colleagues with regard to policy matters of fundamental importance.

Repeated these things will be unless Mr Bevin and his colleagues recast their German policies and decide to make, now or within a fixed period of time, those concessions which can alone give prestige and authority to a moderate German government. If they do this there need be no bidding and counter-bidding with the Russians, who will find the price raised too fast or too high. If they do not, they will drift gradually into the very auction for Germany which they now disdain—and be forced to bid too little and too late.

The Passing of JEIA

A landmark on the path back to German sovereignty was passed on October 15th, when the Joint Export-Import Agency (JEIA) handed over all its administrative functions, with one exception, to the German foreign trade authorities. Until it is dissolved, JEIA will retain advisory and supervisory rights, and will control, or attempt to control, the export of restricted goods to the Russian sphere. After it is dissolved, a committee of the High Commission will assume this limited role in the sphere of German trade.

During its lifetime, JEIA was regarded by Germans as the sinister embodiment of Allied ill-will, and by traders of all nations as a synonym for red-tape. In justice to JEIA it must be said that its task was extraordinarily complicated. At the outset, German exports had to be forced out of a prostrate economy. Prices had to be fixed at a level which would both secure contracts and yet satisfy British and American competitors that the Germans were not dumping. Until the currency reform of June, 1948, the German mark and the internal price level bore no relation whatever to external conditions, and the Agency had to operate a complicated system of individual price-fixing which gave full scope for bureaucratic muddles and national suspicions. The tangle became still worse owing to the American insistence on decentralised government, which gave the local German State Ministries the right to put a finger into the foreign trade pie. Lastly, the obligation to settle balances in dollars, which until recently formed the basis of all JEIA's trade pacts, acted as a brake and irritant on all sides.

Nevertheless, German exports have multiplied under the JEIA regime. In 1947, they totalled only \$222 million; in 1948, they reached nearly \$600 million, and during the first six months of this year they had already passed the total for 1948. In 1947, Germany was paying for only a third of its imports; it has now doubled that proportion, in spite of the fact that imports have risen from \$734 million in 1947 to \$1,400 million in 1948, and to over \$1,000 million in the first six months of this year.

During this time, the American and British heads of JEIA have constantly cut their own red-tape. Exports have been largely freed of licensing controls, and the importing pro-

cedure has been simplified. JEIA's last work has been to negotiate new types of bilateral trade pacts, which, it is hoped, will serve as a model to the Organisation for European Economic Co-operation. In the last few months, agreements have been concluded with Switzerland, Holland and Norway which go a considerable way towards freeing German trade from quota limitations. The latest German pacts specify commodities—a small but important list—which are still restricted, leaving the rest free; and in the agreements with Holland the dollar clause is eliminated altogether.

The manner of JEIA's passing is therefore becoming to an organisation in which the American vote predominated. Already German merchants are finding that the local bureaucracy which has taken its place is the worse of two evils.

Three Peace Treaties in Search of a Judge

The United Nations Assembly has now referred to the International Court of Justice the legal points arising out of the charges that Hungary, Rumania and Bulgaria have been violating the clauses of their postwar peace treaties providing political and civil liberties for their peoples. The Court will not, at this stage at any rate, be asked to decide whether these three states have violated their treaties or not, but simply to rule whether a real dispute exists under the terms of the treaties and whether the three states are bound to take part in the three-member commissions of inquiry which the treaties require for the settlement of any issue arising out of them. When the three states rejected the protests of the western Powers at the treaty violations, the cases should automatically have been referred to the commissions, on which each party was to nominate its representative and the third member was to be appointed by the Secretary-General of Uno. But Hungary, Rumania and Bulgaria have so far refused either to nominate representatives to commissions or to acknowledge the competence of commissions formed without them; and they have been supported in their attitude by Russia on the ground that the charges concerned matters of purely internal jurisdiction.

It is, of course, quite true that suppression of opposition parties, denial of freedom of speech and the staging of political trials *à la russe* are acts of domestic policy which would not normally be regarded as suitable for official protest by other nations or for the jurisdiction of an international court. It is also true that the offences of Hungary, Rumania and Bulgaria, arising out of the Communist system of totalitarian rule, are in no important respect different from the practices of the Soviet Union, Poland or Czechoslovakia against whom no charge is brought. But it so happens that Hungary, Rumania and Bulgaria fought in the war on the side of Nazi Germany, and that the peace treaties imposed on them by the victors, including Russia, have bound them to observe certain principles in their internal policy, so that they cannot plead that any foreign concern at their violation of these principles is an infringement of their domestic jurisdiction.

The treaties they signed are a part of international law, and the Governments of the three nations which have so cynically ignored the obligations they undertook are liable to whatever processes of law exists for the judgment of treaty violation. The realist may say that all this fuss cannot lead anywhere, as the erring states are under Russian protection and cannot be compelled to mend their ways, whatever the International Court may decide. But, as in the case of the Corfu Straits, it is good that claim and counter-claim in the cold war should, wherever possible, be taken out of the arena of mere propaganda contest and submitted to an independent judicial procedure.

Progress in the Gold Coast

The chief interest of the report of the Coussey Committee on constitutional reform in the Gold Coast lies, first, in its reception by the Colonial Office and, secondly, in the reception given in the colony both to the report itself and to the Secretary of State's comments upon it. The committee was composed entirely of Africans. It might, therefore, have reasonably been expected that recommendations would be put forward which would have proved unacceptable to the British Government. As it turns out, the committee has produced a report which, though proposing big steps towards responsible government—so much would indeed have been proposed by any committee—is yet couched in moderate and sensible terms. The result is that Mr Creech Jones can say at the outset in his despatch to the Governor that the Government

accepts the proposals . . . as providing a workable plan within the framework of which constitutional development in the Gold Coast can now proceed.

Those who will claim that the proposals are too ambitious and cannot be justified by the progress made by the African to political maturity should ask themselves what would be the result of refusing to accept them.

It is on the position of the proposed new Executive Council that the Government makes its most important dissension from the Coussey Committee's report. It agrees with the proposal that the Executive Council should have a majority of African members elected by the Legislative Assembly, the others being three *ex-officio* members with the Governor as chairman; that most of these members should have responsibility for the administration of departments; and that the Council would be responsible for formulating policy and the principal instrument of policy. Whereas, however, the committee recommends that the Council should be collectively responsible to the Legislative Assembly and not to the Governor, the Secretary of State declares that it must be responsible to both.

The point is that the transfer of power proposed by the committee is—to its great credit—not complete. By its recommendations the Governor would still have ultimate responsibility for the government of the Gold Coast and would have reserve powers of certification and veto—though in the modified form that holds in Trinidad and Jamaica. But it is worth noting that eight members of the committee, among them Dr Danquah, a prominent Gold Coast nationalist, put forward the reservation, first, that there should be no *ex-officio* members of the Executive Council and, secondly, that the Governor should have no power of veto. By his very reasonable insistence that the Council should be responsible to the Governor, the Secretary of State may provide an excuse for extremists to stir up opposition to the proposals as a whole.

* * *

Second Thoughts on National Parks

The National Parks and Access to the Countryside Bill, which had its second reading in the House of Lords last week, has been considerably amended during its progress through the Commons in order to strengthen the powers of the National Parks Commission—the body which is to designate the areas of the parks and to advise on their layout. The Bill still commands general acceptance, but events have tempered the enthusiasm which its objectives once aroused. It is clear that the threat to amenity comes not from private spoliation which is now effectively controlled, but from industrial projects and the schemes of government departments. Before the national parks have even been constituted, areas which they are to cover have suffered such blows as the partial occupation of Dartmoor by the services, the extension of quarrying in the Peak District and the hydro-electric proposals for North Wales; others will probably follow. A government spokesman in the Lords

made clear that the new Bill will provide little defence against such encroachment.

The declared aims of National Parks are, in the words of the Dower report, to preserve their characteristic landscape beauty and to provide ample facilities for public access and enjoyment. With regard to the second objective, popular taste over holidays, perhaps fortunately, does not lean so strongly towards these rather wild and remote areas as to justify heavy expenditure at the present time on turning them into "people's playgrounds." New roads and hostels and transport facilities can only be forthcoming very slowly; and it may be just as well that some of the cost of these improvements will fall on the local authorities who will count their pennies carefully.

But in relation to the task of preservation, a further doubt exists whether it is worth while having a National Parks Commission taking endless pains over the design of farm buildings, petrol pumps or tea shops, when large and irreparable disfigurements can occur without serious obstruction. The problem is not peculiar to National Parks, since the preservation of the nation's cultural prestige—of Wells and Oxford—is still more important than the salvation of Snowdonia; but if the Commission can put the case for protecting its own special regions effectively before the Government, then and then only will it be worth having.

Another New Town

Corby in Northamptonshire, for which Mr Silkin has made a draft designation order under the New Towns Act, is a town where this Act can be invoked to good advantage. Its purpose is different from most of the new towns, since it is not required to relieve population congestion elsewhere; the congestion is in Corby itself. Corby is one of the few remaining examples of the "company" town, since its whole economy revolves round the large steel works of Stewarts and Lloyds, which removed there in 1934. The town has grown quickly, and at the end of the war the steel company owned 2,300 of its 2,900 houses.

To make Corby a satisfactory town, a large number of houses must be built quickly, some alternative employment—especially for women—must be introduced, and social facilities provided. This is a job beyond the resources of a small local authority; but the proposed Development Corporation, which possesses the necessary powers, will have to move delicately to avoid offending local feeling and good sense by top-heavy and expensive administration.

Corby is a case where town planning may accomplish a useful task of tidying up in the wake of industry. There have been some recent planning schemes, however, which make the mistake of laying down the future course of industrial development in considerable detail. Industrial growth is subject to far too many economic variables for plans of this nature to be desirable or workable. Town planning powers can do something to guide the location of industry, and can do much to civilise its impact; but the need for a flexible economic basis must remain.

Israel's Dependence on America

Within the week, an Israeli economic periodical has told its readers that "unless we succeed in attracting big money, we must radically lower our standard of living" and Dr Weizmann has informed a group of visiting Americans that "our best defence is to fill the country with people. Physically our resources are being taxed. Help from America in ample measure is vital." The two quotations are juxtaposed in order to show that from whatever angle thinking starts it proceeds inevitably to the same conclusion: Israel is over-

whelmingly dependent on American Jewry for at least a generation.

Israeli optimists sometimes argue in terms of self-support within a decade, but home statistics, as well as the foreseeable outlook in the world's markets, seem to belie them. The Israeli balance of payments starts at a handicap. The ratio of Palestinian exports to imports, always seriously adverse, has naturally worsened under the impact of 305,000 immigrants. Foreign trade statistics for the first five months of 1949 show an unbalance which is even graver than it looks because three of the months (January to March) are those in which the seasonal citrus harvest accounts for something over three quarters of all exports:

	£ millions, 1949	
	Exports	Imports
January	1.5	4.1
February	1.5	4.6
March	2.0	6.7
April	1.0	5.3
May	.76	8.2

Now an immense and laudable effort is being made to improve it by internal means—in particular by reducing production costs. By means of an austerity programme that is severe though not as severe as Britain's the cost of living has been driven down from 371 points (August 1939 = 100) in April to 350 points in July and 334 points in October. As the national wage level includes a cost of living bonus, two wage reductions of £2 per month have been made. But the index of wholesale prices in Israel stood, at the end of 1948, at 421 (1937=100) as compared with 191 in the United States and 202 in the United Kingdom. It is clear that these herculean efforts, though important internally and psychologically, are insignificant when viewed in terms of improving the nation's total international balance of payments. Only foreign charity and foreign investment can fill the gap.

Hence this month's anxious visit to Israel of twelve of America's leading Zionist campaign organisers. Hence last week's emergency two-day conference in Washington to discuss the means of arresting the drop in American charitable contributions. Hence the Jewish Agency's onslaught upon multiple campaigns for sectional or minor purposes. The United Jewish Appeal in the United States, which had collected \$131,262,000 by mid-October of its 1948 campaign, has collected only \$96,681 in the same period of this year and has had to borrow to meet its commitments. Its target for 1950, which will, no doubt, be announced when it holds its national conference on November 25th, is said to be at least \$200 million.

General Franco in Lisbon

General Franco has at least retracted none of his proud views. Out of his visit to Lisbon this week has come a provocative statement which can do nothing to promote his cause among democratic western sympathisers. Speaking about the fight against Communism, he is reported to have said that the only way to wage it is to count on countries "which have a social unity and a regime like Portugal and Spain—which I assert are models for the world." Unfortunately, "models for the world" is just what they are not. A reasonable case can be made out for the enlightened rule of Dr Salazar, and indeed for the peace and order which General Franco himself has brought to his own troubled land. But the strength of both arguments depends on the special circumstances prevailing in the two countries. Neither regime should be for export.

The comparative isolation in which Madrid finds itself provides the key to the Generalissimo's historic visit to Lisbon. Portugal's hospitality is in repayment for that

Author and Authority

Chary of the promiscuous adjective, suspicious at all times of superlatives, The Times Literary Supplement picks its way with critical good sense and experience among the vast confusion of new books. As a guide in the selection of what to read it is unprejudiced in sympathy, erudite when the occasion calls for it, unfailingly honest in judgment. For the discriminating reader it carries a stamp of intellectual authority.

welcome accorded to the President, Marshal Carmona, by King Alfonso as much as twenty years ago. But there can be little doubt that Spain rather than Portugal attaches the greater importance to the visit. Franco is seeking to strengthen Iberian solidarity at a moment when, by joining the North Atlantic Pact, the Portuguese have taken their first plunge for a great many years into the waters of international alliance. They have not done so, however, without looking back over their shoulders. And it must be accepted as an axiom that any part allotted to Portugal in western defence will not be accepted, on the one hand, without the Spaniards knowing a good deal about it, and, on the other, without Spanish interests being considered.

Spanish foreign policy is based on a tradition of neutrality. One of Franco's greatest achievements in the eyes of his countrymen was to keep out of Hitler's war. Today, Madrid is looking away from Europe—except for Portugal—more determinedly than ever; it believes that its future lies in as close an association as possible with the United States and with the cousinly nations of Latin America. In particular, the Generalissimo's speech at the opening of the Cortes on May 18th seemed to mark the end of any further Spanish efforts to get along with Socialist Britain, as the major European power. Up till then, he indicated, Spain had been "dreaming that our nation might be allowed to make a constructive contribution to a Europe hitherto divided and astray."

"Europe," Franco said this week in Lisbon, "is living in an antechamber of war." It is natural that there exists a strong Iberian wish to keep out—unless, perhaps, a complete and unlikely reversal of western policy were to bring Spain right back into the comity of nations and allot it a leading role. One of the least helpful effects of Franco's visit to Lisbon, therefore, could yet be to weaken Portuguese willingness to participate actively in the Atlantic Pact.

Timber from Eastern Europe

The International Bank announced last week a loan of \$5,000,000 for Yugoslavia and Finland to finance a timber development project sponsored jointly by two Uno bodies—the Economic Commission for Europe and the Food and Agriculture Organisation. Yugoslavia is to receive \$2,700,000, Finland \$2,300,000.

The project has been brewing for a year and a half. As originally conceived, it called for a World Bank investment of \$8,000,000, and the recipients were to include three additional nations: Poland, Austria and Czechoslovakia. Poland has since declared that it can expand output without the aid of dollars—and also without the financial supervision which a bank loan requires. Negotiations are still in progress

over a loan to Czechoslovakia, and Austria is said to have indicated a "desire to participate."

The loans are part of a novel arrangement for expanding European supplies of timber and at the same time encouraging east-west trade. With their new credits Yugoslavia and Finland are to buy dollar equipment which will in time produce timber exports for western Europe worth many times the original dollar investment. On the basis of the original loan of \$8,000,000, it was calculated that the Eastern producers could by 1950 raise the value of their timber exports by \$120 million.

In the course of prolonged negotiations the two eastern nations have guaranteed to export timber of a specific quantity and at reasonable prices to six countries in western Europe. The latter in turn have agreed to make part payment in dollars directly to the World Bank until the loan is repaid. Wherever possible, the western European nations will also make available non-dollar timber equipment to Yugoslavia and Finland and may extend further credits for that purpose in their own currencies. Those taking part in the agreement with Finland are Britain, Belgium and Denmark, and those signing up with Yugoslavia include Britain, the Netherlands, France and Italy.

It is hoped that the spur to production will be enough to enable western Europe to curtail sharply its imports of dollar timber—not in the immediate future, but gradually throughout the next two years. By spending a few more dollars now Europe can augment its own supplies of timber, which are still very much lower than before the war. Europe's major softwood exporters shipped only 2,000,000 standards last year as compared with nearly 4,000,000 before the war. A serious pinch has been averted only by abnormal timber imports from western Germany, which have rapidly dwindled, and by importing from the western hemisphere for scarce dollars.

The Rise of Malenkov

The *New York Times* has recently collated some indications of the growing importance of G. M. Malenkov in the Soviet Union. It has propounded the theory, long current in diplomatic circles, that Malenkov and the late A. Zhdanov were close rivals for the "succession," and that Malenkov has been replacing Zhdanov's supporters in the party with his own men. The theory rests on the interpretation of some recent changes in the Soviet hierarchy (notably the removal of N. Vosnesensky, head of Gosplan) and amongst the party leaders of Leningrad, where Zhdanov was in charge during the war. There are other signs of Malenkov's high prestige, as for instance that his picture now appears alongside that of Stalin, and that Stalin and he recently signed jointly an important decree. Something could be said against each of these indications; but on the whole it seems that Malenkov's chances are at present better than those of any other Soviet leader.

Malenkov, like many Soviet personalities, is little known. His age is forty-eight, so that he is almost entirely a product of Soviet times. He has had little experience of the outside world. He has been a member of the Politburo since 1946. Like other members of that body, including Stalin, he has risen from obscurity not by brilliance, personal leadership, or authorship, but by hard work in party posts.

Because Stalin's power and prestige are unique, and because those under him—even the greatest—are subject to checking, counter-checking and, occasionally, removal, and never express publicly any individuality, it is tempting to suppose that mediocrity and subservience are the main requirements for survival in the entourage. It is certainly difficult to conceive of Malenkov, or any other member of the Politburo, ever being able alone to replace the master. If, however, Malenkov were eventually to succeed Stalin by

some more or less constitutional means, it seems likely that he would seek to keep the Soviet state in the form that we know today. There would be no real alternative. Modern Russia owes its might, and Malenkov would owe his power, to the centralised control of the Bolshevik party, to Soviet ideology, to the "Stalin Constitution." Some enemies or rivals might disappear, but it would be in the interests of the new ruler to avoid major upheavals.

Besides necessity there is inclination. Malenkov, who has formed his political ideas almost entirely in Soviet times, and while working over twenty years in the Bolshevik party, would surely be as unlikely to introduce, say, English democracy as he would be to revive the Tsardom. As regards foreign policy, Malenkov has not made the violently anti-western speeches of his late rival Zhdanov; but it can safely be assumed that he is solidly behind the present Soviet line, both because of his high position and because of his association with the Cominform. Speculation on Malenkov's chances, interesting though it is, reveals no prospects of a Soviet attitude substantially different from what now exists.

Sickness in Royal Ordnance Factories

An article in *The Economist* of August 20th (page 391) discussed the rise in sickness absenteeism in Royal Ordnance factories after the scheme for allowing employees full pay in sickness was introduced in September, 1948. This chart,

which is drawn from figures given by the Minister of Supply in answer to a Parliamentary question on October 24th, speaks for itself.

Punishment and Reform

The addresses at the annual general meeting of the Magistrates' Association last week emphasised once again the distinction between deterrence and reform, a distinction which was also brought out in the report, published at the same time, of the Scottish Advisory Council on the treatment of offenders. The criminal code, as Dr Bowlby of the Tavistock Clinic pointed out to the magistrates, is largely drawn up in terms of punishments for offences. Reform, on the other hand, is concerned with the offender. The difficulty, as is well known, is to undertake the reform of the offender within the existing prison system. Even those who believe with Dr Bowlby that reform is more important than mere deterrence recognise that while it is being undertaken the public may have to be protected from the offender, which may well imply detention of one kind or another;

but the Scottish Advisory Council does well to emphasise that the punishment consists in being sent to prison. Once an offender is in prison, punishment should not be increased but should give way to reform.

The distinction between the two is also illustrated in the present cleavage of opinion on what to do about the increase in delinquency. There are those who, like Dr Bowlby, advocate long-term research into the causes of delinquency and the effectiveness of the various methods of dealing with delinquents—either by punishment or reform. There are others who say that it is the policy of dealing more leniently with delinquents, by placing them on probation instead of sending them to prison and by treating them more humanely once they are in prison, that may be the cause of the increase in crime, and that what is wanted is action—i.e., punishment—now. The trouble, of course, is that most prisons are totally unsuitable, too overcrowded and too short of staff, for reformatory treatment to be very effective. But those who ask for research at least have this in support of their views. The latest report of the Prison Commissioners shows that, of 28,970 convicted male prisoners, 13,733 had been in prison before; of these, 1,368 had over 11 previous offences recorded against them. These statistics do not support the view that punishment is an effective deterrent.

A Greater Plague than Cholera

After inflicting much suffering—particularly on the lower classes—the cholera seems entirely to have departed. All the nuisances of unflushed sewers, intramural burials, collins bursting and pouring forth poisonous exhalations, are continued. . . . But though all the supposed causes of cholera, which have called forth such torrents of eloquence, are still in existence, the disease has happily disappeared. . . . To live closely packed together—to inhabit towns, if continuous dwellings be towns—must obviously become more and more the condition of our people, and probably of the whole human family. It is most desirable that this fact should be always had in remembrance, and that we should study how to make towns convenient, comfortable, pleasant, and healthy. But, in our present condition of ignorance as to the causes of diseases, such as cholera, we are likely to do a great deal of mischief if we allow the terror it has excited to become our legislator, and impede the future exercise of useful industry. We shall be a far greater plague to each other than the disease itself, if every idle man—and our wealthy community abounds in such—be encouraged to look out for amusement, in denouncing occupations as injurious to health that may be offensive to him. Under the influence of terror, and following the example of one or two persons who have unfortunately been authorised, by a Legislature not over-learned in such matters, to meddle with what they seem as little to understand as the vulgar herd, the disposition of one person to interfere with others is, we are afraid, very much on the increase. Amongst us there is an immense number of persons who have nothing else to do than correct their neighbours. Cholera seems to have called them into redoubled activity, and given them, in the care for the public health, a patriotic motive for their exertions. Believing, for our part, that it is not the business of every man to take care of every other man—believing, too, that the present perpetual interference, both of individuals with individuals, and of the Legislature with most of the business of life, is extremely injurious, we conclude that, if the cholera bequeaths to us as much interference as it has begotten in its progress, it will inflict on us a far heavier plague than itself.

Anglo-Egyptian Sudan The Economist by Air

From this week our Air Express Service is being extended to Sudan. Copies are due to arrive in Khartoum on the day after publication and will be posted to subscribers immediately.

The cost of an Air Express subscription is £5 5s. a year. Orders should be sent to:

The Sudan Bookshop, P.O. Box 156, Khartoum.

Orders originating in the U.K. may be sent to:
THE ECONOMIST, 22 RYDER ST., LONDON, S.W.1.

WHY is the steel industry giving us record output NOW?

Because steel to-day is an enterprising, efficient industry. Energy, initiative, and skill are recognized and encouraged wherever they are found—in mill-hand, melter, or manager.

The result is that annual output is over 15 million tons—2 million tons more than the pre-war record in 1939. Costs are being kept down and the increase in our exports since the war has been almost entirely in steel and goods made from steel.

This great industry is unique in already combining Government supervision with the great advantages of free enterprise working in the best interests of Britain.

STEEL

is serving you well

The Maximum Market at the Minimum Cost

The days of haphazard advertising are over. The ever increasing tempo of competition necessitates a constant re-examination of media so as to be certain of the absolute maximum coverage at the most economic cost.

The Daily Mirror, with an average daily sale of more than 4½ million, tells your product story to hundreds of thousands more prospective buyers than any other daily paper in the world. And, with an advertisement rate of .79d. per inch per thousand it costs less than any other National Daily. Have you based your campaign on these irrefutable facts?

Letters to the Editor

Rescuing the Left

SIR,—On page 820 of a recent issue of *The Economist* there is an argument about the market for cars—an argument on which a great deal is made to hang. It seems to be derived from a statistical mistake. Before the war, as the National Income White Papers show, there were not 2,000,000 (or even 1,000,000) people with net incomes of £550.

It has been more usual to regard £250 as the critical level for the car manufacturer; there were 2½ to 3 million people with gross incomes of £250 or more a year. Since the number of cars was still increasing at an annual rate of about 120,000 in 1939, when more than 2,000,000 were already in use, it seems that too much importance cannot be attached even to the £250 thesis.—Yours faithfully,

16 Queen Anne's Gate, S.W.1

FRANK DAVIDSON

[Owing to a slip in copying, the figure of £550 should have been £350, which would involve consequential alterations in other figures. But the argument, of which these figures were merely illustrations, does not need any alteration. The price of the cheapest British car is more than 2½ times what it was. Whoever may have been the critical income level before the war, above which the 2,000,000 car owners were to be found, it is quite certain that the uppermost 2,000,000 people do not now have 2½ times the net income they had before the war. If the number of people who could afford £125 (or the corresponding second-hand price) in 1938 was 2,000,000, then the number of people who will now be able to afford £325, even after second-hand prices fall back into their proper relationship, must be only a fraction of 2,000,000.—EDITOR.]

SIR,—Your article "Rescuing the Left" is a brilliant analysis of the economic impasse caused by the interplay of apparently immovable doctrinaire political thought and constantly moving economic factors.

What is to be done? Those of us who, in your words, "wish to correct the mistakes of the past few years without abandoning our ambition" do not want to "save the Labour Party from itself." As trustee of liberal principles the Labour Party has failed. It is indeed incumbent on progressive, radical, liberal opinion to gain influence on the machinery of the state. This it can only do if it rallies to it now, before it is too late, all those many Labour Party followers who share the liberal objectives, which you, Sir, defined so well; the right to a minimum standard of living, reward for services to the community, the state's purposive direction over the development of economy—all these combined with the efficiency of the national economy. It must also rally to itself all those enlightened men of the Right who, sharing the liberal belief in the liberty of the individual are already inwardly convinced that the welfare of the many must be the concern of the state and must rank before the welfare of the few, but who can not yet bring themselves to sever old loyalties to conservatism.—Yours faithfully,

R. S. DETSINY

2 Neville Drive, N.2

The Leisure Incentive

SIR,—Among the many who never read what I write, and could not understand it if they did, I have a hearsay reputation as a paradoxmonger. One of my so-called paradoxes is classing *The Economist* as foremost among the few advanced press organs that know with any precision what they are writing about. I read it religiously.

But I miss from its articles one prime factor in the national economy. That factor is not labour, not product, not ability, but leisure. Yet to be a sweated proletariat, overworked and underpaid for centuries past, more leisure is a stronger incentive than more money. It is the only reality of freedom, and is

made possible by division of labour, invention, mass production and scientific management of which last only 5 per cent of the human race are born capable. Its distribution is as fundamental as the distribution of income.

At present, when labour becomes, say, for instance, twice as productive as before, the skilled piece-worker takes his share of the gain not in earning twice as much, but in working from Monday to Wednesday, and from Thursday to Saturday lying late in bed in the morning and loafing for the rest of the day. And when the piece-work rate is reduced by half to compel him to put in a full week's work or starve, he strikes and stops production instead of doubling it.

To correct this, continuous industrial service should be made as compulsory as military service, and employers who now pay for holidays on full wages in days of casual leisure, compelled to pay it in weeks, fortnights or months, duly staggered (in short, banking it on deposit), thus abolishing absenteeism.—Yours faithfully,

G. BERNARD SHAW

Ayot Saint Lawrence, Welwyn, Herts

[Whatever the arguments for or against Mr Shaw's totalitarian solution, the problem is not as he states it. In most industries workers are more interested in earnings than in leisure. Nothing brings an employer into greater odium than a failure to distribute the overtime equitably. Moreover, in a free and expanding economy, the only conceivable one in which labour is likely to become twice as productive, the incentive to earn becomes greater than ever.—EDITOR.]

Dollar Exports

SIR,—Your American Correspondent in London (*The Economist*, October 15th) suggests inherent deficiencies in the average British manufacturer. He infers that (a) the US market is too vast for the small British firm, (b) the British business man is complacent and unwilling to accept risks or Government assistance.

I would like to see the formation of a company under the 1948 Act having a share capital and called, say, "British Dollar Exports, Limited," the objects of the company being (1) to promote dollar exports and (2) the purchase of sterling manufactures for marketing in North America. The company would exist to purchase from invited manufacturers, other than large organisations, a fixed percentage of their outputs (on an agreed basis) for a minimum period, and concentrate solely upon making a drive into hard currency markets. The company could operate upon preference share capital offered to the public and ordinary shares offered to manufacturers. Later, perhaps, additional capital could be raised by the issue of debentures secured upon stock. The board of directors would be captains of industry, working in close contact with Government departments. An under-board would make recommendations and be responsible for general administration.

Such a company, staking its solvency upon earning dollars, fired with British business sense, might offer direct incentives to the manufacturer. A defined sale for a defined period; clean-cut sterling transactions relieving the small producer of risk, distribution charges, personal representation and administration expenses; a possibility of dividend income. Exceptional orders from dollar markets would be passed back to the manufacturer or handled on his behalf by the company. "British Dollar Exports, Limited," need not be publicised unless in slogan form, such as "Britain Delivers the Goods."

The Government, on the other hand, would have the advantage of dealing with a specialist company instead of with numerous small companies. There could be no suggestion of a subsidy to manufacturers to give grounds for higher American

tariffs. A saving of the nation's indirect labour, in addition to helping the full employment policy, might well result. Storage, with the exception of facilities in Canada, should present no unusual problem. Surplus stocks could be turned over by the company to the Government as representing exports not required in hard currency areas and, therefore, freely available for the reduction of sterling balances.—Yours faithfully,

30 Gordon Street, W.C.1

COLIN A. PERRY

Comparative Labour Costs

SIR.—The first point made in Mr Wiles's letter seems to be based on a misinterpretation of your brief note on page 775. As I read it, your note did not imply that "all items in indices of production are based on value calculations," but merely that an index of production which uses postwar weights based on relative values of output discounts, instead of reflecting the increased productivity and relatively lower prices of the expanding industries.

This is broadly correct. In the case of the official Interim Index the problem actually arises from changes in unit labour cost (not overall cost or even output per worker), since the 1946 weights are calculated by adjusting the 1935 weights for estimated changes in the total wage bill of each industry. As

the Central Statistical Office has explained, the results yielded by the 1935 weights and by the 1946 weights differ from each other because "changes in wages per unit of output between 1935 and 1946 were negatively correlated with changes in output. In industries, that is to say, in which output has increased, relatively to the average change in output, wages per unit of output have, in general, shown a relative decline, and vice versa." ("The Interim Index of Industrial Production," p. 45.)

The relative increase in output of the more rapidly expanding industries must have tended to increase the relative size of their wage-bills in the same proportion, but this tendency has apparently been more than offset by the relative reduction in the unit labour cost of these industries—a reduction symbolised by the letter B in the equations on page 19 of the publication quoted above.

As regards Mr Kaldor's assertion in your issue of October 15th that "the question of whether prewar or postwar weights are used is wholly irrelevant to comparisons between different postwar years," this is only true in the sense that doubts about the relative merits of using prewar or postwar weights can only arise in comparisons between prewar and postwar years. But it is not true in the sense that the choice of weights has no effect on comparisons between different postwar years.—Yours faithfully,

P. WYKEMAN

Books and Publications

Search for a Liberal Credo

"The Vital Center." By Arthur M. Schlesinger, Jr. Houghton Mifflin. 274 pages. 83.00.

CONSIDERING the long tenure of power which American liberalism has enjoyed—from the Hundred Days of 1933 down to the present day—it is surprising how little it has evolved of a philosophy of action—even of that most familiar of philosophies, the *ex post facto* rationalisation. The historians of the New Deal are hard put to it to find reasoned expositions of its purposes and policies. They are certainly not to be found in the rather synthetic oratory of its founder-President, still less in the eloquence of its electoral campaigning. Seldom can a reform movement have held office so long and, despite all setbacks, so successfully, without a coherent body of expositors, apologists, political philosophers or social theorists. No doubt there are good reasons for this and a full explanation of the phenomenon would lay bare some of the most characteristic and significant features of American life. But a price has been paid for it, a price which mounted steeply when the death of Roosevelt and the dissolution of the New Deal fraternity coincided with the emergence of the Kremlin as an open enemy of the west. Deprived of the shelter of the great empiricist, their ranks thinned by the defection or the enfeeblement of many of his ablest lieutenants, and exposed suddenly to deadly doctrinal sniping on a virtually unprotected flank, their left, American liberals have had to re-form, purge their Quislings and discipline their Pattons, and, above all, learn from their enemies the need not only for a faith but also for a theology.

This process has been long and painful, but the turning-point came with the elections of 1948, the exposure at the conventions and the defeat at the polls of the Wallace movement. Even if Truman had lost to Dewey the re-establishment of liberal integrity would have been the great gain of 1948. As it is, the events of that year have proved that clarification of purpose need not mean deprivation of power.

Mr Schlesinger, watching all this with the dual vision of an historian of Andrew Jackson and an organiser of American's for Democratic Action, has sought in "The Vital Center" to

tell the story of his generation's American liberalism and, with that as a pointer, to work out the philosophy which it needs if it is to stand up to the harsh tempests of the roaring 'forties and 'fifties. Both the story and the analysis make "The Vital Center" an exciting and important book, uneven perhaps, but eloquent, timely and far-reaching. The story describes searchingly but none too harshly the failure both of plutocratic conservatism and of "doughface progressivism," the menace of the featureless industrial leviathan and the totalitarian-communist crusade, the squalid intrigues of the American Communist Party and the gradual evolution of an American "Non-Communist Left." It is a story hitherto untold, at any rate with the clarity and penetration displayed here. It deserves to be widely read in Britain, especially in those quarters where depreciation of New Deal liberalism and exaltation of American fellow-travellers have very often gone hand in hand.

The virtuoso brilliance of these chapters perhaps makes inevitable a certain sense of disappointment when Mr Schlesinger proceeds to his final task, which is to outline a credo for his new progressivism. Inevitable or no, there is recognisable a certain loosening in the argument when the historian gives place to the prophet. Certain clarities emerge, but they are negative. Social security, like innocence, is "not enough." Civil liberties are not to be infringed. Imperialism will not stop Communism. Democracy cannot "be transformed into a political religion, like totalitarianism." But how does the Non-Communist Left transform the negatives of liberty, the insufficiencies of mere security, into the positive "fighting faith" which Mr Schlesinger desiderates? "How to produce a vigilance that never falters? How to strengthen the human will?" Here we are in the Himalayas of inquiry and if Mr Schlesinger cannot show us as neat a route for the ascent of F6 as some of our prewar guides perhaps we should not complain. But in fact, having brought us so far, Mr Schlesinger virtually abandons us to our own devices and contents himself with asking us to be our age and to recognise that there is no funicular railway to the summit, that indeed the summit is less important than the climb. "We are forced back on the reality of struggle. The choice we face is not between progress with conflict and progress without conflict. The choice is between conflict and stagnation."

The new radicalism, in fact, turns out to be a secular Niebuhr-ism. Barth has ousted Marx. But if one accepts the continuing reality of conflicts, one may still ask, as indeed Mr Schlesinger very properly inquires, how it can be made to issue "not in excessive anxiety, but in creativity." His own answer seems to one reader to take refuge in an optimism which may or may not be justified but which certainly is not substantiated on the same cool and persuasive level of argument as the rest. Yet unless someone can find a solution to this problem the totalitarian fanatics will still be left with all the tactical advantages that accrue to those who maintain the offensive, even when it is the offensive of nihilism and self-abasement.

End of a Story?

"Promise and Fulfilment—Palestine, 1917-1949." By Arthur Koestler. Macmillan. 335 pages. 12s. 6d.

HERE is the first story of Israel's birth-pangs and growing-pains to be published in Britain. It is a story, not a history, for it leaves some substantial gaps in its record of fact. To read it with profit demands a knowledge of thirty years' events in Palestine which relatively few Anglo-Saxons possess. But all who do possess that knowledge should read it. Although maddened by Mr Koestler's rasping style, they will gain benefit from the salutary douches that he pours upon the smug Briton who thinks that "we did all we could" as upon the embittered Jew who sees no difference between the British camps in Cyprus and Hitler's camps in Germany or Stalin's in Russia.

Everyone will agree with some parts of the story as here told—that the stipulations of the mandate were impossible and acted as a permanent irritant; that the mandatory, often in spite of itself, defended the backward Arab against the pushful Jew; that the Jews were goaded, as much as anything, by British incomprehension of the news from Germany when they resorted to terrorism; that the British, when they threw up the sponge, ought not sulkily to have wrecked their edifice and left a vacuum that made war inevitable. But the record is spoilt by palpable exaggerations and untruths. The worst is the statement (page 166) that when the British stopped pumping oil to Haifa they diverted the flow to Amman to "make sure" that the Arab armies should be "well supplied with fuel." This is a physical impossibility. Israelis in the know (the reviewer is not one of them) say that there are mistakes of equal magnitude in the account of relations between Hagannah and Irgun.

The reader who simply scores these errors, and keeps his temper, will be rewarded for his perseverance by the book's final pages, which deal with the effect of the creation of Israel upon Jewry as a whole. Mr Richard Crossman, writing after the Commission of 1946, of which he was a member, said that the state would solve the Jewish problem only for the Jews inside it. For the rest—the contented and the assimilated westerners—it would entail insecurity, because it would create

a constant fear of being told to "go home." Mr Koestler skates over this consideration to take a different, perhaps only a longer, view. He contends that the Jew's differentness from his Gentile compatriot has been based on the sense of exile and of longing for return that is a mainstay of the Jewish faith. Termination of the exile has, he believes, deprived that faith of the quality that made it different from its fellows. If the Jew of today is not to expose himself to a charge of divided national loyalty he must forgo the luxury of differentness formerly justified by his religion. "Now that the mission of the wandering Jew is completed he must discard the knapsack and cease to be an accomplice in his own destruction." But Mr Koestler, in the mood of critical analysis untinted by the affection of a citizen for his own country gives no sign that he himself will follow this advice.

Roads

"The King's Highway." By Rees Jeffreys. Bletchworth. 320 pages. 18s.

MR REES JEFFREYS is one of the great men of the road. He has here recorded the experiences of a lifetime spent in the development of the administration of roads and of road-building and he can throw light on many of the less prominent chapters of road history because he was personally concerned with virtually every one of them. Starting as a cyclist fighting the dust nuisance, Mr Rees Jeffreys succeeded in convincing the highway authorities of the need for better roads, and the motoring community of the need to accept special taxation as a contribution towards the cost of improving the country's roads. After this work had been achieved, many of his creations, such as the Commercial Motor Users Association and the Institute of Automobile Engineers, developed and grew until the pressure of events caused them to be merged into still larger institutions. Through force of circumstances, Rees Jeffreys was on the outside, rather than the inside, during the great organic changes in the structure of the road transport industry of the past decade. For this reason, his account of the fluctuations in the Government's views on the function of roads, which have culminated in the passing of the Special Roads Act and the acceptance of the principle of motorways, is less than complete and, for instance, omits any reference to the valuable work of the British Road Federation.

Shorter Notice

"Introduction to Sweden." By Ingvar Andersson and others. The Swedish Institute, Stockholm. 311 pages. Kr. 12.50.

This book is a model of what such surveys should be. Well-balanced, lucid and accurate, it provides a most useful account of all aspects of Sweden and Swedish life. It is tastefully produced—the wrapper and binding deserve particular mention—on good paper with apt and often beautiful illustrations and a coloured relief map. It never degenerates into a guide-book or a potted history and assumes throughout a refreshingly high level of intelligent interest in the reader.

AMERICAN SURVEY

Dr Nourse and the Budget

(From Our American Staff)

THE departure of Dr Nourse from the President's Council of Economic Advisers, of which he was chairman, marks another milestone on the hard road travelled by many of those who try to formulate economic policy. The open split in the Council between Dr Nourse on the one hand, and Mr Keyserling and Dr Clark on the other, has for over a year made it likely that Dr Nourse would resign. Their disagreement is merely the latest of a series over economic policy and practice which has plagued Washington since the scope and responsibilities of government began to grow under the impact of the great depression nearly twenty years ago. It can be predicted with confidence that this disagreement will not be the last.

It was in a speech last week that Dr Nourse most bluntly outlined the reasons for his determination to press his resignation, and made it inevitable that the President should accept it. This broadside spared no one, not even the President or, by implication, Congress. Dr Nourse confessed himself uneasy over a farm policy which stimulates produc-

appropriate. The proper character of the new organisation has therefore also been an issue.

Consequently, Mr Truman's selection of a successor to Dr Nourse will be unusually significant. If he chooses—and if the Senate confirms—a man sharing Mr Keyserling's views on policy and the council's functions, the CEA will become—certainly in the public eye and almost certainly in fact—substantially an arm of the Administration instead of the objective analytical body many hoped for. And even the moderates will feel that their views have not been considered. The President has the power to make such an appointment, and the decision it implies, but it is fervently to be hoped that he will not exercise it. For if he does, the Council will lose what power it may have to reconcile divergent groups.

It is not surprising that the most notorious cause of the split—though by no means the only one—should have been the budget. For it is in the budget that most differences in economic thought finally meet head-on. State policy on revenue and expenditure decide the extent of its influence on, and intervention in, the economy. And they greatly influence, if they do not actually dominate, most others, such as monetary, agricultural, construction, foreign, or defence policies—to specify only a few. Through its revenue and expenditure policy the state can, and increasingly during the past two decades has, reached into and pervaded every nook and cranny of the economy.

The budget is attracting attention at present because expenditures are rising and a substantial deficit—perhaps \$5 billion—is in prospect for the current fiscal year ending on June 30, 1950. This follows a deficit of \$1.8 billion last year. Before that, there were two years of surpluses, following 16 consecutive years of deficits. The prospect has caused the President to declare that he will ask the Congress in January for a substantial increase in taxes—as he did last January. This has evoked a cry of anguish from business and caused some apprehension elsewhere, exposing the full width of the disagreement over economic policy.

But even the current budget figures do not reveal the problem in its entirety, for it runs all the way from techniques to theory. In simple, unvarnished language, budgetary policy is an unmitigated muddle. For 16 years every attempt to overcome it—and there have been many—has been routed, and the only attitude toward the budget on which there is any agreement whatever is one of lively dissatisfaction.

For years the country has been treated to a variety of concepts about the budget. There are proponents of the annually balanced budget, the budget to compensate for cyclical fluctuations or for secular trends, the budget to supply incentives for this and that. There is the concept of a budget to provide full employment, a budget to ensure the greatest possible efficiency in government, a budget to reduce the war-swollen public debt, a budget to alter income distribution. All these, and variants of them, and still others, com-

tion by high prices and then, to avoid oppressive surpluses, has to resort to restriction. He was "filled with apprehension" by the defeatism of management, which led it, on occasion, to prefer banked fires to price cuts which would stimulate demand; he deplored the spectacle of labour leaders demanding both shorter hours and larger pensions. But his bitterest criticism was reserved for the apparent willingness to accept deficit financing as a "way of life" at a time when high production and employment dictated financial prudence and made it relatively painless.

The Council of Economic Advisers, established in 1946 by the Employment Act, is the newest of a number of super-agencies created to formulate economic policy. That it should split was perhaps inevitable, but is nevertheless regrettable. Dr Nourse is far from a proponent of *laissez faire*, but he has a caution as to the extent of government activity which is not shared by the other two members, Mr Keyserling and Dr Clark. He likewise holds the conviction that a council appointed to advise the President should do exactly that and no more, while the other two believe its functions should include open advocacy and lobbying for policies felt to be

mand considerable followings. But not one commands general acceptance.

For years Congress has struggled to develop a technique to master the budget, so that Congressmen should know how much money they were voting and, in some detail, for what. But no member of the Congress which adjourned in mid-October—nor anyone else—knows within billions of dollars how much expenditure has been authorised for any given period, or can make an accurate and detailed breakdown of the huge total. The Budget Bureau has been reorganised over and over again and new systems of account and summary and analysis have been tried, but there is as much confusion as ever—if not more. For years, private, public and quasi-public bodies have studied the budget and published weighty reports without making much impression.

The fact is that, since the twin concepts that budgets should be balanced annually, and that a government should be deemed the best when it did least, ceased to command general acceptance and support some decade and a half ago, no authoritative alternative has taken their place. What has happened—and to say so is no disrespect to the many who labour diligently and in the best of faith on the subject—is budgeting by opportunism and expediency. There really is no budget: what exists is a sum of special interest and necessities appropriation Bills and a revenue system compounded of tradition and malice, and governed by the maxim, "the most feathers for the least squawk." Since it is more attractive and less painful to spend than to tax, expenditure customarily exceeds income.

All this is not to say—though some do—that public credit is necessarily going to be destroyed and the currency obliterated as a consequence of profligate public finance. There are powerful checks in the very extensiveness of the present disagreements; and a strong inhibition exists in the widespread feeling of guilt over the deficit. Moreover, the productive power of the country has shown it can survive a great deal of abuse. But until there is a broader agreement than exists at present over economic objectives and the kind of budget which will best implement them, many faithful public servants will be doomed to frustrations similar to those of Dr Nourse.

American Notes

Fair Deal Postponed

Mr Truman has bidden Congress *au revoir*, but not goodbye, with far more cordiality than seemed possible this spring, and with the heart-felt wish that two months at home will strengthen Congress for the renewed assault on controversial legislation, postponed until the shorter session next year which will precede the Congressional elections. This first session has sat—or been held in place—longer than any Congress since 1922, and appropriated more money than any of its peacetime predecessors. But only Mr Martin, the leader of the Republicans in the House, could compare it to a "tree bending before the gale of statism." Before the threat to peace would be more exact: the great achievements, and the heaviest spending, have taken place in the field of

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

foreign affairs. Congress passed the second year of the Marshall Plan, accepted the Atlantic Pact and military assistance to buttress it, approved a \$15 billion defence budget, ratified the Wheat Agreement, and renewed, without any jokers, the Reciprocal Trade Agreements Act.

Of these, only the last was passed without Republican support; and of the two foreign affairs measures lost for this session, the DP Bill was buried chiefly by Senator McCarran, a Democrat. Point IV—providing investment guarantees and technical assistance for a global fair deal—has been shelved until next year. The score on domestic legislation also tends to support Senator Taft's observation that few of this session's achievements bear the exclusive "Fair Deal" tag under which Mr Truman campaigned. The farm Bill is in the old, bad tradition of pressure politics, a victory for the President only to the extent that it seems likely, by its cost, to push both consumers and taxpayers towards his alternative, the Brannan plan. The long-range Housing Act—the session's welfare peak, with its final approval of slum clearance and low-cost housing—owed as much to Senator Taft as to Mr Truman.

"THERE—EVERYTHING FITS"

Herblock in the Washington Post

A number of victories, as well as one outstanding defeat—that of the proposal for a Department of Welfare—were registered on the reorganisation of the Government: the pay of public servants was raised, though by less than Mr Truman had specified; military unification was tightened (to such an extent that the Navy blew up); a Reorganisation Act was passed, and Congress accepted the bulk of the minor reforms submitted under it by the President. On minimum wages, the Administration won an increase from the outmoded 40 cents to 75 cents an hour, but lost—to what extent only the courts can determine—in reduced coverage. Rent controls were extended, but weakened by a heavy dose of local option. Perhaps the chief change of heart from the preceding Republican-dominated Congress was shown in the favourable action on public electric and reclamation projects and transmission lines—though this took a piece-meal, rather than the broad regional, form favoured by admirers of the Tennessee Valley Authority.

Of the Bills which failed to get through, the two most embarrassing to the Administration are the one to repeal the Taft-Hartley Labour Act, and the one to advance Negro rights. Administration supporters console themselves with the reflection that these two first-class campaign issues are still on tap, but they may be so forever if future handling is as maladroit as it was this year. Already it is suggested that the Administration means once more to alienate the South by giving priority to its least acceptable civil rights proposal—that for a Fair Employment Practices Bill.

Two corner-stones of the Fair Deal are halfway to their places. The Bill for federal aid to education passed the Senate, but foundered on religious prejudice in the House, while the promised increase in social security benefits passed the House, but stuck in the Senate. On the other hand, business which, unlike labour, fared better in general than

it expected, was bitterly disappointed by the failure of the Senate to legalise freight absorption.

* * *

The Navy Torpedoed?

The Navy's case against the way unification has worked was summed up for the House Armed Services Committee by Admiral Denfeld, Chief of Naval Operations, with more vigour than had been expected, and certainly more than the Secretary of Defence considered becoming in a member of the Joint Chiefs of Staff. Admiral Denfeld professed his own, and the Navy's, belief in unification, and took no part in the blitz of the naval aviators against the Air Force or its B-36 bomber. But he emphatically supported the complaint of other witnesses that the Army and Air Force had no understanding of the crucial part the Navy would play in another war, and that the Navy was at the mercy of arbitrary decisions as to its armament and functions. No unification, in his view, would be better than the present monstrosity.

Stung by what he considered disloyalty, General Bradley, chairman of the Chiefs of Staff, flung himself into a full-scale offensive when his turn came to testify, ranging from heavy artillery to mere nuisance raids. He upheld the Air Force's case and, by suggesting that amphibious operations were a thing of the past, firmly relegated the Navy to the high seas and away from land offensives. He was sceptical that large Marine forces would ever be needed, and made it clear that, in his view, the concept of "balanced forces" was far from identical with dividing the defence dollar into three equal parts. He refused to guarantee the Navy its third of the defence budget. The Navy, its hopes torpedoed, drew what comfort it could from the fact that General Bradley, usually a healer of disputes, had lost his temper and his head. Accusations that the Navy was made up of "fancy dans" (show-offs) who would not play unless they could call all

the signals, his personal references to Admiral Denfeld, and his sarcastic tone lent some colour to the allegations of bias and partisanship which the Navy had made.

From that moment on, General Bradley and the Admirals were not on speaking terms, a difficult position for the man who presides over the Joint Chiefs of Staff. Mr. Johnson, who followed General Bradley, while conceding no part of the Navy's case, and insisting it had built a "straw man" of push-button warfare, in which no one believed, adopted a tone of calculated moderation. General Eisenhower went even further to pour oil on troubled Admirals.

The Committee, the storm over and its hearings concluded, has until January to consider its recommendations. But there is some doubt in Washington whether, before then, Mr Truman may not have to drop at least one of the pilots who have run unification on the rocks. General Bradley, for all his unfortunate outspokenness, has the support of Mr Johnson. It seems more likely that Admiral Denfeld may be retired, if the President can be certain he will not be added to the Navy's roster of martyrs.

* * *

Congress Courts the Farmer

The Democrats, who had long ago given up any attempt to reconcile their differences on labour legislation, did not dare adjourn without agreeing on the line to be taken when courting the fickle farmer, who is always liable to vote for the Republicans. At the last minute, a compromise on agricultural legislation averted the threatened split in the Democratic party and gained the support of a number of Republicans—although not those who represent the cities where housewives are more plentiful than farmers. At first glance the new Gore-Anderson Bill looks like a victory for flexible supports for farm prices, which would reduce the

Government's financial commitments and encourage farmers to grow crops that end up on dinner tables rather than in storage bins. But on further examination the Bill is seen to be as handsome and expensive a bouquet as any that has ever been presented to the farmer, with a carefully chosen bloom in it for every type of agricultural interest.

Prices of the six basic crops—wheat, maize, cotton, rice, peanuts and tobacco—will be supported at 90 per cent of parity during 1950, as it has long been obvious they would be; then, if the Secretary of Agriculture so decides and if Congress can break its habit of postponing the evil day, support levels can be reduced, for all except tobacco, to 80 per cent of parity in 1951 and to 75 per cent in 1952. But parity—the price which gives the farmer an equitable return for his crops in terms of the things he buys—will be calculated according to two different systems and until 1954 support prices will in each case be related to the higher. One system uses the historic basis of comparison, the years 1909-1914, the other takes the last ten years and includes the cost of labour among the things the farmer buys.

The new system will be kinder than the old to most non-basic commodities and is the only one to be used for them. Price supports are now mandatory for far fewer of these commodities than under previous legislation—only tung nuts, honey, milk and its products, wools and mohair and the notorious potato, at 60 to 90 per cent of parity. But the Secretary of Agriculture is permitted to support any other commodity at his discretion; in an election year the temptation to sweep hog and poultry farmers, soya bean and raisin growers and all the rest into the embrace of the Government's generosity, will be hard to resist. Congress has left another, nearly as invidious, responsibility to the Secretary. Perishable commodities acquired under price supporting operations can now be given away for charitable purposes, both at home and abroad, also at the discretion of the Secretary, who will certainly need more chairs in his waiting room.

Stronger Dose for Shipping

The never very robust health of the American shipping industry has taken a turn for the worse. Shipyards will finish most of their present orders by 1951, few new contracts are coming in and the amount of repair work is falling. The shortage of dollars and the availability of foreign vessels has reduced the proportion of the nation's trade that is carried in American ships. But at the same time it remains essential that the invalid should be kept sufficiently resilient to make its vital contribution to the defence of the United States and of its Allies. Shipping's head nurse, General Fleming of the US Maritime Commission, has therefore had no difficulty in persuading President Truman that, if the industry is to withstand the devaluation of sterling, it must have larger doses of its old medicine, the Government subsidies which offset lower ship-building costs abroad.

At present the Commission can pay up to 50 per cent of the cost of ships, and it is suggested that the subsidies may now have to be raised to over 60 per cent. The industry itself, however, might not welcome a subsidy so large that the Government would have a deciding voice in its policies. Yet in the past the Commission has been very ready to see things from the industry's point of view—too ready, in the opinion of a Congressional committee, which has just convicted the Commission of using improper procedures and unjustifiable assumptions when determining the subsidies for the large passenger vessels now under construction. The Commission's excuse was the difficulty of finding any realistic basis on which to assess comparative costs, owing to the secretiveness of foreign shipbuilders; it is now sending technical experts abroad to gather data.

Meanwhile, the Congressional specialists have been strengthening old remedies and devising better ones for the patient's debility. Half the military cargoes under the Mutual Defence Assistance Act must travel to Europe in

American ships and the similar stipulation in the Economic Co-operation Act has been made more specific, instead of being abolished as ECA asked. A Senate Committee is considering what new medicine would suit the case; it is particularly concerned because the present merchant fleet, almost entirely built during the war, will all become obsolete at the same time. The House Merchant Marine Committee has already written its prescription, on lines suggested by the patient itself. It proposes a number of changes in the treatment and would make subsidies available for tramp ships as well as for those operating on regular routes.

More Taxes?

When Congress returns in January, it will find under the "Welcome" mat the same request for higher taxes it picked up last year—and banished to the back of its deepest pigeon-hole. President Truman, who in July conceded to Congress that, with a slight business recession, it might not be wise to grease the skids, last week revived his demand for higher taxes to meet the cost of government and avoid increases in deficit financing. Presumably he has concluded that business looks healthier, while no one can ignore the pallor of the federal budget this year.

Mr Truman blames the \$1.8 billion deficit in the last fiscal year on the reductions in the "rich man's tax Bill" passed by the Republican Eightieth Congress. Arguing that 80 per cent of the budget is in fixed charges, he professes to see no alternative to a tax increase. Many Congressmen hotly disagree, but the session just concluded failed conspicuously to cut spending significantly below the President's estimates. Time—and deficiency appropriations—may swell it further.

It is manifestly undesirable that in prosperous years the United States should incur heavy deficits. But aside from the natural reluctance of a Congress of any political complexion to raise taxes in an election year, the first tax step Congress would like to take is a reduction in the wartime excise taxes, and for this it has the Administration's support. When they were last increased in 1944, it was promised that these taxes would be eliminated six months after the end of hostilities. They were imposed, not only to increase revenue, but to lighten the load on certain facilities—transport, telegraphs, telephones—and discourage luxury spending. Like all sales taxes, they are discriminatory and repressive. High rates apply, for example, to jewellery, furs, leather goods, electric light bulbs, tyres, theatre admissions, and transport of freight and persons. Retailers, who did not chafe too greatly when there was a seller's market, found the levies becoming painful this year as consumers began to count their pennies. Indeed, the yield on retailers' excises has been declining since 1947. Their spokesmen, and some Congressmen, regard the repeal of these taxes as a valuable weapon against unemployment and the recession. The recession appears to be retreating; not so the retailers.

The second call for relief is in the interest of equity capital and consequently is less imperious. Business was pleasantly surprised when in August Mr McCabe, chairman of the Federal Reserve System, urged that the capital gains tax be modified, double taxation of dividends reduced, and income taxes in the higher brackets lightened, to encourage saving and investment in equities. But equity capital casts few votes; and for any relief granted, alternative sources of revenue must be found. Mr Truman, recommending in July that the excise tax on freight bills be repealed, suggested that increased levies on estates and gifts might fill the gap. Business men would like to see the co-operatives taxed, while the Treasury is said to be eyeing other tax-exempt institutions, particularly when they run profit-making enterprises, such as the macaroni company owned by New York University. A postponement of the evil day of tax increases might also be secured by requiring corporations to pay their taxes more punctually. Indeed, if there is to be any substantial increase in taxes next year, corporations may well bear the brunt.

BANKING SERVICE IN CANADA

THE BANK OF MONTREAL offers unsurpassed banking facilities in connection with commercial and financial transactions in Canada.

To those considering development of business in Dollar Markets the Bank offers reliable and up-to-date information and data concerning Canadian marketing opportunities.

Enquiries will be welcomed at the London Office.

THE WORLD OVERSEAS

First Aid for Berlin

(From A Special Correspondent)

AT a first glance, western Berlin is a much happier and more prosperous place this autumn than it was last. Nobody's sleep is disturbed by the interminable, ominous coming and going of aircraft. The shops and street markets are selling fresh and varied food and consumer goods of all kinds. People are better dressed. The Kurfuerstendamm twinkles again by night. There are more trams and buses. You do not see grey men and women wearily dragging home tinder from the Grunewald.

But the appearance of better times is illusory. It is maintained at the cost of a municipal deficit of eighty million marks monthly, caused largely by the payment of unemployment relief. At the beginning of the blockade there were some 40,000 unemployed persons in west Berlin. A year ago, in the most critical phase of the blockade, there were 100,000. Today, six months after the lifting of the blockade, there are 250,000. Unemployment, originating from lack of capital to resuscitate industry, is the cardinal complaint.

Berlin lost its capital in 1945 and has never got it back. Bombing and shelling, followed by the dismantling of eighty-five per cent of plant and the confiscation of 5,000 million marks in the banks, reduced the city's earning power to the minimum possible for bare survival. In its reduced circumstances, and as an uncertain battleground for Four Power politics, it also lost the confidence of those who were in a position to help. Berlin firms have consequently had to rebuild their businesses on short-term credits, never knowing whether they will be renewed.

Three currency reforms and the blockade simply aggravated these conditions. While the big electrical industry has deftly scraped along, most of the smaller undertakings in west Berlin have been brought to a standstill one by one. When the blockade was lifted, the Berlin market was immediately flooded with consumer goods from the waiting West before local firms could get going. Half of these goods could have been made in Berlin.

West German Attitude

Nor did the raising of the blockade revive western Germany's confidence. Western German firms are still shy to place contracts in what they consider so insecure an outpost. Only the other day a Ruhr firm invited tenders for the construction of a turbo-generator. A.E.G. of Berlin offered to make the generator at the cheapest price—950,000 marks—and promised delivery two months earlier than anyone else. The Ruhr customer informed the next-best bidder in the west, who promptly came down to 930,000 marks and obtained the contract. A.E.G., who were ready to come down to that extent, were not consulted again.

Until the establishment of the Pieck Republic, with its headquarters in east Berlin, west Berlin's leaders imagined that the only way to restore confidence in the outpost's future was to proclaim west Berlin the twelfth land of the Federal Republic. They have modified their claims since it became apparent to them that such a move might provoke the Russians to consider the four-power agreement on Berlin at an end. In its present isolation western Berlin cannot forego the protection that the agreement affords. So, with an eye on east Berlin's new status as *de facto*, though not *de jure*, capital of eastern Germany, the west Berlin leaders have

asked that west Berlin shall be *de facto*, though not *de jure*, an integral part of the Federal Republic. They envisage an economic and financial *Anschluss*, such as that of the Saarland with France—the political issue being similarly left open until another, more convenient day. For the time being, it is enough to let Berlin's earning power be restored.

Bonn Officials Expected

Such a proposal suits the book of the ruling west German politicians, who view Socialist Berlin's potential political influence with some misgiving. The plan of help to which Dr Adenauer and the Federal Minister of Finance, Dr Schaeffer, have now committed western Germany promises Berlin substantial credits and government contracts. Private firms likely to place orders in Berlin are to be encouraged by Federal Government guarantees. Goods manufactured in Berlin are to be exempted from certain indirect taxes. Those supposedly lost banking accounts, the so-called *Uraltkonten*, are to be revalued at five per cent. A common west German and west Berlin banking system is to be introduced. Western Berlin is to be an equal, if not favoured, partner with western Germany in receiving Marshall aid. There is still some tentativeness about these proposals. The details of their application are being worked out in Frankfurt and Bonn. The important thing is that western Germany has committed itself to help Berlin. It will be spared additional expense later if it acts swiftly and generously now.

Dr Adenauer did not promise immediately that any federal departments would be moved from Bonn to the former capital, but there seems to be little doubt that some departments will be coming. The British are clearing Cumberland House for the purpose, and all is set at the Berlin end to receive them. President Heuss will probably have something to say on the subject when he comes to Berlin next week. The arrival of part of the federal service will contribute not only towards restoring confidence in Berlin, but also towards repairing the city's finances. It is reckoned that forty per cent of Berlin's invisible exports before the war derived from its services as the German capital.

It is not fair to western Germany to see only lack of vision or selfish calculation in its hesitations over Berlin. Western Germany is militarily powerless, and cannot be expected to have much confidence in the future of the bankrupt, rump city, at the far end of 102 miles of Autobahn, unless the western Allies firmly display their own confidence in Berlin's future and their determination to stay there as long as may be necessary to secure its independence. They did this magnificently during the blockade. They have not made their intentions so clear since, unlike the Communists, who see in Berlin the key to the domination of Germany, and therefore western Europe. From the west there have been fine words, culminating in the Allied High Commission's latest statement that "it regards and will continue to regard Berlin as being confided to the care of the western Occupying Powers in a special manner." In practice the western Allies are giving the impression of a general evacuation at the very moment when east Berlin has been elevated to the status of a capital. It may be more comfortable, convenient, and economical back in the Rhineland. But is it worth while in the long run to give even the appearance of losing interest in Berlin?

Can the Arab Refugees Survive?

WHENEVER the United Nations discusses the Arab refugees politics and emotion vie for first place on the rostrum. Broadly speaking, three streams of thought are vented. The first comes from the anti-communist states with interests in the Middle East. These are all anxious, for political as well as humanitarian reasons, to get the cancer treated quickly. The second comes from the refugees themselves, who rend the air with cries for repatriation. The third stream comes from Israel, which agrees with the West in wishing for quick settlement, but not at the price of disturbing its own Jewish immigration arrangements. Can the West invent a bridge between the Jewish and the Arab views?

The dimensions of the problem are not lessening with time. A few refugees have found jobs and settled to a life not unlike their old one, but their disappearance from the total number of the indigent is offset by the appearance at the relief stations of once better-to-do families who have now exhausted their means, or whose foreign visas have expired, or whose permits to work, granted in a first flush of sympathy, have now been rescinded by some neighbouring Ministry of the Interior.

Neighbours cannot tender succour for ever. But the day is round the corner when the United Nations and its agencies will say that they, too, cannot handle relief indefinitely. Murmurs to this effect are already audible in the offices of the Red Cross. Present arrangements are as follows: The United Nations Relief for Palestine Refugees Organisation (UNRPR) which was set up by the Assembly in 1948, is still responsible for overall financing and organisation. The actual administration of the relief has been transferred to the International Red Cross, to the League of Red Cross Societies, and the American Friends. These contracts expire in January. In any case they are linked to a fund that is approaching exhaustion—the Special Fund collected last year by means of an appeal to the better feelings of States Members. This was intended to total \$32,000,000 for nine months, from December 1, 1948, but on August 15th last only \$21,524,016 had been contributed in cash and kind. To this figure must be added \$6,000,000 contributed by UNICEF (the International Children's Emergency Fund) without which aid numberless refugees would have died since it produced supplies at a time when no other help was in sight.

By following a policy which has at times looked inhuman, but has turned out to be laudable, the American director of UNRPR, Mr Stanton Griffiths, has spun this fund out to cover far more people, for a far longer time, than was originally intended. The intention was to feed and succour 5,000,000 people for the nine months. But Mr Griffiths allowed no spending till the cash was in the bank. As he has organised matters, the fund will last till mid-December in cash, and till mid-January in foodstuffs. It is feeding crowds whose exact numbers are almost impossible to compute on account of the refugees' practice of moving in search of better conditions, of registering at more than one station, and of refraining from recording deaths and departures in order to draw larger rations. All told, just over 1,000,000 are registered with the three societies administering relief, but all know this number to be too high. Only 940,000 rations are being distributed. This figure is again thought to be an overestimate because entitlement to relief encourages exaggeration. The most reliable guess is that there are at present some 820,000 refugees in all, distributed as follows:

Palestine and Jordan	344,400
Syria, Lebanon and Iraq	262,400
Gaza strip	206,000

As things stand, both UNRPR and the agencies are greatly to be congratulated on the work they have done upon the means available. About 33 per cent of the refugees are in

their camps. All are getting on an average at least 1,500 calories a day; the figure for Syria is 1,730. Under-nutrition is therefore common, but malnutrition is rare. No disease has reached epidemic proportions. The death rate can only be guessed; many deaths go unreported for the reason already specified; but it is certainly not above 20-25 per 1,000—that is, about equivalent to the average death rate in Egypt. Nevertheless the refugees, in their poverty stricken condition, with their lowered resistance to disease, and low morale, remain "a public health menace of the first magnitude."

Since no authority, national or international, can continue relief indefinitely, the chances of work or settlement that are open or opening ought to be in every Arab mind. But they are not because the refugees, out of ignorance, and the Arab politicians, out of an obtuse belief in the possibility of collapse in Israel, are bent upon standing out for repatriation, come what may. So far, therefore, only negligible numbers have found what they consider to be a possible way of life. Of the plans so far made for self-help on a large scale, only two are worth mention. The larger is the Jordanian Government's scheme for using part of its £1,000,000 loan from Great Britain to convert the present extensive cultivation of cereals in the Jordan valley into intensive cultivation of early fruits and vegetables. Such a plan, for which there would be a perpetual market in Jerusalem and Tel Aviv, might enrich Jordanians as well as employing some of the practised vegetable growers who used to live in the Palestinian coastal plain. The smaller is a laudable scheme whereby Musa el Alami—the most broadminded and balanced of the former Palestinian Arab leaders—is using funds originally contributed to the Arab Office's "constructive scheme" for buying land to keep it out of Jewish hands in order to establish refugees in permanent homes in an area near Jericho.

Uncle's hands. Its officials estimate that a vote of a further \$6-8 million would enable them to carry on with relief till the end of March. But what then? Will the Arab governments by that time have accepted the proposals that Mr Clapp is expected to make for employment of the able bodied upon public works schemes financed at international expense? If so, some further two hundred thousand might shift and become candidates for absorption. If not, how are the United Nations to persuade the Arab temperament that wholesale return is impossible, that international aid is not eternal, and that to accept something that is second best is better than to lie down and die.

Western Union in the Field

[BY A MILITARY CORRESPONDENT]

DURING the first two weeks of October the British Army of the Rhine with the Royal Air Force, two Belgian brigades and units of the armies of the United States, France and Norway, carried out combined manoeuvres in the area around Paderborn. The exercise, appropriately called "Agility," was in two parts; the purpose of the first, to exercise the British armoured division and one Belgian brigade; the purpose of the second, to exercise the 2nd Infantry Division and the other Belgian brigade, each supported by armour.

During the manoeuvres, the troops practised the occupation of a defensive position, a night withdrawal, defence and counter-attack, and the attack from a defensive position. The 2nd Division's front varied from 4½ to 7 miles in rolling country which, with its woods and a few steep hillsides, occasionally forced tanks into defiles but contained no major tank obstacles. It is not difficult to estimate that, even if the Western Union countries have at the start of a war 30 divisions available to man their eastern frontiers, the frontage of most of these divisions will be nearer 25 miles. It was not surprising therefore to hear General de Lattre de Tassigny ask that BAOR should train on 25 mile fronts during the next year. But that was not a criticism of these exercises. It is doubtful if any division operating on such a front could, even for a short time, have held up an enemy equipped with armour in the country chosen for these manoeuvres. Moreover, a narrow front saves petrol and produces better lessons in night movement, concealment by day, battle procedure and staff work in co-operation of all arms.

These manoeuvres inevitably taught spectators, commanders and troops many purely military lessons, but they had a wider importance also which cannot have escaped the inter-Service Committee which is considering the future shape of the British armed forces. Co-operation between the army and the air force, co-operation between allies and the equipment and organisation of a British division were once again on trial. Co-operation between army and air seems to have lost nothing, save a little practice, since 1945, and the RAF is now better equipped with faster aircraft. The US armoured cavalry unit which took part in both parts of "Agility" received nothing but praise both for its dash and for its wholehearted co-operation.

Co-operation at unit level with our other allies is not so easy to attain because of language difficulties, but French and Belgian infantry attacked successfully with the support of British tanks, and the Norwegians worked well with an infantry brigade and the US armour.

But this co-operation on unit level was but a token of Western Union and Atlantic military unity. How much, one wondered, is going to be done and how soon, towards standardisation of equipment, supply and staff procedure? How much is the military thought, on which the occupation forces and reserves for the European theatre will be trained, to be led from Fontainebleau rather than from each individual War Office? Or is it to be led from Washington? Ultimately the success or failure of united defence rests on the degree of mutual confidence that exists between British,

American and French field commanders particularly, but also between commanders of all the forces of the participating countries. General de Lattre de Tassigny's presence at these manoeuvres was, therefore, important. What is his real status as Commander-in-Chief, Western Union Land Forces? Will he soon have authority to tell British and Belgian commanders how their training is to be conducted or their formations to be organised? At present there is no directive known to the public, and all seems to depend upon the relations between commanders, a strain upon them which they bear with a loyalty to several masters and a skill that their diplomatic colleagues might envy. On this particular occasion General de Lattre de Tassigny, if he arrived with some reservations about the tactics of a British infantry division, appeared to leave in an ecstasy of delight at the excellence of British armoured and infantry co-operation.

Most of the "Agility" exercises were carried out by infantry and armour in close co-operation. It is now difficult to imagine any operation in a war in Western Europe or in the Middle East in which infantry operate without tanks. The balance between infantry and armour will, it is believed, soon be adjusted in BAOR to give all the infantry full armoured support without interfering with the armoured division. But much, surely, has to be done to achieve the same balance in the British Army as a whole. Armour is expensive not only in tanks but in the high standard of mobility and communications that it demands for its co-operating arms. There is a need to look elsewhere for increased fire power, for swollen infantry sections of nine or ten men—which national service allows—may be wasted if more infantry weapons and more artillery than BAOR can boast are not to be available. If infantry must have armour, then it is probable that the numbers of tanks and skilled technicians, including wireless operators, and not the numbers of recruits and national servicemen, may form the limiting factor to the size of the really effective army which Britain can maintain.

Conscripts Well Trained

The importance of equipment emphasises the importance of the professional element in the army. Few national servicemen can be trained to fill many of the technical positions; for example, the grave shortage of wireless operators cannot be eased by them. Everywhere it was said that there are too few regular officers, N.C.O.s and men, too few to form an efficient mobile army, and too few to train the National Servicemen without overstraining their own limited strength.

Yet the national servicemen are clearly being well trained. These young men, some of them with only four months' service, form about seventy per cent of some fighting units. More than half the tanks on training were driven by them, and no tanks broke down in the presence of the spectators. But twelve months hence many tanks will have different crews and perhaps most infantry sections will have no more than two survivors with "Agility" experience. This imposes a great strain on the regular whose task it is to be both the schoolmaster to ever changing pupils and the competent battle leader with pride in his team.

The full effect of the national service scheme, as now organised on an eighteen months' basis, will not be felt until mid 1950, when the army will have lost the last national servicemen with more than eighteen months' service. It is fair to say, however, that even with the present number of regulars the national serviceman in Germany does not waste his time. It is harder to prophesy the effect that the continuation of the present scheme will have on the regular element; unless their number increases it seems their efficiency and their own incentive must decrease. This does not, however, constitute a sufficient reason for abandoning conscription of some kind. All the lessons of these manoeuvres went to show that some form of national service scheme must remain for some years if reserves are to be given that very necessary basic training.

THE BUSINESS WORLD

Cuts Without Policy

IN the long series of pronouncements on economic policy issued by the Government since 1947, none has been more perplexing and unsatisfactory than the Prime Minister's statement last Monday. The country had been warned to expect something unpleasant and was keyed up to receive it. It now feels let down by a statement so diffuse, so inadequate, and so fabian that the Chancellor's unpremeditated outburst at the time of devaluation about crises being followed by expedients has been given new meaning. The Chancellor of the Exchequer had his opportunity on Wednesday to rescue these grave matters from the level of commonplace. His performance, unhappily, was pedestrian and unconvincing.

There was a time in 1948 and even last April when economic policy was submitted to a sincere test whether it fitted the broad diagnosis of the state of the country's economic health. The wisdom of such tests is proved by the improvement in economic conditions in 1948. Disinflation did work: and an "overall" balance of payments was achieved. For several months past, all the evidence has pointed to rising inflationary pressure. Devaluation has worsened the terms of trade, and of itself has heightened the existing pressure. It has caused a wholly new situation in the balance of payments and major shifts of internal and external prices. The first starting point in any attempt to measure by how much the British economy is once again being distorted by inflation and by how much the total of expenditure needs to be cut is to do two sets of sums—first to recalculate the scale of new investment and the means by which it is being paid for, and secondly to discover what effect devaluation is having on the balance of payments. The first objection to this week's statements is that they lack even this foundation of factual data.

Such facts as there are show only too clearly the extent of the deterioration which has taken place since the Chancellor budgeted for his ordinary revenue surplus of £470 million last April. Those who thought that the "true" surplus, together with private savings, would be insufficient to finance the capital investment programme without further inflation have proved to be right. But quite apart from original miscalculations of the true savings which were required at the time, the plain fact is that the crude revenue surplus will not be nearly so great as the Chancellor expected. Soon after he set his face against any Supplementary Estimates, one was presented for £21 million, and there are additional bills to come in for defence, the health services, and to finance stocks at higher prices held by the trading departments. In short, the Chancellor has not kept his part of the bargain to fix Government expenditure at the level budgeted last April. So far as the investment programme can be measured, it appears to be running close to the intended level.

But apart from the Government's failure to provide its share towards financing this programme, there is clear evidence that personal savings, too, have not been making a sufficient contribution.

The second point is that devaluation, by altering the terms of trade, calls for a larger volume of exports to secure a given volume of imports. If these extra exports are to be found without inflation, domestic demand must be correspondingly reduced. A note on page 962 examines (in default of official estimates) the new arithmetic of the deficit. Such calculations have no absolute accuracy; the assumptions are wide and the quantities are constantly changing. But they are a more reliable guide to the adequacy of policy than the Chancellor seemed disposed to admit on Wednesday:

No one has ever imagined that the degree of inflation in our economy could be calculated or measured with mathematical accuracy. It is much more a matter of broad judgment than of calculation. . . .

The Government had made the best review that was possible, and the cuts announced by the Prime Minister on Monday were believed to be enough "to produce the conditions that we need for our renewed export drive." If the judgments were wrong, there was always the Budget "before very long."

But it is hardly necessary to wait as long as that to say, with positive certainty, that the measures proposed are wholly inadequate to get rid of inflation in the economy and to promote energetic salesmanship in the dollar markets. The total economies which are contemplated will, according to the Prime Minister, have a total disinflationary effect when in full operation of about £250 million a year. Some £140 million towards this sum is to be found from cuts in next year's investment programme, while reductions of Government expenditure, coupled with the increase of Profits Tax already announced, should produce "well over £100 million for next year's Budget." The rest is to come from savings on defence. It would have been possible to double this total saving without running any risk of driving the economy into a condition of deflation. The Government propose perhaps half of what is necessary to get back merely to the condition of last spring.

The Investment Programme

Sir Stafford Cripps's speech on Wednesday filled in some of the missing details about the investment programme. This is, in any case, a field in which the intention to cut is a very different thing from actual cutting. The autumn crisis of 1947 produced the same intention, but total investment in the following year in fact rose by £300 million. Perhaps the clearest way of setting down the intended cuts is to compare them with

the estimated rates of fixed investment given in the "Economic Survey" for 1949:—

ESTIMATED GROSS FIXED INVESTMENT, UK (£ Million)		
	1949 Econ. Survey Estimate	1950 Proposed Cuts
Fuel and power.....	220	25
Transport, communications and shipping.....	360	10
Agriculture.....	95	25
Other industries.....	450	
Houses (including repairs).....	420	35
Other social services.....	105	8½
Defence and administration.....	70	...
Northern Ireland.....	35	...
Miscellaneous investment.....	370	35
	2,125	140

It is something that industrial investment has not been treated on a basis of less eligibility, though it is true that aggregate reductions of "not more than 4 or 5 per cent" which are proposed should produce £25 million, which is far from negligible. Once again, the 1947 doctrine has emerged that plant and machinery must be diverted to hard currency markets. How is "some curtailment in our use of these goods in the home market and the removal of some pressure of demand" to be translated into effective policy? Of the £25 million to be cut from fuel and power, electricity (estimated at £115 million this year out of the total of £220 million) takes the biggest reduction. The main blow will be felt by distribution. It was explained by the Chancellor in terms which suggest that the original plans were themselves adrift:

We cannot afford to provide new supplies of electricity as rapidly as we would have liked, and some check must be imposed on the rate at which new connections are made and schemes of rural electrification are implemented. With the present shortage of generating plant, it is in any case undesirable for the industry to take on heavier and heavier consumption loads, which are bound to aggravate the problem of closing the gap between demand and capacity.

Gas is forbidden to make a start on the improvement of supplies and the lowering of costs; since "these schemes would not in any case have matured for a very considerable time" the conclusion appears to be that the Government was over-hasty in nationalising an industry to which it now denies hope of any immediate improvement. The oil refining programme is largely spared, on the ground that it promises a "quick and substantial saving in dollars"—which in the short-run, at any rate, is open to argument.

In transport and communications, a saving of £10 million is looked for. Once again, an attempt is to be made to divert into the export market a large number of passenger and goods vehicles that are now entering the home market. This was proposed in 1948 and failed; it was proposed again for 1949 (to effect a total cut of £20 million) and is still failing. By what means is the diversion to be secured in 1950?

It is perhaps on the proposed housing programme that the greatest doubts arise about intentions and performance in 1950. In 1948, the modest cut proposed was quickly forgotten. In 1950, perhaps, the proposed cut may be more effective because it is deliberately aimed at private building and leaves the local authorities' programmes to proceed without substantial reduction. The reduction of investment which is intended amounts to £35 million, and will mean "during the course of next year" a reduction in houses under construction from

200,000 to 175,000. This is capable of producing a sensible degree of unemployment in the building trades, and the test of the Government's intentions (or of the strength of the Government which succeeds the present administration, for that is the one which will be involved) will be its reaction to the cries of an industry which has more manpower than can be justified either by its efficiency or by the needs of the economy as a whole.

There remains, finally, a sweeping cut of £35 million in "miscellaneous investment." This is perhaps the most doubtful of all the items in the 1950 programme. Much of this miscellaneous total consists of repair work, not at present subject to building control, and never very effectively controlled when the exemption limit was lower. In the Chancellor's view, this is "less essential work," and resources must not be allowed to move indiscriminately into this field. Once again, therefore, the volume of miscellaneous building work is to be "kept within bounds" by tighter controls and a lowering of the exemption limits.

What is the total effect of these cuts in the investment programme? Whatever it is, its impact on the economy will not be felt until quite late next year. "Early results should be obtained where machinery and vehicles are being diverted to the export market." But of the machinery which would compel such diversions, or the economic pulls which might attract them, nothing was said. Over much of the field, only a gradual reduction at best will be possible. And past experience has shown that before a reduction in capital expenditure becomes translated from plan into fact, the surrounding circumstances which ordered the plan have themselves changed out of recognition. It is impossible to put great faith in capital investment which are proposed. To accept them as a reliable forecast of a reduced pressure on resources even in twelve months' time is to ignore all the lessons of past experience.

Government Savings

If the investment programme is unconvincing, the reductions in the Government's non-capital expenditure are plainly inadequate. That conclusion stems inevitably from the area of action which the Chancellor permitted himself—not to injure the main scope of the social services or impose any major reduction of the food subsidies. Given such limitations, it is quite obvious that economies could only be confined to trimming the odd frills from a range of miscellaneous Government activities. Savings on these less essential services are put at between £40 and £45 million a year—which, for practical purposes, means the financial year ending in April, 1951. Some £6,000,000 will be saved by the Ministry of Supply—"this widely-spreading Ministry"—and £1,750,000 by the Ministry of Food. And so the total is built up by a process of departmental snipping, which suggests that much more could be done with a greater will. Curtailments of information services, a penny on school meals, the postponement of de-requisitioning in order to save on building new accommodation for the Ministries, the raising of the qualifying acreage to rank for potato acreage payments—these are some of the examples which the Chancellor quoted.

The second group of measures do involve changes in policy. They are expected to produce £53 million, of which the bulk will come from the ending of

the subsidy on animal feeding stuffs yielding £36 million. The shilling prescription under the Health Service (if a token charge is now admitted, why not also for spectacles and dentures?) should produce £10 million; and increases in food prices will save £7,000,000 from the subsidies. The third class of saving is on defence, where £12½ million is to be found in the present financial year and £30 million in the next.

No estimate is offered of the effect of all these savings on the current year's budget. In terms of disinflationary policy, therefore, they are largely notional savings, of which the true effect cannot be calculated until next year's budget is under review. It is, of course, impossible to make changes in capital or Government expenditure quickly. To produce a quick effect, it is necessary to do what the Government have so obviously shrunk from doing—to propose cuts in expenditure which, even though their full effect is inevitably delayed to some future date, produce in the present a sense of urgency and shock which is capable of making the private sector of the economy behave as the Government would wish. As it is, Sir Stafford's claim that "it will be no less necessary for the private individual to exercise a control, too, or all the good that can be done by the Government economies would be countered and negated by the action of private individuals" merely becomes fatuous, for the Government's economies are inadequate and putative.

Imports and the Balances

Equal confusion arises about the dollar import programme. Last July, the Chancellor announced that the anticipated programme of dollar imports (apparently for the year from mid-1949 to mid-1950) was to be cut to \$1,200 million. That rate was confirmed by the Prime Minister on Monday (though it now appears to refer to 1950). In July, a standstill on new dollar expenditure was imposed, but despite this fact and because of a great increase in dollar imports in the second quarter which had to be paid for in the third quarter, the total of dollar imports for 1949-50 is expected to reach \$1,400 million, instead of the intended \$1,200 million. Here is a good illustration of the fallacy of salvation by import cuts. First, the cuts are simply not being achieved, and the Chancellor's repeated intention on Wednesday that "we should be down to \$600 million in the first six months of 1950" is, in the light of past experience, no guarantee that this will in fact happen. Even so, to put the dollar import programme as high as \$1,200 million a year involves, as the Chancellor recognised, taking a risk about the growth of dollar exports. Even with Marshall Aid, dollar earnings are insufficient to cover this programme of bare necessities.

The cut in British dollar imports was paraded last July as a specific contribution which Britain would make, in concert with the other Commonwealth countries. If it is now clear that British intentions have not yet been fully borne out by achievement, it is doubtful, too, whether the cuts which were then hoped for from the leading sterling countries are being realised. Devaluation has called for a recalculation of sterling area arithmetic and sterling area policy, but of this there was no sign in the Chancellor's speech, except in his reference to the grievous difficulty which is now being caused by an unduly generous release of the sterling balances in the past. Admittedly, the Chancellor did not put

the problem of the balances in those terms, but he did most specifically distinguish for the first time between the reserves which the sterling area countries need to keep in London to meet their current and future needs and the "special considerations" which arise in the case of the wartime sterling balances. Unfortunately, this distinction is too belated to be translated into quick and effective action. It is only a few months since generous releases from the wartime balances were agreed with India and Egypt; and it is a mere matter of weeks since the Chancellor observed that nothing could be done about the sterling releases until the middle of next year. Yet, at one point in his speech, he was prepared to hope that some of the necessary increase in exports to the dollar countries may come from unrequited exports. How can this possibly be so, if investment in the Colonies (which absorbs unrequited exports of capital goods) must be maintained, and if nothing can be done, in the next nine months at least, to reduce the demand for exports which has been generated by this year's agreed releases from the sterling balances? The acceptance of the principle of differentiation takes the problem of the balances very little further at present.

There remain for consideration the domestic consequences of the new programme. The Chancellor claimed that he had been very moderate in meeting the claim of the worker that some of the burden imposed by devaluation should be borne by the profit earner. He described as a fallacy the argument that the raising of the tax on distributed profits would act as a disincentive in the export drive, but the entrepreneur who is being exhorted to increase his production or to undertake the risks of opening up new markets in the dollar countries is unlikely to see the matter quite in this light. Indeed, the whole question of incentive was left aside by the Chancellor. If increases in wages are to be limited to "very low-paid workers" (which admittedly is most improbable) where is the incentive to the craftsman? What kind of response can the Chancellor really expect from an appeal to management to consider whether it cannot help the national economy by "a sustained policy of lower prices rather than by the maintenance of a high level of prices"? This is really as much out of touch with the reality of the market as the decision to suspend bonus issues is out of touch with economic facts. Similarly, although the Chancellor concluded that on balance there was no advantage in raising short-term rates, he left for answer the further question whether the Government are prepared to make an ally of interest rates, instead of trying vainly to suppress their effects. How otherwise can the banks be expected to interpret the Chancellor's request that "inflationary pressures should be held in check"?

What is the conclusion of the exercise which the Chancellor set himself, within so rigid a framework of policy? His own words are sufficiently reserved to justify all the doubt which has been cast on the adequacy of the programme:

It is, I believe, enough, but no more than enough, to create a favourable climate in which we can work. It will cause difficulties and hardships in many quarters but we have done our best while preserving the necessary volume of cuts to make them as little painful as possible. These economies like devaluation, are not in themselves any remedy for our difficulties. . . . They are the passive conditions and not the dynamic energy that will win through our difficulties.

This is true. Where then is the dynamism? How is it possible to rely on asking people to work harder, to export more, to reduce their prices, unless the condition of the economy is itself brought into the right shape to make these things possible? What changes in the total of employment and its distribution are required? What shifts in prices and wages and profits are needed? On this Sir Stafford was completely silent, except in a passage, self-evident to all but his own followers, that full employment did not mean that an individual could be guaranteed his particular job or even his particular trade.

Business Notes

Four per cent

The Cabinet's half-hearted crisis proposals have left the city in a distrustful mood, most evident in the gilt-edged market. None of the imagined new blows against investment have eventuated, except curiously enough a ban on bonus issues which few had expected. But any sense of relief for this reprieve has rapidly given way to grave misgivings on the adequacy of the proposals to curb inflation and reduce costs. The quietude of Tuesday's reflective markets, proved to be merely a lull before the storm. On Wednesday the gilt-edged market was well and truly in the toils with losses of up to 2 points, and next day its discomfiture was nearly as acute.

* To earliest date. † Shorts and middles to earliest date, others to latest date.
‡ To latest date. § Flat yield.

Selling has been fairly heavy, without perhaps recalling quite the proportions of late June. Yet the institutions have apparently contributed little to it. Weakness is most pronounced in the long dated and irredeemable stocks, and here private and industrial sales have predominated. Refuge has again been sought in the "shorts," but only the very earliest dates have sufficed to meet the urgent quest for liquidity. Certainly the middle dated issues have failed to pass the test of a safe haven. In particular the vulnerability of 4 per cent Consols (redeemable at the earliest in 1957) and 4 per cent Funding 1960-90 has been exposed. A yield of £3 19s. 11d. per cent on 4 per cent Consols signals a new stage in gilt-edged calculations. The present downward movement has thus reached the point at which 4 per cent Consols are following 3½ per cent War Loan 1952 into the ranks of the "undated," proclaiming the reality of a 4 per cent long term interest rate.

This tentative and half-hearted piece of "planning," which brings out for an airing all the old clichés which have done service since 1947 and all the proposals which past experience has shown not to work, cannot be accepted as a realistic contribution towards solving the country's difficulties. A Government which lacks the courage to do any better than this has no right to expect that the country will repose any trust in the central direction of economic affairs. The responsibilities of the next six months are too great to make this week's proposals acceptable as a serious contribution towards their solution.

Bear covering of industrial issues was a natural sequel to Monday's innocuous announcement. The fear of repressive measures on profits and capital such as a much higher profits tax, a capital gains tax, increased stamp duty and even a capital levy, had been acute last week, when prices receded to their lowest levels since the June crisis. Tuesday's recovery was therefore sharp, but the mid-week slump in gilt-edged exerted its inevitable downward pull on equities in general. Kaffir shares were the only group to show appreciation of the Prime Minister, for here the spectre of a capital gains tax has departed—at least for the moment—and the expected new wages demands on the Rand have not yet crystallised.

How Big is the External Deficit?

Among the many vital omissions from this week's speeches by Mr Attlee and Sir Stafford Cripps, by far the most glaring was the absence of any estimate of the size of Britain's overseas deficit. The missing figure is the natural starting-point for any statistical diagnosis of the malady for which the new measures are the Government's sole prescription. Moreover, the omission becomes the more flagrant when it is realised that the rate of deficit in the pre-devaluation phase was many times the tiny balance disclosed (for the first half of this year) in a White Paper released only a fortnight ago. Obviously, the doctors are anxious to avoid telling the patient too much; and, in the circumstances, whether intentionally or not, they may have actually misled him. Admittedly, comprehensive estimates of the balance of payments cannot be made without an appreciable time-lag, but in view of the big swing which has occurred in the balance during the course of this year, it was surely the Government's plain duty to make the best guess it could of the position on the eve of devaluation, and then to make a further guess of the impact effects of devaluation itself. The fact that any estimates may be falsified by later data is no excuse for not revealing the guesses which must have been made if the policies about which the Cabinet wrangled last week had any rational foundation at all.

The Balance of Payments White Paper covering the first half of the year, it will be recalled, disclosed an "overall" deficit of no more than £10 million. But this apparently reassuring result concealed the marked deterioration which occurred between the first and second quarters of the year. The figures for visible trade given in the White Paper can be roughly broken down into quarterly periods by adjusting the quarterly totals from the trade returns by percentages equal to the differences between the half-year's totals from those returns and from the White Paper. This adjustment allows for the change from c.i.f. to f.o.b. valuation for imports (14.9 per cent difference) and for the different definition of exports (1.7 per cent). On this basis the visible deficit of £48 million in the first half of the year, given in

the White Paper, would be made up of a visible surplus of just under £9,000,000 in the first quarter and a visible deficit of just under £57 million in the second quarter. By coincidence, a similar calculation for the third quarter gives virtually the same result as that for the second. Thus, as between the first three months of the year and the ensuing six months, there was a swing, expressed in terms of annual rates, from an overall surplus of about £35 million to a deficit of no less than £227 million.

The invisible account, unfortunately, cannot be either estimated or apportioned on any such rational basis; and, as between quarters, there may also be strong seasonal variations—notably, of course, in tourism. But, for the present purpose, no attempt need be made to guess the seasonal changes, since what is required is an average annual rate, not the seasonally distorted annual rate of a particular quarter. After excluding the net effect of special capital transactions with India from the figures given in the White Paper, and roughly apportioning the remainder between quarters—in line with the trend shown by the official figures over a period of eighteen months—the net invisible credits received in the first and second quarters of the year might be put at £28 million and £20 million respectively. On such a basis there would have been an overall surplus at an annual rate of about £147 million in the first quarter, but an almost equivalent annual rate of deficit in the second quarter. If invisible credits for the third quarter are taken as the same as in the second (i.e. ignoring, in effect, the seasonal change in tourism), this would mean that in the six months before devaluation the overall balance was running at an average annual rate of £130 to £140 million in deficit.

This is a very marked contrast from the latest available official figure—the £10 million deficit for the first half-year, or an annual rate of £20 million; yet in his speech on Wednesday Sir Stafford Cripps merely remarked that "there is not at present an overall balance." Moreover, the present position must certainly be very much worse than that on devaluation eve. If the transitory effects of the covering of short positions in sterling goods are ignored, the immediate effect of devaluation was to increase the gap by worsening the terms of trade. Obviously, there is no means by which the extent of this deterioration can be reliably estimated. But if account is taken not only of the loss on hard currency proceeds from existing exports but of the increase in prices which has occurred (in terms of local currency or in sterling) in supplying countries which have also devalued, it becomes clear that the additional strain on Britain's position must have been very substantial. A conservative estimate might put it at £100 million a year at present prices, without taking account of such special possibilities as those inherent, for example, in Argentina's demands under the meat contract. If this is so, the deficit might now be running at an annual rate of perhaps £250 million, while on similar assumptions the corresponding actual deficit for the calendar year 1949 would be about £100 million.

No Stiffening of Short-Term Rates

Sir Stafford Cripps's statement about the future of short money rates should set at rest such doubts as had been raised by recent discussions in banking circles. The Chancellor said:—

Many people are concerned on the question of the credit policy that is now being followed and the possibility that the whole of our policies of disinflation may be frustrated by inflationary credit. I have carefully considered the question of short-term money rates. . . . I have reached the conclusion that in present circumstances, and on the balance of considerations, there is no advantage to be gained by raising the short-term money rates.

Although many—but by no means all—advocates of a rise

in interest rates believe that this should extend to the whole structure of rates and, in particular, should embrace the banks' rates for advances, the question of short-term money rates, strictly so-called, has not been a matter of acute controversy. It is recognised that medium and long-term rates of interest can rise substantially (as, indeed, they have already done) without necessitating any change in the rates at which floating debt is placed in a strictly professional market. Partly for this reason, the Chancellor's announcement had no discernible effect either in the bond market or the discount market. Short bonds, which recently have been virtually immune from the heavy pressure encountered in the rest of the gilt-edged market, remained steady. Indeed, since the Chancellor's assurance did not extend beyond the sphere of money rates, it seems possible, given present uncertainties, that the switching process from medium and long-dated securities into shorts may proceed a good deal further.

This demand for shorts lends added point to a suggestion made recently by the chairman of one of the discount companies—Mr G. M. B. Portman, of Allen, Harvey and Ross—that it might be advantageous "to all parties" if the Treasury's preference for bonds with an optional maturity date were diluted in future operations by bonds carrying a single redemption date. This proposal, of obvious interest to Lombard Street, at least merits consideration, since it might give added flexibility to the whole bond market structure. Since the technical mobility of this market now depends very largely upon the activities of the discount houses, any development which reduces the bond-carrying capacity of Lombard Street or makes dealers there more reluctant to absorb bonds in times of selling pressure is, in principle, undesirable. It appears that, except for times when the trend of the market is plainly "one way" and seems well founded, a preponderance of "double-dated" bonds does have disturbing effects of this kind, since uncertainty about the effective life of very short bonds raises disproportionately the risk of loss (or profit) to the professional dealer.

Control of Bank Advances

The speed with which the Government is preparing to tighten up its various devices of physical and directional control is perhaps the clearest indication of its awareness of the insufficiency of its disinflationary measures. The first instalment of these new directives is, however, relatively innocuous. It takes the form of a new request by the Chancellor to the Governor of the Bank of England, asking him to impress upon the banks and accepting houses the importance of their co-operation in resisting inflation and requesting them, "in their credit policy to use every endeavour to ensure that inflationary pressures are held in check." On this occasion the text of the correspondence between the Chancellor and Governor has been published, and reveals that Sir Stafford Cripps when writing to the Governor was no more specific on this matter than in his speech in Parliament.

The only definite request is the one quoted above, and no indication is given of how the authorities wish it to be construed. It will be read by the banks, however, in conjunction with earlier requests the precise terms of which have not been made public. It is known, however, that apart from requesting the banks to observe, in their lending operations, the same principles as those followed by the Capital Issues Committee, the authorities have drawn particular attention to the need to avoid any lendings which might encourage speculation—notably in commodities, shares, or real estate. As there is no reason to suppose that any of the big banks has been other than punctilious in observing these earlier requests, it is improbable that this new and vague exhortation will have any significant effects. It certainly does not rule out any category of advances which

has been legitimate and eligible hitherto—though it is conceivable that it may lead to a slightly more stringent treatment of the border-line cases which are bound to arise under any system of control such as this.

Action on the Balances?

The Chancellor of the Exchequer, in his speech last Wednesday, gave notice to Britain's sterling creditors that they must expect less generous treatment in the release of their sterling balances than they have received in the past. This is welcome news, but its like has been heard before, and hopes built on it have been disappointed. Sir Stafford Cripps stressing the obvious, explained that the release of these sterling balances "added to the inflationary pressure in Britain just as much as did internal expenditures." He added that Britain could not afford unrequited exports on the recent scale and hence could not continue to make releases from the accumulated sterling balances to the same extent as previously. These assurances were, however, shot through with considerable reservations. Any edge which the warning to the creditors might have was immediately blunted by the assertion that

we must retain a sense of proportion and responsibility. Though we are anxious about our own position, we are also most anxious as to the general world situation and particularly that of some of the large, less developed areas which should be able to contribute much more than they do to their own support.

The Chancellor, therefore, pointed out that the ban on overseas loans would not apply to Colonial development. Even on the problem of the sterling balances the Chancellor went out of his way to pull his punch by explaining that "the very nature of the sterling area's system is that its members should be able to draw on the reserves which they keep with us in sterling when they are in need." Sir Stafford went on to point out that the wartime accumulations of sterling balances deserved special consideration and that releases would have to be reduced when such agreements came up for reconsideration.

The creditors have been warned. It remains to be seen how the intentions of the Chancellor will survive the inevitable horse trading which develops in these bilateral negotiations. The time has perhaps arrived when third parties should be brought into these discussions. They might include the other members of the sterling area. They are highly interested parties, since any undue perference shown to one redounds to the detriment, not only of Britain, but of the other members of the sterling club. The United States also are not without considerable direct interest in the matter, since a substantial part of the assistance they are giving to Britain is in fact canalised to other members of the sterling area through the releases of sterling balances. The problem of the balances was raised in the recent triangular talks in Washington and was remitted for further study to a special committee of British, American and Canadian representatives. This is one of the offshoots of the Washington meeting to whose work and recommendations the highest priority should be given.

★ ★ ★

Bonus Issues Ban

The only "swipe at the rich," if it can be so called, in this week's unfolding of economic policy is the ban on bonus issues. "In the light of existing circumstances and to avoid abuse and misunderstanding," the Chancellor has asked the Capital Issues Committee to suspend for the time being all applications for permission to make bonus issues. This reply was the more remarkable because it was given in answer to a question which concerned itself not with the general question of bonus issues but with the particular question whether they were being exploited as a means of evading

dividend limitation through the issue of bonus preference shares. A few examples of this not very sensible but not very venial practice have recently come to light. But as the Chancellor pointed out, the issue of preference bonus shares would not necessarily imply a breach in the principle of dividend limitation "which is, at present, a voluntary scheme which covers bonus issues as well as existing capital."

From this rather narrow point of technique, the Chancellor proceeded to lay down the general ban. It is, of course, illogical and purely a sop to political sentimentality. But because some of his followers do not understand these matters, is there any excuse for the Chancellor himself to darken counsel by referring to "the capitalisation of huge profits and their distribution as bonus shares to shareholders"? The orderly relating of issued capital to real capital invested in the business is of no more than bookkeeping importance, whatever the critics of the left may say, and whatever excitement may be aroused in the breast of the less expert shareholder when a bonus is in prospect. In plain fact, Boots this week are in no way inferior because a bonus is now ruled out; and Woolworth, whose bonus was agreed almost at the last minute, is in no way superior.

The ban, it should be understood, relates only to free bonus issues. For issues on "bonus terms," the CIC will continue to pass judgment as it has been doing and no change in its immediate view on what constitutes a reasonable "bonus element" is to be expected. The worst thing that could happen is a return to the artificial notions on this question which so impeded the proper working of the capital market two or three years ago. Fortunately, that, at least, does not seem to be intended. Nor does the ban apply to bonus issues of less than £50,000.

★ ★ ★

Oil Prices Raised

The Ministry of Fuel and Power have at length announced the increases in oil prices which have been expected since devaluation. They came into operation last Tuesday, except for the new bunker prices which take effect on November 1st. As the accompanying table shows, the full effects of devaluation have not been passed on to the consumer. The difference between the old prices and the new maximum prices shown in the second column gives the full reflection of the change in the dollar-sterling rate. But the Ministry has asked the oil companies to charge a price in all cases slightly lower than the maximum which devaluation would justify:—

PRICE PER GALLON FOR BULK DELIVERY IN INNER DELIVERY ZONES

	Old Price	New Maximum	Actual Price
Motor spirit (bulk).....	s. d. 1 9	s. d. 2 0½	s. d. 1 11½
Motor spirit (ex pump).....	2 0½	2 3½	2 3
Diesel oil for road vehicles (Derv.).....	1 6½	1 8½	1 8½
White spirit (London zone).....	1 10½	2 2½	2 1½
Kerosene:—			
Burning oil, paraffin oil—ordinary grade	19s.	1 1½	1 0½
Superior grade.....	1 0½	1 3	1 1½
Vapourising oil.....	11½	1 2	1 1½
Gas oil:—Diesel oil.....	9½	11½	11½
Fuel oil.....	7½	9½	8½
Heavy fuel oil.....	7½	8½	8½
Aviation spirit (100 octane).....	2 3	2 8½	2 8

For some months, discussions have been going on between the Ministry and the oil companies about the amount which could fairly be included in the selling price of oil products to cover the cost of distribution. The official view seems to be that distribution costs have fallen sufficiently to justify some slight reduction in prices to the consumer. The oil companies are prepared to admit that distribution costs show some difference as between companies, but they do not agree that the differences are large enough to justify a general price reduction. The talks are still in progress, but the Ministry appears to have anticipated their conclusion by

choosing this moment to impose by request what amounts to a net price reduction.

It will bring little comfort to the consumer. Fuel represents 40 per cent of the total operating costs of an oil-burning ship, and at least 25 per cent of the operating costs of an airline. The new bunker prices, 112s. 6d. a ton for fuel oil, 172s. a ton for marine diesel oil and 208s. a ton for gas oil, represent a 40 per cent price increase, enough to offset the advantages of oil-burning ships over coal-burners. For such a large airline as B.O.A.C. the increased price of aviation spirit will add roughly £750,000 to operating costs in a full year. This extra burden, together with the increased landing and other charges incurred in dollar countries, will go a long way towards offsetting any advantages the airlines might have gained from devaluation. The cost of fuel in road transport operation represents a less significant proportion of total operating costs; there has been some murmur that the extra cost may have to be passed on to the consumer, but in terms of costs per passenger mile or per ton mile it is not heavy.

There seems to be little fear that higher oil prices will lead to any reduction in demand. The possible exception is fuel oil—certain types of oil-burning equipment could be altered to use coal or some other form of energy, if oil should now be regarded as too dear. But in general the raising of oil prices is a valid adjustment of prices which have hitherto been too low, because of an artificial dollar exchange rate which was, until September 18th, too high.

★ ★ ★

Improvement in Exports

The improvement in Britain's overseas trade in September was analysed in these columns two weeks ago. Exports rose by nearly £5,000,000 to £142 million, the daily rate during September being 3½ per cent higher than in August and slightly above that for July. The trend in the value of exports during the past year can be seen from the following table, which recalculates the individual monthly totals on the notional basis that each month has 26 working days.

BRITISH EXPORTS					
Monthly rates, assuming 26 working days.					
	£ mn.		£ mn.		£ mn.
Sept. 1948	... 131	Jan. 1949	... 159	May 1949	... 151½
Oct. "	... 140	Feb. "	... 152½	June "	... 155
Nov. "	... 147	Mar. "	... 154	July "	... 141½
Dec. "	... 151½	Apr. "	... 149	Aug. "	... 137
				Sept. "	... 142

The recovery which took place last month was largely seasonal at the end of the holiday period. What has now to be seen is the effect of the devaluation of sterling as a stimulant to exports by the end of the year. The volume of exports in September has been provisionally estimated at 144 per cent of the 1938 level compared with 138 per cent in August and 143 per cent in July. The quarterly average has declined since the beginning of year from 156 per cent in the first three months to 146 per cent in the second and 142 per cent in the third. The September figure at least holds out the possibility that this downward trend is in process of being reversed.

Exports of most of the main groups of manufactures increased during the month. The vehicle group rose by over £1,000,000 to £24.4 million, thanks to a record shipment of cars and chassis totalling 24,590 units. The number of commercial vehicles sent abroad was exceeded only in May of this year. Exports of machinery increased by £900,000 to £23 million. Textiles, on the other hand, showed a surprising drop. Cotton goods at £12 million were £1,000,000 lower than in August and were the poorest for nearly a year, while wool goods fell by £500,000 to £8,000,000, the lowest figure since June, 1948. Shipments of coal and oils and fats increased and there was a sharp rise in refined sugar.

Imports in September were valued at £181 million or £19

million less than in August. Imports of grain, dairy produce, fruit and vegetables were substantially smaller, while meat imports were well maintained. Arrivals of tobacco, however, increased by nearly £7,000,000 to £9,700,000. Imports of all categories of raw materials declined. Owing to the smaller imports, the adverse balance of trade fell to £35½ million in September—the lowest figure since last March.

★ ★ ★

Steel for Cars

The motor industry's steel allocation is to be increased next quarter on the understanding that the extra steel will go to those manufacturers who can use it to increase their sales in hard currency markets. At present the industry is producing at the rate of over 400,000 private cars a year. Shortage of plant limits the amount of sheet steel which can be produced at home, and if more cars are to be built, additional sheet steel must be obtained from the only country with an export surplus—the United States. In the first nine months of this year, 15,098 tons of steel sheet have been imported and were allocated to those manufacturers whose exports have gone well. This is enough sheet to make 30,000 cars. Recent discussions between the Ministry of Supply and the motor industry have turned on whether the industry can be sure of earning more dollars than have to be spent on importing American sheet.

It is not easy for the industry to give such an assurance. If the export quota of 75 per cent of total output had been rigidly observed, only 100,000 cars would have been sold on the home market this year; the actual figures will be nearer 150,000. During the early summer, when hard currency buyers waited for devaluation and the soft currency markets imposed import restrictions, many cars intended for export were diverted to the home market. The quota system proved unworkable, as it had in 1948.

It will be even more difficult to enforce any discrimination of shipments between hard and soft currency markets. For some months ahead, the prospects should be good. Several hundred cars a week are being sent to the United States, although few manufacturers would care to speculate on how long this will last. Canada is now importing well over 2,000 cars a month, and in the first nine months of the year bought nearly 15,500. South Africa imported more than 600 cars in September, and is soon expected to modify its restrictions on imports. But it is not easy to make the industry cut supplies to the home market, reduce deliveries to soft currency markets, and concentrate its energies on the hard currency countries. Moreover, it seems to be the fact that the discrimination in steel allocations between firms exporting to hard and to soft currency markets is intended to apply to all steel, and not only to the dollar element in supplies. This revives a notion with which the Minister of Supply has flirted before. It is unlikely to work, and it will produce only friction and abuse. In practice, such a system would put half the manufacturers out of business. The industry's prices depend on a large volume of production and its stability on a large number of markets. The success of the scheme depends on getting more sheet steel from America. Is this quite certain, in view of the American steel strike and the high level of demand from the American automobile industry?

★ ★ ★

Australia and the Fund

The announcement this week that the International Monetary Fund has agreed to an initial purchase by Australia of \$20 million from the fund (which is \$30 million less than the maximum annual drawing which the Commonwealth quota permits) raises two points of special interest. In the first place, it puts an end to the rumour that the Fund was to extend its ban on dollar drawings by E.R.P. countries to drawings by nations participating in the sterling area

dollar pool (in effect, to Australia and India, since New Zealand and Pakistan are still not members of the Fund). Such a ban would have been illogical in any case. In the second place, it raises the question of how Australia has convinced the Fund that its dollar deficit is the result of a "short term disequilibrium," for the financing of which drawings from the Fund are reserved. Australia has always had a dollar deficit and, since the war, despite the growth of a considerable active balance with other countries, this deficit has increased largely because of the expansion of Australian secondary industry.

Apart from a few basic items such as oil, tobacco, films and newsprint, most of Australia's imports from the dollar area consist of capital equipment and industrial raw materials. So many licences were already outstanding for these latter that Mr Chifley had already announced that the full 25 per cent cut in Australia's dollar imports, agreed upon at the London conference, could not be carried through in 1949-50. It is charitable to assume that Mr Chifley's recent statement (that this drawing from the Fund is an "alternative" to the cut in dollar imports) means that it is a device to allow the contractual cut in dollar drawings from the sterling area pool to be carried through this year after all. If Australia has justified its plea to the Fund by arguments of this sort, it will still have to carry through the cut next year, which will entail a reduction in the rate of high cost industrial production. But the Australian Labour Party's sensitiveness to any suggestion of "international financial control" (a sensitiveness which even delayed Australia's entry into the Fund itself until March, 1947) may mean that the world will have to wait some time before it knows whether any such bargain has been struck.

* * *

Trading in Tin

The Government seems determined to win both on the swings and on the roundabouts in its tin dealings before handing over to private trading on November 15th. Last July the Ministry of Supply agreed, after much heart-searching, to fix the domestic selling prices for non-ferrous metals at levels equivalent to "world prices"—that is equivalent to those ruling in the New York market. It was shrewd—or fortunate—enough to choose a moment when American prices were on the point of recovering, and thus it turned the change of policy to good account in its own trading results. After sterling was devalued, the Ministry duly raised its selling price for tin in this country from £569 to £750 a ton, and reduced its selling price in New York from 103 cents a lb. to 95 cents. Until this week, however, the Ministry had kept silent about the price it was prepared to pay to producers. Now the Ministry has stated that Malayan smelters will get the benefit of the new price—during the period since devaluation and until the metal market reopens on November 15th—only when the Ministry's purchases are matched by sales. To the extent that the Ministry's purchases go into stock, they will be paid for at the pre-devaluation price of £553 10s. a ton.

Smelters will apparently receive £728 a ton—the current selling price is £739 a ton ex-smelter at Penang and Singapore, and the difference is to cover the Ministry's warehousing costs. Until the final price realised by the Ministry's sales is determined, an interim payment to producers of only 80 per cent of the agreed purchase price will be made. The Ministry's new policy is thus to act as a commission agent, and to limit its risks. But producers have no alternative but to sell to the Ministry. Buyers are firmly convinced that when the market is reopened the price will be much lower than £750 a ton and are holding back, so that most of the Ministry's purchases will go to stock. The Ministry of Supply is justified in trying to reduce its losses but the principles it is pursuing are wrong. It has raised the selling price for tin to a level which purchasers are plainly not prepared to pay, unless their demands must be

met immediately despite the cost. Its interest is clearly to dispose of its stocks at a handsome profit, and in doing so it shows no great concern for the interests of producers.

When the London tin market reopens in a fortnight's time, dealings in copper, lead and zinc will remain in Government hands. Trading in tin will, of course, be subject to exchange control but there will be no export licensing. Buyers within the market will be able to import tin freely under open general licence. A minimum contract for five tons will be in force to prevent speculation; five tons at the current price would require an investment of £3,750. The international tin allocation scheme though still officially in operation, is unlikely to limit the market.

If the new tin market is to have any chance to function properly, it must, at least for the time being, remain unhampered by any form of output or price restrictions. Many months will be bound to elapse before the market can expect to function smoothly. Any discussion on international control at this stage is academic at best, and at worst damaging to the whole conception of what a free market should mean.

Shorter Notes

In a written reply to a parliamentary question Sir Stafford Cripps stated this week that there had been no sales of gold shares by the Government since September 19th, apart from shares held by the Exchange Equalisation Account, "the transactions of which it would be contrary to the public interest to disclose."

*

The minimum wage rates of African (native) labour working in the mines of the Transvaal Chamber of Mines have been increased by 3d. per shift for underground workers and 2d. per shift for surface workers. The African Mine workers are pressing for a 30 per cent increase in basic wage rates and it is also the intention of the South African Mineworkers' Union to solicit a further 15 per cent increase in basic wages and the introduction of a 40-hour week.

*

Coal output last week totalled 4,398,700 tons, 56,000 tons more than in the week before. By October 15th, the number of men on the colliery books had fallen to 710,600, some 2,000 fewer than at the beginning of the month. The labour situation is not so serious as these figures might suggest, because the number of face workers has remained fairly steady. Total output for the first 42 weeks of the year is now 171,836,700 tons. Of this total, 161,496,600 tons is deep mined coal, a little over 4,000,000 tons more than was produced in the same period of 1948.

*

Tea prices in the Colombo market recovered this week and increased by between 2d. and 4d. a lb. After devaluation prices rose by as much as 6d. a lb. under pressure of renewed American buying. But this high level was not maintained. Buyers from the sterling area, who provide the major support to the market, found prices too high and reduced their purchases. Prices, accordingly fell back to approximately the pre-devaluation level. The new recovery is attributed to the smaller offerings and the sharp rise in coffee prices owing to the general shortage of supplies.

*

The Wool Textile Delegation has set up a bureau, called the Wool Industry, Bureau of Statistics, to collect and publish monthly statistics on the British wool textile industry. During and since the war, firms had to render returns to the Wool Control which is ceasing to operate as from the end of October. In future the collection of statistics will be on a voluntary basis, but as the industry has readily agreed to co-operate, the coverage is expected to be as complete as formerly.

INTERNATIONAL BANKING SURVEY

This survey, and the accompanying special 16-page selection of International Banking Statistics which appears in this week's issue of the RECORDS AND STATISTICS supplement, is complementary to the similar survey and statistical analysis of banking in the British Commonwealth published on May 28th last. These new half-yearly features supplant the wartime shortened version of THE ECONOMIST Banking Supplement which has appeared annually in recent years. The latest selection of statistics, which extends and improves the traditional form of the prewar banking supplement, relates to international banking institutions, British banks operating overseas, and central and commercial banking in eighteen territories outside the British Commonwealth.

The New Exchange Structure

THE devaluation of sterling set in motion a realignment of currency values which has completely altered the topography of the sphere of foreign exchanges. The greater part of this readjustment has been effected by members of the International Monetary Fund and has occurred with the consent and through the machinery of that institution. In a statement made after the movement had nearly completed itself, the Chairman of the Fund, M. Camille Gutt, referred to it as "the most extensive realignment of exchange rates ever carried out in a short period of time." M. Gutt also claimed that these adjustments had been achieved "with far more international agreement than the major currency adjustments in the past," heralding them as "a convincing demonstration that international co-operation in this field is beginning to be a reality." This claim, it may be noted, is contrary to the impression which might have been given by certain comments made elsewhere about the initiative which provoked the whole movement.

However that may be, the statement made by the Fund on the reasons for and objectives of this realignment of exchange rates deserves fuller quotation, as a useful exposition of the underlying factors and problems: "The members of the Fund are making these currency changes to help reduce the very large deficits in international payments resulting from the war. For nearly all countries this has taken the form of a dollar shortage, of an inability to sell sufficient goods to the western hemisphere to meet their dollar payments. This gap has been, still is, and will for some time be, large. Hitherto it has been closed by grants, credits and loans. Now the deficit countries are adjusting their exchange rates in order to lower the prices of their goods and increase their sales to the western hemisphere. . . . We must not expect the depreciation which has taken place to solve the payments problem of Europe and the rest of the world. . . . These countries will need continued aid until their export position has been sufficiently improved. The purpose of devaluation is to increase exports. This means that a country must make goods available for export by restraining home demand. . . . The effectiveness of the measures which have been taken will depend also on the policy of the United States and other countries in the dollar area. . . . They must increase

their imports of raw materials and finished goods from all countries which offer them at competitive prices. The Fund considers that the exchange measures which have been taken were necessary to the countries that have devalued and that if appropriate related measures are carried out the exchange adjustments will benefit the peoples in all the countries concerned."

The new pattern of rates has now taken shape, and although all the more important changes have been explained in *The Economist* as they occurred, it may be useful now to survey the pattern as a whole—especially as this gives an opportunity to record some of the formal data which could not be presented at the time.

*

It was on Sunday, September 18th, at 4.30 p.m. Washington time, that the International Monetary Fund announced that the United Kingdom had proposed and the Fund had concurred in a change in the par value of the pound sterling from US\$4.03 to US\$2.80. In terms of gold the new rate gives the pound a parity of 2.48828 grammes, or £12 10s. per troy ounce. The Fund also concurred in the proposal for a proportionate change in the par values of the separate currencies of all territories in respect of which the United Kingdom has accepted the articles of agreement of the Fund (except British Honduras). These include West Africa, Southern Rhodesia, Cyprus, Gibraltar, Malta, the Bahamas, Bermuda, Jamaica, the Falkland Islands, East Africa, Mauritius, Seychelles, Fiji, Tonga, Hongkong, Malaya, Sarawak and British North Borneo.

The other members of the sterling area (or scheduled territories) automatically followed Britain's initiative. Identical statements about their changes in parity were made by the International Monetary Fund at the same time as it issued that covering the United Kingdom and the dependent territories. The one exception was provided by Pakistan, which has maintained the dollar value of its rupee unchanged, so that its sterling parity has been raised from 1s. 6d. to 2s. 1½d. The only other country in this group about whose attitude there had been some doubt was Australia, which, it had been thought, might take advantage of the opportunity pro-

junction and thus to ensure the maximum of stability for the Belgian economy under the impact of the world-wide readjustment. It is probable that Belgium, given the hardness of its currency and the size of its reserves, would not have devalued had the depreciation of sterling not been as large as it was and had the Netherlands not chosen to go virtually the whole way with sterling.

Among the other countries which have chosen to devalue, but to a smaller extent than Britain, Canada has decided to reduce the parity of its dollar by 9.3 per cent against the US \$ and gold. This changes the Canadian dollar parity in London from the former figure of 4.03 dollars to 3.075 dollars to the £.

★

France also chose this opportunity to make some important changes in its exchange system. It has eliminated the former multiplicity of exchange rates and has established a uniform exchange rate for all transactions with every currency. The basis of the new structure is the dollar rate in the free market in Paris. The uniform rate for each currency, therefore, is not a fixed rate but varies in accordance with a rate quoted from time to time on the free market. Previously, financial transactions in dollars, Swiss francs and escudos took place entirely at the free market rate while commercial transactions in these currencies and all transactions in other currencies were based on the average of this free market rate and the former official dollar parity of 214.392 francs to the \$. The extent of the devaluation of the French franc will thus depend on the action of the free franc. The International Monetary Fund has welcomed this reform as a measure of unification of the French exchange system. The immediate effect of the move has been to establish what was formerly the free rate for the dollar in the Paris market (which was 330 francs on September 16th) as the new rate applying to all dollar transactions; this rate stands at 350 francs. The sterling rate in Paris, which previously stood at 1,093 francs to the £, has moved to 980 francs to the £, thus conforming to the new cross rate of 2.80 dollars to the £. At the same time France consulted the Fund on two changes in the exchange system of French overseas territories. The franc in the French Pacific possessions, which until recently was linked to the US dollar at the rate of 49.627 CFB francs to the dollar, is henceforth to be pegged to the metropolitan franc at a rate of 5.50 metropolitan francs per CFB franc. The par value of the rupee in the French possessions in India has been changed in the same proportion as the change in the par value of the Indian rupee, that is, it has been devalued by 30.5 per cent.

In the case of Italy the arrangement under which official rates are fixed monthly on the basis of the previous month's quotations in the free market, is to continue. This leaves Italy's reaction to sterling's devaluation wholly undefined. The problem will be solved *ambulando* with complete freedom of action reserved by the Italian monetary authorities, whose control of the Italian free market is fairly effective. The Italian authorities have, however, undertaken to maintain orderly cross rates in the official rates fixed month by month, and their present intention seems to be to stabilise the dollar rate at around 625 lire, compared with 575 lire before September 18th, representing a depreciation of 8.1 per cent. The immediate effect of the devaluation

of sterling has thus been to shift the sterling parity from 2,340 lire to 1,755 lire to the £.

The Portuguese monetary area has devalued the escudo by 13.3 per cent against the US dollar, involving an adjustment in the sterling rate from 100.60 escudos to 80.50 escudos per £. Siam has devalued the tical by 20 per cent against the US dollar and the sterling rate has moved proportionately, from 40 to 35 ticals to the £. The currency in western Germany has been devalued by 20.7 per cent against the dollar; the sterling rate of the mark has thus moved from 13.43 to 11.76 marks to the £.

Two countries, Argentina and Spain, while maintaining their official parities with the dollar, have widened the range of differential exchange rates which they have been operating for some time past. In the case of Argentina, the effect, expressed in sterling, has been to cause an appreciation of the basic export rate, that is the rate applying to exports of meat and other essentials, from 13.53 to 9.40 pesos to the £. At the other end of the scale, the so-called free rate applying to financial remittances and operations of a capital nature has moved in the opposite direction, namely from 19.37 to 25.25 pesos to the £. At a number of intermediate stages the peso has kept pace with sterling. The basic import rate remains at 17.04 pesos to the £, and the preferential "B" export rate at 16.04 pesos to the £. In the case of Spain, the basic rate remains at its previous dollar parity, and in terms of sterling has therefore moved from 44.50 to 30.66 pesos to the £. Lists of adjusted special rates for various classes of imports and exports have yet to be published in Madrid. Two other countries, Uruguay and Chile, have also made—or are understood to be making—alterations in their structure of differential rates.

★

There remain the countries which have decided not to devalue, and these are a somewhat heterogeneous group. Heading it, of course, is the United States, whose currency in effect determines the value of gold. In its widest sense, the US monetary area includes not only the Philippines but also those central and south American countries which have maintained their currency values in terms of the US dollar. Moreover, in Europe, Austria remains within the dollar area, while in Asia, Japan can be counted in the same category. Switzerland is, as usual, clinging to orthodox hard currency principles and has adequate reserves with which to stand a fairly prolonged deflationary siege. Iran has also chosen to keep its currency unchanged and in this respect has the help of firm dollar or gold exchange guarantees for the substantial amounts of sterling due to it as oil royalties. Finally, there is the group of Communist countries, the USSR and its satellites, which have prided themselves on their ability to withstand the forces which have caused other countries to devalue their currencies. To them, however, exchange rates are of little significance. Most of their international trade is transacted in terms of the currencies of their buyers or sellers, and the figures at which these foreign currencies are ultimately converted into roubles, zlotys, levas or lei, are problems of Soviet accountancy and not of international equilibrium.

To herald the process by which this new pattern of exchange rates emerged, "a demonstration of international co-operation" may be an overstatement. But at least the new structure bears a closer resemblance to economic realities than could be claimed for its predecessor.

Credit Policy in the United States

THE economic background in the United States has changed significantly since last autumn, when the Federal Reserve Board's index of industrial production (1935-39=100) reached its postwar peak of 195. Early this year, the Department of Commerce could record that the closing months of 1948 saw "a rather impressive shift away from an inflationary position." But in January of this year, when the Presidential Budget message was delivered, the level of output was falling only slowly, and Government spokesmen were, therefore, still pre-occupied (as in 1948) with the problem of providing curbs upon inflationary pressure, including the mildly restrictive monetary curbs that were detailed in *The Economist Banking Supplement* twelve months ago (*Records and Statistics*, October 30, 1948).

The Budget Message called for an additional \$4,000 million of taxation, and insisted once again upon the need for the pattern of "selective" anti-inflationary controls already rejected by Congress. In the sphere of monetary policy, Mr Winthrop Aldrich, chairman of the Chase National Bank, was reasserting his demands for more flexible interest rates, and insisting that higher long-term rates would not bring about depression. And the President's Economic Message to Congress (also sent in January) called for "continuing authority to the Board of Governors of the Federal Reserve System to require commercial banks to hold supplemental reserves up to the limits requested last August." At that time (in August, 1948) Congress had authorised a fairly substantial advance in reserve requirements, though to a level much below that set by the President. The Reserve Board had taken partial advantage of these emergency powers, but was reluctant to enforce them fully because the restraints applied only to member banks of the Reserve System. The Board was therefore pressing for its authority to cover all banks insured by the Federal Deposit Insurance Corporation, a development which would have involved the regulation of those banks then, as now, under the control of state authorities.

★

Until the close of February, therefore, the President and most of his economic advisers, including Mr John Snyder, Secretary of the Treasury, and Mr McCabe, chairman of the Federal Reserve Board, held that business activity would probably continue at high levels, with the definite risk of a renewal of inflationary pressure. By early March, however, conditions had changed sufficiently to make inevitable an early reversal of official policy. The Reserve Board first announced its decision to relax the controls on consumer credit (or instalment purchases) which formed part of the emergency powers granted in August, 1948. It followed this step within a week or two by sharp reductions in "margin requirements" for stock market transactions, and shortly afterwards announced the first general relaxation of bank reserve requirements since 1941.

Although these moves were at first represented as being, to some extent at least, merely tactical steps in a campaign for a permanent extension of emergency powers over both reserve requirements and consumer credit, it was soon apparent that they reflected an

abrupt change in the official assessment of the economic situation. Mr Marriner Eccles, who was formerly chairman of the Board of Governors of the Reserve System, and who now ranks as a senior member of the Board, was declaring in March that while recession had "developed for many months past" it was no part of the Government's task to stabilise the economy at such a high level. Only a week or so later, however, Mr Thomas McCabe, as chairman, was declaring the relaxation of obligatory reserve requirements to be "in furtherance of the Board's policy of adjusting all of its credit regulations in accordance with changing economic conditions, and the credit requirements of the current business situation."

This relaxation, which took effect in April, released approximately \$1.2 billion from the cash reserves of the commercial banks. A further reduction in reserve requirements took place at the end of June upon the expiration of the emergency powers—for the extension of which the Board was no longer pressing—and released a further sum of about \$800 million. At this stage, while production and employment were falling sharply from peak levels, the inevitable effect of the cash releases was to cause buying pressure in the Government Bond market; the commercial banks, faced with a continuous fall in advances, had no profitable outlet for new funds beyond the Treasury Bond market. This brought into the open a latent conflict between the Board's objectives. In the past its guiding aim had been to maintain the stability of the bond market, with reflationary measures subsidiary to that aim. But the banks' demands for bonds meant that the Board had to choose between the two objectives: if it wanted to check the fall in interest rates for the sake of stabilising them, it had to meet the demand by selling bonds; but that meant simply mopping up the additional credit which it was setting free in the interests of reflation. In the event, the Board chose reflation. At the end of June, a statement by the Open Market Committee of the Federal Reserve System forecast a more flexible policy—which may ultimately have significance in relation to rising, as well as falling, interest rates.

The statement declared that:—

The Federal Open Market Committee, after consultation with the Treasury, announced today that with a view to increasing the supply of funds in the market to meet the needs of commerce, business and agriculture, it will be the policy of the Committee to direct purchases, sales and exchanges of Government securities by the Federal Reserve Banks with primary regard to the general business and credit situation. The policy of maintaining orderly conditions in the Government security market will be continued. Under present conditions, the maintenance of a relatively fixed pattern of rates has the undesirable effect of absorbing reserves from the market at a time when the availability of credit should be increased.

Bank reserves were reduced again in August, in three successive stages, releasing cash to the extent of \$1.8 billion. Over about four months, therefore, the legal reserve requirements of the commercial banks had been cut by almost \$4 billion. Instead of being held at a high level authorised only by temporary legislation, they had moved to a point at which they were actually some way below the maximum limits permitted under the permanent authority of the Board.

Throughout this period the reserve balances of the member banks have fallen steadily, a movement which is in sharp contrast to the substantial gains which occurred in the latter part of 1948, when the Reserve Board, despite its efforts to curb inflationary pressure by raising short-term rates and reserve requirements, was obliged to add steadily to its total bond portfolio in order to protect the long-term Treasury rate of $2\frac{1}{2}$ per cent.

The following table shows the way in which the Reserve authorities sought to keep control of the interest rate structure through open market operations. These have reduced their security portfolio by the unprecedented amount of more than \$6 billion within a period of nine months.

FEDERAL RESERVE POLICY, 1948-49
(In Billion Dollars)

	Reserve Bank Credit	Member Bank Reserves Total	Member Bank Reserves Required
1948:—			
Dec. 29.....	24.1	20.2	19.2
1949:—			
Jan. 26.....	22.9	20.0	19.0
Feb. 23.....	22.8	19.4	18.7
Mar. 30.....	22.4	19.0	18.5
April 27.....	21.7	19.0	18.5
May 25.....	20.0	18.0	17.3
June 29.....	19.9	18.0	17.3
July 27.....	19.0	17.5	16.6
Aug. 24.....	18.1	16.5	15.5

The steady pressure against the volume of bank reserves throughout this period is at first sight in direct contradiction to the aims of the reflationary policy announced by the Federal Reserve Board. Over most of the period, however, commercial bank loans—following the trend of production—were falling sharply from the highest levels reached at the peak of business activity in the closing months of last year. At the end of December, 1948, the volume of loans held by the weekly reporting member banks totalled \$25.5 billion, with commercial and farm loans amounting to \$15.6 billion. By the end of August, the total had fallen to just above \$23 billion, with commercial and farm loans some way below \$13 billion.

The German Banking Reorganisation

WESTERN Germany's new banking system, launched under Allied auspices shortly before the currency reform, has been working for nearly eighteen months, yet even now few people outside the German banks have become familiar with the far-reaching changes which have taken place. The purpose of this article is to describe the new structure, to explain why changes were made, and to indicate some of the problems with which the system is confronted.

It was apparent from the outset that the postwar condition of German banking necessitated a radical reorganisation. Since the bulk of their assets were in German Government bonds, the German banks had become insolvent upon the collapse of the Reich. Their continued operation was made possible only by the support of Allied authority and by various military government instructions restricting cash withdrawals. Financial considerations, though necessitating drastic reconstruction, did not, however, dictate the very complex pattern of structural changes which has in fact been imposed. This was designed to conform with the

The consequential diversion of new banking resources to the government bond market has been substantial. Between the end of April (the month in which the Reserve Board began to cut reserve requirements) and September 21st, the weekly reporting member banks increased their government portfolios by more than \$3 billion. In the early part of the year, buying pressure was mainly directed towards intermediate and longer-term issues. For technical reasons, short-term rates came under particular pressure following the June announcement by the Reserve Board. Within a month, the market rate for one-year certificates had fallen from $1\frac{1}{4}$ to 1 per cent—whereupon a vigorous open-market policy was undertaken in order to put the yield back to the level of $1\frac{1}{2}$ per cent. The yield on the longest Treasury maturities over the past year has narrowed from 2.45 to 2.30 per cent.

Presumably, the authorities have acted on the assumption that a sudden reduction in the one-year rate to 1 per cent would leave them with little or no scope for manoeuvre. The 1 per cent rate was effectively pierced during the spring of 1946, when the pressure towards low interest rates reached its postwar peak; but it probably marks the effective limit to which the authorities are now likely to go—at least in the absence of a trade depression on a scale far greater than the recession so far witnessed this year. Meanwhile, for some weeks before the development of the strikes in the coal and steel industries, the index of industrial production was rebounding quite sharply from the low point of 162 touched in July—and bank loans were rising with it.

By modifying its interest-rate policy and thus permitting a general credit expansion, the Board may well have had in mind the necessity of achieving a more flexible position and technique in case a revival of business activity brings a renewal of inflationary pressure. In this event, if the Board has indeed thrown off the self-imposed fetters of interest-rate stabilisation, and would be prepared to face a rise as well as a fall, an important weapon would be restored to it to buttress the device of stiffening reserve requirements.

political reconstruction of western Germany, after federal lines and to create, therefore, a federal central banking system and a parallel system of commercial banking. Given this objective, a break-up of the old nation-wide commercial banks became inevitable.

The new central banking system, though founded on the United States Federal Reserve system, bears some resemblance to that which was based around the old German Reichsbank. It is a two tier system. Each of the eleven Laender in the German Federation has its own autonomous central bank (Landeszentralbank), responsible for banking in its region. These regional central banks, in turn, hold the entire share capital of the Bank Deutscher Laender, the central bank of the federal government. The BDL acts as banker for the regional central banks, possesses the sole right of note issue and is the ultimate source of credit for the entire central and commercial banking system. Its policy is decided by a board which sits at Frankfurt and which is composed of the Governor and the chairman of the management committee of the BDL and of the eleven

heads of the regional central banks (who are appointed by the separate Laender).

A majority decision of the BDL board becomes binding on all central banks. Thus changes in bank rate or in the legal minimum reserves held by the commercial banks with the regional central banks (and, in turn, by the regional central banks with the BDL) are decided in Frankfurt and are binding in the whole of western Germany. Equal voting rights at board meetings theoretically give the chairman of a central bank in a small state the same influence as the chairman of the regional central bank for the Ruhr or separatist Bavaria. But bankers of calibre are few and far between in Germany and the weaker members have usually been quite willing to allow the few men of standing to call the tune. This rather clumsy system has therefore worked quite smoothly so far, simply because the bankers have seen relatively little to differ about. More recently, however, questions of credit policy have provoked some disagreement, and should there be a split among the more powerful personalities it is difficult to see how the system could continue to function at all. It is possible to exaggerate this danger, however, for the regional chairmen do not make central banking a whole-time occupation and many influential posts in the new system are filled by old Reichsbank officials to whom decentralisation is anathema.

Moreover, if a deviationist state central bank were in a minority on the Board, the weapons in the armoury of the BDL would probably be potent enough to bring it to heel (although it would be easier for the BDL to restrain excessive credit creation than to make an unwilling state central bank expand the local credit base). To enforce its will the BDL can, first, change the minimum reserve requirements obligatory on all banks and, secondly, refuse re-financing facilities. This refusal could take two forms. In the first case, normally eligible paper might be refused for re-discounting. In the second case, the BDL might refuse to lend against the new *Ausgleichsforderungen* or bank claims. This second measure requires more explanation.

Even after the 10:1 conversion of deposit liabilities at the time of currency reform, the German banks were still insolvent, since so large a part of their assets was locked up in defunct Reich debt. Part of this debt was therefore, in effect, replaced by *Ausgleichsforderungen* or claims by each bank against the Land in which it was registered. These claims, which are serviced at 3 per cent, are not negotiable for the present but may be lodged by any bank as security for overdraft facilities with the Land central banks. The Land central banks, in turn, can borrow against them from the BDL. The potential

denial of this facility is a strong weapon in the hands of the BDL.

One of the most urgent problems of the financial authorities is, however, to put these *Ausgleichsforderungen* on a more permanent footing. For one thing the interest paid is out of keeping with the present structure of interest rates and, for another, until these claims are converted to a more conventional form of public debt the BDL cannot carry out open market operations—simply for lack of suitable paper except in so far as it could encourage more lending by the state central banks against these claims.

Far-reaching though the changes in the central banking structure have been, those that have taken place in commercial banking are proving much more fundamental. Today no German bank may maintain branches in more than one Land. The three "Big Three" ("D") banks, the prewar giants of the German banking system, have been broken up. Each of their separate branches now has a strange new name and the goodwill associated with the traditional names has been lost.

The most fortunate of the new banks are automatically those which were situated in the largest states. Thus the old Deutsche Bank in the Ruhr, previously the largest bank in Rhineland-Westphalia, has become the largest bank under the new regime (it now operates under the title of the Rheinisch-Westphälische bank). By contrast, the successor of the Commerzbank—the smallest of the D-Banks—one of the small states in south-west Germany has, *perforce*, dwindled to relative insignificance. Since the currency reform the

larger banks in the larger states have increased their lead by attracting the lion's share of new deposits. Such business as the limited resources of the banks permit has been profitable. There is a wide margin between interest paid by the banks on deposits—this certainly never exceeds 4 per cent and is usually much less—and the 7 to 9½ per cent which the borrower has to pay, even though bank rate has fallen to 4 per cent. But a wide variety of new problems has been created. In granting credits the banks have become very weary of clients who have claimed to be borrowing for brief periods, but have in fact employed short-term credits on capital investment. The result has been a great increase in illiquidity.

Despite continued misgivings about the structural weaknesses of the new banking system—confidence in which remains to be established firmly—criticism of the new banking system *per se* has lately given way to heated debates amongst politicians, businessmen, financial journalists, and even within the ranks of the Bank Deutscher Laender itself, on the question whether the credit policy pursued by the central banking authorities

has been helpful or a hindrance to economic recovery. Recently the BDL has shown signs of giving way to criticisms of its excessively deflationary policy. Orthodox steps to relieve the shortage of credit have been taken. The bank rate has been lowered from 5 per cent to 4 per cent in two successive stages. The minimum reserves which the commercial banks have to maintain with the central banking system have been lowered; the minimum reserve ratio against sight deposits, which was 10 per cent at the time of the currency reform in June, 1948, and which was raised to 15 per cent as an anti-inflationary measure in December, 1948, was lowered to 12 per cent in June of this year. (Throughout this period the reserve ratio against time deposits has remained unchanged at 5 per cent.) Even more significant has been the distinct change in tone in the policy circulars sent out by the BDL to the state central banks for eventual transmission to the commercial banks.

★

There has, however, been no *volte face* in central banking policy. The Bank Deutscher Laender is showing itself more impervious to outside criticism than central banks in many other countries, though the changes contemplated by the new government will curb this independence. Although it admits that there is a credit shortage in the country, it argues that the additional credit is needed largely for long-term purposes. In the past the German banking system has suffered too much from long-term lending with short-term deposit money. The BDL is determined that that shall not happen under the new system.

Many moderate observers believe, however, that the BDL has been rather too easily impressed by the increase in the note circulation and the volume of credit since the currency reform. At first sight these figures do look startling. In less than a year the note circulation has increased from DM 4,897 million to DM 6,815 million, while the deposits have risen from DM 5,120 million to DM 13,247 million. Advances have increased from DM 1,355 million to DM 7,833 million. The ratio of advances to deposits has increased markedly. It is now over 50 per cent as compared with about 25 per cent prior to currency reform.

Large though these increases have been, the critics of the BDL contend that a much larger increase was necessary. The real question, however, is whether it

is judicious to remedy the deficiency of working and long-term capital through the banking system.

The first need at the present time is for more long-term funds, yet the inability of the German capital market to meet the demands has been demonstrated beyond doubt. Individual savings, though they have been rising, are quite inadequate to finance anything but a small part of the German capital programme. Corporate savings are hampered by taxation which hits the industrialist in Germany even harder than in Britain. Large new savings are, however, accumulating in the public sector, for several state governments are running budget surpluses, and there is also the BDL "counterpart" fund from imports.

Most of the sums released by the public sector are passed on to the credit takers via the new Kreditanstalt fuer Wiederaufbau or Reconstruction Loan Corporation. This corporation is coming in for almost as much criticism as the BDL, mainly on the ground that it does too little. For the present it has to content itself with passing on such funds as are made available from the public sector.

Despite the assistance of the Reconstruction Loan Corporation few new capital issues have been able to raise the full amount for which they called. Yet the German new issue programme has not been ambitious. From the currency reform to the end of July new issues amounted to only DM 1,000 million, and of this not very impressive total only DM 754 million could be placed. The most ambitious operation yet has been the Reichsbahn issue which raised DM 335 million—of which DM 250 million came from public funds. By British standards interest rates on loan capital seem high—a ten-year loan stock normally carries $5\frac{1}{2}$ to $6\frac{1}{2}$ per cent interest. Since even these high-interest rates are not bringing forth the savings needed, it is now widely advocated that the immediate shortage of long-term capital should be overcome by more generous releases of funds from the public sector. Earlier arguments against this step, at a time when inflation still seemed around the corner, have now lost much of their force.

To sum up, no one will deny that the Bank Deutscher Laender is to be commended on establishing the Deutsche Mark as a sound currency in so short a period of time, but many people believe that it must next ensure that a proper balance between long-term and short-term capital is struck.

COMPANY MEETING

LONDON TIN CORPORATION LIMITED

CHAIRMAN'S SPEECH

The twenty-third annual general meeting of London Tin Corporation Limited was held on Friday, October 21, 1949, at The Chartered Insurance Institute, Aldermanbury, London, E.C.2.

Mr J. Ivan Spens, Chairman of the Corporation, who presided, said:—

The accounts for the year ended April 30, 1949, are on almost similar lines to those for the previous year, when we made the necessary amendments to conform with the Companies Act, 1948. Apart from an increase in investment of the Corporation's resources in "Investments at or under cost," and an adjustment, in the main, between loans and shares in "Investments in subsidiary companies," I need only refer to the fact that we have now a general reserve of £250,000, made up of £125,000 reserve against a loan to a subsidiary company not now required, and £125,000 transferred from profit and loss account. This general reserve, which we hope to increase from time to time, is available for meeting contingencies.

MALAYAN WAR DAMAGE COMPENSATION SCHEME

Since we held our last annual general meeting, fresh proposals have been made and laid before the Legislative Councils of the Federation of Malaya and of Singapore. I am certain it is in the interests of all concerned that finality should be arrived at on this matter at the earliest possible moment. Until this is done, so far as the mining companies are concerned, it is impossible to assess their financial positions correctly, as the majority of them have received advances for rehabilitation from the Government, which may be in excess of the amounts such companies might ultimately be entitled to receive under the scheme.

STAFF

Since my speech last year, two more members of the staff of Anglo-Oriental (Malaya), Limited, have been murdered by bandits. To their relatives I know you would wish me to express your deepest sympathy. The activity of the bandits in Malaya has imposed a great strain on staff, many of whom have spent 3½ years in Japanese P.O.W. camps. I feel that I speak for you all when I thank the staff of Anglo-Oriental (Malaya), Limited, for the fine work they have done, and are doing, in Malaya, Burma and Siam under such difficult conditions. I also wish to thank the staff of A. O. Nigeria, Limited, who, though they have so far escaped the turbulent conditions of the Far East, have, I know, their own problems and difficulties.

PRICE OF TIN

Shareholders will recollect that the price of tin metal was fixed up till June 30, 1949, by the Ministry of Supply, who bought the output of both Malaya and Nigeria. In Malaya the price was £553 10s. per ton metal ex-smelter. In Nigeria it was £531 per ton metal in concentrates f.a.s. Nigerian port.

On August 30, 1949, the Ministry of Supply suspended all dealings in Straits tin. The reason for this was a loss of dollars owing to importers in U.S.A. being able to use sterling exchange available for future deliveries at a considerable discount over the official rate. From August 25th, industry in the U.S.A. was relatively free to import tin metal.

On September 7th the Ministry of Supply announced that tin metal would be sold in U.S.A. at \$1.03 per pound through a number of London metal brokers acting as the Ministry's agents. Merchants in Penang and Singapore with experience of the trade up till 1941 were grieved that they were not included in the Ministry's scheme. On September 9th the Ministry arranged that buyers could defer the price to be paid for the metal until ten days after the arrival of the ship carrying it at New York docks.

The devaluation of the £ on September 18th caused the Ministry of Supply immediately to suspend sales of tin, along with other base metals. On September 26th the Ministry announced that the selling price of tin would be £750 per ton in U.K., £739 per ton ex-smelter in Penang or Singapore and 95 cents per pound (equivalent to £760 per ton) in New York. The price to be paid to producers has still to be fixed. The Ministry also announced its intention to discontinue the purchase of tin and to reopen the London Metal Exchange in the near future.

There can be no doubt that the revaluation of the £ sterling in terms of the \$ and other currencies, will increase mining costs, though to what extent remains to be seen.

NEGOTIATIONS WITH ECONOMIC CO-OPERATION ADMINISTRATION

In March, 1949, the U.S.A. informed producing countries who were signatories of Economic Co-operation agreements that E.C.A. desired to negotiate bilateral agreements with them in order to increase deliveries of metallic tin and/or concentrates to the U.S.A. The countries concerned began simultaneous negotiations. In each case the negotiations were interrupted at the request of the E.C.A. representative, when it became clear that financial appropriations were not going to be available as soon as expected.

TIN STUDY GROUP

In 1946 many in the tin mining industry believed that in two or three years supplies of tin metal would probably be greater than industrial demand. They hoped that the then proposed Tin Study Group would consider what action should be taken to prevent this surplus depressing the price below the economic cost of production.

The communiqué issued after the meeting of the Tin Study Group held in London in June, 1949, said that the Group realised that there was an existing and growing excess of production over commercial consumption (estimated at 32,000 tons in 1949 and 1950, 43,000 tons in 1951). While it was thought that purchases for non-commercial purposes would avoid an unbalanced position for an appreciable but unspecified period, it was realised that conditions justifying the conclusion of a commodity control agreement would probably arise within five years. From past experience it may be believed that negotiations for such an agreement might take two years. Another Working Party was set up to draft an agreement which was to be submitted to the members of the Study Group who would consider whether to ask the United Nations to convene a Commodity Conference at which such an agreement could be presented. The Working Party's report was to be ready, if possible, by September 30, 1949. It has now been arranged that this Working Party will meet at The Hague on Wednesday next, October 26, 1949.

I think the majority of the tin producers

in the world are in favour of the calling of a commodity conference and would favour an international commodity agreement on tin. Such majority must believe that that is the only way in which the tin industry will obtain a reasonable, stable, economic price, which will allow it to plan satisfactorily for the future. It seems to me that such an agreement is in the interests of consumers who require adequate supplies of tin at an economic price and above all at a stable one. To the consumer carrying appreciable stocks a constantly fluctuating price with its losses on stocks must be far from satisfactory, while a supply alternating between a dearth and a glut must be even less so.

It must also be remembered that in Malaya the country's economy depends mainly on its two basic industries, tin and rubber. If the tin industry should suffer periods of depression on account of instability of price and if mines were forced to close down, resulting in widespread unemployment of labour or a reduction in the standard of living, the social and political consequences might be serious. Similar considerations must equally apply to all the main tin-producing countries.

Personally, I believe that if the conditions which I have enumerated above are fulfilled, consumers would agree to an international commodity agreement on tin. While the situation is, therefore, not so gloomy as some may suppose, emphasis must be laid on the need for action and the early conclusion of a suitable international commodity agreement on tin.

The report and accounts for the year ended April 30, 1949, were adopted and the retiring directors re-elected.

At the extraordinary general meeting which followed the annual general meeting a special resolution adopting new articles of association was duly passed.

OLYMPIC PORTLAND CEMENT COMPANY, LIMITED

SUCCESSFUL YEAR

The 38th annual general meeting of the Olympic Portland Cement Company, Limited, was held on October 24th in London.

The Hon. Gerald H. G. Williamson, the chairman, in the course of his speech, said: I am pleased to be able to report that your company has had a successful year, more successful indeed than we anticipated a year ago. The trading profit of the Bellingham plant for the year was £44,642, after providing £14,408 for depreciation and depletion as against £16,125 of profit and £19,947 of depreciation and depletion for the previous fifteen months.

The average selling price of cement per barrel for the year under review was 3.23 dollars, compared with 3.19 dollars for the six months to March 31, 1948, and 2.93 dollars for the nine months to September 30, 1947, the volume of sales being 748,000, 192,000 and 449,000 barrels respectively. The increased sales reflected the higher production of cement during 1948-49, the figures being 727,000 barrels, against 707,000 barrels cement in the fifteen months to March 31, 1948.

As the dividend paid a year ago—10 per cent., less income tax—covered a period of fifteen months and as previous distributions had for some years been on a 10 per cent. basis, a bonus of 2½ per cent., less income tax, is now recommended, in view of the improved results for this year, in addition to the final dividend.

The report was adopted.

THE UNITED STEEL COMPANIES, LIMITED

STATEMENT ON YEAR'S OPERATIONS

The annual general meeting of The United Steel Companies, Limited, will be held on November 10th at The Iron and Steel Institute, 4, Grosvenor Gardens, London, S.W.

The directors have issued the following statement on the year's operations to members of the company with their annual report:—

Stockholders—The number of stockholders on the register at June 30, 1949, was: ordinary, 21,410; preference, 14,370.

PRODUCTION

The outstanding feature of the year's operations has been the high level of outputs attained throughout the undertaking. Production of steel, pig-iron and coke for the last two years has been as follows:—

	1947-48	1948-49
	tons	tons
Steel ingots	1,896,000	2,042,000
Pig-iron	1,057,000	1,143,000
Coke	1,114,000	1,175,000

It is believed that this is the first occasion on which a British company has attained an output of over 2,000,000 tons of steel in a single year.

Number of Employees—The number of employees at June 30, 1949, was:—

Cumberland district	5,169
Lincolnshire district	9,930
Sheffield district	14,487
	29,586

SALES

The sales for the year cover a great variety of products and markets and can be generally classified in the following groups:—

	%
1. Semi-finished steel which undergoes further processing	31.0
2. Finished steel products ready for use	13.3
3. All other steel products mainly supplied to various branches of engineering	46.0
4. Oils, fertilisers and chemicals	3.7
5. Engineering products	2.8
6. Miscellaneous	3.2
	100.0

Direct export, which is limited by government regulation, amounted to 7½ per cent. of the sales. A much larger proportion is exported indirectly, but this depends upon the trade of our customers, which includes the making of:—

Ships.
Motor vehicles.
Railway rolling stock.
Electrical equipment.
Wire products.
Machinery.
Hardware.
Chemicals.

INCOME AND EXPENDITURE

During the year the company's gross income from sales and other sources was £50,538,522. This was expended as follows:—

	£	%
Raw materials, fuel, services	30,449,608	60.25
Wages, salaries, national insurance	12,550,934	25.83
Holidays with pay	373,851	
Pensions	150,000	
General expenses including rents, rates, insurances	991,659	1.96
Delivery charges	2,054,199	4.05
Retained in the business	1,435,462	2.84
Taxation	1,958,123	3.87
Dividends to Stockholders	574,686	1.14
	50,538,522	100.00

PROGRESS OF DEVELOPMENT SCHEMES

The company has pursued its development programme with all the speed which the difficult times have permitted. During the three years since the end of the war great progress has been made which can be measured by the fact that over £10,000,000 has been spent. The present state of the programme is as follows:

Since the blast furnace plans at Appleby-Frodingham were prepared discoveries of ways of treating the company's iron ores to increase furnace outputs have been made which may enable the required pig-iron output to be achieved without building new furnaces. The construction of the ore preparation plant which is proceeding will enable these discoveries to be applied to their full extent.

The new melting shop to replace the old Frodingham shop has been in operation for nearly two years and has yielded greater outputs at lower costs. Modernisation of the section mills is also complete, the central engineering shops have been built, and many minor schemes of improvement have been finished. This reconstruction, with greater outputs in both the blast furnaces and the melting shops and various improvements effected in the plate mill, has raised the output of both plates and sections by about a fifth compared with three years ago.

At Steel, Peck and Tozer the modernisation of much of the plant is a long-term task which must be carried out gradually to avoid interference with production. Many improvements have already been effected in the melting shops (including conversion of the Templeborough melting shop to oil firing) which have helped to increase production. Mechanisation of the railway spring shop is complete and the wheel department has been completely re-equipped with the most modern plant which is giving a greatly increased output.

The programme at Samuel Fox and Company is practically complete and the efficiency and economy of all the steel processing and finishing departments have been greatly increased. The only major development still to be finished is the stainless sheet mill which Fifth-Vickers Stainless Steels, Limited, and the company are erecting in partnership.

At Workington also the programme is almost finished. The cogging mill has been replaced and fitted with an electrical drive. The rail bank has been reorganised and extended. Power generating plant has been increased and a large modern steam-raising station comprising four water tube boilers fired by surplus gas or by oil is being installed. Two boilers have been at work for more than 12 months but completion of the remaining two has been delayed owing to priority being given to electric power stations.

The duplication of the coke ovens of the United Coke and Chemicals Company at Orreave will be finished by the end of the year and plans and experiments for the manufacture of additional chemicals are well advanced. At the Scunthorpe ore mines the first underground working is approaching the stage when production will start. Further reserves of ore have been secured, and output has been increased by the introduction of additional and more efficient machinery for open-cast working. Three large additional gasholders each of three million cubic feet capacity have been completed, one at Workington, one at Samuel Fox and Company and the third at Orreave.

POWELL DUFFRYN LTD.

CHAIRMAN'S REVIEW OF ACTIVITIES

The annual meeting of this company was held on October 25th.

The following is an extract from the statement of the chairman, Mr Edmund L. Hann.

Profits for the year do not include interim income for the last quarter since legal effect has not yet been given to the Government's decision to continue payment. The dividend is maintained at 8 per cent. for the year without depleting the carry-forward.

As the ownership of Tredomen Works was in dispute, it was referred to arbitration. The award vested the works in the National Coal Board. This does not affect profits for past years as credit has been taken only for interim income estimated to be receivable if the works vested.

Very little progress has been made in South Wales towards settlement of compensation, either in allocating the award of £14,231,000 to colliery companies or in determining the amounts of compensation payable for the ancillary assets taken over, which for your company comprise carbonisation and tar distillation plants, patent fuel works, electricity generating stations, Phurnacite plant, houses, farms and other assets which now include Tredomen Works.

It is difficult to understand why District Valuation Boards were not set up long before Dec., 1948. Boards are only now starting to carry out physical inspections of assets which vested in the Coal Board on Dec. 31, 1946, and which have to be valued as at that date. There seems no reason to change the opinion that compensation proceedings will not be completed before 1952.

The increase in output of coal has disappointed those who hoped for increased exports. The future of the coal export trade depends on the ability of this country to export traditional quality at competitive prices. Delay in obtaining this is dangerous, as other countries, increasing their output, are becoming less dependent on imports and some have more available for export. Unless more coal is produced at cheaper prices there will be little left for the British exporter of his overseas markets.

Cory Brothers and Company, Limited, and Gueret, Llewellyn and Merrett, Limited, have made continued progress, Cory Brothers in particular having had a most successful year. These companies, together with Maris Export and Trading Company, Limited, have been able to take their fair share in the modest increase in the quantity of coal available for export.

The results of Stephenson Clarke have been satisfactory and further progress has been made in the replacement of their wartime shipping losses.

The output of Cambrian Wagon Works, Limited, continues to expand, and additions now being made will enable the company to widen its range of manufacture to meet the changing demand for rolling stock at home and abroad.

Powell Duffryn Technical Services, Limited, has experienced a year of successful and progressive development. On the fuel utilisation side, much valuable work has been carried out for industrial undertakings, and branch offices have been opened at Birmingham, Sheffield, Newcastle and Glasgow, to serve the surrounding industrial areas.

Powell Duffryn Carbon Products, Limited, has completed the extensions to its factory and is now equipped for the manufacture of carbon for electrical, chemical and metallurgical purposes.

The report and accounts were adopted.

FERRANTI, LIMITED

DEVELOPMENT PROGRESS

The forty-fourth annual general meeting of Ferranti, Limited, was held on October 20 in London.

Sir Vincent de Ferranti, M.C., M.I.E.E., the chairman and managing director, presided.

The following is an extract from his statement which was circulated with the report and accounts:—

In my speech last year I referred to the extension of manufacturing facilities that we had put in hand to enable us to play our part in the rebuilding and development of the country's generating capacity and to obtain our share of the considerable demand from abroad for large transformers. We have made material progress in this direction. The net increase of £257,684 in fixed assets is mainly accounted for by the completion of our foundry extensions and expenditure on the construction and equipment of the new transformer shop. We hope the latter will be completed by the end of this year.

In the course of the year we obtained permission from the Exchange Control Authorities to remit one million dollars (£248,294) to our Canadian company against their issue of new shares, and were thus able to provide them with a part of the increased working capital, called for by the development of their business, which had previously been furnished by their bankers.

The Canadian company further increased their issued capital by capitalisation of undistributed profits to the extent of \$500,000 (£124,069). The issued capital of the Canadian company is now two million dollars and the items referred to above account for the increase of £372,363 in our shareholding in subsidiary companies.

The general reserve, which last year stood at £536,000, has been increased by absorption of the contingency reserve of £150,000, which is no longer required, by the bonus issue received from the Canadian company of \$500,000 (£124,069), and by the allocation from this year's profit of £139,931, leaving the amount of the general reserve at the date of the balance-sheet £950,000.

INCREASED NET PROFIT

The trading profit for the year, together with dividends on investments, amounts to £481,222, as compared with £397,201 for the year ended June 30, 1948. The net profit amounts to £178,818, an increase of £35,430 on last year's figures, and if the directors' recommendations are approved, there will remain a sum of £139,931 to go to increase the general reserve account and £1,637 to increase the undistributed profits carried forward.

The subsidiary companies' activities during the year under review have resulted in a net loss of £45,791. The Canadian company has been passing through a period of reorganisation and its trading results were adversely affected by labour unrest in the latter part of its financial year, which culminated in two strikes occurring in May and June last.

We are glad to say the company is again in production and we hope that it will not have any recurrence of these troubles in the current year and will start to reap the benefit of the reorganisation.

During the year the output of the concern has remained constant, increases in transformers and Government work making up for reductions in electricity service meters, instruments, radio, domestic appliances and clocks. Of our total output, 35 per cent. has again been exported.

We expect our output in transformers to continue increasing during the year ahead to deal with the record order book of the company.

The report was adopted.

TRINIDAD PETROLEUM DEVELOPMENT

MR KENNETH MOORE ON EFFECTS OF DEVALUATION

The annual ordinary general meeting of the Trinidad Petroleum Development Company, Limited, was held on October 25th at the registered office of the company, River Plate House, Finsbury Circus, London, E.C., Mr Kenneth A. E. Moore, F.C.A. (chairman of the company), presiding.

The secretary (Mr J. Mytton) having read the notice convening the meeting and the report of the auditors.

The Chairman said: The accounts before you today, read in conjunction with the directors' report, give you, I hope, as full and lucid a picture of the company's affairs as is practicable within the scope of such documents. There is no need, therefore for me to take up your time today by a tiresome recapitulation of the principal figures and you would prefer, I am sure, that I should deal rather with the broader aspects of the company's affairs.

In the first place, while all sorts of things are happening in the outside world which directly or indirectly impinge upon our fortunes, the work of the company—the search for, and production of, oil in Trinidad—goes on steadily and energetically.

OIL PRODUCTION AND GEOLOGICAL INVESTIGATION

Thus, in the past year, we have pressed on with the routine production of oil from existing wells, with the work of drilling new wells, both in proven and non-proven areas, and with preparations for the extension of the search for oil to the Moruga district. We have also taken the opportunity to acquire oil rights on additional territory, a policy which, over the last twelve years, has more than doubled the area over which we are free to operate. All the time constant geological investigation is going on with the object of adding to our knowledge of our potential reserves of oil and of improving our chances of obtaining commercial production therefrom.

During the past year also we have successfully raised the additional capital which, we foresee, will be required to cover the cost of the further stages of development at present envisaged.

Meanwhile, as I have already indicated, events and circumstances quite external to the fundamental work of the company, and quite beyond our control, exert their influence on our affairs.

OIL PRICES

During the past financial year the most notable of such occurrences was the exceptionally mild winter in the Eastern States of North America which led to a glut of heavy fuel oil and so to a substantial fall in the Gulf Coast export price for that class of oil. As a result, the effective price received for our production began to decline in December, 1948—a decline which persisted right up to the end of the financial year. To counteract the consequential fall in our profits we took the old-fashioned but politically unpopular course of doing our best to increase production and to reduce expenditure.

Success was achieved under both heads, with the result that the profit for the year, though inevitably reduced by the fall in price, was by no means unsatisfactory, and has enabled us, while maintaining our dividend, to add £50,600 to general reserve. In this we were helped by the fact that, at long last, our liability for taxation, including wartime taxation, was finally agreed down to July 31, 1948, at a figure rather less than the reserves built up over the years to meet the estimated liability.

DEVALUATION OF THE £

Since the end of the financial year something has occurred which very materially

affects our fortunes—namely, the devaluation of the pound in relation to the dollar as from September 18, 1949.

Oil is international in character—almost a currency in itself—since it can be shipped to any country and sold for the currency of that country by reference to basic world prices, which, for most practical purposes, can be taken to be the Gulf Coast export prices.

We sell our oil by reference to those prices and, therefore, in terms of U.S. dollars, thus the immediate effect on our fortunes is that, in terms of sterling, we are, since September 18th, receiving some 43 per cent. more for our oil than we were immediately before devaluation.

It is necessary to bear in mind that a proportion of our expenditure, notably that for Trinidad Government royalties and for purchases of plant in the USA, is on a dollar basis, but our remaining expenditure—by far the larger proportion—is in sterling. It is, therefore, obvious that, all other things being equal, devaluation is likely substantially to increase our trading profits until the inescapable secondary effects of devaluation make themselves felt. In the meantime I need hardly remind you that with the increased profits tax imposed last month, taxation will take an even heavier toll than in the recent past.

OIL RESERVES

With regard to our reserves, we have for years past been adding to the area over which we hold oil rights, which now amounts to 55,780 acres, and it is the view of our geologists that, in the proved areas alone, which cover only about one-third of the total area, there are reserves sufficient to cover the present rate of production for many years to come. These reserves, we hope, will be increased by our exploration of the Moruga district and other areas which will be drilled up in due course.

Relations with labour have continued to be good during the past year and our workers greatly appreciate the improved medical and welfare arrangements which we have been providing increasingly in recent years as our progress justified. We have extended Dalley Village during the past year and built a number of additional houses, and you may rest assured that, as employers, we are pursuing an enlightened policy in these matters.

Commander Lavington and Lord Rothes visited the field earlier this year and were well satisfied with the state of our organisation there. It is, I can assure you, a credit to the company and is making an important contribution to the economic and general welfare of Trinidad.

SOUND POSITION

Summing up, I think it fair to say that the affairs of the company are in good shape—we believe our reserve position to be satisfactory, our financial position is strong, and we have a most competent and devoted team in Trinidad carrying on the day-to-day work of the company. To Mr Bennett, our general manager, and to all our staff and employees in Trinidad, we tender our most sincere thanks.

The report and accounts were unanimously adopted and the dividend of 12½ per cent., free of tax, making 16½ per cent., free of tax, for the year ended July 31, 1949, was approved.

The retiring director, the Rt. Hon. the Earl of Rothes, was re-elected, and the remuneration of the auditors, Messrs Joselyne, Miles, Page and Company, having been fixed, the proceedings terminated with a hearty vote of thanks to the chairman, directors, general manager and staff in Trinidad.

Investment Statistics

Company Notes

United Steel Companies.—Balance of trading profit declined from £3,935,551 to £3,767,659 in the year to June 30, 1949. Net profit was £3,225,372 (£3,372,315). Output of steel in the period was a record at 2,042,000 tons (1,896,000 tons). Turnover increased from £43,500,000 to £50,538,522. Group fixed assets were £20,863,127 (£17,886,224) at the year-end; net current assets were lower at £1,993,144 (£3,728,112).

Galico Printers' Association.—Net profit increased from £429,704 to £436,130 in the year to June 30, 1949. The result for 1947-8 benefited by a credit of £113,104 in respect of income tax deducted from dividends. Dividends in 1948-9 have been charged net. Consolidated net profit was £663,549 (£906,147) after charging £1,019,974 (£801,440) taxation, £947,492 (£646,336) for maintenance, depreciation and repairs, etc., and after the transfer of £261,018 (nil) to stock reserve. The dividend has been increased from 5 per cent to 8 per cent for the year.

Crabtree Electrical.—Consolidated trading profit increased from £283,826 to £349,346 in the year to July 31, 1949. Net profit amounted to £122,310 (£136,875). A total distribution of 17½ per cent for the year is recommended.

Baldwins (Holdings).—Total income in the year to September 30, 1949, amounted to £527,304 (£526,083). A total dividend of 16 per cent for the year is recommended.

Eastwoods Ltd.—Group trading profit increased from £274,491 to £281,971 in the year to March 31, 1949. Net profit amounted to £82,647 (£72,406). The dividend is unchanged at 8 per cent.

Oriental Telephone and Electric.—Total profit amounted to £121,340 (£112,415) in 1948. The dividend of 16 per cent is unchanged.

Mufutira Copper Mines.—Production of blister copper increased from 53,360 long

tons to 70,966 long tons in the year to June 30, 1949. Operating surplus amounted to £4,785,366 (£3,227,581) and net profit to £1,723,362 (£1,132,908). A final dividend of 5s. per share is recommended making 8s. 6d. per share for the year (in 1947-8 a single payment of 7s. 6d. per share).

Peruvian Corporation.—The scheme of the Peruvian Corporation to extend the moratorium on its debentures has been passed by a majority of the debenture holders. A petition is now being presented to the High Court for the Court's sanction.

Rhodesian Selection Trust.—Total income for the year to June 30, 1949, amounted to £734,754 (£648,648). A final dividend of 1s. 6d. per share is recommended, making a total of 2s. 6d. per share for the year (compared with 2s. 3d. for 1947-8).

Mexican Eagle Oil.—The resolutions for the repayment of the paid-up capital to the extent of 7 Mexican pesos per share have been duly passed at an extraordinary general meeting of the company.

ended December 31st: 1939, £154,390; 1947, £41,554; 1948, £139,379. Assets as at December 31, 1948: Fixed assets, £39,381; total current assets, £1761,502; net current assets, £345,560.

St. Helena Gold Mines.—Shareholders are to be offered 1,250,000 10s. ordinary shares at 37s. 6d. per share in the proportion of one new share for every four shares held. A further 1,250,000 shares are to be subscribed for by six finance houses.

F. W. Woolworth.—Treasury approval has been given for a 100 per cent script bonus issue to capitalise £7,500,000 from profit and loss account. Holders of the £7,500,000 ordinary stock in 5s. units registered on November 5th will receive one new share for each share held.

Grattan Warehouses.—Shareholders are to receive by way of bonus distribution one new 5s. ordinary share for every three 5s. shares held. The issue will capitalise £125,000 of reserves.

Capital Issues

W. and R. Jacob (Liverpool).—Application has been made for permission to deal in the issued share capital of £575,020 in £75,000 6 per cent cumulative £1 first preference shares, £200,000 in 6½ per cent cumulative £1 second preference shares and £300,020 in 5s. ordinary shares. Profit subject to taxation for years ended December 31st: 1939, £139,212; 1947, £162,579; 1948, £203,185. Assets as at December 31, 1948: Fixed assets, £754,072; total current assets, £890,494; net current assets, £619,836.

G. N. Haden.—Lists opened and closed on October 27th for the issue of 250,000 5½ per cent cumulative £1 preference shares at 20s. 6d. per share. Capital after the issue will consist of £582,930 in £27,200 8 per cent cumulative £1 preference shares, £250,000 in the preference shares subject of the issue, and £305,730 in 5s. ordinary shares. Profit subject to taxation for years

Congress Expects

THERE can be no question of Mr Hoffman's right to use the blunt and challenging language in which he addressed the Council of OEEC in Paris on Monday. As the American primarily responsible for the success of the Marshall Plan, as an adviser trusted and respected by seventeen European governments, he can and must say publicly things which Mr Acheson cannot say. He is entitled to advise the beneficiaries of the plan that Congress is likely either to reduce or to discontinue Marshall Aid in 1950, unless there is a real prospect of seeing some integration of their economies by 1952. He can also tell them what are the general lines of policy that will be regarded in the United States as evidence of a genuine desire for this integration. Both the motive and the purpose of Mr Hoffman's challenge are therefore to be welcomed if the speech is to be regarded as a warning. He has stated with fresh emphasis the kind of expectations aroused among intelligent Americans by the pledges given in 1947 by the beneficiaries of the Marshall Plan. Unless those expectations are in some degree met, then Americans will lose faith in the plan—that in a nutshell is the diplomatic content of the message.

To such a warning there had to be an immediate reply, and on Wednesday the Council of OEEC produced it. It is a tentative pledge of good intentions backed up by one piece of action to be taken before December 15th. Quantitative restrictions on at least 50 per cent of the mutual private trade of the member countries are to be removed, along with as many restrictions as possible on invisible exchanges, such as the tourist trade. The rest is promise—a promise to try to widen the area in which currencies are transferable, a promise to "report on progress" towards regional monetary unions, a promise to "re-examine" how one country's surplus manpower could be absorbed by others. "The single large market in Europe," on which Mr Hoffman laid so much emphasis, is described as the "final aim." This list, modest though it is, shows that the shock of the challenge has had some effect; but it would be quite wrong to imagine that the Council's omnibus resolution goes far enough to relax the pressure of Congress on the US Administration. It remains the duty of Mr Hoffman to demand from OEEC action on the programme and nothing but the programme.

As soon as Mr Hoffman's speech is examined in this light, as a programme of desirable objectives and practicable policies for the immediate future, doubts and reservations present themselves immediately. First come the more obvious political questions. It becomes necessary to ask whether the expectations aroused in the United States are justified in the light of over two years of study and team work. It is doubtful whether the political conditions have yet been created for the revolution in national policies which is being demanded; it has to be proved that the effort to meet American hopes of European integration (which can only be a long-term objective)

would not frustrate, by the political tensions it would create, the urgent short-term objective of enabling Europe to sell more in the American market. It has to be considered whether the economic policies recommended by Mr Hoffman are practicable so long as the European governments have not created some centre of political authority and public opinion where conflicts of interests and expertise can be overcome by the parliamentary method of public discussion and voting.

★

Further doubts arise when Mr Hoffman's programme is examined for its economic advice. His programme can be reduced for the purposes of discussion to four points.

1. There should be a substantial measure of co-ordination of national fiscal and monetary policies.
2. Exchange rates should be allowed to adjust themselves freely, subject to the general supervision of the International Monetary Fund.
3. A central reserve of foreign exchange should be created so that the reserves of individual countries do not feel the whole impact of disturbances in the flow of trade and payments.
4. Trade and commercial policies should be aligned sufficiently to ensure that integration is not strained by conflict between them.

What Mr Hoffman calls "these fundamental requirements" are designed to create a single European market. And it is clear that he and his advisers see in such a programme the one sure way of giving Europe's business men the shock and tonic of competition, of preventing the further growth of high cost industries and of releasing trade from its present bilateral channels.

In principle the objective and the programme are right. They are right in the sense that the Baruch proposals for international control of atomic energy are right, or in the sense that proposals for the unification of the American armed forces are right. But are they right in the sense that they can, and will, be carried out effectively by all concerned, and in the sense that they will achieve the short-term results expected of the Marshall Plan? Quite clearly, in these two senses, they are not right. They could only be right if Mr Hoffman and the Ministers sitting in the OEEC felt able to give confident and affirmative answers to four questions: first, are such measures likely to be taken by the present—or likely future—governments of the participating countries? Second, have the governments the power to force or persuade producers and trade unions to face the consequences of such policies in the shape of competition and unemployment? Third, would they produce lower costs, higher productivity and the ability to compete more vigorously in the dollar world? Fourth, would they solve the dollar problem before 1953 to the extent laid down in the Marshall Plan?

It is wiser to admit frankly that the answers to the last three questions will be guesses, based on more or less scanty evidence from the work of the last two years. And it is reasonable to assume that governments will not—indeed dare not—commit themselves to a policy of integration until they feel they can go beyond guesses about its effects. So delicate are some of the issues involved that no minister at OEEC cares to mention them publicly. Does the pooling of reserves of foreign exchange mean, for instance, that Belgium would be able to draw upon British gold reserves? Would not the disappearance of European trade barriers

in the immediate future mean that British exporters, already denounced for seeking easy markets in the sterling area, would seek them in Europe and so have still less to offer in the dollar market? Can Europe and its overseas dependencies in fact produce, without at least five years' notice, many of the goods they need from America? And in what sense can one talk accurately of co-ordinating the domestic financial policies of countries such as Britain, France, Italy and Greece whose governments and citizens have such different standards of tax collection and payment? Let it be admitted that these questions are in the long run soluble, and that the habits of co-operation created in the last two years make them more easily soluble now than when the Marshall Plan was launched. Even so, can it be seriously argued that the effort to grapple with them in time to impress Congress before next April will not make more difficult the concerted effort—such as it now is—to solve the dollar problem by 1952?

★

It would seem that discussion of integration in Europe in purely abstract terms has reached deadlock. Mr Hoffman issues a warning against dismissing the whole idea as a "merely romantic possibility"—and most people will agree, not with any reluctance but with enthusiasm, since the idea of closer association in western Europe commands enormous support in public opinion. But the European governments—and notably the British—say that, though they are willing to impose sacrifices on their people in such a good cause, they are not empowered to sign any blank cheques—and again everybody must agree. Agreement in principle and inaction in practice have already gone as far as is safe. The avoidance of issues by creating new international bodies to discuss them has already gone further than is wise.

The only way out of the dilemma is for somebody—and it can only be Mr Hoffman himself—to get down to brass tacks. What exactly, in precise terms, is the contribution that "integration" could make to the solution of the European economic problem by 1952? What are the sacrifices that it would impose? And on whom? Until the answers to these questions can be formulated, in public and in some detail, neither Congress nor the American public nor the European public opinion to which the governments are responsible, has any means of judging whether the European countries are, as charged, failing to do something that they could reasonably be expected to do.

The first and fundamental question is this: if the Americans insist that "integration" is the condition of further aid, let there be agreement as to what precisely the word means. Does it mean simply a return to the conditions of 1938, or of 1928, through convertibility of currencies and liberation of trade? If so, that is perfectly feasible—so long as there is no question of convertibility with the dollar world. If not, if it means something more than existed before the war, or before the Great Depression, then how much more? Does it mean unification of economic policies on a scale which would only be possible through radical changes in the political and industrial structure of Europe? If "integration" has this meaning, let the fact be faced that the attempt to achieve it might gravely frustrate present efforts to solve the dollar problem. If this judgment is right, then the next question to put to the Americans is this: will they

underwrite the costs of the experiment? If the execution of Mr Hoffman's programme would delay Europe's progress towards selling more and buying less in the dollar markets, would Congress not only maintain the volume but increase the duration of Marshall aid? If it would, then one set of arguments against Mr Hoffman's proposals would fall to the ground.

America understands by "integration" what the word really means—a political, as well as an economic revolution in Europe, something more drastic and speedy than can be undertaken within the limits of the Council of Europe—will it give governments the time to work out and agree on a practicable scheme? To pretend that this could be achieved in time to save the Marshall Plan is in the present state of Europe indeed "a romantic possibility." But it might be—indeed it should be—possible to lay in the next two or three years the foundations of the new political structure in Europe without which economic integration—in the full sense of the word—can never be achieved. The means do not yet exist for persuading governments, business interests and

the ordinary voter that the sacrifices which such integration would involve are tolerable in the short and beneficial in the long run. There is no forum for European debate save the infant Council of Europe; there is no agreed democratic procedure by which national policies can—in Mr Hoffman's phrase—be co-ordinated.

In short, America has the power, if it will be patient, to impel Europe along the road to real integration; but it must recognise the fact that it may take a generation of planning and adaptation to reach the stage at which it brings real economic benefits to the Continent. It has also the power to persuade Europe to take all the risks involved in quickly creating a free market—if it will underwrite the venture. What is not possible, what might indeed shatter the Marshall Plan and frustrate the whole purpose of American policy, is a spectacular attempt to combine short-term recovery with a long-term reorganisation of Europe, to telescope into one great act of policy a process which took over three generations to complete in the preindustrial United States.

Tighter Credit, Lower Taxes

THE re-animation of the British economy, as previous articles have argued, can be brought about only by liberating its motive forces. At present, in this country, there is far too little incentive to a man—be he manager or bench-hand—to give of his best where he is or to move to where he can do better. What is perhaps even more important, there is no sanction upon him if he gives of his worst. Self-interest is not the only motive of economic activity; but it is the most powerful single motive, and the object of any soundly-conceived economic policy must be to enlist the individual's self-interest in support of the community's needs. Only when the attractions and pressures that bear upon the individual push him in the direction that the nation's needs require, will his energies be fully harnessed.

In order to create the necessary freedom of movement, and the competitive urge necessary to secure movement in the right direction, the preceding article of this series suggested a five-point programme—(1) enough disinflation to make money hard enough to get; (2) a reduction of taxation to make money worth getting; (3) the maximum possible removal of controls upon prices, wages and production; (4) a sincere attack upon all

private restrictions on trade; (5) special measures to prevent the liberation of prices from unduly penalising the poor or endowing the propertied rich. This fifth point is, in essence, a modification of the second and third and need not be separately considered. The other four require, however, some expansion; the present article will deal with the first two, leaving the other two for later treatment. A final article will then deal with the political prospects of acceptance of any such programme.

Disinflation

To call for a policy of disinflation at this stage may seem, at first sight, to ignore everything that has happened since the fall of Dr Dalton two years ago. Has not Sir Stafford Cripps been busy disinflating ever since? He has certainly tried, and it is true that he has piled up a Budget surplus without parallel anywhere in the world. But the proof of the pudding is in the eating, and as is pointed out by the "Report on Internal Financial Stability" just published by the OEEC in Paris, inflationary conditions persist in the United Kingdom although they have ceased in most of the rest of Europe.

£1,000 ON RETIREMENT...

... at age sixty-five, or on previous death, may be assured through an endowment policy for an annual outlay of £25 12s. 6d. from age thirty. Only £4 18s. 4d. more secures the right to participate in profits which, if maintained at current rates, would yield a further £607 by way of reversionary bonuses at age sixty-five.

The premiums for other sums assured, ages or terms of years will be quoted on application.

OUTSTANDING VALUE IN LIFE ASSURANCE

The disinflationary policy will not have succeeded until it has produced the disinflation—that is, until it has brought the aggregate of demand for all goods and services and settles down to, or just below, the aggregate of supply.

The fact is that disinflation cannot be secured by budget surpluses alone—certainly not when the burden of taxation is as high as it is in this country today. The OEEC report, though it is too politely official to make the point explicit, makes it nevertheless very clear. Those countries that have succeeded in bringing their internal inflations to an end have done so—in some cases in spite of budget deficits—by using the old-fashioned weapon of credit control. The same will have to be done in this country. The rate of interest need not be—and in European countries has not been—the direct instrument employed, though it would be bound to be affected. But what the OEEC calls “quantitative and qualitative restrictions on credit” provide an instrument at once delicate and powerful. If disinflation is to be made effective in this country, the Bank of England will have to do what it has almost forgotten how to do—it will have to restrict the cash basis of the credit system and force the banks to restrict credit. It need hardly be said that such a policy would have some unfortunate consequences—not least upon the debt operations of the Treasury. But there is no other way to secure an effective disinflation, and an effective disinflation is the essential preliminary to any policy of economic liberation.

It is unlikely that the policy of credit restriction would have to go very far. The creation of even a tiny excess of supply over demand can have almost magical effects, as Continental experience has demonstrated. Nor is there any cause to be bemused by the fact that some Continental countries—notably Germany and Italy—have suffered from large-scale unemployment. There are special reasons in each case which do not exist here; Britain is not in a state of Malthusian over-population as is Italy, nor is its economy as dismantled and dismembered as the German. There is no need either to wish for, or to fear, mass unemployment here. All that is needed is to move from hyper-full employment to merely full employment, reasonably defined. There are plenty of means (as the OEEC report again points out) of checking any tendency to go beyond that.

Tax Reduction

It is no accident that budgetary disinflation has failed to gain its objective. The theory of the matter is that a budget surplus is necessary in order to cover the investment programme—that is to say, that the state must do the saving that the public fails to do. But if the taxation necessary to create the surplus reduces private saving and encourages drafts on private capital, then the process is self-defeating. High taxation is both enervating and inflationary. As Walter Bagehot wrote to Gladstone in 1863:

Indirect taxation so cramps trade and heavy direct taxation so impairs morality that a large expenditure becomes a great evil.

Moreover, these effects of taxation are likely to be cumulative. A budget surplus produced by high taxes may, in the first year, produce quite a disinflationary effect, as it did in 1948. But gradually the demoralisation of high taxes gains ground. In the second year, a larger surplus would be needed to gain the same effect—as

1949 has shown. No surplus, however large, can expect for ever to offset the cumulative inflationary effects of an intolerable level of taxation.

A sharp reduction of taxes is therefore a necessary part of any sound economic policy. In 1948 the total of taxable income (including transfer incomes) was £10,338 million, and the total of taxes collected by the central government, the local authorities and the insurance funds was £4,162 million, a proportion of almost exactly 40 per cent. It has been held that any level of taxation in excess of 25 per cent is likely to be inflationary. The evidence for this figure is not very strong, and in any case it is out of practical reach for this country in the present generation. But it is essential that some practical target, in terms of the national income, should be set for a programme of tax reduction, and it is suggested that, for the immediate future, the aim should be to reduce the total burden of taxation to not more than 35 per cent of the total of taxable incomes. For the year 1948, that would have indicated a total of £3,618 million; and in that year the local authorities and social insurance funds collected (by coincidence) exactly the odd £618 million. In 1949 the total of taxable income will have been somewhat larger, but so will the exactions of the insurance funds, and probably of the local authorities. The resulting round figure is a temptingly convenient one: for policy-making purposes, the target can be set at a revenue for the central government of not more than £3,000 million. This is £633 million below the budget estimate for the current financial year. If revenue is to be reduced by this amount, the policy of disinflation requires that expenditure be reduced by a like amount—or very nearly, since a reduction of taxation would lead to some increase in private saving. The objective is, therefore, that about £600 million be cut out of government expenditure—that is out of the total envisaged in last April's Budget.

★

This is a tall order—but not an impossible one. The most obvious place to start cutting is in the food subsidies. The gross cost of these was fixed in the Budget at £465 million. All parties have hitherto hesitated to reduce these subsidies because of the effect that such action would have on wage demands. But in the circumstances that are here contemplated, this risk could be faced. The whole point of the disinflationary policy is to create conditions in which prices and wages can safely be allowed to move. The devaluation of sterling by as much as 30 per cent provides some room for manoeuvre, and if an increase in food prices, leading to an increase in some (but by no means in all) wage rates, formed part of a programme the rest of which created definite premiums on efficiency and cost-reduction, the economic risk of removing the subsidies could safely be taken. As *The Times* recently pointed out, their total value to the average consumer is only the equivalent of 15 cigarettes a week. It is ridiculous to say that they cannot be cut out.

If the food subsidies were abolished, it would be right and proper to make some compensating increases in family allowances and in old age pensions—as well as to take other steps (to be mentioned in the next article) to protect the poor. But it should be fully possible to reckon a saving of £375 million to go towards the target of £600 million.

The next largest contribution must come from the social services, particularly from those that have expanded most rapidly. It is to be hoped that the necessary economies could be secured without reducing the scope of these services—that is to say, without taking away any facility that has been provided. But the principle of completely free service must go. Facilities and benefits should continue to be provided at a fraction of their cost, but there is no reason why those who can afford to pay should not pay something, not only for their prescriptions, but also for their spectacles, their teeth, their food in hospitals and their secondary education. The money that would be brought in by this means would be small; but the restraint on expenditure that it would exert might be large. Health, insurance and education were together estimated to cost £866 million in 1949-50; it should not be impossible to reduce this to £750 million without reducing the scope of the services. If not, then, regrettably, the scope will have to be reduced.

This would leave £150 million to go. How much can be found out of the Defence vote, without dereliction of international duty, it is next to impossible for the layman to say. What he can say with certainty is that the country is not now getting £760 million worth of value out of its defence expenditure and that it is difficult to see why the Ministry of Supply should cost anything like £121 million a year. Between these items and the other classes of expenditure, the remaining £150 million will have to be found. There is no very apparent reason why the “Geddes Axe” should have become, in these latter years, a term of abuse. If the departments cannot do their own cutting, an independent committee of investigation serves a useful purpose. All decisions of policy continue to rest with the Cabinet; but it would be most revealing to have it brought out into the open what different policies actually cost.

★

If the money could be saved, the remaining question would be how the tax reliefs should be distributed. A strong Government would do this on one principle only: it would choose those reliefs which would provide the

sharpest incentives to increased economic efficiency. This means that no part of the money saved should be wasted in reductions of sumptuary taxation, such as the duties on tobacco, alcohol or betting—unless, indeed, reductions in the rates of these duties are necessary, as they soon may be, to maintain the total yield from them. It also means—regrettably on social grounds—that any reconstruction of the income tax allowances in the interests of population policy will have to wait for a few years.

The first use to which any fund for tax reduction should be put should be to cover the cost to the revenue of replacing the present PAYE system by one less obviously deterrent to extra effort and of re-modelling the system of taxation of profits “ploughed back” by industry—the lines on which these reforms should be carried out have often been explained in these columns. The second priority should be a reduction in the rates of surtax—at least those charged on earned income. The combined maximum of income tax and surtax should be reduced to 15s. in the £, with corresponding reductions lower down the scale. This change would, of course, be hotly attacked, but it would cost comparatively little, and there cannot be any real doubt that it would remove what is at present a very heavy deterrent. As was suggested last week, this might well be accompanied by some further limitation of inheritance. Any further limitation of a man's right to leave property to his own children might, indeed, be an unwelcome deterrent and should therefore be avoided. But some application of the Rignano principle, to avoid permanent inheritance, coupled as it would be with remission of surtax and of taxation on profits ploughed back, might well have the opposite effect. The third priority in tax remission should be the standard rate of income tax, every shilling of which brings in, in round figures, £150 million. And if anything further were left over, the purchase tax should be the residuary legatee.

It is not claimed that such a policy of cutting expenditure and taxation would be popular—only a strong government fresh from the polls could contemplate it. But it is claimed that it would have a most powerfully stimulating effect upon the national economy.

A Costly Experiment

IN spite of the gloss which Mr Strachey has been wont to put on his replies to questions about the progress of the East African groundnut scheme, everyone knew that the report of the Overseas Food Corporation, once it was forthcoming, would reveal a sorry tale of misjudgment and mismanagement. It was known that the scheme had so far cost the taxpayer £23 million, with no margarine to show for it; it was known that this sum, amounting to nearly half the corporation's total permitted borrowing for all its projects, was not the end of the development expenditure. What, however, was not known, or even expected, was that the auditors should make reservations on the accounts. It comes as a shock that they can say of a public corporation, financed by public money and responsible to a Minister of the Crown who was himself responsible for appointing its directors, that

We are unable to report that in our opinion proper books of account have been kept by the Corporation and that we

have obtained all the information and explanations which, to the best of our knowledge and belief, were necessary for the purposes of our audit. . . .

It need hardly be said that the corporation has provided an explanation for the failure disclosed by the auditors. When it took over control from the United Africa Company (Managing Agency) in March, 1948, it found that the accounting organisations both of the managing agency and many of its contractors had been unequal to the demands made on them by the speed with which the scheme had been launched and the consequent heavy rate of expenditure. It then found itself hampered in setting up its own accounts system by the shortage of experienced accountants. All this is doubtless true, and the Government has no difficulty in accepting it—which is not surprising since the Minister of Food must shoulder much of the blame for the haste and since the Ministry's own Internal Audit Division was supposed to be undertaking this task for the managing agency in East

Africa until the corporation took over. Nevertheless, it must arouse serious misgivings that the expenditure of public money can be treated so irresponsibly. In private enterprise, reservations of this sort by the auditors would be followed by searching questions on behalf of the shareholders, if not by resignations from the board concerned. Is there one standard of commercial morality for private enterprise, and another for the public corporation?

Yet what is most wanted at the moment is some proof that the groundnut scheme—or sunflower scheme—or, as perhaps it might best be called, the Tanganyika development project—can be run on sound business lines. The report is for the most part an apologia. It deals with the difficulties that were encountered in the first two years of operations rather than with future possibilities. Not the least of these—though it is one that has hitherto received little attention—was the system of cost-plus contracting which it inherited from the managing agency. That land clearing in Africa should have been launched on this system on such a large scale, before experiments had been carried out to show how easy or how difficult it would be, seems fantastic. Again it can only be explained by the haste which the Minister of Food enjoined on the United Africa Company, and one can only be relieved that the cost-plus stage of the contracts is, according to the report, due to come to an end this year.

★

It must be admitted that the prospects of making the scheme into a commercial proposition are not bright. So far as is known at present, the programme of development is to be limited to 90,000 acres at Kongwa and 90,000 acres at Urambo, with presumably some experimental plantings in the Southern Province. This limitation of programme was decided on early this year, and it may be that since then, and since the end of the period covered by the report, further plans have been brought forward. But 200,000 acres, at so large a capital cost, does not even begin to look like a sound economic proposition; nor can it justify so large an administrative structure as at present exists in East Africa and in London.

It is therefore tempting to suggest that the whole scheme should be handed over to the Colonial Development Corporation. From the first, it should have been treated as a piece of colonial development, rather than as a means of increasing the margarine ration, and it is worth noting that the most favourable parts of the report concern benefits for Tanganyika rather than for the United Kingdom. For instance, the corporation, contrary to expectations, has had no difficulty in recruiting African labour, and when it is considered that most of the European workers lacked previous experience of handling African labour, the complete absence of labour troubles among the Africans is very much to the corporation's credit. There has certainly been a far too high turnover of the African labour supply; but this is a common experience of employers of East African labour, and the corporation hopes to be able to reduce the wastage by providing good living conditions for the men and their families. A more serious drawback has been the poor quality of the so-called skilled African labour. The corporation has, therefore, set up its own training centre at Ifunda where Africans, who are indentured for four years, are given six months' training

and then sent for three and a half years further training on the job. It is also important to note that it is not only artisans who are trained at Ifunda, but recruits for the corporation's hospital and sanitary services, and it is believed that the Tanganyika Government will send its own students for training at the Ifunda medical school.

This is a small but definite example of how the introduction of capital into a colonial territory breeds development and welfare. Another is provided by the corporation's hospitals which, established to meet the needs of its own employees, provide a service to thousands of Africans who are not employed by the corporation or its contractors but who flock for treatment sometimes from as far as a hundred miles away. Here again the corporation is obviously filling a need which ought properly to be filled by the Tanganyika Government had it the resources.

★

Mention might also be made of the improvements in transport that have followed or are preceding the corporation's activities. But it cannot be emphasised too strongly that all these benefits of colonial development to Tanganyika cannot be maintained without a sound economic foundation. If, when the full £50 million has been spent, the corporation still has little or nothing to show for it in the way of a profitable export, its hospitals, schools, native villages and training centre will close down with the whole scheme. For this reason, however logical a transfer of the groundnut scheme to the Colonial Development Corporation would appear to be, at this stage, it would probably do more harm than good. The bureaucratic methods and organisation which that corporation unfortunately seems to be evolving might well have prevented the extravagant mistakes of the groundnut scheme's first two years. But now they would probably kill whatever chance it has of pulling through.

What, however, does seem essential is a complete reorganisation of the Overseas Food Corporation in London. It is difficult to see how public confidence in the scheme can ever be restored if those at present responsible for it remain in charge after the publication of the auditors' report. And until confidence is restored, the scheme will continue to be a prey to all the press and political sniping that has followed it to date and does much to undermine the morale and confidence of those who work for it. It should also be considered whether the corporation should not be severed from the Ministry of Food—at least so long as the present Minister holds his post. Since Mr Strachey has become so closely identified with the scheme in its first ill-fated years, and is in fact personally responsible for the disastrous speed with which it was pushed forward; since, too, he is a Minister who stirs up bitter political opposition, his continued responsibility for the scheme to Parliament will mean that it will continue to be treated as a political issue, which it never should have been allowed to become. It is to Mr Strachey's credit that he saw at once, in 1946, all the benefits that the scheme might bring. His mistake, and the mistake of those who have so far run the scheme, was that they thought the cost did not matter. The time has now come for the cost to be scrutinised very closely indeed. Until there is clear evidence that some hard-headed business methods have been introduced, the public will continue to treat the scheme as a good idea gone very, very wrong.

Dr Malan and the Protectorates

THERE is nothing new about Dr Malan's claim at a political meeting last week that his government should take over the three native protectorates in South Africa—Basutoland, Swaziland and Bechuanaland. The claim has been made by each successive South African government for the past thirty years. The circumstances now, however, are very different from the circumstances in which the previous claims were made. As head of a party which came to power on a nationalist programme, Dr Malan has already stated that he regards South Africa's status in the Commonwealth as similar to that of India: South Africa is an independent nation which, in the fullness of time, will become a republic. The protectorates, therefore, are to be regarded as colonies of an "external power" within the borders of the Union, and this, he claims, is a direct infringement of the sovereignty of the South African Government. Dr Malan's claim, unlike the claims of his predecessors, General Hertzog and General Smuts, is thus an open challenge to the government at Westminster. He has doubtless calculated that his claim is much more likely to succeed in this form than in any other. For, if there is one point on which Westminster, in its dealings with the Dominions, is more sensitive and more likely to give in than on any other, it is that of sovereignty. The question of the protectorates, however, will almost certainly prove to be the exception to the general rule.

The present position of the protectorates was established in a schedule to the South Africa Act of 1909. The schedule provided that they might eventually be transferred to the Union by an Order-in-Council, that until then, they should be administered by the High Commissioner for the United Kingdom, that they should not be exposed to differential duties, and that the tribal lands should not be interfered with. In his second reading speech, however, Mr Asquith also made it clear that the transfer would not take place without discussion at Westminster and without consultation with the local inhabitants.

Since the Pim reports in the early 1930's, the protectorates have been administered virtually by the Colonial Office through the High Commissioner, who has carried out there the same colonial policies of development and gradual transfer of legislative authority as elsewhere. The population of all three protectorates amounts to about one million people, of whom slightly more than half live in Basutoland; this is the most fertile land of the three and the only one completely surrounded by South African territory. Bechuanaland borders on Southern Rhodesia—which has barely concealed designs on its northern districts—and Swaziland touches Portuguese East Africa. There are a few scattered European settlements in each country, but the native interests predominate in the policies of the

administration and strict regulations prohibit the exploitation of the natives in any way.

The transfer of the protectorates to the Union would mean a number of important changes to the inhabitants. In the first place they would be subject to the restrictive laws which govern the black and coloured races in the rest of South Africa. It is probable that the South African Government would turn large areas of the protectorates into native "reserves," but even so the inhabitants would lose a great deal of their present freedom. They would, among other things, have no power to restrain the land-hungry farmers in the neighbouring districts from taking fertile fields from them. Above all, under the present government, they would have to submit to the naked tyranny of the *apartheid* policy, exercised by men who are bitterly opposed to the principles which govern British policy in other African territories.

★

Dr Malan's case is said to contain some twenty points. Of these the most important are, likely to be first, that it

is wrong for an "external power" to control territory within South Africa's borders. (The fact that that power is Britain makes the situation appear worse in his eyes, for it implies that a few threads of the apron strings which once bound South Africa to Westminster have still not been cut.) Second, the Nationalists choose to regard the protectorates as potential bases for a Bantu revolt against white supremacy in the rest of South Africa, and therefore argue

that they should come under the Union's direct control for security reasons. Third, Dr Malan alleges, as his predecessors did before him, that the bad agricultural practices and poor health of the inhabitants are threats to the economy and health of the rest of South Africa. Fourth, the belief has more than once been stated that the Union cannot develop its raw material resources and its domestic market without taking in the protectorates. Fifth, it is argued that the political ideas which the British Government is fostering in the protectorates are against the policy of the South African Government, and that if these ideas spread through the country as a whole, they will constitute a serious threat to the European population. Finally, Dr Malan may boast—not without justification—that his government has administered the native reserves, of which the two principal areas are the Transkei and Zululand, very much more efficiently than Britain has administered the protectorates—that the natives in the reserves are healthier and wealthier, that the land is better farmed and that the social services are better organised and more extensive.

There is much to be said for many of these arguments, but the prime concern of any British government must

be for the Bantu inhabitants. If it was wrong to hand the protectorates over to General Smuts and General Hertzog with their comparatively mild native policies, no political party in Britain today could conceivably surrender them to the present government in South Africa. During their eighteen months in office, the policy of Dr Malan and his colleagues has been dominated by fear and hatred; each successive step in *apartheid* has meant one more turn of the screw on the Bantu. The inhabitants of the protectorates would in any case have to be consulted before any transfer was made, and in the present state of affairs there can be little doubt of their answer.

Dr Malan's next step will probably be to persuade both Houses of the South African Parliament to present an Address to the Privy Council, formally asking for the protectorates to be merged with the Union. He will face little opposition in South Africa, for it is a move which General Smuts himself has often discussed and which is provided for in the South Africa Act. It is, however, difficult to think of any member of the Parliament at Westminster who will not oppose him, and the Privy Council would almost certainly reject the Address. What is likely to happen then?

If Dr Malan was unwilling tamely to accept an adverse verdict from the Privy Council, three moves would be open to him. He could seize the protectorates by force, thereby virtually declaring war on the United Kingdom

and probably starting a native revolt throughout South Africa; he could seek the support of other members of the Commonwealth, on the grounds that the United Kingdom was infringing the sovereignty of the Union; or, by applying sanctions in a number of different ways, he could bring the economy of the protectorates to a standstill, thereby forcing the British Government to take some positive action which he might be able to turn to good account later. Of the three moves, the last is the only one which is at all probable.

Whatever Dr Malan does, once the Address is presented to the Privy Council, he will have taken an irrevocable step. Whichever train of events is set in motion, its result will be to strain the frail ties of the Commonwealth, already frayed by the behaviour of India and Pakistan in the Kashmir dispute. It may be that Dr Malan sets little value on these ties; some aspects of his policy suggest that he questions the very principles on which the Commonwealth relationship has been developed. But he presumably values the strategic and economic benefits which membership of the Commonwealth brings to the Union. It would be a mistake for him to believe that the power these represent can be enjoyed without some responsibility that it shall not be abused. For better or for worse, the inhabitants of the protectorates have been ruled the British way; there can be no question of their being handed over to be ruled the Nationalists' way.

London's New Towns

THE new towns programme was launched three years ago, primarily as a means of relieving congestion in London and other great centres. The Metropolitan Police District, which is almost wholly overbuilt, contained 8,700,000 people before the war and has about 8,350,000 today. From either a social or a strategic viewpoint, this is too large a population to be huddled close together, while the resulting cost to the public purse by way of measures for transport improvement, traffic control, smoke abatement, and expensive subsidies for flat construction is rapidly swelling. Even the reduction of the population by a million and a quarter, as proposed in the London plans, has been widely criticised as inadequate.

On paper, the task of attracting the surplus population to new centres beyond the green belt has made a good start. Development Corporations have been set up for eight new towns, at Harlow, Stevenage, Welwyn, Hatfield, Hemel Hempstead, Crawley, Basildon and Bracknell. However, this list includes the existing pioneer new town of Welwyn Garden City, which Mr Silkin has arbitrarily taken over, and some other towns which are already largely developed. The total additional population which the eight new towns will eventually accommodate is no more than about 250,000. Moreover, as the annual report of the Development Corporations for 1948-49 (HMSO 3s.) now reveals, building in the new towns has hardly begun. This slow start has its advantages. It has enabled careful plans to be made and public utilities to be laid on in advance of development. But several new towns—such as Crawley, Harlow, Stevenage, and Hemel Hempstead—are now in a position to go rapidly ahead, and further delays would frustrate

their whole programme and leave them with a topheavy administrative overhead—a danger that needs to be carefully watched in any case.

It is vital to the whole conception of a new town that it should be reasonably self-sufficient and not a mere dormitory for London workers. This aim will be frustrated if, as is the case with the estates that the London County Council is developing outside its own borders, the towns are filled with priority claimants from the housing lists of London boroughs. The proper basis for development, certainly the only one that can be economically justified at the present time, is to attract congested factories from London and let them bring their own workers. This method would relieve overcrowding in the metropolis quite as effectively as a scheme for direct rehousing; but since its equity is less obvious in Socialist eyes, there is some difficulty in getting the Government to accept it. There is no reason why each new town should not be linked to a group of London boroughs, so long as the initial linkage is industrial. There are said to be plenty of London factories willing to go to the new towns, if they were permitted to do so.

Given a good start with industrial development, and sufficient building labour, London's new towns have a real opportunity to lead the world in imaginative design. The plan for Harlow, for example, provides for a fine civic centre, a theatre and concert hall, a varied range of houses, and skilful use of the natural landscape. To achieve a balanced community, with wide opportunities for employment, is the aim of all the new towns. It is also important, however—and this may be in part a contradiction—that the new towns should pay their way,

and not be luxury show-pieces. The Development Corporations are rightly expected to balance their accounts over a period (albeit a long period). Already they are experiencing financial difficulties over housing, since there is no rate fund into which they can dip to cover current deficits. Their difficulties are increased by a cautious policy over land acquisition which has been enjoined on them by the Minister. This is no real advantage to the local inhabitants, who know that their land is likely to be acquired eventually. It can be a considerable disadvantage to the corporations, since the ownership of the whole town site is—as Letchworth and Welwyn have largely demonstrated—the best instrument both for controlling development and for balancing accounts.

★

The position of the Development Corporations is not wholly satisfactory. They have not the same popular roots as a local council, but they have not the independence proper to a public trading concern. They have already suffered from some harmful Government interference. For instance, the system of state management of licensed premises which has been extended to the new towns will impair both their social policy and their financial prospects. Any public control which was thought desirable could have been much better exercised directly by the corporations. The new towns are suffering from too much control by the Ministry of Town and Country Planning and too little assistance from other departments on such matters as the location of industry and the provision of building labour.

The course of wisdom is to give the development corporations much greater freedom of policy, but to back them with the facilities essential to success. If the investment cuts necessitate further delays, then it would be better to go ahead at a proper pace with a few of the new towns and suspend work on the others. This is a better alternative than letting elaborate plans and specialised staff hang fire while overhead costs mount up. The Government should give those towns which are being built sufficient assistance over housing and industrial projects to make their development successful and economic. For their part, the corporations would do well to recapture something of the more austere and pioneering spirit of Letchworth and Welwyn. Given a bold and consistent policy, the new towns can be triumphs of social engineering; given vacillations and uncertainties, they can become expensive white elephants.

★

The truth is that the new towns policy is not taken seriously either by the Government as a whole or by the

general public. Is the dispersal of London an important matter of public policy—in this atomic age—or is it not? If it is, then not only will the new towns policy have to be pushed on with much more vigour, but much more will have to be done in other directions. To decant a quarter of a million people, at a leisurely rate, to eight new towns does not amount to an effective programme of dispersal from the capital—especially when public policy in other fields is pulling in a contrary direction. The population of Greater London shows no signs of shrinkage to date. The LCC is proceeding with ambitious plans for rehousing its surplus population, but its main schemes—even of which have already been announced—are all located in or near the green belt, thus adding in effect to metropolitan growth and spoiling the conception of the London plans. Moreover, no scheme of dispersal can work without a much more effective control over industry and commerce throughout the London area than exists today. Even when a firm removes to a new town, there is little to stop a new factory from reoccupying the site. The central areas are losing population much faster than employment, with the result that transport congestion is again on the increase—and will be made worse by the LCC schemes. It can only be relieved at the expense of heavy public expenditure on roads and railways.

It is, therefore, essential that the Government should make up its mind whether it really wants to disperse a large segment of London's population. An effective policy of dispersal would be difficult and costly in its initial stages. Unpalatable measures would have to be taken to prise industry and commerce out of central London. A large number of new centres, besides the existing new towns, would have to be developed and equipped with basic services in order to accommodate the displaced population and industry from London. Serious administrative problems would have to be overcome. The local authorities, including the LCC, would have to be harnessed effectively to the work of dispersal, instead of being allowed to pull against it. So would the various Ministries.

These difficulties no doubt explain why the Government is not carrying out the plan for London which has its official blessing. But the problem of London is far too intractable to yield to half-measures, and tinkering with it may do more harm than good. To build new towns at the present time, with all the attendant difficulties over building labour and public services, can only be justified as part of a wider policy. If the Government thinks that dispersal is urgent and important enough to justify capital expenditure at the present time, then it should put its full weight behind the speedy development of as many new towns as possible and follow this up with wider measures. If it is not, then it had better suspend the whole programme. Half-measures are the one certainly wrong policy.

NOTES OF THE WEEK

Back to Titus Oates

To many people the Chancellor of the Exchequer's announcement—it came out quite casually in a written answer to a Parliamentary question—that “in suitable cases” rewards will be paid to persons who give information to the authorities which leads to convictions under the Exchange Control Act must seem like the last straw. When Mr Churchill, in the course of the last General Election, predicted that the principles of Labour Socialism must inevitably lead to the creation of a British Gestapo, he was very widely derided. It couldn't happen here. It begins to look as if the country owes Mr Churchill an apology: it is happening here.

Exchange control is one of those departments of the law for which the public may—or may not—be prepared to concede a justification in expediency. It has no moral basis. How could it—since it prohibits transactions which were perfectly legal only ten years ago, and are still, in most people's minds, honest (though illegal) today? Yet this new branch of law interferes at countless points with the ordinary life of the ordinary citizen. It prohibits him from going abroad when he wants to, it prohibits her (if the ordinary citizen is a woman) from taking her normal jewellery with her, it involves such absurdities as a prohibition on the sending of stamp collections to schoolboys abroad. To enforce this collection of irritating restrictions, the secrecy of the mails can be, and is, violated in peace time. And now there are to be rewards to informers and relators; the state is deliberately to put a premium upon private spying and grudge-bearing, not among the criminal classes, but throughout the whole population. No form of economic control is worth this price. Away with it.

★

Unfortunately, exchange control, though it may be the most spectacular, is by no means the only instance of the growing arbitrariness of the state. The complex of recent enactments concerned with the public acquisition of and control over land provides a number of scandalous examples. As the law now stands Government departments and even local authorities can, in practice, take virtually whatever land they require, for any purpose that seems good to them, without having to secure the consent of any impartial body and without having to pay compensation that is satisfactory to the dispossessed owner. But if a private owner wants to do anything with his land, he has to submit to an almost endless array of controls and charges, all of them arbitrarily determined, some of them without appeal and even the rest permitting appeal only from one set of officials with a personal vested interest in the Town Planning Acts to another set of officials with the same vested interest. Disinterested common sense—the principle of the jury—nowhere enters in.

Two years ago, the Liberal Party introduced into the House of Lords a Preservation of the Rights of the Subject Bill. It should be revived, and those who have a concern for liberty should refuse to vote at the coming General Election for any candidate who will not pledge himself to support it. Absolute liberty is unattainable and, in this twentieth century, the state must have more powers over the persons and property of its citizens than the nineteenth would have permitted. But if we cannot go back to Magna Carta, we can at least re-assert some of the essential principles. One of these is that if the law creates offences that are not generally regarded as offences against morality, it does so at its own peril. A second is that any law that can only be enforced by methods that are repugnant to the basic liberties is a bad law. A third is that the acts of government are not *ipso facto* to be deemed to be in the public interest; on the

contrary, an officer of the government is more suspect than a private man of having designs upon liberty. A fourth is that no man, even if he be a town planner, ought to be judge in his own case. We are far gone in a peculiarly vicious form of *droit administratif* and it is time to rebel against it.

★ ★ ★

Plus ça Change

Those in France whose voices ring loudest in denunciation of the British contribution to Europe should stop to reflect on the impression made abroad by the behaviour of their own politicians and statesmen. It is a good moment for reflection, as the immediate past is rich in material. It has taken Frenchmen of the centre twenty-four days to find a new government; this is probably a new record among French cabinet crises. The ostensible cause of this crisis was disagreement about whether workers getting less than 15,000 francs a month should have a bonus, to tide them over the time it will take to unfreeze wage rates and return to collective bargaining between employers and trade unions. The real cause of the crisis was the desire of the Socialists first, and the Radicals afterwards, to show the constituencies that their first loyalty was not to the coalition but to the party, that the tail could still wag the dog. In fact they wanted their fling; they have all had it, while vital decisions over the future of the Council of Europe, over Marshall aid, over the future of western Germany were pending. It is that kind of behaviour that makes some people ask whether France is yet really *bündnisfähig*—alliance-worthy.

Now that there is a new coalition government, what is its watchword? M. Bidault, whose reappearance as Prime Minister should bring back a whiff of the robust spirit of the resistance, chooses the phrase “The minimum of austerity with the maximum of justice.” This, in face of an inflationary situation and a budget deficit, the proportions of which are discussed on page 1010 of this issue. What, too, is the first reaction of this government to the suggestion that the liberation of European trade should involve further reductions in French quotas? Shocked surprise and alarm at what the peasants will say. And to the urgently pressed suggestion that the Federal Republic of western Germany should be admitted with the most speed and the least fuss possible into the Council of Europe comes the reply that the Saar—the exact status of which cannot be defined by any lawyer in Europe—should be admitted at the same time. Was such a low trump really worth playing?

Unfortunately, the prospect is that this kind of politics will go on for another two years. French cabinets now have their crises outside the Assembly, thereby avoiding the risk that repeated votes of no confidence will bring a dissolution and new elections. The effect on the integrity of the older and the enthusiasm of the younger politicians is deplorable. So long as the authority of the French state and the will of its leading men remain so demonstrably weak, it is difficult to believe that France can take a leading part in the regeneration of Europe.

Division of Dollar Aid

Among the actions taken by the Council of the Organisation for European Economic Co-operation (OEEC) this week is a decision on how to divide Marshall aid in the final

two years. The new method avoids the two equally disagreeable alternatives that confronted the organisation—either to pass the job back to the Americans or to repeat twice again the bickering performance of last summer, when it tried to reconcile the dollar requests from individual member nations with an inadequate total allotment.

For the next two years ECA will be asked to distribute the available dollars in proportion to the sums received by each nation in the current 1949-50 year. When drawing up their future programmes, the Marshall nations have been told to assume that they will receive three-quarters of their current dollar aid in 1950-51, and one-half of the current total in 1951-52. At the same time the Council has laid down provisional totals for the amount of drawing rights (aid extended by European creditors to debtor nations) to be granted under the intra-European payments scheme in the remaining two years. Since drawing rights are based on the receipt of an equivalent amount of dollars they, too, will be proportionately reduced. Greece is the sole exception; it will receive the same number of dollars and drawing rights next year as in the current period.

The new scheme is a sound one and will release much of OEEC's energies for work in more constructive channels. It rests, however, on two important—but precarious—assumptions that Congress will vote another two years of Marshall Aid and that it will vote the sums on which OEEC is now counting.

★ ★ ★ ★

Inquest on the Boundary Commission

There was a lively debate in the Commons on Wednesday on the second reading of Mr Bevan's bill for winding up the Local Government Boundary Commission. The Opposition claimed that the Commission should have been kept in being to carry out minor and urgent adjustments, such as the regrouping of small county districts and the extension of overcrowded county boroughs. There have been no alterations in local government areas since 1939, and apparently there are unlikely to be any before 1952—since, under the Bill, no county reviews are to take place before that date, and the Government will discourage local authorities from promoting private bills. This arrangement will bear especially hard on the many county boroughs which urgently need land for housing. On many matters of detail, the Commission was doing a useful job—and could have done better, if the Minister had acceded to its request made two years ago for legislative assistance on some minor points.

Mr Bevan's reply was to assert that the Government was working on major proposals for the reform of local government, which would render any minor adjustments abortive. Rather ingenuously, Mr Bevan stated that he had hoped that the Commission's plan would wring either a general acceptance, or some alternative scheme, from the local authority associations. He realised now—what he must have known all along—that an agreed plan was an impossibility, and that the Government must take the initiative itself. This is a welcome, if very belated, recognition of Ministerial responsibility. It does not explain or excuse the Minister's delays and discourtesies in dealing with the Commission, or his failure to have its plan debated.

Mr Bevan has stuck his neck right out this time. He will find it very hard to produce a plan which is less unpopular and more statesmanlike than that put forward by the Commission itself. Any alternative plan must either be more drastic—which would arouse fierce local opposition—or else much less effective. If, on the other hand, the Minister fails to produce his plan, his whole policy becomes inexcusable. These considerations will be some compensation should he be removed from office by the election.

End of a Refinement

The abolition of the 2s. 3d. price limit on meals served in certain catering establishments constitutes one of the first of those withdrawals from “refined” control by the Ministry of Food to which Mr Attlee alluded when announcing his economy programme last week. The consequent saving of expense and manpower, though not likely to be large, is perceptible; and every little helps. It seems likely, however, that the economy cue has been welcomed by administrative common sense as an opportunity to press for the ending of what was, in fact, hardly more than a gesture of class discrimination. The five-shilling limit remains, for the time being, to placate the chronically envious—even if their approval of it is based mostly on misapprehension. True, it does not much reduce the amount spent in restaurants, nor, indeed, achieve anything much beyond complicating the customer's bill; but it looks, from a distance, as though it prevented the rich from enjoying themselves as they pleased, and accordingly has political value.

The 2s. 3d. limit did mean more than this, since it marked the dividing line between establishments receiving, or failing to receive, preferential quantities of meat and other rationed goods. Thus it served the purpose of increasing the buying power of lower incomes and formed part of that Heath-Robinsonian contemporary apparatus of subsidy, tax, and general sumptuary discrimination which does so much to make extra money less worth earning. It does not, of course, follow that all those establishments which have hitherto been serving meals below the 2s. 3d. limit will now raise their prices, any more than the great majority of restaurants now working under the 5s. limit would raise theirs at the first legal opportunity. In both cases it is the pocket and the tastes of the clientèle served by each caterer which determine what prices it is most profitable for him to charge. One suspects that here, and in many other fields where prices are controlled (at considerable administrative expense) in the supposed interests of the buyer, the removal of the controls would in most cases make very little difference. It takes just as elaborate and costly an apparatus to sustain the consumer, as it were, a couple of inches above *terra firma* as to hold him safely up over the deepest abyss of exploitation. There must be other instances, outside the catering trades, offering scope for the demolition of superfluous safety devices.

Agreement on Indonesia

The long conference on Indonesia is over. It ended on Wednesday, as it began ten weeks ago, with a plenary session in the Ridderzaal at the Hague. Generally speaking, agreement has been reached on all the most important points under discussion, and a draft constitution for the new Republic of Indonesia has been drawn up. So far so good. It would be idle to pretend that the present degree of agreement was a foregone conclusion, but it cannot be claimed that all is over in Indonesia bar the shouting. The new agreement has still to be ratified by both the Dutch and Indonesians; this is supposed to take six weeks, during which there may be some fierce arguing at the Hague as well as in Jogjakarta; and the experts have still to work out a great many details. Then, when the time comes for the actual transfer of sovereignty over the end of the year, Dutch troops, many officials and some private citizens will have to be withdrawn, and the new Indonesian government will have to get to grips with some ugly economic and internal political problems. There are thus plenty of rocks ahead.

What has been achieved looks like a fairly good agreement so far as it goes. It includes a statute for the Netherlands-Indonesian Union and a charter of sovereignty which accept the basic Indonesian claim to complete independence—like that of India. It includes a last-minute compromise on outstanding Indonesian debt—by appointing a special commis-

sion—and on future Indonesian banking policy. It establishes a transitional military period of between six months and a year during which some 80,000 Dutch soldiers, sailors and airmen will either withdraw or be absorbed into the new Indonesian federal forces. And in the provisional constitution—embodying two advisory legislative chambers, a president, prime minister, and inner cabinet of five—it points the road towards eventual elections for a constituent assembly.

In their accord on all these and other matters, both delegations are to be congratulated. The Dutch delegates have recognised at last the inevitability of historical development and have taken the bull by the horns in spite of opposition from many of their countrymen. And the Indonesian leaders have proved themselves willing to learn from experience, although giving nothing away on their fundamental claim to sovereignty. Perhaps the most promising sign of all is that the Indonesians are already pressing several thousand of their experienced Dutch officials to stay on and see the young state born.

Simmering Kettle in Korea

The United Nations Assembly has decided to keep its commission in Korea, in spite of a serious threat against it made officially by the Foreign Minister of the Communist-controlled government of North Korea, Pak Heun-yong. In a letter to the Secretary-General of Uno and the chairman of the Assembly, he protested against the "unlawful" discussion of the Korean question by the Assembly and declared:

should the United Nations ignore in the future the will and strivings of the Korean people, . . . the Korean people . . . will reserve for itself the right to continue by the measures at its disposal the struggle for the immediate removal of the United Nations Commission from Korea and for the final unification of the country by its own forces into a united democratic state.

This arrogant language towards the majority of the nations of the world which endorsed the creation of the Uno Commission for Korea—language reminiscent of that which Japan once used towards the League of Nations—is only made possible for the North Korean Government because of its confidence in Soviet protection. The Korean Communists feel sure that nothing will happen to them even if members of the commission meet with death by violence; those members certainly remain in Korea at their personal peril.

The commission at present comprises representatives of Australia, (Nationalist) China, El Salvador, France, India, the Philippines and Syria. The Ukraine was originally elected but refused to take part. The Soviet position has always been that the Assembly has no jurisdiction in the matter and that none of its decisions in Korea have any validity—including its endorsement of the commission's supervision of the general election in South Korea, from which the present Seoul Government derives its mandate. In their repudiation of the electoral verdict accepted by Uno the Russians have produced one of the most remarkable of all their stories; they claim that the general election held by the Korean Communists in North Korea was also extended to South Korea, where, under the eyes of "the reactionaries and the foreign occupation authorities," 77.52 per cent of the electorate illegally voted and sent suitable delegates to the National Assembly set up in North Korea. On the basis of this claim—which naturally is immune from any kind of checking—the Communists claim that their regime is the choice of both North and South Korea and they have been increasingly vehement in expressing their intention to subdue the south by force.

The struggle in Korea is already a shooting war in so far as fighting is taking place, but the main armies of the rival Korean governments are not yet committed. Since the withdrawal of the Russian and American occupation forces, the field has been clear for civil war, but the Communists have not hitherto tried to cross the demarcation line in force,

and have resorted only to local infiltration and support to their guerrilla supporters in the south. They appear to be testing the strength of the south before attempting a full-scale invasion; but this may come at any time, and its success would be a heavy blow not only to the United States, which has built up the South Korean state, but to Uno which has committed itself so definitely on the Korean question. The presence of the Uno Commission may still be a restraining factor and, as the American delegate said to the Assembly, "if a conflict should occur, the United Nations would have testimony from a duly constituted agency regarding its nature and origin and regarding the responsibility therefor."

Chewing Gum and the Cold War

Chewing gum is universally recognised as an essential part of the American way of life, and the incidence of perpetual motion to be observed in the jaws of the young provides in any country a reliable index of the degree of American cultural penetration. As the United States administered the Philippines for a generation and returned victoriously to the islands after breaking the naval power of Japan in the last war, it is not surprising that the habit of chewing gum is firmly established among the Filipinos, and the news that their annual bill for purchases of this commodity has quadrupled since before the war might seem at first sight to indicate an increase in human happiness satisfactory to consumers, sellers and anyone else interested.

Now Mr S. S. Nemtchina, the Soviet delegate to ECAFE (United Nations Economic Commission on Asia and the Far East) finds it a matter for grave reproach. At a recent meeting of ECAFE he accused the United States of giving exports of chewing gum priority over materials needed by eastern peoples for their industrialisation, thereby demonstrating its selfish and frivolous attitude towards the great problems with which ECAFE is trying to deal. In reply the American delegate said he sympathised with Mr Nemtchina's "dismay" at the size of the Philippines' gum bill, but did not know "what we can do about it," while the British delegate declared that "countries must be permitted to import whatever they like." The delegate of the Philippines was quite unrepentant and stated that "when we have money we buy chewing gum from America and caviare from Russia."

There seems, indeed, to be complete collusion between Americans who want to sell gum and Filipinos who want to chew it. Yet this is perhaps after all the primrose path of dissipation for a country whose economy has been none too healthy since the war, and such stern moralists as the Russians are naturally shocked at the foolish indulgence of consumers' desires. How much better it would be for the Filipinos if they got more machinery and less gum! But dynamos are no good for chewing, and if Filipino jaws were deprived of their customary pleasure, they might begin shouting for the overthrow of President Quirino's Government.

It is a dilemma often likely to occur in schemes for American economic aid or in schemes of dollar-lacking countries for rebuilding their economies. Nor is it only a difficulty to be expected among people who live under coconut palms and fail to take sufficient thought for the morrow. Even the British, who were once famous for the virtues of the Economic Man, suffer from so invincible an addiction to American tobacco that they refuse to close the dollar gap by cutting it out of their import list. It has been said that to compel the British people to smoke anything but Virginia cigarettes would be the one sure way of bringing about a revolution in this country. The democratic politician has to take account of such passionate preferences, and it is probable that the smokers of American tobacco and the chewers of American gum will continue to confront Mr Nemtchina with deplorable examples of unproductive and thoroughly bourgeois expenditure.

Propaganda for Savings

Lord Bruce's much criticised speech at the Guildhall National Savings rally, when he went out of his way to emphasise that money not spent now would rapidly lose its value, may turn out to have been less unfortunate than it seemed if it stirs those responsible for the National Savings movement to realise their own shortcomings. A little imagination in visualising the ordinary men and women to whom they are supposed to be appealing would have told them that this is precisely what people are saying to themselves, Lord Bruce or no Lord Bruce.

Granted that small savings are important, granted, too, that they are well worth all the official encouragement and propaganda that they get, surely it is necessary to think out more carefully the quality and tone of the appeal. If outsiders drop bricks from the Committee's platform, and parsons make public statements confusing Savings with Socialism, is not the movement itself to blame for failing to provide a suitable popular lead on the real meaning of small savings from the community's point of view?

The individual feels it is foolish to save while prices rise. The job of the savings campaign is to show how savings can help, in the aggregate, to bring them down. The individual saver buys savings stamps out of personal self-interest, and propaganda is right to appeal to this. But it is surely wrong to neglect the distrust and scepticism which are aroused by the paraphernalia of National Savings Weeks which have no obvious connection with economic crises, rising prices or threats of coming shortages.

It may be that the subject no longer lends itself sufficiently to a simple mass enthusiasm, to be suitably boosted by Savings Weeks, as it was during the war. Changed times may need changed methods. The essential point, however, is that if savings appeals are to arouse more than a merely derisory response, they must explain their real purpose clearly to the man in the street, who feels that a national campaign demands a simple common-sense national justification.

Cleaner Food

The cleanliness with which food is packed, handled and served is as much a matter of public opinion as of bylaws. If the public will tolerate old newspapers as wrappings, cracked and scantily washed crockery in public eating places, and fish on slabs exposed to flies and dust, local authorities cannot be expected to enforce regulations which are very far in advance of these general acceptances. Nevertheless the Ministry of Food has done well to publish last week a set of model bylaws concerning the conditions upon which local authorities should insist in the arrangements for handling, wrapping, delivering and selling food. They serve, in particular, to remind us how far we have sunk below even those modest levels achieved by 1939.

Visitors from Scandinavian countries, some of the Dominions and the United States, have been struck, even in prewar days, at the inadequate protection of food in butchers and fishmongers, bakers and street stalls, and at the insufficient care taken by those touching food. Shortage of wrapping materials during the war increased the dangers of contamination of food in transit, while the encouragement given to works canteens and communal feeding, coupled with very inadequate washing-up facilities, produced a sharp increase in illness due to dirty food and utensils. To complain about these conditions during the war may have been unpatriotic; not to complain now is equally so, yet ten years of bad habits have lowered the public's sensitivity. To be served with an unwrapped pork (*sic*) pie by someone who takes the money and strokes the nose of the next person's pike is no longer causes an internal qualm, much less an audible protest.

Wrapping materials are, however, becoming more plenti-

ful, and more food can thus be protected from infection in transport. But what happened to the pork pie before it acquired a concealing and protective covering has not in the past proved easy to investigate unless a customer died or was ill as the result of some improper ingredient—or germ provided by the person responsible for preparing it. The new bylaws, if they are adopted by local authorities, should greatly strengthen their hands, since they require the individuals concerned in handling food to observe proper precautions, and this much more explicitly than hitherto. Nevertheless it still remains true that until education raises the general level of cleanliness voluntarily, compulsory enforcement can only remove the worst abuses.

The Lords and Legitimacy

Last week, the House of Lords inserted into the Law Reform (Miscellaneous Provisions) Bill two amendments intended to relieve two specific cases of acute social hardship—the hardship may fall upon few, but justice is not a matter of numbers. One amendment was designed to secure that a child, once legitimate, should not be made illegitimate simply by reason of the avoidance of his or her parents' marriage. Certain causes may make a marriage ceremony void; certain other events, occurring after marriage, may make the marriage voidable. In English law as it is, a marriage declared void for any reason becomes void from its start, with the inevitable result that any children of the marriage automatically become illegitimate. It is difficult to think of any argument to support a legal rule that makes illegitimate, children who were legitimate when born.

The other amendment was one repealing what has become known in divorce law as the rule in *Russell v. Russell*, namely, that neither a husband nor a wife can be allowed to

The Economist DIARY

The ideal present for the busy man

A memorandum book, an appointments register, and a complete reference book, combined in a diary for the desk. Published by Messrs. Charles Letts & Co. Ltd. Price: in the U.K. (including Purchase Tax) 36/8, or 37/6 post free; overseas 32/6 post free by surface mail.

Full details are given in illustrated pamphlet available from:

**The Economist Intelligence Unit,
22 Ryder Street, St. James's, London, S.W.1.**

give evidence in court which would tend to make a child of their marriage illegitimate. A husband who was, say, a prisoner of war, and who returns to find that his wife has had a child during his absence, has been unable himself to give evidence that he could not be the father of the child, and why. He has been compelled, if he sought a divorce on those grounds, to call evidence from a Service department that he was out of the country, and for how long. The rule was described by Lord Merriman in the debate as an incubus and a nuisance. It has been in existence some twenty-eight years: the only appropriate comment on its removal is, "at last."

* * *

Seven Arabs in Search of Security

The apparent *aplomb* with which the Arab League has decided to draw up a collective security pact can be put down to three motives. One is fear of Israeli expansion; another is fear of the Soviet advance in Asia; a third is the anxiety of some members lest Iraq (which is the League's grumbler and recalcitrant) and Syria (which has lately wavered in its likes and dislikes of fellow members) might conclude some pact or partnership on their own.

There is an element of paradox in the first two of these motives. Arabs like to talk as if Israel were non-existent, or were bound to collapse, yet they will argue in the next breath that Jewish immigration on its present scale must lead Israel to seek *Lebensraum*, and that they must be ready to meet the threat. Likewise, Egypt and Iraq like to shout slogans about ousting Britain's treaty garrisons, while an Egyptian delegate to the current Arab League meeting can argue that "we smaller nations must be tied to one of the great Powers if we are to survive." When it comes to choosing which great Power it shall be, most Middle Easterners find Great Britain the least obnoxious. If the security pact matures (which is still doubtful) it implies a link with the western camp. Perhaps the idea of this link will be more easily sold to xenophobe electorates if each government can claim that it bears only one-seventh of the responsibility for adopting it.

*

It seems to have been the rumour of an intended merger between Iraq and Syria that hurried the three kings Farouk, Ibn Saud and Abdullah into unaccustomed unanimity, but too much importance should not be ascribed to it. The idea of such a union has considerable backing in both countries, and there are attractions in the thought of getting rid of the artificial frontiers drawn after the first world war. Yet, when they are analysed, the motives of its backers turn out to be little more than blind gropings after change—almost any political change—that might put an end to their countries' present unsatisfactory political systems and produce some economic or social improvement.

Moreover, influential groups are against the union, particularly in Syria. Large parts of the Syrian army do not want to play second fiddle to Iraq's bigger and better armed

forces, and the Syrian army has, at present, the last word in Damascus. In both capitals, those in favour of the merger are saying to visiting Britons: "All we want is a word of encouragement . . ."; but this they will not get from London. In present conditions the merger could only lead to quarrels, and any foreign influence that gave a word of encouragement would have all the blame thrust upon it as soon as things went wrong.

Czechs and the Churches

President Gottwald has announced that the problem of Church and State in Czechoslovakia has been "solved" by the new church laws which came into force last Tuesday. It is unlikely that he could find many to agree with him. The new laws (which have been reluctantly accepted by the Protestant Churches) do not provide a solution, but only the most powerful weapon which the Czech Communists have yet possessed in their protracted struggle against the Roman Catholic Church. Previous weapons, such as the arbitrary arrest and imprisonment of priests and the seizure of Catholic schools, monasteries, consistories and property, have proved remarkably ineffectual. The Government's attempts to muzzle the Catholic clergy have conspicuously failed and the separatist and subservient Catholic Action movement which it started has attracted only a handful of priests.

Under the new laws the state is given full and complete control over all church affairs, including salaries and the appointment of clergy who will be required to take an oath of loyalty to the state; and a new government department is set up to "unify" the administration of church affairs. It is as yet too early to tell exactly how the Government will use its new powers, but the appointment of Mr Cepicka, as head of the new department, does not augur a conciliatory policy. As Minister of Justice he has been prosecuting Catholic priests for treason.

The Government's new measures were undoubtedly designed to create a split in the Catholic ranks. Government propaganda has made much of a comparison between the lives of the Catholic hierarchy who "owned huge landed estates, luxurious palaces and castles," and those of the lower clergy, who, unless very lucky, were "living very modestly and often in want." It was hoped to secure the support of the lower clergy by offering them increased salaries and financial stability, and thereby to undermine the position of the bishops. However, as soon as the Government's plans became known the clergy destroyed this delusion by announcing their refusal to accept the new laws because they "will better the social position of the clergy at the cost of freedom." The bishops, anxious that the Church's activities should not be completely disorganised, have announced that the clergy may take a qualified oath of loyalty and may accept salaries from the State. But they have reserved their own attitude to the oath, refused to accept salaries themselves and reaffirmed their opposition to the new laws.

Thus the Communists may have succeeded, in a sense, in dividing the Czech Catholic clergy, but in a way and with results which they cannot have anticipated. Now that the Czech bishops are assured that the parish priests will be able to continue their activities, it seems likely that they will feel free to adopt an even more uncompromising attitude towards the Government; and their opposition will be stiffened by the fact of Archbishop Beran's continued imprisonment in his palace in Prague.

Beveridge for Ireland

An Irish social security scheme has now made its appearance in a world that has grown colder since the brave days

of Beveridge. It attempts to fit arrangements made for an urban and wage-earning population to an economy that is still largely based on the small farmer. The White Paper embodying the proposals envisages an amalgamated scheme of benefits for unemployment and disability, widows' pensions, maternity benefits and payments to orphans. To these services, which have grown up since the first Old Age Pension Act in 1908, are now added retirement pensions, at 65 for men and 60 for women, and grants on death. The means test is abolished, but, in view of the low level of wages in some occupations, provision will be made for contributions and benefits on a smaller scale. The general scale is to be fixed at a weekly contribution of 3s. 6d. for men and 2s. 2d. for women, with equivalent contributions by their employers. These payments will be compulsory on all persons working under a contract of employment except those engaged in the public services and some employees of local authorities. Compulsory insurance on this scale is an innovation in Ireland. The rates of benefit in the major schemes of unemployment, disability, retirement and widows' pensions run at 24s. a week for men and 18s. for women, with additional sums for children.

The White Paper has the merit of making no bones about the bill. It estimates a cost of £12.6 million annually after the scheme gets into its stride. No less than 10 per cent of the total population is aged 65 and over, so that retirement pensions will constitute a heavy burden. The state's contribution to insurance and to the assistance schemes which will still be necessary is put at £15½ million, or between a fifth and a quarter of the annual budget. This will provoke second thoughts as an ambitious scheme of health services is said to be under consideration.

A contributory scheme has the drawback that it has to be applied to a community in which there are many farmers whose cash incomes are small and uncertain and who will not benefit by it. This is reflected in the fact that the number of participants is put at about 700,000, while 1,200,000, mainly "persons working on their own account" (including their relatives), are excluded. The White Paper, however, seems to have made an honest attempt to translate Beveridge into Irish; and it seems that legislation will wait on its reception by the public.

Shorter Notes

It is to be hoped that the latest reorganisation of British Overseas Airways, which was announced earlier this week, will be the last for some time, for it is the third and the most drastic in the Corporation's short life. The reasons for it can be grasped only too clearly. But there surely was some case for modifying last year's plan rather than throwing the whole organisation into the melting-pot to be moulded into yet another new shape. The increasingly frequent accessions of modern types of aircraft should at any rate give this new plan a fairer chance to work. It is based on a functional rather than a geographical division of operational responsibility, each line being responsible henceforth for a particular type of machine wherever it flies. The main thing now is that the new scheme should be given a chance to work.

*

British European Airways have just announced a welcome profit for the July-September quarter. It amounts to 6s. 8d. a passenger, or, compared with the corresponding period last year, a profit of £2 9s. for each aircraft flying-hour as against a loss of £10. Over 3,000 passengers were carried daily in this period and by a staff 14 per cent smaller than in 1948. This at least shows that BEA are on the right lines, even though the falling-off in traffic at other seasons of the year means that it will be some considerable time before their annual accounts show any profit. Nevertheless, having regard both to the opportunities which the island position of Britain

affords for high-density short-range air traffic, and also to the fact that from next year the Corporation is likely to start operating machines with an economic performance, its accounts may well balance sooner than was expected.

*

The case of the lady, who was injured by a cricket ball driven over the boundary of the cricket ground, has now been reconsidered by the Court of Appeal. The view of the Court of Appeal is that she should recover damages for her injury against the club. It is suggested, however, that the case will go to the House of Lords for a full review of the authorities who decide whether or not cricket clubs and other sports organisations are responsible for the consequences of the exceptional prowess of their playing members.

*

The National Health Service (Amendment) Bill was given its second reading in the House of Lords this week, but the Government spokesman was unable to say whether the proposed charge for prescriptions would be brought into this Bill or be dealt with by separate legislation. One amendment, made when the Bill was in the Commons, deserves recognition. It was introduced by Mr Bevan and allows doctors to treat private patients in health centres—when they are established. Hitherto he had firmly refused to agree to the doctors' request to this effect, and his conversion from prejudice to common sense is consequently very welcome. Otherwise, many doctors might have found themselves unable or unwilling to practise from health centres since they would have been obliged to maintain two surgeries.

The Source of Our Greatness

The opening, on Tuesday, of the New Coal Exchange by his Royal Highness Prince Albert, was a great event for the City of London. . . . Taking their cue from the city address, which spoke of coal ministering, "by appliances innumerable, to the wants and prosperity of millions" . . . some of our contemporaries have dwelt with great emphasis on the material itself; but largely as it ministers, like air and sunshine and rain, and many of the other gifts of heaven, to our welfare, the industry and the skill that draw it from its hiding place, and turn it to a thousand useful purposes, are the things to admire. . . . To forget the colliers, who pass a large part of their lives in the deep cut galleries of the coal mine, exposed to scorching death from fire damp, and to drowning from the bursting in of water, who breathe foul air, and labour naked, bent, and blackened with dust, far away from the cheering light; to forget the seamen, who, braving all weathers, the ice of winter, and the storms of the equinoxes, and defying hail and rain, navigate their vessels along our sand begirt and dangerous coast: to forget these men . . . is to forget the spirit which has gathered bread from the salt waves, which can turn water into fuel, and win power from the magnet and the electrical battery. . . . We hope the occasion will not be lost to improve the condition of these useful, but, perhaps, not well treated classes. We do not ask charity for them—do not ask Government interference with their avocations on the pretence of serving them, lest their ingenuity and exertions might be stifled by its kind embraces; but we should like that some of the respect shown to coalowners and coal merchants and coal exchanges should be reflected downwards on such men as colliers and sailors, the living authors of the wonders we admire, and raise them in their own and in public estimation.

Letters to the Editor

The Future of OEEC

The Case of the Karens

SIR,—Your article on this subject raises a very important question. Will the economic unification of Europe come about without external pressure? And if pressure is necessary, from where will it come? The economic unification of Europe is a fundamental conception of the United States Foreign Assistance Act. ECA have repeated the need for it many times. Mr Hoffman requested it as late as October 27th, when he pointed out that "higher productivity in Europe would not alone bring durable economic recovery," and when he called on western Europe to achieve economic unification without delay. This request he has repeated in very forthright terms only this week at the meeting of the Council of OEEC in Paris.

Surely the remedy lies in the hands of ECA, the State Department and Congress themselves? They could have had a unified Europe by now if they had wanted it enough. I have yet to learn of a bank or financial institution lending (much less giving) money to a group of bankrupt companies in an industry without insisting first on their reconstruction by way of amalgamation as a condition of the loan. If the unification of Europe had been a condition precedent to Marshall Aid, would the European countries have refused the offer? But Marshall Aid has to be voted each year, and there are already doubts about its renewal in 1950. Thus, it is not too late for such a condition to be made. The State Department are well aware that Congress may not renew Marshall Aid for the third time without conditions of some kind, if they renew it at all. Thus, let Europe unite now, with a prior understanding with the leaders of Congress that aid will be voted for 1950 and 1951, or let Congress vote Marshall Aid for those years not for the seventeen states of Western Europe as at present, but for one state—a new state—an eighteenth state—the Union of Western Europe. Within the Statute of the Council of Europe machinery exists to bring this unification about. The Standing Committee could become the government. The Assembly could be given the necessary legislative powers. The Committee of Ministers could retain the right to veto its legislation. Surely something positive and constructive on these lines could be done if only the State Department made a United Europe a condition of further aid?—Yours faithfully,

House of Commons

R. W. G. MACKAY

Which Party?

SIR,—I think most people will agree that the result of the next election will be of vital importance for the future of the nation. We have all of us to decide which political party, taking the good with the bad in their policies, should be entrusted with the government of the country. I wonder if other readers are as puzzled as I am as to what your views are on this question. You have been telling us for some time that the present government is leading us to disaster and you have come to the conclusion that there is no reason to suppose that the Socialist ministers should change their characters overnight. You are writing a series of articles giving a policy for the Left, which you must realise has little or no chance of being adopted by the Socialist party. On the other hand Mr Eden, speaking on behalf of the Conservative party in the recent debate, argued for further economies in government expenditure, and thus showed political courage and leadership which is so lacking in the Socialist leaders. However, the only encouragement he gets from you is an expressed doubt whether this will be a politically successful line.—Yours faithfully,

C. L. OVERTON

Tenlys, Mill Lane, Willaston, Wirral

[The political implications of the policy put forward will be discussed in a later article in the series.—EDITOR.]

SIR,—I hope you will be able to find space for a brief statement of the case for the Karens in Burma, which is being overlooked in the present anxiety to aid the Rangoon Government against the Communists.

1. The antagonism between the Burmese and the Karens lies deep in the traditions of both races. Relations between them greatly improved in the quiet times of British rule, but in times of disorder antagonism came to fierce life again, arising partly from the resolute stand the Karen villages took on the side of law, order and loyalty to us. The Karens lived in terrible sufferings and fear throughout the Japanese occupation, Christian Karens being singled out for special persecution by Burmese. The Karens gave notable aid to Wingate and to our invading armies. By our actions the Burmese forces, which had begun their rebellion by a massacre of Karens, were placed in a dominant position in Burma. All this lays on us special responsibilities.

2. The Karens are distrusted by the Burmese because they are (rightly) believed to be pro-British, pro-Christian and pro-Western, all that Communism is not. The Karens revolted many months after revolts by Communist Burmese political factions had caused widespread disorder, and the cause was the policy of disarming Karen villages. Burmese Communists and Karens have in common only enmity with Rangoon. A hated minority in a country in chaos cannot consent to being disarmed, nor could the Karens agree now to a status which did not, in fact and in law, give them access to supplies of arms.

3. The Karens of the Delta, five to six hundred thousand in number but only one-fifth of the population of that area, are in grave peril. They should have an opportunity of moving to the Karen state (mainly east of the Salween), and such a movement might well require the supervision of the United Nations. The United Nations might also reassure Burmese fears and suspicions about the advisers and technicians from the west which the Karens desire and require.

That a British Government should provide arms for the subjugation of Karens is a sorry return for a century of loyal support.—Yours faithfully,

C. F. GRANT

16 Campden House Chambers, W.8

Dollar Exports

SIR,—Your correspondent, Mr Graham Hutton (page 887 of *The Economist*, October 22nd) shows with great clarity how British exports to the United States can be effectively restricted by the action of American suppliers in applying "stop-orders" to American distributors attempting to increase their turnover of British goods.

The creation of British-owned distributing houses in the United States would overcome this difficulty, only at the cost of the reappearance of the same problem one stage further on. American retailers, desirous of increasing their purchases from the British-owned distributing house, would presumably be subjected to similar "stop-orders" by their American suppliers.

This dilemma could only be resolved either (a) by the setting up of British-owned retail outlets in the United States—at best a solution with strictly limited possibilities, at worst an impracticable proposition—or (b) by resort to an American institution whose popularity far exceeds that of its smaller counterparts in this country—the mail order house. Nothing short of the creation of an entire mail order house organisation, fully supplied by British exporters, could be successful.

The initial dollar outlay on a project of this nature would be considerable, but could be provided by joint action on the part of some of our larger exporters. These same firms would provide all the necessary supplies to build up and maintain their joint stocks in America at a level sufficient to ensure immediate delivery of catalogue-based orders, leaving the mail order house completely free from pressure on the part of American suppliers. Direct contact by mail between the house and the ultimate consumer obviates any danger of crippled retail outlets.

Nor are the marketing economies which would result from this scheme, once successfully launched, of a negligible order. Wholesaler and retailer margins—at present payable in dollars, not in devalued pounds—would be replaced by direct distribution at lower cost per unit. Moreover, it is feasible that the British-operated mail order house, once securely established, would serve as an admirably efficient vehicle for the introduction of new lines of British exports to the American market.

It may be argued that, as soon as the impact of any such scheme began to be felt on the American market, its inevitable reaction would be the engendering of a strong demand from American business interests for higher tariffs, more restrictive Customs regulations, etc., but this would entail the United States Government breaking faith with Britain and the recent 10 point Washington agreement—at present, as Mr Hutton shows, the expansion of British exports to the United States can be effectively prevented without any restrictive action on the part of the United States Government at all.

In conclusion, may we submit our export slogan: "Let a British Sears Roebuck become an American household necessity!"—Yours faithfully,

D. J. OVENS

C. P. DALTON

SIR,—The first reaction to Mr Perry's conception of British Dollar Exports, Limited, is one of admiration. On second thoughts, however, the difficulties become apparent. First, Mr Perry excludes "large organisations," by which he means, presumably, large organisations already exporting to the dollar area. Therefore, British Dollar Exports, Limited, will be concerned with exporting goods which have at present no large dollar sales. It will have to create the market, spending vast sums of money and encountering grave risks in so doing.

If the sterling goods do not sell, they can be turned over to the Government for export to non-dollar areas, says Mr Perry. At what price? Is there such a great demand for British goods that these unwanted articles will sell easily and profitably?

Secondly, will the public and the manufacturers take up the share capital which is to finance this scheme? The preference shares will have to be made attractive, and will thereby commit the company to a heavy distribution of profits, which it is by no means certain will accrue. In view of this, will manufacturers willingly lock up a proportion of their own capital in the

ordinary shares of a venture that is unlikely to pay dividends in the very near future, and may, indeed, unless it is run at a very high pitch of efficiency, never do so?

Finally, possibly the biggest obstacle of all is the fact that British Dollar Exports, Limited, would have to be a truly huge undertaking if it were to preserve the individuality and fine craftsmanship which is one of the main reasons why British goods still sell in the dollar area, and if it were to conduct adequately the individual market research and selling campaigns so essential to any attack on this notoriously difficult market.

Can these difficulties be overcome?—Yours faithfully,

Mount Royal, Richmond Hill, Surrey LEONARD GAUNT

Salvation by Fleabite

SIR,—Your articles on "Salvation by Fleabite" and "Cuts Without Policy" imply that the worsening of the terms of trade will intensify inflationary pressure. This in addition to the increase in pressure which will be caused by a more favourable balance of payments.

No one disputes the latter point that, as the balance of payments is improved, inflationary pressure will increase unless compensating cuts are made in one or other form of home expenditure. To the extent that changes in the terms of trade contribute to changes in the balance of payments, their inflationary or deflationary effect is already taken care of. To suggest that the worsening of the terms of trade calls for additional cuts in expenditure to prevent inflation is either wrong or else depends on a misleading ambiguity in the use of the word inflation.

Suppose that an improvement in the balance of payments is exactly offset by a reduction in private and/or public expenditure at home. Effective demand, or money incomes, will remain the same. In this case higher import prices (absolute or relative to exports) will raise costs and prices at home and hence lower real incomes. Do you argue that this rise of prices (which is ambiguously called inflation) relative to money incomes calls for additional reductions in expenditure? On the contrary, it is through this rise that what you flippantly call fleabites will be found to have much deeper stings for all of us.

To put the matter in another way, you seem now to be identifying the Government's attempt to maintain full employment with the maintenance of real income. If that were attempted, higher import prices would indeed raise both the price level and the level of money incomes. But, as you have pointed out many times in your columns, full employment is compatible with falling real income.

It may be true that the proposed retrenchment is not enough to offset the change in balance, or that higher import prices will reinforce the price-wage spiral. But the terms of trade argument by itself cannot justify further cuts.—Yours faithfully,

Common Ground for Radicals

"The Principles of Economic Planning." By W. Arthur Lewis. Allen and Unwin and Dennis Dobson. 128 pages. 7s. 6d.

THIS admirable handbook for the general reader goes far to rebut the criticism that Socialist thought on the economics of planning has got stuck in the irrelevancies of the 1930's. Professor Lewis is a Socialist, but he is not concerned to defend a sacrosanct thesis by intellectual sleight of hand. Seeking to elicit and expound the truth, he provides the common ground of honest debate. The case for planning, in his view, is not that the "invisible hand" of the market economy is maleficent or ineffective, but that in certain respects, certain fields and certain circumstances it needs to be supplemented by social controls for the sake of efficiency, stability and social justice—a proposition commanding the assent of practically everyone. The only essential distinction between Socialists and others is that Socialists demand a far greater degree of equality. Nationalisation, price controls, the general apparatus of *dirigisme*, are merely technical devices which should be unhesitatingly discarded if they cannot be justified on their merits.

Professor Lewis does not argue about the precise degree of equality which he feels desirable. "No man is worth £10,000 a year," he asserts; and that is that. The importance of his book, however, does not lie in this arbitrary estimate, but in the technique of social control by which equality, among other aims, may be pursued. The arguments with which this is presented are calculated to cause some alarm and despondency among more representative Fabians; they are, indeed, familiar to readers of *The Economist*. "The real choice we have to make," says Professor Lewis, "is between planning by inducement and planning by direction," and he proceeds to deal with the latter after a fashion which Professor Hayek could hardly better, allowing it at most a subordinate and temporary role when, as in wartime, major immobilities have to be overcome in a hurry. His major planning instrument is the Budget. As regards equality, he considers that redistributive taxation on incomes has already reached its limit, and that any further advance must be through greater equality of opportunity, through the modification of death duties to encourage a wide distribution of property, and (very cautiously) through a well-conceived capital levy. Stability can be attained by the use of deficits and surpluses in the light of the statistics of bankruptcy and of unemployment. (Incidentally, the case against over-full employment has rarely been more succinctly put.) On investment, the chief instrument of progress, Professor Lewis is equally realistic. Voluntary savings and budget surplus between them must be adequate; due attention must be paid to stocks; the limits to particular physical resources must be remembered. Otherwise there is "intolerable confusion." His subsequent comments on the Government's actual investment policy will make excellent election ammunition—but not for the Government.

On foreign trade, on the "social control" of business (e.g., monopoly policy), on economic mobility, on nationalisation itself, he is far from the orthodox Socialist standpoint. (Socialists and others may equally complain that he scamps the question of price policy in the "public sector." Even in so deliberately untechnical a book as this, the nature of the problem and the preferred lines of its solution ought to be indicated, and the author of "Overhead Costs" is surely the man to do it.) His account of the actual technique of plan-building is brief and clear; and his book is rounded off by two sound and stimulating appendices, on Economic Union and on the Planning of Backward Areas.

It would be wrong to leave the impression that Professor

Lewis thinks the existing planned society a failure. He pillories its shortcomings; he denies that these have outweighed its benefits. Here then is room for rational debate, debate on the relative achievements of planned and less-planned economies, debate on the causes of divergence, just as there is room for debate on the merits and demerits of the economic devices which he favours, and on the proper balance of the aims which he shares with all men of good will. Such debate is certainly profitable. It is less certain that the publicists of the Labour Party are capable of jettisoning their cherished irrationality sufficiently to pursue it.

An Orderly Gentleman

"The Great Pierpont Morgan." By Frederick Lewis Allen. Gollancz. 306 pages. 15s.

THIS book, according to its dust cover, is the life of America's last grandee, but the photograph above the words could be that of America's first dictator. Pierpont Morgan came very near to being that at the beginning of this century, in the opinion of many of his contemporaries and more of their descendants. Mr Allen's fair and very readable biography explains not only why, and to some extent how, this emperor built his dominion, but also how Morgan was himself responsible for that government interference with private enterprise which seemed as accursed to him as it does to his successors. His railroad amalgamations demonstrated the desirability of increasing the powers of the Interstate Commerce Commission; his rescue of the United States from the panic of 1907 proved the need for a central banking system; his combination of three-fifths of the American steel industry into the US Steel Corporation gave new life to the anti-trust laws. Even his failure had the same effect: his inability to make a success of the International Mercantile Marine showed that only government subsidies could give the United States an adequate shipping industry.

Other millionaires in that great age of millionaires ran railroads, pumped oil, smelted steel; people saw them doing it and used the results. And they were men who had risen from the farms, the slums, the free schools. But Pierpont Morgan, brought up to be wealthy and educated abroad, was incomprehensible both in his outlook and his work. He produced balance sheets, share certificates, cablegrams, in a financial labyrinth that ordinary Americans neither knew nor wanted to know. He was a wizard to be regarded with suspicion, and that suspicion has ever since attached to the Wall Street where he laboured and the House of Morgan which he founded.

But Mr Allen makes it clear that Morgan was inspired neither by lust for power nor by the desire for wealth. He wanted only order; everything that impinged on his life must be efficient and tidy. Cut-throat competition on railroads and in steel-mills was neither, and the obvious way to eliminate it was by amalgamations. Art treasures were more orderly when they were gathered together in one place. To Morgan, at least in Mr Allen's opinion, any personal profit or pleasure resulting from his collections and combinations was incidental; his chief concern was for the public good. His methods of achieving it were ruthless, but they were honest and fair according to his lights. He was a self-confident gentleman of the nineteenth century, taking the responsibilities of the position, working on a basis of trust and confidence, and expecting others to do the same. He thought it a duty for him to give orders and for others to obey them. He was, in fact, a benevolent dictator, who, like others of the species, could not see that, in less competent and benevolent hands, his methods would seem neither orderly nor gentlemanly.

RUSSIA

by

GENERAL BEDELL SMITH

AMERICAN AMBASSADOR IN MOSCOW

(1946 - 1949)

"There are no experts on the Soviet Union — there are only varying degrees of ignorance"

True, but an Ambassador has better opportunities of finding out what is going on in Russia than any private individual, General Smith, already famous as General Eisenhower's wartime Chief of Staff, gives a unique account of the present state of Russia and its 12 rulers. *These are some of the questions to which he provides answers:*

- *Is Stalin the absolute boss?*
- *What may happen when he dies?*
- *Why did the Berlin blockade fail?*
- *What are Russia's intentions?*
- *What is the state of her armed forces?*
- *How efficient is her administration?*

A Brilliant Condensation

"Europe and a Wider World, 1415-1715." By J. H. Parry. Hutchinson's University Library. 194 pages. 7s. 6d.

PROFESSOR J. H. PARRY is known to scholars by two valuable studies on sixteenth century Spanish America. He has now written a short introductory work on the expansion of Europe from Prince Henry the Navigator to the Treaty of Utrecht. The subject is wide, various, and at times highly technical, so that the interest of adventure can easily be lost in the complexity of economic causes and scientific methods; but Professor Parry has performed a masterpiece of simplification and exposition. Beginning with an analysis of the scientific knowledge and technical limitations of trade, exploration and discovery in the age of the Renaissance, he describes in turn the Portuguese and Spanish discoveries, the organisation of their empires for trade and government, the attempts of the Northern Europeans to penetrate through America or find markets and sources of supply in it, the struggle of the Dutch with their rivals in the East and of the English with their rivals in the West, and their culmination in the War of the Spanish Succession. All this is done in the compass of 200 pages; the economic mysteries are lucidly explained, the human drama never forgotten; Albuquerque and the Jesuits, Magellan and Coen are as luminously delineated as the economics of spices and sugar, company finance and slavery.

Canadian Compendium

"Financing Canadian Government." By A. E. Buck. Public Administration Service, Chicago. 367 pages. \$5.00.

CANADA is notably short of those institutions, universities and endowments which finance the earnest student's research in so many fields, but it benefits from time to time from the wealth of such institutions in the United States. Some of the best books about Canada have been financed from south of the border, and this work by Mr. Buck of the Chicago Institute of Public Administration provides a compendium of information about Canadian government which might never have been produced inside Canada.

"Financing Canadian Government" is a thorough, detailed and painstaking account of the complicated procedures of government finance on the federal, provincial and municipal levels in Canada. It makes some valuable comparisons with the United States and the British system, and has valuable chapters on the highly complicated story of dominion-provincial financial relations. Mr. Buck is rarely critical, though once in a while he points out the advantage of the Canadian method over its American counterpart and goes out of his way to explain how and why Canada has developed methods of organisation differing from the British prototype. With a formidable bibliography and an adequate index, this book forms a most useful reference work. But its very thoroughness and completeness make it heavy going for the general reader.

Rayon History

"The Fibro Manual." Edited by C. M. Whittaker. Sylvan Press. 311 pages. 21s.

VISCOSE rayon staple has already a long enough life behind it to illustrate that innovations in textile materials—even the successful innovations—come into full use only by a slow and laborious evolution. German spinners used cut rayon as a substitute for natural fibres in the first world war. But the expectations then pinned on cut staple were at first disappointed: cotton and wool were too cheap, and after the war the German rayon factories were driven back on to continuous filament production. Courtaulds began to produce *Fibro* viscose staple in 1925. Its use progressed only gradually, and the company's initiative in setting up demonstration mills in Lancashire and Yorkshire was largely responsible for getting the new material accepted by the cotton and worsted trades.

This form of development has influenced the trend of rayon technology, which (so far as staple fibre is concerned) has for the most part been strictly related to the existing spinning systems. The manual which has now been prepared by Courtaulds deals largely with the use of rayon staple on these existing systems—cotton, wollen, worsted, flax, spun silk and jute. Its primary concern is to select and summarise the accumulated empirical knowledge for spinners and manufacturers. As one consequence of the empirical development, the manual notes that although the fibre is first produced in continuous and regular filaments it is, after cutting, crushed into bales; and the spinner has to disentangle the material by carding and combing to produce a sliver of parallel fibres before he can spin. Carding and combing may cost the spinner 8½d. a pound; it is obvious that a short cut from filament to yarn-spinner may revolutionise the economic relationship of rayon staple to some other fibres. Some progress has already been made in producing ready-combed staple ("Greenfield Top") for the worsted industry, which is the textile branch technically best suited to the method. Similar "tops" for flax, jute and silk spinning are to follow; the cotton type presents, unfortunately, the greatest difficulty and will come last.

Portrait of a Great Woman

"Eleanor Rathbone." A Biography by Mary Stocks. Gollancz. 376 pages. 21s.

THE life of Eleanor Rathbone is a vindication of so many of the standards and values which have been eclipsed over the past thirty years, that to read the record of her achievements is to derive great comfort about the continued power of the individual to influence social progress by democratic means. There could be no stronger tribute to the effectiveness of the individual social reformer who can harness voluntary action to his reforms, to the importance of the independent private member of Parliament and the private member's Bill, or even to the value of a private income comfortable enough to permit its owner undivided attention to public affairs. Eleanor Rathbone's tenacity, her clarity and honesty of thought and her complete lack of personal ambitions swept obstacles aside. She was a formidable opponent of apathy, mental laziness and intellectual dishonesty. She was fortunate in that most of the causes she fought for were achieved in her own life-time—and this essentially because she saw the limits of the practicable and never antagonised by asking for the impossible. To most people she is best known for her life-long and successful efforts for family allowances. But she never pursued one objective at a time. Any one of her activities might have been a life-time occupation for some people—the battle for the equal franchise for women and the subsequent legislation which expanded and confirmed this equality in other fields, the long defence of the rights of Indian women and their representation in the Indian Constitution and the incessant campaign from the nineteen-thirties onwards for the cause of refugees both at home and abroad. To these major preoccupations were added a firmament of lesser activities.

Eleanor Rathbone's success in accomplishing so many of her objectives is an object lesson in the art of parliamentary infiltration. She understood to the full the force of authoritative evidence, and was an accomplished mistress of the art of approaching Ministers and civil servants with a fully documented case.

As a biography one must regret that the wit and style which informs Mrs Stocks's writing concerning the more obscure parts of Eleanor Rathbone's existence—before her birth and after her death—are not permitted to sparkle so brightly during the most active parts of her career. It is as if the biographer herself became so immersed in sorting out the turmoil of papers in that unforgettable black bag that the result is closer to faithful photography than to imaginative portraiture. Nevertheless it is an excellent book.

AMERICAN SURVEY

Half-Time in Congress

(From Our American Staff)

AFTER Mr Truman's victory last November it was understandable that extravagant optimism should, for a few weeks, succeed extravagant pessimism in the Democratic Party's high command. There were predictions of another Hundred Days in which the President would be able, as Mr Roosevelt was in 1933, to get an important part of his programme through Congress without serious opposition. Half a dozen of the diminishing band of Republican diehards in the Senate had gone and almost a fifth of the new House was made up of earnest young Democrats. Few of them would have been encouraged to run had their local machines thought anything of the party's chances, many of them were as surprised as Dr Gallup at their success, but all of them were eager to get on with the task of turning the programme on which they had been elected into legislation.

Mr Truman, who had been less doleful than anyone else about his prospects, was probably also less impressed by the implications of his victory. The people had spoken, no doubt, but not with any great unanimity or in very imposing numbers. Thanks to the essentially gerrymandered basis on which the Senate is elected, an uncomfortably large part of the Democratic majority was made up of Southerners unsympathetic to the President's programme, whose Democratic disguise was so thin that it was used only to retain seniority on committees. In the House the old and cynical had not such a commanding majority, but they held many of the commanding positions. The President began by welcoming the rebels back into the party, but he soon found himself forced, by the facts of his policies, to drive them into sullen, but unofficial, opposition again. When the Hundred Days were over, there was almost no legislation to show for a great many words and the sporadic association between Southern Democrats and Republican reactionaries was beginning to look like a firm alliance.

The months dragged on, and by June accomplishment was still meagre and talk of adjournment was general. But Mr Truman, who is a much abler manager than he is usually given credit for being, refused to give up and kept Congress in Washington through one of its worst summers and into the autumn. When he let it go, after nine and a half months, he had contrived, by continuous exercise of patience, interspersed at regular intervals by bursts of carefully calculated temper, to get a reasonable proportion of what he wanted passed into law and, even more important, the bulk of what he did not want laid aside.

★

The young Democratic Congressmen have, over the months, passed from disillusion and something near despair to a realisation that the American form of representative government is a confused and confusing business, which works slowly and erratically and demands patience to be workable at all. But in the end they saw something accomplished, enough certainly to suggest that, if the second session

of the Eighty-First Congress is as productive as the first, they will be able to face the electorate next November without shame. On foreign affairs the record was, as the Secretary of State said in a letter to the Chairmen of the two foreign committees, "magnificent," even if it achieved some of its magnificence almost at the last minute, thanks to hurried approval of perfunctory compromises reached after months of disagreement. Only on Point Four—the programme of international technical aid—was no action taken, and the blame for this lies more with the Administration, which took too long to prepare its proposals, than with Congress.

In domestic affairs the Eighty-First Congress did not give the President as much of what he wanted. And it is on the domestic programme that the Democrats must appeal to the country next year. Since they won last time with the votes of labour and the farmers, it has become conscious policy for the Democrats to build their platform around a farmer-labour coalition. Whether that coalition, born rather by accident in 1948, can be held together and develop into the permanent base of the party will depend to a large extent on what is done in the next session.

It has always been believed that, except in moments of crisis like the early years of the New Deal, the interests of labour and agriculture were so divergent that no programme could be genuinely attractive to both. The Brannan farm plan was an attempt to produce a policy that was. Its idea was simple—that the farmer should, through government subsidy, continue to receive an income higher than the law of supply and demand would warrant, while the consumer would pay only the true market price for farm products. The subsidy, in fact, would be paid mainly by the taxpayer, rather than, as it is today, by both the housewife and the taxpayer. To the surprise of the Secretary of Agriculture, his plan has not been popular with the farmers, presumably because they are scared at the thought of the real amount of subsidy they receive being published for all to see. It seems unlikely that this part of the President's programme will ever get past both Houses of Congress, but what got past them both in the last hours of the session should certainly ensure the farmers continued, even heightened, prosperity. The compromise between the Senate's Anderson Bill and the House's Gore Bill took the most expensive features of each and set a support level which, according to the best estimates, is 10 per cent higher than any ever known—just at the moment when it was generally agreed that a gradual decline was necessary from the high level established during the war to encourage production.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

Who will be given the credit by the farmers for this piece of sectional legislation—which has been called “dismal,” “rapacious,” “disgraceful,” and “a sorry sham” in newspapers in the big cities—is doubtful. They have obtained from a Democratic Congress, but against the wishes of a Democratic Administration, guarantees for which they should be truly grateful. The Senators who finally agreed to so much of the House Bill are believed to look upon it as a temporary expedient. But it will be hard for the Democrats, who must offer the conservative farmer something very substantial if he is not to vote Republican, to urge in an election year the removal of some of the benefits he has been inadvertently given.

While the farmer must be wooed away from the enemy, labour can be treated rather differently. There is no danger of it deserting, but there is danger of apathy—a risk that, as in 1946, it will not think it worth while to go to the polls. The Administration, therefore, has demanded the repeal of the Taft-Hartley Act and is refusing to settle for anything short of unconditional surrender. It wants either to be able to impress the industrial worker by pointing with pride to total success on his behalf, or to frighten him into voting by exhibiting total failure and exhorting him to even greater effort. So, although some marginal measures which benefit labour—the raising of the minimum wage, the extension of rent controls and the housing programme—were passed, mere amendment of Taft-Hartley was not accepted. Nor was any compromise on the Civil Rights programme. The fight for all or nothing on the most serious issues will go on next year, with little chance of all being achieved, and labour will be kept on its toes.

★

For the young Congressmen, the worst disappointments have been the failures to correct the work of the previous Congress. The Taft-Hartley Act is one of these; so also are the unbalanced budget and the existing Act governing the admission of Displaced Persons. Mr Truman had to give up, early in the session, his attempt to get a new Bill passed to increase taxes, but at a recent press conference he said he would try again next year. The present deficit, he said, was caused by the “rich man’s Tax Bill” of the Republican Eightieth Congress, which reduced income tax revenues by nearly \$5 billion—roughly the amount of this year’s prospective deficit—and which gave the greatest benefit to the higher incomes.

Worse still, even if less far-reaching in its effects, was the refusal of the Senate—or, rather, of the Chairman of the Judiciary Committee, Senator McCarran—to do anything about revising the Displaced Persons Bill which, in its careful discrimination against Catholics and Jews, was the most shameful accomplishment of the Republicans in their two years’ rule. The House passed a revised Bill and nothing that has been done or left undone has been more discouraging to its new Democrats than the machinations by which it was shelved in the Senate.

Some months ago the Republicans, when they had succeeded in producing a deadlock in both Houses, triumphantly announced that this was the “Eighty-Worst” Congress. At that time it certainly did not look very good. By now it can be said that any Republican who wants to repeat the jibe must have suffered a change of heart since his party lost power. The failure of this Congress is largely its failure to correct the mistakes and cynicisms of its predecessor. If that makes it the “Eighty-Worst,” what does it make the Eightieth?

New York’s Double Election

[FROM OUR AMERICAN STAFF]

ON November 8th the residents of New York will cast their ballots for a mayor for their city and for a United States Senator from their state. The coincidence of the two elections, caused by the need to choose a successor for Senator Wagner, casts vivid light on that confusion in loyalties which arises when national and local interests are forced together into the narrow slots of the party system. The tangle is made more complicated this year by the addition of a third dimension—both senatorial aspirants are men whose public fame has been heightened by their activities between the nations. Thus international affairs are now, with national affairs, mired in the mud of municipal bickering.

The mayoralty race is a three-cornered contest, in which the re-election of the Democrat incumbent, Mr. O’Dwyer, is challenged on the right by Mr Newbold Morris, running as both a Republican and a Liberal, and on the left by Mr Vito Marcantonio, a US Congressman, running as candidate of the American Labour Party. A three-cornered contest has usually resulted in a victory for Tammany Hall, but this year the forces which are split are those hitherto controlled by that local Democratic machine.

The reform forces which Tammany’s most effective enemy, the late Mayor La Guardia, forged into a fragile machine of his own, are supporting Mr Morris, who served as president of the City Council and Deputy Mayor under that regime. A personable young man of good family, possessed of a private fortune and an honest devotion to public service, Mr Morris is also an athlete, a patron of the arts, and fond of figure-skating on thin ice. All this makes him an unusual figure in the grubby arena of New York City politics, but he is conducting a campaign in the familiar manner of reform candidates—promising better government on the one hand and, on the other, berating Tammany for corruption and too much friendliness for gamblers and racketeers. The third candidate for the mayor’s chair, Mr Marcantonio, represents a crowded district in upper Manhattan which is heavily populated by the coloured, both native and Caribbean, and by foreign groups huddled in Harlem or the slums on its fringe. In the old days this type of neighbourhood would have been in Tammany’s pocket. Its present leftist tendencies (Mr Marcantonio has held the Communist vote for years) are not echoed in enough other neighbourhoods to give its favourite candidate much chance of election to City Hall, but the damage he can do to other candidates is considerable. Mr O’Dwyer is making a gallant fight, but he may be the principal sufferer.

★

All this local jockeying, plentifully sprinkled with heavy humour, practical joking and scurrilous name calling, would attract little attention outside the city were it not that the state-wide senatorial candidates must speak to the same voters in the same districts and—in the closing days of the campaign—at the same time, for tradition demands that state campaigns must end in New York City. This inevitable mixing of interests holds more than the usual chance for exploitation and embarrassment this year because of the action of the Liberal Party—a local left-of-centre coalition which has made the Republican Mr Morris its candidate for mayor and the Democratic Mr Lehman its candidate for Senator. Both names appear twice on the city voting machines, and both men run risks from this awkward pairing.

Left to itself, the senatorial campaign would be relatively

simple. The two seats allotted to New York State have in recent years been held, one by the Democrats and one by the Republicans. When the Democratic Senator, Mr Wagner, resigned last spring after long illness, Governor Dewey appointed his own distinguished Republican adviser on foreign affairs, Mr John Foster Dulles, to serve until an election could be held. Thus for a short and interesting period, the Republican Party has been able to claim the Governor and both Senators in this populous state. Their desire to hold this prize, as well as Senator Dulles’ eagerness to keep his newly acquired seat, gives the senatorial contest its flavour.

His opponent is Mr Herbert Lehman, Democratic Governor of New York State for ten honourable years, and Director-General of Unrra for three. Mr Lehman’s prestige is established and his party needs him in the Senate more than he needs to be there. Mr Dulles, on the other hand, is still building his political career. Well known in his profession as a member of a firm of international lawyers, his public reputation rests on his work for the Federal Council of Churches in the field of international amity, and on his more recent emergence as State Department adviser and American representative in the United Nations Assembly. Active in the formation of America’s bi-partisan foreign policy, it may be that he wearied of working behind the scenes, or perhaps his debates with Mr Vyshinsky convinced him that as an advocate he was invincible. In any event, he is, at the age of sixty-one, making his first public bid for election to office.

Mr Dulles thus has more to gain than his opponent and also more to lose. He is fighting a three-fold battle for personal power in Congress, party power in Congress, and personal power within the party. He wants to hold his senatorial seat so that he can sway Republican, and Congressional, action on foreign policy during the coming years; he would like to give the Republican party an ideological content attractive to the independent voter; he wants to take control of Republican affairs into his own hands rather than cede it to a colleague with different ideas—Senator Taft, of Ohio, for instance.

★

Unfortunately most of these not unworthy aims lie unexplained behind a façade as hollow as a Hallowe’en pumpkin. In acting as his own advocate, Mr Dulles has been emphatic but unilluminating, and he has made blunders which have cost him heavily. In the main, his campaign has followed lines marked out by other Republicans. He has thumped the anti-Communist tub in forty-four counties, and done his best to convince audiences that Communism and the welfare state are indistinguishable. He has praised “states’ rights” as the saving alternative to a dangerously powerful federal government, and he has condemned “statism” (a new word on the American side of the Atlantic) as the looming evil most to be feared. But to most Americans a state is a state, and the United States is a country which has forty-eight of them. How then, they ask, can Mr Dulles call states’ rights good, and statism evil? A Gallup survey recently estimated that 10 per cent of the voters think the new word means state control, 11 per cent of them think it synonymous with states’ rights, and 68 per cent have not the remotest idea what it means. The confusion is, of course, worse confounded by the fact that states’ rights were never a Republican slogan, and now belong to recalcitrant Southern Democrats. The emphasis on them in this campaign may be a commentary on the North-South coalition in Congress, as well as on the barrenness of Republican political thought.

As the *Washington Post* observed recently, the public had a right to expect that two gentlemen as distinguished as

Mr Dulles and Mr Lehman would conduct a senatorial campaign of high quality. It has, in fact, been chiefly remarkable for the bitterness of the dust thrown up and the skill with which both candidates have avoided coming to grips with each other. Governor Lehman is old and tired. He has stood “on his record,” but he has added little to it. Senator Dulles has disclosed with obvious relish the clay feet of his ambition—he will be far more vulnerable, in Congress or out, than if he had stayed on the high planes where he functioned with such skill. Whichever man wins, the public is already the loser.

American Notes

Admiral at the Yard-arm

When President Truman hung Admiral Denfeld from the yard-arm of military unification, Congress as well as the Navy gained a martyr. The Admiral’s curt “transferral” from the post of Chief of Naval Operations, which made him the naval member of the Joint Chiefs of Staff, was an assertion of that civilian control over the armed forces which is a basic American principle. But it was certainly intentional that the order was not given until Congress had adjourned, although it may perhaps have been chance that it was issued on what used, before the Services were “unified,” to be Navy Day. Admiral Denfeld may only, as the Administration insists, have paid the overdue penalty for the Navy’s defiance of the spirit of the Unification Act, but in Congressional eyes he was punished for his outspoken criticism of the Administration before the House Armed Services Committee. Not only does Congress jealously guard the privileged status of evidence given to its Committees, but the Secretary of Defence had specifically guaranteed that there would be no reprisals on this occasion. Furthermore, under the Unification Act, the Joint Chiefs of Staff are required to present their views directly to Congress.

The President’s loyalty to his friends makes it unlikely that the Secretary of the Navy will be strung up beside the Admiral in order to appease Congress and Mr Truman has further fanned Congressional resentment, by spurning its gift of \$615 million for the ten extra Air Force groups which neither he nor the Defence Department want. But the Air Force still gets the largest share of the \$15.5 billion which was finally appropriated for defence, and is expected to do the same next year. It will not have to fold any of its existing wings, while the Navy will be forced by the need for economy to furl its sails to the extent of 54,000 men and 73 ships, half of them combat vessels, including aircraft carriers and cruisers. The Army is also reducing its strength by 26,000 men, to 630,000, chiefly by releasing its conscripts at the end of a year instead of 21 months. The postwar draft law, which expires next June, was only in actual use for a few months at the end of 1948; all the 30,000 men inducted under it will now be out by February, with the exception of one who avoided conscription until June.

Admiral Denfeld’s successor, Admiral Sherman, an expert in naval aviation, will come from the peaceful Mediterranean into a Washington still arguing over the question which drove the Navy to open mutiny, the division of next year’s defence funds. Last year Mr Forrestal backed up the attempts of the Chiefs of Staff to raise the roof of \$14.5 billion; this year the new Secretary of Defence, Mr Johnson, not only agrees that \$13 billion is all the nation can afford to spend on defence in the 1951 fiscal year, but is insisting that the Services should begin to economise at once so that they should not feel the pinch so severely next July. There are many in Washington who are far from being warmongers, but who feel that this emphasis on economy at all costs is unrealistic when the Russians have the atomic bomb three years ahead of time.

Hope in Steel

It was pleasant, and probably not altogether a coincidence, for Mr Murray to be able to announce to a stormy convention of the Congress of Industrial Organisations that his steelworkers had won a settlement from the Bethlehem Steel Corporation, the second largest producer. This partial victory strengthened Mr Murray's hand, raised against the rebellious left-wing unions of the CIO who have been accusing him of softness in the steel negotiations. There is nothing soft about his treatment of these fellow-travellers, who refuse to submit to the rule of the anti-Communist majority in the CIO. The United Electrical Workers have been expelled, and the convention is expected to show the door to the other unions which toe the party line.

The issue over which the steelworkers and the steel industry have been deadlocked is whether pensions should be financed entirely by the employer, or whether the worker should make some contribution to his own old-age security. The Bethlehem agreement provides for worker contributions toward a welfare scheme, comprising death benefits, hospital care, and sickness pay, but the increased pensions will be financed entirely by the company. The minimum will be \$100 a month for employees with 25 years' service, at the age of 65, but the company will pay only the difference between this sum and the federal old-age benefits to which each worker's family is entitled.

The Bethlehem Corporation's case differs from that of the other steel companies in that it has wholly financed a modest pension scheme for its workers for 25 years. But with the employers' dyke thus breached, it is hard to believe that the objections of the US Steel Corporation will not be swept away. It has already asked for negotiations to be resumed, as have other leading producers.

A steel settlement, however, will not mean that the blood can circulate freely through a cramped economy; the coal strike is still on, and Mr Lewis even threatens to extend it. The steel companies' stocks of coal are unknown, but may be enough to last a month. But a voluntary settlement which ended the steel strike to the satisfaction of the Administration's friend and supporter, Mr Murray, would clear the way for Mr Truman to deal, much more enthusiastically and bluntly, with a coal strike called by an old political enemy against whom he has not been unwilling to invoke the Taft-Hartley Act in the past. Perhaps for this reason Mr Lewis has now offered to negotiate settlements State by State, beginning with Indiana, where the economic repercussions of the coal strike have been particularly severe.

* * *

Buying in Order to Sell

The report is now available of the American mission which, early last summer, studied European trade problems, under the auspices of the Economic Co-operation Administration and the Department of Commerce. In its opinion the best prospects for increased exports to America were for raw materials, services, such as travel, and the output of specialised skills—tools, handicrafts, "artisan" products. The need for Europe to reduce its costs of production and to deal with its "oppressive" controls on trade was stressed, as was the desirability of improved marketing and distribution and of more aggressive selling practices. The latter should be facilitated by the trade fairs which are being arranged next year in the United States for the first time, with the encouragement of ECA.

The report's emphasis, like ECA's when talking to Americans, and like Mr Acheson's when speaking in New York this week, is on the increased purchases which they must make abroad if they wish the dollar gap to be filled. The only alternatives are the subsidies which the American taxpayer has been pouring into the gap for the last 35 years, or a substantial reduction in exports which would seriously

damage both American industries and international relations. Expanded private investments would help to bridge the gap, but an increased expenditure of some \$2 billion a year on goods and services from Europe is the main necessity. The mission pointed out that this would in fact have been achieved in 1948, if the ratio between imports from Marshall plan countries and the US gross national product had been the same as in 1937; then such imports were valued at 2 per cent, last year at only 1.2 per cent, of the gross national product.

US FOREIGN TRADE RELATED TO GROSS NATIONAL PRODUCT (\$Million)

Year	Gross National Product	Exports	Imports	Imports as % of GNP	Export Surplus
1919	81,000	8,891	3,995	4.9	4,896
1929	103,828	5,347	4,463	4.3	884
1933	55,760	1,736	1,519	2.7	226
1937	90,213	3,451	3,181	3.5	270
1939	90,426	3,347	2,419	2.7	938
1947	232,000	15,923	5,940	2.6	9,983
1948	255,000	13,398	7,711	3.0	5,687

The mission gives welcome recognition to the fact that, in spite of the very substantial reductions which have been made in the average US tariff rate, individual rates are still prohibitive on many things which Europe could otherwise expect to sell in the United States. It lists 260 articles on which the duty is 25 per cent or more—mostly more. More important, the report joins, and gives official weight to, the chorus of American voices which has recently been blaming the customs administration for the low level of American imports.

The customs regulations have been built up over many decades for the purpose of keeping imports out, but already they are becoming easier to get over as the result of the promises made at the Washington talks last September. Some customs officials now seem ready to welcome imports and to build ladders over the barriers by simplifying the procedures. But only Congress can pull down the barriers, by changing the laws which, for example, require that duty must be assessed on "foreign" value, or that a rug with a fringe must be classified as lace and be dutiable at a much higher rate than if it had no fringe. In the opinion of the mission, imports can be increased to the necessary extent with little or no effect on America's industrial economy as a whole. But individual businessmen, and through them their representatives in Congress, cannot fail to be affected, and their complaints will be heard when Congress is asked, probably in January, to make the necessary amendments to the Tariff Act.

* * *

Printers Under Pressure

The International Typographers Union, a long-established and respected trade union, with few strikes in its history, has just been defeated in its two-year battle against the Taft-Hartley Act, which bans the closed shop traditional in the printing industry. The National Labour Relations Board has ordered the ITU to abandon its attempts to get round the ban by entering into short-term contracts, so that a strike can be called if a non-union man is hired. In practice the union had already found a new strategy: its recent contracts require tests for job applicants which are likely to disqualify non-union men. Such provisions were contained in the September settlement of the long-drawn-out strike against Chicago newspapers; the printers also gained an increase of \$10 in weekly pay, two-thirds of the amount they had demanded.

While the legal defeat is therefore not very serious for the union which has also won a local success in its Chicago battle, that battle was in fact a major victory for newspaper publishers all over the country. For nearly two years Chicago newspapers were without compositors, yet they never failed to appear. Neither circulation nor revenue suffered notice-

ably, although the pages looked odd, contained fewer words and were less up-to-the-minute than usual. The publishers owed their triumph to the varitype machine, a justifying typewriter that can be operated by any good typist and that spaces the margins evenly on both sides of the column. These columns were then photo-engraved on metal sheets which were put on to the press as cylinders.

This comparatively clumsy process, while much improved during the strike, takes longer than the usual linotype or monotype process, but in Boston the Graphic Arts Research Foundation has unveiled a new electronic machine which sets type and photographs it in one process. Like the varityper it automatically spaces the words and, if all that is claimed is true, it can set type three times faster than the present average for linotype; this may be bettered later on with the help of tape. This experimental machine sets type vertically and it can perhaps be given a range of over three million characters, while its photographic image is sharper than anything produced by linotype machines.

But these in their turn are being improved and there are so many other inventions rumbling beneath the surface of the printing world that it hardly seems exaggerated to talk of a revolution. The aristocrats whose heads are in danger are the compositors, the lithographers and so on, whose skills are being superseded. The Chicago publishers agreed in September not to use varitypers in future unless the men struck, but more constructive was their promise to give six months' notice before introducing the new typesetters, so that the printers could learn to use them. The ITU will be well advised if it comes to similar terms with more of the revolutionary trends, which are likely in the long run to bring new demands for printing by lowering its cost and increasing its speed.

* * *

Houses for the Middle Class

The housing boom, which, after three years, showed some signs of sagging last spring, has taken on a new lease of life, partly because prices have come down a little and buyers are sceptical of a further fall, and partly because builders are paying more attention to the middle-class market. A total of 950,000 dwellings is now expected to be started this year, at last breaking the record set up in 1925. Indeed, all construction activity remains high; industrial building is tapering off, but long-deferred public construction has more than filled the gap, and a new crop of modest office

sky-scrapers is appearing on the New York skyline, which has been unchanged since the erection of towering white elephants in the nineteen-twenties and thirties.

This year's bumper housing harvest owes nothing to the new Housing Act; local authorities are only now drawing up plans for the low-cost developments to be subsidised by the Federal Government. It owes a great deal, however, to the refusal of Congress to turn off the golden stream of federal credit, in the form of insurance of private mortgages. This has been extended, on a temporary basis, until March, 1950.

This stop-gap measure takes the place of an ambitious Bill designed to round out the housing programme by stimulating housing for the forgotten middle-class families in the \$2,000 to \$4,000 a year income group, who cannot afford new privately built houses, but who are forbidden to live in the low-rent estates. Besides making it even easier for prospective home-owners and builders to obtain government insurance, the Bill would have provided, for the first time, direct loans to veterans, educational institutions, and co-operatives. It was this last proposal that capsized the Bill, for this session at least. Building co-operatives are relatively unknown in the United States and suspect as blood-brothers to Socialism.

One building venture which, despite direct government loans, has not been floated off the rocks, is the Lustron Corporation, builders of porcelain-enamelled prefabricated steel houses. Started on a \$1,000 shoestring, the Lustron Corporation has secured \$37.5 million from the Reconstruction Finance Corporation but, because of lagging production, it is still turning out its \$10,000 pastel-coloured creations at a loss. Another problem is that some building codes, written 30 years ago, do not permit steel houses; still another is that the down-payment is high. Government insurers balk at crediting the costs of radiant heating and combination clothes-dishwashers, and distributors find their capital inadequate.

Congress, exasperated by Lustron's frequent reappearances, hat in hand, alarmed by equally frequent resignations of its executives, and perturbed by stories that RFC officials sometimes find comfortable berths with firms which have received loans, flatly refused any more money to finance the distribution of prefabs. The RFC, which has put most of its eggs in one prefabricated basket, probably cannot afford to drop it now, but it is likely to require drastic changes in management.

Shorter Notes

The strike of longshoremen which blockaded Hawaii for over five months has at last been settled. The men have gained, not the 32 cents an hour increase in wages for which they were fighting, but only the 14 cents which they rejected three months ago, and a further rise of 7 cents an hour next March. However, their new contract will expire in June, 1951, at the same time as that of their fellow unionists in California. This will put longshoremen on both sides of the Pacific in a stronger bargaining position; on the other hand, if a strike does occur, it will be difficult for the President to refuse to deal with it as a national emergency, which he would not recognise in the case of the Hawaiian strike.

*

"Funnies," as American children call their "comics," are now to carry a message. The National Social Welfare Assembly is turning their mass circulation to socially constructive ends. Thirty-two magazines, with a circulation of over 10 million, recently printed a comic strip pointing out to children that a prolonged school career would be a profitable investment in the end, however unattractive it might seem at the moment.

*

President Truman has vetoed the \$88 million authorisation Bill for the rehabilitation of the Navajo and Hopi Indian tribes, on the ground that Indian water and property rights might be imperilled by the amendment extending state law to reservation Indians, now subject only to Federal and tribal law. The President promised, however, that next year he would request Congress to appropriate funds for the objectives outlined in the vetoed measure—road and trail building, education, resettlement, soil conservation, irrigation, and medical care.

THE WORLD OVERSEAS

The French Economic Outlook

(From A Special Correspondent)

MR ATTLEE'S cuts, disappointing though they may be in Britain, look Herculean across the Channel. In the French National Assembly last week, where M. Bidault had just been elected Premier, Mr Reynaud called attention to the British cut of £280 million and, contrasting it with what France has failed to do, exclaimed: "What a difference!" This tribute to British Socialism is the more remarkable in that it came from a man whose reputation in France for financial Toryism is beyond dispute. In drawing the parallel, however, M. Reynaud was merely reflecting what must now be of great concern to all responsible French leaders. For once again it is touch and go whether a French government can maintain confidence in the franc and thus whether France can make a positive contribution to any fresh assault on the problem of European recovery.

Six months ago the French national budget appeared at last to be in balance, agricultural prices were on their way down as a result of a good harvest, and industrial prices were beginning to follow suit. When to these events was added the effect of a firmer-than-usual credit policy and a successful reconstruction loan, it seemed as if the French economy had finally swung against the tide of inflation. French officials had even begun to speak with alarm of the perils of the contrary force—deflation—and the most acute observers were unable to diagnose the financial climate beyond saying that "whatever it is, it is not inflation."

Yet even before the franc was devalued six weeks ago in the wake of the pound, French inflation was on the move again. Whatever damage the steep and unilateral devaluation of the pound may have wrought on the Continent, it was not the root, as French politicians often allege, either of the recent government crisis or of recent French economic troubles. The effect of devaluation may well be to intensify French difficulties, but the trend which led the Socialists to demand a fresh wage increase was already plain to see.

Impetus to Inflation

The new impetus to inflation comes from three main sources. The first is one over which the Government has no control—the drought. This has brought a sharp rise in the price of agricultural products; vegetables, for instance, have become as much as 50 per cent more expensive. Pork has grown scarce and more expensive because of lack of potatoes. The drought also reduced hydro-electric power, and while this did not lead to direct unemployment, it created irritating and unsettling patches of under-employment.

The second stimulus to inflation came when the precariously-balanced 1949 budget went awry. It became obvious during the year that receipts did not cover expenditure, and, to bridge the gap, the French Government dipped a little deeper into the Marshall Aid "counterpart fund." More important, it again took to expanding the note circulation.

A third spur to inflation, as yet no more than incipient, is the rise of a certain amount of social unrest among the working population. It is by no means as vocal or as vociferous as it was prior to the coal strike last autumn,

and working people generally are believed to be more contented than a year ago. However, it is a demonstrable fact that the fruits of the economic gains which France made in the spring were not equitably divided between the profit makers and the wage earners. The consequent sense of injustice has probably made the working population more sensitive than it might otherwise have been to the effect of the drought on prices and employment. This undercurrent of dissatisfaction was not strong enough perhaps at the time to justify M. Daniel Mayer's demands on the Queuille Government for a wage bonus; but neither was it, as some have suggested, a mere figment of his imagination. The discontent was and is real. Unless it is met fairly, it may force its way into the open and lead to a renewal of class strife.

Pressure for Bonuses

M. Bidault may have had this background in mind when in reply to M. Reynaud's taunt of British achievement he claimed to be basing his economic policy on "a minimum of austerity and a maximum of justice." The crucial question is by what means M. Bidault and his finance minister, M. Petsche, propose to effect the necessary redistribution of the national income. Raising wages will not automatically lower profits and it might even do the reverse by touching off a price spiral. It is hard to see how the present government can avoid granting the "once for all" wage bonus to lower paid workers and the pressure for a permanent bonus or for a return to free universal collective bargaining may also become irresistible. If this materialises before economies are made elsewhere and before a general overhaul of national finances has taken place, inflation may get out of hand.

There is nothing very original in the remedies which are now being put forward from many sides. Most of them have been commonplaces of French financial debates for the past thirty years. The three main pillars of reform are the reorganisation of tax assessment and collection, the imposition of stricter controls on bank credit, and the cutting of government expenditure. The difficulties in the way of substantial reductions in expenditure are particularly large at the moment. There are three rapacious claimants—the nationalised industries which need funds both for investment and current deficits, the housing programme, and the Indo-China fighting. Perhaps the best that can be expected from the new government is to hold expenditure at last year's level.

What steps the Government intends to take in these matters must emerge very soon, since the budget for 1950 has to be presented to the Assembly within the next few weeks. It was believed that M. Petsche, the finance minister in M. Queuille's cabinet, was preparing a very stiff budget. As a foretaste the Government only a week before its demise had passed by decree another tax on profits. Now M. Petsche is back at the finance ministry, but no one knows how soon his work may again be interrupted. Already much valuable time has been wasted. It is obvious that devaluation will aggravate the ailments that were calling for treatment when devaluation was merely a rumour. Its full impact on the domestic economy has not yet been felt, but the time in which to prepare for it is short.

Failure now to hold the line would be all the more disappointing since it had seemed earlier in the year that France was getting on its feet—and it would be a pity if all the effort that went into bringing France to that point should now turn out to have been fruitless. If inflation can be staved off for another few months that struggle will not have been in vain. The pipelines have been re-stocked so that ephemeral difficulties need not lead to industrial crises. Indeed, some of the reserves are so substantial that they are likely to be released by speculators if it becomes clear that the battle against inflation has been won. Again, given a little more time, the reduction of French import quotas contemplated in the next few months would help to keep down French prices by making markets more competitive.

Hopes in Jeopardy

All these domestic hopes are now jeopardised, and there is even more at stake. For a France once more struggling unsuccessfully with inflation would be regarded by its neighbours as an unwelcome partner in any plans for closer European co-ordination. The idea of a monetary union between nations becomes nonsense if one of the participants is sliding hopelessly down the inflationary slope. The lowering of trade barriers becomes equally pointless if the French economy is split into two sections, one trying desperately to spend all its money, the other hoarding all the goods it can lay hold of. In short, Mr Hoffman's latest proposals for closer association can lead nowhere unless French stability is assured.

The picture is not entirely gloomy. French industrial production has held up well. By the beginning of this year the index for industrial output was 25 per cent above the 1938 level. During the summer it reached a plateau, but with the end of the holiday season it is expected to start rising again, and next year's figures may be six to seven per cent higher than those for 1949. Apart from this more or less normal trend, the French real national income can soon expect to benefit from two appreciable dividends. Some of the large postwar investments in the colonies should begin to mature and the first phases of M. Jean Monnet's plan for domestic reconstruction and expansion will have started to add to the output of goods—and at lower prices.

These increases will be frittered away unless France is now assured of a period of political calm under a government ready and able to produce a balanced budget and to accompany it with credit restrictions. Only if such a government stays in the saddle will it be possible for France to join with its neighbours in relaxing import restrictions. Until internal stability is a certainty, the Government can reasonably claim that reduction of these barriers would worsen France's debtor position in international trade. It

is this which explains in part the paradox of a French government welcoming the removal of trade restrictions in principle and at the same time making only the most niggardly gestures toward such a goal in practice.

Anti-Semitism in the Soviet Union

[FROM A CORRESPONDENT]

LAST spring there occurred in the Soviet Union one of those purges which periodically overtake one or other branch of the intelligentsia. This time it was the turn of the literary critics. The paper *Literary Gazette*, famous alike for its strident abuse of foreign statesmen and for its incessant denunciations of heresies among all kinds of Soviet bodies (including, more than once, its own editorial board), published some scathing articles, and an account of a congress of literary critics at which the party's spokesmen exposed the heretics in long speeches of the standard type and stigmatised their errors. However, on this occasion the stylised procedure of an ideological purge showed some peculiar features. Almost all the heretics exposed either bore Jewish surnames or had a Jewish surname printed in brackets after a Russian surname, a thing which was unprecedented in the Soviet press. Significant, too, was the heresy with which these Jewish critics were charged. Its name was "cosmopolitanism," and this was said to mean an absence of true Soviet patriotism and of proper respect for Soviet culture, allied to an undue attachment to the rotten culture of the non-Soviet world. The adjective applied to this "cosmopolitanism," and subsequently to the "cosmopolitans" themselves, was the word *bezrodny*, an abusive term meaning "without race," "without home."

In accordance with the usual pattern of events the "cosmopolitan" campaign of the central press was speedily taken up throughout the Soviet Union. In all the republics newspapers began to publish reports of congresses of literary critics, at which spokesmen exposed the same error and at which the participants unanimously joined in exorcising the heretics and in calling for an eradication of their error from Soviet literature. In all of these congresses it was once again the Jewish critics who were assailed; and over and again one met the suggestive word *bezrodny*. Finally the question was taken up by the illustrated comic weekly *Crocodile*, and two cartoons left no doubt that the new campaign had an anti-Jewish trend.

In due course the campaign ended, but not before some able critics and their works had been banished from the Soviet literary scene. (The question of whether there was any other kind of banishment involved cannot, of course, be

answered; but the heretics were so strongly denounced as "agents of Anglo-American imperialism," as to make it at least problematic whether or not they would continue to remain in normal society.) The Soviet papers have now ceased to be full every day of "cosmopolitanism," and there are only occasional echoes of the campaign.

The Lure of Israel

The explanation of this campaign is to be sought firstly in international politics. The very time of the incident, apart from anything else, suggests that it was provoked by the repercussions occasioned by the formation of the state of Israel. The new state at last offered to the Jews a spiritual and an earthly home, and it would be natural to expect that Soviet Jews, certainly no less than any other Jews, might look upon Israel as their real fatherland. No such dual loyalty would, of course, be desirable in the Soviet Union. It was doubtless with the aim of guarding against it in advance that *Pravda* of September 21, 1948, published an article by the well-known Soviet journalist Ilya Ehrenburg, himself a Jew, which maintained that the realisation of the hopes of Jews, as of other peoples, depended not on residence in this or that state, but rather on the attainment of such just social conditions as were to be found in the Soviet Union. However, such articles were not likely to eliminate the natural longing of a people for its own home; and however just the social conditions in the Soviet Union, it remained a fact—and a fact well known to the Soviet Government—that millions of people had fled the country at all costs rather than continue to enjoy them. Was not the setting up of a new home specially for the Jews liable to make Soviet Jews a class particularly prone to become dissatisfied with what it had? Once the state of Israel had been set up the Soviet Government had even more cause to be suspicious of the Jews. For, although the new state had been accorded early recognition by the Soviet Union, it failed, both at home and at Uno, to repay this support by that complete and unconditional allegiance which the Soviet Union is accustomed to receive from its protégés. Israel proved no satellite and maintained all kinds of cultural and political links with the west. Plainly the political orientation of Israel was not all that the Soviet Government could wish, and the activities and influence of Jews in the Soviet Union would need to be carefully watched.

It is probable, none the less, that these political considerations, though important, were not so important as ideological considerations in evoking the campaign against the "cosmopolitans."

Two kinds of Patriotism

For some years now Soviet propaganda has been assiduously fostering the concept of "Soviet patriotism." The source of this is supposed to be a recognition that the Soviet motherland is the home of every possible good and happiness. It is a very exclusive sort of recognition, and it has been increasingly allied to a hostile attitude to the extraneous world and its culture. From this recognition is meant to spring a patriotism surpassing all other patriotisms that exist, or have existed, in less enlightened countries and epochs. In this Soviet patriotism there has been incorporated, supposedly, Russian patriotism; but it is a little hard to say, particularly on the evidence of wartime propaganda, which patriotism is in fact incorporated in the other. In any case the Russian share in Soviet patriotism has been receiving steadily greater attention. It was the Russian people, according to today's Soviet propaganda, which made the glorious Soviet revolution; it is the Russian people which is the greatest member of the Soviet family, and which has raised up the other peoples; it is the glorious past achievements of Russia which are being exalted in the newly-written histories; and it is Russians who are found, so late in the day, to have invented railways, penicillin, and scores of other things.

There were several reasons why the concept of Soviet patriotism, more especially in its latest Russianised form,

should prove particularly unpalatable to the Jews. In the first place the Jews have always occupied an important place in the Russian intelligentsia; Jews played no small part in the making of the Bolshevik revolution; and until the "cosmopolitan" campaign Jews held leading positions in the world of art and science in the Soviet Union. Despite all this the Jews found no recognition of themselves in a patriotism which was developing more and more into Russian nationalism. Secondly, the exclusiveness of Soviet patriotism would repel the Jews. They are not the people to be contented with the Soviet Union and Soviet culture to the exclusion of all else, because their religion and history as a nation belong to another area and another age and because they, more than other peoples, have international connections. Thirdly, Jewish literary figures, by the very fact of being Jews and literary figures, were the more able to appreciate the absurd lengths to which the exalting of Russia was liable to go (a recent choice example has been the discovery that the hero of the Trojan war, Achilles, was in fact a Russian) and were the less likely to write such material. The Jews, in fact, have their own strong Jewish culture and national feeling; and this did not accord with "Soviet patriotism." Soviet peoples other than the Jews would not have so strong a cause for disliking Soviet patriotism. The Russians themselves did, at any rate, have their homeland in the Soviet Union, and were daily being told the most flattering things about their unsurpassed talents; and Asiatic peoples of Soviet Asia had comparatively little autochthonous culture, and still less any international connections.

Thus, both political and ideological considerations were present to occasion dissatisfaction with the Jews. The struggle against them was waged in an ideological manner and the influence of the Jewish intelligentsia on the world of thought and letters was effectually suppressed. But it did not amount to racial persecution of the Jews. The Jews were not held up as an inferior non-Slav race: there was no question of segregating or expelling Jews. Nevertheless, whether wittingly or otherwise, the authorities, by choosing Jews as a butt, were reviving the age-long Russian tradition of anti-Semitism, the spirit that produced in Russia the pogrom (a Russian word) and the Pale of Settlement. If the campaign, in its inspiration from above, was intended rather as a suppression of deviationists, or potential deviationists, from Soviet orthodoxy, it was none the less a campaign which was dangerously likely to be understood below as more down-to-earth.

Old Friends of New China

[FROM OUR OWN CORRESPONDENT]

THE inauguration of the new Chinese Communist central government on October 1st was followed almost immediately by formal Soviet diplomatic recognition. Since then Communist newspapers and broadcasts have been characterised by the most adulatory references to Soviet Russia, and for the first time there has been official confirmation from the Chinese side of what has long been known by hearsay from north China—that the Chinese are receiving aid from a considerable, and apparently increasing, number of Russian technical experts. On October 7th the Sino-Soviet Friendship Association was addressed by Liu Shao-chi, one of the six vice-chairmen in the new government and probably the next ranking Communist after Mao Tse-tung; he revealed that Stalin had sent 200 specialists, at the request of the Chinese Communists, to help in industries in Manchuria and other parts of China. (There was something slightly self-conscious about the way in which he went on to stress that these 200 specialists lived on the same scales of pay as Chinese technicians, and did not receive the vast salaries which would have been demanded by British or American advisers.)

The rapid restoration of China's railways—one of the most remarkable achievements of the new regime—has been

attributed by the Communists themselves in part to the help which they had received from Russian advisers. The Russian cultural and educational mission, consisting of forty-one members headed by Alexander Fadeyev, which attended the inaugural celebrations in Peking on October 1st, has since been touring the larger cities and has been everywhere accorded an elaborate welcome. References have also been made during the past two weeks by the Communist New China news agency to the presence of Russian town-planning experts in Peking, to a Russian plague prevention team in Manchuria, to the official adoption of the Russian system of railway maintenance for the whole of Manchuria, to the official encouragement of the Russian language in universities, to the presence of large numbers of Russian technicians in factories at Dairen, and so forth.

Recent travellers from north China, although unable to give exact details, report large staffs of Russian officials at the Embassy in Peking and the consulate-general in Tientsin. Reports continue to filter south of the presence of large numbers of military advisers helping to train the Communist armed forces. Nothing is more probable; if the Russians have been invited to advise in the industrial sphere, it is fairly certain that the military sphere, in its more technical branches, is accorded an even higher priority.

A plausible explanation for this sudden recent intensification of pro-Soviet sentiment and the now overt references to the assistance being given by Russians is that, if these had occurred *before* recognition, they would have placed both the Russians and the Chinese Communists in a compromising and embarrassing position, especially at the United Nations. The Sino-Soviet Friendship Association, which already has branches in all the main cities and which is evidently going to be the main instrument for promoting close relations with the USSR, was only officially inaugurated after the central government had been established; yet its preparatory committee, to the accompaniment of much publicity, began work

"I think I'd like
a White Horse
better than anything"

MAXIMUM PRICES:—Bottles 33¹/₄, ½-Bottles 17¹/₅

several months ago. The recent intensification of pro-Russian propaganda represents, therefore, a sort of sudden release.

Tactful Handling

The cynical foreign observer, remembering the previous experiences of Russian advisers to the Chinese at Canton in the 'twenties, remembering, too, how the popularity of a foreigner in China varies in inverse ratio to the power of his country and its degree of involvement in China (as the British found before the last war and the Americans after it), cannot help wondering what the Chinese will be thinking of the Russians in two, or five, or ten years' time. The Russians, of course, have learned a lot, and perhaps will take care not to overplay their hand.

In order to understand the present state of Sino-Soviet relations it is important to understand that it is not the hostile, expansionist manifestations of Moscow's policy, such as preoccupy the west, which strike the Chinese Communists. For them the Soviet Union has been something more than the fount of their faith: during their long struggle, from nothing to undisputed rule over the most populous single country in the world, it was the only country which never embarrassed them in their struggle and which gave them unwavering moral support, and periodical material support as well. In dealing with many problems, which for the Russian revolutionary leaders were completely new and to which they had gropingly to find the answers, the Chinese Communist leaders hope to draw on Russian experience and thereby greatly accelerate the creation of a Communist society. This hope is a great source of strength to them.

Finally, these Chinese Communist leaders do genuinely feel that they are members of a world-wide international movement, and that the cause of world peace, and the spread of the Communist system, can best be achieved by demonstrating the absolute solidarity and identity of Communist

China with the Soviet Union and the other countries of the Soviet bloc. These factors have to be understood and appreciated. Otherwise current Chinese Communist references to the Russians will merely appear, as they do to the veteran British "China hand," incomprehensibly "un-Chinese."

Purges in Bulgaria

[FROM A CORRESPONDENT]

THE purges in the leadership of the Bulgarian Communist Party are assuming enormous and surprising proportions. They amount, indeed, to a total and violent change of the leadership of the party and the state machine. The axe has so far struck down the following:

The acting Prime Minister and Secretary-General of the party (Kostov); the Finance Minister (Stefanov); the Minister of Industry (Kunin), who was also Minister of Finance for two months after the arrest of Stefanov; the Governor of the National Bank (Tsonchev); the Minister of Public Works (Sekalarov); the Minister of Transport (Tonchev); the deputy Foreign Minister and Director of the Communist Propaganda Services (Topencharov); the Foreign Under-Secretary (Andreychin); the Chief of the General Staff (General Kinov); the Chief of the Army Political Department (General Balgaranov); the chairman of the Control Commission of the Communist Central Committee (Pavlov).

Apart from these prominent figures, nearly a dozen other ministers, under-secretaries and generals the whole railway directorate and a great number of provincial party secretaries, local army chiefs, police chiefs and inspectors have been involved. Moreover, the all-powerful deputy premier, Anton Yugov, for five years Interior (Police) Minister, has also completely disappeared from the Sofia scene in the last three weeks. This is presumably the first sign of his impending downfall.

Impeachment of Ministers

Ten days ago the National Assembly, which had been disbanded in September, was quickly summoned for a short half an hour session to vote a new law which is certainly unique in the world: it is a special law for the trial of Cabinet Ministers and members of the Government. A new "Supreme People's Court" is created which has to try the accused not later than one week after the publication of the indictment. There is, of course, no appeal, and Ministers and members of parliament can be arrested "without the prior removal of their parliamentary immunity."

The purged men are now accused of "Kostovism," which—to quote the present Communist dictator in Bulgaria, Valko Chervenkov—is "nothing but Titoism on Bulgarian soil and, just like Titoism, it grows on treason and espionage." As for Kostov himself, his "immediate trial," announced last August, has again been postponed, a fact which shows his remarkable endurance (he was arrested in March) and which has undoubtedly raised his prestige within the Communist rank and file. Kostov was not, like Rajk, just one of the leaders of the Communist Party; he was the universally accepted leader after Dimitrov. A member of the Central Committee since 1924, a member of the Politburo since 1935, secretary of the Central Committee since 1940, and Secretary-General of the whole party since 1944, Kostov was, above all, responsible for the building up of the party machine. All party secretaries, inspectors and functionaries were his men. At the last party congress in December, 1948, he presented the party political programme, which presumably is still in force. As chairman of the cabinet committee co-ordinating all economic ministries, he was the virtual economic dictator of the country, the author and supreme chief of the five-year plan. On his fiftieth birthday, in 1947, the Central Committee sang his praises in the following manner:

Great are your achievements, Comrade Kostov, as the builder of the party, as the teacher and instructor of the

party members. Under your leadership and inspired by your heroic life, thousands of Communists were educated into unquestionable loyalty to the party.

Titoism in the Villages

Inefficiency and opposition in the country are obviously part of the background of the present political transformation. Official Communist figures published in the last two months reveal an alarming economic state of affairs and chaos in the transport system. The passive resistance of the peasants to the dictates of Sofia is obviously the Government's greatest problem. The autumn requisition quotas for wheat and rye have been met with 90 per cent, and for oats with 80 per cent delivery. It is most interesting and significant, however, that the districts round the Black Sea and the Rumanian border (the districts nearest Russia) have fulfilled their quotas with deliveries of 143, 112 and even 219 per cent. The districts bordering on Yugoslavia, however are seriously lagging behind: for example, Breznik 22 per cent, Tran 27 per cent, Belogradchik 20 per cent. Even more revealing are the figures for the Macedonian districts—59, 54.42 and 20 per cent. Clearly, the "Tito influence" does exist in Bulgaria, and especially in Bulgarian Macedonia.

For the defects in the transport system "Nationalistic and anti-Soviet elements" are blamed. The goods trains are said to have been running at an average speed of 1½ miles per hour. Special "railway tribunals" have been set up now for "the quick investigation and trial" of wreckers. "Soviet transport specialists" are to "help the reorganisation of the transport system."

As Chervenkov appears to have the complete confidence and support of the Soviets his ruthless regime is there to stay. How many Cabinet ministers and Central Committee members will be actually executed for treason, espionage and spying is a matter of speculation, but Chervenkov obviously wants to frighten the remaining Communists into complete submission. His purge has drastically affected the army, the police, the party machine and the economic ministries—the pillars of the Communist dictatorship. Loyal party leaders, efficient economists, cabinet ministers and generals cannot be produced over night, nor can the imported specialists from Russia take their place. The Bulgarian Communist Party and the "people's democratic" state machine must have suffered serious damage which it will take years to repair.

New Phase for Benelux

[FROM OUR BRUSSELS CORRESPONDENT]

It was no small achievement that the Luxemburg conference of the Benelux Governments ended in a protocol which marked a definite step towards economic union. For some weeks beforehand the non-official atmosphere had shown signs of strain, largely as the result of the economic difficulties into which Belgium is running at the moment. Moreover, since the interests which were at the time most affected (and most vocal) were close to the counsels of M. Eyskens's Government, the danger was consciously faced that Benelux, a prototype of European economic collaboration, might after all become a dead letter. The fortunate conclusion is that this did not take place, and for this much of the credit must go to M. Eyskens and his Foreign Minister, M. Paul van Zeeland.

The basic clash in opinion arose from the refusal of the Netherlands Government to be unduly hurried along the path to which they had committed themselves in the Châtaignau. This is easily understood, for the postwar Netherlands have had to face problems which, neither in kind nor in degree, confronted the Belgo-Luxembourg union. A period of economic austerity has been forced on the Dutch and this has taken the inevitable form of rationing, subsidised prices, cheap money and of a debtor position in international trade.

The system, though it looked unconscionably rigid to Belgian eyes, was sympathetically watched as marking the very real progress towards the Dutch entry into the Benelux partnership on a prosperous footing. Belgium, meantime, was putting all its weight into the export drive which, aided by the Marshall Plan and the Intra-European Payments Scheme, yielded a wholly abnormal trade surplus in the first half of this year. It had deliberately refrained from impairing its export capacity by any undue diversion of its resources into reconstruction and capital expansion until the demand for Belgian exports declined.

This decline has now happened and it has become desirable for Belgium that Belgian industry should be able to take its share of the enlarged Benelux home market which, despite the Customs Union, was still confined by the Dutch retention of import licensing and quota regulation. It was particularly important for the steel industry which, after carrying the main weight of the export boom earlier this year, had already seen its American, Argentine and Swiss markets folding up and was preparing for the still greater blow, which actually fell officially during the Luxemburg conference, of the cessation of the British purchases of blooms and billets. Similarly, the textile industry, having recently done good business with western Germany, was seeing conditions revert to their prewar norm with the increase in Germany's own capacity to cover its own needs. With the prospect, publicly admitted by M. Eyskens, that devaluation might have altered the Belgo-Dutch trade balance adversely to Belgium, there was an obvious argument in favour of a total opening of the Dutch frontier. Industrial propaganda in Belgium took the line that it was now or never.

Full Union by July

It was obvious from the start of the Luxemburg conference that the differences of outlook between Belgium and Holland still persisted, and both the immediate pre-union and the full union (scheduled for July 1, 1950) stood in some danger. Nevertheless, both unions were preserved, though in a somewhat attenuated form. The full union, indeed, is to be established next July "in the light of experience gained during the pre-union period," which clearly indicates the possibility that the frontiers may not by then be fully opened and the fiscal systems duly harmonised. Moreover, the monetary difficulties still continue and, though rules are laid down for procedure in the case of Belgo-Dutch disequilibrium, there is as yet only the vaguest outline of the communal monetary and credit policy upon which the success of the union will depend.

The first task was to solve the immediate trade problem. This was helped by the fact that devaluation had increased the value, measured in Belgian francs or Dutch guilders, of the \$139 million of drawing rights available to the Netherlands for 1949-50. It was possible therefore to base estimates on Belgian exports to the Netherlands at the rate of B. frs. 15,000 million a year, as compared with B. frs. 12,000 million of which the 1948 figures, and those of the first half of 1949, fall slightly short. From this it was possible to appropriate B. frs. 250 million for steel and metal manufactures, and the frontier is to be opened to these products in the near future. As an offset to this the Dutch demanded, and obtained, from the Belgians the concession that steel should be sold to them at the Belgo-Luxembourg domestic prices and not as hitherto at the high export prices which have marked the period of the world steel shortage. The extent of Dutch export sales to Belgium could not, so short a time after devaluation, be estimated with any confidence. The balance is as yet adverse to the Netherlands, last year's deficit being above B. frs. 4,000 million and this year's figures having been at a somewhat higher rate. The Dutch, not unnaturally, were unwilling to go farther into Belgium's debt; and it was agreed that the deficit should not be allowed to run at a figure exceeding what could be dealt with by drawing rights.

Discrepancy in Taxes

A number of general problems were brought nearer to a solution. Among these is the agreement that a special regime must be contemplated for Luxemburg agriculture, which is comparatively expensive; but there is also contemplated the creation of a fund for agriculture which shall be applied, more especially in Belgium, to further the modernisation of this very important industry. At present Dutch costs are lower than Belgian, and it has been necessary to deal with the position by importing Dutch butter at specially high prices. The fund will be fed by a licence-tax on imported feeding stuffs, a system favouring the small farmer; but there are doubts as to whether this will, in the long run, offset the uneconomic parcelling of farmland which characterises so much of Belgian cultivation.

★

Questions of ports and inland waterways, which have produced more thorny problems between the interests concerned than most other aspects of the union, have been entrusted to a rather belatedly formed committee. Among the questions which this committee will discuss will be that of Antwerp's access to the Rhine by the proposed Moerdijk canal, which Belgium so energetically claims from the Dutch, and the competitive position between Antwerp and Rotterdam, affected as it is by the lower level of Rotterdam wages. Fiscal questions are still causing some difficulty. The ground is prepared for the unification of excise duties, but the problem of the *taxe de transmission* or turnover tax, which affects retail prices, remains outstanding. This is a question of the sixty-forty ratio between Dutch direct and indirect taxation, which is reversed in the case of Belgium, where indeed the discrepancy may be rendered still more noticeable by the avowed policy of M. Liebaert, Belgium's liberal Finance Minister, to reduce the rates of tax on personal incomes. The budgetary problem is a difficult one, especially as the Belgian taxpayer is so notably less disciplined than the Dutch.

Differences in Approach

On the longer term, the protocol contemplates adjustments in credit policy as a means of correcting disequilibrium between the partners, or between any of them and the outside world. It makes little mention, however, of the basic differences which actually exist, and which were enhanced by the contrast between the essentially practical approach of the Belgians and the rather more theoretical attitude of Professor Liefinck on the Dutch side. There is no question as yet of a pooling of gold and currency resources, such as already exists between Belgium and Luxembourg, but there appears to have been general agreement to work towards a greater harmony in money market conditions. At present Belgium is moving towards cheaper money with caution and, in some quarters, misgiving. It has lately reduced the bank rate from 3½ to 3¼ per cent, and a further reduction is possible if world conditions do not impel the withdrawal of the large volume of hot money now taking refuge in Belgium. The Dutch bank rate is 2½ per cent, reflecting in a controlled economy the substantial need for capital. Belgian investment in the Netherlands was mentioned as a possible corrective of the Belgo-Dutch payments position; but the present discrepancy of interest rates does not encourage the movement of Belgian capital into the Netherlands, nor does it yet seem that Belgium has capital resources to spare.

It would obviously be over-optimistic to say that, as a result of the Luxemburg discussions, Benelux is fully out of the wood. Ministers have courageously put the long-term advantages of co-operation ahead of the pressure of sectional interests, but the difference of outlook in the monetary field remains crucial. There is, indeed, some ground for doubting whether it is still to Benelux that Belgium looks for the furtherance of that opening of trade frontiers on which, as a manufacturing country, it so largely depends.

This is the sign of a group of companies which for seventy years have been designing and building specialised plants to perform various industrial processes better and more cheaply. Coal, steel, gas, electricity, chemicals and food are typical of the essential industries and public utilities which are served by Simon coal washeries, coke ovens, power stations, chemical and gasworks plants, flour mills, granaries, and engineering installations of many other kinds in Britain and abroad. With overseas companies in Australia, New Zealand, South Africa and South America, the Group directly employs more than 4,500 people and sends visible exports of machinery and invisible exports of scientific knowledge and experience to some forty countries throughout the world.

There are many ways in which the Simon Engineering Group serves the fundamental needs of civilisation.

MARKET RESEARCH IN THE AMERICAS

RESEARCH SERVICES LTD

*have pleasure in announcing
a reciprocal association with*

INTERNATIONAL

**PUBLIC OPINION RESEARCH INC. (I.P.O.R.)
NEW YORK**

I.P.O.R. is the international affiliate of the Elmo Roper organization, whose reputation in the field of Market Research is world-wide. It was established by Mr. Roper and Mr. Joshua B. Powers in 1945, in order to provide business men with a detailed picture of buying habits and preferences throughout the two Americas. I.P.O.R., under the direction of Mr. Elmo Roper and Mr. E.C. Wilson, formerly Research Director of the Columbia Broadcasting System, is now in a position to give—in association with Research Services Ltd.—any Market Research service which British exporters may require in the United States, Canada, Central and South America and the West Indies.

Mark Abrams, Managing Director of Research Services, has just returned from the United States, where he has completed an intensive study of American markets. Mr. Wilson, the President of I.P.O.R., is now in Europe and both will be available to clients for discussions in this country. Research Services will collaborate fully in the preparation of the necessary plans for surveys in the areas concerned.

Manufacturers and exporters in this country will appreciate the value of this arrangement, which ensures for them the joint services on their overseas marketing problems of the foremost British and American Market Research experts.

The Strasbourg Proposals

ALMOST superhuman efforts were required from the Committee of Ministers of the Council of Europe which met in Paris last Thursday. It seemed doubtful whether it could consider at all adequately within the time at its disposal the results of the Strasbourg meeting of the Consultative Assembly. For the various resolutions on the economic, political, social and cultural aspects of European union which were produced at Strasbourg have far-reaching implications.

It is in the economic field that the Committee of Ministers is asked to take the most urgent and varied action, for the Assembly felt that "millions among us will soon go hungry and unemployed unless we act at once to re-establish the economic equilibrium between Europe and North America." It believed that the people of Europe could do much to save themselves by mutual help and by building up an "economic union of free Europe" which would require "central planning combined with a maximum degree of individual liberty." In order to facilitate the creation of this union the Assembly makes a number of requests to the Ministers, of which the most important are:—

To take all practical steps to establish as quickly as possible a multilateral system of payments, including the inter-convertibility of European currencies, subject to the safeguards necessary to enable the movement of capital to be controlled during the transitional period.

To take all preliminary action for the creation of a European economic union, which shall retain the preferential systems and economic ties now in existence between certain European nations and the overseas countries and territories associated with them; and to consider their progressive extension to the other member states of this union.

To follow up and extend both the work of OEEC in liberalising inter-European trade and all studies now being made in regard to the economic relations of Europe and its overseas associates and territories.

The Ministers are also requested to create permanent machinery for consultation on credit policies between the central banks of issue; to study the conditions which would encourage American and other investors; to extend and develop a system of guaranteed markets; to study the development of production in member countries; to study how to promote the free movement and the widest possible employment of labour within the territories of member states; and to draw up a draft convention for the control of international cartels. The Ministers are asked to summon an economic conference to study all the above recommendations; and also to summon "industrial conferences" to make concrete proposals on how to improve the organisation and productivity of the chief manufacturing and agricultural industries.

Less Control by Ministers

The Ministers are also asked to submit to the Assembly proposals to carry out all the above recommendations and, after the Assembly has considered these, to

nominate a delegation from the Council of Europe which shall enter into negotiations with the Government of the United States of America and with any other Government concerned, in order to express the common policy of the member states and to seek through joint agreement the modifications which should be made to existing treaties, and in particular the action to be taken in the matter of lowering customs tariffs in the United States so as to allow of the development of European exports to that country.

This last suggestion, with its implied transfer of governmental authority to an international mission, was only passed in the face of considerable opposition.

By comparison with these somewhat involved recommendations for achieving economic union the Assembly's recommendations on political union seem almost straightforward.

The Assembly was broadly concerned with the "creation of a European political authority with limited functions but real powers." In particular it was concerned with emancipating itself from what most of its members considered the irksome and over-cautious tutelage of the Committee of Ministers. It has, therefore, asked the Ministers to deprive themselves of some of their authority by agreeing to a number of revisions of the statute of the Council of Europe. The effect of the principal revision proposed would be to abolish the Ministers' right to select the subjects which the Assembly may discuss. It would, however, reaffirm the Assembly's duty to discuss any subject proposed by the Ministers; it would still debar discussion of defence. A second revision would abolish the system of alternates in the Assembly and double the number of full representatives allowed to each member country. A third would make the admission of new members subject to the approval of a simple majority of the Assembly. At present new admissions are solely the concern of the Committee of Ministers.

With its eye doubtless on the problem of western Germany the Assembly also asked the Ministers "to consider the question of the admission of new members and new associate members" before the next session of the Assembly. Some points that are not actually referred to the Ministers are bound to tax their time and ingenuity. For instance, when they come to consider the above proposals they can hardly avoid studying the action taken by the Assembly on its own account both to enhance its authority and to further the political unification of Europe. It set up a "permanent committee of the Assembly" of twenty-eight members which will meet at least four times a year to co-ordinate the work of the Assembly and in general to "take any measures that appear calculated to facilitate or expedite the work of the Assembly." This committee may prove a serious rival to the Committee of Ministers itself as the executive part of any political authority that may eventually be evolved.

Problems of Political Union

The Assembly has also instructed its Committee for General Affairs to make a detailed and objective study of the problems involved in closer political union and to "formulate precise and definite proposals" including "definite recommendations concerning the modifications in the political structure of the member states which it considers desirable with a view to greater unity between them." This task is to be completed by April 30, 1950, and the Committee's report placed on the 1950 agenda of the Assembly. Here the only action required of the Committee of Ministers is that after the Assembly has discussed the report, the Committee "shall propose to the members of the Council of Europe that the recommendations then adopted by the Assembly shall be immediately discussed by the respective Parliaments."

The chief remaining recommendations to the Committee of Ministers are concerned with human rights and cultural co-operation. The Ministers are asked to have a draft convention drawn up for the collective guarantee, through a European Commission of Human Rights and a European Court of Justice of ten of the personal and political rights and freedoms set forth in the United Nations Declaration. The convention would also contain an undertaking by member states to hold free elections at reasonable intervals with universal suffrage and secret ballot. The Ministers are also asked to summon "in the near future" a conference of Ministers of Education to draw up a European plan for cultural co-operation; to summon a meeting of responsible University authorities to consult on what measures of co-operation they should adopt; and to institute a European Cultural Centre.

It will be known by next week whether the Committee of Ministers has succeeded in giving serious attention to all these matters. It is difficult to see how they can avoid agreeing that the Consultative Assembly should meet early next year, instead of waiting until next August.

THE BUSINESS WORLD

“Fritalux”

DURING the recent meeting of the International Monetary Fund in Washington, M. Petsche, then and now once again the French Finance Minister, produced a memorandum on a scheme for achieving interconvertibility of French and Belgian francs, the Italian lira and the Dutch guilder. This is the scheme which has been provisionally baptised with the portmanteau name of “Fritalux.” It has been in preparation for some months. This fact, and the timing of its first semi-official airing, should be stressed in order to counter the impression that the proposal is a direct and somewhat resentful answer to the devaluation of sterling.

The details of this plan have not yet percolated to London—perhaps they do not exist. But the main principles underlying the proposals have been widely canvassed, even though the British Government has not yet been officially apprised of them. The main feature of the plan is that the effective interconvertibility of the four currencies should go hand in hand with freedom for their rates of exchange to fluctuate. This aspect of the scheme would be expected to interest the International Monetary Fund and it was no doubt this element of fluctuating exchange rates which prompted M. Petsche's initiative in informing the IMF of his intentions. According to report, the IMF was willing to give a blank authorisation for such exchange fluctuations—an authorisation, it should be added, which did not go far beyond a recognition of existing facts, for neither France nor Italy has so far notified official parities of their currencies to the IMF and both in effect are operating free markets, though they are markets subject to some intervention and control.

But while freely fluctuating rates within this group of currencies are contemplated, there would necessarily have to be a link between the group as a whole and the dollar. One of the four currencies would be chosen for this purpose, and at the moment there is no doubt about the currency on which the choice would fall. It would be the Belgian franc, the hardest of the group, and the currency which has the greatest affinity to the dollar bloc. It is, moreover, a currency with an official parity notified to the IMF. Though provision would have to be made for changes in that parity if the equilibrium of the “Fritalux” group with the dollar world demanded it, the necessary elasticity could and would be found within the IMF machinery.

★

The object of introducing the element of fluctuating rates within the group would be to ensure the maintenance of approximately balanced payments between the member countries. The basic assumption on which the scheme evolved—and one without which Belgium would not be even an interested spectator—is that intercon-

vertibility of these currencies could not be secured if the price for it were to be an unlimited and unpredictable mutual extension of credits. Belgium's view is that it has gone to the limit in extending credit to its colleagues in Europe. Another condition is that there should be no settlement of ultimate balances in gold. The other countries concerned have not the gold with which to establish and maintain convertibility of their currencies even within this limited group. The maintenance of approximate balance in the payments accounts between these countries would, therefore, be an essential prerequisite of any such scheme.

Fluctuating rates of exchange are to be the means by which that balance is to be achieved and maintained. If, as a result of convertibility within the group, the currency of one particular member country is being acquired in any appreciable quantity by the others, that will be the signal for allowing the currency in question to depreciate in terms of the others. Such accumulations would be a sign that the country in question was running a current deficit, and the lowering of the value of the currency would be the natural means chosen to remedy that disequilibrium. There would, of course, have to be two-way margins, such as now obtain in payments agreements between most European countries, providing for the normal seasonal movements in current payments. But as soon as these were exhausted, recourse would be had to the price mechanism brought into effect through allowing rates of exchange to fluctuate freely.

★

Such appears to be the main outline of the scheme. It must at the outset be questioned whether the natural simplicity of the principles which it invokes has much reality in the present situation. In particular it may be doubted whether the mutual deficits and surpluses which are likely to arise in the payments between the countries concerned are modest enough to be corrected by reasonable adjustments in rates of exchange. If the scheme were to promise success, it would have to rest on the assumption that there would be no likelihood of wide and severe fluctuations in exchange rates. Recent changes in the so-called free markets for Italian lire and French francs are probably a measure of the order of magnitude of fluctuations visualised under the new scheme. Experience might well prove that the convertibility envisaged under the scheme could be achieved only at the cost of further extensions of credit, simply because the adjustments in the values of the weaker currencies would otherwise be intolerably large. The creditor countries might find themselves compelled *post facto* to hold, and to fund, accumulations of the debtors' currencies which they acquired, in spite of a reasonably free play of the mechanism of exchange

adjustment. This suspicion is strengthened by the considerable variations which still exist in the underlying fiscal and monetary positions and policies of the proposed member countries. The prevailing co-existence within the group of sound and unsound budgetary positions, and hard and soft economies would inevitably give rise to capital movements veiled in the familiar guise of current transactions. These would be encouraged first by the greater freedom of exchange dealings within the group, and secondly by the probability of greater exchange fluctuations and, therefore, of greater capital profits for the successful operator.

The official British attitude towards any such scheme would be to welcome it in principle but to reserve judgment about details. There will be support in Britain for any regional advance towards the goal of true convertibility of currencies, provided that advance is not made through the creation of exclusive or discriminatory blocs. This general goodwill towards “Fritalux,” or whatever else may emerge from the proposed grouping, would, however, be subject to certain reservations. The first of these would concern the problem of the cross rates, that is the sterling-dollar equivalents which the freer markets in the countries concerned would produce. Britain has financial agreements with each of the countries in question by which they undertake to maintain orderly cross rates for sterling in their respective markets. This assurance of good behaviour might, however, have to be supplemented by further assurances that the undertaking in question was not undermined through the encouragement of commercial arbitrage operations which, in fact, would produce divergencies of the dollar-sterling rate from the official parity. The possibilities of such deviation would be increased by the fact that some of the countries in the proposed grouping, namely the Netherlands and Italy, enjoy transferable sterling account facilities while the others do not. Only experience—or far more detailed knowledge of the proposed arrangements than is available—would make it possible to say with assurance that these differences in the monetary relations between each of the members of the group and the sterling area could be allowed to continue.

Whatever may be Britain's reservations about the scheme, it appears for the moment to have “gone over big” with ECA and the authorities in Washington. M. Petsche in Washington appears to have extracted from the Americans a promise that a large part of the

\$150 million pool which ECA has at its disposal to help the liberalisation of trade and payments in Europe would be pledged for this particular scheme. Presumably the dollars in question would provide a reserve out of which any extension of local currency accumulations over and above normal working balances would be convertible into dollars. They would give time for fluctuating exchanges to work on the balance of payments of the countries concerned without demanding from the member countries any undue extension of credits. For the reasons which have already been given, however, it is probable that a pool of this size would be exhausted without much delay.

Among the suggested participants in this proposal, the least comfortable and most sceptical must be the Netherlands. By tradition—a tradition reaffirmed by recent reactions to the devaluation of sterling—the Netherlands belong to the sterling bloc in Europe, that is to the group of countries which may be reckoned as the “dirigistes” as opposed to the free economies of the Latin countries. If, therefore, the “Fritalux” scheme were to go through it might be the last straw that would break the back of Benelux. That would not be exactly the best note on which to launch what has on occasion been referred to as the greater Benelux.

The “Fritalux” scheme must not be too closely identified with other and even vaguer proposals that have been recently floating around the *coulisses* of OEEC—among them a Federal Reserve Bank for western Europe and a European Investment Bank. A Federal Reserve Bank cannot begin to operate except on the basis of effective political federation. Of that there is still no sign in Europe. The Investment Bank has been spoken of as the instrument through which compensation would be made for the damage to vested industrial and commercial interests caused through the liberalisation of trade. But the objective, however praiseworthy, does not call for the creation of yet another piece of international machinery. The ingenuity with which these new blueprints are produced could far better be devoted to the essential task of recreating that approach towards uniformity in fiscal and monetary conditions without which all talk about economic integration in Europe must perforce remain mere talk. Even the Americans are unlikely to be taken in by such schemes or to award any points to their progenitors in the new distribution of Marshall aid by merit.

Markets for British Aircraft

BY 1952, the aircraft of the bulk of the world's civil air-fleets will be due for replacement. Reckoned by numbers the market is small, but it is lucrative. If the operational life of an aircraft is taken as ten years, 10 per cent of the airfleets need to be replaced each year. In 1948, international airline operators were using something over 2,000 aircraft. The tendency is to increase the number of passenger-miles per aircraft by using larger and faster machines; the actual replacement demand, averaged over the course of years, may therefore be less than 200 aircraft a year. This, with the requirements of the American and Australian internal lines added—perhaps 100 more—is the cream of the market. British aircraft manufacturers have been excluded from it since the war by their inability to

compete with American aircraft which were then in production. The British aircraft industry decided to concentrate on the field in which British engineers held the lead—the production of gas turbine engines. All the leading firms in the industry have concentrated in the past four years on developing these engines as civil as well as military power units.

The British aircraft industry consists of about a dozen major groups. The Hawker-Siddeley group, probably the largest, includes Armstrong-Siddeley (aero engines), Armstrong-Whitworth, Gloster Aircraft, and A. V. Roe (airframes), and High Duty Alloys (special castings for the aviation industry). De Havilland makes both airframes and engines; so do the Bristol Aeroplane Company and English Electric. Handley-Page, one of the

oldest firms in the industry, concentrates on airframes, as do Vickers-Armstrongs, Fairey Aviation Westland and the flying-boat specialists, Short Brothers and Saunders-Roe. A number of smaller firms such as Auster, Percival, Blackburn Aircraft and Boulton Paul specialise in small aircraft for short distances, in private aircraft and in trainers. Rolls-Royce and Alvis are the only firms which make engines alone.

When the war ended the Meteor jet fighter, built by Gloster Aircraft with Rolls-Royce engines, was in use by the RAF, and the Vampire fighter, with engine and airframe both made by De Havilland, was coming into production. The RAF relied on these three firms for the rapid conversion of its fighter squadrons to turbo-jet aircraft.

Only two important civil types went into production during the postwar years. The story of the Tudors is well known. Vickers-Armstrongs produced the Viking, a medium-range aircraft used in large numbers by the British Corporations. Altogether 167 have been built, about 60 of them for export, and the Viking is now out of production. De Havilland produced the Dove, a small aircraft designed for use on "feeder" lines, and have so far built 300, mostly for export. The policy of staking everything on the success of the gas turbine is only now beginning to bear fruit. New military aircraft and engines are in quantity production for the Navy and the RAF. De Havilland, Gloster and Rolls-Royce have between them built up a useful export business based on the sale of Vampires and Meteors abroad. The trade returns do not give a full picture of the size of this business since some part of the sales are transactions between Governments which are omitted from the published figures. Fees for patents used under licence abroad also do not appear in the trade figures, but are a growing source of invisible exports. Rolls-Royce have licensing agreements in five different countries, including the United States. Vampires and Meteors form the bulk of current aircraft exports; other military aircraft will be sold abroad once RAF priorities have been met.

On the civil side, progress has been slower because there was more ground to be covered. Several gas turbine prototypes have flown, and three are already on the market; they will be ready for operation in 1952. Virtually every airline sent a representative to see these aircraft at the Society of British Aircraft Constructors' annual flying display at Farnborough in September. While some were merely showing interest, others are seriously considering the new gas-turbine aircraft as alternatives to the Conqair and modernised Dakota class of piston-engined aircraft. Yet they are cautious of placing firm orders. The turbine engines have yet to build up a record of flying hours to confirm their test performances. Buyers are perhaps more cautious than is strictly necessary, but some of them have had unhappy experiences with new American aircraft bought since the war, and are determined to take no more leaps in the dark. On the other hand, if they wait for proved commercial performances they may lose ground to competitors prepared to take the risk. This atmosphere of indecision makes it difficult for manufacturers to plan their production. Some seven years elapse between the

first work on drawings and the flying of an aircraft on scheduled operation; the prototype's first flight is only a half-way mark. Tooling up for production occupies about one year.

If the necessary orders to justify proceeding with this stage do not come in until the aircraft has a certificate of airworthiness and has completed its flight trials, the date when it can be delivered for scheduled operation is further delayed. The usual procedure is for the Ministry of Supply to order two prototypes of aircraft and engine designs considered suitable for development. It is then understood that the price which the Ministry is charged for the prototypes includes most of the cost

UK AIRCRAFT PRODUCTION & EXPORTS

Monthly Average	Production		Exports		
	Number	*Index of Structure Weight (Average Jan. to Mar. 1946=100)	†Aircraft Delivered for Export (Number)	*Index of Structure Weight (Average Jan. to Mar. 1946=100)	‡Value of Complete Aircraft (£'000)
1946.....	54	135	...	...	6,427

1949:—					
1st quarter	41	172	34	128	5,994
2nd "	43	125	44	97	3,277
3rd "	33	70	33	68	1,499

The figures show production of all types of civil aircraft and those military aircraft which are built for sale abroad. All other military aircraft are excluded. * Expresses the size of the aircraft delivered. † Obtained by dividing the combined weight of the aircraft by their number, and relating this to the average for the first quarter of 1946. ‡ New aircraft only. † These figures include second-hand, as well as new aircraft, and also the value of any repair work done to aircraft brought back for overhaul. The value of these other sales is very small compared to those of new aircraft.

of developing them. If the aircraft is subsequently bought by commercial operators or licensed for manufacture abroad, the Ministry expects to recover part of its money. Although the £12 million already spent on the Brabazon is quite exceptional, development is too costly to be fully borne by the producer; to develop an engine costs perhaps £1,250,000, and modifications to a single wing section can absorb £250,000.

The only large British aircraft being built with private money is the De Havilland Comet, though even here the Ministry of Supply is paying for the development of the engines. The De Havilland company had orders for sixteen Comets from the Ministry of Supply and BOAC. By Christmas, there should be sufficient flying experience to give performance figures on long-distance flights, and the company can already discuss prices (which, though still to be fixed, are expected to be between £300,000 and £400,000) and delivery dates. Although at least three American manufacturers have prepared drawings for an aircraft of the same class and others have thought about it, nothing has actually been put in hand. The Comet, therefore, promises to enjoy a great advantage once it has accumulated a necessary minimum of flying experience. Even then, however, the experience of commercial operation of jet aircraft will remain to be acquired. The turbo-jet engines have the drawback that they give

an economic performance only at heights and speeds double those now flown on civil operation. The great speeds make for ground control difficulties, and the high altitude multiplies the problems of pressurisation.

Turbo-prop aircraft, with their lower cruising altitude, do not suffer from these difficulties, and the Viscount or the Apollo could go into operation at once if they were ready for delivery. But although the first flight of the Viscount was made 15 months ago, Vickers are only now tooling up for production. When work started on the aircraft, it was understood that it would be used by British European Airways. The Armstrong-Whitworth Apollo, a slightly smaller aircraft which made its first flight last April, was to be used on the West Indian routes of BOAC, and would also have been available for export while Vickers were occupied with home orders. But neither manufacturer yet enjoys the advantage of a signed order from the Corporations; negotiations over the Viscount are still proceeding. British manufacturers complain that the Corporations change their minds too frequently, are preoccupied with irrelevant details, and in general fail to give the clear lead that is needed. So long as the Corporations' decisions remain uncertain, discussions with overseas buyers about delivery are difficult; when aircraft have been developed with the aid of public money, the manufacturers are under an obligation to meet the needs of the British Corporations first.

Since an aircraft company needs to build 100 of one type of aircraft to recover its full investment, an export market is of vital importance. Gas turbine aircraft are proving hard to sell, but there is no doubt in anyone's mind that they will be bought. Some manufacturers think that the transition can be more easily made—that is, that sales difficulties can be more easily overcome—with an airframe which has been designed to fly both with piston engines and turbo-prop engines. Two Handley-Page aircraft, the Ambassador built by the De Havilland subsidiary Airspeed Ltd., and the big Bristol 175, have been designed on these lines. The makers are able to change from piston engines to gas turbines without interrupting production, and an operator buying a piston-engined version now can have his engines changed later to gas turbines at a fraction of the cost of buying a new aircraft. Engine manufacturers are hoping that a similar conversion could be carried out on existing piston-engined aircraft. Both Armstrong-Siddeley and Rolls-Royce turbo-prop engines have been successfully tried out in Dakotas, and

Armstrong-Siddeley are now offering this conversion to Dakota operators as a commercial proposition. This step brings the Dakotas into line with new International Civil Aviation Organisation standards (coming into force in 1952) and saves replacement before the aircraft has completed its useful life. Well over 1,000 Dakotas are known to be in operation.

Conversion on these lines suggests a possibility of strong competition for the manufacturers of complete aircraft. For the moment, the British have the gas turbine field to themselves. But it is rash to assume that because they have lagged in the past, the Americans are incapable of building gas turbines. If airframe manufacturers in America were to buy British engines now, they could probably put converted aircraft on scheduled freight runs within six months, long before a British manufacturer could deliver one of the new aircraft. The recent talk of selling large numbers of aircraft to American airlines is, therefore, too hopeful. The American lines would need Government permission to operate foreign aircraft, and are unlikely to ask for it if there is any chance that their own manufacturers can supply similar machines.

British manufacturers who have lately visited the United States think that the effect of American national pride is underrated here; even the licensing of British developments, although it takes place, is resented. It is true that some American airlines are taking a more businesslike interest in British aircraft than was expected, but there is a feeling that, if they do buy one or two, it will be to examine them rather than to use them as replacements for American aircraft. The British firms may be exaggerating the difficulties of the American market. Their technical lead is very strong, the prices of their aircraft are more than competitive, and on the face of it they should gain an entry—provided that they can deliver earlier than the Americans. Time has always been the key to aircraft sales; and from this point of view it is unfortunate that both Vickers and Armstrong-Whitworth, whose aircraft fit into the existing traffic systems, have been left in such uncertainty about orders that it will now take them time to get into production. The Comet, which has escaped this disadvantage, cannot operate on crowded routes without a reorganisation of ground control. Hopes that the Ministry of Supply would arrange to give manufacturers partial cover for the cost of going into production appear to have come to nothing. It is regrettable that much time has already been lost.

Cable Complexities

INITIAL reactions to the scheme announced by Cable and Wireless (Holding) this week have been mixed, and, on balance, unfavourable. It is not that the scheme introduces any major changes of thinking on the part of the board. The directors propose, as they promised last April, to distribute a "substantial portion" of the compensation received from the Government for the operating company. Indeed, they have gone further, and are proposing to distribute practically the whole of it. Nor can it be said that the scheme fails in its balance of treatment of the various classes of stockholders. That may be a hard saying for the holders of the $5\frac{1}{2}$ per cent preference stock, but their prospects of obtaining more than par in the event of a liquidation were never high, and in recent months they have faded out completely.

Within these limits, the scheme is ingenious and reasonably presented. It is based on two main principles. First, substantially the whole of the compensation money is to be distributed; and secondly, it contemplates the continuance by the company of its present investment business. On the merits of the proposal to continue the investment business, discussion is left to a later part of this article. But the intention involves three considerations which the directors outline. The Holding company must, in future, have a simple capital structure, and in this there is obviously no room for a preference stock carrying a $5\frac{1}{2}$ per cent dividend. A fair balance between the various classes of stocks must consider the special position of the Eastern Telegraph preference stock. And, finally, the ordinary stockholders should have the promise of a satisfactory yield on their investment.

The first stage is to repay the existing £16,766,591 of $5\frac{1}{2}$ per cent preference stock at par. That is the holders' right in a liquidation. But to mitigate this loss of a high yielding security, preference stockholders are offered a "modest share in the award" in the form of an option to receive instead £65 in cash plus £40 (nominal) 3 per cent Savings Bonds 1960-70. These bonds now stand at 94, so that the attraction of the option is at present no more than £2 12s. per cent and rests, eventually, on the attitude of preference stockholders towards holding a stock with 20½ years still to run.

As for the ordinary stock, it is proposed, first, to distribute £125 nominal of 3 per cent Savings Bonds 1965-75 for each £100 ordinary stock now held. At the present price of 92, the Savings Bonds would be worth £115 for each £100 of ordinary stock. Further, it is proposed to exchange each £100 of ordinary stock (there is £6,883,103 in issue) for £75 of a new 4 per cent preference stock and £75 of ordinary stock. This will involve a bonus distribution of 50 per cent, which would have to surmount the ban lately imposed by the Capital Issues Committee.

The next stage is the repayment of the £2,000,000 of Eastern Telegraph preference stock. This is to be paid off at 150, absorbing £2,000,000 in cash and £1,000,000 in 3 per cent Savings Bonds 1960-70. The argument here is that Eastern Telegraph has net assets of almost £14 million, which might have been paid out

in dividends to the ordinary stockholders (which means as to 99 per cent to the Holding company. The directors hold that the company should continue in being, but with a smaller capital. In a liquidation, it is probable, though not certain, that Eastern Telegraph preference stock would rank *pari passu* with the ordinary. The point could only be finally determined by litigation, and the directors are proposing as a fair compromise that the stock should be repaid at a 50 per cent premium.

These are the main features of the scheme. There are complicated intergroup liquidations and reductions of capital which are consequential on the main scheme, and are chiefly designed to leave all the seven underlying cable companies in existence with uniform capitals of £100,000. The main point of public consequence here is that the Eastern Telegraph debentures (£4,000,000 in all) are to be repaid at 3 per cent premium; the stocks have no fixed date of redemption.

If the scheme is adopted, the balance sheet of the re-formed company will have the following appearance:—

VALUES AS AT AUGUST 31, 1949			
4% Pref. Stock	£ 5,162,327	Land and buildings . .	£ 1,121,672
Ord. Stock	5,162,327	Quoted Investments . .	11,263,635
Surplus	3,839,296	Unquoted invests:—	
		Cables Inv. Trust	
		Ord.	1,085,000
		Others	2,322,634
		Net current assets . .	14,123,241
		Less Cash for Pref.	
		and Deb. repay-	
		ments	15,752,232
			£14,163,950
			£14,163,950

What the scheme proposes, therefore, is to retain the existing corpus of investment holdings, and to distribute practically the whole of the compensation stocks. That will provide a portfolio of £10,600,505 of quoted investments other than Savings Bonds, and £532,405 of investments quoted on Stock Exchanges abroad. There will be £3,407,634 of unquoted investments, of which rather less than one-third consists of the holding of Cables Investment Trust ordinary stock. No information is provided in the scheme about the nature of the investment portfolio; to expect a list of individual holdings would be asking for a good deal, but stockholders would have been assisted in judging the scheme if they had been given some analysis of the holdings, by industry, country, or class of security. The circular declares that "it can be stated with confidence that the group has an organisation and accumulated expert knowledge which would be wasted by liquidation." That is no doubt true; but although the further claim is made that the business of the Holding company since 1928 has primarily been that of the management of investments, it has not been to this side of the business that stockholders have been in the habit of looking, and it is about this side that they know least and have been told least.

In terms of prospective earnings, the scheme shows tolerably favourable prospects for ordinary stockholders. In exchange for their present income of £4 per £100 stock, they can expect £9 15s. (assuming a minimum 4 per cent dividend on the new ordinary stock out of

prospective earnings of slightly over $7\frac{1}{2}$ per cent). But it is not to prospective income that many of the ordinary stockholders are looking. They are looking to prospects under a liquidation. The directors argue, as they have done before, that liquidation would destroy the existing organisation, and would involve difficulties in liquidating a portfolio which includes some securities acquired "as sound long-term investments without any particular regard to marketability in the accepted sense." They claim that liquidation would have to be prolonged, and might well leave shareholders in the end with a total sum "substantially below the estimates of break-up values made in some quarters."

But that, surely, is not quite the point. A more realistic standard of comparison, in this context of capital values, would be the prospective market price of the new ordinary stock, rather than unofficial estimates of the break-up value of the portfolio. If the Savings Bonds are taken at their present worth of £115, the £75 new preference stock at par, and the new ordinary stock, on a 5 per cent yield basis, at £60, it might be worth £240. The market's scepticism about such calculations (the ordinary stock fell to £230 after the scheme was published) is apparent. What, in fact, is being offered to ordinary stockholders under the scheme is an opportunity to remain invested on a prospective yield basis of slightly over 4 per cent. And if, as frequently happens with investment trust equities, the market value of the new ordinary stock were to settle appreciably below its break-up value, there would be a fall in the total value of the new holdings offered in exchange for the existing stock.

Ordinary stockholders should not be put off from a liquidation, if they regard it as desirable on broader grounds, by the argument that liquidation would be prolonged and might be disadvantageous. With the long and successful history of the E. D. and R. N. Realisation companies in mind, they can afford to dis-

count such objections fairly liberally. But the question whether to liquidate rests, indeed, on wider considerations than this. The fact is that stockholders know and are told comparatively little about the one matter which is relevant to the scheme. Can the board of the new company be expected to invest on behalf of their stockholders to better account than they can invest for themselves? Is £100,000 out of a net annual income of £725,000 an economic loading for the services which the board have to offer? If ordinary stockholders were to decide in favour of liquidation, the question of the rights of the Eastern Telegraph preference stockholders would have to be submitted to the courts, and the outcome would be prolonged, uncertain, and perhaps costly. There is no clear and unequivocal answer in favour of liquidation to be gained from estimates of how ordinary stockholders might fare. There are still the unrepentant bulls of the ordinary stock who think they might do better in a liquidation. There are other holders of the ordinary stock who would be quite content to leave their interests in the hands of the board, to take their annual income and to leave capital values to look after themselves. The Ordinary Stockholders' Committee have announced that they will oppose the scheme, and will shortly put out their reasons. For the average stockholder, the scheme itself seems still to leave open the broad question of principle whether liquidation is preferable to continuation as an investment trust. His decision might have been easier if he were given specific proof of the advantage to be gained from the latter course. It is perhaps the real weakness of the scheme, fair in detail though it is, that its arguments against liquidation are not supported by greater factual evidence. After all, the responsibility for administering one of the biggest trust portfolios is not a light one; general claims of expertise in investment practice are admissible, but clearer evidence of past administration and the present position of the funds would do much to enhance them.

Business Notes

What Next on the Sterling Balances?

Discussion of the problem of the sterling balances is now likely to remain in the limbo until the outcome of the joint talks between Britain and the United States is known. These talks, as Lord Pakenham announced in the House of Lords this week, are due to begin before the end of November and preparatory work for them is now going on in London. It has been widely reported that the United States will press for some sort of a definitive solution to the problem this time and may even be ready to share with the British Government the task of grasping the nettle from which Dr Dalton recoiled after the Washington loan negotiations in 1945.

If some detailed plan is really being worked out behind the scenes, recent official comment in London, Delhi, Karachi and elsewhere can be excused its terseness and apparent lack of substance. Sir Stafford Cripps's rather vague statement in the Economic Debate really boiled down to nothing more than an admission that Britain cannot afford to continue repaying war-accumulated debt at the same rate as hitherto—despite the Government's recognition that it is in the general interest that less developed areas should not be hampered, by lack of capital, in their attempts to contribute more to their own support. The response of the creditor countries to this statement—to judge from such official and semi-official comments as have been made in public—has generally been

pitched in the same moderate key, although each creditor naturally puts first the need for local development, and concedes Britain's present inability to maintain the rate of payment merely as a tempering condition. Comment of this sort is quite reconcilable with the suggestion that a request is to be made to the United States to share the burden of debt servicing with Britain. It is also, however, reconcilable with a desire on the part of both creditors and debtor to continue the present disastrous policy of keeping the whole problem in respectable hibernation throughout the winter, and fighting each battle away from the public eye—in the separate negotiations which in the past have taken place in the two months following midsummer.

Meanwhile, a written answer in the House of Commons has revealed that total releases from the sterling balances in the first three quarters of this year amounted to £206 million—equal to some 15 per cent of the total value of exports and re-exports in that period. This figure can be compared with the releases of £267 million in the whole of 1948 (which included the £40 million released to Argentina in connection with the railway deal), of £156½ million in 1947 and of £5 million in 1946. It can also be compared, rather ruefully, with the annual release of £43 million tentatively anticipated as a reasonable rate of release at the time of the Washington loan agreement.

Two Reports on Simplification

The second of the group reports of the Anglo-American Council on Productivity* deals with simplification: the benefits to be derived from "a policy of deliberate reduction of variety" in the materials, intermediate components, and end-products of manufacture. "In our present economic situation," observes the foreword, "high productivity and low cost acquire a new importance." It is unfortunate to open a specific and useful industrial study with a general fallacy of this kind. The importance of high productivity and low costs is not new; it has been overlooked. One consequence has been that the general impulse towards the simplification of production in Britain has been unnaturally weak; and no short-term impulse, applied to meet a need which is conceived as temporary, can replace it.

The report shows how in the United States competitive pressure, the "cost-conscious climate," and the general obsession of industry with high productivity have long been impelling the manufacturing community towards simplified processes and, in each plant, a narrowing range of products turned out on a growing scale in long runs. It gives instances of the manner in which this has been done in various industries. It describes the official and trade agencies concerned with standards in the United States and shows how the receptive attitude of American manufacturers makes the pressure applied by these institutions so readily effective. Decisive, perhaps, is the relationship between industry and the consumer—who, while he gains in lower prices, loses through the restriction of his choice. American industry makes a deliberate effort to convince the consumer that the advantages of simplification to him outweigh the disadvantages.

Appropriate marketing techniques are, therefore, an essential part of any movement towards simplification. The report (HMSO, 9d.) of the Committee under the chairmanship of Sir Ernest Lemon, which was appointed by the Minister of Supply to consider the standardisation of engineering products, shows awareness of this:

Manufacturing industry should ensure that its commercial and selling policy pays due regard to the overall savings which accrue when production is concentrated on a standardised or simplified range of products.

The Lemon committee discards any idea of compulsory standards, but makes suggestions designed to render British industry more responsive to change: the reader publication by large firms of the standards in use by them; a greater readiness (by, among others, "industries under public control") to consider other using and manufacturing interests instead of determining standards unilaterally; a bolder and more energetic policy by the British Standards Institution. It also points out that standardisation and simplification usually require the spending of money on re-equipment, and urges that the Government "should consider whether it is possible to amend taxation in this respect." This is shrewd; exhortation will not replace incentive, nor will it overcome fiscal deterrents.

International Commodity Clearing

The most important item on the agenda of the Food and Agriculture Organisation conference which meets in Washington on November 21 is the proposed International Commodity Clearing House. This new organisation (of which an outline was given in *The Economist* of October 1st) is intended to be a public corporation with a capital equivalent to \$5,000,000 contributed by member countries in their national currencies. Its function would be to sell surpluses of food and other agricultural products to importers, to be

* Simplification in Industry. Anglo-American Council on Productivity. 1s.

paid for in the importer's currency or at a considerably reduced price in the currency of the supplying country. There is, oddly enough, nothing in the scheme about the prices to be used. To take a specific case, the ICCH would enable importers short of dollars to purchase surplus dollar goods in their own currencies.

Theoretically, the idea seems attractive, but there are many practical obstacles which have first to be overcome. The Director-General of FAO (Mr N. E. Dodd) has urged member governments to be prepared for earliest action. "Nothing could be more discouraging and disastrous," he has said, "than for the proposal to set up ICCH to be approved in principle and then for endless months to be wasted while committees intermittently meet to consider details. The world cannot wait for protracted deliberations. . . . Deliberate action is called for—promptly and comprehensively." This certainly smacks of prejudging the issue. It is a proposal, not a plan, which is coming before FAO, and it requires deliberation, even if deliberation has to be protracted, before it should be translated into action. The same tactic has been seen before at various international wheat conferences and in commodity discussions where the United States had an interest or a desire for immediate action.

The basic principle of the scheme is that countries with surpluses of agricultural produce would be willing to sell them for inconvertible currencies. But will the United States or even Canada accept sterling now in payment for their surplus products? If countries were willing to accept inconvertible currencies in payment, where would be the need for a new and expensive organisation such as the ICCH? If the scheme were put into operation, within a relatively short period the ICCH would use up its capital contributions of hard currencies and accumulate a vast sum of soft currencies. What happens then? Are the soft currencies forcibly made convertible into gold or dollars or does the ICCH have a bonfire of, say, sterling bills every twelve months?

The member governments of FAO would be well advised not to take the Director-General's remarks as being the final word. Two major matters remain. First, it is idle to suppose that the ICCH would be a first stage in the return to convertibility of soft currencies into hard. It is more likely to reinforce the very factors which keep the two currency systems apart. Secondly, at what level of prices do the various products become surplus and who is responsible for fixing prices so high that surpluses become inevitable?

Industry and Exports

Electricity During the Winter

The early start of electricity cuts suggests a difficult winter ahead. Economy warnings have been broadcast daily since the cold weather began, and on October 28th 20 per cent of the load was shed. In fact, the electricity supply position ought not to be any worse than it was last year. By the end of 1949 between 700,000 and 800,000 kw of new generating capacity will have been installed in the year; 500,000 kw of this is already in operation. Since demand increases at the rate of about 700,000 to 800,000 kw a year, this year's new construction will have done no more than maintain the *status quo*.

In normal circumstances, the power cuts should not have been necessary so soon. Total generating capacity is about 12,000,000 kw and the peak demand nine days ago was probably a little under 9,200,000 kw. But 25 per cent of the generating plant was out of service. All plant needs an annual overhaul, and as much plant as possible is taken out of commission during the spring and summer in order that the bulk of it will be back in service during the peak winter months. Normally, January sees the peak of the winter loads, but

November

By November manufacturers have completed delivery of their Christmas orders and, although the large demand for exports must be met, the children at home will not be forgotten. A great nation of shopkeepers is preparing to put goods into its shop windows, and bankers make ready to meet heavy seasonal demands upon their services. Whichever side of the counter will be your concern during the Christmas shopping season, you can depend upon the service of the Midland Bank, whose wide commercial experience is available at over 2,000 branches throughout England and Wales.

MIDLAND BANK LIMITED

last winter's peak did not occur until March, and this delayed the start on overhauls.

The weather will decide what is to happen as the winter goes on. Not more than 90 per cent of generating capacity is likely to be in operation at any one time. Even in January, when it is planned to have all possible plant working, five per cent is scheduled for overhaul. Since much of the plant is old, it is thought reasonable to assume that another five per cent will be out of operation for mechanical reasons. If the winter is mild, the position will be the same as it was last year when there was very little load shedding; if it is normal, a gap of 1,000,000 kw can be expected between peak demand and peak supply. If it is severe, the gap will be one of 2,000,000 kw.

★

The British Electricity Authority emphasises that the peak loads occur for only four hours of the twenty-four. In the off-peak hours there is plenty of generating capacity, and no fear of a fuel shortage at the power stations has arisen. A campaign has lately been noticeable, one apparent purpose of which is to stimulate consumption, especially domestic consumption, in these off-peak hours. This seems ill-advised; the effect may well be to increase peak load demand as well. Appeals for economy in peak hours, unsupported by incentives, have yet to achieve demonstrable success with the domestic consumer.

★ ★ ★

The Capital Cuts in Electricity

When Sir Stafford Cripps said in the House of Commons that the largest proportion of the £25 million cut to be made in the fuel and power investment programme was to fall on electricity, he made it clear that the new power stations would not be much affected. The British Electricity Authority is building 38 new stations and extending 43 more. Apart from the national need for more generating capacity, most of this work is in hand and can hardly be suspended. Each project takes from four to five years to complete, so what economies can be made are in those marginal schemes which are not likely to be started yet. The bulk of the economies falls on the plans of the fourteen Area Boards for improving distribution. It is easy to show immediate savings on some projects.

The Area Boards, which are responsible for distribution, had planned to spend £150 million on improving distribution in the next three years. But while some of this money was to be spent on rural electrification, most of it was to be used for the improvement and strengthening of existing networks. Cables in some industrial towns are carrying loads far heavier than those for which they were designed, and the danger of breakdowns in these networks grows more acute as generating capacity is enlarged. There is reason to suppose that this danger is not negligible, and that—even without the capital cuts—it would have persisted for at least two years more.

The capital cuts are still being worked out in detail, but as they stand at present they involve a reduction of a third in the combined programmes of the Area Boards. Even if all the rural electrification projects are dropped immediately, as seems likely, it will still mean that the programme of work on the town distribution networks has to be spread over four or five years, and that, long before it is finished, a substantial amount of new generating plant, imposing additional burdens, will be in operation. It would be wrong to suppose, therefore, that these cuts can be made without affecting the electricity expansion plan as a whole.

★ ★ ★

Export Coal Prices

The resentment expressed in Denmark this week at the increases in export prices for some grades of British coal

is too strong to be dismissed lightly. It can, no doubt, be argued that this is merely one of many changes in the price structure of the European coal trade which can be expected to follow from devaluation, and that in these changes the movement of Polish and German prices is proving even more unfavourable to the consumer than the movement of British prices. But if Britain does not wish to pay more for Danish goods, some care needs to be taken to avoid the appearance of demanding more for British goods as a result of devaluation; and the same argument applies to trading relations with other countries.

Devaluation has tended to raise the prices of German and Polish coal to the European importing countries, and to put Britain in a more favourable competitive position than before. Export prices for Ruhr coal are quoted, not in marks, but in dollars. Without a deliberate revision of the German price lists, German coal would automatically have become dearer; and further, the existing differential between German inland and export coal prices would automatically have been widened. To avoid this, and to meet the requirements of the Allied High Commission, the German government produced a new price list in which dollar prices were generally reduced. But the opportunity was taken to adjust the relative prices of certain qualities; for instance, Ruhr coking fines were increased in price relatively to other qualities, and metallurgical coke was reduced. At the same time the transport charges for long rail hauls within Germany were increased; Denmark has now to pay three marks a ton more for carriage, and Germany's customers in southern Europe have to pay eight marks a ton more. In the upshot—and because the mark was not devalued to the same extent as sterling—German coal prices are now slightly higher than British; before devaluation the British prices were the higher.

The National Coal Board has not embarked on any general increase in coal export prices as a result of devaluation; apparently, however, it is taking the opportunity to change the price relationships between the different qualities. Thus the qualities of British coal most in demand (large screened coal, some gas coals, and the better grades of anthracite) will become dearer, and the qualities least in demand will become cheaper. The trouble is that for many individual customers, and even for some importing countries, this is indistinguishable from a price-raising policy. It is accepted less readily from a state monopolist than it might be from individual business firms in competition with one another; and it excites unfavourable reflections on the disparity between British coal prices for the home market and for export.

★ ★ ★

Development Councils Debate

The prospects of usefulness of development councils, and the merits of the Government proposals for any particular industry, tend to be obscured by the more topical question of whether the Government will get its various proposals of this kind through in the lifetime of the present Parliament. The Commons debate on Tuesday, in which the draft order for a development council for the clothing industry was approved, showed the bulk of the clothing manufacturers to be hostile to the proposal, and the Government to be determined to force it through. In the circumstances, the debate was a good deal concerned with whether or not the Government had gone back on its original intention of seeking to create development councils by co-operation rather than by command, and whether or not the Opposition had abandoned its original attitude of benevolence towards the Industrial Development and Organisation Act.

This was unfortunate. There was no great dispute about the improvements in the clothing industry which are desired; the better use of labour, export promotion, standards of quality, better training, and the mitigation of seasonal fluctuations in employment. But, although the President of the Board of Trade stated these commendable purposes, it was

MAY 29 — JUNE 9, 1950

TORONTO CANADA

DEDICATED TO THE PROMOTION OF INTERNATIONAL
TRADE BY THE GOVERNMENT OF CANADA

He had to hide his invention from men's anger

IN 1779 Samuel Crompton, a mill worker, invented his spinning "mule"—an invention that was to bring untold wealth to Britain. But in those days textile workers feared that the "mule" would throw them out of employment, and Crompton was compelled to hide it in order to save it from destruction. Nevertheless, Crompton persevered with faith and courage. Gradually the confidence of the workers was assured, and Britain's mighty textile industry is the result.

Crompton's dogged spirit lives in Britain today— not least among the men who are successfully struggling to overcome the nation's electricity shortage. Already electricity may be used freely at all times except at peak hours, and continually new applications of electricity are bringing greater efficiency to our factories and new comforts and conveniences to our homes.

Films can be used to spread knowledge of the latest applications of electricity. The E.D.A. film library is at the free disposal of all interested bodies. Call at your Electricity Service Centre for further particulars, or write to the Electrical Development Association, 2 Savoy Hill, London, W.C.2.

not easy for him to show that the development council will bring them about. If the experiment fails, it will not be an inexpensive failure; a compulsory levy of perhaps £100,000 a year (not more than £150,000 in any one year, but not more than £300,000 in any period of three years) will be raised to pay for it—and, as Mr Wilson at one moment appeared to recognise, it will very likely be the consumer who finally pays. It is fair to ask for a reasonable prospect of success; and if, as now appears certain, the development council is imposed on a hostile trade, what are the prospects of success?

The fact seems to be that the feeling in favour of this type of centralising movement in the non-nationalised industries has largely been dispersed since the Government's early days. It is no gibe against the efforts of the Board of Trade to say that the attempt to get industrial interest and support for development councils has to a large extent failed; but this is so. The Government's central purpose was to create for each industry "one responsible body of persons who can speak for all interests in the industry with a single voice"; and this, administratively attractive though it is, assumes a desire for unanimity which industries do not always feel. The clothing trade with its many diversified and unrelated groups does not feel itself to be a single industry at all. Other trades are less anarchic, but still may not wish to be organised by law. Right or wrong, their feelings are a relevant fact which it is foolish to brush aside.

* * *

Appointed Day for Road Haulage

The Minister of Transport has now made an order, fixing the appointed day for the 25-mile limit for road haulage as February 1, 1950. After that date goods may not legally be carried for hire or reward beyond a radius of 25 miles from the operating base of the vehicle. To this general restriction there are certain exceptions. These include the special traffics (such as bulk liquids, furniture removals, and abnormal and indivisible loads, among others) for which exception is made in the Transport Act itself.

Hauliers will be able to exceed this distance restriction if they have permits from the Road Haulage Executive to do so. The Act made provision for the issue of "original permits" to protect the position of hauliers who were operating in November, 1946. The provisions are complicated, but their broad intention is to provide a free period in which the 25-mile limit may be exceeded, provided that application for a permit has been duly made. But although it is stated that 17,000 applications for such permits have been made, the area of the industry to which they apply has been greatly reduced, for already some 30,000 road vehicles have been acquired by the Transport Commission out of a total of 40,000, and all notices for compulsory acquisition will have been served by the end of this year.

The fixing of the appointed day represents the most important stage in the long process of taking over road haulage by the Executive. The long shadow of restriction envisaged under the Act will in due course become actual and effective. It will then remain to be seen how the Road Haulage Executive uses its full powers. At present its work of integration is in an early stage. The road undertakings are being operated very much as they were acquired, but the study of flows of traffic which is now being conducted will presumably lead to reorganisation of services and the determination of systems of charges (in conjunction with new charging schedules for the railways) will put the theory of co-ordination to the test in the next few years. It is important that, in the meantime, no threat to the freedom of the "C" licensed vehicle should be tolerated. The Commission and its Executives have powers of near-monopoly which should suffice for the discharge of their duty to provide an efficient and adequate system of public transport.

Restriction on Cotton Yarn Exports

At the time of devaluation, the Chancellor of the Exchequer suggested that the change in the dollar-sterling-rate itself provided a sufficient incentive to British traders to sell their goods to hard-currency markets. If this is generally true, cotton yarn is an exception, as the action taken by the Board of Trade this week demonstrates. After consultations in Manchester on Monday between the Board of Trade, the Cotton Board, and representatives of the spinners and doublers, it was announced that the issue of export licences for cotton yarn for soft-currency markets was being stopped for the time being.

Interference of this kind with the pattern of export trade is unwelcome, even though the reasons behind it may have been compelling. It was noticeable before devaluation that yarn exports to some soft-currency countries were increasing rapidly. Yarn exports to Pakistan rose from 1,500,000 lb. in the second quarter of 1948 to 5,100,000 in the second quarter of 1949; exports to Holland rose from 400,000 lb. to 2,400,000 lb. in the same period. Since devaluation the pressure for British yarn from soft currency countries has been further intensified. The reason is easy to see; the expenditure of sterling on yarn saves the expenditure of dollars on raw cotton, and devaluation has automatically made the shortage of dollars more acute in many countries which have cotton manufacturing industries to keep going. Britain, for its part, is not anxious to turn its dollars into soft currencies by re-exporting American cotton at an early stage of manufacture. But it is regrettable that no way could be found of warding off this abnormal demand without forcing the more permanent foreign customers to look elsewhere for their supplies.

* * *

Emphasis on Tankers

Little change in the tonnage of ships under construction is recorded in the September quarter returns of Lloyd's Register of Shipping. United Kingdom shipyards have increased their work in hand by 52,209 tons gross, and are now engaged on building 2,095,217 tons of new shipping. In the rest of the world, tonnage in hand increased by 109,460 tons to 2,512,522 tons. Thus, the British proportion of the world total remains at just over 45 per cent. There are no returns for Germany or the Soviet Union, and none on this occasion from China. Fuller information about activity in Japanese yards, however, shows that 46 vessels, totalling 137,760 tons gross, are being built, and 13 of these are of 4,000 tons or more. Of the present British output, some 765,812 tons, or nearly 37 per cent, are for foreign owners; 292,788 tons are building for Norway and 102,893 tons for Argentina, but only 13,900 tons for the U.S.A. and 64,010 tons for Panama.

The statistics still show a rapid increase in the proportion of tankers. Six months ago 1,526,823 gross tons of tankers (of more than 1,000 tons) were under construction in the world. By the end of June the tanker total had risen to 1,667,000 tons, and last quarter it increased further by over 241,000 tons to 1,908,167 tons gross. In the United Kingdom, tankers under construction increased by 161,021 tons gross during the quarter, making a total of 894,385 tons, or nearly 200,000 tons more than six months ago. They now represent about 45 per cent of the tonnage of all merchant ships under construction in British yards. Few passenger ships remain on the stocks, the postwar replacement of cargo liners is being worked off, and the reconversion programme is nearly completed. Unemployment is appearing, particularly in the finishing trades, but this must be regarded as the inevitable shedding of extra labour drafted into the industry to meet the abnormal demands of the war and post-war years. For some time to come the industry will still be able to offer good employment for a normal labour force, for

To be gracious in the dining room, a hostess must be sure that all goes well in the kitchen. Cooking for a houseful of people is quite a business in these days and any woman appreciates the blessing of a reliable range.

The Advance Cooker No. 1 provides sufficient hotplate and oven space for twenty people—or even thirty with an auxiliary oven. It will burn night and day with the minimum of solid fuel, replenished only once in twenty-four hours—or twice when using coke. In the morning, the kitchen is warm, the fire is quickly revived and cooking temperatures reached in a very short time. This is a range to save time, work, health and temper. It brings a new joy to cooking—the Advance Cooker No. 1. Write for folder No. 34 which tells you all about it.

it has about 3,750,000 tons gross on the order books, including work in hand.

What worries managements and men, however, is that total business in sight is considerably smaller than it was a year ago. In recent months new contracts have been coming in much more slowly than completed ships have moved out. Completions amounted to 339,862 tons in the quarter, while in the same period 336,985 tons were launched and work on 401,850 tons was started. So far this year about 990,000 tons have been completed, 958,000 tons launched and 964,000 tons begun—figures equivalent to an annual output of about 1,250,000 tons gross if the rate is maintained. Thus present orders should occupy the yards fully for about three years more (in the case of particular builders, of course, the period might be less), and then a rapid decline in activity will be threatened unless the industry can attract further orders.

Finance and Banking

Sharp Rise in Bank Deposits

The clearing banks' return for October shows an appreciable rise in published deposits, and a much larger rise in "net" deposits. These, computed in the usual way, by excluding the disclosed items in course of collection, rose by £79 million on the month, to £5,868 million. Even this increase, however, certainly understates the true rise, since the September figures were heavily distorted by the accumulation of cheques in course of clearing caused by the sudden post-devaluation closure of the banks. This distortion, as noted here last month, naturally affected not only the published items in course of collection but also the inter-branch transit items which most of the banks group in their balance sheets with their advances. Most of the £37.7 million rise in the advances item in September was understood to be due to this extraneous factor. If allowance is made for this, the true increase in deposits during October must have approached £110 million, compared with an increase of £84 million or less in the corresponding period of last year.

Similarly, the fall of just under £2,000,000 in the advances item obviously conceals a large increase in loans and advances as such. Because of the distortion of the September figures, the trend of advances can best be gauged by considering the movement over the past two months: between August and October this year advances rose by £35.8 million, compared with increases of £28.3 million in the similar period of 1948 and £29.8 million in 1947. Evidently, the latest increase arises from seasonal needs, and does not yet reflect the increased demands which are likely to arise from the effects of devaluation upon import costs and upon the prices of raw materials. The trend of advances in recent months does not, of itself, suggest that there was any need for the new directive to the banks which the Chancellor announced last week. The advances total, at £1,466 million, is now roughly £111 million above its corresponding 1948 level, whereas in January last the increase on the year was over £150 million. Over the whole period, therefore, the upward trend was decelerating; and its steeper movement in the past few months is sufficiently explained by the difficult conditions ruling in the new issue market.

Of the true increase in deposits, the concealed portion of possibly £30 million naturally reflects the demands for advances. The remainder—that is, the £79 million disclosed increase in "net" deposits—appears to be wholly attributable to governmental demands. This rise in governmental requirements is also seasonal and is, indeed, rather less than might have been expected from the trend of the revenue position as shown in the Exchequer return. In the four weeks most nearly comparable to the period covered by the banks' return, there was a net overall deficit of £100 million—before allowing for the cash portion of the supplementary payment to the IMF. The additional borrowing has, of

course, been entirely confined to Treasury bills, since the switch from Treasury deposit receipts has been carried a good deal further. During the month, the TDR holding was reduced by £158½ million to only £744 million, reducing the ratio to deposits to 12.3 per cent. Simultaneously, call money and bills have both reached new high records and now aggregate £1,718 million, raising the ratio to deposits to the almost unprecedented level of 28.4 per cent.

Wider Sterling Discounts

It is a matter of some concern that the discount on free sterling abroad continues to widen. The pound note in Switzerland has fallen to SF. 10.65 after showing signs of stability at SF. 11.50 three weeks ago—indeed, immediately after devaluation it was quoted at a modest premium. It is, of course, misleading to attach too much significance to these quotations, which are conditioned largely by influences that have little to do with the official exchanges. But a renewed discount of 12 per cent in little more than six weeks since devaluation cannot be ignored.

The more significant quotations for transferable account sterling are hardly faring better. The discount on Dutch account sterling has not changed much in the past fortnight, but French account sterling has further fallen to a discount of 7 per cent and Chinese account sterling is by now below \$2.60 to the pound. All these quotations are lower still in Hongkong, where transferable account sterling can be bought for \$2.50. These discounts become serious at the point where

"commodity shunting" is once again a profitable exercise, and this point has been reached for a number of exports. For manufactures the discount is still too narrow. Motor cars, which on occasion had been "shunted" before devaluation, are expensive to ship and there is little fear at the moment of industrial exports being paid for in sterling instead of the dollars which ought to be earned. Such third country trade in manufactured exports is unlikely to arise unless the discount is widened to 10 to 15 per cent. But the crucial rate where wool transshipment becomes profitable rests around 5 to 7 per cent and appears to have been reached. In furs, skins and hides, shunting trade has certainly become profitable again and in diamonds such business has never stopped.

	£1,868,057	

SUMMARISED APPROPRIATION ACCOUNT OF GESTETNER, LIMITED.

Profit for year, after providing for Taxation, Depreciation, Staff Insurance Schemes, etc.	£188,889
Distribution for year:—	
Preference Dividend (7 per cent.)	Net £10,106
Ordinary Dividends (30 per cent.), plus bonus (7½ per cent.)	Net 83,205
	93,311
Retained in the business	£95,578

Extracts from the Directors' Report are appended:—

"The Directors propose to capitalise £403,417 15s. 0d. of the General Reserve and issue 1,613,671 "A" Ordinary Shares in the proportion of one Share for each 5s. unit of Ordinary Stock; the "A" Ordinary Shares thus issued will be converted into Stock transferable in units of 5s. each. Export and home market sales increased substantially during the period under review and created a new record. More Gestetner machines were installed throughout the world than ever before. Currency restrictions and import regulations in many countries still put difficulties in the way of meeting the increasing demand for your Company's products. The current year may well be a period of consolidation, although there is no reason to expect a fall in sales. Your Sales Organisation everywhere are geared to meet any change-over from Sellers' markets.

"The total expended on Capital Account during the year was £150,391. Your Directors are determined that the Company's products shall continue to retain their pre-eminent position in the business world."

Future of the Australian Banks

The Australian General Election is now only five weeks off and the Federal Opposition parties are making it plain that they intend to bring Mr Chifley's unhappy attempt to nationalise the commercial banks into the forefront of discussion. They contend that, despite the Privy Council's rejection of the Commonwealth Government's appeal, the issue is still a live one, since a new Labour Government could carry through the project of bank nationalisation without constitutional amendment by re-introducing the abortive 1947 Act in a slightly different form; or it might achieve almost the same result by making use of the powers granted under the still constitutional 1945 Act to drive the private banks out of business.

From a legal standpoint, these contentions are probably correct. The Privy Council judgment, after laying down the economically satisfactory dicta that banking "should be included among those activities described as trade, commerce and intercourse" and that freedom of trade may be deemed to be impaired even where there is no reduction in trading volume, went on to discuss what measures of Federal intervention were ruled out under Section 92 of the Constitution (which provides that "on the imposition of uniform duties of customs, trade, commerce and intercourse among the states . . . shall be absolutely free"). It suggested that Federal interference might be constitutional if its prime purpose was "regulatory" (as would be the case, for example, with a ban on the carriage of noxious drugs across state frontiers) or if restriction of freedom of trade was a remote instead of a direct result of Federal action. In other words, although it is unconstitutional for any Australian Government to condemn private banks to sudden death, it may be quite constitutional to strangle them slowly without indecent directness. Fortunately, however, it may now be doubted whether even a re-elected Labour Government would carry its war against private enterprise as far as this—although continued competition between the state-owned Commonwealth bank and the private banks would have to be expected. The original decision to nationalise the commercial banks was taken in haste after an unexpected ruling of the Australian High Court declaring one section of the 1945 Banking Act invalid. In the last few months it has become clear that the disappearance of the private banks would weaken instead of strengthen central banking control in Australia (since the states would then certainly extend their own banking activities into the trading field). In all the circumstances, therefore, Mr Chifley may well be wise enough not to pursue, by direct or indirect means, a goal which was originally conceived in little more than a fit of bad temper.

* * *

Swiss Gold Losses

Devaluation by the majority of Switzerland's competitors and, more important, its customers, has inevitably raised the question whether the Swiss franc can be maintained indefinitely at its present rate. That some such doubts are entertained is clearly borne out by the efflux of gold and foreign exchange from Switzerland since September 19th. In the first five weeks following devaluation the Swiss National Bank's gold holdings fell from SF6,281 million to SF6,148 million, and its foreign exchange assets dropped from SF313 million to SF236 million. At the same time the Swiss Government lost more than SF250 million of foreign exchange. The movement seems by now to have spent its first force; indeed, in the week ended October 31st there was a small reflux of both gold and foreign exchange. Thus the latest figures show the National Bank's gold stock at SF6,161 million and foreign exchange at SF254 million.

Notwithstanding the considerable influx of hot money in the weeks before devaluation, the loss of some SF430 million is significant. It is the more significant because the drain largely arises from the repatriation of fugitive French

balances. The French franc has, in consequence, been very firm in the Swiss market, while the Swiss franc on the Paris free market has declined steadily. A further cause has been some closing of open positions in sterling, accompanied in the immediate post-devaluation period by purchases on some scale of forward sterling at a premium. Lastly, the Swiss themselves have been buyers of finance dollars on the Swiss market, with the result that for the first time since the war the discount in "free" dollars has been eliminated.

While the cause of much of this drain is thus a purely financial reflex stimulated by devaluation all around Switzerland, uncertainties about the longer-term future of the Swiss franc have played their part. Devaluation has certainly made Swiss goods more expensive for many of Switzerland's most important customers and the cost of tourism has increased by the full amount of devaluation. But it should not be forgotten that before devaluation the cost of Swiss goods to sterling importers, for instance, was distinctly attractive. Moreover, while most countries continue to ration their Swiss franc expenditure by import licences and tourist quotas, it is perhaps unlikely that higher prices in terms of local currencies will mean that these quotas are not taken up in full.

* * *

Premiums on Dollar Stocks

Two influences appear to underly the persistent rise during the past two weeks in the premium which buyers in London are prepared to pay above the New York price for American dollar securities. The premium is now fully 17 per cent; after devaluation it fell to 12 per cent, compared with 37 per cent before devaluation. Part of the explanation of the renewed rise may be found in the London market's reaction to New York price movements. Ever since switching in dollar stocks was again permitted in 1947, London prices for dollar stocks have moved by wider margins than in New York; the margins have expanded when New York was firm, and they have also emphasised any declines by contracting in a falling market.

But the rise in London premiums is due to something more than Wall Street's recent firmness. The view is gaining ground that, at a 17 per cent premium, dollar stocks are cheap. Two reasons are put forward for this view. First, under the Anglo-American double taxation convention of 1946, common stock dividends can be regarded virtually as taxed income by those holders of dollar stocks in this country who pay income tax at the standard rate of 9s. in the £. The British holder can offset the American corporation tax and withholding tax against his own tax liability here. These American taxes deducted at source amount to roughly 45 per cent of the gross dividend, and are thus equivalent to income tax at 9s. in the pound. The one can therefore be offset against the other. To take an example, an American company may pay a dividend of \$6 per annum. The company is likely to have paid American taxes of at least \$4 per share. As far as the Inland Revenue is concerned it is, therefore, not a \$6 dividend, but a \$10 dividend, on which 9s. in the £ or \$4.50 (45 per cent) is payable in British taxes. But \$4 or more will already have been deducted in the United States, leaving only 50 cents or less to rank for British income tax.

The second reason put forward is concerned with yields. Even after paying a 17 per cent premium it is possible to obtain 6 to 7 per cent net yield on, for instance, first-class American public utilities with unimpeachable dividend records. Such yields are attracting the increasing attention of institutional investors in Britain. Evidently, they are not taking too seriously the suggestions that dollar stocks might be requisitioned by the Government and paid for on New York terms instead of London terms. The institutions are rather better equipped to make the necessary applications for obtaining the tax relief granted by the tax

convention and are less concerned than the private investor about the time lag of perhaps 18 months before the rebate is credited. Brokers' orders suggest that the bulk of the buying does, in fact, come from the institutions, and that their purchases are concentrated on public utilities and bank shares. In the past few days, the London office of one firm of New York brokers had 44 orders for public utility and bank shares against four orders for industrial common stocks.

* * *

Distribution of German Assets

A written answer by Mr Glenvil Hall, the Financial Secretary to the Treasury, about the future of German assets held by the Custodian of Enemy Property, is characterised by all the vagueness of earlier government pronouncements on this admittedly involved topic. Briefly, it has been decided to follow the precedent established after the first world war. Claims by creditors in this country arising from prewar contracts against German firms, individuals or the Reich government are to be satisfied out of German property held by the Custodian. Where a German firm owing money to a British firm had assets in this country now vested in the Custodian, the British creditor will apparently be given the alternative of taking in final settlement the sequestrated assets of the German debtor, or, alternatively, of taking his chance by awaiting his portion of the eventual share out. Two of the many questions which have yet to be answered are worth raising. Will a bank be allowed to choose between these alternatives for each of its claims, or must it plunge blindly for one course or the other for all of its claims? When will the Custodian make available to claimant creditors the full information to indicate whether a German firm in which a British creditor is interested has any assets in this country?

It seems now fairly certain at least that none of the specific assets claimed by a particular debtor will, as was threatened earlier this year, be credited to the international reparations pool. Britain is to receive 28 per cent from this pool; but the claims of British creditors will be limited to the funds which are actually held by the Custodian. They will have no claim on the reparations pool, the British share from which will be paid by the Government. At any rate there is no likelihood that British holdings of German assets exceed 28 per cent of the prospective pool, and no fear, therefore, that any part of them will have to be transferred to the Reparations Agency. Nothing has been disclosed to indicate how much the Custodian holds. The Administrator to be appointed for distributing the assets should provide claimants with sufficient information so that they can make sensible decisions. This is the more important since, in contrast to the situation after the first war when German assets exceeded German pre-1914 debts, Mr Hall has warned creditors that "the dividend payable will not be large."

* * *

The Demand for Wool

The wool market has been very firm since devaluation and prices at the London and Liverpool sales confirmed the upward trend in primary markets. On the average, prices are about 15 per cent above those ruling in July, but demand has concentrated mainly on crossbred types, which no doubt reflects the stiffening of consumer resistance to high priced textiles. Britain as usual has been taking the bulk of the wool offered but competition from the Continent has been active and American buyers have also appeared once more, though not as yet on any significant scale.

Why has the demand for raw wool been so strong in recent weeks? World commercial stocks are not very plentiful—probably not much more than six months' supply—which is a bull point for the market. The Soviet Union has also been buying quite heavily and as usual without much regard

for the level of prices. Again, countries may have bought in anticipation of a strong American demand for raw wool later in the season. But clearly devaluation by itself is unlikely to expand world demand for wool textiles and, therefore, for raw wool, so that some adjustment in the present level of wool prices seems possible.

Next Monday, the third meeting of the International Wool Study Group will open in London with representatives from all the important wool producing and consuming countries. Its main problem will be to assess world supply and demand for wool and to see what steps should be taken internationally if a world shortage appears inevitable. Since the end of the war, consumption of wool has considerably exceeded output, and the balance has been made up from stocks held by the Joint Organisation and the US Commodity Credit Corporation. By the end of last June, however, these stocks had declined to about 650 million lb (greasy), or a little over two months' supply at the current rate of consumption. This quantity would be adequate, theoretically, to bridge the prospective gap between world production and consumption this season, but the types of wool which remain in stock are unlikely to be those which manufacturers want. But if demand continues at its current high level what happens next season if stocks are exhausted? World output could not expand by 650 million lb in a single season. It would seem, then, that there is some prospect of a world shortage of wool—if demand continues at its present level.

Shorter Note

The first British television transmitter designed for the 625-line negative modulation system used in the United States is being taken to Washington this week by Pye Ltd. This makes possible a direct comparison between the performance of British and American equipment working on the same system, and will put to the test the claim that British equipment is technically superior to American. The result of the test will be important, in view of the large potential market for transmitting equipment in the United States and Canada.

COMPANY MEETING

ARMSTRONG SHOCK ABSORBERS, LIMITED

PREDOMINANT POSITION

The fourteenth ordinary general meeting of this company was held on November 1st, in London, Colonel J. D. Macindoe, M.C. (chairman), presiding.

The following is an extract from his statement circulated with the report and accounts for the year ended June 30, 1949:—

The trading profit of our wholly owned operating company, Armstrong's Patents Company, Limited, for the year to June 30, 1949, after charging that company's working expenses but before providing for depreciation, directors' remuneration and taxation, amounted to £98,195 compared with £89,923 in the previous year. Your directors propose to maintain the rate of dividend at 15 per cent, less income-tax, and have decided to transfer the sum of £24,000 to general reserve as against £22,000 in the previous year.

During the year covered by these accounts, your company has maintained and consolidated its predominant position in the automobile shock absorber field and therefore remains in a strong position for the future. Owing to pressing needs for additional factory space for vital shock absorber production, and owing to the difficulty of obtaining building licences and permits, your directors decided to sell the subsidiary, Kolectric, Limited, which was accomplished at a profit of £900. The space made available by this sale is now being used to advantage for shock absorber production.

We have still not proceeded with the provision of further capital for the business because we have found conditions unsuitable for obtaining capital on satisfactory terms up to the present time.

The report was adopted.

STANDARD MOTOR COMPANY, LIMITED

RECORD TURNOVER EXCEEDS £31 MILLION

STRONG ASSETS POSITION

INCREASING SALES

MIR C. J. BAND'S SPEECH

The forty-sixth annual general meeting of the Standard Motor Company, Limited, was held on November 2nd at Coventry, Mr. C. J. Band (chairman of the company) presiding.

The chairman said: Once more I have pleasure in proposing the adoption of the directors' report and the balance sheet and accounts for the year ended August 31st last.

The accounts and balance sheet have been in your hands for several weeks, and the figures are so clearly set out that it is unnecessary for me to say very much about them. I may, however, emphasise two or three of the more striking facts. The turnover exceeded £31 million, a record in the history of the company and one that reflects the greatest credit upon all concerned in the management of the company's affairs, especially when the many difficulties experienced during the past year are taken into consideration.

Although the capital additions during the year slightly exceeded £1,000,000 the written down value of the fixed assets shows a reduction of £330,000, due to the heavy depreciation which your directors have thought it prudent to provide in accordance with the policy which they have adopted for many years. Almost £7,000,000 has been invested in capital assets during the last five years.

IMPROVED LIQUID POSITION

Turning to the net current assets, stockholders will be gratified to see the great improvement in the net liquid position to £2,575,817, compared with £1,599,441 last year. Stock (which has been taken in the usual manner) has been reduced by more than £1,000,000, to £3,748,064, cash in hand has risen by £836,862 to £2,320,809 and debtors have increased by £970,953 to £1,519,840. There has been a reduction of £575,998 in the amount owing to creditors, the figure now standing at £4,551,586.

The total net assets of the company are now £7,599,826, an increase of £646,144 over last year. In any consideration of the real profits earned, this is the only figure on which any computation may be based. It is difficult to see how anyone, looking at the turnover and the real capital of the company, could contend that the profits earned are excessive.

May I now say a few words about the profit and loss account. There has been a very large increase of £966,049 in the balance from trading account.

It is essential, however, that the heavy cost of tooling for modern production methods should be amortised quickly to enable the company to keep abreast of ever-changing conditions, and no less a sum than £623,050 falls to be written off this year for dies, etc. Depreciation of fixed assets is again higher due to the large amount spent on new plant and follows the policy which has enabled us to face competition within the industry by having the most up-to-date factories and production methods. There is also a large increase in the amount provided for taxation, the figure required being £675,000.

PROFIT AND DIVIDEND

The net profit for the year is £555,249, an increase of rather more than £100,000 above the previous year.

Your directors recommend the payment of a 25 per cent. dividend, less tax, which is the same as last year, and the allocation of

£75,000 to the employees' special fund. Personally, I cannot bring myself to agree with the policy laid down by the Chancellor of the Exchequer with regard to the freezing of dividends, and I would express the hope that this policy may be changed before we meet again next year. I believe that one of the most urgent alterations required by the country today, in view of the serious financial position in which it is placed, is to give some incentive to every citizen, whether an employer or an employee, and that until this is done we as a nation cannot hope to recover the position we held in the past.

The employees' special fund is, of course, still carrying out the excellent work for which it was created.

Stockholders will observe that, if the directors' proposals are approved, the amount carried forward to next year will be £376,236, which is almost equivalent to two years' net dividend at the rate now recommended.

SALES AND THE FUTURE

In these days it is not easy to forecast the future. Stockholders may be interested to hear that the sales of the Vanguard, including the estate car and the company's commercial vehicles, are increasing from month to month. Certain detail improvements have been made, more particularly in the bodywork. Improvements in the Triumph car have also been made, and I feel sure that sales of this model will be satisfactory. The Mayflower, the new model introduced at the last show, has had a wonderful reception, and will, I am sure, have a phenomenal success.

Stockholders will be gratified to know that production of the Ferguson tractor, of which we have the sole manufacturing rights in the eastern hemisphere, will be speeded up this month and will be substantially increased during the next three months. Providing nothing unforeseen happens, it is hoped that the weekly output by next spring will be at the rate of 1,000 units. Considerably more than 100,000 have been produced and sold since the inception of tractor production.

EXPORT PRODUCTION

Stockholders will have noticed in the leaflet accompanying the report and accounts that no less than £20 million worth of the products of the company were exported in the last financial year. May I say that a substantial part of the exports went to dollar countries.

Important decisions have been made to enlarge the exports of the company. Companies which will soon be operating have been formed in Australia and India for assembling both cars and tractors and which later on will be carrying on the manufacture of certain parts. Arrangements are already in hand for the formation of similar companies in Canada and South Africa. Assembly plants for our cars are in operation in Belgium, Eire, Sweden and New Zealand.

We are urged by the Government to increase production and to export more, especially to the dollar countries. I think I can say that so far as the Standard Company is concerned these requests will be complied with, always assuming the Minister of Supply will allocate more steel, especially sheet-steel, to the company and its suppliers.

CHAIRMAN'S THANKS

I cannot conclude my remarks without tendering on my own behalf, and may I say all stockholders, grateful thanks to our managing director, his executive staff and all the company's employees for the manner in which they have carried out their duties, which has resulted in the excellent report and balance sheet which are before you and the adoption of which I now propose.

I will ask Mr E. J. Corbett to second the proposition.

Mr E. J. Corbett, in seconding the resolution, which was carried unanimously said: A great deal of economic nonsense is being talked today about the profit motive. He added: But if you look at the figures in our balance sheet and realise the Government takes £600,000 of the available profit of the company, leaving £555,000, which represents 1.77 of our turnover, and the distributed profit to shareholders represents .632, I think you will agree the chairman's comments in this respect are fully justified.

The retiring directors, Mr H. S. Weale and Mr E. J. Corbett, were re-elected, and it was resolved that £75,000 be voted to the employees' special fund and that the fee of the auditors, Messrs Thomson McLintock and Company, be agreed with them by the directors.

IMPORTANCE OF AGREEMENT WITH SIR JOHN BLACK

Continuing the chairman said: I come now, ladies and gentlemen, to item number five on the agenda—the ratification of the provisional agreement between the company and the managing director referred to in the directors' report.

The agreement, which is provisional, in that it becomes binding if it receives the approval of this meeting, is laid on the table here for you to inspect, should you wish to do so.

In my opinion, it is unfortunate that so much publicity has been given to the proposal. This has led, I think, to a considerable amount of confused thinking. The initiative in making the proposal to Sir John that he should bind himself in this manner came not from Sir John but from myself and the other members of the board, and we make no apologies at all to the critics. Ladies and gentlemen, the important thing here and the thing which we as a board have had to consider, is the interests of the company, and the directors are of opinion that this agreement with Sir John Black is the most economical and effective method of securing those interests.

A BUSINESS BARGAIN

I have observed that some commentators upon the proposal have described it as a free gift by the company to our managing director. It is, of course, nothing of the kind. It is a business bargain negotiated with our managing director by which he binds himself irrevocably, for the remainder of his life, not to be interested, either directly or indirectly, in the manufacture of motor-cars or tractors should his connection with the company for any reason be severed. This is, as I am sure you will agree, a most serious step for our managing director to be asked to take.

No one will deny the part Sir John has played in the fortunes of this company, and you will know the place he has secured for the company and himself in the motor industry—and for the company to risk his competition would be a grave error and one against which, in my opinion (and, I may say, that of all the other members of the board), it is imperative to guard the company in its own interests and, of course, those of its stockholders and employees, whose concern it is to see this company strong and prosperous.

A TRUE PERSPECTIVE

I read in one of our daily papers the comments of the City Editor, which, in my view,

placed the position in its true perspective. I will read an extract from his comments:—

"By the vigorous prosecution of a courageous postwar development programme, the Standard Motor Company has climbed to a very strong position in the motor and tractor manufacturing industries. Naturally, the maintenance and even improvement of that position is the constant concern of the directors. With that end in view, they have recently entered into an agreement with the managing director, Sir John Black, under which, should his connection with the company at any time be severed, he is bound during the remainder of his life not to carry on or be engaged or concerned in the manufacture of motor-cars and tractors in widely defined areas. As consideration he is to be allotted £25,000 of the unissued Ordinary capital."

"For this arrangement the directors now seek the approval of the stockholders. The latter may well consider, as the board does, that this covenant is of the utmost importance to the company. Sir John has played a leading part in building up the fortunes of the Standard business and £100,000, the approximate market value of the stock to be issued to him, does not seem to be an extravagant price to pay to secure complete protection against the possibility that one day Sir John might decide to leave the company and become a serious competitor."

I would add that it is not a novel agreement and that precedents exist of the course recommended by the directors. As to the amount of the consideration, I can only say that I would not expect so valuable and capable a man to give up his freedom of action for anything less than the amount already conveyed to you.

I believe I am correct in stating that in certain parallel cases a similar course has been taken by directors without seeking the approval of the shareholders, but in a matter of such importance we considered the proper course was to place the matter before the stockholders. I am hoping that the shares proposed to be allotted to Sir John will be retained by Sir John and his family for very many years.

AGREEMENT APPROVED

The resolution which I now have pleasure in proposing is as follows:—

"That the conditional agreement dated September 26, 1949, made between Sir John Black and the company produced to the meeting and for purposes of identification signed by the chairman thereof be and the same is hereby approved."

I will ask Mr E. J. Corbett to second the proposition.

Mr E. J. Corbett, in seconding the resolution, which was unanimously approved, said: In view of certain criticisms raised—some without very much knowledge of the situation—I would like to emphasise that it is brought to the shareholders by the board purely as a safeguard for the future. Economic shadows are spreading over the whole world, and we are having our share of them in this country at the moment and shall continue to do so. Is it not clear that it is the duty of the directors of large industrial companies to take what steps they can to enable them to meet the difficulties which may have to be overcome in the near future?

ALLIED INDUSTRIAL SERVICES, LIMITED

RECORD OUTPUT

The fifteenth annual general meeting of Allied Industrial Services, Limited, was held on October 28th at Bradford, Mr W. H. Rhodes, C.B.E., the chairman, presiding.

The following is an extract from his circulated statement:

The output of our various factories was, in total, in excess of any previous year,

which, coupled with every effort to reduce production costs, has resulted in a satisfactory year's trading. The expenditure on plant and buildings during the year amounted to approximately £48,000, and a sum of £50,000, as shown in a note on the balance sheet, is estimated for future commitments of a similar nature.

The maintenance of supplies has been constantly before your board, and with this in mind an investment has been made in a well-established company supplying types of material we require. Nevertheless, the position generally remains acute, and it is difficult to envisage much improvement during the present year.

The net profit amounts to £145,848. Following the increase in the interim ordinary dividend from 9 per cent. to 15 per cent., the final dividend proposed is 35 per cent. instead of 41 per cent.

We have received from H.M. Treasury permission to capitalise part of our accumulated reserves by the issue of one new ordinary share for each such share now held. This will bring the issued capital of your company somewhat nearer the actual capital employed. The output to the end of September has been in excess of that for the same period in the previous year.

The report was adopted.

METAL TRADERS LIMITED

STRENGTH AND LIQUIDITY MAINTAINED

The twenty-ninth annual general meeting of Metal Traders Limited will be held at the registered office of the company, 7 Gracechurch Street, London, E.C., on November 28th.

The following is the statement by the chairman and joint managing director, Mr Frank L. Baer, issued with the annual report and accounts:—

Although the upward movement in prices of non-ferrous metals continued right through 1948, there were already signs in the late summer months of that year that a state of saturation might be round the corner and bring in its train a downward adjustment of values with all the attendant complications. In view of the fantastic heights to which prices had risen, it was only to be expected that once the downward trend began it was unlikely to stop until a reasonable level had been reached.

In his address to the shareholders in 1934, our late chairman, Lord Abertay, said: "Our trading business is not without its speculative element, but the London Metal Exchange, unique in its traditions and functions, affords us a basis whereby speculation becomes an incident rather than the main theme of our affairs."

As the London Metal Exchange remained closed, and no hedging facilities existed, your board decided, and, as events have shown, decided wisely, to reduce commitments all round. Some contraction in our activities has resulted, but—and this is our main concern—the financial strength of the company and the liquidity of its resources have been fully maintained.

Following a moderate rise in prices of non-ferrous metals from the low points touched, there has been a quick rebound to conform with the alteration in the official dollar/sterling rate of exchange.

Although results for the year show some falling off, the directors regard the dividend which they are recommending as satisfactory under all the circumstances.

RESULTS OF ASSOCIATED COMPANIES

Metal Traders, Inc. New York.—Metal Traders, Inc., have had a successful year, and after providing for every contingency

were able to pay a satisfactory dividend on their increased capital of \$500,000. The management are to be congratulated on the excellent results achieved.

L.P.C. Chemicals and Dyes, Limited.—Import restrictions and actual import bans in many parts of the world were responsible for greatly reduced turnover and consequent diminished earnings. So far this year there have been no signs of any revival of business.

Brookside Metal Company, Limited.—From January until the autumn of 1948 this company was extremely busy, but, in view of the general policy laid down, the management curtailed its activities very considerably in the last quarter of the past financial year. Yet the results were substantially the same as in the previous year.

An adequate scrap yard in Reading was acquired during the period under review.

CAPITALISATION OF RESERVES

As already announced, the directors have decided to write up the value of the investment in Metal Traders, Inc., to £125,000 from £50,000, at which figure it stands in our books, although the New York company increased its paid-up capital from \$250,000 to \$500,000 in 1948. The difference will be added to general reserve.

The directors are also of opinion that the existing somewhat anomalous capital structure should be corrected. They propose, therefore, to seek permission of the Capital Issues Committee to capitalise £374,184 of the reserves by issuing free to the shareholders nine new £1 shares for each £1 of stock now held, and proportionately in the case of fractions. Assuming approval is given, the new shares will be converted into stock, which will rank *pari passu* with the stock now in issue.

The balance sheet will then show issued capital £415,760, general reserve £100,816, and carry forward £133,870.

GOODE DURRANT AND MURRAY, LIMITED

RECORD SALES

DEMAND MORE SELECTIVE

MR. G. P. SCHOOLAR ON THE POSITION

The fifty-first annual general meeting of Goode Durrant and Murray, Limited, was held on November 3rd, at 197, Great Portland Street, London, W. Mr L. A. Kemp presided in the absence abroad of the chairman, Mr George P. Schoolar.

The following is the chairman's statement circulated with the report and accounts for the year to July 20, 1949:—

The directors have pleasure in presenting to the shareholders a balance sheet disclosing a result that can be considered satisfactory, under the circumstances. The period under review has been an anxious one and, although sales have created a record, the demand for merchandise has been more selective—especially during the latter part of the year. Goods in short supply are easily disposed of, but in lines where supplies are overtaking demand, sales are much more difficult, and competition is increasingly keen. In view of the very high prices of textiles, we regard the position with some uncertainty.

FORCEFUL TRADING

The results were obtained by forceful trading. The rates of profit margins governing our Australian business as controlled by price regulations, appear to be based on the assumption of complete stock clearance at the percentages set out by the prices department, without any margin for error or reduction of price to effect sale of difficult lines, or to meet a market decline. Any drop in turnover will immediately affect results.

Skilled factory labour continues short, and output insufficient. The disastrous coal strike in Australia had a serious effect on the whole country; the loss of wages in industry will never be made up, and the upset to secondary industries will be felt for some time to come. Trade with New Zealand continued good, but import licences restricted business. African trade experienced restrictions, but we had a satisfactory year. The lack of import licences will cause a large curtailment in the volume of business during the current year. This will allow time for stocks to be reduced and finances adjusted.

DISTRIBUTION MAINTAINED

You will observe that your directors are recommending the appropriation of £42,000 to reserve for contingencies, and also the allocation of a further £10,000 to the super-annuation fund for employees. The latter fund is available for those members of the staff who cannot be included in the insurance scheme already set up. Ample provision has been made for doubtful debts; stock is clean and conservatively valued. The reserves for future taxation are made on the recommendation of the company's auditors. The crushing burden of taxation continues to absorb the greater part of the company's net profit, and limits the resources for capital replacement and investment in overseas territories.

The balance of profit available enables us to recommend a dividend of 10 per cent. on the Ordinary shares and, in addition, a bonus of 5 per cent.—the same as paid last year. The balance sheet on this occasion shows the comparable figures for the previous year.

OBSCURE OUTLOOK

We are now three months on in the company's new trading year, and can state that business is far from easy. We are inclined to the opinion that more difficult days are ahead. Preference for British goods is still in evidence, but price factors are of more concern than was the case during the time of acute shortage, and competition from European suppliers and from India is diverting business from the United Kingdom. This drift will grow unless British suppliers face up to the situation.

It is not easy to forecast at any time, and on this occasion the future is obscure, owing to unusual influences. The agricultural outlook was unpromising in both South and West Australia, owing to dry conditions persisting until well along in June. The position has improved very considerably since, and prospects of a fair average harvest are promising. The position for wool is sound, with fair clips in sight. The general outlook in Australia is good and, given freedom from labour troubles, the economic situation should continue sound. Immigration is proceeding rapidly and unemployment is practically nil.

WORLD SITUATION

The world situation, from a commercial standpoint, is not reassuring. Financial problems are the main concern. Import licences are being withheld, pending currency agreements. We are hoping these difficulties will be surmounted, and a free flow of exports restored as a result of the devaluation of currencies.

The company has been well supported by a loyal staff, who have made a great contribution to the satisfactory results both in Australia and London. It is gratifying to realise that their efforts have secured to the company an important share of the increased export trade of the United Kingdom.

The report and accounts were unanimously adopted.

At an extraordinary general meeting which followed, a resolution adopting new Articles of Association was passed.

HAROLD WESLEY LIMITED

INCREASED EXPORTS

The third annual ordinary general meeting of Harold Wesley Limited was held on October 27th in London, Mr Percy Day-Winter (chairman and managing director) presiding. The following is an extract from the chairman's circulated statement.

In last year's statement circulated with the accounts I ventured an opinion that there might be an increase in paper supplies, and also that the Dominion of Canada would lift the embargo on imports of paper articles. This opinion has, in both respects, been justified and we have been able to secure, although not for the full year covered by these accounts, increased supplies of raw materials and, since December, 1948, been able to export to Canada; also for the year under review our exports to the United States of America increased over those of the previous year.

The additional quantities of materials obtained have enabled us to increase production and reduce costs and selling prices. Home and export sales have, however, been increased and it is considered satisfactory that we are able to present accounts showing a trading profit only slightly less than that of the previous year, and a net profit slightly higher, due to the smaller requirements for taxation.

DIVIDEND OF 22½ PER CENT.

Your directors therefore recommend a dividend of 22½ per cent. for the year under review and after placing a further sum of £5,000 to reserve for future liability to income-tax, the balance of profits carried forward has been increased from £31,319 to £45,442.

Stock-in-trade at June 30, 1949, was greater than that held at the commencement of the year and having regard to the reduction of raw material prices, depreciation has been taken on stock, where necessary, to bring it into line with current replacement cost.

Additions to plant and machinery amounting to £20,434, have been made during the year, and in this connection I would refer you to Note "A" on the balance-sheet, which informs you that outstanding commitments for capital expenditure amount to approximately £34,000, indicating that your company is continuing its policy of equipping its factories with the most modern machinery.

Your directors are very pleased to inform shareholders that the company has at last received a licence to build an extension to its Burton-on-Trent factory. Construction has commenced and should be completed by the end of 1949. This, with the additional machinery that will be installed upon completion, will increase our productivity, give us greatly needed room for additional storage and make for more economical operation.

With regard to the prospects of the ensuing year to June 30, 1950, shareholders will be pleased to hear that we are busier than ever in the long history of the business. Your company's merchandise commands a ready sale at home and abroad and, given circumstances as they are today, it would appear that we should have a good year of business.

Your company's subsidiary Wesley and Clark Engineering Company Limited, has had a successful year and has delivered machinery to the export market to the extent of 58 per cent. of its total production, and has a well-filled order book for home and export trade.

Again your directors desire to place on record an acknowledgement to all grades and sections of employees for the satisfactory work that has been accomplished during the year under review.

The report and accounts were unanimously adopted and a final dividend of 14½ per cent., less tax, making 22½ per cent., less tax, for the year, was approved.

WILLIAM DOXFORD AND SONS

SATISFACTORY ACCOUNTS

The 57th annual general meeting of William Doxford and Sons, Limited, was held on October 28th in London.

Mr E. P. Andreae, Ph.D. (the chairman), in the course of his speech, said:—

Once again I have pleasure in submitting for your consideration a very satisfactory statement of accounts covering the year ended June 30, 1949. After providing for taxation, a net profit of £237,163 is shown, as compared with £192,174 for the previous year. I have, in the past, drawn attention to the growing importance of our marine engineering department, which centres around the now world-famous Doxford oil engine and the ancillary development connected with it. This has naturally called for the employment of large sums on capital account, and has proved to be a very important contributor to the profits of the company, by widening its scope far beyond that of the actual shipbuilding activities. In other words, I think it advisable to make it clear, at the outset, that the expansion of turnover in directions other than the building of ships has materially contributed to the increase in our profits.

Your directors recommend the same dividend and bonus as has been paid for the last two years. In addition, they have decided that it would be prudent, and in the interests of the company, to capitalise £50,000 of the undivided profits resulting from the ploughing back of profits in past years, and to distribute this amount in the form of fully-paid shares amongst the ordinary shareholders in proportion to the number of shares held by them.

NEW SHIPS

During the year under review we completed and delivered to their owners five cargo ships and two oil tankers, all powered, of course, by Doxford oil engines. In addition, several sets of our engines were built by us and installed at our Palmers Hill quay in ships built by other shipbuilders.

Our Palmers Hill works, primarily equipped to meet the ever-increasing demand for spare parts and maintenance work, continues to be of great value to the company. The Doxford oil engine continues to command the confidence of the marine engineer. During the past year we have issued four additional licences to engineering firms at home and abroad, and they will shortly commence building to our designs.

Another new departure which has been recorded with much interest in the technical papers was the recent completion, and highly successful test-bed trials, of an engine of much smaller power than our usual design. This engine develops 1,100 B.H.P. on service, and will be fitted in a large trawler now under construction in Scotland. We are very hopeful that this and other designs in the low power range will still further extend our activities.

What effect devaluation of sterling is going to have on our industry is, as yet, unpredictable. Time alone will show. In so far as our own company is concerned, I can with confidence say that the immediate future is assured. We have contracts on our books which will certainly keep us well employed for the next two years. Beyond that, I cannot express any opinion, but I am sure that with our up-to-date shipyard and engine works, we shall, even in bad times, be able to obtain a fair share of any orders that may be forthcoming.

The report was adopted

FRAS. HINDE AND SONS, LIMITED

CONTINUED OUTPUT INCREASE CONTRIBUTION TO EXPORT DRIVE CAPT. W. M. H. POLLEN ON THE OUTLOOK

The twenty-fifth annual general meeting of Fras. Hinde and Sons, Limited, was held, on October 26th, at St. Mary's Silk Mills, Norwich, the chairman of the company (Capt. W. M. Hungerford Pollen, M.C.) presiding.

The following is the statement by the chairman, which was issued with the report and accounts:—

Ladies and gentlemen.—Once again I have to tell you of a tragic loss. Mr C. Walden, secretary and a director of this company, died on January 30th after a short illness. He had spent more than 20 years of his life in this service to which he gave his unremitting care, devotion and loyalty. This sad loss was a great grief to all of us who worked with him.

Mr A. L. L. Arnold, a senior employee of the company, has joined the Board. He is our dyeing and finishing manager, and also has long experience in every department of our business. We feel sure that we have gained great strength from his appointment to the Board. Mr Arnold holds office until the forthcoming annual general meeting, when he will retire under the provision of the articles of association and offer himself for re-election.

Another loss to the company will be the retirement of Mr E. F. Williamson on his attaining his seventieth birthday. We value his services very highly, and much regret to announce his decision not to offer himself for re-election at the annual general meeting.

TRANSFER OF LOOMS

The transfer of our looms from their makeshift positions to the new weaving shed was accomplished without interfering with production. Indeed, for the third year in succession, I am able to report an increase in yardage woven, in spite of the rigid standard of perfection on which we insist. The money value of our production is, however, lower, as we decided to foster and increase our export markets by reducing our profit margin. This has been successful in spreading the good name of our fabrics as well as contributing to our country's need for hard currency.

The second phase of our rebuilding at St. Mary's is progressing well and new looms are being delivered. At Mile Cross and Oulton Broad we have carried out extensive repairs and maintenance work which we could not do previously, indeed, our plant and buildings are now in better order than they have ever been in before, and we hope to see greater production from them in the near future. The third phase of reconstruction at St. Mary's is now being planned so as to complete our war damage replacements.

DIVIDEND MAINTAINED

The accounts show a reduced trading profit for reasons already stated, and we do not consider it wise to increase the dividend of 25 per cent. Income tax and profits tax absorb £58,000 in respect of the current year's trading. Stock in trade at £159,026 is £18,172 higher than last year; the increase is explained by the necessity of carrying greater stocks of raw materials to supply increased production. You will notice that a new reserve of £60,000 has been created under the heading of reserve towards the increased cost of replacement of fixed assets. £35,000 of this comes from the current year's profits, and to this has been trans-

COVENT GARDEN PROPERTIES COMPANY, LIMITED

RECORD PROFITS

The twenty-fifth ordinary general meeting of Covent Garden Properties Company, Limited, was held on November 3, in London, Mr Louis Nicholas, J.P., F.C.A., the chairman, presiding.

The following is an extract from the chairman's circulated statement: The aggregate profits of the company and its two subsidiaries, English Property Corporation, Limited, and Sanctuary Buildings, Limited, amounted for the year ended June 30, 1949, to £409,695, which compares with £406,216 for the year ended June 30, 1948.

The profits for the year ended June 30, 1948, were the highest in the history of the company, and these profits have been more than fully maintained in the year under review. The gross income of Covent Garden Markets and the surrounding property belonging to your company again shows a slight increase, but the net income shows a small decline over that of the previous year, resulting from the increased charge for rates caused by an increased assessment and additional expenditure upon repairs and other outgoings.

During the year the company obtained the necessary licenses to carry out a large number of the repairs to markets and other properties belonging to the company and its subsidiaries. A large proportion of this work has now been carried out and it is hoped to complete it during the current year.

The net profit of the company is £109,176, as compared with £85,975 last year. To this has been added the amount brought forward from last year, and the sum of £10,000, a provision made in past years for possible losses on loans on mortgage which is no longer required, bringing the total profits available up to £180,203.

DIVIDEND ARREARS PAID

Out of this sum your directors have paid or provided for the dividends on the Preference shares for the year, and have paid the dividends on the Eight per cent. Preferred Ordinary Shares for the two years ended June 30, 1947, and propose to pay a further two years' dividend on the Preferred Ordinary shares immediately after the general meeting, which payment will discharge all outstanding arrears of dividend upon these shares up to June 30 last. After giving effect to these proposals, there will remain a balance to be carried forward unappropriated in profit and loss of £61,953, as compared with £61,027 brought in.

Last year I reported to you that the Government had given notice of its intention to acquire under the Town and Country Planning Act, 1947, the Royal Opera House, but after negotiations the Ministry of Works has agreed not to proceed with the compulsory acquisition of this property, but to take a lease for a term of 42 years, with an option on its part to break after the 21st year, upon terms which your directors consider satisfactory. This lease has not yet been completed.

It is most difficult under present conditions to give any estimate of the results for the current year, but up to the present I am pleased to say profits of the company have been well maintained. If the profits for the year ending June 30, 1950, are not less than those of last year and nothing unforeseen takes place, the directors hope to be able to then recommend a small dividend on the Ordinary shares.

The report was adopted.

ferred the existing reserve for postwar reconstruction. The reason for this reserve is that the provisions for depreciation have been based on the original cost of the assets, which is vastly below the present costs of replacement.

HIGH QUALITY FABRICS

Export markets open and close with bewildering suddenness and prices are far more competitive. The former is very difficult to cope with, though the latter indicates a return to normal healthy trading conditions. We base our hopes for the future on our increasing output, and the production of the finest quality pure silk fabrics with which we are primarily concerned; a large part of our production will continue to be the best quality nylon and rayon fabrics, and we are always on the lookout for new raw materials, which can be used in the highest quality fabrics. We have orders that will keep us in full production for many months to come, and we feel sure that whatever the coming year may bring there will always be a demand for the best quality goods in which we specialise. No one can predict what profits will be, as the increasing cost of production and the opening and closing of export markets are matters that we cannot control.

On behalf of the board and shareholders, I would like to thank most sincerely the managers, the staff and the employees at all our mills for their hard work, loyal service and splendid co-operation during the past year.

The report and accounts were adopted and a dividend of 25 per cent. was declared on the ordinary shares for the year ended June 30, 1949.

The retiring directors, Mr L. G. Beveridge and Mr A. L. L. Arnold, were re-elected and the remuneration of the auditors, Messrs Price Waterhouse and Co. was fixed.

FINNEYS SEEDS LIMITED

ANOTHER SUCCESSFUL YEAR

The third annual general meeting of Finneys Seeds Limited was held on October 25th in London, Mr Ernest Cornwall, the chairman, presiding.

The following is an extract from his circulated statement:—

In presenting the accounts of Finneys Seeds Limited for the twelve months ended June 30, 1949, the bi-centenary of the chief operating company, it gives me great pleasure to report another successful year's trading with a satisfactory profit, although it is less than the record figures of last year. We have made sufficient to repeat the dividend at 12½ per cent. The turnover has been well maintained, but in common with every other business we find that costs continue to rise. However, we start the third century with a sound record of experience and a healthy, progressive business.

The agricultural side of the business has been good, but there has been some recession on the horticultural side, primarily due to the large importation of foreign vegetables, especially onions. The heavy cost of imported foodstuffs should result in every encouragement being given to the producer in this country, but I do not think that all that could be done in this direction is being done.

The weather for the harvesting of almost all seeds during recent months has been excellent, and probably never have seed crops been gathered in such perfect conditions, so that the supply of home-produced seeds for next year should be of the highest quality.

Our endeavour is to produce and handle only the finest stocks and strains of seeds for agriculture and horticulture of the highest possible standard. We have every confidence that progress will continue to be satisfactory.

The report was adopted

Investment Statistics

Company Notes

D. and W. Murray.—Total group profit increased from £416,264 to £470,593 and net profit from £158,511 to £180,807 in the year ended July 19, 1949. The dividend and bonus again total 17½ per cent.

Amalgamated Anthracite.—Consolidated profit amounted to £279,944 (£271,617) in 1948.

Higson's Brewery.—Group trading profit declined from £231,345 to £125,072 in the year to September 30, 1949. A total distribution of 25 per cent is recommended for the year (30 per cent).

Morphy-Richards.—Consolidated profit increased from £114,156 to £131,772 and net profit from £37,214 to £41,798 in the year to June 30, 1949. A total distribution of 160 per cent is recommended for the year (same).

John Crowther.—Group trading profit increased from £466,194 to £513,815 and net profit from £179,845 to £196,401 in the year to June 30, 1949. Net current assets at year end amounted to £1,511,648 (£1,332,211).

Electric and Musical Industries.—Consolidated net profit amounted to £346,720 (£498,192) and parent company's net profit to £206,250 (£143,000) for year to June 30, 1949. The dividend of 6 per cent and 2 per cent bonus are repeated.

British Celanese.—Increased turnover, particularly in export sales, resulted in an expansion of group profit from £3,671,489 to £3,885,764 in the year to July 2, 1949. Net expenditure on buildings, plant and machinery amounted to £1,444,423 and on maintenance (including deferred repairs), £1,070,555. Net current assets at the year-end were £7,165,139 (£7,301,587). Stocks increased from £3,290,731 to £3,352,459 and debtors declined from £1,744,302 to £1,566,389. Liquid funds amounted to £6,290,609 (£5,749,913) at July 2, 1949.

Courtaulds.—It is intended to form a new company to operate in Australia with a nominal capital of £A10,000,000. The sponsors include leading Australian financial and industrial interest. The greater part of the share capital will be raised in Australia.

North British Rayon.—Trading profit of group amounted to £163,421 (£167,519) in year to June 30, 1949. A dividend of 10 per cent is recommended for the year.

Financial News.—Consolidated profit amounted to £116,749 (£120,343) in the year to June 30, 1949. A total dividend of 60 per cent for the year is recommended.

Trinidad Leaseholds.—Net profit for the year to June 30, 1949, was £548,134 (£653,510), after charging depreciation, £681,387 (£641,979), taxation £1,485,000 (£1,750,000) and adding £139,836 (£304,274) to internal reserves; an appropriation of £300,000 (£400,000) is made to other reserves. A dividend of 8.4d., tax free per 5s. stock unit has been recommended.

Southern Malayan Tin Dredging.—Net profit for the year to June 30, 1949, amounted to £156,000 (£157,528). A final dividend of 3d. per share is recommended, equivalent to 1½ per cent on total capacity invested in business.

The Borneo Company.—Net profit declined from £135,602 to £93,998 in the year to March 31, 1949. The dividend has been raised from 5 per cent to 7½ per cent.

Southern Kinta Consolidated.—Trading profit increased from £157,279 to £632,705, and net profit from £55,779 to £155,970 in the year ended March 31, 1949. A dividend of 22½ per cent is proposed for the year.

Wright's Biscuits.—Group profit increased from £232,857 to £297,755 in the year to June 30, 1949. The final dividend of 50 per cent is unchanged, making 65 per cent for the year.

Capital Issues

Macowards.—Shareholders are to be offered 150,000 4s. ordinary shares at 8s. per share.

Brand and Co. (essence and sauce makers).—Arrangements are being made to place 150,000 five per cent redeemable cumulative £1 preference shares. In addition to the new preference issue there is outstanding £150,000 in £1 ordinary shares.

Hiram Walker and Sons (whisky distillers).—A debenture issue of £1,000,000 in £500,000 four per cent "A" debenture stock, 1954, and £500,000 four per cent "B" debenture stock, 1959, has been placed privately.

Constructors.—Application has been made to deal in £150,000 5½ per cent cumulative £1 preference shares. Capital consists of £250,000 of which £150,000 is in the above preference issue and £100,000 in 5s. ordinary shares.

Ankobra River Power.—A debenture issue of £150,000 five per cent mortgage guaranteed debenture stock, 1962, has been placed at 98 per cent.

Winterbottom Book Cloth.—Treasury approval has been given to capitalise £427,384 of reserves by issuing one £1 ordinary share for each four £1 shares held.

Matter at the New York, N.Y., Post Office.

AT the age of 48 Georgi Malenkov is by any standards a formidable and successful man. As a leading member of the Politburo which rules the Soviet Union he was chosen this year to celebrate the anniversary of the Bolshevik revolution in the traditional speech before the Moscow Council. As secretary of the central committee of the Communist Party—the post from which Stalin wove his way to power—he must feel that he has under his hands the controls of world revolution. As recognised candidate for a part—or the whole—of Stalin's legacy of power he can afford to be second to none in the fervour and firmness of his dogma. As the expert on party organisation and as the emissary who helped to shape the Cominform for eastern Europe he is a maker of policy compared with whom Vyshinsky is but a tool. Much more than Stalin and Molotov he represents the ruling class created by thirty-two years of Bolshevism and Stalinism. His vision of the world outside the Soviet Union is not sharpened by memories of Russia before 1914; the ideological slang of his party comes spontaneously to his lips. If the peoples of the Soviet Union—and the world outside—are to be given a stocktaking of the present and a glimpse into the future, Malenkov is the man to do it, for he is a product not a pioneer of the Russian revolution.

It was a grim and horrifying picture of himself and the world as he sees it that Malenkov drew last Sunday. A picture of war held at arm's length only by the strength of the Soviet Union. A boast that never before in its history had Russia been surrounded by countries so friendly: the people's democracies of Poland, Hungary, Czechoslovakia, Rumania, Bulgaria, all "cemented by ties of eternal friendship"—with Korea, Mongolia, and China, also politically converted but with the cement not yet hard. Outside this charmed circle all is hostility, frustration and decay. The United States, says Malenkov, has a plan "to enslave the entire world" more crazy than the ambitions of the Nazis and the Japanese combined. Faced with an inevitable slump, it is planning to "create by violence and new wars" an empire "which is scaled to surpass all the world empires of conquerors that ever existed in history."

These are gloomy thoughts to broadcast over the Soviet Union on the eve of a national festival, tidings that might be expected to make flesh creep in an audience less experienced than the one that Malenkov faced in the Bolshoi Theatre. But, as Hitler used to, he defied the monsters of his own fantasy. A third world war would be "the grave of capitalism"; the game is up for "atomic diplomacy." The Soviet people, convinced of their own indomitable strength, are against war and for peace—they don't want to fight, but by jingo, if they do. . . . The imperialists, on the other hand, turn to military adventures, "because they fear the peace-time competition of Socialism."

It is wise to assume that Malenkov, like his predecessors on previous

anniversaries, is serious and that his ideas are an exact reflection of Stalin's. For practical purposes, it has to be assumed that the rulers of the Soviet Union do in fact believe that capitalism must die in their time, that its final convulsions will be violent and that the main purpose of their policy must be to hasten death—to restrain the convulsions. To all of them—as persons and as a group—it is a matter of life and death that their “scientific diagnosis” should be proved correct. All that seems hard to explain is treated with frightened abuse—Titoism, the effort of western Europe to unite, above all parliamentary Socialism in Britain and America's refusal to drift into a slump. The western world, they say, is doomed; but its efforts at recovery are sometimes so vigorous that they feel bound to assist the “historically inevitable” process of disintegration. Their method is the cold war.

★

Malenkov's general argument shows no sign of a desire for agreement with the west, beyond a reference to the proposal of a pact of the Big Five “for the strengthening of peace,” made by Vyshinsky on September 23rd at Uno, too abusive to be taken seriously. But against this uniform and unchanging background, and within the strategy of the cold war there can be great variety and flexibility in Soviet tactical method and aim. There is room there for a “peace campaign” and a rearmament budget side by side; for preparations to withdraw from Europe and steps to take a firmer foothold there; for policies which simultaneously encourage the nationalists of Germany in their denunciations of the Oder-Neisse frontier and the Poles in their hope that the Russians will stand by them against the Germans; for assurances that the Soviet and American systems can live side by side in peace and promises that the ultimate aim is world revolution.

It is because of this ability of Stalin's to keep two balls in the air at once that Malenkov's speech was given special significance by the news from Warsaw that came on the following day. It was announced that Marshal Rokossovsky had become Minister of Defence of Poland; and the Marshal, by birth a Pole, marked his arrival in Warsaw by issuing an order to officers and men of the army

to protect Poland, her independence and sovereignty, to guard her boundaries on the Oder-Neisse Line and the Baltic Sea, and to tighten brotherly relations between Poland and the Soviet Union.

Clearly, the appointment of a military leader so unpopular among Poles who remember the tragedy of Warsaw's siege, can be interpreted in two ways: as a sign that Moscow is so worried by the spread of Titoism that it feels bound to gain direct control of the strongest army in eastern Europe and to integrate it with the Red Army; or that it intends to rely on Poland as the bulwark against resurgent Germany. It can be read as a sign of distrust or trust of the Poles. If it means the former, then it can be assumed that the Soviet Government still has hopes of winning the allegiance of a united Germany to its system. If it means the latter then, for the time being at any rate, the Germans take second place to the Poles in Stalin's good books.

It is on this point that Malenkov's speech throws some light. His references to Germany were long and explicit. The German question, he said, “cannot be

solved unless German democracy takes into its own hands the fate of its country.” The Ruhr magnates must be dispossessed and “radical democratic change carried out.” The establishment in eastern Germany of the Pieck Republic meant that

requisites for the radical solution of the German problem are already being created there on a democratic foundation.

In round terms this means that it will be henceforth Soviet policy to offer the east German state such political and economic favours as will enable its leaders to bid for and win leadership of nationalist feeling throughout Germany, regardless of party. So much was already implied in Stalin's telegram on October 14th to Herr Pieck. Last Sunday Malenkov was merely breaking the news to the Soviet public.

★

Obviously the men of the Kremlin have had to wrestle with precisely the problem which has been exercising the three western Foreign Ministers in Paris this week—how to build up and profit from the political and economic strength of the Germans without endangering security and alienating allies. They have the advantage that they need not publicly explain their policies, that they can swing rapidly from one tack to the other, the course always remaining the same. And that in turn enables them to consider bids in the auction for Germany which are out of the question for the western governments. They could now, if they wished, withdraw all troops from eastern Germany; although they would run risks in doing so. For the western governments it is not possible to contemplate such a withdrawal for a long time to come—nor do the western Germans want the occupation troops to go. Having reassured the Poles with Marshal Rokossovsky's pledge about the Oder-Neisse line, the Russians can now give the eastern Germans a certain freedom in their foreign relations whenever they think fit. The western governments are not inclined to do this. Having tightened their grip on eastern Europe with the purges and trials of the last months, the Russians can secure for the eastern Germans such economic and other advantages as the satellites have to offer. The western governments can—on present plans—only offer Marshall Aid up till 1952, and even that now seems doubtful.

What in fact the Russians do, which cards they play, depends to a great extent on what Mr Acheson, Mr Bevin and Mr Schuman now do for western Germany, and on the extent to which the efforts for European recovery and defence look like succeeding according to timetable. The west still holds the initiative in the diplomatic struggle, and it is perhaps for that very reason that it is showing signs of serious disagreement for the first time since 1947. It is only by keeping constantly in mind what are the ultimate purposes of Soviet policy and the means by which they can be frustrated that the American, British and French governments can overcome the differences of aim and method which are now appearing. There are signs that the Soviet Government are prepared for a tactical retreat in Europe if they are convinced that their German policy is failing; but of that they will not be convinced until it is clear that western policy in Germany is succeeding. To create the conditions for that success is the main task of Mr Bevin and his colleagues in the months ahead.

Economic Liberation

THE programme of action that has been put forward in earlier articles consists of four separate but closely connected policies. Two of these—an effective disinflation and a reduction to £3,000 million of the taxes levied by the central government—were discussed last week. The remaining two—a liberation of the economy from its present restrictive bonds, official and private—fall to be discussed in the present article. To single out these four policies is not, of course, to imply that there are not plenty of other lines of action that ought to find place in a complete programme. One requirement—that the basic canons of social justice should not be infringed—can, indeed, almost be regarded as a policy in its own right. But the selection of these four can be justified because they form together a coherent emergency plan for surmounting the present crisis of the British economy. These at least are necessary if the economy is to survive; the other desirable things can come later, as the fruits of survival.

★

Virtually the whole of the present official apparatus of price control has been built up in the past ten years. Price controls are not, of course, the only form of governmental economic controls, or even, in their impact, the most irritating and obstructive. But they are the fundamental controls; all the rest of the apparatus—rations, allocations, quotas—follow in the wake. If demand and supply are not allowed to adjust themselves to each other by the normal route of rising prices, they must be brought together either by the sweat of the administrative brow or else by queues, favouritism and corruption. But if it becomes no longer necessary, or desired, to prevent prices from following their natural course, most or all of these other controls can be dispensed with.

The reasons for instituting price control, at its inception in wartime, were compelling. War always leads to an excess of demand over supply—partly because supplies are limited and partly because demand is swollen by monetary inflation. To allow this excess of demand to have its “natural” effect of raising prices would, in wartime, be disastrous; it is worth running any risks of making the economy rigid and of muffling its usual motive powers to avoid the still greater evil of a runaway inflation. When the war is over, many of the shortages are rectified; moreover, the perils of rigidity become greater and greater as time passes. But so long as the general situation remains inflationary—so long, that is, as the demand for goods-and-services-in-general exceeds the supply of them—it is still the lesser evil to maintain the controls.

That is why it is not a sensible policy simply to call for the removal of controls—“set the people free.” To do this so long as the inflation lasts would simply be to set off the old familiar spiral of prices, wages and costs chasing each other upwards. It would do great social injustice and fatally undermine the external credit of the currency. What is more relevant to the immediate argument, it would do little or nothing to stimulate the natural adjustment processes of the economy, without which there can be no hope of restoring its efficiency. It serves no useful purpose for all prices to rise indiscriminately.

An effective disinflation is therefore an essential preliminary to any process of liberation. But if it were once boldly carried out, much of the economy would liberate itself almost automatically. As was pointed out in a Note of the Week in the last issue, “it takes just as elaborate and costly an apparatus to sustain the consumer, as it were, a couple of inches above *terra firma* as to hold him safely up over the deepest abyss of exploitation.” There is not a great deal of inflation in the British economy; there are many commodities where demand is only slightly above supply; but it is the marginal two inches that causes the trouble and keeps the whole economy suspended rigid. If the total of demand could be lowered the requisite two inches, much of the control apparatus would fall away—that is to say, the market prices for a large number of commodities would fall below their controlled prices, and quotas (or coupons) would go a-begging.

It would not be enough, however, to rely on this automatic liberation. What is here proposed is that, an effective disinflation having first been produced, there should be a deliberate attempt to sweep away as many of the price controls, and their attendant rationing, allocation and quota schemes, as is humanly possible. It should be clearly recognised that it would not be nearly enough to make a bonfire of those controls that would by then have ceased to be effective—Mr Harold Wilson does that from time to time—but the axe would also have to fall on other controls that would still be effective—that is, where the abolition of the control would lead to a rise in the market price.

★

This is an essential element in any policy of liberation. We are, however, as a nation, so accustomed to the policy of first creating inflation and then trying to stop it from having its normal effect that any deliberate talk of raising prices sounds like treason. But the whole purpose of a policy of liberation is to allow individual prices—and wages—to move relatively to each other. To create conditions in which “movement relatively to each other” excluded any increases would involve a very severe deflation indeed, with massive unemployment. It is not even necessary to insist that there should be more decreases than increases; the policy should deliberately envisage some increase, on the average, in the rates of wages, if thereby the competition and the movement that can alone increase efficiency and lower costs can be secured. If the home market is made less profitable, the profits of selling to America at the new rate of exchange will become more attractive, and if the industries that can reap those profits are allowed to collect the materials and the labour they want, by bidding them away from others, higher wages would be the means to larger exports. There is all the difference in the world between the indiscriminate, spiralling rise in all wages and prices that Sir Stafford Cripps is trying to avoid—rightly, since he has not eliminated the inflation from the system—and the discriminating increases that are here proposed, which would be a means to higher efficiency and lower costs. There is, of course, less room for this sort of manoeuvre within the rigid limit of a fixed exchange rate of \$2.80 than there would have

been with a more flexible exchange policy. But there is still enough room, provided that the disinflation is first made effective enough to secure that prices and wages rise only when there is a real economic justification for them to do so.

In any event, nobody should be under any illusion about the fact that a policy of economic liberation involves a rise in some prices and in some wages. But to this there is another set of familiar objections. To the extent that any prices rise, relatively to incomes, "rationing by the purse" is involved. Here again, the comment to be made is that this is precisely the object of the policy. To call it "rationing by the purse" is of course to put the most pejorative colour on it and create prejudice against it. But if it is put in another way and described as the policy of enabling those firms and industries and individuals to have a priority claim on the resources of the community who can make the most economic use of them, it becomes the obvious foundation of a policy aiming at the restoration of economic efficiency.

★

Indeed, if efficiency were the sole object of policy, there should be no limits to "rationing by the purse." But social justice is a co-equal objective, and it must be recognised that in the present circumstances of Britain, a complete return to free prices would cause much hardship. There are some things—the staple foodstuffs most notably—where supplies are still absolutely short. It was proposed last week that the food subsidies should be removed (the ban on wage increases simultaneously being withdrawn); it would be asking too much to propose that, in addition to the increase in food prices that this would entail, there should be a further rise owing to the removal of price control. On the other hand, it would be a very large hole in the policy of liberation if the quarter of total consumption represented by food were entirely exempt from it. The way of escape from this dilemma may be by means of a two-price system for the basic foodstuffs, in which a certain quantity, the basic ration, is sold against coupons at an artificially low price and the rest of the available supplies sold freely at whatever price equates demand and supply. In Germany, this has been found an effective way of reconciling social justice and economic incentive. The "utility" principle—by which tax remission is used as a means of securing that a proportion of the total supply is made available at low prices—is, of course, another application of the same idea. The two-price system might also be extended to individual raw materials that are still absolutely scarce.

In these various ways, it is believed that virtually all prices could be brought within the ambit of the policy of liberation. In some cases, an effective disinflation would automatically dismantle the machinery of control; in others, a moderate rise in price would bring demand and supply together; and in the obstinate residuum of absolute scarcities, some scope for incentives could be provided by a two-price policy.

The whole policy could, however, be frustrated if the only effect of dismantling the public controls and restrictions were to reinstate a mass of private controls and restrictions. A price control or a quota scheme or a ban on new entrants is no less of an obstruction to the mobility on which efficiency depends simply because it is privately imposed. This is a problem that was growing in urgency long before the war, ever since the Conservative Govern-

ment decided, as a corollary to the Import Duties Act of 1932, to put a positive premium on cartelism in British industry. There is no need to go to the extremes of American anti-trust legislation. If security is to be one of the co-equal objectives of economic policy, there is obviously a case for reasonable security for the employer as well as for the employee. But if efficiency is also to keep its co-equal place—or, more accurately, to be restored to it—then there must be some retreat from the conditions of the 1930s. Nor is this retreat likely to be secured by such timid methods as the Monopolies Act of last year, which entirely excludes from its purview two of the biggest areas of restrictionism—the trade unions and the statutory corporations—and even where it does operate puts upon the attorneys of the public interest the onus of proving their case. Real progress will be made only by reversing this bias, by re-enacting the old prohibitions of the common law against all forms of combination in restraint of trade, and then putting upon those who wish to indulge in any of them the onus of proving that it will be in the general interest to grant them licence. Such a policy would not be popular with anybody. But it is essential in fact and in logic. Those who jib at it disqualify themselves from any complaining about the confining effects of government control.

★

The four policies that have now been briefly expounded in this series of articles hang closely together. They are, in fact, completely interdependent, and a programme of reviving the motive power of the British economy cannot pick and choose among them. It will be impossible to secure an effective disinflation (as Sir Stafford Cripps has discovered, though he has not yet admitted it) unless there is also a sizable reduction in the burden of taxes, since taxation of the present height is itself strongly inflationary. To set prices and wages free without first squeezing the inflation out of the economy would be highly dangerous. To remove official controls would serve little purpose unless the private obstructions to flexibility were simultaneously reduced. Disinflation is a necessary preliminary to any restoration of flexibility; but, on the other hand, the more flexible and responsive to pressure the economy is made, the smaller is the degree of disinflation that will be needed, and the fuller employment can remain.

It cannot be claimed for the policy sketched out in these articles that it would be popular with all sections of the electorate. But it is claimed that it provides a logical and consistent means by which the British economy could be put upon its feet without any real sacrifice of the principles of stable employment and social justice. It is a policy that defines its objects and selects methods that are designed to attain them—and of what other policy now before the British public can the same be said? It is a policy that should be judged as a whole, and judged by its ultimate effects, not by its electoral impact. Only a government with its strength freshly renewed at the polls could contemplate it; but any government that made up its mind to seek national regeneration over the whole lifetime of a Parliament, rather than immediate popularity, would be bound to proceed on some such lines as those here set out. The last article in the series will enquire into the chances of such a government emerging from the coming general election.

Test Point in Malaya

DURING the past eighteen months Malaya has faced two dangers—Communism and economic recession. From the one it has been slowly and painfully rescued for the time being. The cost of the operation—still continuing—is something like £25,000 a day. From the other it has been temporarily saved by the drug of devaluation. But the question must now be faced: what next? How secure is Malaya in the brighter future which seems for the moment to be ahead of it? How does it stand in relation to long-term Communist pressure from China and elsewhere? And what, if anything, should now be done by the country's rulers, the British, to consolidate what has been gained?

The campaign against the Communist bandits, who launched into rebellion in June of last year on instructions received at the Moscow-directed Asian Communist conference in Calcutta a few weeks before, has cost about 1,500 civilian and military casualties in killed, wounded and missing. An almost identical number of bandits has now been eliminated. To accomplish this, the British forces have been far more numerous, expensive and efficient than the resources of any small and independent Asian state could have provided on their own. But even although the rebellion has failed in the sense that it long ceased to have any chance of usurping power, this handful of a few thousand desperate men continues to hold up peaceful development over very wide areas. And this is not a situation which can continue indefinitely without doing lasting damage both to the political and to the economic life of the country.

Rubber, which provides Malaya's economic background, has lately been the medium of a threat even more fundamental than that of banditry to the territory's stability. Before devaluation, the price of natural rubber had fallen to about 10½d. a pound, a figure so low that only the better estates could operate with a reasonable margin of profit. Since devaluation, the price has risen to around 1s. 1½d. a pound, a level which enables the European estates, as well as the native producers, to make ends meet, so long as their costs are not also increased by a rise in the general price index—and particularly so long as rice continues to be available in adequate quantities from Burma. It would be too much to say that the Malayan economy has now been entirely relieved. The danger that widespread economic distress would soften up the country for Communism, by making normal life intolerable for a large proportion of the population, has, at least temporarily, been averted. But the uncertainties ahead are still so great that there is a noticeable tendency for the older Europeans in Malaya to get out while they still can, and a still more noticeable reluctance among young men in Britain to take up planting as a career.

The British administration, however, cannot so lightly turn its back on a difficult territory. Despite the two temporary gains that it has consolidated, it faces a complicated future. It is the last colonial power to occupy any substantial part of south-east Asia without opposition from the main weight of public opinion. Yet it must cater for a shift in that opinion occasioned by events to both north and south—both in Indonesia and in China. All eyes are therefore upon it. Malaya has

become the testing point of the existing order in South East Asia.

What are the influences which its British rulers must foresee and ward against if they are to maintain Malaya's security and prosperity? The first is the development of the Malayan Communist party. Malaya is, surprisingly enough, alone among the countries of south-east Asia in not possessing an active and lively organisation. (That in neighbouring Siam, for instance, numbers, with fellow travellers, at least 50,000.) The bandits should not be mistaken for a mass movement. The Malayan Communist party is 20 years old, but even when it organised popular resistance during the war through the Malayan Peoples Anti-Japanese Army, its strength never exceeded 10,000 members. But this figure may prove far from static. Now that the Communists have won their great victory in China, Chinese Communism is likely to exercise increasing influence in Malaya both because it is Chinese and because it is

Communist. Only the richer and better educated Chinese in Malaya have any real stake in the country and are assimilated. The other Chinese, the poorer and the less successful, are for the most part recent immigrants, and have never lost that elastic attachment to their homeland which is a characteristic of the Chinese however far afield they go. Now, with China itself Communist, these immigrants are bound to be more and more affected by events at home.

Some of them will, of course, be used as active agents by the men of Peking. Here the British answer must be so far as possible to restrict immigration, and to draw a line between the Chinese in Malaya who owe allegiance to Malaya and those who owe allegiance to China. But whatever happens the danger will be there.

★

On the economic front some of the benefits accruing from the recent rise in the sterling price of rubber have already been described. Others are rubber's new cheapness in terms of dollars, and the American administration's undertaking at the Washington September talks to resume stockpiling and to lower the legal minimum use of synthetic in the United States. All these factors will probably help to consolidate the temporary turning point in the downward drift of the Malayan economy. It should, however, be Britain's first task to stress and go on stressing in Washington that this improvement must somehow be maintained—through a continuation of American purchases of rubber and tin—if the West is to retain a foothold and goodwill in this, the most favourable part of south-east Asia.

But how are these arguments to be reconciled with the antipathy of Americans and others to colonialism? Very few people in Malaya, least of all the Malays themselves, want to see the British go in the immediate future. Yet it is the declared object of British policy in Malaya, as in other colonial territories, to prepare for self-government—which, of course, includes the status of a dominion member of the Commonwealth. But already, quite apart from any question of Communist pressure, the British are out on something of a limb in Malaya. It is only the accident of racial rivalry and the even balance between Malaya's two and a half million Malays and an almost equal number of Chinese—not to mention the 750,000 Indians—which has left the British in undisputed control for far longer than either the French or the Dutch in their nearby territories. And, although delaying any serious movement for independence, these facts certainly cannot be expected to postpone it indefinitely in an area where national self-consciousness is marching as fast as it is in south-east Asia. Even if the inhabitants fight among themselves, they will all sooner or later want this part of Asia for the Asians. The question was mooted in London some months ago of making a public declaration that the British would not leave Malaya for at least ten, twenty or even thirty years. In the end no time limit was set. That was wise. But all plans broached in Washington or elsewhere for the future of the territory had best be based upon the assumption that a time limit is in mind.

★

Against the advantages of talking terms, however, must always be offset one matter of overriding importance—the role that Malaya plays, or could play, in the cold-war planning of the anti-Communist Powers. There has been, hitherto, a division of opinion between London and Washington on this subject. The Japanese proved that Singapore was no fortress. Today many people in Washington doubt whether any territory on the mainland of south-east Asia can ultimately be held against the rising tide of Asiatic Communism-cum-nationalism. But London, for economic rather than strategic reasons, takes a different view. Malaya's only

hope of sustaining its present relatively high standard of living—high, that is, for Asia—is to continue its present role in the sterling area. There, it is not only eminently prosperous internally, but an asset on a broader basis—as a leading exporter to the dollar world, contributing no less than one-fifth of that area's dollar earnings. If these assets are to be retained in the interests of all their present beneficiaries, the territory must have for some time to come all the defensive and administrative backing that Britain can give it. How far can this British point of view be made clear to Washington? The Americans are entirely unwilling to underwrite colonial regimes anywhere; but, to judge by Mr Bevin's recent talks with Mr Acheson, they seem to be changing their minds about Malaya. They are prepared, at least for the moment, to give a modest blessing to what the British are doing there. It is worth emphasising again and again to them that every British action must be trebly weighed—in the light of British and American needs in the cold war, of the sedate progress of an Asian state towards self-government on a non-Communist model, and, last but not least, of the effect of Malayan developments on relations with such vital members of the Commonwealth as India and Pakistan.

Devising the pattern of British policy for Malaya is therefore no light matter. It must be firm enough to keep bandits at bay, progressive enough to keep a jump ahead of Communism, tactful enough to suggest that a time limit is always in mind, popular enough to keep Malaya in the Commonwealth and the sterling area. The assignment would be simpler if the Malayan population were homogeneous. But if it were, the chance would not exist, for Britain would long since be on the road now being trodden by the Dutch in Indonesia and the French in Indo-China. The position constitutes the most crucial test which British overseas administration is at present facing. The cynosure of all eyes, it entails the handling, on an exposed promontory, of a difficult admixture of races. If the work of the next decade or so produces a friendly and prosperous member of the Commonwealth, there will be no more striking advertisement for British methods. If not, there will be one more twentieth-century tombstone to the western way of handling Asian peoples.

The Professional Practitioner

MUCH has been written of the changing economic and social position of the "professional classes"—a term that is generally a synonym for that section of the middle class not engaged in industry or commerce. What is frequently overlooked is the difference in the problems and fortunes of the salaried occupations—the civil service, teaching, soldiering and so forth—and the professions proper—that is to say doctors, surveyors, accountants, barristers and solicitors who live by charging fees for advice given or services undertaken in accordance with standards laid down by the profession itself. The latest National Income White Paper showed that, of total personal incomes, professional earnings still constituted 1.8 per cent in 1948, as they did in 1938, although the share of salaries and *rentier* incomes has diminished considerably. This indication that the professional practitioner is quietly holding his old position seems, as far as it goes, to suggest a reassuring stability. But is this anything more than the accidental balancing

out of opposing forces? Is the postwar flood of arrears of work and loose money still masking the first symptoms of a slow decline?

In the first place, there is in many professions a noticeable drain of younger men into salaried posts in industry and government. In architecture, the bigger opportunities offered by public works in their widest sense attract better men than formerly, although probably many of them will return to private practice when the peak of the government expenditure on housing and building and new towns has been passed and private building, both residential and commercial, revives. Medicine has evolved its own unique halfway house. Accountants are feeling a more permanent lure; nationalisation, and the new developments in cost accounting and scientific management, have combined to improve the salaries in openings for juniors by something like 150 per cent since 1938. Experienced accountants, at present, can earn high salaries in industry. So far as can be foreseen, this

trend towards salaries and away from fees is a permanent feature of accountancy; yet it is the office of the practising accountant which forms the nursery for the very distinctive set of professional methods and codes which is so demanded.

Similar trends are noticeable elsewhere. At present, the independent surveyor is in enormous demand in connection with war damage and town planning legislation, and though this boom is temporary, it may be that the need for this type of work is on a permanently higher level—yet even here the accumulation of property in corporate and official hands may lead to a growth in the proportion of salaried surveyors. With solicitors, however, the same forces work differently. There are comparatively few salaried posts of a lucrative kind to draw them out of private practice, but recruitment to the profession is falling off, which suggests, in part, a loss to comparable professions offering greater security than the uncertainty of living on fees. Certainly living on solicitors' fees has many drawbacks at present; scales, as regulated by law, have risen only by 50 per cent since 1881. Work such as conveyancing, buoyed up by rising values, has to be used by a firm of solicitors to subsidise its litigation work, which is often downright unprofitable.

★

A second influence at work is the growth of professional occupations inside government departments and nationalised boards. Eventually it may be possible to reduce the number of professional employees for narrowly specialised purposes by training internal recruits to do the more elementary routine connected with their work. Some tasks, obviously, will always require minds with a thorough professional and technical training, but when the dust of reorganisation has settled, many accountants or doctors at present largely engaged on administrative work may be replaced by men with more limited skills. Accountancy is a case in point. The National Coal Board took into its service many practising accountants who are now working out the complex accounting problems of one huge concern, reducing them to a routine. The Exchequer and Audit Department provides a nucleus for a government audit system which in time might cut out the profession from the nationalised sector, as well as reduce the prestige of its methods in the private sector of industry. Similarly, solicitors and counsel suffer a loss of possible fields for litigation work whenever a national board replaces numerous small units in an industry.

Yet a third change in the climate of the private pro-

fessional man is the comparatively modern idea that his services should be made available, not only to those who can afford them or as occasional charity to the pauper, but to every member of society, irrespective of his means. The free legal aid scheme will probably mean, like the health scheme, an increase in the volume of work paid for at a slightly lower rate. Both professions were themselves strong advocates of state assistance to poorer clients, on grounds of social justice; both have ingeniously avoided a salaried service and kept their professional citadels intact.

But doctors in general practice already complain that in many localities they work harder for a smaller income; solicitors and counsel will receive for most types of "assisted" cases only 85 per cent of their already low scale, and although not all members will go on the panels the volume of work will probably affect the whole profession. It is perfectly reasonable to argue that (save for the question of justice to existing members) doctors and dentists, lawyers and barristers, should be prepared, in the long run, in return for an assured volume of work at the state's expense, to forgo something of the standards many professional people enjoyed when they largely took their chance of high fees from the well-to-do. But even on the narrowest view, any welfare scheme is uneconomic which eventually cheapens the quality of the services obtained. Status, in the last resort, is obstinately linked with income.

In the case of the Bar, it is notoriously difficult to estimate the volume of demand for counsel's services. One big constituent of the present boom, postwar divorces, will probably die down in a few years; another, running-down cases, cannot continue its phenomenal growth indefinitely. Looking ahead, say, thirty years or so, the shrinkage of the work of the Probate and Admiralty Courts and the Parliamentary Bar, the substitution, in many fields, of the internal decisions of government departments for legal disputes between firms or individuals (in the nationalised sectors of industry, for example) and not least the general decline in the public's taste for litigation, can only mean, in total effect, fewer practising barristers.

Finally, it may be expected that wider educational opportunities of the future will affect recruitment. Professions which article apprentices are finding article fees hard to obtain; good juniors of any kind are in short supply. Even accountancy's bright prospects have not prevented a steady decline in recruitment since the peak in 1931. Solicitors will have seriously to consider whether their conditions of training will continue to com-

pete with the attractions of assisted university education for their proper share of the more studious and responsible products of the grammar school.

A greater adaptation of university courses to professional needs may solve the recruitment problems of some professions. The enlarged size of the universities may produce in time proportionately more aspirants to the dignities of architecture, medicine, dentistry or the Bar. Salaries which keep the wolf from the door immediately after qualifying will then influence an impecunious student's choice. Newly-fledged architects can now earn about £550 a year, and starting, as distinct from higher, salaries show the same tendency in most professions. Private practice, however, has two distinct costs of entry. The first that of qualifying; the second that of building up a practice or buying a share in one already established. In the future an increasing number of people will achieve the first step, but the proportion (and indeed the absolute number) of those who can afford to enter practice will probably decline. Nothing has altered the cost of entering private medical practice. Dental practice still has a costly threshold. The young barrister normally expects to cover his costs only after four or five years. It is not possible to foresee in any particular profession, or over the whole professional field, whether, if the intake of the relatively impecunious is increased, the number of salaried openings, in practitioners' offices or in industry or government, will be sufficient to absorb them. Even where it is, there is still the danger of destroying the existing balance between a profession's backbone of independent practitioners, and its salaried members.

One cannot generalise about earnings among so many individualists. All, however, have sharply rising expenses which solicitors estimate on an average as 70 per cent of their fees. Much as this may vary between firms, or professions, higher staff salaries seem a permanent feature. The large firm or partnership by extensive division of labour can utilise in the most fruitful way all the time of its more highly paid staff; in the small busi-

ness the time of the experienced man is likely to be filled in partly with work his juniors could do. The narrowing margin between fees and costs, therefore, may eventually force most professions towards concentration into those bigger units which tradition has, so far, held at bay. (This trend is already noticeable in stockbroking.)

"All professions," says one of Shaw's characters, "are a conspiracy against the laity." Certainly the standards they set and the fees they charge are accepted almost without question. It may not be good Marshallian economics, but it is an indisputable fact that the individual practitioner charges, not the marginal utility of a piece of advice, but a contribution to the status of his profession as a whole. It is less obvious, however, that because membership of an established profession gives a practitioner this freedom from the "higgling of the market" it also gives him, as an individual, a virtual independence of his employers. It enables him to resist financial pressure. It enables him, as an expert, to do what he thinks best—not what his client imagines should be done. It enables him, in short, to raise his standard of competence and conduct to heights which, on a purely commercial basis, he could not attain. His independence, therefore, while valuable to him, is even more valuable to the rest of the community.

The decline in the strength of the independent profession is not an urgent matter of today and tomorrow, nor is there any villain of the piece to dramatise the issues. But it should be a matter of genuine concern in a democratic society, for it is unquestionable that the maintenance of high standards of competence and conduct depends upon the private fee-earning practitioner, endorsed by a corporate professional body. If the private practitioner were to lose his foothold among the shifting economic forces of the future, the community would lose that unique combination of independence and integrity which his calling evokes—an independence which relates not only to professional standards, but which represents one of the strongest safeguards of genuine political and intellectual freedom.

NOTES OF THE WEEK

Fortnight in Paris

Swift and spectacular results are not to be expected from the short meeting in Paris between Mr Acheson, Mr Schuman and Mr Bevin. There has been little time to prepare the ground, partly because the new French government is barely a fortnight old, partly because no one was really expecting, until nearer the end of the year, a thorough review of policy towards western Germany. Of the events that have forced the three Foreign Ministers to revise their views about dismantling—for which they as a body, and not the British on their own, are responsible—the appearance of the Pieck Republic in eastern Germany and the calculated indiscretions of the American High Commissioner, Mr McCloy, stand out as decisive. It is as important for the future that the three High Commissioners should receive—and follow—identical instructions on a long-term policy as it is that the Bonn government should feel the curb exchanged for the snaffle, and show its paces as freely as the government in Berlin.

Mr Acheson may not have had an easy passage with his European colleagues. They and their officials are still recovering from the effects of watching Mr Hoffman last week pulling some of the strings attached to future Marshall Aid. They remember his rapt expression as he preached "inte-

gration" before the Council of OEEC, with a machine recording proceedings which are normally regarded as private, and cameras taking pictures of Europe being told to get busy. Mr Acheson's technique—indeed the whole approach of the State Department to the European governments—is more polished and understanding; but he may find his colleagues unready to move forward in their German policy the distance that good sense and foresight would seem to dictate. And for an American to broach the question of a more up-to-date French policy in Indo-China, which is not even controlled by the Quai d'Orsay, is to rush in where angels fear to tread—and where Mr Nehru is said already to have slipped and hurt himself.

Integration by Numbers

This fortnight of activity, during which almost every important committee that has anything to do with west European co-operation has been meeting in Paris, has produced a wide variety of results. Even in the secret sphere of defence, where progress should in some respects prove easier than elsewhere, some curious decisions have been made. It having been arranged that the north

European and west European regional planning groups under the Atlantic Pact should work in London, so as to economise in brains and offices, everyone expected that the south European-western Mediterranean planning group, consisting of France, Italy and Britain, would join them there. That was not good enough for French pride, so this group will work in Paris; this ensures much unnecessary expenditure of money and time by three governments that are short of both.

It is satisfactory, on the other hand, that the defence organisation of the five Brussels Pact governments is not to disappear into the pattern of the Atlantic Pact; this well-knit body with much good work behind it is to keep its identity.

Indeed, it is in limited regional groupings of this kind that the next advances towards Europe's "integration" seem likely. Sir Stafford Cripps's candid warning, in reply to Mr Hoffman last week, that Britain would do all it could to help, but would not necessarily join, such groups may induce some governments to give themselves the lead for which they looked to London. We may expect a number of facetious sounding but economically plausible combinations to come up for discussion for the next few weeks. "Fritalux" is already being displaced by "Benefit," and letters have to be found for groupings in which Germany and the Scandinavians might take part, with the British doing what they can to help.

In British eyes this line of advance has the immense advantage that some continental ministers will no longer be able to conceal their own lack of precise projects and resolution behind the complaint that the British are holding up the unification of Europe. For the continental ministers it has the no less important advantage that such groupings will offer less scope for American intervention of the kind which caused ministerial eyebrows to be raised in OEEC last week.

Rising Anxiety

The debate in the House of Lords on Wednesday on British and western European defence was not up to the standard of previous defence debates in that chamber, partly because none of the military leaders of the late war happened to be taking part. The speeches, however, of Lords Trenchard, Teynham and Templewood from the Opposition and of Lord Winster from the Government benches reflected the rising nervousness of the intelligent public about the effectiveness of the Government's defence arrangements and the reality of Western Union defence. Once again the question was raised, how can the line from the Alps to Arnhem, which at a conservative estimate would need thirty divisions, be held by a force which no one can calculate at more than a third of that size? What are the mass of international and co-ordinating committees in fact producing in the shape of an allied plan? In addition Lord Winster in an able, but depressing, speech put his finger on an aspect of purely British organisation which may suggest that shortcomings of the Ministry of Defence are not solely the result of Mr Alexander's personality.

There has always seemed to me to be a certain danger in the whole idea of a Ministry of Defence: the danger of setting up a system of stooges. The Prime Minister of the day is unlikely to appoint as Minister of Defence a man so strong and of such commanding position and influence in the country that a resignation on a point of principle may involve the Prime Minister himself. Equally, the Minister of Defence, it seems to me, is extremely unlikely to select for appointment as head of a Service Ministry a strong man whose resignation on a point of principle might again involve his own position or his own resignation.

In replying for the Government, the First Lord of the Admiralty recited a series of platitudes which as much as anything reveal the contempt in which civil servants, whose

briefs are uttered through the mouths of Government spokesmen in the House of Lords, hold the institution of parliamentary debates. The only point of any substance was his statement that the Government do not intend to modify the present system of National Service call-up in favour of selective service (although he admitted that nearly fifty per cent of those eligible have to be deferred). Whether selective service be practical or not, it has sufficient political disadvantages to make the Government very wary of considering it at this moment.

A Time to Probe

The announcement that a further £8,000,000 has been advanced by the Government to the Overseas Food Corporation, almost entirely for the East African groundnut scheme, in addition to the £21 million which had been advanced by last March, has made MPs all the more anxious to press their inquiries into the administration of the scheme. Their first opportunity will be in the debate in the Commons the week after next. The Opposition will have a heavy responsibility both in the groundnuts debate and in the discussions on the other nationalised industries this autumn, since the technique of Parliamentary control is still very much in the formative stage and a great deal may depend upon the precedents laid down during these discussions. The tortuous story of previous debates on the groundnut scheme in the Commons does not, however, provide a very good omen for that particular discussion, and it is clear that the effectiveness of these probings, particularly into the criticisms of the accounts of the Overseas Food Corporation, will depend on what can be done by the Committee of Public Accounts. Hitherto it has not been clear how deeply the Committee of Public Accounts will be able to go into the accounts of the Corporation. It is very much to be hoped that the Committee will reverse its initial decision and decide to question the private auditors appointed by the Minister of Food—Messrs Cooper Brothers—about their strictures on the accounting system of the Corporation.

The Labour Party's line of defence over the groundnut scheme has been made plain in many articles and speeches already. It is broadly to put the blame as far as possible on to the managing agency, formed by the United Africa Company, to run the scheme in its opening stages. But this is a double-edged weapon. For it ignores the fact that the managing agency, though organised by the United Africa Company, was a managing agency of the Minister of Food, operating under his direct instructions and that the Internal Audit Division of the Ministry of Food was responsible for auditing its accounts. It was not made sufficiently clear in *The Economist* last week that the Audit Division was responsible only for auditing the records, not for organising the accounting system of the managing agency. To attack the agency is therefore to attack the Minister. The United Africa company must certainly shoulder some of the blame. But Mr Strachey must carry the chief responsibility both in the period of the managing agency, which operated directly under him, and even to a large degree in the period of the Corporation, whose leading members were largely his own choice, and whose progress reports have been almost entirely uttered through him. It is the duty of Parliament to probe whether here has been waste or extravagance in the spending of public money, whether that spending has been done by a private company acting as the Government's agent or by a public Corporation.

TUC Abandons its Position

In the seven weeks since devaluation the TUC has presented an even more painful spectacle of doubt and hesitation than the Cabinet itself. The special economic

committee has been wrestling with a report which would define the TUC's attitude to the changes attendant on devaluation. Last week it was known that a plan for radical action to suspend cost-of-living agreements and take effective action to limit wage increases was rejected by the General Council. On Wednesday of this week, Mr Tewson, the secretary of the TUC, made it publicly known that the General Council has still no guidance to offer its affiliated unions, and that although "certain broad and general conclusions" have been reached no word will be transmitted to the unions until there has been a meeting with Sir Stafford Cripps and Mr Bevin.

In effect the leaders of the TUC are saying to these two Ministers "You got us into this mess by devaluing the pound without consulting us, now you get us out of it." By so doing, of course, the TUC undermines any serious claim it may have possessed to be regarded as an estate of the realm, as a body capable of exercising industrial statesmanship and helping to formulate economic policy. Finding policy beyond it, now that the easy days are past when policy simply meant demanding and receiving greater benefits for trade unionists, it throws the problem back upon the Government. And provided the TUC will acknowledge that it is merely a pressure group it is with the Government that the problem should rest. In its attempts to evade the responsibilities of governing—particularly in the field of wages—the Government has tried to make the TUC do its work for it, and now the General Council has quietly rebelled, revealing—what should have been obvious from the start—that it is not a body capable either of evolving policies in the public interest or of enforcing them on the unions, but simply a collection of trade union leaders intent on furthering the interests of their members.

* * *

Prices Rise in East Germany

On November 10th food subsidies disappeared in the new Soviet German Republic; they had been withdrawn from textiles and soft coal a few days before. Explanations of this first practical step by the economic chiefs of the Pieck Republic have done little to allay public dismay. The sole consolation offered by the Minister of Finance was the news that pensions would be restored to former Nazis and raised in the lowest grades for the aged.

This step, which will raise the prices of rationed goods by from six to thirty per cent, was necessary if the east German budget was to be balanced. For, as a result of western devaluation, the price of imported textile raw materials has increased, and with it the cost of textile subsidies. Presumably the Russians and the other eastern suppliers of Soviet-occupied Germany have raised their prices in step with the west. Furthermore, state investments in capital projects, notably in the steelworks that are to reduce eastern Germany's dependence on the Ruhr, have been pressed to such an extent that the budget is too strained to bear further subsidies. The eastern German economy also suffers, of course, from the fact that reparations to Russia flow out, and no equivalent of Marshall aid flows in.

All Soviet-controlled economies are guided by the principle of maximum incentives for extra production, and the need for nationalised industries to show profits. Policy in the Soviet zone has been only one example of this policy in practice. Some time ago, the dual price system was introduced, with the idea of mopping up excess purchasing power in the hands of the skilled workers, as well as providing additional incentives to all. As elsewhere, state shops were established to sell at "free" prices the goods that could be bought over and above the ration. Now that the cost of rations is increased, the prices in the state shops are brought down. When the prices meet, rationing can be abandoned.

In the Pieck Republic, however, the carrot has been placed too far out of the donkey's reach. Food is still so scarce

that rations are not always obtainable in full; and the prices in the state shops are so exorbitant that they are out of reach of all but the *élite*—the skilled Stakhanovite or the intelligentsia. In the hands of Communists, the dual price system—introduced before the supplies warrant it—is used not only to provide incentives for workers, but as a means to eliminate the lower middle classes, who do not get adequate rations. In state shops of the Pieck Republic the housewife will still have to pay the equivalent of an hour and a half of an average workman's wage for 1 lb. of flour, and over two hours' wages for 1 lb. of sugar.

All that the new Minister of Finance could say in reply to the widespread complaints was:

When I am asked why the burden should be levied on the people, I must ask back: "On whom else?" Capitalists no longer exist in the Soviet zone, and foreign countries cannot be expected to carry the burden.

* * *

Dutch Rationing by the Purse

Last week the Dutch Government dismantled nearly the whole of its rationing machinery; its move toward "rationing by the purse" might well be worth the attention of bureaucrats in this country. Four more commodities have now joined the list of unrationed goods—cheese, meat, rice and textiles. Only coffee and coal remain: coffee because it requires scarce foreign exchange, and coal because home production does not satisfy demand and imports must be kept to a minimum.

The decision to abolish rationing is part of the Dutch Government's campaign to throw off controls with all possible speed, as an essential prelude to the realisation of the Benelux Union. Hitherto, the disparity between free-enterprise Belgium and *dirigiste* Holland has been one of the big obstacles to the merger.

Derationing was made possible at this time for a variety of reasons. In the case of meat internal production, especially the output of pork, had reached a satisfactory level. Simultaneous with derationing the Government scrapped the maximum price for beef and placed a heavier subsidy on pork, the price of which has fallen by 6d. per pound. In other words, the Dutch public must now turn into pork eaters or pay a special price for the luxury of eating beef. Cheese presented a different problem. Production is not sufficient to meet the demands of both the home and export markets, and therefore price controls for cheese have been lifted; it is a valuable export commodity, and if the Dutch consumer wants to compete for it with the foreigner he must henceforth pay more.

Textiles have gone off the ration partly as a result of expanding Dutch production and partly because the Belgians have insisted that Holland drop some of its barriers to the import of Belgian textiles during the current preparatory stage of union. Since Belgium devalued less than Holland, these imported textiles are likely to be expensive—a fact, incidentally, which will make it easier for the Dutch producer to accept the new Belgian competition.

At the same time as the relaxation of rationing occurred the Dutch Government was forced to take a step backward in the matter of subsidies. It announced that, because of devaluation, subsidies totalling 150 million guilders (£15 million) will be restored on bread, milk, margarine, coal and fodder; the total cost of subsidies will thus amount in the coming year to approximately 9 per cent of the budget as compared with a projected 5 per cent. This is a reversal of the policy of gradually lowering subsidies which started a year ago, and the Government has emphasised that it is only temporary. Its object is to keep prices at the level that prevailed before devaluation until a new wage-price policy can be worked out with labour and employers. Unless the

SUPPLIED THROUGH RETAIL AGENTS

WHY Wholesaling?

Manufacturers cannot just make textile goods and leave them. They must be collected from the factory in bulk quantities and distributed to retailers—sometimes hundreds of miles away—in relatively small quantities. That is where the textile wholesaler comes in. He acts collectively for hundreds of manufacturers and thousands of retailers. But his job is not so easy as it sounds. The goods have to be bought, sorted, stored, displayed, sold, packed and dispatched. Somebody must do these things and the wholesaler does them out of the small margin prescribed for this essential purpose by the Government.

Thus in the specialised textile trade the wholesaler efficiently serves the manufacturer, the retailer and the consumer.

impact of devaluation was softened in this way, it was felt that labour would have become restive and the wage stop agreement would have been jeopardised.

Baying About the Bomb

This week the General Assembly has once again turned to the problem of controlling atomic energy. A new urgency has been given to its work by the knowledge that the atom bomb is believed to be available to the Russians. Unfortunately, there is no reason to think that Soviet successes in atomic research have engendered a more co-operative attitude towards plans for its control.

The Atomic Energy Commission sensibly decided last summer that further talk could serve no useful purpose until the Great Powers had decided amongst themselves whether the basis for an agreement existed. So far the representatives of the Big Five and Canada, who have been meeting privately at Lake Success, have failed to find this basis. The gap that yawns between the attitude of the majority and that of Moscow has been fully disclosed in a majority interim report on these talks. Those who wrote it are willing—or say they are willing—to put world security before national sovereignty; the Soviet Union is not. All would agree to a ban on atomic weapons; but, whereas the majority would have all explosive atomic materials controlled by an international agency, the Soviet Union would allow them to remain under national ownership. Likewise, whereas the majority propose to give the international agency power to carry out comprehensive and continuous inspections of national atomic plants, the Soviet plan would in general only allow for periodic and pre-announced inspections of whatever atomic facilities the national governments chose to disclose. The loopholes provided for a secretive government in the Soviet plan need no pointing out.

The French and Canadian resolution, which was submitted this week to the Assembly's *ad hoc* political committee, is a gallant attempt to remove the chief obstacle to effective control. Among other things, it calls on all nations to surrender all sovereign rights which are incompatible with world security. But it is certain to meet with just as frigid a Soviet reception as the well-meaning proposals of General Romulo, which he described as "the application of an emergency brake" and which would include a short-term ban on the production and use of atomic weapons accompanied by adequate safeguards. In fact, the men at Uno are being reduced to talking deliberate nonsense on this subject.

Most non-Soviet resolutions and statements on atomic control talk of the necessity of "exploring every avenue." But it is a perfectly well-known fact that at the end of every avenue there is a Russian waiting to say "Not this way, please." Sir Carl Berendsen, of New Zealand, has said that to search for a formula of control in the absence of Soviet co-operation, is to bay at the moon. As the Russians, for propaganda purposes, bay much better than we do, it might be better to stop talking about the matter and to give everybody's nerves a rest. The attitude of the Russians will not change on this question until it has changed on other matters with which Uno does not deal.

Fillip for the Liberals

The recent appeal by Mr Frank Byers, the chief Liberal Whip, for more Liberals to come forward as possible parliamentary candidates has met with a remarkable response. The shortage of good candidates has recently been causing a great deal of anxiety to the Liberal Party, and in making a public appeal Mr Byers took the risk of exposing the extent to which the Liberal front line was undermanned

and of sapping confidence in the party's organisation. In the event, however, his gamble has succeeded for his appeal has elicited over one hundred and fifty replies, many of them from people of first-rate calibre, and including four men anxious to oppose that ex-Liberal, Mr Churchill, at Woodford. This may increase the number of Liberal candidates to a figure which may reassure the electorate that the Liberals are in a position to provide an alternative government.

A larger number of Liberal candidates in the field will also affect the fortunes of the two major parties. Public opinion polls have regularly found that about 12 per cent of the electorate say they would vote Liberal. In two fairly recent surveys about 50 per cent of Liberal candidates in the absence of a Liberal candidate they would vote Conservative, about 25 per cent would support Labour and 25 per cent were undecided. (This varies according to locality and it is generally accepted as a rough rule of thumb that at elections in the North of England Liberals vote Conservative if they have no candidate of their own, and in the South, particularly in urban constituencies, they vote Labour). If this is correct, it becomes a Labour interest that there should be a minimum, number of Liberal candidates. If there were none at all, the net gain to the Conservatives might be as much as three per cent of the popular vote or possibly 45 extra seats. The larger the number of Liberal candidates, however, the less bonus will either the Conservatives or Labour receive, particularly as these candidates will presumably contest constituencies which contain the largest potential number of Liberal votes. What, on the other hand, is fraught with danger for the Liberals is the evident intention of both the Conservative and Labour parties to contest almost all the constituencies, for the Liberal tends to fare worst in a three-cornered fight.

One Less House in Eight

There is to be one more zig-zag in the housing programme. There is no doubt that in the national interest a pruning of £35 million in housing expenditure, as a capital outlay not directly related to production, was necessary; but it is nonetheless regrettable that an industry which has had its full share of dislocations due to changes in government policy should have its balance upset once again. Mr

Bevan has now sent an interim circular to local authorities telling them how they are to implement the cut of 20,000 to 25,000 houses by issuing no further licences to private builders. Unsubsidised building is to be stopped in order that subsidised building may continue—and this in the name of economy.

As the diagram shows, the output of houses has been improving fairly steadily for more than a year—steadily, that is, compared with 1946 and 1947. During this

year the rhythm of the industry has gradually improved. From the quarterly returns* it can be seen that the number of houses completed is running at some 195,000 a year, and those under construction at 198,000. As the result of the cuts, output is now to be reduced to 175,000 a year, which is equivalent to a cut of one house in eight, and the full brunt is to be taken by private enterprise, while local authority building schemes remain untouched. No licences already given are to be withdrawn, but local authorities are to suspend "for the time being" the granting of any new licences.

It is clear that licences to private builders have been stopped partly because with 21,000 houses under construction their operations were of a handy size for cutting without involving too much departmental hard work, and partly as the price of Mr Bevan's acquiescence in abandoning the principle of a completely free health service. But the saving words "for the time being" are the private builders' life-line. The circular explicitly states that when future arrangements have been disentangled, local authorities are to be allowed some discretion to issue licences to private builders for a proportion of the houses allocated to them. That proportion is not yet determined, but it is to be hoped that Mr Bevan, or his successor, will permit a good deal of local discretion. Building costs are now so high that numbers of local authorities are dipping into the rates beyond their statutory obligations in order to bridge the gap between rents and costs. It is doubtful if many of them will be willing to build many more houses on this basis. Are the private builders willing to step in and build at least a proportion of houses at economic rents of 30s. to 40s. a week without subsidy? If so, they should get a hearing.

The Wisdom of Mr Morrison

Mr Herbert Morrison, most convincing and disarming of Government spokesmen, is ill served by his colleagues—and by events. "Put the nation first," he unexceptionally pleaded at Preston last Sunday, while Mr Shinwell, only forty-eight hours earlier, denounced the minority who "still have too much" and promised that "in spite of the snarls of the Tories" a victorious Labour government would spend the next five years in "ironing out" differences in the standard of living. "The man or the team who do a better day's work," says Mr Morrison, "should be entitled to correspondingly better earnings." But not, says Sir Stafford Cripps in effect, the man who does a better year's business, who cultivates a more difficult market, who seizes an opportunity which the national interest demands should be exploited; not, says the Labour movement in general, the professional man who qualifies himself for specialised tasks and capitalises his talents by intensive work. Redistribution, says Mr Bevan, is retribution. Mr Morrison's campaign for national unity and for adequate incentive faces an uphill road with the brakes full on.

Nor does he get, in practice, much backing for his contention that there is something excessive about the rate of national expenditure on "comparative inessentials" (alcohol, tobacco, cinemas, racing, and "other private fun and games"). Let private incomes balloon up, keep expenditure on essentials down by lavish subsidy coupled with strict and comprehensive rationing and control, discourage saving by letting every potential saver see his savings lose value every day he keeps them, and it is fairly predictable that "fun and games" will boom—and, incidentally, attract to their service a proportion of the country's resources hardly compatible with any rational manpower and capital plan. If he wants to see a more realistic outlay, Mr Morrison should appeal to his colleagues rather than to the public.

When he reminds his hearers, platitudinously but never-

* Housing Returns (Cmd. 7808, 7809) Sept. 30, 1949.

theless wisely, that one cannot both keep at home goods needed for export and obtain the materials which these would buy, that new capital equipment requires saving, that the social services cost money which cannot, if devoted to their needs, be spent on private pleasure, it is his own past which rises up to deafen the audience. The age of scarcity is ended, he told the voters of 1945, the age of plenty is beginning. Much unwisdom is uttered in the heat of election year; but this particular unwisdom has been Socialism's most characteristic stock in trade from its origins. Mr Morrison's current speeches deserve all praise; it is the actions for which he is collectively responsible which make them so ineffective as influences upon the event.

Peace Treaty for Japan

The old idea of a postwar peace treaty was that it was a settlement imposed by the victors on the vanquished, and that it should be made as soon as possible after the close of hostilities. But many have said that the Treaty of Versailles was rendered harsher by the wartime hatred remaining in 1919 than it would have been if concluded a year or two later. This gave rise in the Second World War to the notion of postponing peace treaties until after the lapse of a "cooling off" period. Now that the cooling off has turned into a cold war between the victors of 1945, it has become impossible for them to agree on terms for either Germany or Japan; so that a peace treaty now means an agreement reached separately with the ex-enemy by one or the other of the opposed camps for the purpose of winning his support rather than punishing him for past misdeeds.

The auction in Germany has already produced some high political bidding, and now there is fresh talk of a peace with Japan to be concluded by the United States and any other

nations willing to come in on the basic American terms. This, broadly speaking, means accepting conditions which would guarantee that Japan is not pulled behind the Iron Curtain by Soviet sleight of hand. As the aim of Soviet policy, now supported by Communist China, is to prevent such guarantees, and as the Russians have hitherto insisted on the right of Great Power veto in the preparation of the treaty, there is no prospect of a general agreement. It is therefore expected that Russia and China would be left outside.

★

There are various motives for speeding up a peace treaty rather than continuing indefinitely on the present basis. The Yoshida Government is anxious for a treaty which would strengthen its position by ending the uncertainty of the treaty-less period, getting rid of the formal authority of Allied Headquarters, and enabling Japan to resume normal diplomatic relations abroad. Important sections of American opinion want it both for its expected moral effect in Japan and for the sake of fixing a *status quo* which can be defended in the impending conditions of political stress in the Far East. The British Government wants it because of the advantage, for negotiations on economic questions, of renewing direct official intercourse with the government of Japan. But there are certainly some Japanese who are alarmed at the prospect of a treaty binding them permanently to America in latent antagonism to the power now dominant on almost the whole mainland of East Asia.

The crucial point in any peace treaty must indeed be the retention on Japanese soil of American armed forces in some form. Their presence might well mean that Japan would be involved in any future war; but it would be involved in any case, the only difference being that, if the Americans were to withdraw, leaving Japan defenceless, it would be forced sooner or later on to the other side. Short of abandoning Japan to Communist infiltration and disruption, the only alternative to keeping American troops there by treaty would be to permit the remilitarisation of the country, a counsel of despair which is not advocated by any responsible person.

★ ★ ★

Nigerians for Moscow?

This week's news of a Nigerian delegation's forthcoming visit to Prague and Moscow is no surprise. The delegation is led by Dr Nnando Azikiwe, a newspaper owner and member of the Legislative Council, who is president of his country's more extreme nationalist movement, known as the National Council for Nigeria and the Cameroons. But it has been clear for some time that Moscow was closely interested in political developments in Nigeria, and it is equally understandable that an invitation to attend the International Conference on Human Relations in Prague would look too flattering to decline. Neither the conference nor the voyage can be expected to serve the interests of the people of Nigeria.

Since the Communist successes in China and south-east Asia, it has been inevitable that sooner or later signs would emerge of similar tactics being employed in Africa. The colonial territories are regarded in Moscow as the vulnerable rear of the capitalist camp; and the way to strike at it is to infiltrate into the leadership of local nationalist movements. This is less easily done in Africa than in Asia because the nationalist movements there are less highly developed.

Behind the present moves of Dr Azikiwe's delegation lie the unsettling events of the past few months in Nigeria and the current discussions about a new constitution in the colony. The first hint of trouble occurred in May, when an extreme splinter group broke away from the Nigerian

National Federation of Labour. This was followed two months later by a lightning strike on the Nigerian railways which held up traffic for about four days. Its importance, apart from the brief—but irritating—delay caused in shipping the accumulations of groundnuts, was that it looked like the first mainly political strike in Nigerian history. Further, the *Cominform* journal away in Bucharest gave the strike its hearty blessing, saying that it emphasised how the railwaymen were “leading the struggle of the people of Nigeria . . . for democratic self-government and independence from the British colonial yoke.”

It would be quite wrong to assume that the Communists have obtained anything like a firm hold even on the more nationally-conscious elements in Nigeria or any other African colony; indeed, the bulk of the native rulers have repudiated extremism, are co-operating loyally over the new constitution, and stand firm behind the British administration at this stage.

Snubs After Strasbourg

The Standing Committee of the Council of Europe's Assembly—a select and powerful body—has not concealed its chagrin at the way in which the Committee of Ministers has dealt with the resolutions so painfully hammered out at Strasbourg. Perhaps it is because Paris has lately been the scene of such an orgy of committee and council meetings on European unity that the Ministers felt it necessary to draw a dust sheet over the Council of Europe, which would muffle its cries without suffocating it. Most members of the Assembly may feel that their proposals for economic co-operation in Europe are too important merely to be handed over to the OEEC for consideration. Some jealousy, of course, and a good deal of delay must be expected, but there is no body more fitted by its experience and membership—the number of economic experts in Europe is strictly limited—to say whether they are useful and workable.

The decision of the twelve Foreign Ministers that it is too early to make any changes in the statute—or constitution—of the Council of Europe is sensible, and has in fact been accepted by the Standing Committee. In any case, the Assembly's General Committee, which has been charged with studying the changes necessary in Europe to achieve political unity, will not report before next April. The Ministers were also well advised to come some way towards meeting the Assembly's wishes by agreeing not to control its agenda—as they are entitled to do—unless the Assembly steps outside the limits laid down for it.

The Ministers have also graciously agreed not to decide on the admission of new members without consulting the Standing Committee. This gives that body some prestige and a right which it has already exercised by supporting Western Germany and the Saar as candidates. But in the process it has been out-maneuvred, as the most compelling reason for summoning an extraordinary session of the Assembly early next year has now been removed. Not till next August, it appears, will German press reporters and photographers be able to describe to the German public what membership of the Council of Europe means, to give the Adenauer Government that pat on the back which it needs. The quite courageous restraint shown by the West German Chancellor in not pressing the claim to membership has been met with a display of procrastination.

It is said that Mr Bevin played a leading part in the Committee of Ministers' decisions to keep the wings of the Assembly clipped. This may be quite untrue; but what does seem evident is that the Ministers—in their relationship to the Assembly—are now feeling both tired and avuncular, whereas at Strasbourg they were fresh and paternal. Having been responsible for the birth of the infant Council, they should be giving it a better start in life.

Pharmaceutical Alumina

(Aluminium Hydroxide B.P.C.)

DESCRIPTION -

An almost amorphous aluminium hydroxide in the form of a fine white powder having a minimum acid neutralising value of 250 ml.N./10 hydrochloric acid per gram, for one hour's continuous agitation test at 37°C.

Al ₂ O ₃ content	50/54%.
SO ₂ content	0.2% max.
Arsenic	5 p.p.m. max.
Heavy metals	20 p.p.m. max.

USES -

An antacid in the treatment of peptic ulcers, dyspepsia, and for incorporation in pharmaceutical compounds requiring an acid sorptive material

The fable of the fish and the facts

There was once a Fish so huge and old and cunning that no-one said him nay, and so wonderfully ugly that his friends avoided the subject. "Great king!" cried a school of small whales, saluting as they passed. "Tide-breather!" "Stream-snorter!" "Storm-swallower!" The Fish grinned terribly. "Poetry," said he, "Poetry . . . Now, in plain human prose, what am I but so many tons of cooking fats . . ."

There's a time for rhetoric and a time for simple statement. TI, if they liked, might describe their manifold production processes in terms to make a pageant seem prosaic. They would rather tell you that their direct exports for 1947-8 amounted to over £10,000,000, that, if indirect exports are included, they made well over £1 out of every £100 won by the whole country in overseas markets. Every £1 earned that way is worth a cwt. of orchestral accompaniment.

A riverside raw material

The riverside willows of East Anglia would appear to be far removed from the busy hum of Bowaters building and insulation board mills at Kemsley in Kent. Yet willow and other woods have been found to be eminently suitable for certain descriptions of board marketed by Bowaters. The use of English wood for board manufacture, and straw for conversion into strawpaper, is helping to protect sterling. From spinney and field Bowaters harvest home-grown materials to save dollars for Britain. By resourcefulness in tackling problems of manufacture, and in their search for new materials, the Bowater Organisation has kept pace with the ever increasing demands for the products of pulp, paper, and board.

The manufacture of medical equipment often involves the most delicate precision work.

An experimental X-ray apparatus was being built. It was found that a lug on a cast aluminium bearing had to be heightened by an extension piece. The fine limits imposed made fusion welding impossible. The solution? A B.O.C process, Aluminium Brazing, did the job perfectly. From the lightest industry to the heaviest, B.O.C processes are making an immeasurable contribution to Britain's advance in every field.

Wide-open Canadian markets

only a day away!

BRITISH EXPORTERS must move fast! Britain will sell goods worth \$300,000,000 to Canada this year. Add the vast potential of the American market, the advantages of devaluation, and you have undreamed-of opportunities! It's vital dollars for Britain and good hard sterling for manufacturers who get in first! In less than a day you could be right in the heart of Canada's market—by flying T.C.A. A few more hours and you can be in the lucrative markets of New York or the U.S. Middle West! Trans-Canada Air Lines, the most frequent direct service to all important Canadian cities, offer

fast daily flights in luxurious North Star pressurised Skyliners, with immediate connections to all major U.S. cities. U.K. passengers save dollars by booking T.C.A. right through to their final destination. Let T.C.A. rush you to the great wealthy markets of Canada and the U.S.A.!

DEVALUATION

Because the Canadian dollar is at a 10% discount with the U.S. dollar, there is less devaluation between the Canadian dollar and the £. So T.C.A. are now quoting the lowest sterling fares to all North American destinations, beyond gateway points, provided the domestic trip starts in Canada!

IT'S ONLY A DAY BY **TCA**

More Assistance for the Old?

A short debate on the adjournment at the end of last week raised a matter which will probably become very prominent in the course of the next few months. Already old age pensioners had asked for a higher basic pension and been refused. Last week, therefore, in the House of Commons the plea was put forward for a higher scale of supplementary pensions for those who have to have their basic 26s. a week supplemented by the Assistance Board. The reasons advanced are the rise in the cost of living that has taken place since the rates for basic and supplementary pensions were fixed and the rise that is expected to follow from devaluation.

To these arguments the Parliamentary Secretary to the Ministry of National Insurance gave the usual non-committal, temporising answer that they would be carefully studied. It is important, however, that in the meantime the implications of the proposal should be clearly thought out. First, it should be realised that the Assistance Board has two classes of pensioner beneficiaries: those who have no other resources than their state pensions, and those who have other resources which are either wholly or partly disregarded by the Board in assessing their needs. If the Board's scales are to be altered to allow higher supplementary pensions to be paid, some means should be found of concentrating the additional assistance on those who really need it, that is, on those who, but for state aid, would be utterly destitute. Every additional sum paid to those who have resources of their own is paid at the expense of those who have none—so long, of course, as any limit is placed on the amount that can be paid out in national assistance.

This raises a second point. Even if supplementary pensions were raised by only a shilling or two a week, it would still be an extra burden on the taxpayer, placed just at a time when all policy should aim at reducing it. To start by raising supplementary pensions is to start at the wrong end of the stick. The first essential—however strong the claims of old age pensioners at the present time—is to reduce expenditure on the social services, not increase it. When that has been done, but only then, it will be both right and necessary to relieve real hardship by, among other measures, higher assistance payments.

Press Laws in the Colonies

The new Press Bill in Jamaica has been withdrawn after much opposition to it had been voiced in the colony. Since, too, it was only the latest of a series of measures that have restricted the freedom of the press in the colonial empire, it has aroused some questioning in this country. The Bill's declared purpose was to prevent the disclosure of confidential information—there has recently been considerable leakage to the press of what has been going on in the Executive Council. But the opponents of the Bill alleged that its terms were much wider than those of the British Official Secrets Act and that it could be used to prevent the press printing anything that Government officials did not want discussed.

Now that the Bill has been withdrawn, its merits and objections are beside the question. The incident does, however, throw light on certain features of colonial government. The first is that there is good reason for the press laws of the colonies to be more drastic than believers in the freedom of the press would like, simply because the standard of the press in the colonies is for the most part deplorably low. It does not follow that drastic press laws are the right answer, but those who denounce them should try to suggest a constructive alternative.

Secondly, it is worth pointing out that those who ask the Secretary of State to intervene often do not know what they are talking about. Even when a press law emanates from the Colonial Office, it is the colonial government which is responsible for its administration. Whether to prosecute or not

depends on the local Attorney-General, and the Secretary of State has no power to influence him one way or the other. When, as in the case of Jamaica, a press law emanates from a colony which is all but self-governing, he cannot say that it goes too far and should be modified. The grant of more responsible government would be quite meaningless if, after making it, the Secretary of State tried to interfere in matters of this sort.

Thirdly, the incident shows clearly one of the disadvantages of the "all but self-governing" status. The Jamaican Press Bill was introduced in the House of Representatives by the Jamaican Minister for Social Welfare, a member of the Executive Council. But Mr Bustamante, presumably on noticing its bad reception, could immediately say that although he originally approved the Bill, he now felt that it was an infringement of democracy, etc., etc., and that he would advise his party to reject it. In other words, he disclaimed responsibility for the Bill, and threw it upon the Governor, although as a member of the Executive Council and so-called Prime Minister, he was as responsible as the rest of the Council. It may well be necessary, before a colony finally attains fully responsible government, to reserve some vestige of power for the Governor. But there is no doubt that it tends to breed irresponsibility in those to whom the rest of the power has been handed over.

Italian Socialist Confusions

The Italians have a flair for *combinazione*, a word that can mean anything from a personal or business deal to a tacit political understanding. It covers the extraordinary position which has arisen since the three Socialist ministers—Signore

Shirley

A Tale. By CURRER BELL, author of "Jane Eyre." Smith, Elder and Co. Cornhill.

CURRER BELL's new work would be more appropriately called a talk than a tale. It is made up of conversations rather than narrative, and contains as many discussions as events. The reputation already acquired by the author will make it, however, the novel of the season. It is published at a favourable time, when the world is tired of politics, and before the opera has begun; when Mr Hudson and railways have become stale, and nobody yet cares about the opening of Parliament; it has already been extensively praised, and will be much sought after, and we have no alternative but to take notice of it. . . . "Shirley" is . . . as a tale much inferior to "Jane Eyre." In both works there is the same vigour, raciness and freshness of style—indeed, these qualities are even more conspicuous in the present than in the former work; the same scorn of trifling conventionalities, and the same acquaintance with the peculiarities of the North, with schools and teaching, and with the distinctive characteristics of dissent and the church. Notwithstanding numerous defects, the vigour of the writing will attract many readers, and the book will share in the popularity which "Jane Eyre" has deservedly acquired. . . .

The book is not, as a whole, natural; but there are many characters in it sketched to the life. That its impassioned and exaggerated language will be as beneficial as it will be much admired, we are inclined to doubt, while we warn our young readers that the wilfulness and more than ordinary energy ascribed to Shirley is much more pleasing in books than in actual life. Exaggeration of conduct is more likely to be pernicious than exaggeration of sentiment; and the more seductive is the eloquence of Currer Bell, the more mischievous may be the influence of the very masculine, wilful character of the heroine of the present novel.

The Economist

November 10, 1849

Saragat, Tremelloni and Lombardo—recently withdrew from Signor de Gasperi's predominantly Christian Democrat coalition cabinet. There appears to be a political understanding that the three ministers will be welcomed back into the fold in January, after a right-wing Socialist (PSLI) congress has said that they can re-apply.

The origins of this move lie embedded in the current manoeuvres for reunion between the various dissident Italian Socialist groups. For a long time the Saragat group—rather like the Socialists in France—has felt itself to be losing ground in the country because it held office under a right wing coalition leader. Further, it has come under fire from the left wing for helping to lead Italy into the Atlantic Pact. With the Socialists proposing to confer on unity in December, Saragat and Lombardo felt that a gesture was needed to strengthen their position in relation to the Romita-Silone group, if they were not to be swamped by their allies. Sigore Saragat and Romita, respectively, head the two main Socialist groups which are not co-operating with the Communists. United, they would possibly represent some three or four million votes in an electorate of something over 25 million. But Romita's relations with the extreme left wing, pro-Communist Socialists under Signor Nenni, are still very suspect in the Saragat party, and it is unlikely that a new merger will be achieved.

The tragedy of this whole story is that it shows a return of that hereditary palsy from which Italian Socialism has suffered ever since its foundation in 1892. For years Italian Socialists were unable to make up their minds whether they meant to achieve their ideals by reform or by revolution, and it was their almost incredible capacity for indecision which let

Mussolini into Rome in 1922. At present, fortunately, Italy does not depend on the Socialists to stem the Communist tide. But it would be a grave loss to Italian democracy if, by doctrinaire division among themselves, the democratic Socialists again forfeited any chance of a future claim to speak with one voice for a substantial section of public opinion.

Shorter Notes

Mr John Dugdale, the Parliamentary Secretary to the Admiralty, made two reassuring statements on Wednesday. He announced that all British operational submarines are now fitted with the *schmorkel* or "snort"—a device which enables a submarine to remain submerged for a month or more and which was used effectively by the Germans towards the end of the war—and that British submarines are, as far as is known, as fast as those of any other country. But one of the chief naval problems for Britain remains—how to counter rather than to produce such weapons.

A reply to a Parliamentary question suggests further fuel for Mr Wilson's bonfire of controls.

"Mr Keeling asked the Financial Secretary to the Treasury if he will publish in the Official Report the rules governing purchase tax on Christmas cards. . . . Mr Glenvil Hall replied that at present Christmas cards . . . are charged at the rate of 33½ per cent under Group 34 of the Purchase Tax Schedule unless they are charged under Group 25 at 100 per cent (or 66½ per cent if the picture reproduces a work executed more than 100 years ago)."—"Hansard," November 8, 1949.

Letters to the Editor

Promise and Fulfilment

SIR,—In your issue of October 29th you print a review of my book "Promise and Fulfilment" which accuses me of "palpable exaggerations and untruths." Of these, two are specified by your reviewer. "The worst," according to him, is the statement in my book that the British diverted the flow of oil from Haifa to Amman in order to supply the Arab armies with fuel. This, he writes, "is a physical impossibility." I assume that your reviewer means that it is a physical impossibility because the pipeline does not pass through Amman. It does not seem to have occurred to him that a pipeline is not the only means of transporting oil. No official British source has ever denied that Great Britain supplied not only the arms but also the oil of Brigadier Glubb's Arab Legion, while at the same time the Haifa refineries were closed down and Israel cut off from oil. The facts are on record, and consequently your reviewer's accusations of "palpable untruths" can only refer to a literal reading of my metaphoric statement that "the flow from the pipeline was . . . diverted to Amman." I might just as well have said that "the gold of Fort Knox has saved Greek children from starvation" and been accused of telling an untruth because it is a "physical impossibility" for Greek children to feed on gold ingots.

Your reviewer clinches his argument by stating: "Israelis in the know (the reviewer is not one of them) say that there

are mistakes of equal magnitude in the account of relations between Haganah and Irgun." The past relations between Irgun and Haganah are a matter of bitter controversy among Israelis, and every "Israeli in the know" has strong and not necessarily unbiased views on the subject. To print derogatory hearsay evidence from unspecified sources; to refuse responsibility for it and in the same breath use it to substantiate a charge of "palpable untruths," is a method of journalism about which your readers will form their own opinion.—Yours faithfully,

ARTHUR KOESTLER

c/o Macmillans, St. Martin's Street, London, W.C.2

[Our reviewer writes: On Mr Koestler's first point, the passage I challenged, which appears on page 166 of "Promise and Fulfilment," runs as follows:

The oil refineries, run by the British-owned Consolidated Refineries Ltd., closed down in mid-April. Palestine was entirely dependent on them for her petrol supply, which amounted to 12 per cent of the output of these refineries. They received about half of their crude oil through the pipeline from Kirkuk, the other half by tankers from abroad. From now on the company's tankers were employed in the opposite traffic: the existing stocks of crude oil were removed to Tripoli, the refined petrol to Beirut; the flow from the pipeline was simultaneously diverted to Amman. True to her interpretation of neutrality in the conflict, Great Britain not only continued to deliver arms to Iraq and Transjordan, but also made sure that their armies should be well supplied with fuel; while the Jews saw an arms embargo enforced upon them and their motor transport left high and dry.

The facts are: that the Iraq Petroleum Company, which is not "Great Britain," but an international concern constituted in equal shares by British, American, French and Anglo-Dutch oil companies, owing to the *force majeure* generated by the war, ceased pumping crude oil to Haifa in the spring of 1948. The British-owned refinery at Haifa closed down; from April, 1948, it ceased to function as a supplier. The IPC's constituent companies necessarily removed from Haifa, for refining at their refineries in other parts of the world, most of the crude oil left lying at Haifa. It is true that some crude oil went to Tripoli, but only *en route* to other destinations. It is not true that any refined oil went to Beirut. The remains of crude oil left at Haifa after this removal was completed—some 30-40 thousand tons in the bottom of the tanks—was sometime later drained by the Israelis and put by them through the refinery, which machinery they

"borrowed" for the purpose. The IPC in response to the normal requirements of the commercial distributors in Jordan (where the maintenance of civilian as well as military life is almost wholly dependent on motor transport) later pumped some petrol from Kirkuk to these distributors. I was not so childish as to suggest that Mr Koestler is wrong because the pipe does not go to Amman; the point is (1) that there was no "diversion" from Haifa because the oil that goes to Haifa is crude, and crude oil is useless in Jordan, and (2) that to state that "Great Britain" supplied it is incorrect because the company, though registered in London, is internationally controlled; the supply was in response to a natural trade demand and was not in excess of peacetime quantities. The amount was in any case much less than that which the Israelis seized from the Haifa tank bottoms. There were no restrictions on the sale of the oil so supplied to Jordan, as oil was not included in the arms embargo. The Jordanian forces were as free to buy it as were the Israelis to buy petrol commercially and to import it, as they did, in tankers by sea.

On Mr Koestler's second point, I confirm my statement that there is "bitter controversy" over what really happened between Haganah and Irgun, and would have made no criticism had Mr Koestler said so in his book, instead of offering his version positively and without qualification.]

Propaganda for Savings

SIR,—The article under the above heading in *The Economist* of November 5th last suggests that the National Savings Committee has failed "to provide a suitable popular lead on the real meaning of small savings from the community's point of view." The recent National Savings Week, said the writer, "had no obvious connection with economic crises, rising prices or threats of coming shortages." If he means that these grim questions were not featured in the press advertisements and on the posters which announced and heralded the Week we, of course, plead guilty.

The expert advice we receive and our experience suggest that posters and advertisements are unsatisfactory media for such purposes. They and some of the other "paraphernalia" of the Week were designed to attract the attention of the British people and to provide an opportunity and a stimulus for the combined efforts of many thousands of voluntary workers in the Savings Movement to increase savings and the number of savers, and in this they were successful.

The "real purpose" of the Week was conveyed to the "man in the street" by the speeches of leaders of the political parties, by addresses given at more than 6,000 meetings organised during the Week, by reports and articles in the press, by the BBC and the cinema. Leaflets which were widely distributed during the Week, and the notes for speakers we issued are concentrated upon some of the main arguments concerning savings and the economic crisis.—Yours faithfully,

MACKINTOSH OF HALIFAX, Chairman

National Savings Committee

DISTRIBUTIVE TRADING

AN ECONOMIC ANALYSIS

MARGARET HALL, M.A.

Yellow and Tutor in Economics at Somerville College, Oxford.

Surveys a field of economic activity until recently somewhat taken for granted. War experience emphasized the critical importance of distribution in keeping living standards, and the peace, with its crippling labour shortages, shows the need for accurate information and economic analysis of Britain's largest industry.

HUTCHINSON'S UNIVERSITY LIBRARY
LONDON NEW YORK MELBOURNE SYDNEY CAPE TOWN

Purchase Tax Uplift

SIR,—The case of the Attorney-General *v.* this company, which was reported at some length in your columns, has aroused considerable interest not only in this particular issue of a manufacturer selling by retail, but also in much wider issues, particularly that of manufacturers selling by wholesale.

In view of the possibility of this case going to the Court of Appeal, I feel that it would not be proper for me to offer any comment at this stage; but, in view of the importance of the matter, I shall be very pleased to arrange for a copy of the official report of the hearing in the High Court—which includes *inter alia* the arguments of counsel, the remarkably interesting evidence which was given on behalf of the Commissioners of Customs and Excise, and, of course, the judgment—to be sent to any trade association or to any firm or company who might be affected.—Yours faithfully,

ERIC M. GAMAGE, Chairman

A. W. Gamage Ltd., Holborn, E.C.1

Development Council for the Clothing Industry

SIR,—In view of the statements made by Mr Harold Wilson, President of the Board of Trade, in the House of Commons (a) that the Bespoke Tailors Guild was in favour of a development council for the clothing industry and (b) had not declared its opposition, I must draw your attention to a press conference called at the offices of the Guild on February 21, 1949.

At this conference it was said "we have never supported the proposals for the formation of a development council" and the following statement was issued:—

"Our concern and desire has been to safeguard the interests of the craftsman tailor. You will undoubtedly realise that the President of the Board of Trade has the power and, further, has expressed his intention (November 9, 1948) of making the development council a reality. Our efforts, therefore, have been, and must continue to be, directed towards the ensuring of protection of the retail bespoke trade."—Yours faithfully,

R. GILLESPIE-BROWN, General Secretary

Bespoke Tailors Guild,
10 Golden Square, London, W.1

The English Landowner

SIR,—Without wishing, on this occasion, to take sides about the rights and wrongs of owning property, may I give an example of one aspect of the economics of it? I recently had to have new window frames put into a small cottage here. The cost was roughly equal to nine years' rent.—Yours faithfully,

Sense and Nonsense

"I Choose Peace." By K. Zilliacus. Penguin Books. 509 pages. 2s. 6d.

It is useful to have Mr Zilliacus around provided he gives us his tonic in short doses—less than 500 pages. It is salutary to have his ingenious and well-informed mind stating the case against British and American foreign policy and blurring the black and white patterns in which the causes of present international tensions are now presented. But the ordinary reader who seeks wisdom will be bruised and baffled by the rat-tat-tat of Mr Zilliacus's pleading. The better informed reader, who simply wants to know quickly what he has to say, will be infuriated by the lack of index, by the repetition of themes, and the manner in which every red herring is followed around at least one corner. Mr Zilliacus preens himself throughout on being clear-headed and rational where almost everybody else is being muddled and emotional; yet he is often carried away by his own emotion and by a desire to show the comprehensiveness of his mental attitude—and his files. (Let him ask himself for example what on earth pages 365-8 have to do with the theme of Chapter x.)

A pamphleteer is perhaps entitled to give no sources, but the practice is undesirable in a book which covers in separate chapters such vast subjects as the League of Nations, European history 1920-30, Labour in World Affairs 1914-49, Communism and the Soviet Union, and 150 pages on American preparation for war. It leads one to doubt, for instance, whether the author really knows what happened at the first meeting of the Cominform: on page 416 we are told that nobody objected in principle to American aid, provided it was without strings; on page 202 we are told that Zhukov "pledged the nine Communist parties . . . to combat the alleged attempts through the Marshall Plan to subvert the independence of their countries." The gravest defect in the argument, which purports to offer a way to peace through a drastic reversal of British policy, is its failure either to explain or to describe accurately those features of Soviet behaviour which have led the Americans and the British since 1947 to distrust Moscow. For instance Mr Zilliacus suggests emphatically that the Economic Commission for Europe could have been the scene of the closest Soviet-European co-operation, perhaps even the instrument of the Marshall Plan. To say this shows either ignorance of how ECE has in fact worked, or a wilful disregard of the refusal of the Russians first, and the east European governments later, to give full and accurate information such as the Marshall countries have given to ECA. His statement that the west's trade with eastern Europe is severely restricted by American veto on what is sent to Poland and its neighbours is, without qualification, misleading. These are only two examples of ways in which Mr Zilliacus's views, or description of facts, fit in with lines that are regularly put forward in Communist propaganda.

The curious thing is that Mr Zilliacus's view of what is wrong with British foreign policy could be applied so aptly to much of the foreign policy of Stalin. He says that British Governments for thirty years have been so frightened of social revolution as to become incapable of framing an intelligent foreign policy. Would it not also be true to say of Stalin that for twenty years he has been so frightened of counter-revolution as to be incapable of an enlightened foreign policy? After all, when simple Englishmen (on whom Mr Zilliacus bases all his hopes and for whom this extra big Penguin is designed) complain of the abuse, distrust, brutality, and double-dealing which have marked Soviet foreign policy since the war, they are told by people like the author that it is all because the Russians are frightened. And now Mr Zilliacus tells us that we are frightened too. If he had any historic

sense at all he would treat his readers with more respect.

None the less there is enough in Mr. Zilliacus's argument to be taken seriously: can the "common people" of Britain work out and achieve a peaceful foreign policy which would make Stalin co-operative? Can the British leave the American camp without becoming satellites of the Soviet system? Can Uno be made to work? Is American foreign policy really run by diehard and capitalist warmongers? Did Marx foresee all this 100 years ago? And . . . if President Benes could not get on with Stalin, what reason have we to think that President Zilliacus could?

Peace Offers

"Les Tentatives de Paix dans la Seconde Guerre Mondiale, 1939-45." By Maxime Mourin. Paris. Payot. 221 pages. 480 frs.

M. MOURIN's latest contribution to recent diplomatic history attempts to do two separate things which he does not always successfully distinguish. Under the general heading of "attempts at making peace" there are, first of all, the efforts common to all wars of coalitions—or nearly all—by which the diplomacy of the belligerent groups attempts to break up the common front of their adversaries, and the efforts of junior partners in such coalitions to detach themselves from the common cause. There is also the separate issue created by the attempts in non-official circles to enter into contacts with the enemy in order to bring about a cessation of hostilities, ranging all the way from the merely foolish to the downright treasonable.

The first type of activity is really inseparable from the general diplomatic and political history of the war itself, and the evidence from the Axis side is by now fairly well known. It is difficult to see that M. Mourin has done more than summarise a well-known story. Nor where he goes outside the Berlin-Rome story does he add much. Indeed, the successful defections of Germany's satellites in south-eastern Europe are only dealt with in passing; nor does M. Mourin add anything to our knowledge of the reasons for that curious episode in Soviet diplomacy, the Soviet support for the German peace offensive of October, 1940.

With regard to the other type of peace-seeking activity, M. Mourin naturally draws heavily on his own earlier book on the anti-Hitler conspiracies. He is less fortunate when he deals with the alleged peace-feelers sent out by British and American pro-appeasement groups, since his sole authority seems to be W. Root's *Secret History of the War*, which is hardly a first-hand source.

Otherwise the book is, within its limits, a reasonably accurate narrative. There are some misspelt names, and it is unfortunate that in a single footnote Britansky Soyuznik should be referred to as a Soviet journal and Dame Myra Hess elevated to the peerage.

For most readers the chief interest will be in the light such a narrative can throw upon the wisdom of "unconditional surrender"—a policy that has undergone much criticism since the Russian danger has replaced the German danger as a major preoccupation of British foreign policy. What does emerge is the irrelevance of this discussion. No group of Germans, even among the so-called opposition, had the slightest intention of giving the kind of guarantees of Germany's future good faith that would have given point to an offer of compromise if Hitler were overthrown. Nothing but the prospect of imminent defeat made any German abandon even temporarily his country's claims to dominate Europe. And most Germans to the end still hoped that some sudden breakdown in allied cohesion would enable them to escape their merited fate.

RUSSIA

by

GENERAL BEDELL SMITH

AMERICAN AMBASSADOR IN MOSCOW

(1946 - 1949)

"There are no experts on the Soviet Union — there are only varying degrees of ignorance"

True, but an Ambassador has better opportunities of finding out what is going on in Russia than any private individual. General Smith, already famous as General Eisenhower's wartime Chief of Staff, gives a unique account of the present state of Russia and its 12 rulers. These are some of the questions to which he provides answers:

- Is Stalin the absolute boss?
- What may happen when he dies?
- Why did the Berlin blockade fail?
- What are Russia's intentions?
- What is the state of her armed forces?
- How efficient is her administration?

HERE IS AN ACCOUNT OF COMPELLING INTEREST TO EVERYONE

Socialism or Democracy?

"The Socialist Tragedy." By Ivor Thomas, M.P. Latimer House. 249 pages. 10s. 6d.

"Fifty Years' March: the Rise of the Labour Party." By Francis Williams. Odhams Press. 379 pages. 7s. 6d.

ONE of the most obvious facts of the postwar years has been the decline of Socialism as the obvious credo of the progressively minded man. The natural accompaniment to Labour in office has been the dethronement of Socialist thought from the unchallenged intellectual leadership it possessed before the war. But in political terms it still remains the touchstone, the most important body of beliefs to reject or adhere to, and it is this which has prompted both Mr Williams and Mr Thomas to take up their pens.

The thesis of "The Socialist Tragedy" is a simple one and is contained in its dedication "to all Social Democrats in the hope that when confronted with the choice between socialism and democracy, they will choose democracy." The book is not in any direct sense an attempt to justify Mr Thomas's recent voyage across the floor of the House of Commons, but an effort undertaken in deadly earnest to prove that socialism is but a pale shadow of Communism. To achieve this in the first part of his book, he applies three tests, the declared attitude of Socialism and Communism to ownership, to private income and to planning, and proves—to his own satisfaction at any rate—the differences are merely those of timing, nuance, or degree. With a wealth of quotation he traces the failure of social democratic movements in Europe to provide effective barriers to Communism. The second half of the book, "Socialism and the Life of Man," attempts a more fundamental analysis. But despite much erudition and a number of telling quotations—in particular those drawn from that convenient quarry, the earlier writings of Mr John Strachey—the whole leaves the impression of an expanded piece of Conservative Central Office literature. Perhaps what is wrong with Mr Thomas is wrong with most political conservatives, the ability to destroy in words the pretensions of socialism without being able to give any coherent explanation of what better, freer, happier society they have a vision.

Mr Francis Williams is becoming the official Laureate of the Labour Party. This year his bardic duties have demanded the remembrancing of the Labour Party's Jubilee which falls due next February. What he has produced is in no sense a history of the Labour Party or movement, since the story comes virtually to a close in 1931. There is little evidence of original research, and to have Charles Booth's great book *Life and Labour in London* described throughout as *Labour and Life of the People*, undermines one's confidence in the correctness of other facts. But Mr Williams has succeeded in what was presumably his object—to impart life and colour to the history of the various organisations, the Fabian Society, the ILP, the Trade Union Congress, that eventually threw up the modern Labour Party. By describing their struggles largely in terms

of personalities, Mr Williams has made this history more readable to the young entry of the Left—for whom this book is presumably intended—than more penetrating and reliable works.

Men in the Tropics

"Men in the Tropics." By Harold Evans. William Hodge and Company. 375 pages. 18s.

"I am part of all that I have met" runs a line of Tennyson's *Ulysses*. This book brings with it the hot breath of the tropics and glimpses of the richly diverse countries of the Colonial Empire, through the ideas, over the centuries, of equally diverse Britons. "This book," says the author, "... is an ambitious kind of book, and ... aims at being both a piece of entertainment and a work of reference." He has surely succeeded in that aim. Mr Evans has chosen his authorities with extraordinary skill, and his short historical sketches are admirable. To take one example; the reader sees the West Indies through the eyes of Sir Walter Raleigh, of a pirate who shipped with Morgan, of an eighteenth-century Jamaican estate owner writing from a debtors' prison, of a Governor's wife at the beginning of the nineteenth century, of a garrison officer, a planter's lady and, last of all, of a colonial servant sixty years ago. The photographs accord with the text. With so much of hot blood and romance it would have been a jarring discord to show trousers, a Homburg hat or a petrol station. In an era of conscious Philistinism, of the conception that time now stops, of the future being merely an extension of the ideas of the present, and an oblivion of the past, this book is most refreshing.

Shorter Notice

"Maintenance of Full Employment." United Nations Department of Economic Affairs. Obtainable from HMSO. 97 pages. 3s. 9d.

If there is one thing which economic history, prewar and postwar, makes clear, it is that full employment is, like peace, indivisible. (At least this is so in a free economy. Serfs are never listed as unemployed.) There is thus a most practical significance for Britain in the measures contemplated or taken by other countries to maintain employment; their adequacy, their flexibility, and the whole-heartedness with which they are applied. This booklet consists of a questionnaire submitted in 1948 by the Secretary General of the United Nations to the Governments of the member States, and the replies received. It provides more hints at possibilities, and generalisations capable, according to circumstances, of much or little real content, than specific programmes, and although useful as a handy work of reference listing agencies and legal provisions and recording commitments, it casts disappointingly little light on the likelihood of success in each of the countries concerned. It is noteworthy that every country except the United States listed balance of payments difficulties as the chief obstacle in the way of successful action to counter unemployment, and that the iron curtain countries were, in this field as in others, almost totally uncooperative.

AMERICAN SURVEY

Steelworkers and Stalinites

(From Our American Staff)

THE ovation which greeted the re-election of Mr Philip Murray as President of the Congress of Industrial Organisations also celebrated two other victories he had won while the convention met. One was economic, the first surrender in the steel strike; the second was political, the determined effort to cleanse the CIO of its Communist-controlled unions.

The first triumph came just in time to provide suitable enthusiasm at the opening of the convention. A collective bargaining agreement was signed by the Bethlehem Steel Corporation and Mr Murray's steelworkers. The stubborn nature of the six-week-old steel strike has been due, in large part, to disagreement over a principle. The union contended that the industry should regard adequate retirement pensions for its workers as one of its normal costs, and that pensions, therefore, should be non-contributory. The industry, led by the US Steel Corporation, contested the argument. The new Bethlehem agreement concedes it, and three other large steel companies, Jones and Laughlin, Republic Steel and Youngstown have now followed Bethlehem's example, leaving the US Steel Corporation—long accustomed to setting the pace—to bring up the rear. The Bethlehem contract provides pensions, financed solely by the company, at the minimum rate of \$100 a month, less Government social security payments, for workers with 25 years' service, on reaching the age of 65.

There were obvious advantages, in the form of better labour relations, for the firm which reached the first settlement, particularly if it came in time to strengthen Mr Murray's convention hand. Moreover, the exhaustion of steel supplies had reached a point beyond which Presidential intervention could hardly be long deferred, while losses from the strike made the benefits of agreement temptingly clear. Furthermore, the Bethlehem Corporation was in a position to concede, without loss of face, the principle which the union had fought to establish, and thereby furnish the industry with an escape exit. Unlike the US Steel Corporation, which changed in 1940 from a non-contributory to a contributory pension scheme (confined to those earning \$3,000 or more a year), Bethlehem has long operated a non-contributory plan for all its staff.

Under this arrangement, Bethlehem's workers have received pensions averaging about \$46 a month. In addition, they receive Government social security payments. These average about \$26 a month for the country as a whole and, since steel workers' earnings are in the top brackets, their benefits are above this average. For the company to make up the minimum pension to \$100 a month represents an increase

of some 70 per cent over Bethlehem's present pension costs, but the new burden will be considerably less than that on companies which have had no pension scheme.

For these companies—and only 13 of the 32 companies that appeared before the fact-finding board in September were operating pension schemes, of which only seven were non-contributory—the cost will be materially higher than the 10 cents an hour proposed by the board. Yet Mr Murray has indicated that the Bethlehem formula must be accepted by the companies which still have to reach agreements with the union. It is not clear how this can be done by companies already operating at a loss or on slender profit margins. One has estimated that to meet the union demand for retirement provisions alone would require a reserve, to cover liability for previous service of present employees, equal to the total present value of all its plant and equipment. The liability for past service accepted by the Ford Company, under the pensions agreement signed with the United Auto Workers at the end of September, is estimated at \$200 million; the Ford Company, however, happens to have a labour force with a high proportion of workers near the retirement age.

Just how much account the steel union will be willing to take of the relative financial positions of the companies remains to be seen; the auto workers have recognised the problem of the smaller and weaker businesses by proposing that all the firms in an area should join together to set up an insurance scheme for all union members. Under the circumstances, businessmen may be tempted

to abandon their opposition to increases in Federal social security protection, for, under the Ford and Bethlehem contracts, any increase in Government pensions lightens the load on industry.

These important matters remain to be worked out. Meanwhile, Mr Murray has won recognition of the principle of non-contributory pensions, and is in a position to look his old rival, Mr John L. Lewis, in the face. In fact, the glance might be just a trifle down the nose, for Mr Lewis's present bargaining position is probably weaker than it has ever been.

The closing of the steel mills shortly after Mr Lewis substituted the no-day week for the three-day week removed one of the principal users of coal from the market and made existing supplies last longer. In his offer to the Indiana coal operators, Mr Lewis failed to divide and conquer as Mr Murray has done. Moreover, Mr Lewis's welfare scheme, begun two years ago, depends for its funds on coal being mined; today, a coal strike means not only loss of wages, but loss of royalties and hence of benefits for aged miners. Finally, in view of the Lewis record of opposition, it would

FORESIGHT

We used to know a lecturer on current affairs who never mounted the rostrum without an up-to-date copy of KEESING'S. With KEESING'S at his elbow, he was for ever armed with evidence on all the latest developments in national and international Politics, Economics, Social Questions—ready to cap any impromptu question promptly with a conclusive fact. Lack of space and fear of creating a false impression may prevent you from taking bulky parcels to political meetings, but there is no doubt that the authentic knowledge of facts gleaned within a few minutes from your own copy of KEESING'S will prime you most effectively for any battle of words, be you on the platform or be you on the floor.

Should you by any chance still be devoid of KEESING'S it's high time you joined the service, for equipped with KEESING'S you need neither resort to catcalls nor live in fear of hecklers, because nothing in the field of current affairs will ever be "beyond your ken."

Mrs. Beeton . . . and all that

The pleasures of the table are, perhaps, rated lower in Britain than in France; nevertheless the literature of food and wine contains some notable works in English.

The cookery book section at our West End branch will appeal both to collectors of these books and to those in search of Christmas presents for their friends—or for themselves.

The Economists' Bookshop,

35A BURY STREET, ST. JAMES'S LONDON, S.W.1.

have been understandable if President Truman had over-come, in the coal strike, his general reluctance to use the Taft-Hartley Act. All this explains why Mr Lewis decided to beat Mr Truman to the draw. Reversing his traditional "no contract, no work" policy, Mr Lewis has suspended the coal strike until the end of the month, as his contribution towards reaching an agreement.

★

This disguised capitulation, contrasted with the successful steel strike, will enhance Mr Murray's prestige at a time when the members of the eleven left-wing unions, expelled, or threatened with expulsion, from the CIO, must choose between following their present leaders into the wilderness or joining new right-wing unions authorised by the federation. Official figures, which are probably high, give a total of about a million members to the eleven unions accused of following the Communist party line. The convention took two steps to rid the CIO of them: it barred Communists from the executive board, which is responsible for policy, and expelled the Farm Equipment Workers and the United Electrical Workers. The latter accounts for approximately half the members of the left-wing and until last week was the third largest CIO union. The executive board was then given the power to expel the remaining nine rebels, if the charges made against them are sustained. A new charter for another electrical union was the first bid for the allegiance of the rank and file, bids which, in the long run, at least half a million workers are expected to accept. Mr James Carey, who lost the presidency of the Electrical Workers some years ago on the Communist issue, is virtually certain to head its new rival.

The CIO is now united in its allegiance, and general admiration is being expressed for Mr Murray's courage and capacity to grasp first the issue and then the nettle. But the house-cleaning is bound to result in some economic disruption, even if the dissidents do not form a third labour federation—as they may. Efforts to wrest bargaining rights from the rejected organisation will be accompanied by membership drives. The courts can count on a busy season: where factional allegiances are fairly evenly divided, what happens to the property of union locals? What happens if a collective bargaining contract carries the signature of officers of both the local and the national union, and the local elects to remain within the CIO?

Considerations such as these may have determined the postponement of the expulsion of unions such as the fur workers and the longshoremen, in which there is no ready-made loyal opposition to Communist control, as there was in the electrical union. (Mr Bridges, head of the longshoremen, is in double jeopardy; not only have CIO charges been preferred against him and his union, but the United States is once more bringing suit to expel him.) In the coming struggle for bargaining rights between the two factions, employers are likely to be caught in the middle; some may decide to wait until a National Labour Relations Board election determines which is the legal bargaining agent.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

Super-Market

[FROM OUR AMERICAN STAFF]

THE constant enmity between chain stores and independent shopkeepers has again taken legal form in the attempt of the Government to dissolve into its component parts the largest of the grocery chains, the Great Atlantic and Pacific Tea Company, known to every American housewife as the A and P. It had already been convicted under the Sherman Anti-Trust Act of practices that unlawfully stifled competition, and this new process is a civil suit to implement the criminal conviction. It is an attempt to force the company to separate its manufacturing and processing from its selling business, to divide its 6,000 retail stores into seven separately owned food chains and to dissolve its brokerage subsidiary which handles perishable goods. Thus the Government's action appears to be directed not against chain stores as such, but against the big chains which integrate their component businesses both horizontally and vertically in order to restrain and monopolise trade at all levels of the food industry. Little of this technical complaint reaches the housewife who does her daily marketing at the A and P. Even if it did, she would probably agree with the Judge who, deciding against the company in 1946, nevertheless said: "To buy, sell and distribute to a substantial portion of 130 million people \$1.75 billion worth of food annually at a profit of 1½ cents on the dollar is an achievement one may well be proud of."

The highest form of development of the chain store is the self-service shop, which is now being copied by independent grocers. Known as the super-market, it houses under one roof staple groceries, perishable fruits and vegetables, meat, fish and bakery products. Its success is based on what a visiting Briton once called "the lamentable insistence of the American woman on helping herself," and it has brought about a revolution in the shopping habits of the housewife, the selling methods of other shops, and the packaging methods of the manufacturer and wholesaler.

★

The essence of super-market technique is that the housewife no longer waits for the assistant to bend a lordly eye on her, but sells to herself. She goes straight to the shelves (the shelves of each chain are stacked according to a prescribed pattern), takes off what she wants, and puts her parcels into a rolling two-storey wire basket. Obviously she could not do this if tea had to be measured, sugar weighed, butter or cheese cut to her order. Measuring, weighing and cutting are done ahead of time, and the product packaged and placed on the shelves. The grinding of coffee, for the fussy few who do not want to buy it tinned, is virtually the only individual grocer's service which remains to be done on the spot. When the purchase is complete, the housewife wheels her basket (commonly called a "baby buggy") to the checking-out desk, where the two or three assistants that run these huge establishments stand beside intricate cash registers, ready to ring up the cost of each item, accept the indicated sum, and stuff the packages into a box or paper sack. The saving to the merchant in labour costs is obvious. This American method of food distribution also saves the time and energy of the housewife, who is not compelled to queue up unless she goes in crowded hours when the checking-out counters are taxed beyond the speed of the cashiers on duty.

The technique of marketing in one of these giant shops varies with the neighbourhood and the customer. In

suburban districts the super-markets are built with adjoining parking lots, where housewives may leave their cars while doing their shopping once or twice a week only. In the heart of the metropolis, where land is too expensive for such luxury, the housewife shops daily, and carries food home on her arm. The city customer often strolls aimlessly round the counters, picking what strikes her fancy, putting back a tentative purchase on the wrong shelf, fingering the melons and pinching the peaches. For her the super-market is a social centre and, with her baby riding in the top basket of the rolling pair, she avoids going home as long as she can. If the market provides music along with recorded incitements to purchase this bargain or that, so much the better. The problem for the chain store is to balance the economic value of the sociable customer as purchaser against her disvalue as a blocker of aisles and occupier of space which might be used more profitably. Experiments are under way for replacing rolling baskets with some system of conveyor belts.

The prepurchase packaging of staple food products in small units is now almost universal, but along with its advantages go abuses. Weevils seldom appear in packaged oatmeal, prunes need no longer be inspected for worms; on the other hand, the housewife who knows what a package costs seldom stops to find out what it weighs. The unscrupulous packer may reduce weight, or even size, by a considerable amount before she is moved to complain or to buy another brand. The prepurchase packing of fresh vegetables, fruits and meat is a newer development, and thus far not so successful. Potatoes come packed by weight in paper sacks, and are ostensibly graded to size, but of this the housewife is never sure until she gets home. Oranges are sold by weight in string bags, and certain types of spinach

are washed at the farm and marketed in transparent bags; the housewife complains of spoilage not discovered until she unpacks her purchases. She reaches for the packaged perishables because they are convenient, and in 1949 convenience is the added intangible that sells more goods, but, according to kerbside gossip, she is not yet convinced that they give her good value. The same objection is made to the growing practice of packaging fresh meats. Certain super-markets cut standardised portions in the morning, wrap them in cellophane with weight and price noted, and display them on cooled shelves where the housewife may pick them up without waiting for the butcher to cut to her order. The practice, while not yet entirely satisfactory, is in the spirit of the times and there is every reason to expect its popularity to grow.

Each of these super-markets must sell its thousands of dollars' worth of goods a day in order to justify the cost of the organisation behind it. They are suppliers to the multitude, and can only afford to handle items for which there is wide popular demand in the neighbourhood they serve. The chains which control them cannot be too small or they will lose money, too large or they will become top-heavy. If, as does the A and P, they not only sell food but also manufacture, bake, butcher, process and pack, they become microcosms of the entire food industry and bring down the Government's wrath. How well they tread these intricate paths is shown by the fact that together the chains handle 39 per cent of all the food sold at retail in the United States. Yet they sold that same proportion in 1941. It is still a question whether they have reached the limit of the trade they can take from the independent shopkeeper who, serving a special clientele, develops services and economies of his own which enable him to compete with the giants.

American Notes

Fair Deal Triumphant

Mr O'Dwyer's retention of his mayoral chair in New York City was only one of a series of Democratic victories in the municipal elections held all over the country this week. Like some of the others, it nailed down the coffin of an old-time city machine—in this case Tammany Hall—and brought the Democratic Party nearer to laying these ghosts of its past. But the party's future was involved in the New York Senatorial contest and Mr Lehman's satisfactory majority over his equally respected Republican opponent, Mr John Foster Dulles, is hailed as a national triumph for the Fair Deal and for Mr Truman. This victory in the most populous state in the country, which last November rejected Mr Truman, will certainly generate new enthusiasm for his Fair Deal amongst members of Congress who must stand for election next year. Senator Lehman himself will be one of them.

He was not an altogether satisfactory standard bearer for the Fair Deal; his support of federal health insurance is as half-hearted as his enthusiasm for the Administration's farm programme. The latter's vote-getting ability was in any case hardly tested in this election, since the Republican allegiance of the New York farmer is apparently unshakable. But the appeal of the Fair Deal to labour voters was demonstrated by the Democratic successes in up-state industrial centres as well as in New York City itself, where the 400,000 votes of the local Liberal Party gave Mr Lehman his state-wide majority. The vote was heavy and for this labour organisations can, and certainly will, take credit.

★

Neither of the two distinguished candidates fought as strong or as clean a campaign, nor did they put the issues as clearly, as might have been expected of them. But Mr Dulles based his case unswervingly on the extravagance of the Fair Deal and on its threat to individual liberty. There was no trace in his campaign of "me-tooism," the promise to do the same as the Democrats only better, which Mr Dewey offered so unsuccessfully to the voters last year. Mr Dulles's close links with Mr Dewey suggest that the latter's advisers were using Mr Dulles as a guinea-pig, to see if the uninhibited criticism advocated by die-hard Republicans might pay better political dividends. The only members of his unhappy party who will profit from Mr Dulles's failure are the "Young Turks," who maintain that to survive the party must offer a positive alternative to the Fair Deal.

Mr Dulles's defeat may also give some cheer to Mr Kemper, the treasurer of the Republican National Committee, who has just resigned on the excuse of the party's approach to bankruptcy. He accompanied his resignation with a blast against the bi-partisan foreign policy, a policy which Mr Dulles claimed would be jeopardised if he were not returned to the Senate. But foreign policy as a whole was not an issue in the New York campaign; it hardly could be, when both candidates had such well-known records of international co-operation.

Business After the Strikes

Both the steel and coal industries, spurred to new activity by the need to make up for lost time, will probably benefit from the holiday imposed on them by their workers, and not even the national economy as a whole seems likely to suffer more than a temporary setback. While the Federal Reserve Board estimates that industrial output fell during October to a lower point than at any time since 1946, this was

due almost entirely to the steel and coal stoppages themselves. The strikes had certainly not by November 1st increased unemployment by the 2,000,000 which the Secretary of Commerce had forecast. During the past month the general public showed, by its lack of interest in the strikes, that it agreed with the President that they did not yet constitute a national emergency. But this would not have been true much longer: this week lay-offs and short-time working were becoming widespread, especially in the automobile industry, owing to shortages of steel.

It is, however, not absolutely certain that business will resume its upward climb once it has recovered from its hang-over. The strikes have naturally had serious reper-

cussions on retail traders (except pawnbrokers) in the steel and coal centres, but elsewhere, even before the strikes, buyers were not showing their usual autumn exuberance. The unseasonably warm weather was becoming a threadbare excuse. If buyers continue to dig in their toes, the Christmas balloon will not rise very far from the ground this year and 1950 will open under a cloud.

On the other hand, in January ex-servicemen who carried life insurance during the war will begin to receive refunds amounting to \$3 billion. Part of this will have been spent in advance, but it should nevertheless do something to counteract the taxpayers' blues that always afflict retail trade during the first part of the year. Furthermore, by January the automobile assembly lines should once more be flowing steadily; a study conducted for the Federal Reserve Board in July showed that demand for new automobiles during the first half of 1950 was likely to continue at the record rate of 1949. This hardly bears out the widely held view that the automobile industry cannot much longer postpone its inevitable postwar readjustment. Its success in postponing it so far was proved by its profits during the third quarter of this year; they were 60 per cent higher than in the comparable period of last year, while the average for other leading corporations was 18 per cent lower. The General Motors Corporation is about to distribute \$190 million, the largest sum ever paid out at one time in cash dividends by an American company.

★ ★ ★

Negro Education

The backwardness of southern education is due not only to the low income of the region but to the duplication of schools required if white and Negro children are to be segregated. Yet nothing is more urgent than better education if the south is to make the most of its human resources and conquer its poverty. The greatest lack of all is in professional and graduate schools, particularly for Negroes. Consequently there is much to be said for the plan of the southern states to pool their funds in regional colleges, even though the immediate stimulus was a Supreme Court

decision requiring them either to admit Negroes into their tax-supported professional schools, or supply them with equal facilities.

The regional scheme, due to begin this autumn, provided for a grant to Meharry Medical College for Negroes, and a number of other Negro and white institutions. Each participating state is given a quota of students to fill, for whom it must pay \$1,500 a year in the case of medical and dental students, and \$1,000 for veterinary students. Apparently white as well as Negro students have been selected, but they will be segregated according to race.

The National Association for the Advancement of Coloured People hotly opposes the plan on the grounds that it perpetuates the pattern of segregation, and that it flouts the requirement of the Supreme Court that each state provide equal facilities *within its own borders* for Negro students. A test case has now been brought in Maryland by a Negro girl who was barred from the Maryland University School of Nursing, but given, instead, the opportunity of attending Meharry Medical College in Tennessee.

If the regional college scheme is declared unconstitutional, the states will then be confronted with the alternatives of admitting Negroes to their white colleges, or of extending the dual system into the costly upper reaches of education. The NAACP plainly believes that such a choice would bring tumbling down the barriers against Negroes, already breached in Oklahoma. Attempts to make pitiful Negro schools the equal of those for white children are not only astronomically expensive but have the ironic result that in some cases the Negro schools, being more modern, are not only equal, but superior, to those for whites.

But to establish duplicate graduate schools would not only be even more costly, it would involve denuding many of the existing 36 private Negro colleges of their staffs. They are already losing more teachers than they can replace as the States adopt equal pay for white and Negro instructors. The problem for the Negro is whether it is better to wait for a grudgingly conceded millenium, or to accept a segregated plan which at least would make an immediate, if modest, inroad on the tragic lack of Negro doctors, nurses, and dentists.

★ ★ ★

Cold War in Trade

The extension of export controls to another 100 strategic materials is a reminder that the cold war in trade still goes on. The stricter application of "destination" controls will also guarantee that goods which might strengthen the war-making power of Russia do not find their way behind the iron curtain via Latin America or the Far East. Nor are the steps all negative. Only the day before export controls were strengthened, the Government had permitted the first exports of aircraft petrol and lubricants to Yugoslavia, and it is intimated that reasonable requests for civil aircraft and parts will not be refused.

Aircraft have been considered war material since April, 1948, and as such have come under the ban imposed on shipments to nations in the Russian orbit. The decision to exempt Marshal Tito is the latest of the efforts now being made to improve Yugoslav communications, inside the country, on air routes to Rome and Paris, and on railways with Greece. Better transport facilities should not only give Yugoslavia new trade opportunities, but might become invaluable in case war ever became an actuality. The new concession follows permission to export a steel mill, granted in August, that to export oil refining machinery in April, and an Export-Import Bank loan of \$20 million.

Meanwhile, strategic considerations have reduced Russian-American trade to a mere trickle. The value of exports to Russia fell to \$100,000 in August, from \$400,000 in July; the monthly average in the first half of 1949 was \$1,000,000,

while in the comparable period for 1948 it was \$2,300,000 a month. The most vital American import from Russia has been manganese, used for hardening steel; and the sharp decline in Russian manganese exports in the first half of this year suggests that the Russians hoped to use manganese as a lever to pry open the American market and resume their purchases of machinery. While Russia supplied 27 per cent of American imports of manganese in the first half of 1948, it provided only 7.7 per cent in the first half of this year.

When coercion failed, the Russians, perhaps fearful of losing their manganese market permanently, tried priming the pump; shipments shot up in July and August, but this brought no relaxation of the ban, and the Russians have had to be content with turning their fur exports into peaceful purchases of cotton, tobacco, and rosin. The ineffectiveness of the Russian reprisals is due to the expansion of supplies of manganese from India, South Africa, and the Gold Coast, which nearly met American needs in the first half of this year and are expected to do better in the last six months.

Feather in the Community Cap

In October and November, burtonholes, lamp-posts, bulletin boards and hoardings all across America flaunt the red feather, the symbol of the united charitable appeals that are conducted in over 1,200 cities and towns at this time of year. The red feather has even followed the Stars and Stripes into Germany and Japan. The Community Chests are collecting the funds which will next year support over 14,000 different health, welfare and recreation services. The goal is \$185 million, nearly half of which will be spent on children and young people. That is more than twice the amount raised ten years ago and the number of local Chests has more than doubled also. A million voluntary workers are canvassing 20 million of their fellow citizens.

The Community Chest has many advantages. The contributor pays a lump sum once a year, instead of having to deal with door-to-door collections, flag sellers and all the rest of the charitable paraphernalia. Collection expenses are reduced to a minimum. Independent and expert examination of the budgets of the various participating organisations ensures that their activities do not overlap, and that they are neither dishonest, extravagant nor useless. Each charity gets its fair share; no longer do epileptics go uncared for all the year round while curly-headed orphans have a weekly treat. But the standards of Community Welfare Councils are sometimes both rigid and unimaginative. Nor are all local charities in fact included; apart from the "lunatic" fringe, organisations devoted to special interests are not admitted to membership and the Red Cross has in the past always maintained its separate identity. Some people respond more generously to spontaneous individual appeals than to high-pressured centralised campaigns, especially when the latter are conducted with a para-military precision and a determination recalling the Sherwood Foresters and Indian scalp-hunters who used to wear the red feather.

Contributions from those of independent means are usually assessed on their apparent standard of living, while wage-earners are asked to give a day's pay. This is often deducted automatically from wage packets, a practice which is far from popular with workpeople. Community Chests expect to fill their bottom drawers with contributions from local business firms. High taxation and the growing coverage of government social security schemes have, however, made many people feel that they neither can afford, nor need, to give so much to charity as in the past. Last year the red feather campaigns failed by 10 per cent to reach their national goal. But American generosity is no more easily discouraged than is American efficiency and both are to be found in large quantities under the lids of the Community Chests.

THE WORLD OVERSEAS

The United States of Indonesia

(By Our Correspondent at The Hague)

THE Round Table Conference ended on November 2nd and Indonesia is free. Somewhere between now and the end of the year, probably in December, Holland will solemnly transfer its sovereignty over the former Netherlands East-Indies to the "Republik Indonesia Serikat," or Republic of the United States of Indonesia; it will do so "unconditionally and irrevocably." Most of the Indonesian delegates to the conference have returned home, taking with them a draft charter for the transfer of sovereignty, a draft constitution for Indonesia and a draft statute for the Dutch-Indonesian Union. What is it they are really taking with them, what do they leave behind, and what do they face on their return to Indonesia?

Of the three documents, two were drafted by the Dutch and the Indonesians; the third, the future Indonesian constitution, was made by the Indonesians themselves—that is, by the Republicans and the "Federalists." It was clear from the outset that the main question, the transfer of sovereignty, was already agreed; this being so, the Federalists, as the more moderate elements in the future Indonesian Republic (and containing many good friends of Holland), came gradually over to the side of the radical Republicans, so that no less than complete independence was asked for—and granted. The outcome was inevitable after everything that had happened: the upheaval of the war, a national revolution, two military actions which failed, and a menacing situation in the East in which the West can only hope for some success in "containing" the Soviets if full independence is granted to the young nations of Asia.

As far as the transfer of sovereignty is concerned, one main question has been left by the conference for further settlement: the status of the western half of New Guinea. This more primitive territory has never participated in any national movement and is, in fact, not yet capable of any self-government. The Dutch hesitate to transfer it, as another "colony," to the inexperienced administration of Indonesia; on the other hand Indonesia, for reasons of prestige, can hardly leave it in mid-air between Holland and Indonesia.

Elections Within a Year

According to its draft constitution, the future Indonesian Republic shall consist of "negaras" of which the previous republic will be the most important. In the popular assembly, 75 of the 150 members will be Republicans, and no doubt the Republic's President Soekarno will be President of the new Republic too. The federal negaras will be able to check part of the Republic's power in the senate, in which each negara will have two members, and in the newly created institution of three people from all over Indonesia who will, together, recommend a prime minister and a list of cabinet ministers to the President. But the old Republic's national hymn, its red-white flag and its language, the *bahasa Indonesia* will be taken over by the new Republic and this indicates to what extent the new federal state will, as is usual after national revolutions, be guided by the more radical wing. The refusal of the negara of East Sumatra, at the last moment, to initial the draft constitution on account of territorial questions might be a sign of future conflicts between the partners in the Federation. General elections

will be held throughout Indonesia within a year. Then a constituent assembly, consisting of a popular assembly and a senate, both with double numbers, will draw up a constitution to replace the present provisional arrangements.

The former Netherlands Indies contained a number of semi-autonomous states, bound by special treaties with the Dutch Government. They were much the same as the native states in India and, although the draft constitution of Indonesia stipulates that their treaties with the Dutch will simply be replaced by treaties with the new Government, it is probable that they, like their counterparts in India, will tend to associate themselves closer with the new Republic.

Ties with Holland

The Dutch-Indonesian Union is set up without the superstructure which many Dutchmen had still hoped for. There will be no Union ministries, no executive power of Union

institutions, only a combined arbitration court with three Dutch and three Indonesian members to settle constitutional difficulties, and a joint conference of at least three cabinet ministers from both sides meeting two or three times a year as a consultative institution. No aspect of co-operation is excluded; on the contrary, the Indonesians have expressly said that they hoped for a larger amount of Union co-operation, and many of them have privately intimated that they would be glad to see Dutchmen, but preferably new Dutchmen without "colonial" experience coming to Indonesia as technicians and advisers, rather than other nationals. All attempts, however, to provide for a return of Dutch political influence have been successfully warded off by the Indonesians.

The touchstone of future co-operation is perhaps in military affairs. Here, too, withdrawal of all Dutch forces has been agreed. In the same breath, however, the Dutch promise their help in the organisation of the federal Indonesian army and navy; the last hardly exists and depends upon the transfer of a few small vessels which the Dutch have promised. The Indonesian troops under Dutch command, the former "Royal Netherlands-Indies Army," can transfer, if they wish to do so, either to the Indonesian or the Dutch forces. (Dutch naval help to Indonesia, which will cost the Dutch taxpayer a considerable sum, has aroused much criticism in Holland.)

Soerabaya will remain a naval base operated by the Dutch under a Dutch commander who will be nominated by the

Dutch and appointed by Indonesia. The fact that the commander is under the orders of the Indonesian Government makes the situation less favourable to the Dutch than, for example, the Simonstown agreement in South Africa was to Britain, although the port might be valuable for Allied operations in the event of an armed conflict in the Pacific.

A sore point at the conference was the division of the debt. The Dutch asked the Indonesians to assume responsibility for 5.800 million guilders, and the Indonesians began by offering to take over no more than 3.400 million guilders. The main difference was that, understandably, the Indonesians did not want to pay for the Dutch military actions. As usual a compromise solution was reached and 4.300 million guilders of the debts will be charged to Indonesia.

One of the most important points is the status of Dutch enterprises and estates in Indonesia. The Dutch owners are afraid of nationalisation; the financial and economic agreement of the conference does nothing to abate this fear, but stipulates that there must be a legal procedure and "previously received or guaranteed indemnification." Somewhat more reassuring is the provision that concessions and licences for new and existing enterprises and estates can be renewed or granted "for such a period and at such a time that these enterprises remain or are operable on a sound business basis and that the rightful owners are guaranteed continuation." But there is the slightly menacing proviso "except in those cases which are against the public interest inclusive of the general economic policy of the Republik Indonesia Serikat." The Dutch must place their hopes on another article which restricts the burdens on business to "reasonable limits . . . permitting normal replacements, depreciation and reserves and permitting a reasonable profit for the capital invested in said enterprises."

End of an Empire

Public opinion in Holland is fairly calm about the new situation, if one takes into account that this means the end of a historical tie of several centuries. The extreme right-wing protests vigorously, and the general public does not quite see why the Government should spend so much money on help (military and economic, not to mention the expense of the whole Round Table Conference) for Indonesians "if the fellows want to be completely rid of us." Some dissatisfaction has been caused by the former Dutch civil servants in Indonesia getting a guarantee of only two years, but it is possible that the Dutch Government from their side will greatly extend the period of security. Most people think the Cabinet is right in deciding that the agreement, though perhaps unpleasant, was necessary anyhow; some think it could have been reached—and would have been better—three years earlier; and it is generally thought that opposition rumours in two of the smaller government coalition parties will not effect any change in the present policy.

In Indonesia, however, the situation is quite different. Even if a civil war is not a necessary sequel of every national

revolution, as some prophets of doom suggest, it is a fact that neither the present Republican Government nor the future Government of Indonesia have complete and effective authority over all the territories and their 60 million inhabitants. The Indonesian delegates are fortunate in having "unconditional and irrevocable sovereignty" to bring back home, for with less they would have returned in the same position as the Irish delegates of 1922: to face murder by their own fellow countrymen. And, indeed, even with their present success on paper, murder, or at least grave civil unrest, is not improbable.

Nobody knows how strong the Communists in Indonesia really are. On the other hand it is known that the Republican troops are disorganised and badly disciplined, and Dutch military help, even if it is wholeheartedly given, will have to be tactfully offered and cleverly accepted if its contribution to the restoration of law and order is to be effective and lasting. The ordeal is not yet over. Not only has Holland lost a part of its economic "guilders area" which before the war brought in between 10 and 16 per cent of the Dutch national income—an amount which cannot be compensated by any future co-operation, however valuable it may be—but Indonesia also, with no more than at the very best a token amount of Marshall aid, will have to put its house into order, restore its economic system and maintain its independent position—perhaps against more powerful influences than Holland's former colonialism.

Brazil's Boom in Coffee

[FROM OUR RIO DE JANEIRO CORRESPONDENT]

BRAZILIAN coffee prices are soaring to new records. At 1.320 cruzeiros (over £25) a bag, street sales in Santos of "paper" coffee (for delivery in 1951) prompted a wag to declare that coffee would soon be quoted by the bean instead of by the bag. Indeed, it is now said here that coffee may reach 2,000 cruzeiros a bag. Santos spot prices are nine times higher than their lowest in 1940 and almost twice their previous highest in 1947.

Brazilians are watching with understandable interest this boom in their major export. Even before it began, coffee had risen to half of all Brazilian exports, and 70 per cent of all the coffee shipped goes to the United States, earning dollars for the Bank of Brazil against cruzeiros which have not been devalued. This is important for a country whose trading relations with the United States are overshadowed by an accumulation of commercial debts believed to stand now at \$150 million. Real significance attaches to the estimate that coffee shipped from October to next June (when the crop year ends) may have earned over \$500 million.

The immediate prospect appears rosy enough, if only for a reason on which the industrious statisticians of the inter-

national coffee trade seem to agree. World consumption, which before the war ran at about 20 per cent below world production, is now rated at 7½ per cent above it. In the Inter-American Coffee Bureau's estimate for 1949, showing consumption at 32½ million bags and production at 30½ million bags (to which Brazil was expected to contribute 16½ million bags), the scales have tipped beyond the "statistical equilibrium" for which Brazilians have long yearned. American consumption and Brazilian production are the important counter-weights; while American consumption has grown by at least a half in 10 years, Brazil's postwar production is down, and its stocks of excess coffee exhausted. Brazil, which before the war supplied 70 per cent of the world's exportable coffee, now provides 48 per cent. The following table shows the opposing trends.

WORLD PRODUCTION AND CONSUMPTION OF COFFEE BEANS
('000 Bags of 60 Kilogrammes)

Crop Year*	Production		Consumption		
	Brazil	World	USA	Britain and Europe	World
1936/7.....	26,359	37,248	12,349	11,206	24,886
1937/8.....	23,579	33,590	12,565	11,948	25,472
1938/9.....	23,300	33,425	13,817	10,819	26,727
1945/6.....	15,266	27,744	20,373	4,350	26,500
1946/7.....	13,965	27,000	19,285	5,500	27,000
1947/8.....	13,353	27,653	20,234	7,000	29,760

* The crop year runs from July 1 to June 30.

Brazil's excess coffee stocks were the accumulation of "sacrifice quotas" exacted by the Government from growers during and since the war and—after 78 million bags had been destroyed between 1931 and 1944—stored by the

National Coffee Department. These stocks, vast if conjectural, haunted the coffee trade long after the formation, in 1940, of the Inter-American Coffee Bureau, which, by agreement among 15 Latin-American countries producing over 80 per cent of the world's coffee exports, was to apportion American orders. In stifling cut-throat competition and regulating supplies this international scheme showed fair success where "valorisation" loans, floated internationally since 1906, had failed. Conjecture on the size of Brazil's excess stocks is now academic, for it is generally agreed that they have been liquidated. How they found their way into the trade stream may be guessed from the second table. This, however, serves mainly to show the direction of Brazil's coffee exports, and the relative importance of its American and European customers.

BRAZILIAN COFFEE EXPORTS
('000 Bags of 60 Kilogrammes)

The United States overtook Europe in 1914 as Brazil's best coffee customer, but Brazilians are hopeful that progressively greater purchases (especially by France and Germany) will accompany European recovery—a prospect for the moment dimmed by devaluation if nothing else. Anticipating devaluation, Europe bought heavily in August, and

A FREELY MARKETABLE INVESTMENT IN A TRUST
SPREAD OVER THE SHARES OF THE LEADING
30 BRITISH INSURANCE COMPANIES

INSURANCE-UNITS

AT THE PRESENT TIME, these Trust Units are particularly suitable for those who seek a stable income combined with good prospects of capital appreciation.

"Ploughing Back"

The insurance companies, whose shares constitute Insurance-Units, have a common policy of maintaining a wide margin between what they earn and what they pay out in dividends. This "ploughing back" should indicate further dividend increases when existing dividend limitation comes to an end.

Advantages of £ Devaluation

These companies receive a large part of their premium income in \$. They also have very big \$ investments. Devaluation of the £ means therefore greater £ income from \$ sources and a considerable increase in the £ value of their \$ investments.

Easy Purchase of Units

Though "Insurance-Units" gives a spread over the shares of the 30 leading British insurance companies, the investor can purchase Units for as small a sum as £10.

Ask any Stockbroker or Bank for full details.

Offer Price 8th Nov. 21/11. Commencing yield (conservatively calculated on net cost, including commission and 2% Stamp Duty) 4½/12/6.

TRUSTEES: WILLIAM DEACON'S BANK LTD.
MANAGERS: BANK INSURANCE TRUST CORP. LTD.
30, CORNHILL, LONDON, E.C.3

is not expected here to return to the Brazilian market for several months. Even Britain, whose heavy 1948 purchases were mainly for entrepôt trading (now suspended), has this year broken all records for purchases from Brazil on domestic account, because, it is thought here, of the diversion of British colonial coffees to dollar buyers.

Brazilian interest in all these developments is, however, tinged with anxiety, and on more than one score. Recently in Santos your Correspondent found that the prospect of "consumer resistance" from the American housewife was causing some heart-searching; and the effect of devaluation on slim European purses is not overlooked. Competition from rival producers (Columbia runs to 6,000,000 bag harvests) provoked less conjecture—perhaps a tribute to the Inter-American quota system. In Brazil itself, where coffee drinking is a national institution, the ubiquitous *cafézinho* costs four times more than in 1939, and "consumer resistance" has meant no more than an occasional storm in a coffee cup over attempts to push café prices farther and faster, for wholesale and retail business here is a ruthless servant of inflation.

Brazil's declining production is the dominant worry. The last crop (most, if not all, of which should be cleared through the coffee ports by next June) has been tentatively estimated at about 15 million bags, against probably 16 million last year. But, given the persistence of demand, exports for the crop-year ending in June may reach 19 million bags (including the remnant of excess stocks). Shipments during the July-September quarter, in fact, reached 6,000,000 bags—almost a third more than last year—and there is widespread doubt whether the coffee ports' usual carry-over of 3,000,000 bags will remain next June.

There is anxiety, too, about next year's harvest, and it seems timely to recall the predictions made by a careful American expert in 1946. He thought then that the *fazendas* had moved into the last available coffee belt which could be economically exploited. Production, he calculated, might remain steady for five years, but, unless there was a radical improvement in methods of cultivation, or unless railways pushed westwards to open up new land, by 1961 production would have declined to perhaps a third of its all-time peak of 29.6 million bags in 1933.

Production is already down to half that figure, or less, and President Dutra's appearance at a meeting of coffee interests underlines the importance attached by the Government to the suggested encouragement of more scientific methods of planting. A Bill is before Congress to finance planters for a three-year period of expanding production, and the problem is demonstrably a national one. Tired trees and exhausted soils in Sao Paulo (which supplies at least half of Brazil's coffee exports) have lowered that state's mean annual yield to about 1.1 lb. of coffee a tree—only half of that in northern Paraná's newer plantations, which may soon achieve a 3,000,000 bag harvest. Fresh trees may be counted on to

yield a large and a small crop in alternate years, but these days have gone for Sao Paulo's older estates, and new plantations take five years to bear.

Other problems lie ahead. Though estates are generally smaller than formerly, labour costs about nine times more than in the early thirties and is much scarcer. By and large, the *fazendeiro* system is still feudal, opposed to small land-holdings and dependent on the cheapest labour from the bottom of the social scale. The trek of rural workers to the towns strikes at its roots, and DP immigrants are no solution, for it has been proved that they, too, tend to desert from the *fazendas*. In the southern United States the Civil War struck a telling blow at feudalistic husbandry, but Brazil has had no Civil War. Agrarian reform lies near the heart of the growers' problems—and, indeed, much else in the Brazilian economy. But that economy is as resistant as the coffee tree itself, and world demand may arouse a livelier response from Brazil than statistics suggest.

French Fears in Indochina

[FROM OUR PARIS CORRESPONDENT]

It will be three years this December since the resumption of hostilities between the French forces and the Indochinese resistance movement, the Vietminh. In the summer of 1946, after the Fontainebleau Conference between the French Government and the Communist leader Ho-Chi-Minh, then recognised as the spokesman of Indochinese nationalism, a *modus vivendi* was signed by the two parties amounting to a truce or an agreement to differ. The Fontainebleau agreement came to nothing, however, and since December of that year Indochina has been ravaged by large-scale guerrilla warfare. France is compelled now to support an army of some 125,000 men in Indochina at a cost to the budget of about 90 billion francs, and a once lucrative colony has become a serious financial liability.

Apart from the followers of General de Gaulle who still think of direct military reconquest by *la France seule*, and Socialist back-benchers who still hanker after a settlement with Ho-Chi-Minh (once probably possible but now certainly out of the question) there is broad agreement among responsible Frenchmen that Indochina, that is Vietnam, Cambodia and Laos, must be kept within the Union Française and that within this juridical frame Vietnam should become a viable independent state. Economically, it is true that the removal of war-devastated Indochina from France's orbit would make little difference to the present day French consumer, whose rice tends to come from Italy or the Camargue and whose rubber may also be made synthetically in Europe. But Indochina also contains large capital installations representing individual metropolitan interests and provides a livelihood for some 90,000 French settlers who have no intention whatever of leaving it of their

own accord. Even more important, as a potential source of modern industrial wealth, Indochina, which is rich in minerals, would undoubtedly be a most serious loss to an ideal French economy of the future.

To maintain French power and influence throughout this large and unwieldy territory, the French Coalition Government has adopted a two-fold policy: it has waged the war against the Vietminh with determination and it has given its full support to the ex-Emperor of Annam, Bao-Dai, who was reinstated (although not as emperor) as head of the new *état associé* of Vietnam—comprising Tonking, Annam and Cochinchina—in the spring of this year. This constitutional change has since been juridically perfected and letters of goodwill have been exchanged between Bao-Dai and the President of the French Republic.

French military strategy has been to hold the big towns and the main roads and, in view of the accelerating approach of the Chinese Communist armies towards the northern border of Tonking, to clear a belt of territory south of this frontier. The campaign under General Alessandri in this sector has been successful. Nevertheless, no conclusive victory over a mobile guerrilla force of some 90,000 fanatics operating in the jungle is feasible with the French and Vietnamese forces available. French morale is good and certainly in the military sphere everything which a relatively impoverished metropolitan power can do, is being done.

The Bao-Dai policy cannot yet be said to have failed nor even properly to have begun. The transplanted ex-Emperor is attempting, with the support of the able, sincere but rather unpopular French, to assume the direction of a new "paper-state" lacking any kind of administrative coherence or tradition. At the same time he is forced, again in company with the ex-colonial power from which he is supposedly proclaiming Vietnamese independence, to conduct an interminable war against a national leader with far greater prestige and capacity than he himself possesses and to whom a large number of his own 27 million "subjects" are bound by conviction or convenience. Even the Catholics have hesitated to break with the legendary Ho-Chi-Minh.

It is also pointed out by some that Bao-Dai's nationalism is effective chiefly to the extent that it is xenophobic, that is, anti-French and that it smacks of the Kuomintang, lacking the essential "progressive ideology" to which the Vietminh and all Eastern "freedom-movements" owe their success. The French colonial authorities, never having previously tolerated an opposition to their direct administration and having thereby for decades thrown Indochinese nationalists into the arms of the Kremlin, have created for their successors an almost insuperable problem. Ho-Chi-Minh himself, originally a disciple of the French Socialists, joined the Third International in 1921 and since then he has lived chiefly in Moscow, and China. Thus it was only at the age of over 60 that he, a French subject, first came to have any real political dealings with the French authorities.

The Indochinese, however, look upon their northern neighbours with about as much affection as the French regard the Prussians, and this may prevent, at least for a time, a union between Vietminh and the Chinese Communists. But it is evident that if the Chinese Communists continue their thrust into rich South East Asia before trying to consolidate China itself, the Indochinese would be transposed immediately on to the plane of world-strategy. In the meantime direct intervention by the United States in South East Asia is, in French opinion, unlikely—partly owing to vague American disapproval of the remnants of "colonialism" and partly on account of the all too real past losses. Moreover, since American aid is at present unlikely, France must be careful to avoid giving the impression of soliciting it. For any suggestion of an American liaison would tend further to discredit Bao-Dai as a foreign puppet.

A good index of the intrinsic importance of Indochinese nationalism is perhaps the reserved attitude of Pandit Nehru

towards the Franco-Bao-Dai experiment. Nehru still clearly regards the combination with suspicion, attributing at least equal worth to the Vietminh. When, for instance, the question recently arose which Indochinese group should be permitted to send a delegation to the Far Eastern conference of Ecafe now sitting in Singapore, the Indian Government proposed that both Vietnam and Vietminh should be received simultaneously. Coming from a government which is already under fire from Communist propaganda this pronouncement has a certain undeniable weight. It seems, therefore, that so long as the Indochinese problem remains domestic in scope, French Vietnamese progress must be slow, being the fruit of political attrition rather than of physical conquest.

Fall in Foreign Trade

None the less, if the war could be localised, it would perhaps be possible to embark upon a policy of partial

economic reconstruction, although not upon the full development scheme envisaged by M. Monnet's organisation. At present the broad economic picture is that Indochina is exporting less than one-tenth of prewar quantities of rice and maize. (Since, however, there is now a considerably greater domestic consumption, this figure does not apply so drastically to production itself.) The Tonking coal-mines which used to export anthracite to China and Japan are now producing little and exporting nothing. Exports of rubber and pepper to France stand at about a half and a third respectively of prewar totals. The volume of Indochinese exports has shrunk from 3,995,000 metric tons in 1938 to 540,000 metric tons in 1948, while imports have fallen from 490,000 tons to 351,000 tons. The balance of trade which showed a credit of 82 million piastres (=£5,811,000) in 1938 has been turned into a deficit of 1,186 million piastres (=£22,919,000) (the post-1946 piastre being worth 170 per cent of that of 1938).

The Administration of Israel

[FROM A TEL AVIV CORRESPONDENT]

THE new Israel administration has been hastily put together from bits and pieces, but seems to be working well. The secret is that, even under the British Mandate, the new tooth was pushing up under the old one. The Jewish Agency, the Hagana, the Vaad Leumi, the Histadruth, the Jewish civil servants of the Palestine Government, the Municipalities, each provided a cadre of administrators for the new state. Some of the key civil service posts have gone to men inexperienced in administration, but their loyalty and energy are, of course, beyond question. Some were party men, others nominees of individual Ministers, others men who had worked in the underground movements. In the chaos that attended Israel's birth, there was no time for civil service commissions, competitive examinations and selection boards. Anyone with any capacity was snatched out of his previous job and told to get on with organising the new state. It is these men who are now the new administration. They have their faults; but at least they are united in their devotion to duty. They work extremely hard: none of the posts they hold are sinecures. But the machine has not yet been run in: there is excessive centralisation, formality and red tape; the amount of time and effort expended in getting anything through is enormous.

Israel is a small state—with a population of only a million. But many of its citizens are accustomed to an advanced type of European government. Their expectations call for the employment of a large number of civil servants to operate the intricate system of administration that has been set up. Some 12,000 Government employees are hard at work in Israel today, including teachers, but excluding the army and the police. Two thousand seven hundred of them work in the Kiriya alone—the Whitehall of Israel on the outskirts of Tel Aviv.

Advance by Trial and Error

There are only eighteen ministries in Israel today, compared with the forty departments under the Mandate. This reduction in the number of separate units is an advantage. The sub-division of the ministries into branches and divisions is neat and orderly. The Ministers form a cohesive Cabinet, self-reliant and firmly established. The Cabinet has great achievements to its credit and is deservedly popular. But in the lower ranks of the civil service there is still a great deal of wartime improvisation and muddle, largely due to inexperience and the preoccupation of the Ministers with matters far more vital and immediate than organisation. Advance is by trial and error, a groping towards improvement, learning the hard way.

A glass of DRY FLY SHERRY is the ideal aperitif, and is a gracious welcome to your guests. Obtainable all over the world from your own Wine Merchant, or from:

FINDLATER MACKIE TODD & CO. LTD.
Wine Merchants to H.M. The King.
Wigmore Street, London, W.1.
The price is 20/- a bottle.

But the public is unwilling to wait for efficiency. The new state was to be synonymous with immediate perfection. The state machine is still largely a wartime improvisation and yet the public demands peacetime service. There is constant grumbling because letters are not answered, because decisions are not given at once, because papers are circulated from ministry to ministry, because no civil servant is quite sure what authority he has got. And as none of them has yet received a letter of permanent appointment, few are willing to take risks.

Faith in the Future

The intensity of work in the civil service is incredible. The senior civil servants go all out, at a wartime tempo. Many are still working ten, twelve, even fifteen hours a day. They keep going on endless glasses of hot, weak, milkless tea (about two hours to the glass). Most of them are tired out: nearly everyone needs a good rest.

The administration has a profound faith in the future. They are feverishly preparing for the next trial of strength, wherever and whenever it may come. The immense problems of immigrant absorption and housing depend on long-term plans which are only now beginning to mature. There will be a time-lag of several years, during which this almost intolerable strain will continue.

Meanwhile, much has already been achieved: the railway has been repaired and trains are running again; new roads have been built, old ones reconditioned and widened; there is vigorous party activity, but no serious political tension; public security is excellent and one can travel freely anywhere by day or night.

But so much more needs to be done. Anyone who arrives with any particular knowledge or skill is at once put to work. There is great respect for the expert and an almost pathetic willingness to learn. The thirst for information, in all ranks of the army, for example, is astounding. Everyone is going on courses: new training schools are constantly being established, from Signal Schools to Army Medical Services—and even schools of Army Administration.

The Israel Civil Service, though tired, is buoyant and supremely self-confident. It is proud of its achievements and anxious for recognition of what it has done. Foreign interest and approbation is most warmly received. Those who wish for better relations with Great Britain point out that one way of winning the confidence of Israel would be to offer to help in the training of selected members of the new Israel Administration in Great Britain in any branch of activity where Israel has not yet got the means of training locally. In spite of the critical attitude of Israel to the old Mandatory administration of Palestine, the British Civil Service in Great Britain is regarded with respect.

"Glad you like this sherry —it's South African"

It's extremely good. I got some South African wine the other day . . .

I know. A good wine, but not of this quality.

Precisely, but why the difference?

Well, this is a truly representative South African wine. You see, though the Cape has been for centuries one of the world's finest wine countries it couldn't compete in Britain with European countries until Empire wines got a duty preference twenty years ago. That bucked up the South African industry.

But why haven't we tasted such wines before?

Because really fine wines are achieved by selectivity, experiment and slow maturing. South Africa has done as much in twenty years with some wines as the Continent has in generations.

Only certain wines, then?

So far. All are good, but not all are fine. The improvement is naturally progressive.

Were South African wines well-known here before the preference twenty years ago?

Now you're delving into history. They used to be very popular. But in 1866 Mr. Gladstone removed the Colonial Preference and sent the South African wine industry into the wilderness.

Is that likely to happen again?

I hope not. Imperial Preference has encouraged the South African wine growers to tremendous efforts. The British Government is not likely to lead such an important Empire Industry up the garden again. It wouldn't make sense.

So we can look forward to several kinds of really fine wines from South Africa?

You certainly can, and very soon, too."

THE BUSINESS WORLD

Films and the Future

TWO problems are posed by the reports of the Odeon group. First, it is necessary to disentangle the figures to decide whether the group's position is merely as bad as appears on the surface—and that is very bad indeed. The second is to decide what significance the accounts and Mr J. Arthur Rank's statement which accompanies them have for the future of the British film industry. The first exercise involves a study of the accounts, which is best concentrated on the consolidated figures for Odeon Theatres and its subsidiaries. This is the operating foundation of the Rank Organisation, and here its weaknesses are laid bare.

The accounts afford an interesting comparative study between the ostensible results for the group as a whole to June 25th last and the actual results which a sterner method of presentation would reveal. For example, the profit and loss account shows a "net loss" of £746,747, compared with a net profit of £4,175,732 for the previous accounting period. But the consolidated profit and loss account is so overlaid by special credit items that it is best reworked on the following lines

ODEON THEATRES AND SUBSIDIARIES			
	Periods to June 26, 1948	Periods to June 25, 1949	
Trading profits less losses.....	£ 5,908,809	£ 290,890	
Other normal income.....	313,398	272,649	
Total Income	6,222,207	563,539	
Less:—			
Depreciation.....	977,653	1,169,779	
Audit fees.....	40,273	59,584	
Debenture and Bank Interest.....	1,028,549	1,377,589	
Net Profit or Loss	4,175,732	Dr. 2,043,213	
Taxation.....	2,564,085	716,729	
Profits attributable to outside share- holders.....	941,747	669,780	
Sundry charges less profits.....	86,549	98,893	
Transferred to reserve.....	403,660	Nil	
Distributable Profit or Loss	179,691	Dr. 3,528,615	
Special Credits:—			
Non-recurring credit arising from changed basis of film valuation...	...	1,296,466	
Taxation.....	54,458	234,837	
Withdrawn from reserves.....	...	1,341,494	
Loans waived by Holding Company.....	...	648,757	
Profit as adjusted.....	234,149	Dr. 7,061	
Preference dividend.....	90,750	90,750	
Ordinary dividend.....	165,723	35,513	
	(10½% t.f.)	(31% t.f.)	
Drawn on carry forward.....	22,324	133,324	

This table puts a very different complexion on the latest figures. On a strict accounting, before bringing in a batch of special adjustments and credits, the group's loss amounted to the prodigious sum of £3,528,615, compared with a distributable profit of £179,691 in the previous year. More than £3,500,000 of special credits and adjustments are needed to remedy this huge loss. A change in the basis on which films are valued brings

in £1,296,466; though this item is described as non-recurring, it is, nevertheless, credited in the accounts as a part of trading profits. Reserves are raided to the extent of £1,341,494, including £179,642 ironically withdrawn from equalisation of repairs account. There is a taxation credit of £234,837, from provisions no longer required. And, finally, there is a most unusual item to appear in a profit and loss account, described as "Loans waived by Holding Company after June 25, 1949" (the date of the accounts) amounting to £648,757. But despite these various reliefs and adventitious items, there is no credit balance from which to meet the preference dividend; this and the 3½ per cent tax free dividend on the ordinary shares entail a draft of £133,324 on the carry forward. That account now stands at a mere £33,010; the group's revenue reserves have been reduced in a year from £1,735,773 to £248,429.

The Odeon group, then, is stripped and bare. It has emerged from a disastrous year only by pulling out reserves and bringing in special credits on the grand scale. It will not be able to repeat these devices in a second year. Accompanying these sorry figures, there is an increase in bank loans and overdrafts from £13,589,858 to £16,286,581 (so far from satisfying his desire to fund a substantial portion of this bank credit, Mr Rank has in fact increased it) and in mortgages, debentures and other loans from £18,228,212 to £19,981,167. These are tremendous liabilities incurred for the making of so little profit.

The rub of the consolidated assets, however, is the value placed on film productions. This is given in somewhat greater detail than before:—

ODEON THEATRES AND SUBSIDIARIES			
	June 26, 1948	June 25, 1949	
Film Production:—			
Released films at estimated recover- able value.....	...	6,320,769	
Unreleased and uncompleted films at cost less provision for possible losses on release.....	...	3,827,268	
Story rights at cost.....	...	426,487	
Total	12,431,117	10,574,524	

A year ago, Mr Rank proposed a new method of valuing released films. The old method of making estimates of value was declared to be unsatisfactory, and a new system was to be adopted, by which the cost of each film was to be written off during the period of its estimated life. This "more scientific way of valuing released films" has not been put into operation. It would have meant, if it had been applied last year, that losses would have to be carried forward into subsequent years—clearly it is a method which presupposes an accruing surplus from released films over their costs of production, not an accruing loss. Instead, the group has fallen back on the system of estimation which it criticised a year ago as being unsatisfactory. Every released film

has been valued at its estimated revenue, after deducting costs of distribution. As for unreleased films

it has been considered desirable to consider the films unreleased or in process of production at the end of the financial year and form some opinion of their potential value at the box office in cases where they were sufficiently advanced in production to make this possible. A provision has been deducted from the aggregate cost of these films to cover possible losses.

In the aggregate, film productions have been included in the accounts at estimated realisable value, which is less than cost. Even here, it must be pointed out that the group has already taken credit in its accounts to June last for the increased sterling value, resulting from devaluation on September 18th, of accruing film revenues from the United States and Canada.

This is frank enough, though it raises some questions about the eventual value not only of the film productions but also of "story rights at cost" which stand at £426,487. Mr Rank makes no bones in his statement about the quality of recent productions; there are the brilliant exceptions (artistically, at any rate) in "Hamlet" and "The Red Shoes." But

many of the films we produced were not of a quality to ensure even reasonable returns.

The next question is the effect of this writing-down of the value of films on the group's finances. Mr Rank has the following comments to offer on future financial policy:

I realise that the Company has had a serious set-back as the result of losses on production and that its resources are greatly diminished. I have made a personal contribution to meet a difficult situation, but there is a great deal more to be done to repair the financial strength of the Company. We believe that considerable improvement can be achieved by disposing of certain assets which are either non-productive or not directly allied to the main activities of the business, but sales of this kind can only be effected slowly and then only with success when we find buyers who are prepared to pay reasonable prices. We intend, however, to pursue this policy, and I hope that the results will be reflected to a substantial extent in the current year's accounts.

It is questionable, however, whether mere jettisoning of some of the top-hammer of the group will be enough to stave off a much more serious act of financial salvage. Clearly the group is not within sight of earning sufficient profits to service and redeem its financial obligations. Mr Rank's control rests precariously on the continued payment of preference dividends by the parent company and the subsidiaries. The present price of Odeon preference shares (9s. despite their full payment) is a better measure of prospects than the more fanciful quotation of 9s. 1½d. for the 5s. ordinary shares.

The reports, and the statement by Mr J. Arthur Rank which accompanies them, explode beyond question certain of the assumptions on which Government policy for the film industry has been based. The first of these rosy and (it is now apparent) indefensible assumptions is that the modest scale of the industry's production in recent years has been a quite temporary manifestation, in some way the result of the war. The shortage of bank finance and of risk capital for film-making is also (it has been assumed) temporary. Once the Treasury has primed the pump, the argument runs, and once the industry has made an effort to restore a sound relationship between costs and returns, British films can be produced in growing volume on a basis of financial independence. Thereafter they can enjoy a high and constantly growing pro-

portion of screen time in British cinemas, together with a growing export trade.

It was on these assumptions that the three lines of Government policy were evolved. The Films Act, and the level of quota fixed under it—beginning at 45 per cent, and reduced only with great reluctance to 40 per cent for the new quota year—was to ensure that every British film enjoyed the largest proportion of screen time that the law could enforce. The Film Production (Special Loans) Act applied a fund of £5,000,000 to the financing of "independent" film production—substantially, to production outside the Odeon group. A committee of inquiry into film distribution and exhibition, together with a working party on production costs, was to help the industry to put its internal economics in order. The reports of these two bodies are expected during the next few weeks.

The weight of the effort to meet the quota fell on the Odeon group, as the dominant group in production and in exhibition. Mr Rank describes the effort, and its results, with some frankness, though his account overweights the part played by the period between August, 1947, and June, 1948, when new American feature films were withheld by their producers in protest against Dr Dalton's import duty. He explains that the Odeon group expanded its production programme in order to assure a supply of films to its 559 cinemas. A settlement "concerning which the British film industry was not consulted" brought the American embargo to an end, but—and Mr Rank appears this year to overlook this side of what happened—the film producers, with the Odeon group in the lead, pressed successfully for a high quota in the first year of the new Films Act. The fulfilment of this 45 per cent quota required an output of at least 75 British feature films in the year, and more than half of these were expected to come from the Rank studios. In the upshot the group did expand its film output sharply, and it is largely to this that Mr Rank attributes last year's disastrous trading results:

It can now be seen that our plans to meet an unexpected and critical situation were too ambitious, that we made demands on the creative talent in the industry that were beyond its resources, and that as a result we spread our production capacity, in which I still have unshaken faith, too thinly over the films we made.

Allowance has to be made for the possibility that the statement does less than justice to the volume of creative talent available, and does not look critically enough at the failure to mobilise and use those resources. But—given the present organisation of the industry—it is plain that, once the volume of output is pushed up above a quite modest ceiling, quality declines and the loss per film increases sharply. This is what the exhibitors, hard pressed and embittered by a quota policy which seemed not to take their interests reasonably into account, have been saying for the past eighteen months; and Mr Rank appears at last to have conceded their point.

Now that this is cleared up, it is obvious that the quota will have to come down. Mr Rank indicates that production by his group will continue on a reduced scale (between six and ten films in the six months) in the first half of 1950, and that production plans will not be made beyond next June. If the Odeon group is credited with an output of 15 first features in 1950, it seems likely that the total first-feature output of the British studios in 1950 may not be much more than 40 films. This will mean a growing shortage of British films to meet the quota. Mr

Rank himself indicates that "the time must come when compliance with the quota, at least with new films, becomes impossible"; and he has given notice to this effect to the Board of Trade.

The question seems to be whether the quota will be brought down in an orderly manner, or will collapse through non-observance. In the quota year which has just ended, individual reliefs reduced the nominal quota of 45 per cent to an effective quota of something like 38 per cent; how far even this figure was in fact observed will not be seen until the figures of defaults are published. In the second quota year, which opened on October 31st, exhibitors will be forced to rely increasingly on the clause in the Films Act which permits them to apply for a certificate of exemption at the end of the year. But it seems clear that the present 40 per cent figure, even more than its predecessor, will be a "target" rather than a quota, and the bad legal and moral effects of this state of affairs do not need to be explained. The Government will not merely have to abandon its original idea of a high quota rising year by year—a necessity which the President of the Board of Trade had not faced in March, when he spoke of *reculer pour mieux sauter*. If the quota is not to bring the film industry and the law into contempt, it will further be necessary to detach the flag from the mast and calculate the quota afresh. Such a calculation, coldly and realistically made, would probably reach the conclusion that the quota for the next two or three years ought to be 22½ or 25 per cent. But this figure, low as it would be, would have the advantage that it could be made effective.

This is not all that will need to be reconsidered. Since

nothing has happened to restore the confidence of the banks (or of the almost-forgotten race of "angels") in film production as an investment, the demands on the Film Finance Corporation are proving heavier than was at first calculated by the Government. In consequence, the £5,000,000 entrusted to the corporation will not go as far as was hoped; and the Government will have to decide within the next few months whether to extend the corporation's lending powers or allow its activities to be restricted. In making this decision it will need to be borne in mind that—however intelligently and skillfully the corporation discharges its task—the money is being put into a risky industry, and that the prospects of recovering it are, in the long run, only modest.

A further decision which the Government is being pressed to make ought not to be made before the reports of the two bodies at present inquiring into the industry have been published and fully digested. The suggestion that the production end of the film trade ought to be subsidised with funds drawn from the Entertainments Duty is not new. It has been considered and rejected before, and nothing that has recently happened strengthens the case for it. Unsoundness in an industry is not by itself a ground for subsidy. Evidence that the industry is willing and able to put itself on a proper economic basis has still to be provided; and so long as this condition persists, a subsidy would be reckless and ill-advised. To say this still leaves unanswered the further question, which will arise when the Anglo-American Films Agreement comes up for review early next year: how can the dollar cost of imported films be kept within bounds?

Turn in the Tide?

THERE have been signs for some months past that the earning of profits was becoming less easy. The reports of companies which appeared during the past quarter July-September now afford statistical proof of the fact. For the first time since the new analyses of profits began nearly a year ago, a fall in trading profits is reported by 522 companies for the September quarter, from £184.6 million to £183.7 million. This, indeed, is not a matter for great excitement, but it is significant when it is set in conjunction with the trend of earlier quarters. In the same quarter of 1948, reported trading profits showed an increase of nearly 50 per cent; the December quarter showed an advance of 20 per cent, and in the two succeeding quarters there was a further decline in the rate of increase to 17½ and then 15 per cent. Now there is a small fall in profits to add to the score.

In some quarters this will be dismissed on the ground that the decline is small, while the absolute size of profits is "much too high." It is a matter almost for despair that the furnishing of accurate and up-to-date information about industrial profits has so little effect on this line of argument. There is now clear evidence for the first time that the flush of inflationary profits is over—no one denies that profits were to a material extent inflationary in their origin, but they have been damaging not because they were "too high," given the pervading inflationary conditions, but because high taxation on high profits prevented industry from using them for maintaining its physical assets. Further, it must be remembered that the average balance sheet date for the companies

which issued their reports last quarter falls approximately at the end of March. Nothing that happened during the summer rebuts the suggestion that the fall has been continuing during the past six months.

There will be evidence to support this guess in future computations of profits in this series. The latest figures

show that profits, and to a large extent their appropriation, have become static. The 522 companies which provided comparative figures last quarter show a slight reduction in total income (including investment income and other items) to £202.7 million, compared with £203.4 million. Depreciation has again absorbed slightly over £25½ million, income tax somewhat less (£62.7 million against £68.6 million), contingencies and

provisions rather more (£21.1 million against £18.4 million) and retained profits £6,000,000 more. Ordinary dividends are slightly down, from £21.0 million to £20.9 million. That in itself is of no great moment, but it does reflect the fact that the trend of profits is now working, in addition to voluntary dividend limitation, as a curb on distributions.

Detailed figures for the thirty industrial groups whose profits are summarised in the accompanying panel will be found as usual in this week's issue of the *Records and Statistics Supplement*. The different trends of the broad classes into which these groups fall are of interest. Consumption trades show a distinct setback, for their total income has fallen from £84.3 million to £80.7 million; on the other hand, income of the capital industries is well up, from £27.5 million to £30.3 million, and general industries (chemicals, motors and miscellaneous manufacturing among others) show a relatively small reverse from £44.9 million to £44.7 million. The textile group has done well, thanks to active exports and home trade, for its total income has risen by nearly £2,000,000 to £16.9 million, but virtually the whole of this increase has gone to swell reserves.

These results are in line with what common observation had suggested many months ago. The mid-point of the notional financial year to which they relate is more than twelve months ago. Obviously the reaction in the ordinary share markets, even since devaluation occurred, rests on a cautious view about the ability of large sectors of British industry to maintain their profits during the course of the coming year.

Since this new series of investigations into industrial profits began in *The Economist* of January 15th last, sufficient material has accumulated to throw important light on the real earnings and dividends of industrial companies. The cry that "dividends are too high" usually rests on the fallacy of comparing the gross dividend paid with the issued ordinary capital of selected companies. In this sense, the Woolworth dividend is "too high" because (before the bonus issue) it was at the rate of 70 per cent whereas the dividends of, say, Turner and Newall or Tube Investments are "lower," because the gross rate calculated by reference to the issued capital is smaller. The opportunity for removing the source of this fallacy has now passed, since bonus issues have again been suspended (thus admitting the further fallacy that such issues represent the free distribution of millions of pounds from the coffers of industry).

But at any rate the facts can now be established about the true rate of industrial earnings and dividends. The

accompanying chart shows, for each quarter since the beginning of 1948, the contrast between the issued ordinary capital of the companies whose reports then appeared and the "real equity" or "net worth" which their accounts revealed. There is nothing mysterious about net worth; it includes, in addition to the issued ordinary capital, all the accrued reserves which belong as a matter of right to the ordinary shareholders. It shows, in short, the book value of the real worth of the equity capital, as distinct from the nominal value of the legal capital which represents this equity.

As the chart shows, the average dividend even when calculated by reference to issued ordinary capital does not appear extravagant; it has varied from quarter to quarter (largely because the sample of companies in each quarter varies in its character) between 17.3 per cent to 12.6 per cent, and in the latest quarter it was 13.3 per cent. In all quarters (except the first quarters in each year) the earnings actually distributed have been less than half of the amount which was theoretically distributable. In all probability, this would have been largely true even in the absence of dividend limitation.

But it is to the other pair of lines on the chart that the critics of "high dividends" should look. These express the earnings and dividends as a percentage of the real equity—the actual stake of the ordinary shareholders in the companies reporting each quarter. Here the results are very different. Earnings reckoned as a percentage of net worth have been more modest and on the whole more stable. The latest quarter's figure is 12.2 per cent, and the range for earlier quarters

has been between 12.7 per cent and 15.4 per cent. And finally, when dividends paid are expressed as a percentage of net worth, it is obvious enough that they are not "too high." Since the first quarter of 1948, the percentages have been 9.4, 6.7, 6.0, 5.8, 8.4, 6.0, and, in the latest quarter, 5.3 per cent.

The sole purpose of this article, as of earlier articles in this series, is to get at the facts about profits. There is no magic in the figures; anyone with the resources and energy to analyse nearly 3,000 company reports which appear each year will reach the same conclusions if he follows accepted accounting methods. There is no excuse after the passing of the new Companies Act for arguing about profits without reference to the facts. The facts are now known; the results quarter by quarter are consistent and are clearly free from any bias or major error. It would be a relief if, in the next debate on profits, some of the Labour back-benchers who make a hobby of the subject might arm themselves with some acceptable evidence.

Pakistan at Par

THE divergence of policy between Pakistan and India about devaluation has disrupted trade between the two dominions. Despite the palpable damage which is being done to each of them, there is no sign of any rapprochement. Each professes its intention to pursue an independent exchange policy, despite the fact that the two new dominions form an integral economic unit. Pakistan nurses its injured pride, and feels that India broke its undertaking not to alter the exchange rate between the two dominions except "after due notice and mutual consultation." To follow India's example would have meant condoning the breach.

Political arguments apart, however, Pakistan had good economic reasons for maintaining the parity of its rupee with the dollar. These reasons can be broadly summarised under four heads. First, Pakistan's balance of payments with the rest of the world, including the United States, is favourable. Secondly, Pakistan has embarked on a programme of industrialisation and therefore needs to import capital goods as cheaply as possible. Thirdly, the Pakistan Government believes that its exports (and again particularly those to hard currency markets) have an inelastic demand; they certainly have an inelastic supply. Finally, Pakistan wants to bring about a fall in domestic price levels.

These contentions can to some extent be tested by figures. Unofficial figures of Pakistan's seaborne trade for the first full year of independence (April, 1948, to March, 1949) show that total imports amounted to Rs 109.4 crores (£82.3 million at the old rate) while exports of domestic produce totalled Rs 85.6 crores (£64.3 million). In addition Pakistan exported Rs 6.1 crores of foreign merchandise. This unfavourable balance on seaborne trade was more than offset by a surplus on trade across land frontiers. On this trade there are no figures, but it is reliably estimated at 50 per cent of Pakistan's total trade. Pakistan has a trade deficit with practically all countries, but its surpluses with India and the United States produce a net balance in Pakistan's favour which has been estimated at Rs 72 crores (£54 million) for 1948-49. Even if trade with India is excluded, Pakistan's total seaborne exports (domestic and foreign) during its first year exceeded its imports by some Rs 5.5 crores. From the balance of payments standpoint, there was no need for Pakistan to devalue its currency in terms of the dollar. As for imports of capital equipment into Pakistan, machinery and vehicles together represented less than one-tenth of total imports. The total was about £8,000,000, supplied by the United Kingdom and the United States. By not devaluing the Pakistan rupee, the cost of American goods in rupees remains unaltered while British goods become cheaper. True, a relatively larger amount of sterling funds would now be required to set up a new factory in Pakistan than before September, but the sterling return on these invested funds will increase correspondingly. The position for United States investors is, of course, unaltered, but American investors show no eagerness as yet to embark on new projects in Pakistan.

On balance, then, the argument that devaluation might have impeded industrialisation holds. What now

of the future course of Pakistan's exports? Raw cotton is the largest item in seaborne trade, worth Rs 38 crores (£28.5 million), followed by jute, which amounted to Rs 24.8 crores (£18.6 million). These two items accounted for over 70 per cent of Pakistan's seaborne exports in 1948-49. A considerable quantity of cotton and jute also goes across the land frontier to India; some of the jute is, of course, exported from Calcutta. The remaining exports include hides and skins, tea, wool and cottonseed. The price for cotton is closely determined by American prices. But Pakistan should have little difficulty in disposing of its crop without having to reduce its price to compensate for the devaluation of sterling. It may no longer command a higher price than the American equivalent as it has done in the past, but, whatever happens, Pakistan will still be an important source of sterling cotton. The rupee price of tea might decline, for a large part of the crop has been sold to Britain at a fixed sterling price.

The real problem is jute. The sterling price has risen, but certainly not by 44 per cent. Reports from Pakistan quote jute as selling now at between £113 and £116 a ton compared with about £100 two months ago. For the Pakistan grower, this means a considerable fall in price in his own currency. The demand for jute is sufficiently inelastic to absorb the increase in sterling prices without much affecting purchases. In the United States, Pakistan's main market for seaborne jute, the price of jute has fallen considerably, partly because of the lower rupee price and partly because baling charges and transport charges to Chittagong are now also lower. But two important questions need to be answered. First, will the Indian mills be able to buy jute at the new price—that is, if they are allowed to buy? And, if not, would Pakistan be able to sell this important part of its output to other markets? There would be no shortage of prospective purchasers, even at £116 a ton. Jute shipments to markets other than India have been severely restricted since the war, and although substitute packing materials have appeared, there is still a strong demand for jute manufactures. The main problem in these extreme circumstances might be to ship the entire Pakistan crop through Chittagong.

If, therefore, Pakistan's position could be considered in isolation, a reasonable case could be made out for the decision not to devalue in line with the Indian rupee. But isolation is impossible, simply because of the problem of the long land frontier with India. Some 60 per cent of Pakistan's total imports (including land-borne imports) come from India and three-quarters of its exports go there in return. Broadly speaking, Pakistan sends India raw materials and foodstuffs—jute, cotton hides and skins, potassium nitrate, grain and rock salt—and receives in return manufactured goods—cloth, yarn iron and steel, coal, tyres, paper, paints and enamels. Pakistan could get these goods more easily from outside countries (provided its ports could cope with the traffic than India could get the raw materials which hitherto have been bought from Pakistan. But Indian manufacturers could do without the Pakistan market for a longer period than Pakistan agriculturalists could do without the Indian market for their raw materials.

In the past, trade between the two dominions has not been subject to any stern control. Before sterling was devalued, there was no exchange control between them and no restrictions on the transfer of funds, either on current or capital account, from one dominion to the other. Quantitative restrictions and tariffs on merchandise trade, however, did exist, together with a ban on inter-dominion traffic in bullion and (after March, 1949) in Indian currency notes. Where these restrictions applied to the import of heavy equipment or raw materials used by large concerns, they were to some extent effective; but applied to consumer goods sold in the bazaars or to Indian currency notes they largely failed because of the impossibility of keeping a watch on the long land frontier. In fact, in many of the frontier villages, where normal husbandry has been made impossible by the axe of partition, smuggling has become a form of employment in which all the inhabitants, including the police, have acquired a vested interest.

This rampant smuggling ensured that, even after the imposition of the ban on the export of Indian currency notes to Pakistan, a large part of India's deficit with Pakistan continued to be financed by an outflow of notes. Up till June 30, 1949, the Reserve Bank of India was obliged to transfer fixed proportions of its various types of assets to the State Bank of Pakistan against the repatriation of Indian currency notes. Since part of these assets was held in gold, Pakistan has, in effect, been a hard currency country from India's point of view. Since June 30th, however, this obligation to honour repatriated Indian notes in specie has lapsed. Settlements between the two dominions should now be carried through in accordance with the Payments Agree-

ment of June, 1948, which provided for the extension of credit from one dominion to the other up to a limit of Rs 15 crores and, thereafter, for sterling transfers between the two dominions at the Bank of England. Before devaluation, however, it seemed quite probable that some payments at least would not be made in this formal manner but would continue to be financed by the direct (and illegal) transfer of Indian currency notes, which—in view of Pakistan's active balance with India—would presumably tend to be driven to a discount in unofficial dealings.

What happens now? If India were to accept the new exchange rate of Indian Rs 144 = Pakistan Rs 100 and were not to intensify its import restrictions at the frontier, Pakistan's active balance with India would probably increase. Most of India's imports from Pakistan obviously consist of raw materials or foodstuffs for which the demand is likely to be inelastic, so that India's total payments to Pakistan—in terms of Pakistan rupees—should certainly not decrease. Although Pakistan's imports from India would increase in volume if trade were carried on at the new exchange rate, it seems unlikely that this increase would approach the 44 per cent which would be needed to keep Pakistan's payments to India (in terms of Pakistan rupees) up to the pre-devaluation level. If all external and political factors could be excluded, therefore, it might be expected that free trading would tend to drive the Indian rupee to a discount against the Pakistan rupee, reckoned on the new exchange rate. Obviously, political considerations cannot be excluded. India has apparently accepted the Pakistan decision not to devalue as a declaration of economic war. Restrictions imposed on all dealings

It helps both ways

The Westminster Bank provides a service to both exporters and importers that covers all aspects of foreign trade. As the volume of post-war exports increases, a number of people inevitably enter into foreign business for the first time, and it was for such people that the Westminster Bank issued their booklet on *The Foreign Business Service of the Westminster Bank*. The booklet describes some of the problems of overseas trade and gives an account of the services that are provided by the Bank to meet them. Ask for a copy at your local branch.

across the frontier since September 18th have brought open trade between the two dominions to a standstill. No doubt some trade will soon be resumed, but India seems determined that this will be kept to a bare minimum until the exchange position is clarified—by which India apparently means until the Pakistan Government beats the retreat.

Although Indian consumers (and particularly Indian factory owners) are likely to be hard hit by the standstill on imports from Pakistan, it is possible that Pakistan might suffer more during this period of trial. There are three reasons for this view. First Pakistan exporters and particularly the jute growers of East Bengal would have been reduced to a state of penury, had not the Pakistan Government decided to buy all surplus supplies of raw jute. Secondly, if the legal ban on trade remains, Indian exports will probably be easier to smuggle into Pakistan than Pakistan exports will be to smuggle into India. Thus, India might have an active balance with Pakistan for the first time in its history, owing to the impossibility of enforcing trade restrictions. Finally, so long as the trial of strength lasts, some transfer of capital from

Pakistan to India must be expected, simply because of the lack of confidence in some quarters in Pakistan's ability to hold the current rate. It is impossible to say that this is happening yet, for the first quotations on the Calcutta black market of Indian Rs 112 to Pakistan Rs 100 would seem to be too low to entice new capital from Pakistan.

To sum up, if the exchange rate between the two rupees were to be determined by economic considerations alone, the present official parity of Indian Rs 144= Pakistan Rs 100 would probably not be an overstatement of Pakistan's economic strength. But the events of the last eight weeks have shown that the decision on the new exchange rate will not be determined solely by the arbitrament of economic forces. It will depend to a real degree on the relative willingness of the two Governments to impose suffering upon their people by a standstill of legal trade, on the ability of smugglers on both sides of the frontier to breach imperfect economic defences and on the odds laid by speculators in both countries on the outcome of economic war.

Business Notes

A Painful Week

Gilt-edged stocks go from bad to worse. This week 4 per cent Consols, redeemable from February 1, 1957, have fallen well below the "big figure." They stand at present no better than 98½, including 1½ points of interest, and yield £4 rs. 1 rd. per cent flat. Thus the 4 per cent level has been established with a vengeance for the one-way option stocks. War Loan (£3 19s. 4d. per cent flat) and 3½ per cent Conversion (£3 19s. per cent) are virtually on a 4 per cent basis, with Old Consols and "Daltons" only a shilling or two better off. Those investors who have still to receive their

Gas Stock have seen with dismay the further fall to 83½—a 17 per cent loss to which they have been exposed without means of redress. Each fall brings its crop of surmise whether the market has touched bottom, but so far the momentum of the market has swept aside all such hopeful speculation. It seems daily more defenceless and punch-drunk.

Certainly, it is impossible to argue from the economic and political background that there are good grounds for sup-

posing that the rise in interest rates will soon be checked by natural forces and returning confidence. The break in gilt-edged is part of a pattern of doubt about the adequacy of economic policy to meet the economic crisis. It fits into the general background of falling savings and rising inflation at home. It is at one with the widening discount at which free sterling is quoted in foreign centres—a discount which now ranges as high as 6 per cent, only eight weeks after the pound had been devalued to what was ostensibly a low rate. It accords, too, with the rising premium (now 21½ per cent) which investors are prepared to pay for dollar securities in London.

The Prime Minister claimed at the Lord Mayor's banquet on Wednesday that the cuts recently announced in expenditure and investment were "about right" and that in other countries there was a juster appreciation of the magnitude of the Government's efforts to put the economic situation in order. It can hardly be said that this view is reflected by the arbitrament of either the gilt-edged market (where some foreign selling appears to be going on) or in those vestigial free exchange markets on which it is possible for foreigners to deal in sterling. The danger which the market apprehends is that the advantages which looked so powerful at the time of devaluation are being rapidly dissipated by the inadequacies of economic policy to make devaluation effective. These doubts spread well beyond the confines of the gilt-edged market. On Wednesday, the *Financial Times* index of industrial ordinary shares touched 100, from which it started in July, 1935. In the fourteen years since the index began, the general level of prices has risen two and a-half times. Gone are the claims for equities as an automatic hedge against inflation. As for the ordinary shareholder's view about devaluation, the fall of 10 per cent in the index since September 19th surely tells its own story of rapid disillusionment.

Anomalies in Short Bonds

Meanwhile, a distinctive feature of the gilt-edged market's further demoralisation is that this time the collapse in values of medium and longer dated stocks has not left the short bond market unscathed. Previously, the market for shorts had stood in splendid isolation; indeed, despite the slight easing of prices this week, yields on all the "money

market" securities are, even now, perceptibly below their levels on the eve of devaluation. In consequence, the spread in the yield structure from shorts to longs has been widened drastically in these past eight weeks. For example, the margin between the redemption yield (to latest date) on National War Bonds, 1951-53, and on Transport Stock (to 1988) was £1 2s. 9d. per cent on September 16th, but is now £1 11s. This widening of the spread of yields arises partly, of course, from the fact that the very influences which are causing a flight from longer dated securities tend to some extent to generate a demand for shorts—for not all investors can afford merely to switch from longs into cash.

The basic reason, however, for the stability of the shorts is their close relationship to the technical structure of money market rates; and these, of course, still remain at the low levels to which Dr Dalton reduced them in 1945. Obviously fearing the budgetary repercussions of any rise in the cost of financing the floating debt, Sir Stafford Cripps has recently declared that "on the balance of considerations there is no advantage to be gained by raising short-term money rates." There is, in fact, room for argument even about the proposition that low rates ought to be maintained upon the floating debt; but, apart from this, there is the further consideration that, if the authorities are guided by precedent, a stabilisation of Treasury bill and TDR rates would involve stabilisation of other rates—such as those on bank advances—an increase in which may be definitely desirable.

Differential Money Rates?

Recognition that the vested interest of the Treasury in the 1½ per cent rates for floating debt is likely to impede any effort to remove the growing anomalies in the whole structure of rates has led this week to a discussion of some novel proposals. To break the deadlock, it is suggested that a substantial portion of the floating debt at present held by the banks should be converted into permanent debt in their hands, at a fixed rate of, say, ½ per cent, on the analogy of the funding of the Government's debt to the Bank of England in the eighteenth century. The objective of this operation would be to ensure that for a fixed but substantial proportion of its borrowings the Treasury would pay only a very low rate, while for all other borrowings it would pay a varying rate determined by the natural conditions in the money market.

If there were no other way of achieving this second objective, the scheme might be worth consideration. But, surely, faith in the principles of a freely functioning money market has not been so utterly destroyed that in order to restore any freedom at all it is necessary to adopt an arbitrary and inflexible device which is repugnant to those very principles. A funding of this kind would be a pure expedient which would penalise the banks without offering them any *quid pro quo*. In effect, the banks and bank shareholders would be paying a subsidy to the general body of taxpayers. If the authorities wanted to impose some differential control of bank profits, there are more flexible and less objectionable ways of doing it than this. Oddly enough, the principal technical device available for the purpose—namely, the practice of borrowing from the banks on Treasury deposit receipts—is at this very moment being progressively whittled down by the welcome policy of the Treasury of switching its borrowings from TDRs to tender bills.

Capital for Local Authorities

The *Economist* has for some weeks been pressing for the raising of the rates at which local authorities can borrow from the Public Works Loan Board. These have long been out of touch with the market rates at which the Government would itself be able to borrow. In particular, loans with a life of

more than 15 years can be obtained at a rate of 3 per cent. The full schedule of rates is given below, with comparative rates on Government stocks of similar life:

PWBL Loans	Per cent	Government Stocks	Yield per cent
5 years or less	2	2½ per cent Nat. War, 1952-54	2.36
5-15 years	2½	3 per cent Savings, 1955-65	3.43
Over 15 years	3	3 per cent Savings, 1965-75	3.67
		2½ per cent Treasury Stock, after 1975	3.86

On Friday of last week the Agricultural Mortgage Corporation faced the facts of the market and raised its loan rate from 3½ per cent to 4 per cent. It has long been obvious that the Public Works Loan Board should raise its rates. In a written answer this week, the Chancellor of the Exchequer stated that the rates at which interest is charged on issues from the Consolidated Fund to the Local Loans Fund must, by virtue of a Treasury direction, "correspond as nearly as possible with the rates charged to local authorities." This certainly puts the cart before the horse. First, fix the rate to the local authorities; then adjust the rate on Consolidated Fund issues to that rate; and finally disregard any disparity between the rate charged on issues and the rate which would have to be paid if the Consolidated Fund were to attempt to replenish its resources by new borrowing on the open market.

Here, at any rate, is a positive source of encouragement to local authorities to borrow as quickly as possible and as much as possible. There is plenty of evidence that the authorities (as is only sensible) have been filing their applications for loan sanctions in great haste in recent weeks. What they are doing, in effect, is to obtain an advance lien on physical resources to become effective when they come to spend the money. In the June quarter, sanctions for local authority borrowing totalled £92½ million, and in the first quarter of this year nearly £97½ million. The annual rate for the two quarters was, therefore, roughly £380 million, whereas the total sanctions for the twelve months to March last (even including the heavy January-March quarter) amounted to £314 million. Thus nearly one-fifth of the gross rate of investment expenditure is now being financed at quite unrealistic rates of interest.

There is a further point, which leads to an extraordinary conclusion. A personal borrower can obtain a loan at 3½ per cent from his local authority (if it is working a scheme under the Housing Acts) to purchase a house. Here, surely, there are useful opportunities for profit if he has funds of his own. He can finance his house purchase at 3½ per cent and invest his own funds in, say, 3 per cent Savings Bonds 1965-75, making a turn of about half of one per cent per annum. Is there not something seriously wrong with an artificial structure of interest rates which enables the ordinary borrower to do better for himself than the Government can borrow on its own account?

Finance and Investment

Cables Discussions

Neither the board of Cable & Wireless (Holding) nor the stockholders committee opposing the scheme of reconstruction have advanced their cases much further in announcements and circulars issued this week. Sir Edward Wilshaw's personal letter to stockholders purports to explain the scheme in words of one syllable; but in aiming at simplicity it has actually magnified one untenable argument which was advanced in the last week's presentation of the scheme:

You will see that not only will your nominal capital have been increased two and three-quarter times from £100 to £275, but your gross income will have been increased nearly two and a half times from £4 per annum to £9 15s. per annum.

This will convey to the stockholder of simple mind that he is to receive some sort of free gift of capital under the scheme as well as a higher gross income.

To write in this strain can only confuse the uninformed and irritate the knowledgeable stockholder. The facts are simple. It is possible to sell the ordinary stock in the market at 232 and to reinvest the proceeds to obtain, with equally good security, an income as high and conceivably higher than the prospective income on the combined holding of Savings Bonds and new Cable & Wireless ordinary and preference stocks which the directors offer. In the event of liquidation of the Holding company, can it be doubted that the ordinary stock would be worth substantially more than 232?

Even at this late stage, it seems necessary to emphasise that the market price of Cable & Wireless (Holding) ordinary stock during the past year has risen because it has been discounting an ultimate gross return of the order of £9 15s. from the distribution, in some form of other, of the compensation received for the operating subsidiaries and from the equity in the Holding company's investment portfolio. Sir Edward waves no magic wand. It would be better to drop all reference to "nominal" capital gains from any assessment of the reconstruction scheme. All that is being offered is an option to stay invested on the basis of a four per cent yield, at the expense of forgoing a real capital advantage from the realisation and distribution of the company's assets.

* * *

Opposition from Stockholders

The Stockholders' Committee, though strong in its opposition to the scheme, has not made the most of its opportunities. Sir Edward Wilshaw rebuts the first argument in favour of liquidation cited in the committee's circular—the claim that the substratum of the company has disappeared—by referring to the company's Articles which provide for carrying on the business of investment. That, however, is a matter which in the last resort only the Courts can decide. The circular is on stronger ground when it maintains that in a liquidation the ordinary stock might receive as much as £315 in cash or securities for each £100 nominal of stock. The committee is unimpressed with the performance of the board of Cables and Wireless (Holding) as investment managers since January 1, 1949, for it points out that depreciation of investment values has occurred to the extent of at least £2,100,000, equivalent to £30 per £100 ordinary stock, of which £25 per cent arises from the fall in gilt-edged holdings.

Whatever the justification for this opinion—it may be that liquidation at a satisfactory price of all the Savings Bonds received as compensation was impossible since, it is understood, they have been more or less on tap to the market—the committee make only a subsidiary point of criticising the estimated cost of running the proposed investment trust. Compared with the cost of running other established trust portfolios of comparable size, the proposed charge for management of the Cables portfolios can only be characterised as exorbitant. In a press interview this week, Sir Edward explained that this was an outside figure, and that in practice the cost would probably be very much less. At the same time he appeared greatly to overcall the difficulties of liquidation which might arise through legal obstacles and disturbed markets.

On the question of delay in a liquidation it would, at least, be possible, as the committee points out, for the liquidator to make an immediate distribution of the Savings Bonds for which the scheme itself provides. As for the remaining holdings of the company, there are unquoted stocks in three investment trusts in Rhodesia and South Africa, an unquoted investment in Rhodesian Breweries, and a mixed holding of South African gold shares. At any rate, this last element in

the portfolio would not be difficult to sell under present conditions. But the board is quite obviously in no mood to let go the reins. That is clear quite apart from the relative advantages of liquidation. It remains to be seen if the campaign to throw out the proposed scheme—a 75 per cent majority of the ordinary stockholders is required for its acceptance—is successful. One key to the decision may be the action taken by the board of Globe Telegraph Trust which holds 15 per cent of the ordinary stock of Cables and Wireless (Holding).

* * *

Financial Talks with Sweden and Portugal

It is becoming increasingly clear that Treasury and Board of Trade missions are likely to find the negotiation of trade agreements for 1950 a formidable task. The problems are well illustrated by the fate of the current agreements with Sweden and Portugal, with which preliminary talks started this week. Under the current agreement with Sweden the largest European buyer of British exports, Swedish sterling balances were expected to fall from £25 million to £10 million in the course of the year; it now transpires that they have risen from £25 million to £40 million. In part this has been due to two factors outside Britain's control. First, the Commonwealth, and in particular India, has bought more from Sweden than was originally anticipated. Secondly, Sweden has made use of the transferable account system to accept payment for some of its exports into South America, Denmark and Holland in sterling. Despite their reluctance to hold sterling, the Swedish authorities have evidently preferred exports paid for in sterling to no exports at all. But part at least of the rise in Sweden's sterling balances is due to the fact that "inessential" British exports have failed to establish themselves in the Swedish market. Import quotas for iron and

TRADE WITH SWEDEN AND PORTUGAL

Period	Exports to Sweden	Imports from Sweden	Exports to Portugal	Imports from Portugal
January to August, 1948....	31,861	39,142	15,011	6,407
January to August, 1949....	39,179	30,516	15,721	4,905

steel, coal and textiles have been fully taken up, but nearly all other commodities are falling behind schedule. Although Swedish import licences to a value of Kroner 950 million were issued under the pact, imports to date amount to only Kroner 650 million. The position is serious, since Swedish exports of pulp and timber are essential commodities for Britain and since promises from the Board of Trade to supply limited quantities of steel and coal are losing their potency as bargaining counters in trade negotiations. On the other hand, Britain is much the most important market for Swedish exports, and as the Swedish Ambassador implied in a speech in London on Thursday, there are numerous British exports Sweden would be loath to see diverted as a result of the dollar export drive.

The trade position with Portugal is rather similar. British exports have fallen off, largely because the Portuguese ship-building programme has been completed. Gold losses to Portugal (which last year were largely due to purchases of diamonds for re-export to dollar areas) have been rather more substantial this year. Here again, although Britain has a healthy-looking surplus on merchandise account, purchases from the overseas sterling area have been greater than was expected. Unless exports to Portugal increase, these purchases by the overseas sterling area will have to be cut down, for it is difficult to believe that British imports from Portugal can be reduced much further.

Before Lombard Street

Giovanni dei Medici is credited with being the founder of a great banking system in Italy and other countries in the 15th century, and it was from Italian connections that Lombard Street in London City acquired its world-famous name.

Martins Bank has associations with Lombard Street dating back to the middle of the 16th century.

at all Branches and Agencies.

I.C.F.C. was set up in 1945 by the English and Scottish Banks, with resources of £45,000,000, to supplement existing facilities by providing an accessible source of share capital and long term funds for well conducted businesses of small or medium size. It applies to all proposals the usual canons of sound finance and is not averse from supplying risk capital. I.C.F.C. has so far provided over £16,000,000 for British Industry, divided among more than 250 concerns of many kinds.

*Full particulars of the facilities offered
may be obtained from the General Manager,*

Cold Comfort from Argentina

In dealings with Argentina it is well to be thankful for small mercies, for even they are rarely forthcoming. Formal welcome should therefore be accorded to the announcement that Argentina is to reopen the import of essential goods (suspended since sterling was devalued) and to allot £2,000,000 for the import of "inessential" goods from the United Kingdom (in which trade has been largely suspended since the war). This allotment of £2,000,000 (which is to become available only at the turn of the year) compares with an allotment for "inessentials" of about £15 million envisaged in the recent Trade Agreement as the amount needed to bring the Anglo-Argentine trade account into balance in the year to June, 1950.

For most of the "inessential" imports, including motor-cars (allotment £500,000), woollen cloth (£330,000), linen cloth (£85,000), earthenware (£60,000), tiles (£30,000), glass (£25,000) and fish (£10,000), the import quotas now announced represent about 10 per cent of those envisaged in the Trade Agreement. The main exceptions are cotton cloth (£960,000, or 20 per cent of the estimate in the Agreement) and whisky, which, in deference to the local manufacture of imitation "scotch" bearing tartan labels, is not to be allowed in at all. All "inessential" imports for which foreign exchange permits are granted, together with other commodities lately pruned from the "essential" imports list, will be financed at the so-called "auction exchange rate," which will probably be allowed to depreciate below the rate of 19.89 pesos to the £ at which it stood before September 18. It is unlikely, however, that the rise in prices inside Argentina which this will entail will prevent consumers there from absorbing such modest supplies of "inessential" imports.

Although the previous delay in granting any import licences for "inessential" British goods may have been partly due to Argentina's desire to store up sterling to take

advantage of the revaluation guarantee in the event of devaluation of the pound, two other reasons for imposing restrictions on imports have lately come to the fore. First, the Perón Government now depends politically on the protectionist manufacturing interest (the more so since the Government's first faltering steps towards curbing expenditure on food subsidies and on defence brought about an ugly rift with both the trade unions and the army last summer). Secondly, Argentina's exchange reserves, the true state of which is disguised by the Central Bank's statistical reticence, are now believed to have ebbed to a dangerously low level. It has only recently been revealed that the official deficit in the balance of payments amounted to some \$300 million in 1947 and some \$540 million in 1948. The blunt fact is that Argentina, which held more than \$1,700 million of foreign assets at the end of 1946, now has no dollars and precious little sterling left with which to pay for any imports at all.

* * *

Canada and Sterling Trade

If some Labour backbenchers and left wing publications are to be believed, the only act necessary to put the British dollar deficit right is that Canada should "return to the sterling area"—a not very explicit way of saying that Canada should take sterling for wheat supplied to Britain. The suggestion blithely ignores any number of factors—among them, the voluntary basis on which the sterling area is founded and the character of Canada's relations with the United States. Under present conditions, to include Canada in the sterling area would merely involve a new drain on the sterling area dollar pool, since Canada needs dollars to buy from the United States both those goods which Britain does not make in comparable qualities and at comparable

prices, and those goods which Britain does make, but which are not fashioned to Canada's taste.

This problem of style and consumers' taste was stressed last week by Mr J. S. Duncan (president of Massey, Harris and Co.) when he outlined the tasks of the new Canadian Dollar-Sterling Trade Board. This board, consisting of leading Canadian manufacturers, has been set up to help to sell more British goods in the Dominion. Mr Duncan urged that British exporters should have resident salesmen in Canada feeling the pulse of the Canadian market and ready to study—and emulate—American standards of salesmanship on which Canadians have been brought up. Some alterations of British design, Mr Duncan asserted, would also be necessary if Britain is to capture the 15 per cent of present American trade with Canada which would bring Britain's balance of payments with Canada into equilibrium.

On the question of selling prices, perhaps, Mr Duncan was less convincing. He advised British exporters to sell below the corresponding prices of American-made goods in Canada but to avoid arousing antagonism by selling below the price of Canadian-made goods. In other words, British exporters were exhorted to find an opening within the 10 per cent margin which devaluation has left between the Canadian and American dollars. It would not, in any case, be very easy to gauge this narrow entry, and it might not be very wise to attempt to strike it.

* * *

Rhodesian Copper Profits

The rise in net profit from £4,668,094 to £5,425,175 announced by Rhokana Corporation this week provides an interesting contrast with the results of Roan Antelope whose full accounts covering the same period to June 30, 1949, have also been published. Net profit of Roan Antelope actually declined from £969,314 to £636,543; the surplus on operating account was slightly lower on the year at £2,779,129, compared with £2,834,493. This result followed an increase in output from 51,757 long tons to 56,162 long tons of blister copper, an annual rate which was fully maintained in the quarter to September 30, 1949. It would appear that the improvement shown by Rhokana is largely attributable to a higher return from its big interest in the expanding Nchanga mine (whose net profit of £1,609,924 for the year to March 31, 1949, was nearly double that for the previous year) and possibly to some extent to the operations of Rhodesia Copper Refineries. The smallness of the increase in the dividend received by Rhodesian Selection Trust from Mufulira for the period suggests that Rhokana's receipts from this source were not much increased.

The full accounts of Rhokana must be awaited for an indication of the course of trading profit from its own mining operations. It is clear from the report of Roan Antelope that the companies have had to face a sharp increase in costs over the period. Roan Antelope's cost per long ton of blister copper f.o.b. Beira increased, for the ninth successive year, to £72 14s. 11d. per ton compared with £66 4s. 10d. in 1947-48 and £52 in 1946-47. Mining costs have risen by 17 per cent owing to increases in wages, in the labour force and in the costs of supplies and more extensive underground development. Royalties, general expenses and welfare payments were also higher. The only reductions effected were in milling and smelting costs. Revenue from copper sales rose from £115 10s. 7d. to £120 7s. 9d. per ton, so that profit per ton actually declined from £40 11s. 11d. to £35 3s. 7d. The price of copper has tended to rise since June, and there is still no sign of a weakening in demand in the United States. Under the new purchasing arrangements between the Ministry of Supply and the Rhodesian copper producers—the contracts will run for shorter periods than three months, possibly as short as one month—producers will tend to gain more if the market continues to rise.

Claims on German Assets

The Distribution of German Enemy Property Bill, of which the main outline was described in *The Economist* last week, was introduced in the House of Commons last Tuesday. It should bring a sizeable compensation to pre-war creditors of Germany in the United Kingdom. The claims which will rank for compensation against the assets affected by the Bill amount to about £35 million. By far the largest item consists of old standstill claims outstanding to the amount of £28,841,000. The German assets in Britain which are to be mobilised to meet claims of the UK creditors are a very mixed bag. They include pre-war balances maintained in London by German banks, shares in British subsidiaries of German companies, many of which have been kept operating for account of the Custodian for Enemy Property, the proceeds of German goods seized by the Allies during the war, a certain amount of real property and royalties and patent payments which have been accumulating in Britain on German account during the past ten years. It is difficult to put an estimate on the value of these assets, many of which are not readily realisable but it is probable that they will net very nearly £10 million. A substantial proportion of this is available in cash. This should allow a rather more generous distribution to creditors than most of them had until recently anticipated.

The position of the creditors would, however, be happier if the assets in Germany against which they have a lien were not being disposed of without reference or compensation to them. The most glaring example of this procedure is provided by the dispersal of German steel plants under Law No. 75 of the British Military Government passed in December, 1948. The sterling debts of the German steel industry amount to about £6,500,000, a figure included in the total of £28,841,000 mentioned above.

Further the security behind these debts is being gradually eroded by the dismantling programme. The proceeds of sales of dismantled equipment are acquired and retained by the British Government and do not appear to be earmarked or kept in trust for the creditors. During the past ten years, most of the British creditors of Germany have written down their claims to negligible proportions—and have done so out of taxable profits. It follows that any amounts recouped as a result of the new legislation will in most cases be liable to tax. This fact may help to explain the comparatively passive attitude which has hitherto been maintained by the British banking community in its efforts to secure its claims on Germany.

Industry

Coal Export Prices—and Output

The question of differential price levels for home and export trades in Europe, which was taken up with some vigour at the recent meetings of the Organisation for European Economic Co-operation, seems unlikely to be allowed to rest. The council of the OEEC instructed the executive last week to inquire into ways and means to eliminate dual prices in intra-European trade, and asked for an early report. Mr Hoffman, the ECA administrator, is reported on his return to Washington this week to have expressed confidence that Britain was in full agreement that there should be an end to the dual price system; and he mentioned British coal export prices in particular. It would be surprising if this degree of confidence were entirely justified. The British point of view has so far been that the National Coal Board is an independent trading corporation responsible for its own price policy. Some agility is required to maintain this position towards the board as an export agency without applying it to the board as supplier of coal to the British home market; but there has been no evidence of the position being abandoned. Nor, indeed, has the other principal exporter within the OEEC area,

The table shows some of the goods that Southern Rhodesia bought from Britain in 1948. There is a market, too, for many other British products. Write for our new booklet 'Overseas Markets'. It contains detailed trade tables for Southern Rhodesia and other territories where the Bank has branches.

Total 1948 U.K. exports to the territory were £15,507,000. These included:			
	CUTLERY, HARDWARE, IMPLEMENTS	£471,000	
	ELECTRICAL GOODS & APPARATUS	£959,000	
	MACHINERY	£1,915,000	
	POTTERY, GLASS, ABRASIVES, ETC.	£472,000	
	WOOLLEN & WORSTED YARNS & MANUFACTURES	£563,000	
	COTTON PIECE GOODS	£2,221,000	

BARCLAYS BANK (DOMINION, COLONIAL AND OVERSEAS)
HEAD OFFICE: 54 LOMBARD STREET, LONDON, E.C.3

western Germany, wholly abandoned the system of dual prices which was taken up largely under American direction.

A sufficiently large increase in the quantities of coal available for export would cause the question to settle itself, for in that case it would hardly be possible to maintain coal export prices at a scarcity level. Such an increase is probable in Europe in the long run, but it has not happened yet; and the current improvement in British coal output, though useful is not of an order to bring it about. The Coal Board expects to reach a total export (including bunkers) of about 19 million tons for the year, and this will be about 3,000,000 tons more than last year; there is still little question that, as Lord Hyndley said this week, several million tons a year more could be sold if it were available.

British output from the mines rose last week to 4,253,200 tons, and opencast output brought the total to 4,513,400 tons, which is the best week's total since the peak period before Christmas last year. Total output for the first 44 weeks of the year was 180,725,800 tons, which is 5,000,000 tons greater than in the first 44 weeks of 1948. Even so, a total of 215 million tons for the year—the lower of the two objectives stated in the *Economic Survey*—looks difficult of attainment. Output per manshift in the mines has risen to 3.08 tons at the face and 1.19 tons for all workers. But the labour force, at 709,100, is 15,000 less than it was a year ago. Absenteeism has been reduced in the last few weeks, but is still higher than last year's average; "involuntary" absenteeism at the end of October still represented substantially more than half of the total of 11.96 per cent.

Progress of Cotton Re-equipment

Mr John Edwards, Parliamentary Secretary to the Board of Trade, reviewed in the adjournment debate in the Commons last week the progress of the cotton spinning re-equipment scheme. Measured by the number of firms and of mills which have registered under the Act, the scheme has begun to show a modest success. Mr Edwards said that the Board of Trade had been accepting groups of about 250,000 spindles, and that not all of these were vertical groups. The 28 groups which had registered represented 59 per cent of the spindles in the industry, and "it looks as if there may be one or two others as well."

It is in the next stage of the scheme that, as Mr Edwards admitted, "the groups are holding back": out of 280 mills owned by the approved groups, actual proposals for modernisation have been submitted in respect of only 60. Since contracts can be placed up to April 5th, the picture may yet change; but at present it is disappointing. Mr Edwards conceded that economic as well as technical considerations were tending to hold the groups back from taking the final step:

I know that at present firms are finding it necessary to increase their working capital for the financing of stocks, following devaluation and things of that kind, but, even after making allowances for that, the progress made up to date is disappointing.

Mr Austin, the member who raised the matter, appeared to blame lack of public spirit, or hostility to the Government, among the Lancashire firms for this reluctance to plunge. This is to over-simplify the matter. The period during which the re-equipment Act operates happens to be a period of inflationary boom, in which the costs of new plant and new buildings are extremely high. Whether the 25 per cent subsidy makes re-equipment desirable for a firm or group in these circumstances is, or ought to be, an economic decision; and uncertainties, not only about future market prospects, but also about the effect of re-equipment on costs make the decision far from simple. Professor E. Devons, in a paper on prices and costs at the Cotton Board conference at Harrogate last month, emphasised the hypothetical nature of much of the information available about the effect of re-equipment on costs. On the weaving side of the industry, he concluded

that "cost reductions alone do not appear to be a powerful inducement towards introducing new equipment"; and in general he felt that "the cotton industry is not one in which one can expect large scale investment to take place over the next few years at least."

This does not close the subject, and re-equipment is not likely to stop. But the emphasis of feeling among observers of the industry continues to be in favour less of re-equipment on a vast scale than of the improvement and better use of the plant that exists already.

British Cars in the United States

Sir Peter Bennett said in the House of Commons last week that four of the leading British motor manufacturers were selling in the United States at prices which did not cover their costs of production. Mr Piratin had previously said that the British-built Ford was now being sold in America at a price which was, in terms of sterling, 18 per cent higher than before devaluation. The purpose of this statement is obscure, but in fact the f.o.b. price of British Ford cars sent to the United States has not altered since devaluation and (Sir Peter Bennett said) does not cover the British company's full costs.

The Nuffield group also loses; production cost exceeds the ex-works price of a Nuffield car going to the United States by up to £17. After distribution and sales promotion costs have been met, the total loss on each car averages £100. At the time of devaluation, Mr L. P. Lord, chairman of the Austin Motor Company, said that the ex-works price of the A.40 was £205. This compares with an ex-works price of £392 for the home market, and £362 for a foreign visitor buying the car in Britain. The price for the United States just covers the cost of the materials and components used in the car. The Rootes group also loses on its sales to the United States.

It is possible to exaggerate the seriousness of these losses, for they contain two elements. A good proportion can be considered as the ordinary expenditure necessary to break ground in a new market. It includes the organising of a system of distribution; experiments with different sales and advertising techniques; and expensive publicity such as the stock car trials arranged for the Austin A.90, which cost the company nearly £2,000 for the hire of track and timekeepers alone. Now that the manufacturers are more sure of their ground, a good deal of pruning can be done on these expenses. The Nuffield group, which before devaluation sold every car before it was shipped, is planning a new system of distribution. The Ford company avoids these expenses by using the distribution system of the American parent company.

The second element is a deliberate policy of price discrimination between markets. This may involve selling in one market at a loss which is recovered by charging a higher price in others—the object being to keep costs down by a high volume of production. Since the number of British cars sold in the United States is small in relation to the total volume of British production, this cannot yet be an important factor. Again, it is common practice in some industries to make initial sales at a loss, in order to gain a profitable market for spares and replacements. It may be possible, therefore, for motor manufacturers to regard their losses per car sold as a short-term loss which, over the life of the car, might become a profit.

There are signs that the losses will not be tolerated indefinitely. Economies are being made in the distribution expenses of Austin cars; and the Austin company has reduced its prices in the United States by only 20 per cent since devaluation. In this way the gap between production costs and the ex-works price has been narrowed. This is as well, for certain dollar items in car production have increased as a result of devaluation.

Trouble over Gas Tariffs

The decision of the South-Western Gas Board to suspend the new gas tariffs which it announced in June does not mean that price increases in that area can be avoided. No big changes had been made in gas charges since before the war, and the prices which many consumers were paying at the time the industry was nationalised did not cover costs. In the particular case of the South-Western Area, the Board was losing more than £600,000 a year under the old tariffs.

By the Gas Act of 1948, if an Area Board introduces a new tariff it is bound to show the principles on which the new charges are to be made. The intention appears to have been that price adjustments could be made within an existing tariff structure, without the necessity of such exposition; and the South-Western Gas Board acted on this interpretation when it increased its prices by 1½d. a therm. The Member of Parliament for Bath, Mr I. J. Pitman, attacked the new charges on the ground that they constituted a new tariff and that, since the principles on which the charges are to be made have not been shown, they violated the Gas Act. Counsel's opinion left the issue in doubt, and a clear decision could only be obtained by taking the matter to the High Court. The Board has chosen the easier, and possibly cheaper, course of revoking the June order, repaying to consumers the difference between the old and the new tariffs, and drafting a wholly unambiguous order to bring the price increases into operation again. There should be no difficulty in doing this, but the Board will continue to lose money in the meantime by selling gas at the old rate.

Other district Gas Boards have also increased prices since they came into being in May. They did not use the same formula as the South-Western Gas Board, but it is not yet clear whether their increases can also be challenged on the same grounds; nor is it clear what their response would be to such a challenge.

Flag Discrimination

At its annual conference in London this week the International Chamber of Shipping (formerly known as the International Shipping Conference) reaffirmed its traditional opposition to all forms of flag discrimination. Before the war discrimination in favour of shipping of particular flags generally took the form of preferential port dues or similar measures, although the reservation of coastal shipping and the subsidising of national shipping and shipbuilding were other more debatable forms. Since the war, however, flag discrimination has assumed an entirely new character, mainly owing to the interference of Governments in the principal commodity markets and the insertion of provisions in trade agreements which stipulate that cargoes, including those bought or sold by Government agencies, should be reserved for the ships of particular flags.

The American rule that 50 per cent of ECA cargoes must be carried in American bottoms might have come under this heading, but the Chamber specifically excluded it on the ground that such cargoes were in the nature of a gift. The Chamber did not indicate whether it took a similar view of the 50 per cent provision relating to arms exports under the Mutual Defence Act. It welcomed, on the other hand, the efforts made by the OEEC towards the "liberalisation" of trade and shipping services, and urged that the latter should be freed from exchange controls, particularly those which impede the freedom of importers and exporters, as well as passengers, in their choice of vessel. Fifteen delegations attended the conference, representing the private shipowners of Australia, Belgium, Canada, Denmark, Finland, France, Greece, India, Italy, the Netherlands, New Zealand, Norway, Sweden, USA and UK, but only the Indian

delegation dissociated itself from the terms of the resolution calling on Governments to refrain from legislation and trade agreements which lead to flag discrimination.

Prices and Trade

Boom in Colonial Products

The sharp rise in coffee prices in recent weeks has surprised producers and consumers. Eight weeks ago, coffee was selling in New York at 19½ cents a lb. The current price is 49½ cents—an increase so sharp that the price of a cup of coffee has had to be raised. The main reason for the coffee boom is a fall in world output. Production this season is put one-fifth lower than the prewar level, whereas consumption has increased by nearly ten per cent. Before the war world production exceeded world consumption by 10 to 20 per cent; now, consumption is about 7½ per cent above world production.

Brazil, the main producer of coffee, now grows barely half the quantity of twelve years ago, and supplies less than half of the world's export compared with nearly three-quarters before the war. The main consumer is the United States. In 1936-37, annual consumption there amounted to 12.3 million bags out of a world total of 24.9 million; in 1947-48 it had increased to 20.2 million bags, though world consumption had expanded to only 29.8 million bags. For Brazil, which twenty years ago was dumping coffee in the sea and using it as fuel for locomotives, this turn of events means relative prosperity; its effect on the Brazilian economy is discussed in more detail on page 1070. But the sterling area will also gain, for it, too, exports coffee to the United States, though on a smaller scale. The Ministry of Food apparently intends to sell to the United States coffee purchased from East Africa under its long-term contract, although that specifies that the purchase was for British consumption only. The East African producers are rightly protesting against this step. They hope to sell any surplus they may have above the contract requirements to USA.

Cocoa, too, has been rising recently. Before devaluation, it cost 20½ cents a lb in New York; last week the price had risen to 24½ cents a lb. This year's crop is expected to be smaller, and American demand has been improving. Reckoned in terms of devalued sterling, the increase in price has been very considerable. Imports of cocoa into the United States come mainly from British West Africa; thus the sterling area may earn the same amount of dollars from cocoa as it did last season. This turn in the market will be welcome to the Nigerian and Gold Coast Marketing Boards, but they will have greater difficulty in eradicating the "swollen shoot" disease. All experience shows that if cocoa is highly profitable, infected trees will be kept in fruit and not grubbed out, which is the only way yet discovered of eradicating the disease.

Sugar is also firm. Cuban raw sugar for shipment in April has risen slightly to \$4.15 per 100 lb; a year ago it was under \$4.00. The Ministry of Food has purchased the entire exportable surplus from San Domingo—a quantity estimated at 400,000 tons—at \$4.00 per 100 lb., but this purchase is to cover the Ministry's overseas commitments and not consumption at home. The world crop for 1949-50 is estimated by Messrs. Czarnikow at 30.1 million tons, a decline of a mere 27,000 tons for the season, and still a million tons larger than in 1937-38. Output in Commonwealth countries is expected to increase slightly but Cuban production to decline. The full crop statistics are included in this week's issue of the *Records and Statistics Supplement*. Firmness in sugar, however, arises largely from local factors. Carry-over stocks of Cuban sugar, which were expected to be fairly large this season, have been liquidated and

immediate supplies are somewhat scarce. They should improve as the season progresses, and there is a fair prospect that the price will remain stable at around \$4.00 per 100 lb.

All Quiet in Wool?

The third meeting of the International Wool Study Group ended in London on Wednesday without reaching any startling conclusion. After considering the prospective wool supply and demand "the group concluded"—to quote from the press communiqué—"that no immediate problems existed in connection with the production, consumption or trade in wool which called for inter-governmental action." From the figures given in the accompanying table this seems to be a fair comment. World production this season is estimated at 3,844 million lb (greasy basis) compared with 3,758 million lb last season, and 3,788 million lb between 1934 and 1939. The output of apparel wool has followed a similar trend. World consumption for 1949-50 was estimated at 4,357 million lb, of which 3,528 million lb will be apparel type. Consumption of apparel wool should therefore show a slight fall on the year, but consumption of carpet wool should tend to increase. Stocks of apparel at the close of the current season are estimated at 2,448 million lb, of which 317 million lb would be in government hands (the Joint Organisation and the Commodity Credit Control) compared with 2,961 million lb at the beginning of the season, when 640 million lb were government owned.

WORLD BALANCE SHEET FOR WOOL
(Million lb—Greasy Basis)

	1948-49 Average	1946-47	1947-48	1948-49	1949-50

The trends are in the right direction. Production is expanding, consumption is declining slightly, and government-held stocks are being rapidly liquidated. But during the past six months, Australia, New Zealand and South Africa have each put forward proposals for a wool marketing scheme to be introduced when the Joint Organisation is wound up. For the Study Group, these proposals are apparently not an "immediate problem." It is not difficult to sympathise with producers who want a guaranteed minimum price for their produce—the proposals of each of the three Dominions included a reserve price system similar to that operating under the Joint Organisation. American wool-growers have enjoyed such a protection for some time. But the consumer's interest ought also to be considered. The British Government, to judge from the position which it has taken on rubber and tin, can hardly be relied upon to protect the consumer from the demands of the producer, and the proposed scheme is essentially a producers' scheme. Even the Study Group noted that over the past twelve months prices of wool "were generally at a high level." Is this state of affairs to be so perpetuated that the consumer's only defence is to wear less wool?

Future of Tin

The London tin market, which has been closed since 1939, is to re-open on November 15th. Already proposals

are being heard to introduce an international marketing scheme. Reports from The Hague, where the Tin Study Group sits, indicate that the scheme would be designed to control output. The tendency of demand for a raw material to fluctuate over a period perhaps makes it inevitable that an international scheme for tin would be of this type. But before the nature of the scheme is decided it ought surely to be conclusively demonstrated that there is a real need for a scheme at all. Nobody would contend that a commodity market operates perfectly, or that it can equate supply and demand without hurting the producer or the consumer at one time or another. But at least the market reflects the changing conditions in the world and allows both producers and consumers to adapt their plans accordingly.

The main outlet for tin is in the manufacture of tinplate, which in turn is used mainly for containers. During and since the war great technological advances have been made in the canning industry, and it is not presumptuous to foresee a declining market for tin over the next ten or twenty years unless its price is sufficiently low in relation to other goods to encourage the development of new fields of use, or to compete with the newer materials now being evolved. If output is restricted under international arrangement in order to maintain the market price at a given level, it is not the output of inefficient producers which will be curtailed, but the output of all producers on a *pro rata* basis. In the result costs will tend to rise, and economic resources will be wasted. If under such a scheme output is maintained but supplies are kept off the market, the question then arises: who will finance the holding of these stocks, the consumer or the taxpayer? And what happens to the stocks if the long-term trend is for consumption to decline? Capital and labour would then be used to produce goods for a stockpile which might never be used.

At least time should be given to permit the reopened market to function properly, to allow the postwar pattern of demand to appear and to let the price of tin find its own level in the framework of commodity prices in general. And before all this can be achieved, certain complications confronting the tin market will first have to be solved. Not the least are American stockpiling and the operation of the Texas smelter. The sterling area's dollar problem is admittedly urgent, and tin is a valuable dollar earner. But the palliative proposed would only exacerbate the malady in the long run.

The Dollar Leak

Loss of dollar earnings through transit trade conducted in free sterling has long been notorious. It was one of the arguments put forward by Sir Stafford Cripps for devaluation to a rate as low as \$2.80 to the £. Statistical evidence which gives some impression of the extent of this trade by means of cheap sterling has been provided by the Office of International Trade in Washington. It consists of an analysis of imports into the United States both by country of lading and by country of origin. Normally, American import figures refer only to country of origin: the analysis shows the country of shipment as well. A special study of imports last April was made for a range of commodities, and some of the more important examples of "third country trade" are given in the accompanying table.

Nearly nine per cent of all imports from the sterling area into the United States were, in fact, shipped from other countries. Not all of this nine per cent can be said to consist of contrived "third country trade"; a large part of it might be called legitimate transit trade—for example Iraqi goods going through Lebanon, Indian goods through Pakistan, or New Zealand wool through the United Kingdom. Perhaps 5 per cent would be a more reasonable measure of that part of sterling area goods imported into the United States through cheap sterling trade via third countries. Such

WHY are prices low and output high in steel?

Now that we are fighting for markets overseas it is good to know that competition among the firms in steel is giving us record output at low costs.

That is why the Government can fix the prices of our steel so low, while the workers in steel who give us such fine output are among the best paid in Britain.

This great industry is unique in already combining Government supervision with the great advantages of free enterprise working in the best interests of Britain.

BRITISH IRON AND STEEL FEDERATION

'Caledon' Jade Green

During the early years of the present century, the anthraquinone dyestuffs were developed from coal tar chemicals for use with cottons and cellulosic rayons. These new dyes gave the dyer a range of colours both more permanent and more brilliant than he had had before. But the range was incomplete; there was no green of brilliant hue.

In 1921, the discovery of 16:17-dimethoxydibenzanthrone gave the world the dyestuff known as 'Caledon' Jade Green. The ingenious piece of research that led to 'Caledon' Jade Green was carried out by Arthur Davies, Robert Fraser Thomson and John Thomas of Scottish Dyes Ltd.—a company later merged in I.C.I. They started with an established blue dye, dibenzanthrone, which they transformed by chemical means into an unattractive green powder, insoluble in water. In the process of application this was convertible into a soluble form, enabling it to be dyed on to cloth, and then oxidised to give the vivid green shade that is now famous throughout the world. 'Caledon' Jade Green is especially resistant to laundering and dry-cleaning, besides being little affected by bright sunlight. Its discovery was a major achievement of the British dyestuffs industry, and ranks as one of the world's five greatest dyestuffs discoveries of recent years, three of which have been the work of I.C.I. chemists.

goods totalled a little over \$100 million in April, so that the possible loss of dollars to the sterling area in that month might, according to these figures, have amounted to

IMPORTS INTO U.S.A. THROUGH THIRD COUNTRIES, APRIL, 1949

\$5,000,000. It should be noted that the proportion of total goods originating in countries other than the sterling area which were shipped to the United States through third countries was a little under 9 per cent.

The main intermediary was Holland, trading in wool, hides and skins, rubber, fur and cotton. France, second on the list, had an important third-country trade in furs, rubber and wool, while Belgium was third, mainly dealing in wool and furs. The volume of third-country trade in wool has certainly declined; in the first nine months of 1948, about 7 per cent of American imports of Australian wool was invoiced from other countries, whereas in April the proportion was very much smaller. The same appears to be true of rubber. Last December, more than one-fifth of American imports of Malayan rubber came from third countries; in April, the proportion was under 6 per cent.

The table clearly suggests the main sources of leakage of dollar earnings. More than a quarter of South African exports to the United States was by way of third countries, and this trade was to some extent encouraged—or at least not hindered—by the South African Government. The other leaks, except British East Africa, whence 26 per cent of the hides and skins sent to the United States went via the Netherlands, seem quite small in comparison. The value of this study indeed is more to show the different routes of the various commodities than to measure the size of the leak.

Base Metal Prices

The course of base metal prices in the United States since devaluation has been conflicting. Copper has remained firm and at the end of last week the price in New York moved up from 17.62 cents a lb to 18.50 cents. On the other hand, lead fell from 15½ cents a lb on September 16th to 13 cents on October 17th, and has since remained at that level. Zinc also declined at first from 10 cents a lb to 9½ cents. But three weeks ago it began to rise once more. By November 1st it had recovered to 9½ cents and on November 9th some smelters were quoting 10 cents. The price of tin fell, following the devaluation of sterling, from 103 cents a lb to 96 cents. On October 24th it dropped a further cent and by the end of the month it had fallen to 94 cents. It, too, showed a recovery at the beginning of November, but it was not maintained and on Wednesday it could be bought for 93½ cents a lb. The price changes for the different metals are shown in the accompanying table.

Prices in Britain have followed these movements closely

for all metals except tin. Copper is now £153 a ton or £5 above the sterling equivalent of the New York price, which covers the cost of freight, warehousing and delivery. Lead is £105 a ton compared with £104 in America and zinc £85 10s. a ton against £78 and £80 in the United States. A rise of £2 a ton in the price for zinc in Britain might, therefore, be imminent.

At this stage it is difficult to obtain a clear picture of the factors affecting the American demand for base metals. An important factor no doubt was the steel strike. A shortage of steel clearly limits the demand for both zinc and tin, and the

" 9	18.50	13.00	9.75-10.00	93.50-95.00

recent recovery in the price of these two metals was due doubtless to the improved prospects of settlement after Bethlehem Steel had agreed to meet the strikers' basic demands. But possibly, apart from copper, the longer-term demand for non-ferrous metals does not as yet appear very firmly established.

Shorter Notes

Quotations for free sterling abroad have changed little this week. Transferable account sterling has remained unchanged around \$2.62. Quotations for pound notes are somewhat lower. In Paris the pound note has fallen to Fr. 925, and the Zurich rate is 5 cents lower at S.F. 10.60.

*

Restrictions have been announced by the Chancellor of the Exchequer on the remission of legacies to hard currency areas. Transfers of legacies to the United States, Canada, American account countries, Belgium and Switzerland will in future be limited to the first £500 of a legacy, any balance to be paid into a blocked sterling account. Transfers to other countries remain as hitherto, free of any restriction.

*

Average weekly output of steel ingots and castings in Britain in October was 306,900 tons; this is equivalent to an annual rate of output of 15.96 million tons and is substantially higher than in October last year. Total output in the first ten months of this year was 12,814,000 tons, compared with 12,253,000 tons in the first ten months of 1948. Output of pig iron also rose in October, when the weekly average was 183,900 tons—equivalent to an annual rate of 9.6 million tons; this is only slightly higher than in October last year.

*

The index of industrial production (1946 = 100) prepared by the London and Cambridge Economic Service rose from 115 in August to 127 in September, according to the "A" index which is based on actual deliveries of goods. The "B" index, which reflects work in progress in addition, rose from 113 to 126. Calculated on the basis of working days however, and after adjustments for holidays, the "A" index remained unaltered at 129 and the "B" index was unchanged at 128.

Rayon for men

Today, makers of men's clothes rely more and more on rayon to give the best modern cloth designs. There is rayon in your suits; it is often attractively woven into tweeds, flannels, worsteds, and other textiles. Because of their admirable comfort and wear, rayon linings have a wide popularity. And so too have rayon shirts, pyjamas, underwear and ties. The complete list is very long, and all the time it grows longer still, as the strength, good looks and versatility of rayon are approvingly noted in town and countryside.

Every power station has its batteries. That will always be so, no matter what future source of energy may generate the main supply. For switchgear operation, emergency lighting, fire-fighting equipment and other auxiliary services, batteries are essential: for only in a battery can electrical power be stored against an emergency. In power stations all over the world batteries made by The Chloride Electrical Storage Company are at work or are being installed. Over 50 years' experience of battery design and manufacture goes into every Chloride, Exide or Exide-Ironclad battery. They are batteries men have learnt to trust.

COMPANY MEETINGS

PETER BROTHERHOOD LIMITED

SATISFACTORY YEAR'S TRADING

The forty-second ordinary general meeting of Peter Brotherhood Limited was held on November 8th in London, Mr Alexander M. Neal, J.P., A.C.G.I., A.M.I.C.E. (the chairman), presiding.

The chairman in the course of his speech said: Last year I remarked that of the sum of £98,214 received by way of Excess Profits Tax Refund, £36,092 had already been spent and that the remainder would probably be absorbed during the then current year. This has in fact taken place, and machinery to keep our plant up to date has been purchased during the year to the value of £70,185, the residue of the fund in question having been utilised towards this purpose.

General reserve now stands at £127,000 against £98,500 last year, while reserve in respect of replacement of fixed assets has been strengthened by the transfer of £17,500 from this year's profits. Loose tools have been revalued and have been reduced from £20,975, the figure at which they stood in last year's accounts, to £13,947. The fact that loose tools, especially in work of changing character, may soon become obsolete and therefore redundant, has been a determining factor in this decision.

Cash at bankers at March 31st last was £105,247 as against £61,643 last year, which I think you will agree, in view of the fact that stock and work in progress and sundry debtors show a considerable increase on last year's figures, is satisfactory.

We have indeed been fortunate until now, in view of the large amount extracted from us in cash year by year for purposes of taxation, to have been able to finance the increasing volume of work with which we have had to deal.

SALES 9 PER CENT. LARGER

The value of our sales for the year was 9 per cent. larger than last year's and I am pleased to report that the net trading profit for the year, before providing for taxation, amounts to £227,527 as against £174,842 in 1948.

This, I think, is a matter on which the shareholders may quite properly congratulate themselves. It should, however, be borne in mind that the sellers' market which has obtained during the last few years has already shown signs of deterioration and that this may normally be expected to have an effect upon the trading profit of future years.

Of this trading profit of £227,527, provision for taxation absorbs £127,000—a reminder of the extent to which industry is called upon to contribute to the governing of the nation—leaving us with a net profit for the year, after taxation, of £100,527.

The question of a final dividend has been before your board, who have felt it their duty to fall into line with the wish of the government that dividends should not be increased at this time. We accordingly recommend the payment of a final dividend of 12 per cent., less tax, on the ordinary shares, making with the 8 per cent., less tax, already paid, a total dividend on the ordinary shares of 20 per cent., less tax, for the year. It is proposed to place to general reserve the sum of £28,500, to reserve for contingencies the sum of £15,000 and to allocate for replacement of fixed assets a further sum of £17,500. The balance of the net profit—£7,236—will increase the carry forward to a figure of £166,977.

Well, gentlemen, the accounts before you show, I suggest, that the result of the year's trading has been satisfactory, reflecting credit on all who have been concerned with carrying on the business of the firm.

The report was unanimously adopted.

UNION FREE STATE COAL AND GOLD MINES LIMITED

(Incorporated in the Union of South Africa)

DEVELOPMENTS AT RALEIGH COLLIERY

DRILLING RESULTS IN HARMONY AREA

MR G. V. R. RICHDALE'S REVIEW OF INTERESTS

The annual general meeting of Union Free State Coal and Gold Mines Limited was held in Johannesburg on November 2nd.

Mr G. V. R. Richdale, the chairman, presided and, in moving the adoption of the report and accounts, said that the authorised capital of the company had remained unchanged at £2,000,000 in 8,000,000 shares of 5s. each. During the year 1,000,000 reserve shares had been issued at a price of 10s per share and 275 options had been converted into shares at 12s. 6d. per share, the issued capital being thus increased from £1,075,575 at June 30, 1948, to £1,325,643 15s. at the end of the financial year under review. Of the 2,697,425 shares held in reserve at that date, 2,075,175 shares were under option at a price of 12s. 6d. per share until January 31, 1950.

RESULT OF YEAR'S OPERATIONS

During the year, income which accrued to the company by way of loan interest, rent, and sundry revenue had amounted to £39,301. From this sum had been deducted £33,773, representing the debit balance on the appropriation account brought forward from the previous year, together with directors' fees, exchange, taxation and administration and general expenses, thereby leaving an unappropriated balance at June 30, 1949, of £5,528.

The issue of 1,000,275 reserve shares to which he had already referred, provided £500,172 for the further development of the company's properties. Of this sum, £250,103 had been credited to the share premium account.

Net capital expenditure incurred during the year on development of the company's coal and gold areas had totalled £390,900 and after allowing for depreciation charged to the share premium account, those assets had been valued at £705,661. It had been deemed expedient to write down certain of the assets in order to align book values more closely with what were considered fair valuations of the company's properties. The share premium account had accordingly been reduced by the amount of the depreciation and stood at £388,093 at June 30, 1949.

NEW UNION GOLDFIELDS LOAN

In addition to the company's coal and gold interests, other assets, less liabilities and provisions, totalled £1,013,604. The original amount of the unsecured loan owed to the company by New Union Goldfields Limited at the time that company was placed under judicial management had been £784,333. During the previous financial year, an amount of 7s. 6d. in the £ had been repaid and a further 7s. 6d. had been repaid during the period under review. Since the close of the financial year, an additional 2s. 6d. in the £ had been paid, and the balance of the loan owing to the company, excluding interest, stood at £98,041. In addition, an amount of

£34,913 had been raised in the company's books, being interest to June 30, 1949, on the loan to New Union Goldfields Limited. The directors considered that the outstanding loan, together with interest thereon, would ultimately be recovered.

The balance sheet as at June 30, 1949, had been qualified in the same terms as the previous balance sheet by the company's auditors, Messrs J. W. Higgerty, Ross-Spencer and Company, who required confirmation of payment by New Union Goldfields Limited on September 2, 1947, of three amounts of £2,000 each which had been in turn charged to the company by means of debit notes, the amount of £6,000 being added to the cost of acquisition of certain coal properties.

That question was being investigated by the present board and the opinion of a senior counsel was being sought, and the chairman hoped to be in a position to report further on the matter at the annual meeting next year.

RALEIGH COLLIERY

He then dealt with the coal-mining interests of the company, the major undertaking of which, he said, was the Raleigh Colliery, situated about 10½ miles south of Middelburg, in the Transvaal. Fifty-eight boreholes drilled in the area had disclosed the existence of a main seam of an average thickness of 17 feet at a depth below the surface nowhere greater than 150, with an average of 80 feet to 100 feet of cover, indicating substantial reserves containing a proportion of first-grade export quality coal.

Two shafts had been sunk and underground development had been sufficient to enable the colliery to commence production on a small scale some time in November, when the railway line to Middelburg should be completed and the temporary screening plant ready for operation. The monthly output was estimated at between 25,000 and 30,000 tons until Barvoys coal preparation plant was erected towards the middle of 1950, when it would be possible to effect an increase in output.

The colliery had been accepted as a member of the Transvaal Coal Owners Association and had been granted an allotment of three per cent. of the trade of the association, equivalent at the present time to some 40,000 tons a month. The potential trade of the association could be expected to grow during the next few years, however, and any improvement in overall trade would naturally result in a greater tonnage allocation to individual member collieries.

CAPITAL EXPENDITURE

Capital expenditure on the colliery during the year had totalled £256,747, of which £255,534 had been incurred mainly in the construction of a railway line and siding and in shaft sinking and provision of equipment.

Additional capital expenditure to bring the colliery to full production was estimated at £500,000, of which approximately £400,000 would be spent during the current year. The major portion of that expenditure would be

incurred on the purchase of surface plant, machinery and mining equipment, on housing, on completion of the railway line, and one the main washing plant. The sum of £313,047 shown in the balance sheet under the heading "Payments in advance—purchase of equipment," included an amount of £283,760 for which bankers' guarantees had been issued in respect of the main washing plant, but since the close of the year arrangements had been made with a view to obtaining a refund of a large proportion of that sum which would then be paid out as and when due.

RECENT ACQUISITIONS

The company had recently purchased a portion of the farm adjoining Raleigh Colliery in order to acquire water rights of a natural spring which occurred on that farm and which was a valuable source of water.

During the year, full coal rights of an area of 340 morgen in the Hendrina district had been purchased, and since the close of the financial year the company had taken up a free option to purchase a coal-bearing area of Farm Twyfelaar in the Carolina district, the coal rights of which were already held by the company and where satisfactory coal deposits had been encountered. In the Ermelo district the company's options to purchase coal and torbanite rights over approximately 10,000 morgen adjoining the Camden Colliery were being maintained, but no prospecting or drilling was being carried on at the present time, although the geological formation of the area and the results obtained in the vicinity indicated the existence of torbanite.

In Natal, the company owned the Newcastle Colliery, including machinery, stores and equipment, and as that colliery had been worked out, steps were being taken to transfer a portion of the plant to the Raleigh Colliery, and the balance would be disposed of in due course. Four miles to the south of Newcastle lay the company's Farm Roy Point, old plans of which had indicated coal seams with coking properties. Coking tests had been carried out on a sample of that coal, but the results did not warrant further prospecting at that stage.

At the close of the previous financial year, the company held a 50 per cent. interest in the Indumain coalfield between Dundee and Glencoe, and also held the total share capital of the Sanford Mining and Investment Company, Limited, which owned the remaining 50 per cent. interest. During the year, that latter half share had been transferred into the name of the company and shares in the Sanford Mining and Investment Company had been sold. Some of the options concerned had now been exercised and mineral leases had been acquired over some 1,440 acres, the balance of options having been abandoned. No further prospecting or drilling had been undertaken in the Indumain, Elandslaagte or Vreda areas.

In the Orange Free State, the company held coal options and prospecting contracts over some 3,805 morgen on farms situated about 10 to 12 miles south of Vereeniging and to the west of Deneyville, in the Heilbron district. Three boreholes were being drilled on those farms in an endeavour to establish the existence of coal in that area.

GOLD INTERESTS

He then dealt with gold interests and activities.

During the year, the company had, he said, exercised the option to purchase the rights to minerals, excluding diamonds, of remaining extent and sub-division 1 of Harmony Farm No. 222 and of sub-division 5 of La Riviera No. 289 in the Ventersburg district

of the Orange Free State, a total area of about 2,406 morgen. In addition, the company had purchased some 612 morgen of the freehold of remaining extent and sub-division 1 of Harmony Farm No. 222.

WESTERN AREAS AGREEMENT

Since the close of the financial year, agreement in principle had been reached between the company and Middle Witwatersrand (Western Areas), Limited, whereby mineral rights of an area in extent of approximately 800 claims in the south-eastern portion of sub-division 1 of Harmony Farm to the south of Sand River, would be exchanged for mineral rights of approximately an equal area comprised in three portions of Farms Moriyah No. 288, Rustgevonden No. 564 and La Riviera No. 289, adjoining the Harmony block.

Agreement in principle had also been reached whereby New Consolidated Free State Exploration Company, Limited, would contribute to the proposed mining lease area mineral rights of remaining extent of Farm La Riviera in extent of approximately 1,500 claims, and New Free State Gold Estates, Limited, would contribute mineral rights of contiguous portions of sub-divisions 1 and 3 of the same farm in extent of approximately 469 claims.

PROPOSED APPLICATION FOR LEASE

It was proposed shortly to make application to the Government for the lease of undermining rights of those areas totalling approximately 5,469 claims, of which the company would contribute 3,500 claims in which it had an 80 per cent. interest, the remaining 20 per cent. being held by the Anglo-American Corporation of South Africa, Limited, in the terms of an arrangement concluded before the present board assumed control.

If the lease was granted, the company would therefore have a 51.19 per cent. interest in the lease area. It was the present intention of the board that a separate company would then be formed to take cession of the lease and operate the Harmony mine, and shareholders in Union Free State Coal and Gold Mines, Limited, would be given the opportunity to participate in the flotation.

DRILLING RESULTS

Drilling had already been carried out on a fairly extensive scale in and around the proposed area and four additional holes were at present being drilled by the company on Farms Harmony and La Riviera primarily in order to assist in planning the underground layout of the mine. The position of those holes was shown on the plan of the proposed lease area which had been issued with the annual report.

Results in two holes had recently been announced, and were as follows: H-3—Leader reef 7.1 dwt. over 10.34 inches, equivalent to 72 inch-dwt. Basal reef 13.0 dwt. over 42.0 inches, equivalent to 546 inch-dwt.; H-3—first deflection. Basal reef 9.4 dwt. over 45.4 inches, equivalent to 427 inch-dwt.; LR-3—Leader reef 2.1 dwt. over 7.7 inches, equivalent to 16 inch-dwt. Basal reef 6.4 dwt. over 16.2 inches, equivalent to 104 inch-dwt.

It was expected that results of the other two holes, H-2 and LR-4, which at October 29th had reached depths of 4,414 feet and 4,712 feet respectively would become available within the next few weeks. Two deflections of all four holes would be made. Results so far obtained in those boreholes and in other holes previously drilled in the area were encouraging and indicated that the basal reef was at present at a workable depth and with a satisfactory percentage of payability.

WATER SUPPLY

Other preliminary work done at Harmony included contour and magnetometric surveying of the area and the testing of the subsoil for foundations. Ten holes had been drilled in the hope of locating a good water supply, but results had not been entirely satisfactory and consideration was now being given in conjunction with adjoining mineral right holders to the possibility of applying for permission to construct a dam and abstract water from the Sand River at a point on the property.

Plans were being drawn up on the assumption that at the commencement of the production period the mine would have two hoisting shafts and one ventilation shaft, with the possibility that a third hoisting shaft might be sunk at some later date. Detailed plans had been prepared of siting of the surface works of the mine, including the location of shafts, offices, reduction works and slimes dams, and the approval of the Natural Resources Development Council was being sought to that proposed layout. If those plans were approved it was hoped that it would be possible to commence shaft collars of No. 3 and ventilation shafts in the near future. Meanwhile, the first temporary accommodation at the mine was already under construction and tenders had been invited for initial houses for the staff.

PURCHASE OF PLANT

Orders had already been placed in America for two Ward Leonard winders for No. 3 shaft, and those were expected to arrive in the Union shortly. Suitable winders for the ventilation shaft had also been purchased. With those winders installed at the commencement of sinking operations, which were estimated to begin in June, 1950, the speed of sinking for both shafts would be maintained at a satisfactory rate without the usual delays caused by changing over from temporary hoists and the cost of purchasing and erecting temporary equipment should thus be obviated.

Shareholders would be glad to know that the winders from the United States had been paid for before the devaluation of the South African pound, the consequent saving in cost being in the region of £60,000. In other respects, however, the devaluation was likely to increase the cost of bringing the mine to production. The extent of such an increase would, of course, be largely dependent on the proportion of necessary equipment which would have to be purchased in America. Where possible, plant would be bought in countries of the sterling area. Furthermore, increased labour charges would add to the capital cost of bringing the mine to production.

The company's remaining gold options and prospecting contracts in the Orange Free State had all been abandoned following upon the poor results obtained in the borehole on Eenvogelkuil No. 132 and in neighbouring boreholes drilled by other mining houses. As provided for in the original flotation agreement, those options had been ceded to Shares and Investments (Proprietary), Limited.

TWO MAJOR UNDERTAKINGS

From information he had given, shareholders would realise that for the present the activities of the company were being concentrated on its two major undertakings, namely, the Raleigh Colliery in the Transvaal and the proposed Harmony mining lease area in the Orange Free State. Those ventures, together with additional valuable assets to which he had referred, gave cause for satisfaction with future prospects of the company.

During the financial year under review there had been two changes in the administrative and technical control of the company. As from January 1, 1949, Anglo-Transvaal Consolidated Investment Company, Limited, had been appointed to the position of technical advisers, consulting engineers and transfer Secretaries in place of Union Free State Mining and Finance Corporation, Limited. Subsequently, arrangements had been concluded whereby the Central Mining-Rand Mines group purchased a controlling

interest in the company and the Central Mining and Investment Corporation, Limited, had consequently been appointed consulting engineers and technical consultants, while Rand Mines, Limited, had become Secretaries of the company, with effect from March 14, 1949.

A report of the proceedings at the meeting would be circulated to shareholders and would also be published in the press.

The report and accounts were adopted.

MODDERFONTEIN EAST, LIMITED

(Incorporated in the Union of South Africa)

CHANGES IN ECONOMIC POSITION

GOOD SALES AT ENHANCED PRICES

BENEFITS OF DEVALUATION

MR P. H. ANDERSON'S SPEECH

The annual general meeting of Modderfontein East, Limited, was held in Johannesburg on November 1st.

Mr P. H. Anderson, the chairman, presided, and in moving the adoption of the report and accounts said that during the year under review there had been no improvement in the conditions under which the company's mine operated; the average number of European and native employees in the service of the company had been much the same as during the previous year; certain essential materials remained in short supply; and the growing disparity between the price of gold and other commodities continued. Since June 30th last, there had, however, been a material change in the position, to which he would refer after giving shareholders a brief review of the year's operations.

RESULT OF YEAR'S WORKING

Compared with results achieved during the previous year, tonnage milled had decreased by 10,000 to 1,427,000 and development footage by 3,925 to 8,182. Yield per ton milled had been lower by 0.046 dwt., with the result that working revenue had decreased by 5d. per ton. That was more than offset, however, by a reduction of 6d. per ton in working costs, partly due to the decreased amounts of development and consequently the working profit had increased by £3,696 to £415,754.

Total profit had been £418,210. Provisions made in respect of silicosis outstanding liabilities had totalled £22,302, provisions for taxation had accounted for £122,922, provision for lease consideration had amounted to £46,475, and dividends had absorbed £232,701.

DECREASE IN DEVELOPMENT

As he had already mentioned there had been a decrease of 3,925 feet in development accomplished during the year. He had explained last year that a further decrease in the amount of development should be expected, as there remained very little ground of any promise to be explored, and that this was concentrated in the south-eastern corner of the lease area. That portion of the property had now been opened up and a few small payable blocks had been established.

During the year, notification had been received that the Government had agreed to grant a mining lease over an additional 735 claims at the northern end of the Klipfontein corridor and that those claims would be incorporated in the lease area without alteration to the existing formula. That additional area was shown on the plan accompanying the annual report. Up to the end of June, 1949,

the 11th level had been extended 113 feet into the new area, but no payable disclosures had been made. Since then, however, the level had been advanced a further 223 feet, and of that 60 feet had proved payable, averaging 7.1 dwt. over 16 inches, equivalent to 113 inch-dwt.

TWO BOREHOLES

With a view to gaining further information about the undeveloped area below the 14th level adjoining the Klipfontein corridor, it had been decided to sink two boreholes from the surface. The depth of the reef horizon below the surface in that portion of the property was about 1,500. Shareholders would notice from the plan that much development had been done around that area, but it had all proved unpayable.

Further investigations had been made into the question of the existence of such payable Hanging Wall Leader Reefs as existed on mining properties to the west of Modderfontein East.

The only positive result had been in No. 5 Shaft, where a narrow reef bend corresponding in position to the NA-7 leader of New Modderfontein had been resampled but had assayed only 34-inch-dwt.

ORE RESERVES

The quantity of payable ore developed during the year under review had totalled 492,800 tons, which represented an increase of 6,800 tons over that opened up during the previous year, the value at 3.0 dwt. being lower by 0.2 dwt. By far the greater proportion of that was developed by stoping operations, and shareholders would no doubt recall that in his address to them last year he had dealt rather fully with that aspect of ore reserve prospects at the mine.

At June 30, 1949, the available ore reserve had been estimated to be 4,115,000 tons, averaging 3.3 dwt. over a width of 42.9 inches. Compared with the estimate made the year previously, the available ore reserve had decreased by 440,000 tons, the value being unchanged and the width 0.1 inch less.

In concluding the review of operations at the company's mine for the year ended June 30, 1949, he mentioned that there had been no change in the rates of gold mining taxation, which remained the same as those introduced with effect from January 1, 1948, and also that there had been no change in the price of gold, which remained fixed at 172s. 6d. per ounce fine.

Since June 30th last, certain material changes had taken place in the economic position of the South African gold mining industry which shareholders would realise

should have an appreciable and beneficial effect on the future of the company.

INDUSTRIAL SALES

Firstly, negotiations between the South African Government and the International Monetary Fund regarding the sale of gold at enhanced prices for industrial and artistic purposes had resulted in the receipt of a relatively small but welcome increase in revenue.

The first such sale had been made earlier in the year by the Union Treasury, which had disposed of 100,000 ounces at 17s. 6d. over and above the then standard price of 172s. 6d. per ounce. The additional amount realised had been paid into the scheduled mines compensation and outstanding liabilities fund of the Silicosis Board by the Union Treasury and was, therefore, of indirect benefit to gold producers. Subsequent sales had been made by the Chamber of Mines to various purchasers. The amounts realised in respect of the difference between the industrial price and the standard price of gold was being pooled and the net accrual distributed to individual gold producers pro rata to their gold output.

The company's pro rata share of the amount received from sales during July and August, 1949, had been £3,551 16s. 3d., which was equivalent to an extra 2s. 3d. per ounce on the total output during that period. Such income, being in the nature of variable and abnormal accrual which would be spread over some indefinite period, was not being included in the monthly declarations as working revenue, which was still based on the standard price of gold.

It was, of course, not feasible to give shareholders any forecast of how much more gold would be absorbed by the industrial market, nor was it possible to forecast at what prices any such sales would be made. It seemed fairly certain, however, that the market would not be limitless.

DEVALUATION BENEFIT

The other and far more important respect in which there had been improvement in the economic condition of the gold mining industry was the increase in the standard gold price received by producers from 172s. 6d. to 248s. 3d. per ounce fine, which had been brought about by the devaluation of the pound on September 19, 1949.

In terms of the American dollar, however, the price of gold remained at 35 dollars per ounce fine. The downward adjustment in exchange values of the pound in relation to the dollar had, of course, started a readjustment in the direction and strength of other economic forces. Resultant action and reaction would take some time to work themselves out, and as yet it was too early to foresee when and at what level the economic equilibrium would be established. Consequently, although immediate prospects of the company were crystallising fairly rapidly, the more distant prospects were not so clear.

POSITION SUMMARISED

The position could, however, be summarised as follows: First, from the revenue point of view the company was now receiving 248s. 3d. per ounce of gold, which was 75s. 9d. more than the amount received on sales prior to September 19, 1949.

Second, from the working cost point of view the company would have to pay more for direct imports from such countries as America and Switzerland. As the mine was a fully equipped producer, it would not be affected to any great extent in that direction. It would also have to pay more for those commodities which, although not imported direct from dollar countries, depended in varying degrees on the importation of raw materials and capital goods from such countries as America

How much costs would increase on that account it was impossible to say, but the company, in common with the rest of the industry, was faced with the prospect of progressively increasing costs due to what was commonly termed "spiralling." Whether that spiral would be moderate or severe depended largely on what measures would be taken to keep a tight rein on the Union's economy by preventing disproportionate increases in prices and wages.

The company also had to meet higher labour costs within the gold mining industry due to the recent increases in wages and the indirect benefits which had been granted to European and native employees.

Turning to a purely internal matter affecting costs, shareholders would also appreciate that the acquisition of the northern portion of the Klipfontein corridor would necessitate an increased amount of development in order to explore the area and that the expenditure on that work would be reflected in working costs.

PAY LIMIT LOWERED

Those changes in revenue and costs would naturally have a material effect on the company's mining economy, because the increase in revenue was at the moment greater proportionately than the increase in costs. In effect, therefore, the pay limit had been lowered, thereby rendering payable a fairly large quantity of low-grade ore which had previously been unpayable. Some of that ore had already been fully developed and, by bringing that in the total, ore reserve would be increased but the average value would be lowered.

Probably, however, a large proportion of that newly payable ore remained to be developed, principally by stoping, and would therefore only be brought into ore reserves in the future provided rising costs did not once again render it unpayable. It had become necessary to re-estimate the ore reserve on the basis of the new pay limit. That would be done as soon as the new level of costs per ton could be determined with any degree of accuracy, and it was intended to give re-estimated ore reserve figures in the quarterly report for the period ending December 31, 1949. Due to the large amount of low-grade ore brought within the pay limit and to the fact that it had become increasingly difficult to maintain the grade over the past few years, a falling off in mill yield must be expected.

In that connection, he drew shareholders' attention to the fact that the yield per ton milled had steadily decreased during the past five years from 3.329 to 2.754 dwt., an average decrease of little more than 0.1 dwt. per ton per annum. On the other hand, increased payability would make it easier to obtain sufficient ore to maintain an economic rate of milling.

SLIDING SCALE FORMULÆ

Finally, he drew the attention of shareholders to the effects of the sliding scale formulæ on which the company's lease consideration and gold mining taxation were calculated. The combined effect of those two formulæ was that approximately 60 per cent. of increased profits accruing to the company as a result of devaluation, after allowing for increases in costs, would accrue to the Union Government.

The results of operations during the first three months of the current financial year resulted in a profit of £112,261, but he pointed out that that reflected in part the increase in revenue but none of the increases in costs.

A report of the proceedings at the meeting would be published in the press and shareholders could obtain copies on application to the Secretaries in Johannesburg or London.

The report and accounts were adopted.

BLYVOORUITZICHT GOLD MINING COMPANY LIMITED

(Incorporated in the Union of South Africa)

PROFIT EXCEEDS £2,798,000

BENEFITS FROM CURRENCY DEVALUATION

MIR W. M. FRAMES ON YEAR'S OPERATIONS

The annual general meeting of Blyvooruitzicht Gold Mining Company Limited was held in Johannesburg on November 1. Mr W. M. Frames, the chairman, who presided, moving the adoption of the report and accounts, said that in the terms of the special resolution passed by shareholders at an extraordinary general meeting held on November 12, 1948, each of the ten shilling shares of the company were divided into four shares of a nominal value of 2s. 6d. There had been no change in either the authorised or issued capital, which remained at £3,300,000 and £3,000,000 respectively.

Operations, particularly in the latter half of the year, were adversely affected by an unexpectedly severe shortage of European underground labour and, as a consequence, it had not been possible to step up output as rapidly as he had forecast last year.

ALLOCATIONS FROM PROFIT

Total profit amounted to £2,798,943. Amounts set aside in respect of silicosis outstanding liabilities had totalled £43,985, provision for taxation had amounted to £737,431, provision for mineral lease consideration had accounted for £149,432, two dividends had absorbed £1,800,000, making a total of £2,730,848, leaving an unappropriated balance carried forward of £340,200. The balance of working capital on hand was £853,761.

Capital expenditure during the year totalled £703,477 and had been incurred mainly in connection with additions to the power supply, purchase of hoisting and underground equipment, sinking of a ventilation shaft and the installation of main ventilation fans, the erection of change houses, offices and stores, extensions to the reduction plant, provision of additional housing accommodation for European employees, and a proportion of the cost of drilling Boreholes B-2 and B-3 in the area south of the company's property.

CURRENT YEAR'S CAPITAL EXPENDITURE

It was estimated that capital expenditure during the current financial year would amount to £1,600,000, and would be incurred principally on increasing the hoisting capacity and the provision of pumps and sumps at No. 2 Shaft, additional accommodation for European and native employees' recreation hall, and further extensions to the reduction works to increase the milling capacity to 120,000 tons per month.

Development and stoping operations had again been retarded by the frequent occurrence of water-bearing fissures, particularly in the vicinity of No. 2 Shaft where the fissure zones run in a northerly and north-easterly direction from the shaft. Those zones, when intersected, required protracted treatment by cement injection. Where development work and diamond drilling had indicated the presence of water in the stoping

areas, the practice had been adopted of pre-treating the hanging wall by cementation. Owing to the persistent necessity for this work, there had been an appreciable increase in the number of men employed on cementation operations, which represented a considerable item of cost in the underground working expenditure.

DEVELOPMENT ACCOMPLISHED

Development accomplished during the year totalled 32,640 feet, an increase of 697 feet compared with the figure for the previous year. The total advance in country rock was 13,128 feet, of which 8,985 had been in the No. 1 Shaft area and 4,143 in the No. 2 Shaft area. Of 15,875 feet sampled on the Carbon Leader, 15,610 feet, or 98.3 per cent., had been classed as payable values averaging 50.5 dwt. per ton over a channel width of 11 inches, equivalent to 556 inch-dwt.

The few disclosures of unpayable ore in development had been isolated and of a limited extent. The longest stretch of poor development exposed to date had been on the 6th level, west No. 2 Shaft, where 160 feet showed 13.6 dwt. over a reef width of 10.0 inches.

AVAILABLE RESERVE

The available reserve re-estimated at June 30, 1949, was 6,136,000 tons of an average value of 13.7 dwt. over a stoping width of 46.1 inches. That was an increase of 93,000 tons on last year's figure, the stoping width being 1.1 inches greater and the value 0.1 dwt. lower.

In the westerly section, the ore reserve totalled 3,241,000 tons valued at 10.1 dwt. as compared with a total of 3,802,000 tons valued at 16.5 dwt. in the area around No. 1 Shaft and extending up to the eastern boundary of the mine. There remained a large tonnage of ore to be blocked out towards the sub outcrop in the eastern section of the mine. Although development operations had proceeded in that area, it was probable that increasing proportions of ore reserve would, in the course of the next few years, be derived from extending the existing levels in the western section.

UNDERGROUND FACILITIES

Work in connection with the provision of improved underground facilities for haulage and the handling of ore had proceeded satisfactorily. The main haulage on No. 6 level had been completed between Nos. 1 and 2 Shafts and No. 5 level had been holed through shortly after the close of the financial year. Completion, towards the end of the year, of ore passes south of No. 3 Shaft had facilitated the handling of ore in the central area.

Progress had been made in connection with the sinking of No. A.1 Sub-incline Shaft. Work at present in hand was the excavation of hoist chambers, shaft boxes and stations and shaft raise between the 6th and 5th levels. Preliminary work had also been started in

connection with the sinking of Nos. A.2 and A.3 sub-inclines.

The average quantity of water pumped to the surface during the year under review had been approximately 1,320,000 gallons per day of 24 hours, which had been about 360,000 gallons per day more than the figure for the previous year. The second ten-inch pump column and the fourth pumping unit with a capacity of 60,000 gallons an hour had been brought into commission at No. 1 Shaft. Work was proceeding on pump chambers and clear water and settling sumps at No. 2 Shaft. No. 3 Circular Ventilation Shaft, the completion of which had been reported at the last annual meeting, was now in use. Two of the three main ventilating fans were in operation and the third was in course of erection. With the bringing into commission of No. 3 Shaft, the northern compartments of No. 1 Shaft previously used for upcast ventilation, had been freed for handling of material in addition to rock.

ULTRA DEEP BOREHOLES

During the year, the two Boreholes B-2 and B-3 had been drilled on joint account by Western Ultra Deep Levels Limited, south of the southern boundary of the company's mine. Borehole B-2 had intersected the Carbon Leader at a depth of 8,798 feet, assaying 17.88 dwt. over a width of 27 inches, equivalent to 483 inch-dwt. In Borehole B-3, the mean of an original intersection at 8,715 feet and two deflections had given a Carbon Leader value of 6.27 dwt. over a width of 12.5 inches, equivalent to 78 inch-dwt.

Those results indicated that no major displacement of the reef was likely to exist in the lower levels of the mine and that the Carbon Leader persisted at depth. Discussions were taking place with other interested parties in order to formulate plans for the exploitation at some future date of the Ultra Deep area to the south of the company's property.

PRICE OF GOLD

The price obtained for gold had remained unchanged throughout the period under review at 172s. 6d. per ounce fine. In February, the South African Government had concluded arrangements for the experimental sale of 100,000 ounces of gold to a well-known firm of bullion brokers at a premium of 17s. 6d. per ounce. The Government had announced that the total premium thus realised was to be used in the reduction of the amount levied for the last quarter of 1949 on the mining companies in terms of the Silicosis Act. In July, with the full approval of the South African Treasury and the International Monetary Fund, the Chamber of Mines commenced selling gold at a premium to certain clients for industrial and artistic purposes. The premium earned in this way during July and August represented 2s. 3d. per ounce on the total sales of all gold mines, and in the case of the company's mine amounted to £10,437.

CURRENCY DEVALUATION BENEFITS

As the result of the devaluation of the British and South African currencies, the price received for gold had, with effect from September 19, 1949, been increased to £12 8s. 3d. per ounce fine. Since no blocks of unpayable ore had been disclosed in the mine, this increase in the sterling price of gold did not affect the tonnage or grade of ore reserves but the basic revenue per ounce fine of gold produced had been increased by 75s. 9d.

Against this increase in revenue had to be offset the recent increases in wages and

benefits granted to Europeans, increase in wages granted to natives and the higher costs of certain materials and equipment purchased from overseas. The difference between the additional revenue and the increased expenditure would, moreover, be subject to lease payment and taxation at a high rate, estimated at about 60 per cent., in accordance with the sliding scales of the lease and tax formulae. The overall benefit to the company as the result of devaluation would, however, be considerable.

THE CURRENT YEAR

During the first three months of the current financial year, tons milled had been 209,000, the yield per ton milled 14.963 dwt., the revenue per ton milled 149s. 10d., and working costs per ton milled 44s. 6d. Working profit had amounted to £1,100,368, to which had to be added £10,437 in respect of additional revenue received from sales of gold at the enhanced prices for industrial and artistic purposes and sundry revenue of £7,402, giving a total profit of £1,118,207. Development footage had been 9,494 and 3,225 feet had been sampled, all of which had been classed as payable, averaging 43.1 dwt. over a channel width of 11 inches.

A report of the proceedings at the meeting would be published in the press and copies could be obtained by shareholders on application to the head office of the company in Johannesburg, or to the London secretaries.

The report and accounts were adopted.

BRITISH OVERSEAS STORES, LIMITED

ANOTHER SATISFACTORY YEAR

The 23rd annual general meeting of British Overseas Stores, Limited, was held on November 8th in London, Mr R. J. Blackadder, C.A., the chairman, presiding.

The following is extracted from his circulated statement:—

The accounts in your hands again show the results of another satisfactory year's trading, although since the close of the financial years of our subsidiaries in February or March last we have witnessed a change-over in certain classes of goods from a sellers' to a buyers' market with a definite falling off from the high level of business done during the past few years.

In Jamaica we have suffered a falling off in business, but having regard to the large amount of rebuilding and reconstruction work in view and the increase in the population of the island, it seems that the demand for lumber, building materials, and house fittings, which constitute a considerable part of our trade, must continue on a substantial scale, whatever temporary fluctuations may be experienced.

New Zealand.—Our store is continuing to hold its own, but rising expenses dictated by social legislation are a continued feature of the business; there is little that the local management can do to meet these increased costs other than the striving for further business, which objective is well in the minds of the board of our Wellington company.

South Africa and Portuguese East Africa.—Development of interests in Africa is proceeding on normal and satisfactory lines. Although impossible to forecast full results of devaluation in these and other territories, it is hoped that the higher price for gold will lead to a distinct improvement in business throughout the Union, from which the Cape Town Store should benefit.

The report and accounts were adopted.

DALGETY AND COMPANY, LIMITED

BUSINESS WELL MAINTAINED

The sixty-fifth annual general meeting of Dalgety and Company, Limited, will be held in London on December 1st.

The following is an extract from the statement of Mr D. Abel Smith, the chairman, circulated with the report and accounts for the year to June 30, 1949:—

I am glad to be able to report the conclusion of another satisfactory year's trading. The company's business has been well maintained. The three main earning sections are wool, merchandise, and stock and station, but all departments have contributed to the excellent results achieved, notwithstanding a very considerable rise in operating costs and charges, particularly in the salary and wages account. So far there is little sign of this serious inflationary movement slowing down, and the effect of a shorter working week so generally adopted both here and overseas inevitably increases production costs and contributes to the inflationary spiral. In these circumstances, and taking advantage of a good year, it was considered prudent to make more substantial appropriations to reserves and provisions than normally.

Your company's chief business—wool—has again produced results which have surpassed all expectations. The previous season's Australian and New Zealand realisations, which were in themselves a record, have been exceeded by £A and NZ 40½ million, bringing the 1948/49 returns for new clip wools up to the unprecedented total of £A and NZ 226 million—an increase of some 21.8 per cent. I need hardly mention the benefit of this to Australia and New Zealand, where wool plays such a predominant part in the national economy. The quantity handled by the company, overseas and in London, was well maintained at 619,163 bales—an increase of about 3 per cent. over the previous year's total.

DEMAND FOR WOOL

The demand for wool—particularly of the finer qualities—still seems in excess of current production and, under world-wide competition, the offerings throughout the season under review were rapidly absorbed and prices attained the highest level in the history of the trade.

The profits for the year, after deducting expenses and provisions for bad and doubtful debts and other contingencies, amounted to £1,021,972 compared with £1,005,056 for the previous year. We are recommending the payment of a final dividend of 5 per cent. on the ordinary shares which, with the interim dividend of 3½ per cent. paid in May, represents a distribution for the year at the rate of 8½ per cent., and we are again recommending the payment of a bonus of 1 per cent. on the ordinary shares, making a total distribution of 9½ per cent.

The net cash payments to the ordinary and preference shareholders for the year amounted to £92,125, which compares with the company's turnover in wool and produce, stock, merchandise, etc., of £80,896,965, and amounts to the fractional sum of 0.2733d. (or about one farthing) in the £ on such turnover, and still only 0.4777d. (or less than one halfpenny) in the £ if the cost of servicing the company's loan or debenture capital is included. A substantial proportion of even these small amounts is paid out to shareholders resident in the overseas territories, where the company has its main business. It is obvious from these figures that the company's numerous overseas customers need have no feeling that the modest charges made to them for the variety of services performed include any unreasonable contribution to distributed profits.

CALCUTTA TRAMWAYS COMPANY, LIMITED

QUESTION OF FUTURE TENURE

The annual general meeting of the Calcutta Tramways Company, Limited, was held on November 9th in London.

Sir Geoffrey R. Clarke, C.S.I., O.B.E., the chairman, in the course of his speech, said: After setting aside £80,000 for renewals and replacements and making an addition of £25,000 to the provision for deferred repairs, there remained a working profit for the year to December 31, 1948, of £268,736. It is proposed to distribute 6 per cent. on the nominal amount of the issued ordinary share capital of the company. I would point out that this 6 per cent. represents little more than 3 per cent. on the actual capital expenditure provided by the ordinary shareholders, the balance of expenditure having been provided out of profits placed to reserve accounts in past years which would otherwise have been available for dividend.

An undertaking such as this company, formed to supply cheap transport to a city like Calcutta, cannot stand still, and we have a programme for future extensions and improvements which it will take many years to implement.

It is not intended to commit the company to any further large capital expenditure until the future tenure of the company can be satisfactorily agreed with the authorities concerned.

It is now apparent that although the Corporation of Calcutta in 1944 gave notice of its intention to purchase the company's undertaking, and, in fact, subsequently made an offer, they were never financially in a position to implement the purchase, and we understand that the necessary sanction by the Government to raise a loan was not forthcoming.

At the moment the corporation is under suspension and its duties have been assumed by a commissioner. Presumably, the Government could, by legislation, at any time take over the undertaking; still, the company is in a strong position to negotiate terms in view of its agreement with the corporation, which is sanctioned by special Acts.

The company's power to operate the tramways is restricted by the right of the corporation under agreement to purchase that part of the undertaking lying within the municipal boundaries at periods recurring every seven years, the next such date arising on January 1, 1952. Although in present circumstances it seems improbable that this right can be exercised, its existence acts as a deterrent to any extension of the company's system, and to the raising of additional capital for such purposes should that be deemed necessary and advantageous in the future.

This uncertainty with regard to the future tenure of the company is causing the directors great concern, and Mr David Webb, during his visit to Calcutta at the end of 1948, had interviews with the Premier of West Bengal and the Minister of Finance, at which the whole position was discussed. These discussions were of an exploratory nature, but it was felt that, as a result of them, it might be possible to reach an agreement acceptable to both the Government and the shareholders, as to the future tenure of the company and the terms on which the Government, ultimately, might acquire the undertaking. The Government is interested, and negotiations will be continued as opportunity offers.

The report was adopted.

CONSOLIDATED MAIN REEF MINES AND ESTATE, LIMITED

(Incorporated in the Union of South Africa)

LABOUR SHORTAGE AFFECTS RESULTS

BENEFITS FROM CURRENCY DEVALUATION

MR W. M. FRAMES ON THE OUTLOOK

The annual general meeting of Consolidated Main Reef Mines and Estate, Limited, was held in Johannesburg on November 2nd.

Mr W. M. Frames, the chairman, presided and, in moving the adoption of the report and accounts, said that operations had been adversely affected by a further decline in the available strengths of European and native labour.

At 2,203,057 tons, ore mined had been 17,607 tons less than in the previous year, but ore taken from surface dumps had increased by 14,875 tons and ore milled had decreased slightly to 2,225,000 tons, which was much below the capacity of the reduction plant. Working costs had decreased by ninepence per ton milled, but as the yield had been lower by 0.144 dwt., equivalent to 1s. 2d. per ton milled, working profit for the year had fallen by £48,486 to £223,897.

PAST YEAR'S PROFIT

After adding £1,363, being the difference between sundry items shown in the income and expenditure account, the total profit was £225,260. There had been a withdrawal of £13,400 from the shareholders' contingency reserve and a net credit on capital expenditure of £15,519. Provision in respect of silicosis outstanding liabilities had accounted for £27,163 and provision for taxation had amounted to £2,854. Forfeited dividends refunded to shareholders had totalled £13,427 and dividends absorbed £218,330.

Development footage advanced during the year had totalled 80,303 feet, representing a decrease of 16,783 feet, compared with the previous year. Total footage sampled had amounted to 57,640 feet, of which 24,715 feet, equal to 42.9 per cent., had proved payable at an average value of 5.3 dwt. per ton over a channel width of 39 inches.

DEVELOPMENT RESULTS

During the latter part of the year, development had been largely restricted to the more promising of the undeveloped areas of the mine. On the Main Reef and the Main Reef Leader small areas of payable ore had been opened up in widely separated parts of the mine, principally west of Bantjes Dyke and in the lower levels east of No. 3 Shaft. Elsewhere, in the lower levels, exposures on those two reefs had again been disappointing. The satisfactory tonnage of payable South Reef had been added to the reserves in the upper levels of the mine. Values on that reef had decreased rapidly with depth, and it was only in the north-east corner of the property that any material tonnage of the payable South Reef was likely to be developed.

On the Bird Reef, payable development had been mainly in the lower levels to the east of No. 10 Shaft where an appreciable tonnage of low-grade ore had been opened up. In the lower levels at No. 8 Shaft, the reef exposure had been generally of low value but indicated the existence of a few blocks of payable ore.

Development on the Kimberley Reef had been curtailed in the south-western portion of the mine where disclosures confirmed the

very low values revealed in the boreholes sunk from the surface some years ago to test this reef. East of No. 6 Shaft, however, values had shown an encouraging improvement as development advanced into the area in which boreholes drilled during 1946 and 1947 had given promising results. Present indications were that a substantial tonnage of payable ore would be opened up in that area.

ORE RESERVES

The tonnage of payable ore developed had increased by 441,500 tons to 1,104,900 tons, the average value being 0.1 dwt. lower at 3.6 dwt. per ton.

The available ore reserve had been re-estimated as at June 30, 1949, to be 4,175,000 tons, averaging 3.7 dwt. over a stopping width of 55.1 inches. Compared with the previous year, that represented a decrease of 24,000 tons, the stopping width being lower by 0.1 inch and the value unaltered.

At the last annual meeting he had drawn the attention of shareholders to the appreciable decrease in the ore reserve tonnage that had taken place in recent years. He had also stressed the importance of preserving existing reserves for as long as possible in order that the undeveloped area of the mine lying at depth towards the southern boundary might be thoroughly prospected. The decrease of only 24,000 tons in the available reserve was satisfactory in the circumstances.

LOWER GRADE NOW PAYABLE

The increased price obtained for gold following the devaluation of the pound would make possible economic mining of ore of a lower grade and would benefit the mine materially by adding to payable reserves appreciable tonnages as it justified the continuation of development operations in certain areas where expectations were previously considered too unpromising to warrant further exploration. The profitable life of the mine would be prolonged, but he pointed out that undeveloped areas were small and scattered with the exception of deep level ground lying between the bottom workings and the southern boundary, where results of exploration had continued to be consistently barren. One winze had been sunk some 1,700 feet below the 62nd level and had failed to disclose any payable values even at a reduced pay limit.

SALES FOR INDUSTRIAL PURPOSES

No alterations had been made in the basis of gold mining taxation in the Income Tax Act of 1949. As the company's ratio of profit to recovery had again been below 6 per cent., no liability for taxation had been incurred on profits arising out of gold mining. The price of gold had remained unchanged at 172s. 6d. per ounce fine throughout the period under review. In February last, however, the Union Government had made an experimental sale of 100,000 ounces of gold to a well-known firm of bullion brokers at a premium of 17s. 6d. per ounce. The total premium thus realised by the

Government would be used in the reduction of the silicosis levy on mines for the last quarter of 1949. In addition, the company would benefit from certain transactions which, as shareholders were aware, were being conducted on behalf of South African gold producers by the Transvaal Chamber of Mines for the sale of gold at enhanced prices for industrial and artistic purposes. The premium received by the Chamber of Mines in respect of those sales during the months of July and August had represented additional revenue amounting to 2s. 3d. per ounce fine on all sales during the period, and in the case of Consolidated Main Reef had amounted to £6,173. The sale of gold at a premium was continuing and would provide a relatively small, but welcome, addition to the revenue of the mine.

With effect from September 19th, the price received by producers for gold had been increased to 248s. 3d. per ounce fine by the devaluation of the South African currency. As he had already indicated that new price would result in an addition to the payable reserves of a considerable tonnage of ore previously standing below the pay limit. To what extent available ore reserves would be increased and the average value lowered, could not be estimated until more was known of the influence of wage and other increases upon working costs and pay limits in different sections of the mine.

The company would maintain the policy of drawing upon ore reserves at approximately their average value insofar as a change in

the distribution of reserve tonnages could be met by existing shaft and other facilities.

The decline in yield per ton milled would be slow and gradual as stopping operations were adjusted economically and efficiently to meet the new reserve conditions.

THE FUTURE

While the company could view with optimism the major financial benefits accruing to the company which had been operating for so long upon a small margin of profit, shareholders would realise that expectations of future dividends could not be based upon remarkably high profits earned during the period of transition. The good profits the company hoped to make when working costs and yields were finally stabilised and when the best economic advantage had been taken of the lower pay limits to strengthen the life and prospects of the mine, would be subject to heavy taxation. No big burden of capital expenditure, however, was likely to be incurred unless important and unexpected extensions of payable ore were found in depth.

During the first three months of the current financial year, the working profit had amounted to £145,324. Development footage had totalled 14,917.

A report of the proceedings at the meeting would be published in the Press and copies could be obtained by shareholders on application to the Head Office in Johannesburg or to the London Secretaries.

The report and accounts were adopted.

J. GLIKSTEN AND SON, LIMITED

LARGE INCREASED PROFIT WIDE-SPREAD ACTIVITIES

MR ALBERT A. GLIKSTEN ON PROGRESSIVE EXPANSION

The forty-fourth annual general meeting of J. Gliksten and Son, Limited, was held on November 10th at the Holborn Restaurant, London, W.C., Mr Albert A. Gliksten, chairman and joint managing director, presiding.

The secretary, Mr R. Law, A.C.A., read the notice convening the meeting and the report of the auditors.

The following is the chairman's address, circulated with the report and accounts for the year to June 30, 1949:—

The accounts have been in your hands for a period of three weeks, and I assume that in accordance with our customary practice, the directors' report and accounts as circulated may be taken as read.

GROUP PROFITS

Stockholders, will, I feel sure, be gratified with the results disclosed in the statement of accounts annexed hereto. The trading profit of the group amounts to £509,118, as compared with £364,388 a year ago. Adding income from investments, etc., of £8,680, and deducting directors' fees, interest and depreciation of £121,533, a figure of net profit before taxation results of £396,265, as against £320,677. The annual provision for taxation on this occasion required £233,198, as compared with £203,168 for the previous year.

The board have deemed it desirable to make a supplementary reserve of £35,797 against future taxation by reason of the change in date of accounting period of two subsidiary companies.

The profits then remaining have been appropriated as set forth in the directors' report, the dividend on ordinary stock being maintained at 25 per cent., less tax, as for the previous year.

As regards depreciation very full provision has been made on this occasion at £103,021, as against £39,889 a year ago, such provision being again substantially in excess of the statutory wear and tear allowance granted for tax purposes.

The progressive expansion in net earnings has again enabled your board to transfer increased amounts to reserve, £60,000 on this occasion as against £50,000 a year ago, while the undistributed profit balance carried forward is £50,350, as compared with £46,903.

RECORD NET EARNINGS

Once again I am able to report that the net earnings of our group in the past year have surpassed all previous records, and it is all the more creditable that this has been achieved during a year when trade recession had already developed in many industries coupled with widespread economic difficulties.

As reported to stockholders, prior to the annual general meeting a year ago a controlling interest was acquired subsequent to the close of the accounts in an old-established enterprise which is one of the leading primary timber producers throughout the British Colonies. This acquisition, taken in conjunction with a regulated policy of expansion of the field of the group's activities over the past few years, has contributed towards group earnings.

CONSOLIDATED BALANCE-SHEET

The undistributed surplus and reserves, including reserve for future taxation, aggregate £655,736 equivalent to 166 per cent. of the Ordinary stock issued, as compared with £580,835, an increase during the year of

£84,901. Current assets exceed current liabilities to the extent of £780,673.

As will be noted from the consolidated balance sheet, considerable moneys have again been expended in broadening the activities of the group throughout the past year. By reason of increasing production of our Colonial enterprises, and also in some measure through partial decontrol in our industry, trading stocks carried show a substantial increase when compared with the preceding year.

ISSUE OF NOTES

After giving mature consideration to alternative methods of finance, the directors decided upon certain of the operating companies within the group offering for subscription Two and a half per cent. Ten Year Unsecured Notes to a total amount spread over the companies concerned of £400,000. These Notes will be repaid by annual instalments over the period of ten years, or earlier at the companies' option, the first repayment being made one year from date of issue, and this, coupled with our normal banking facilities, should prove to be fully adequate.

The question of finance in more permanent form was considered, but having regard to market conditions it was deemed expedient to retain the capital of the parent company at its present level and cover necessary amortisation of the Unsecured Notes out of accruing profits. Stockholders will, I feel sure, be satisfied with this decision, and with the terms upon which the moneys represented by the respective Note issues of the companies operating within the group have been raised. Stockholders may rest assured that the whole question of finance in more permanent form will not be overlooked given a return to normality in international currency relationships and also some measure of easement in world economic conditions.

GENERAL SURVEY

While considerable capital expenditure was embarked upon during the year, as reflected in the increased charge for depreciation, further expenditure on fixed assets will be incurred in the year ending June 30, 1950, as it is the considered policy of your board not only to maintain the fixed assets of the group at their highest efficiency, but also to bring into operation new and more efficient processes for dealing with the very considerable group turnover handled by its operating units.

I would lay stress on the fact that the results secured represent a very modest profit margin indeed per unit of turnover, which is spread over the five continents. While group direction and formulation of group policy remain centred in London, there is considerable decentralisation in the executive functioning of our operating units. At the same time I would mention that frequent visits are paid in each year to our overseas subsidiaries by directors and executive officers of the parent company.

HIGH EFFICIENCY

It is an especially pleasing factor in the operations of the group that the trading stocks are turned over most rapidly, and the working capital of the group, also in terms of turnover, is profitably employed by reason of the high efficiency ratio in all the companies' processes. It will be of interest to stockholders to know that the sawing capacity of our group exceeds 50,000,000 board feet per annum, of which approximately one-half is centred in British Colonies.

Throughout the past year an increasing flow of logs and lumber has been shipped from Colonial sources to the United Kingdom and also to hard currency areas. Further considerable expenditure on development

has been fully provided for in the accounts of the group and forms a charge against the group profit, no part being capitalised. Important progress has also been made by way of technical research, while export turnover has shown a marked increase throughout the year. Your board is well satisfied with trading progress to date in the current year.

TRIBUTE TO STAFF

The directors would like to place on record their satisfaction with the executive and other personnel employed throughout the group and for their wholehearted efforts in its best interests. Relationships between the board, executive and other personnel continue to be excellent throughout the whole organisation, and whatever difficulties may arise in the future, stockholders may be assured that the group is well equipped in every way to cope with changing conditions.

The report and accounts were unanimously adopted; the proposed dividend was approved; the retiring director, Mr. G. H. Punchard, was re-elected and the remuneration of the auditors, Messrs Pannell Crowdon and Hardy, was fixed.

The proceedings terminated with a hearty vote of thanks to the chairman, directors, staff and employees.

ASPRO, LIMITED

CHAIRMAN'S STATEMENT

The fourteenth annual general meeting of Aspro Limited was held on November 7, at Winchester House, Old Broad Street,

NOTICES

PERSONNEL MANAGEMENT

Applications invited for appointment as Consultant in Personnel Division of Urwick, Orr & Partners Ltd., University education, with degree in humanities or technology. Some years' experience in responsible positions in industry or commerce as well as at least three years' experience in personnel work at high level. Accustomed to employee consultation and Trade Union practice. Academic training in psychology desirable. Successful candidate must be prepared to reside in North of England. High level of salary commensurate with responsible work entailed. Applications must be in writing and should give full details of qualifications and career; and should be addressed to Urwick, Orr & Partners Ltd., 7, Park Lane, W.1. quoting Reference B/1026. Only candidates selected for interview will receive acknowledgments.

EXPORT Executive, Graduate B.Com. (London) (first-class honours) and M.B.A. (Marketing) Chicago, age 33, now consular trade officer in Middle West. Experience marketing, market research and advertising practice in U.S.A. Open to offers, but prefers appointment in U.K. or U.S.A. developing U.K. exports. Interview U.K. November.—Box 214.

MANUFACTURER of nationally advertised and distributed packed foods requires services of an assistant to production manager in Liverpool district. Applications can only be considered from a man aged between 25 and 35, of first-class education and having experience with production methods and organisation, preferably in a food manufacturing concern of national repute.—Full details, including salary expected, should be addressed to Box A18, Furness Advertising Offices, 66 Bold Street, Liverpool.

YOUNG man (28). National and Higher National in Commerce. Taking Final C.I.S. December. Sound experience in Secretarial Practice with large public company. Requires position as Assistant Secretary or similar progressive position, commencing early 1950. 600-1600.—Box 255.

CHENIL GALLERY, Kings Road, S.W.3. Greek Photographic Exhibition daily, Oct. 29th-Nov. 19th, excepting Sundays, 10 a.m. to 7 p.m. Admission free.

WEEKEND AND CHRISTMAS PARTIES: If you feel in need of a break and would like an informal holiday in interesting company, ask for details of our latest arrangements.—Erna Low, 5, Reece Mews, London, S.W.7. KENington 0911.

ECONOMIST April, 1947, July, 1949—114 issues. What offers?—Box 247.

MANUFACTURING concern, public company, requires Secretary capable of co-ordinating all departments London factory under Managing Director. Experience of radio industry an advantage. Applicant must have capacity, drive and tact.—Write with full details to Box 249.

VACANCY will exist in the New Year for director to organise and control production in chemical factories in the North of England. Executive production experience and a scientific background essential.—Write to Box 216, stating age, education and experience.

London, E.C.2. Mr Maurice A. Nicholas, the chairman, presided.

The following is the chairman's circulated statement.

For the reasons stated in my letter to stockholders of the 5th July, the financial year end of the Company has been changed to the 31st March.

The profit on trading as shown in the consolidated profit and loss account for the period of nine months ending March 31, 1949, before taxation and other chargeable items, amounted to £432,457 as compared with £585,506 for the twelve months to June 30, 1948. The surplus after income tax is £132,720; to this is added the balance of profits carried forward from the previous year, augmented by the release, due to the change of the year end, of a sum previously set aside as provision for taxation, giving a total of £376,562 for nine months as against £345,278 for the previous year. After deducting £52,594, representing preference and interim ordinary dividends, your directors propose (a) to allocate the sum of £100,000 to Aspro Limited's general reserve and (b) as anticipated in my letter of July 5 to recommend a final dividend of 11½ per cent., less tax, on the ordinary stock. The balance to be carried forward on profit and loss account will be £194,773, as against £132,152 for the year 1947-48.

For comparison purposes between the two years ending June, 1948, and June, 1949, the following information relating to the Parent Company is given:—

Aspro Limited sales for the year ending June, 1949, show an increase of 9 per cent. over the previous year, establishing an all-

time record for the Company. Charts are embodied in this report demonstrating the continued progress of sales. The net profit before taxation for the year ending June, 1949, is calculated to be £455,200 as compared with £394,789 last year.

As a consequence of the adoption and the presentation to our stockholders of the new form of balance sheets I do not consider there is any need to draw attention to or to comment on any particular items contained in them. The balance sheets have been prepared in a form which is fully explanatory and which gives a clear and concise picture of the position.

Due to retirement from business activities Mr G. R. R. Nicholas, C.B.E., J.P., one of the founders of Aspro, decided to resign from the board. In his place his son Mr H. J. Nicholas was invited to join the board and has accepted the appointment. In conjunction with the late Mr Alfred Nicholas, Mr George Nicholas was responsible for not only the initial success of Aspro Limited but also played his part in a maintenance of that success. He is still one of the largest stockholders and we are assured that, despite his retirement, his sage advice will always, if required, be readily available.

My letter of July 5, to stockholders reported fully on changes in management and directorships and on our subsidiary companies. Copies of the letter are available to any stockholder requiring them. There have been no developments of consequence since the date of the letter.

I wish to thank my colleagues on the board together with the executives and staff for their co-operation and continued efforts to promote the Company's interests.

URWICK, ORR AND PARTNERS seek additional staff for the Control Division of their professional work as Consulting Specialists in Organisation and Management. Applicants must satisfy the following requirements:

1. Professional qualifications in Accountancy.
2. Some years' executive experience in responsible industrial appointments, with particular reference to costing.
3. Sound general education and wide interest in contemporary affairs.

Applications should be addressed in WRITING to the Company's Offices at 7 Park Lane, London, W.1, quoting reference C.1027.

ECONOMIST (M.A. Cantab.), Statistician, Barrister-at-Law (qualified in economic research and statistical analysis only), seeks employment leading to executive position in commerce, finance or industry. Aged 30. Single. Fit.—Box 252.

MONSANTO CHEMICALS LIMITED require young men of sound education and good address as trainees for positions on their sales staff in London. Applicants should have completed their National Service commitments and be between 20-25 years of age. Some previous commercial experience an advantage. Apply, giving full details of age and qualifications, to Chief Personnel Officer, 8 Waterloo Place, S.W.1.

WOMAN, age 42, recently lost husband, seeks permanent full-time employment. Public school and L.S.E. Wide, up-to-date experience, including senior executive level in industry and commerce and direction of economic and statistical research. Music degree. Pilot's licence.—Box 253.

FOR SALE.—Economist, unbound; (a) July, '45-Feb., '47 (11 numbers missing); (b) April, '47-August, '49 (complete). Offers.—Box 254.

ACCOUNTANT/SECRETARY (qualified) required by progressive Hosiery Manufacturing Company in Nottingham area. Appointment calls for share in general administration as well as usual accountancy duties. Large expansion programme offers excellent opportunity to a capable and energetic man. Commencing salary £800/£1,000 according to qualifications.—Box 248.

PERMANENT Bureaucrat (39), now in four-figure brackets, ex barrow boy, no degrees, but plenty of go, seeks less inhibited outlet for it. London area preferred.—Box 250.

THE advertiser, a young man aged 26, formed a small company in Ireland in 1947 and has since been responsible for management of its finances, policy and personnel. The company now manufactures itself, and, though it is still expanding, the advertiser wishes to resign his active interest to gain wider business experience in a larger organisation. Company imports raw material from U.S. and processes it in Ireland; advertiser has just completed negotiations in Paris and Brussels to export entire output. Another department sells a high quality technical service to business organisations and Government departments. Personnel are highly-skilled technicians of diverse temperaments doing precision work, and well kept at work efficiently under—at first—primitive conditions due to lack of capital. Will travel anywhere provided work is interesting, prospects good and salary reasonable. Available for interview at London.—Box 256.

Investment Statistics

Company Notes

International Nickel.—Net earnings for nine months to September 30, 1949, amounted to \$26,077,125 (\$29,920,873).

Wall Paper Manufacturers.—Group trading profit amounted to £3,287,439 in the year to June 30, 1949, compared with £3,314,957 in the previous 11 months' period.

Ind Coope and Allsopp.—Consolidated trading profit declined from £2,567,827 to £1,984,892 in the year to August 31, 1949. Net profit was £666,177 (£778,552). A final dividend of 20 per cent is recommended, making 30 per cent for the year (30 per cent for 11 months).

Austin Motor.—Group net profit amounted to £790,029 (£556,962) in the year to July 31, 1949. The dividend of 40 per cent is unchanged.

Bebenham's.—Net earnings, after profits tax, but before income tax and future tax reserve allocation increased from £957,776 to £1,132,214 in the year to July 31, 1949.

Tube Investments.—Net profit of the group amounted to £2,064,075 (£2,071,200) in the year to July 30, 1949. The dividend of 25 per cent is unchanged.

Crittall Manufacturing.—Net profit increased from £219,128 to £241,373 in the year ended August 31, 1949. The dividend of 20 per cent for the year is repeated.

Montague Burton.—Net profit increased from £439,244 to £842,229 in the year to March 31, 1949. A dividend of 12 per cent is recommended for the year.

Harrisons and Crosfield.—Group profit, including special credits of £84,373 (£18,074) amounted to £788,932 (£639,989) in the year to June 30, 1949. A dividend of 25 per cent for the year is recommended (same).

Rhokana.—Net profit rose from £4,668,094 to £5,425,175 in the year to June 30, 1949. The dividend of 100 per cent for the year is repeated.

Thos. W. Ward.—Group normal income amounted to £1,703,324 (£1,682,331) in the year to June 30, 1949. Exceptional income declined from £212,314 to £18,223, making total income £1,721,547, against £1,894,645. Net current assets at the year end were £2,362,705 (£2,402,329). Liquid funds are lower at £375,989 (£630,586).

The Calico Printers' Association.—Consolidated trading profit, after transferring £261,018 to stock reserves, amounted to £2,579,596 (£2,288,044) in the year to June 30, 1949. Total income was £2,780,014 (£2,494,142). Net current assets increased from £6,482,125 to £7,139,415 by the year-end; stocks are up from £4,402,748 to £5,104,503, and debtors from £1,783,194 to £2,076,403; liquid funds amounted to £4,433,016, against £4,434,288.

Gloucester Railway Carriage and Wagon.—Group trading profit increased from £166,916 to £267,277 and net profit from £79,922 to £105,308 in the year ended May 31, 1949. The dividend of 15 per cent is unchanged. Net current assets amounted to £648,975 (£788,137) at the year-end.

Roan Antelope Copper.—Profit in the year ended June 30, 1949, amounted to £1,963,065 (£2,281,465) and net profit £636,543 (£969,314). Revenue from copper sales in the period was £120 7s. 9d. (£115 10s. 7d.) per long ton of blister copper and total cost £85 4s. 2d. (£74 18s. 8d.) per long ton. Total output increased from 51,757 long tons to 56,162 long tons.

London Express Newspapers.—Total group revenue in the year to June 30, 1949, amounted to £7,403,693 (£6,654,114), and net profit £232,433 (£200,250).

Capital Issues

BONUS ISSUES

Clear Hooters.—Shareholders are to receive one new 1s. share free for each share held on December 19th.

Serck Radiators.—Capital is to be increased to £750,000 by the creation of 550,000 £1 shares of which £200,000 are to be distributed as a bonus issue and a further £200,000 to be offered to shareholders at par.

Villiers Engineering.—Shareholders are to receive a free issue of one 4½ per cent £1 preference share for each £1 ordinary share held.

Metal Traders.—The proposed scrip bonus issue of nine £1 ordinary shares for each £1 share held has been deferred.

Whessoe.—Shareholders are to be offered 200,000 5s. ordinary shares at 30s. per share in the proportion of one new share for every four shares held.

Derby and Midland Mills (1935).—Shareholders are offered 208,000 5s. ordinary shares at 11s. 6d. per share in the proportion of two new shares for every five shares held.

Brand and Co. (Sauce and essence makers).—Permission is being obtained to deal in 150,000 cumulative redeemable 5 per cent £1 preference shares. Capital consists of £300,000 in £150,000 of the above issue and £150,000 in £1 ordinary shares. Profit subject to income tax for years ended September 30th: 1938, £12,261; 1947, £58,449; 1948, £74,806. Assets as at September 30, 1948: Fixed assets, £176,052; total current assets, £450,935; net current assets, £194,823.

Redemption yields are worked out on the assumption that all dated stocks will be repaid at latest date. Such yields are marked 'r'. To this rule there is one exception (Funding 4 per cent) on which the yield is taken to earliest date and marked 'e'. (a) Net yields are calculated after allowing for tax at 9s. in £. (b) Flat yield. * Assumed average life 15 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) Assumed dividend 18½% after capital bonus. (f) To latest redemption date. † Free of tax

Statistical Summary

EXCHEQUER RETURNS

For the week ended November 5, 1949, total ordinary revenue was £85,960,000, against ordinary expenditure of £87,442,000 and issues to sinking funds (£230,000). Thus, including sinking fund allocations of £9,597,000, the surplus accrued since April 1st is £965,000 compared with £772,168,000 for the corresponding period a year ago.

(1948 Accounts)

CIVIL SERVICE COMMISSION

The Civil Service Commissioners announce an Open Competition for about six vacancies in the Junior Assistant grade in the Government Communications Headquarters, to be held in 1950 concurrently with the competition for the Administrative Class of the Home Civil Service (Method II). Age limits at least 20½ and under 26 on August 1, 1950, but certain candidates born on or after August 2, 1923, may be admitted at the Commissioners' discretion. Entry on the salary scale, for men in London, of £330 x 125-£725; salaries are somewhat lower for women and for officers serving outside London. Promotion is possible in about seven years to higher grades on salaries from £700-£1,200 per annum, with prospects of further advancement. The work of G.C.H.Q., is very varied and although mainly specialised, requiring high-class linguists, mathematicians and scientists, it also covers most aspects of the work of a medium-sized Government department.

Further particulars and forms of application obtainable from the Secretary, Civil Service Commission, Burlington Gardens, London, W.1, quoting No. 2703; completed Application Forms must be received by him by November 5, 1949.

Our company has vacancy in London for senior copy-writer with considerable agency experience, including technical accounts. Under 40. Five-day week; free lunches and pension scheme.—Write Box Z.V.330, Deacon's Advertising, 36 Leadenhall Street, E.C.3.

PRODUCTION going smoothly? Or are you losing sleep over it? Young executive, B.Com., experience management research, now in comfortable post in large engineering group, wants tougher job in small firm. Really good handling both facts and people. Probably worth your while to investigate.—Box 259.

The Extreme Centre

THE compromise on the Iron and Steel Bill, to which the Labour Commons agreed on Wednesday and the Conservative Lords are expected to agree within a day or two, clears the way for a general election this winter. It is not yet by any means certain that the Government will go to the country in February. But it is very probable, and—since the alternative, for a variety of technical reasons, would be late May or early June—it is very much to be hoped for. This means that the blanket of party politics, which already lies heavy over all public affairs, will now be thicker than ever, and all the great issues of state will be pushed into the background while the partisans lead the cheers for themselves and the electors struggle to make up their minds which party, on a balance of all considerations, will do most good, or least hurt, to the common weal by being in office for the next five years.

It is not, at any time, an easy question to answer—that is, for a non-partisan to answer—and this time least of all. It has been said that, at a political election, nobody ever votes for anybody, but against somebody else. This certainly looks like being true at this election. And yet, if ever there was a time when Britain required a positive policy, backed by active confidence that it would attain its objects, that time is now. Previous articles that have appeared in these columns in the last five weeks have attempted to sketch, very summarily, an economic policy designed to put the wealth-creating apparatus of the British community back into good working order. It could hardly be described as a popular policy, nor would its measures be painless, either to the electors or to the elected. But it is consistent; and it is designed to achieve the purposes that any resolute government ought to set itself. To end the series, it is necessary to enquire whether the coming election offers any chance at all of a government emerging clear-headed enough to define the goal of national reinvigoration and courageous enough to take all the necessary measures to attain it.

One of the stories that came out of the meeting of the Council of Europe at Strasbourg last summer was of the Greek lady, who, when asked what party she belonged to, declared herself a member of the Extreme Centre. When asked what the party stood for, she explained that it held very moderate views, but, if it came to power, would liquidate everybody who would not accept them. Not for the first time, Greek political philosophy points the way for other democracies. In the translation from Athens to Westminster, of course, "liquidate" would be softened to "keep out of office." But that is a trifle of procedure; the essential thing is to raise the banner of the Extreme Centre. What this country manifestly needs, and, to judge by many of the indications, is impatiently waiting for, is a government which will pursue moderate ends by forthright means. Moderation of aims does not mean acceptance only of those things on which all men can agree—that would be the Dead Centre—but it does involve acting on the assumption that neither of the competing philosophies is

likely to be either completely right or completely wrong. A Government which set out in the scientific spirit to define where it wanted the country to get to in five years, which deduced from that the measures that were best calculated to achieve the object, and then had enough moral courage to push its policies through, disregarding interim unpopularity in the conviction that the success of the policy would bring its political reward—that would be a government of the Extreme Centre, and the ills from which the British economy is suffering are not so large that they would not yield to such a treatment.

★

Where, in the coming election, is such a government to be found? Much of what has here been urged is in the programme of the Liberal Party. But—though it is said with real regret—it is hardly possible to believe that the Liberal Party could, unaided, provide such a government. The Liberals could assist and strengthen it—and the more of them there are in Parliament, the greater their assistance could be. But they cannot provide its main structure.

Is the solution, then, to be found in a National Government, a coalition of the main parties? It is an idea which greatly attracts many minds. But there are two things against it, either of which is conclusive. The first is that it appears to be politically impossible. The prejudice of the Labour Party against coalitions is based on instinct reinforced by history, and it would take much more than one closely-balanced election to upset it. Many Conservatives hanker after a coalition because it would enable them to stave off further nationalisation while still keeping a curb on the unions; but it is very difficult to see what advantage the Labour Party could expect from a coalition, whether it was the senior or the junior partner.

The second argument against a coalition is that it would be a thoroughly bad government. What is needed is a policy and rapid forceful action to apply it. How could Socialists and Conservatives agree on an economic policy? If the government either proceeded to further nationalisations or refused to do so, one side would declare itself tricked. They could never agree on how much social equality to barter for how much economic efficiency. On questions like these a one-party government can sometimes call upon its followers to beat a retreat, since its own sincerity in the cause is unquestioned; but in a coalition (exception always made for wartime) neither side can retreat for fear of being accused of weakness. A coalition cannot go beyond the Highest Common Factor of agreement; and it tends, by its existence, to lower that level.

The search is thus driven back on to one or other of the two major parties. In principle, a policy such as here sketched out ought to appeal to a strong Labour government. The objectives that it is designed to attain are those of the Left—not, it is true, public ownership (which, though it can sometimes be a means to other ends, ought to be exploded by now as an end in itself), but regularity of employment and an assured standard of living. If it appears to offend members of the Labour Party, it is only their tactical prejudices not their basic principles that are affronted. What the central section of public opinion wants is not to replace a government of the Left by one of the Right, but to replace a fumb-

ling, ineffective and doctrinaire government of the Left by a realistic, forthright and successful one.

Is it possible to hope that the present Ministers, in a new Parliament, would at last be willing to put first things first and seek rational means of achieving defined ends? The hope is perhaps not yet dead; but equally it is not very much alive. The present Government consists of a group of very tired men, fed down by strings of commitment to past mistakes. In the Labour party of five years ago, combined with class-conscious self-interest, there was a great deal of real progressive, crusading idealism. One of the more disturbing spectacles of the last five years has been to watch the idealism crumbling away. Ministers' speeches no longer reflect any conviction that they know how to build a better world; but the rancour and the hatred seem to grow stronger. The Labour Party is not reacting well under pressure. It may yet be able to lead the nation in a great jump forward; but something will first have to happen to coil its spring again.

★

Must it then be the Tories? Not a few correspondents have written, as this series of articles has been appearing, to protest against the policy being labelled one of the Left, when it is, they say, that of the Conservative Party. Conservative policy, it is true, is visibly dragging its anchor and it may conceivably by now have drifted over to the Left. But if the measures sketched out in these articles are Conservative policy now, they certainly never were in the days when the Conservatives were in power—and conversions that are announced on the hustings are rightly as suspect as those on the deathbed.

There are three cardinal points in which the policy here outlined is radically different from what has been Conservative policy hitherto. The first is that this policy deliberately embraces the philosophy of the purposively directed economy. It accepts the view that it is both possible and desirable for the community to exercise mastery over its economic environment—a view which the prewar Conservatives specifically and repeatedly rejected. In particular, the policy accepts as one of its primary objectives the maintenance of a high and

Rignano

Several correspondents have written to ask that a passing reference two weeks ago to "the Rignano principle," in connection with a proposal to put further limitations on inheritance, should be expanded.

The Rignano principle (named after its originator) has many technical variants, but the purpose of all of them is to ensure that a man may endow his immediate heirs more fully than his heirs of the second generation. One form of the proposal is that part of the total death duties payable should be collected at the time of the original decease and the remainder at the decease of the original heirs. Another form is that death duties should be collected in their entirety at the original decease but that, in respect of part of them, annuities, limited to one life, should be issued to the heirs.

It should be recalled that the proposal for further limitations on inheritance, on Rignano lines, was coupled with a proposal to reduce the present taxes on income, especially surtax.

regular volume of employment—which the prewar Conservatives neither accepted as a duty nor attained as an objective. Secondly, the policy accepts as one of its three co-equal objectives not merely the assurance of a reasonable minimum standard of life for all but the active pursuit of social justice as a primary objective of policy, not merely enough social security to avoid scandal but as much of the welfare state as is consistent with efficiency and regularity. The Tory Party is still far too much of a rich man's party to be able with any sincerity to make such an avowal. And thirdly, it is an essential element of the policy here advocated that a real attempt should be made to bring back the spirit of competition as the only guarantee of economic efficiency. It was the deliberate policy of the prewar Conservative governments to substitute cartels for competition and to replace the free market by the protected market. This attitude, which makes nonsense of most of the claims that are made for "free enterprise," the Conservatives do not even profess to have abandoned.

Moreover, is there any reason to suppose that the Conservatives would pass the two essential tests any better than the present Government—could they formulate a consistent policy, and would they have the courage to push it through? Far too much of the current Conservative criticism of the Government seems to imply

Peace With Tokyo?

THE question of ending by treaty the state of war with Japan has now come to the fore. It has been discussed in the last fortnight between Mr Bevin and Mr Acheson, and by the Prime Ministers of the Dominions. Indirectly this is a consequence of the Communist victory in the Chinese civil war. The dramatic and decisive events on the mainland of Asia—in particular, the elimination in China of the political influence of the Americans by the collapse of the regime which they supported—have made urgent a definition and consolidation of the American position in Japan. That position at present depends on the almost unlimited authority conferred by the surrender terms of 1945 on the Supreme Commander of the Allied Powers (SCAP) in the person of General MacArthur, sustained by four divisions of American troops. The powers of SCAP enable the American Government to do almost anything it likes in regulating the affairs of Japan. In practice, more and more discretion has lately been allowed to the Japanese Government, and the Americans are now in danger of bearing responsibility for everything that is done in Japan without in fact being any longer in full control. It is clearly desirable, therefore, from an American point of view that the present situation should not continue indefinitely, but that there should be a clear definition of the rights and obligations of the Japanese Government. This might be achieved, as in western Germany, by an Occupation Statute; but as there is a single, recognised government of all Japan, capable of signing a peace treaty on behalf of the Japanese nation, it seems preferable to proceed directly to a legal instrument finally terminating the state of war with Japan.

There is also a British desire for an early peace treaty, because of the difficulty and inconvenience which the ex-

that the mere replacement of Socialist Ministers, judging questions on their merits as they arise, by sound Conservatives, judging questions on their merits as they arise, would constitute a change of policy. And can one believe that a Conservative Government would really be willing to say "It does not matter how unpopular we are after two years, so long as the policy works in five"?

★

Must one therefore despair of British politics? It is impossible in their present state to feel very hopeful. But there is one recourse left, and that is to the British people. Politicians are quick to respond to public opinion—that is their profession—and there have been a few signs recently that public opinion is restive and anxious and far closer to a bold and forceful mood than either of the parties has yet reflected. If conditions improve over the next few months, this mood will doubtless pass, as it did in the winter of 1947-48, and whichever party wins the election will have a mandate for complacency. But if the storm should rise still further, then it is not impossible that, even as early as February, the election might take place in conditions that would put a premium on courage and produce one of those governments of the Extreme Centre which have been the glories of British history.

isting system has caused. As long as Japan is allowed no diplomatic relations with other nations and all dealings with Japanese authorities have to be routed through SCAP, attempts to put economic relations between Japan and the sterling area on to a satisfactory basis are continually being entangled in a web of bureaucratic red tape which is the despair even of officials accustomed to Whitehall ways.

If, then, both Britain and the United States want a peace treaty, what is there to prevent one being concluded as a normal sequel to a war in which the decision by arms has been complete? The principal obstacle remains what it has been for the last two years: the insistence of the Soviet Union that the treaty shall first be drafted by the four Great Powers—consisting in the Pacific of America, Britain, Russia and China—with each having a right of veto. It would then be presented as the joint decision of the "Big Four" for the formal concurrence of other nations which took part in the war against Japan. The Soviet attitude was clearly stated as long ago as December, 1947, when a Note to China referred to "the Four Powers which bore the main burden of the war and secured with their armed forces victory over Japan." Australia and other nations which were at war with Japan from December, 1941, to August, 1945, regard this claim on the part of the Soviet Union, which only participated in the war for a few days when Japan was already in a state of collapse, as a piece of colossal impudence, and Australia, at any rate, has made known its absolute refusal to agree to any procedure of Four-Power dictation. Further, even if the smaller nations were to accept, there can be virtually no doubt that the use of the veto would make agreement impossible. Owing to the manner in which Soviet demands were conceded

at Yalta in return for the promise of Soviet military assistance—which turned out to be superfluous—there are now no opportunities for diplomatic trading between the Russians and the Americans. At Yalta the Soviet Union got the Kuriles, South Sakhalin, control of the Manchurian railways and Port Arthur, and in addition, subsequently helped itself to the pick of Japan's external assets—the industrial installations created in Manchuria—as "war booty." America has now nothing left to offer the Soviet Union as a *quid pro quo* for Soviet agreement to American objectives in Japan. In any peace conference the Russians may be expected to pursue relentlessly the single aim of getting the Americans out of Japan and eliminating all safeguards which might prevent a disarmed Japan from being drawn, by a mixture of violence and cajolery, into the Soviet-Chinese orbit.

As the Russians or Chinese—if it can be assumed that Communist China would be represented at a Big Four conference—would presumably veto any proposals to retain American garrisons in Japan, or to give the United States any special right of intervention for securing observance of the treaty, the chances of a successful peace conference of all the former belligerents are remote. For this reason, American opinion has been inclining towards a peace treaty negotiated primarily by the United States, with the participation of as many other nations as possible, but leaving out the Soviet Union, and perhaps also China, if they refuse to drop the demand for Four-Power drafting with veto right. In a full conference of nations which were at war with Japan, the United States could probably obtain a majority for its basic policy; though it might have to make concessions on certain points to countries such as Australia and the Philippines which have recently been very restive at American favours to Japan. Australia, for example, would very strongly oppose suggestions—said to have been seriously considered in some American quarters—that Japan should be given facilities for emigration to areas in the Pacific.

The most important ends to be obtained through a peace treaty are three. Japan should be prevented from rearming and becoming again a menace to its neighbours; its newly established political democracy should be preserved from domestic violence, whether from the Right or Left; and, having been totally disarmed, it should be protected against external aggression, whether in the form of open seizure or of that more subtle kind of attack with which the examples of Spain in 1937 and of Greece since 1945 have made us familiar.

None of these objects can be achieved in present cir-

cumstances without an arrangement which keeps a body of American troops somewhere in Japan. Japanese democracy is by no means such a sham as some foreign critics of General MacArthur like to make out—for the agrarian reform carried out under the orders of SCAP has given it a definite social basis such as it has never had before—but it cannot be regarded as anything but very fragile. The strong habits of submission to autocratic authority, the difficult economic conditions which—even on the most optimistic calculations—must persist for a long time, the bitter frustration of Japanese national ambitions by the result of the war, and the absence of any Japanese armed forces to support the civil police in the event of serious disorder, all expose Japan to a grave danger of *coups de force* if the American occupation forces were to be completely withdrawn.

The danger of a Communist revolt is not negligible.

The party has made large gains in the last general election and has been greatly encouraged by events in China. Though there has been no opportunity for Communists to be put in power anywhere in Japan by Soviet military authority as in East Germany or North Korea, Communism has the advantage in propaganda to Japan that there is nothing similar there to the Oder-Neisse Line. Nor is it possible for the Japanese to observe close at hand what life is like under Soviet rule. Moreover the Chinese brand of Communism appears to have attractions for the Japanese which strongly supplement those of the Soviet model. It would not be at all difficult for the Japanese Communists to obtain arms across the narrow seas from the

mainland and cause serious trouble with even quite small guerilla bands, in a country which had no army. The Government, if it succeeded in quelling such outbreaks, would almost certainly do so by forming *Freikorps* of ex-officers and others, with the result that power would pass back into the hands of the militarist and nationalist elements.

If the work that has been accomplished by the Allied occupation is not to be completely undone, to the advantage of either an infiltrating militant Communism or of a reactionary, nationalist revival, the presence of an American force in Japan for an indefinite time to come is indispensable. And that can only be secured by negotiating a peace treaty or Occupation Statute in circumstances which would make it impossible for either the Soviet Union or China—or both—to exercise a veto. A policy of circumventing the agreement reached at Yalta is not to be undertaken lightly, even though the Soviet Union has already created precedents for doing so—notably in its treatment of Poland. But the alternative is one which neither the United States nor the British Commonwealth can contemplate.

Agricultural Progress

THE charts set out below tell, in summary fashion, the story of British agricultural production in the past ten years. The bottom two charts, which are based on the annual June census of the Ministry of Agriculture, explain themselves, but the two top ones, which are based on official figures only recently made available, require elucidation.

Gross agricultural output represents the total value of sales of agricultural produce, including an allowance for the amounts consumed by farmers themselves, calculated in this case at constant prices (the base year is 1945-46). To get a proper measure of the agricultural effort of the United Kingdom, it is necessary to deduct the value of imported feedingstuffs, seeds, and store animals, which have been used but not produced by farmers in this country. The figure thus produced is that of net agricultural output. Prior to the war, there were no official statistics of gross and net output. The figures recently published (Agricultural Statistics, United Kingdom, Part 2) only cover the war years 1939-40 to 1945-46. The figures for later years used in the charts are provisional estimates.

During the war, there was little increase in the gross output of agriculture, but gains were made in net output, especially after 1941-42. The explanation lies in the much greater self-sufficiency attained by domestic agriculture and the very drastic curtailment of imports of feedingstuffs. The acreage under grain crops was practically doubled by 1943, but even so a large

number of livestock had to be slaughtered for lack of feed.

It is not fair to judge the magnitude of farmers' efforts during wartime by the figures of net output. They were required by the Government to pursue a highly artificial pattern of production, with the aim of saving the maximum amount of shipping space and producing as much food as possible for direct human consumption. Net output did increase by about a quarter, but the increase in output of calories was considerably greater. Under peacetime conditions, on the other hand, when the object is to economise, not in the bulk of imports, but in their monetary cost, the figures of net output provide the best available measure of the contribution of British agriculture. Net output last year, a year of bumper crops, was about a third greater than in the years immediately before the war. Impressive as this figure may sound, it is considerably below the fifty per cent increase on prewar output which is the immediate objective of agricultural policy. Moreover, it may have owed as much to the weather as to policy.

The revival of livestock production has been disappointingly slow. It is only during the last two years that the numbers of poultry and pigs have increased. Meat production is still low, and inferior in quality. By 1948-49, the value of livestock production was nearly as large as before the war, but the share of milk production—which has advanced rapidly during the last two years—was disproportionately great.

A satisfactory expansion of British agriculture can only be built on a thriving livestock industry. This in turn requires that the industry shall be assured of regular and substantial imports of feedingstuffs. Temporary bonuses of rationed feedingstuffs are not good enough; and the attempt to make British farmers maintain permanently a high tillage acreage is both proving unsuccessful and is distracting their energies from livestock output

Soviet Semantics

"AN olive branch surrounded by thorns" is the American description of the Soviet peace proposals that have been debated in the Political Committee of Uno this week. The crux of these proposals is that there should be a "pact for the strengthening of peace" between the Big Five—which means something like a new Yalta agreement on spheres of interest. But already intelligent discussion of peace is proving as fruitless as ever because east and west talk a different language, and because the abuse and allegation with which Mr Vyshinsky accompanies his argument is too obviously part of the current "peace offensive" that is being waged by Communist parties all over the world. Public diplomacy is once again poisoning the streams of that private diplomacy through which the few agreements reached by west and east since the war have been achieved. Once upon a time President Wilson believed that secret diplomacy was a principal cause of war; "open covenants openly arrived at," he said, "would ensure peace." Since then, thirty years of publicity in international relations have been marked by greater international bitterness and insecurity than any period of modern history. The truth is, of course, that there never has been, and never can be, "open diplomacy." Diplomacy, the negotiation of agreements between governments, the daily rub of vital national interests, has always been, and must always be, secret. What now goes on at international conferences, at the United Nations, is not diplomacy but political warfare. In real warfare, before the infantry goes into action, a barrage of artillery and bombing prepares the way; so in political warfare a barrage of propaganda, directed at public opinion in the enemy's country—and in neutral countries whose attitude or votes are of importance—precedes the action of the diplomatists. When the "softening up" is over the real bargaining can begin—in secret.

Propaganda-by-conference and diplomacy are not alternatives; both are indispensable means of modern power politics. No government has yet so clearly understood this as that of the Soviet Union. Protected by its own defences against the importation of foreign ideas it can, with the "scientific method" of Marxism-Leninism, systematically undermine the public opinion of its opponents. But when secret diplomacy is needed none can excel the Moscow experts, as the negotiations with Hitler in the summer of 1939 conclusively proved.

The current phase of Soviet "softening up" tactics is this year's "peace campaign." In Paris, Prague and Rome, congresses of intellectuals have been held, in order to convince men and women of good will in the free countries that "peace" with the Soviet Union is to be had for the asking, that only the machinations of Wall Street imperialists and their Social Democratic lackeys are depriving the peoples of the world of this

—where the scope for expansion is still enormous. If the Government is in earnest about agricultural expansion—and the money which it is lavishing on the industry suggests that it is—it must proceed on the assumption that foreign exchange spent on feedingstuffs now will be amply recouped later by a greatly increased domestic output of meat, bacon, and eggs. Otherwise it, or its successor, must reconsider its whole agricultural policy.

great blessing. A variation on the same theme is that trade with the Soviet Union and Eastern Europe (presumably in large volume and on favourable commercial terms) is also to be had for the asking, as soon as the yoke of the Marshall plan exploiters is thrown off. To underrate this campaign is a great mistake. Its organisers are clever enough to turn to their advantage hopes, fears and prejudices that can be made, however diverse their origins, to coincide with their own aims. The "peace campaign" is a serious challenge which must be understood for the political manoeuvre that it is. This makes it necessary to examine the meaning of "peace," "independence," "imperialism" and other words used in Soviet political vocabulary.

Most governments naturally prefer peace to war. But they all also have their vital interests—be it only the vital interest of self-defence—which, in the last analysis they prefer to peace. These vital interests always include strategic and economic elements, but other factors may be equally important. Hitler demanded rights for German minorities beyond the German frontiers, and Mao-tse-tung may soon raise demands on behalf of the Chinese in Siam, Malaya or Indochina. The vital interests of the Soviet Union include opportunities to exact from vassals various forms of tribute in goods, and the control of strategic areas—Manchuria, the Danube Valley and the Baltic states today, perhaps Korea and the Straits of the Baltic and Black Seas tomorrow. They also include the extension throughout the world of the Soviet way of ruling and working, which used once to be called "world revolution." When Stalin overthrew Trotsky and proclaimed "socialism in one country," Soviet policy changed less than wishful thinkers in the west supposed. For Stalin has never ceased to emphasise that Soviet socialism is threatened by capitalist encirclement, and he argues that the encirclement and, therefore, the need to increase the home and foreign defence organisations—MVD and Red Army—will last as long as there are capitalist states left to do the encircling. Since every state is capitalist that has not a Soviet system, the threat to "socialism in one country" will not be removed until the "one country" in which the one true socialism is built has become "one world."

Governments in their hypocrisy have often identified vital interests with peace; but the Soviet government is peculiar in identifying peace with its vital interests. Peace, in its vocabulary, is the state of affairs required at any moment by the Soviet government. Thus, "Yugoslavia threatens peace," means "Yugoslavia threatens Soviet aims in eastern Europe." Because Tito has resisted Soviet threats and pressure for 18 months, he is, by definition, threatening peace, and whoever threatens peace is a "warmonger."

The hypocrisy of Great Powers has often led them to interpret the independence of small states as freedom from the influence of their own rivals: the Soviet government is peculiar in interpreting independence as subjection to its own orders. With perhaps one exception there is, in the Soviet view, no independent state in the world today outside the area which non-Communists call the Soviet sphere. The one exception is the United States which, though not subject to Moscow, cannot easily be represented as subject to any other Power. All other non-sovietised states are "puppets of American imperialism," ruled by native quislings in the pay of Wall Street, or of its minions in London or Paris. No British soldiers or bureaucrats under British orders remain in India, while Soviet soldiers, bureaucrats and "technical specialists" abound on Rumanian soil; yet India is not independent and Rumania is. India is not really independent because its foreign policy is decided in Delhi, not Moscow; Rumania is really independent, because its foreign policy is decided in Moscow, not Bucharest.

Likewise "imperialism" and "warmongering" are sins of the non-Stalinist infidel only; the truly faithful are, by definition, incapable of them. If the British Government owns shares in Iranian oil fields that is imperialism; but if the Soviet government owns one third of Rumania's oil resources that is comradely help to a young people's democracy. If American companies control air lines in South America that is imperialism; but if Soviet companies possess a monopoly of air transport in Hungary that is democratic co-operation. Western help to Greece in defeating rebels supported by Albania and Bulgaria is warmongering; the march of Chu Teh's armies is a historic victory for the peace front.

It is noticeable how often Soviet statesmen accuse the Americans of imperialism. Yet to non-Stalinist observers Soviet policy seems strangely similar to old-style European imperialism. The great industrial trusts and banks of the Soviet Union have their representatives in the vassal states. From Harbin to Tirana and from Canton to Leipzig, dazzling and lucrative careers are open to ambitious young men of the Soviet ruling class as "technical experts" in police repression, Marxist indoctrination or Stakhanovite labour methods. As the area of Sovietisation extends, so the prizes for the trusts and the jobs for the boys increase. Here are two substantial economic motives for Soviet imperialism.

It is often argued against this view that the Soviet Union, unlike Germany, has within its boundaries the

resources it needs for industrial development and so has no need for expansion. But if these resources are devoted to heavy industry, including war industry, while the average standard of living rises only slowly, the Soviet leaders will need to find a way to divert discontent. The only satisfactory scapegoat is one who cannot be reached—the foreigner. Xenophobe propaganda diverts the questions of the masses from the party's leaders, and from the masses its effects work back through the party pyramid upon the leaders. The Politburo manufactures hatred of the outer world, and like all propagandists, is affected by its own propaganda.

There is, too, a special department of state which has a personal interest in both internal tension and international hatred—the security police. As in the Ochrana of Imperial Russia, so in the MVD of the Soviet Union, promotion for the local informer and high honours for the police chiefs depend alike on their ability to persuade those greater than themselves that conspiracy is rife, inspired by foreign spies and saboteurs, which only their Bolshevik vigilance and devotion can frustrate. The extraction of confessions from enemies of the people, like the extraction of coal from the mines, requires Stakhanovite methods. The more numerous and the more lurid the confessions, the more far-reaching their international implications, the better is the promotion for the policeman, the greater the xenophobia, and the stronger the case for still greater efforts in heavy industry and armaments. That is why the people of the Soviet Union live in the shadow of "capitalist encirclement."

All who expose the international dangers inherent in the Soviet regime, and the double meaning of Soviet terminology, are, of course, denounced by Communists as warmongers. Many people of good will are sensitive to the argument that to say anything unpleasant about the Soviet Union is to create international tension. The Nazis once used the same argument. They had a special word, "*Brunnenvergifter*" ("well-poisoner") to brand those foreigners who doubted the Fuehrer's intentions. There is, of course, something to be said for the argument; for unpleasant truths do create hatred and distrust. But the danger that exposure of the truth may help the few real warmongers in the west is far smaller than the opposite danger: that misunderstanding of the challenge of Soviet policy may lead the people of the west, the vast majority of whom wish to live in peace with the Soviet Union, into dangerous illusions. To spread an understanding of Soviet semantics should be one of the major purposes of policy in the western world.

NOTES OF THE WEEK

Compromise on Steel

Common sense and the national interest, as well as the views of the House of Lords, have been victorious in the Government's decision to delay putting the nationalisation of iron and steel into effect until after the General Election. The House of Lords have made their point—that the electors, by returning a Conservative or Labour Government, should have a chance to pronounce again on the wisdom of the measure—and they will almost certainly accept the modified form of their own amendments to which the Commons have agreed. The Prime Minister will be able to redeem his personal pledge to get the Steel Bill through in this Parliament, without waiting until it had been passed under the amended Parliament Act some time towards the end of next February, and thus will be free to call an election any time after the New Year. Common sense has been vindicated since the Government could have done nothing effective to the steel industry before the election, and the original vesting date of May 1, 1950, which the Lords had rejected, bore no relation to practical possibility. Moreover, the nature of the compromise is a reasonable one—the Lords' amendments calling for the vesting day to be postponed to July 1, 1951 or later, verged on the extreme, and in transferring it to January, 1951, or within twelve months therefrom, the Government have allowed for an adequate time lag after the electors have decided whether nationalisation shall be proceeded with or not. To delay the total operation of the Statute until October, 1950, as originally demanded by the Lords, is of dubious constitutional validity, and the point has been substantially met by Mr Strauss's promise that a Labour Government if returned would not begin the appointment of a nationalised Iron and Steel Corporation before that date.

This compromise was first bruited in the summer, and the possibility of it explains why the amended Iron and Steel Bill was held over at the end of July, when it came back from the Lords, until the present time. Earlier in the autumn, however, the Government were understood to have abandoned the idea of a compromise and to be preparing to force the measure through under the amended Parliament Act. The reason why the compromise plan was brought forward again in the last few weeks was probably that the Labour Party's election tacticians became convinced that the party should have the greatest possible freedom of manoeuvre from the turn of the year onwards.

★

Much credit for this outcome must go to Lord Salisbury, the Conservative leader in the Lords, whose handling both of the Iron and Steel Bill and of the Parliament Bill has confirmed that he is the only parliamentarian of Mr Morrison's calibre in the Palace of Westminster. By persuading even the most recalcitrant of his followers to drop all their amendments to the Steel Bill except those that altered the date of operation, he forced the Government to fight out the issue on the ground of the Lords' constitutional right to give the people a chance to think twice on a measure for which no overwhelming body of public support can be shown. The Government for their part can argue that had the two-year veto period not been in existence they would never have been forced to hold over the Bill. Mr Herbert Morrison for his part deserves credit for the way in which he, too, has damped down the acrimony and vehemence in these disputes between the Commons and the Lords, disputes which could have split public opinion deeply and bitterly and which with careless handling could have caused great damage to the fabric of the constitution. The peculiar mechanisms of the British constitution are most safely handled by those who are skilled in politics.

Danger to the TUC

After weeks of hesitation and travail and after conferring with the Chancellor, Mr Bevin and Mr Bevan, the special economic committee of the TUC issued on Monday a statement urging their affiliated unions to suspend negotiations for wage increases until the General Council could produce a full statement on the economic situation. It is to be presumed that all that the committee learnt from its consultations with Ministers was that the Government have no intention of departing from their policy of trying to hold back inflation by means of physical controls—a policy which could be wrecked overnight by raising the lid on wage demands—and that for their part the unions must grin and bear such rises in the cost of living as would result from devaluation.

Although the public has grown wearily accustomed to appeals for wage restraint which are never in fact fully accepted by individual unions, it should not be forgotten that in the short run this is the only responsible line of action for the TUC to take, however much it may be dictated by a tenderness for the health of the Labour Government on the eve of an election. To adopt any other line in the present economic context—to condone even by silence general demands for higher wages while the rest of the economy is pegged tightly down—would lead straight to disaster. But nonetheless there are two questions which must be answered. First, can the TUC in fact restrain unions from pressing their demands? The question seems to have been answered by the decision on Wednesday of the Confederation of Engineering and Shipbuilding Unions to continue with a claim which would, if conceded, cost the engineering industry something of the order of £125 million a year. This is justified by the confederation's secretary on the grounds that there are sufficient profits in the industry to pay for this increase, and that it does not conflict with the TUC's appeal. In other words one of the country's largest unions has declared its respect for the TUC's appeal by defiantly ignoring it. If a well-paid industry like engineering can do this, what chance is there of restraining demands on behalf of less well-paid workers in other industries?

Secondly, even if the majority of unions do respect the agreement, does the TUC think that it can restrain wage claims for several years or more? Its present policy is based on a gamble that the Government can hold the cost of living down by main force until increased production has countered the danger of inflation. But this in fact is merely an extension of a policy that has failed to solve the problem over the past two years. Does the TUC never consider the possibility of urging upon the Government a less painful, sterile and ignoble policy than that of simply battenning the hatches upon all the motive forces within the economy? Does it never occur to it to demand a policy of economic mobility in which wages can safely be allowed to rise? If it does not, its leaders should reflect that by getting more and more deeply committed to the policy of the freezing of wages and profits as an end in itself, they are pursuing a course of action which is unlikely to produce economic recovery and which is quite certain to corrupt, and possibly in the end to disrupt, the trade union movement.

New Stage in Germany

The conference held last week in Paris between Britain, France and the United States to determine the next phase in their German policy ended in a communiqué notable, even among official handouts, for platitudinous generality.

The explanation was, no doubt, the Allies' desire to avoid any appearance of confronting the Germans with a *Diktat*. But there were equally urgent reasons in the prevailing uncertainty in French politics, the newness of M. Bidault's Cabinet and the imminence of a debate in the Assembly on foreign affairs. The precaution was, however, meaningless, since, only a week later, Dr Adenauer gave the German Assembly a full account of the bases of his negotiations with the Allied High Commission—negotiations based upon instructions sent to the Commissioners as a result of the decisions reached in Paris.

From Dr Adenauer's account, it can be seen that the three powers have, very sensibly, accepted the necessity of making genuine concessions to the present moderate German regime at Bonn. Dismantling on all save purely war plants—the "A list" for dismantlement—is to be slowed down and reconsidered, and it seems likely that many factories will now be reprieved—even perhaps the Thyssen works of the *Vereinigte Stahlwerke* over which British and French opinion has been most stubborn hitherto. Moreover, the High Commissioners have been empowered to negotiate with the Bonn Government on the right of the Republic to take part in international organisations and to send trade and consular representatives abroad; they are also to reconsider the disadvantages imposed on Germany by the continuing state of war, and to discuss the revision of the present limits set to Germany's merchant marine. All this adds up to an important modification of earlier restrictions, and it is not surprising that Dr Adenauer found little difficulty in persuading the Bonn Assembly that real progress has been made.

The feeling need not be confined to German opinion. Dr Adenauer has made a statesmanlike attempt to transcend disgruntled nationalism and his effort to establish a basis upon which genuine negotiations between the Allies and Germany could be undertaken has been rewarded. The chief shadow falling across the new picture is the Allies' lack of preparedness for a new phase in their relations with Germany. To restore prestige, elbow room and sovereignty to the Germans is right and inevitable and this process has now been set seriously in motion. But the policy cannot be pursued safely unless a resurgent Germany is quickly fitted into a number of European institutions which give it scope, yet control its dangerous proclivities. Germany is now a full member of the OEEC, and Dr Adenauer has offered German co-operation in making the Security Board and the Ruhr Authority genuine instruments of international co-operation. His Government also seeks admission to the Council of Europe. But do the Allies yet know what they mean by any of these bodies? If they do not, they may find that German ambitions, not European interests, finally dictate their policy.

★ ★ ★

The Ruhr's Place in Europe

The visit to Paris of the German Minister of Economics, Dr Erhard, during the Foreign Ministers' talks was undertaken in order to press ideas for Franco-German economic collaboration that have been germinating for some time past. If anything is to come of the regional areas of free trade for which Mr Hoffman is pressing, western Germany must have a place in them. The Federal Republic's representative on OEEC has already proposed that his country should join the discussions on "Fritalux." Dr Erhard has spoken of the possibility of freeing Franco-German trade on the lines of the most recent pacts between Germany, Switzerland and Holland, and envisages greatly increased turnover as a result. At the same time, a memorandum submitted to the Foreign Ministers by the *Vereinigte Stahlwerke* suggests that foreign capital should be invested in the steel combine as a way both of raising capital and allaying French fears about security. Finally, Dr Adenauer has formally proposed that the Ruhr Authority should be enlarged to cover the

heavy industries of France, the Saar and the Benelux countries.

Amid this wealth of proposals it is possible to discern a German effort to make capital out of the aspirations of the Economic Co-operation Administration and the State Department. The Americans like free markets; the German economy is based on freedom from state controls. The Americans want a free trade Europe; so does the Ruhr. German heavy industry looks forward to the collapse of plans for expanding steel production in uneconomic areas, such as Italy and Norway, should protective devices be removed. The Americans believe that, by interlocking the capital structure of French and German industry, French fears may be allayed without blocking Germany's capacity to pay its way. German industry is crying out for capital. Since France itself has little for investment abroad, the idea has been broached from the German side that American funds might be channelled to Germany through France.

★

The French are fearful of this new partner that Washington is edging towards them. The fate of French heavy industry if it were exposed to free competition from the Ruhr is something Paris does not dare to contemplate. Sceptics in France and Britain may easily prove that there is little in the history of two world wars to show that the interlocking of capital deters adventurous countries from aggression. And the German suggestion on behalf of the *Vereinigte Stahlwerke* is crippled by innumerable practical and political difficulties. Finally, critics may point out, the Americans show a lack of logic by advocating the extension of the Ruhr Authority while demanding that it shall have none of the functions of an international cartel.

Nevertheless, a purely negative response to such efforts is not enough. Germany will always act from self-interest, and it is a great deal won if the self-interest is as enlightened as it is now. Something may emerge from the present vague proposals in the long run, if nowhere else than in the field of Franco-German trade. A great step towards the well-being of western Europe would, indeed, be taken if the prerequisite to a great expansion of trade across the Rhine were established—that is, if anything were to come of M. Monnet's far-sighted scheme for increasing French grain production, in order to supply western Germany, the "little Britain" of the Continent.

★ ★ ★

In the Steps of Stresemann

How far Dr Adenauer is personally responsible for making real negotiation possible between his government and the High Commissioners seems not to be generally understood outside Germany. In Bonn it is well understood, and his courage in donning at this early stage the mantle of Stresemann has exposed him to violent attack from Dr Schumacher and his Social Democrats. They have not hesitated to use that fly-blown and Hitlerian charge that a moderate German Government is helping the French to establish their hegemony in western Europe. This is a rabble-rousing line unworthy of Dr Schumacher. It is true, however, that Dr Adenauer made a serious error in not consulting the opposition while planning his personal initiative; for it is vital that the policy of the Bonn government in foreign affairs should be agreed between both sides of the *Bundestag*.

The quality of this initiative by the Chancellor is best judged by two things: the proposals for German guarantees of security sent to Paris last week, during the meeting of Mr Acheson, Mr Bevin and M. Schuman; and the interview he gave to *Die Zeit* at the beginning of this month, and reproduced in full in *Le Monde*. The interview is the more important because it reveals the mental attitude of Dr

Adenauer. He declared that a working partnership with France was the pivot of his policy. That did not exclude friendship with Britain, and the "Chancellor of the federal German Republic must be at the same time a good German and a good European." He did not claim that all Germans would support him in this view, but he believed the younger generation would. He thought it a pity—as indeed it is—that the French should have made Germany's entrance into the Council of Europe conditional on the simultaneous admission of the Saar; but he realised that the French attitude on the Saar was only one symptom of their deep anxiety about future security. And it was on this subject that Dr Adenauer showed himself a statesman of quality by saying:

If France demands more security without taking account of the most elementary necessities on the German side, our attitude can hardly fail to stiffen. If—on the other hand—we are only ready to offer too little security, France cannot be expected to come to an understanding with us. It is a question of finding the happy medium.

Some Frenchmen would think this statement stiff-necked; some Germans would think it too appeasing. But that is the problem of Dr Adenauer—and of M. Schuman; each has to find the courage to face attack at home from men more interested in power than in peace. It is a thousand pities that, at the moment, the government of M. Bidault is less able to stand up to such attacks than the government of Dr Adenauer.

* * *

Mr Bevan Unrepentant

With characteristic self-confidence Mr Bevan has launched the new 1949 *Housing Manual** upon the world at the same time as he is attempting to cut £35 million out of the housing programme. Not that the two actions are necessarily incompatible—one can with skill build good houses as cheaply as bad. Most Ministers might, however, have felt a twinge of the incongruous. But not Mr Bevan. So local authorities have now been presented with the fruits of four years' experience of design and layout embodied in a glossy handbook without a word being said about costs.

Mr Bevan presented the book to the world with a speech to the press which was interesting in its own right. He discussed two aspects of his policy which have been much criticised. First he dealt with the criticism that too many three-bedroomed houses have been built and too few larger and smaller ones. The Royal Commission on Population also attacked the housing authorities on this score. In effect, this criticism has been accepted and local authorities have been instructed to "review their long-term housing needs more analytically" and to cater for large families and for more elderly and single people. The 1944 *Housing Manual* dealt very largely with the three-bedroomed house; the 1949 manual introduces a welcome variety of types, including three-storey terrace houses, maisonettes and small houses. The time for this is overdue; a recent survey of a town of 50,000 to 60,000 inhabitants revealed that 860 houses capable of holding families were occupied by single persons (a fact not unconnected with the present rent-control policy). It is quite clear that there is now to be a change of policy and that local building programmes should in future fit local needs more closely.

Secondly, the Minister defended the high standards of size, layout and construction as set by his department, which have contributed their full share to the rise of costs of local authority housing, on the ground that short-term reliefs would only result in long-term headaches. He is outwardly unrepentant, his only explicit gesture to economy being some references to instructions to rural authorities to economise on service roads and to other authorities to lower forecourt

* HMSO. 3s. 6d.

walls. But this is merely playing with the problem of costs. There is no justification for the pretence that costs can only be reduced by building mean and shoddy houses. It is necessary for the Minister to give more visible signs that he is concerned with costs and to give more encouragement and, if necessary, publicity to those authorities—and there must be some—who can combine good design with economy.

* * *

Housing Rents

A decision of the courts has produced an important clarification of the contemporary law of rent. Houses owned and let by local authorities are not subject to the control of rents imposed by the Rent Acts, as the tenants of those houses up and down the country have been discovering over the last year. In fixing its rents the duty of the authority, in a sense, is to hold a balance between the interests of the individual tenants and of the interests of the ratepayers of the district as a whole. Recently a rent increase by a particular borough was challenged in the courts and on Wednesday Mr Justice Romer gave his reserved judgment on the claim.

The challenge was made by Mr Belcher, a trade union official, on behalf of himself and some three thousand tenants of the Reading corporation; the plaintiffs claimed that a general rent increase made by the corporation at the beginning of 1948 was void and *ultra vires*. The evidence showed that, in making their final decision over rent increases, the corporation had acted on two guiding principles: first, that they should not budget for a surplus from the rents of the corporation's housing generally, and, second, that they should not charge against the housing revenues local and interest charges on unproductive development expenditure. Otherwise, the tenants of the corporation's houses should pay, in total, the net cost to the corporation of the houses they occupied. Mr Justice Romer's view was that the council had "carefully and conscientiously observed their duties to their tenants to the best of their ability, without losing sight of the duties which they owed to the ratepayers as a whole." He accordingly rejected the plaintiff's claim.

This decision is so comprehensively argued and stated that it should help to clear the air very considerably over the rights and liabilities of local authorities and their tenants. As the Court pointed out in this case, to ease the burden of rent on council tenants merely throws it on to the ratepayers as a whole, and that the majority of ratepayers in any local authority district are no better placed, so far as income is concerned, than the authority's own tenants—many of them, in fact, are worse placed in so far as the accommodation they get for their rent is concerned.

* * *

Wanted—a Rent Policy

The judgment described above brings out the confusion of thought which has come to surround the whole conception of rent for house property. Local authorities, being exempt from rent control, can raise the rents of council houses to meet increased costs of administration and repairs, at least within the limits of local public opinion. But private owners still cannot. The difficulties under which the private landlord is labouring and the discomforts suffered by those tenants who live in houses which the landlord cannot afford to repair are well described in a broadsheet published by PEP last week.*

Any policy of rent control must plait together three strands of interest—the landlord's, the tenant's and the public's. Traditionally, the landlord gets no sympathy; he merely grinds the faces of the poor. In practice, if he owns rent-

* Rent Control Policy. Planning 305.

controlled property he has suffered so severely in relation to other sections of the community that good and scrupulous landlords are being driven more and more to sell their property to the less scrupulous. The interest of the tenant is to combine a rent within his means with a standard of accommodation suitable to his circumstances. Few tenants in controlled property have any complaints against their rents; in most cases rent absorbs a much lower proportion of income than in 1939. But they have many complaints about repairs which some landlords will not, but most landlords cannot, afford to carry out.

The interest of the public is in preserving the fixed capital of the nation intact. A policy which results in landlords neglecting their property so that it falls into premature decay must involve a serious loss to the nation as a whole. This is happening at the present time, and it is urgent that steps should be taken to arrest this deterioration. The 1949 Housing Act contains provisions for grants to private landlords to cover half the cost of capital improvements, but it does nothing to help towards the cost of repairs.

There are no simple solutions to meet these claims. The PEP report rejects rather sweepingly, and for reasons of political inexpediency, any short-term policy of permitting rents to rise by any flat amount. It advocates some compensation to the landlords, by rent increases, tax allowances or subsidies to cover a rise of about 150 per cent in the cost of repairs, and visualise that rents might be permitted to rise from 25 to 75 per cent according to circumstances.

This may be as far as any government would dare to go in the first instance, but it is certain that any policy aimed at reducing the rigidity and fragility of the present economic structure of Britain must cease to placate the tenant at the expense of the nation, and put the creation of a more sensible rent restriction policy among its first objectives.

Whose Weapons for Europe?

The part that American equipment and materials are to play in the defence of western Europe needs rather more careful and public consideration than it has yet received. Much of the American aid now made available under the Military Aid Programme will take the shape of surplus ships, vehicles, arms and ammunition. These may be pressed on governments whose forces have been trained not only in the use of British weapons but in co-operation with British forces, both in Germany and elsewhere. What are these governments to do and say if they find that to accept aid in this form means changing the habits and training of their forces? Are they to look the gift horse in the mouth? Are they to ask the question—which will seem ungenerous and grasping to the donors—whether American arms are to be had free indefinitely, and go on to ask how they are to be paid for when Congress thinks MAP should come to an end?

Representatives of the US State Department and Department of Defence have been in London, Rome and Oslo during the last ten days, and they will doubtless have run already against this difficulty. They will have found that the western governments have made deplorably little progress in the standardisation of their defence requirements. The delay is generally explained—not without reason—as due to uncertainty about American intentions. In such a situation the case for pushing in American material is difficult to resist; if defences are to be improved quickly only the Americans can overcome the difficulties that stand in the way.

Nevertheless, it is not right that Norway should be asked to receive American destroyers for a navy that has been equipped and trained on British lines. Nor is it right that French divisions should be equipped in a way that makes them entirely dependent on American material reaching them by sea. If there must be a good deal more alacrity and

realism in the British and French handling of the industrial and financial side of integrated defence plans, there should also be more give and take from the American side. It would be easier and safer for the Americans to change in some respects to good European designs in equipment than for the Europeans to change to American designs. To judge by wartime experience American service advisers are likely to be quite obstinate in resisting such ideas. But such questions will at least be discussed openly in the United States, whereas in London they will rebound from the baize curtain of secrecy that envelops Mr Alexander.

Progress Report on ERP

Concern with western Europe's failure to increase dollar exports is the keynote of the fifth and latest quarterly report on the European Recovery Programme which President Truman has just sent to Congress. The report covers the pre-devaluation period, April 3rd to June 30th. It notes that in spite of gains in production and a rise in total exports, the Marshall countries were unable to reduce the dollar gap. Indeed, their sales to the dollar area fell.

During the period under review, industrial production in Marshall Europe reached a record height of 18 per cent above the prewar level and total exports to the world rose to a peak of nearly \$5 billion, while exports to the western hemisphere sank by \$60 million. The result is that whereas last year the visible exports of western Europe paid for 23 per cent of their American imports, the rate fell to only 16 per cent in the second quarter of the current year. Britain and Belgium alone accounted for two-thirds of the drop in dollar earnings, and the products which registered the sharpest decline were motor cars, tractors, metals and iron and steel.

To reverse the trend, the report suggests, will require vigorous effort on both sides of the Atlantic:

The United States, of course, must be willing to accept greater competition from European supplies in order to help Europe pay its way.

European governments, it says, emphasising a point made by Mr Hoffman on his recent trip to Europe, must "provide immediate incentives to exporters to shift their sales from soft currency to hard currency areas." Its advice to European businessmen is to install more efficient machinery and to pay greater attention to merchandising and advertising their goods in dollar markets.

The only crumbs of comfort which the report drew from the European scene during the period covered were the expansion of production, the decline in inflationary pressures and the strengthening of stable, democratic governments.

Present Problems

We all number among our friends at least one who seems to have everything he could want: the Christmas present for him is the most difficult of all to choose.

The Economist Diary—which combines in one volume a memorandum book, an appointments register, and a complete reference book—is the ideal present for the busy man. It will be in constant use on his desk throughout 1950.

Price: in the United Kingdom (including Purchase Tax) 36/8, or 37/6 post free; overseas 32/6 post free by surface mail. Published by Messrs. Charles Letts & Co., Ltd.

Full details of the enlarged and improved edition for 1950 are given in the illustrated pamphlet available from:

**The Economist Intelligence Unit,
22 Ryder Street, St. James's, London, S.W.1**

Much has happened since June 30th when the report closed its accounts, but the document has more than historic value. Its statistics show in detail how critical was the position of Britain and the other soft currency areas in the early summer of this year. If there are still lingering doubts about the inevitability of devaluation, this record should dispel them.

* * *

Peasant Revolt in Italy

Ever since the Christian Democrat triumph in the Italian elections of April last year, there has been a tendency to dismiss the danger of upheaval or Communist gains there. It is, of course, true that in both France and Italy the Communist wave which was sweeping forward during 1946 and 1947 has spent itself. But what has been achieved in Italy is in reality no more than a breathing space. The country is bound to remain basically unstable, politically as well as economically, until some way can be found of modifying the fundamental tensions produced by its rising population, its static economic resources—and outlook—and the extremes of rich and poor.

No one understands this better than Signor De Gasperi, the Prime Minister; but it is doubtful if he can do enough about it to be sure of another success at the next general elections—probably in 1953. He is regarded as too rooted in Catholicism not to incur hatred as a clerical reactionary even if he does press land reform, and too much of a genuine liberal to be really stiff, intolerant and domineering. Further, by 1953 the flow of American aid which is now being pumped through Italy's veins will have slackened, if not stopped; and far too much of it has been spent on consumer goods to have a decisive effect on Italy's capital resources.

This is the background against which must be judged the recent very serious riots of landless peasants in southern Italy. The De Gasperi government has embarked on a programme of land reform, which is aimed at attacking one of Italy's key economic and social problems. But parliamentary delays, the web of bureaucratic procedure, and opposition and evasion by some of the landlords bid fair to slow down so much the execution even of this relatively modest reform that its positive effects may well be lost. It was sheer despair which lately drove the peasants of Catanzaro in Calabria to seize by force several thousand acres of private land. After heated negotiations between the landlords, the government and the Peasants' Union, a temporary calm has been restored—but not without the peasants gaining a good deal of what they fought for, and the government introducing a special Bill to expropriate 110,000 acres in Calabria without waiting for land reform on a national scale. The whole affair has received great publicity in the Italian press, most of it sympathetic to the insurgent peasantry.

The result is that the Communists may be able to threaten a sufficiently widespread upheaval in the south to force the government to try and act spectacularly—or admit a grave defeat. Drastic action would split the Christian Democrat Party irretrievably. Whatever happens these are signs that Italy still has a stormy and most difficult future to face.

* * *

Enforced Example from the Civil Service

The Civil Service at the present moment presents a remarkable spectacle of enforced self-denial. A month ago the more senior civil servants were standing grimly on the bridge as their promised salary increases sank beneath the waves of the economy cuts. Two weeks ago the Civil Service Arbitration Tribunal rejected the claim for a 15 per cent increase in pay for 60,000 clerical officers, and this week it has rejected a claim for temporary clerks. Crew as well as

officers are thus doomed to the unwelcome task of being an example to the passengers—the nation at large—with only slender hopes that their example will be followed. The best comfort that can be given is that even if the good example is not imitated widely, a bad example would have been.

In present circumstances the rejection of both the Civil Service Clerical Association's claims must be right, although Mr L. C. White, the Secretary of the Association, has been prompted to condemn the whole arbitration machinery. The principal claim was based on the argument that civil service clerical salaries had increased by only 28½ per cent compared to an increase in the cost of living of 86 per cent. The Treasury rebutted this view by claiming that even if the maximum of the clerical officers' scale is only 28½ per cent higher than in 1938 the minimum is up by 76 per cent and that at the mean of the scale the rate is now 48 per cent higher. This gives a less unfavourable picture for the new entrant and the officer in the early stages of his career, but it does not look attractive to the older officer. In happier times some improvement in the maximum might well have seemed justified.

A more convincing argument put forward by the Treasury was that rates of pay for work of a similar kind outside the civil service is roughly the same. Fancy salaries for secretaries and typists in commercial offices in the City are not general for all clerical work. The truth is that black-coated workers have been slipping down the nation's salary scale for some years, while the artisan and factory worker have been climbing up. For the nation as a whole this may be no bad thing, and is one example of the price mechanism working where it should. And, unlike the senior civil servants, the clerical officers have not the additional grievance that they have been denied what was once promised.

* * *

Civil Defence Recruiting Starts

This week recruiting has been opened for the Civil Defence Services. The organisation of the services is roughly similar to that developed during the late war. First and foremost, there is the Civil Defence Corps—a Crown service (a new phrase in official nomenclature) under the Home Secretary—which is responsible for communications, wardens, ambulance, pioneer and rescue work and organised with functional sections under geographical divisions based roughly on the county and county borough. There is the Auxiliary Fire Service organised under the local fire brigade. The National Hospital Service Reserve is designed to train a corps of people capable of creating the enormous expansion in hospital resources attendant on air attack (but not for epidemics or peacetime crises). Finally, there is the traditional Special Constabulary, needed in peace as well as in war to maintain order in an emergency. Recruiting is open to all those not enrolled in some other active military or civil defence reserve, but excluding all those in the Class Z reserve (that is those who served in HM forces in the late war or subsequently under national service). Apparently the Army, as the price of committing itself to mobile assistance to the civil defence organisation in time of war, has demanded that its ultimate reserves are not to be tapped.

There are two reasons why it is to be hoped that civil defence recruiting will prosper better than recruiting for the territorial and auxiliary reserves of the fighting services. In the first place, recruiting has not been launched until the planning of the internal reorganisation and training has been completed, so that the recruit can enter the service with some confidence that his or her time will not be wasted. In the second place, three of the services are sponsored by a minister—Mr Chuter Ede—who is trusted by the public and who has not gone out of his way, as has Mr Shinwell of the War Office, to alienate those very people upon whose goodwill he is most dependent.

Marshal Aid for Poland

Ex-Soviet citizen and Polish Marshal Rokossovsky is quickly settling down to his job as Poland's Defence Minister and Commander-in-Chief. Within a week he has expelled from the Polish Communist Party that controversial and allegedly Titoist personality, Mr Gomulka, who had so far survived disgrace and public recantation of his ideological errors. Soon the Marshal will be able to pull every string of importance in the Polish State, resuming the tradition of rule by marshals founded by Pilsudski and Rydz-Smigli before the war.

Over his predecessors Marshal Rokossovsky has one enormous advantage: the presence in Polish Silesia of several divisions of Soviet troops—his own praetorian guard, as it were. For his task of integrating—western Europe should note what this word really means—the Polish with the Soviet forces and the Polish state with the Soviet system, he has been given powers more conspicuous, more imperial than Moscow has yet claimed in any other country, save perhaps Bulgaria.

To grasp what it really means one has to imagine a sudden announcement from Paris that, at President Auriol's request, the Americans have released General Clay so that he may become Minister of Defence and Commander-in-Chief of the French forces, with a permanent seat in the French cabinet and a high place in the counsels of the coalition. In the fact that such a happening in France is incredible but in Poland is credible lies the essential difference between what is called American imperialism and what is in fact Soviet imperialism.

It is now easier to see how and why Tito saved Yugoslavia from Poland's fate. He was himself head of state and head of the armed forces; to get a grip on Belgrade like that he now has on Warsaw, Stalin would have to liquidate a whole regime, not merely remove an unimportant general like

Rola-Zymierski in Poland. Tito saw what Soviet attempts to interfere in his army and economy foreshadowed. He was able to plan resistance with some hope of success because Yugoslavia has frontiers that nowhere run with those of the Soviet Union and a coast line that outflanks the iron curtain.

Ruthless though it is, the appointment of Marshal Rokossovsky is a brilliant piece of opportunism. It guarantees the subservient behaviour of the Polish armed forces—unless, of course, the Marshal should one day turn Titoist by infection from his native Poland. It leaves Moscow free in the future to pursue with the Germans policies that the Poles might bitterly resent. Indeed, it makes a new partition of Poland in the next decade a practical possibility. On the other hand it gives a show of authenticity—rather emphatically proclaimed in the Marshal's first order of the day—to Soviet assurances that Russians and Poles stand shoulder to shoulder in defence of the Oder-Neisse frontier with Germany. If, as part of his policy for Germany and Austria, Stalin should wish to withdraw his troops from Europe—or at least to eastern Poland—the major precautions have now been taken. He could stage a tactical retreat of great diplomatic value in his dealings with the western powers; the master hand would be withdrawn from sight but the grip would remain.

* * *

Recognising Mao's China

It is reported from Washington that the conference of British Far Eastern diplomats recently held at Singapore has recommended unconditional recognition of the Chinese Communist Government at an early date. The United States Government is said to have shown a sympathetic understanding of the urgency of Britain's need, on account of the importance of its trade with China, to put its relations with the new power on a regular basis as soon as possible.

Monsanto makes nearly two hundred chemicals of vital importance to British industry. If you have a chemical problem it is highly probable that Monsanto will be able to assist you

In Zanzibar, East Africa, ALI BIN DAOUD grows cloves. In Nigeria, West Africa, EZE BARTERI grows cocoa trees. In England, Monsanto makes Vanillin-Monsanto from clove oil, and supplies it to flavour chocolate and cocoa (among other things). Thus Ali Bin Daoud and Eze Barteri through Monsanto are helping each other, and Monsanto, helping the pair of them, is also helping Britain's export drive in manufactured goods, and helping provide you with goods you need. Just one more illustration of the way in which Monsanto is 'serving industry which serves mankind'

MONSANTO CHEMICALS LIMITED 8 WATERLOO PLACE · LONDON, SW1

The American Government itself cannot immediately grant recognition because Mr Acheson has promised not to take any vital decision on China without consulting Congress, and Congress will not reconvene until January. There has been so much criticism—some of it well deserved—of the Administration's handling of Chinese affairs that it would now be politically dangerous to take any major step in policy towards China without Congressional concurrence.

There is a considerable body of American opinion which demands that diplomatic recognition—with the consequent admission of Chinese Communist representatives to the Security Council and other international bodies—should at least be made conditional on undertakings by the new regime to observe treaties concluded by previous Chinese governments, especially as the Communists have announced their intention of abrogating "traitorous" agreements made by Chiang Kai-shek. The British view is that it is better not to attach any conditions to diplomatic recognition which may cause indefinite delay before diplomatic intercourse is resumed, but rather to rely on negotiations after recognition for the protection of British interests.

There is a strong case for independent British action in this matter, but it would be well to recognise clearly the risks involved. However benevolent the State Department may be towards prior recognition of Communist China by Britain, a large section of American opinion will undoubtedly regard it as a selfish British attempt to steal a march on America in Chinese favour. If, later on, Britain has need of American support in a Far Eastern crisis, there will be a strong inclination in America to say that Britain, having chosen to take its own way over the recognition question, must bear alone any unpleasant consequences of following an independent policy. It can, of course, be argued that the British—having not materially aided Chiang Kai-shek after the war—have a much better chance than the Americans of establishing good relations with the new Chinese Government. On the other hand, it is Britain, and not America, which has authority over some millions of Chinese in Hong-kong and Malaya, and is therefore the obvious target for attack whenever Chinese Communism finds it expedient to beat the nationalist drum. All in all, Mr Bevin's decision, announced in the House of Commons on Wednesday, to delay recognition and continue discussions with the Commonwealth and the United States, appears the only sensible course to pursue.

Conferences in the Commonwealth

Dr Evatt, the Australian Minister for External Affairs, has been the first Commonwealth statesman to make public what has been privately known for some time—that a conference of Commonwealth Foreign Ministers would take place early in the new year. The scene of the meeting is to be Colombo and the date probably some time in January; the Prime Minister of Ceylon, Mr Senanayake, has thus gladly renewed the invitations which he first issued at the Commonwealth meeting in London just over a year ago.

The unusual feature of the Colombo conference is that it will apparently be an attempt to frame a single view on various problems of foreign policy, to which all the Dominions will subscribe and for which they will all jointly be responsible—rather as Cabinet Ministers frame a government policy. It remains to be seen whether or not this means that, in discussing the Japanese peace treaty with the United States, one Commonwealth delegation will be responsible for putting forward the case for the Commonwealth as a whole instead of several delegations arguing each for its own Dominion government.

Such a step would be a remarkable innovation in the development of the Commonwealth. It has been avoided in the past, partly because each Dominion has been—indeed still is—peculiarly sensitive about its sovereignty, partly because of the difficulty of ensuring adequate discussion and

support in all the parliaments concerned in time for whatever common action is needed. The latter objection is no longer so strong as it was, for governments now tend to act first and to consult parliament only to secure approval for what they have already done. Sovereignty is still as jealously guarded as ever, but the habit of co-operation is growing, for it is clear that the Commonwealth as a single unit is more powerful than any one member of it.

Another good piece of news about the Commonwealth is the decision of South Africa, India and Pakistan to discuss among themselves the question of the status of Indian minorities outside the sub-continent—a matter which should never have been brought before Uno and exposed to the mercies of South American and Soviet bloc voting.

Alderney's Future

The Report of the Committee of the Privy Council of the island of Alderney presents, besides a fascinating picture of a little known and historically interesting community possessing the charm of the miniature and archaic, an instructive example of the difficulties besetting a very small economic and social unit. Alderney has an area of about $3\frac{1}{2}$ square miles, some 1,200 inhabitants, perhaps 500 houses, a few cattle, some market gardens, and a summer tourist trade. It has one doctor (aged 73), one lawyer (who, as public prosecutor, sometimes conducts both sides of a case), and two minute primary schools. It also has a heavy legacy of confusion and destruction from the German occupation, a legacy now being liquidated by a Rehabilitation Authority financed by the Government at Westminster. Given certain necessary reforms, farming, horticulture, fishing and the tourist trade should, the Commissioners think, keep the islanders going economically; but with regard to amenities they found the island administration "not in a position to provide the minimum standards which are essential in a present day community." They discerned a risk that in time "the island might become derelict, a situation which His Majesty's Government could not allow to occur."

A democratically approved solution to Alderney's most pressing fiscal and administrative difficulties has been found in the transfer to its more substantial neighbour, Guernsey, of responsibility for some major services, with a corresponding diminution, though by no means eclipse, of local autonomy. But no administrative ingenuity can give its inhabitants the benefit of full integration into a large-scale economy. Higher education and social services on the mainland scale, for instance, are simply impossible. There are compensating advantages. Alderney is a genuine community, a genuine neighbourhood, a genuine political and social entity, not, like most comparably sized mainland groups, a soulless suburban sprawl or urban agglomeration. It has a right to survive. But one wonders what Authority would have recommended had Alderney not been surrounded by the "moat defensive" of the Channel. The value of community tradition, set against that of 100 per cent main drainage and a quota of institutes, is not always so highly considered on the mainland.

Tax-Free Titus

The scandal of the exchange control informers is even worse than could have been supposed from Sir Stafford Cripps's original disclosure a fortnight ago that rewards would be paid "in suitable cases" to those who provided information leading to convictions under the Exchange Control Act. Two further written answers to Parliamentary questions (put by Mr Gammans) have elicited the facts, first, that in assessing the rewards "all the relevant factors will be considered, including any expenses incurred by the informant" and, secondly, that "it is the practice of the Treasury not to divulge the names of persons who give such information."

PRACTICAL INVESTMENT

How to select Mining Shares
How to read Balance Sheets
How to Calculate Yields
How to judge New Issues

Life to the investor these days is one big query. But neither panic nor despair pays dividends. More valuable than ever is the practical approach. Investors were advised of such an approach in "Notes for the Small Investor" which used to appear in The Investors' Chronicle.

Many questions like those above were answered in this series. Now, as events become more confusing, the demand is more insistent for a return of this simple, sensible advice. In a genuine attempt to help those who are searching for practical guidance, the Notes have been revised, increased and brought up to date. They have been published in book form by The Investors' Chronicle and Eyre & Spottiswoode.

"PRACTICAL INVESTMENT"

published on November 18, is available from your Bookseller or from 72, Coleman Street, E.C.2.

PICTURE POST EXPOSES THE GROUNDNUT SCANDAL

We sent a top flight journalist to Tanganyika to get the *real* groundnut story. He got it all right! The only thorough-going account of this imaginative scheme that anyone has ever printed. *You* pay for the groundnuts. What do you think of questions like these:

"Why did it cost nearly £80 to clear an acre of bush when the original estimate was £4 odd?"

"Why were expensive steel root-rakes only tested in England and completely useless in the African soil?"

"How many desk workers are employed for every staff man active in the field?"

Pompous officials, miserable bungling, inefficiency at high levels (in London and Africa), the kind of red tape that requires a harassed field-worker to take note of a 152-page book of instructions. We found all this going on—and more.

But we also found the real workers on the job were good and keen and hopeful—in spite of the bureaucrats. People who realised what a vital experiment this groundnut scheme is for the Empire and the world. People who will welcome the truest, ablest report on the scheme.

The full story is in this week's Picture Post, 11 pages and 25 pictures.

PICTURE
POST

This is really scandalous. The common informer known of old to the law did at least have to possess enough intestinal fortitude to show his face in court, have his name in the newspapers and suffer cross-examination. In the new dispensation he is to sneak in secret, and no amount of protest that this is what the Inland Revenue has been doing for years can make it smell sweet. Furthermore, it now appears that informers are to get their "expenses," and any man of the world knows what that means—the rewards will be tax-free.

It is a disgusting business and one can only record a real sense of surprise that Sir Stafford Cripps should have stooped to lend his name to it.

Shaping Libya

There is still one hurdle to cross before the fate of the ex-Italian colonies is settled. The Assembly must pronounce on the decisions taken, by large majorities, in its Political Committee. It is unlikely to reject them, for the Assembly is composed of the same delegations, sitting on different chairs.

By the arrangement voted last week, Libya is to become an independent sovereign state at latest by January, 1952; Somalia is to become sovereign after ten years of an Italian trusteeship, the terms of which will no doubt be drawn up at the Trusteeship Council meeting in January. Eritrea is to be the subject of yet another inquiry into the wishes of its inhabitants. For the moment, the plan for Libya offers

the most complications. By its terms, there shall be one Libya, not three Libyas, yet at the moment the territory is divided into Tripolitania, administered by the British, with local administration only of municipalities; Cyrenaica, also in British charge but with considerable autonomy, under its Emir, in internal administration, and the more backward inland Fezzan, administered by the French. Over the next two years, these three areas, assisted by a United Nations commissioner and a council of seven foreign and four local advisers, must draw up a federal constitution through the agency of a national assembly. Can they do it amicably?

The united Libya movement has been vocal partly because the Arab League has encouraged it and partly because the Tripolitarians, though they think the Cyrenaicans backward, have thought that the quickest route to independence was to join with Cyrenaica and to profit by the rewards the British have been giving it for its help against the Italians in the war. In fact few Tripolitarians want to be too subservient to a Cyrenaican Senussi Emir. Now that they are sure that all danger of an Italian return is averted a tenuous link would suit them better. If United Nations state-making is to succeed better here than it did in Palestine, a great deal depends on its choice of commissioner. He must look ahead, not back—that is, not waste time throwing up Uno hands in horror at all that was not done by the impecunious caretaker administrations. He must be a man of single purpose, unwilling to be played off by local adepts against the outgoing British and French administrations. He must, too, be intent on creating a Libya with enough common services—customs, currency, defence and so on—to constitute a unity but enough local autonomy to please most of the people all the time. For a man of parts, the job is not impossible. The chief rocks ahead lie outside Libya. One of these is the effect that the creation of Libyan sovereignty will have on the more forward dependencies in Africa—notably on Tunisia and the Sudan. The other is the repercussion of the Libyan negotiations upon Anglo-French relations.

* * *

Overseas France *versus* Overseas Britain

Few people in this country realise how many situations in Asia and Africa create French grievances about British policy. Now that the quarrel over Syria—as symbolised by General de Gaulle on the one side, General Spears on the other—is over, what is there left to cause misunderstanding? The current French retort is: first, unfavourable Anglo-Saxon comparisons between French Indochina and the British action in India or the Dutch in Indonesia; second, British "sponsorship" of the Arab League, leading to a United Libya, leading to unsettlement in Tunisia, which the French hope will under some new treaty opt for inclusion in the French Union, and in Algeria, which is part of France. The French arguments are cogent: "Why should you encourage us to do in Indochina what you are not doing in Malaya?" "Can you not see that your encouragement to Arabs disrupts us—whose Moslem population live just across the way from Marseilles—far more than they do you in Sudan or Aden?" These views cannot be lightly set on one side just because they are uttered in the same breath as baseless contentions—such as that the mooted *Anschluss* between Iraq and Syria is a British design to get Damascus under a British puppet's thumb.

It would be a grave pity were the friction to be allowed to invade the commission of six foreigners—Britain, France, Italy, the United States, Egypt and Pakistan—who are to help the Libyans to frame their federal constitution. At a moment when Franco-British relations on Germany are troubled, preliminary agreements, at least between the Western Union members, on small points about the Fezzan and Cyrenaica are highly desirable. Anglo-French agreement has been successful in Africa south of the Sahara. Can it not be secured elsewhere?

Letters to the Editor

More Coal or Cheaper Coal

SIR,—In your article "More Coal or Cheaper Coal" in *The Economist* of October 15th you state that emphasis must be laid on reduction of costs, leaving production to find its own level. Yet on the other hand you blame the Board for failing to take advantage of foreign demand: you agree that exports are necessary, yet you support a policy which would result in the demands of the home market being barely satisfied without any available export margin. You side-track the loss of manpower and its disastrous effect on the industry, you skirmish lightly with absenteeism—"it is intolerably high"—and pass on to your main theme—reduction of costs.

What you miss is:

(i) The loss in manpower has been most severe in the South Wales district, which was the greatest exporting area. This loss is largely responsible for the failure of South Wales to reach its target and to export to dollar earning areas.

(ii) The Board has a Committee which is devoting all its time to reduction of costs. It has been particularly active in South Wales. It has succeeded in effecting cost reductions though not, as yet, on a very large scale, as it is studying the problem pit by pit as would seem necessary. But of necessity its work is of considerable duration. In most areas, the mines were in an appalling state when the Board took them over, and to feed them with capital equipment, to weld them into one large industry is of necessity a long term project.

With the exception of one or two coal owning companies, capital investment in mechanisation was almost unknown. Does *The Economist* propose a continuation of a cheap labour policy, or is it willing to face the vast reorganisation involved which will take at least ten years to resolve?

On the basis of what you call Professor Beacham's "incontrovertible statements" you reason that the opportunity for exporting British coal is now passing and that the "plodding progress" of British coal output will not now overtake it. I am surprised that your journal pays attention to a statement which, whilst it is true in itself, takes no account of the facts—obviously demand is affected by prices but, as yet, there is no indication that future world supplies are likely to be more than adequate for demand. On the contrary, the demand for British coal continues to increase.—Your faithfully,

STATISTICIAN

[There are more ways of getting cheaper coal than by a "cheap labour" policy; and to talk, in present circumstances of "the continuation of a cheap labour policy" begs two questions at once. Clearly reorganisation of the coalfields is to be supported; but the longer it will take, the more necessary it is that it should be designed to meet the market conditions of the future, not of the past or present.—EDITOR.]

Medical Expenditure

SIR,—Your correspondent's last sentence in "Polio's Peak," which appeared in *The Economist* of October 15, 1949, is a masterpiece of understatement. Since it is the first criticism, however, that I have seen in a lay publication with respect to our sentimental squandering, I am grateful to you for publishing it. According to the last data that I have seen, we are spending more than five dollars *per annum* per polio death. Our expenditures on diseases of the heart (which are to a great extent the result of rheumatic fever in childhood) amount to about forty-three cents *per annum* per death. We spend so little on diseases such as leukemia, lymphosarcoma, and Hodgkin's disease that statisticians do not even bother to calculate how much is spent for each death per year.

Lay publications could serve their communities far better if they had the courage to point out the iniquitous situation

that exists in the financing of medical research. Contributions are sought and obtained on the basis of sentiment rather than on the basis of need. I can only hope that more non-medical journals, particularly in the United States, will follow your example.—Yours faithfully,

PAUL DE R. KOLISCH

130 West Kingsbridge Road, Bronx 63, New York

Plebiscite for Protectorates

SIR,—Following on your article "Dr Malan and the Protectorates," might I make a proposal regarding British action should Dr Malan persist in his demand to incorporate the territories in spite of our having given him a categorical "No"? We have promised that no action will be taken until the people are consulted—let us then put such a consultation in hand. It should be carried out with the utmost impartiality, and under the supervision of neither Britain nor South Africa who are the two contestants. A Commission representing three or four other Commonwealth countries—including at least one of the Asiatic Dominions—might be charged with responsibility for organising the plebiscite (or whatever form of consultation is decided upon). We have no doubt what the answer of the native populations will be. After that Dr Malan's moral position will be as untenable as ours will be impregnable.—Yours faithfully,

RITA HINDEN

134 Greenhill, N.W.3

Australian Budgeting

SIR,—Your article "Australia's Pre-election Budget" (September 24th) could be regarded as good electioneering material for the Australian Government. This is not surprising because your Melbourne Correspondent has drawn heavily on the Australian Prime Minister's own assertions. Your correspondent states: "It (the Government) can point to the establishment of the Australian motor-car industry and the expansion of the steel industry. . . ." The facts do not support these assertions. Plans for an all-Australian motor-car date back to pre-Curtin and Chifley Labour Government's days, and, in fact, motor-body building, car assembly and the production of a large range of motor-car parts had reached substantial figures during the period of the Lyons and Menzies non-Labour Governments. So far as the steel industry is concerned, in 1948-49 6.3 per cent less pig-iron was produced in Australia than in 1938-39, 11.9 per cent less blooms and billets, and 3.3 per cent less of steel ingots. This falling-off of production in the basic industries, due mainly to inadequate production of high quality coal, has seriously prejudiced both primary and secondary industrial expansion in Australia. Your correspondent claims that the Government "has actively encouraged the expansion of secondary industry." This may be so, but, to quote Professor Copland, Chancellor of the National University in Canberra, the Australian economy should be described as of "the milk-bar type." Australians can buy plenty of ice-cream, but few tiles for housing. Output of confectionery has increased, but brick production is still lagging on prewar figures.

Australia's undoubted prosperity is not due in any extent to the Federal Government's efforts. Primarily it arises from soaring prices for Australia's exports in the face of strong world demand for primary products, particularly wool, wheat and base metals. The pity of it is that the prosperity in the Commonwealth is not nearly so great as the increased income from overseas could have made it if the Government's financial methods had been sound. Wages are high—so is the degree of inflation. In 1938-39 14.3 per cent of the national income was spent on imports. In 1948-49 the percentage so spent was

The Economist

November 17, 1949

22.6. With few exceptions, exports of Australian primary products are below prewar quantity levels. When overseas prices fall, the present postwar honeymoon will be over for the majority of Australians.—Yours faithfully,

W. S. BENGTTSSON, Senior Research Officer
The Liberal Party of Australia, Sydney

Small Savings

SIR,—One of the contributing factors to the present inflationary condition has been the fall in the level of small savings, where for the current financial year withdrawals have exceeded new savings.

In fact it is clear that the *past* encouragement of savings in the liquid form of Post Office Savings and Trustee Savings Accounts and National Savings certificates has proved a present embarrassment, and has helped to render a deflationary budget policy ineffective.

We wish to encourage savings of a more permanent nature that are a genuine offset to investment, while providing adequate facilities for the transient seasonal savings. Might not the solution be found in a new type of savings certificate, carrying a higher rate of interest but not encashable on demand, while there is no reason why the liquid convenience of savings should carry more interest than those paid on deposit account with the commercial banks? This would in effect represent a funding operation of the most liquid liabilities now outstanding against the national output.

These assets should however be made transferable at a nominal fee, and the Stock Exchange might be encouraged to quote them, thus making the advances to the small man that many feel it should do if it is to survive.—Yours faithfully,

C. N. WARD-PERKINS

Pembroke College, Oxford

SIR,—The terms of the letter from the chairman of the Savings Movement in your issue of November 12th must inevitably give the impression to many that the leaders of the movement fail to appreciate the basic reason for the continual falling off in savings. Surely it is the fact that the people no longer feel that savings invested with the Exchequer are secure. For several years the saver has seen the real value of his savings progressively dwindling to such an extent that his confidence has to a large extent been sapped. There is no use being unrealistic and endeavouring to divorce savings from politics. Obviously the Government's shilly-shallying and negative approach to the economic crisis have played a considerable part in shaking public confidence.

Until confidence is restored there can be no real prospect of any material improvement in the savings figure and confidence will not be restored until the public feel in their own minds that, whatever government is in power, it is prepared to face up to the realities of the situation confronting it.—Yours faithfully,

B. GRANT CARNEGIE

15 Glengate, Kirriemuir

Death Duties

SIR,—In your article "Tighter Credit, Lower Taxes," it is suggested that death duties might be revised on the Rignano plan.

Might I suggest that a more fruitful change would be the substitution of a legacy duty for the present tax on the estate. This change could be carried out without loss of revenue, by arranging a suitable graduation. Moreover, by fixing a comparatively lower rate on bequests to near relatives an increased incentive to greater efforts would be given. In addition this would encourage a wider distribution of property ownership. A change, which can make a bow to egalitarian sentiment, with

a possible increase in incentive and without loss of revenue, is surely worthy of notice.—Yours faithfully,

JOHN G. WALKER

226 Spen Lane, Gomersal, Leeds

Rights of the Subject

SIR,—You have recently set out, with admirable clarity, four examples of individual rights. Is there not, however, a fifth right, namely, that an individual is innocent until proved guilty?

For any man to be automatically labelled criminal if the tank of his motor-car contains red petrol makes a mockery of his rights and of the law which brings it about. I cannot do better than describe the Motor Spirit (Regulation) Act in your own words as: "an unmistakable hallmark of the police state."—Yours faithfully,

P. B. W. COX

2 Castlebar Hill, Ealing, W.5

Dollar Exports

SIR,—Mr Gaunt asks some questions about the conception of British Dollar Exports, Limited. The purpose of the company is conceived to be, first, to offer direct incentives to the small producer, or the manufacturer who is unwilling to venture into non-sterling areas, by purchasing a percentage of his goods in sterling and marketing them in North America. British Dollar Exports, Limited, would be a tough, capable exporter, working, it is envisaged, in harmony with the Export Credits Guarantee Department. This would mean, *inter alia*, (a) financing of market research by survey, advertising and promotional expenditure, guaranteed by the ECGD (i.e. bank credit extended to the company on the guarantee of the ECGD. In the event of failure the Department would protect the company from liabilities which might otherwise prove too onerous); and (b) the company organised to supply the requirements of the North American market, with the stock carrying necessary to maintain North American standards being "underwritten" by the ECGD. Large organisations exporting to the dollar area are excluded because they are already tuned to meet demands upon them. At what price would the Government perhaps take over goods from the company not required in dollar areas? That is a matter for negotiation; but probably they would consist in the main of consumer goods in short supply at home which, by a decision of the directors who would represent concerns selling to the company, could be released for home consumption.

Secondly, Mr Gaunt asks, will the shares to finance this company be taken up? Why not? The manufacturers would have every inducement to finance their own super-sales organisation, and the subscription lists should appeal to the patriotic and speculative citizen. And why not a subsidy to the company in a *winding up*? It would certainly make the prospectus attractive. I do not quite understand the significance of Mr Gaunt's "biggest obstacle" because British Dollar Exports, Limited, would, of course, be a "truly huge undertaking" and the manufacturers would sell to the company as arranged.

The President of the Board of Trade stated the Exports Credits Guarantee Department is willing and anxious to support any proposition, large or small, however unusual, which is business-like and sound in its approach to increasing dollar markets. The Department is commercially inspired, it impresses, is helpful in a real way, and it is undoubtedly a permanent feature in the economic structure of the country. The arguments for British Dollar Exports, Limited, are too numerous to unfold in a letter in your columns; but if my suggestion puts a thought into any head that can turn it into a practical proposition, then your space, sir, will not have been wasted.—Yours faithfully,

COLIN A. PERRY

Drayton House, London, W.C.1

[Advertisement]

WELL DONE, SIR GRAHAM!

SIR GRAHAM CUNNINGHAM has poured a stiff dose of realism into Whitehall's milk-and-water of pious hopes. We congratulate him and all others concerned in the formation of the Advertising Advisory Committee for the Dollar Exports Board, and we wish them well. In the course of his speech to the Advertising Association announcing this move, Sir Graham rightly emphasised that it is no use making goods unless we know how to sell them, where to sell them, how to induce the customer to buy them, how to let him know they are available and where they are available.

OFFICIAL SPEAKERS of all grades have been suggesting for some months past that our real problem is one of selling. From our own studies and operations in the Transatlantic markets we have reached a different conclusion. We recognise the selling problem, but we do not think it comes first. We believe that the basic trouble is that British manufacturers, despite five years of urging, have not yet geared their production to the making of consumer goods specifically designed for these markets.

THE DOLLAR EXPORTS BOARD is right to concern itself with selling, merchandising and advertising, but should it not start with first things first? British manufacturers as a whole badly need education in the function of marketing by means of market research.

WE ARE NOW TOLD that because of devaluation we must all work with great haste to close the dollar gap for good and all. We believe this to be dangerous nonsense. The horrible truth is that we have wasted the last five years in 'opportunity' exporting to a sellers' market. We cannot now correct overnight the mental debility of years. We are engaging upon the most ruthless trade war since the end of the 19th century, at a time when our selling brains seem addled with complacency and staleness. Even if we overcome this defect during the next year or two, even if we equip ourselves with the right weapons, we shall then only have reached a point at which we can give battle on equal terms. The battle will still remain to be fought. Then, and only then, can we bring up the supporting arms of merchandising, selling techniques and advertising.

INTAM LIMITED International Advertising and Marketing, 112 Park Street, W.1
One of the London Press Exchange Group of Companies
In association with Ellington & Company Inc., New York

IN OUR OPINION the Dollar Exports Board should concentrate on the following

1. Satisfying themselves that their brief is realistic; that their own activities will be matched by strong Governmental efforts to solve relevant matters of higher policy not within the Committee's brief. For instance, a re-examination of the Trade Agreements Act just reviewed by Congress. This needs persistent pressure at the top level. However well we prepare and fight we cannot surmount insurmountable obstacles.

2. Funds should be found either from the Government, Trade Associations, groups of manufacturers, or any combination of these, to investigate particular markets for groupings of products or industries. We do not believe that much will be done here on a voluntary basis. Although our official trade intelligence may prove helpful on occasions, it will always be a poor substitute for business initiative and drive.

3. Control of the price structure of anything British. American middlemen must somehow be made to realise that not all British goods are in the luxury class. High mark-ups kill volume; but volume is surely not a difficult thing to sell to the American businessman. The future of British exports is not in luxury products such as whisky or super woollen goods, but in mass production items with a small mark-up, quick delivery and, of course, consumer acceptability and competitive price.

4. Prevailing freight rates should also be examined. They present great problems even to American manufacturers. For example, bulky toys pay freight on cubic measurement not on weight.

5. The techniques of delivery need urgent study. Whatever the difficulties, stock building must be undertaken so that shipping delays do not affect orders which are needed to meet carefully designed merchandising plans at the market end. There is no confidence in the hard currency markets that Britain has really attempted to solve this problem. Americans certainly will not risk a let-down on their forward stock planning and rapid turnover techniques.

6. British trade representation in these markets is still woefully weak, both in quantity and quality. This is a very difficult problem. A comparatively small number of really good men representing groups of manufacturers could soon make a difference. They must be men who can analyse the markets and sell. The mere order-taker is useless. Whoever represents Britain across the Atlantic must know his market, know his products and be able to quote price and delivery dates which will be honoured without a doubt.

Books and Publications

Dim Light on the Chancellor

"The Biography of Sir Stafford Cripps." By Eric Estorick. Heinemann. 369 pages. 21s.

GRANTED sufficient intellectual curiosity and power of detached penetration in the biographer, this is the right moment for a study of Sir Stafford Cripps. Never, in the course of a career that has set many questions, has he appeared in quite so questionable a shape as in the summer and autumn of this year; never have his bearing and his action so puzzled both enemies and friends. An "authoritative biography" by one who "has had access to all family documents and papers" ought to be a book of fascinating interest, severe as are the limitations set to any account of a living man.

It ought to be, but somehow, it is not, for it tells the careful reader of the press little that he did not know before. It leaves the puzzle where it was. Mr Estorick suffers from two main handicaps. The first is that he does not know the British labour movement from the inside. This, though serious, need not be fatal: his subject never suggests that he responds to its characteristic "feel." The second is more serious: he never conveys the sense that he knows the religious impulse from the inside. Dr Busch, writing the life of Bismarck, described himself as being "on his knees." Formally, this is Mr Estorick's attitude to his subject, but, on the essential, central point, his adulatory words convey no illumination. He devotes many pages to stating and restating the one fact universally known and accepted about his hero—that Christian faith is what makes him go, but, while adding nothing to understanding, these pages fail to carry conviction. The reader feels that the impulse that burns in Sir Stafford is, to his biographer, no more than a word, and a word devoid alike of precision of content and of any moral carrying power. It is a small, yet indicative point that in dealing with the events of 1931 and the far reaching shock they delivered to the Labour Party's very recent convert, there is no mention of the effect on him of the utterances, at that time, of certain ecclesiastics. Yet this attitude on the part of the Church carried the shock to the sensitive centre and goes far to explain the aberrations of the immediately succeeding years. Within a remarkably short space of time, Sir Stafford brought into being two, antithetical, "Unity" movements: the first, strictly based on class, was formed in close alliance with the Communists; the second, called by his father, Lord Parmoor, the "Holy Alliance," ignored both class and party affiliation, and extended as far to the right as the Duchess of Atholl. Small wonder that the patient Labour Party had in 1939 to expel him; small wonder that a letter from Sidney Webb expresses "complete bewilderment" as to "what Stafford's line is." Bewilderment remains.

Although the early chapters contain a somewhat high proportion of infantia, they are interesting above all in their suggestion of hereditary and background strains. The two on Russia are a baffling naïveté, not least where Mr Estorick is moved to draw a parallel between the Ambassador and Stalin.

Both men were scientists. . . . Both men were of high principle and great character whose integrity was unquestioned and whose sustained intensity of purpose had brought them into the forefront of the political leaders of their respective countries. This ambiguous tribute may help to explain why Mr Estorick is quite at a loss when he has to deal with Sir Stafford's relations with the Labour Party. A thorough study ought, nevertheless, not to omit to inspect his failure as Leader of the House of Commons in 1942, and at party conferences: since, in either case, what is lacking is contact. It is strange, for instance, that a brilliant advocate should, almost invariably, bring from his pocket a speech, composed in the study, which

he proceeds to read. He reads remarkably well; but reading is by no means the medium of direct communication that speech can be: it is apt to suggest lack of connection with—even indifference to—the previous course of debate. Some of the speeches quoted—for instance that delivered at Chungking in February, 1940, cited by his biographer as "the greatest of his career"—are wholly detached from any views save those held, at the moment, by the orator, and imply a considerable inclination to impose those views. There are no more illuminating pages in this dubiously illuminating book than those recording the exchange of letters at the time when Sir Stafford was trying to bring political pressure on the Trustees of the Albert Hall to allow it to be used for a Unity (Communist phase) meeting. The last word, here, is with Mr Churchill, who outraged Sir Stafford by drily replying to his appeal for support: "I cannot feel that right of free speech is directly involved in the inability of a particular person to procure a particular hall."

The Interpreter's Story

"Statist uf Diplomatischer Buhne: 1923-1945." By Paul Schmidt. Athenaum Verlag. Bonn. 589 pages. 15 marks.

THERE can be no doubt that these memoirs of the German interpreter will be one of the important source-books for the twenty-two years covered by his official career. The condemnation of secret diplomacy and the natural trends of the times created the necessity for professional interpreters at the end of the first world war, and the linguistic helplessness of Hitler brought Dr Schmidt into the stalls of the political theatre throughout the Nazi act. The garrulousness of the Führer made the post of his interpreter a singularly trying one, all the more for someone who had been devoted to Stresemann and to Stresemann's later aims.

His life before 1933 and after it were as different from one another as civilisation from savagery. In the earlier period he records only one primitive episode, when Pilsudski came to Geneva in December, 1927, and behaved so rudely that his own Foreign Minister, Zaleski, blushed to the roots of his hair. In the transitional period between the coming of Hitler to power and his breach with the League Dr Schmidt describes a clash between Nadolny, who was head of the German delegation, and Heydrich, who had come to Geneva to represent the German para-military formations. Heydrich hoisted the swastika over the Carlton hotel, but the Genevese reaction was so hostile that Nadolny insisted upon having it removed; in view of Nadolny's recent activities it is interesting to have this indication of the strength of his personality—not many other people over-rode SS Gruppenführer Heydrich.

The picture of Hitler which emerges from this book is no new one; it is rather as if this time we were given a close-up photograph. Among a thousand other incidents he is able to describe Lloyd George's fateful visit to the Berghof, and it was he who received the British declaration of war from Henderson on September 3, 1939; when the news was conveyed to Hitler, Schmidt saw the Führer give Ribbentrop a furious look as if to say "You told me they were not capable of it."

There are a few minor slips in Dr Schmidt's book, but on the whole it is a valuable and careful piece of work. Above all it is a plea for a return to diplomacy in the place of gangsterism, a return, that is to say, to a consciously political search after practical compromise, to the battle waged by Briand and Stresemann against nationalist fanaticism and in favour of the federation of Europe.

The Pursuit of Happiness

"The English Utilitarians." By John Plamenatz. Basil Blackwell. 228 pages. 10s. 6d.

"The Growth of Philosophic Radicalism." By Elie Halévy. Faber and Faber. 554 pages. 25s.

THE first of these books contains John Stuart Mills' famous essay on Utilitarianism, together with a critical essay by a Fellow of All Souls. The second is a reprint of M. Halévy's masterly historical analysis of the Utilitarian school, with its skilful unwinding of the relationship between their political and their economic theories.

Utilitarianism—which may crudely be described as the theory that the greatest happiness of the greatest number should be the supreme objective alike of private morality and of state action—deserves reconsideration. It was, claims Mr. Plamenatz, the greatest English contribution to political and moral philosophy; but he asserts that the doctrine is destroyed and no part of it is left standing. This is surely an overstatement. Certainly many of the psychological and economic theories of the Utilitarians can now be seen to be crude or false; but not all of them. It is true that the Utilitarians were supreme individualists. In believing that the sole aim of state action should be the satisfaction of individual desires, they overlooked the historical process whereby a man's wants are themselves shaped by the institutions under which he lives; but this omission does not, as Mr Plamenatz supposes, make the welfare of the individual a false criterion. It is true also that the *laissez-faire* economic doctrine, which—as M. Halévy so well demonstrates—was closely linked to the political and moral beliefs of the earlier Utilitarians, has long been discredited. But the connection between the two theories is historical and not logical. The pure milk of Utilitarian theory can be, and has been, equally well used to buttress the Fabian Socialism or middle-of-the-road Liberalism or any

other economic system which seems likely to maximise total happiness.

Whether discredited philosophically or no, the happiness criterion has taken firm root in the minds of politicians and peoples. The great historical service performed by Bentham and his followers was to rule out the appeal to established authority, or convention as providing any sort of justification for laws and institutions which have outlived their usefulness. In their own day, the Utilitarians were led on to a ruthless attack on harmful government controls and private monopolies. More recently, the self-same criterion has been used to justify the widespread extension of public social services and government planning. Now, perhaps, the pendulum will swing slightly back. It is the planners today who are in danger of exceeding their usefulness.

Utilitarianism has no set application. The very vagueness of its central belief—for how is happiness to be measured?—must make its practical application obscure as well as fluid. Yet the theory from its skilful blend of humanitarianism and realism still has value. The early Utilitarians made great play with the need for harmonising individual self-interest with the cause of social welfare, and by this means of increasing the total store of happiness. Bentham regarded this as the guiding principle of good legislation. Contemporary legislators would do well to attend to this criterion.

Television

"Television." By Maurice Gorham. Percival Marshall. 141 pages. 12s. 6d.

TELEVISION, its potentialities, its impact on the social pattern of this country, is still an unknown quantity, and so a legitimate field for speculation. Television is primarily a form of entertainment; that is, the majority of viewers will be people who expect the bulk of transmission time to be devoted to

Speedway to South Africa

One restful night in a flying hotel — with perfect service, free food and drink — and there you are in South Africa! What's more you'll feel rested and refreshed, having enjoyed air travel at its *level* best in one of K.L.M.'s wonderful new DC-6's.

Route: London — Amsterdam — Tunis — Kano — Leopoldville — Johannesburg.

Frequency: Twice weekly.

Fare: £309.12.0 return (Sleeping berths £12.10.0 extra per trip).

It's time you flew K.L.M.

Enquiries and reservations from all Air Travel Agents, or from K.L.M. Royal Dutch Airlines, 202/4 Sloane Street, S.W.1. (Tel. KENington 8111) and at Manchester, Glasgow and Dublin.

The Currency of Criticism

It has never been the habit of The Times Literary Supplement to debase the currency of criticism by the lavish use of superlatives. In distinguishing the good book, on whatever subject, from the flood that pours from the world's presses to-day it is content to be informed and balanced, wearing its learning lightly while preserving a sense of permanent literary values. The common reader, in Dr. Johnson's phrase, who is uncorrupted by literary prejudice will find The Times Literary Supplement an unfailing stimulus and critical guide.

THE  TIMES
LITERARY SUPPLEMENT

entertainment rather than instruction. It can bring sight and sound into the home, and actuality. It will compete directly with both radio and cinema; it may overwhelm both. It is a challenge to the whole idea of the BBC's present monopoly, to the shareholders in the film industry (who already receive so small a share in the initial takings) and to the revenue (whose entertainments tax is the major beneficiary of every film performance). It may well challenge the educationists of every kind in its more specialised fields. In short, a survey of what television is and may become could give a great many people a great deal to think about.

But, unfortunately, this book by Mr Gorham will not do that. Mr Gorham was head of the BBC's television service for two years and resigned at the end of 1947. He has, then, had some time since in which to think over the implications of the next few years, but his thinking, as reflected in this book, has not been very profound. For instance, Mr Gorham has very little to say on the question of finance and yet, in every form of entertainment, the promoter knows that there is a limit to his takings and that, if he is to live at all, he must contrive some room for himself in between his ceiling of takings, which may descend, and his floor of costs, which so often rises faster and further than he had planned. Or does Mr Gorham think that the BBC television service should be subsidised indefinitely? He does not say. And, when anyone writes, "If the film industry joined hands with television . . . it would be possible to have both television and a film industry in countries that can now hardly afford either," he is not even stating a problem; he is skirting round it. The book reads in fact, like an expanded collection of Sunday newspaper articles.

Help on a Dull Subject

"Elementary Theory of Finance." By William Lundie. John Smith and Son. 133 pages. 8s. 6d.

THIS book is written by the Lecturer in Mathematics and Actuarial Science at the Glasgow Institute of Accountants and Actuaries and is primarily intended for students preparing for the "intermediate"—a euphemism for the most elementary—examination taken by would-be chartered accountants in Scotland. The author indicates in his introduction, however, that he has cast his net rather wider than is usual in such works in the hope of interesting those who have to deal with financial and investment problems in their everyday business.

In the event Mr Lundie has written something which is too competent as a textbook for it to fulfil any other useful purpose. Actuaries, accountants and, to some extent, bankers, are fated by their profession to carry the cross of that rather dull sort of factual examination, which most people leave behind at school, into realms of quite incredible, technical complexity. There is no doubt that many ordinary business men would do well to acquaint themselves with the ground covered by these professional examinees in the earlier stages of their journey. But the technique of guiding amateurs over the ground is a difficult one for professional instructors to acquire. Examinees need books such as this, which seeks to impress rigid formulæ on their minds (without always quite fully explaining them), which underlines the pitfalls dear to the hearts of examiners (but to nobody else) and which sets out—in one hundred and thirty-three pages of text—no less than one hundred and thirty-four mathematical exercises. But the wider audience, which Mr Lundie apparently seeks, is likely to wilt under such schoolmasterly handling.

Indian Land Problems

"The Agrarian Problems of Madras Province." By V. V. Sayana. Business Week Press. 332 pages.

DR Sayana writes rather badly and his detailed suggestions for reform are somewhat unpractical. But these are minor blemishes on the only book available in England which gives

an up-to-date picture of the Indian agricultural situation. Dr Sayana's primary field is Madras, but he has illumined his description of Madras's problems with so many illustrations from other parts of India that the book is, in fact, a fairly comprehensive review of the whole position.

India's main agrarian problems are well enough known. There are too many people on the land; there is too much tenancy and debt, and there is an increasing tension between the peasant and his landlord and moneylender. Dr Sayana's main merit is that he provides the figures and the details which give these generalisations definition. He shows how the zemindar, who was supposed to take from his tenants only a little more than he himself paid to the Government, has, in fact, been charging them anything up to forty times the land revenue. In the villages Dr Sayana surveyed, non-resident landlords held from one-quarter to one-half the land. He quotes the census to show how the proportion of landless labourers to the total number engaged in agriculture, increased from 317 to 429 per thousand in the single decade 1921 to 1931. He makes clear the extent to which the introduction of a money economy into the countryside has made all relationships fluid. There has been an average of over one million transactions a year in sales and mortgages in the twenty years 1925-1945, and reached one-and-a-half million transactions in 1943. This is hardly the static countryside of the romantic imagination.

Finally, Dr Sayana has performed a very considerable service in bringing together in one book all the main reform legislation which has been undertaken in the last half century. His discussion of the most interesting Act in the recent legislation—the Bombay Tenancy and Agricultural Land Act, 1948—is particularly valuable.

Shorter Notices

"Population." Vol. 4, No. 3. Revue Trimestrielle de l'Institut National d'Etudes Démographiques. Editions de l'INED, 23 Ave. Franklin-Roosevelt. Paris. 586 pages. 300 frs.

THE preoccupation of French opinion with demographic problems is both more intense and of longer standing than that of Great Britain. It is reflected in the excellence of this quarterly journal which offers articles of statistical, economic, historic and sociological interest deserving the most respectful study. M. Louis Henry's analysis of the relation of population structure (as against total numbers) to housing needs, is one which might well find a parallel here; M. Alfred Sauvy's warning as to the "false problem" of world population deserves to be taken to heart by neo-Malthusians and optimists alike; M. Philippe Aries opens a window of fascinating speculations on the radical change, between the 17th and 19th centuries, in accepted social attitudes to birth and death; M. J. Fricart's close and detailed study of the forces of decline in a village community points the way to a valuable field of research; M. Bourgeois-Pichat provides a logical framework to the economics of migration; M. Leon Tabah's article on the relations of sugar and alcohol production, and Mr. P. H. Karmel's statistical and mathematical study (translated from Population Studies) are strictly for specialists; the rest, including a thirty-page critical bibliography, is in no way beyond the scope of the general reader.

"Documents on European Recovery and Defence." March, 1947-April, 1949. Royal Institute of International Affairs. 150 pages. 8s. 6d.

HERE is a volume of first-hand sources in the shape of documents and speeches which diplomatic correspondents and historians will cherish. What has been so far available only in well-thumbed clippings is now presented in a durable book—the story of the treaties, declarations by statesmen, expert reports and economic agreements through which western Europe has moved towards closer association with national policies. There are only two criticisms to be made of a job which Chatham House always does well: the Franco-Italian Customs Treaty of March, 1949, is not worthy of inclusion because it is not being taken seriously; and it should have been possible to give a sketch of the defence planning machinery set up under the Brussels Pact.

AMERICAN SURVEY

Wealth to Come

(From Our American Staff)

IN spite of all the talking about undeveloped areas in the ten months since Mr Truman first made their problems and possibilities the Fourth Point of his inaugural address, the scope and practical meaning of the President's idea are still obscure. No one knows exactly what he had in mind, and there is more than a little doubt whether he himself knew. The idea was, however, a fertile one, and it has gone on pushing up a shoot here and a shoot there, some of them in unexpected ground. In the last fortnight the prevailing vagueness has been given a slightly sharper definition in two different places. President Truman's speech to the women of the Democratic Party on election night dealt with the "what" and the "why" of Point Four, as it appears to him now. A spate of prophecies from economists of various schools touch on the "how"; if their forecasts of the country's next half-century are correct, the United States can afford Point Four—if it chooses to spend its money that way.

The President's speech, almost unnoticed under a blanket of election news, is said to have been extemporaneous. Sounding like an amiable attempt to explain a complex fragment of foreign policy to a group of school girls, it was a simple and rather moving presentation of the double dream that occupies this unpredictable President—"the welfare and the prosperity of the United States of America, and the welfare and the prosperity of the world as a whole." The first part of the dream Mr Truman took for granted. The second part, he seemed to think, was equally obtainable: he talked not of ways and means, but of the historical background against which he saw it, the areas in which it might be set, the analogies from the past which illustrate what might come about.

To Mr Truman, the dream means peace. Wars are fought "for economic reasons, or because some country is overpopulated, or because some country wants some riches that another country has"; do away with these inequalities, and all will be quiet. What the President is expressing is a modern and international version of the dream of the American pioneer: the development of untouched resources into marketable products, the transforming of barren river basins into blossoming Tennessee Valleys, both to be used "for the welfare and benefit of the inhabitants of those countries, and not for their exploitation."

The job has two parts. The first is to revive those nations which invested their capital in the United States in its early days, so that American railroads might be built and American mines opened. "This country was developed by capital from France and Holland and Belgium and Great Britain," Mr Truman reminded his listeners. Later, during two world wars, that capital was withdrawn from such profitable investments and spent for American munitions to be used "in the fight for liberty." Marshall aid thus becomes a returning of bread cast upon the nineteenth century waters, a paying back

of money entrusted to a youthful land needing capital for its own development. (There was no mention of any returns that might previously have been made on that capital to the individuals who invested it.)

The second job, said Mr Truman, is to tap "the immense well" of uninvested private capital in order to develop resources which now lie idle in "Asia, Africa, in South America, in Australia and in Indonesia and all the rest of the world." The President took as an example (and he is not the first to use it) the valley of the Tigris and the Euphrates which in Nebuchadnezzar's time supported, he said, twenty-five million people "all the time in luxury," and can do it again if the requisite technical knowledge is applied.

Much of this Presidential musing (including the apparent implication that Babylonian slaves lived amid what would be recognised as luxury by modern workers) might be brushed aside as reflecting merely the expansive influence of a night when Democrats were winning elections, were it not that it coincides with a current of optimism which has sprung up in places far from the White House, and which has its source in the slow lifting of fears that have obsessed the American mind for two decades. Bit by bit the scars of the great depression are healing. Bit by bit the country is being persuaded that another shooting war is not imminent, that its attempt to keep Communism out of Western Europe is succeeding, that the post-war depression, expected soon after Japan surrendered and anticipated every year since, is not going to materialise to any important extent.

★

As for the future, economists know that the accomplishments of the scientists during the past half-century have not yet been fully exploited; the prophecies based on them dazzle the most cautious. It is twenty-one years since the theme of two chickens in every pot, and two motor-cars in every garage, was sounded by the then Presidential candidate, Mr Herbert Hoover. Citizens, bidden to marvel at the new millennium which lies just over the horizon, may be forgiven if they hear echoes of that older optimism and remember what followed.

Such scepticism does not daunt the prophets, who are gentlemen of experience and wisdom in their fields. Mr Harold Moulton, head of the Brookings Institute, considers, after years of study, that the United States a century hence may support double its present population at a standard of living eight times as high as at present. Mr Sumner Slichter,

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

professor of economics at Harvard University, "suggests" to the readers of the usually sober *Atlantic Monthly* that by 1980 the "output of goods and services of the American economy, which was \$246.7 billion in 1948, will be at least \$416 billion (in terms of present prices) and that it is more likely to be larger—probably in excess of \$550 billion a year."

Business men agree with the economists. Mr Emil Schram, president of the New York Stock Exchange, informs audiences in the Middle West that tomorrow "will be more interesting and fruitful in finance than even the past," for "capital markets will be opened by reason of the world need for capital," and the government will cease to penalise the private investor. Mr Donald Woodward, of the Mutual Life Insurance Company, tells agency managers in Quebec that the future is bright for insurance because incomes are rising and life is lengthening—the family which had \$2,800 a year in 1900 has \$5,800 a year now, and will have more than \$7,000 by 1975 (all in 1949 dollars). And *Life* magazine, studying a still shorter term of years with the aid of figures prepared by the Twentieth Century Fund, uses a series of full-page advertisements to call attention to the "Decade of Opportunity" lying ahead, and the possibilities it offers to the sellers of consumer's durable goods.

All this is heady stuff, even to the most persistent sceptic, and he is in a minority in a nation normally inclined toward optimism. It represents a long swing of the pendulum from the depression psychology of the nineteen-thirties, when the talk was of a "maturing economy," of the American frontier coming to an end, of America's need to learn to live self-contained in a static world. Its significance may be no more deep or lasting than the earlier plunge into despair. On the other hand, if the country is coming to accept the implications of the widening of its economic frontiers by wars and international readjustments, the argument that Point Four will cost too much may have less force in 1950 than it had last January.

One Year After—Connecticut

[FROM OUR AMERICAN STAFF]

CONNECTICUT, in New England, is one of the States, like Illinois and Michigan, to which the Democratic tide in last year's elections brought a new liberal administration. Small though the State is, its problems are large and, as seen through the magnifying glass of its alert new Governor, Mr Chester Bowles, they form a worthy subject for the efforts of a man who may some day aspire to be President. Mr Bowles is in many ways a big man. Enthusiasm is the breath of his life, and persuasiveness comes naturally to him. Having made a fortune in the advertising business, he retired while still a young man, became a devoted admirer of President Roosevelt, and acted as his administrator of price controls during the latter years of the war. His liberalism, grown more doctrinaire as the New Deal has faded, seems to spring from a Goethean love of all mankind—a sunny characteristic which serves him well.

Mr Bowles was elected Governor last year on the Democratic ticket by a margin so narrow that his Republican opponents took the ballot boxes to court and demanded a recount before they would yield. His inauguration was delayed for four hours until the court's confirmation of his election was received. Even then, the Republican holders of certain minor offices, usually placed at the disposal of a new administration, clung to their jobs; several of the 169 towns into which the State is divided were treated for some

time to the unedifying spectacle of rival judges, belonging to opposing parties, dispensing justice in rival courts.

The State which gave the new Governor so grudging a welcome lies across the New York-Boston trade route, and takes commerce and colour from both. The first it welcomes, the second it deprecates. The State is only ninety-five miles long and seventy-five miles wide, but in 1662 its boundaries extended, by royal charter, to the Pacific Ocean. Some of the stubborn insistence on tradition and individual right which characterises it can be seen in its efforts to hold on to that empire; the last fraction of land outside the State to which it had any claim—a remnant of the Western Reserve in Ohio—was only yielded up this year.

The political structure of Connecticut is by no means adequate to its economic and industrial importance. The "Fundamental Orders," adopted in 1639 by the three rival sets of pioneers who first explored Connecticut's wilderness, are said to form the first written constitution in the English language. A modification approved in 1818, and still in force, secured to the rural regions the power to accept or reject further changes, by means of a rotten borough system under which any two towns, no matter how small, may out-vote any one town, no matter how large. The State motto *Qui Transtulit Sustinet* (He who transplanted still upholds) under three grape vines rampant, is not construed as applying to political innovation.

The Governor must work within this archaic framework, and within it he must deal with forces as diverse as the

Republican machine which governs upland towns no matter who sits in the Governor's chair, and the industrial workers in coastal towns who vote not only for Democrats, but in two cases, at least, for Socialists. Further complications are added by the various economic interests which exert pressure on the State government in devious ways. They include agriculture in the fertile river valleys (which produce 18,000 acres of the most valuable tobacco grown in the United States), insurance in Hartford (twenty-six of the big companies originated or have offices in the State) and manufacturing in the southern tier of towns along the coast (which adds \$1.9 billion to the value of the raw material used). Combined, they created the \$4.5 billion of goods and services produced within the State in 1948.

The construction of this lively economy, within an antiquated political structure, has resulted in a degree of political corruption which is hardly a secret. A critic writing as early as 1907 observed that Connecticut "illustrates the tendency of capital, centralised in private control, to assume control also of government." Fifteen years later another charged flatly that "the electorate is corrupt," and added: "Election

Day is a biennial harvest. The Republicans are the usual purchasers." If this is still true, Mr Bowles, a Democrat, may owe his election to the Republican tendency to underestimate the power of the independent voter.

Faced with the sorry complexities of this situation, the new Governor started on a programme of self-education which is widening to include both the other leaders in the community and the led. Elected in November, 1948, he found himself expected to produce a legislative programme and a budget to pay for it when the legislature convened on February 1, 1949. Examining former budgets, Mr Bowles found them "neither complete, nor comprehensible, nor prompt." State practice was to provide legislators with a slip of paper bearing in round figures the amounts that each department intended to ask for. On this basis the political trades were made, and the totals of approved items, added together at the end of the session, became the "budget" for the next two years.

*

Mr Bowles, stirred by the challenge, believing that "the executive budget should be a vitally important instrument of government," enlisted in Hartford a small group of devoted burners of midnight oil, and set to work with them. When the legislators arrived in February, they found on each desk not one sheet of paper, but a volume of a hundred sheets, printed in big type and with plenty of charts, bound so that it would lie flat, containing a detailed analysis of the State's income, its tax structure, the programmes of expenditure already under way, and the recommendations of the new Governor. The volume even included the text of a proposed Appropriation Bill, complete to the last detail, for each department. This analysis of state finances and state needs was presented with such simplicity that any citizen could understand it, and those who wished to circumvent it would have to do so in a glare of publicity. The glare distressed the legislators, but did not defeat them. They took refuge in devious subterfuges and, although the biennial session technically came to an end in June, the Assembly has not yet passed anything which could be called the budget for 1949-51.

The Assembly did, however, pass the appropriation of \$49,000 requested by the Governor for a "survey of all the functions of government—legislative as well as executive." A Committee on State Organisation has been set up, composed of leaders in industry, education, insurance and other fields. Under their guidance, study teams, each having the advice of an expert (and in choosing them the Committee has not confined itself to Connecticut residents) are now at work reaching into the farthest corners of the State. Field studies are expected to be finished in late 1949, with a consolidated report to be ready about March, 1950. There is every reason why this could become a powerful campaign document if Mr Bowles decides to run for another term, but that is not the primary reason for its existence.

The Connecticut Committee has taken the lead among the state committees on reform, which have been created, in large part, as a result of Mr Hoover's attacks on the cobwebs in the federal Government. The new techniques of analysis being used in Connecticut are attracting wide attention. Since the first world war, the trend in the States has been towards reform of the executive, while legislative inadequacies have been passed by. If Connecticut can improve both, it may wipe from the record the judgment of 1907 which has been so often quoted: "The State's chief pride is in its inability to move forward."

American Notes

Climbing Down in the Strikes

Even a giant can be smoked out and, once its competitors' chimneys showed signs of life, the US Steel Corporation quickly climbed down from its obstinate refusal to negotiate with the steelworkers. The strike was brought virtually to an end by this capitulation of the company that produces one third of the country's steel. The corporation signed on the same pension and welfare line as the Bethlehem Corporation and the rest of the steel companies. The new contract is binding for two years and, from rough calculations, it appears that it will cost about \$3 a ton of steel. It is difficult, for the companies, at least, to see how a rise in the price

"Maybe It's A Little Cool For Pole-Sitting Anyhow"

Herblock in the Washington Post

of steel can be avoided, especially as other costs have gone up in the 16 months since the price was last increased.

This welfare plan seems to have a sounder actuarial basis than the one which Mr Lewis established for his coal miners in 1946, and which is financed by a royalty of 20 cents on each ton of coal mined. Approaching bankruptcy stopped the payment of pensions in September and provided the excuse for the coal strike, which cut the royalties almost to the bone. The Supreme Court last week dealt a direct blow at the union's own purse, by refusing to review Mr Lewis's conviction for contempt of court in 1948, when he kept his men out of the mines in spite of a legal injunction. The fine of \$1,420,000 had, therefore, to be paid and another fine will be inevitable should this year's strike involve similar defiance of an injunction. Such government intervention was imminent when Mr Lewis suspended the strike last week; attempts to split the coal owners had only made their front more solid; hunger and boredom were weakening Mr Lewis's hold over his miners, almost for the first time.

It is not, therefore, surprising that the giant of labour also decided that, after seven weeks, the time to climb down had

come. But Mr Lewis has only put one foot to the ground. He sent the miners back to work, to relieve the public distress—and to earn a little money for Christmas. But he warned the nation that the strike would be resumed if no settlement had been reached by November 30th. The Administration, however, has no intention of letting Mr Lewis get away again and the President has now taken over from the federal labour mediators, who were no more successful than the coal owners in discovering what the miners want. Mr Lewis has only let it be understood that higher wages, shorter hours and another 20 cents a ton for the welfare fund would not come amiss.

* * *

Facts in the Far Eastern Dust

The three official receivers, who have been examining Far Eastern affairs since last August when the State Department filed its petition in Chinese bankruptcy, are about to present their re-organisation scheme. Final details may, however, be delayed until Mr Jessup returns from his projected field trip to the Far East. Meanwhile, the dust is settling in China, as Mr Acheson has been waiting for it to do, and it is possible to distinguish a number of facts on which Far Eastern policy can focus.

One of these is the Japanese peace treaty, although it is still in the "working paper" stage; the State Department, unlike General MacArthur, has not yet declared its position on this question, but there is a strong feeling that Japan must quickly be restored to normal relations with the rest of the world if its friendship for democracy is to be ensured. The new Chinese Government's dislike of democracy has been demonstrated by its treatment of American consular officials. These arbitrary arrests are one reason why the US Government is not yet prepared to recognise the Communist regime, even though further delay may involve falling out of step with Britain. Mr Acheson has also promised to consult Congress before withdrawing recognition from the Nationalist Government, and Congress is in recess until January.

President Truman, who is said to be taking as keen a personal interest in China as he did in Palestine, has been presented with \$75 million of military assistance funds, to spend as he thinks best, in the general area of China. The smallness of the sum is in inverse ratio to the number of suggested uses: amongst them are help for Americans stranded in China; military equipment for Tibet, whose independence of China may be recognised before long; military aid for Indo-China, presumed to be the next Communist target; and assistance for the Indonesian Republic.

Some form of financial help coupled with recognition of the Indonesian government are expected to provide speedy evidence of approval for this successful end to a revolution which has always been, unofficially at least, after America's own heart. The United States, it is widely held, must help the new republic to prove that freedom does not, in the Far East, mean Communism. The neighbouring Filipinos have just polished up their halos with their voting papers; not only did they refuse to be led astray by Communism, but they re-elected the favourite President Quirino, in preference to the ex-collaborator, anti-American Señor Laurel.

Another way in which "the revolt of Asia" can be handled with the "fine discrimination," for which the *Washington Post* has called, has just been tried. Mr Nehru's invitation to visit the United States was an attempt to bring India, with Pakistan the strongest and most stable centres of western influence in the Far East, into the American connection. But both Mr Nehru's refusal to commit himself on active opposition to Communism and the difficulties being met in negotiating a commercial treaty with India show that to woo the East is not to win it.

\$50 Gold?

Not even President Truman, apparently, can stay the rumours of a much higher dollar price for gold. Fostered by Congressmen, and by radio "experts" whose knowledge of monetary matters is usually in inverse ratio to their value as broadcasters, these rumours have become the strangest sequel to the world-wide devaluation of currencies in terms of the American dollar. Against them, Washington has brought its biggest guns to bear. Repeated denials of any change in policy have been made by Mr John Snyder, Secretary of the Treasury. Mr Thomas McCabe, Chairman of the Board of Governors of the Federal Reserve System, has joined combat, and finally Mr Truman himself has dismissed the rumours in the most categorical terms. But they persist, and they derive some strength, at least, from the way in which European central banks have shown, since devaluation, their decided preference for gold against dollars.

In the propagation of these stories, the gold bulls do not lack material on which to work. There is an open—and a perennial—bid for a higher gold price by the domestic gold producers, who carry little weight in Washington, but who can rely upon valuable publicity. There is an abiding school of "hard-money" theorists who advocate the abandonment of "managed money," the restoration of gold coinage and an "automatic gold standard." But the real foundation for the present campaign is supplied by two contradictory considerations. The first is the possibility that inflation in the United States will again become so strong that the dollar itself will become an overvalued currency. The second is that deflationary influences will develop to the point at which "a shot in the arm" will be necessary.

*

Whatever may be the longer-term consequences of devaluation, the first of these theories is in such plain contrast to the facts of 1949 that it can be dismissed out of hand. Nor do deflationary causes provide any more rational foundation for a possible revision of the gold price. The reserve requirements of the commercial banks have been reduced sharply this year, but they are still much above the standards prevailing for many years, and they can be cut again, and cut substantially. These banks (in round figures) hold \$70,000 million of Treasury securities, all of which provide reserves, dollar for dollar, for multiple credit expansion. The Reserve System itself holds a reserve of gold certificates equal to almost 60 per cent of its combined liabilities in notes and deposits, against a legal minimum of 25 per cent. Here is a base for credit expansion wide enough to blow the roof from the US economy. But the rumours go on.

Perhaps the most solid ground upon which they stand is the opportunity which devaluation would give to the US Government to take the "paper profit" and to use it, either for the finance of a spectacular operation designed to bolster debtor nations on the return to convertibility, or for the purpose of debt redemption, or the finance of a budgetary deficit on the grand scale. Such a profit would amount to \$6,000 million with gold at \$43 an ounce, and \$11,000 million at \$50, the highest level to which the gold bulls presently aspire. It is not impossible to imagine circumstances in which such an operation with its "painless tax yield" would become an enticing one for Washington. But equally, it is scarcely possible to believe that it is within sight.

Bosses on the Run

Three notorious political machines, two of them Democratic and one Republican, received damaging defeats in the elections last week. Two ancient Democratic bosses, Mayor Curley, of Boston, and Mr Frank Hague, of Jersey City, suffered what can hardly fail to be the *coup de grâce*, while Philadelphia, for half a century "corrupt and content," wit-

nessed the beginnings of revolt against the Republican machine. Registered Republicans outnumber Democrats by three to one in Philadelphia, but not all the machine's efforts to call in reputable candidates at the last minute persuaded the voters to overlook the revelations of embezzlement and fraud during the past two years. The Democrats won four non-policy-making city jobs; the real test will come in two years' time when elections for Mayor are held.

In Boston, where the Irish vote seemed to endow Mayor Curley with eternal political life, he has been defeated by another Democrat, Mr Frank Hynes. Mr Curley was the victim of the split vote which in the past has often served to divide the opposition. He polled the highest vote of his career, but Mr Hynes did better, with the aid of Mr Tobin, Secretary of Labour, once Mr Curley's aptest political pupil and later his most effective adversary. Boston welcomed Mayor Curley back after he had served a prison sentence for mail fraud, during his fourth term, but has declined to give him a fifth. But as a precaution against his political resilience—even at 74—the voters decided to transfer some of the Mayor's powers to a new city council, after 1951.

*

The re-election of Governor Driscoll in New Jersey gave the Republicans their solitary substantial triumph, and it was well deserved. So liberal that some conservative Republicans deserted him as a "Fair Dealer in disguise," Mr Driscoll in his first term replaced the state charter with a new constitution which gave New Jersey an efficient modern government, outlawed racial discrimination, and guaranteed the right of collective bargaining. Some Republicans even see a moral for their party in the Driscoll triumph on a record of efficient, humane, and constructive rule. But it was also due to the collapse of the Hague machine.

Defeated in Jersey City last May by Mr Robert Kenney, the election for the governorship represented the last chance for the Hague machine to regain the ground it has steadily been losing since 1942. The prize was made more glittering by the increased power of appointment given the Governor in the new constitution. But the loss of Jersey City to an anti-Hague Democrat, with ambitions to succeed Mr Hague as the state Democratic boss, scotched this plan; Governor Driscoll was the first Republican to carry Jersey City since 1920, and his lead there made the difference between victory and defeat. The campaign of the Hague candidate, Mr Wene, could also have been hardly more inept. The attempt to enlist Catholic support for legalising bingo—the gambling game which elsewhere makes a substantial contribution to church revenues—alienated the rural Protestant vote. And Democratic billboards proclaiming "It looks like Wene" cried out for the Republican postscript: "But it's really Hague." When the returns were in, Mr Hague announced the final retirement from politics which the voters had ordained, and even offered to relinquish the vice-chairmanship of the Democratic National Committee that he still holds.

* * *

California, Land of Cotton

The "Maid of Cotton" was crowned last February at Memphis, Tennessee, as usual, but she came from California, recognition at last that cotton has gone west. Texas alone is expected to produce more than a third of this year's crop of 15.5 million bales, and with California, New Mexico, and Arizona will account for nearly half of it. The land where cotton once was king, east of the Mississippi, will supply less than 30 per cent of the total. California, with an expected yield of 1,300,000 bales, has become the fourth largest producer.

Cotton now means more to California than oranges and lemons; and the Golden State characteristically produces bigger and better yields, at lower cost than its rivals. Until this year much of California's cotton, deprived of its prewar market in the Orient, has gone "into the loan"—the federal

price support programme which is responsible for the great increase in cotton acreage and the new cotton fortunes in the west (and, in part, for declines in consumption). This year, however, there has been enough of a new variety of seed—Alcala 4-42, perfected by the Department of Agriculture—to make its use compulsory for all farmers, in order to protect the purity of the strain.

The crop now being picked has qualities which command slight premium prices and attract private buyers, no mean feat in a year of glut. Alcala 4-42 has a longer and stronger staple than earlier varieties of Alcala; it ripens earlier and carries its bolls higher, which facilitates mechanical picking. To complete California's satisfaction, Alcala is a stay-at-home; it does badly elsewhere.

Apart from Alcala's virtues, the heat and rich soil of the San Joaquin Valley have proved ideal for cotton, while its aridity repels the boll weevil. The cost of driving the deep wells, on which irrigation depends on the Valley's west side, and in Texas, is prohibitive to all but large-scale producers, but with capital for water and machinery, cotton can be grown in the west at a cost estimated to be one quarter of that in the "one acre, one mule" economy of the south. Only a few voices have warned that eagerness for quick profits may be robbing the future of its water.

But the cup is about to be dashed from California's lips. National production of cotton this year is expected to exceed domestic consumption and exports by about 3,000,000 bales, resulting in an expected carry-over next year of over 8,000,000 bales—a full year's home requirements. Cotton growers, therefore, will be asked, on December 15th, to approve marketing quotas and acreage allotments designed to reduce next year's crop by more than 20 per cent; if they refuse, federal price supports will drop from 90 to 50 per cent of parity. California, the newcomer, will suffer a greater cut of 33 per cent, for acreage allotments are to be based on plantings in the years 1945-48. Millionaire growers will not be the only victims. Although 15 per cent of California's crop is being picked by machine, some 115,000 itinerant pickers will round off this year's work in the cotton fields of the valley in which John Steinbeck set his novel, *The Grapes of Wrath*.

Shorter Notes

As the hundred-thousandth Displaced Person landed in the United States, the Senate's failure to amend the DP Act bore fruit. The DP Commission announced that it could no longer defer adjusting the number of the various types of refugees to the percentages required under the Act; until now it has paid little attention to these, in the hope that they would be removed and in order to keep up a steady flow of admissions. As a result only 31 per cent, instead of 40 per cent, have been of Baltic origin and only 26 per cent, instead of 30 per cent, have been agricultural workers. Now 84 per cent of the next 100,000 DPs must fall into one or other of these categories, which make up only 40 per cent of those remaining in the European camps.

*

Just before Congress adjourned, it authorised the Commodity Credit Corporation to make up the difference, of about 40 cents a bushel, between the domestic price of wheat and the lower rate at which it is exported under the International Wheat Agreement. Marshall dollars may now be used to buy wheat at the treaty price; previously only free dollars could be used and exports had been running at a very low rate.

*

Harvard, recognising that since women are equal to men in the eyes of the law they should have equal opportunities to study it, will admit women to its Law School, beginning next year. This, one of the most famous law schools in the country, is also one of the last to admit women.

THE WORLD OVERSEAS

No Confidence at Kongwa

(By a Correspondent Recently in Tanganyika)

THESE is one factor above all which has led to the sad pass in which the groundnut scheme now finds itself. It is quite simply lack of leadership. At no point has there been genuine respect for, or trust in, the wisdom or competence of the directors of this enterprise.

Take the bare facts—an expanse of poor land, a plan for quick mechanical cultivation, the glorious prospect of extension on a twentieth-century footing of the spirit of empire building and pioneering. Certainly those are difficult ingredients to throw together, but two very positive items were added to the mixture—an astronomical financial backing calculated airily in millions, and a number of keen technicians and administrators, still flushed with pride at having helped to win a world war. What was lacking? A master hand to galvanise the enterprise and reconcile the difficulties within it.

It is inevitable in any discussion of the groundnut scheme that mention be made of the original White Paper. It stands to politicians much in the same relation as the Versailles Treaty did to Hitler. It is a useful oratorical jumping-off point that has little relation to today's problem. It does, however, point clearly to the muddled thinking that has all along entered into the consideration of this project. A short, swift survey was undertaken. The chances of the results of the report being anywhere near right were a gamble—necessarily—but worth taking at a moment when constructive action was so badly needed for economic and psychological reasons. Throughout Africa, across public bars, and from worn chairs on mosquito netted stoeps came a rumble that should have been a warning. But the fearless planners ignored it. What did old-fashioned farmers and back-water business men know about the splendid new victory mechanics had won over nature? Science and caterpillar tractors hand in hand could meet the worst that Africa might put up against them. To pay attention to gloomy forebodings of old fogies was to show a lack of faith akin to treason.

Little Credit for the Workers

On that basis the scheme was launched. It is difficult to sort out who deserves blame for what. The Overseas Food Corporation took over responsibility in April, 1948, from the United Africa Company, who had started the project until such time as the newly formed Corporation was instituted and ready to assume its task. The Corporation was handed a sticky situation. Things had not gone according to plan, but the attitude that was allowed to percolate through was: "Never mind, UAC have handed this mess on—blame them for anything that has gone wrong. We'll change all that; wait and see." This call was welcomed by the workers on the spot, who knew things were going wrong, and who were more concerned to get the position righted than they have ever been given credit for. Hope that strong measures would be taken and a lead be given did not, however, last for long; and gradually the UAC scapegoat had fewer floggings and even some champions harking back to the good old days.

The disintegration that comes quickly when an unsure atmosphere takes hold, set in and has never been checked. Throughout its early history the groundnut scheme was regarded and run as an operation of war—with the implication that the cost need not be counted. But imagine an

army corps with no code of discipline, an ill-defined chain of authority, demoralising orders and counter orders, occasional short visits from the CIGS publicly countermanning rules and regulations—some purely domestic—which had painstakingly been agreed and accepted. Add to this the awareness, which can never be hidden from all grades, that the powers-that-be were (and still are) at variance with each other. It only takes the added factor of spasmodic political interference overruling all else, to produce chaos.

Resignations of Good Men

Anyone who has lived and worked on the groundnut scheme—how unfortunate it is that distinguished visitors are so blinkered by the pressure of their programmes and the speed of their transit—would agree that bewilderment and disillusion are and have been the prime sentiments shared between all grades. This is the tragedy. Many good, vigorous men saw the writing on the wall and took themselves off to jobs elsewhere. Almost for certain they stayed in Africa, for once having experienced life in that country they were bitten with it. It was not the hardship of dust storms or the grilling sun that prompted them to move.

At monotonously regular intervals there have been bursts of conscience-stricken energy from on high. Purges have been introduced in the name of reorganisation. The words "retrenchment" and "redundancy" have rung intermittently across the dusty acres and still echo faintly. No one questions the need for such stocktaking, but it may be held that here prevention would have been better than cure. There have been instances, and repeated ones, of employees of excellent credentials and experience arriving bursting with keenness in their new khaki shorts and bush hats, left kicking their heels in the red dust for weeks, and then being told they are redundant. So home they went, all expenses paid by the long-suffering taxpayer. Rather naturally when they get home they spread the word that it is a poor show.

It is horrifying and depressing to a degree to feel insecure in one's own job, not because of taking a venturesome risk which may not come off, but because one is involved in a bureaucratic organisation where mediocre values are acceptable. General conditions may be bad enough, but the worst drought or cloud-burst is less damaging than finding oneself involved in an action which is questionable on grounds of wisdom, need or rightness, purely because a political question raised 3,000 miles away convinces the authorities, against the advice of the experts on the spot, that it must be done. Everyone forced into acceding to such a practice or taking part in it loses respect for the source of such orders, and themselves become muddled in carrying them out.

Lack of respect has done fearful damage to the scheme. When one is in the middle of it all one finds out quickly enough the few personalities who have the power of inspiring this first essential of good organisation. They stand out head and shoulders above their fellows. They have their own personal tug-of-war in trying to fight for the principles in which they believe, and they are tempted to clear off to other fields where they can do their work without this fight against dictatorial ignorance and obstinacy. A reasonable man begins to despair at the low standard of efficiency, and

even intelligence among his colleagues, until he realises that he himself is not giving of his best, since no one seems to encourage it. No amount of planning, good, bad or indifferent, can ever come to life without the yeast of inspiration.

Five minutes of the technique which Field-Marshal Montgomery knows so well would have changed the picture completely. He could not have raised acres of nuts perhaps, but he would have explained what was happening on a basis of truth. One clear statement that could be accepted by the men whose lives are wrapped up in the success or failure of the venture, and by the great public watching the progress of British colonial development would have saved morale. So far one story has been served up for the public, quite another to the workers—if indeed they have been told anything at all. No wonder there has been mistrust and lack of confidence.

This lack has been crystallised at least twice in the space of one year, in the form of a signed round robin statement of "no confidence" drawn up by a number of responsible heads of departments who have clearly demanded better guidance. Nothing has happened, of course, except a further breach in the already flimsy fabric of authority. The reaction has been a degrading "fend-for-yourself, there is £23 million in the till and nobody cares anyway" attitude.

A Commission of Inquiry is long overdue. It cannot do much about the accounts now; that is a situation that can be deplored but has to be written off. It could insist on a chance being given for enthusiasm, faith and loyalty to be infused throughout the groundnut scheme. This will only come through sincere, firm and consistent leadership, commanding respect for the whole project, and restoring self-respect to those in whose hands the future lies.

Self-Help in Sicily

[FROM OUR ROME CORRESPONDENT]

Six years after its brief celebrity as a world battlefield, Sicily figures in the international and even in the Italian news chiefly as the home of the bandit, Giuliano. In reality the "Giuliano zone," as understood by the police, covers only about the tenth part of the island's surface, embracing, unfortunately, the outskirts of the capital, Palermo. As a very rough generalisation the Palermo end of the island is poorer and wilder than the Catania end. These two big cities, the former loaded with architectural splendours of all ages, the latter a dignified but bustling commercial and university town, contend for the moral leadership of the 4,500,000 inhabitants of the island. Together with Messina, the gateway to the mainland, the big cities house a quarter of the population. The characteristic Sicilian unit is, however, the township of about 10,000 people. It is usually built on a hilltop with a baroque Cathedral and several baronial mansions, only some of which are occupied. Most of the

peasantry live in single street-level cavities which serve the large families for all their needs, and the donkeys for dormitories. But the population appears to the rapid glance of the tourist to be neither ill-clad nor unkempt nor devitalised. It is increasing by some 40,000 yearly.

A great deal of conversation in Sicily turns upon historical injustices. Of the conquerors who have held Sicily in the past two and a half thousand years, the Saracens alone have left a good name as stewards of the land, and the inclusion of Sicily in the modern Kingdom of Italy is held to have been disastrous. Publications sponsored by local Sicilian authorities display with graph and statistic the contentions that Sicily's share in the industry and shipping of the whole Kingdom abruptly diminished after the unity, that its part in the public works and improvements financed by the state has always been puny, that the island steadily earned an export surplus in foreign trade which was swallowed in the Kingdom's persistent import surpluses. Sicilian savings are held to have been drained away to enrich the north, and northern companies to have acquired Sicilian enterprises to stifle them. A typical story tells how the insurance companies from the north brought up compensation rights of the Messina earthquake victims early this century and gained cheap possession of the best street sites. One even hears that Giuliano has been written up in order to keep Sicily out of the lucrative tourist market. If these grievances are sometimes fanciful, acceptance of the general thesis that Sicily has suffered neglect and high-handed overriding of its interests has been forced on the "Continent" by the demand for severance which sprang up in Sicily in the wake of the Allied landings in 1943.

Separation from Italy

The Separatist movement, supported both by Catanian progressives, who in 1944 viewed Victor Emmanuel and Badoglio as camouflaged Fascists, and by Palermo noblemen who a year later anticipated a social revolution on the Italian mainland, strongly impressed the authorities of Allied Military Government who appointed one of the leading exponents of separatism to be Mayor of Palermo. Civilian contacts between Italy and the island, reduced in August, 1943, were only very gradually resumed. The Badoglio and subsequent governments despatched High Commissioners to try to stop the Separatist rot, and an experienced Christian Democrat politician, Salvatore Aldisio, himself a Sicilian landlord, finally did much to forge a substantial Christian Democratic link between island and mainland. This political group now controls the Sicilian Regional Government which enjoys autonomy within the limits of a Regional Constitution which obtained recognition by Rome in the summer of 1946.

The militant Separatist movement supported some guerrillas in the mountains at least until late in 1946. Its political head, Finocchiaro Aprile, sat in the Rome Con-

stituent Assembly in 1947. He there attempted to explain away the previous demands for total severance, claiming to have advocated Sicily's inclusion in an Italian confederation of autonomous states. He had actually demanded a "Mediterranean" Confederation. Signor Aprile is now out of affairs, while his senior comrades are in different stages of grace—one a member of the Regional Government, another recently subjected to police visitations at his stately home, and a third in prison. Meanwhile, that ancient counterpart to misgovernment and absence of government in Sicily, the Mafia or "Honoured (Secret) Society" for self protection against official and private violence, impinges powerfully upon property and affairs. According to the local Communists, the Mafia is now controlled from the other side of the Atlantic by a tough group of Sicilian Americans charged with facilitating the tasks of a future American military occupation when Sicily once again becomes a strategic keypoint. But the Mafia probably has no connection with the higher Separatist leaders except when extorting money from them.

The powers made over to the Regional Government and Assembly of Sicily are quite wide enough to endorse the Sicilian view that they are political, and not merely administrative. The Regional President, who is also Premier, provides for the maintenance of order. The delimita-

tion of the territory into provinces is suppressed, and the region may set up such local government units as it thinks fit. A clearing house at the Bank of Sicily is empowered to devote to the requirements of the Sicilian Region the foreign exchange resulting from Sicilian exports, tourism, and emigrants' remittances.

Taken at face value the first two provisions mentioned would eliminate the Italian Minister of the Interior, who commands the prefects in each province, while the last would detach Sicilian finance from the lira exchange system. None of these provisions have been put into force. Transference of responsibility for order is in voluntary suspense because the region does not feel equal at present to the task. (The campaign against Giuliano is being conducted by a special force of mainland Carabinieri.) Abolition of the provinces waits upon a discussion whether this really implies abolition of the prefects who have in Sicily perhaps more than anywhere else represented the severity of officialdom. An attempt to implement the exchange independence provision seems to have been given up in a few hours when it was suggested by Rome that Sicily would be asked to pay for imported supplies coming from Italy in foreign currency.

The Sicilian Government is, however, installed with considerable splendour in the royal palaces of Palermo, surrounded by remnants of the island's national history and backed by an Assembly which boasts its descent from a Parliament with many centuries of intermittent traditions. It has taken over, or is taking over, a large part of the

administration of public works, education, and other Government branches. The regional constitution, however, can evidently mean a great deal or very little according to the political forces of the moment.

The Palermo political world is a small one and its brilliant cultivated members may be more at home in history and jurisprudence than in administration and economics. Their leading men and the mayors and notables throughout the country seem to be fired with genuine progressive ardour and one feels that it will not be their fault if for another generation Sicily continues to force its peasants to trek many miles each twilight because rural settlement lacks the necessary basis of water, side roads and reasonable safety. The literature put out under Regional Government auspices shows a determination not to gloss over the painful and backward features in the life of the people, but to stir public opinion by portraying them dramatically.

Disappointed Danes

[FROM OUR COPENHAGEN CORRESPONDENT]

UNLIKE his fellow social democrats in Norway and Sweden, the Danish Premier, Mr Hedtoft, has no majority in Parliament. His government has to rely on support from the *bourgeois* parties. During the last two years he has managed to get it—but now and then with such poor results that he felt himself "more like a messenger boy coming with fine bills which the other party leaders altered beyond recognition" than as a leader of a vigorous labour movement. Encouraged, however, by the success of the Norwegian social democrats in the recent elections, he obviously sought, when Parliament met this October, for a situation where he could appeal to the country.

The Opposition, however, gave him no chance. The Farmers' Party (*Venstre*), the leading opposition group, split. One section, headed by the party's leader, called the Government's policy "detrimental to the country." But the majority, under the leadership of the former Minister of Finance, Professor Thorkil Kristensen, was willing to co-operate with the Government on a practical basis. They consider that in the present economic circumstances Denmark ought to have a coalition government; by abstaining from voting they secured for the Labour Government an unwelcome vote of confidence.

Desire for Free Trade

Whether the Government will be able—or will want—to continue under these circumstances will be decided by temperament and political flair, no less than by the economic situation. The former two questions are imponderables, but Mr Hedtoft is a cunning politician who may be relied on to take his chances. No crisis could arise on the devaluation—*Venstre* and the Radical Left here followed the Government wholeheartedly—but on November 15th two important laws expired. These affect the control of supply and of prices. The Opposition considers that the principles of liberal, free trade are involved; they object to the insulation of the Danish market from outside competition and to the retention of Danish industry on an artificial basis. Furthermore, they oppose the continued delegation of Parliament's power to the cabinet. For their part, the Government say that they have cancelled as many wartime regulations as they justifiably can; out of 18 rationing orders made after the war, only six are still in force. If Denmark abolishes what is left of rationing—on butter, margarine, sugar and meat, for instance—this will mean losses in foreign currencies, even hard currencies, which the country cannot spare. But, short of a technical hitch over some unforeseen minor question, there is no reason to expect that Mr Hedtoft's minority government will not remain in power for the present session.

At the same time as the hectic debates in Parliament, the Anglo-Danish trade discussions started on October 11th. As has already been reported, it was decided after eleven days to prolong the current agreements and to begin new negotiations in London at about the turn of the year. This postponement was suggested by the Danes from two motives. One was selfish: the complexities of the situation made it preferable to wait for a more precise view of the market's reaction to devaluation. The other was altruistic: in the middle of Britain's economic crisis Denmark would not press for higher prices.

Higher Prices for Raw Materials

That devaluation in the long run will necessitate a change in prices in the long-term agreements for butter, bacon and eggs exported to Britain is inevitable. The raw materials—feeding stuffs, oilcakes and artificial manure—are bought in dollar countries, while exports are paid for in sterling. Nevertheless, it meant immediate sacrifices for Denmark to continue the agreements. Prices in the devaluing countries are generally rising, while Denmark, under the current agreements, automatically gets lower prices for agricultural exports to Britain.

Although it was not actually promised during the first round of the negotiations, it was understood that Britain would not increase the prices on such goods as were not affected by the devaluation—coal, coke, steel and so forth. The surprise was very great, therefore, when Britain only a week later put 10 shillings on to the price of each ton of exported coal. The Danes were prompt to express official regret at this unfortunate move. First of all it will mean that the Danish Government will almost certainly have to ask for new negotiations immediately: the long-term agreements include a clause which gives both parties the right to ask for a revision of prices if the economic situation changes

fundamentally. Furthermore, the Poles, who have been suppliers of an important part of Denmark's coal, are likely to get their demand for a 25 per cent increase in their coal prices accepted (as they have in Sweden).

New Markets for Denmark?

Denmark is bound to deliver a certain percentage—up to 90 per cent.—of its total agricultural exports to Britain, but the new situation will mean that Denmark, as it cannot afford to have a production based on dollar prices with payment in sterling, will not further increase agricultural investments. It will be more interested in increasing commercial intercourse with third countries, such as France, which is now able to export coal, steel, petrol and so on at favourable prices, and even South American grain and oilcakes at sterling prices.

Denmark was one of the first members of the sterling group. After the war all parties agreed to conclude export agreements with Britain on terms which were worse than those to be had with third countries. It was a trade policy based partly on sentimental feelings—a little gratitude to Britain for its sacrifices during the war—and partly on a long-term and traditional policy. Moreover, during the present economic crisis, Denmark has felt itself linked to Britain. Nevertheless, it cannot afford simultaneously to continue exporting to sterling countries at pre-devaluation prices goods on which dollars have been spent and importing from sterling countries at dollar prices.

One may, therefore, say that developments after the devaluation of sterling, brought to a crisis by the British decision on coal prices, have created a feeling in Denmark somewhat analogous to that witnessed in France and elsewhere on the Continent: a feeling that Denmark should not join with Great Britain economically as fully as it did before, and that it would have a better chance by looking for contacts with other countries.

Used to be a long journey

It's a big hill; steep, curving. No chance to take a run at it. Lorries block you to a crawl. Throttle. Brakes. Throttle. It takes the guts out of a car. And out of a driver, too.

But not this car; not this driver. A clear patch and you put your foot down in 3rd. In a flash the needle says 50—you're away.

How long have you been travelling now? Two hours? Three hours? Travelling fast—60, 65, 70, 75. But there's no strain. You're fresh; relaxed.

A corner comes and goes; and another and another. A surprising absence of roll. You work out your average. It's high. Somehow this car grips a bend and straightens it out; comes to a hill and flattens it down.

You sit enjoying it.

It's a good road now. But there have been bad patches; they got lost in the torsion bar suspension, and not a kick in the steering. Only your eyes noticed.

Two hours to go. The light fades. You snap on the head lights; brightly reassuring in the dusk.

This used to be a long journey. But this car conquers distance.

And what about space? Plenty. You can take up to six with luggage—and still have driving fun.

This car is a waste of money if you don't care what a car does. There's such a lot built into it that doesn't really show until you have it in your hands. Once tried, you'll say "I'd rather go by Javelin!"

Civil War Threats in Colombia

[FROM A CORRESPONDENT]

COLOMBIA is tottering on the verge of civil war. The rivalry between the two traditional parties has reached such a stage of bitterness that it threatens to divide the country into two opposing military camps. The root of the trouble goes back to the election of 1946. At that time the Liberal Party, which has the allegiance of a majority of the people of Colombia, and which had been in power since 1930, was seriously split, and therefore lost the presidential election. There were two Liberal candidates, Gabriel Turbay for the more orthodox and moderate faction of the party, and Jorge Eliecer Gaitan for the more left-wing element, and as a result the Conservative Party's nominee, Mariano Ospina Perez was elected chief executive. Fearing trouble, the new President immediately invited his Liberal rivals to join him in a National Union Cabinet. This was agreed upon and a Liberal-Conservative Cabinet remained in office until early in 1948, when the Liberals withdrew as the result of pressure on the part of Gaitan, who had now become the chief figure in the Liberal Party.

Disaster then struck. On April 9, 1948, Jorge Eliecer Gaitan was assassinated and within a few hours, Bogotá, which is a predominately Liberal city, had arisen in a spontaneous rebellion. In a raging fury the mobs attacked the principal centres of Conservatism in the city, including the Archbishop's palace, and the headquarters of the Conservative paper *El Siglo*. The mobs also pursued the leading figures of the Conservative party, including Laureano Gomez, then Foreign Minister and presiding officer of the Inter-American Foreign Ministers' conference. In the course of this search, the building in which the conference was meeting was set on fire.

Had there been real direction given to this uprising the government would certainly have fallen. The Liberal leaders hesitated, however, and the Communists were too weak to do much more than see to it that a few places against which they had a special grievance were burned. As a result the siege which the mob laid to the Presidential palace was repulsed by only a few hundred soldiers.

After long conferences between the Liberal leaders and President Ospina Perez, it was decided to form a new National Union Government, with Dario Echandia, who had succeeded Gaitan as leader of the Liberal Party, as Prime Minister, and General Ocampo, chief of the general staff, as Minister of Defence. Thus order was restored and a beginning was made in reconstructing the centre of Bogotá which had been reduced to the state of London after the blitz.

Conservatives in Power

The unrest of the people, however, was not alleviated. The Conservatives, who represent the large landowners and the Church throughout the country, and the industrial bourgeoisie of the province of Antioquia (the chief industrial centre), saw in the presidency of President Ospina Perez a chance to gain full control of the country once more. In spite of the truce which was agreed upon with the formation of the Echandia cabinet, a number of those Conservatives who were appointed governors of provinces used their positions to oust all Liberal office-holders and even, as in the case of Antioquia, to imprison a number of the leading members of the opposite party.

There was violence on both sides, but the Liberals were the worst sufferers. The situation became so serious from their point of view that after constant warnings by Echandia, the Liberals finally withdrew from the cabinet in May, 1949. An all-Conservative administration was then formed, and for the first time that party was in full control of the administra-

tive apparatus of the country. They have used it with a vengeance. They have attempted to make a clean sweep of office-holders in the public administration. Virtually all the public works employees—who after nearly twenty years of Liberal control, were overwhelmingly Liberal—were dismissed and replaced by Conservatives. The same process was applied to nearly all the other government departments, and it has even been put into practice in the armed forces. General Ocampo, who is a Liberal, was summarily retired, as were numerous other high ranking army officers of a Liberal persuasion. At the same time, the Conservative regime has violated the long civilian tradition of Colombia by putting an army officer in as Prime Minister.

Meanwhile violence has increased. It has even reached the halls of Congress, where in a gun duel one Liberal deputy was killed and several on each side were wounded. In the countryside it is a good deal worse, with casualties mounting

into the thousands. Here again the Liberals are the worst sufferers from this violence, since, fundamentally, the present period is one in which the Conservatives are attempting to purge their traditional rivals from all political posts and in some cases, even to drive them underground.

Liberals Fight Back

The Liberals have fought back both in Congress and in the country. In spite of the Conservative control, the Liberals won the Congressional elections of June 1949, and they then used their majority to push through a law advancing the 1950 presidential elections to November, 1949. By doing this, they hoped to win the presidency before too much damage had been done to their political machine, or before they had, perhaps, been driven underground. The law was vetoed by President Ospina Perez, but was passed over his veto. It was then placed before the Supreme Court which finally ruled that the law was constitutional. The presidential election will, therefore, take place this month.

If the elections this month result in the victory of Dario Echandia—the Liberal candidate—it seems probable that the situation in Colombia will calm down. The present turbulence between the two parties arises basically from the attempt of the Conservatives to maintain the advantage they reaped from the temporary Liberal split of the Gaitan period and to get complete control of the government. If they fail in this attempt, it seems not unlikely that things will return to their more or less normal state. But should the Conservatives decide not to accept political defeat, or if they should succeed in the next few months in winning enough converts through a show of force and violence to

re-elect a president, it seems very likely that Colombia will be split by civil war.

A civil war in Colombia would be a severe setback for democracy and civilian government in Latin America, because that country has been one of the principal examples of both a civilian and a democratic regime for many decades. In 1930 a peaceful transition was made from Conservative to Liberal rule after almost half a century of the former being in power. And last year, after the Bogotá insurrection, the strength of the democratic forces was demonstrated by the fact that the uprising did not result in a military dictatorship, as would have occurred in almost any other Latin American country. Having survived that, it is to be hoped that Colombian democracy can survive the further ordeal of the presidential election.

South Africa's Forgotten Man

[FROM OUR JOHANNESBURG CORRESPONDENT]

ON December 16th, at a monument near Pretoria, "national" celebrations will be held to commemorate the victory of the Voortrekkers over the Zulus at Blood River in 1838. But speeches will be in Afrikaans only—though a Nationalist newspaper has kindly given an assurance that members of the public may speak English among themselves, if that is their home tongue. At first it was proposed that one of the exhibits should be the gallows beam from which the Slagtersnek rebels were hanged by the wicked British—twenty years before the Great Trek began. This will now probably be shown separately; nevertheless English-speaking South Africans are being given every inducement to stay away from the "national" celebrations. The event, despite all official denials, is more and more assuming the character of an Afrikaner victory over the English. It follows logically from Dr Malan's exclamation on the day of his political triumph in May last year: "South Africa is now again ours."

The Voortrekker celebrations emphasise the fact that the Afrikaner who is not a Nationalist is rapidly becoming the forgotten man in South African politics. In fact the Nationalists have no right to identify themselves with all Afrikaans-speaking South Africans. Afrikaners are among the bitterest opponents of the Nationalists and the most stalwart supporters of the United Party, whose leader, General Smuts, is a great Afrikaner. The Nationalists constantly complain that the outside world wilfully misunderstands them. Afrikaans-speaking South Africans who are not Nationalists have much greater cause for complaint.

The Nationalists themselves are in no doubt about the real position. Non-Nationalist Afrikaners living in small remote *dorps* surrounded by Nationalist neighbours risk social ostracism and worse for refusing to be swept off their feet by bitter Nationalist anti-British propaganda. For years the

Nationalists have vilified General Smuts as "the handy-man of Empire" and, more recently, as "the British Field-Marshal." Only very grudgingly did the committee in charge of the Voortrekker celebrations consent to his being present. They are determined not to recognise him as an Afrikaner at all. But the late General Hertzog was an even clearer case. During the Voortrekker celebrations in 1938, when the memorial which has now been built was first mooted, General Hertzog, who was then Prime Minister, was kept away from the event by a Nationalist campaign of unbridled bitterness and ferocity. This should make clear to the onlooker six thousand miles away in Britain the danger of confusing "Afrikaner" with "Nationalist."

Danger of Afrikaans Separatism

If white South Africa divided politically on purely racial lines, as some British comment tends to suggest, the game would have been up long ago. Sixty per cent of white South Africans are Afrikaners, only 40 per cent are English-speaking. In fact, they never have so divided, and it is to be hoped they never will. In 1948 they came close to it, but already there are indications that many people who then voted for the Nationalists wished they had not.

The danger nevertheless remains that non-Nationalist Afrikaners may be driven into the Nationalist camp. They are still rightly proud of being Afrikaners. One of the most damaging charges made against the United Party—even though it was not true—was that it had become essentially an English party, with the Afrikaners merely the tail which in this case quite failed to wag the dog. Attacks on the Nationalist Government too often take the form of contrasting present economic troubles with past prosperity, and hinting that a United Party Government would have no difficulty in raising money abroad. This is like saying that a British Tory Government would receive more sympathetic treatment from America than the present Labour Government. Even the Afrikaner who detests the Nationalists' policies begins to wonder if there may not be some truth in the Nationalist propaganda that the Malan Government is discriminated against because its members are all Afrikaners.

Similar instances occur frequently. The Minister of Education, Mr C. R. Swart, has instructed his department to prepare a new history of the Boer War which will include "British atrocities" he claims to have seen for himself (when he was a child of six). To revive fifty-year-old "atrocities" can only further embitter racial feeling, and one of Mr Swart's critics suggested that he needed the services of a psychiatrist rather than a historian.

But a good-many English-speaking commentators played into the Nationalists' hands by pouring scorn not only on Mr Swart but on the very idea that the Boer War was anything but an impeccably fought gentlemen's war. Yet there are scores of non-Nationalist Afrikaners who can vividly remember instances of what they regarded at the time as

"enemy" brutality. This does not mean they want those painful memories revived; but they do resent the confident assumption of English-speaking South Africans that there were no "atrocities" at all.

Struggle for the Schools

Finally, there is the language question. In the Transvaal, the United Party is fighting tooth and nail against a proposal to send English- and Afrikaans-speaking children to separate schools—whether their parents, who may be bilingual themselves, like it or not. If the children are thus "kraaled," the Nationalists will have ample opportunity to get at the Afrikaans children with racial propaganda, and the "English" schools might also teach a form of racial propaganda, if only in self-defence. The Nationalists do not want one South African nation; one of them, Dr Theo Wassenaar, has plainly said so.

Non-Nationalist Afrikaners are among the strongest opponents of this form of educational segregation. But this does not mean that before the Nationalists came to power there were no strong feelings about the two languages. In the thirty-nine years since Union, the English-speaking South Africans have made the slowest possible progress towards learning to speak Afrikaans; the Afrikaners have made immense strides towards being thoroughly at home in either language. But their reward is that today the conversation in a "mixed" gathering is almost always English—because the English have never bothered to learn Afrikaans and trade on the fact that the Afrikaners know English as well as they do. Too often insult is added to injury by the remark, "It's so much easier for you to learn English—we're no good at languages." The Afrikaner cannot but think that this is a poor compliment to his language, and that if the English are not so prepared to pay so small a price for the big prize of real national unity, they cannot really want it. The refusal of the English to learn Afrikaans gives the Nationalists their biggest excuse for reintroducing separate schools and writing off bilingual schools as a failure.

These factors go to the very root of contemporary South African politics. If they are ignored or not known abroad, and if in Britain and elsewhere the non-Nationalist Afrikaner is treated as the forgotten man, then South African politics will remain a complete mystery to outsiders, and a distorted picture will be presented which may end by convincing the Afrikaners that the Nationalists are right when they say that the outside world has no real understanding of South Africa.

Trade With Communist China

[FROM A CORRESPONDENT IN HONGKONG]

Now that the occupation of Canton by the Communists is a *fait accompli*, two questions are uppermost in the minds of merchants in Hongkong. Will the Communists ask for recognition on a basis that will allow trade to flow easily? If the Communists show signs of being approachable, is the British Government considering the granting of such recognition now, or are they intending to postpone action for the time being until it is clear that the new regime has established itself firmly all over the country? No one knows the answer, but it is urgently hoped that one will be forthcoming soon, as an attitude of "expectant waiting" is always hard to bear, especially when a ripe plum in trading waits to be plucked. The foreign trading concerns are prepared to adapt themselves to any new regime, provided they are not hampered with too many regulations such as would make trade impossible. They hope that the British Government, with much to offer that is required by China, will be able to negotiate matters more or less satisfactorily.

At present there is no sign that the Communists intend to make trouble over Hongkong. Opinion here is that they will have their hands too full with stabilising their government and getting it to function over the tremendous area that they now occupy to be able to stir up such a hornet's nest as Hongkong might prove to be. It is interesting that although there was the usual exodus from Canton by train, ship and plane before the occupation, the stream of refugees was composed mainly of people who had been identified with the Nationalist Government and of well-to-do merchants who, by sending as much of their goods as possible to Hongkong, hoped to be able to continue trading without fear of molestation; the poorer part of the community mainly stayed where they were, with the exception of those directly in the path of the armies. Compared with previous occupations and the panic that seized the people on those occasions, there was very little excitement about the fall of Canton, and comparatively few refugees crossed the border into the Colony. The news had got around that the Communist troops have a sense of discipline and that the "devil" was not as bad as the Nationalists had painted him.

Breaking the Blockade

The Nationalist Government, acting from Taiwan, has now extended the blockade, which hitherto has been directed against the northern ports, to Canton, and on October 16th a ship, making its way to that port, was stopped by three destroyers flying the Nationalist flag and ordered back. Since then no large ships have attempted to run the blockade, but cargo has been coming into Hongkong and leaving for Canton by junks, which sail from the Colony a couple of hours before sunset in order to arrive at the Pearl River delta at dark and thus to elude the vigilance of the destroyers. If they are caught, they have to buy their way through—adding a considerable sum to the cost of the voyage for passengers and to the cost of freight for cargo. But the game seems to be worth the candle, for, with the cutting off of communications between Canton and the outer world, the prices of commodities, particularly of foodstuffs, have soared to double, and in some instances almost treble, what they were before, and good profits can be expected by any dealer who cares to take the risk of getting his goods to the market. To make matters more difficult the opening of the Kowloon-Canton railway, which runs direct to Canton, has been delayed. At present only mails are taken by this route, the mail sacks having to be transferred across the border to a train on the other side.

As usual, Macao continues to play an important part in the struggle. Junks or small launches and towboats of every description as well as larger sized steam vessels leave Hongkong loaded with cargo to capacity, discharge it in Macao and from there it is despatched over the border into China, so avoiding seizure by the Nationalist destroyers. In the same way country produce is collected at inland ports scattered throughout the Pearl River delta and taken by small launches via Macao to the Colony. This method of handling trade is still being organised, but it should not be long before it begins to operate efficiently.

Meanwhile, in Canton itself, the Communists are busy getting their government going and arranging financial matters. A temporary rate has been fixed for the new People's Notes of 2,000 for one silver dollar and PN 500 to HK\$1, and it will probably not be long before overtures are made to Hongkong for the reopening of trade. In fact there is a feeling of relief in the air that at last the tension is over and that now it is for the new government to declare its metal. It is well understood that international politics must play a large part in the granting of any sort of recognition to the new regime, but it is hoped that some sort of method can be worked out under which trading relations can commence. A military control committee has already been established and is functioning; shops and schools have reopened and electricity, water and telephone services, as well as the various departments of the Municipal government, have been restored with very little delay.

GEARS

Gears are among the least conspicuous but most important of engineering products, for industry uses gears to transmit incalculable millions of horsepower between motor and machine. Inefficient gears waste fuel and power; the breakage of a single tooth can halt a whole process. Turbine Gears Ltd., a Simon Company, have won their place among the outstanding makers of gears whose products are trusted for vital work such as colliery winding, where men's lives are at stake and rolling mills in which gears must stand up to continuous heavy duty and the shock of sudden overloads. In these and many other processes where only the best is good enough, Turbine Gears maintain the reputation of British engineering and earn many currencies from Canadian dollars to Mexican pesos and South African pounds.

One of many ways in which the Simon Engineering Group serves the fundamental needs of civilisation.

He had
to hide his invention
from men's anger

IN 1779 Samuel Crompton, a mill worker, invented his spinning "mule" — an invention that was to bring untold wealth to Britain. But in those days textile workers feared that the "mule" would throw them out of employment, and Crompton was compelled to hide it in order to save it from destruction. Nevertheless, Crompton persevered with faith and courage. Gradually the confidence of the workers was assured, and Britain's mighty textile industry is the result.

Crompton's dogged spirit lives in Britain today — not least among the men who are successfully struggling to overcome the nation's electricity shortage. Already electricity may be used freely at all times except at peak hours, and continually new applications of electricity are bringing greater efficiency to our factories and new comforts and conveniences to our homes.

Films can be used to spread knowledge of the latest applications of electricity. The E.D.A. film library is at the free disposal of all interested bodies. Call at your Electricity Service Centre for further particulars, or write to the Electrical Development Association, 2 Savoy Hill, London, W.C.2.

THE BUSINESS WORLD

Cotton Exports in Two Worlds

THE cotton industry, which is rarely disposed to be cheerful, has watched anxiously for the approach of the buyers' market. The implications of this expected—and, one day, inevitable—change in the tone of the world market for cotton textiles provided the theme for the conference which was organised at Harrogate last month by the Cotton Board. An annual conference to review current industrial problems has in the last three years become an established and useful custom in the industry; the meetings this year produced much material for an estimation of long-term probabilities in the cotton trade, and should prove a useful stimulus to the study of ways in which the industry can adapt itself to those probabilities.

The buyer's market for cotton textiles is still, however, in the future; it has arrived in some countries, but in the countries to which the great bulk of the Lancashire output is sold it is still no more than a dream or a memory. As the dust settles after devaluation it is becoming apparent that for the cotton industry, at least, the buyer's market has receded. Sir Charles Renold pointed out at the Harrogate conference the extreme difficulty of recognising the crucial point of change in the market until it has actually passed. Managements which have been for so many years ceaselessly preoccupied with output do not instantaneously turn their attention to selling. Further, if the portents of change—the relaxation of pressure of demand, the thinning-out of order books—are noticed, "there always seem to be valid reasons for regarding the falling-off as purely temporary."

*

When cotton export business began to flag slightly last summer, such reasons were not difficult to find; and, indeed, it now begins to appear that they were in fact temporary. A few orders were cancelled; some buyers in some countries appeared to lose interest; complaints and fault-finding became a little more common. It was, however, quite reasonable to suppose that anticipation of the devaluation of sterling was behind these manifestations. This is now beginning to be confirmed by the sharp increase in the number—and in the urgency—of inquiries from overseas markets which has been noticed in the past six weeks. It would be foolish as yet to project this revival of interest into any startling triumph for the export drive; conclusions of that sort ought not to be drawn until the contracts have been signed and the goods are on the move. Export negotiations can break down on any of a number of points, and one of these is the date of delivery. But, though the volume of export business will still be below what is desired, deficiency of output will continue to be the limiting factor. Further, so long as output is insufficient, delivery dates will be long, and therefore exports to soft-currency countries (which endure long delivery dates patiently) will continue to flourish at the expense of

exports to hard-currency countries, where patience is uncommon.

To some extent, no doubt, the rush of inquiries in the last few weeks reflects demand which was bottled up through the summer months when the world was waiting for devaluation. It may also reflect some anticipation of demand by buyers who now expect the prices of cotton goods to rise. To determine the real level may take some time. But in one branch of the trade—cotton yarn—overseas demand has risen so sharply as to alarm the Treasury. It was announced on November 1st that the issue of licences for the export of cotton yarn to soft-currency countries was being temporarily stopped by the Board of Trade. Exports of yarn had been increasing over the past two years, and had assumed in the first half of 1949 a quarterly rate of more than 20 million lb. There was nothing objectionable in this, since yarn supplies to British manufacturers had become comparatively easy, and the production bottleneck had shifted from spinning to weaving. The increased sales had been to soft-currency countries, but this was broadly true of the trade in woven goods also—and, indeed, of the country's export trade as a whole. Last month, however, the volume of new applications for yarn export licences drew the attention of the Treasury to the fact that dollars are scarce not only in Britain but also in other countries which have cotton manufacturing industries—and that the import of British yarn instead of American raw cotton offered a useful, if limited, means for other countries to side-step their own dollar shortage. The increased demand from Europe—France, Norway, and Denmark have been particularly mentioned—was concentrated on the medium counts which are made from American cotton, and the suspicion arose that the European countries might be proposing to switch some of their spinning activity over to Egyptian yarn and take their "dollar counts" from the British spinners.

Situations of this kind are not easily dealt with without destroying or damaging some normal and useful trade. Europe contains traditional markets for Lancashire yarn—notably in Holland, Norway and Denmark; and the industry is quite properly anxious not to lose these markets or to fail its regular customers. It has, therefore, resisted the complete stoppage which was at first announced, and has succeeded in obtaining some rather ambiguous relaxations. Applications for licences can now be considered, but those for export to soft-currency countries outside the Commonwealth "cannot be issued for the excessive quantities which caused the present embargo to be imposed."

Plainly the same considerations do not become invalid, but are merely diluted, when they are applied to cotton manufactures as a whole and not merely to yarn. The cotton trade is a large user of dollars. It is not a large earner of dollars. Its products go mainly to the countries of the sterling area. A speaker at the Harrogate conference observed that British sales of cotton

textiles outside the Commonwealth and Empire are now down to some 60 million yards a year, or rather less than a fifteenth of the total. In the economies of the sterling countries they play an important dollar-saving part. They are also an essential stimulus to production, and particularly to the delivery of goods for export, in the colonies.

The industry is now expected also to earn dollars, in the first place from the Canadian market which was lost to Lancashire during the war. Canada, which took 76 million square yards of British cotton piece goods in 1939, took only 8,000,000 square yards in 1947. The special measures which were taken to expand dollar exports last year had some initial success in Canada, but the achievement of the third quarter of 1948, when 12.8 million square yards were exported to Canada, proved to be the peak of the effort, and these exports have since declined steadily. Devaluation has now, however, largely removed the price disadvantage of British as against American cotton goods in Canada, and Canadian inquiries for Lancashire goods appear suddenly to have revived. It remains to be seen whether these inquiries will lead to actual exports.

*

The industry is aware that if dollars are not earned the supply of its raw material will be endangered. But the experiences of three firms are worth describing briefly to illustrate the kind of obstacles which arise. One exporter, who has been selling corduroys to Canada, has found the quality of his goods very well received and could sell perhaps 20 times as much—if he could get the material made. There is, however, some reluctance among weavers to weave corduroys, since the operation of the Uniform List of payments in the weaving industry makes some other cloths more profitable. There is a shortage of labour for cutting. It is difficult to make the material in the width required for the Canadian market (36 in., instead of the customary 28 in.); there are not enough wide looms. The difficulty of width arises with many materials; during the years in which Canada has been supplied by the United States, the Canadian makers-up have become accustomed to the American width of 42 in. for dress goods, and much of their cutting machinery is laid out for this width. Many Lancashire looms were put down to weave a narrower cloth, which is readily accepted throughout most of the world. But the market in Canada is not a sellers' market. "Weavers' choice," as a speaker observed at Harrogate, is a large determinant of what cloths are made in

Lancashire. But in Canada the consumers' choice prevails.

A second firm had large orders from Canada, which were cancelled in May. The firm thereupon took on other orders from other overseas markets. After the devaluation of sterling it received renewed inquiries from Canada, where perhaps the price had become more acceptable—or where, not less probably, the purchaser had been waiting to see what would happen to the sterling exchange rate. By now the manufacturer was booked up for some months ahead and was unable to promise quick delivery; but the Canadian buyer is accustomed to quick delivery and tends to insist upon it.

A third firm had many difficulties in its Canadian trade with complaints or claims on the ground of deficient quality, which it believed to be in general unfounded. It produced a shirting material to the order of three Canadian importers, and in order to avoid claims took exceptional precautions to ensure the uniform quality of the three consignments. When production was sufficiently advanced, the firm sent samples to the Canadian purchasers with the assurance that the delivered goods would match the sample. One purchaser did not reply; one wrote to say that he no longer required the goods; the third accepted, but when the shipment arrived complained of flaws.

These difficulties of detail will serve to bring out the position which may arise when an industry in enjoyment of an insatiable sellers' market in one area of the world is urged to invade a buyers' market elsewhere. In the sterling area and in the soft-currency markets the buyer is not always right; in North America, he is. The Lancashire cotton industry today is a prosperous industry which can still sell roughly everything it makes; its problems are problems of labour supply, labour utilisation, equipment and methods of work. As it slowly overcomes these difficulties its output slowly expands, and there is no real difficulty in selling the product. The devaluation of sterling, since it has obliged the countries of the sterling area to seek fresh economies in dollar imports, has made the demand for Lancashire textiles more insatiable than ever. By removing or diminishing the British price disadvantage, it has also revived the demand from Canada and possibly from other hard-currency markets also. But devaluation has not altered the essential difference in commercial atmosphere between the sterling area and the hard-currency markets, which are by comparison fickle and hard to please, given to fault-finding and disposed to drive hard bargains on prices. These unattrac-

tive habits were familiar to the trader in cotton goods in prewar years; but today, for every difficult buyer in a dollar country there are many willing buyers elsewhere.

It is plain that no course of action which is wholly within the control of the cotton industry will provide the solution to this dilemma. Certain courses of action are within its control, though they will provide only a partial answer: the expansion of production, the cutting of costs, and the elimination of "weaver's choice." Greater output would make more rare the situation in which a manufacturer can supply the demand of one cus-

tomers only by refusing the demand of another. Lower costs would give greater freedom of choice of markets and greater room for manoeuvre in trading policy. A more rational system of payment (on which, as it was worked out in the Moelwyn Hughes report, the weaving unions are about to ballot) would contribute to these ends. It would also remove some of the conflict between the weaver's choice and the consumer's taste. By such measures as these, the industry can at least increase its powers of survival, which it will need when the markets change and the test of fitness comes

The Burden of Stocks

THE closed season in the new issue market is proving a considerable embarrassment for some industrial concerns who are in mid-course with expansion schemes or whose stocks and work in progress have now grown to a comfortable—if not, indeed, an uncomfortable—level. Some reflections of these tighter financial conditions are evident in the latest batch of company reports for the September quarter. Last week the profits of these 597 companies were reviewed; now it is proposed to look at their balance sheets. The figures have been compiled in exactly the same way as for earlier quarters* and in one important particular they tell the same story. The burden of stocks is now becoming a point of real economic importance.

Compared with the other quarters of the year, the September quarter, broken by the holiday season, sees the publication of fewer reports. But the figures for the 522 companies (out of the total of 597) which gave comparative balance sheets for the latest and the previous end-years are of great significance. For these 522 companies, the value of stocks (which, of course, include intermediate products and work in progress as well as raw materials and finished output) rose by nearly 16 per cent, from £318.8 million to £368.8 million. This is a rise which far exceeds any broad measure of increased prices during the last financial year of these companies. The end of the average financial year of these companies fell, not in the September quarter (that was when the

figures were published) but somewhere near the end of March. Of course, some of the reports were made up to June 30th, but others were made up to much earlier dates. March 31st probably strikes a fair balance.

It is for the twelve months from March, 1948, to March, 1949, therefore, that price comparisons are needed in order to deflate the rise in the money value of stocks and so to gain some impression of the increase in their real volume. There is no one price index which accurately measures the changing prices of the multi-

tudinous items which industry has to keep in stock. Wholesale prices of industrial raw materials increased during the twelve months by about 3 per cent; export prices of manufactures rose rather more, by 3½ per cent, while metal manufactures increased by 4½ per cent in price and textiles by 5½ per cent. It would probably not be too far out to take 3½ per cent as the average rise during the latest trading periods in the price level of the stocks held by these companies.

It follows, on this assumption, that the rise in the real volume of their stocks, in the year roughly to last March, was of the order of 12 per cent. It is too late to argue that an increase in stocks of this order was necessary to maintain a high level of industrial output; with a few exceptions the stock bins of components and the pipe lines of intermediate products were filled quite comfortably two years ago. What these company accounts show is the ending of the sellers' market when stocks were snatched off the shelves as soon as they appeared. They now stay longer, and there are more of them.

A situation in which stocks represent no less than 40 per cent of industry's current assets, and in which they absorbed no less than £236 million of new investment in the year to March last (this figure is based on company accounts which have been published in the past twelve months and the full tally could well be nearer £300 million) requires some thought. The pressure of inventories is rising. It has not risen so far that it is causing general embarrassment, but there is increasing evidence of strain in particular directions. Is the stock all "good," in the sense that it is moving steadily through the productive process into final consumption? How much of it is "sticking"? How much would still "stick" even if selling prices of some lines of finished products were reduced? These questions are not of immediate importance, for so long as the general level of prices and incomes continues to rise, so long will it be possible to dispose of stocks—or the great bulk of them—without any danger of significant monetary loss.

But these conditions will not last for ever, and they might not last much longer. It is a point of real substance in the discussion of economic policy and the need for a further measure of disinflation that in the coming year the growth of investment in stocks is likely to be severely checked. The figures in the accompanying panel show that industry as a whole cannot find finance out of its own resources to carry higher inventories and also to expand its plant and equipment. For the 522 companies which gave comparative figures last quarter, the net investment in fixed assets and stocks was roughly £50 million for each item. Their net current assets, excluding stocks, fell during the year from about £86 million to about £75 million. Their holdings of gilt-edged and other investments are considerably lower, and they are now financing an appreciably higher burden of trade debt as well as stocks. Meanwhile, bank loans continue to increase.

Clearly, there is not much by way of cash reserves to cushion a moderately stiff fall in prices or a fairly marked contraction in demand should it occur during the next year or so. It would be unfair to accuse British industry generally of overtrading, since the war; but undoubtedly it has come to depend to a greater extent than ever before

on the maintenance of demand at a high level, and a continued advance in prices. It has made its trading dispositions accordingly. It follows, therefore, that if these expectations should be belied, it would have to expect a fairly powerful bout of liquidation and financial stringency. If industry is not going to invest another £300 million or more in working capital this year, that fact alone will upset many calculations which have already been made by suppliers of raw materials and finished products.

Moreover, in one important respect, pressure on industry's financial resources will be heightened by the higher prices of many imported raw materials, both from dollar and sterling sources, as a result of devaluation. Some branches of industry will no doubt be able to pass on the full burden of higher replacement costs to their customers—thus following the perfectly reasonable example provided by the Ministry of Supply. But others may not find this so easy, particularly where the post-war peak of demand for their particular products has been passed. If, to add to these forces, the banks were to pursue a lending policy which looked more critically at the inner nature of the advance rather than the credit worthiness of the borrower—which is what the Chancellor of the Exchequer would like, though the banks would no doubt rather be spared such a difficult exercise of judgment—the possibility of some limited degree of actual liquidation of stocks could hardly be ruled out.

These possibilities lie almost entirely in the future. But it would be an act of commonsense to pay some attention to them now. There is, in the year to year movement of stocks, perhaps more scope for rapid and effective application of disinflationary (or inflationary) forces than in any other set of decisions for which individual entrepreneurs are responsible. Low interest rates and easy access to finance may disguise this truth, or give it confirmation by producing inflation. But sooner or later the rise in prices absorbs the pool of easy money, and when that happens the economic barometer can shift very rapidly towards "change." The anatomy of British industry, as revealed in its recent accounts, suggests that it is less able than it was to run quickly and undamaged through a spell of unsettled weather.

Business Notes

Sir Stafford's Diagnosis

At a press conference on Thursday, the Chancellor claimed that "there is no economic or financial reason for any lack of confidence in sterling at the existing rate." He declared that "quite undue importance" is attached to transactions in sterling below the official rate; a discount was inevitable given a fixed rate for an inconvertible currency (which raises again the wisdom of fixing a rate) but it was not so wide as to encourage bulk trade at unofficial rates. He maintained that the cuts in government expenditure and capital investment were decided "upon the best and most careful assessment of the actual need," but there was no proof either of their sufficiency or insufficiency. If more needed to be done, there would be "an excellent opportunity at the time of the 'Economic Survey' and the Budget." All the factors he affirmed—increased exports in October, rising stocks of food and raw materials (mainly food, it would appear), rising production, the steadiness of retail prices, and restraint in the main items of popular expenditure—confirmed his estimate that inflationary pressure was being brought under control.

On the recovery in the gold and dollar reserves, Sir Stafford Cripps contented himself with "a safe statement of what people can expect." He declared that "there is no reason to anticipate for the period up to next June any fall in the reserves from their level at the end of the third quarter." This, one hopes, should indeed prove "a safe statement," but to encourage confidence in sterling something more positive was surely needed than so dismal a forecast for the next seven months. There is not so much justification for publishing the figures of reserves only at quarterly intervals as the Chancellor believes. But, even so, his failure to give any general indication of the movement in the reserves since September is disappointing.

As for home financial policy, the Chancellor (claiming to repeat an earlier statement) declared that he had no intention of raising the rate of interest charged by the Public Works Loans Board (to which reference is made in a later note). But it was on last week's official intervention in the gilt-edged market that the Chancellor threw in some intriguing observations. He would take every chance of squeezing the bears when opportunity served. But it was not "his intervention"; it was the Bank of England's. Was he not advised by the Bank? Indeed, no; the Bank was not his adviser, it was his creature; but creatures sometimes went their own way. "In the normal way," the Bank would finance its operations by using funds in the Issue Department. This statement might have been careful or inadvertent—careful in the sense that it preserved the fiction that no government money was ever used, or inadvertent in the disclosure of the thin end of the technical wedge which has been inserted in the market. In any event, the result had been to give gilt-edged stocks "a more true valuation." Without the Chancellor's prompting, the creature had turned waywardness to good account.

Intervention and Confidence

If a market was ever ripe for official support, the gilt-edged market was on Friday morning eight days ago. It was technically weak and oversold; the momentum of falling prices was sapping all confidence in its potentialities of unaided recovery; the breach of the 4 per cent line by 4 per cent Consols, which had closed at 98½ (including 1½ points of accrued interest) on the previous evening, had pushed out a salient which was being rapidly filled by other "single option" stocks moving towards a 4 per cent yield basis. Then, just before lunch on November 11th, the Government

broker appeared. It was enough, given the tender condition of the market, to let his intentions be known. Market report suggests that his positive support was not on a large scale. The bears rushed to cover, and trading became as narrow in the recovery as it had been during the sliding market a few days earlier. Prices immediately bounded by 3 points in the "longs."

The fact that the Government broker has inserted a peg in the market gives it a foundation that was previously lacking. Obviously, sustained and large-scale support would be needed to jack prices up very far, and a policy of that kind (of which admittedly there is little present sign) would call in question the whole basis of the Government's present attempt to resume a disinflationary course. Indeed, one of the factors which helped to bring such a spectacular result from such modest official intervention is the growing mood of belief that the "consequential measures" to make devaluation work are more adequate than was judged when they were announced. Part of this belief rests on hints that the

gold and dollar reserves are recovering satisfactorily. But part is also founded on the importance of higher interest rates in checking undue expansion in industrial investment. If financial pressure of this kind has some chance of becoming effective, the less justification, surely, could be advanced for large-scale official support in the gilt-edged market which would have precisely the opposite effect.

Market discussion has naturally turned to new loan possibilities. The South African operation, deferred after the dismaying fate of opening dealings in the New Zealand loan, now has a fairer wind. Premature expectations of an announcement about the refinancing of the £787 million of Exchequer Bonds, due on February 15th next year, have naturally come to nothing. But that impending operation suggests that official support, having made its belated appearance, will not hurriedly be withdrawn. The recovery has spread out widely over the market. The Rootes issue of £2,000,000 5 per cent preference capital at par, which will be offered next week, illustrates the effect of rising interest rates on the terms for new capital; but the issue could hardly have been contemplated at all in the market conditions of ten days ago. The compromise on the Steel Bill has helped the industrial market, and there are hints that the nationalisation programme on which the Government

New Vesting Date for Steel

The iron and steel industry had already ceased to believe it possible that the transfer of assets under the Bill could in fact take place next year. As the Minister of Supply said in the Commons on Wednesday, the Government's timetable for taking over the industry was based on an assumption that the Bill would pass into law before the last summer recess. Since this did not happen, next May had become out of the question as transfer date, and the alternative was "such later date within 18 months of the Royal Assent as the Minister might decide." The new date is January 1st, 1951, or such date within the following twelve months as the Minister may determine. In the meantime the Bill will have passed into law, and the various provisions concerning the transfer of assets, the making of leases and agreements, and other transactions which fall to the lot of boards of directors will have legal effect.

This is, in the circumstances, to be welcomed. The provisions in question are in any case retroactive to a date in October, 1947, and therefore the sooner they become law the better. The iron and steel industry has to carry on its business, and cannot do so (particularly in a period of great physical expansion) without engaging in many transactions of a kind which might later be questioned by the Corporation under the terms of the Bill.

Once the Bill has reached the statute book the industry will know the statutory framework in which it has to conduct its affairs. The Bill, in the form which it has now reached, exempts from the retroactive provisions transactions in respect of which the company concerned has obtained the written approval of the Minister of Supply. It has already become customary to seek such approval; Mr Strauss said on Wednesday that the companies concerned have in the last twelve months "acted with a real sense of responsibility in putting their submissions to me," and gave an assurance that he would continue to treat these submissions expeditiously.

Finance and Investment

German Assets Share-out

In the second reading of the Distribution of German Enemy Property Bill on Tuesday, Mr Glenvil Hall went some way towards removing the accumulated confusion and uncertainty of four years. For the first time the two cardinal figures—the value of the assets and the expected claims against them—have been provided. The Financial Secretary put the claims at £100-£120 million and the value of German property in this country at not more than £15 million.

It seems important, however, that creditors should know how the figure of £100-£120 million is arrived at. Commercial claims, including the Standstill debts, certainly fall far short of this total. Presumably the anticipated claims include accrued arrears on the Dawes and Young Loans, Konversionskasse, and, possibly, German municipal and state loans. Any provision (apart from arrears of interest) for repaying part of the principal of these bonds out of the £15 million would seem misplaced. The British Government's intention to put in a claim of £3-£4 million to recoup its payments under the guarantee on the Austrian guaranteed loan (this loan became a German responsibility after the Anschluss in 1938) suggests that claims for arrears of interest on Germany's funded foreign debt will be allowed to rank for a share in the assets.

Mr Glenvil Hall again declined to publish a list giving full details of all German assets held by the Custodian of

Enemy Property, on the ground that this was impracticable. The United States Custodian was able to publish a list some time ago. As the Bill gives commercial creditors of German firms the alternative of awaiting their share in the pool or of exercising power of attachment against assets of their debtors located in this country, it seems incongruous that creditors should not be told in detail what the assets are. Moreover, a creditor who has decided to claim a specific asset will not be entitled to any share in the pool should the final dividend prove to exceed the value of the specific asset. In the United States, creditors in this position have had a share in the general pool.

This question of specific assets is important. British creditors who make specific claims thereby increase (under Article 6A of the Paris Reparations Conference) the British share in the international reparations pool. The British share of this pool is 28 per cent. Assets located in Britain, but not specifically claimed, count in the pool, whereas assets which are individually claimed are outside the pool settlement. Since the Government has conceded the importance of making full use of Article 6A, it should make that course possible by giving creditors all the information they need to do so.

Local Authority Borrowing

From the distribution of German property, Mr Glenvil Hall turned to local authority borrowing, by introducing the Public Works Loans Bill. The previous measure, passed some eighteen months ago, authorised the Public Works Loans Board to advance up to £500 million in cash to local authorities, and to keep within a limit of £680 million for cash advances plus commitments. The Financial Secretary disclosed that up to the beginning of this month, actual advances had reached £360 million, of which £285½ million was for housing. But future commitments now total £225 million; therefore, the board is within £95 million of the limit of its authority, and since it is making cash advances at the rate of £8 or £9 million a week, its resources would be exhausted by February or March next year.

The Bill, therefore, seeks a renewal of the provisions made in 1947—that is a limit of £500 million for further advances and of £680 million for advances and commitments. Loan sanctions under the existing Act and future cash advances will come out of the new provisions. The measure is, of course, only an enabling bill, and it does not determine the size or the charges for local authority borrowing in the next year or so.

It is important, now that borrowing by local authorities is canalised through the Public Works Loans Board, that the rate of interest charged upon the loans should reflect the conditions which they would have to satisfy by the test of the open market. This is manifestly not so at present, and in the debate on Tuesday Mr Osbert Peake added his comments to those which have appeared in recent issues of *The Economist* on the dangers of concealed subsidies in the form of lower rates charged to local authorities than the Government itself would have to pay in the open market. His observations failed to draw a reply, but they underlined the need—which has been apparent for many weeks—to adjust the interest rates charged by the Public Works Loans Board to a realistic level in conformity with what the Treasury itself might be expected to pay on its own borrowing. The Chancellor, however, will have none of this; on Thursday he declared that he will not raise the PWLB rates.

"Departments" and Gilt-Edged

The annual question to the Chancellor of the Exchequer about the extent of "Departmental" holdings of Government debt produced last week its usual deceptive answer. At March 31st last, Government departments held £406

million of floating debt and £3,347 million of "other" debt, making a total of £3,753 million, compared with £3,622 million twelve months earlier. The reply, though technically adequate, is deceptive for two reasons. The Government agencies to which it relates exclude the Bank of England and the Exchange Equalisation Account—and the Bank's Issue Department alone holds £1,288 million of Government securities apart from the special funded debt. Secondly, the securities embraced in the reply include only direct obligations of the Government: accordingly, they used to exclude Local Loans but now include the ill-fated successor stock (Daltons), and they exclude the important Government-guaranteed nationalisation stocks such as Transport and Electricity.

In the circumstances, it is impossible to draw any firm conclusions, market-wise, from the published figures. Because of the first exclusion, the distribution between floating and other debt—which otherwise would be a highly significant relationship—affords no clue to the extent of "support" afforded to the gilt-edged market. The published figures imply that the departments concerned have been "going long," because the whole of the disclosed increase in the total funds has been employed in "other" debt (holdings of which stood at £3,217 million in 1948, compared with £405 million of floating debt). The increase in these departments' holdings of marketable gilt-edged stocks, incidentally, has probably been larger than the change in "other" debt implies, because a large part of this debt comprises terminable annuities and other non-marketable securities, the volume of which has been declining under the pressure of savings withdrawals. But it does not follow, even so, that the authorities, in their aggregate operations, have been "going long": it is possible, perhaps probable, that other agencies have been operating in the reverse direction from that taken by the departments whose holdings are ostensibly disclosed. Finally, because of the exclusion of guaranteed

stocks, it is impossible to ascertain even the aggregate internal holdings or the extent of the accumulation of internal funds. All that can be said is that the *masse de manœuvre* is very much greater than the published figures suggest.

£8.2 Million for Persia

It was disclosed by question and answer in Parliament last week that Britain has made a final payment to Persia of £8.2 million—apparently bringing the total settlement to £19 million—for the wartime use of the Persian railway system. This settlement, resulting from protracted postwar negotiations, brings to light yet another of the many onerous financial agreements which Britain accepted during the war. The basic arrangements for all payments to Persia before 1947 provided that 60 per cent of any sums due should be paid in gold, the balance being covered by sterling which carried a revaluation guarantee. In the railways settlement arising from a pre-1947 obligation, apparently the only concession which the British negotiators managed to extract is an agreement by Persia not to insist on the 60 per cent payment in gold—but only provided that dollars "will be available in case of need." On the other hand, under the exchange guarantee the agreed final payment had to be raised from £5.7 million to £8.2 million. A substantial proportion of the £19 million was claimed by the Persians on the ground that during the war Britain paid for use of the railways at prewar freight rates which did not take account of increased operating costs. But prewar freight charges were based on a very low level of activity on the Persian railway system and when, after 1942, one train every ten minutes was dispatched to Russia, outgoings were met comfortably from the greatly increased revenue, despite the increase in operating costs. The arrangements now finally settled seem to have proved highly profitable to Persia.

Indeed, Persia is receiving very favourable treatment in other respects. Thus, under the 1947 agreement with the Bank Melli Iran—its text has never been published officially—Persia is allowed to retain all its dollar earnings and, in addition, to convert any sterling earned (principally from royalties on the operations of the Anglo-Iranian Company) into dollars for the import of goods from the United States when such goods “cannot be imported from the scheduled territories at comparable prices and delivery dates.” This flexible arrangement is apparently interpreted most liberally by the authorities in London; in practice, Persian merchants find no difficulty in obtaining exchange for almost any dollar import. (Persia obtains, for example, nearly half of its imports of cotton textiles from the United States, and buys only small quantities of cotton goods from Britain.) As more oil is exported from Persia, Persian sterling earnings will further increase, and there will be still more Persian sterling available for conversion into dollars.

New Target for National Savings

It is now unhappily evident that the brave display of bunting and rhetoric in “Savings Week” at the end of last month failed to induce the public to save “for Britain and a happy future.” Since the published figures are always a week in arrear, any new savings brought in by this special effort must have shown themselves either in the Savings return for the week ended November 5th (when receipts, at £13,652,000, were the lowest for four weeks, and net dis-saving, at £1,696,000, was the highest since August) or in the return for the week ending November 12th (when a smaller deficit of £148,000 was recorded). This result is not altogether surprising, for it was obvious from the start of the week’s drive that pomp was to be overlaid by adverse circumstance.

The value of the National Savings Movement to the community has, however, never really been indicated by the results of its special drives (the apparently glittering success of its wartime campaigns—as distinct from the unspectacular progress in the quiet seasons—often largely reflected a shuffling in of funds from other forms of savings). Its faithful retainers should, therefore, be more concerned now with the challenge offered to them by the threat to their proud record of always having shown a surplus of receipts over withdrawals (as officially defined) at the end of each financial year. The cumulative deficit for the thirty-one weeks of the financial year to date amounts to £44,760,000 (against a cumulative deficit of £6,124,000 at this time last year). If the usual seasonal pattern were followed, the cumulative deficit would decline from now to the end of November, would increase sharply—and to a new peak—over Christmas and would then come tumbling down in January as end-year bonuses were invested and as rights of deposit in the Post Office Savings Bank (for those who had reached the yearly £500 limit in 1949) were renewed. In 1948-49 the cumulative figures emerged from the red at the beginning of February. It will be a great achievement if they do so in this current fiscal year.

Gas Light and Coke Compensation

The terms agreed between the stockholders’ representative of Gas Light and Coke Company and the Minister of Fuel and Power for the compensation payment due to the company under the Gas Act 1948 have now been announced. The award has been delayed by the claim of the company to additional compensation under section 26 of the Act which allows for an increase in the value of securities of companies suffering loss of revenue from war causes. Payment for the prior charges will be on the basis of £95 per cent for the £2,600,000 3½ per cent maximum stock, £105 10s. per

cent for the £4,477,106 4 per cent consolidated preference and £104 5s. per cent for the 3½ per cent redeemable preference. The biggest total payment will be for the £19,101,877 ordinary stock at present outstanding. Each £1 of this issue will receive 26s. 6d., of which the additional compensation agreed under section 26 appears to be 3s. 2d. All compensation will be paid in the form of 3 per cent British Gas Guaranteed Stock 1990-95, allotted at par.

The award can truly be regarded as the “pay off” in this entirely unsatisfactory chapter of nationalisation. The point has been made before, but certainly bears repetition, that gas stockholders awaiting compensation awards have been left to the unmitigated mercy of fluctuations in the gilt-edged market. On the day when the Gas Light and Coke terms were announced, the price of Gas Stock touched 83, which represented a capital loss of 17 per cent on the nominal issue price of their compensation stock. Perhaps they will find some small comfort in the fact that the price has rallied to 87½ in the past few days. Perhaps they will take the Chancellor’s advice, and wait until the stock reaches par.

* * *

Profits Tax Bill

The Profits Tax Bill providing for an increase in the rate of profits tax on distributed profit from 25 per cent to 30 per cent was passed in all its stages by the end of last week. In the second reading it was made abundantly clear that Mr Douglas Jay, the chief Government spokesman, was by no means happy with his brief. His arguments that the measure would restrain spending and check inflation were muddled to say the least of it. He made his case depend largely on whether dividends would be cut as a result of the higher tax. It can be remarked at once that at least preference dividends cannot be cut. Again, particularly in view of dividend limitation, it is unlikely that, other things being equal, most companies would reduce ordinary dividends in the new circumstances. It is much more likely, therefore, that the additional payments to the Treasury will be found by drawing on reserves. Only if these fresh drafts on reserves entail a reduction in capital expenditure might a reduction in overall spending be expected.

Yet Mr Jay stuck fast to his argument that by widening the gap between the tax on distributed and undistributed profit the Bill would increase the incentive of companies to increase the proportion of profits set aside for reserves. And in support he could quote from a speech made by Mr David Eccles last year. When this proposition was hotly challenged by the Opposition, he stated that the Bill must be considered “alongside” the increase in initial allowances in the last Budget. It is apparent that the Government still regards this earlier measure as a “large concession to the financing of industrial re-equipment.” Clearly, the Treasury Bench has much to learn about the nature and uses of industrial profits. Whatever else can be said in favour of the increase in profits tax—and there is very little—it cannot be regarded as an incentive to industry to increase its reserves.

Industry

Minister and Board

When the report of the National Coal Board for 1948 was debated in the Commons last week, the Minister of Fuel and Power had something to say on the constitutional degree of responsibility for the operations of the board which rests on him—and the extent to which, therefore, Parliament can supervise the board’s affairs. It is not to be supposed that his elucidation was final; these are matters as much of practice as of statutory definition, and much of the practice has yet to be established. The debate itself set a precedent.

The Coal Industry Nationalisation Act lays on the

Minister certain specific responsibilities—for the health and safety of workers and for policy on capital investment, research, training and education. The Minister has to approve the form of the board’s accounts, appoint its auditors, and direct its payments of interest and repayments of capital. There remains the power to give the board—after consultation with it—

directions of a general character as to the exercise and performance by the Board of their functions in relation to matters appearing to the Minister to affect the national interest.

This, as Mr Gaitskell explained it, amounts to “responsibility for what I should describe as the general success or failure of the enterprise.” It also falls on him in another way, as the man who appoints the board.

The appearance of simplicity in this explanation began to fade when Mr Gaitskell explained his degree of responsibility for the price policy of the Coal Board. Under the Act, the arbiter of prices is the board itself. But when the board came into existence it continued a voluntary agreement which had been made between its predecessors (the mineowners) and the Minister of Fuel and Power, not to increase prices without the Minister’s agreement (Mr. Gaitskell called it “permission”). This arrangement is not in the Act, but it might still become a constitutional practice. It still holds for inland prices, and the report for 1948 records an instance of its working. When the board adjusted home prices in July, 1948, with the idea of widening the differential between qualities, it was at the Minister’s request that no change was made in the prices of house coals.

But the agreement was waived so far as export and bunker prices were concerned in December, 1947, when exports were resumed; and the board then added 25s. a ton to its export and bunker prices. The recent new increases in the prices of some export grades caused questions to be asked last week. The Minister’s reply was that the board is now free to fix its prices for the export market “on commercial considerations, in the same way as any other exporter”; and the matter is no longer a Government affair. Critics might argue that, since the National Coal Board is under a statutory obligation to pay its way, and since it cannot raise its prices to the home market without the Minister’s approval, then the attempt to recoup on export sales the losses incurred at home flows inevitably from Government policy.

* * *

Film Industry Finance

The President of the Board of Trade said only what was expected last week when he indicated, in reply to a Parliamentary question, that the present quota of 40 per cent must continue until September 30th next year. When the Cinematograph Films Act, 1948, was brought in, the Government attached importance to giving plenty of notice of changes in the quota, so that producers could make their plans with the firm assurance of a market. Now that Mr J. Arthur Rank has indicated that the production plans of the largest organisation in the industry are being severely cut, the Act leaves no flexibility to meet such a situation even if the President wished to do so; though it must be said that he gave no indication of recognising the necessity of any change. The Board of Trade fixes the quota by order, and may amend its orders. But—the Act provides—

no such amending order shall have effect in relation to any quota period beginning earlier than six months from the date on which it is made.

It is left to the procedures of exemption and relief, and to the retrospective procedure by which the Board can certify that failure to meet the quota was caused by circumstances outside the exhibitor’s control, to make the quota workable until next October.

Mr Wilson this week added one more to the list of

inquiries into the affairs of the film industry. He has asked the Standing Consultative Committee on the administration of the Companies Act to report on the variations of practice in valuing films for balance sheets. This matter arose on the accounts of the Odeon group, and was discussed in *The Economist* last week. The President, who will be in the United States this week-end on other business, has arranged to meet Mr Eric Johnston, president of the Motion Picture Association of America, for what is apparently to be a series of discussions beginning on Sunday. No agenda has been published. It has been customary to exclude the quota (as a purely British concern) from discussions of this kind, but this convention has not had happy results and its abandonment would be no great loss. American complaints, apart from the quota itself, are likely to refer to the level of releases under the Anglo-American Films Agreement (which is due for review next year); they may also include the renter representation on the Films Council. Mr Wilson, for his part, might be expected to raise questions about the poor marketing facilities accorded to British films—even when they are good—in the United States, and the meagre scale of investment of American “frozen” sterling in film production in Britain.

Of the two reports expected on the film industry’s affairs, the report of the Gater working party on production costs is now in the hands of the Board of Trade. The report of the committee on film distribution and exhibition, which started work a year ago under the chairmanship of the late Lord Portal, and is concluding its task with Sir Arnold Plant as chairman, is not yet ready; but it is expected to be finished this month. The Films Council, when it meets on November 30th, is expected to discuss the future of the British film industry in general terms. An attempt is being made by the British Film Producers’ Association to work out a common policy with the exhibitors for the occasion; this would be a welcome novelty.

* * *

Warning on Commercial Vehicles

The Ministry of Supply has sent a stiffly worded letter to manufacturers pointing out that far too many commercial vehicles are being sold on the home market and that if the rate of delivery has not been reduced by about 40,000 vehicles a year by next summer, sanctions will be applied. The *Economic Survey for 1948* allowed for the sale of 50,000 vehicles on the home market, but in fact 85,000 were delivered. The *Economic Survey for 1949* repeated the 1948 estimate, but deliveries have in fact been at an annual rate of nearly 115,000. Only 17,000 of these are heavy vehicles; the rest are lighter types, and 55,000 of them are delivery vans. The new figure laid down by the Ministry is 73,000. Production is now about 230,000 vehicles a year, and the industry has been given the alternatives of exporting more or reducing its output. Exports are at present about half of the total of vehicles being built, and sales are made in the face of considerable difficulties. Can the industry find foreign buyers for an extra 40,000 vehicles a year? The possibility of switching production from commercial vehicles to passenger cars (the export market for which is still far from saturation) would appear to be ruled out by the shortage of steel sheet for bodies.

While many firms are fully booked with orders the industry doubts whether the export markets are capable of great expansion. The dollar countries are ruled out by the arrangements between hauliers and the big American manufacturers. Other countries are building up—and therefore protecting—domestic industries. British manufacturers sell almost entirely to countries not able to build their own vehicles, and to many of them can only sell chassis to be fitted out by body-builders in the country of destination. Such sales account for well over half the value of exports of

commercial vehicles in the first nine months of this year. Other markets are for specialised vehicles such as the long-distance buses used in South America, which are built almost without exception by British firms. The industry feels that, before complaining of the number of vehicles sold, the Ministry might have taken into account the export target announced for the year. This was fixed in terms of monthly

PRODUCTION OF COMMERCIAL VEHICLES* IN GREAT BRITAIN				
	Production		Exports (Complete Vehicles)	
	Number	£'000	Number	£'000
1948:—

1st.....	51,703	31,255	26,158	11,245
2nd.....	52,314	31,414	23,737	10,991
3rd.....	50,994	19,149	25,784	6,483
		(2 months)		(2 months)

* Including chassis delivered as such by motor manufacturers.

exports at £3,600,000, to be reached by the end of the year. It is a figure which has already been reached in three particular months, and judged by this target alone, the industry has done what was required of it.

If home deliveries are not reduced by the required proportion by the middle of next year, the Ministry proposes to control sales by some form of licence. But the official direction of sales of passenger cars has not proved easy, and past experience suggests that commercial vehicles present a still more difficult field for exercises of this kind.

* * *

Rise in Unemployment

Preliminary figures published by the Ministry of Labour show that unemployment rose during September. On September 12th 267,900 workers were registered as unemployed in Great Britain; by October 10th there were 300,300. This is an increase of from 1.3 to 1.5 of the insured population. Only 13,965, or less than 16 per cent, of those unemployed were of school-leaving age. There is a seasonal increase in unemployment at this time of year, largely among hotel and catering workers, who move to other work in the winter. A large proportion of the decrease of 9,000 in employment in "professional, financial and miscellaneous services" during the month represents this class. Nevertheless, the rise is steeper than it was in 1948, when in the same month unemployment rose from 294,300 to 314,500. To some extent the statistical movements are likely to be greater because of the larger number of workers covered by national insurance. But the number of workers who have been unemployed for more than eight weeks has risen from 106,821 to 121,582. This suggests that at least part of the increase is due to non-seasonal factors.

The working population rose by 25,000 during the month, primarily because of school leavers. The textile industries gained 6,000 workers; the metal and engineering trades, and the building and contracting industry, 7,000 each and the clothing and chemical industries, 3,000 each. There was very little change in employment in the distributive trades or in the basic industries. Although 4,200 men less were on the colliery books at the end of the four-week period, the loss was partly offset by small increases in other basic industries, and the decrease in employment in the "basic industries" group was only 2,000.

Trade and Prices

Exports after Devaluation

Exports last month showed an encouraging rise. The total value reached £156 million, some £14 million more

than in September and only £3,900,000 less than the record achieved last March. At first sight, the figures suggest that devaluation is bearing fruit. The daily rate of exports in October compared with September increased by 10 per cent; October showed a 7 per cent increase over September. Thus in 1948, after allowance for the seasonal rise in exports after the holidays, the increase this year has been sharper.

Exports to both the United States and Canada showed a substantial rise over the September level. Shipments to the United States were valued at £5,600,000, against £4,100,000 a month earlier—an increase of nearly 37 per cent. Compared with October, 1948, however, the value of exports to the United States increased last month by only 2 per cent. Exports to Canada totalled £6,400,000, an increase of 21 per cent on September and of 3 per cent on October, 1948. Clearly, no hard and fast conclusions can be reached from the trade returns for a single month. No indication is yet available of the movement in the volume of exports, as distinct from their value. The increased value in sterling may be due in part to the fact that some exporters have been able to quote higher sterling prices. That does not mean that they have obtained the same dollar price per unit (unless, of course, they have increased their sterling prices by the full 44 per cent to correspond with the devaluation); nor does it mean that exports to the United States and Canada are yet bringing in as many dollars as they would have brought in at the old rate of \$4.03 to the £. Britain's dollar-earning capacity, so far as the evidence goes, did not worsen last month—or, if it did, only by a very little—compared with September, but it was appreciably lower than twelve months ago.

The visible trade balance showed no improvement. Imports exceeded exports by £36.8 million; thus the gap was £1,300,000 larger than in September, though still £5,400,000 lower than the monthly average for the September quarter. Imports totalled £198 million in October, some £17 million more than in September, and the third highest total since the war. Again, it is not known to what extent the rise in the import bill can be attributed to devaluation. But obviously devaluation will have an increasing influence on import costs.

* * *

First Dealings in Tin

Tuesday saw the first dealings in tin in the London Metal Exchange since 1941. The market got off to a slow start, understandable enough since the Ministry of Supply is the only large holder of tin for immediate delivery. The total turnover on the first day amounted to 225 tons, but trade declined on both Wednesday and Thursday. The first sale was made by the Government broker at £715 a ton, compared with the Ministry's fixed selling price last week of £750 a ton, which is now no longer operative. Closing prices for the day were given as £720 a ton for cash sales and £652 10s. a ton for three months' delivery. By Thursday the closing price had dropped to £695 a ton for cash sales and to £619 for three months' delivery. The spot price is still higher than the City's forecast, which was generally put at £650 a ton. But the wide backwardation between spot and future quotations suggests that the market expects that the cash prices are likely to fall in the next few months.

In fact, the prospect is not easy to assess. Stocks of tin in this country amounted to 15,872 tons at the end of September (the latest figures available) and, of this quantity, only 1,520 tons was in consumers' hands. At the current rate of consumption, consumers' stocks then represented less than a month's supply, whereas the Ministry of Supply held over eight months' stock apart from tin concentrates. It is unlikely that consumers' stocks have been built up to any great extent since August, as the re-opening of the London tin market was expected to herald a fall in prices. In fact

We help to make colours brighter

WE CLAIM the credit for the bright colours of such things as lacquer and linoleum, plastics and printing inks. That's because we make lithopone.

Lithopone is a most widely used white pigment, and white pigments are the most important of all pigments. For they're the base, the 'body' that makes white paint white and opaque, and makes brilliant colours possible in paints and many other materials.

Our illustration shows an early stage in the production of ORR'S ZINC WHITE LITHOPONE at our Widnes works—the roasting of one of the raw materials in a revolving furnace.

Besides lithopone and other zinc pigments, our products include zinc metal and alloys, zinc dust, cadmium, metallic arsenic, sulphuric acid, catalysts, fungicides and fluorides: all basic materials for Britain's home and export trade.

stepped up output...
lowered costs...
guaranteed accuracy

The 'Nelson' welding gun (marketed by Crompton Parkinson Ltd.), which fixes studs to steel surfaces by welding instead of drilling and tapping, is now produced to specification much more quickly by transfer moulding the main body in BAKELITE high-strength material Grade X199 3 Natural. This moulding incorporates many metal inserts, including a heavy copper solenoid, and is characterized by its precision and great strength.

There is a BAKELITE material for every known application—and among them one which may help you to simplify some operation, speed it up and reduce its cost. Why not avail yourself of our co-operation? Ring our technical representative at Sloane 9911 (London); Midland 5911 (Birmingham); Central 4908 (Manchester); City 6825 (Glasgow).

BAKELITE PLASTICS

because the price was expected to fall sharply, tin producers rushed to sell their stocks to the Ministry almost at the last minute rather than risk sale on the open market. The course of the market depends very largely on more adequate supplies being made available. Both Belgium and the Netherlands are believed to have little tin for immediate delivery; hence the market is virtually at the mercy of the Government broker.

In New York, the price of tin has fallen to 92½ cents a lb. (equivalent to £740 a ton) although the Reconstruction Finance Corporation, which sells the output of the Texas smelter, is still quoting 95 cents a lb. Unless the RFC soon alters its price, it might pay American consumers to buy in the London market. But, despite all the uncertainties of the immediate future, a lower price seems inevitable, though it may take time for the market to settle down.

Tin and Exchange Control

To reopen a free commodity market and at the same time to preserve effective exchange control is not easy. The arrangements made for tin have, of course, been made in the light of the exchange control arrangements when the rubber market was re-opened.

The general principle which has again been followed is to apply *post facto* control and to restrict the market to "persons and firms recommended by the Committee of the Metal Exchange." These authorised participants will be free to purchase tin in any part of the world and the Board of Trade will give them an open licence to import tin freely into the United Kingdom.

All payments and receipts for tin must be segregated by each participant in one banking account to be known as "Metals Scheme account." Monthly statements of these accounts must be submitted to the Bank of England. Participants in the market will also have to make confidential monthly returns to the Bank of England showing their transactions and positions. Freedom to deal in tin extends to operations in metal which will never physically touch the United Kingdom. The freedom of the market is, therefore, complete, but it is reserved for authorised firms whose operations are subject to *post facto* control.

This form of control has called for a new system of sanctions and discipline by the Metal Exchange executive. The sanctions will be put into effect if the Bank of England decides in any case that "an excessive position or unwarrantable speculation or any other undesirable situation or practice is developing." In that event the Bank of England may pass to the executive of the Exchange the name of the suspect participant who in turn will then be compelled to give the executive a copy of his return.

This compromise between freedom and control has all

the objectionable features of a mixture of that kind—the closed shop principle, the scrutiny of confidential documents, the grant of power to punish to a trade association. All this can be justified only on the ground that it marks a step forward towards the freeing of a hitherto closed market. But as long as such trammels exist—that is as long as exchange control persists in its present form—it would be too much to expect the great commodity markets in this country to recover their former glory.

* * *

Jump in Wholesale Prices

The effect of devaluation on British wholesale prices finds some reflection in the Board of Trade index for October. This showed a rise of almost 3 per cent on the month—a rise which is likely to reflect more accurately and more promptly the effect of devaluation on British costs. The index for food and tobacco was 5 per cent higher than

occurred in non-ferrous metals (15 per cent.), which were of course promptly raised to the new sterling equivalent of their dollar prices. The next largest rise was in wool (7.7 per cent), followed by cotton (6.4 per cent) and other textiles (4.8 per cent). The wholesale price of coal was unchanged. These group changes, of course, mask the rises and falls in individual commodities. In the miscellaneous group, for example, four types of chemical wood pulp fell on average by 17 per cent, and mechanical wood pulp by 18 per cent. On the other hand, the price of rubber rose by 11 per cent. Yet the miscellaneous group index fell by more than 3 per cent during the month—the only group to decline.

The total index stood at 236 (base, 1930=100) in October, and exceeded the previous peak reached last June by 2 per cent. A rise of 3 per cent in one month may not sound very alarming, but it is only the beginning. The rise has occurred primarily in basic materials (including foodstuffs) and intermediate products, and in due course it will be reflected in the price of manufactured goods.

* * *

Meat From Uruguay

A new long-term contract for beef is expected to be signed with Uruguay next Tuesday. The period is for five years from last July so that the contract will run concurrently with the Argentine contract. The quantity is said to be a minimum of 40,000 tons each year and the price, which is to be reviewed annually, is reported as £96 a ton for the first year. Under the Argentine contract the price agreed upon was £97 10s. a ton. Discussions are continuing with the Argentine Government about a possible revision following the devaluation of sterling. Meanwhile imports of Argentine meat into Britain are being paid for at the original sterling price.

The new contract with Uruguay will not afford much immediate relief to the British consumer. The annual quantity represents barely 10 days' consumption at the present ration. But it may encourage the development of Uruguay as a source of supply—the 40,000 tons is a guaranteed minimum. Last year Britain imported only 22,000 tons of meat (mainly beef) from Uruguay, whereas before the war the annual import exceeded 55,000 tons.

* * *

Active Retail Trade

Retail trade in September increased with a rapidity which may not be entirely due to seasonal factors. The exceptionally fine weather and the postponement of the 1s. in the £ reduction in utility prices until the end of the month might have been expected to lead to some delay of autumn buying. Early in the month several large retailers were complaining about the slackness of trade caused by the fine weather. Nevertheless, the Board of Trade index of weekly sales (1947=100) which is based on the large retailers' returns, showed a rise of five points between August and September, from 115 to 120. In 1948 the corresponding figures were 110 to 113.

Sales of apparel rose from 110 to 131. The increase is larger than in 1948, when clothes were still rationed, but in 1948 the decline in August had been smaller; the index for September was the same in both years. Sales of household goods rose from 105 to 121, again a greater increase than in 1948, when the index rose by 11 points to 107. Sales of food in both years showed an increase of only one point, to 112 in September, 1948, and 120 in September this year. Sales of "non-food merchandise" rose from 110 to 118 this year and from 109 to 114 last year. Returns from the small retailers confirm these increases, although the increases in their turnover, especially in clothing and footwear, were not so large as in the main index.

These figures suggest that towards the end of the month there may have been a good deal of buying which was inspired by a fear that devaluation would raise prices. One or two stores held sales in September, but these could not account for the big increases which took place. As the announcement of devaluation was made in the second half of the month, it may be possible to test this theory more accurately from the October sales.

Shorter Notes

The remarkable recovery in Commonwealth trade since the war is shown in a report prepared by the Commonwealth Economic Committee entitled "Review of Commonwealth" and published this week. Last year, Commonwealth countries accounted for over 28 per cent of world exports compared with 25½ per cent in 1938, and 30½ per cent of world imports against 32½ per cent prewar. But perhaps the most significant feature has been the rise of Canada to the position of the third largest trading nation in the world, while the Colonies and India were not far behind. The report also discusses in detail production trends in the various Commonwealth countries, development plans and changes in population.

*

In a motion on the adjournment on Monday night Mr Glenvil Hall denied the suggestion made by Mr D. Houghton in the House on an earlier occasion that income tax evasion could be put at £100 million a year. In reply to a suggestion by the same speaker that it was surprising to find income tax recovered from fraud or evasion—£4,000,000 in 1947-48—hardly higher than in prewar years when tax was 5s. 6d. in the £, Mr Hall stated that by 1951 the number of tax inspectors would be 1,630, against 1,430 at present, which would permit of more thorough investigation.

*

The figures in a table on page 1084 of last week's issue giving trade with Sweden were transposed. Exports to Sweden in the first eight months of 1948 were £39.2 million, against £30.5 million in 1949. Imports in the same period rose from £31.9 million to £39.1 million.

*

The jute market in Pakistan is reviving. The general quality of jute being offered is low and there appears to be a serious shortage of all finer grades. Daisee—2/3, good marks, is now quoted at £122 a ton against a nominal price of £116 some ten days ago and £100 prior to devaluation. Earlier in the year, when Pakistan was expected to have a large crop, the price fell to as low as £85 a ton. Since then, flooding has damaged the crop considerably and the Pakistan rupee has been kept at par with the dollar. Exports of raw jute from Calcutta are still prohibited by the Indian Government except to fulfil existing contracts.

COMPANY MEETINGS

THE UNITED STEEL COMPANIES, LIMITED

RECORD VOLUME OF SALES

NATIONALISATION THREAT

CHANGE OF GOVERNMENT POLICY VITAL

SIR WALTER BENTON JONES'S VIEWS

The annual general meeting of The United Steel Companies Limited was held on November 16th at the Iron and Steel Institute, 4, Grosvenor Gardens, London, S.W.

Sir Walter Benton Jones, Bt., the chairman, said: Gentlemen, the death of Sir Herbert Walker on September 29th was recorded in the directors' report. Sir Herbert was elected a director in 1937. His special knowledge and experience were gained in the administration of railways and transport, in which he was an outstanding figure and a pioneer. But he was not only a specialist, he was a man of the world and had wide interests. The company has lost a wise counsellor and a staunch friend.

If we may take the report and accounts as read, I beg to move: "That the report of the directors produced together with the annexed statement of the company's accounts at June 30, 1949, duly audited, be received, approved and adopted."

An account of the year's working operations and the progress made in modernisation and extension schemes was appended to the report of the directors. I hope this change in procedure meets with your approval. I should add that the schemes are part of a comprehensive plan and although very good progress has been made, capital expenditure will continue at a high rate for three or four years.

HIGHEST OUTPUT EVER ATTAINED

The directors told you in their report that the output of two million tons of steel was believed to be the highest ever obtained by any company in the United Kingdom, which means also that it is the highest reached by any company in the Commonwealth. This high rate of production was due to some extent to improvements and extensions to plant, but perhaps more to careful organisation, adequate and regular supplies of materials, co-operation between management and employees, pride in their work, good attendance, good temper and persistent and regular concentration by everybody on the job they had to do.

It is sometimes said that Britain is not working seriously. It is true there are unofficial strikes, that great interest is taken in football and in all forms of sports and recreation, but because men enjoy relaxation it does not follow that they do not take work seriously nor apply themselves to their daily task. It may be that some of the less responsible are deceived by apparent prosperity and they may not understand that thousands of men and women in North America and in the Dominions are working solely to supply us with food and raw materials. They do not realise and perhaps they do not know that this charity will end in 1952, nor do they realise that we have to repay large debts contracted in foreign countries and the Dominions during the war and since. But if some are callous they are a small part of the whole.

EMPLOYEES' FULL CONTRIBUTION

In our own case we believe that the employees of our company are making a full contribution to the country's production. And to illustrate that interest in the works where they are employed and in the job each one

has to do has not declined and that the efforts made to overcome emergencies when they occur are as great as they have been in the past, let me give a recent example from our Appleby-Frodingham works. In the course of our modernisation programme it has been necessary to make major transformation in large operating units. In such cases it is of great importance that interruptions in production should be as short as possible.

During the summer holiday a three-stand roughing and finishing mill in which 4,250 tons are rolled each week with its electric motor of 5,000 H.P. was picked up from its foundations, re-erected on new foundations and re-equipped with many additional and very modern manipulating devices, in fourteen days. Not a single working day was lost. Great ingenuity was displayed in planning the work and large numbers of employees of all grades worked enthusiastically to complete it stage by stage according to a set timetable. I could give examples of the same kind at other branches, particularly at Workington where an equally important change over at the rail mill was carried out. The same spirit and the same application prevails in daily production.

It will be your wish I feel sure to convey from this meeting to all employees our appreciation and sincere thanks for all they have done in the past year.

SALES

The volume of sales recorded in the report at over £50,000,000 is a record. In recent months the change from a sellers' to a buyers' market has become a factor which causes widespread questioning, if not anxiety. It must be remembered that for more than ten years there has been a famine in all kinds of goods. In times of scarcity buyers order more than they need; when supplies become more plentiful, first they try to accumulate larger stocks, and then as they begin to feel more secure they go into reverse, so to speak, cut or cancel orders and let down their stocks. But these manoeuvres do not necessarily mean a fall in need. In the things we sell we do not find any general decline. Moreover, we have an advantage in that we do not depend on specialities, that is to say we supply steel in many forms, and although we do not make sheets we have a large interest in John Summers and Sons Limited, who are equipped with modern continuous strip mills and are one of the largest sheetmakers in the country.

NATIONALISATION

We are all greatly concerned about the proposal to nationalise iron and steel both because the proposal is part of a national policy of unlimited nationalisation of industries, which we think is a wrong and harmful policy, and because it involves the confiscation of private property. Your directors are unalterably opposed to the nationalisation of our industry.

When we met a year ago the Bill to nationalise iron and steel had just been introduced, stockholders no doubt have followed the course of the Bill through Parliament and will be aware that in order to

force it through without the approval of the Second Chamber, the Constitution is to be altered by limiting the power of the House of Lords.

It is now possible for the Iron and Steel Bill to become law by January, 1950. If and when this happens the proposed Iron and Steel Corporation can be set up and the securities of the companies named in the Bill, including our company, may be taken over by May, 1950, or at the discretion of the Minister of Supply, at some date not more than eighteen months later. We know therefore that unless Parliament is dissolved in the meantime, or the Bill is dropped or amended, our securities may be taken from us in May, 1950, or within eighteen months thereafter.

Since I wrote this address it has been announced that the Bill is to be amended and that it will not come into operation until after the General Election, the Iron and Steel Corporation is not to be set up before October 1, 1950, and the date for taking over our securities will not be before January 1, 1951. But the price of such an amendment is the placing on the Statute Book of an Act to nationalise the so-called Iron and Steel Industry with all its implications. It will remain on the Statute Book unless the next Parliament removes it.

OPPOSITION GROWING

The Bill has aroused great opposition both in Parliament and in the country generally and this opposition becomes progressively greater as time goes on. Year by year and month by month the industry has produced record outputs, no strikes have interrupted its progress, its approved development schemes have progressed as fast as possible in present conditions, and it has continued to observe the requirements of the Government in the matters of distribution and price as heretofore. In other words, the proposed nationalisation of the iron and steel industry will not serve the country better than it is served under private enterprise.

The Iron and Steel Bill and the Acts which have nationalised other activities illustrate the enormous power which is given by electors to Parliament in a single life. It is said that unless electors change their views about the way the country's affairs should be conducted, the next Parliament will continue to confiscate more and more of the properties which private individuals have built up and which it may be said without question have served the country well. For this and many other reasons the next election will be critical.

CHALLENGE TO FREEDOM

To make these comments is not to enter into party political controversies. It does not matter what we call ourselves, what matters is what we do. The election of Parliament determines the country's policy for a number of years ahead. If this policy were only a matter of ethics it might not concern industry. But we are not a self-contained, self-supporting country. We live by trading with other countries and their confidence in us is vital. It is therefore not out of place for those engaged in industrial administration to express a view about the national policy which Britain has been pursuing and which it may continue to pursue unless the views of the electors change from what they were in 1945.

For years the world has been engaged in abolishing slavery, but in recent years some countries have adopted policies which inevitably lead to slavery. The challenge to freedom is real and grave.

Those who believe in slavery or in a policy which will inevitably take us back to slavery, we call Left, and those who believe that freedom alone can save civilisation we call Right.

So long as our very existence depends upon successful trade with every country

in the world, as it does, our national policy must not only have regard to our domestic affairs, it must inspire and maintain the confidence of all our customers.

LOSS OF WORLD CONFIDENCE

When in 1945 Britain adopted a Socialist policy, however mildly we may have intended to turn towards the Left, the rest of the world which had regarded us as the pillar of freedom interpreted our action as revolutionary and conversion to the kind of totalitarianism which had had such disastrous effects in Europe.

The Right hold the view that the reaction to this change of policy retarded the recovery of the world from the effects of the war. Some countries menaced by the Left gave up the struggle and in every country the Left was encouraged.

Since 1945 in pursuit of the policy then adopted we have not conducted our domestic affairs very well. Individually we have not had restored to us the many liberties we surrendered during the war. The nationalisation of our industries has not improved our earning capacity. We have allowed the gifts we have received from abroad to obscure the need to pay our way and we are not paying our way. The world, our customer, has lost much of the confidence it had learned to place in us and it doubts if we can pull ourselves together unless we change our national policy, and it fears the reaction of our failure in other countries.

THREAT TO WESTERN EUROPE

In the opinion of the Right, and many who do not see very clearly the full implications of Right and Left, but rely mainly on intuition, unless Britain returns to a policy of self help and freedom not only Britain, but Western Europe, will be overcome.

From these fears grow lack of confidence in Britain without which we cannot trade to the full and without which we cannot again become self supporting.

The future policy therefore which this country is to pursue is not confined to the subject in which this meeting is immediately interested, viz.: the nationalisation of our own and other industries, nor is it a question of personalities or parties, it is a national question and if it sounds rhetorical to talk of freedom or slavery or life or death, no thinking person can doubt that the stake is our standard of living. Is it to rise or is it to tumble down?

The report and accounts were unanimously adopted.

TRINIDAD LEASEHOLDS LIMITED

Mr SIMON J. VOS' REVIEW

The thirty-sixth annual general meeting of Trinidad Leaseholds Limited will be held on December 6th.

The following is an extract from the chairman's statement circulated with the report and accounts for the year ended June 30, 1949:—

The year under review has been one of steady progress for the company. The refinery throughput has increased. Regent Oil Company, Limited, continues to make extremely satisfactory progress. The latter half of the period under review was marked by a severe drop in fuel oil prices, which is largely responsible for the reduction in the profits of your company to below last year's level.

Although these prices have recovered somewhat they are still considerably below those ruling a year ago. We should therefore expect even further reduced profits in the current year, but this may be offset, to some extent, by price changes resulting from the devaluation of the pound.

The company's net income from operations in Trinidad, from shipping, marketing

activities and investments was £548,134 as against £633,510 last year, in each case after allowing for depreciation, taxation and transfers to contingencies. A final dividend of 6d. per 5s. stock unit, free of tax, is proposed, making the total dividend of 8.4d. for the year, the same as the preceding year.

A record refinery throughput was realised. Agreement was reached with the Trinidad Government to exempt from duty, subject to reasonable conditions, oil imported for 25 years. The board has sanctioned large capital expenditure for modernising its refinery.

CARRIER ENGINEERING COMPANY, LIMITED

BONUS ISSUE APPROVED

MR S. L. GROOM'S STATEMENT

The ordinary general meeting of Carrier Engineering Company, Limited, was held at Caxton Hall, Caxton Street, London, S.W., on November 17th, Mr S. L. Groom (chairman and managing director) presiding.

The Chairman, in the course of his speech, said: During the year covered by the accounts before you your company has considerably enlarged the scope of its business, resulting in a satisfactory increase of turnover and profit.

The primary object of our endeavour during the post-war years has been to develop and provide industrial equipment to give increased production with the available labour and, at the same time, produce a better product at a lower cost and coincidentally create improved working conditions conducive to increased manual effort and alertness.

Your company, among its many activities of this nature, has developed a continuous mechanical process for the cleaning, rust-proofing and painting of vehicle bodies. These systems are named "Rotodip" and "Rotospray," and have been installed with outstanding success in the works of several automobile manufacturers. Although these installations account for a very small proportion of our total turnover for the year under review, we have in hand further important orders for this equipment, and I make special mention of this section of our business because doubtless you have already learned of this particular activity through the daily and technical Press.

We have made licence arrangements for the manufacture and sale of similar equipment by others in America and Canada under which we shall receive a percentage on sales, and these arrangements should result in a valuable contribution to our earnings. This will represent net dollar income to our country having been earned by the sale of technical "know-how."

SATISFACTORY ORDER BOOK

Orders in hand are sufficient to provide a satisfactory turnover for the current financial year, beyond which you would not expect me to prophesy. I would, however, suggest the company's past record justifies the confident assumption that our organisation can yet again successfully adapt itself to meet any drastic change in commercial or industrial conditions.

The total profits for the year, subject to taxation, amount to £323,554 earned on a considerably increased turnover.

In these accounts we have made provision for income-tax as well as profits tax payable on the profits of the year under review, and the total deduction for taxation is £212,921.

Provision has been made for dividends on the preference and ordinary shares totalling £33,034 leaving a balance of £31,279, which is considerably more than our issued capital.

You will note that goodwill and patents, and also factory fixtures and fittings, stand at £1: cash at bank, holdings of tax reserve certificates and Government securities amount to £468,000, which is more than two and a-half times our current liabilities, including the dividends which are recommended.

CAPITAL RESERVE ACCOUNT

Of the capital reserve account to which reference has already been made £51,272 in cash which shareholders have actually subscribed by way of premium and no part of this reserve has anything whatever to do with trading profits. In our opinion this fact calls for special treatment and we are proposing that £50,000 of this balance should be distributed in the form of five per cent. irredeemable second preference shares. The remainder of the capital reserve—£4,795—plus £76,455 to be taken from undistributed profits, making £81,250 in all, will be distributed in ordinary shares. If these proposals are approved at the extraordinary general meeting which is to follow, the total issued capital will become £350,000, the balance to be carried forward to next year will be £254,824—which is practically the same figure as that brought in from the previous year—and our assets will, of course, remain unchanged at £948,653.

Your board wishes me to state that the suggested issue of ordinary shares does not necessarily mean that any increase will be made in the total dividend on the ordinary shares.

In conclusion I welcome this opportunity of expressing my gratitude and appreciation to my colleagues for their able and energetic co-operation in the day-to-day management of the company's affairs and I am sure you will also wish me to express our appreciation of the splendid services rendered throughout the past year by all our employees.

The directors' report and accounts were adopted and the dividends approved.

At a subsequent extraordinary general meeting resolutions amending the Articles of Association were approved.

EASTWOODS LIMITED

CEMENT NATIONALISATION

The twenty-ninth annual general meeting of Eastwoods Limited was held in London on November 17th.

Mr G. W. A. Miller, F.C.I.S., chairman and managing director, who presided, in the course of his speech said:—

There was improvement in the group trading profit from £274,491 to £281,971, which is reflected in an increase of the Eastwoods' net profit from £70,417 to £80,391. The results for the first half-year of the current period to September 30th show further improvement. Whatever political circumstances may intervene, therefore, the substantial fund of undistributed profit, will act as a very valuable cushion against any possible recession in the building programme.

The programme of the Socialist Party as outlined in "Labour Believes in Britain" suggests that cement is included in the further short list of industries upon which the blight of nationalisation may fall. As is very well known, the cement industry has played a most vigorous and successful part in furthering the national interest before, during and since the war: the facts are incontrovertible and plain for all to see.

For many years our selling prices and profit margins have been controlled by the Ministry of Works, the export tonnage is exceeding all previous records, several government committees have pronounced that there is no monopoly or undue profit taking, while the Minister himself has expressed his entire satisfaction with the work of the industry, and we may, I think, conclude that the interference contemplated at this time of all times cannot be justified by any argument of logic or national expediency. The Socialist case falls completely unless it can be shown that under nationalisation more and better cement could be made, and made more cheaply. Does anyone of us seriously imagine that it would?

ISOLATION OF CEMENT BUSINESS

Unlike many of our other friends in the industry, it is only part of our activities which are threatened even in the doubtful event of the proposals for cement nationalisation going forward, and there is no suggestion (except to that limited extent) that Eastwoods itself could be involved. It happens that we have no cement assets whatever outside the United Kingdom which require to be dealt with, but we have nevertheless taken the precaution to "hive off" our cement businesses and to isolate those assets for transfer to a wholly owned subsidiary of Eastwoods known as Eastwoods Cement, Limited. We cannot anticipate the future working of warped minds. In the opinion of the directors, however, this scheme does represent the minimum requirements necessary for securing the company's interests. It is my innate conviction that no further irrevocable step should be taken, nor, indeed, is any necessary at this time of complete political uncertainty.

For three years in succession we have provided entirely from our internal funds more than £200,000 per annum to finance

NOTICES

URWICK, ORR AND PARTNERS seek additional staff for the Control Division of their professional work as Consulting Specialists in Organisation and Management. Applicants must satisfy the following requirements:

1. Professional qualifications in Accountancy.
2. Some years' executive experience in responsible industrial appointments, with particular reference to costing.
3. Sound general education and wide interest in contemporary affairs.

Applications should be addressed in WRITING to the Company's Offices at 7 Park Lane, London, W.1, quoting reference C.1027.

GRADUATE, 29, B.A. (Cantab.) Economics, ex-Naval officer, seeks opening in shipping or international commerce for work of an interesting nature. Previous experience in export administration. Fluent French, slight knowledge of Spanish.—Box 267

expansion without borrowing or mortgages or pleas for State aid. Nevertheless, any constructive scheme now takes twice as long to complete at three times the expense. Against this we get only the threat of nationalisation, increased taxation, the setting up of the Monopoly Commission, further attacks on the profit motive and piteous appeals to work still harder and re-man the pumps to save the sinking ship: not our ship, but the one they navigate so dangerously and so near the rocks with so very little sense either of courage or adventure.

The report was adopted.

HORLICKS LIMITED

EXPANSION OF SALES

The annual general meeting of Horlicks Limited was held on November 11th at Slough, Bucks, Lt.-Col. J. N. Horlick, O.B.E., M.C. (chairman of the company), presiding.

The chairman, in the course of his speech, said:—

The group profit for the year to March 31, 1949, after providing for interest payable, depreciation, directors' fees and other emoluments and audit charges, amounted to £379,233 compared with £345,222 for the previous year. Expansion of sales at home accounts very largely for the increase of £63,451 in the parent company's profit, while the decline of £29,440 in the profit earned by the subsidiaries indicates to some extent the difficult conditions that have been encountered by the overseas companies, particularly the American subsidiary.

In common with all other companies in this country, we face an inevitable increase in costs. Export advantages gained by our factories in England, Australia and New Zealand are counterbalanced by the more difficult trading conditions in those export markets supplied from our American factory. It is, in my opinion, quite impossible to take anything but a pessimistic view of the future until changes are made in the economic and financial policy which the present Government has pursued for the past four years, and unless the crushing burden of taxation which bears down so heavily upon industry is lifted from our shoulders.

TAXATION AND PROFITS

The Chancellor of the Exchequer recently told the House of Commons that taxation of profits does not enter into the costs of production. There is a technical sense, of course, in which he is right, but from the broader viewpoint of the welfare of British industry, it would seem to me he is wrong. While no one would deny that profits are legitimate targets for the tax-collector, it is in fact impossible to tax them beyond a certain point without materially influencing the cost of production.

One of the most clearly marked and, I think, most pernicious developments of recent years, has been the tendency to evolve what are known as utility articles at the expense

of quality goods. We all know by now that one of the main planks of our economic recovery rests upon the expansion of our export trade. But the great advantage that we have had in the past in the export market has lain in our superior workmanship, in our ability to produce goods of a quality just a little higher than others have been able to achieve.

In prewar years branded goods won the respect and confidence that were the very foundations of progressive merchandising in overseas markets. To attempt to suppress quality production in this country and continue the wartime processes of so-called standard values, is gratuitously to throw away what is one of our great assets.

Unless we can reverse the tendencies which have been apparent in Government policy in the last four years, these consequences will be felt, with increasing harshness and severity, by all of us. Public extravagance, the penalising of past prudence, the attempt to put industry into a strait-jacket, the crushing down of all initiative and all sense of responsibility, these are things which, if we do not check them, will bring us all down, workers, management and stockholders alike.

The report was adopted.

JOHN I. THORNYCROFT AND COMPANY, LIMITED

INCREASED OUTPUT

The forty-eighth annual general meeting of John I. Thornycroft and Company, Limited, was held on November 16th in London.

Sir John E. Thornycroft, K.B.E. (governing director and chairman) said that on August 1, 1949, the company's Reading works and all the United Kingdom sales and service depots and the vehicle and marine home sales organisation had been transferred to Transport Equipment (Thornycroft) Limited, thus completing the division of the Southampton shipbuilding and ship-repairing organisation from the commercial vehicle and marine and industrial engine businesses.

During the year an order was obtained for the construction of the hull of a 5,000 tons gross passenger cargo vessel for Akers Mek. Verksted, Norway. Work had been proceeding slowly on H.M.S. "Duchess." A number of tugs (steam and diesel engine) and other small craft had been delivered during the year. Work had been proceeding satisfactorily on the rebuilding of the "New Australia" (ex "Monarch of Bermuda"), and the conversion of the "Empire Orwell" from troopship service. That work, with the running repair work on "Queen Elizabeth" and "Queen Mary" and other repair work had kept the Southampton organisation working to capacity within the limits of the labour available.

With regard to commercial vehicle business, output for the year had been in excess of the previous year due to the material supply position improving. Thirty-five per cent. of the output in value had been exported, making 37 per cent. since January 1, 1946.

The report was adopted.

CHARTERED ACCOUNTANT, preferably under 30, required by leading firm of Stockbrokers for Company analysis and statistical work in their New Issue and Statistical Department. Only those suitable for dealing with sound investment business without any speculative element will be considered. WINTER SPORTS: If you would like a good Winter Sports holiday at reasonable cost—in Switzerland, France or Austria—either with other university and professional people or independently please contact: Erna Low, 9, Reece Mews, London, S.W.7. KENSINGTON 0911.

Investment Statistics

Company Notes

Marston, Thompson and Evershed.—Consolidated trading profit and rents receivable declined from £616,886 to £510,838 in the year to March 31, 1949. Net profit amounted to £109,887 (£170,711). Net current assets at the year-end were £847,896 (£845,153).

Crabtree Electrical Industries.—Group trading profit increased from £280,932 to £346,624 in the year to July 31, 1949. Net profit declined from £136,875 to £122,310. A total dividend of 17½ per cent is recommended for the year. Net current assets amounted to £713,860 (£622,797) at the year-end.

Great Universal Stores.—Consolidated trading profit increased from £2,928,448 to £4,576,290 and net profit from £829,659 to £1,440,869 in the year to March 31, 1949. Subsidiaries have written £439,166 off goodwill compared with £49,816 written off in 1947-8. Fixed assets less depreciation have been increased from £6,522,537 to £7,439,111 and net current assets are up from £8,453,578 to £11,284,351. Revenue reserves are higher at £3,740,890 against £2,880,244. The dividend rate of 40 per cent has been maintained on the increased capital.

Wall Paper Manufacturers.—Fixed assets less depreciation were expanded from £3,697,019 to £3,933,735 in the year to June 30, 1949. Net current assets rose from £7,501,084 to £8,002,353 and reserves from £3,188,644 to £3,580,785. Goodwill has now been wholly written off with the latest appropriation of £300,000 from group profit for the year.

South Durham Steel and Iron.—Profit increased from £567,922 to £880,998 in the year to September 30, 1949. Taxation absorbs £322,000 (£115,000) and depreciation £120,000 as in 1947-8. A dividend of 4 per cent is recommended on the "B" ordinary shares (same).

Montague Burton.—Consolidated trading profit, including the new subsidiary Peter Robinson, amounted to £2,172,989 in the year to March 31, 1949. Group net profit was

£899,646 (£451,031). General reserve is allocated £400,000 (£200,000). Net current assets amounted to £5,381,678 (£1,714,124); stocks have jumped from £2,357,654 to £5,197,726 and cash from £459,600 to £1,638,694. Capital reserves have increased from £766,030 to £2,282,367 on the year.

Benskin's Watford Brewery.—Net profit amounted to £277,778 (£294,640) in the year to September 30, 1949. Recommended dividend is 20 per cent for the year (20 per cent plus 5 per cent jubilee bonus for 1947-8).

Nchanga.—A note in last week's issue implied that Rhokana received a return from its interest in Nchanga for the year to June 30, 1949. Nchanga had paid no dividend up to that date.

Joseph Lucas.—Consolidated net surplus from operations amounted to £825,732 in the year to July 31, 1949. The comparative profit for 1947-8 was £807,526 from which a special non-recurring tax provision of £299,977 was deducted. After including non-trading income and deducting profit retained by subsidiaries net profit of the parent company showed an increase from £398,416 to £642,379. The dividend of 17½ per cent for the year is unchanged.

Prices Tailors.—Group profit amounted to £811,239 (£724,792) in the year to June 30, 1949. Net profit was £297,531 (£247,007). Net current assets at the year end were £1,374,727 (£1,349,659).

Joshua Hoyle.—Group net profit increased from £474,820 to £637,564 in the year to September 30, 1949. The dividend of 15 per cent for the year is repeated.

Capital Issues

Rootes Securities (now Rootes Motors).—In replacement of the group's loan capital, an offer for the sale of £2,000,000 preference capital is being underwritten. The issue will take the form of 5 per cent cumulative redeemable £1 preference shares, the shares to be offered at par.

Argus Press Holdings.—Ordinary shareholders registered on November 3rd are offered 160,000 5s. ordinary shares at par

in the proportion of one new share for every five shares held. Directors and employees are offered 40,000 5s. shares at par.

David Whitehead (spinners and weavers).—A private placing has been made of £100,000 4½ per cent unsecured loan stock repayable at par in 1960 with an option to repay £50,000 in 1955 at a premium of £1 per cent.

British Wagon Company.—A bonus issue to be made to shareholders in the proportion of one new £1 share for each £1 share held will capitalise £520,000 of reserves. A further free distribution of £86,666 13s. 4d. is to be applied to paying up the £20 shares, (£3 paid) to £5 paid up, and the £20 shares, (£1 paid) to £1 13s. 4d. paid up. After the issue, £631,336 will remain in reserves.

Ruston and Hornsby.—Shareholders have approved the 100 per cent bonus issue capitalising £2,050,000 of reserves.

Donaldson Line.—Shareholders are to receive a bonus distribution of four new 4s. shares for each 4s. share held. The issue amounts to 2,227,420 shares and will capitalise £445,484 of reserves.

BANKING BUSINESS OF EVERY KIND TRANSACTED
A comprehensive service to Traders and Exporters is also undertaken by the Bank's Trustee Companies in
HONG KONG LONDON SINGAPORE

HIS MAJESTY'S COLONIAL SERVICE, GOLD COAST

Vacancies exist for two ASSISTANT CONTROLLERS OF COMMERCE AND INDUSTRY in the Department of Commerce and Industry, Gold Coast. The officers will be required to undertake responsible duties in regard to the issue of import and export licences and correspondence in connection therewith. Candidates with previous knowledge of customs procedure and commercial experience and any war experience in connection with supplies will be preferred.

The appointments will be on three years' probation for permanent and pensionable employment. The salary scale, including pensionable expatriation pay, is £600-£1,200, with a promotion step at £850. A temporary local non-pensionable cost-of-living allowance is payable on salaries (plus expatriation pay) up to £1,140 a year (inclusive). War service, qualifications and experience will determine the point of entry into the salary scale. Partly furnished Government quarters are normally provided, and a sum of between £90 and £100 is deducted for rent. Free passages are provided for the officer and his wife on first appointment and on leave. Income tax is at local rates, which are very much lower than those in the United Kingdom. An allowance of £60 is payable on a salary of less than £750 (inclusive of expatriation pay). The tour of service is 18 to 24 months, and leave on full salary is granted at the rate of seven days for each completed month of resident service.

Candidates must be under 40 years of age. Forms of application can be obtained from the Director of Recruitment (Colonial Service), Colonial Office, Sanatorium Buildings, Great Smith Street, S.W.1. The closing date for the receipt of completed application forms is December 31, 1949.

CITY OF BLOEMFONTEIN

CIVIL SERVICE COMMISSION

An Open Competition will be held in 1950 for recruitment by Methods I and II to the Special Departmental Classes (see H.M. Inspector of Taxes; Departmental Class (Cadet Grade); Ministry of Labour and National Service; Probationary Assistant Postal Controllers; Research Assistants; Ministry of Defence. Age limits 20-25 on August 1, 1950, with extension for regular service in H.M. Forces, but certain candidates born on or after August 2, 1923, may be admitted at the Commissioners' discretion, and candidates at least 25 and under 30 on August 1, 1950, may compete under Method II if they have experience in employment in industry or social work particularly fitting them for posts in the Ministry of Labour and National Service. The number of vacancies will be about 60, the majority in the Inland Revenue Department.

Regulations and particulars are obtainable on application (preferably by postcard) to the Secretary, Civil Service Commission, Burlington Gardens, London, W.1. quoting No. 2701. The 1 date for the receipt of completed Application Forms is November 31, 1949 (for Method II), or January 31, 1950 (for Method I).

BRITISH BROADCASTING CORPORATION

The Civil Service Commissioners announced that there are vacancies on the administrative staff of the Corporation may be filled from among eligible candidates for either Method in the Competition of 1950 for the Administrative Class of the Home Civil Service, who express an interest in service with the B.B.C. Age limits 20-25 on August 1, 1950. Minimum starting salary £1. Full particulars and application forms from Secretary, Civil Service Commission, Burlington Gardens, London, W.1. quoting 2700 B.B.C. Closing dates for the receipt of completed application forms November 30, 1949 (Method II), January 31, 1950 (Method I).

CIVIL SERVICE COMMISSION

An Open Competition will be held in 1950 for the Administrative Class of the Home Civil Service and the Administrative Class of the Northern Ireland Civil Service (Methods I and II), and for the Senior Branch of the Foreign Service (arrangements as for Method II). Age limits 20-25 on August 1, 1950, with extension for regular service in H.M. Forces, but certain candidates born on or after August 2, 1923, may be admitted at the Commissioners' discretion.

Regulations and particulars are obtainable on application (preferably by postcard) to the Secretary, Civil Service Commission, 6, Burlington Gardens, London, W.1. quoting No. 2700. The 1 date for the receipt of completed Application Forms is November 31, 1949 (for Administrative Class Method II and for Foreign Service) or January 31, 1950 (for Administrative Class Method I).

AN EXECUTIVE AND CHIEF RESEARCH OFFICER is required to organise and conduct a survey of the economics of the cotton-producing areas of Nigeria. Funds have been made available by the Nigeria Cocoa Marketing Board for a comprehensive and scientific survey and for adequate payment of staff stipends and expatriation allowances. Full particulars from Survey Committee, Agricultural Economics Research Institute, Parks Road, Oxford.

An Army for Germany?

THE problem of the part that Germany should play in its own defence has suddenly sprung to the surface of thought and discussion. President Truman and Mr Acheson gave the initial impetus by refusing to commit themselves to a permanent ban on the creation of a German army, and for a few days it looked almost as if Washington had such a plan in mind. This caused understandable alarm in western Europe; both in Britain and France official statements were issued denying that there is any intention to restore a German army. It is now announced that official American opinion regards a German army as "impracticable and undesirable" and to round off the sudden spate of discussion, the agreement concluded between the western Powers and western Germany contains a pledge on the part of the German Government to prevent the creation of armed forces of any sort in Germany.

It is natural that this speedy reaction of dissent should have followed the first public discussion of the issue. There is no doubt that most of the world would regard a restoration of German armed might as repugnant and disastrous.

In this century, when the Germans have had large armed forces, they have used them first of all to provide backing for diplomatic bullying and then for armed aggression. When they have been permitted to have only small forces, they have exercised their intelligence and duplicity in finding devices by which a small army could be used as the nucleus of a large army to come and in preparing for the day of rearmament. After the experience of 1914, of the interwar years and of 1939, can there be salvation in any other course save that of seeing the Germans have no army at all, large or small? It is almost inconceivable to propose within four years of victory that the engine of destruction which ravaged and occupied the Continent should now be permitted to revive, even if it claims to do so under entirely new management.

In Germany, too, a return to military preoccupations would have unfortunate results. It is not only outside western Germany that voices are raised against the pressure of the nationalists and the militarists. The Christian Democrats repudiate the idea of rearmament and Dr. Adenauer has said categorically: "We do not want a German army." It is these forces of peace and reason that should surely be supported by the Allies.

The revival of a German army would also raise an issue of more than European importance. Many of those in the United States who advocate the revival of German military might do so in the unexpressed belief that by such a move America's commitments in Europe could be reduced and finally liquidated. But if one thing is more certain than any other, it is that, in face of Russia's immense military preponderance, a strategic balance in western Europe can be maintained only if the United States is a permanent partner in European defence. If the United States were to stop putting real strength and determination

into its membership of the Atlantic Pact, in the mistaken belief that Europe, now reinforced by its former conqueror and gaoler, could stand alone, either of two results—both disastrous—would follow: the actual gain in military strength offered by a German army would be insufficient to offset the immeasurable psychological effect of an American withdrawal, in which case the Russians might be tempted to aggression; or the German contribution would be so overwhelmingly strong that the Germans would become, in effect, the military masters of Europe and might then attempt to lead the European coalition into a war to remove the Oder-Neisse line, Europe's permanent festering *casus belli*.

★

The arguments against the revival of a German army are thus irresistibly strong. But policy cannot be based simply upon arguments, however strong, of what is desirable. It must be rooted in the realities of the European situation. Germany is not a second Sweden or Switzerland, a sheltered area, preserved by remoteness or high mountain ranges from the direct threat of invasion. On the contrary, it lies directly along the fault line in international affairs, it is the inevitable area of any possible dispute between east and west. It is quite impossible to think of "neutralising" Germany or to believe that it can be left as a species of strategic vacuum.

Germany must therefore be defended. Indeed, it is in Germany that the defence of the west must begin, and that it might fatally end. This being so, it is impossible indefinitely to postpone the crucial question of who is to do the defending of Germany. It is inconceivable that the present western occupying powers should accept in perpetuity the burden of providing the whole defence themselves, even if they had united German good will and support in the attempt. But they will face, on the contrary, Germany's constant and increasing claims—as of right—to contribute to its own defence. At the moment, the memories of defeat and devastation are strong. They offset to some extent the sensitive nationalism which will sooner or later demand a measure of equality with other nations in western Europe. They even offset the fear of facing, unarmed and helpless, the risk of Russian aggression. But these conditions cannot last. The more Germany becomes a partner in western Europe, the more inequality will be found irksome. As the implications of western defence become clearer, such vital questions as the exact line in Europe to be defended—the line of the Elbe or the line of the Ruhr—will remind Germans of their intense vulnerability on the marches of Europe. From the resulting combination of pressures—Allied pressure to reduce the burden of defence, German pressure to take it on—only one result is conceivable, an Allied agreement to restore a German army and to entrust it with German defence.

★

This then is the dilemma. The restoration of an autonomous German army would be on every score politically disastrous. Events, on the other hand, if they continue to follow their present course, make it practically certain that the pressure to revive a Germany army will at some

point prove irresistible. The desirable and the practicable, as so often in politics, obstinately refuse to march in step. Fortunately, there is a way out of the dilemma. The danger of a revived German army lies primarily in its autonomy, in the freedom to shape events which undivided control over a military machine would place in the hands of some future, and possibly less well-intentioned, German government. If, however, the German contribution to defence took the form, not of a separate national army, but of the inclusion of German manpower in a European defence system in which the determination of policy were no longer in the hands of individual states but in a Council of European Defence, and if, in turn, this European force were working in closest alliance with the United States, the safeguard against the revival of German militarism should be sufficient to quieten Europe's legitimate fears.

Such a solution demands, it is true, a sufficient pooling of sovereignty in western Europe to make the new defence system a genuinely international body and the new army a really integrated force. Germany will not in the long run tolerate more "internationalisation" than its neighbours are prepared to accept for themselves and anything less than an international framework would restore a dangerous freedom of action to German arms. But the progress achieved under the Western Union Pact and the Atlantic Pact, although it falls far short of a genuine pooling of sovereignty and of an integration of forces on a completely international basis, nevertheless represents a greater advance along the road of union than has been achieved anywhere else. If the other countries of western Europe keep their national armies then it is quite inevitable that Germany will some day—and probably before long—have a national army of its own again. The way to prevent the creation of a new German army is not just to say that it is unthinkable, but to press on with the only possible alternative.

★

But perhaps the creation of an international army in western Europe is another instance where the desirable and the practicable conflict? Possibly; the task would certainly not be easy. But there are three solid grounds for hopefulness. The first is that it is precisely the defence aspect of Western Union for which there is the strongest support in the public opinions of western Europe. The second is that there is quite a body of practical experience in the pooling of armed forces, and in the creation of a supreme instance of political and strategic decision, to build on. The third is that the process of genuine integration is not likely to be hampered in the military sphere, as it would be in every other, by a great variety of entrenched economic and social interests which, by their very worthiness, would put up a stronger opposition the further the proposals went. If integration can be achieved anywhere, it is in the field of defence. To propose that there should be a German contribution to a general scheme of European defence does not, therefore, run counter to every trend in present policy. Nor does it presuppose conditions impossible of achievement. On the contrary, the need to solve the problem of German defence may prove the momentum necessary to make European defence a reality

Honour and Office

ON Monday last Mr Strachey, the Minister responsible for the Overseas Food Corporation, was subjected to a sustained and reasoned demand in the House of Commons for an inquiry into the conduct of the East African groundnut scheme. Mr Strachey steadfastly defended the actions of the Corporation, refused to accept any stricture on the conduct of its chairman, Sir Leslie Plummer, and declined point blank to consider the possibility of an independent inquiry. The past and future of the groundnut scheme have been discussed in these columns many times; and it is not proposed to argue the matter again here (although the questions arising out of the debate are dealt with in Notes of the Week on page 1170). What is worth considering is the propriety of Mr Strachey's personal behaviour.

The Minister of Food clearly considers himself to be a very ill-used man. He has convinced himself that since he is the originator of the groundnut scheme, he is also the only man who has the true interests of colonial development at heart. He has made it clear that he regards any criticism as inspired by partisan political motives or the malice of a capitalist press, and to be disregarded by a courageous minister. Is this political courage or political megalomania?

This can be settled by the facts, and the facts are not with Mr Strachey. During the past years there has been a mounting feeling of anxiety among informed people that the groundnut scheme was encountering unforeseen difficulties which would greatly reduce its value and prospects. On every occasion when these doubts have been expressed in Parliament they have been rebutted in the most scathing language by Mr Strachey. On November 2nd, the first report of the corporation revealed that anxiety about the scheme had been grounded on fact, that the commercial prospects for its future were, to say the least of it, dubious, and that in addition the internal accounting arrangements had been neglected. In fact the British public now has to resign itself to having expended a large amount of capital on a project which, if it ever succeeds at all, will certainly never succeed on the scale on which it was planned.

★

Mr Strachey, in fact, staked his reputation upon a gamble—a quite legitimate gamble—which has failed. He would have done a service both to the groundnut scheme and to his own reputation if he had resigned on the day the corporation's report was published. So far as concerns the scheme, Parliament and public would then have heard him with the respect that is always accorded to the man who will make a sacrifice for what he believes to be right. He could, before long, have returned with honour to an office requiring somewhat different qualities, or at least have retired to private life with a clear conscience. Many of the most eminent political careers have been assisted by the honest admission of failure or the courageous acceptance of ill fortune. Instead, the effect of rising public anxiety has merely been to stiffen Mr Strachey's determination to cling to office at all costs. Three days before last Monday's

debate, he dismissed from the corporation two of the directors, one of whom appears to have committed no other crime than that of being somewhat critical of the course of action pursued by the Minister and the corporation's chairman. On Monday he offered Parliament, together with much unabated optimism for the future, neither explanation nor apology for the past, ending in a blank wall of defiance. Mr Strachey permits the independent observer to draw only one conclusion, namely that he would rather cling to office even if it means performing every doubtful mental antic that a highly educated intellectual can devise, and stooping to the ignoble policy of shuffling blame on to subordinates.

The real thing to do (he said in Monday's debate) when you strike difficulties as we have struck them in this enterprise, is to examine your board and to see whether you have absolute confidence that it is the best instrument to do the job which faces it.

For a minister under attack, this is astonishing arrogance. It invites the retort that the first thing for a minister to do (or for his Prime Minister to do for him) is to examine himself, and in this instance particularly, to decide whether he possesses the necessary qualities for office.

★

Mr Strachey's position is of special importance since, like a growing number of his colleagues, he is responsible not only for a government department, but for a public corporation. It has become increasingly clear, as a result of the repeated efforts of Parliament to get at the truth about the groundnut scheme, that one man alone—the responsible Minister—has the means to probe at the right time into the efficiency of a nationalised board or public corporation. The House of Commons is too blunt an instrument for this purpose, and its Public Accounts Committee can take action only in the vanishing wake of events. The Minister is the only effective Inspector-General of a public enterprise and if he forgets his loyalty to Parliament and his duty to the nation, not only does he devalue his own reputation, but he destroys public confidence in the enterprise itself. If Ministers are to behave like this, they should reflect that the final

A recent series of six articles in THE ECONOMIST examined Britain's present economic ills and made suggestions for their cure. These articles are to be reprinted as a pamphlet under the title

A Policy for Efficiency

Copies of this pamphlet (at 3/- post free) can be obtained from:

THE ECONOMIST, 22, RYDER ST., LONDON, S.W.1.

result may be a limiting of their independence by hanging a millstone round their necks, in the shape of a constitutional device akin to the American congressional inquiry. There is everything to be said against such a process, but the freedom of action that a British minister at present enjoys can be maintained only if ministers remember to whom their loyalty is owed—that is neither to their colleagues nor to their party but to the public.

But the questions which are raised by the events of last weekend have a wider implication. One of the oddest features discernible in the present Government is its attitude to public office. When a man becomes a minister or a junior minister he becomes a very special kind of individual with great power and certain privileges but subject to the full glare of publicity. It is open to him to resume at will the status of a private member of Parliament or even of a private individual, and for a century it has been accepted that he should do so if one of three things happened: if he found himself in disagreement with his colleagues on a major matter; if by cupidity or folly—or even, sometimes, by misfortune—it could be held that there was the slightest tarnish on his personal honour; or if any public undertaking for which he held personal responsibility had manifestly failed. It could be held that it was one of the Prime Minister's main duties to safeguard the honour of his government and to enforce resignation where the conscience of a particular minister was sluggish.

Yet the curious paradox exists, that Mr Attlee, one of the most high-principled men ever to be Prime Minister, presides over a government in which these tenets have come to mean little or nothing. On issues of

In the early days, the Sun Fire Office used to provide each policy-holder with a special plaque or 'mark' bearing the number of his policy. This was affixed to the insured premises and in the event of fire, the Company's fire-fighters were authorised to extinguish the blaze only after the premises had been identified as being 'Sun Insured.'

Eventually, this practice was discontinued as Public Fire Brigades developed, but for more than two centuries the 'Sun' emblem has been recognised as the symbol of Service and Security to be sought wherever insurance is arranged.

Branches and Agencies throughout the World

policy, there has been only one resignation—and that of a very junior minister—during the whole four and a half years. This does not mean that there has been a heavenly harmony among ministers. There are and have been open disagreements upon issues of principle and policy which some ministers are only too ready to air. But no minister has felt impelled to forgo the charms of office for the sake of his personal integrity. This can only mean either that ministers feel more strongly about being Ministers of the Crown than about being thought honest, or that they are terrified of presenting a disunited front to the opposition—a curious state of affairs in a government with a large majority and a well-filled reservoir of unused talent among its younger men. This attitude to resignation has had the effect of reducing the Cabinet at each crisis to the status of a coalition, working only to a common factor of agreement that satisfies a number of powerful but dissentient men—and thereby producing only the shadow of a policy.

On the issue of personal integrity, the Government seems to have joined in a conspiracy to pretend that personal morality is irrelevant to politics. Only the junior minister directly implicated by the Lynskey tribunal felt impelled to quit public life, although it uncovered a remarkably low standard of behaviour on the part of other ministers. Last week a junior minister was fined in connection with some piece of minor company malpractice and in greater and lesser degree there have been other examples. It is true that Mr Dalton resigned immediately upon committing a budget indiscretion—in conformity with a tradition evolved in sterner times which still has force because the previous instance had occurred only a decade earlier. Yet Mr Dalton has been back in office for over a year.

If the Labour Party is beaten at the polls, they must reflect that the electorate's judgment will be pronounced as much upon their performance as men as upon the correctness of Socialist theory.

By way of antithesis, it is instructive to look at two examples of what may be called the Victorian standard of conduct. In 1845 Mr Gladstone had just achieved office as the President of the Board of Trade. He resigned from Peel's Cabinet on the question of giving a small grant to the Catholic College at Maynooth, not because he believed it wrong—indeed, he supported it—but because he had, as a private individual, written against such grants some years earlier, and was unwilling that anyone should believe him capable of changing his mind simply in order to stay in office. Forty-one years later and on the opposite side of politics, Mr W. H. Smith, builder of the great business, was made Chief Secretary for Ireland on January 23, 1886. He immediately caused his company to sell outright their business in Ireland. On January 26th the Government fell, a fact which he knew to be almost certain on the 24th. It may be said that those are examples of conscientious scruple, absurd by any standard in any century. But the fact remains that one of the greatest services of the Victorians, apart from cleaning up the Civil Service, was to rescue politics from the corruption which had previously haunted it, and set British political standards upon a level which has done as much as any display of economic strength to maintain Britain's strength and prestige.

Delhi and the Future

IT has been given to few men to undergo the tremendous reception which greeted Pandit Nehru in the United States. And certainly no Asian statesman ever went to Washington in the unique circumstances which surrounded this recent visit of India's Prime Minister. During this tour Mr Nehru lived up to the part in which he had cast himself—the modest, charming and, indeed, saintly intellectual which is one side of his character. But he also impressed Americans as the forward looking statesman who knows that, if his country is to prosper, it needs foreign economic assistance. They, for their part, also appreciate, from experience gained with the Marshall plan in Europe, that the conditions attached to any foreign aid must not be such as would undermine a country's own government.

The United States is the only source from which aid and investment can come on a sufficient scale to do any good in Asia. It is, therefore, peculiarly fortunate for India that a feature of the last few months has been the growing American interest in providing just that economic help which is required—in order to fight the creeping paralysis of Communism. It is true that the American idea is to assist several countries of Asia at once; but India is both the largest and the most important country that could be affected. Indeed, it is probably the key to the whole position. The chances of success of the main operation, therefore, depend on the results it is likely to achieve in the Indian economy, and the steps which Delhi itself may take to pull that economy out of its present serious difficulties. Sardar Patel, the Deputy Prime Minister, broadcasting on Pandit Nehru's sixtieth birthday, recently recognised these difficulties. He virtually declared a state of economic emergency and appealed to Indians to save more, to spend less and to invest in their country's future—or risk a further lowering of living standards.

Broadly, the dilemma that faces Mr Nehru and his colleagues in Delhi is that India's importing capacity is limited to what can be paid for by exports, borrowed, or drawn out of the sterling balances. One pressure is to use more and more of this limited capacity to bring in foodstuffs, to ward off the risk that a remorselessly rising population may lower the existing low standard of living. But the standard of living must be raised if the present Government and the possibility of moderate non-Communist government in India are to survive. The only permanent way of achieving this is through capital development, which sets up a contrary pressure to import capital goods. Quite a lot of Indian thought is obscured by the belief, based on Soviet achievements, that there is some way in which a poor country can dodge this dilemma and raise itself by its own bootstraps. But the Soviets obtained their capital by starving their people, which is unthinkable in India. For India, the conclusion is inexorable. The only way to avoid the cruel choice between grain and generators—the one essential for the standard of living today, the other no less imperative for the same standard in the future—is to borrow large sums abroad. Nor, indeed, can outside aid, however generous, achieve all that it might if the

country's internal economy continues to grind along at its present pace.

By far the biggest single factor throttling the Indian economy, and one moreover which it lies within Delhi's power to loosen, is the excessive cost of government. Inordinate official spending has lifted taxation to the point where it absorbs, perhaps, something like a fifth of the national income, which is very high for a country with India's relatively low standard of living. In the Provinces particularly, expenditure has been allowed to increase when revenue was decreasing, with the result that innumerable additional indirect taxes have recently been imposed on essential commodities. In the field of central expenditure, defence costs in particular have soared—largely because of the war atmosphere engendered by the Kashmir deadlock—until the military outlay now amounts to the fantastic figure of nearly half the budget. In India, as in Britain or anywhere else, heavy taxation is inflationary because it increases costs; if Indian production is to recover, this process will need to stop.

There are two possible lines on which India might immediately attack current expenditure. The first would be to reorganise and reduce the milling crowd of bureaucrats, who have multiplied profusely since the transfer of power; it would probably pay Delhi to cut them by a third. The second is to slash defence expenditure, if only to a level proportionate to that of European budgets for which, of course, a settlement of the Kashmir dispute is imperative. The fifty per cent of the Indian budget that is to be spent on defence next year compares with some 34 per cent of the American and 23 per cent of the British. There is no call whatever for such expenditure unless Delhi means to use its forces against Pakistan—which Mr Nehru has flatly denied; in any case the Indian army will remain largely dependent on foreign arms until a more varied home industry has been built up.

A great number of India's capital projects are designed to raise agricultural production, by irrigation, by the use of better equipment and by other means. But here Delhi's basic dilemma—a perpetual struggle between current and future needs—comes in again. The need to prevent the people starving must be set against the Government's understandable desire, on purely political as well as other grounds, to build up some promise of future improvement through capital development. And it is in the scope of such investment that the Government of India must unfortunately make its other great economy. Dr Matthai, the Finance Minister, is to be congratulated on measures which he has taken both before and since devaluation to see that new capital projects are reviewed again and again. It has, indeed, been no mean achievement to reduce capital expenditure by Rs 40 crores (£30 million) in this year's central budget, as he has just undertaken to do. But many of these cuts are only in theoretical future spending, and both in Delhi and the Provinces, the national economy is already burdened with a vast miscellany of projects, some of them already started, some of them just about to start, which far outrun any genuine resources likely to be available in India for many years to come. This problem arose from the mass of unco-

ordinated and often irresponsible planning, which took place on the morrow of independence. What is needed, now that the honeymoon is over, is a pause to give the Government time to reconsider the whole network of development schemes, to compile a detailed and comprehensive statement, listing the varieties, volumes and costs of all the raw materials required, both imported and home produced. In any case, nothing less will satisfy the Americans if they decide to help with India's capital development.

Reduction of the cost of government, the stepping up of food production, and limitation of capital spending to the resources available are all essential preliminaries. But it is also necessary to raise the output of Indian industry. Delhi, like London, is out of breath from exhorting business men and workers to go to it—without any apparent success. Some facts about the decline in the performance of Indian industry have been provided by the Tata Iron and Steel Works at Jamshedpur. It has been reckoned that a Tata employee was earning in 1949 twice what he got in 1939, but was producing one third less: to enable him to do this the consumer had to pay three times more for his steel. Gloomy statistics such as these emphasise both the lack of incentive to the workman—his doubled wage buys 30 per cent less than in 1939—and the boost being given to inflation. But there is also the business man's viewpoint, and it is here that Delhi could really strike at the problem.

The capital market in India has been dead for months. Its state is the direct result of the widespread lack of confidence which still exists in the Government's intentions. This goes back to the Socialist-Radical attitude adopted by Congress in the months following independence, when every sort of nationalisation cry went up. And although, ever since Mr Nehru's calming speech at Lucknow early this year, confidence has begun to return, it is still very frightened of the dark. India, however, cannot afford

these doubts, any more than it can afford excessive cost of government. It would seem to be in Delhi's political as well as economic interest to put them to rest by finally recanting its early unsettling pronouncements on industrial control, profit sharing and so on.

★

At present, the future of India's balance of payments is in suspense, as a result of the jute war with Pakistan. But the moment this is settled—as settled it must be—a considered plan should be drawn up to cover the proportions of food, capital and consumer goods to be imported over a definite period. No man can predict exactly what India's foreign earnings will be; but, once a coherent plan for internal capital development is established, it should be possible to determine the proportion at least of each type of import. The need for this is all the greater in that the margin of earnings has grown smaller as the terms of trade have been turning against India. In 1939, one ton of imported food was paid for by exporting a quarter of a ton of jute or 100 lb. of tea; today a third of a ton of jute or 300 lb. of tea are required.

India's own resources are at present insufficient both to feed its people and to improve their standard of living at a satisfactory rate. Yet if it is not raised, India will be incapable of exercising to the full that leading role in South East Asia to which its population and prestige entitle it. Equally, the aid which may yet become available from the New World will either not be granted as freely as it might or else will be partly wasted. Any giver is bound to look closely at the efforts made by the person he is going to help. Mr Nehru's visit to Washington has enlivened hopes not only for India, but for all South East Asia. It is up to India's own economists and politicians to see that they, at least, do all they can to increase the potential value of any aid which their own country may receive.

Dilemma or Challenge?

(By a Correspondent)

IT has become almost impossible these days to discuss the method and technique of colonial development without referring to the colonial dilemma. Indeed, even development itself is sometimes queried as posing a dilemma: here, on the one hand, are Britain's need for non-dollar foodstuffs and raw materials, and large untapped sources of supply in the colonies; here, on the other, are colonial peoples who cannot be forced to change their way of life in the interests of development, but must be persuaded and educated to do so, a process that will take far longer than Britain's balance of payments crisis will allow.

But does the dilemma really exist? It is a defeatist word, implying that there is no shade of grey between black and white and that policy has to be based on one extreme or another. One so-called dilemma, for instance, is that policy must be guided either by the technician or by the administrator and that neither is wholly suited to the task. Now, what those who plead this dilemma in the interests of the administrator really mean is that social questions cannot be ignored when any course of action is decided upon. If we ride roughshod over traditional ways, if we neglect local values and local methods, we

come right up against a wall of resistance. The people may be sullen and passive, or they may riot, or they may indulge in unhealthy ritual or religious fanaticism. But it does not follow that, because this will happen, the administrator should be favoured rather than the technician. Indeed, if such symptoms are treated as simply political, as being appropriately dealt with by elections, local legislatures and, in the last resort, by police action, the result may be far more harmful than if they are neglected by technicians and economists. It is not, therefore, a dilemma of administrator versus technician. It is a question of how far sociologists and anthropologists can give advice on the social consequences of a technical reform and suggest ways of building up modern methods of production that are based on local, not European, values.

Consideration of this problem leads to a second dilemma. On the one hand, local opinion appears to be irremovably resistant; on the other the need for change appears to be infinitely pressing. Here, again, the real problem is to decide how much change is practicable and desirable and how it can be brought about more quickly. Too often, native inhabitants are expected to adjust

themselves to western-conceived groundnut schemes. Not often enough are western plans adapted to fit the human resources which are both the justification of the schemes and their primary raw material. The real factors which enter into competition tend to be forgotten; for instance, that the competitive uses of labour are not solely alternative industries run on western capital, but village production in village surroundings. Money, in the colonies as elsewhere, is not the only thing that counts. Feasting, home life, the calm tempo of gossip—all these are important and must be used, not ignored.

Indeed, the speed of change depends more than anything else upon the ability to adapt ideas and plans to use these real incentives. Sometimes, the dilemma is put in the form that either we must destroy native culture and progress on a new, individualistic basis, or else we must retain native culture and be content not to develop. Again the dilemma is unreal. In no case is it possible to destroy native culture completely—unless all its adherents are killed off or turned into maniacs; while they live, they retain a memory of the past, and their habits cannot entirely be broken. Even education has its limits—for the state is never the sole educator.

★

If more concrete matters are considered, we are still haunted by this habit of creating dilemmas. One of the most heatedly discussed, in the colonies, is that local officials are unable to discharge all their new tasks without overseas help, but that if the provision of external aid brings with it more control by the Colonial Office, it results in mistakes due to ignorance of local conditions or to the crushing weight of bureaucracy. Once again the way out is shown by defining the problem more exactly. How can the maximum expert aid be obtained with the minimum outside interference, the maximum local knowledge with the minimum local inertia?

One possibility is the building up of a special band of highly trained research workers for service in many colonies, who would stay on particular problems in particular colonies for a minimum tour of a year or more. Such a scheme, of mobile shock-workers if you like, might obviate the present tendency for workers in the colonies to lose contact with stimulus from outside, yet give them sufficient time in those colonies to avoid the evils of rushed six-week commissions of inquiry. The research workers at present employed under the Colonial Research Council represent a nucleus; but their appointments will have to be made more permanent if recruitment is to be encouraged.

Another possibility worth investigating is that of cutting down to the minimum the number of reports and despatches submitted by colonial governments to the Secretary of State and replacing them by consultations with the Secretary of State's representative sent to the colony for the purpose. There are already signs, in the frequent movement of Ministers to the colonies, that such a scheme is accepted in practice. But what the colonies often need is something more than consultation with Governors. They often need jolly along; and a modification of the French system of colonial inspectors, to find out what is being done by all ranks of the hierarchy including the lowest, would have much to recommend it.

Another so-called dilemma is that immediate large-scale production from the colonies is needed, yet this is

opposed to the natives' permanent interests, which lie in small-scale peasant production. This dilemma depends on the truth of the statement that a large-scale organisation cannot make use of small-scale units. Nothing could be further from the truth. Production may be in peasant units; but large-scale operations can take place by peasant co-operation, for instance in ploughing. Smallholders may be provided on a large scale with inspection and services, marketing, capital, and the like, by corporations as huge and imaginative, or unimaginative, as you like to make them. The sugar industry of Fiji provides one example; it has been said that a major fault of Malayan policy has been the failure to incorporate the peasant in a wider framework of technical and marketing assistance; and the Maori of New Zealand has shown that tribal lands can either be split into peasant holdings or can be worked as estates with the individual as co-operating shareholder. There are infinite gradations between groundnut scheme and shifting cultivator; and the most certain way to failure is to organise development whether privately, co-operatively, or nationally, along preconceived western lines.

The need for the imaginative use of local knowledge, of the views of the man on the spot, rather than preconceived western ideas, is clearly illustrated in colonial trade. Material benefits are not the only incentive that should find a place in colonial development, but they are always important. The trouble is that Britain has never seriously tried to find out what these incentives should be. Does Britain really know what the colonies want to buy? And even if it knew could it sell cheaply enough? If its prices are too high for the United States, how can it sell in the colonies?

★

There are three major kinds of colonial market. The first is the market for industrial capital equipment. Here in its chosen field Britain can hold its own. But this market depends upon the availability of resources, and particularly labour, to operate the equipment. Before long, the native demand for new avenues of employment will be satisfied, at least until new incentives and methods of organisation are devised. It is a gamble building hydro-electric power stations if it is not known whether natives will engage in secondary industry. This first market depends in the long run, at least in part, upon the production of the right kind of incentive goods; in the end, of course, it may contribute towards that production—at the expense of British sales.

The second kind of market is for European consumption goods. This is reasonably well supplied in the colonies, though even here there are defects. Networks of colonial agencies often raise the price of goods, and it is cheaper to import the article individually from England; but some firms refuse to allow this in order to protect their agents. Some articles are quite unobtainable. Where, for instance, can a portable non-electric refrigerator be found? Or the water-proof map-case? Or the cheap movie camera? "Britain can make it" runs the slogan—but too often Britain does no such thing.

The third kind of market is by far the most important and most difficult to meet. Native incentive goods must be cheap, impossibly cheap to the present-day English manufacturer. From this point of view the alternative possibilities of inter-colonial trade have not yet been

examined properly. Trade between the West Indies and West Africa; between East Africa and Indonesia; between Malta and Malaya—are these fantastic suggestions? Or might there be possibilities here both of encouraging new colonial industries and of meeting colonial demands?

There is no doubt that there is a pressing need for bold, and perhaps costly, experiment in colonial trade. We read of the enterprise of the British jewellery trade in conducting its flying survey of the possibilities of adapting designs to meet the demand of backward areas. It is to be hoped that the survey will be followed by more intensive studies of particular areas. For jewellery has a chequered history as an introduced commodity; used by natives to a considerable extent in ceremonial barter, it depreciates very rapidly if the supply is inflated, especially if it is regarded as a cheap substitute for the indigenous "genuine" thing. This was the case with the mass introduction of dogs' teeth as ornaments in certain parts of Oceania.

NOTES OF THE WEEK

New Front on Insurance

The decision of the National Executive Committee of the Labour Party to drop their plans for nationalising industrial assurance in favour of an ill-defined scheme for mutual ownership by policy-holders is undoubtedly based largely on electoral necessity. It is a sign that, for once, the leaders of the Labour Party have realised the greater importance of not offending the middle-of-the-road voter rather than of whipping up the enthusiasm of their devoted followers.

The division of opinion among the Labour leaders on this issue was not the usual split between Mr Bevan's left wing and the more moderate elements, but rather between Mr James Griffiths, the Minister of National Insurance, who wanted to take over industrial assurance to round off the full recommendations of the Beveridge report and those, like Mr Herbert Morrison, who were acutely aware of the political dangers involved. Their nightmare was of the armies of insurance collectors being transformed over night into anti-Labour canvassers. This view was reinforced by the Co-operatives, who wanted to retain control of their own insurance business, and at the last moment by Sir Stafford Cripps, who is reported to have expressed alarm about the effect that nationalisation might have on foreign confidence in British insurance and therefore on its earnings abroad, particularly in the dollar area.

Just how the new formula would be translated into action is not clear. The Labour Party statement defined the new policy as one in which "the proprietary companies in the field of industrial assurance will be owned by the policy-holders themselves instead of by private shareholders." This would leave the structure of the Co-operative Insurance Society virtually unaltered, but it would presumably mean divorcing the industrial assurance business of the big companies from their other activities, a step unlikely to produce economies of staff or greater efficiency. It is doubtful whether it would give policy-holders any greater control over the companies than the shareholders ever possessed, and it is also unlikely to mean greater financial benefits for them since the bulk of life assurance profits are already returned to the policy-holders. The mutual society is well adapted to the business of life assurance, where the customers naturally provide the capital of the business. But there are very few, if any, other industries where it can be expected to work well.

There is also some talk of a Government board to exercise surveillance of the huge investment side of insurance business. This idea should be choked at birth, for it would

It is to be hoped, too, that other trades will consider their opportunities. Cheap radios, children's toys, and books in the vernacular are difficult but possibly remunerative lines of development, and there are many others. The fundamental principle to be observed is to avoid swamping the market with one or two limited lines, however cheap, and instead to increase the variety and range of products. The so-called unresponsiveness of the native to incentive goods, his so-called idleness, is often no more than a reflection of the unimaginativeness of sellers who forget that anyone, of whatever race, will soon tire of working if he has more than attained his rewards of scent and tobacco and cotton singlets—after all, there are limits to the consumption of these.

The difficulties of colonial development are a challenge to anyone with imagination, who is willing to cast aside old limited methods and prepared to define new ideas with native values as their basis. Who will take it up?

involve nothing less than the divorce of those who make decisions from those who must bear responsibility for them.

TUC Takes the Plunge

The TUC, which has laboured so long and so painfully, has at last adopted a sensible and courageous attitude in the report of its Economic Committee, which was this week endorsed by the full General Council, with only two dissentients. It calls on all unions to adopt a voluntary wages standstill until January 1, 1951, and to waive sliding scale wage arrangements in the unions where these exist. It is, of course, a conditional policy—conditional upon the Government's control of the cost of living. The standstill agreement, it is proposed, should be abandoned if the retail price index moves up or down six points from its present level of 112. There is also a proviso that exceptions may have to be made for the lower-paid workers. This is, perhaps, the weakest part of the document, since many unions may seek to justify wage claims on the ground that they have a large proportion of underpaid workers. No attempt is made to define "lower-paid workers" for the reason that it could be construed as advocacy of a national minimum wage. The council is also emphatic that there shall be no interference with the freedom of collective bargaining.

The report also theoretically admits the need to relate earnings to output, by giving its official blessing to systems of payment by result and by proposing special incentive schemes to help the lower-paid workers. But past history has shown that it is inclined to underestimate incentives as a means of securing greater output or attracting workers to export industries. Moreover, it gives no hint of how it intends to reconcile the abandonment of mobility in wages with the need to increase the mobility of labour.

It is, however, right to recognise that the General Council has moved a long way and conceded a great many points in its attempt to conform to the needs of the economic situation. The policy accepts the fact that devaluation inevitably involves a fall in real wages as in the living standards of the rest of the community. Many critics on the left will no doubt accuse Mr Tewson and his colleagues of abandoning the sacred rights of trade unionism—the freedom to negotiate the best possible wages and conditions for their members regardless of all other considerations. But the TUC will have the support of the rest of the nation.

The General Council emphasises that it cannot dictate policy to its affiliated unions, but can only guide and advise. Here, of course, is the rub, the fundamental obstacle to any fully planned wages or industrial policy. Some unions, notably in the iron and steel and boot and shoe industries, have already anticipated the General Council for forgoing their claims. The Confederation of Shipbuilding and Engineering Trade Unions, however, is still determined to press for its £1 a week. The building operatives, while they have agreed to drop their demands for shorter hours and higher pay, are, understandably enough, unwilling to drop their sliding scale arrangement. The railwaymen are about to start pressing again for more wages for their lower-paid men. The proposed meeting with unions which have sliding scale arrangements and the conference of trade union executives in January will show how far in fact the unions are prepared to accept the advice of their leaders.

Turbulence in the Air

When a KLM airliner crashed at Prestwick in October, 1948, the Minister of Civil Aviation appointed a court of inquiry under an eminent lawyer, Mr T. P. McDonald, K.C., to produce a report and presumably to apportion responsibility for the disaster. The ensuing report was published on Tuesday. Simultaneously Mr McDonald released to the press a letter to him from the Minister, Lord Pakenham, which expressed concern at the implication in the report "that members of the air traffic control staff or meteorological services indirectly bore some measure of responsibility for the accident." It went on to say that he and the Secretary for Air had concluded that the pilot's mistake could not have been influenced by their staffs, and that he proposed to publish what was tantamount to a dissenting opinion to the report, in the interests of protecting the staffs involved. Mr McDonald replied with unassailable logic that if the two Ministers had some evidence to support their view why in thunder had they not produced it before his court of inquiry.

As neither you nor the Secretary of State for Air were present in the aircraft at the time of the pilot's decision, there can be no other relevant basis in fact for such an attitude which, if I may respectfully say so, renders the whole procedure of impartial public inquiry nugatory, if not indeed indecently farcical. It is plain to me that the purpose of this statement is to impute, without evidence, sole responsibility to a dead man, a pilot of unblemished record and unrivalled experience.

Further questioning of Lord Pakenham's Parliamentary Secretary in the House of Commons revealed what was implicit in the correspondence—that Lord Pakenham for some reason or other found the findings of the court extremely unwelcome. It is not yet known what inspired this distaste, whether it arose from a human impulse that civil servants should not be publicly blamed when they could not publicly defend themselves, or perhaps with a less altruistic eye to possible future legal proceedings.

Whatever the reason, Lord Pakenham's actions—like Mr Strachey's in another connection—have shown what happens when a Minister's loyalty to his department outweighs his loyalty to the legislature and the public. No quasi-judicial body such as this court will command any respect (and for commercial reasons it is of the utmost importance that accident inquiries should be respected) if its findings are not as binding upon the Ministry and the Minister who set it up as upon the other interests concerned. It may be that such inquiries will have to be given a fully judicial character—being organised for instance from a separate department under the Lord Chancellor.

The Petersberg Agreements

The agreements reached at Petersberg between the three Allied High Commissioners and the German Chancellor

mark an important step forward in the task, accepted as a "primary objective" by the three occupying powers, of incorporating "the Federal Republic as a peaceful member of the European community." For the first time, in the long negotiations between Germany and its occupiers, the Germans have spoken with a voice of real responsibility and have been treated virtually as an equal by the other powers. This enhancement of Germany's status is explicitly recognised in the communiqué issued as a result of the discussions.

The Germans are to be granted commercial and consular representation abroad; the three powers will promote Germany's "participation in all those international organisations through which German experience and support can contribute to the general welfare." In particular, they recommend that Germany should be "promptly admitted" to the Council of Europe. The question of the continuing state of war between Germany and the western powers was also considered, but is referred back for further study. The Allies regard its ending as "consistent with the spirit" of the new agreements, but many nations are involved in the problem—including the whole British Commonwealth—and further negotiations are necessary.

In return for these political concessions the German Chancellor has associated his government with the need to create a general sense of security in Europe. He has offered to apply for full membership of the Ruhr Authority—hitherto Germany has been represented by an observer only. Moreover, he has promised his government's full collaboration with the Military Security Board in order to check the remilitarisation of Germany. It is true that this important pledge has been to some extent weakened by the concurrent reports of support in certain American circles for a revived German Army, but the German Chancellor went so far as to undertake that his government would "endeavour by all means in its power to prevent the re-creation of armed forces of any kind."

All in all, the political provisions of the new agreements undoubtedly confirm Germany's new status and amply justify Mr Bevin's initiative in calling a special conference to reconsider allied policy towards it.

Next Stage in Dismantling

The economic clauses of the Petersberg agreements lack the precision of the political decisions. Permission has been given to the Germans to build ocean going ships up to the present level of size, and in 1950 six ships even beyond this limit are to be permitted. But restrictions remain on the building of ships both for home use and for export. The main economic issue was, naturally, that of dismantling and here, too, the picture remains confused. Eleven synthetic oil and rubber plants have been reprieved and seven steel plants, including the hotly contested August Thyssen Hütte at Hamborn. Dismantling is also to cease in Berlin and in the I.G. Farben works at Ludwigshafen. Some compensation will be offered to the western powers represented in the Inter-Allied Reparations Agency. But the concessions add up to the virtual ending of dismantlement and the year's battle has now been decided—in Germany's favour.

The savour has, however, been largely removed from the victory—and the Allied gesture thus deprived of much of its effectiveness—by the fact that the provisions governing the level of German industry are apparently to remain as they are. The decision to leave Germany with more steel capacity has not been accompanied by any permission to let it produce more steel. On the contrary, the present limit on the German production of steel—11.1 million tons a year—is specifically reaffirmed. The Germans cannot fail to feel that this contradiction considerably reduces the value of the concession that has been made. The chance to pursue a

courageous policy—for instance, to scrap this last remnant of the Potsdam approach and to transfer the whole question of European steel output either to the arbitration of competition or to agreement within the Organisation for European Economic Co-operation—has been allowed to slip. The battle against dismantlement will now in all probability be followed by the fight against the limit on steel production. The psychological gain will be lost, even though the concession of a higher level must be now only a matter of time.

* * *

Red Danube

Last week, at Galatz, the Russians set their seal on their domination of the Danube, and completed the turning upside down of the inter-war regime in which they had no part or lot. By reannexing Bessarabia during the war they once more gained a foothold on the banks of the Danube; and fifteen months ago at the Belgrade conference the western powers were forced to retreat before the blasts of Mr Vyshinsky's eloquence. Wielding the automatic majority of subservient satellites, he was able to set up a new Danube commission composed entirely of riparian states. The western powers can now only fulminate from afar, and place on record both their indignant refusal to recognise the new regime and their pious hope that sometime there will be a new convention which "effectively promotes non-discriminatory, constructive utilisation of the Danube."

The elimination of all the non-riparian states formerly interested in a freely navigable river has left only the Yugoslavs to oppose Soviet views on the exploitation of the Danube. Since over half its middle course flows through Yugoslavia, even the ingenuity of the Russians cannot hit on a formula which excludes the Yugoslavs but includes both themselves and the Ukrainians. But at this first meeting of the new commission they have succeeded in stripping Yugoslav participation of everything except its nuisance value. Not only was the Yugoslav delegate excluded from all official positions, but the Soviet delegate—at his own suggestion—was given complete control over the management of the commission, including the right to appoint, organise, and direct the members of the secretariat. The Yugoslav opposition to all this, although stubborn, was just as ineffective as had been the western opposition at Belgrade.

Soviet domination of the river was, of course, already firmly established. Under the Austrian peace treaty the Russians will retain the assets of the Danube Shipping Company, which they have already seized; and they have secured control over the Danubian fleets and port facilities of Rumania and Hungary through joint companies in which they have a controlling voice. (The similar Soviet-Yugoslav company was terminated last August.) So long as the quarrel with Tito continues to rage they will continue to use their grip on the Danube to tighten the economic blockade against him. This has already reduced traffic on the river to a mere trickle, although the avowed purpose of the Belgrade convention was to increase it.

Scapegoats

The wider principle involved in Mr Strachey's attitude towards the East African groundnuts scheme is discussed in a leading article on page 1163. Here it need only be said that, whatever the merits or demerits of Mr Wakefield and Mr Rosa as members of the board of the Overseas Food Corporation, Mr Strachey's dismissal of them on the eve of this week's debate can only be regarded as an attempt to find scapegoats to hide his own and Sir Leslie Plummer's responsibility for the sorry state in which the groundnuts scheme now finds itself. Mr Rosa was the director in charge of

finance; he had, therefore, a special responsibility for the auditor's reservations on the accounts. But the signature of Sir Leslie Plummer, the chairman, appears on the balance sheet above his own—here, surely, responsibility should have been joint. As Mr Wilson Harris said, in a short but telling speech in the debate, the "national sense of fair play has been very gravely affronted" by Sir Leslie's remaining in office.

It may be that the appointment of Sir Donald Perrott of the Ministry of Food and of Sir Eric Coates, financial adviser in Germany, in the place of the dismissed directors, will strengthen the board of the corporation—though it means that the number of men with expert knowledge of the colonies is now reduced to one full-time and one part-time member. But nothing that they can do will restore confidence in the board on the part of its employees in East Africa—to whom tribute was again justly paid in the debate—and of the public as a whole so long as Sir Leslie Plummer remains on it. It was, however, a tactical blunder for the Opposition to have concentrated their attack on him instead of on Mr Strachey, whose ultimate responsibility is greater. For by so doing they provoked another advocate in his defence in the Colonial Secretary Mr Creech Jones, who was thereby placed in the unhappy position of having to side against Mr Wakefield and Mr Rosa, previously two of his servants. Sir Leslie Plummer is now able to say that two Ministers have publicly declared their confidence in him. Why, therefore, should he resign? To which the reply is that the value of the testimonial depends upon its source.

* * *

Groundnuts' Past and Future

Personal issues played such a large part in the debate that many questions went unanswered, and others unasked. Mr Strachey made a lengthy defence of the validity of the original conception—which was not in question and never has been. But he did not explain such astonishing revelations in the corporation's report as that more money has been spent on office furniture and equipment in East Africa than on the total cost of developing the corporation's successful scheme in Queensland.

Again, Mr Strachey indignantly declared that so far from there being nothing to show for the £23 million spent to the end of last March, there were "railways, ports, roads, towns, villages, water supplies, hospitals, training colleges and tractor fleets" as well as 100,000 acres of cleared land to show for it. The colonial development by-products of the corporation are indeed impressive, though nothing like so grandiose as Mr Strachey made out—as witness the fact that the amount recoverable from the East African Railways and Harbours for the new harbour and railway lines which they are to take over is estimated in the balance sheet at less than £1,000,000. The point is that most of these assets will be worthless if there is no profitable production to maintain them.

Whether this can be achieved is still far from certain. Mr Strachey gave details of the programme of development up to 1954, the first programme, it is worth pointing out, to have been evolved by the management on the spot in Tanganyika. This will give a total clearance of 600,000 acres by 1954 and is obviously much more realistic than anything yet put forward (again one asks why Mr Strachey last March gave an acreage of 2,000,000 as being possible and did not withdraw it in the debate at the end of July?). He did, however admit that a capital reconstruction will be necessary—in other words that the corporation will default on its advances. Before this happens there should be a writing down of the huge administrative machine to a scale more in keeping with the reduced agricultural programme.

Abuse and the Press

When a Minister of the Crown is heard condemning the British press in the sweeping and vituperative terms recently used by Mr Bevan and Dr Dalton, one wonders what all the public relations officers in Whitehall are for. If inaccurate statements are made about a department or a nationalised industry in a newspaper or periodical the public relations officer has both the duty and the opportunity to reply on behalf of his Minister or board. If the editor concerned refuses to publish the reply, the Minister or board can issue the reply for general use and information; it can certainly be made to reach the public through one channel or another. The balance of power between Whitehall and Fleet Street is in fact not nearly so unequal as some Ministers and Members of Parliament pretend, more particularly since the public can check Fleet Street's presentation of the news against the BBC's. Indeed, the most obvious present difficulty is for the press to secure redress or apology for statements by politicians which vilify indiscriminately all organs of opinion and news. Even the direct pressure of the Royal Commission on the Press was insufficient to procure from Mr Bevan any justification of his taunt that the British press is the most prostituted in the world.

It is surely time that the daily press at least gave some thought to the representation of its interest and good name before the public. It did not come out of the Royal Commission's inquiry as scot-free as some newspapers have claimed. If the accusations that led to that inquiry had been framed with more moderation and accuracy, some of the evidence printed in the appendices of the Royal Commission's report would have seemed—to a less expectant public—quite disturbing and ludicrous enough. There have been several cases since then in which reporters or editors appear to have offended by sensationalism or inaccuracy; and it is quite intolerable that each case should start a public altercation in which abusive generalisation on both sides leaves the customers of the press bewildered and no one satisfied. The Commission's proposal of a Press Council should either be accepted by the press, or convincing reasons given against it, before the press has torn from it during the election campaign any more of the reputation which was patched up by the Royal Commission.

It is a sign of the times that the Speaker of the House of Commons should have found it necessary on Tuesday—at the prompting of Lord Winterton—to remind Members that there is no Minister responsible for the press. He has had to rule that the press must not be indirectly attacked by Members who ask a question about allegations made in a newspaper and then follow it up by suggesting a ministerial inquiry into the newspaper's grounds for making the allegations. Members, he said, "cannot quote what a newspaper says. They must take the responsibility themselves."

* * *

The Shah in the States

The Shah of Persia is having no difficulty in winning hearts in America. He is a handsome young man with one of the most romantic titles in the world. To these advantages he has now added a series of heart-warming speeches. Persia, he says, needs United States military and economic aid in order to preserve its security and to make its "contribution to a peaceful world order." These statements are being widely interpreted as proof that Persia is now as steadfastly determined as Turkey to line up with the western Powers. Is this so?

Certainly the Shah wants it. So does the able and forceful head of his National Bank, Mr Ebtehaj. So do many of his present cabinet, and the army is personally loyal to the Shah. So did Mr Hazhir, his minister of court or permanent cabinet representative, who was murdered while at prayer three weeks ago. But there exists among educated Persians a considerable body of opinion which, without being

pro-Russian to the extent of following the Moscow party line, argues that America is far away, that Russia is an immediate and powerful neighbour with whom trade is useful and whom it would be imprudent to flout, and that to plump ostentatiously for one side in the cold war is a course that had best be avoided. The voice of this group is seldom heard in politics except when the clever veteran Qarwames Saltaneh is in power. But its reasoning is logical enough to carry weight and that weight offsets the Shah's.

It has, too, to be remembered that the Shah is not everywhere popular. A wave of emotion rallied patriots to his support after the attempt upon his life in February, but since then he has lost in popularity. He has lost ground on account of efforts—some of them laudable—to shake the Majlis into action and to increase his personal power. Court interference in the current elections is one of the accusations levelled against him; another is the sad lack of administrative ability that accompanies his desire for authoritarian rule.

*

It is plain that Persia is for the moment set upon the American tack. The five-volume report of Overseas Consultants Inc.—the American combine which has been hired to produce a blue print for Persia's seven-year plan—is now published. Loans are being sought in America for the foreign part of the investment that it entails. The total cost—which is assessed at the immense sum of 21,000 million rials or \$650 million—is to be met largely out of oil royalties, but partly out of private investment and partly out of loans of 4,500 million rials and \$250 million to be sought from the Iranian National Bank and the International Bank in Washington, respectively. An American contribution of \$9 million towards Iranian armaments has been accepted, though it is thought too small. But it is both premature and

THE CHRISTMAS PRESENT for the man who seems to have everything: that is the most difficult of all to choose. For him

the ideal gift is **The Economist Diary**

a memorandum book, an appointments register, and a complete reference book, combined in one volume measuring 10 in. by 8 in. Bound in red morocco-grained leather.

Price: in the U.K. (including Purchase Tax) 36/8, or 37/6 post free; overseas 32/6 post free by surface mail.

Full details are given in an illustrated pamphlet available from:

The Economist Intelligence Unit
22 RYDER STREET, LONDON, S.W.1.

injudicious to proclaim too loudly that these events and intentions are firm evidence of Persia's incorporation into the western bloc.

* * *

Mr Nehru and Kashmir

Among the danger-points threatening the peace of the world Kashmir remains one of the most serious. It is not less so because no fighting is actually going on there; but troops face each other as if war were on, and the fact that news from the front is censored does not mean that nothing dangerous ever happens.

The attitude of the Indian Prime Minister in his statement to the Press on his recent visit to London unfortunately gave little ground for hope of an early settlement. He indicated that India will continue to refuse to agree to a Uno-supervised plebiscite as long as any area is held by Azad forces—that is to say, until Kashmir state troops and police have regained exclusive control of the whole country. In relation to this stand his insistence that the dispute must be settled without war loses much of its value, for if the military *status quo* remains undisturbed, with India in possession of the real bone of contention—the Vale of Kashmir—and if the plebiscite is indefinitely postponed, there can be no settlement, but only a perpetual challenge to Pakistan to undo the accomplished fact.

Pakistan, which knows that India resolved its dispute with Hyderabad by force, can hardly be impressed by Mr Nehru's devotion to peace when faced with the possibility of renewed violence in Kashmir. There is evidence that the exasperation in Pakistan at the delaying tactics of Delhi is increasing to a point at which some reckless action may not be unlikely, and one effect of the situation—with Commonwealth countries trying to avoid taking sides in the dispute—is to strengthen the tendency to seek some kind of diplomatic alignment with Russia. The recent arrival in Pakistan of several Chinese Nationalist generals and other refugees, who rode across the passes from Kashgar to Gilgit after the defection of the Sinkiang provincial army to the Communists, is a reminder that the affairs of India and Pakistan are not entirely insulated from the march of events in Asia to the north and east.

There is no valid reason why a Uno-supervised plebiscite should not be held in Kashmir next spring at the latest. If India recognises the Uno supervision as adequate, then it does not matter which areas are controlled by Indian-Kashmiri or Azad forces. If, on the other hand, India contends that Uno supervision would be insufficient to prevent rigging of the plebiscite by the *de facto* local authorities, then the balance of advantage in such a situation would be plainly in favour of India, which controls the most populous areas, including the Vale of Kashmir. On neither assumption has India valid ground for refusing a plebiscite. If, nevertheless, India still insists that all Azad forces must be eliminated before there can be a plebiscite, then the possibility of using an international force for supervision of the plebiscite, as has been previously suggested in *The Economist*, should be seriously considered. Mr Nehru has a golden opportunity to practise in Asia what he preached in America.

* * *

Pakistan Flirts with Moscow

People on the spot consider the Americans are making a serious mistake in Asia. It may have results which no one can yet foresee. Pakistan is deeply affronted by what appears to be American favouritism for India. No one who knows the facts doubts that the appearance is worse than the reality; but this is not how it looks to the ordinary Moslem. He hears about the great welcome given to secular

India's Hindu Prime Minister, Pandit Nehru, and he feels that this is one more proof that Pakistan's status and interests are not taken seriously by the rest of the world. If Mr Nehru went to Washington—followed by the Shah of Persia—why should not Liaquat Ali Khan also be invited to Washington?

It is easy to see how these misunderstandings arise. India is bigger, it has inherited the name of the whole sub-continent, and Mr Nehru has long been something of a world figure. Yet it is not only the Americans who have appeared to ignore Pakistan's 75 million people. Britain's apparently casual attitude at the last Commonwealth Conference in April, and its rejoicing in the compromise constitutional formula which enabled the Republic of India to stay in the Commonwealth, were the dominant factors in securing an invitation for Liaquat Ali Khan to visit Moscow. This invitation was issued, through Teheran, immediately after the conference, and its acceptance was the most popular thing that Liaquat Ali Khan had done since he succeeded the late Mr Jinnah.

*

Pakistan's Prime Minister has not yet left to see Marshal Stalin; indeed the date of the visit, already once postponed till this month, is still uncertain. But diplomatic contact with Moscow has just been established by Karachi for the first time, and a Soviet trade mission is conducting long drawn out negotiations. It is true that these trade talks are not progressing well, that an exchange of diplomats is a normal procedure, and that Karachi is being most cautious in all its dealings with the great Communist power so near its northern frontiers. It is true, also, that Pakistan has few economic interests in common with the Soviet Union; none of its available exports, like jute, grain, and cotton, are of great concern to Moscow, nor does it want the very similar types of goods normally offered by the Russians in return. Even machinery from the Soviet Union, if specially offered, would be a doubtful asset, since it might lead to an unwanted inflow of Russian maintenance staff—and in any case far better material is to be had from the West.

All this cat and mouse atmosphere is the result of western failure to take full account of the volatile mood of Pakistan opinion. It is surely not too late to begin now, and to make to Liaquat Ali Khan the gesture that was made to Pandit Nehru—now, while tempers are hot, and before it is too late to do real good.

* * *

Labour's First Shot

It would be rash to draw any conclusion about the date of the election from the appearance of the Labour Party's "Speaker's Handbook" for 1949-50. There are disadvantages in being first on the hustings—it gives the adversary time to wheel his heavy artillery into position (if he has any) and moreover offers him the opportunity to produce more up-to-date weapons; but against these must be set the advantages of seizing the initiative. It is, therefore, profitable to look for the issues on which it appears likely to Transport House that the election will be fought. Obviously it will be fought at least as much on Labour's record as on Labour's programme, and the greater part of the handbook's 470 pages is duly devoted to proving that Britain is a much better country to live in than before the war and that all those features wherein it shows improvement are to be attributed exclusively to the Labour Government. The existence of a full employment policy, of a national health service, and of the Education Act, it seems, has nothing to do with agreed policy—nor has that of such minor improvements to the machinery of advancement as the Council of Industrial Design or the National Research Development Corporation. All those features of prewar or

postwar Britain which are to be deplored are similarly debited to "Toryism," whether they concern the prewar unemployment with which Labour grappled no more successfully than anyone else, the generally inadequate standards of living for which higher productivity, then as now, was the only remedy, or the obsolescence of British industrial equipment under a regime of penal taxation. This is, of course, good electioneering form. But it may seem a little more than ordinarily comic to display such remedies as industrial redeployment as Labour specifics—with examples drawn entirely from private enterprise—and a little more than ordinarily ingenuous to boast on page 126 about the safeguards afforded to the consumer by maximum prices, and on page 230 about the admirable results achieved by abolishing them. But the standard of ingenuousness is, as hustings literature goes, not really remarkable, nor is the proportion of sheer claptrap and classwar catch phrases higher than one would have supposed.

*

What matters more is the manner in which the handbook reflects the Labour Government's chief and quite unconscious intellectual weakness; the lack of any effective contact between their understanding of Britain's economic position in the world, and their home policy. Certain early chapters put with really admirable clarity the essential facts concerning the former; others—notably those on the social services and the standard of living—display a total and enthusiastic indifference to those facts. The effect, as of Sir Stafford Cripps and Dr Dalton in antiphonal harmony, is odd—and depressing.

The reasons for the handbook's silence on insurance are now obvious. There is, indeed, less emphasis on nationalisation (apart from defence of existing schemes) than on the cost of living and on full employment. The consolidators, one might cautiously infer, have for the moment the upper hand of the forward marchers. But to consolidate one must have a tenable position to begin with. Nor until Labour displays an ability, here manifestly absent, to assess the terribility of the line they hold, will they deserve the nation's full confidence.

* * *

New Teeth for Planning

The debate last week in the Lords on the administration of the Town and Country Planning Act of 1947 produced many instances of the unsatisfactory working of the system of development charges. The Central Land Board has a monopoly of selling the right to develop land; but there are too many instances of the Board varying its charge under pressure for there to be confidence in the impartiality of this procedure. This is not necessarily the fault of the Board, but of the principles which guide its work—principles which are theoretically precise but highly nebulous in practice. There is also evidence that development charges in their present form are hurtful to enterprise, and that they deter the very sort of skillful improvisation with the aid of a small outlay which ought to be encouraged. In this connection there are again far too many stories like the one (apocryphal or not) of the man charged £1 development charge for keeping bees.

On one point the critics have not made out their case. It has not been shown—yet—that the levying of development charges is seriously holding up development. The Board is prepared to acquire compulsorily land needed for development if the owner refuses to sell, but it has found it expedient to exercise this power in only eleven cases. However, the reason for this is instructive. Building licences are so hard to get and so precious when obtained that the cost of the site becomes a secondary consideration. This, no doubt, is one reason why the Board is able to report that development charges have been agreed in over 95 per cent of cases. Many

firms pay whatever is asked in order to get on with building. The Government spokesman in the Lords may be right in maintaining that some of the difficulties are "teething" problems. But not all of them. It looks as if a whole new set of dentures may be necessary.

* * *

Businessmen and Dollars

It has been clear ever since the end of the war that businessmen in general are less inclined to fling themselves into the battle for dollars than the Chancellor would like to see them. The difficulties of the North American market and the attractions of soft currency markets have been obvious for a long time. This was made even clearer at the annual conference organised by the British Institute of Management last week. At one meeting in which the advantages of group selling organisations for promoting sales in the United States were under discussion, the main speaker, Mr. S. C. Turner, received strong support for the view that it would be wholly wrong to concentrate on dollar markets to the neglect of other parts of the world whose trade is equally vital to Britain in the long run. So strongly was this view held that all mention of the American market as a special problem was deleted from a resolution on group selling, thus giving it the curious inference that group selling was desirable in all overseas markets.

An interest in the world—as opposed to a specifically dollar-market—is, of course, the correct long-term view. The businessman is interested in the long view, since the protection and perpetuation of his markets and, therefore, of his firm is his particular task and *raison d'être*. But simply wishing for a return to a period when the world market can be regarded as a whole and a refusal to be stampeded into neglecting non-dollar for the sake of dollar customers will not bring multilateral trade any nearer. Nor will the Government's attempt to expand dollar exports by exhortations. The harmonising of private and public interest—the incentive to expand all trade but dollar trade most of all—remains largely a matter of words, and until it is translated into policy British businessmen will continue to be more interested in their traditional customers than in breaking new ground.

* * *

Work for the Arab Refugees

The United Nation's Economic Survey Group on the Arab refugee problem has handed its report to the Assembly. Mr Gordon Clapp, its chairman, and his British, French and Turkish colleagues are to be congratulated on producing a document in which realism is the chief feature. To quote but two of the many sentences which debunk popular illusions: "Political stalemate precludes early repatriation or large scale resettlement"; and "Less congested lands (than the fringes of Palestine in which the refugees are now clustered) are not available for the settlement of additional population until much money has been spent."

Their plan, therefore, is for the time being to employ the refugees in the areas where they lie, and their formula is: "More work and less relief" on a progressive scale. They hope to convert all able bodied breadwinners into wage earners within twelve months from January 1, 1950, and will employ them at international expense until eighteen months from that date. They estimate the cost of doing this at \$53.5 million, of which one quarter—or \$13.3 million—would be the cost of tools and could be found locally, leaving \$47 million to be found internationally. The rate proposed—\$2,700,000 per month—is the same as that now being spent upon mere relief.

The public works they plan are all operations in which labour accounts for the bulk of the cost: terracing to con-

serve the soil, reforestation for the same purpose as well as to provide fuel, road building, and water conservation works "on a moderate scale." They recommend that the scheme be administered through a new agency which will simultaneously take over from existing charitable bodies and "counsel" with the local governments about financing and managing the works to be done. The scheme, as its authors frankly admit, is devised principally to gain time while political wounds heal, and to root out pauperisation and idleness.

★

The jobs ahead of the Uno Assembly are, first, to find a director for the new agency who will get on with the local governments, and secondly to find \$47 million. It seems that the only means of doing this last is to do as Count Bernadotte did—send round the hat among governments of good will. Assembly funds can scarcely be used because there are states members who do not hold these refugees to be Uno's responsibility. Given the man and the money, it seems likely that Jordan, Syria and Lebanon will all be glad of productive works executed at small expense to themselves. Iraq and Israel say they "do not need assistance." The hard core of the problem lies in the Gaza strip where more than a quarter of these 750,000 displaced persons are huddled in a small and poor area where there is no hope that work can be found for all.

Housing Standards

But at the same time we must not be led away by a desire for the elevation of the working class, to apply to their dwellings and habits a standard of comfort applicable to a very different class. We yield to none in anxiety for improving the moral, mental, and physical condition of the labouring classes, especially of the rural labourer, but we do not expect such improvement to be produced by creating an exaggerated notion of what the dwelling place of the farming man ought to be. We look to increased employment, and its consequence, better wages, as the main element of that improvement, and the effect will be, first, a desire for better food and clothing, and, next, for a more commodious cottage. Much has been said of the want of cleanliness amongst the labouring population, and it has been somewhat hastily assumed that such defect is attributable to the absence of convenience and opportunity for ablution from the crowding of their dwellings. We fear, however, that personal cleanliness is not among the indigenous virtues of our people; it is the result of education. Even among the middle classes, there is much deficiency in this particular. In farm houses, the arrangements for washing are usually of the most scanty sort, and the habits of no inconsiderable numbers of the farmers are not far before the labourers in this respect. Nor is this surprising when the nature of their avocations is regarded. The farming man rises at four or five in the morning, goes immediately to his work, and pursues his toilsome labour throughout the day; he works in the open air, and in all weather, returning to his cottage at night thoroughly wearied. Does any one who knows what rural labour is expect such a man to undertake very elaborate ablution? Practically what he might do, would be to wash well on the Saturday night or Sunday morning, and to a certain extent he does so. For this, however, no great space is wanted; it is the inclination, a knowledge of the true value and enjoyment of a clean skin, which is absent. This can only be corrected by training the young to improved habits, and it ought to form an essential part of the discipline of rural schools.

November 24, 1949

Towards a Point-Four Programme

On November 16th the United Nations General Assembly adopted unanimously and without abstentions—a rare occurrence—a number of resolutions launching two programmes of technical assistance to backward areas. The first is one internal to the United Nations, to be financed out of its own budget to the tune of \$700,000 a year; the second is to be financed by the governments and may run at an annual level of between \$15 and \$20 millions.

Now that the Assembly's imprimatur is on the plans, the real effort can begin. The chief administrative obstacle in the way of effective functioning is undoubtedly the amount of overlapping between agencies which seems certain to arise. The co-ordination between the United Nations and the specialised agencies—the World Bank, the Food and Agriculture Organisation and the rest—is rather tenuous; indeed, it is reported that the World Bank is not to take part in the scheme, preferring its own methods of action and enjoying its own sources of funds. There is only a limited supply of specialists and technicians available for international work and an overlapping of effort would be an unfortunate waste. It is not yet clear how it is to be avoided.

The governmental programme still faces two uncertainties. Congress has not yet appropriated the \$35 million which President Truman called for under his Fourth Point programme. Yet this sum is to provide probably 70 per cent of the international programme. The Administration hope to see the appropriation through Congress in January, but a longer delay is all too likely. Only then will it be possible to settle decisively the second uncertainty—the scale of governmental assistance from other than United States sources. The powers have not shown any great alacrity in responding to President Truman's lead. The reaction was almost negligible compared with the leap into action that followed General Marshall's much vaguer Harvard speech. It is still uncertain how much other governments are prepared to commit themselves to an international scheme; yet if one thing is more certain than any other, it is that any marked lack of enthusiasm on their part will be very quickly communicated to Congress.

Communists Make Capital in Italy

The visit of Signor de Gasperi, the Italian Prime Minister, to the Sila plateau in Calabria, where land was recently seized by the peasants, was an unprecedented event. On the one hand, it is reported that no Italian Prime Minister, during his term of office, has ever been seen before in some of the places he visited. On the other—what is equally significant, but possibly more important—it is certain that Signor de Gasperi's journey, in company with his Minister of Agriculture, Signor Segni, reflected the grave concern felt in Rome at the course events have taken. It is, in fact, fair to suppose that they may have three direct or indirect consequences.

First, of course, the Government will do far more not only to speed up land reform, particularly in Calabria and Sicily where the troubles have occurred, but also to direct the flow of Marshall Aid money to those areas. Already, in his speeches while on tour, the premier was able to tell his listeners that \$750,000 had been made available for the construction of roads and other improvements in the Sila district. And Mr McClelland, the ECA agricultural representative in Italy, has stated that 25 out of about 100 land projects financed out of Marshall funds worth \$100 million have begun. All this will have some effect, though a modest one, in improving the lot of the landless southerners.

Secondly, there may be a general shaking up of the political situation before next spring, when there is to be a large series of municipal elections, and also by stages the

first elections for the newly created regional administrative bodies. The fortunes of the leading political parties are therefore likely to be put to the test at an early date, and in an atmosphere of heightened political feeling. In particular, the Christian Democrats, who dominate the Government, will come in for a good deal of criticism for having only toyed with land reform. If conditions at the time of these elections are turbulent, it is expected that the tendency will be for voters to concentrate on the major parties. But apart from the Christian Democrats and the Communists, it remains quite uncertain who will be the residual legatee for all those who reject either.

Thirdly, the Communists are likely to exploit the complaints of the peasants to the full. Already they claim to have forced the Government's hand by their support of the demands for land, and it may well be that this will help to restore some of their prestige among the industrial working classes further north. There has been a tendency of recent months for workers to abandon the Communist-led CGIL, in favour of either the Catholic or Socialist trade union organisations. Of the two, it has been the Catholic LCGIL which has been by far the greater alternative attraction. But now, if the Christian Democrats lose ground and the Socialists fail to gain it in the trade union world, there will be every prospect of at least a minor Communist comeback.

Doctors' Pay

The Minister of Health has refused the British Medical Association's request for higher remuneration for general practitioners on the ground, first, that the facts of the case do not justify an increase and, second, that the general economic situation precludes any unjustified raising of

remuneration anywhere. The association was well aware that it had chosen an unpropitious time for its claim to be considered, although the claim had been advanced in principle long before devaluation imposed a ban on increases in wages and salaries. But it might well have been prepared to agree if Mr Bevan had accepted its claim in principle, but postponed implementing it till the economic situation justified it.

The claim has, however, been turned down flat. The Ministry argues that general practitioners are receiving as a group an amount fully equal to the recommendations of the Spens Committee, which may well be true if the betterment factor allowed for converting the committee's recommendations from 1938 values to postwar values is accepted—20 per cent for net incomes and 55 per cent for practice expenses. The British Medical Association has never accepted it and proposed a betterment factor of 70 per cent on gross incomes. It also asked that sources of income outside the central pool from which capitation fees are calculated, such as mileage money, maternity services and so on, should be ignored in calculations of what the total remuneration of general practitioners should be, a request which the Ministry has also turned down.

The association's reaction to the rejection of its claim has still to be made known. One thing does, however, stand out. In comparing doctors' pay today with the Spens Committee's recommendations, the Ministry has made no allowance for the increase in work which the introduction of the health service has brought about. Nor has it regarded the cost of the general practitioner service in the light of the cost of the other items of the health service. General practitioners, all things considered, come off worse than other practitioners. This does not justify higher pay for them now, but it might have induced the Ministry to hold out some hope of their claim being reconsidered at a later date.

Now you can

Fly BEA to Paris £10 Return

On Four daily services

It takes about 1 hr. 40 mins. from Northolt to Paris, with refreshments and custom-free bar facilities. Bookings: Travel Agents, local BEA offices, or BEA, Dorland Hall, 14/20 Regent

Street, S.W.1. Telephone: GERard 9833.

Remember, there are also four other daily flights from Northolt: fare £14.8.0 return.

BEA there and back

Focus on Farming

THE TIMES REVIEW OF AGRICULTURE

On December 5 *The Times* will publish a separate 16-page Supplement dealing with Agriculture. It will be on sale at news-agents and bookstalls—price 3d.

The contributors are leading authorities and their articles will be illustrated with photographs. Among the many subjects dealt with will be—Raising More Beef, Milk Production, Poultry Prospects and Feeding Stuff Supplies.

Ready December 5
PLACE YOUR ORDER NOW
Price 3d.

Letters to the Editor

The Extreme Centre

SIR,—When the Greek lady gave me the definition of the extreme centre, which you quoted last week, I, too, was enchanted, but on reflection it did not seem to fit British politics. We do not want to learn how to liquidate oppositions, but we do want to keep our opponents out of office. This requires the strength of a national party operating a national machine. Of these there are only two, so that if a central policy is to prevail you must capture either Transport or Abbey House.

There is this to be said about the choice. The Socialists would have to go through the divorce court. The Conservatives are free to marry, and have already made similar proposals to your own. For although your unrivalled skill in presenting the case for the central policy may make it appear new, almost the whole of it has been advanced from the Tory benches.

Conservative economics of 1949 are much nearer your economics than Socialist economics. But you cannot come down to us off your high fence because you remember days that are gone. For example, you write as though none of us had learned anything about employment policy since 1931, as though the White Paper had never been produced, and Sir David Maxwell Fyfe had done no work on monopolies.

Then you dislike us because we are "still the party of the rich." By and large the rich are the successful, and your economics are essentially success-economics. Even if you have your Rignano death duties (and I prefer Mr John G. Walker's suggestion) you will still have a society of unequal wealth. But surely it is not wealth that is dangerous but the abuse of the power that accompanies it, and if you will concede that political and bureaucratic power is now as great a temptation as money, then it is the Socialists who are the richest, most covetous and illiberal party in the country.

But leaving party politics on one side, my main criticism of your articles is that they raise economics too high in human affairs. The question "Why should I produce more?" has to be answered before the question "How can I produce more?" There are commonly said to be three motives for work—money, fear of the sack, and some cause outside selfish interests. You accept the desire for money, but in our times it is weakened by a preference for leisure, the extension of social security and the burden of taxation. The carrot is on the ration. You allow something for fear because you rightly say that over-full employment is fatal to efficiency. But you would agree that unemployment must be a limited, temporary and we hope diminishing concession to human sluggishness. The stick has become a twig.

What then about motives beyond the carrot and the stick? You would agree that it is right to tell the truth. Is it also right to work hard? Or is honesty in work something different from honesty in words? Or, to shift the ground a little, do you think the British people still care about peace? Ought we to try to make peace, and can we contribute effectively to peace-making unless we work hard? I wonder if productive efficiency is not getting more like happiness—unattainable if pursued for its own sake; and I wonder, too, whether the economists should not take the lead in demanding the return of politics and morals to restore life to their calculations.—Yours faithfully,
DAVID ECCLES
House of Commons

Promise and Fulfilment

SIR,—Your reviewer puts me before the awkward dilemma either to appear as a self-righteous pedant or to accept to be regarded as a dispenser of "palpable untruths." To avoid technical details I enclose some of the documentary material

on which the contested statements in my book were based and shall confine myself to the essence of the argument.

Your reviewer does not deny that Britain supplied the officers, the money and equipment of Jordan's army. It is only logical that once you supply an army with tanks you will also see to it that it gets the petrol to run them. Yet it is on this minor point that your reviewer picked his quarrel and obscured the issue with a smokescreen of technicalities. He now admits that the British-owned Haifa refinery was closed down though it had plentiful stocks of crude oil; that British tankers carried off crude oil from Haifa to Tripoli; that about the time when the Iraq Petroleum Company stopped pumping oil to Israel it started pumping petrol to Jordan. (It is amusing to note, in passing, that your reviewer justifies cutting off Israel from fuel by the "force majeure of war" and the simultaneous supply of fuel to Jordan as a "response to a natural trade demand . . . for the maintenance of civilian as well as military life"—sauce for the gander is poison for the goose.) But while he thus confirms the substance of my argument, he fights a rearguard action on split hairs: there was no "diversion" of oil supplies, he says, because the oil which went to Israel was crude, while to Jordan it went refined—a chicanery based on a literal interpretation of the word "diversion." He further solemnly points out that "the Iraq Petroleum Company is not Great Britain." Cross my heart, I never thought it was; I said in my book that Britain "saw to it" that the oil was delivered to Jordan; and that she did of course most efficiently. The technical means by which this was done are set out in detail in the enclosed documents. There remain two minor points: (a) your reviewer says "it is not true that any refined oil went to Beirut." It did go; for details see the enclosed Israeli Foreign Office Communiqué of June 16, 1948. (b) Your reviewer says that the Israeli Government "borrowed" the machinery of the British-owned Haifa refinery. This is again untrue; see the enclosed Press Release of July 23, 1948.—Yours faithfully,
ARTHUR KOESTLER
c/o Macmillans, St. Martin's Street, W.C.2

[The documentary material referred to in Mr Koestler's letter consists of two press releases issued by the Foreign Press Office of the Israeli Government in June and July, 1948. They are *ex parte* statements made by a belligerent government in the middle of the fighting, and in support of its cause. Moreover, some of the statements made in them are at variance with evidence from other sources in the possession of *The Economist*. We are therefore unable to accept these documents as proving the accuracy of Mr Koestler's version of certain of the events in question, or as establishing that it was the deliberate policy of the British Government to starve the Israelis of oil, while supplying it in unusual quantities to the Arabs. According to our information, he is in error on a number of material points, including some of the statements and inferences in the above letter.

The documents, however, in our opinion confirm (if it was ever in doubt) that Mr Koestler wrote in good faith. It may be that the phrase "palpable exaggerations and untruths" used in our original review might be thought to carry an imputation of deliberate prevarication. We are satisfied that there was no intention of making any such imputation, and the reviewer joins us in apologising to Mr Koestler for the use of words that might be thought to suggest it.—EDITOR.]

Nigerians for Moscow?

SIR,—At page 1054 of your issue of November 12th, you published a short commentary entitled "Nigerians for Moscow?" Permit me to state that it is a hodgepodge of half-truths, untruths, and distortion of truths in six particulars:

- (1) My first name is not "Nando" but *Nnamdi*.
- (2) My organisation is not National Council for Nigeria and the Cameroons, but *of*.

(3) The implication that we were invited by Soviet Russia or any of its satellites is untrue. The truth is that a British organisation (National Council for Civil Liberties) extended an invitation to us, in Nigeria, to attend the International Conference on Human Rights, to be held in Prague, which we accepted, last August.

(4) The statement that we were to attend the "International Conference on Human Relations" is completely false.

(5) The statement that "an extreme splinter group broke away from the Nigerian National Federation of Labour" is completely false. The truth is that a splinter group broke away from the Nigerian Trades Union Congress and formed the NNFL.

(6) The statement that the railway strike was politically inspired is completely false. The truth is that it was for purely economic reasons that the railway workers struck, following their rejection of the awards of the Ian MacDonald Arbitration Tribunal of which I was a member.

If it is the editorial policy of *The Economist* to encourage the disintegration of the British Commonwealth by the publication of tendentious matter which is unfounded and highly provocative, as should be expected in the irresponsible and "yellow" press of Britain, then the Nigerian nationalists should thank their stars because such publications are bound to engender bitterness and hatred of Britons and British rule in Nigeria.

The leaders of India, Ceylon and Burma were described in the British press as "naked fakirs," "jail birds," "irresponsible agitators," etc. Today, they are being enfeebled by British royalty. Now, Malayan nationalists are being described as "bandits" and Nigerian nationalists are labelled "extremists" and "Communists." We should not be expected to anticipate any friendly and sympathetic attitude towards our nationalist aspirations from the British press. Do not make the mistake of thinking that African leaders, like Nehru, will forget these

bitter humiliations. The African elephant never forgets.—Yours faithfully,

NNAMDI AZIKIWE,
Member of the Legislative Council of Nigeria

Financial Talks With Sweden

SIR,—Referring to your article on the financial talks with Sweden in your publication of November 12th, the writer feels that it is not the fault of the British exporter that inessential British goods have failed to establish themselves in the Swedish market. British manufacturers of goods, which are sometimes classified as semi-luxury articles, have been, and are, only too ready to supply Sweden with large quantities of their first-class products.

A very large number of Swedish importers would be only too happy to be permitted to import such goods and offer them to their customers. It does give the Swedish importer and retail distributor a great deal of prestige when offering famous high-class British products.

It would appear that the Swedish licensing authorities have been over-careful in granting licences, and very definitely have turned down applications for some British goods which we could only in this country classify as essential merchandise.

A very important point is not the value of import licences agreed to in the Treaty, but the value of the applications for import licences refused to the importer by the Swedish Board of Trade, which may have used an invisible and unmentioned price ceiling control. These rather rigid import controls have been used to give support to Swedish competitive domestic industry, which is now to some extent producing more goods than the home market is likely to be able to consume.—Yours faithfully,
JAMES BENNETT
76, Grosvenor Street, London, W.1

How to reduce your advertising costs

At a time when Industry is fighting a constant battle to reduce its costs, your advertising requires more careful planning than ever before.

Are you getting the maximum results for the money you spend?

Is your advertising based on these vital facts?

The Daily Mirror, with an average daily sale of more than 4½ million, tells your sales story to hundreds of thousands more potential buyers than any other daily paper in the world.

The Daily Mirror's advertisement rate of .79d per inch per thousand readers is lower than that of any other National Daily.

Daily Mirror

Books and Publications

Quem vidistis, pastores?

"Christianity and History." By Herbert Butterfield. Bell. 146 pages. 7s. 6d.

THIS is a curious book. It has the sincerity, charm, and persuasiveness of everything which Professor Butterfield writes. It is based upon wide study and a deep examination of conscience. The book contains many things of great value, and yet through it all there runs a thread of wilfulness and irritation. Irritation over the "dumbness" of textbooks, dislike and suspicion of most writings on fairly recent history. The study of ancient history is contrasted favourably with the "hurried, superficial compilations of recent happenings which have currency . . . because they happen to be the first in the field." And yet, one asks, do we not owe a considerable debt to Thucydides who wrote about "recent happenings," and was among "the first in the field"? Moreover, do the historians who concern themselves with the ancient world in fact escape prejudice more often than those who deal with the nineteenth and twentieth centuries?

In spite of his castigations Professor Butterfield allows himself far too many generalisations—for example, about Bismarck's foreign policy, or the treaty of Versailles—which must seem to other students of the subject dangerously superficial. Or again, what is one to make of this passage, following a suggestion that not one but two Powers have been struggling in the last hundred years or so for the domination of Europe? "If two rival giants are offering an alternate threat to the existing order of things on the continent, and if you are unwilling to let the two rascals fight it out by themselves, choose carefully the time of your intervention in their struggle and see that you intervene only in order to save whichever of the two it may be from being destroyed by the other." Can this be intended as a serious judgment on the declaration of war by Great Britain and France in 1939, and, if so, could there be a greater misrepresentation of the facts? Or, for that matter, what has a Machiavellian maxim of this kind to do with the study of Christianity in history?

The main difficulty, however, in accepting Professor Butterfield's account of the heaven of the Christian religion in history lies not in his digressions but in his central theme. His "Providence" is too much like Hardy's President of the Immortals, and, at worst, like a cat playing with a mouse. Professor Butterfield employs the concept of original sin, though he never explains what it is. Owing to this original sin, "Providence" is for ever chastising us. "A God who could use even the Philistines in order to chastise His chosen people may similarly use us for the purpose of chastening Germany, while still reserving for us a terrible judgment later." If God "uses" men in this cold, ruthless way, if children are born into the world to be "used" as instruments of this type of Grand Design, then one reader at least is on the side, not of Professor Butterfield's Deity, but of the sad choruses in Swinburne's "Atalanta."

Although he is haunted by a grim Jehovah, Professor Butterfield turns in the end to the Gospels rather than to the prophets, and here he is far more convincing and free from petulance. Nevertheless, he evades the most perplexing question. He agrees that, if Christianity is a historical religion, the validity of the claims of the Christian Church must rest on historical evidence. One cannot employ Indian rope trick methods about the "tradition"; at all events, these methods cannot satisfy the historian. Professor Butterfield gives only seventeen pages to this problem of the evidence, and much of what he says in the chapter has the ring of special pleading.

In this final question it is playing with the issues to talk

about clever doctrinaires who cannot see truths open to the simple. The assessment of historical evidence, as Professor Butterfield of course agrees, is a task which requires long training and experience; the fact that some scholars are fools does not mean that an untrained man of noble mind can settle problems of textual criticism. The problem of interpreting the evidence in the New Testament about the "historical Jesus" is supremely difficult; a western European cannot even approach it apart from countless associations with his own childhood and with the greatest poetry and art of many centuries. A reviewer who has no solution of the problem ought not to reproach anyone else for a failure to solve it. Nevertheless, when Professor Butterfield tells us to "hold fast to Christ, and for the rest be totally uncommitted," we may remember the strange, tragic undercurrent of irony in the words of the liturgy for Christmas morning: "*Quem vidistis, pastores? Dicite, annunciate nobis in terris quis apparuit?*"

Without Rancour

"Ack-Ack." By General Sir Frederick Pile, GCB, DSO, MC. Harrap. 398 pages. 18s.

DESPITE the fact that the second world war has engendered nothing like the rancour which followed on the first, it is natural and inevitable that the important figures involved should want to render their own account. This General Pile has done most successfully. "Ack-Ack" is not a literary masterpiece, but it accomplishes a difficult feat—to explain the complexities of the task which confronted Anti-Aircraft Command before and throughout the war and of the way in which it was confronted. This is not an easy thing to do: successful anti-aircraft defence depends primarily upon intelligent organisation and anticipation of the enemy's intentions, and of effective co-operation with a multitude of civil and service authorities. There are few set battles to enlarge the comprehension or quicken the blood of the inexperienced reader, and if his understanding sometimes fails among the mysteries of 3.7s and 4.5s, GL predictors or Stiffkey sticks, he can be assured that General Pile has made it much clearer than anyone else could have done.

General Pile occupied a unique position among the senior commanders, being concerned with the protection of the ordinary citizenry and exposed to their interference and criticism. As he says, "The difficulties of a Commander-in-Chief trying to fight a battle within earshot of the Houses of Parliament, to which, in our modern democracy, everyone in the country can appeal, are very great." But he kept his temper and his sense of humour, despite the fact that "From the earliest days of rearmament right to the end of 1940 those responsible for siting the guns were constantly hampered by the protests of those who found their amenities threatened or their privileges infringed."

General Pile's shafts are reserved for those in authority in Westminster and Whitehall (particularly in the War Office, and much less so in the Air Ministry) who could not or would not see the importance of an adequate air defence of Great Britain, who resisted technical and scientific improvements, or who preferred to drop great but difficult men like Dowding in the interests of a quiet life. The gradual overcoming of personal and impersonal obstacles, the improvements in disposition and technique, often achieved only after pitched battles in Whitehall, is well told. It is very much to be hoped that if war returns, with the vastly increased problems created by the atomic threat, Britain's air defences will be in the hands of men of General Pile's calibre.

An American Journalist on Russia

"Stalin and Co." By Walter Duranty. Secker and Warburg. London. 252 pages. 12s. 6d.

MR DURANTY'S theme is the story of the Politburo and the men who now compose it. There is a section reviewing the career of each of the Politburo members, and an amount of miscellaneous material on Soviet affairs in general. Everybody, of course, would like to know the truth about the Politburo, and Mr Duranty would like to tell it to us; but Mr Duranty is no more admitted to the councils of that publicity-shy body than anybody else is. Certainly he has a good knowledge of the Soviet press, he has been a correspondent in Moscow for many years and has interviewed a minority of the people he describes. Drawing mainly on Soviet publications and on his own experience he has compiled some notes and made some surmises; but these do not amount to a satisfying or full account of the Politburo. Like any book that promises to enlighten us on the Russian question, this will pique the reader's curiosity; but like many other books of its kind it will leave him still asking questions.

What is useful about Mr Duranty's offering is that it does collect together what few facts are known about the members of the Politburo, particularly about the lesser known ones, and the student of Soviet affairs will find these chapters useful for reference. There is an interesting analysis in the chapter describing how the Politburo has kept the army under its control; and the postscript on the recent changes in the Politburo is worthy of attention. For the rest Mr Duranty supplements the scanty material (not scanty through any fault of his, admittedly) on his proper subject by discursions and by personal reminiscence, in all of which there is little that could not be found better set forth elsewhere.

Much material from Soviet sources is accepted quite uncritically in the book. The fault is met when the author describes the careers of the Politburo members, as for instance when he says that Lenin chose Stalin "to carry the red torch in Russia after the Revolution of 1905-7," that is at a time when Stalin was a minor figure in the Transcaucasian revolutionary movement. In the section on foreign affairs the fault is even more glaring. Here Mr Duranty tries to show the point of view and the good intentions of "the Russians" by pointing to the various pacts which they have concluded; but the value of these pacts is hardly what is suggested. The pact of friendship with Czechoslovakia, which is given as an example of "Russian" goodwill, by no means prevented the imposition of an unwanted communist government on the Czech people; the 1945 Sino-Soviet pact, also cited, did not prevent the Soviet Union supporting and ultimately recognising the Chinese Communists who overthrew the Chinese government which signed the pact; and it can hardly be said of the pact with Yugoslavia that it was "not protested by either party." The "mutually advantageous" Soviet-Swedish trade agreement, the "mutual assistance" in Eastern Europe, and Stalin's pledge to support UNO are other points susceptible of challenge. In discussing foreign affairs and elsewhere the author speaks of "the Russians" doing this and that, and this loose identification is typical of the book. In fact the Russians do not initiate the Politburo's course of action any more than the British.

Tributes to a Great Teacher

"Essays in British and Irish History." In honour of James Eadie Todd. Edited by T. W. Moody, H. A. Cronne and D. B. Quinn. Frederick Muller. 336 pages. 21s.

THE late James Eadie Todd was Professor of Modern History in the Queen's University of Belfast from 1919 to 1945. During this period he completely revolutionised the teaching of history in the University. He built up, from small foundations, a school of history, the quality of which can be judged by the collection of essays contributed by sixteen of his former students, includ-

ing the three professors of history who have edited the collection. Todd brought a liberal, independent and scholarly approach to the subject which enabled the history school in Queen's University to escape unsmirched from the violent political and sectarian passions that raged in Ulster at the time. Indeed, it is a promising omen for the future of Irish unity that the renaissance in Irish historical studies has ignored Partition. Belfast and Dublin have co-operated harmoniously and successfully. The collection of essays written in honour of Todd ranges over a very wide field. Nine of them are devoted to Ireland. New light is thrown on some of the great figures of Irish history. Mr J. C. Beckett shows that Swift's record as an ecclesiastical statesman was marred by political prejudices and personal animosities. Miss Teresa O'Connor finds in the conflict between Flood and Grattan the seeds of the rising of 1798. In the concluding essay Professor Moody examines the relations between Devoy, Davitt and Parnell in the years 1878-79 which led to the foundation of the Land League and the union of the agrarian and nationalist movements which, under Parnell's leadership, had such momentous consequences.

Keynes for Students

"The Economics of J. M. Keynes." By Dudley Dillard Lockwood. 351 pages. 18s.

PROFESSOR DILLARD'S restatement and appraisal of Keynesian economics appears to have three related but distinguishable aims. He sets out the general theory, complete with its own special vocabulary (a task very properly left alone by purveyors of really simple versions) in relation to classical economics; he translates it into terms of policy, applied in concrete circumstances by concrete institutions; and he carries on, and applies, its conclusions to today's circumstances of inflation and universal funny-money, circumstances diametrically opposite to those in which the theory was first conceived. The part of the book in which this is accomplished has a particular value in that a disproportionate amount of Keynesian interpretation has been—to some extent and for practical purposes—vitiated by the assumption that the task of policy would always and in all circumstances be the maintenance of investment and the sustaining of demand, never the curbing of demand and the rationing of investment. Keynes' followers, in fact, have paid him the dubious compliment of assuming that the application of his precepts could never be entirely successful. Professor Dillard's specific examples are mostly, though not exclusively, American, and his public in England is unlikely to be large, but students and teachers of economics will find his book useful.

David and Goliath

"Maintaining Competition: Requisites of a Governmental Policy." By Corwin D. Edwards. New York. McGraw-Hill Book Company. 318 pages. 22s. 6d.

ON the evidence of this closely argued and incisive book, the Federal Trade Commission is fortunate in enjoying Mr Edwards's services. He is not only an acknowledged authority on the problems of monopoly and competition, but an experienced giant-killer, since he drew up the plan for deconcentrating Japanese industrial monopolies. Unlike many other experts, he is not content to trace—and bewail—the circles that big business runs round the Government's economic policemen, and the gap between the aims of anti-trust policy and its achievements over the past 60 years.

The United States has gone further than any other country in attempting to preserve and enforce business competition. Mr Edwards believes it should go much further, and submits a blueprint for the changes in the law, its theory, and its administration which he believes are necessary if the whole anti-trust battle is not to be lost. No unreconstructed free

enterpriser, Mr Edwards believes in planning and control, but where business is left free, he would insist that the competitive regulator do its job without hindrance. The prime requisite of a competitive policy, in his view, is that excessive size of businesses should not be tolerated. And excessive size is defined as growth beyond the point necessary to achieve maximum efficiency of operation. This is a theoretical revolution in a country which has long accepted the maxim that "size in itself is no offence," but that attention should be concentrated on the abuses that size makes possible. It would also need a practical revolution to put the new doctrine into effect, along with proposals for discouraging further elephantiasis. One might compare Mr Edwards to a David reflecting that Goliath would present no problem were he half his size, and if the anti-trust authorities were not now trying to dissolve such industrial Goliaths as the DuPont Company and the Atlantic and Pacific Tea Company—the great chain food stores. The latter is already bombarding the housewife with claims that it is its low price policy which has drawn the Government lightning. Few housewives will ever read—let alone understand—Mr Edwards's point that possession of the power to coerce competitors and to exploit consumers, even if it is not employed overtly, constitutes evidence of undesirable concentration of economic power.

Americans have a human liking for eating their cake and having it, too, for regarding "big business" with obstinate suspicion while enjoying its fruits, for paying lip service to competition while exempting many groups from it. Mr Edwards discusses and condemns the exemptions granted to foreign traders, insurance companies, groups of agricultural processors and producers, and to retailers under resale price maintenance. He would like to eliminate the abuses which have grown up around the exemption of co-operatives. Labour unions present a harder case; Mr Edwards concludes, after some struggle with himself, that unions should be subjected to the anti-trust laws only when their activities threaten commercial competition. On patents he has much of interest to say concerning this grant of monopoly power and the research it is expected to stimulate, which will grieve patent lawyers and their clients. And, finally, he analyses the relations between the competitive policy and economic planning, and finds no difficulty in reconciling them, save where planning is a cloak for private control (as under the NRA or in many "health and safety" ordinances) or where it is excessively detailed.

This is a well-planned, exhaustive and authoritative tour of what to most non-American readers must still seem the jungle of American anti-trust law and business practice. Mr Edwards's critics will, of course, say that, as on most conducted tours, the tourist sees only what he is meant to see; that the author glosses over many difficulties and exaggerates the ability of a democratic Government—if it is to remain democratic—to make and enforce sound decisions on business policy and the economic climate.

The Grass Roots

"From This Foundation." By Thomas Brackley. Harvill Press. 190 pages. 7s. 6d.

BEHIND statistics, charts and social generalisations there are people; solid, unassimilable individuals, linked in families and neighbourhoods, grouped by tastes, conventions, and common habits of earning and living, but still unique. Mr Thomas Brackley's "From This Foundation" is a loving, keenly observed, densely worked study of the sociologist's raw material, the interwoven individual lives of the group. His subject is a smallish Midland town through the passing of the seasons, the human relationships, habits, and human foibles and grandeurs of a loosely related group of neighbours. He describes their houses, shops and cinema, the prams and the games of their children; he evokes the taste of strong tea and beer, the smell of train smoke, the sound of dustbin lids rattling on a windy night, and weaves the whole into a remarkably living and significant picture.

His style, which is deliberately wrought, poetic, and rather reminiscent (as is, indeed, the whole plan of the work) of Mr Henry Williamson's "Village Book," is not likely to please everyone; but it is worth putting up with the somewhat strained vocabulary and the too precious cadences for the sake of the affection, humour and sympathetic insight which run through the book, together with something which one can only call a reverence for life. If one could wish for Mr Brackley more literary restraint, one could certainly wish for sociologists and economists his eye and his human sensitiveness.

Shorter Notices

"The Annual Register 1948." Edited by Ivison Macadam. assisted by Hugh Latimer. Longman's. 490 pages. 42s.

THIS is the 190th year of publication of a volume which has had such famous editors as Burke. Its method of arrangement is to divide the events of the year into a series of essays by distinguished contributors. As a reference book for the contemporary it is for this reason not very good, but it fulfils the function of its 189 predecessors—that of providing a base from which future historians can build an understanding of the year's events.

"Introduction to the Study of Economics." By Henry Smith. 222 pages. 10s. 6d.

THE perfect introduction to the study of economics badly needs writing; but it is not written yet. Mr. Smith's shot at this elusive target has certain respectable merits; he is logical, up-to-date, possessed of a sense of historical perspective, scrupulous in his avoidance of the slapdash on the one hand and the esoteric on the other. He is, however, a good deal harder to follow than many authors catering for more advanced readers, so much so, indeed, as to scare off the general reader or independent student for whom his book appears to be intended; while his arrangement of his subject matter in six massive chapters and a decidedly unorthodox sequence makes it an awkward supplement to class work or lecture course. The Appendix, on the use of geometry in economics, should be a real lifesaver to those beginners whom indifference curves and similar devices afflict with a Laocöon complex.

AMERICAN SURVEY

Sharing the Surpluses

(From Our American Staff)

THE controversial subject on the agenda for this week's meeting of the Food and Agriculture Organisation is the proposal to distribute world surpluses of staple crops through an organisation known as the International Commodity Clearing House. This scheme, discussed in *The Economist* of October 1st and November 5th, is designed to channel surpluses from countries in which they appear to those which cannot find the dollars to pay for them, and to even needier nations which cannot afford the full market price. It would also authorise barter deals and the accumulation of stocks in time of plenty to protect consumers in periods of shortage.

The chief opposition to this plan will come from the United States, also the chief source of the surpluses. In the preliminary discussions in Washington, departmental counsels were divided. The State Department and the Treasury opposed the plan and, when the conference opened on Monday, they had carried their point, over the opposition of the Department of Agriculture. The departments primarily interested in foreign affairs pointed out that most, if not all, of the present and prospective surpluses are American, and that in fact, therefore, the proposal is to establish an international agency to dispose of US goods.

This they feel to be undesirable, partly because the accumulation of new debts in soft currencies would make it even harder, eventually, to re-establish the convertibility of those currencies. Moreover, if the surpluses were distributed through an international organisation, the United States would lose the political advantage to be gained from making food and fibre available to deficit areas. Distribution through ECA, they believe, has served US purposes better than did distribution through Unrra; and an arrangement for other areas, parallel to that for Western Europe, might not be impossible under the Fourth Point programme for technical aid and capital investment.

A similarly unenthusiastic view is taken of barter arrangements, both in theory, as representing a type of exchange it is desirable to get away from, and as a practical matter, because certain tentative efforts in this direction have come to nothing. The suggested exchange of American wheat for Indian manganese has run into problems of timing: the Indians want the wheat now, but since they are already finding dollar purchasers for all their present output of manganese, enlarged facilities and several years' time would be required before India could carry out its share of the bargain.

Despite this reasoning, the official position of the US delegation is almost certain to be attacked by influential domestic groups. All three of the major farm organisations are thought to favour the ICCH. The Farmers' Union, whose attitude is always close to that of Mr Brannan, the Secretary of Agriculture, has already declared its support; and the National Grange and the American Farm Bureau Federation are expected to go on record in favour of the scheme. The disagreement over ICCH between the Depart-

ment of Agriculture and the State Department is a difference between officials eager to use all available means to consolidate the international political position of the United States, and officials concerned to secure the orderly, long-term marketing of farm surpluses which, if not orderly, are at any rate likely to be long-term.

★

The farm pressure for favourable consideration of the FAO plan will be tempered, however, by the new attitude toward surpluses in the staple commodities, noticeable among experts in the field in recent months. No one doubts that surpluses are going to accumulate in the United States. Few people take very seriously the Agricultural Act of 1949, hastily passed by the departing Congress; its revision early in the new year is universally expected. But similarly, few people expect whatever legislation is actually applied to next year's crops and livestock, or to those of the seasons immediately following, to have more than a moderate, and temporarily discouraging, effect on farm output. The increase of a third in the volume of American farm production which occurred during the war years is surely going to be further enhanced as the existing results of research are more widely applied, and as new experiments pass the testing stage.

But the agricultural economists are far from sure that this added output should be regarded as a burden. While the curve of American farm production has risen, the American population has also grown. The surpluses which accumulated during the final years of the nineteen-thirties proved exceedingly useful after the outbreak of war. And there is the weather to consider. The tendency to scan the sky for the cloud no bigger than a man's hand grew on agricultural economists during the Biblical seven good years that smiled on American fields during the war, and that have now become nine. Many of the scanners of the sky remember 1934 and 1936 when, week by week, as the droughts of those seasons spread and deepened, they calculated what the parched and baked sterility of the normally fruitful Mid-west and Great Plains areas meant in shortages, in rising prices, in sacrificed herds. Even more recently, they saw that the 1947 maize crop, the shortest on record, coming at a moment of depleted reserves, caused cattle and hog raisers to liquidate their herds, and set the stage for the subsequent rise in meat prices.

Consequently, the fact that on October 1, 1949, maize

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

stocks were at the record level of 815,376,000 bushels, and the prospect that the carry-over may reach a total of a billion bushels by next October, are not taken as signs of disaster. Wheat has the protection of the International Wheat Agreement, and stocks on July 1, 1949, at 293 million bushels, were in any case far below the record 630,775,000 of 1942. Cotton and tobacco present more perplexing problems, but the carry-over on August 1st of 5,287,000 bales of cotton was much less than the 13,033,000 bales of 1939. Tobacco supplies, on the other hand, are pressing on a record carry-over, from last year's marketing season, of 3,003,000,000 pounds.

If, in the legislation which is actually applied to next year's output, the stipulations in the 1949 Act, governing the disposal of surpluses, are not repealed, the Commodity Credit Corporation must first offer them to the Munitions Board for use in barter deals in return for strategic materials; it can then give them away at home for the use of the school lunch programme, the Bureau of Indian Affairs, federal, state and local welfare agencies, and private welfare organisations, in that order. When this list is exhausted, if there are still no takers, the surpluses can be disposed of abroad.

To some extent, therefore, the tendency is to draw the line at which farm commodities are regarded as surplus higher than it has been drawn before. For producers of perishables whose output exceeds demand at remunerative prices, the outlook is clearly less bright than for producers of storable goods. The former must rely on a continued high level of consumer incomes and their own ingenuity in presenting perishable goods in a wide enough variety of attractive forms to attract the consumer's dollar. As the new crop seasons come around, producers of more commodities will be asked by the Secretary of Agriculture to accept acreage allotments, and those that already have acreage allotments will be asked to vote for marketing quotas. These measures will put a partial brake on output, but the cycle of such restraints, in the past, has been a short one; their costs have soon reached a level that persuaded Congress to scrap the programme and start afresh. If, in another two years, no wars and no bad weather have come along to cut down present rates of accumulation, the basic non-perishable commodities will be straining to the bursting point the bag the Commodity Credit Corporation holds—and in an election year.

More Men, More Years

[FROM OUR AMERICAN STAFF]

FORECASTS made in advance of the coming census indicate that the population of the United States will reach 150 million by 1950. This means that it will have doubled in the first half of the twentieth century, an achievement due neither to a change in the birthrate (which has been declining, except for wartime exuberance, since 1900), nor to immigration (which has been small since 1920), but to the continued fall in death rates, which has occurred not only in America but in all English-speaking countries and in most of Western Europe, during this century.* The phenomenon is no longer one of people pouring in from other lands, but one of Americans living longer and enjoying better health than their parents and grandparents. The added years constitute one of the great scientific achievements of an age more famed for killing men than for keeping them alive.

* See tables in "Length of Life," by Dr. Louis I. Dublin of the Metropolitan Life Insurance Company. Ronald Press, New York, 1949.

They also pose problems which are being recognised, although slowly, and by few of the newly blessed, as perhaps more difficult than those already solved.

The basic methods by which the individual's life has been lengthened are roughly the same everywhere, but each country shows its own peculiarities. Certain diseases, which were common and dangerous throughout the nineteenth century, have become rare through the discovery and use of materials and methods that cure them, alleviate them, or prevent their occurrence. Those who used to die of them now live to die of something else later on. Infants and children were the first to benefit, then those of middle years. Deaths from the ordinary diseases of childhood—typhoid, tuberculosis, diphtheria, measles, scarlet fever, whooping

cough, diarrhoea and enteritis—fell by more than 90 per cent between 1860 and 1945 in Massachusetts, as in England and Wales.

In the United States, where government aid for medicine and medical research is new and small, the credit for this achievement is shared between privately endowed research centres, sanitary engineers and public health experts, scientists in academic and commercial laboratories, and a public whose curiosity, not to say gullibility, have been noticed by every traveller. In earlier days it was not only the settled eastern seaboard which had to be reached with new remedies and new methods, but the streams of immigrants and the scattered communities farther west. Popular journalism helped by presenting scientific discoveries as flamboyantly as though they were earthquakes—as, indeed, they may be. Life insurance companies have, for at least two decades, spent millions of dollars on advertisements which tell people how to live longer by staying well. Teachers of physical education, beauty experts, sellers of refrigerators (to keep food from spoiling and poisoning its eaters) and of fur coats (to keep women from catching pneumonia), all invoke the latest discovery to prove their point and sell their product. In consequence, a conglomerate population, which inherited all the medical superstitions of Europe, Asia and Africa, is now fairly well persuaded that science can do anything, if given time. In some instances, especially where health can be linked with beauty or with popularity, it has even been possible to convince the public that the prevention of illness, through proper diet, proper sleep, early medical attention, is cheaper than its cure.

In all this progress the United States claims few primary discoveries. Its most important contribution, in this as in other fields, lies in the recognition and adaptation of scientific advances wherever made, in the public alertness which creates an immediate market for new products, in the manufacturing skill which adapts these products to the exigencies of mass production. At times this public alertness outpaces

the drug manufacturer. Thanks to interest in the accounts of new discoveries and new developments, the demand for such marvels as cortisone (reported from the Mayo clinic to bring almost complete relief to rheumatoid arthritis) has forced the beleaguered makers to ration the small supply.

★

More, perhaps, than anyone else does the American believe what scientists tell him, and assume that it will pay him to act accordingly. A willingness to experiment is part of his daily attitude. He recognises that it is wise to go to his doctor for a regular check-up; he will even spend a week-end in a hospital for a more thorough examination, without assuming that this means the end. He has no government health insurance, but voluntary group insurance has become increasingly popular as medical and hospital costs have risen.

Applying his scientific convictions to his daily life, the American wants his loaf of bread wrapped in paper and sealed against dirt, his house screened against disease-carrying flies and mosquitoes. He wants his restaurants, cheap or expensive, to be supervised by city and state inspectors who insist that the handling of food shall be clean, the food of a quality that meets sanitary standards, the dirty plates properly washed and sterilised after every using. The paper towel on which he wipes his hands, the paper cup from which he drinks in office or factory, the paper tissue he carries instead of a handkerchief when attacked by the common cold, are all expendable in the service of health—prepared for a single using and then destroyed.

The prevailing assumption that science, given time and public co-operation, can banish from American life all the ills which have afflicted the flesh at other times and places does not come cheap. The nation's bill for medical services and supplies in 1942 was \$3.7 billion—about \$100 per family. The country is spending huge sums in medical research, most of it privately contributed; cancer research alone takes \$25,000,000 every year, yet the incidence of the disease is increasing because the populace is longer-lived. The leading causes of death today, apart from accidents and violence, are the degenerative diseases—cancer, heart disease, cerebral hemorrhage—hard to treat and harder to cure. No one yet knows how infantile paralysis is caused or carried, little is known of the ways of viruses or of bacteriological toxins. Tensions produced by living at the machine's pace take their toll of nerves and minds; psycho-somatic ailments result from social maladjustment and prove harder to deal with than was yellow fever. The common cold still plays its wintry part, though a new remedy tried by the Navy has just been announced and news of it has already reached the taxi-driver level.

Optimists expect such stubborn ailments to yield in time. What they prefer not to see are the economic and social costs of medical victories. The winning of more years for more men has shifted the proportions between the various age groups. The middle group which does the working and the earning is not increasing in size, but its burdens are; it must support those younger people whose dependent youth is lengthened, and those older ones who do not die as soon after retiring as their parents did. Labour's demands for pensions are only the latest evidence of this. Even more depressing are the problems that come with prolonging life after sight, hearing and mind have begun to go. Modern pretensions of immortality on earth have resulted in a new science, geriatrics, which studies the physical ailments of the aged. Their economic needs also require study.

American Notes

After the Marshall Plan

The annual migration of American legislators which has become a feature of the postwar world is once more with us. From Guam to Sweden, from Spain to Alaska, the voice of the Congressman is heard in foreign lands—not always cooing like the turtle dove. Senator Thomas has had sharp things to say of the Swedes, who he considers did not roll out a sufficient yardage of red carpet for his visit; a few days later, by urging aid to Spain, he succeeded in ruffling French feathers. In fact, the speed of Senator Thomas's flight may give the impression of more Congressmen than are actually on the wing; this year a considerable number eschewed what the American press always likes to call "foreign junkets" in order to catch up on their homework for next year's elections.

More disturbing to European officials has been the joyful conclusion of members of a Senate Appropriations subcommittee, as they whirled through one capital after another, that European recovery has been so striking that further aid is unnecessary. It has long been recognised that the third appropriation for Marshall aid would be difficult to extract from a Congress faced with a heavy budget deficit. Mr Hoffman's demand for more speed in the economic integration of Europe was accompanied by a hint that, without some spectacular progress in this direction, Congress may hesitate to appropriate even the reduced sum—perhaps between \$2.5 and \$3 billion—which the ECA is expected to request for next year in a few months' time.

★

The risk, of course, is that Mr Hoffman may merely have made a gift to ECA's enemies in Congress of a yardstick against which they can measure Europe's supposed failures. But the Administration shows signs of placing less reliance in future on Congressional appropriations to solve the economic problems of Western Europe, though both Mr Hoffman and Mr Acheson have suggested that foreign aid, on a reduced scale, may be necessary after 1952. This is not because the Administration is disillusioned with the Marshall plan but, on the contrary, because it has succeeded, in two years instead of four, in doing what it was expected to do—revive European production. The obstinate problem of the dollar deficit and trade distortion requires other remedies: lower costs and better salesmanship in Europe, and a radical alteration in the North American attitude toward imports.

The campaign to convince American opinion of the urgency of increasing imports by \$2 billion a year or more has already been launched by Mr Hoffman and Mr Acheson, on the basis of the Taylor report. There are four main avenues of attack on the "unbalanced state of American trade": a third round of tariff negotiations in February, 1950, legislation to clear a way through the jungle of customs procedure, a campaign to increase American tourist expenditures, and, finally, the repeal of legislation requiring the government to "Buy American." Whether Congress, however much it grumbles at the direct costs of foreign aid, will swallow the Administration's alternative remains to be seen. Businessmen and members of unions have votes, as well as taxpayers, and by next year ECA may appear an even more attractive outlet for domestic surpluses than it does today.

★ ★ ★

Trouble on the Waterfronts

The strike of ships' officers in the Atlantic and Gulf ports has been postponed, for the third time, until December 16th. Only about 2,000 masters, mates and pilots are involved, but other unions belonging to the American Federation of Labour are pledged to support them; a strike would therefore hold up almost all shipping on the east coast. The trade unions are as anxious as the employers

to avoid this, since unemployment amongst seamen is already causing concern, with from four to twenty men applying for each job offered. As the result of wartime expansion, there are now nearly twice as many seamen available as there were before the war, to man a merchant fleet already little larger than it was then, and still shrinking. This situation is at the root of the dispute with the ships' officers, who are demanding that they be hired in rotation, apart from captains and first officers, so that jobs may be shared fairly among them. The shipping companies insist that they must be free to select their officers, who have full responsibility for the ships when at sea.

A seamen's strike is also threatening in the Pacific ports, where negotiations have been going on for three months over a new contract involving wage increases and a welfare scheme. Another strike might be a knock-out blow for west coast shipping firms, still dazed by last year's lengthy stoppage in San Francisco and this summer's blockade of Hawaii. Mr Harry Bridges, head of the Longshoremen's Union, was responsible for both these strikes. He is now on trial in San Francisco for perjury, allegedly committed by denying his membership of the Communist Party when he was naturalised in 1945. Previous attempts to prove this have failed, but the Government now claims to have new evidence and is confident of deporting Mr Bridges to his native Australia.

★

If it succeeds, it will deserve the gratitude of the Congress of Industrial Organisations, since Mr Bridges is one of the most troublesome of the fellow-travellers which the CIO is now determined to eject. If he were absent his longshoremen's hearts might grow fonder of the CIO's right-wing head, Mr Murray. But another CIO leader, Mr Curran of the National Maritime Union, of east coast seamen, is now finding that it is not easy to make Communism lie down and die. The NMU was amongst the first unions to challenge and frustrate party-line infiltration and Mr Curran, as he thought, finally finished the Communists off in September. But last week his New York headquarters were besieged, and his lieutenants assaulted, by a mob of seamen led by, if not entirely composed of, the left wing elements which had supposedly been buried two months before. Violence is no novelty to this union, or to Mr Curran, and with the help of the police he had the situation under control in three days. But dissatisfaction with Mr Curran's methods, both within the union and when dealing with the shipping companies, gave the rebels some of their strength, and will give them more if unemployment continues to grow amongst seamen.

★ ★ ★

Blowing Up the Budget

Last week the guardian angels of the national solvency—Mr Snyder, Secretary of the Treasury and Mr Pace, Director of the Bureau of the Budget—put a bomb under the national budget which may blow sky-high that already shaky temple of financial orthodoxy. In statements prepared for the Joint Congressional Committee studying monetary, credit and fiscal policy, they made it clear that they neither expected nor desired a balanced budget. Mr Pace went so far as to imply that the national economy would not suffer if the Government's expenditure permanently exceeded its income. Belief in the necessity of balancing the budget each year was of course lost long ago, but now faith is apparently also weakening in the modern dogma of a compensatory, or cyclical, budget, which supposedly piles up reserves in good years to balance deficits in bad ones. Mr Snyder and Mr Pace confessed that the automatic changes in policy, on which this system is based, were not in their opinion practicable and that Congress can not escape a detailed examination of the budget each year.

In discharging its responsibility this year, Congress added to the deficit (now expected to reach \$5.5 billion) by giving the President more than the \$42 billion he had asked for. Mr Truman has said that he is drawing up next year's budget even more tightly than he did this year's, in order to forestall possible Congressional cuts. But even in the unlikely event of Senator Douglas's inducing Congress to make its own contribution in the form of lower mail subsidies and smaller public works appropriations, reductions in existing expenditure are unlikely to counteract the cost of new Fair Deal enterprises. Mr Truman is still talking of increased taxation, but such a political realist must know that his chances of getting it in an election year are negligible. Mr Pace hinted that higher taxes might not be advisable, when he said that the best way to achieve a budgetary surplus was by raising the national income; the general economic welfare should, in Mr Snyder's view, decide whether or not the budget is to be balanced.

It is now being suggested that the prospect of a steady increase in national expenditure, involving permanent inflation, would seem less menacing to the fiscal conservatives if the budget were divided into two parts. Current expenditure and receipts, which would frequently show a favourable balance, would be separated from capital outlays and loans, which, as Mr Pace points out, are relatively uncontrollable and make it impossible to balance the budget. At present these expenditures appear as lump sums in the accounts for the year in which they are incurred, although many of them are partially or entirely self-liquidating. The private business practice of distinguishing between operating costs and investments is certainly one which the federal accountants might copy, especially now that, under the welfare state, the Government is taking a positive responsibility for the national economy.

★ ★ ★

Nine Lives for the Poll Tax

The poll tax, which must still be paid by voters in seven southern States, is harder to kill than any cat. In the recent elections two States, Virginia and Texas, voted not to repeal the tax, while in Tennessee the electorate turned down the proposal for a constitutional convention which, among other things, would have made possible the extraction of the poll tax from the state constitution in which it is embedded. In Tennessee, however, it seems to have been the fear that the renovators would let in the income tax, rather than turn out the poll tax, which decided the day; while in Virginia, the vote was not so much a vindication of the poll tax as a recognition that, undemocratic as it may be, there are worse alternatives.

In Virginia, ancient enemies of the poll tax were forced to vote for it, while the Byrd machine, which has long won electoral victories on low votes, supported repeal. The machine and other supporters of the amendment pointed out that a federal prohibition of the poll tax was sure to come, and that although this would apply only to the election of federal officers, two versions of the electoral register—one long and one short—would prove an intolerable embarrassment. They saw an opportunity to couple repeal with the introduction of new restrictions, on the Georgia model, which might prove even more discriminatory and undesirable. This was to be achieved by closing the registration books 120 days before the election, when interest is low, rather than 30 days before, as at present; and requiring a literacy test for voters, as well as other proofs of capacity, at the discretion of the Legislature. An interesting point is that in Virginia the proceeds of the poll tax help to support the schools; its abolition would require new taxes, which would have been levied on all citizens, rather than merely on those who could afford up to \$4.50 for the luxury of a ballot.

In Ohio, the right to vote was not the issue; instead, it was whether voters should be deprived of the short cut of voting the "straight party ticket" and required to make known all their choices. A majority of those voting on the amendment accepted the so-called "Massachusetts ballot," which makes it impossible to enter a vote for the whole list of one party's candidates by marking a cross beside its candidate for Governor at the top of the paper. The amendment may be thrown out on a technicality but, if it is sustained, it will be reckoned a useful aid to Senator Taft in his race in 1950. In the past the Democrats in Ohio have benefited from the popularity of their Governor, Mr Lausche, and both the party organisers and the trades unions campaigned vigorously to retain this advantage in their fight to unseat Senator Taft. Their disappointment is all the greater because Mr Lausche has announced that he is not available to run against Mr Taft for the Ohio Senatorship.

Filipinos Vote for America

The United States shared its election day with the Philippine Islands when they graduated from American tutelage; on the Tuesday after the first Monday in November Filipinos, like Americans, went to the polls. Unlike Americans, this year they had to elect a Congress and a President. They did it with a violence and corruption unprecedented even in their history, and many Americans are wondering whether the evident failure of the Filipinos to absorb the lesson of democracy is the fault of the teacher or the pupils. But at least the Filipinos, unlike graduates from other imperial schools, are still anxious to please their former instructors. All three Presidential candidates vied with each other in protesting their friendship for the United States. President Quirino probably owed his victory as much to the official visit to Washington, which proved his claim three months before the election, as he did to the patronage and control over the polling booths which his office gave him.

In large part, at least, it is the hope of further economic aid which inspires the Philippine affection for the United States, but President Quirino did not bring back any specific promises from a Washington becoming very conscious that its purse is far from bottomless. The financial assistance given under the Philippine Rehabilitation Act of 1946 will run out in the course of next year; 1954 is also approaching, when Philippine exports to the United States, duty-free until then, must begin climbing tariff walls which will reach their full height twenty years later. Already trade with the United States is seriously out of balance; any good done by the quotas imposed early this year on imports from America has been offset by declining prices for such major Philippine exports as copra. President Quirino is expected to impose even more drastic restrictions now that the elections are over.

★

This enforced reduction in imports from America is being made up from other sources; Japan is the chief of these, and it also offers an export market to replace the one lost in China. Reparations from Japan would provide a partial solution for other economic difficulties, and it will be difficult to obtain Philippine acceptance of a peace treaty which does not contain reparations in some form. Philippine resentment against Japan is acting as a brake on American enthusiasm for a Japanese settlement and President Quirino is not as likely to yield on this matter as his chief rival, Señor Laurel, would have been.

Señor Laurel was President during the Japanese occupation and his puppet past was the chief cause of his defeat this month. He also suffered from the unsolicited support given to him by the Huks, the Communist-led rebels. The Philippine Government, determined that these poverty-

stricken peasants shall not achieve the same success as their Chinese counterparts, is, with American encouragement, using US military aid to protect the country's internal security rather than for defence against foreign enemies. By next July, this aid will have amounted to some \$170 million. The United States also has a military advisory group in the Islands and 99-year leases on a number of bases for its own use.

Shorter Notes

In November, 1948, the voters of Idaho repudiated the isolationist Republican Mr Henry Dworshak, who had been representing them in the Senate, and chose instead a Democrat, Mr Bert Miller. Senator Miller died at the beginning of October and the Republican Governor of Idaho used—or misused—his legal power to appoint a successor by sending Mr Dworshak back to Washington.

★

The Senate sub-committee has adjourned, until the beginning of the year, its inquiry into the activities of the "five percenters," the Washington "management counsellors" who are alleged to charge that percentage for helping businessmen to obtain government contracts. Meanwhile, the original "pedlar of influence," Mr James V. Hunt, has gone out of business on the advice of his doctor.

★

Even gold is not what it was: the nuggets found at Fishwheel, Alaska, turned out to be only brass, to the disappointment of the nineteen-forty-niners, who apparently looked and acted very much like their Californian predecessors of a century ago, but travelled by taxi-cab and airplane, instead of by covered wagon.

Soviet Uranium Sources

(By a Correspondent)

PRESIDENT TRUMAN'S recent announcement about the atomic explosion in Russia has brought to light the extent to which experts in the west indulged in wishful thinking when they confidently asserted that Russia possessed neither the uranium nor the technical "know-how" required for the production of atomic energy. Even now the view has still been current that the Soviet Union does not possess substantial uranium deposits and is therefore completely dependent for supplies of fissionable material on imports from Czechoslovakia and Saxony. This view does not accord with the facts that can be freely learned from Russian technical geological publications, which appeared before the war at a time when it occurred to nobody that uranium would soon become the most jealously guarded military secret, and when the now precious ore was treated by the Russians somewhat slightly, because there had been little industrial demand for it.

The Great Soviet Encyclopædia (Vol. 56, pages 245-247, published in 1936) indicates briefly that the main uranium deposits of the Soviet Union are located at Tuya Muyun and Taboshar in Central Asia. Detailed descriptions of these and other deposits, their exact location and an analysis of the geological and industrial problems involved in their exploitation are contained in Russian mineralogical surveys of Central Asia published in the middle thirties. The information given in this article is based mainly on an extensive survey by I. Bashilov ("Deposits of Radio-Active Ores in Central Asia and the problems of their exploitation") which was published, under the auspices of the People's Commissariat for Heavy Industry, in Leningrad in 1935. The survey sets forth the findings of the great Tadjik-Pamir expedition which had explored the resources of Central Asia in connection with development schemes of the second and third Five-Year Plans.

Investment in the Thirties

According to this survey, the main zone of Soviet uranium deposits spreads from Samarkand eastwards over an area of several hundred kilometres to Tuya Muyun. By the middle thirties this vast area had only just been explored, and Tuya Muyun was still the main centre where uranium was actually mined. The place is situated on the northern slopes of the Alai mountains, to the southwest of the town of Osh, in the Kirghiz Soviet Socialist Republic. Tuya Muyun has been known as a source of uranium since the beginning of this century; and the ore mined there has been called Tuya Muyunit. The deposits were re-explored in the thirties by order of the *Soyuz Redmeta*, the Association for Rare Metals, which had its headquarters in Moscow and operated its own uranium refinery.

In the middle thirties the mines of Tuya Muyun were in a somewhat critical condition. Large scale investments were needed to expand output. The veins of uranium ran between powerful veins of water, and costly installations were needed to pump out the water, sometimes from great depths. But no power stations existed in the vicinity, and transport was inadequate—a distance of more than 60 kilometres separated Tuya Muyun from the Central Asiatic Railway.

The geological experts were rather hesitant in their practical recommendations laid before the Government: they were not sure whether the investments required would be economically sound. They insisted on the richness of the deposits: there were two types of ore, a rich one with 65-80 per cent of uranium content and a poorer one with only 52 per cent. But the mineral was then considered to be relatively unimportant; and, because of intensive competition between Belgian, Czech and American uranium companies, it could be cheaply imported from abroad. The Soviet explorers were then more interested in gold, silver, copper, wolfram and other non-ferrous metals in which this area is fabulously rich. In the late thirties the mines of Tuya Muyun were probably not developed any further. In those years many Soviet administrators were tried on charges

of having induced the Government to make false industrial investments, as a form of sabotage; and hardly anybody would have dared to press on with schemes for capital development in what was thought to be a non-essential industry. Since 1945, however, new mines have been opened up in the stretch of land between Osh and Molotovabad in the east and Samarkand in the west.

Another zone of uranium deposits is in the Tadjik Republic, on the western slopes of the mountains of Kara-Mazar, between the rivers Syr Darya and Angren, 40-50 kilometres north of the town of Khodzhen, close to the Tashkent-Melnikovo railway. The centre of this mining area is Taboshar and Sarımsakla. These deposits were discovered only in 1926 and their exploitation did not begin until the thirties. Taboshar and Sarımsakla are situated high in the mountains, but they are easily reached by road. Even in the thirties this area was better populated than Tuya Muyun. The Taboshar deposits were, however, reported to be poorer than those of Tuya Muyun, but the conditions for exploitation were better. Bashilov, quoted above, urged the Commissariat for Heavy Industry to develop

the Taboshar mines and to cover the expected deficit of the enterprise through fostering the growth of health resorts on the spot. In the same way, he argued, the Czech uranium company was deriving financial benefits from the health resort of Joachimsthal. He reported on the strong radio-activity of the Taboshar waters and called the place "our Soviet Joachimsthal."

Other sources of uranium reported at the time were Kara-Khagir in the southern Fergana valley and Agadik (or Agalik?), 16 kilometres east of Samarkand. Agadik uranium was discovered by an expedition under Professor Silbermintz in 1933. In subsequent years the place was again explored and abundant and rich reserves of uranium were reported. New finds were simultaneously made on the river Maili Su, 53 kilometres north of the town of Andizhan. Here, in the centre of the old Tamerlane empire, another "polymetallic" area was discovered, containing, apart from uranium, gold, platinum, lead, mercury and so on. Finally, abundant deposits of thorium, important as a substitute for uranium, were discovered in 1932 on the eastern slopes of the Pamir ("The roof of the Soviet Union"), in the valley of the river Alichura, at a height of nearly 12,000 feet. The deposits can, however, be easily reached by the Khorog-Osh road and are located about 450 kilometres from Osh.

All these areas were intensively developed during the second world war, when Soviet industry was greatly dependent on them for supplies of various non-ferrous materials. This wartime development should have later facilitated the extraction of uranium as well, because the latter has usually been found in combination with wolfram, vanadium, etc. In Tadjikistan, for instance, the wartime output of wolfram and lead was reported to have increased ten times. From some indirect indications in the postwar Five-Year Plan it may be inferred that the main emphasis has now been on the development of the uranium deposits in the Kirghiz Republic. The Plan for Kirghizia has aimed at doubling the output of non-ferrous metals and at a four-fold increase in the extraction of rare minerals between 1946 and 1950.

Impregnable Atomgrad?

The information given here on the sources of uranium in Soviet Central Asia has been available since the middle thirties. It seems almost certain that other sources have been found in the meantime. Anxious to shift the centres of its power eastwards, the Soviet Government has attached very great importance to geological exploration. By 1929, before the first Five-Year Plan was started, only 18 per cent of the whole area of the Soviet Union had been explored by geologists. In the middle thirties 35 per cent had already been explored. By 1940 new expeditions had extended research to 66 per cent of the total surface of the Soviet Union. The work was continued even during the war, and on January 1, 1945, 73 per cent of all Soviet territory had been covered by mineralogical exploration.

It is quite possible, and even probable, that Russia's atomic piles are also situated somewhere in the Kirghiz and the Tadjik Republics, near the sources of the raw material. Reports which have appeared in the press about an Atomgrad allegedly situated in Armenia, near the Russo-Turkish frontier in the Caucasus, sound more than a little fantastic. It would be very strange indeed for the Soviet Government to build up its atomic industry in an area which is strategically so vulnerable. The sources of uranium in Kirghizia and Tadjikistan are well sheltered. Those areas have been little known to foreigners, and they are protected from invasion by land or attack from the air by the impassable peaks and glaciers of the Tiau-Shan and Pamir-Alai mountains. Two peaks symbolically guard the entrance from non-Soviet Asia: Mount Lenin (nearly 24,000 feet high) and Mount Stalin, towering even higher, to about 25,000 feet.

France, Germany—and Britain?

[FROM OUR PARIS CORRESPONDENT]

LAST Monday evening, on the eve of the debate on Foreign Policy in the *Assemblée Nationale*, the front page of *Le Monde* contained the following statement:

In spite of Mr Bevin's speech in the House of Commons, several of our deputies are toying with the suspicion that the British Government believes that both time and means are lacking for the true fortification of the Continent of Europe. According to it, the compelling aim is to attract to Britain the essential part of American aid. It also holds that an Anglo-Saxon common front would be less provocative to Russia than the arming of the Continent, which might incite her to preventive action.

This repugnant suggestion is tragically characteristic of the current French distrust of Britain, which gained in emotional force at the time of the devaluation of the pound and has never since subsided. No doubt this "sentiment of no confidence" has its partial origin in certain British inadequacies of public behaviour and utterance. But much more does it seem to derive from an extraordinary incoherence and, it must be said, defeatism in the French body politic. Not that Frenchmen are conspicuously depressed in their individual lives; but rarely can a resourceful nation have been so hypnotised by the problems, real and imaginary, with which it has to contend. The clear-cut decisiveness of those few individuals and groups which see the road ahead is in dazzling contrast to the confused, lifeless and shifting mass of opinion.

It was, indeed, natural that the recent three-power talks on Germany should have caused misgivings. What is surprising is their endless variety and abstract complexity. Some Frenchmen want dismantling to go on and Allied control of Germany to be maintained; others demand the

immediate formation of a Franco-German army under the command of General (Charlemagne) de Gaulle. Some adopt the pure American metaphysic of Germany's "integration" into Europe; others, on the other hand, dread the prospect of economic "domination" by Dr Adenauer and the Ruhr magnates that "integration" would, in their opinion, surely bring. Some—and not only the Communists—are looking again to a western European *bloc* "independent of America" to act as a buffer-*bloc* between the colossi, with, if possible, an adjacent buffer in the shape of a "nationalised Germany."

Confusion of Rival Remedies

Then there are the subtler economic subdivisions: the liberal integrationists who are out for freer trade; the less liberal integrationists who want cartels (of the *beneficial* kind); the Socialist integrationists demanding European ownership of everything in sight, but who, in the presence of Herr Schumacher, feel lonely without Mr Bevin. (*Humanité* commented most unkindly on M. Léon Blum, who had proposed to include Labour Britain in his own brand of Socialist integrationism—M. Blum, declared the editorial, was worried because the American capitalists wished to collar the Ruhr aided only by the French capitalists, thereby leaving their British Big Business brothers right out in the cold. It was this omission which M. Blum was so obviously anxious to rectify.) This crossword puzzle of contending abstractions bids fair to obsess politics for many months to come.

M. Raymond Aron, of *Figaro*, has presented the clearest sequence of arguments in favour of a full Franco-German *rapprochement*. Granted, he writes, that in the logic of events and, above all, in American eyes, Allied control of western Germany is a back number, French energies had better be directed forthwith towards bringing Germany into the western camp. He who rejects this policy must formulate an alternative. He who accepts it must support it to the full. "Going slow reduces the chance of success without reducing the risks involved." The reverses suffered by the OEEC had demonstrated the necessity of a full continental agreement, economic as well as military. "Now or never must French diplomacy overcome its complexes." "The conditions were more favourable for a Franco-German agreement two years ago. In one year they will be worse still." M. Aron, while recognising the vital importance of British participation in Europe, culturally and in defence, does not see why its absence (if absence it must be) from European commerce should paralyse Franco-German relations in this field.

Views of the Planners

In view of public and parliamentary confusion over the German-Soviet problem it is fortunate that the Civil Service, aided and guided by the *Commissariat général au Plan de Modernisation et de l'Équipement*, has a grasp of the concrete essentials at stake in the matter of a Franco-German *rapprochement*. These quiet experts are concerned not with ideological slogans, but with exploring the best means of strengthening the French economy. Their opinion appears to be that a liberalisation of trade with western Germany is necessary for the development of French production, but that no dogmatic principle governs the course which should be taken, the relative power of each French industry being the criterion in determining the aggregate of German competition desirable. There is general agreement, however, that there can be no serious Franco-German economic link until Germany abolishes its present differential system of domestic and export coal prices. Once this discriminatory practice ceases, trade may expand. As to French exports to Germany, there is known to be a considerable market for agricultural produce; French exporters hope also to revive their sales of luxury and semi-luxury goods (woollen goods, silk, gloves, glass, preserves, wine and so forth).

In assessing France's contemporary strength it is possibly

erroneous to pay too much attention to the disturbances of the last two months in its domestic and external affairs. If the present government is unlikely to attain the standard of the now lamented M. Queuille, it may yet survive the vote on the budget and the turn of the year before giving place to a further version of the Third Force. If inflation can be prevented by curbing labour's discontent, if production and productivity can continue to rise, France stands a good chance of raising its standard of living appreciably in two or three years. During the intervening danger period, however, it is essential that fears for its security should not arouse passions and inspire policies detrimental to its economic stability. It is, therefore, vitally important that the defence of its frontiers should become a solid reality and that Britain should take the very greatest pains to define its position in speech and in action, whatever the occasional injustice of the allegations made against the British Government. If economic integration is impossible for Britain, its military participation must be by that much the more conspicuous. For it is only when Britain's various inter-European relationships are firmly established that it will be possible to dispel the odour of uncertainty and sense of shapelessness that France, perhaps more than most other European countries, suffers from. France should, it seems, at this moment in its history recover its own internal unity through the establishment of firm relations with its neighbours. And these neighbours should take France's predicament to heart; otherwise they will lose an irreplaceable ally.

Double-Pricing in Europe

[FROM A CORRESPONDENT]

THERE was some surprise among producers in the Marshall countries at the vehemence with which Mr Hoffman recently attacked "double pricing"—that is, the practice of charging the foreign buyer a higher price than the domestic consumer pays for the same article. There was also righteous indignation. For, since the end of the war, it has become a commonly accepted practice of nations throughout much of the world to keep the domestic prices of basic materials as low as possible while squeezing from the harrassed foreigner the last drop of profit. From time to time a victim complains, but he can usually be found to be indulging in a similar game whenever the opportunity presents itself. The practice is defended on the grounds that "everyone does it" and that it is "sound business." This article sets out only some of the arguments now heard in Europe against the practice.

Among the trading nations of the world, Argentina has been the outstanding practitioner of this philosophy; in Europe the leaders have been the big coal producers—Germany, Britain and Poland, as well as all of the nations which produce steel and iron ore. The same characteristics are said to prevail in the chemical and fertiliser trades. Mr Hoffman's criticisms sprang partly from idealistic considerations. He was disturbed at the evidence of the lack of "mutual self-help" in Europe. But he was also questioning the commercial merits of the system of dual pricing—whether in fact it was "sound business." Since Mr Hoffman spoke a number of concrete cases have arisen which lend point to his doubts.

Sweden is protesting at the action of the National Coal Board in raising the price of British coal exports after devaluation and thus widening the disparity which already existed between prices at home and abroad. Swedish officials claim that this will seriously hamper their efforts to liberalise trade, a project to which both Mr Hoffman and Sir Stafford Cripps attached great importance at the Paris meetings of the Marshall nations last month. Swedish manufacturers, like those elsewhere in Europe, were already resisting proposals that they be laid bare to competition by the removal of import quotas; now, it is feared, they will clamour for

protection with the argument that, since they must use high-cost imported coal they are in no position to compete with British and German industries, based on cheaper domestic fuel.

Holland provides another illustration of the long-term damage that double pricing may inflict. For some months the large steel producing nations in western Europe have been opposing Holland's plans to expand its steel plant. They have been lecturing the Dutch on the evils of expanding production of a commodity that will soon be in surplus; they have been reminding them that the Dutch product will be expensive. Holland's answer is that the only time they can obtain cheap and abundant supplies of steel is during a depression, when they do not need steel. Under postwar conditions they have gone short, and they have had to pay through the nose. It is suspected that an additional Dutch reason for pursuing its plans is the national desire for a more balanced economy. The arguments for this and similar "uneconomic" projects, however, would lose much of their strength if it were not for the recent history of double-pricing.

Wasteful Use of Resources

It is instances such as these which suggest the unhealthy character of the double-price system to the American authorities in ECA. And they find it difficult to resist the conviction that an all-round abandonment of the practice would be to everyone's advantage. In some cases producers might not seek compensating increases in domestic prices; here the gain to all would be obvious. In other instances it is argued that any reduction in export prices would involve an overall loss which could only be avoided by raising home prices. But where this occurred the readjustment and equalisation of import and export prices might also be to the general benefit; a domestic price below the costs of production leads to a wasteful use of resources while unduly

high prices to foreigners may entail a wasteful contraction of overseas production. If, for instance, Sweden is unable to develop its resources fully because of the high price of British coal, then both the British and the Swedish consumer suffer.

It was on behalf of this wider point of view—the standard of living of the ordinary consumer—that Mr Hoffman made his plea for the abandonment of double-pricing. His appeal was one more facet of the American hope that western Europe will turn itself into a single free market and thereby gain all the advantages of cheap mass production. Double-pricing is regarded as essentially discriminatory and not in harmony with this concept of one market. (Why, for instance, should Germany discriminate between the Ruhr and Lorraine when such discrimination would be unthinkable between Dortmund and Düsseldorf?) Moreover, the system is one of the few forms of discrimination where the cost of progress could be easily and precisely measured. In making the necessary price adjustments it would be difficult for even the most ardent nationalists in Europe to complain that they were being asked to take a leap in the dark.

In some instances the dropping of dual prices would probably bring the exploiter only intangible benefits. Trade relations between Denmark and Britain are a case in point. At the moment Britain has again raised the price of the sharply limited quantity of high-grade coal that it is allowing the Danes to buy. This behaviour is resented by the Danes, particularly since they remember that in the thirties, when Britain was hard-pressed by mass unemployment, they were induced to purchase British coal under the pressure of the suggestion that they would otherwise lose their market for agricultural produce in Britain. An added grievance is that devaluation has brought a rise in the production costs of Danish agriculture, since it depends on feeding stuffs imported from the Western Hemisphere; but Britain, while raising the price of coal exports, has held the Danes to the

terms of their long-term food contract. This means that Danish prices cannot be reviewed until next year and then can only move a maximum of seven per cent.

If Britain and the other powers in a strong bargaining position persist in pressing their advantage to the utmost, then the chances for an atmosphere of friendly co-operation are certainly diminished. It might well pay the strong to make a gesture now rather than to have concessions forced on them by the appearance of increased supplies in the not too distant future. Then it will be their turn to ask for favours.

New Zealand Elections

[FROM OUR NEW ZEALAND CORRESPONDENT]

November 8th

NEW ZEALANDERS will go to the polls on November 29th—in four Maori electorates—and on November 30th—in 76 European electorates—to decide whether the Labour Party, which has been in office continuously since 1935, should be given a further tenure of three years or whether the National Party, a fusion of the old Conservative (Reform) and Liberal (United) Parties, should supplant it. The election campaign has been fought on domestic issues, particularly on the cost of living; but the verdict may well turn on whether the voters consider that the Labour Party has grown old, and hence less vigorous, in office or whether it would be safe to risk giving power to the more zestful National Party.

The Labour Party's manifesto is called "Security for All." Its planks are full employment; guaranteed prices for the farmers; a continuation of import, stabilisation and price controls; social security and an improved housing programme. The National Party says that its aim is to build a country in which everyone can enjoy happiness, good health, security and freedom. It pledges itself to restore an economy based on private ownership and management and on fair competition; to encourage thrift and self-reliance; and to care, generously and sympathetically, for those in need. It also says that it will deal with the basic causes of the rising cost of living; that it will support a Government loan plan for increasing the number of houses; and that it promises to maintain full employment and the social security system.

It will be seen that there is not a great deal of difference between the two parties in many of their policy planks. Both promise full employment, no reduction in social security benefits and more aid in financing home-building. The recent conscription referendum, when the leaders—the Prime Minister, Mr Fraser, and the Leader of the Opposition, Mr Holland—campaigns together to obtain a four to one majority showed that on defence and the Imperial connection generally the two parties are also broadly agreed.

A Quiet Campaign

The issue of state control versus private enterprise has provided one of the few lively points of disagreement. On taxation the Government has challenged the National Opposition to show where it would cut down expenditure, and Labour speakers have asked whether the Nationalists propose to cut pensions or to reduce the civil service. The National Party has denied any such intentions, but has also been careful not to promise any definite rate of tax reduction until it has had the opportunity to examine the present Government's commitments. The National Party argues generally that there must be scope for tax cuts in the elimination of "wasteful expenditure."

At the time of writing the campaign has been quiet, with only the two leaders drawing considerable audiences. Some speeches are being broadcast, and the angriest feelings to date have been roused by Mr Fraser's decision to reserve for himself the sole right to broadcast on the eve of the election. His similar decision in 1946 was bitterly criticised by Mr Holland. One National Party candidate has hinted that he may take steps to test the legality of Mr Fraser's action.

Maoris Hold the Balance

Labour holds all four Maori seats, and on this fact—"the brown mandate," as a popular cartoonist consistently describes it—its life has depended in the Parliament just dissolved. The relative strengths were: Government 42 seats; Opposition, 38. In the last two months even this narrow majority has been reduced through one Labour member quitting the party because of opposition to conscription and the death of a Maori member just before the last session ended. The policies of both parties pay special attention to the Maori people, and Mr Fraser, who is his own Minister of Maori Affairs, has been indefatigable in visiting Maoris in their own communities.

All the indications point to another close election. In most constituencies the issue is directly between the two parties. A few Communists, without hope of success, are standing for propaganda purposes. Thirteen seats were decided by comparatively narrow margins in 1946. A swing in a few of them on November 30th could decide the political colour of the next Government. There are signs that the National Party's main slogans, "New Zealand's greatest need—a new Government" and "This is a cost-of-living election," will be countered most effectively not by Labour's "square deal" advertisements, addressed to various sections of the community, but by the feeling of many voters that only Labour can maintain and extend social security benefits and banish the fear of a recurrence of a depression, the memory of which still sears many minds.

WHY is the steel industry delivering the goods?

The question is answered by the facts.

The British steel industry is composed of five hundred independent firms, working under Government supervision and in competition with each other. To-day the efficiency of the industry is such that:

- 1 Output has achieved an all-time record.
- 2 Exports of goods made from steel are now double pre-war.
- 3 Steel prices are among the lowest in the world.

What produced these results?

The team spirit in the industry, the stimulus of competitive enterprise, and the sense of public responsibility on the part of both workers and management.

THE BUSINESS WORLD

Sterling since Devaluation

HOW fares sterling two months after its devaluation? The evidence is conflicting. The Chancellor of the Exchequer has told the world that the gold and dollar reserve has been recovering from the nadir of £330 million (at the old rate) reached just before devaluation on September 18th. In the subsequent twelve days, as the quarterly figures showed, there was a return of £20 million; all that is known about the position since then is that "the reserves have continued to move upwards." But, had the gain been really large, the Chancellor would presumably have said so. Sir Stafford's statement cannot, therefore, be any cause for congratulation. The speculative position in sterling was widespread and massive. The surprise is that the immediate rebound, since the speculators have been offered profits ranging up to 40 per cent on their deals, proved to be so modest. In part, this sluggishness of the response must reflect the fact that most of the speculative position—if it can be so called—was built up by delaying postponable purchases of sterling commodities and, on the other side of the account, by an acceleration of British purchases abroad (of which the £100 million increase in stocks of food and raw materials during the past six months may be a reflection). This interference with the normal flow of commercial operations and payments will be readjusted in time, and the consequent reinforcement of the reserves will not be completed for some months. The rebound from the speculative position could not, therefore, be as rapid as the movements which followed the great devaluations of the inter-war period, when the exchange adjustments were preceded and precipitated by massive speculative operations on the free foreign exchange markets—which no longer exist.

This technical fact does not, however, completely explain the modest dimensions of the covering operations. There is no doubt that abroad, as in Britain, the effectiveness of sterling's devaluation has been brought into question, and confidence in the new rate has been undermined, first by the delay in announcing the "consequential domestic measures" and then by their unexpectedly meek character. This disappointment, allied to the fact that the new parity of \$2.80 provides a ceiling beyond which sterling is most unlikely to rise, has probably tempted many operators to allow their position in sterling to run a little longer, on the argument that they cannot lose and may gain further by doing so.

It is, however, deceptively and dangerously tempting to try to measure this lack of confidence merely by the rates quoted for various types of sterling abroad. Given the elaborate system of exchange control which surrounds the inconvertible pound, and given the continuing world-wide shortage of dollars, some volume of unofficial business in sterling at a discount is bound to be transacted, whatever the official rate may be. The Chancellor of the Exchequer said last week that these

discounts become dangerous only when they are wide enough to make profitable "cheap sterling" transactions on a considerable scale such as were taking place before devaluation and were leading to substantial losses of dollars. But he claimed that the Government had at present no evidence that the existing discounts on sterling were having this effect, or that more than "very small" volumes of business were being done. He also expressed the hope, in the best heads-in-the-sand tradition of the present Government, that press comments on these rates for cheap sterling "will be reduced to the negligible dimensions deserved."

★

Sterling quoted abroad in free markets falls into three main categories. They are, in inverse order of importance, the rates for pound notes, for security sterling, and for various types of commercial sterling. Of the last and most important group, the three main subdivisions are American account sterling, transferable account sterling, and bilateral account sterling.

The rates for pound notes are bound to stand at a discount on the official rate in terms of a convertible currency. Pound notes have to be smuggled out of Britain to become available abroad in any substantial quantities. They have to be smuggled back into Britain to reacquire effective purchasing power over goods and services. This "double smuggle," plus the ever-present risk that the notes in question may be forgeries, will normally cause the rate to fall to a discount on the official parity. The pound note is now quoted in Switzerland at Frs. 10.35 and in New York at \$2.42, in each case at a discount of between 13 and 14 per cent of the parity. These, however, are the extreme discounts for notes, for they are measured in terms of the hardest available currencies. Even in Zurich there was a short period after devaluation when the pound note was quoted at a slight premium. That was when many people in Switzerland thought that the Swiss franc would have to follow the pound some of the way in its devaluation against the dollar. For long periods the pound note was also quoted at a premium on the official rate in France, because the French franc was under even greater suspicion and the pound note thus became relatively attractive as a medium of hoarding and a hedge against depreciation of the franc.

The rates for security sterling are even more certain to fall to a discount on the official rate than those for sterling bank notes. Security sterling represents the proceeds of capital transactions held for account of non-residents. These proceeds are ineligible for conversion into foreign currencies through the official market, except in very special cases of hardship; but such sterling may be invested in securities provided they have a currency of more than ten years. This minimum life is explained by the fact that the proceeds of maturing obligations held by non-residents may be remitted over the exchanges

at the official rate. But for the restriction, it would, therefore, be all too easy to evade the basic regulation by investing immobilised security sterling in, say, three-months' Treasury bills. Such sterling, once invested in securities, may be traded between non-residents, but again subject to two main restrictions—that such operations must be limited to nationals of the same country and that a non-resident switching from one security to another may do so only within the same group of securities. Thus a French holder of sterling securities can sell them only to another French holder, and if he holds gilt-edged he can re-invest the proceeds of his sales only in another gilt-edged security.

This is the basis of the overseas markets for British securities, of which undoubtedly the most important is that in New York. At the moment, gilt-edged securities in New York are dealt in at prices which give a cross-rate of about \$1.50, while British industrials give a rate of about \$2. The discount of as much as 46 per cent on the gilt-edged rate reflects not only the pure discount on immobilised sterling but the fact that, even in a free market, the American investor would not be satisfied with a yield of $3\frac{1}{2}$ to $3\frac{3}{4}$ per cent on British Government securities. Similarly, the discount at which British industrials sell in New York is due in part to the fact that "blue chip" dollar equities are valued on an appreciably higher yield basis than are high-class equities in London. The wide disparity in the rates at which security sterling is quoted is due to the restrictions placed on switching from one type of security to another. Most of the existing non-resident holdings of sterling are invested in gilt-edged securities, and that alone would go a long way to account for the fact that gilt-edged sterling is found at the bottom of the list of rates.

The third category quoted in free markets abroad consists of the various types of commercial sterling. American account sterling stands in a class apart: it is automatically convertible into dollars at the official rate of the day, so that the market in such sterling in New York records no more than slight higgling of the rate around the official parity of \$2.80. Sterling accumulated in the various types of transferable or bilateral accounts in London is quite another matter. By devious means—most of them openly tolerated by the monetary authorities of the countries concerned—these varieties of sterling can be made to serve as the basis for commercial arbitrage transactions of varying degrees of intricacy. The supply of sterling in these accounts is constantly changing in volume and composition. Recently, for example, French "No. 1 account" sterling has been

accumulating in a surprising manner. French sterling is, therefore, in good supply, and, since France is short of dollars, a market has developed in French sterling at a discount on the official rate. Belgian sterling balances, on the other hand, have been declining.

If all this sterling were transferable as between non-sterling (and non-dollar) countries, it would find a uniform rate in terms of dollars. Much of it, however, is in bilateral accounts—that is, it can be transferred only between residents of the same monetary area (or, of course, to residents of the sterling area). Even that which is held by "transferable account" countries can no longer be used with the freedom that would provide a uniform rate for all transferable account sterling, since the British authorities are now increasingly insisting that transfers of sterling between transferable account countries can be made only for direct commercial transactions between them and may not be used for third party operations. For the moment, however, the range of these discounts on different varieties of transferable account sterling is narrow. The present quotations in New York vary between \$2.55 and \$2.60, representing discounts of 7 to 9 per cent on the official rate. Bilateral account sterling ranges from \$2.55 for French sterling to \$2.75 for Tangier sterling.

These discounts on commercial sterling can offer grounds for serious concern only when they widen to a point at which the "shunting" of commodities through the familiar triangular operations—and still more complicated commodity operations—becomes profitable. The arbitrage points for these operations are difficult to define. They vary for each commodity and each country in question. They take account of costs of trans-shipment, and in some cases of much more subtle items—including "conscience" money paid to get the necessary co-operation of local officials. It is probable that some shunting of commodities becomes possible with sterling at a discount of 5 per cent; and the volume of these operations could well reach serious proportions if the discount widened beyond 10 per cent, a point which fortunately has not been exceeded since devaluation.

These discounts on free sterling, and particularly those on sterling available for commercial transactions, may not have done great damage since devaluation, but they act as a serious drag on the present official rate. It is true to say that these discounts reflect the continued relative scarcity of dollars and corresponding abundance of sterling (an abundance in which the excessive releases of sterling balances have played a part—a question which will be discussed in a

subsequent article). But the reappearance of these variegated discounts also suggests that the time has arrived to reverse the strategy of exchange control which hitherto has fought its battle mainly on the defensive, trying to plug each successive leak as it occurred. By seeking safety first, it is in fact destroying its real efficacy. There can, of course, be no free convertibility of sterling with the dollar in the foreseeable future. That must be the inevitable, though regrettable, verdict of all reasonable people. But some progress should now be made in dismantling the increasingly inefficient machinery of exchange control between sterling and other non-dollar currencies.

One of the justifications for the devaluation of sterling would have been a "loosening up" of this cumbrous system of control. In fact, events have moved in the other direction. Intellectually and emotionally, the Treasury is still living in the panic of 1947. It is still

wedded to the theory that Britain must first re-establish equilibrium in each of its multitudinous bilateral balances of payments, and that only when that is assured can it trust itself to move towards greater convertibility of sterling. In all financial negotiations undertaken by Britain since the devaluation, the attitude of its representatives has been even more fearful, defensive and restrictive than it was before September 18th. Is it any wonder, then, that foreign opinion is convinced that the position of sterling has been weakened and not strengthened by devaluation? This attitude must be reversed. Britain's financial authorities would be better employed exploring how far exchange control can be dismantled than in offering tax-free rewards to informers about exchange control offences. The results in restoring foreign confidence in sterling, and removing the discounts at which commercial sterling is quoted abroad, would probably surprise them.

Commonwealth Trade

TWO important changes have occurred in the economic links of the Commonwealth since the war. Inconvertibility of sterling into dollars and the dependence of Canada on imports from the United States together mean that the Commonwealth is no longer a single trading unit. Canada, now the third largest trading nation in the world, and South Africa are both members of the Commonwealth, but the one is not a member of the sterling area and the other is plainly not a full member. Secondly, although the Ottawa Agreement of 1932 still influences private trade between Britain, the dominions and the colonies by its system of tariff preferences, Government purchases and long-term contracts play an important part in Commonwealth trade today. Some 51 long-term contracts are in operation, and of these 42 are with Commonwealth countries. It is not preferences, but guaranteed markets, that are important now.

The recovery in Commonwealth trade since the war, which is described in a factual study* prepared by the Commonwealth Economic Committee, can only be under-

(a) Included in India. Note—Figures in brackets are partially estimated.

Commonwealth trade. The figures given in Table I relate only to merchandise. In 1938, 51 per cent of Commonwealth exports went to foreign countries while 59 per cent of Commonwealth imports came from foreign sources. These proportions were much lower than for 1929, but they show that despite the Ottawa Agreement more than half of Commonwealth trade was with other countries. Since the war, this proportion has slightly increased; in 1947, some 53 per cent of its exports went to foreign countries while imports remained at 59 per cent. In considerable part, the increased foreign share of Commonwealth exports reflects the development of trade between the Commonwealth and western Europe. The

value of exports to western Europe more than trebled between 1938 and 1948, whereas Commonwealth imports from western Europe increased by 80 per cent. Apart from Britain, the main countries interested in European trade are Canada, Australia, New Zealand and South Africa. A fuller measure of European recovery would expand trade with Commonwealth countries still further, particularly with Australia and New Zealand. Britain, of course, remains the largest single market for the rest of the Commonwealth and the main provider of its imports, but in both respects Britain's importance has declined, while trade among the other Commonwealth countries has increased.

Perhaps the most striking change in the pattern of Commonwealth trade is with North America. The figures are given in Table II. This clearly shows the increased dependence of Canada on imports from the United States. By value, they have increased more than fivefold within ten years. In 1947, Canada had a visible trade deficit with the United States equivalent to approximately £280 million; in the following year, when exports were expanded and imports reduced, the deficit was lowered to £120 million. In the postwar phase, Britain also has become much more dependent on North American supplies, though it succeeded in 1948 in showing a considerable improvement in its adverse balance on dollar trade. The same has been true of other Commonwealth countries, especially South Africa, India and the colonies; all have sought food and equipment which only the North American continent could supply, and the dollar deficits of both Australia and South Africa increased further in 1948.

Exports from Commonwealth countries to North America have also increased. Britain and the colonies have achieved a considerable expansion in the value of their exports to both Canada and the United States: in each case, the value of shipments more than trebled between 1938 and 1948. India, Pakistan, Australia and

South Africa have also become important dollar earners, though each of them except Pakistan had a large visible trade deficit with the dollar area. (In these calculations, of course, South Africa's sales of gold for dollars are not directly recorded.) But increased exports were by no means sufficient to pay for increased dollar imports. The Commonwealth Economic Committee suggests in the report that the dollar deficit on visible trade in 1948 "may have been of the order of £500 million for the Commonwealth as a whole"; it put the deficit for 1947 at double that figure.

The report clearly shows that the Commonwealth is faced with a twofold problem. The member countries who remain in the sterling area must reduce their imports from dollar sources and at the same time expand their exports to dollar markets. Secondly, Canada being situated economically in the dollar area, must seek to increase its exports to dollar markets but would clearly prefer to do so without reducing its exports to the traditional and assured markets of the sterling area. The answer depends on the capacity of the United States to import, which depends in turn on the maintenance of a high level of economic activity. Without this, American demand for imported raw materials, largely from Commonwealth sources, will fall. Prosperity in America also implies larger imports of consumers' goods, including textiles, whisky, cocoa, coffee and vehicles. But, important though these are, they are still the frills of Commonwealth commerce with the United States. The level of world commodity prices (nowadays dictated by American demand) is the more vital influence on the Commonwealth's balance of payments with the dollar area. Commodity prices present a special dilemma for the Commonwealth. Britain is still the largest exporter within the Commonwealth (though not

to the dollar area) and its exports consist mainly of manufactured goods. Britain's specific trade problem would be eased if prices of primary products declined relatively to those of manufactures. But both for Britain and the Commonwealth the dollar problem would be aggravated by such a turn of events, at least in the short run.

A second hope lies in the expansion of the North American market for foodstuffs. Both the United States and Canada are important agricultural producers and are to a large extent self-sufficient in foodstuffs. But it is not unreasonable to expect that within a measurable

Sell to dollar markets NOW—

span of years both countries may begin to import such commodities as meat, butter, fruit and tea. Thirdly, the development of Canada as an industrial power during and since the war makes it one of the world's leading markets for certain raw materials. In 1948, for example, imports of rubber, coal, iron and iron products, cotton and petroleum increased to over £250 million. Such imports cannot be wholly supplied by other Commonwealth countries. Finally, there remains the possibility of increased exports of British manufactures to Canada, which calls for adaptation of design and standards to Canadian requirements. If British exporters could supply Canada with 15 per cent of the goods which are at present bought from the United States, Britain's trade deficit with Canada would be overcome.

The future of Commonwealth trade therefore depends on the development of sources of raw materials and foodstuffs. During the war, Britain's agricultural production was expanded by 30 per cent and Canada's by 25 per cent, while food production in New Zealand also increased. But the main direction of the development which has so far taken place, at least in the dominions, is towards further industrialisation. The experience of the thirties impressed all primary producing countries with the value of secondary industries as an economic support, and this trend was, of course, accelerated by the war. The pace of industrialisation has, of course, varied from country to country, and so far it has had only a limited

effect on the pattern of Commonwealth trade. If Canadian experience offers any guide, the development of secondary industries may help Commonwealth trade to expand. But unless those countries developing secondary industries maintain at the same time a large volume of exports to pay for imports of capital goods and raw materials, industrialisation may create serious difficulties in their balance of payments.

The conclusion suggested by this study of Commonwealth trade is that the colonial areas must be developed, on a larger scale than has yet been envisaged, as sources of supply for foodstuffs and raw materials—products which the Commonwealth at present has to import from the United States or which can be exported to countries outside the Commonwealth, in particular to western Europe and to North America. Industrialisation of the dominions will undoubtedly continue, but it would be dangerous to foster industrialisation at a rate which imposes strain on the balance of payments of any particular country. In the meantime, dollar imports must be pruned and exports to dollar markets, whether of primary products or manufactures, encouraged. Finally, under these conditions, trade between the Commonwealth and foreign countries is likely to expand rather than to contract. Any policy which attempts to keep Commonwealth trade within a closed unit on the false notion that the Commonwealth is self-sufficient will create more difficult problems.

Business Notes

South African Flop

To the cynically minded, the almost indecent haste with which the sponsors of the South African loan followed in the wake of the Government broker may have implied a fear that the calm after the storm in the gilt-edged market would barely last long enough to permit the successful launching of their vessel. In one sense, any such fear proved to be groundless. The gilt-edged market this week has shown scarcely a ripple, and the fear of renewed disturbance has abated. For all that, South Africa's descent into the waters resulted in a considerable flop. Underwriters of the £10 million of 3½ per cent stock, 1965-67, offered at 99, were called upon to take up no less than 84 per cent, and the first quotation for the scrip when the market opened on Thursday was 4·2 per cent discount. Necessarily, this situation demanded careful handling from the sponsors, and later in the day the discount narrowed to 1½ per cent.

The terms of the operation were not, in any case, such as to promise a smooth launching. The redemption yield of £3 11s. 6d. per cent at the issue price was scarcely a shilling more than that offered, on the day before underwriting took place, by the existing 3½ per cent South African Stock, 1954-59. Compared with British Government 2½ per cent Savings Bonds, 1964-67—the nearest comparable stock in the gilt-edged market proper—the yield differential was rather less than ½ per cent. Evidently the terms had been cut very fine; but few people had expected the response to be quite so unsatisfactory. In the search for reasons, it is hard to disentangle the effects of the rudely-shaken confidence in gilt-edged generally, from specific doubts about the economic and political prospects of South Africa. Apart from the longer term political uncertainties, it might have been felt that a difference of one-half per cent between South African and British Government credit was more than adequate; for the Union's economic problem has lately begun to show the first incipient signs of response to treatment.

For all that, it seems astonishing that those who advised on the terms of this issue—and they must surely have included the British authorities—apparently took no account of the fact that the Union plans to approach the London market again in the New Year. One would have thought it would have been a matter of common prudence, therefore, to ensure attractive terms for the first operation. In the circumstances, the fineness of the terms raises a suspicion that the British authorities may have been giving particular weight to their own problem of re-financing the £787 million of Exchequer Bonds which mature in February; but, if so, it is now very questionable whether such a policy will prove to have been to their advantage.

The indigestion caused by the South African operation does not improve the chances for the Treasury, even though any replacement stock which may be offered for the Exchequer Bonds will certainly be primarily designed to suit very different types of investor from those who would normally have been interested in the South African loan. At this stage, however, it cannot even be taken for granted that the re-financing will not be achieved merely by floating debt; but, apart from that, the most popular guess in the market is that the authorities will have hardly any choice but to offer a security with a life of five years, or a little more. This view is founded on the argument, first, that this is the minimum life which could enable the authorities to "save face" and, secondly, that 1955 is the only proximate year (except 1952) which is free from compulsory maturities. It may be noted, incidentally, that in 1957 the only compulsory repayment is £101 million; but a further £400 million of 4 per cent Consols become optionally redeemable.

* * *

Influencing the Use of Labour

The new and firmer policy of wage restraint announced by the Trades Union Congress (which is discussed on page

1168) will, if it proves effective, make the placing work of the employment exchanges more difficult and even more important than before. It is apparent that a general "freezing" of wage rates will tend also to "freeze" employment in its existing pattern. The burden of inducing labour to move into the industries (or into the individual concerns and factories) to which the national interest most urgently requires labour to move will, therefore, fall more heavily on the employment exchanges, which operate the Control of Engagement Order.

Some of the policies which the employment exchanges are required to work were discussed this week by the Joint Consultative Committee of the National Joint Advisory Council for Industry, resurrected after two years. The Minister of Labour presided. Recruitment of labour, with special reference to the dollar-earning and dollar-saving industries, was one of the points discussed. The committee agreed to a review of the present list of "first preferences." The list includes coal mining, agriculture, iron and steel, pottery, and the textile industries. It also includes certain branches of industries: not, for instance, building and civil engineering in general, but the construction of power stations and chemical plants and the maintenance of the railway permanent ways; not machinery in general, but machines for the coal mines, equipment for gasworks, and generating plant for the electricity undertakings. The list is to be reviewed "in order to put the utmost emphasis on jobs which directly contribute to the present-day economic and financial needs of the country." Some restriction of the range of employments offered by employment exchanges was also agreed to be necessary, together with a tightening up of the present practice in accepting nominations from employers.

The "redistribution of labour becoming available as a result of the cut in the investment programme and the reduction in Government expenditure" was also considered; but, since nobody knows how much labour will "become available" from these causes, it was not to be expected that the discussion could be very specific. The arrangements under which the employment exchanges seek—without great success—to transfer labour between one industry and another are, however, to be "overhauled."

It is through such arrangements as these—and principally through the method of offering "first preference" employments to workers looking for a job—that the Control of Engagement Order exerts its real effect. Actual directions to workers are rare; 24 were issued in September, 21 to mine-workers and three to farm workers. The Joint Consultative Committee did not suggest any extension of the use of these little-used powers.

* * *

The Reyrolle Investigation

The reports of the late Sir Douglas Garrett on the affairs of A. Reyrolle and Company are meticulous, and not easy to summarise without running the risk (which Sir Douglas himself was at pains to avoid) of doing injustice to any of the parties. The original contention, which led to his appointment as inspector last January, was that an offer of shares in Morphy-Richards in May, 1947, disclosed that certain shares stated to have been offered as of right to Reyrolles were taken up by Mr George Wansbrough, who at that time was chairman of both companies. Certain shareholders in Reyrolles sought an explanation of this transaction, and, being dissatisfied with it, applied to the Court for an inspection.

The Inspector's report shows that this original complaint was not supported by the underlying facts. There was never any likelihood that Reyrolles would be given the right to subscribe for further shares in Morphy-Richards. No right was transferred by Reyrolles to Mr Wansbrough, because no

right had ever been granted to them. But the Morphy-Richards prospectus had stated

By Special resolution dated March 4, 1947, A. Reyrolle and Company Limited were given the right to subscribe for 1,000 ordinary shares of £1 each in the Company at the price of £10 per share, which right was duly exercised in favour of Mr George Wansbrough who paid for and was allotted the said 1,000 shares.

That statement in the offer for sale started the complaint, but the Inspector found that it was untrue and misleading. The resolution by the directors of Morphy-Richards conferred no rights upon Reyrolles and made no reference to Mr Wansbrough; and it was unfortunately described, by mistake, as a special resolution. Further, the Inspector found that the reference to this matter in the application on behalf of Morphy-Richards to the Capital Issues Committee was also misleading.

The reason for the wording in the offer for sale and the application to the Capital Issues Committee, the Inspector found,

was simply and solely to endeavour to safeguard Mr Wansbrough personally from the possibility of a claim for income tax and surtax on the profit element contained in the transaction. . . .

For this "camouflage" in the original resolution and in later references to it in the prospectus and elsewhere, the Inspector finds that Mr Wansbrough and Mr Michael Richards, his legal adviser, "must be held jointly responsible." The Inspector finds it impossible "to justify or to condone" their actions in this matter. As for the original point from which the inspection started—namely that Mr Wansbrough might be accountable to the shareholders of Reyrolles for any profits derived from the transaction—the Inspector contents himself with summarising the considerations for and against such a claim.

*

Thus the inspector has arrived at a stern conclusion on a matter which is ancillary to the original question. His conclusions are not, for that reason, to be lightly regarded. He found in his first report that the statement in the prospectus was not merely misleading, but intentionally misleading. In his second report, he re-examines this conclusion. He points out that Mr Wansbrough was neither accused of, nor censured for, trying to induce the public to buy the Morphy-Richards stock units by means of a false statement. But he argues that, in determining the question of intent, it is necessary to look beyond the effect of the statement on the minds of prospective applicants for the stock units. The report gives Mr Wansbrough all due credit for his frankness in giving evidence and for the fact that he made no attempt to take advantage of the market which for a short time was created in the Morphy-Richards shares. Nevertheless it amounts to a rebuke on a matter of fundamental importance—the need for the utmost care, frankness and sincerity in the terms on which shares are offered to the public by prospectus.

* * *

Tax Free Covenants

Shareholders of Standard Motor recently approved the proposals for making an allotment of shares worth approximately £100,000 to Sir John Black, in consideration of an undertaking on his part not to engage in motor-car production in future except with the Standard Motor Company. A similar proposal has been made by the directors of Austin Motor to pay to Mr L. P. Lord, the chairman and managing director, £25,000 in cash and ordinary shares to the nominal value of £20,000. Since the market value of these shares (ex bonus) would be in the region of £76,000, the total value of the consideration proposed would be about £100,000. In return, Mr Lord undertakes, for the rest of his life, not to manufacture mechanically propelled vehicles for any other

HOLIDAYS FOR BOILERS?

Steam boilers should work efficiently all the time. Unnecessary holidays are to be deplored. But if boilers use untreated water, scale will certainly form, and some sort of holiday however inconvenient and costly to other people must be given in order to dismantle and descale. But scale need never form

if the modern method of boiler water conditioning with Calgon (sodium metaphosphate) is used. Calgon prevents scale. It saves endless trouble and far more money than it costs, as you will find if you consult Albright & Wilson's Technical Service Department. A really fit boiler does not need a holiday.

CALGON

a very little Calgon prevents a lot of scale

A MESSAGE to MEN OF VISION

14 NEW IDEAS Applicable to Every Type of Business Activity

FREE DETAILS ON REQUEST

YOU, as a progressive business executive, need to keep pace with every modern innovation in business.

Below are listed 14 plans for helping modern business men—in all types—in all departments—of both factories and offices.

They are all based on the one system... the shannographic system of full-vision files.

Briefly, these files are made rather like slim boxes, with flat tops extending the full width of the files. They are suspended metal on metal. They fit into any standard cabinet.

The flat tops provide room for a great deal of information, apart from means of identification. They are colour-coded to make misfiling impossible. They carry sliding signals for indicating dates, or "progressing" (ready-printed slips numbered 1 to 12 and 1-31 are provided for this purpose).

On the front of every file is provision for slotted-in record cards—either for purposes of transfer and cross-reference or for annotating the file and its content.

In effect, then, you have a visual record for immediate identification; a means of filing correlated correspondence, invoices, plans, costings, etc.; a foolproof filing system and a visual means of signalling unseen information.

Collective Security provided by Chubb Safe Deposits

PRESTIGE and profit are two results of the installation of a Safe Deposit for the use of customers or of the public in general. Facts about the demand for this type of service, and the most effective means of meeting it, are contained in the attractive and informative brochure "Collective Security." Among the many illustrations are photographs from various aspects of modern Chubb Safe Deposits and a plan of a typical installation. Write for a copy now.

TWO CAPTAINS ON WHITE LEAD

From a letter to

ASSOCIATED LEAD

MANUFACTURERS

September 3rd,

1949

"Some flying showers again. This morning we hauled the pinnacle a Shore to examine her bottom, and had the Satisfaction to find that not one worm hath touched it, notwithstanding she hath been in the water nearly as long as the Long Boat. This must be owing to the White Lead with which her bottom is painted . . . for no other reason can be assigned why the one should be preserved and the other destroyed, when they are both built of the Same sort of Wood and have been in equal use. From this Circumstance alone the bottom of all boats sent into Countrys where these worms are ought to be painted with White Lead . . ."

"For many years I was Deputy Conservator of the Port of Rangoon and had under my charge four unattended light-ships. They were anchored off the mouth of the Rangoon River and were subject to rigorous climatic changes and sea conditions . . .

In March 1942 the Port fell to the Japs. At the time all our light-ships were on station, with the exception of one relief. In May 1945 I returned to Rangoon and it was evident that none of these craft had received any paint attention during the Jap occupation but I found the lead-painted decks as intact and in as good order as the day we left them and some had not been painted for four years."

Yours faithfully,
H. C. Granger-Brown,
Captain M.N.

undertaking in any part of the world. The directors regard this covenant as being of the "utmost importance" to the company, and strongly recommend its approval by stockholders.

There is no reason to repeat on this occasion the arguments which were put forward only recently in connection with the previous case. The underlying object of this arrangement is to make Mr Lord a payment for his exclusive future services which will not, under present law, attract income tax. The precedent set in the Standard Motor case was bound to be followed, and it would clearly be capable of almost indefinite extension throughout industry. It is that argument, rather than any appeal to the widespread criticism that such arrangements are bound to encounter from the ranks of Labour, which is relevant now.

Mr Glenvil Hall, answering a Parliamentary question on behalf of the Chancellor on Thursday, recalled that the Courts had held that payments of this kind are not liable to tax. But he also offered the reminder that the Chancellor promised in his Budget Speech in 1948 that he would watch "such devices" and would not hesitate to propose legislation, if need be with retrospective effect. That, declared the Financial Secretary, is the Chancellor's continued intention. It would not, perhaps, be stretching the reply too far to say that it puts industrial concerns under notice that steps may be taken next April to prevent similar schemes and to reopen those which have been already agreed.

Industry and Finance

British Transport's Predicament

In the first 44 weeks of 1949, railway traffic receipts have fallen by £7½ million, from £282½ million to £275 million. The disagreeable feature about recent traffic returns is that they suggest a worsening of the downward trend. In the latest four-week period, to November 6th, there was a fall of £1½ million compared with the corresponding period of 1948. This suggests that the out-turn for the full year on the railways may show a fall in takings of £10 million, if not more. Since it would be wildly optimistic to suppose that progress towards greater operating efficiency (of which there is some evidence in the operating statistics) can do more than absorb some of the further increases in operating costs, it is obvious that the railways will act as an even greater drag on the Transport Commission's revenue account than they did in 1948. There are no signs whatever of any assistance, on a material scale, from the receipts of the other executives to put the Commission's total receipts in better shape. It would be an act of plain commonsense to expect for this year a deficit several times greater than last year's deficit of £4.7 million.

This, indeed, is no new discovery; it was fully recognised in the Commission's recent report. The predicament of the Commission is to fulfil its statutory obligation to meet all its proper revenue charges, taking one year with another. It did not succeed in 1948; it will not succeed in 1949; and by all appearances it will not succeed in 1950. Where does the solution lie? Not in "a general increase in charges, indiscriminately applied," for as the report showed, this "might not benefit railway traffic and revenues." The Commission had been reluctant to make a special application to the Minister, "so long as the trends of traffic did not unmistakably declare themselves" for increases in charges in those many directions in which increases could be made without detrimental effect upon their revenue. And the report added:—

It is not possible that any undertaking which is to pay its way should submit to constant increases in the cost of the services and commodities which it needs and yet refrain indefinitely from raising its prices to its customers.

The trends have unmistakably declared themselves now. But the embarrassments remain. How would the Minister

of Transport react to such an application with a general election in sight? Could he consider such an application without giving way to pressure within his own party to curtail the present freedom of the "C" licence-holder? There is little doubt about the direction which such an application would take. It would apply the doctrine mentioned elsewhere in the Commission's report:—

When the railway tariff underestimates the difficulties of a certain traffic and in effect the railways "undercharge" for that traffic, there will be no competition for it.

For other traffics, there would be a loss to the railways, even though other services owned by the Commission might gain. No diligent search is needed to uncover the traffics for which rates have traditionally been regarded as "too cheap." The consequent rise in industrial costs if such traffics were charged at higher rates would in itself be a formidable political obstacle to any move to increase them. Yet the plain fact remains that long before the Commission can begin to show the benefits of integration and coordination of the different means of transport, it is faced with an enormous deficit and no prospect of righting it save through an increase in charges. It may be true that the Commission and its Executives could be cheaper and more efficient than they are. But sooner or later, this predicament of falling traffic receipts will have to be frankly faced.

Green Light for Weaving Redeployment

Both sides of the cotton weaving industry have now approved the draft agreement to put into effect the main recommendations on the weavers' wage structure which were proposed by the Moelwyn Hughes Commission. A representative meeting of the Weavers' Amalgamation gave the approval of the trade union side last Saturday by an overwhelming majority. It suggested some last-minute amendments, which are now being discussed with the employers, but these will not, it is hoped, hold up the definitive agreement for long. Mr. Andrew Naesmith, secretary of the Weavers' Amalgamation, estimated this week that about 100 weaving sheds will apply the new system as soon as the agreement comes into effect.

If there is no further delay—and it must be said that delays and disappointments have already been too many—the dual wage system recommended by the Commission can now be brought into being. Mills which wish to redeploy their labour will adopt the Moelwyn Hughes system of payment; those which do not will continue to observe the Uniform List.

It is obvious that this can only be an intermediate stage for the industry. The shortest, but not the least persuasive, paragraph of the Commission's interim report last year consisted of five words: "The Uniform List must go." The list will have to go because it is an effective barrier to managerial improvement, to the proper harnessing of effort, and to the application of incentives in the average weaving mill. The intermediate stage which is now to begin was proposed largely for reasons of urgency; to remove the Uniform List altogether, and to institute the new method of payment universally, would have taken longer. "No adequate measure of redeployment will take place in Lancashire," said the final report, "as long as manufacturers are required to observe wage agreements which are founded on the Uniform List." When the new agreement goes through, manufacturers will be able to choose, and progress will be possible. The Commission estimated that this ought to bring about a rapid increase of "20 per cent and more" in the cloth output of the existing labour force. There is nothing alarming about this; the cotton trade could very well use 20 per cent more cloth. But it seems likely that after a while, if the expectations are fulfilled, the manufacturers who have not changed will find themselves handicapped in the competition for trade, and also in the com-

petition for labour, and that most of them will eventually have little choice but to adopt the new system.

The detail of the Moelwyn Hughes system is somewhat complex to anyone outside the trade, but its purposes are simple: to encourage "the employment by the manufacturer of the most efficient methods of work," and to secure that the weaver's rate of payment is "related directly to the amount of effort required, in the conditions provided by the manufacturer, for each unit of output." It may be a cold plunge at first to an industry that has clung tenaciously to its nineteenth-century system of payment; but in the relatively small number of mills in which it has already been tried in practice, the results have been almost uniformly encouraging.

Rootes Preference Issue Success

The Rootes Motors (formerly Rootes Securities) preference issue was oversubscribed on Thursday. The lists closed at 10.5 a.m. and applications were reported to cover the amount of the issue some eight times. The offer was for £2,000,000 5 per cent redeemable cumulative £1 preference shares at par. The shares are optionally redeemable by the company at 22s. during the five years prior to January 31, 1970, at 21s. 6d. from this date to 1975, at 21s. up to 1980, and at par up to 2000; thereafter they become irredeemable. In the event of liquidation similar repayment provisions would apply. Net tangible assets of the group at July 31, 1949, provide a threefold cover for the new issue, while on the average for the past twelve years the service of the dividend would have been secured more than eight times. The new money is to be used to replace bank advances to the group amounting to £2,000,000 at July 31, 1949, and secured by 4½ per cent debentures redeemable 1960 carrying a charge on the undertaking. Sir William Rootes has already made it clear that the bank loan is now actively invested in the business, so that the issue represents in essence simply a substitution of the public as a shareholder for the bank as a creditor. This, it is rightly held, will clear the decks for further financing operations, even though none is at present intended. Perhaps at some future date the public will be invited to participate in the equity of this flourishing motor business. At present this is a privilege shared by the Rootes family and Prudential Assurance.

The success of the issue provides an oasis in the present desert of the capital market, yet it should not be regarded as pointing the way to a revival in new issues. Perhaps that must await the oversubscription of a fair-sized issue of ordinary capital—a most unlikely prospect in present circumstances. Its significance is rather in the confirmation provided that the investor—particularly the institutional investor—still has an appetite for sound preference shares even though the prospects of capital appreciation have been circumscribed as a result of this year's decisions of the House of Lords on the rights of preference shareholders to participate in surplus assets and for repayment of capital. At any rate there can be no doubt of the position of subscribers to the Rootes issue. And that in itself may have contributed to its good reception.

Scottish Banks' Experience

Much attention has been paid lately to the question of the effects of the fall in gilt-edged on end-year institutional balance sheets. The accounts of the three Scottish banks which have been published since devaluation are therefore of more than usual general interest—even though each of them was made up before the phase of acute weakness in the market. The accounts of the British Linen Bank, issued recently, have this week been followed by those of the Commercial Bank of Scotland and the National Bank of Scotland. All three have evidently been able to take their investment

depreciation in their stride—in the sense that no draft has had to be made on disclosed reserves, and no change has been made in the respective formulæ by which published profits are defined. Apart from this negative evidence, the accounts afford no clue to the investment experience.

The British Linen Bank, whose accounting year ended on September 30th, shows a fall in net profits by some £18,500 to £242,700, while the Commercial Bank of Scotland (October 29th) shows a fall in profits of some £34,200 to £396,600; profits of the National Bank (November 1st), however, rose by just over £1,800 to £293,200. In investment portfolios, the pattern is similarly varied; the gilt-edged holdings of the British Linen are slightly higher, while those of the other two banks each show declines of the order of £2,000,000 to £3,000,000. Given the recent recovery in gilt-edged, this experience is a heartening pointer to that of the clearing banks, for it has always been the practice of the Scottish banks to hold a much larger proportion of their deposits in the form of investments than do the English banks. The Scottish ratio averages over 50 per cent, compared with about 25 per cent for the clearing banks as a whole. On the other hand, it is reasonable to suppose that the reserve policy of the Scottish banks has customarily been formulated with this position in mind.

Pattern of Petroleum Consumption

While the consumption of oil in Europe grows steadily, the pattern of use of the various petroleum products has been changing. The full extent of this change was brought out by the new figures (on which the accompanying chart is based) of past and estimated future consumption which appeared in the recent report of the Organisation for European Economic Co-operation on the co-ordination of refinery plans. Motor spirit, which accounted for 46 per cent by volume of the consumption in 1938 of the four major products which are included in the survey, accounted last year for only 31 per cent; fuel oil accounted for 34 as against

27 per cent. Last year's consumption of motor spirit was less absolutely than before the war; this is not regarded as a permanent phenomenon, but if all goes well and consumption is permitted to recover by 1952-53 to a level well above that of 1938, the changed pattern of consumption will still persist. Motor spirit will then represent 32 per cent of the total, while gas, diesel, and fuel oils together will be 61 per cent. It is assumed that the motorist's use of petrol will still by one means and another—in Britain, by rationing, and on the Continent by the dreaded price mechanism—be restricted.

The motorist, it is clear, has ceased to be the key figure in the petroleum market. In Britain the change has been still

more marked than in the OEEC area as a whole. The *Petroleum Times* has published the following table to indicate the changing pattern of British consumption. The table uses Customs releases as the indicator for 1938 and 1949, and scheduled refinery output as the indicator for 1952-53:

	1938	1949	1952-53
	Per cent of releases	Per cent of releases	Per cent of refinery output of these products
Light oils	68	33	30
Kerosene	10	13	5
Gas/diesel oils	8	14	18
Fuel oil	14	40	47

The refinery output anticipated for 1952-53 will, however, cover no more than 80 per cent of British requirements, and it is possible that the relationships shown in the table may be altered by imports. As one example, no aviation spirit appears in the scheduled British refinery output; presumably, therefore, it is to be imported in refined form. The relative shrinkage of kerosene output discounts any suggestion that jet propulsion is to displace the piston-engined aircraft in so short a time. No doubt the extremely modest place occupied by kerosene in the projected refinery outputs in Europe is due largely to technical causes. It suggests that the present fiscal devices to encourage kerosene consumption cannot expect a long life.

Imposing a Development Council

The Order to establish a Development Council for the wool textile industry was laid before Parliament this week by the President of the Board of Trade; but the employers, expressing their "profound regret" at this action, have indicated that they are not giving up the fight. The Wool Textile Delegation, in a statement issued from Bradford, emphasises (no doubt to avoid the kind of argument which arose in the Commons over the right of the organisations in the clothing trade to speak for the employers against the Clothing Development Council Order) that the delegation is fully representative and has taken the trouble recently to confirm its mandate on this matter. It adds that in the negotiations which ended in the present deadlock it "had gone quite as far to provide an agreed solution as any mandate from its members would allow it to go." In recalling the long record of success of the wool textile industry in organising itself to meet tasks demanded of it in the national interest, it is able to quote specific and impressive examples. The statement points out that the alternative methods of meeting the President's requirements which the employers put forward and which they would have supported, were still untried. It is not easy to dispute their contention that those methods would, in the circumstances, have had a better chance of success. As it is, they have taken their stand on principle:

Spotlighting Waste

Administrative and productive costs tend imperceptibly, but steadily, to rise. Every unnecessary record, every needless operation pushes costs up. Our new booklets "500 Unnecessary Miles" and "An Invitation to Industry" tell you how we can help to get them down and keep them down. Why not write for a copy? Consultancy Division, Remington Rand Ltd., Dept. 3, Commonwealth House, 1-19 New Oxford Street, London, W.C.1.

The issue is narrowed to the straight question whether statutory methods for achieving certain agreed objects are desirable for their own sake.

This position the employers do not propose to modify; and the prospects for the Development Council, since they regard it as an imposition, do not look bright.

Thoughts on Locomotive Policy

Sir Eustace Missenden's paper to the Institute of Transport on railway motive power is in no sense an official pronouncement on behalf of the Railway Executive (of which Sir Eustace is chairman) about future locomotive policy. Sir Eustace spoke as a member of the Institute to his fellows. But, as he pointed out, the Transport Act gives the railway authorities a great opportunity to consider needs and resources as a whole. It is the task of management to weigh, with the best technical advice, the types of motive power which will give the public the service it wants and is prepared to pay for.

As Sir Eustace showed, research and experiment are going forward. These involve five "Leader" class steam locomotives costing about £20,000 each; five diesel electric locomotives, costing £70,000 to £80,000 each; the "Fell" diesel-mechanical locomotive, costing about £60,000; and two gas-turbine locomotives at between £75,000 to £100,000 each. A change in locomotive policy thus requires very large expenditures. At present, there are over 20,000 steam locomotives in service, which stand at nearly £100 million in the books and cost over £25 million a year for maintenance. The decision confronting railway management is to strike a balance between costly adventure in the hope of big returns, or modest progress on proven lines which may stifle progress and breed inertia.

Sir Eustace suggested that future operating requirements on the railways would involve the concentration of effort and resources on main lines. On that assumption, he subjected the different forms of locomotive power to a critical review. The modern steam locomotive was relatively cheap, robust, thermally inefficient, costly to prepare and replenish with fuel and water, difficult to turn round, and smelly. What are the alternatives? The gas turbine locomotive is in an early stage of development, and the practical choice is between diesel and electric traction. Sir Eustace admitted all the claims made for diesel-electric locomotives in the United States but he concluded that in this country their use would probably be limited to shunting (where they have already proved their worth), for medium power units on branch lines in electrified areas, and for railcars.

These conclusions are based on several factors—high initial cost of diesels (though the United States has shown

THE BRITISH METAL CORPORATION LTD.

is associated with
The British Metal Corporation (Australia) Pty. Limited, Sydney; The British Metal Corporation (Canada) Limited, Montreal; The British Metal Corporation (India) Limited, Calcutta and Bombay; The British Metal Corporation, (South Africa) (Proprietary) Limited, Johannesburg; C. Tennant Sons & Co. of New York, New York; Vivian, Younger & Bond Limited, London.

and with the organisation of
Henry Gardner & Co. Limited, London, Canada, Cyprus and Malaya.

The Group trades in and markets other specialist engineering and non-ferrous metals and minerals, metallurgical equipment; and it many kinds of produce, timber and furnishes allied shipping, insurance, other materials; it provides coal, secretarial, financial, technical and washing plant, ventilation plant and statistical services.

how costs can be reduced by mass production and standardisation), dependence on imported oil, and the absence of long runs in this country. (To this last point, it might be answered that it is not long runs which enable diesels to be used to the fullest extent throughout the 24 hours of the day, but rather efficient rostering.) So, at the end of his analysis, Sir Eustace came down firmly in favour of electrification for main line working. The Weir Committee had shown the potential economies eighteen years ago. The figures would need revision, but it was his belief that conditions will be not less favourable for electrification than before the war. This is, to repeat, a personal opinion. It will need very careful examination before it is adopted as the basis of official policy.

Trade and Payments

Shocks for the Wheat Agreement

The operation of the international wheat agreement is proving to be anything but agreeable for Britain. The first shock came with the devaluation of sterling, when it was realised, rather belatedly, that the maximum and minimum prices agreed to, although expressed in Canadian dollars, were in fact tied to the price of gold. The sterling equivalent of the maximum price rose (owing to devaluation) from 9s. a bushel to 12s. 10d. and the minimum for this season from 7s. 6d. a bushel to 10s. 9d.

The second shock has been delivered by Australia. As is usual at this time of year, Britain and India are negotiating with Australia for the disposal of its new crop, which first estimates put at 200 million bushels. If this quantity is harvested—recent reports suggest that the crop may have suffered storm damage—Australia would have an export surplus of 120 million bushels compared with the agreed export under the agreement of 80 million bushels.

The negotiations have been proceeding slowly—too slowly, it seems for certain members of the Australian Wheat Board. Britain and India have offered prices below the agreed maximum. Australia is at present willing to sell only at the maximum price. The British line should clearly be to delay buying until the size of the world crop is known, in the hope that the price of wheat will fall. In any case, Australia has a sizeable carry-over from last season and pressure on storage space later on may force the Australian board to revise its price policy. One member of the board (Mr R. A. O'Neill) has stated that if Britain and India did not decide within ten days, their quotas might be cut. The chairman of the board quickly repudiated this statement. Under the wheat agreement there is no clause which stipulates the time within which a purchase must be made—except that it must be made within the appropriate season. Up to next July, Australia must be prepared, under the agreement, to sell a maximum of 80 million bushels of wheat at the maximum price to the signatory importing countries. But it is perfectly true that if Britain and India do not buy, Australia

"Happy Birthday"? — NEVER AGAIN...

ON every birthday, the loving greeting used to come from her skipper father aboard his trawler. Now, alas, it would never come again. The sea had claimed him, too... Truly, the fish that we enjoy is paid for not only in money but also in human suffering—the relief of which is one of the main tasks of this Mission. In the fishing ports, Deep Sea Mission Institutes are centres of comfort, welfare and worship for fishermen and their families... Gifts of money, books, comforts etc. or requests for fuller information about the Mission's Christian work among the fisherfolk, are gratefully received by the Secretary.

DEEP SEA MISSION

ROYAL NATIONAL MISSION TO DEEP SEA FISHERMEN

could sell to other members of the agreement such as Belgium, Italy or the Netherlands. In the past few years Britain has taken an annual quantity of between 60 and 80 million bushels from Australia. At present, there are ample reserves of wheat in this country, and the contract with Canada will provide 140 million bushels. Britain need not, therefore, be bounced into immediate decisions about buying Australian wheat. Its action will in fact provide the first trial of strength between consumer and producer under the agreement. To pay the maximum price for Australian wheat would mean, presumably, a further increase in the cost of bread.

* * *

Trends in Exports

The encouraging rise in exports last month was offset by the sharp increase in the value of imports. It is too early to measure the effect of devaluation merely by the October trade figures, but they suggest some possible trends. The value of exports increased from £142 million to £156 million while the volume was provisionally estimated at 158 per cent of the 1938 average compared with 144 per cent in September. Last month, then, exports increased both in value and in volume at virtually the same rate. Imports increased from £181 million to £199 million, of this 11 per cent increase, about 8 per cent is attributed by the Board of Trade as the direct result of devaluation.

Changes in the export prices of particular exports after devaluation will be watched with close attention during coming months. The trend during the past three months for certain items is shown in the accompanying table. The

figures are averages and thus mask the differences in types and qualities which may be sold to different markets.

The broad impression from the table is that the average prices of British exports to the United States and Canada have not increased in sterling—certainly not to the extent of devaluation. Thus, if Britain's dollar earning capacity is to be maintained the volume of exports to these markets in the coming months will have to show a correspondingly greater degree of expansion. Chinaware, machinery, steel and spirits are the only cases in which the average export prices (in sterling) to the United States or Canada have shown any marked increase. The volume of these exports is small. The average value of motors and textiles exported to America has tended to decline, while the value of similar goods shipped to sterling area markets appears to have been more or less maintained. The provisional conclusion must be that the pulling power of the soft-currency markets for British exports remains practically undiminished.

The EXPORT VALUE of BRITISH INSURANCE is £33,000,000 a year

£33,000,000 a year is a lot of money.

And that is what British Insurance brings into this country from overseas.

For two reasons these earnings are specially valuable today.

★ First, some £20,000,000 of the total comes in the form of badly needed dollars.

★ Second, it is all clear gain, calling for no imports of raw materials, making no demands on shipping space.

£33,000,000 a year is the value of the confidence that other countries have in British Insurance. We simply cannot afford to forfeit their confidence.

Not so funny for Mr. Nash!

Mr. Nash's sudden transformation from a dignified business man to a sprawling figure of waving arms and legs struck some passers-by as funny. But when he was helped to an ambulance with an injured back and head, Mr. Nash could hardly be blamed if he did not share the joke. He was unable to work for many months, while expenses mounted. Yet he was able to convalesce with an easy mind, for under his 'General' Personal Accident Policy he received £10 a week until he was fit.

**Peace of mind
costs very little**

£4 a year covers you for £10 a week accident benefit. Are you wise to face the risk—and all that it means to your dependants—without this cover? It's worth while finding out more about this and other benefits of the 'General's' Personal Accident Policies—just send the coupon.

Please send me full particulars of 'General' Personal Accident Policies.

Talks with Belgium

The commercial and financial negotiations with Belgium which were held in London towards the end of last week provided unexpectedly smooth going. The fact that the Belgian Minister of Foreign Affairs, M. Van Zeeland, headed the delegation and that the talks were thus taken to the highest Ministerial levels, with the Chancellor of the Exchequer intervening for Britain, had led to assumptions that the fundamental issues which have divided the two countries for some time past would be considered and if possible settled.

What in fact emerged from the discussions was an agreement to extend until March 31st next the existing payments arrangements. The official communiqué issued at the end of the talks announced that both parties desired to avoid settlements in gold and that the level of UK imports from the Belgian monetary area would thus be related to developments in the balance of payments between the sterling area and the Belgian monetary area. Trade in essentials between the two will presumably continue unhampered, and fears which had been entertained on the Belgian side that Britain might invoke the escape clauses in the long-term contracts for the purchase of Belgian steel have proved groundless for the time being. The necessary adjustments to achieve equilibrium in the balance of payments will fall wholly on trade in "inessentials."

The gold ceiling on Belgian sterling balances after adjustment to the recent differential devaluation of the two currencies is £15 million. There have been indications lately of the actual balances falling sufficiently below this maximum to put out of court the possibility of an early resumption of substantial gold losses to Belgium. This fact no doubt played its part in helping the recent discussions to their comparatively successful conclusion. It will be noted that the agreement is extended to the end of March, that is, to the end of the current tourist year. The British tourist allocation for expenditure in Belgium, always a sensitive issue in Anglo-Belgian discussions, thus remains to be discussed when the next extension of the agreement is negotiated.

Intra-European Payments

The monthly compensation of intra-European payments for October which was completed by the Bank for International Settlements in Basle this month was the first to take full cognisance of the new rates of exchange created by the September devaluations. The September compensation had proved more than usually complicated because of the variations of exchanges which occurred during the month. The first four months of operation of the second version of the IEPS have now been completed and some interesting deductions can be drawn from the figures. The drawing rights exercised so far total \$221 million out of the \$802 million sanctioned for the year to June 30th next. The exercise of these drawing rights is a little behind schedule; in some cases it is considerably behind.

The most remarkable instance is provided by French drawing rights on the United Kingdom, which are available to the equivalent of \$162 million for the year, half representing unutilised drawing rights carried over from the previous year and half a new contribution by Britain. No part of these rights has yet been used by France. This remarkable forbearance on the part of France tallies with evidence of the increase in balances accumulating on No. 1 French accounts in London. It is quite clear that something has gone seriously wrong with the estimates of the balance of payments between the franc and sterling zones made earlier this year, on the basis of which the new contributions and drawing rights were established. The most important single factor in this miscalculation seems to have been the amount of tourist expenditure incurred by British visitors to France.

It is clear from all the available evidence that the average amount spent by British tourists in that country was well over the regulation limit. The attraction of good food has played havoc with the estimates, surprisingly so since the calculations were made in Paris.

Unless the position changes very drastically during the next few months France will end the second IEPS year with further substantial unspent drawing rights on the United Kingdom. There were no further drawings on Belgium by the United Kingdom in October, but that was because £10,513,000 out of some £27 million was used in the first three months. Thanks to this heavy utilisation of drawing rights on Belgium in the first part of the year, gold transfers from Britain to Belgium have been temporarily arrested. The total amounts drawn on the United Kingdom in October amounted to £2,453,000 divided in almost equal parts between Austria, Greece and Turkey.

Larger Trade with Japan

Trade between Japan and the sterling area is expected to double in value during the next twelve months under a new trade arrangement, announced this week, between Japan on the one side and Britain (with the colonies, but excluding Hongkong), Australia, India, New Zealand and South Africa on the other. At the end of last June, Japan held a balance of £10 million which was liable for conversion into dollars. Japan, however, agreed to hold this sum as working capital, and if trade in the coming year conforms to the programme, this balance should be liquidated. Purchases by Japan from the sterling area are scheduled at £55 million and Japanese exports to the sterling area at £45½ million. Any sterling balance which Japan holds must exceed £10 million before it is eligible for conversion into dollars.

Last year, imports from Japan were planned at £28 million and exports to Japan at £27 million. Japan is to buy cereals, cotton, wool, iron ore, rubber, hides and skins, tanning materials salt and petroleum—the last two items coming from Britain. In return the Commonwealth will get a wide range of manufactured goods including textiles, machinery, canned fish, metals, lumber, electrical products, chemicals, pottery and glassware. All these goods are destined for countries other than Britain which will receive only raw silk and grey cotton cloth.

The new arrangement contemplates that Japan will double its purchases from the sterling area, and in return the Commonwealth will at least maintain its imports of Japanese goods and possibly increase them. Although British manufacturers will not meet any direct Japanese competition in the home market, they are likely to do so in some parts of the sterling area. The prices of certain basic raw materials such as coal, manganese, iron ore and copper are still subsidised in Japan. In this way Japanese manufacturers are able to sell their goods abroad more cheaply than their competitors. The volume of Japanese exports will still be restricted, compared with the prewar volume, but even so they may present serious competition for certain British exports. This in itself is not necessarily a bad thing, particularly if it encourages British exporters to switch from the sterling area to dollar markets.

Breakdown in Polish Talks

The breakdown in the Polish debt talks this week may serve to disabuse the Polish delegations which have been travelling between London and Warsaw for more than two years of any impression that the matter of the Polish debts to this country could be settled on terms more favourable than those agreed between Poland and Sweden and other European countries. The British negotiators have now refused

to discuss the question any further until there is a radical alteration in Poland's offers, and the delegation has returned to Warsaw.

British claims for compensation alone amount roughly to £15.5 million. Earlier this year, Britain and Poland had agreed on most of the items to be negotiated, but not on the value of the compensation. The terms which the Poles were prepared to offer were considered totally inadequate. For example they suggested that Polish bonds might be paid off at current market prices without any payment for interest. The hand of the British negotiators seems to have been weakened by the granting of new British banking credits to Poland. It would now seem, however, that the Poles have been given some indication that these credits may not be extended unless the debt question is settled satisfactorily.

The trade and payments talks with Hungary are stated to be progressing well after the breakdown of negotiations earlier this year. The full terms of the agreement have yet to be announced, but it is already clear that resumption of food imports within the framework of the 1947 agreement is assured. Hungary's short-term creditors (who have already received some money out of Hungarian assets in the hands of the Custodian of Enemy Property) will receive in all about 22½ per cent of the sums owing to them. The position of Hungarian bond holders will only be clarified when the full text of the agreement is published. British owners of industrial undertakings in Hungary are to receive compensation over a period of three years. The method of assessing and paying individual claims will require negotiation on the spot. This is unlikely to prove palatable to the considerable number of British minority shareholders in Hungarian undertakings.

* * *

Weakness in Base Metals

The price of copper alone among the non-ferrous metals has remained firm during recent weeks at 18½ cents a lb. (equivalent to £148 a ton). The demand, which comes mainly from the American building industry, continues strong with little sign of any slackening in the immediate future, though copper scrap fell by a quarter cent on Wednesday to 14½ cents a lb. Consumption of copper in the United States

is at present estimated to be above current production plus imports, but stocks were built up to a fairly high level during the first half of the year. Contrary to expectations, the ending of the American steel strikes did not increase the demand for zinc, and this week the price fell by a quarter cent to 9½ cents a lb. (£78 a ton). The price for lead in the United States has continued to fall and is now quoted at 12 cents a lb. (£96 a ton)—back to the level it reached last June. American demand has tended to weaken somewhat in recent months

while Europe is still shipping supplies to the United States in search of dollars. In Britain, both lead (now £97 a ton) and zinc (£85 10s.) have kept pace with the downward trend in the American market. The price for copper has remained unchanged at £153 a ton.

In tin, the American price has followed the London market downwards, and in New York it was quoted on Wednesday at 85 cents a lb. (£680 a ton). During the past week the price in London has fallen from £750 a ton—the first offer when the Metal Exchange reopened on November 15th—to £642 10s. for cash sale. For three months' delivery, the quotation is now £595. The backwardation has thus narrowed to £47 10s. a ton against £81 5s. in the opening days of the market. Turnover is still small, and so long as the difference between spot and forward prices remains large, consumers will naturally tend to buy to meet only current needs. Mr Ernest V. Pearce, the chairman of Kamunting Tin Dredging, Limited, has declared this week that for the market to function properly the Ministry of Supply should be prepared to support it by buying as well as selling. But no market could be expected to function properly within a week, after being closed for eight years. As supplies become available from more than one source, it will begin to look more like a market.

Shorter Notes

The decline in employment in the coal mining industry was checked in the week ended November 12th, when the total of 708,600 workers on colliery books was the same as in the preceding week; this figure was 16,500 less than the total on colliery books on November 13, 1948. Output per man-shift for all workers remained constant at 1.21 tons, compared with 1.15 tons a year before. Total output of deep-mined coal rose last week (the week ended November 19th) to 4,290,900 tons—the highest output this year, and 30,000 tons higher than the output of the previous best week at the beginning of November. Opencast output recovered to 229,400 tons.

*

The interim index of retail prices prepared by the Ministry of Labour remained unchanged at 112 on October 18th (June, 1947=100). The increases in the maximum permitted prices of bread (22 per cent) and flour (nearly 17 per cent) which followed the devaluation of sterling caused the index for food to rise from 117 to 119. This change was partly offset by the reductions in the maximum prices of utility clothing which came into force on September 26th, and which caused the index for clothing to fall from 119 to 117.

*

Mr Cameron Cobbold, the Governor of the Bank of England, has left this country for a visit to Canada and the United States. This is his first visit to the other side of the Atlantic as Governor of the Bank. He will return the call recently made to this country by Mr Graham Towers, Governor of the Bank of Canada. He will also discuss problems of mutual interest with the Federal Reserve Bank of New York and the Federal Reserve authorities in Washington.

*

Figures published in the *Ministry of Labour Gazette* show that the aggregate membership of trade unions in the United Kingdom was about 9,301,000 at the end of 1948. This figure, 159,000 more than at the end of 1947, is the highest ever recorded. It includes 144,000 members in Eire and in other branches outside the United Kingdom. Of the total, 7,632,000 were men and 1,669,000 women. Seventeen large unions, with a membership of more than 100,000 each, account for 66.9 per cent of the total trade union membership. But the total number of unions is 706, and there are still more than 400 which have fewer than 1,000 members each.

COMPANY MEETINGS

SOUTH AFRICAN DISTILLERIES AND WINES

DIVIDEND AGAIN 21 PER CENT.

The fifteenth annual ordinary general meeting of South African Distilleries and Wines, Limited, was held on November 18th, in London, Mr H. R. Mosenthal, the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts for the year to February 28, 1949:—

The consolidated trading profits of the subsidiary companies amount, before providing for taxation, to £736,933, as compared with £913,476 last year, a decrease of £176,543. The directors propose a final dividend on the ordinary stock of 15 per cent, less tax, making 21 per cent. for the year, the same as was paid last year.

EFFECT OF RATIONING

Last year I was able to inform you that although our subsidiary companies were not able to maintain their sales at the same volume because of the necessity to ration many of their products, nevertheless, they were able to concentrate their efforts to increase the sales of certain of their products with satisfactory results. Unfortunately, in the year under review they suffered a further reduction in their quota of rebate brandy and this proved to be a handicap which could not be countered and necessitated the still further tightening up of the rationing of the sale of their products. They were, however, able to minimise this very serious handicap to a certain degree by again concentrating their attentions to the preparation for sale of those wines and brandies which showed a bigger margin of profit although it could be no part of their policy to neglect the manufacture of reasonable quantities of their cheaper brands for which there is a constant demand.

The boards of the subsidiary companies inform me that it is of the utmost importance that maturing brandy stocks, which require a minimum maturation period of three years, be considerably increased and it is their policy to do this as soon as possible, and the same applies to maturing wine stocks so as ultimately to satisfy the demands of their customers. I am also informed that the demand for their products is so strong and the goodwill so great that they have been able to sell the whole of their available production and given the supplies, they could readily sell a great deal more than they do at present. Sales of the products of our subsidiary companies for the first six months of the current trading year are slightly ahead of those of the corresponding period of last year.

THE OUTLOOK

In regard to the future, there has been for some time a lack of confidence in South Africa, mainly due to lack of knowledge. For the future, what South Africa needs is to get away from a policy of isolationism and attempted self-sufficiency; her economic policy should be to concentrate on the production and export of gold, diamonds, chrome, copper, manganese, coal, wool, wines, etc., encourage only those local industries which are not dependent on imported raw materials and import goods from other countries where they can be more economically produced.

We may reasonably anticipate for the Union an early economic convalescence, followed by a resumption of normal healthy conditions facilitated by the recent devaluation, and we may therefore look forward with confidence to the progress and prosperity of our operating companies.

The report was adopted.

BANK OF LONDON AND SOUTH AMERICA, LIMITED

MULTIPLE EXCHANGE RATES AND CURRENCY COMPLICATIONS

The eighty-seventh annual general meeting of the Bank of London and South America will be held in London on December 20th. The following are extracts from the address to the stockholders by the chairman, Mr Francis M. G. Glyn, circulated with the balance sheet. Copies of the full address are obtainable from the head office of the bank at 6, Tokenhouse Yard, London, E.C.2.

BALANCE-SHEET

You will observe that the balance sheet totals at £165,852,025 compare with totals of £156,284,811 last year, showing an increase of £9,567,214. If all the exchange rates ruling on September 30, 1948, had been operative on September 30th last this increase would have largely disappeared. Current, deposit and other accounts, etc., at £86,175,077 this year compare with £77,064,123 for the previous year, the increase of over £9 millions being mainly accounted for in the same way. Acceptances on account of customers at £3,807,317 show an increase of £1,171,683, of which approximately half derives from increased business and half from movement in exchange rates. Documentary and other credits outstanding at £13,401,385 show a drop of £6,883,512, which is mostly due to a contraction in overseas business arising from official restrictions on imports necessitated by shortages of foreign exchange. This decrease in business done under bankers' credits is a sign of a transition from a sellers' to a buyers' market and is reflected in an increase of shipments on credit, as is shown by the rise in bills for collection on account of customers to the present figure of £26,889,945 from £21,543,538 a year ago.

PROFIT AND LOSS ACCOUNT

Starting with a balance of £180,761 brought forward from 1948, the profit and loss account shows that the profit for the year amounts to £313,217, against the corresponding amount of £350,030 a year ago. It will come as no surprise to you that many of the countries in which we are established derived considerable benefits in trade under wartime conditions which could not reasonably be expected to continue indefinitely. Such change has taken or is now taking place, and has affected our net earnings accordingly. At the same time the increased charges to which I referred a year ago, have not been diminished during the year under review, and particularly in the case of social services, contributions have shown a further upward tendency.

THE PAST YEAR

The pattern of foreign trade in Argentina, Brazil and Chile changed considerably under the double influence of inflation and the development of buyers' markets generally; and as exports decreased and consequently fewer consumer goods could be imported, a further stimulus was given to inflation in the vicious spiral. Finally, as is too often the case, the inflation encouraged reiterated demands for higher wages, on which the increases granted generally lagged too far behind the rising costs of living to satisfy the agitation. Naturally this picture varied considerably between the countries of Latin America.

UNREAL EXCHANGE RATE

Even before last September it was clear that these factors were making some exchange rates unreal. When the pound was devalued

those Latin American countries whose trade is more closely attached to the U.S.A. naturally kept with the dollar; Chile maintained her rate with the dollar and with sterling, while Argentina and Uruguay kept nominally to the old dollar basis, but established scales of widely differential rates applying to various categories of exports, imports and financial transactions. For instance, as you probably know, the rate which, according to the Argentine Government regulations, is to be applied to Great Britain's meat purchases is 9.40 pesos to the £, whereas for a large proportion of the imports which Argentina should be taking from the United Kingdom the rates, while varying with categories, would average at least 18 pesos to the £. Finally, for financial transactions such as remittances of interest and profits which concern us so vitally, the relevant rate is about 25.20 pesos to the £. Surely, one might say, a currency cannot be worth so many different values for so many different purposes? But in fact one gets a more accurate appreciation of the situation and its very serious effects if one realises that these differential rates are roughly equivalent to having a single rate of, say, 9 pesos to the £ for all imports and exports and a 100 per cent. import duty on all British goods entering Argentina. If such a duty had in fact been imposed, the protest from all of us, including, one hopes, H.M. Government, would have been immediate and vigorous since it would be only too obvious that the volume of United Kingdom exports would then be seriously reduced.

Multiple exchange rates and all the other complications of currency restrictions sometimes get overlaid with such mystification and obscurity that we miss their full implications. One cannot too often emphasise this other way of looking at differential exchange rates in terms of import duties so that the dangers may be exposed. The only practical method of trading with countries employing widely differential rates is, of course, to conduct all transactions in sterling prices.

BRITISH EXPORTS

In the conclusion to my review last year I referred to the importance of British exports to Latin American countries and of British exporters realising the implications of so many of these countries having to look increasingly to sterling sources of supply. Clearly the general need for maintaining and increasing exports is as important as, if not more important than, ever before. But one aspect of this takes precedence in the present dollar crisis. As a result of the stream of exhortation to increase our dollar sales our thoughts turn naturally, and rightly, to the U.S.A. and Canada. But it would be a mistake to forget those countries of Latin America which are in the dollar area and not to study the possibilities of increasing our exports there also.

REMITTANCES

Finally, I would refer to a point of vital importance to this bank and to many other institutions which trade abroad. I refer to remittances to cover financial services and profits. We are compelled to make substantial sterling payments to meet the tax demands without having received the corresponding sterling resources from which they should be drawn. We have already made representations on this very important matter to the Tucker Committee which, as you know, is considering the bases of taxation, and I can only hope that they will give the most careful consideration to what we consider a very just complaint.

CONSOLIDATED AFRICAN SELECTION TRUST

RECORD EARNINGS

The twenty-fifth annual general meeting of this Company will be held in London on December 14th.

The following is an extract from the circulated statement by the chairman, Mr. A. Chester Beatty:

The combined profit for the year ended June 30th, 1949, for this company and its subsidiaries was £2,589,640 before taxation. This result, showing the highest earnings so far achieved by your company, was a direct reflection of the record world sales of diamond in the calendar year 1948.

The combined surplus, after taxation, was £1,221,888. Appropriations out of this sum to specific reserves total £445,000, and to general reserves, £107,793, leaving a surplus for the year, available for distribution, of £669,095. An interim dividend of 1s. has already been paid, and the directors recommend a final dividend of 2s. 6d., making a total for the year of 3s. 6d.

Your directors foresee the necessity for substantial expenditure over the next few years for replacement of plant and equipment, and for increased mechanisation. It is for this reason that a further £350,000 has been appropriated out of the year's profits to raise the combined reserves for replacements and extension of fixed assets to a total of £700,000. The other major transfer from the year's profits is the item of £60,000 to the reserve for prospecting and development, bringing the total of that account at June 30, 1949, up to £275,727.

Our prospecting and mine development programmes are being actively pursued and additions to the mining reserves both in Sierra Leone and Gold Coast were sufficient substantially to offset the mined production for the year. The examination of certain promising developments in both Colonies is proceeding.

AMENITIES FOR EMPLOYEES

Our policy of raising the living standard of our African employees and of providing healthy living conditions is being consistently pursued. The retirement gratuity schemes for all Africans with more than five years' service, which were introduced in both Colonies in 1947, are now in full operation. Further allocations have been made to build up the funds required to maintain the schemes.

In spite of political and industrial unrest and strikes, especially in the Gold Coast, our mines operated without interruption throughout the year under review. We have, however, since had to report a four-day strike in the Gold Coast early in July. There have been definite signs of deterioration in the quality of the work of our African personnel. The man-hour output in both Colonies has declined and in the Gold Coast there has been a shortage of suitable labour. This, of course, results for the time being at least in reduced production at higher costs, but all possible steps are being taken to overcome this adverse trend.

World sales of diamond in the current year are running at a lower level than in 1948, and it is not to be expected that the exceptional results achieved by your company in the year under review will be repeated in this financial year. Sales have in fact been proceeding at a more normal rate, which is permitting us to improve our stock position. Taking into account the enhanced prices which our product will command as a result of the devaluation of sterling, the outlook for this current financial year is favourable, and as the consolidated balance sheet shows, the strong liquid position of your company is being fully maintained.

ROAN ANTELOPE COPPER MINES

MR. A. CHESTER BEATTY'S STATEMENT

The twenty-second annual general meeting of Roan Antelope Copper Mines Limited will be held in London on November 29th.

The following is an abridgment of the statement of the chairman, Mr. A. Chester Beatty, dated 11th November, 1949, which has been circulated to the stockholders:—

For some years the pricing basis for the copper delivered by us to the Ministry of Supply has been the American quotation converted into sterling at the official rate of exchange, and adjusted suitably by freight and grade differentials. I have previously stated that our sales to the Ministry are for delivery six months ahead. Last July, at the Ministry's request, we reduced this pricing period to three months.

It is public knowledge that the Ministry, subsequent to devaluation of the £1 sterling, asked the Rhodesian producers to consider some new pricing basis. This matter has been the subject of consideration for some weeks, and although I am not in a position to announce any final agreement, the Ministry has indicated that the previous pricing basis shall continue—that is to say, the American quotation converted into sterling at the new rate of exchange will be used as the pricing basis. However, I am not in a position to say what price this will result in, at the present time, as there are other matters still under discussion with the Ministry on which agreement has not yet been reached, namely, questions relating to the freight and grade differentials. An official announcement will be issued in due course as to the result of the negotiations.

RESULTS FOR THE YEAR

Production was 56,162 tons (51,757 tons the previous year). Cost of production was £72 14s. 11d. per long ton of blister copper (£56 4s. 10d.). Some of this production was retained as stock, which will be built up this year to about 18,000 tons. The remaining copper produced was sold at an average of £120 7s. 9d. per ton (£115 10s. 7d.).

The appropriation for replacements and obsolescence for the year is £700,000, compared with £450,000 for the previous year. We are in the middle of a considerable expansion programme brought about by the opening up of the western end of the mine. The programme for the next few years includes not only the shaft sinking and development required to bring the Roan Extension into production, but also the surface transport arrangements as well as additional power and housing requirements involved. The board has felt that the reserve for this year should be made at a figure approximating the actual amount which will be paid rather than on a figure based on the average which will be required over the next five years.

In line with previous policy, £100,000 has been transferred to general reserve to ensure that the increase in the book value of the copper stocks is not treated as distributable profit for the year. The board recommend the same dividend for the year as during the previous year—namely, 1s. 1½d. per unit of stock or share, of which 6d. was distributed as an interim dividend in June.

MINE CONDITIONS

The measures which have been developed in recent years to combat the difficult underground conditions are proving effective. The current year will, it is expected, be the peak year for costs arising from the build-up of

development work which has been involved in this changeover. This is the first occasion for some years when I have been able to indicate the prospect of easier mining conditions and of a reduced mining cost per ton.

During the current year it is expected that the equipment of the Irwin Shaft will be completed. This will mark the end of the first stage of the programme designed to bring about the simultaneous mining of the east and west ends of the Roan Basin and Roan Extension areas with a view to the simultaneous exhaustion of both these areas in due course. Drilling has also been started again on Muliashi, the westernmost of the three grants comprising the leased area of your company.

LABOUR RELATIONS

The last year has seen the formation, under Government sponsorship, of an African trade union; within a short time the union had formulated certain demands, and at conciliation proceedings agreement was reached resulting in an adjustment to some of our native labour wage scales.

There is no progress to report on the subject of the advancement generally of Africans in industry, following the discussions, referred to last year, between the Government, the staff association, the union and the companies.

The establishment of an African trade union is a development which will be watched with interest. If it is to be a permanent and successful part of the employer-employee relationship in the Northern Rhodesian copper-mining industry, it will require the development of a sense of responsibility on the part of the Africans, who have attained this highly developed form of organisation in what is relatively speaking a very short space of time.

There is a dispute in existence between the copper companies and the Northern Rhodesian Mine Workers' Union, the union having requested the companies to recognise the principle of a forty-hour week. The dispute was referred to conciliation, at which no agreement was reached, and there the matter stands.

COAL

The coal position is still not satisfactory. We should receive more coal in this year, but it will still be necessary to undertake intensive wood-burning. It is difficult to say much beyond this except that the matter is one which is constantly under review and discussion.

Given uninterrupted production, output should average, during the current year, between 4,500 and 5,000 tons of copper per month.

MARKET

The outlook for the copper market still depends largely on the business outlook in the United States. At the present time, the copper market in the United States is in a sound position.

GENERAL

The London Metal Exchange will reopen this month for transactions in tin. No indication has been given of the market being reopened for other base metals nor of cessation of bulk buying. I should however expect there would be developments in one or both of these directions during the year, although I am only expressing my own opinion in this matter.

DEBENHAMS LIMITED

TAXATION A HANDICAP TO TRADE

The ordinary general meeting of Debenhams Limited, will be held on December 15th in London.

The following is an extract from the statement by Sir Frederick Richmond, Bt. (chairman of the company), which was circulated with the report and accounts for the year ended July 31, 1949:—

The profit and loss account of the parent company shows a balance of £1,412,118, and that after deducting provision for profits tax (£200,000) and debenture interest, trustees' fees and directors' fees (£79,904), the net figure is £1,132,214, against £957,776 last year, an increase of £174,438. After adding £569,705 brought forward and paying the preference dividends and the interim dividend of 4d. per share on the ordinary shares, there is a balance available of £1,201,802. From this falls to be deducted £330,000 for current taxation (income tax) and £186,000 for future taxation, and after making the usual allocation of £50,000 to reserve, the directors recommend the payment of a final dividend of 1½d. per share on the ordinary shares, leaving £383,719 to be carried forward.

You will notice that we are providing no less a sum than £716,000 for taxation (including profits tax). The present high level of taxation is one of the most serious handicaps to trade and it would be reassuring to know that some steps were being taken to ease this burden, but unfortunately there is no indication that this is even in contemplation by the Government at the present time.

CAPITALISATION OF RESERVES

As you know, the directors have consistently followed a conservative policy and profits have been ploughed back into the company over a long series of years, with the result that the total funds employed in the business are largely in excess of the issued share capital. The proposal to capitalise reserves was abandoned as H.M. Treasury would only grant permission if the company were prepared to pay a special tax of 10 per cent. on what was called "the bonus element." Recently, however, this tax was repealed, making it possible for your directors to renew their application to the capital issues committee. The necessary permission was duly granted and an extraordinary general meeting has been convened, to follow the annual general meeting, to pass the appropriate resolutions.

Your directors are recommending that the sum of £1,500,000 be capitalized by the transfer of this amount from reserves. This sum will be applied to paying up in full 30,000,000 new ordinary shares, which will be allotted to the ordinary shareholders in the proportion of three new shares for every share already held. As soon as the new shares are issued they will be consolidated with the existing shares into shares of 4s. each. The final result of these changes will be that each ordinary shareholder will have the same number of shares as at present, but they will be of a 4s. denomination instead of 1s.

I venture to think you will agree with me that the results of the period under review are satisfactory when all the circumstances are taken into consideration. The total sales of the parent company and its subsidiaries have once again shown a substantial increase over those of the previous period, partly due to the higher level of prices, inflated as they are by the purchase tax—perhaps the main contributory factor in the high prices ruling to-day.

As I have frequently pointed out, the geographical spread of our businesses and the diverse classes of the community for which they cater provide us with a very real measure of security against the inevitable fluctuations of trade. Nevertheless, the heavy and ever-increasing burden of expenses in practically every direction is bound, in the absence of a substantial increase in turnover, to affect in greater or lesser degree all businesses. It is therefore not surprising that, as you will see from the consolidated accounts, our profits have in the aggregate fallen somewhat short of the previous year. The falling-off is only £23,000 and, therefore, I feel that in view of all the circumstances we have no cause to be dissatisfied with the results achieved.

IMPORTANT ACQUISITIONS

As I have indicated on more than one occasion, it is the intention of your board to pursue a progressive policy by acquiring suitable businesses from time to time as favourable opportunities present themselves. Several such opportunities have occurred in the course of the year, and we have acquired the control of a number of businesses which we felt would fit well into our already large group. The most important is Woolland Brothers Limited, of Knightsbridge. This business was founded as far back as 1869, and quickly established an enviable reputation, which it still retains, for the exclusive character of its wares. The trustees from whom we purchased the business were anxious that the Woolland tradition should be preserved, and with this we are in complete agreement. The old staff is being retained and there is no doubt in my mind that the business cannot fail to benefit from its association with our organisation.

The next in importance of our new acquisitions is Chamberlins Limited, with its subsidiary Buntings Limited, of Norwich. With the other businesses in East Anglia, viz., Footman, Pretty & Company, Limited (to which has recently been added E. Pretty and Company, Limited, of Bury St. Edmunds); Curl Brothers Limited; Garland & Sons Limited; and Arnolds Limited; this gives us the control of an important group of stores in an area where we believe there are great possibilities for further expansion.

The other new acquisitions are William Hill (Hove) Limited, which will be associated with the Bobby Group in regard to management; Z. Dudley Limited, an old-established business, doing a popular trade in the Kingsland Road, E. (associated in management with Dawson Brothers (London) Limited); and, finally, Pendlebury & Company, Limited, Wigan, and Heap & Son Limited, Bury, two businesses which can conveniently be supervised from Pauldens Limited, of Manchester.

You will, I feel sure, be interested to hear that all the provincial businesses I have mentioned show encouraging signs of progress since we took them over and, given anything like normal conditions, we feel confident that future results will justify our enterprise and that they will be profitable additions to our organisation.

If the Government will only leave us alone, apart from any serious trade recession, I am not unduly worried about the results of the coming year. Indeed, judging by the estimated profits to date, which include eight months' trading of our subsidiaries, I shall be disappointed if they compare unfavourably with the figures we have been discussing today.

JOHANNESBURG CONSOLIDATED INVESTMENT COMPANY, LIMITED

BENEFITS FROM DEVALUATION

The annual general meeting of this company was held on November 22nd in Johannesburg.

Mr H. J. Joel, who presided, in the course of his speech said:

This is our diamond jubilee year. I stated at our last meeting in November, 1948, that activity in the stock markets had up to that date been on a reduced scale as compared with the previous year. The fact that these conditions continued during the year accounts to a great extent for the fall of £208,060 in gross profit. On the other hand, gross dividends received increased from £760,869 to £827,178.

After charging income tax amounting to £424,037, the balance of profit for the year available for dividend and other appropriations amounted to £782,512. There is no transfer to general reserve this year, but an amount of £400,000 has been transferred to investment reserve. Dividend No. 57 of 3s. 6d. per share, less United Kingdom income tax at the standard rate of 9s. in the £, absorbed £380,183, and after the transfer of £400,000 to investment reserve there remains a balance of undistributed profits amounting to £342,276, reflecting an increase of £2,324.

The aggregate book value of investments at June 30, 1949, is almost the same figure as that at the end of the previous year. The greater part of our investment in the gold mining industry consists of interests in companies in the Orange Free State and elsewhere, which have not yet reached the dividend-paying stage.

GOLD MINING INDUSTRY

During the first six months of 1949 the operations of the gold mining industry were on a scale which compared closely with the operations for the first six months of 1948. For the half-year ended June 30, 1949, the tonnage mined declined by 384,000 tons, costs increased by 3d. per ton, while profits per ton decreased by an equivalent amount.

Prior to September 19, 1949, the future of several mines was gravely endangered by rising working costs and the depletion of payable ore. Amongst the gold mining companies of this group, the Randfontein Estates, one of the largest producers on the Witwatersrand, had been struggling to maintain a narrow margin of profitability to enable it to continue in production.

You are all aware of the change which occurred on the 19th of that month. The devaluation of sterling and of the South African pound raised the sterling price of gold from 172s. 6d. per ounce to 248s. 3d. per ounce fine. Immediate relief has been afforded to those mines which have been struggling to continue in production. The prolongation of their lives will mean the extraction of large quantities of gold that would otherwise have remained valueless and unmined.

The mining of this gold represents an additional asset to this country. This asset remains in being only for so long as the cost of production is less than the value of the product obtained. Should working costs rise and absorb a large portion of the increased sterling price of gold, then to that extent is our new asset again lost to the country.

The report was adopted. Owing to the quorum necessary for the passing of the special resolutions in connection with the proposed increase of capital not being present in person or represented by proxy at the extraordinary general meeting, it was adjourned, in terms of the Companies Act, for one week to November 29, 1949.

NORTH BRITISH RAYON RECORD OUTPUT

The twenty-first ordinary general meeting of North British Rayon, Limited, was held on November 24th in London, Mr Ernest Walls, the chairman, presiding.

The following is an extract from his statement, circulated with the report and accounts for the year to June 30, 1949:—

On June 28th the company completed its first 20 years as the only producers of rayon in Scotland. In this anniversary year the output was the highest in the history of the company. This is doubly gratifying at a time when higher output, especially for export, is a national duty. Our output, in fact, is now well high up to total capacity, itself about four times the capacity with which we started 20 years ago.

Demand continues good, both for home and export. Devaluation should stimulate the latter, but on the other side it means considerable increase in our costs, since important materials, especially woodpulp, used in our industry, come from Canada and U.S.A. All these and probably more repercussions of devaluation to come will have their influence on our costs, especially our costs after December 31st. As regards costs in the year under review, on balance they went somewhat against us, as compared with the previous year. The larger output reduced our overhead and indirect costs per pound of rayon, but not enough to set off all increased items. There has been no corresponding increase in the selling price of rayon.

The liquid position is very strong. Current assets, less liabilities, leave a net balance of current, that is cash or quickly realisable, assets of £372,748, which covers the whole of the loan and Preference capital, with something over.

The report was adopted, the proposed dividend of 7½ per cent. and bonus of 2½ per cent., both less tax, were approved, and the revised articles of association adopted.

AMALGAMATED ANTHRACITE COLLIERIES LIMITED

EXTENSION OF ACTIVITIES

The twenty-fifth annual general meeting of Amalgamated Anthracite Collieries Limited was held, on November 22nd, in London, Mr John Waddell (chairman of the company) presiding.

The following is an extract from the statement by the chairman circulated with the report and accounts:—

Dealing firstly with the colliery position, I must say that the general outlook is not satisfactory or encouraging. Whatever amount was likely to be received in compensation stock in respect of collieries and colliery properties based upon the original claim, must be scaled down by nearly 50 per cent.

I will now turn to our subsidiary trading group owned by Anthracite Holdings Limited. Originally, this group was formed to take over all the various distributing, merchanting, wagon owning and manufacturing sections of the original Amalgamated Anthracite Collieries Limited. This took place in 1942, and the company has an excellent record since that date.

We can see further difficulties in the offing due to the passing of the Coal Industry Act of 1949. This new Bill gives special powers to terminate long-term contracts taken over by the Coal Board on a basis which may, under certain circumstances, enable the Board to discontinue its contracts without paying full compensation in accordance with the terms of the contracts.

We have widened our scope of trading in industrial and colliery requisites by purchasing from the Custodian of Enemy Property

the capital of the Concordia Electric Safety Lamp Company Limited, with its subsidiaries.

The general situation of the distributive trade at present is such that your board feel we should put no more eggs in this basket.

Your board have every confidence that our general situation is such that we shall emerge with good results.

The report was adopted.

FINANCIAL NEWS LIMITED

REVIEW OF SUCCESSFUL YEAR'S RESULTS

The annual general meeting of this company was held, on the 24th instant, in London. The Rt. Hon. Brendan Bracken, M.P., in the course of his speech, said:—

All the publications in which your company is interested traded profitably during the year under review. In each case total revenue was well maintained.

The balance sheet figures show very little change. Last year I referred to our large reserves and stated that if it were not for the tax on bonus issues your directors would bring the issued capital more into line with the company's true asset values. You will be aware that after a brief period of relaxation, the ban on bonus issues has now been reimposed in order to placate those who profess themselves the Chancellor's "followers."

We are recommending the payment of a final dividend of 35 per cent. making an unchanged total of 60 per cent. for the year. This 60 per cent. equals 12½ per cent. on the capital employed in the business.

THE FINANCIAL TIMES

Let me now say something about the various publications in which your company is interested. *The Financial Times* is earning very good profits despite the fact that costs of production have risen during the past year through increases in wage and other printing costs. We have also gladly spent a good deal of money in adding to the service given to readers.

Before the war most of the readers of *The Financial Times* were investors, bankers, brokers and merchants. We are now advantaged by a steadily increasing circulation among those engaged in commerce and industry. Few newspapers in the world can equal the quality and quantity of commercial and industrial news provided by *Financial Times* reporters and correspondents at home and abroad.

The Investors' Chronicle.—Shareholders in this company owe a great debt of gratitude to the editor, Mr Harold Wincott. He produces one of the soundest and liveliest of newspapers. The services manifold he has rendered to investors are beyond praise. *The Investors' Chronicle* well deserves the excellent profits received by shareholders.

The Banker.—*The Banker* maintains its high reputation. It is one of the few papers that writes intelligently about that mystery called currency. All that one need say about *The Banker* is that it is worthy of the great tradition of British banking.

The Economist.—*The Economist*, of which we hold half the ordinary share capital, has enjoyed a steady growth in its circulation and continues to earn excellent profits.

The Practitioner.—The circulation and revenues of this paper have also increased. The enterprise and sagacity of its editors and management are rewarded by a steady growth of new readers in the medical profession at home and overseas.

Printing Interests.—As the principal shareholder in *The Financial Times*, we have a considerable interest in two large London printing firms. Despite the shortage of newsprint and delays in delivering new machinery, both firms prosper.

The report and accounts were adopted.

W. AND J. LAWLEY, LIMITED

FULL ORDER BOOK

The tenth annual general meeting of W. and J. Lawley, Limited, was held on November 23rd at Birmingham, Mr J. W. Gaunt, Senior (the chairman), presiding.

The following is an extract from his circulated statement:—

I am happy to present the company's accounts for the year ending July 31, 1949, and to be able to report to you that the results of our first year's trading as a public company are substantially better than was anticipated at the time of the offer for sale in March last. Turnover was substantially higher than in the previous year, and the trading profit for the year at £69,538 is an increase of £7,550 on the previous year, and the net profit, after providing for taxation and all other outgoings, amounts to £27,983, an increase of £7,170. Before arriving at this net profit it has been necessary to provide £28,500 for taxation on the current year's profits. Your directors are recommending the payment of a dividend of 40 per cent., less income-tax, which was the rate forecast in the recent offer for sale.

The strength of the company's balance-sheet has been materially increased during the year.

Forecasting future trends is a very hazardous business in the present unsettled state of affairs, but in spite of increasing price competition in some lines our order book is full. The recent Government cut in the building programme will of course affect the demand for our products for new houses, but, in view of the heavy replacement demand which still exists, I do not think we need fear any serious falling off in total sales. I consider that your company's prospects continue to be good.

The report was adopted.

ANGLO-DUTCH PLANTATIONS OF JAVA

PROGRESS OF REHABILITATION

The thirty-ninth annual general meeting of the Anglo-Dutch Plantations of Java, Limited, was held in London on November 22nd.

The following is an extract from the circulated statement of the chairman, Mr W. H. Daukes.

The year 1948 was occupied mainly in the rehabilitation of the properties. Three factories had to be reconditioned and one almost completely rebuilt. The crop amounted to 3,108,579 lbs., and was almost entirely obtained from the comparatively small area which had been pruned by the Republicans.

The rubber position was the reverse of the tea, the crop harvested being severely restricted by the lack of manufacturing facilities. During 1948 and the first two months of the current year, all the factories were restored or rebuilt, the capacity for manufacturing smoked sheet now being considerably greater than that of prewar. In spite of all the difficulties we had to contend with a crop of over 8,000,000 lbs. was manufactured, the upkeep and cultivation was brought back to normal in all important areas, and approximately 1,191 acres were replanted.

At the end of this year we will have between 33,000 and 34,000 acres of rubber, compared with just under 40,000 before the war. Under normal conditions the annual crop should be not less than 22,000,000 lbs., rising steadily to 25,000,000 lbs. or more.

The tea position is much less satisfactory. Of 27,000 acres before the war only just one-half remains, and this includes nearly 1,000 acres on Pagilaran Estate, where the main part of the lease expires next year.

The meeting then stood adjourned.

Company Notes

Birmingham Small Arms.—Consolidated trading profit increased from £1,146,383 to £1,438,294. Group net profit, including £250,000 (nil) taxation no longer required, amounted to £507,442 (£429,630). The dividend of 7½ per cent is unchanged.

Dorman Long.—Group profit after transferring £325,156 to provision for relinings, repairs, etc., increased from £4,219,601 to £5,187,645 in the year to September 30, 1949. After depreciation of £961,755 (£1,002,225) and taxation £2,404,421 (£1,790,127), net profit amounted to £1,342,079 (£1,081,577). The dividend of 8 per cent on the ordinary shares is repeated.

The Rover Company.—Trading profit amounted to £611,996 (£565,110) for the year to July 30, 1949. Net profit was £158,098 (£132,199). Net current assets were £1,311,408 (£982,090) at the year-end.

Tube Investments.—Consolidated trading profit, after providing £1,078,782 (£1,126,513) for depreciation, declined from £5,042,521 to £4,840,467 in the year to July 30, 1949. Net current assets at the year-end were £12,331,744 (£11,107,113) of which £4,181,588 (£5,315,399) was represented by liquid funds. Stocks were £9,872,017 (£8,152,824), debtors £6,260,429 (£5,687,986) and net fixed assets £16,912,850 (£16,721,160).

Rhokana Corporation.—Operating profit increased from £4,390,987 to £4,743,280 in the year to June 30, 1949. Net current assets at the year-end were £6,492,171 (£5,622,935) and fixed assets, less depreciation, £13,227,642 (£12,989,977).

Arthur Guinness and Son.—Net profit of Arthur Guinness and Son amounted to £2,073,091 (£2,045,685) in the year to September 30, 1949. The ordinary distribution of 29 per cent for the year is unchanged. Reserve allocations are lower at £820,000 against £1,200,000.

Austin Motor.—Group trading profit increased from £1,647,762 to £2,224,146, and

Investment Statistics

total profit of the group from £1,653,624 to £2,232,671 in the year to July 31, 1949. Reserves receive £125,000 (£361,529, including £126,000 from taxation provisions written back). The dividend rate of 40 per cent is unchanged on the increased ordinary capital. Net current assets were £6,262,825 (£4,024,925) at the year-end.

Glaxo Laboratories.—Group trading profit amounted to £2,491,389 for the year to June 30, 1949, compared with £1,585,757 for the previous 9 months. Total group profit was £2,605,817 (£1,641,805). The dividend of 125 per cent is at the same rate as in 1947-8. Net current assets increased from £1,237,790 to £2,115,728 in 1948-9.

Rhodesian Selection Trust.—To income amounted to £734,754 for the year to June 30, 1949, compared with £648,648 for the nine months to June 30, 1948. Profit of Mufulira increased from £2,745,166 to £4,193,086. Mufulira's dividend was 8s. 6d. a share for the year, and RST's 2s. 6d. per share.

Crittall Manufacturing.—Consolidated total profit declined from £573,307 to £554,227 and group net profit from £249,511 to £243,745 in the year to August 31, 1949. Net current assets at the year-end were £1,630,658 against £1,479,651 a year earlier.

Heenan and Froude.—Group profit before taxation and miscellaneous income amounted to £242,546 (£171,374) in the year to August 31, 1949. A final dividend of 10 per cent is recommended, making a total of 15 per cent for the year (same).

Ansell's Brewery.—Profit before taxation declined from £1,283,269 to £1,026,695 and net profit from £614,569 to £490,673 in the year to October 2, 1949. A final dividend of 12 per cent is recommended on the ordinary capital as increased to £3,000,000 by the 50 per cent share bonus.

Morris (Herbert).—Group trading profits increased by £154,101 to £585,729 in the year to July 31, 1949. A final dividend of 15 per cent tax free and a 2 per cent tax free bonus is recommended on the capital as

increased by the 10 per cent capital bonus. Net current assets at the year-end were £998,003.

Capital Issues

Union of South Africa.—Lists opened and closed on November 23rd for the issue of £10,000,000 3½ per cent stock, 1965-67, at £99 per cent.

British Field Products.—The Agricultural Mortgage Corporation has supplied £120,000 3 per cent debenture stock and £100,000 in £1 ordinary shares is being subscribed privately for the erection of a Rosin-Buttner crop drier.

Frederick Braby.—Shareholders are to be offered 455,000 £1 ordinary shares in the proportion of one new share for each share held. The price of the new shares remains to be decided.

Howards and Sons (chemical manufacturers).—Underwriting has been completed for a placing of 189,514 5½ per cent cumulative £1 preference shares.
